For channel types sender, server, cluster sender, cluster receiver and client connection (*SDR, *SVR, *CLUSSDR, *CLUSRCVR and *CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No header data compression is performed.

***SYSTEM**

Header data compression is performed.

Message Compression (COMPMSG)

The list of message data compression techniques supported by the channel.

For channel types sender, server, cluster sender, cluster receiver and client connection (*SDR, *SVR, *CLUSSDR, *CLUSRCVR and *CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No message data compression is performed.

***RLE**

Message data compression is performed using run-length encoding.

***ZLIBFAST**

Message data compression is performed using the zlib compression technique. A fast compression time is preferred.

***ZLIBHIGH**

Message data compression is performed using the zlib compression technique. A high level of compression is preferred.

***ANY**

Any compression technique supported by the queue manager can be used. This option is only valid for channel types receiver, requester and server connection (*RCVR, *RQSTR and *SVRCN).

Channel Monitoring (MONCHL)

Controls the collection of online monitoring data.

Online monitoring data is not collected when the queue manager attribute MONCHL is set to *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

The collection of online monitoring data is inherited from the setting of the queue manager attribute MONCHL.

***OFF**

Online Monitoring Data collection for this channel is disabled.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for a channel type (CHLTYPE) of *CLTCN.

Channel Statistics (STATCHL)

Controls the collection of statistics data.

Statistics data is not collected when the queue manager attribute STATCHL is set to *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATCHL.

***OFF**

Statistics data collection for this channel is disabled.

***LOW**

Statistics data collection is turned on with a low ratio of data collection.

***MEDIUM**

Statistics data collection is turned on with a moderate ratio of data collection.

***HIGH**

Statistics data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Cluster Workload Rank (CLWLRANK)

Specifies the cluster workload rank of the channel.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-rank

The cluster workload rank of the channel in the range 0 through 9.

Cluster Workload Priority (CLWLPRTY)

Specifies the cluster workload priority of the channel.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-priority

The cluster workload priority of the channel in the range 0 through 9.

Cluster Channel Weight (CLWLWGHT)

Specifies the cluster workload weight of the channel.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-weight

The cluster workload weight of the channel in the range 1 through 99.

Sharing Conversations (SHARECNV)

Specifies the maximum the number of conversations which can be shared over a particular TCP/IP client channel instance (socket).

This parameter is valid for channels with CHLTYPE defined as *CLTCN or *SVRCN.

The possible values are:

***SAME**

The attribute is unchanged.

0

Specifies no sharing of conversations over a TCP/IP socket. The channel instance runs in a mode prior to that of IBM WebSphere MQ 7.0, with regard to:

- Administrator stop-quietce
- Heartbeating
- Read ahead

1

Specifies no sharing of conversations over a TCP/IP socket. Client heartbeating and read ahead are available, whether in an MQGET call or not, and channel quiescing is more controllable.

shared-conversations

The number of shared conversations in the range 2 through 999999999.

This parameter is only valid for client-connection and server-connection channels.

Note: If the client-connection SHARECNV value does not match the server-connection SHARECNV value, the lower of the two values is used.

Property Control (PROPCTL)

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor).

The possible values are:

***SAME**

The attribute is unchanged.

***COMPAT**

If the message contains a property with a prefix of "mcd.", "jms.", "usr." or "mqext." then all optional message properties, except those in the message descriptor (or extension) will be placed in one or more MQRFH2 headers in the message data before the message is sent to the remote queue manager.

***NONE**

All properties of the message, except those in the message descriptor (or extension), will be removed from the message before the message is sent to the remote queue manager.

***ALL**

All properties of the message will be included with the message when it is sent to the remote queue manager. The properties, except those in the message descriptor (or extension), will be placed in one or more MQRFH2 headers in the message data.

Maximum Instances (MAXINST)

Specifies the maximum number of clients that can simultaneously connect to the queue manager via this server-connection channel object.

This attribute is valid only for server-connection channels.

The possible values are:

***SAME**

The attribute is unchanged.

maximum-instances

The maximum number of simultaneous instances of the channel in the range 0 through 999999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

Maximum Instances Per Client (MAXINSTC)

Specifies the maximum number of simultaneous instances of an individual server-connection channel which can be started from a single client.

In this context, multiple client connections originating from the same remote network address are considered to be a single client.

This attribute is valid only for server-connection channels.

The possible values are:

***SAME**

The attribute is unchanged.

maximum-instances-per-client

The maximum number of simultaneous instances of the channel which can be in the started from a single client in the range 0 through 99999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running from individual clients, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

Client Channel Weight (CLNTWGHT)

The client channel weighting attribute is used so client channel definitions can be selected at random based on their weighting when more than one suitable definition is available.

The possible values are:

***SAME**

The attribute is unchanged.

client-channel-weight

The client channel weight in the range 0 through 99.

Connection Affinity (AFFINITY)

The channel affinity attribute is used so client applications that connect multiple times using the same queue manager name can choose whether to use the same client channel definition for each connection.

The possible values are:

***SAME**

The attribute is unchanged.

***PREFERRED**

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any applicable CLNTWGHT(0) definitions first and in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful non CLNTWGHT(0) definitions are moved to the end of the list. CLNTWGHT(0) definitions remain at the start of the list and are selected first for each connection.

***NONE**

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process select an applicable definition based on the weighting with any applicable CLNTWGHT(0) definitions selected first in alphabetical order.

Batch Data Limit (BATHLIM)

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

The batch is terminated when one of the following conditions is met:

- **BATCHSZ** messages have been sent.
- **BATHLIM** bytes have been sent.
- The transmission queue is empty and **BATCHINT** is exceeded.

This parameter is valid only for channels with a channel type (**CHLTYPE**) of SDR, SVR, CLUSSDR, or CLUSRCVR.

The value must be in the range 0 - 999999. The default value is 5000.

The **BATHLIM** parameter is supported on all platforms.

The possible values are:

***SAME**

The value of this attribute does not change.

batch-data-limit

Specify a value ranging from 0 through 999999.

This parameter can only be specified for channel types (CHLTYPE) *SDR, *SVR, *CLUSSDR, or *CLUSRCVR.

Default client reconnection (DFTRECON)

Specifies whether a client connection automatically reconnects a client application if its connection breaks.

***SAME**

The value of this attribute does not change.

***NO**

Unless overridden by **MQCONN**, the client is not reconnected automatically.

***YES**

Unless overridden by **MQCONN**, the client reconnects automatically.

***QMGR**

Unless overridden by **MQCONN**, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO_RECONNECT_Q_MGR.

***DISABLED**

Reconnection is disabled, even if requested by the client program using the **MQCONN** MQI call.

This parameter is specified for a client connection channel, (CHLTYPE) *CLTCN

Copy MQ Listener (CPYMQMLSR)**Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Copy MQ Listener (CPYMQMLSR) command creates an MQ listener definition of the same type and, for attributes not specified in the command, with the same attribute values as an existing listener definition.

Parameters

Keyword	Description	Choices	Notes
<u>FROMLSR</u>	From Listener	Character value	Required, Key, Positional 1
<u>TOLSR</u>	To Listener	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 5
<u>CONTROL</u>	Listener control	*SAME , *MANUAL, *QMGR, *STARTONLY	Optional, Positional 6
<u>PORT</u>	Port number	0-65535, *SAME	Optional, Positional 7

Keyword	Description	Choices	Notes
<u>IPADDR</u>	IP Address	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 8
<u>BACKLOG</u>	Listener backlog	0-999999999, *SAME	Optional, Positional 9

From Listener (FROMLSR)

Specifies the name of the existing listener definition to provide values for the attributes not specified in this command.

The possible values are:

from-listener-name

Specify the name of the source MQ listener.

To Listener (TOLSR)

Specifies the name of the new listener definition to be created. The name can contain a maximum of 48 characters.

If a listener definition with this name already exists, REPLACE(*YES) must be specified.

The possible values are:

to-listener-name

Specify the name of the new listener being created.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Replace (REPLACE)

Specifies whether the new listener definition will replace an existing listener definition with the same name.

The possible values are:

***NO**

This definition does not replace any existing listener definition with the same name. The command fails if the named listener definition already exists.

***YES**

Replace the existing listener definition. If there is no definition with the same name, a new definition is created.

Text 'description' (TEXT)

Specifies text that briefly describes the listener definition.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Listener control (CONTROL)

Whether the listener starts automatically when the queue manager is started.

The possible values are:

***SAME**

The attribute is unchanged.

***MANUAL**

The listener is not automatically started or stopped.

***QMGR**

The listener is started and stopped as the queue manager is started and stopped.

***STARTONLY**

The listener is started as the queue manager is started, but is not automatically stopped when the queue manager is stopped.

Port number (PORT)

The port number to be used by the listener.

The possible values are:

***SAME**

The attribute is unchanged.

port-number

The port number to be used.

IP Address (IPADDR)

The IP address to be used by the listener.

The possible values are:

***SAME**

The attribute is unchanged.

ip-addr

The IP address to be used.

Listener backlog (BACKLOG)

The number of concurrent connection requests the listener supports.

The possible values are:

***SAME**

The attribute is unchanged.

backlog

The number of concurrent connection requests supported.

IBM i Copy MQ Namelist (CPYMQMNL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Copy MQ Namelist (CPYMQMNL) command copies an MQ namelist.

Parameters

Keyword	Description	Choices	Notes
<u>FROMNL</u>	From Namelist	Character value	Required, Key, Positional 1
<u>TONL</u>	To Namelist	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 5
<u>NAMES</u>	List of Names	Values (up to 256 repetitions): <i>Character value</i> , *BLANKS, *SAME, *NONE	Optional, Positional 6

From Namelist (FROMNL)

Specifies the name of the existing namelist, to provide values for the attributes not specified in this command.

from-namelist

Specify the name of the source namelist.

To Namelist (TONL)

The name of the new namelist to be created. The name can contain a maximum of 48 characters.

If a namelist with this name already exists, REPLACE(*YES) must be specified.

to-namelist

Specify the name of the MQ namelist being created.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

The default queue manager is used.

message-queue-manager-name

Specify the name of the queue manager.

Replace (REPLACE)

Specifies whether the new namelist should replace an existing namelist with the same name.

*NO

Do not replace the existing namelist. The command fails if the named namelist already exists.

*YES

Replace the existing namelist. If there is no namelist with the same name, a new namelist is created.

Text 'description' (TEXT)

Specifies text that briefly describes the namelist.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

*SAME

The attribute is unchanged.

description

Specify no more than 64 characters enclosed in apostrophes.

List of Names (NAMES)

List of names. This is the list of names to be created. The names can be of any type, but must conform to the rules for naming MQ objects.

*SAME

The attribute is unchanged.

namelist

The list to create. An empty list is valid.

IBM i Copy MQ Process (CPYMQMPCR)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Copy MQ Process (CPYMQMPCR) command creates an MQ process definition of the same type and, for attributes not specified in the command, with the same attribute values as an existing process definition.

Parameters

Keyword	Description	Choices	Notes
<u>FROMPRC</u>	From process	Character value	Required, Key, Positional 1
<u>TOPRC</u>	To process	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 5

Keyword	Description	Choices	Notes
<u>APPTYPE</u>	Application type	<i>Integer, *SAME, *CICS, *MVS, *IMS, *OS2, *DOS, *UNIX, *QMGR, *OS400, *WINDOWS, *CICS_VSE, *WINDOWS_NT, *VMS, *NSK, *VOS, *IMS_BRIDGE, *XCF, *CICS_BRIDGE, *NOTES_AGENT, *BROKER, *JAVA, *DQM</i>	Optional, Positional 6
<u>APPID</u>	Application identifier	<i>Character value, *SAME</i>	Optional, Positional 7
<u>USRDATA</u>	User data	<i>Character value, *SAME, *NONE</i>	Optional, Positional 8
<u>ENVDATA</u>	Environment data	<i>Character value, *SAME, *NONE</i>	Optional, Positional 9

From process (FROMPRC)

Specifies the name of the existing process definition to provide values for the attributes not specified in this command.

The possible values are:

from-process-name

Specify the name of the source MQ process.

To process (TOPRC)

The name of the new process definition to be created. The name can contain a maximum of 48 characters.

If a process definition with this name already exists, REPLACE(*YES) must be specified.

The possible values are:

to-process-name

Specify the name of the MQ process being created.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Replace (REPLACE)

Specifies whether the new process definition should replace an existing process definition with the same name.

The possible values are:

***NO**

This definition does not replace any existing process definition with the same name. The command fails if the named process definition already exists.

***YES**

Replace the existing process definition. If there is no definition with the same name, a new definition is created.

Text 'description' (TEXT)

Specifies text that briefly describes the process definition.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Application type (APPTYPE)

The type of application started.

The possible values are:

***SAME**

The attribute is unchanged.

***CICS**

Represents a CICS/400 application.

***MVS**

Represents an MVS application.

***IMS**

Represents an IMS application.

***OS2**

Represents an OS/2 application.

***DOS**

Represents a DOS application.

***UNIX**

Represents a UNIX application.

***QMGR**

Represents a queue manager.

***OS400**

Represents an IBM i application.

***WINDOWS**

Represents a Windows application.

***CICS_VSE**

Represents a CICS/VSE application.

***WINDOWS_NT**

Represents a Windows NT application.

***VMS**

Represents a VMS application.

***NSK**

Represents a Tandem/NSK application.

***VOS**

Represents a VOS application.

***IMS_BRIDGE**

Represents an IMS bridge application.

***XCF**

Represents an XCF application.

***CICS_BRIDGE**

Represents a CICS bridge application.

***NOTES_AGENT**

Represents a Lotus Notes application.

***BROKER**

Represents a broker application.

***JAVA**

Represents a Java application.

***DQM**

Represents a DQM application.

user-value

User-defined application type in the range 65536 through 999999999.

Application identifier (APPID)

Application identifier. This is the name of the application to be started, on the platform for which the command is processing. It is typically a program name and library name.

The possible values are:

***SAME**

The attribute is unchanged.

application-id

The maximum length is 256 characters.

User data (USRDATA)

A character string that contains user information pertaining to the application, as defined by APPID, to start.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The user data is blank.

user-data

Specify up to 128 characters of user data.

Environment data (ENVDATA)

A character string that contains environment information pertaining to the application, as defined by APPID, to start.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The environment data is blank.

environment-data

The maximum length is 128 characters.

Copy MQ Queue (CPYMQMQ)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Copy MQ Queue (**CPYMQMQ**) command creates a queue definition of the same type and, for attributes not specified in the command, with the same attribute values as an existing queue definition.

Parameters

Keyword	Description	Choices	Notes
<u>FROMQ</u>	From queue name	Character value	Required, Key, Positional 1
<u>TOQ</u>	To queue name	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 3
<u>QTYPE</u>	Queue type	Character value	Optional, Positional 4
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 5
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 6
<u>PUTENBL</u>	Put enabled	*SAME , *NO, *YES	Optional, Positional 7
<u>DFTPTY</u>	Default message priority	0-9, *SAME	Optional, Positional 8
<u>DFTMSGPST</u>	Default message persistence	*SAME , *NO, *YES	Optional, Positional 9
<u>PRCNAME</u>	Process name	<i>Character value</i> , *NONE, *SAME	Optional, Positional 10
<u>TRGENBL</u>	Triggering enabled	*SAME , *NO, *YES	Optional, Positional 11
<u>GETENBL</u>	Get enabled	*SAME , *NO, *YES	Optional, Positional 12
<u>SHARE</u>	Sharing enabled	*SAME , *NO, *YES	Optional, Positional 13
<u>DFTSHARE</u>	Default share option	*SAME , *NO, *YES	Optional, Positional 14
<u>MSGDLYSEQ</u>	Message delivery sequence	*SAME , *PTY, *FIFO	Optional, Positional 15
<u>HDNBKCNT</u>	Harden backout count	*SAME , *NO, *YES	Optional, Positional 16
<u>TRGTYPE</u>	Trigger type	*SAME , *FIRST, *ALL, *DEPTH, *NONE	Optional, Positional 17
<u>TRGDEPTH</u>	Trigger depth	1-999999999, *SAME	Optional, Positional 18
<u>TRGMSGPTY</u>	Trigger message priority	0-9, *SAME	Optional, Positional 19

Keyword	Description	Choices	Notes
TRGDATA	Trigger data	<i>Character value</i> , *NONE, *SAME	Optional, Positional 20
RTNITV	Retention interval	0-999999999, *SAME	Optional, Positional 21
MAXDEPTH	Maximum queue depth	0-999999999, *SAME	Optional, Positional 22
MAXMSGLEN	Maximum message length	0-104857600, *SAME	Optional, Positional 23
BKTTHLD	Backout threshold	0-999999999, *SAME	Optional, Positional 24
BKTQNAME	Backout requeue name	<i>Character value</i> , *NONE, *SAME	Optional, Positional 25
INITQNAME	Initiation queue	<i>Character value</i> , *NONE, *SAME	Optional, Positional 26
USAGE	Usage	*SAME , *NORMAL, *TMQ	Optional, Positional 27
DFNTYPE	Definition type	*SAME , *TEMPDYN, *PERMDYN	Optional, Positional 28
TGTQNAME	Target object	<i>Character value</i> , *SAME	Optional, Positional 29
RMTQNAME	Remote queue	<i>Character value</i> , *SAME , *NONE	Optional, Positional 30
RMTMQMNAME	Remote Message Queue Manager	<i>Character value</i> , *SAME	Optional, Positional 31
TMQNAME	Transmission queue	<i>Character value</i> , *NONE, *SAME	Optional, Positional 32
HIGHTHLD	Queue depth high threshold	0-100, *SAME	Optional, Positional 33
LOWTHLD	Queue depth low threshold	0-100, *SAME	Optional, Positional 34
FULLEVT	Queue full events enabled	*SAME , *NO, *YES	Optional, Positional 35
HIGHEVT	Queue high events enabled	*SAME , *NO, *YES	Optional, Positional 36
LOWEVT	Queue low events enabled	*SAME , *NO, *YES	Optional, Positional 37
SRVITV	Service interval	0-999999999, *SAME	Optional, Positional 38
SRVEVT	Service interval events	*SAME , *HIGH, *OK, *NONE	Optional, Positional 39
DISTLIST	Distribution list support	*SAME , *NO, *YES	Optional, Positional 40
CLUSTER	Cluster Name	<i>Character value</i> , *SAME , *NONE	Optional, Positional 41
CLUSNL	Cluster Name List	<i>Character value</i> , *NONE, *SAME	Optional, Positional 42
DEFBIND	Default Binding	*SAME , *OPEN, *NOTFIXED, *GROUP	Optional, Positional 43

Keyword	Description	Choices	Notes
CLWLRANK	Cluster Workload Rank	0-9, *SAME	Optional, Positional 44
CLWLPRTY	Cluster Workload Priority	0-9, *SAME	Optional, Positional 45
CLWLUSEQ	Cluster workload queue use	*SAME , *QMGR, *LOCAL, *ANY	Optional, Positional 46
MONQ	Queue Monitoring	*SAME , *QMGR, *OFF, *LOW, *MEDIUM, *HIGH	Optional, Positional 47
STATQ	Queue Statistics	*SAME , *QMGR, *OFF, *ON	Optional, Positional 48
ACCTQ	Queue Accounting	*SAME , *QMGR, *OFF, *ON	Optional, Positional 49
NPMCLASS	Non Persistent Message Class	*SAME , *NORMAL, *HIGH	Optional, Positional 50
MSGREADAHD	Message Read Ahead	*SAME , *DISABLED, *NO, *YES	Optional, Positional 51
DFTPURRESP	Default Put Response	*SAME , *SYNC, *ASYNCR	Optional, Positional 52
PROPCTL	Property Control	*SAME , *COMPAT, *NONE, *ALL, *FORCE, *V6COMPAT	Optional, Positional 53
TARGTYPE	Target Type	*SAME , *QUEUE, *TOPIC	Optional, Positional 54
CUSTOM	Custom attribute	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 55
CLCHNAME	Cluster-sender channel name	<i>Character value</i> , *NONE, *SAME	Optional, Positional 56

From queue name (FROMQ)

Specifies the name of the existing queue definition, to provide values for the attributes not specified in this command.

The possible values are:

from-queue-name

Specify the name of the source queue.

To queue name (TOQ)

Specifies the name of the new queue definition. The name can contain a maximum of 48 characters. Queue name and type combinations must be unique; if a queue definition already exists with the name and type of the new queue, REPLACE(*YES) must be specified.

Note: The field length is 48 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

The possible values are:

to-queue-name

Specify the name of the queue being created.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Queue type (QTYPE)

Specifies the type of queue that is to be copied.

The possible values are:

***ALS**

An alias queue.

***LCL**

A local queue.

***RMT**

A remote queue.

***MDL**

A model queue.

Replace (REPLACE)

Specifies whether the new queue will replace an existing queue definition with the same name and type.

The possible values are:

***NO**

Do not replace the existing queue definition. The command fails if the named queue already exists.

***YES**

Replace the existing queue definition with the attributes of the FROMQ and the specified attributes.

The command fails if an application has the queue open or the USAGE attribute is changed.

Note: If the queue is a local queue, and a queue with the same name already exists, any messages already on that queue are retained.

Text 'description' (TEXT)

Specifies text that briefly describes the object.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Put enabled (PUTENBL)

Specifies whether messages can be put on the queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Messages cannot be added to the queue.

***YES**

Messages can be added to the queue by authorized applications.

Default message priority (DFTPTY)

Specifies the default priority of messages put on the queue.

The possible values are:

***SAME**

The attribute is unchanged.

priority-value

Specify a value ranging from 0 through 9, where 9 is the highest priority.

Default message persistence (DFTMSGPST)

Specifies the default for message-persistence on the queue. Message persistence determines whether messages are preserved across restarts of the queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

By default, messages are lost across a restart of the queue manager.

***YES**

By default, messages are preserved across a restart of the queue manager.

Process name (PRCNAME)

Specifies the local name of the MQ process that identifies the application that should be started when a trigger event occurs.

The process does not have to be available when the queue is created, but it must be available for a trigger event to occur.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The process name is blank.

process-name

Specify the name of the MQ process.

Triggering enabled (TRGENBL)

Specifies whether trigger messages are written to the initiation queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Triggering is not enabled. Trigger messages are not written to the initiation queue.

***YES**

Triggering is enabled. Trigger messages are written to the initiation queue.

Get enabled (GETENBL)

Specifies whether applications are to be permitted to get messages from this queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Applications cannot retrieve messages from the queue.

***YES**

Suitably authorized applications can retrieve messages from the queue.

Sharing enabled (SHARE)

Specifies whether multiple instances of applications can open this queue for input simultaneously.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Only a single application instance can open the queue for input.

***YES**

More than one application instance can open the queue for input.

Default share option (DFTSHARE)

Specifies the default share option for applications opening this queue for input.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

By default, the open request is for exclusive use of the queue for input.

***YES**

By default, the open request is for shared use of the queue for input.

Message delivery sequence (MSGDLYSEQ)

Specifies the message delivery sequence.

The possible values are:

***SAME**

The attribute is unchanged.

***PTY**

Messages are delivered in first-in-first-out (FIFO) order within priority.

***FIFO**

Messages are delivered in FIFO order regardless of priority.

Harden backout count (HDNBKTCNT)

Specifies whether the count of backed out messages is saved (hardened) across restarts of the message queue manager.

Note: On IBM MQ for IBM i the count is ALWAYS hardened, regardless of the setting of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

The backout count is not hardened.

***YES**

The backout count is hardened.

Trigger type (TRGTYPE)

Specifies the condition that initiates a trigger event. When the condition is true, a trigger message is sent to the initiation queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***FIRST**

When the number of messages on the queue goes from 0 to 1.

***ALL**

Every time a message arrives on the queue.

***DEPTH**

When the number of messages on the queue equals the value of the TRGDEPTH attribute.

***NONE**

No trigger messages are written.

Trigger depth (TRGDEPTH)

Specifies, for TRIGTYPE(*DEPTH), the number of messages that initiate a trigger message to the initiation queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

depth-value

Specify a value ranging from 1 through 999999999.

Trigger message priority (TRGMSGPTY)

Specifies the minimum priority that a message must have before it can produce, or be counted for, a trigger event.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

priority-value

Specify a value ranging from 0 through 9, where 9 is the highest priority.

Trigger data (TRGDATA)

Specifies up to 64 characters of user data that the queue manager includes in the trigger message. This data is made available to the monitoring application that processes the initiation queue, and to the application started by the monitor.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No trigger data is specified.

trigger-data

Specify up to 64 characters enclosed in apostrophes. For a transmission queue you can use this parameter to specify the name of the channel to be started.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Retention interval (RTNITV)

Specifies the retention interval. This interval is the number of hours for which the queue might be needed, based on the date and time when the queue was created.

This information is available to a housekeeping application or an operator and can be used to determine when a queue is no longer required.

Note: The message queue manager does not delete queues, nor does it prevent your queues from being deleted if their retention interval has not expired. It is your responsibility to take any required action.

The possible values are:

***SAME**

The attribute is unchanged.

interval-value

Specify a value ranging from 0 through 999999999.

Maximum queue depth (MAXDEPTH)

Specifies the maximum number of messages allowed on the queue. However, other factors can cause the queue to be treated as full; for example, it appears to be full if there is no storage available for a message.

Note: If this value is subsequently reduced by using the CHGMQM command, any messages that are on the queue remain intact even if they cause the new maximum to be exceeded.

The possible values are:

***SAME**

The attribute is unchanged.

depth-value

Specify a value ranging from 0 through 999999999.

Maximum message length (MAXMSGLEN)

Specifies the maximum length for messages on the queue.

Note: If this value is subsequently reduced by using the CHGMQM command, any messages that are on the queue remain intact even if they exceed the new maximum length.

Applications might use the value of this attribute to determine the size of buffer they need to retrieve messages from the queue. Therefore change the value only if you know this will not cause an application to operate incorrectly.

The possible values are:

***SAME**

The attribute is unchanged.

length-value

Specify a value ranging from 0 through 100 MB in bytes. The default is 4MB.

Backout threshold (BKTTHLD)

Specifies the backout threshold.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine if a message should be backed out. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

***SAME**

The attribute is unchanged.

threshold-value

Specify a value ranging from 0 through 999999999.

Backout requeue name (BKTQNAME)

Specifies the backout-queue name.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine where messages that have been backed out should go. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No backout queue is specified.

backout-queue-name

Specify the backout queue name.

Initiation queue (INITQNAME)

Specifies the name of the initiation queue.

Note: The initiation queue must be on the same instance of a message queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No initiation queue is specified.

initiation-queue-name

Specify the initiation queue name.

Usage (USAGE)

Specifies whether the queue is for normal usage, or for transmitting messages to a remote message queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

***NORMAL**

Normal usage (the queue is not a transmission queue)

***TMQ**

The queue is a transmission queue that is used to hold messages destined for a remote message queue manager. If the queue is intended for use in situations where a transmission queue name is not explicitly specified, the queue name must be the same as the name of the remote message queue manager. For further information, see IBM MQ Intercommunication.

Definition type (DFNTYPE)

Specifies the type of dynamic queue definition that is created when an application issues an MQOPEN API call with the name of this model queue specified in the object descriptor.

Note: This parameter only applies to a model queue definition.

The possible values are:

***SAME**

The attribute is unchanged.

***TEMPDYN**

A temporary dynamic queue is created. This value should not be specified with a DEFMSGPST value of *YES.

***PERMDYN**

A permanent dynamic queue is created.

Target object (TGTQNAME)

Specifies the name of the object for which this queue is an alias.

The object can be a local or remote queue, a topic or a message queue manager.

Note: The target object does not need to exist at this time but it must exist when a process attempts to open the alias queue.

The possible values are:

***SAME**

The attribute is unchanged.

target-object-name

Specify the name of the target object.

Remote queue (RMTQNAME)

Specifies the name of the remote queue. That is, the local name of the remote queue as defined on the queue manager specified by RMTQMNAME.

If this definition is used for a queue manager alias definition, RMTQNAME must be blank when the open occurs.

If this definition is used for a reply-to alias, this name is the name of the queue that is to be the reply-to queue.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No remote-queue name is specified (that is, the name is blank). This can be used if the definition is a queue manager alias definition.

remote-queue-name

Specify the name of the queue at the remote queue manager.

Note: The name is not checked to ensure that it contains only those characters normally allowed for queue names.

Remote Message Queue Manager (RMTMQMNAME)

Specifies the name of the remote queue manager on which the queue RMTQNAME is defined.

If an application opens the local definition of a remote queue, RMTMQMNAME must not be the name of the connected queue manager. If TMQNAME is blank there must be a local queue of this name, which is to be used as the transmission queue.

If this definition is used for a queue manager alias, RMTMQMNAME is the name of the queue manager, which can be the name of the connected queue manager. Otherwise, if TMQNAME is blank, when the queue is opened there must be a local queue of this name, with USAGE(*TMQ) specified, which is to be used as the transmission queue.

If this definition is used for a reply-to alias, this name is the name of the queue manager that is to be the reply-to queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

remote-queue-manager-name

Specify the name of the remote queue manager.

Note: Ensure this name contains only those characters normally allowed for queue manager names.

Transmission queue (TMQNAME)

Specifies the local name of the transmission queue to be used for messages destined for the remote queue, for either a remote queue or for a queue manager alias definition.

If TMQNAME is blank, a queue with the same name as RMTMQMNAME is used as the transmission queue.

This attribute is ignored if the definition is being used as a queue manager alias and RMTMQMNAME is the name of the connected queue manager.

It is also ignored if the definition is used as a reply-to queue alias definition.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No specific transmission queue name is defined for this remote queue. The value of this attribute is set to all blanks.

transmission-queue-name

Specify the transmission queue name.

Queue depth high threshold (HIGHTHLD)

Specifies the threshold against which the queue depth is compared to generate a queue depth high event.

The possible values are:

***SAME**

The attribute is unchanged.

threshold-value

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

Queue depth low threshold (LOWTHLD)

Specifies the threshold against which the queue depth is compared to generate a queue depth low event.

The possible values are:

***SAME**

The attribute is unchanged.

threshold-value

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

Queue full events enabled (FULLEVT)

Specifies whether queue full events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Queue full events are not generated.

***YES**

Queue full events are generated.

Queue high events enabled (HIGHEVT)

Specifies whether queue depth high events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Queue depth high events are not generated.

***YES**

Queue depth high events are generated.

Queue low events enabled (LOWEVT)

Specifies whether queue depth low events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Queue depth low events are not generated.

***YES**

Queue depth low events are generated.

Service interval (SRVITV)

Specifies the service interval. This interval is used for comparison to generate service interval high and service interval OK events.

The possible values are:

***SAME**

The attribute is unchanged.

interval-value

Specify a value ranging from 0 through 999999999. The value is in units of milliseconds.

Service interval events (SRVEVT)

Specifies whether service interval high or service interval OK events are generated.

A service interval high event is generated when a check indicates that no messages have been retrieved from the queue for the time indicated by the SRVITV parameter as a minimum.

A service interval OK event is generated when a check indicates that messages have been retrieved from the queue within the time indicated by the SRVITV parameter.

The possible values are:

***SAME**

The attribute is unchanged.

***HIGH**

Service interval high events are generated.

***OK**

Service interval OK events are generated.

***NONE**

No service interval events are generated.

Distribution list support (DISTLIST)

Specifies whether the queue supports distribution lists.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

The queue will not support distribution lists.

***YES**

The queue will support distribution lists.

Cluster Name (CLUSTER)

The name of the cluster to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-name

Only one of the resultant values of CLUSTER or CLUSNL can be non-blank; you cannot specify a value for both.

Cluster Name List (CLUSNL)

The name of the namelist which specifies a list of clusters to which the queue belongs. Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

***SAME**

The attribute is unchanged.

namelist-name

Only one of the resultant values of CLUSTER or CLUSNL can be non-blank; you cannot specify a value for both.

Default Binding (DEFBIND)

Specifies the binding to be used when the application specifies MQOO_BIND_AS_Q_DEF on the MQOPEN call and the queue is a cluster queue.

The possible values are:

***SAME**

The attribute is unchanged.

***OPEN**

The queue handle is bound to a specific instance of the cluster queue when the queue is opened.

***NOTFIXED**

The queue handle is not bound to any particular instance of the cluster queue. This allows the queue manager to select a specific queue instance when the message is put using MQPUT and to change that selection subsequently if necessary.

The MQPUT1 call always behaves as if NOTFIXED had been specified.

***GROUP**

When the queue is opened, the queue handle is bound to a specific instance of the cluster queue for as long as there are messages in a message group. All messages in a message group are allocated to the same destination instance.

Cluster Workload Rank (CLWLRANK)

Specifies the cluster workload rank of the queue.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-rank

Specify a value ranging from 0 through 9.

Cluster Workload Priority (CLWLPRTY)

Specifies the cluster workload priority of the queue.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-priority

Specify a value ranging from 0 through 9.

Cluster workload queue use (CLWLUSEQ)

Specifies the behavior of an MQPUT when the target queue has both a local instance and at least one remote cluster instance. If the put originates from a cluster channel then this attribute does not apply.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

The value is inherited from the Queue Manager CLWLUSEQ attribute.

***LOCAL**

The local queue will be the sole target of the MQPUT.

***ANY**

The queue manager will treat such a local queue as another instance of the cluster queue for the purposes of workload distribution.

Queue Monitoring (MONQ)

Controls the collection of Online Monitoring Data.

Online Monitoring Data is not collected when the queue manager attribute MONQ is set to *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

The collection of online monitoring data is inherited from the setting of the queue manager attribute MONQ.

***OFF**

Online monitoring data collection for this queue is disabled.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

Queue Statistics (STATQ)

Controls the collection of statistics data.

Online monitoring data is not collected when the queue manager attribute STATQ is set to *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATQ.

***OFF**

Statistics data collection for this queue is disabled.

***ON**

Statistics data collection is enabled for this queue.

Queue Accounting (ACCTQ)

Controls the collection of accounting data.

Accounting data is not collected when the queue manager attribute ACCTQ is set to *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

Accounting data collection is based upon the setting of the queue manager attribute ACCTQ.

***OFF**

Accounting data collection for this queue is disabled.

***ON**

Accounting data collection is enabled for this queue.

Non Persistent Message Class (NPMCLASS)

Specifies the level of reliability for non-persistent messages put to this queue.

The possible values are:

***SAME**

The attribute is unchanged.

***NORMAL**

Non-persistent messages put to this queue are only lost following a failure, or a queue manager shutdown. Non-persistent message put to this queue will be discarded in the event of a queue manager restart.

***HIGH**

Non-persistent messages put to this queue are not discarded in the event of a queue manager restart. Non-persistent messages put to this queue may still be lost in the event of a failure.

Message Read Ahead (MSGREADAHD)

Specifies whether non persistent messages are sent to the client ahead of an application requesting them.

The possible values are:

***SAME**

The attribute is unchanged.

***DISABLED**

Read ahead is disabled for this queue. Messages are not sent to the client ahead of an application requesting them regardless of whether read ahead is requested by the client application.

***NO**

Non-persistent messages are not sent to the client ahead of an application requesting them. A maximum of one non-persistent message can be lost if the client ends abnormally.

***YES**

Non-persistent messages are sent to the client ahead of an application requesting them. Non-persistent messages can be lost if the client ends abnormally or if the client application does not consume all the messages it is sent.

Default Put Response (DFTPUTRESP)

The default put response type (DFTPUTRESP) attribute specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO_RESPONSE_AS_Q_DEF option.

The possible values are:

***SAME**

The attribute is unchanged.

***SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are issued as if MQPMO_SYNC_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application. This is the default value supplied with IBM MQ, but your installation might have changed it.

***ASYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are always issued as if MQPMO_ASYNC_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application; but an improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

Property Control (PROPCTL)

Specifies what happens to properties of messages that are retrieved from queues using the MQGET call when the MQGMO_PROPERTIES_AS_Q_DEF option is specified.

The possible values are:

***SAME**

The attribute is unchanged.

***COMPAT**

If the message contains a property with a prefix of mcd . , jms . , usr . or mqext . then all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

***NONE**

All properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

***ALL**

All properties of the message, except those contained in the message descriptor (or extension), are contained in one or more MQRFH2 headers in the message data.

***FORCE**

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

***V6COMPAT**

When set, *V6COMPAT must be set both on one of the queue definitions resolved by MQPUT and one of the queue definitions resolved by MQGET. It must also be set on any other intervening transmission queues. It causes an MQRFH2 header to be passed unchanged from the sending application to the receiving application. It overrides other settings of **PROPCTL** found in a queue name resolution chain. If the property is set on a cluster queue, the setting is not cached locally on other queue managers. You must set *V6COMPAT on an alias queue that resolves to the cluster queue. Define the alias queue on the same queue manager that the putting application is connected to.

Target Type (TARGTYPE)

Specifies the type of object to which the alias resolves.

The possible values are:

***SAME**

The attribute is unchanged.

***QUEUE**

Queue object.

***TOPIC**

Topic object.

Custom attribute (CUSTOM)

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

custom

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

CLCHNAME

This parameter is supported only on transmission queues.

***SAME**

The attribute is unchanged.

***NONE**

The attribute is removed.

cluster-sender channel name

`ClusterChannelName` is the generic name of the cluster-sender channels that use this queue as a transmission queue. The attribute specifies which cluster-sender channels send messages to a cluster-receiver channel from this cluster transmission queue.

By specifying asterisks, "*", in **ClusterChannelName**, you can associate a transmission queue with a set of cluster-sender channels. The asterisks can be at the beginning, end, or any number of places in the middle of the channel name string. **ClusterChannelName** is limited to a length of 20 characters: `MQ_CHANNEL_NAME_LENGTH`.

Copy MQ Subscription (CPYMQMSUB)**Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Copy MQ Subscription (CPYMQMSUB) command creates an MQ subscription of the same type and, for attributes not specified in the command, with the same attribute values as an existing subscription.

Parameters

Keyword	Description	Choices	Notes
<u>FROMSUBID</u>	From subscription identifier	<i>Character value</i> , *SAME	Optional, Key, Positional 3
<u>FROMSUB</u>	From subscription	<i>Character value</i> , *SAME	Optional, Key, Positional 2

Keyword	Description	Choices	Notes
<u>TOSUB</u>	To subscription	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 4
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 5
<u>TOPICSTR</u>	Topic string	<i>Character value</i> , *NONE, *SAME	Optional, Positional 6
<u>TOPICOBJ</u>	Topic object	<i>Character value</i> , *NONE, *SAME	Optional, Positional 7
<u>DEST</u>	Destination	<i>Character value</i> , *NONE, *SAME	Optional, Positional 8
<u>DESTMQM</u>	Destination Queue Manager	<i>Character value</i> , *NONE, *SAME	Optional, Positional 9
<u>DESTCRLID</u>	Destination Correlation Id	<i>Character value</i> , *NONE, *SAME	Optional, Positional 10
<u>PUBACCT</u>	Publish Accounting Token	<i>Character value</i> , *NONE, *SAME	Optional, Positional 11
<u>PUBAPPID</u>	Publish Application Id	<i>Character value</i> , *NONE, *SAME	Optional, Positional 12
<u>SUBUSER</u>	Subscription User Id	<i>Character value</i> , *CURRENT, *SAME	Optional, Positional 13
<u>USERDATA</u>	Subscription User Data	<i>Character value</i> , *NONE, *SAME	Optional, Positional 14
<u>SELECTOR</u>	Selector String	<i>Character value</i> , *NONE, *SAME	Optional, Positional 15
<u>PSPROP</u>	PubSub Property	*SAME , *NONE, *COMPAT, *RFH2, *MSGPROP	Optional, Positional 16
<u>DESTCLASS</u>	Destination Class	*SAME , *MANAGED, *PROVIDED	Optional, Positional 17
<u>SUBSCOPE</u>	Subscription Scope	*SAME , *ALL, *QMGR	Optional, Positional 18
<u>VARUSER</u>	Variable User	*SAME , *ANY, *FIXED	Optional, Positional 19
<u>REQONLY</u>	Request Publications	*SAME , *YES, *NO	Optional, Positional 20
<u>PUBPTY</u>	Publish Priority	0-9, *SAME , *AS PUB, *ASQDEF	Optional, Positional 21
<u>WSHEMA</u>	Wildcard Schema	*SAME , *CHAR, *TOPIC	Optional, Positional 22
<u>EXPIRY</u>	Expiry Time	0-999999999, *SAME , *UNLIMITED	Optional, Positional 23

From subscription identifier (FROMSUBID)

Specifies the subscription identifier of the existing subscription to provide values for the attributes not specified in this command.

The possible values are:

from-subscription-identifier

Specify the 48 character hexadecimal string representing the 24 byte subscription identifier.

From subscription (FROMSUB)

Specifies the name of the existing subscription to provide values for the attributes not specified in this command.

The possible values are:

from-subscription-name

Specify a maximum of 256 bytes for the subscription name.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

To subscription (TOSUB)

The name of the new subscription to be created.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

If a subscription with this name already exists, REPLACE(*YES) must be specified.

The possible values are:

to-subscription-name

Specify a maximum of 256 bytes for name of the MQ subscription being created.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

***DFT**

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Replace (REPLACE)

Specifies whether the new subscription should replace an existing subscription with the same name.

The possible values are:

***NO**

This subscription does not replace any existing subscription with the same name or subscription identifier. The command fails if the subscription already exists.

***YES**

Replace the existing subscription. If there is no subscription with the same name or subscription identifier, a new subscription is created.

Topic string (TOPICSTR)

Specifies the topic string associated with this subscription.

The possible values are:

topic-string

Specify a maximum of 256 bytes for the topic string.

Note: Topic strings of greater than 256 bytes can be specified using MQSC.

Topic object (TOPICOBJ)

Specifies the topic object associated with this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

topic-object

Specify the name of the topic object.

Destination (DEST)

Specifies the destination queue for messages published to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

destination-queue

Specify the name of the destination queue.

Destination Queue Manager (DESTMQM)

Specifies the destination queue manager for messages published to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No destination queue manager is specified.

destination-queue

Specify the name of the destination queue manager.

Destination Correlation Id (DESTCRLID)

Specifies the correlation identifier for messages published to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Messages are placed on the destination with a correlation identifier of MQCI_NONE.

correlation-identifier

Specify the 48 character hexadecimal string representing the 24 byte correlation identifier.

Publish Accounting Token (PUBACCT)

Specifies the accounting token for messages published to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Messages are placed on the destination with an accounting token of MQACT_NONE.

publish-accounting-token

Specify the 64 character hexadecimal string representing the 32 byte publish accounting token.

Publish Application Id (PUBAPPID)

Specifies the publish application identity for messages published to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No publish application identifier is specified.

publish-application-identifier

Specify the publish application identifier.

Subscription User Id (SUBUSER)

Specifies the user profile that owns this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***CURRENT**

The current user profile is the owner of the new subscription.

user-profile

Specify the user profile.

Subscription User Data (USERDATA)

Specifies the user data associated with the subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No user data is specified.

user-data

Specify a maximum of 256 bytes for user data.

Note: User data of greater than 256 bytes can be specified using MQSC.

Selector String (SELECTOR)

Specifies the SQL 92 selector string to be applied to messages published on the named topic to select whether they are eligible for this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No selection string is specified.

selection-string

Specify a maximum of 256 bytes for selection string.

Note: Selection strings of greater than 256 bytes can be specified using MQSC.

PubSub Property (PSPROP)

Specifies the manner in which publish / subscribe related message properties are added to messages sent to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Publish / subscribe properties are not added to the message.

***COMPAT**

Publish / subscribe properties are added to the message to maintain compatibility with IBM MQ 6.0 Publish / Subscribe.

***RFH2**

Publish / subscribe properties are added to the message within an RFH 2 header.

***MSGPROP**

Publish / subscribe properties are added as message properties.

Destination Class (DESTCLASS)

Specifies whether this is a managed subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***MANAGED**

The destination is managed.

***PROVIDED**

The destination is a queue.

Subscription Scope (SUBSCOPE)

Specifies whether this subscription should be forwarded (as a proxy subscription) to other brokers, so that the subscriber will receive messages published at those other brokers.

The possible values are:

***SAME**

The attribute is unchanged.

***ALL**

The subscription will be forwarded to all queue managers directly connected via a publish / subscribe collective or hierarchy.

***QMGR**

The subscription will only forward messages published on the topic within this queue manager.

Variable User (VARUSER)

Specifies whether user profiles other than the creator of the subscription can connect to it (subject to topic and destination authority checks).

The possible values are:

***SAME**

The attribute is unchanged.

***ANY**

Any user profiles can connect to the subscription.

***FIXED**

Only the user profile that created the subscription can connect to it.

Request Publications (REQONLY)

Specifies whether the subscriber will poll for updates via MQSUBRQ API, or whether all publications are delivered to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***YES**

Publications are only delivered to this subscription in response to an MQSUBRQ API.

***NO**

All publications on the topic are delivered to this subscription.

Publish Priority (PUBPTY)

Specifies the priority of the message sent to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPUB**

The priority of the message sent to this subscription is taken from that supplied in the published message.

***ASQDEF**

The priority of the message sent to this subscription is taken from the default priority of the queue defined as the destination.

priority-value

Specify a priority ranging from 0 through 9.

Wildcard Schema (WSHEMA)

Specifies the schema to be used when interpreting wildcard characters in the topic string.

The possible values are:

***SAME**

The attribute is unchanged.

***TOPIC**

Wildcard characters represent portions of the topic hierarchy.

***CHAR**

Wildcard characters represent portions of strings.

Expiry Time (EXPIRY)

Specifies the expiry time of the subscription. After a subscription's expiry time has elapsed, it becomes eligible to be discarded by the queue manager and will receive no further publications.

The possible values are:

***SAME**

The attribute is unchanged.

***UNLIMITED**

The subscription does not expire.

expiry-time

Specify an expiry time in tenths of a second ranging from 0 through 999999999.

 **Copy MQ Service (CPYMQMSVC)**

Where allowed to run:	Threadsafe:
All environments (*ALL)	Yes

The Copy MQ Service (CPYMQMSVC) command creates an MQ service definition of the same type and, for attributes not specified in the command, with the same attribute values as an existing service definition.

Parameters

Keyword	Description	Choices	Notes
<u>FROMSVC</u>	From Service	Character value	Required, Key, Positional 1
<u>TOSVC</u>	To Service	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK , *SAME	Optional, Positional 5
<u>STRCMD</u>	Start program	Single values: *SAME , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 6
	Qualifier 1: Start program	Name	
	Qualifier 2: Library	Name	
<u>STRARG</u>	Start program arguments	<i>Character value</i> , *BLANK , *SAME	Optional, Positional 7
<u>ENDCMD</u>	End program	Single values: *SAME , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 8
	Qualifier 1: End program	Name	
	Qualifier 2: Library	Name	
<u>ENDARG</u>	End program arguments	<i>Character value</i> , *BLANK , *SAME	Optional, Positional 9
<u>STDOUT</u>	Standard output	<i>Character value</i> , *BLANK , *SAME	Optional, Positional 10
<u>STDERR</u>	Standard error	<i>Character value</i> , *BLANK , *SAME	Optional, Positional 11
<u>TYPE</u>	Service type	*SAME , *CMD, *SVR	Optional, Positional 12
<u>CONTROL</u>	Service control	*SAME , *MANUAL, *QMGR, *STARTONLY	Optional, Positional 13

From Service (FROMSVC)

Specifies the name of the existing service definition to provide values for the attributes not specified in this command.

The possible values are:

from-service-name

Specify the name of the source service.

To Service (TOSVC)

The name of the new service definition to be created. The name can contain a maximum of 48 characters.

If a service definition with this name already exists, REPLACE(*YES) must be specified.

The possible values are:

to-service-name

Specify the name of the service being created.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Replace (REPLACE)

Specifies whether the new service definition should replace an existing service definition with the same name.

The possible values are:

***NO**

This definition does not replace any existing service definition with the same name. The command fails if the named service definition already exists.

***YES**

Replace the existing service definition. If there is no definition with the same name, a new definition is created.

Text 'description' (TEXT)

Specifies text that briefly describes the service definition.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Start program (STRCMD)

The name of the program to run.

The possible values are:

***SAME**

The attribute is unchanged.

start-command

The name of the start command executable.

Start program arguments (STRARG)

The arguments passed to the program at startup.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

No arguments are passed to the start command.

start-command-arguments

The arguments passed to the start command.

End program (ENDCMD)

The name of the executable to run when the service is requested to stop.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

No end command is executed.

end-command

The name of the end command executable.

End program arguments (ENDARG)

The arguments passed to the end program when the service is requested to stop.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

No arguments are passed to the end command.

end-command-arguments

The arguments passed to the end command.

Standard output (STDOUT)

The path to a file to which the standard output of the service program is redirected.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The standard output is discarded.

stdout-path

The standard output path.

Standard error (STDERR)

The path to a file to which the standard error of the service program is redirected.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The standard error is discarded.

stderr-path

The standard error path.

Service type (TYPE)

Mode in which to run service.

The possible values are:

***SAME**

The attribute is unchanged.

***CMD**

When started the command is executed but no status is collected or displayed.

***SVR**

The status of the executable started will be monitored and displayed.

Service control (CONTROL)

Whether the service should be started automatically at queue manager start.

The possible values are:

***SAME**

The attribute is unchanged.

***MANUAL**

The service is automatically started or stopped.

***QMGR**

The service is started and stopped as the queue manager is started and stopped.

***STARTONLY**

The service is started as the queue manager is started, but will not be requested to stop when the queue manager is stopped.

 IBM i**Copy MQ Topic (CPYMQMTOPTOP)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Copy MQ Topic (CPYMQMTOPTOP) command creates an MQ topic object of the same type and, for attributes not specified in the command, with the same attribute values as an existing topic object.

Parameters

Keyword	Description	Choices	Notes
<u>FROMTOP</u>	From topic	Character value	Required, Key, Positional 1
<u>TOTOP</u>	To topic	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 5
<u>TOPICSTR</u>	Topic string	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 6
<u>DURSUB</u>	Durable subscriptions	*SAME , *ASPARENT, *YES, *NO	Optional, Positional 7
<u>MGDDURMDL</u>	Durable model queue	<i>Character value</i> , *NONE, *SAME	Optional, Positional 8
<u>MGDNDURMDL</u>	Non-durable model queue	<i>Character value</i> , *NONE, *SAME	Optional, Positional 9
<u>PUBENBL</u>	Publish	*SAME , *ASPARENT, *YES, *NO	Optional, Positional 10
<u>SUBENBL</u>	Subscribe	*SAME , *ASPARENT, *YES, *NO	Optional, Positional 11
<u>DFTPTY</u>	Default message priority	0-9, *SAME , *ASPARENT	Optional, Positional 12
<u>DFTMSGPST</u>	Default message persistence	*SAME , *ASPARENT, *YES, *NO	Optional, Positional 13
<u>DFTPUTRESP</u>	Default Put Response	*SAME , *ASPARENT, *SYNC, *ASYN	Optional, Positional 14
<u>WILDCARD</u>	Wildcard behavior	*SAME , *PASSTHRU, *BLOCK	Optional, Positional 15
<u>PMSGDLV</u>	Persistent message delivery	*SAME , *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 16
<u>NPMSGDLV</u>	Non-persistent message deliver	*SAME , *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 17
<u>CUSTOM</u>	Custom attribute	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 18

From topic (FROMTOP)

Specifies the name of the existing topic object to provide values for the attributes not specified in this command.

The possible values are:

from-topic-name

Specify the name of the source MQ topic.

To topic (TOTOP)

The name of the new topic object to be created. The name can contain a maximum of 48 characters.

If a topic object with this name already exists, REPLACE(*YES) must be specified.

The possible values are:

to-topic-name

Specify the name of the MQ topic being created.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

***DFT**

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Replace (REPLACE)

Specifies whether the new topic object should replace an existing topic object with the same name.

The possible values are:

***NO**

This object does not replace any existing topic object with the same name. The command fails if the named topic object already exists.

***YES**

Replace the existing topic object. If there is no object with the same name, a new object is created.

Text 'description' (TEXT)

Specifies text that briefly describes the topic object.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Topic string (TOPICSTR)

Specifies the topic string represented by this topic object definition.

The possible values are:

topic-string

Specify a maximum of 256 bytes for the topic string.

Note: Topic strings of greater than 256 bytes can be specified using MQSC.

Durable subscriptions (DURSUB)

Specifies whether applications are permitted to make durable subscriptions on this topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

Whether durable subscriptions can be made on this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Durable subscriptions can be made on this topic.

***NO**

Durable subscriptions cannot be made on this topic.

Durable model queue (MGDDURMDL)

Specifies the name of the model queue to be used for durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

***SAME**

The attribute is unchanged.

durable-model-queue

Specify the name of the model queue.

Non-durable model queue (MGDNDURMDL)

Specifies the name of the model queue to be used for non-durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

***SAME**

The attribute is unchanged.

non-durable-model-queue

Specify the name of the model queue.

Publish (PUBENBL)

Specifies whether messages can be published to the topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

Whether messages can be published to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Messages can be published to the topic.

***NO**

Messages cannot be published to the topic.

Subscribe (SUBENBL)

Specifies whether applications are to be permitted to subscribe to this topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

Whether applications can subscribe to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Subscriptions can be made to this topic.

***NO**

Applications cannot subscribe to this topic.

Default message priority (DFTPTY)

Specifies the default priority of messages published to the topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

The default priority is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

priority-value

Specify a value ranging from 0 through 9.

Default message persistence (DFTMSGPST)

Specifies the message persistence to be used when applications specify the MQPER_PERSISTENCE_AS_TOPIC_DEF option.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

The default persistence is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Messages on this queue survive a restart of the queue manager.

***NO**

Messages on this queue are lost across a restart of the queue manager.

Default Put Response (DFTPUTRESP)

Specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO_RESPONSE_AS_Q_DEF option.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

The default response type is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are issued as if MQPMO_SYNC_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application.

***ASYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are always issued as if MQPMO_ASYNC_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application. An improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

Wildcard behavior (WILDCARD)

Specifies the behavior of wildcard subscriptions with respect to this topic.

The possible values are:

***SAME**

The attribute is unchanged.

***PASSTHRU**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will receive publications made to this topic and to topic strings more specific than this topic.

***BLOCK**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will not receive publications made to this topic or to topic strings more specific than this topic.

Persistent message delivery (PMSGDLV)

Specifies the delivery mechanism for persistent messages published to this topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***ALL**

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

***ALLDUR**

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

***ALLAVAIL**

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

Non-persistent message delivery (NPMSGDLV)

Specifies the delivery mechanism for non-persistent messages published to this topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***ALL**

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

***ALLDUR**

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

***ALLAVAIL**

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

Custom attribute (CUSTOM)

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

custom

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

**Create Message Queue Manager (CRTMQM)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Create Message Queue Manager (CRTMQM) command creates a local queue manager that can be started with the Start Message Queue Manager (STRMQM) command.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK	Optional, Positional 2
<u>TRGITV</u>	Trigger interval	0-999999999, 999999999	Optional, Positional 3
<u>UDLMSGQ</u>	Undelivered message queue	<i>Character value</i> , *NONE	Optional, Positional 4

Keyword	Description	Choices	Notes
<u>DFTTMQ</u>	Default transmission queue	<i>Character value</i> , *NONE	Optional, Positional 5
<u>MAXHDL</u>	Maximum handle limit	0-999999999, 256	Optional, Positional 6
<u>MAXMSG</u>	Maximum uncommitted messages	1-999999999, 10000	Optional, Positional 7
<u>DFTQMGR</u>	Default Queue Manager	*YES , *NO	Optional, Positional 8
<u>MQMLIB</u>	Queue Manager Library	<i>Name</i> , *AUTO	Optional, Positional 9
<u>MQMDIRP</u>	Data Directory Prefix	<i>Character value</i> , *DFT	Optional, Positional 10
<u>ASP</u>	ASP Number	1-32, *SYSTEM , *ASPDEV	Optional, Positional 11
<u>ASPDEV</u>	ASP device	<i>Character value</i> , *ASP	Optional, Positional 12
<u>THRESHOLD</u>	Journal receiver threshold	100000-1000000000, *DFT , *MIN , *MAX	Optional, Positional 13
<u>JRNBUFSIZ</u>	Journal buffer size	32000-15761440, *DFT	Optional, Positional 14

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Text 'description' (TEXT)

Specifies text that briefly describes the queue manager definition.

The possible values are:

***BLANK**

No text is specified.

description

Specify no more than 64 characters enclosed in apostrophes.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Trigger interval (TRGITV)

Specifies the trigger time interval, expressed in milliseconds, for use with queues that have TRGTYPE(*FIRST) specified.

When the arrival of a message on a queue causes a trigger message to be put on the initiation queue, then any message that arrives on the same queue within the specified interval does not cause another trigger message to be put on the initiation queue.

The possible values are:

999999999

The trigger time interval is 999999999 milliseconds.

interval-value

Specify a value in milliseconds, in the range 0 through 999999999.

Undelivered message queue (UDLMSGQ)

Specifies the name of the local queue that is to be used for undelivered messages. Messages are put on this queue if they cannot be routed to their correct destination.

The possible values are:

***NONE**

There is no undelivered-message queue. The attribute is set to a blank string.

undelivered-message-queue-name

Specify the name of a local queue that is to be used as the undelivered-message queue.

Default transmission queue (DFTTMQ)

Specifies the name of the local transmission queue that is to be used as the default transmission queue. Messages transmitted to a remote queue manager are put on the default transmission queue if there is no transmission queue defined for their destination.

The possible values are:

***NONE**

There is no default transmission queue. The attribute is set to a blank string.

default-transmission-queue-name

Specify the name of a local transmission queue that is to be used as the default transmission queue.

Maximum handle limit (MAXHDL)

Specifies the maximum number of handles that any one job can have open at the same time.

The possible values are:

256

The default number of open handles is 256.

maximum-handle-limit

Specify a value in the range 0 through 999999999.

Maximum uncommitted messages (MAXUMSG)

Specifies the maximum number of uncommitted messages. That is:

- The number of messages that can be retrieved, plus
- The number of messages that can be put on a queue, plus
- Any trigger messages generated within this unit of work,

under any one syncpoint. This limit does not apply to messages that are retrieved or put outside syncpoint.

The possible values are:

10000

The default value is 10000 uncommitted messages.

maximum-uncommitted-messages

Specify a value in the range 1 through 999999999.

Default Queue Manager (DFTQMGR)

Specifies whether the queue manager being created is the default queue manager.

The possible values are:

***NO**

The queue manager is not to be the default queue manager.

***YES**

The queue manager is to be the default queue manager.

Queue Manager Library (MQMLIB)

Specifies the library to be used by the queue manager.

The possible values are:

***AUTO**

The library to be used by the queue manager is chosen automatically.

library name

Specify the library to be used by the queue manager.

Data Directory Prefix (MQMDIRP)

Specifies the data directory prefix to be used by the queue manager. The queue manager creates a directory here to store its data files, principally message data residing on queues.

The possible values are:

***DFT**

The default data directory prefix is '/QIBM/UserData/mqm'.

directory-prefix

Specify the data directory prefix to be used by the queue manager. This directory prefix may be located in a filesystem either in a local disk pool or in a networked filesystem e.g. NFS.

The queue manager directory can be placed into an independent auxiliary storage pool by setting the data directory prefix accordingly. For example specifying MQMDIRP('/MYASPDEV/QIBM/UserData/mqm/qmgrs') would store queue manager data in the MYASPDEV device.

The queue manager library, journals and journal receivers can be placed into an independent auxiliary storage pool by setting the ASP and ASPDEV parameters.

Independent auxiliary storage pools can be switched between systems to increase the availability of a queue manager. Refer to the IBM MQ documentation on configuring a queue manager for high availability.

ASP Number (ASP)

Specifies the auxiliary storage pool from which the system allocates storage for the queue manager library, journal and journal receivers.

Note that the auxiliary storage pool identified in this parameter will not be used for the queue manager data files which are located in the integrated file system (IFS). To allocate queue manager data files in a specific auxiliary storage pool refer to the MQMDIRP parameter.

The possible values are:

***SYSTEM**

The system auxiliary storage pool (ASP 1) provides the storage for the queue manager library, journal and journal receivers.

***ASPDEV**

Storage for the queue manager library, journal and journal receivers is allocated from the primary or secondary ASP specified for the ASPDEV parameter.

auxiliary-storage-pool-number

Specify a value in the range 1 through 32 to specify the number of the system or basic user ASP to provide storage for the queue manager library, journal and journal receivers.

Independent auxiliary storage pools can be switched between systems to increase the availability of a queue manager. Refer to the IBM MQ documentation on configuring a queue manager for high availability.

ASP device (ASPDEV)

Specifies the auxiliary storage pool (ASP) device name where storage is allocated for the queue manager library, journal and journal receivers.

Note that the auxiliary storage pool device name identified in this parameter will not be used for the queue manager data files which are located in the integrated file system (IFS). To allocate queue manager data files in a specific auxiliary storage pool refer to the MQMDIRP parameter.

The possible values are:

***ASP**

The storage for the queue manager library, journal and journal receivers is allocated from the system or basic user ASP specified for the ASP parameter.

device-name

Specify the name of a primary or secondary ASP device. The storage for the queue manager library, journal and journal receivers is allocated from the primary or secondary ASP. The primary or secondary ASP must have already been activated (by varying on the ASP device) and have a status of 'Available'.

Independent auxiliary storage pools can be switched between systems to increase the availability of a queue manager. Refer to the IBM MQ documentation on configuring a queue manager for high availability.

Journal receiver threshold (THRESHOLD)

Specifies the threshold in kilobytes for the queue managers journal receivers.

The possible values are:

***DFT**

Use the default threshold of 100000 KB.

threshold-value

Specify a value in the range 100000 through 1000000000 in kilobytes (KB) of storage. Each 1000 KB specifies 1024000 bytes of storage space. When the size of the space for the journal receiver is larger than the size specified by this value, a message is sent to the identified message queue if appropriate, and journaling continues.

Journal buffer size (JRNBUFSIZ)

Specifies the journal buffer size in bytes

The possible values are:

***DFT**

Use the default journal buffer size of 32000 bytes.

journal-buffer-size

Specify a value in bytes, in the range 32000 through 15761440.

IBM i

Create MQ AuthInfo object (CRTMQMAUTI)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Create MQ AuthInfo object (CRTMQMAUTI) command creates a new authentication information object, specifying those attributes that are different from the system default.

Parameters

Keyword	Description	Choices	Notes
<u>AINAME</u>	AuthInfo name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Required, Key, Positional 2
<u>AUTHTYPE</u>	AuthInfo type	*CRLLDAP, *OCSP, *IDPWOS, *IDPWLDAP	Required, Key, Positional 3
<u>CONNNAME</u>	Connection name	Character value, *SYSDFTAI	Optional, Positional 4
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 5
<u>TEXT</u>	Text 'description'	Character value, *SYSDFTAI , *NONE	Optional, Positional 6
<u>USERNAME</u>	User name	Character value, *SYSDFTAI , *NONE	Optional, Positional 7
<u>PASSWORD</u>	User password	Character value, *SYSDFTAI , *NONE	Optional, Positional 8
<u>OCSPURL</u>	OCSP Responder URL	Character value, *SAME	Optional, Positional 9
<u>CHCKCLNT</u>	Authentication checks required	*ASQMGR, *REQUIRED, *REQADM	Optional, Positional 10
<u>CHCKLOCL</u>	Authentication checks required	*NONE, *OPTIONAL, *REQUIRED, *REQADM	Optional, Positional 11
<u>FAILDELAY</u>	Failure delay	Integer value	Optional, Positional 12
<u>BASEDNU</u>	Base user DN	Character value, *SAME	Optional, Positional 13
<u>ADOPTCTX</u>	Context adoption	Integer value	Optional, Positional 14
<u>CLASSUSR</u>	LDAP object class	Character value, *SAME	Optional, Positional 15
<u>SHORTUSR</u>	Short user name	Character value, *SAME	Optional, Positional 16
<u>USRFIELD</u>	User field	Character value, *SAME	Optional, Positional 17
<u>SECCOMM</u>	LDAP communications	Character value, *SAME	Optional, Positional 18
<u>AUTHORMD</u>	Authorization method	Character value, *OS , *SEARCHGRP, *SEARCHUSR, V 9.0.5 , *SRCHGRPSN	Optional, Positional 19
<u>BASEDNG</u>	Base DN for groups	Character value, *SAME	Optional, Positional 20
<u>CLASSGRP</u>	Object class for group	Character value, *SAME	Optional, Positional 21
<u>FINDGRP</u>	Attribute to find group membership	Character value, *SAME	Optional, Positional 22
<u>GRPFIELD</u>	Simple name for group	Character value, *SAME	Optional, Positional 23
<u>NESTGRP</u>	Group nesting	*NO *YES	Optional, Positional 24
<u>AUTHENMD</u>	Authentication method	*OS Cannot be changed	Optional, Positional 25

AuthInfo name (AINAME)

The name of the new authentication information object to create.

The possible values are:

authentication-information-name

Specify the name of the authentication information object. The maximum string length is 48 characters.

Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

Adopt context (ADOPTCTX)

Whether to use the presented credentials as the context for this application. This means that they are used for authorization checks, shown on administrative displays, and appear in messages.

YES

The user ID presented in the MQCSP structure, which has been successfully validated by password, is adopted as the context to use for this application. Therefore, this user ID will be the credentials checked for authorization to use IBM MQ resources.

If the user ID presented is an LDAP user ID, and authorization checks are done using operating system user IDs, the [SHORTUSR](#) associated with the user entry in LDAP will be adopted as the credentials for authorization checks to be done against.

NO

Authentication will be performed on the user ID and password presented in the MQCSP structure, but then the credentials will not be adopted for further use. Authorization will be performed using the user ID the application is running under.

This attribute is only valid for an **AUTHTYPE** of **IDPWOS* and **IDPWLDAP*.

Authentication method (AUTHENMD)

The authentication method used for this application.

*OS

Use operating system groups to determine permissions associated with a user.

You can use only ***OS** to set the authentication method.

This attribute is valid only for an **AUTHTYPE** of **IDPWOS*.

Authorization method (AUTHORMD)

The authorization method used for this application.

*OS

Use operating system groups to determine permissions associated with a user.

This is how IBM MQ has previously worked, and is the default value.

***SEARCHGRP**

A group entry in the LDAP repository contains an attribute listing the Distinguished Name of all the users belonging to that group. Membership is indicated by the attribute defined in [FINDGRP](#). This value is typically *member* or *uniqueMember*.

***SEARCHUSR**

A user entry in the LDAP repository contains an attribute listing the Distinguished Name of all the groups to which the specified user belongs. The attribute to query is defined by the [FINDGRP](#) value, typically *memberOf*.

V 9.0.5

***SRCHGRPSN**

A group entry in the LDAP repository contains an attribute listing the short user name of all the users belonging to that group. The attribute in the user record that contains the short user name is specified by [SHORTUSR](#).

Membership is indicated by the attribute defined in [FINDGRP](#). This value is typically *memberUid*.

Note: This authorization method should only be used if all user short names are distinct.

Many LDAP servers use an attribute of the group object to determine group membership and you should, therefore, set this value to *SEARCHGRP*.

Microsoft Active Directory typically stores group memberships as a user attribute. The IBM Tivoli Directory Server supports both methods.

In general, retrieving memberships through a user attribute will be faster than searching for groups that list the user as a member.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

AuthInfo type (AUTHTYPE)

The type of the authentication information object. There is no default value

The possible values are:

***CRLLDAP**

The type of the authentication information object is CRLLDAP.

***OCSP**

The type of the authentication information objects is OCSPURL.

***IDPWOS**

Connection authentication user ID and password checking is done using the operating system.

***IDPWLDAP**

Connection authentication user ID and password checking is done using an LDAP server.

Base DN for groups (BASEDNG)

In order to be able to find group names, this parameter must be set with the base DN to search for groups in the LDAP server.

This attribute is valid only for **AUTHTYPE** of **IDPWLDAP*.

Base user DN (BASEDNU)

In order to be able to find the short user name attribute (see [SHORTUSR](#)) this parameter must be set with the base DN to search for users within the LDAP server.

This attribute is valid only for **AUTHTYPE** of **IDPWLDAP*.

Check client (CHCKCLNT)

Whether connection authentication checks are required by all locally bound connections, or only checked when a user ID and password are provided in the MQCSP structure.

These attributes are valid only for an **AUTHTYPE** of **IDPWOS* or **IDPWLDAP*. The possible values are:

***ASQMGR**

In order for the connection to be allowed in, it must meet the connection authentication requirements defined on the queue manager. If the CONNAUTH field provides an authentication information object, and the value of CHCKCLNT is **REQUIRED*, the connection will not be successful unless a valid user ID and password are supplied. If the CONNAUTH field does not provide an authentication information object, or the value of CHCKCLNT is not **REQUIRED*, then the user ID and password are not required.

***REQUIRED**

Requires that all applications provide a valid user ID and password.

***REQDADM**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the **OPTIONAL* setting.

Check local (CHCKLOCL)

Whether connection authentication checks are required by all locally bound connections, or only checked when a user ID and password are provided in the MQCSP structure.

These attributes are valid only for an **AUTHTYPE** of **IDPWOS* or **IDPWLDAP*. The possible values are:

***NONE**

Switches off checking.

***OPTIONAL**

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

***REQUIRED**

Requires that all applications provide a valid user ID and password.

***REQDADM**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the **OPTIONAL* setting.

Class group (CLASSGRP)

The LDAP object class used for group records in the LDAP repository.

If the value is blank, **groupOfNames** is used.

Other commonly used values include *groupOfUniqueNames* or *group*.

This attribute is valid only for **AUTHTYPE** of **IDPWLDAP*.

Class user (CLASSUSR)

The LDAP object class used for user records in the LDAP repository.

If blank, the value defaults to *inetOrgPerson*, which is generally the value needed.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

Connection name (CONNAME)

The DNS name or IP address of the host on which the LDAP server is running, together with an optional port number. The default port number is 389. No default is provided for the DNS name or IP address.

This field is only valid for **CRLLDAP* or **IDPWLDAP* authentication information objects, when it is required.

When used with *IDPWLDAP* authentication information objects, this can be a comma separated list of connection names.

The possible values are:

***SYSDFTAI**

The connection name is set to the system default value in SYSTEM.DEFAULT.AUTHINFO.CRLLDAP.

connection-name

Specify the fully qualified DNS name or IP address of the host together with an optional port number. The maximum string length is 264 characters.

Failure delay (FAILDELAY)

When a user ID and password are provided for connection authentication, and the authentication fails due to the user ID or password being incorrect, this is the delay, in seconds, before the failure is returned to the application.

This can aid in avoiding busy loops from an application that simply retries, continuously, after receiving a failure.

The value must be in the range 0 - 60 seconds. The default value is 1.

This attribute is only valid for an AUTHTYPE of *IDPWOS and *IDPWLDAP.

Group membership attribute (FINDGRP)

Name of the attribute used within an LDAP entry to determine group membership.

When AUTHORMD = *SEARCHGRP, this attribute is typically set to *member* or *uniqueMember*.

When AUTHORMD = *SEARCHUSR, this attribute is typically set to *memberOf*.

V 9.0.5 When AUTHORMD = *SRCHGRPSN, this attribute is typically set to *memberUid*.

When left blank, if:

- AUTHORMD = *SEARCHGRP, this attribute defaults to *memberOf*
- AUTHORMD = *SEARCHUSR, this attribute defaults to *member*
- **V 9.0.5** AUTHORMD = *SRCHGRPSN, this attribute defaults to *memberUid*

This attribute is valid only for an AUTHTYPE of *IDPWLDAP.

Simple name for group (GRPFIELD)

If the value is blank, commands like setmqaut must use a qualified name for the group. The value can either be a full DN, or a single attribute.

This attribute is valid only for an AUTHTYPE of *IDPWLDAP.

Group nesting (NESTGRP)

The possible values are:

***NO**

Only the initially discovered groups are considered for authorization.

***YES**

The group list is searched recursively to enumerate all the groups to which a user belongs.

The group's Distinguished Name is used when searching the group list recursively, regardless of the authorization method selected in AUTHORMD.

This attribute is valid only for an AUTHTYPE of *IDPWLDAP.

OCSP Responder URL (OCSPURL)

The URL of the OCSP Responder used to check for certificate revocation. This must be an HTTP URL containing the host name and port number of the OCSP Responder. If the OCSP Responder is using port 80, which is the default for HTTP, then the port number may be omitted.

This field is only valid for OCSP authentication information objects.

The possible values are:

***SYSDFTAI**

The OCSP Responder URL is set to the system default value in SYSTEM.DEFAULT.AUTHINFO.OCSP.

OCSP-Responder-URL

The OCSP Responder URL. The maximum string length is 256 characters.

Replace (REPLACE)

If an authentication information object with the same name already exists, this specifies whether it is replaced.

The possible values are:

***NO**

This definition does not replace any existing authentication information object with the same name. The command fails if the named authentication information object already exists.

***YES**

Replace an existing authentication information object. A new object is created if the named authentication information object does not exist.

Secure comms (SECCOMM)

Whether connectivity to the LDAP server should be done securely using TLS

YES

Connectivity to the LDAP server is made securely using TLS.

The certificate used is the default certificate for the queue manager, named in CERTLABL on the queue manager object, or if that is blank, the one described in [Digital certificate labels, understanding the requirements](#).

The certificate is located in the key repository specified in SSLKEYR on the queue manager object. A cipherspec will be negotiated that is supported by both IBM MQ and the LDAP server.

If the queue manager is configured to use SSLFIPS(YES) or SUITEB cipher specs, then this is taken account of in the connection to the LDAP server as well.

ANON

Connectivity to the LDAP server is made securely using TLS just as for SECCOMM(YES) with one difference.

No certificate is sent to the LDAP server; the connection will be made anonymously. To use this setting, ensure that the key repository specified in SSLKEYR, on the queue manager object, does not contain a certificate marked as the default.

NO

Connectivity to the LDAP server does not use TLS.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*

Short user (SHORTUSR)

A field in the user record to be used as a short user name in IBM MQ.

This field must contain values of 12 characters or less. This short user name is used for the following purposes:

- If LDAP authentication is enabled, but LDAP authorization is not enabled, this is used as an operating system user ID for authorization checks. In this case, the attribute must represent an operating system user ID.

- If LDAP authentication and authorization are both enabled, this is used as the user ID carried with the message in order for the LDAP user name to be rediscovered when the user ID inside the message needs to be used.

For example, on another queue manager, or when writing report messages. In this case, the attribute does not need to represent an operating system user ID, but must be a unique string. An employee serial number is an example of a good attribute for this purpose.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP* and is mandatory.

Text 'description' (TEXT)

A short text description of the authentication information object.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SYSDFTAI**

The text string is set to the system default value in SYSTEM.DEFAULT.AUTHINFO.CRLLDAP.

***NONE**

The text is set to a blank string.

description

The string length can be up to 64 characters enclosed in apostrophes.

User field (USRFIELD)

If the user ID provided by an application for authentication does not contain a qualifier for the field in the LDAP user record, that is, it does not contain an '=' sign, this attribute identifies the field in the LDAP user record that is used to interpret the provided user ID.

This field can be blank. If this is the case, any unqualified user IDs use the [SHORTUSR](#) parameter to interpret the provided user ID.

The contents of this field will be concatenated with an '=' sign, together with the value provided by the application, to form the full user ID to be located in an LDAP user record. For example, the application provides a user of fred and this field has the value cn, then the LDAP repository will be searched for cn=fred.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

User name (USERNAME)

The distinguished name of the user that is binding to the directory. The default user name is blank.

This field is only valid for **CRLLDAP* or **IDPWLDAP* authentication information objects.

The possible values are:

***SYSDFTAI**

The user name is set to the system default value in SYSTEM.DEFAULT.AUTHINFO.CRLLDAP.

***NONE**

The user name is blank.

LDAP-user-name

Specify the Distinguished name of the LDAP user. The maximum string length is 1024 characters.

User password (PASSWORD)

The password for the LDAP user.

This field is only valid for **CRLLDAP* or **IDPWLDAP* authentication information objects.

The possible values are:

***SYSDFTAI**

The password is set to the system default value in SYSTEM.DEFAULT.AUTHINFO.CRLLDAP.

***NONE**

The password is blank.

LDAP-password

The LDAP user password. The maximum string length is 32 characters.

IBM i Create MQ Channel (CRTMQMCHL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Create MQ Channel (CRTMQMCHL) command creates a new MQ channel definition, specifying those attributes that are to be different from the default values.

Parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Key, Positional 1
<u>CHLTYPE</u>	Channel type	*RCVR, *SDR, *SVR, *RQSTR, *SVRCN, *CLUSSDR, *CLUSRCVR, *CLTCN	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 4
<u>TRPTYPE</u>	Transport type	*LU62, *TCP, *SYSDFTCHL	Optional, Positional 5
<u>TEXT</u>	Text 'description'	Character value, *BLANK, *SYSDFTCHL	Optional, Positional 6
<u>TGTMQMNAME</u>	Target Queue Manager	Character value, *NONE, *SYSDFTCHL	Optional, Positional 7
<u>CONNNAME</u>	Connection name	Character value, *NONE, *SYSDFTCHL	Optional, Positional 8
<u>TPNAME</u>	Transaction Program Name	Character value, *BLANK, *SYSDFTCHL	Optional, Positional 9
<u>MODENAME</u>	Mode Name	Character value, *BLANK, *SYSDFTCHL	Optional, Positional 10
<u>TMQNAME</u>	Transmission queue	Character value, *SYSDFTCHL	Optional, Positional 11

Keyword	Description	Choices	Notes
<u>MCANAME</u>	Message channel agent	Single values: *SYSDFTCHL , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 12
	Qualifier 1: Message channel agent	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
<u>MCAUSRID</u>	Message channel agent user ID	<i>Character value</i> , *NONE, *PUBLIC, *SYSDFTCHL	Optional, Positional 13
<u>MCATYPE</u>	Message channel agent Type	*PROCESS, *THREAD, *SYSDFTCHL	Optional, Positional 14
<u>BATCHINT</u>	Batch Interval	0-999999999, *SYSDFTCHL	Optional, Positional 15
<u>BATCHSIZE</u>	Batch size	1-9999, *SYSDFTCHL	Optional, Positional 16
<u>DSCITV</u>	Disconnect interval	0-999999, *SYSDFTCHL	Optional, Positional 17
<u>SHORTTMR</u>	Short retry interval	0-999999999, *SYSDFTCHL	Optional, Positional 18
<u>SHORTRTY</u>	Short retry count	0-999999999, *SYSDFTCHL	Optional, Positional 19
<u>LONGTMR</u>	Long retry interval	0-999999999, *SYSDFTCHL	Optional, Positional 20
<u>LONGRTY</u>	Long retry count	0-999999999, *SYSDFTCHL	Optional, Positional 21
<u>SCYEXIT</u>	Security exit	Single values: *SYSDFTCHL , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 22
	Qualifier 1: Security exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
<u>CSCYEXIT</u>	Security exit	<i>Character value</i> , *SYSDFTCHL , *NONE	Optional, Positional 23
<u>SCYUSRDATA</u>	Security exit user data	<i>Character value</i> , *SYSDFTCHL , *NONE	Optional, Positional 24
<u>SNDEXIT</u>	Send exit	Single values: *SYSDFTCHL , *NONE Other values (up to 10 repetitions): <i>Qualified object name</i>	Optional, Positional 25
	Qualifier 1: Send exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	

Keyword	Description	Choices	Notes
CSNDEXIT	Send exit	Single values: *SYSDFTCHL , *NONE Other values (up to 10 repetitions): <i>Character value</i>	Optional, Positional 26
SNDUSRDATA	Send exit user data	Values (up to 10 repetitions): <i>Character value</i> , *SYSDFTCHL , *NONE	Optional, Positional 27
RCVEXIT	Receive exit	Single values: *SYSDFTCHL , *NONE Other values (up to 10 repetitions): <i>Qualified object name</i>	Optional, Positional 28
	Qualifier 1: Receive exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
CRCVEXIT	Receive exit	Single values: *SYSDFTCHL , *NONE Other values (up to 10 repetitions): <i>Character value</i>	Optional, Positional 29
RCVUSRDATA	Receive exit user data	Values (up to 10 repetitions): <i>Character value</i> , *SYSDFTCHL , *NONE	Optional, Positional 30
MSGEXIT	Message exit	Single values: *SYSDFTCHL , *NONE Other values (up to 10 repetitions): <i>Qualified object name</i>	Optional, Positional 31
	Qualifier 1: Message exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
MSGUSRDATA	Message exit user data	Values (up to 10 repetitions): <i>Character value</i> , *SYSDFTCHL , *NONE	Optional, Positional 32
MSGRTYEXIT	Message retry exit	Single values: *SYSDFTCHL , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 33
	Qualifier 1: Message retry exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
MSGRTYDATA	Message retry exit data	<i>Character value</i> , *SYSDFTCHL , *NONE	Optional, Positional 34
MSGRTYNBR	Number of message retries	0-999999999, *SYSDFTCHL	Optional, Positional 35

Keyword	Description	Choices	Notes
MSGRTYITV	Message retry interval	0-999999999, *SYSDFTCHL	Optional, Positional 36
CVTMSG	Convert message	*YES, *NO, *SYSDFTCHL	Optional, Positional 37
PUTAUT	Put authority	*DFT, *CTX, *SYSDFTCHL	Optional, Positional 38
SEQNUMWRAP	Sequence number wrap	100-999999999, *SYSDFTCHL	Optional, Positional 39
MAXMSGLEN	Maximum message length	0-104857600, *SYSDFTCHL	Optional, Positional 40
HRTBTINTVL	Heartbeat interval	0-999999999, *SYSDFTCHL	Optional, Positional 41
NPMSPEED	Non Persistent Message Speed	*FAST, *NORMAL, *SYSDFTCHL	Optional, Positional 42
CLUSTER	Cluster Name	<i>Character value</i> , *NONE, *SYSDFTCHL	Optional, Positional 43
CLUSNL	Cluster Name List	<i>Character value</i> , *NONE, *SYSDFTCHL	Optional, Positional 44
NETPRTY	Network Connection Priority	0-9, *SYSDFTCHL	Optional, Positional 45
SSLCIPH	TLS CipherSpec	<i>Character value</i> , !*TLS_RSA_WITH_NULL_MD5', !*TLS_RSA_WITH_NULL_SHA', !*TLS_RSA_EXPORT_WITH_RC4_40_MD5', !*TLS_RSA_WITH_RC4_128_MD5', !*TLS_RSA_WITH_RC4_128_SHA', !*TLS_RSA_EXPORT_WITH_RC2_40_MD5', !*TLS_RSA_WITH_DES_CBC_SHA', !*TLS_RSA_WITH_3DES_EDE_CBC_SHA', !*TLS_RSA_WITH_AES_128_CBC_SHA', !*TLS_RSA_WITH_AES_256_CBC_SHA', *NONE, *SYSDFTCHL	Optional, Positional 46 CipherSpec TLS_RSA_WITH_3DES_EDE_CBC_SHA is deprecated.
SSLCAUTH	TLS Client Authentication	*REQUIRED, *OPTIONAL, *SYSDFTCHL	Optional, Positional 47
SSLPEER	TLS Peer name	<i>Character value</i> , *NONE, *SYSDFTCHL	Optional, Positional 48

Keyword	Description	Choices	Notes
LOCLADDR	Local communication address	<i>Character value</i> , *NONE, *SYSDFTCHL	Optional, Positional 49
BATCHHB	Batch Heartbeat Interval	0-999999999, *SYSDFTCHL	Optional, Positional 50
USERID	Task user identifier	<i>Character value</i> , *NONE, *SYSDFTCHL	Optional, Positional 51
PASSWORD	Password	<i>Character value</i> , *NONE, *SYSDFTCHL	Optional, Positional 52
KAINT	Keep Alive Interval	<i>Integer</i> , *AUTO, *SYSDFTCHL	Optional, Positional 53
COMPHDR	Header Compression	Values (up to 2 repetitions): *NONE, *SYSTEM, *SYSDFTCHL	Optional, Positional 54
COMPMSG	Message Compression	Single values: *ANY Other values (up to 4 repetitions): *NONE, *RLE, *ZLIBHIGH, *ZLIBFAST, *SYSDFTCHL	Optional, Positional 55
MONCHL	Channel Monitoring	*QMGR, *OFF, *LOW, *MEDIUM, *HIGH, *SYSDFTCHL	Optional, Positional 56
STATCHL	Channel Statistics	*QMGR, *OFF, *LOW, *MEDIUM, *HIGH, *SYSDFTCHL	Optional, Positional 57
CLWLRANK	Cluster Workload Rank	0-9, *SYSDFTCHL	Optional, Positional 58
CLWLPRTY	Cluster Workload Priority	0-9, *SYSDFTCHL	Optional, Positional 59
CLWLWGHT	Cluster Channel Weight	1-99, *SYSDFTCHL	Optional, Positional 60
SHARECNV	Sharing Conversations	0-999999999, *SYSDFTCHL	Optional, Positional 61
PROPCTL	Property Control	*COMPAT, *NONE, *ALL, *SYSDFTCHL	Optional, Positional 62
MAXINST	Maximum Instances	0-999999999, *SYSDFTCHL	Optional, Positional 63
MAXINSTC	Maximum Instances Per Client	0-999999999, *SYSDFTCHL	Optional, Positional 64
CLNTWGHT	Client Channel Weight	0-99, *SYSDFTCHL	Optional, Positional 65
AFFINITY	Connection Affinity	*PREFERRED, *NONE, *SYSDFTCHL	Optional, Positional 66
BATCHLIM	Batch Data Limit	0-999999, *SYSDFTCHL	Optional, Positional 67

Keyword	Description	Choices	Notes
DFTRECON	Default client reconnection	*NO, *YES, *QMGR, *DISABLED, *SYSDFTCHL	Optional, Positional 68

Channel name (CHLNAME)

Specifies the name of the new channel definition; the name can contain a maximum of 20 characters. Channel names must be unique. If a channel definition with this name already exists, REPLACE(*YES) must be specified.

Channel type (CHLTYPE)

Specifies the type of the channel being defined.

The possible values are:

***SDR**

Sender channel

***SVR**

Server channel

***RCVR**

Receiver channel

***RQSTR**

Requester channel

***SVRCN**

Server-connection channel

***CLUSSDR**

Cluster-sender channel

***CLUSRCVR**

Cluster-receiver channel

***CLTCN**

Client-connection channel

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

Replace (REPLACE)

Specifies whether the new channel definition should replace an existing channel definition with the same name.

The possible values are:

***NO**

Do not replace the existing channel definition. The command fails if the named channel definition already exists.

***YES**

Replace the existing channel definition. If there is no definition with the same name, a new definition is created.

Transport type (TRPTYPE)

Specifies the transmission protocol.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***LU62**

SNA LU 6.2.

***TCP**

Transmission Control Protocol / Internet Protocol (TCP/IP).

Text 'description' (TEXT)

Specifies text that briefly describes the channel definition.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Target Queue Manager (TGTMQMNAME)

Specifies the name of the target queue manager.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The name of the target queue manager for a client connection channel (CHLTYPE) *CLTCN is unspecified.

message-queue-manager-name

The name of the target message queue manager for a client connection channel (CHLTYPE) *CLTCN.

For other channel types this parameter must not be specified.

Connection name (CONNAME)

Specifies the name of the machine to connect.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The connection name is blank.

connection-name

Specify the connection name as required by the transmission protocol:

- For *LU62, specify the name of the CSI object.
- For *TCP, specify either the host name, or the network address of the remote machine (or the local machine for cluster-receiver channels). This can be followed by an optional port number enclosed in parentheses.

 On [Multiplatforms](#), the TCP/IP connection name parameter of a cluster-receiver channel is optional. If you leave the connection name blank, IBM MQ generates a connection name for you, assuming the default port and using the current IP address of the system. You can override the default port number, but still use the current IP address of the system. For each connection name leave the IP name blank, and provide the port number in parentheses; for example:

```
(1415)
```

The generated **CONNNAME** is always in the dotted decimal (IPv4) or hexadecimal (IPv6) form, rather than in the form of an alphanumeric DNS host name.

Where a port is not specified the default port 1414 is assumed.

For cluster-receiver channels the connection name relates to the local queue manager, and for other channels it relates to the target queue manager.

This parameter is required for channels with channel type (CHLTYPE) of *SDR, *RQSTR, *CLTCN and *CLUSDR. It is optional for *SVR and *CLUSRCVR channels, and is not valid for *RCVR or *SVRCN channels.

Transaction Program Name (TPNAME)

This parameter is valid for channels with a TRPTYPE defined as LU 6.2 only.

This parameter must be set to the SNA transaction program name, unless the CONNAME contains a side-object name in which case it must be set to blanks. The name is taken instead from the CPI-C Communications Side Object.

This parameter is not valid for channels with a CHLTYPE defined as *RCVR.

The possible values are:

*SAME

The value of this attribute does not change.

*NONE

No transaction program name is specified.

*BLANK

The transaction program name is taken from CPI-C Communications Side Object. The side object name must be specified in the CONNAME parameter.

Transaction Program Name

Specify the SNA transaction program name.

Mode Name (MODENAME)

This parameter is valid for channels with a TRPTYPE defined as LU 6.2. If TRPTYPE is not defined as LU 6.2 the data is ignored and no error message is issued.

If specified, the value must be set to the SNA mode name, unless the CONNAME contains a side-object name, in which case it must be set to blanks. The name is then taken from the CPI-C Communications Side Object.

This parameter is not valid for channels with CHLTYPE defined as *RCVR or *SVRCONN.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***BLANK**

Name will be taken from the CPI-C Communications Side Object. This must be specified in the CONNAME parameter.

***NONE**

No mode name is specified.

SNA-mode-name

Specify the SNA Mode Name

Transmission queue (TMQNAME)

Specifies the name of the transmission queue.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

transmission-queue-name

Specify the name of the transmission queue.

A transmission queue name is required if the channel type (CHLTYPE) is *SDR or *SVR. For other channel types, the parameter must not be specified.

Message channel agent (MCANAME)

This parameter is reserved and should not be used.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The MCA program name is blank.

This parameter cannot be specified for a channel type (CHLTYPE) of *RCVR, *SVRCN, or *CLTCN.

Message channel agent user ID (MCAUSRID)

Specifies the message channel agent user identifier which is to be used by the message channel agent for authorization to access MQ resources, including (if PUTAUT is *DFT) authorization to put the message to the destination queue for receiver or requester channels.

The possible values are:

***SYSDFTCHL**

The value is taken from the system default channel for the type of the channel being created.

***NONE**

The message channel agent uses its default user identifier.

***PUBLIC**

Uses the public authority.

mca-user-identifier

Specify the user identifier to be used.

This parameter cannot be specified for a channel type (CHLTYPE) of *CLTCN.

Message channel agent Type (MCATYPE)

Specifies whether the message-channel-agent program should run as a thread or a process.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***PROCESS**

The message channel agent runs as a separate process.

***THREAD**

The message channel agent runs as a separate thread.

This parameter can only be specified for a channel type (CHLTYPE) of *SDR, *SVR, *RQSTR, *CLUSSDR or *CLUSRCVR.

Batch Interval (BATCHINT)

The minimum amount of time, in milliseconds, that a channel will keep a batch open.

The batch is terminated by which ever of the following occurs first: BATCHSZ messages have been sent, BATCHLIM bytes have been sent, or the transmission queue is empty and BATCHINT is exceeded.

The default value is 0, which means that the batch is terminated as soon as the transmission queue becomes empty (or the BATCHSZ limit is reached).

The value must be in the range 0 through 999999999.

This parameter is valid for channels with CHLTYPE defined as *SDR, *SVR, *CLUSSDR, or *CLUSRCVR.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

batch-interval

Specify a value in the range 0 through 999999999. A value of 0 indicates the batch will be terminated as soon as the transmission queue is empty,

Batch size (BATCHSIZE)

Specifies the maximum number of messages that should be sent down a channel before a checkpoint is taken.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

batch-size

Specify a value in the range 1 through 9999

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Disconnect interval (DSCITV)

Specifies the disconnect interval, which defines the maximum number of seconds that the channel waits for messages to be put on a transmission queue before closing the channel.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

disconnect-interval

Specify a value in the range 0 through 999999. A value of 0 indicates an indefinite wait.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR or *CLTCN.

Short retry interval (SHORTTMR)

Specifies the short retry wait interval for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. This defines the interval between attempts to establish a connection to the remote machine.

The possible values are:

*SYSDFTCHL

The value of this attribute is taken from the system default channel of the specified type.

short-retry-interval

Specify a value in the range 0 through 999999999.

Note: For implementation reasons, the maximum retry interval that can be used is 999999; values exceeding this are treated as 999999.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Short retry count (SHORTRTY)

Specifies the short retry count for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. This defines the maximum number of attempts that are made to establish a connection to the remote machine, at intervals specified by SHORTTMR, before the (normally longer) LONGRTY and LONGTMR are used.

The possible values are:

*SYSDFTCHL

The value of this attribute is taken from the system default channel of the specified type.

short-retry-count

Specify a value in the range 0 through 999999999. A value of 0 means that no retries are allowed.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Long retry interval (LONGTMR)

Specifies the long retry wait interval for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. It defines the interval in seconds between attempts to establish a connection to the remote machine, after the count specified by SHORTRTY has been exhausted.

The possible values are:

*SYSDFTCHL

The value of this attribute is taken from the system default channel of the specified type.

long-retry-interval

Specify a value in the range 0 through 999999999.

Note: For implementation reasons, the maximum retry interval that can be used is 999999; values exceeding this are treated as 999999.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Long retry count (LONGRTY)

Specifies the long retry count for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. This defines the maximum number of further attempts that are made to connect to the remote machine, at intervals specified by LONGTMR, after the count specified by SHORTRTY has been exhausted. An error message is logged if the connection is not established after the defined number of attempts.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

long-retry-count

Specify a value in the range 0 through 999999999. A value of 0 means that no retries are allowed.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Security exit (SCYEXIT)

Specifies the name of the program to be called as the security exit. If a nonblank name is defined, the exit is invoked at the following times:

- Immediately after establishing a channel.

Before any messages are transferred, the exit is given the opportunity to instigate security flows to validate connection authorization.

- On receipt of a response to a security message flow.

Any security message flows received from the remote processor on the remote machine are passed to the exit.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The security exit program is not invoked.

security-exit-name

Specify the name of the security exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

Security exit (CSCYEXIT)

Specifies the name of the program to be called as the client security exit. If a nonblank name is defined, the exit is invoked at the following times:

- Immediately after establishing a channel.

Before any messages are transferred, the exit is given the opportunity to instigate security flows to validate connection authorization.

- On receipt of a response to a security message flow.

Any security message flows received from the remote processor on the remote machine are passed to the exit.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the SYSTEM.DEF.CLNTCONN channel.

***NONE**

The client security exit program is not invoked.

security-exit-name

Specify the name of the client security exit program.

Security exit user data (SCYUSRDATA)

Specifies a maximum of 32 characters of user data that is passed to the channel security exit program.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The user data for the security exit is not specified.

security-exit-user-data

Specify the user data for the security exit program.

Send exit (SNDEXIT)

Specifies the entry point of the program to be called as the send exit. If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The send exit is not invoked.

send-exit-name

Specify the name of the send exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

Send exit (CSNDEXIT)

Specifies the entry point of the program to be called as the client send exit. If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the SYSTEM.DEF.CLNTCONN channel.

***NONE**

The client send exit is not invoked.

send-exit-name

Specify the name of the client send exit program.

Send exit user data (SNDUSRDATA)

Specifies a maximum of 32 characters of user data that is passed to the send exit program.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The user data for the send exit program is not specified.

send-exit-user-data

Specify a maximum of 32 characters of user data for the send exit program.

Receive exit (RCVEXIT)

Specifies the entry point of the program to be called as the receive exit. If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The receive exit program is not invoked.

receive-exit-name

Specify the name of the receive exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

Receive exit (CRCVEXIT)

Specifies the entry point of the program to be called as the client receive exit. If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the SYSTEM.DEF.CLNTCONN channel.

***NONE**

The client receive exit program is not invoked.

receive-exit-name

Specify the name of the client receive exit program.

Receive exit user data (RCVUSRDATA)

Specifies user data that is passed to the receive exit.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The user data for the receive exit program is not specified.

receive-exit-user-data

Specify a maximum of 32 characters of user data for the receive exit program.

Message exit (MSGEXIT)

Specifies the entry point of the program to be called as the message exit. If a nonblank name is defined, the exit is invoked immediately after a message has been retrieved from the transmission queue. The exit is given the entire application message and message descriptor for modification.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The message exit program is not invoked.

message-exit-name

Specify the name of the message exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Message exit user data (MSGUSRDATA)

Specifies user data that is passed to the message exit program.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The user data for the message exit program is not specified.

message-exit-user-data

Specify a maximum of 32 characters of user data for the message exit program.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Message retry exit (MSGRTYEXIT)

Specifies the entry point of the program to be called as the message retry exit.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The message retry exit program is not invoked.

message-retry-exit-name

Specify the name of the message retry exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Message retry exit data (MSGRTYDATA)

Specifies user data that is passed to the message retry exit program.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The user data for the message retry exit program is not specified.

message-retry-exit-user-data

Specify a maximum of 32 characters of user data for the message retry exit program.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Number of message retries (MSGRTYNBR)

Specifies the number of times the channel will retry before it decides it cannot deliver the message.

This attribute controls the action of the MCA only if the message-retry exit name is blank, the value of MSGRTYNBR is passed to the exit for the exit's use, but the number of retries performed is controlled by the exit, and not by this attribute.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

message-retry-number

Specify a value in the range 0 through 999999999. A value of 0 signifies no retries will be performed.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Message retry interval (MSGRTYITV)

Specifies the minimum interval of time that must pass before the channel can retry the MQPUT operation. This time is in milliseconds.

This attribute controls the action of the MCA only if the message-retry exit name is blank, the value of MSGRTYITV is passed to the exit for the exit's use, but the retry interval is controlled by the exit, and not by this attribute.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

message-retry-number

Specify a value in the range 0 through 999999999. A value of 0 signifies that the retry will be performed as soon as possible.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Convert message (CVTMSG)

Specifies whether the application data in the message should be converted before the message is transmitted.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel for the type of channel being created.

***YES**

The application data in the message is converted before sending.

***NO**

The application data in the message is not converted before sending.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Put authority (PUTAUT)

Specifies whether the user identifier in the context information associated with a message should be used to establish authority to put the message on the destination queue. This applies only to receiver and requester (*CLUSRCVR, *RCVR and *RQSTR) channels.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***DFT**

No authority check is made before the message is put on the destination queue.

***CTX**

The user identifier in the message context information is used to establish authority to put the message.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Sequence number wrap (SEQNUMWRAP)

Specifies the maximum message sequence number. When the maximum is reached, sequence numbers wrap to start again at 1.

Note: The maximum message sequence number is not negotiable; the local and remote channels must wrap at the same number.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

sequence-number-wrap-value

Specify a value in the range 100 through 999999999.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Maximum message length (MAXMSGLEN)

Specifies the maximum message length that can be transmitted on the channel. This is compared with the value for the remote channel and the actual maximum is the lower of the two values.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

maximum-message-length

Specify a value in the range 0 through 104857600. A value of 0 signifies that the maximum length is unlimited.

Heartbeat interval (HRTBTINTVL)

Specifies The time, in seconds, between heartbeat flows passed from the sending MCA when there are no messages on the transmission queue. The heartbeat exchange gives the receiving MCA the opportunity to quiesce the channel.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

heart-beat-interval

Specify a value in the range 0 through 999999999. A value of 0 means that no heartbeat exchanges are to take place.

Note: For implementation reasons, the maximum heartbeat interval that can be used is 999999; values exceeding this are treated as 999999.

Non Persistent Message Speed (NPMSPEED)

Specifies whether the channel supports Fast Non Persistent Messages.

The possible values are:

***SYSDFTCHL**

The value of this attribute does not change.

***FAST**

The channel supports fast non persistent messages.

***NORMAL**

The channel does not support fast non persistent messages.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Cluster Name (CLUSTER)

The name of the cluster to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

This parameter is valid only for *CLUSSDR and *CLUSRCVR channels. If the CLUSNL parameter is non-blank, this parameter must be blank.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

No cluster name is specified.

cluster-name

The name of the cluster to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

Cluster Name List (CLUSNL)

The name of the namelist that specifies a list of clusters to which the channel belongs

This parameter is valid only for *CLUSSDR and *CLUSRCVR channels. If the CLUSTER parameter is non-blank, this parameter must be blank.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

No cluster namelist is specified.

cluster-name-list

The name of the namelist specifying a list of clusters to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

Network Connection Priority (NETPRTY)

The priority for the network connection. Distributed queuing chooses the path with the highest priority if there are multiple paths available. The value must be in the range between 0 and 9 where 0 is the lowest priority.

This parameter is valid only for *CLUSRCVR channels.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

network-connection-priority

Specify a value in the range 0 through 9; 0 is the lowest priority.

TLS CipherSpec (SSLCIPH)

SSLCIPH specifies the CipherSpec used in TLS channel negotiation. The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

cipherspec

The name of the CipherSpec.

Note: From IBM MQ 8.0.0 Fix Pack 2, the SSLv3 protocol and the use of some IBM MQ CipherSpecs is deprecated. For more information, see [Deprecated CipherSpecs](#).

TLS Client Authentication (SSLCAUTH)

SSLCAUTH specifies whether the channel should carry out client authentication over TLS. The parameter is used only for channels with SSLCIPH specified.

The possible values are:

*SYSDFTCHL

The value of this attribute is taken from the system default channel of the specified type.

*REQUIRED

Client authentication is required.

*OPTIONAL

Client authentication is optional.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *CLTCN or *CLUSSDR.

TLS Peer name (SSLPEER)

SSLPEER specifies the X500 peer name used in TLS channel negotiation. The possible values are:

*SYSDFTCHL

The value of this attribute is taken from the system default channel of the specified type.

x500peername

The X500 peer name to use.

Note: An alternative way of restricting connections into channels by matching against the TLS Subject Distinguished Name, is to use channel authentication records. With channel authentication records, different TLS Subject Distinguished Name patterns can be applied to the same channel. If both SSLPEER on the channel and a channel authentication record are used to apply to the same channel, the inbound certificate must match both patterns in order to connect. For more information, see [Channel authentication records](#).

Local communication address (LOCLADDR)

Specifies the local communication address for the channel.

This parameter is only valid for *SDR, *SVR, *RQSTR, *CLUSSDR, *CLUSRCVR and *CLTCN channels.

The possible values are:

*SAME

The attribute is unchanged.

*NONE

The connection is blank.

local-address

Only valid for transport type TCP/IP. Specify the optional IP address and optional port or port range used for outbound TCP/IP communications. The format is:

```
LOCLADDR([ip-addr] [(low-port[, high-port])][, [ip-addr] [(low-port[, high-port])]])
```

Batch Heartbeat Interval (BATCHHB)

The time in milliseconds used to determine whether batch heartbeating occurs on this channel. Batch heartbeating allows sender-type channels to determine whether the remote channel instance is still active before going in-doubt. A batch heartbeat will occur if a sender-type channel has not communicated with the remote channel within the specified time.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

batch-heartbeat-interval

Specify a value in the range 0 through 999999999. A value of 0 indicates that batch heartbeating is not to be used.

Note: For implementation reasons, the maximum batch heartbeat interval that can be used is 999999; values exceeding this are treated as 999999.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Task user identifier (USERID)

This is used by the message channel agent when attempting to initiate a secure LU 6.2 session with a remote message channel agent.

This parameter is valid only for channels with a channel type (CHLTYPE) of *SDR, *SVR, *RQSTR, *CLTCN or *CLUSSDR.

Although the maximum length of the attribute is 12 characters, only the first 10 characters are used.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

No user identifier is specified.

user-identifier

Specify the task user identifier.

Password (PASSWORD)

This is used by the message channel agent when attempting to initiate a secure LU 6.2 session with a remote message channel agent.

This parameter is valid only for channels with a channel type (CHLTYPE) of *SDR, *SVR, *RQSTR, *CLTCN or *CLUSSDR.

Although the maximum length of the attribute is 12 characters, only the first 10 characters are used.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

No password is specified.

Password

Specify the password.

Keep Alive Interval (KAINT)

Specifies the Keep Alive timing interval for this channel.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel for the type of channel being created.

***AUTO**

The Keep Alive interval is calculated based upon the negotiated heartbeat value as follows:

- If the negotiated HBINT is greater than 0, Keep Alive interval is set to that value plus 60 seconds.
- If the negotiated HBINT is 0, the value used is that specified by the KEEPALIVEOPTIONS statement in the TCP profile configuration data set.

keep-alive-interval

Specify a value in the range 0 through 99999.

Header Compression (COMPHDR)

The list of header data compression techniques supported by the channel.

For channel types sender, server, cluster sender, cluster receiver and client connection (*SDR, *SVR, *CLUSSDR, *CLUSRCVR and *CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

No header data compression is performed.

***SYSTEM**

Header data compression is performed.

Message Compression (COMPMSG)

The list of message data compression techniques supported by the channel.

For channel types sender, server, cluster sender, cluster receiver and client connection (*SDR, *SVR, *CLUSSDR, *CLUSRCVR and *CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

No message data compression is performed.

***RLE**

Message data compression is performed using run-length encoding.

***ZLIBFAST**

Message data compression is performed using the zlib compression technique. A fast compression time is preferred.

***ZLIBHIGH**

Message data compression is performed using the zlib compression technique. A high level of compression is preferred.

***ANY**

Any compression technique supported by the queue manager can be used. Only valid for channel types Receiver, Requester and Server-Connection.

Channel Monitoring (MONCHL)

Controls the collection of online monitoring data.

Online monitoring data is not collected when the queue manager attribute MONCHL is set to *NONE.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***QMGR**

The collection of Online Monitoring Data is inherited from the setting of the queue manager attribute MONCHL.

***NONE**

Online Monitoring Data collection for this channel is disabled.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for a channel type (CHLTYPE) of *CLTCN.

Channel Statistics (STATCHL)

Controls the collection of statistics data.

Statistics data is not collected when the queue manager attribute STATCHL is set to *NONE.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATCHL.

***NONE**

Statistics data collection for this channel is disabled.

***LOW**

Statistics data collection is turned on with a low ratio of data collection.

***MEDIUM**

Statistics data collection is turned on with a moderate ratio of data collection.

***HIGH**

Statistics data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Cluster Workload Rank (CLWLRANK)

Specifies the cluster workload rank of the channel.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

cluster-workload-rank

The cluster workload rank of the channel in the range 0 through 9.

Cluster Workload Priority (CLWLPRTY)

Specifies the cluster workload priority of the channel.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

cluster-workload-rank

The cluster workload priority of the channel in the range 0 through 9.

Cluster Channel Weight (CLWLWGHT)

Specifies the cluster workload weight of the channel.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

cluster-workload-rank

The cluster workload weight of the channel in the range 1 through 99.

Sharing Conversations (SHARECNV)

Specifies the maximum the number of conversations which can be shared over a particular TCP/IP client channel instance (socket).

This parameter is valid for channels with CHLTYPE defined as *CLTCN or *SVRCN.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

0

Specifies no sharing of conversations over a TCP/IP socket. The channel instance runs in a mode prior to that of IBM WebSphere MQ 7.0, with regard to:

- Administrator stop-quietce
- Heartbeating
- Read ahead

1

Specifies no sharing of conversations over a TCP/IP socket. Client heartbeating and read ahead are available, whether in an MQGET call or not, and channel quiescing is more controllable.

shared-conversations

The number of shared conversations in the range 2 through 999999999.

Note: If the client-connection SHARECNV value does not match the server-connection SHARECNV value, the lower of the two values is used.

Property Control (PROPCTL)

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor).

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***COMPAT**

If the message contains a property with a prefix of "mcd.", "jms.", "usr." or "mqext." then all optional message properties, except those in the message descriptor (or extension) will be placed in one or more MQRFH2 headers in the message data before the message is sent to the remote queue manager.

***NONE**

All properties of the message, except those in the message descriptor (or extension), will be removed from the message before the message is sent to the remote queue manager.

***ALL**

All properties of the message will be included with the message when it is sent to the remote queue manager. The properties, except those in the message descriptor (or extension), will be placed in one or more MQRFH2 headers in the message data.

Maximum Instances (MAXINST)

Specifies the maximum number of clients that can simultaneously connect to the queue manager via this server-connection channel object.

This attribute is valid only for server-connection channels.

The possible values are:

***SYSDFT**

The value of this attribute is taken from the system default channel of the specified type.

maximum-instances

The maximum number of simultaneous instances of the channel in the range 0 through 99999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

Maximum Instances Per Client (MAXINSTC)

Specifies the maximum number of simultaneous instances of an individual server-connection channel which can be started from a single client.

In this context, multiple client connections originating from the same remote network address are considered to be a single client.

This attribute is valid only for server-connection channels.

The possible values are:

***SYSDFT**

The value of this attribute is taken from the system default channel of the specified type.

maximum-instances-per-client

The maximum number of simultaneous instances of the channel which can be in the started from a single client in the range 0 through 99999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running from individual clients, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

Client Channel Weight (CLNTWGHT)

The client channel weighting attribute is used so client channel definitions can be selected at random based on their weighting when more than one suitable definition is available.

The possible values are:

***SYSDFT**

The value of this attribute is taken from the system default channel of the specified type.

client-channel-weight

The client channel weight in the range 0 through 99.

Connection Affinity (AFFINITY)

The channel affinity attribute is used so client applications that connect multiple times using the same queue manager name can choose whether to use the same client channel definition for each connection.

The possible values are:

***SYSDFT**

The value of this attribute is taken from the system default channel of the specified type.

***PREFERRED**

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any applicable CLNTWGHT(0) definitions first and in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful non CLNTWGHT(0) definitions are moved to the end of the list. CLNTWGHT(0) definitions remain at the start of the list and are selected first for each connection.

***NONE**

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process select an applicable definition based on the weighting with any applicable CLNTWGHT(0) definitions selected first in alphabetical order.

Batch Data Limit (BATHLIM)

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

The batch is terminated when one of the following conditions is met:

- **BATCHSZ** messages have been sent.
- **BATHLIM** bytes have been sent.
- The transmission queue is empty and **BATCHINT** is exceeded.

This parameter is valid only for channels with a channel type (**CHLTYPE**) of SDR, SVR, CLUSSDR, or CLUSRCVR.

The value must be in the range 0 - 999999. The default value is 5000.

The **BATHLIM** parameter is supported on all platforms.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

batch-data-limit

Specify a value in the range 0 through 999999.

This parameter can only be specified for channel types (CHLTYPE) *SDR, *SVR, *CLUSSDR, or *CLUSRCVR.

Pending Reset Sequence Number (RESETSEQ)

Pending reset sequence number.

This is the sequence number from an outstanding request and it indicates a user RESET CHANNEL command request is outstanding.

The possible value is:

pending-reset-sequence-number

A value of zero indicates that there is no outstanding RESET CHANNEL. The value can be in the range 1 - 999999999.

Default client reconnection (DFTRECON)

Specifies whether a client connection automatically reconnects a client application if its connection breaks.

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NO**

Unless overridden by **MQCONN**, the client is not reconnected automatically.

***YES**

Unless overridden by **MQCONN**, the client reconnects automatically.

***QMGR**

Unless overridden by **MQCONN**, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO_RECONNECT_Q_MGR.

***DISABLED**

Reconnection is disabled, even if requested by the client program using the **MQCONN** MQI call.

This parameter is specified for a client connection channel, (CHLTYPE) *CLTCN

IBM i Create MQ Listener (CRTMQMLSR)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Create MQ Listener (CRTMQMLSR) command creates a new MQ listener definition, specifying those attributes that are to be different from the default.

Parameters

Keyword	Description	Choices	Notes
<u>LSRNAME</u>	Listener name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 3
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SYSDFTLSR	Optional, Positional 4
<u>CONTROL</u>	Listener control	*SYSDFTLSR, *MANUAL, *QMGR, *STARTONLY	Optional, Positional 5
<u>PORT</u>	Port number	0-65535, *SYSDFTLSR	Optional, Positional 6
<u>IPADDR</u>	IP Address	<i>Character value</i> , *BLANK, *SYSDFTLSR	Optional, Positional 7
<u>BACKLOG</u>	Listener backlog	0-999999999, *SYSDFTLSR	Optional, Positional 8

Listener name (LSRNAME)

The name of the new MQ listener definition to be created.

The possible values are:

listener-name

Specify the name of the listener definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Replace (REPLACE)

If a listener definition with the same name already exists, this specifies whether it is to be replaced.

The possible values are:

***NO**

This definition does not replace any existing listener definition with the same name. The command fails if the named listener definition already exists.

***YES**

Replace the existing listener definition. If there is no definition with the same name, a new definition is created.

Text 'description' (TEXT)

Specifies text that briefly describes the listener definition.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SYSDFTLSR**

The value of this attribute is taken from the system default listener.

***BLANK**

The text is set to a blank string.

description

Specify the new descriptive information.

Listener control (CONTROL)

Whether the listener starts automatically when the queue manager is started.

The possible values are:

***SYSDFTLSR**

The value for this attribute is taken from the system default listener.

***MANUAL**

The listener is not automatically started or stopped.

***QMGR**

The listener is started and stopped as the queue manager is started and stopped.

***STARTONLY**

The listener is started as the queue manager is started, but is not requested to stop when the queue manager is stopped.

Port number (PORT)

The port number to be used by the listener.

The possible values are:

***SYSDFTLSR**

The value for this attribute is taken from the system default listener.

port-number

The port number to be used.

IP Address (IPADDR)

The IP address to be used by the listener.

The possible values are:

***SYSDFTLSR**

The value for this attribute is taken from the system default listener.

ip-addr

The IP address to be used.

Listener backlog (BACKLOG)

The number of concurrent connection requests the listener supports.

The possible values are:

***SYSDFTLSR**

The value for this attribute is taken from the system default listener.

backlog

The number of concurrent connection requests supported.

IBM i

Create MQ Namelist (CRTMQMNL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Create MQ Namelist (CRTMQMNL) command creates a new MQ namelist. A namelist is an MQ object that contains a list of other MQ objects. Typically, namelists are used by applications, for example trigger monitors, where they are used to identify a group of queues. A namelist is maintained independently of applications, therefore you can update it without stopping any of the applications that use it.

Parameters

Keyword	Description	Choices	Notes
<u>NAMELIST</u>	Namelist	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 3
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SYSDFTNL	Optional, Positional 4
<u>NAMES</u>	List of Names	Values (up to 256 repetitions): <i>Character value</i> , *BLANKS, *SYSDFTNL, *NONE	Optional, Positional 5

Namelist (NAMELIST)

The name of the namelist to be created.

namelist

Specify the name of the namelist. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used.

message-queue-manager-name

Specify the name of the queue manager.

Replace (REPLACE)

Specifies whether the new namelist should replace an existing namelist with the same name.

***NO**

Do not replace the existing namelist. The command fails if the named namelist already exists.

***YES**

Replace the existing namelist. If there is no namelist with the same name, a new namelist is created.

Text 'description' (TEXT)

Specifies text that briefly describes the namelist.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

***SYSDFTNL**

The value of the attribute is taken from the system default namelist.

description

Specify no more than 64 characters enclosed in apostrophes.

List of Names (NAMES)

List of names. This is the list of names to be created. The names can be of any type, but must conform to the rules for naming MQ objects.

***SYSDFTNL**

The value of the attribute is taken from the system default namelist.

namelist

The list to create. An empty list is valid.

IBM i

Create MQ Process (CRTMQMPRC)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Create MQ Process (CRTMQMPRC) command creates a new MQ process definition, specifying those attributes that are different from the default.

Parameters

Keyword	Description	Choices	Notes
<u>PRCNAME</u>	Process name	Character value	Required, Key, Positional 1

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 3
<u>TEXT</u>	Text 'description'	<i>Character value, *BLANK, *SYSDFTPRC</i>	Optional, Positional 4
<u>APPTYPE</u>	Application type	<i>Integer, *SAME, *CICS, *MVS, *IMS, *OS2, *DOS, *UNIX, *QMGR, *OS400, *WINDOWS, *CICS_VSE, *WINDOWS_NT, *VMS, *NSK, *VOS, *IMS_BRIDGE, *XCF, *CICS_BRIDGE, *NOTES_AGENT, *BROKER, *JAVA, *DQM</i>	Optional, Positional 5
<u>APPID</u>	Application identifier	<i>Character value, *SYSDFTPRC</i>	Optional, Positional 6
<u>USRDATA</u>	User data	<i>Character value, *SYSDFTPRC, *NONE</i>	Optional, Positional 7
<u>ENVDATA</u>	Environment data	<i>Character value, *SYSDFTPRC, *NONE</i>	Optional, Positional 8

Process name (PRCNAME)

The name of the new MQ process definition to be created.

The possible values are:

process-name

Specify the name of the new MQ process definition. The name can contain up to 48 characters.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Replace (REPLACE)

If a process definition with the same name already exists, this specifies whether it is replaced.

The possible values are:

***NO**

This definition does not replace any existing process definition with the same name. The command fails if the named process definition already exists.

***YES**

Replace the existing process definition. If there is no definition with the same name, a new definition is created.

Text 'description' (TEXT)

Specifies text that briefly describes the process definition.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SYSDFTPRC**

The value of this attribute is taken from the system default process.

***BLANK**

The text is set to a blank string.

description

Specify the new descriptive information.

Application type (APPTYPE)

The type of application started.

The possible values are:

***SYSDFTPRC**

The value for this attribute is taken from the system default process.

***CICS**

Represents a CICS/400 application.

***MVS**

Represents an MVS application.

***IMS**

Represents an IMS application.

***OS2**

Represents an OS/2 application.

***DOS**

Represents a DOS application.

***UNIX**

Represents a UNIX application.

***QMGR**

Represents a queue manager.

***OS400**

Represents an IBM i application.

***WINDOWS**

Represents a Windows application.

***CICS_VSE**

Represents a CICS/VSE application.

***WINDOWS_NT**

Represents a Windows NT application.

***VMS**

Represents a VMS application.

***NSK**

Represents a Tandem/NSK application.

***VOS**

Represents a VOS application.

***IMS_BRIDGE**

Represents an IMS bridge application.

***XCF**

Represents an XCF application.

***CICS_BRIDGE**

Represents a CICS bridge application.

***NOTES_AGENT**

Represents a Lotus Notes application.

***BROKER**

Represents a broker application.

***JAVA**

Represents a Java application.

***DQM**

Represents a DQM application.

user-value

User-defined application type in the range 65536 through 999999999.

The values within this range are not tested, and any other value is accepted.

Application identifier (APPID)

Application identifier. This is the name of the application to be started, on the platform for which the command is processing. It is typically a program name and library name.

The possible values are:

***SYSDFTPRC**

The value for this attribute is taken from the system default process.

application-id

The maximum length is 256 characters.

User data (USRDATA)

A character string that contains user information pertaining to the application, as defined by APPID, to start.

The possible values are:

***SYSDFTPRC**

The value for this attribute is taken from the system default process.

***NONE**

The user data is blank.

user-data

Specify up to 128 characters of user data.

Environment data (ENVDATA)

A character string that contains environment information pertaining to the application, as defined by APPID, to start.

The possible values are:

***SYSDFTPRC**

The value for this attribute is taken from the system default process.

***NONE**

The environment data is blank.

environment-data

The maximum length is 128 characters.

 **Create MQ Queue (CRTMQMQ)**
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Create MQ Queue (CRTMQMQ) command creates a queue definition with the specified attributes. All attributes that are not specified are set to the default value for the type of queue that is created.

Parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value	Required, Key, Positional 1
<u>QTYPE</u>	Queue type	*ALS, *LCL, *MDL, *RMT	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SYSDFTQ	Optional, Positional 5
<u>PUTENBL</u>	Put enabled	*SYSDFTQ, *NO, *YES	Optional, Positional 6
<u>DFTPTY</u>	Default message priority	0-9, *SYSDFTQ	Optional, Positional 7
<u>DFTMSGPST</u>	Default message persistence	*SYSDFTQ, *NO, *YES	Optional, Positional 8
<u>PRCNAME</u>	Process name	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 9
<u>TRGENBL</u>	Triggering enabled	*SYSDFTQ, *NO, *YES	Optional, Positional 10
<u>GETENBL</u>	Get enabled	*SYSDFTQ, *NO, *YES	Optional, Positional 11
<u>SHARE</u>	Sharing enabled	*SYSDFTQ, *NO, *YES	Optional, Positional 12
<u>DFTSHARE</u>	Default share option	*SYSDFTQ, *NO, *YES	Optional, Positional 13
<u>MSGDLYSEQ</u>	Message delivery sequence	*SYSDFTQ, *PTY, *FIFO	Optional, Positional 14
<u>HDNBKTCNT</u>	Harden backout count	*SYSDFTQ, *NO, *YES	Optional, Positional 15
<u>TRGTYPE</u>	Trigger type	*SYSDFTQ, *FIRST, *ALL, *DEPTH, *NONE	Optional, Positional 16
<u>TRGDEPTH</u>	Trigger depth	1-999999999, *SYSDFTQ	Optional, Positional 17
<u>TRGMSGPTY</u>	Trigger message priority	0-9, *SYSDFTQ	Optional, Positional 18

Keyword	Description	Choices	Notes
<u>TRGDATA</u>	Trigger data	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 19
<u>RTNITV</u>	Retention interval	0-999999999, *SYSDFTQ	Optional, Positional 20
<u>MAXDEPTH</u>	Maximum queue depth	0-999999999, *SYSDFTQ	Optional, Positional 21
<u>MAXMSGLEN</u>	Maximum message length	0-104857600, *SYSDFTQ	Optional, Positional 22
<u>BKTHLD</u>	Backout threshold	0-999999999, *SYSDFTQ	Optional, Positional 23
<u>BKTQNAME</u>	Backout requeue name	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 24
<u>INITQNAME</u>	Initiation queue	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 25
<u>USAGE</u>	Usage	*SYSDFTQ , *NORMAL, *TMQ	Optional, Positional 26
<u>DFNTYPE</u>	Definition type	*SYSDFTQ , *TEMPDYN, *PERMDYN	Optional, Positional 27
<u>TGTQNAME</u>	Target object	<i>Character value</i> , *SYSDFTQ	Optional, Positional 28
<u>RMTQNAME</u>	Remote queue	<i>Character value</i> , *SYSDFTQ , *NONE	Optional, Positional 29
<u>RMTMQMNAME</u>	Remote Message Queue Manager	<i>Character value</i> , *SYSDFTQ	Optional, Positional 30
<u>TMQNAME</u>	Transmission queue	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 31
<u>HIGHTHLD</u>	Queue depth high threshold	0-100, *SYSDFTQ	Optional, Positional 32
<u>LOWTHLD</u>	Queue depth low threshold	0-100, *SYSDFTQ	Optional, Positional 33
<u>FULLEVT</u>	Queue full events enabled	*SYSDFTQ , *NO, *YES	Optional, Positional 34
<u>HIGHEVT</u>	Queue high events enabled	*SYSDFTQ , *NO, *YES	Optional, Positional 35
<u>LOWEVT</u>	Queue low events enabled	*SYSDFTQ , *NO, *YES	Optional, Positional 36
<u>SRVITV</u>	Service interval	0-999999999, *SYSDFTQ	Optional, Positional 37
<u>SRVEVT</u>	Service interval events	*SYSDFTQ , *HIGH, *OK, *NONE	Optional, Positional 38
<u>DISTLIST</u>	Distribution list support	*SYSDFTQ , *NO, *YES	Optional, Positional 39
<u>CLUSTER</u>	Cluster Name	<i>Character value</i> , *SYSDFTQ , *NONE	Optional, Positional 40

Keyword	Description	Choices	Notes
<u>CLUSNL</u>	Cluster Name List	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 41
<u>DEFBIND</u>	Default Binding	*SYSDFTQ , *OPEN, *NOTFIXED, *GROUP	Optional, Positional 42
<u>CLWLRANK</u>	Cluster Workload Rank	0-9, *SYSDFTQ	Optional, Positional 43
<u>CLWLPRTY</u>	Cluster Workload Priority	0-9, *SYSDFTQ	Optional, Positional 44
<u>CLWLUSEQ</u>	Cluster workload queue use	*SYSDFTQ , *QMGR, *LOCAL, *ANY	Optional, Positional 45
<u>MONQ</u>	Queue Monitoring	*SYSDFTQ , *QMGR, *OFF, *LOW, *MEDIUM, *HIGH	Optional, Positional 46
<u>STATQ</u>	Queue Statistics	*SYSDFTQ , *QMGR, *OFF, *ON	Optional, Positional 47
<u>ACCTQ</u>	Queue Accounting	*SYSDFTQ , *QMGR, *OFF, *ON	Optional, Positional 48
<u>NPMCLASS</u>	Non Persistent Message Class	*SYSDFTQ , *NORMAL, *HIGH	Optional, Positional 49
<u>MSGREADAHD</u>	Message Read Ahead	*SYSDFTQ , *DISABLED, *NO, *YES	Optional, Positional 50
<u>DFTPUTRESP</u>	Default Put Response	*SYSDFTQ, *SYNC , *ASYN	Optional, Positional 51
<u>PROPCTL</u>	Property Control	*SYSDFTQ , *COMPAT, *NONE, *ALL, *FORCE, *V6COMPAT	Optional, Positional 52
<u>TARGETYPE</u>	Target Type	*SYSDFTQ , *QUEUE, *TOPIC	Optional, Positional 53
<u>CUSTOM</u>	Custom attribute	<i>Character value</i> , *BLANK, *SYSDFTQ	Optional, Positional 54
<u>CLCHNAME</u>	Cluster-sender channel name	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 55

Queue name (QNAME)

Specifies the name of the queue definition. Queue names must be unique. If a queue definition with this name already exists, you must specify REPLACE(*YES).

The name can contain up to 48 characters.

Note: The field length is 48 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

The possible values are:

queue-name

Specify the name of the new queue.

Queue type (QTYPE)

Specifies the type of queue that is to be created.

If the queue already exists, REPLACE(*YES) must be specified, and the value specified by QTYPE must be the type of the existing queue.

The possible values are:

***ALS**

An alias queue.

***LCL**

A local queue.

***RMT**

A remote queue.

***MDL**

A model queue.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Replace (REPLACE)

Specifies whether the new queue will replace an existing queue definition with the same name and type.

The possible values are:

***NO**

Do not replace the existing queue. The command fails if the named queue already exists.

***YES**

Replace the existing queue definition with the attributes of the FROMQ and the specified attributes.

The command will fail if an application has the Queue open or the USAGE attribute is changed.

Note: If the queue is a local queue, and a queue with the same name already exists, any messages already on that queue are retained.

Text 'description' (TEXT)

Specifies text that briefly describes the queue definition.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Put enabled (PUTENBL)

Specifies whether messages can be put on the queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

Messages cannot be added to the queue.

***YES**

Messages can be added to the queue by authorized applications.

Default message priority (DFTPTY)

Specifies the default priority of messages put on the queue.

The possible values are:

***SYSDFTQ**

The value of this attribute taken from the system default queue of the specified type.

priority-value

Specify a value ranging from 0 through 9.

Default message persistence (DFTMSGPST)

Specifies the default for message-persistence on the queue. Message persistence determines whether messages are preserved across restarts of the queue manager.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

By default, messages are lost across a restart of the queue manager.

***YES**

By default, messages are preserved across a restart of the queue manager.

Process name (PRCNAME)

Specifies the local name of the MQ process that identifies the application that should be started when a trigger event occurs.

The process does not have to be available when the queue is created, but it must be available for a trigger event to occur.

The possible values are:

***SYSDFTQ**

The value of this attribute taken from the system default queue of the specified type.

***NONE**

No process is specified.

process-name

Specify the name of the process.

Triggering enabled (TRGENBL)

Specifies whether trigger messages are written to the initiation queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

Do not write trigger messages to the initiation queue.

***YES**

Triggering is active; trigger messages are written to the initiation queue.

Get enabled (GETENBL)

Specifies whether applications are to be permitted to get messages from this queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

Applications cannot retrieve messages from the queue.

***YES**

Suitably authorized applications can retrieve messages from the queue.

Sharing enabled (SHARE)

Specifies whether multiple instances of applications can open this queue for input.

The possible values are:

***SYSDFTQ**

The value of this attribute is from the system default queue of the specified type.

***NO**

Only a single application instance can open the queue for input.

***YES**

More than one application instance can open the queue for input.

Default share option (DFTSHARE)

Specifies the default share option for applications opening this queue for input.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

The open request is for exclusive use of the queue for input.

***YES**

The open request is for shared use of the queue for input.

Message delivery sequence (MSGDLYSEQ)

Specifies the message delivery sequence.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***PTY**

Messages are delivered in first-in-first-out (FIFO) order within priority.

***FIFO**

Messages are delivered in FIFO order regardless of priority.

Harden backout count (HDNBKTCNT)

Specifies whether the count of backed out messages should be saved (hardened) across restarts of the message queue manager.

Note: On IBM MQ for IBM i the count is ALWAYS hardened, regardless of the setting of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

The backout count is not hardened.

***YES**

The backout count is hardened.

Trigger type (TRGTYPE)

Specifies the condition that initiates a trigger event. When the condition is true, a trigger message is sent to the initiation queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***FIRST**

When the number of messages on the queue goes from zero to one.

***ALL**

Every time a message arrives on the queue.

***DEPTH**

When the number of messages on the queue equals the value of the TRGDEPTH attribute.

***NONE**

No trigger messages are written.

Trigger depth (TRGDEPTH)

Specifies, for TRGTYPE(*DEPTH), the number of messages that initiate a trigger message to the initiation queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

depth-value

Specify a value ranging from 1 through 999999999.

Trigger message priority (TRGMSGPTY)

Specifies the minimum priority that a message must have before it can produce, or be counted for, a trigger event.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

priority-value

Specify a value ranging from 0 through 9.

Trigger data (TRGDATA)

Specifies up to 64 characters of user data that the queue manager includes in the trigger message. This data is made available to the monitoring application that processes the initiation queue and to the application started by the monitor.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NONE**

No trigger data is specified.

trigger-data

Specify up to 64 characters enclosed in apostrophes. For a transmission queue you can use this parameter to specify the name of the channel to be started.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Retention interval (RTNITV)

Specifies the retention interval. This interval is the number of hours for which the queue might be needed, based on the date and time when the queue was created.

This information is available to a housekeeping application or an operator and can be used to determine when a queue is no longer required.

Note: The message queue manager does not delete queues, nor does it prevent your queues from being deleted if their retention interval has not expired. It is your responsibility to take any required action.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

interval-value

Specify a value ranging from 0 through 999999999.

Maximum queue depth (MAXDEPTH)

Specifies the maximum number of messages allowed on the queue. However, other factors can cause the queue to be treated as full; for example, it appears to be full if there is no storage available for a message.

Note: If this value is subsequently reduced by using the CHGMQM command, any messages that are on the queue remain intact even if they cause the new maximum to be exceeded.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

depth-value

Specify a value ranging from 0 through 999999999.

Maximum message length (MAXMSGLEN)

Specifies the maximum length for messages on the queue.

Note: If this value is subsequently reduced by using the CHGMQM command, any messages that are on the queue remain intact even if they exceed the new maximum length.

Applications might use the value of this attribute to determine the size of buffer they need to retrieve messages from the queue. Therefore change the value only if you know this will not cause an application to operate incorrectly.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified queue type.

length-value

Specify a value ranging from 0 through 104 857 600.

Backout threshold (BKTTHLD)

Specifies the backout threshold.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine if a message should be backed out. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified queue type.

threshold-value

Specify a value ranging from 0 through 999999999.

Backout requeue name (BKTQNAME)

Specifies the backout-queue name.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine where messages that have been backed out should go. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified queue type.

***NONE**

No backout queue is specified.

backout-queue-name

Specify the backout queue name.

Initiation queue (INITQNAME)

Specifies the name of the initiation queue.

Note: The initiation queue must be on the same instance of a message queue manager.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified queue type.

***NONE**

No initiation queue is specified.

initiation-queue-name

Specify the initiation queue name.

Usage (USAGE)

Specifies whether the queue is for normal usage, or for transmitting messages to a remote message queue manager.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified queue type.

***NORMAL**

Normal usage (the queue is not a transmission queue)

***TMQ**

The queue is a transmission queue that is used to hold messages destined for a remote message queue manager. If the queue is intended for use in situations where a transmission queue name is not explicitly specified, the queue name must be the same as the name of the remote message queue manager. For further information, see the IBM MQ Intercommunication.

Definition type (DFNTYPE)

Specifies the type of dynamic queue definition that is created when an application issues an MQOPEN API call with the name of this model queue specified in the object descriptor.

Note: This parameter only applies to a model queue definition.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***TEMPDYN**

Creates a temporary dynamic queue. Do not specify with a DEFMSGPST value of *YES.

***PERMDYN**

Creates a permanent dynamic queue.

Target object (TGTQNAME)

Specifies the name of the target object for which this queue is an alias.

The object can be a local or remote queue, a topic or a message queue manager.

Do not leave this field blank. If you do so, it is possible that you will create an alias queue, that has to be subsequently modified, by the addition of a TGTNAME.

When a message queue manager name is specified, it identifies the message queue manager that handles the messages posted to the alias queue. You can specify either the local message queue manager or a transmission queue name.

Note: The target object does not need to exist at this time but it must exist when a process attempts to open the alias queue.

The possible values are:

***SYSDFTQ**

The name of the target object is taken from the SYSTEM.DEFAULT.ALIAS.QUEUE.

target-object-name

Specify the name of the target object.

Remote queue (RMTQNAME)

Specifies the name of the remote queue. That is, the local name of the remote queue as defined on the queue manager specified by RMTMQMNAME.

If this definition is used for a queue manager alias definition, RMTQNAME must be blank when the open occurs.

If this definition is used for a reply-to alias, this name is the name of the queue that is to be the reply-to queue.

The possible values are:

***SYSDFTQ**

The name of the remote queue is taken from the SYSTEM.DEFAULT.REMOTE.QUEUE.

***NONE**

No remote-queue name is specified (that is, the name is blank). This can be used if the definition is a queue manager alias definition.

remote-queue-name

Specify the name of the queue at the remote queue manager.

Note: The name is not checked to ensure that it contains only those characters normally allowed for queue names

Remote Message Queue Manager (RMTMQMNAME)

Specifies the name of the remote queue manager on which the queue RMTQNAME is defined.

If an application opens the local definition of a remote queue, RMTMQMNAME must not be the name of the connected queue manager. If TMQNAME is blank there must be a local queue of this name, which is to be used as the transmission queue.

If this definition is used for a queue manager alias, RMTMQMNAME is the name of the queue manager, which can be the name of the connected queue manager. Otherwise, if TMQNAME is blank, when the queue is opened there must be a local queue of this name, with USAGE(*TMQ) specified, which is to be used as the transmission queue.

If this definition is used for a reply-to alias, this name is the name of the queue manager that is to be the reply-to queue manager.

The possible values are:

***SYSDFTQ**

The name of the remote queue manager is taken from the SYSTEM.DEFAULT.REMOTE.QUEUE.

remote-queue-manager-name

Specify the name of the remote queue manager.

Note: Ensure this name contains only those characters normally allowed for queue manager names.

Transmission queue (TMQNAME)

Specifies the local name of the transmission queue to be used for messages destined for the remote queue, for either a remote queue or for a queue manager alias definition.

If TMQNAME is blank, a queue with the same name as RMTMQMNAME is used as the transmission queue.

This attribute is ignored if the definition is being used as a queue manager alias and RMTMQMNAME is the name of the connected queue manager.

It is also ignored if the definition is used as a reply-to queue alias definition.

The possible values are:

***SYSDFTQ**

The transmission queue name is taken from the SYSTEM.DEFAULT.REMOTE.QUEUE.

***NONE**

No specific transmission queue name is defined for this remote queue. The value of this attribute is set to all blanks.

transmission-queue-name

Specify the transmission queue name.

Queue depth high threshold (HIGHTHLD)

Specifies the threshold against which the queue depth is compared to generate a queue depth high event.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

threshold-value

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

Queue depth low threshold (LOWTHLD)

Specifies the threshold against which the queue depth is compared to generate a queue depth low event.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

threshold-value

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

Queue full events enabled (FULLEVT)

Specifies whether queue full events are generated.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

Queue Full events are not generated.

***YES**

Queue Full events are generated.

Queue high events enabled (HIGHEVT)

Specifies whether queue depth high events are generated.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

Queue Depth High events are not generated.

***YES**

Queue Depth High events are generated.

Queue low events enabled (LOWEVT)

Specifies whether queue depth low events are generated.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

Queue Depth Low events are not generated.

***YES**

Queue Depth Low events are generated.

Service interval (SRVITV)

Specifies the service interval. This interval is used for comparison to generate service interval high and service interval OK events.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

interval-value

Specify a value ranging from 0 through 999999999. The value is in units of milliseconds.

Service interval events (SRVEVT)

Specifies whether service interval high or service interval OK events are generated.

A service interval high event is generated when a check indicates that no messages have been retrieved from the queue for the time indicated by the SRVITV parameter as a minimum.

A service interval OK event is generated when a check indicates that messages have been retrieved from the queue within the time indicated by the SRVITV parameter.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***HIGH**

Service Interval High events are generated.

***OK**

Service Interval OK events are generated.

***NONE**

No service interval events are generated.

Distribution list support (DISTLIST)

Specifies whether the queue supports distribution lists.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

Distribution Lists are not supported.

***YES**

Distribution Lists are supported.

Cluster Name (CLUSTER)

The name of the cluster to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

cluster-name

Only one of the resultant values of CLUSTER or CLUSNL can be non-blank; you cannot specify a value for both.

Cluster Name List (CLUSNL)

The name of the namelist which specifies a list of clusters to which the queue belongs. Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

namelist-name

The name of the namelist that specifies a list of clusters to which the queue belongs.

Default Binding (DEFBIND)

Specifies the binding to be used when the application specifies MQOO_BIND_AS_Q_DEF on the MQOPEN call and the queue is a cluster queue.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***OPEN**

The queue handle is bound to a specific instance of the cluster queue when the queue is opened.

***NOTFIXED**

The queue handle is not bound to any particular instance of the cluster queue. This allows the queue manager to select a specific queue instance when the message is put using MQPUT and to change that selection subsequently if necessary.

The MQPUT1 call always behaves as if NOTFIXED had been specified.

***GROUP**

When the queue is opened, the queue handle is bound to a specific instance of the cluster queue for as long as there are messages in a message group. All messages in a message group are allocated to the same destination instance.

Cluster Workload Rank (CLWLRANK)

Specifies the cluster workload rank of the queue.

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

cluster-workload-rank

Specify a value ranging from 0 through 9.

Cluster Workload Priority (CLWLPRTY)

Specifies the cluster workload priority of the queue.

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

cluster-workload-priority

Specify a value ranging from 0 through 9.

Cluster workload queue use (CLWLUSEQ)

Specifies the behavior of an MQPUT when the target queue has both a local instance and at least one remote cluster instance. If the put originates from a cluster channel then this attribute does not apply.

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***QMGR**

The value is inherited from the Queue Manager CLWLUSEQ attribute.

***LOCAL**

The local queue will be the sole target of the MQPUT.

***ANY**

The queue manager will treat such a local queue as another instance of the cluster queue for the purposes of workload distribution.

Queue Monitoring (MONQ)

Controls the collection of Online Monitoring Data.

Online Monitoring Data is not collected when the queue manager attribute MONQ is set to *NONE.

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***QMGR**

The collection of Online Monitoring Data is inherited from the setting of the queue manager attribute MONQ.

***OFF**

Online Monitoring Data collection for this queue is disabled.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

Queue Statistics (STATQ)

Controls the collection of statistics data.

Online monitoring data is not collected when the queue manager attribute STATQ is set to *NONE.

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATQ.

***OFF**

Statistics data collection for this queue is disabled.

***ON**

Statistics data collection is enabled for this queue.

Queue Accounting (ACCTQ)

Controls the collection of accounting data.

Accounting data is not collected when the queue manager attribute ACCTQ is set to *NONE.

*SYSDFTQ

The value of this attribute is taken from the system default queue of the specified type.

*QMGR

Accounting data collection is based upon the setting of the queue manager attribute ACCTQ.

*OFF

Accounting data collection for this queue is disabled.

*ON

Accounting data collection is enabled for this queue.

Non Persistent Message Class (NPMCLASS)

Specifies the level of reliability for non-persistent messages put to this queue.

*SYSDFTQ

The value of this attribute is taken from the system default queue of the specified type.

*NORMAL

Non-persistent messages put to this queue are only lost following a failure, or a queue manager shutdown. Non-persistent message put to this queue are discarded in the event of a queue manager restart.

*HIGH

Non-persistent messages put to this queue are not discarded in the event of a queue manager restart. Non-persistent messages put to this queue may still be lost in the event of a failure.

Message Read Ahead (MSGREADAHD)

Specifies whether nonpersistent messages are sent to the client ahead of an application requesting them.

The possible values are:

*SYSDFTQ

The value of this attribute is taken from the system default queue of the specified type.

*DISABLED

Read ahead is disabled for this queue. Messages are not sent to the client ahead of an application requesting them regardless of whether read ahead is requested by the client application.

*NO

Non-persistent messages are not sent to the client ahead of an application requesting them. A maximum of one non-persistent message can be lost if the client ends abnormally.

*YES

Non-persistent messages are sent to the client ahead of an application requesting them. Non-persistent messages can be lost if the client ends abnormally or if the client application does not consume all the messages it is sent.

Default Put Response (DFTP UtreSP)

The default put response type (DFTP UtreSP) attribute specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO_RESPONSE_AS_Q_DEF option.

The possible values are:

*SYSDFTQ

The value of this attribute is taken from the system default queue of the specified type.

***SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are issued as if MQPMO_SYNC_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application. This is the default value supplied with IBM MQ, but your installation might have changed it.

***ASYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are always issued as if MQPMO_ASYNC_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application; but an improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

Property Control (PROPCTL)

Specifies what happens to properties of messages that are retrieved from queues using the MQGET call when the MQGMO_PROPERTIES_AS_Q_DEF option is specified.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***COMPAT**

If the message contains a property with a prefix of mcd . , jms . , usr . or mqext . then all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

***NONE**

All properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

***ALL**

All properties of the message, except those contained in the message descriptor (or extension), are contained in one or more MQRFH2 headers in the message data.

***FORCE**

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

***V6COMPAT**

When set, *V6COMPAT must be set both on one of the queue definitions resolved by MQPUT and one of the queue definitions resolved by MQGET. It must also be set on any other intervening transmission queues. It causes an MQRFH2 header to be passed unchanged from the sending application to the receiving application. It overrides other settings of **PROPCTL** found in a queue name resolution chain. If the property is set on a cluster queue, the setting is not cached locally on other queue managers. You must set *V6COMPAT on an alias queue that resolves to the cluster queue. Define the alias queue on the same queue manager that the putting application is connected to.

Target Type (TARGTYPE)

Specifies the type of object to which the alias resolves.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***QUEUE**

Queue object.

***TOPIC**

Topic object.

Custom attribute (CUSTOM)

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

*SYSDFTQ

The value of this attribute is taken from the system default queue of the specified type.

*BLANK

The text is set to a blank string.

custom

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

CLCHNAME

This parameter is supported only on transmission queues.

*SYSDFTQ

The value of this attribute is taken from the system default queue of the specified type.

*NONE

The attribute is removed.

custom

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

By specifying asterisks, "*", in **ClusterChannelName**, you can associate a transmission queue with a set of cluster-sender channels. The asterisks can be at the beginning, end, or any number of places in the middle of the channel name string. **ClusterChannelName** is limited to a length of 20 characters: MQ_CHANNEL_NAME_LENGTH.

IBM i

Create MQ Subscription (CRTMQMSUB)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Create MQ Subscription (CRTMQMSUB) command creates a new MQ subscription, specifying those attributes that are different from the default.

Parameters

Keyword	Description	Choices	Notes
<u>SUBNAME</u>	Subscription name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Key, Positional 3
<u>TOPICSTR</u>	Topic string	<i>Character value</i> , *NONE, *SYSDFTSUB	Optional, Positional 4

Keyword	Description	Choices	Notes
<u>TOPICOBJ</u>	Topic object	<i>Character value</i> , *NONE, *SYSDFTSUB	Optional, Positional 5
<u>DEST</u>	Destination	<i>Character value</i> , *SYSDFTSUB	Optional, Positional 6
<u>DESTMQM</u>	Destination Queue Manager	<i>Character value</i> , *NONE, *SYSDFTSUB	Optional, Positional 7
<u>DESTRRLID</u>	Destination Correlation Id	<i>Character value</i> , *NONE, *SYSDFTSUB	Optional, Positional 8
<u>PUBACCT</u>	Publish Accounting Token	<i>Character value</i> , *CURRENT, *SYSDFTSUB	Optional, Positional 9
<u>PUBAPPID</u>	Publish Application Id	<i>Character value</i> , *NONE, *SYSDFTSUB	Optional, Positional 10
<u>SUBUSER</u>	Subscription User Id	<i>Character value</i> , *CURRENT, *SYSDFTSUB	Optional, Positional 11
<u>USERDATA</u>	Subscription User Data	<i>Character value</i> , *NONE, *SYSDFTSUB	Optional, Positional 12
<u>SELECTOR</u>	Selector String	<i>Character value</i> , *NONE, *SYSDFTSUB	Optional, Positional 13
<u>PSPROP</u>	PubSub Property	*SYSDFTSUB , *NONE, *COMPAT, *RFH2, *MSGPROP	Optional, Positional 14
<u>DESTCLASS</u>	Destination Class	*SYSDFTSUB , *MANAGED, *PROVIDED	Optional, Positional 15
<u>SUBSCOPE</u>	Subscription Scope	*SYSDFTSUB , *ALL, *QMGR	Optional, Positional 16
<u>VARUSER</u>	Variable User	*SYSDFTSUB , *ANY, *FIXED	Optional, Positional 17
<u>REQONLY</u>	Request Publications	*SYSDFTSUB , *YES, *NO	Optional, Positional 18
<u>PUBPTY</u>	Publish Priority	0-9, *SYSDFTSUB , *ASPUB, *ASQDEF	Optional, Positional 19
<u>WSHEMA</u>	Wildcard Schema	*SYSDFTSUB , *TOPIC, *CHAR	Optional, Positional 20
<u>EXPIRY</u>	Expiry Time	0-999999999, *SYSDFTSUB , *UNLIMITED	Optional, Positional 21

Subscription name (SUBNAME)

The name of the new MQ subscription to be created.

The possible values are:

subscription-name

Specify a maximum of 256 bytes for the subscription name.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

***DFT**

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Replace (REPLACE)

If a subscription with the same name already exists, this specifies whether it is replaced.

The possible values are:

***NO**

This subscription does not replace any existing subscription with the same name or subscription identifier. The command fails if the subscription already exists.

***YES**

Replace the existing subscription. If there is no subscription with the same name or subscription identifier, a new subscription is created.

Topic string (TOPICSTR)

Specifies the topic string associated with this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

topic-string

Specify a maximum of 256 bytes for the topic string.

Note: Topic strings of greater than 256 bytes can be specified using MQSC.

Topic object (TOPICOBJ)

Specifies the topic object associated with this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

topic-object

Specify the name of the topic object.

Destination (DEST)

Specifies the destination queue for messages published to this subscription.

The possible values are:

destination-queue

Specify the name of the destination queue.

Destination Queue Manager (DESTMQM)

Specifies the destination queue manager for messages published to this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

destination-queue-manager

Specify the name of the destination queue manager.

Destination Correlation Id (DESTCRLID)

Specifies the correlation identifier for messages published to this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

destination-correlation-identifier

Specify the 48 character hexadecimal string representing the 24 byte correlation identifier.

Publish Accounting Token (PUBACCT)

Specifies the accounting token for messages published to this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***NONE**

Messages are placed on the destination with an accounting token of MQACT_NONE.

publish-accounting-token

Specify the 64 character hexadecimal string representing the 32 byte publish accounting token.

Publish Application Id (PUBAPPID)

Specifies the publish application identity for messages published to this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***NONE**

No publish application identifier is specified.

publish-application-identifier

Specify the publish application identifier.

Subscription User Id (SUBUSER)

Specifies the user profile that owns this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***CURRENT**

The current user profile is the owner of the new subscription.

user-profile

Specify the user profile.

Subscription User Data (USERDATA)

Specifies the user data associated with the subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***NONE**

No user data is specified.

user-data

Specify a maximum of 256 bytes for user data.

Note: User data of greater than 256 bytes can be specified using MQSC.

Selector String (SELECTOR)

Specifies the SQL 92 selector string to be applied to messages published on the named topic to select whether they are eligible for this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***NONE**

No selection string is specified.

selection-string

Specify a maximum of 256 bytes for selection string.

Note: Selection strings of greater than 256 bytes can be specified using MQSC.

PubSub Property (PSPROP)

Specifies the manner in which publish / subscribe related message properties are added to messages sent to this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***NONE**

Publish / subscribe properties are not added to the message.

***COMPAT**

Publish / subscribe properties are added to the message to maintain compatibility with V6 Publish / Subscribe.

***RFH2**

Publish / subscribe properties are added to the message within an RFH 2 header.

***MSGPROP**

Publish / subscribe properties are added as message properties.

Destination Class (DESTCLASS)

Specifies whether this is a managed subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***MANAGED**

The destination is managed.

***PROVIDED**

The destination is a queue.

Subscription Scope (SUBSCOPE)

Specifies whether this subscription should be forwarded (as a proxy subscription) to other brokers, so that the subscriber will receive messages published at those other brokers.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***ALL**

The subscription will be forwarded to all queue managers directly connected via a publish / subscribe collective or hierarchy.

***QMGR**

The subscription will only forward messages published on the topic within this queue manager.

Variable User (VARUSER)

Specifies whether user profiles other than the creator of the subscription can connect to it (subject to topic and destination authority checks).

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***ANY**

Any user profiles can connect to the subscription.

***FIXED**

Only the user profile that created the subscription can connect to it.

Request Publications (REQONLY)

Specifies whether the subscriber will poll for updates via MQSUBRQ API, or whether all publications are delivered to this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***YES**

Publications are only delivered to this subscription in response to an MQSUBRQ API.

***NO**

All publications on the topic are delivered to this subscription.

Publish Priority (PUBPTY)

Specifies the priority of the message sent to this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***ASPUB**

The priority of the message sent to this subscription is taken from that supplied in the published message.

***ASQDEF**

The priority of the message sent to this subscription is taken from the default priority of the queue defined as the destination.

priority-value

Specify a priority ranging from 0 through 9.

Wildcard Schema (WSCHEMA)

Specifies the schema to be used when interpreting wildcard characters in the topic string.

The possible values are:

*SYSDFTSUB

The value of this attribute is taken from the system default subscription.

*TOPIC

Wildcard characters represent portions of the topic hierarchy.

*CHAR

Wildcard characters represent portions of strings.

Expiry Time (EXPIRY)

Specifies the expiry time of the subscription. After a subscription's expiry time has elapsed, it becomes eligible to be discarded by the queue manager and will receive no further publications.

The possible values are:

*SYSDFTSUB

The value of this attribute is taken from the system default subscription.

*UNLIMITED

The subscription does not expire.

expiry-time

Specify an expiry time in tenths of a second ranging from 0 through 999999999.

IBM I

Create MQ Service (CRTMQMSVC)

Where allowed to run:	Threadsafe:
All environments (*ALL)	Yes

The Create MQ Service (CRTMQMSVC) command creates a new MQ service definition, specifying those attributes that are to be different from the default.

Parameters

Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 3
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SYSDFTSVC	Optional, Positional 4
<u>STRCMD</u>	Start program	Single values: *SYSDFTSVC, *NONE Other values: <i>Qualified object name</i>	Optional, Positional 5
	Qualifier 1: Start program	Name	
	Qualifier 2: Library	Name	

Keyword	Description	Choices	Notes
<u>STRARG</u>	Start program arguments	<i>Character value</i> , *BLANK, *SYSDFTSVC	Optional, Positional 6
<u>ENDCMD</u>	End program	Single values: *SYSDFTSVC, *NONE Other values: <i>Qualified object name</i>	Optional, Positional 7
	Qualifier 1: End program	Name	
	Qualifier 2: Library	Name	
<u>ENDARG</u>	End program arguments	<i>Character value</i> , *BLANK, *SYSDFTSVC	Optional, Positional 8
<u>STDOUT</u>	Standard output	<i>Character value</i> , *BLANK, *SYSDFTSVC	Optional, Positional 9
<u>STDERR</u>	Standard error	<i>Character value</i> , *BLANK, *SYSDFTSVC	Optional, Positional 10
<u>TYPE</u>	Service type	*SYSDFTSVC, *CMD, *SVR	Optional, Positional 11
<u>CONTROL</u>	Service control	*SYSDFTSVC, *MANUAL, *QMGR, *STARTONLY	Optional, Positional 12

Service name (SVCNAME)

The name of the new MQ service definition.

The possible values are:

service-name

Specify the name of the service definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Replace (REPLACE)

If a service definition with the same name already exists, this specifies whether it is replaced.

The possible values are:

*NO

This definition does not replace any existing service definition with the same name. The command fails if the named service definition already exists.

*YES

Replace the existing service definition. If there is no definition with the same name, a new definition is created.

Text 'description' (TEXT)

Specifies text that briefly describes the service definition.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SYSDFTSVC**

The value of this attribute is taken from the system default service.

***BLANK**

The text is set to a blank string.

description

Specify the new descriptive information.

Start program (STRCMD)

The name of the program to run.

The possible values are:

***SYSDFTSVC**

The value of this attribute is taken from the system default service.

start-command

The name of the start command executable.

Start program arguments (STRARG)

The arguments passed to the program at startup.

The possible values are:

***SYSDFTSVC**

The value of this attribute is taken from the system default service.

***BLANK**

No arguments are passed to the start command.

start-command-arguments

The arguments passed to the start command.

End program (ENDCMD)

The name of the executable to run when the service is requested to stop.

The possible values are:

***SYSDFTSVC**

The value of this attribute is taken from the system default service.

***BLANK**

No end command is executed.

end-command

The name of the end command executable.

End program arguments (ENDARG)

The arguments passed to the end program when the service is requested to stop.

The possible values are:

***SYSDFTSVC**

The value of this attribute is taken from the system default service.

***BLANK**

No arguments are passed to the end command.

end-command-arguments

The arguments passed to the end command.

Standard output (STDOUT)

The path to a file to which the standard output of the service program is redirected.

The possible values are:

***SYSDFTSVC**

The value of this attribute is taken from the system default service.

***BLANK**

The standard output is discarded.

stdout-path

The standard output path.

Standard error (STDERR)

The path to a file to which the standard error of the service program is redirected.

The possible values are:

***SYSDFTSVC**

The value of this attribute is taken from the system default service.

***BLANK**

The standard error is discarded.

stderr-path

The standard error path.

Service type (TYPE)

Mode in which to run service.

The possible values are:

***SYSDFTSVC**

The value for this attribute is taken from the system default service.

***CMD**

When started the command is executed but no status is collected or displayed.

***SVR**

The status of the executable started will be monitored and displayed.

Service control (CONTROL)

Whether the service should be started automatically at queue manager start.

The possible values are:

***SYSDFTSVC**

The value for this attribute is taken from the system default service.

***MANUAL**

The service will not be automatically started or stopped.

***QMGR**

The service will be started and stopped as the queue manager is started and stopped.

***STARTONLY**

The service will be started as the queue manager is started, but will not be requested to stop when the queue manager is stopped.

IBM i Create MQ Topic (CRTMQMTOPTOP)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Create MQ Topic (CRTMQMTOPTOP) command creates a new MQ topic object, specifying those attributes that are different from the default.

Parameters

Keyword	Description	Choices	Notes
<u>TOPNAME</u>	Topic name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 3
<u>TEXT</u>	Text 'description'	Character value, *BLANK, *SYSDFTTOP	Optional, Positional 4
<u>TOPICSTR</u>	Topic string	Character value, *BLANK, *SYSDFTTOP	Optional, Positional 5
<u>DURSUB</u>	Durable subscriptions	*SYSDFTTOP, *ASPARENT, *YES, *NO	Optional, Positional 6
<u>MGDDURMDL</u>	Durable model queue	Character value, *NONE, *SYSDFTTOP	Optional, Positional 7
<u>MGDNDURMDL</u>	Non-durable model queue	Character value, *NONE, *SYSDFTTOP	Optional, Positional 8
<u>PUBENBL</u>	Publish	*SYSDFTTOP, *ASPARENT, *YES, *NO	Optional, Positional 9
<u>SUBENBL</u>	Subscribe	*SYSDFTTOP, *ASPARENT, *YES, *NO	Optional, Positional 10
<u>DFTPTY</u>	Default message priority	0-9, *SYSDFTTOP, *ASPARENT	Optional, Positional 11
<u>DFTMSGPST</u>	Default message persistence	*SYSDFTTOP, *ASPARENT, *YES, *NO	Optional, Positional 12
<u>DFTPUTRESP</u>	Default Put Response	*SYSDFTTOP, *ASPARENT, *SYNC, *ASYNC	Optional, Positional 13
<u>WILDCARD</u>	Wildcard behavior	*SYSDFTTOP, *PASSTHRU, *BLOCK	Optional, Positional 14
<u>PMSGDLV</u>	Persistent message delivery	*SYSDFTTOP, *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 15

Keyword	Description	Choices	Notes
<u>NPMMSGDLV</u>	Non-persistent message deliver	*SYSDFTTOP , *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 16
<u>CUSTOM</u>	Custom attribute	<i>Character value</i> , *BLANK, *SYSDFTTOP	Optional, Positional 17

Topic name (TOPNAME)

The name of the new MQ topic object to be created.

The possible values are:

topic-name

Specify the name of the new MQ topic object. The name can contain up to 48 characters.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

*DFT

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Replace (REPLACE)

If a topic object with the same name already exists, this specifies whether it is replaced.

The possible values are:

*NO

This object does not replace any existing topic object with the same name. The command fails if the named topic object already exists.

*YES

Replace the existing topic object. If there is no object with the same name, a new object is created.

Text 'description' (TEXT)

Specifies text that briefly describes the topic object.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

*SYSDFTTOP

The value of this attribute is taken from the system default topic.

*BLANK

The text is set to a blank string.

description

Specify the new descriptive information.

Topic string (TOPICSTR)

Specifies the topic string represented by this topic object definition.

The possible values are:

topic-string

Specify a maximum of 256 bytes for the topic string.

Note: Topic strings of greater than 256 bytes can be specified using MQSC.

Durable subscriptions (DURSUB)

Specifies whether applications are permitted to make durable subscriptions on this topic.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

Whether durable subscriptions can be made on this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Durable subscriptions can be made on this topic.

***NO**

Durable subscriptions cannot be made on this topic.

Durable model queue (MGDDURMDL)

Specifies the name of the model queue to be used for durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

durable-model-queue

Specify the name of the model queue.

Non-durable model queue (MGDNDURMDL)

Specifies the name of the model queue to be used for non-durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

non-durable-model-queue

Specify the name of the model queue.

Publish (PUBENBL)

Specifies whether messages can be published to the topic.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

Whether messages can be published to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Messages can be published to the topic.

***NO**

Messages cannot be published to the topic.

Subscribe (SUBENBL)

Specifies whether applications are to be permitted to subscribe to this topic.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

Whether applications can subscribe to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Subscriptions can be made to this topic.

***NO**

Applications cannot subscribe to this topic.

Default message priority (DFTPTY)

Specifies the default priority of messages published to the topic.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

The default priority is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

priority-value

Specify a value ranging from 0 through 9.

Default message persistence (DFTMSGPST)

Specifies the message persistence to be used when applications specify the MQPER_PERSISTENCE_AS_TOPIC_DEF option.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

The default persistence is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Messages on this queue survive a restart of the queue manager.

***NO**

Messages on this queue are lost across a restart of the queue manager.

Default Put Response (DFTPUTRESP)

Specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO_RESPONSE_AS_Q_DEF option.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

The default response type is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are issued as if MQPMO_SYNC_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application.

***ASYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are always issued as if MQPMO_ASYNC_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application. An improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

Wildcard behavior (WILDCARD)

Specifies the behavior of wildcard subscriptions with respect to this topic.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***PASSTHRU**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will receive publications made to this topic and to topic strings more specific than this topic.

***BLOCK**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will not receive publications made to this topic or to topic strings more specific than this topic.

Persistent message delivery (PMSGDLV)

Specifies the delivery mechanism for persistent messages published to this topic.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***ALL**

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

***ALLDUR**

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

***ALLAVAIL**

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

Non-persistent message delivery (NPMSGDLV)

Specifies the delivery mechanism for non-persistent messages published to this topic.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***ALL**

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

***ALLDUR**

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

***ALLAVAIL**

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

Custom attribute (CUSTOM)

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***BLANK**

The text is set to a blank string.

custom

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form *NAME (VALUE)* and be specified in uppercase. Single quotes must be escaped with another single quote.

**Convert MQ Data Type (CVTMQMDTA)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Convert MQ Data Type (CVTMQMDTA) command produces a fragment of code to perform data conversion on data type structures, for use by the data-conversion exit program.

For information on how to use the data-conversion exit, see the IBM MQ Application Programming Guide.

Support is provided for the C programming language only.

Parameters

Keyword	Description	Choices	Notes
<u>FROMFILE</u>	Input file	Qualified object name	Required, Positional 1
	Qualifier 1: Input file	Name	
	Qualifier 2: Library	<i>Name</i> , *LIBL, *CURLIB	
<u>FROMMBR</u>	Member containing input	Name	Required, Positional 2

Keyword	Description	Choices	Notes
<u>TOFILE</u>	File to receive output	Qualified object name	Required, Positional 3
	Qualifier 1: File to receive output	Name	
	Qualifier 2: Library	<i>Name</i> , *LIBL , *CURLIB	
<u>TOMBR</u>	Member to receive output	<i>Name</i> , *FROMMBR	Optional, Positional 4
<u>RPLTOMBR</u>	Replace to member	*YES , *NO	Optional, Positional 5

Input file (FROMFILE)

Specifies the qualified name of the file, in the form LIBRARY/FILE, that contains the data to convert.

The possible values are:

***LIBL**

The library list is searched for the file name.

***CURLIB**

The current library is used.

from-library-name

Specify the name of the library to be used.

from-file-name

Specify the name of the file containing the data to convert.

Member containing input (FROMMBR)

Specifies the name of the member containing the data to be converted.

The possible values are:

from-member-name

Specifies the name of the member containing the data to convert.

File to receive output (TOFILE)

Specifies the qualified name of the file, in the form LIBRARY/FILE, that contains the converted data.

The possible values are:

***LIBL**

The library list is searched for the file name.

***CURLIB**

The current library is used.

to-library-name

Specify the name of the library to be used.

to-file-name

Specify the name of the file to contain the converted data.

Member to receive output (TOMBR)

Specifies the name of the member containing the converted data.

The possible values are:

***FROMMBR**

The from-member name is used.

to-member-name

Specify the name of the member containing the converted data.

Replace to member (RPLTOMBR)

Specifies whether the converted data replaces the existing member.

The possible values are:

***YES**

The converted data replaces the existing member.

***NO**

The converted data does not replace the existing member.

IBM i Delete Message Queue Manager (DLTMQM)**Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Delete Message Queue Manager (DLTMQM) command deletes the specified local queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

IBM i Delete MQ AuthInfo object (DLTMQMAUTI)**Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Delete MQ AuthInfo object (DLTMQMAUTI) command deletes an existing MQ authentication information object.

Parameters

Keyword	Description	Choices	Notes
<u>AINAME</u>	AuthInfo name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 2

AuthInfo name (AINAME)

The name of the authentication information object to delete.

If an application has this open, the command fails.

The possible values are:

authentication-information-name

Specify the name of the authentication information object. The maximum string length is 48 characters.

Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

IBM i

Delete MQ Pub/Sub Broker (DLTMQMBRK)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The delete IBM MQ broker command (DLTMQMBRK) is used to delete the broker. The broker must be stopped when this command is issued, and the queue manager must be running. If the broker is already started, you must issue ENDMQMBRK before issuing this command. To delete more than one broker in the hierarchy, it is essential that you stop (using the ENDMQMBRK command) and delete each broker one at a time. You should not attempt to stop all the brokers in the hierarchy that you want to delete first and then try to delete them.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

queue-manager-name

Specify the name of the queue manager.

IBM i

Delete MQ Channel (DLTMQMCHL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Channel (DLTMQMCHL) command deletes the specified channel definition.

Parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2
<u>CHLTYPE</u>	Channel type	*RCVR, *SDR, *SVR, *RQSTR, *SVRCN, *CLUSSDR, *CLUSRCVR, *NONCLT , *CLTCN	Optional, Positional 3

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

channel-name

Specify the channel name.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

Channel type

Specifies the type of the channel to delete.

The possible values are:

*NONCLT

Any channel type, that is not a client-connection channel, that matches the channel name.

*SDR

Sender channel

*SVR

Server channel

*RCVR

Receiver channel

*RQSTR

Requester channel

*SVRCN

Server-connection channel

*CLUSSDR

Cluster-sender channel

*CLUSRCVR

Cluster-receiver channel

*CLTCN

Client-connection channel

IBM i Delete MQ Listener (DLTMQMLSR)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Listener object (DSPMQMLSR) command deletes an existing MQ listener object.

Parameters

Keyword	Description	Choices	Notes
<u>LSRNAME</u>	Listener name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Listener name (LSRNAME)

The name of the listener object to delete.

The possible values are:

listener-name

Specify the name of the listener definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

IBM i Delete MQ Namelist (DLTMQMNL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Namelist (DLTMQMNL) command deletes the specified namelist on the selected local queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>NAMELIST</u>	Namelist	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Namelist (NAMELIST)

The name of the namelist to delete.

namelist

Specify the name of the namelist. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used.

message-queue-manager-name

Specify the name of the queue manager.

IBM i Delete MQ Process (DLTMQMPC)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Process (DLTMQMPC) command deletes an existing MQ process definition.

Parameters

Keyword	Description	Choices	Notes
<u>PRCNAME</u>	Process name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Process name (PRCNAME)

The name of the process definition to delete. If an application has this process open, the command fails.

The possible values are:

process-name

Specify the name of the process definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

IBM i Delete MQ Queue (DLTMQMQ)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Queue (DLTMQMQ) command deletes an MQ queue.

If the queue is a local queue, it must be empty for the command to succeed. CLRMQM can be used to clear all of the messages from a local queue.

The command fails if an application has:

- This queue open
- A queue that resolves to this queue open
- A queue open that resolves through this definition as a queue manager alias.

An application using the definition as a reply-to queue alias, however, does not cause this command to fail.

Parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 2

Queue name (QNAME)

The name of the queue.

The possible values are:

queue-name

Specify the name of the queue.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

IBM i

Delete MQ Subscription (DLTMQMSUB)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Subscription (DLTMQMSUB) command deletes an existing MQ subscription.

Parameters

Keyword	Description	Choices	Notes
<u>SUBID</u>	Subscription identifier	<i>Character value</i> , *NONE	Optional, Positional 1
<u>SUBNAME</u>	Subscription name	<i>Character value</i> , *NONE	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3

Subscription identifier (SUBID)

The subscription identifier of the subscription to delete.

The possible values are:

subscription-name

Specify a maximum of 256 bytes for the subscription name.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

Subscription name (SUBNAME)

The name of the subscription to delete.

The possible values are:

subscription-name

Specify a maximum of 256 bytes for the subscription name.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

*DFT

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

IBM i Delete MQ Service (DLTMQMSVC)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Service object (DLTMQMSVC) command deletes an existing MQ service object.

Parameters

Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Service name (SVCNAME)

The name of the service object to delete.

The possible values are:

service-name

Specify the name of the service definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

IBM i Delete MQ Topic (DLTMQMTOP)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Topic (DLTMQMTOP) command deletes an existing MQ topic object.

Parameters

Keyword	Description	Choices	Notes
<u>TOPNAME</u>	Topic name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Topic name (TOPNAME)

The name of the topic object to delete. If an application has this topic open, the command fails.

The possible values are:

topic-name

Specify the name of the topic object. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

***DFT**

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

IBM i Dump MQ Configuration (DMPMQMCFG)

Where allowed to run:	Threadsafe:
All environments (*ALL)	Yes

The Dump MQ Configuration (DMPMQMCFG) command is used to dump the configuration objects and authorities for a queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *ALL</i>	Optional, Positional 1

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	<i>Character value</i> , *ALL	Optional, Positional 2
<u>OBJTYPE</u>	Object type	*ALL , *AUTHINFO, *CHL, *CLTCN, *COMMINFO, *LSR, *NMLIST, *PRC, *Q, *MQM, *SVC, *SUB, *TOPIC	Optional, Positional 3
<u>EXPTYPE</u>	Export type	*ALL , *OBJECT, *AUTHREC, *CHLAUTH	Optional, Positional 4
<u>EXPATTR</u>	Export attributes	*NONDEF , *ALL	Optional, Positional 5
<u>WARN</u>	Warnings	*NO , *YES	Optional, Positional 6
<u>OUTPUT</u>	Output	*MQSC , *ONELINE, *SETMQAUT, *GRMQMAUT	Optional, Positional 7
<u>CLIENT</u>	Client connection	*NO , *YES, *CHL	Optional, Positional 8
<u>CLIENTCHL</u>	MQSC Channel Definition	<i>Character value</i> , *NONE	Optional, Positional 9
<u>MSGSEQNUM</u>	Message sequence number	1-999999999, *NORESET	Optional, Positional 10
<u>RPLYQ</u>	Reply Queue	<i>Character value</i> , 'SYSTEM.DEFAULT.MODEL.QUEUE'	Optional, Positional 11
<u>RMTMQMNAME</u>	Remote Message Queue Manager	<i>Character value</i> , *NONE	Optional, Positional 12
<u>TOFILE</u>	File to receive output	<i>Qualified object name</i>	Optional, Positional 13
	Qualifier 1: File to receive output	<i>Name</i>	
	Qualifier 2: Library	<i>Name</i> , *LIBL	
<u>TOMBR</u>	Member to receive output	<i>Name</i>	Optional, Positional 14

Message Queue Manager name (MQMNAME)

Specifies the name of the IBM MQ queue manager for which object information is to displayed.

The possible values are:

***DFT**

queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

Object name (OBJ)

Specifies the name of the objects to dump. It is a 48-character MQ object or generic object name.

The possible values are:

***ALL**

All objects of the specified type (OBJTYPE) are dumped.

generic-object-name

Specify the generic name of the objects. A generic name is a character string followed by an asterisk (*). For example, ABC*. It selects all objects having names that start with the selected character string.

Specifying the required name within quotation marks ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

object-name

The name of an object for which the corresponding name and type is to be displayed.

Object type (OBJTYPE)

Specifies the type of the objects to be dumped.

The possible values are:

***ALL**

All MQ Objects with names specified by OBJ.

***AUTHINFO**

All MQ authentication information objects with names specified by OBJ.

***CHL**

All MQ channel objects with names specified by OBJ.

***CLTCN**

All MQ client connection objects with names specified by OBJ.

***COMMINFO**

All MQ communication information objects with names specified by OBJ.

***LSR**

All MQ listener objects with names specified by OBJ.

***NMLIST**

All MQ namelist objects with names specified by OBJ.

***PRC**

All MQ process objects with names specified by OBJ.

***Q**

All MQ queue objects with names specified by OBJ.

***MQM**

The queue manager object.

***SVC**

All MQ service objects with names specified by OBJ.

***TOPIC**

All MQ topic objects with names specified by OBJ.

Export type (EXPTYPE)

Specifies the type of the export.

The possible values are:

***ALL**

All MQ object, authority and subscription configuration information is dumped.

***OBJECT**

Only MQ object information is dumped.

***AUTHREC**

Only MQ authority information is dumped.

***CHLAUTH**

Only MQ channel authority records are dumped.

***SUB**

Only MQ durable subscription information is dumped.

Export attributes (EXPATTR)

Specifies the attributes to export.

The possible values are:

***NONDEF**

Only non-default attribute values are dumped.

***ALL**

All attribute values are dumped.

Warnings (WARN)

Specifies whether warnings should be generated during the dump, for example if the command is issued against a newer queue manager or encounters a damaged object.

The possible values are:

***NO**

No warnings messages will be issued during the dump.

***YES**

Warning messages may be issued during the dump.

Output (OUTPUT)

Specifies the output format from the dump.

The possible values are:

***MQSC**

The output format is in the form of MQSC commands that could be used as input to the RUNMQSC or STRMQMMQSC commands.

***ONELINE**

The output format is in the form of MQSC commands formatted into single line records, suitable for use with line comparison tools.

***SETMQAUT**

The output format is in the form of setmqaut commands, suitable for use with Windows or UNIX.

***GRTMQMAUT**

The output format is in the form of GRTMQMAUT commands, suitable for use generating a CL program on the IBM i platform.

Client connection (CLIENT)

Specifies whether to use a client connection to the queue manager.

The possible values are:

***NO**

The command will first attempt a server bindings connection, if this connection fails a client connection will be attempted.

***YES**

The command will attempt to connect via a client connection using the default client connection process. If the MQSERVER environment variable is set it will override use of a client connection channel table.

***CHL**

The command will attempt to connect to the queue manager using a temporary channel definition defined by the MQSC string specified in the CLIENTCHL parameter.

MQSC Channel Definition (CLIENTCHL)

Specifies, via MQSC syntax, a temporary client channel definition to use in connecting to the queue manager.

The possible values are:

***NONE**

Do not use a temporary client channel definition when connecting to the queue manager.

mqsc-define-channel-string

The command will attempt to construct a temporary client channel definition from the using the MQSC command supplied on this parameter. The MQSC command must define all required attributes for a client connection channel, for example:

```
"DEFINE CHANNEL(MY.CHL) CHLTYPE(CLNTCONN) CONNAME(MYHOST.MYCORP.COM(1414))"
```

Message sequence number (MSGSEQNUM)

Specifies whether to generate reset channel commands for sender, server and cluster sender channel types when dumping channel objects.

The possible values are:

***NORESET**

Do not include any reset channel commands in the dumped output.

1 - 999999999

Specify a message sequence number for the reset channel commands included in the dump.

Reply Queue (RPLYQ)

Specifies the name of the queue to use for receiving PCF replies when inquiring configuration information.

The possible values are:

SYSTEM.DEFAULT.MODEL.QUEUE

The default model queue, a dynamic queue will be generated to receive replies.

reply-to-queue-name

Specify the name of the reply to queue.

Remote Message Queue Manager (RMTMQMNAME)

Specifies the name of a remote MQ queue manager for which object information is to displayed.

The possible values are:

***NONE**

The configuration information is collected from the queue manager specified in the MQMNAME parameter.

remote-queue-manager-name

Specify the name of the remote queue manager. PCF inquiry commands are issued to the queue manager specified in RMTMQMNAME via the queue manager specified in MQMNAME, this is known as queued mode. \

File to receive output (TOFILE)

Specifies the qualified name of the file, in the form LIBRARY/FILE, that will be used to store the dumped configuration data. The FILE should have been created with a record length of 240, otherwise the configuration information might be truncated.

The possible values are:

*LIBL

The library list is searched for the file name.

*CURLIB

The current library is used.

to-library-name

Specify the name of the library to be used.

to-file-name

Specify the name of the file to contain the configuration data.

Member to receive output (TOMBR)

Specifies the name of the member to store the dumped configuration data.

The possible values are:

to-member-name

Specify the name of the member to contain the configuration data.

Examples

To make these examples work you need to ensure that your system is set up for remote MQSC operation. See [Preparing queue managers for remote administration](#) and [Preparing channels and transmission queues for remote administration](#).

```
DMPMQMCFG MQMNAME('MYQMGR') CLIENT(*YES) CLIENTCHL(''DEFINE CHANNEL(SYSTEM.ADMIN.SVRCONN)
CHLTYPE(CLNTCONN) CONNAME('myhost.mycorp.com(1414)')'')
```

dumps all the configuration information from remote queue manager *MYQMGR* in MQSC format and creates an ad-hoc client connection to the queue manager using a client channel called *SYSTEM.ADMIN.SVRCONN*.

Note: You need to ensure that a server-connection channel with the same name exists.

```
DMPMQMCFG MQMNAME('LOCALQM') RMTMQMNAME('MYQMGR')
```

dumps all configuration information from remote queue manager *MYQMGR*, in MQSC format, connects initially to local queue manager *LOCALQM*, and sends inquiry messages through this local queue manager.

Note: You need to ensure that the local queue manager has a transmission queue named *MYQMGR*, with channel pairings defined in both directions, to send and receive replies between queue managers.

Related tasks

 [Backing up queue manager configuration](#)

 [Restoring queue manager configuration](#)

IBM i Disconnect MQ (DSCMQM)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Disconnect Message Queue Manager (DSCMQM) command does not perform any function and is provided only for compatibility with previous releases of IBM MQ and MQSeries.

Parameters

None

IBM i Display Message Queue Manager (DSPMQM)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display Message Queue Manager (DSPMQM) command displays the attributes of the specified local queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 2

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

IBM i Display MQ Object Authority (DSPMQMAUT)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Authority (DSPMQMAUT) command shows, for the specified object, the current authorizations to the object. If a user ID is a member of more than one group, this command displays the combined authorizations of all of the groups.

- The 48-character MQ object name
- The MQ object type
- Authorizations for object, context and MQI calls

Parameters

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	Character value	Required, Positional 1
<u>OBJTYPE</u>	Object type	*Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *MQM, *NMLIST, *PRC, *LSR, *SVC, *CHL, *CLTCN, *TOPIC, *RMTMQMNAME	Required, Positional 2
<u>USER</u>	User name	Name, *PUBLIC	Optional, Positional 3
<u>OUTPUT</u>	Output	*, *PRINT	Optional, Positional 4
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 5
<u>SRVCOMP</u>	Service Component name	Character value, *DFT	Optional, Positional 6

Object name (OBJ)

Specifies the name of the MQ object for which the authorizations are displayed.

Object type (OBJTYPE)

Specifies the type of the object for which the authorizations are displayed.

*Q

All queue object types.

*ALSQ

Alias queue.

*LCLQ

Local queue.

*MDLQ

Model queue.

*RMTQ

Remote queue.

*AUTHINFO

Authentication Information object.

*MQM

Message Queue Manager.

*NMLIST

Namelist object.

***PRC**

Process definition.

***CHL**

Channel object.

***CLTCN**

Client Connection Channel object.

***LSR**

Listener object.

***SVC**

Service object.

***TOPIC**

Topic object.

***RMTMQMNAME**

Remote queue manager name.

User name (USER)

Specifies the name of the user for whom authorities for the named object are displayed.

The possible values are:

***PUBLIC**

All users of the system.

user-profile-name

Specify the name of the user.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Service Component name (SRVCOMP)

Specifies the name of the installed authorization service in which to search for the authority to display.

The possible values are:

***DFT**

All installed authorization components are searched for the specified object name, object type and user.

Authorization-service-component-name

The component name of the required authorization service as specified in the Queue manager's qm.ini file.

IBM i Display MQ AuthInfo object (DSPMQMAUTI)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ AuthInfo object (DSPMQMAUTI) command displays the attributes of an existing MQ authentication information object.

Parameters

Keyword	Description	Choices	Notes
<u>AINAME</u>	AuthInfo name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2
<u>OUTPUT</u>	Output	<i>Character value, *, *PRINT</i>	Optional, Positional 3

AuthInfo name (AINAME)

The name of the authentication information object to display.

The possible values are:

authentication-information-name

Specify the name of the authentication information object. The maximum string length is 48 characters.

Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

*

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

*PRINT

The output is printed with the job's spooled output.

Display MQ Pub/Sub Broker (DSPMQMBRK)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display IBM MQ broker (DSPMQMBRK) command does not perform any function and is only provided for compatibility with previous releases of IBM MQ.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1

Message Queue Manager name (MQMNAME)

The name of the queue manager.

The value is:

queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

Display MQ Channel (DSPMQMCHL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Channel (DSPMQMCHL) command displays the attributes of an existing MQ channel definition.

Parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3
<u>CHLTYPE</u>	Channel type	*RCVR, *SDR, *SVR, *RQSTR, *SVRCN, *CLUSSDR, *CLUSRCVR, *NONCLT , *CLTCN	Optional, Positional 4

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

channel-name

Specify the channel name.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

Channel type (CHLTYPE)

Specifies the type of the channel to be displayed.

The possible values are:

***NONCLT**

Any channel type, that is not a client-connection channel, that matches the channel name.

***SDR**

Sender channel

***SVR**

Server channel

***RCVR**

Receiver channel

***RQSTR**

Requester channel

***SVRCN**

Server-connection channel

***CLUSSDR**

Cluster-sender channel

***CLUSRCVR**

Cluster-receiver channel

***CLTCN**

Client-connection channel

IBM i

Display MQ Command Server (DSPMQMCSVR)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Command Server (DSPMQMCSVR) command displays the status of the MQ command server.

The status of the command server can be one of the following:

Enabled

Available to process messages

Disabled

Not available to process messages

Starting

STRMQMCSVR command in progress

Stopping

ENDMQMCSVR command in progress

Stopped

ENDMQMCSVR command completed

Running

Processing a message

Waiting

Waiting for a message

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 1

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

IBM i Display MQ Listener (DSPMQMLSR)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Listener object (DSPMQMLSR) command displays the attributes of an existing MQ listener object.

Parameters

Keyword	Description	Choices	Notes
<u>LSRNAME</u>	Listener name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 2

Keyword	Description	Choices	Notes
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 3

Listener name (LSRNAME)

The name of the listener object to display.

The possible values are:

listener-name

Specify the name of the listener definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

IBM i Display MQ Namelist (DSPMQMNL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Namelist (DSPMQMNL) command displays an MQ namelist.

Parameters

Keyword	Description	Choices	Notes
<u>NAMELIST</u>	Namelist	Character value	Required, Positional 1
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3

Namelist (NAMELIST)

The name of the namelist to be displayed.

namelist

Specify the name of the namelist. The maximum length of the string is 48 bytes.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used.

message-queue-manager-name

Specify the name of the queue manager.

IBM i

Display MQ Object Names (DSPMQMOBJN)**Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Display MQ Object Names (DSPMQMOBJN) command is used to provide the name, type, and fully-qualified file name for a specified MQ object.

Parameters

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	<i>Character value</i> , *ALL	Required, Positional 1
<u>OBJTYPE</u>	Object type	*ALLMQM , *Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *CTLG, *CHL, *CLTCN, *SVC, *MQM, *NMLIST, *PRC, *LSR, *TOPIC	Optional, Positional 2
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 3
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 4

Object name (OBJ)

Specifies the name of the objects for which the corresponding name, type and file name to display. It is a 48-character MQ object or generic object name.

The possible values are:

***ALL**

All objects of the specified type (OBJTYPE) are displayed.

generic-object-name

Specify the generic name of the objects. A generic name is a character string followed by an asterisk (*). For example, ABC*. It selects all objects having names that start with the selected character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

object-name

The name of an object for which the corresponding name and type is to be displayed.

Object type (OBJTYPE)

Specifies the type of the objects to be displayed.

The possible values are:

***ALLMQM**

All MQ Objects with names specified by OBJ.

***Q**

All MQ queues with names specified by OBJ.

***ALSQ**

All MQ alias queues with names specified by OBJ.

***LCLQ**

All MQ local queues with names specified by OBJ.

***MDLQ**

All MQ model queues with names specified by OBJ.

***RMTQ**

All MQ remote queues with names specified by OBJ.

***AUTHINFO**

All MQ authentication information objects with names specified by OBJ.

***CHL**

All MQ channel objects with names specified by OBJ.

***CLTCN**

All MQ MQI client connection channel objects with names specified by OBJ.

***SVC**

All MQ service objects with names specified by OBJ.

***LSR**

All MQ listener objects with names specified by OBJ.

***CTLG**

The MQ queue manager catalog object with name specified by OBJ. This has the same name as the queue manager object.

***MQM**

The Message Queue Manager object with name specified by OBJ.

***NMLIST**

All MQ namelists with names specified by OBJ.

***PRC**

All MQ process definitions with names specified by OBJ.

***LOBJ**

All MQ listener objects with names specified by OBJ.

***TOPIC**

All MQ topic objects with names specified by OBJ.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the MQ queue manager for which object information is to displayed.

The possible values are:

***DFT**

The default queue manager.

queue-manager-name

Specify the name of the queue manager.

IBM i **Display MQ Process (DSPMQMPRC)**

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Process (DSPMQMPRC) command displays the attributes of an existing MQ process definition.

Parameters

Keyword	Description	Choices	Notes
<u>PRCNAME</u>	Process name	Character value	Required, Positional 1
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3

Process name (PRCNAME)

The name of the process definition to be displayed.

The possible values are:

process-name

Specify the name of the process definition. The maximum length of the string is 48 bytes.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

IBM i Display MQ Queue (DSPMQMQ)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Queue (DSPMQMQ) command displays the attributes of an existing MQ queue definition.

Parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value	Required, Positional 1
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3

Queue name (QNAME)

The name of the queue.

The possible values are:

queue-name

Specify the name of the queue.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

IBM i Display MQ Route Information (DSPMQMRTE)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The DSPMQMRTE command generates a trace route message based on user specified parameters and puts it to a specified queue. One or more reports about the route the message takes to its final destination might be generated, as well as a reply. These will be got from a specified reply queue and the information contained within them will be written to the job's spooled output when it is received.

Parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Target object	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2
<u>CRRLID</u>	Correlation Identifier	<i>Character value, *NONE</i>	Optional, Positional 3
<u>MSGPST</u>	Message Persistence	*YES, *NO, *QUEUE	Optional, Positional 4
<u>MSGPRTY</u>	Message Priority	0-9, *QUEUE	Optional, Positional 5
<u>OPTION</u>	Report Option	Single values: *DFT, *NONE Other values (up to 6 repetitions): *ACTIVITY, *COA, *COD, *DISCARD, *EXCEPTION, *EXPIRATION	Optional, Positional 6
<u>RPLYQ</u>	Reply Queue	<i>Character value, *DFT</i>	Optional, Positional 7
<u>RPLYMQM</u>	Reply Queue Manager	<i>Character value, *DFT</i>	Optional, Positional 8
<u>EXPIRY</u>	Message Expiry	0-999999999, *DFT	Optional, Positional 9
<u>EXPRPT</u>	Pass Expiry	*YES, *NO	Optional, Positional 10
<u>RTEINF</u>	Route Accumulation	*YES, *NO	Optional, Positional 11
<u>RPLYMSG</u>	Reply Message	*YES, *NO	Optional, Positional 12
<u>DLVRMSG</u>	Deliver Message	*YES, *NO	Optional, Positional 13
<u>FWDMSG</u>	Forward Message	*SUPPORT, *ALL	Optional, Positional 14
<u>MAXACTS</u>	Maximum Activities	1-999999999, *NOMAX	Optional, Positional 15
<u>DETAIL</u>	Route Detail	*LOW, *MEDIUM, *HIGH	Optional, Positional 16

Keyword	Description	Choices	Notes
<u>BROWSE</u>	Browse Only	*YES, *NO	Optional, Positional 17
<u>DSPMSG</u>	Display Message	*YES, *NO	Optional, Positional 18
<u>TGTMQM</u>	Target Queue Manager	<i>Character value</i> , *DFT	Optional, Positional 19
<u>DSPINF</u>	Display Information	Single values: *ALL, *SUMMARY, *NONE Other values (up to 6 repetitions): *ACTGRP, *ID, *MSGGRP, *MSGDELTA, *OPGRP, *TRGRP	Optional, Positional 20
<u>WAIT</u>	Wait Time	0-999999999, *DFT	Optional, Positional 21
<u>BIND</u>	Bind Option	*OPEN, *NOTFIXED	Optional, Positional 22

Target object (QNAME)

Specifies the name of the target queue of the trace route message or, if displaying previously gathered information, the name of the queue storing the information.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

Use the default queue manager.

message-queue-manager-name

Specify the name of the queue manager.

Correlation Identifier (CRRLID)

Specifies the CorrelId to use when retrieving previously gathered information. The format of the 24 byte CorrelId is a 48 character hexadecimal string. You must supply a CorrelId if you are retrieving previously gathered information, rather than generating a trace route message.

The possible values are:

*NONE

No CorrelId is supplied.

correlation-identifier

The 48 character hexadecimal string representing the 24 byte CorrelId.

Message Persistence (MSGPST)

Specifies the persistence of the trace route message.

The possible values are:

*NO

The message will be put with MQPER_NOT_PERSISTENT.

*YES

The message will be put with MQPER_PERSISTENT.

*QUEUE

The message will be put with MQPER_PERSISTENCE_AS_Q_DEF.

Message Priority (MSGPRTY)

Specifies the priority of the trace route message.

The possible values are:

***QUEUE**

The message will be put with MQPRI_PRIORITY_AS_Q_DEF.

message-priority

The priority of the message ranging 0 through 9.

Report Option (OPTION)

Specifies the report options of the trace route message. Reports generated on a non trace route enabled queue manager can potentially remain in the network undelivered, which is why most report options are disabled by default. By requesting full data to be returned, it allows the trace route information contained in the message to be returned in the result of a problem.

The possible values are:

***DFT**

Turns on MQRO_ACTIVITY and MQRO_DISCARD_MSG.

***NONE**

No report options are set.

***ACTIVITY**

Turns on MQRO_ACTIVITY.

***COA**

Turns on MQRO_COA_WITH_FULL_DATA.

***COD**

Turns on MQRO_COD_WITH_FULL_DATA.

***DISCARD**

Turns on MQRO_DISCARD_MSG.

***EXCEPTION**

Turns on MQRO_EXCEPTION_WITH_FULL_DATA.

***EXPIRATION**

Turns on MQRO_EXPIRATION_WITH_FULL_DATA.

Reply Queue (RPLYQ)

Specifies the name of the reply queue to which the reply and all report messages should be sent. This must exist on the local queue manager unless the RPLYMQM parameter is also specified. The reply queue should not be a temporary queue if the trace route message is to be persistent.

The possible values are:

***DFT**

The SYSTEM.DEFAULT.MODEL.QUEUE is used and the reply queue is by default a temporary dynamic queue.

reply-queue

The name of the reply queue to use.

Reply Queue Manager (RPLYMQM)

Specifies the queue manager to which replies are sent.

The possible values are:

***DFT**

Replies are sent to the local queue manager.

reply-queue-manager

The name of the reply to queue manager.

Message Expiry (EXPIRY)

Specifies the Expiry time, in seconds, of the trace route message.

The possible values are:

***DFT**

The default expiry time of 60 seconds is used.

expiry-time

The expiry time of the message ranging from 0 through 999999999.

Pass Expiry (EXPRPT)

Specifies whether the expiry of the trace route message is passed to reports or the reply message. This effectively turns MQRO_PASS_DISCARD_AND_EXPIRY on and off. This allows users to keep the reports indefinitely if required.

The possible values are:

***YES**

Expiry is passed to reports or the reply message.

***NO**

Expiry is not passed to reports or the reply message.

Route Accumulation (RTEINF)

Specifies that the route information is accumulated within the trace route message as it flows through the queue manager network.

The possible values are:

***NO**

No information is accumulated within the trace route message.

***YES**

Information is accumulated within the trace route message.

Reply Message (RPLYMSG)

Requests that a reply message containing all accumulated information is returned to the reply to queue when the trace route message reaches its final destination (if this is permitted by the queue manager hosting the final destination queue).

The possible values are:

***NO**

No reply message is returned.

***YES**

A reply message is returned to the the reply to queue.

Deliver Message (DLVRMSG)

Specifies whether the trace route message is delivered to getting applications if the message successfully arrives at the destination queue.

The possible values are:

***NO**

If the trace route message successfully arrives at the target queue it is not delivered to getting applications.

***YES**

The trace route message is delivered to a getting application if the message successfully arrives at the target queue. Specifying this option effectively gives permission for the message to arrive on a queue manager, whether it supports trace route or not.

Forward Message (FWDMSG)

Specifies whether the trace route message is forwarded to the next queue manager in the route.

The possible values are:

***SUPPORT**

The trace route message is forwarded only to queue managers that can ensure that the delivery option is honoured.

***ALL**

The trace route message is forwarded on without any regard given to the next queue manager in the route. This option can be used to force a non-trace route enabled queue manager to accept trace route messages, even when they cannot process them in line with the delivery option.

Maximum Activities (MAXACTS)

Specifies the maximum number of activities that can take place on the trace route message before it is discarded.

The possible values are:

***NOMAX**

No maximum number of activities are specified.

maximum-activities

The maximum number of activities ranging from 1 through 999999999.

Route Detail (DETAIL)

Specifies how much detail about the route is requested.

The possible values are:

***LOW**

At this level of detail no information about queue manager activities is requested. This gives a very high level view of what user activity has taken place on the message.

***MEDIUM**

Low detail information, as well as information on the movements of the message within the queue manager is requested. This includes the work of the MCA.

***HIGH**

Low and medium detail, as well as more detailed information about the route the message took is requested. For example, in clustering this might include detail about why the route was chosen.

Browse Only (BROWSE)

Specifies whether messages returned are browsed only. This means that the information remains on the queue for future display operations.

The possible values are:

***NO**

Messages returned are not browse only.

***YES**

Messages returned are browse only.

Display Message (DSPMSG)

Specifies whether when a trace route message is generated the information returned is displayed.

The possible values are:

***YES**

The returned information is displayed.

***NO**

The returned information is not displayed. This allows DSPMQMRTE to exit as soon as the trace route message has been put to the target queue. On exit, a 48 character hexadecimal string is output, which is the MsgId on the trace route message that was generated and can be used as the CRRLID supplied to a subsequent DSPMQMRTE call.

Target Queue Manager (TGTMQM)

Specifies the target queue manager for the trace route message.

The possible values are:

***DFT**

No target queue manager is specified. Either the destination queue is a local queue, or there is a local definition of the queue.

target-queue-manager

The target queue manager for the trace route message.

Display Information (DSPINF)

Specifies how much of the information gathered should be displayed.

The possible values are:

***ALL**

All available information is displayed.

***SUMMARY**

Displays only the queues which the message was routed through.

***NONE**

None of the available information will be displayed.

***ACTGRP**

All non-group parameters in the Activity groups will be displayed.

***ID**

Values with parameters identifiers MQBACF_MSG_ID or MQBACF_CORREL_ID are always displayed. This overrides *MSGDELTA which normally prevents certain values in the Message groups from being displayed.

***MSGGRP**

All non-group parameters in the Message groups are displayed.

***MSGDELTA**

Like *MSGGRP, except that information in the Message groups is only displayed where it has changed since the last operation took place.

***OPGRP**

All non-group parameters in the Operation groups are displayed.

***TRGRP**

All parameters in the TraceRoute groups are displayed.

Wait Time (WAIT)

Specifies how long, in seconds, that DSPMQMRTE should wait before assuming that all a reply message or all the reports (depending on the options specified) that were generated en route that can be delivered to the reply queue have now done so.

The possible values are:

***DFT**

DSPMQMRTE waits for 60 seconds longer than the Expiry time of the trace route message.

wait-time

The time that DSPMQMRTE should wait.

Bind Option (BIND)

Specifies whether the target queue is bound to a specific destination.

The possible values are:

***OPEN**

The target queue is bound to a specific destination. The queue is opened with option MQOO_BIND_ON_OPEN.

***NOTFIXED**

The target queue is not bound to a specific destination. Typically this parameter is used when the trace route message is to be put across a cluster. The queue is opened with option MQOO_BIND_NOT_FIXED.

IBM i

Display Queue Manager Status (DSPMQMSTS)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display Message Queue Manager Status (DSPMQMSTS) command displays the status attributes of the specified local queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 1
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 2
<u>"STARTDA" on page 1196</u>	Start Date		Optional, Positional 3
<u>"STARTTI" on page 1196</u>	Start Time		Optional, Positional 4

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

STARTDA

The date on which the queue manager was started (in the form yyyy-mm-dd).

STARTTI

The time at which the queue manager was started (in the form hh.mm.ss).

IBM i **Display MQ Service (DSPMQMSVC)**

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Service object (DSPMQMSVC) command displays the attributes of an existing MQ service object.

Parameters

Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 2
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 3

Service name (SVCNAME)

The name of the service object to display.

The possible values are:

service-name

Specify the name of the service definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

IBM i

Display MQM Security Policy (DSPMQMSPL)**Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Display MQM Security Policies (DSPMQMSPL) command displays security policies, that are used by Advanced Message Security to control how messages should be protected when being put, browsed, or destructively removed from queues.

The policy name associates digital signing and encryption protection for messages with queues matching the policy name.

Parameters

Keyword	Description	Choices	Notes
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 1
<u>POLICY</u>	Policy name	Character value	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Policy name (POLICY)

Specifies the name of the security policy, the name of the policy matches the name of the queue that the policy applies to.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

IBM i Display MQ Subscription (DSPMQMSUB)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Subscription (DSPMQMSUB) command displays the attributes of an existing MQ subscription.

Parameters

Keyword	Description	Choices	Notes
<u>SUBID</u>	Subscription identifier	<i>Character value, *NONE</i>	Optional, Positional 1
<u>SUBNAME</u>	Subscription name	<i>Character value, *NONE</i>	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 3
<u>OUTPUT</u>	Output	<i>*, *PRINT</i>	Optional, Positional 4

Subscription identifier (SUBID)

The subscription identifier of the subscription to be displayed.

The possible values are:

subscription-name

Specify a maximum of 256 bytes for the subscription name.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

Subscription name (SUBNAME)

The name of the subscription to be displayed.

The possible values are:

subscription-name

Specify a maximum of 256 bytes for the subscription name.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

***DFT**

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

IBM i **Display MQ Topic (DSPMQMTOPTOP)**

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Topic (DSPMQMTOPTOP) command displays the attributes of an existing MQ topic object.

Parameters

Keyword	Description	Choices	Notes
<u>TOPNAME</u>	Topic name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 3

Topic name (TOPNAME)

The name of the topic object to be displayed.

The possible values are:

topic-name

Specify the name of the topic object. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

***DFT**

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

*

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

IBM i Display MQ Version (DSPMQMVER)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Version (DSPMQMVER) command provides the current MQ version.

Parameters

Keyword	Description	Choices	Notes
<u>OUTPUT</u>	Output	*, *PRINT	Optional, Positional 1

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

*

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

IBM i End Message Queue Manager (ENDMQM)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The End Message Queue Manager (**ENDMQM**) command ends the specified local message queue manager or all queue managers. The attributes of the message queue managers are not affected and it can be restarted using the Start Message Queue Manager (**STRMQM**) command.

You can also use this command to fully quiesce all application programs connected to the queue manager or all queue managers.

The **ENDMQM** command's default parameters should not be changed with the CHGCMDDFT (Change Command Default) command.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 1
<u>OPTION</u>	Option	*CNTRLD , *IMMED, *WAIT, *PREEMPT	Optional, Positional 2
<u>INSTANCE</u>	Instance To End	*ALL , *STANDBY	Optional, Positional 3
<u>ALWSWITCH</u>	Allow Switchover	*NO , *YES	Optional, Positional 4
<u>RECONN</u>	Reconnect	*NO , *YES	Optional, Positional 5
<u>ENDCCTJOB</u>	End connected jobs	*NO , *YES	Optional, Positional 6
<u>RCDMQMIMG</u>	Record MQ Object Image	*NO, *YES	Optional, Positional 7
<u>TIMEOUT</u>	Timeout interval (seconds)	0-3600, 30	Optional, Positional 8

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

***ALL**

All queue managers are ended.

Option (OPTION)

Specifies whether processes that are connected to the queue manager are allowed to complete.

The possible values are:

***CNTRLD**

Allow programs currently being processed to complete. An MQCONN call (or an MQOPEN or MQPUT1, which perform an implicit connection) fails. If ENDCCTJOB(*YES) is specified, a controlled shutdown of the queue manager is attempted ten times. If the queue manager shuts down successfully, it is followed by immediate termination of the processes that are still connected to it.

***IMMED**

End the queue manager immediately. All current MQI calls complete, but subsequent requests for MQI calls fail. Incomplete units of work are rolled back when the queue manager is next started. If ENDCCTJOB(*YES) is specified, a controlled shutdown of the queue manager is followed if necessary, after an interval of TIMEOUT seconds, by an immediate shutdown of the queue manager. This is followed by immediate termination of processes connected to it.

***WAIT**

End the queue manager in the same way as the *CNTRLD option. However, control is returned only after the queue manager has stopped. This option is not allowed with MQMNAME(*ALL). If ENDCCTJOB(*YES) is specified, a single controlled shutdown of the queue manager is issued, which waits for all processes to disconnect. When this completes it is followed by the actions described in the ENDCCTJOB parameter.

***PREEMPT**

Use this type of shutdown only in exceptional circumstances The queue manager stops without waiting for applications to disconnect or for MQI calls to complete. This can give unpredictable results for IBM MQ applications. All processes in the queue manager that fail to stop are ended 30 seconds after the command is issued. This option is not allowed with ENDCCTJOB(*YES).

Instance To End (INSTANCE)

Specifies whether to end all instances of a queue manager, or to end just a standby queue manager instance.

The possible values are:

***ALL**

All instances of a queue manager are to be ended. This option can only be requested against a non-standby queue manager instance.

If a standby instance is running elsewhere, the ALWSWITCH parameter on the ENDMQM command will control whether the standby instance is itself ended.

***STANDBY**

Only the standby queue manager instance should be ended, any active queue manager instance will continue to run. This option can only be requested against a standby queue manager instance.

Allow Switchover (ALWSWITCH)

Specifies whether switchover to a standby instance of the queue manager is allowed when the active queue manager instance has ended.

The possible values are:

***NO**

Switchover to a standby queue manager instance is not allowed. Any standby instances that are running will also end on successful completion of this command. P.: Reconnectable client applications connected to this queue manager are instructed to disconnect.

***YES**

Switchover to a standby queue manager instance is attempted, if a standby queue manager instance is not running this command will fail and the active queue manager instance will remain active.

Reconnectable client applications connected to this queue manager instance are instructed to begin reconnect processing, to maintain connectivity.

Reconnect (RECONN)

Specifies whether client applications currently connected to this queue manager should attempt to reconnect to a queue manager instance.

The possible values are:

***NO**

Reconnectable client applications connected to this queue manager are instructed to disconnect.

***YES**

Reconnectable client applications connected to this queue manager are instructed to begin reconnect processing, to maintain connectivity.

End connected jobs (ENDCCTJOB)

Specifies whether all processes connected to the queue manager are forcibly terminated.

The possible values are:

***NO**

The queue manager or queue managers are ended but no further action is taken.

***YES**

The following steps are taken for each queue manager to be ended:

- If the queue manager is running and RCDMQMIMG(*YES) has been specified, media images for all objects defined for the queue manager are recorded.
- The queue manager is ended in the appropriate manner (*CNTRLD, *WAIT, or *IMMED).
- All shared memory and semaphores used by the queue manager are deleted irrespective of whether applications have disconnected from the queue manager. Applications that have not disconnected from a shared memory resource when this option is specified receive a return code of MQRC_CONNECTION_BROKEN (2009) the next time an MQI call is issued with an existing connection handle.

Record MQ Object Image (RCDMQMIMG)

Specifies whether media images are recorded for a queue manager.

The possible values are:

***YES**

If the queue manager is running, media images for all queue manager objects are recorded.

***NO**

Media images of queue manager objects are not recorded as part of the quiesce.

Timeout interval (seconds) (TIMEOUT)

Specifies the time interval in seconds between the controlled and immediate shutdowns of the queue manager when *IMMED is specified. It also determines the number of seconds between attempts to shut down the queue manager when *CNTRLD is specified.

The possible values are:

30

The default value is 30 seconds.

timeout-interval

Specify a value in seconds, in the range 0 through 3600.

**End MQ Pub/Sub Broker (ENDMQMBRK)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The End IBM MQ Broker (ENDMQMBRK) command is used to stop a broker.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1
<u>OPTION</u>	Option	*CNTRLD , *IMMED	Optional, Positional 2

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

queue-manager-name

Specify the name of the queue manager.

Option (OPTION)

Specifies how the broker is ended.

The possible values are:

***CNTRLD**

Allows the broker to complete processing for any message that it has already started.

***IMMED**

Ends the broker immediately. The broker does not attempt any further gets or puts, and backs out any in-flight units-of-work. This might mean that a nonpersistent input message is published only to a subset of subscribers, or lost, depending on the broker configuration parameters.

IBM i End MQ Channel (ENDMQMCHL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The End MQ Channel (ENDMQMCHL) command closes an MQ channel, and the channel is no longer enabled for automatic restarts.

Parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>OPTION</u>	Option	*CNTRLD , *IMMED, *ABNORMAL	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3
<u>STATUS</u>	Channel status	*STOPPED , *INACTIVE	Optional, Positional 4
<u>CONNNAME</u>	Connection name	<i>Character value</i> , *NONE	Optional, Positional 5
<u>RQMNAME</u>	Remote queue manager	<i>Character value</i> , *NONE	Optional, Positional 6

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

channel-name

Specify the channel name.

Option (OPTION)

Specifies whether processing for the current batch of messages is allowed to finish in a controlled manner.

The possible values are:

***CNTRLD**

Allows processing of the current batch of messages to complete. No new batch is allowed to start.

***IMMED**

Ends processing of the current batch of messages immediately. This is likely to result in 'in-doubt' situations.

***ABNORMAL**

Ends processing of the current batch of messages immediately and terminates the channel thread or job. This is likely to result in 'in-doubt' situations.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

Channel status (STATUS)

Specifies the required status of the channel after successful completion of the command.

The possible values are:

***STOPPED**

The channel status is set to STOPPED.

***INACTIVE**

The channel status is set to INACTIVE.

Connection name (CONNAME)

Specifies the connection name of the channel instance that you want to end.

Remote queue manager (RQMNAME)

Specifies the name of the remote queue manager of the channel instance that you want to end.

End Queue Manager Connection (ENDMQMCONN)**Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The End MQ Connections (ENDMQMCONN) command allows you to end a connection to the queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>CONN</u>	Connection Identifier	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 2

Connection Identifier (CONN)

The connection identifier to end.

The connection identifier is a 16 character hex string.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

IBM i

End MQ Command Server (ENDMQMCSVR)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The End MQ Command Server (ENDMQMCSVR) command stops the MQ command server for the specified local queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1
<u>OPTION</u>	Option	*CNTRLD , *IMMED	Optional, Positional 2

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

queue-manager-name

Specify the name of the queue manager.

Option (OPTION)

Specifies whether the command message currently being processed is allowed to complete.

The possible values are:

***CNTRLD**

Allows the command server to complete processing any command message that it has already started. No new message is read from the queue.

***IMMED**

Ends the command server immediately. Any action associated with a command message currently being processed might not be completed.

IBM i

End MQ Listeners (ENDMQMLSR)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The End MQ Listener (ENDMQMLSR) command ends an MQ TCP/IP listener.

This command is valid only for TCP/IP transmission protocols.

Either a listener object or specific port can be specified.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 1
<u>PORT</u>	Port number	1-65535, *ALL	Optional, Positional 2
<u>OPTION</u>	Option	*CNTRLD , *WAIT, *FORCE	Optional, Positional 3
<u>LSRNAME</u>	Listener name	<i>Character value, *NONE</i>	Optional, Positional 4

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Port number (PORT)

The port number to be used by the listener.

The possible values are:

***SAME**

The attribute is unchanged.

port-number

The port number to be used.

Option (OPTION)

Specifies the action taken after processes to end the listeners have been started.

***CNTRLD**

Processes are started to end all the listeners for the specified queue manager and control is returned before the listeners actually end.

***WAIT**

End the listeners for the specified queue manager in the same way as the *CNTRLD option. However, control is returned only after all the listeners have ended.

Listener name (LSRNAME)

The name of the MQ listener object to end.

The possible values are:

***NONE**

No listener object is specified.

listener-name

Specify the name of the listener definition. The maximum length of the string is 48 bytes.

IBM i End MQ Service (ENDMQMSVC)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The End MQ Service (ENDMQMSVC) command ends an MQ service.

Parameters

Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Service name (SVCNAME)

The name of the MQ service object to end.

The possible values are:

***NONE**

No service object is specified.

service-name

Specify the name of the service definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

IBM i Grant MQ Object Authority (GRTMQMAUT)

Where allowed to run:	Threadsafe:
All environments (*ALL)	Yes

The Grant MQ Authority (GRTMQMAUT) command is used to grant specific authority for the MQ objects named in the command to another user or group of users.

Authority can be given to:

- Named users.
- Users (*PUBLIC) who do not have authority specifically given to them.
- Groups of users who do not have any authority to the object.

The GRMQMAUT command can be used by anyone in the QMQMADM group, that is, anyone whose user profile specifies QMQMADM as a primary or supplemental group profile.

Parameters

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	Character value	Required, Positional 1
<u>OBJTYPE</u>	Object type	*ALL, *Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *MQM, *NMLIST, *PRC, *LSR, *SVC, *CHL, *CLTCN, *TOPIC, *RMTMQMNAME	Required, Positional 2
<u>USER</u>	User names	Single values: *PUBLIC, Other values (up to 50 repetitions): <i>Name</i>	Required, Positional 3
<u>AUT</u>	Authority	Values (up to 22 repetitions): *ALTUSR, *BROWSE, *CONNECT, *GET, *INQ, *PUT, *SET, *PUB, *SUB, *RESUME, *PASSALL, *PASSID, *SETALL, *SETID, *ADMCHG, *ADMCLR, *ADMCR, *ADMDLT, *ADMDS, *ALL, *ALLADM, *ALLMQI, *NONE, *CTRL, *CTRLX, *SYSTEM	Required, Positional 4
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 5
<u>SRVCOMP</u>	Service Component name	<i>Character value</i> , *DFT	Optional, Positional 6

Object name (OBJ)

Specifies the name of the objects for which specific authorities are granted.

The possible values are:

*ALL

All objects of the type specified by the value of the OBJTYPE parameter at the time the command is issued. *ALL cannot represent a generic profile.

object-name

Specify the name of an MQ object for which specific authority is given to one or more users.

generic profile

Specify the generic profile of the objects to be selected. A generic profile is a character string containing one or more generic characters anywhere in the string. This profile is used to match the object name of the object under consideration at the time of use. The generic characters are (?), (*) and (**).

? matches a single character in an object name.

* matches any string contained within a qualifier, where a qualifier is the string between periods (.). For example ABC* matches ABCDEF but not ABCDEF.XYZ.

** matches one or more qualifiers. For example ABC.**.XYZ matches ABC.DEF.XYZ and ABC.DEF.GHI.XYZ, ** can appear only once in a generic profile.

Specify the name required within quotation marks to ensure that your selection is precisely what you entered.

Object type (OBJTYPE)

Specifies the type of the objects for which specific authorities are granted.

***ALL**

All MQ object types.

***Q**

All queue object types.

***ALSQ**

Alias queue.

***LCLQ**

Local queue.

***MDLQ**

Model queue.

***RMTQ**

Remote queue.

***AUTHINFO**

Authentication Information object.

***MQM**

Message Queue Manager.

***NMLIST**

Namelist object.

***PRC**

Process definition.

***CHL**

Channel object.

***CLTCN**

Client Connection Channel object.

***LSR**

Listener object.

***SVC**

Service object.

***TOPIC**

Topic object.

***RMTMQMNAME**

Remote queue manager name.

User names (USER)

Specifies the name or names of users to whom authorities for the named object are being given. If user names are specified, the authorities are given specifically to those users. Authority given by this command can be revoked specifically by the Revoke MQ Authority (RVKMQMAUT) command.

***PUBLIC**

All users of the system.

user-profile-name

Specify the names of one or more users who are to be granted specific authority for the object. These names can also be group names. You can specify up to 50 user profile names.

Authority (AUT)

Specifies the authority being given to the named users. Values for AUT can be specified as a list of specific and general authorities in any order, where the general authorities can be:

*NONE, which creates a profile for the user with no authority to the specified object, or leaves the authority unchanged if a profile already exists.

*ALL, which confers all authorities to the specified users.

*ALLADM, which confers all of *ADMCHG, *ADMCLR, *ADMCRRT, *ADMDLT, *ADMDSP, *CTRL and *CTRLX.

*ALLMQI, which confers all of *ALTUSR, *BROWSE, *CONNECT, *GET, *INQ, *PUT, *SET, *PUB, *SUB and *RESUME.

Authorizations for different object types

***ALL**

All authorizations. Applies to all objects.

***ADMCHG**

Change an object. Applies to all objects except remote queue manager name.

***ADMCLR**

Clear a queue. Applies to queues only.

***ADMCRRT**

Create an object. Applies to all objects except remote queue manager name.

***ADMDLT**

Delete an object. Applies to all objects except remote queue manager name.

***ADMDSP**

Display the attributes of an object. Applies to all objects except remote queue manager name.

***ALLADM**

Perform administration operations on an object. Applies to all objects except remote queue manager name.

***ALLMQI**

Use all MQI calls applicable to an object. Applies to all objects.

***ALTUSR**

Allow another user's authority to be used for MQOPEN and MQPUT1 calls. Applies to queue manager objects only.

***BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option. Applies to queue objects only.

***CONNECT**

Connect the application to a queue manager by issuing an MQCONN call. Applies to queue manager objects only.

***CTRL**

Control startup and shutdown of channels, listeners and services.

***CTRLX**

Reset sequence number and resolve indoubt channels.

***GET**

Retrieve a message from a queue using an MGET call. Applies to queue objects only.

***INQ**

Make an inquiry on an object using an MQINQ call. Applies to all objects except remote queue manager name.

***PASSALL**

Pass all context on a queue. Applies to queue objects only.

***PASSID**

Pass identity context on a queue. Applies to queue objects only.

***PUT**

Put a message on a queue using an MQPUT call. Applies to queue objects and remote queue manager names only.

***SET**

Set the attributes of an object using an MQSET call. Applies to queue, queue manager, and process objects only.

***SETALL**

Set all context on an object. Applies to queue and queue manager objects only.

***SETID**

Set identity context on an object. Applies to queue and queue manager objects only.

***SYSTEM**

Connect the application to a queue manager for system operations. Applies to queue manager objects only.

Authorizations for MQI calls

***ALTUSR**

Allow another user's authority to be used for MQOPEN and MQPUT1 calls.

***BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

***CONNECT**

Connect the application to the specified queue manager by issuing an MQCONN call.

***GET**

Retrieve a message from a queue by issuing an MQGET call.

***INQ**

Make an inquiry on a specific queue by issuing an MQINQ call.

***PUT**

Put a message on a specific queue by issuing an MQPUT call.

***SET**

Set attributes on a queue from the MQI by issuing an MQSET call.

***PUB**

Open a topic to publish a message using the MQPUT call.

***SUB**

Create, Alter or Resume a subscription to a topic using the MQSUB call.

***RESUME**

Resume a subscription using the MQSUB call.

If you open a queue for multiple options, you must be authorized for each of them.

Authorizations for context

***PASSALL**

Pass all context on the specified queue. All the context fields are copied from the original request.

***PASSID**

Pass identity context on the specified queue. The identity context is the same as that of the request.

***SETALL**

Set all context on the specified queue. This is used by special system utilities.

***SETID**

Set identity context on the specified queue. This is used by special system utilities.

Authorizations for MQSC and PCF commands

***ADMCHG**

Change the attributes of the specified object.

***ADMCLR**

Clear the specified queue (PCF Clear queue command only).

***ADMCR**

Create objects of the specified type.

***ADMDLT**

Delete the specified object.

***ADMDS**

Display the attributes of the specified object.

***CTRL**

Control startup and shutdown of channels, listeners and services.

***CTRLX**

Reset sequence number and resolve indoubt channels.

Authorizations for generic operations

***ALL**

Use all operations applicable to the object.

all authority is equivalent to the union of the authorities alladm, allmqi, and system appropriate to the object type.

***ALLADM**

Perform all administration operations applicable to the object.

***ALLMQI**

Use all MQI calls applicable to the object.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Service Component name (SRVCOMP)

Specifies the name of the installed authorization service to which the authorizations apply.

The possible values are:

***DFT**

Use the first installed authorization component.

Authorization-service-component-name

The component name of the required authorization service as specified in the queue manager qm.ini file.

IBM i

Ping MQ Channel (PNGMQMCHL)**Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Ping MQ Channel (PNGMQMCHL) command tests a channel by sending data as a special message, to the remote message queue manager and checks that the data is returned. This command is successful

only from the sending end of an inactive channel, and the data used is generated by the local message queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 2
<u>DATAcnt</u>	Data count	16-32768, 64	Optional, Positional 3
<u>CNT</u>	Count	1-16, 1	Optional, Positional 4

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

channel-name

Specify the channel name.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

Data count (DATAcnt)

Specifies the length of the data in bytes. The actual number of bytes might be less than the amount requested depending on the operating system and communication protocol being used.

The possible values are:

64

The default value is 64 bytes.

data-count Specify a value ranging from 16 through 32768.

Count (CNT)

Specifies the number of times that the channel is to be pinged.

The possible values are:

1

The channel is pinged once.

ping-count Specify a value ranging from 1 through 16.

Record MQ Object Image (RCDMQMIMG)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Record MQ Object Image (RCDMQMIMG) command is used to provide a marker for the selected set of MQ objects, so that the Re-create MQM Object (RCRMQMOBJ) command can recover this set of objects from journal data recorded subsequently.

This command is intended to enable journal receivers, detached prior to the current date, to be disconnected. On successful completion of this command those journals are no longer required to be present for a Re-create MQ Object (RCRMQMOBJ) command on this set of MQM Objects to succeed.

Parameters

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	<i>Character value</i> , *ALL	Required, Positional 1
<u>OBJTYPE</u>	Object type	*ALL, *Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *CTLG, *MQM, *NMLIST, *PRC, *CHL, *CLTCN, *LSR, *SVC, *SYNCFILE, *TOPIC	Required, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3
<u>DSPJRNDTA</u>	Display Journal Receiver Data	*YES, *NO	Optional, Positional 4

Object name (OBJ)

Specifies the name of the objects that should be recorded. This is a 48-character MQ object or generic object name.

The possible values are:

*ALL

All MQ objects of the specified type (OBJTYPE) are recorded.

generic-object-name

Specify the generic name of the objects to be recorded. A generic name is a character string followed by an asterisk (*). For example, ABC*. It selects all objects that have names which start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

object-name

The name of an MQ object to be recorded.

Object type (OBJTYPE)

Specifies the type of the objects to be re-created.

The possible values are:

*ALL

Specifies all MQ object types.

***Q**

Specifies MQ queue objects with names specified by OBJ.

***ALSQ**

Specifies MQ alias queue objects with names specified by OBJ.

***LCLQ**

Specifies MQ local queue objects with names specified by OBJ.

***MDLQ**

Specifies MQ model queues objects with names specified by OBJ.

***RMTQ**

Specifies MQ remote queue objects with names specified by OBJ.

***AUTHINFO**

Specifies MQ authentication information objects with names specified by OBJ.

***CTLG**

Specifies the MQ queue manager catalog object. This has the same name as the queue manager object.

***MQM**

Specifies the Message Queue Manager object.

***CHL**

Specifies MQ channel objects with names specified by OBJ.

***CLTCN**

Specifies MQ MQI client connection channel objects with names specified by OBJ.

***NMLIST**

Specifies MQ namelist objects with names specified by OBJ.

***PRC**

Specifies MQ process objects with names specified by OBJ.

***LSR**

Specifies MQ listener objects with names specified by OBJ.

***SVC**

Specifies MQ service objects with names specified by OBJ.

***SYNCFILE**

Specifies the MQ channel synchronisation file.

***TOPIC**

Specifies the MQ topic objects with names specified by OBJ.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

message-queue-manager-name

Specify the name of the queue manager.

Display Journal Receiver Data (DSPJRNDTA)

Specifies whether additional messages should be written to the job log when the command completes to inform the user which journal receivers are still required by IBM MQ.

The possible values are:

***NO**

No messages are written to the job log.

***YES**

Messages will be sent to the job log when the command completes. The messages will contain details about which journal receivers are required by IBM MQ.

IBM i Re-create MQ Object (RCRMQMOBJ)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Re-create MQ Object (RCRMQMOBJ) command is used to provide a recovery mechanism for damaged MQ objects. The command completely re-creates the objects from information recorded in the MQ journals. If no damaged objects exist, no action is performed.

Parameters

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	<i>Character value, *ALL</i>	Required, Positional 1
<u>OBJTYPE</u>	Object type	*ALL, *Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *CTLG, *MQM, *NMLIST, *PRC, *CHL, *CLTCN, *LSR, *SVC, *SYNCFILE, *CLCHLTAB, *TOPIC	Required, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 3

Object name (OBJ)

Specifies the name of the objects which should be re-created if they are damaged. This is a 48-character MQ object or generic object name.

The possible values are:

***ALL**

All damaged MQ objects of the specified type (OBJTYPE) are re-created.

generic-object-name

Specify the generic name of the objects to be re-created. A generic name is a character string followed by an asterisk (*). For example, ABC*. It selects all objects that have names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

object-name

The name of an MQ object to be re-created if it is damaged.

Object type (OBJTYPE)

Specifies the object type of the objects to be re-created.

The possible values are:

***ALL**

Specifies all MQ object types.

***Q**

Specifies MQ queue objects with names specified by OBJ.

***ALSQ**

Specifies MQ alias queue objects with names specified by OBJ.

***LCLQ**

Specifies MQ local queue objects with names specified by OBJ.

***MDLQ**

Specifies MQ model queues with names specified by OBJ.

***RMTQ**

Specifies MQ remote queue objects with names specified by OBJ.

***AUTHINFO**

Specifies MQ authentication information objects with names specified by OBJ.

***CTLG**

Specifies the message queue manager catalog object. The catalog object has the same name as the message queue manager object. It holds the names of MQ objects. A user needs authorities on this object to be able to start or stop the message queue manager, or, to create or delete MQ queues and process definitions.

***MQM**

Specifies the message queue manager. This object holds the attributes of the message queue manager.

***CHL**

Specifies MQ channel objects with names specified by OBJ.

***CLTCN**

Specifies MQ MQI client connection channel objects with names specified by OBJ.

***NMLIST**

Specifies MQ namelist objects with names specified by OBJ.

***PRC**

Specifies MQ process objects with names specified by OBJ.

***LSR**

Specifies MQ listener objects with names specified by OBJ.

***SVC**

Specifies MQ service objects with names specified by OBJ.

***SYNCFILE**

Specifies the MQ channel synchronisation file.

***SYNCFILE**

Specifies the MQ MQI client channel table file.

***TOPIC**

Specifies MQ topic objects with names specified by OBJ.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

message-queue-manager-name

Specify the name of the queue manager.

IBM i Refresh IBM MQ Authority (RFRMQMAUT)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The IBM MQ security cache refresh (RFRMQMAUT) command refreshes the IBM MQ object authority manager security cache.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 1
<u>TYPE</u>	Refresh Type	*AUTHSERV, *SSL	Optional, Positional 2

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager to perform the security refresh.

The possible values are:

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

*DFT

Specifies that the default queue manager should be used.

Refresh Type (TYPE)

The type of security refresh to be performed. The possible values are:

*AUTHSERV

Refreshes the list of authorizations held internally by the authorization services component.

*SSL

Refreshes the cached view of the TLS Key Repository allowing updates to become effective when the command has completed successfully. Also refreshes the locations of the LDAP servers to be used for Certificate Revocation Lists and the Key Repository.

IBM i Refresh MQ Cluster (RFRMQMCL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Refresh MQ Cluster (RFRMQMCL) command refreshes locally held cluster information (including any autodefined channels that are in doubt), and forces it to be rebuilt. This enables you to perform a "cold-start" on the cluster.

Parameters

Keyword	Description	Choices	Notes
<u>CLUSTER</u>	Cluster Name	Character value	Required, Positional 1

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2
<u>REPOS</u>	Refresh Repository	*NO, *YES	Optional, Positional 3

Cluster Name (CLUSTER)

The name of the cluster to be refreshed.

The possible values are:

The queue manager is refreshed in all of the clusters to which it belongs.

If Refresh Repository is also set to ***YES**, then the queue manager restarts its search for repository queue managers, using information in the local cluster-sender channel definitions.

name

Specify the name of the cluster.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Refresh Repository (REPOS)

Specifies whether the information about repository queue managers should be refreshed.

The possible values are:

***NO**

Do not refresh repository information.

***YES**

Refresh repository information. This value cannot be specified if the queue manager is itself a repository manager.

IBM i

Refresh Message Queue Manager (RFRMQM)

Where allowed to run

All environments (***ALL**)

Threadsafe

Yes

The Refresh Message Queue manager (RFRMQM) performs special operations on queue managers.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Required, Positional 1
<u>TYPE</u>	Refresh Type	*CONFIGEV, *PROXYSUB	Required, Positional 2

Keyword	Description	Choices	Notes
<u>OBJECT</u>	Object Type	*ALL , <i>Specified objects</i>	Optional, Positional 3
<u>NAME</u>	Object Name	*ALL , <i>generic- object-name, object-name</i>	Optional, Positional 4
<u>INCLINT</u>	Include Interval	*NONE , <i>include- interval</i>	Optional, Positional 5

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue_manager_name

Specify the name of the queue manager.

Refresh Type (TYPE)

The type of queue manager refresh to be performed.

The possible values are:

***CONFIGEV**

Requests that the queue manager generates a configuration event message for every object that matches the selection criteria specified by the OBJECT, NAME, and INCLINT parameters.

***PROXYSUB**

Requests that the queue manager resynchronizes the proxy subscriptions that are held with, and on behalf of, queue managers that are connected in a hierarchy or publish/subscribe cluster.

Object Type (OBJECT)

Requests that only objects of the specified type are included in the refresh.

This parameter is only valid for TYPE(*CONFIGEV)

The possible values are:

***ALL**

All specified objects.

Specific objects

Select from:

- *QUEUE
- *QLOCAL
- *QMODEL
- *QALIAS
- *QREMOTE
- *CHANNEL
- *NAMELIST
- *POLICY
- *PROCESS
- *QMGR
- *AUTHINFO
- *AUTHREC

Object Name (NAME)

Requests that only objects whose names match the name specified are included in the refresh.

This parameter is only valid for TYPE(*CONFIGEV)

The possible values are:

***ALL**

All object names are included.

generic-object-name

Specify the generic name of the objects to be included. A generic name is a character string, followed by an asterisk (*), for example ABC*, and it selects all queues having names that start with the character string.

object-name

Specify the object name to be included.

Include Interval (INCLINT)

Specifies a value in minutes, defining a period immediately before the current time, and requests that only objects that have been created or changed within that period are included in the refresh.

This parameter is only valid for TYPE(*CONFIGEV)

The possible values are:

***NONE**

No time limit is used.

include-interval

Specify the include interval in minutes (0-999999).

IBM i

Remove Queue Manager Info. (RMVMQMINF)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Remove Message Queue Manager Information (RMVMQMINF) command removes configuration information for a queue manager. This command can be used, for example, to remove a secondary queue manager instance by removing reference to shared queue manager data.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Optional, Positional 1

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager to remove information for.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Remove Queue Manager Journal (RMVMQMJRN)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Remove Queue Manager Journal command (RMVMQMJRN) removes a queue manager journal. This command can be used, for example, to remove a remote journal previously used for a standby or multi-instance queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 1
<u>JRN</u>	Queue Manager Journal	Character value, *DFT	Optional, Positional 2
<u>RMTJRNRDB</u>	Remote Relational Database	Character value	Optional, Positional 3

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager associated with the journal.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Queue Manager Journal (JRN)

Specifies the journal name to create.

The possible values are:

*DFT

The journal name is chosen by the system. If a local journal already exists for the queue manager on this system - the existing local journal name is used, otherwise a unique name is generated of the format AMQxJRN where x is a character in the range 'A - Z'.

journal-name

Specify the name of the journal. The name can contain up to 10 characters. Journal receiver names will be derived from this journal name by truncating at the 4th character (or at the last character if the journal name is shorter than 4 characters) and appending zeroes. If the local queue manager library already contains a local journal, its name must match that supplied. Only one local journal can exist in a queue manager library. DLTMQM will not remove journal artifacts from a queue manager library unless they are prefixed with "AMQ".

Remote Relational Database (RMTJRNRDB)

Specifies the name of the relational database directory entry that contains the remote location name of the target system. Use the WRKRDBDIRE command to locate and existing entry or configure a new relational database directory entry for the target system.

relational-database-directory-entry

Specify the name of the relational database directory entry. The name can contain up to 18 characters.

Resume Cluster Queue Manager (RSMMQMCLQM)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

Use the RSMMQMCLQM command to inform other queue managers in a cluster that the local queue manager is again available for processing and can be sent messages. It reverses the action of the SPDMQMCLQM command.

Parameters

Keyword	Description	Choices	Notes
<u>CLUSTER</u>	Cluster Name	Character value	Optional, Positional 1
<u>CLUSNL</u>	Cluster Name List	Character value	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 3

Cluster Name (CLUSTER)

Specifies the name of the cluster for which the queue manager is available for processing.

cluster-name

Specify the name of the cluster.

Cluster Name List (CLUSNL)

Specifies the namelist specifying a list of clusters for which the queue manager is available for processing.

namelist

Specify the name of the namelist.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

*DFT

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Reset MQ Channel (RSTMQMCHL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Reset MQ Channel (RSTMQMCHL) command resets the message sequence number for an MQ channel to a specified sequence number for use the next time that the channel is started.

You are recommended to use this command for Sender(*SDR), Server (*SVR) and Cluster-sender (*CLUSDR) channels only.

If you use this command for a Receiver (*RCVR), Requester (*RQSTR) or Cluster-receiver (*CLUSRCVR) channel, the value at the other end of the channel is NOT reset. You must reset the values separately.

The command does not work for Server-connection (*SVRCN) channels.

Parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>MSGSEQNUM</u>	Message sequence number	1-999999999, 1	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

channel-name

Specify the channel name.

Message sequence number (MSGSEQNUM)

Specifies the new message sequence number.

The possible values are:

1

The new message sequence number is 1.

message-sequence-number

Specify the new message sequence number ranging from 1 through 999999999.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

Reset Cluster (RSTMQMCL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

Use the Reset Cluster (RSTMQMCL) command to forcibly remove a queue manager from a cluster.

Parameters

Keyword	Description	Choices	Notes
<u>CLUSTER</u>	Cluster Name	Character value	Required, Positional 1

Keyword	Description	Choices	Notes
<u>QMNAME</u>	Queue Manager Name for removal	<i>Character value</i> , *QMID	Required, Positional 2
<u>ACTION</u>	Action	*FRCRMV	Optional, Positional 3
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 4
<u>QUEUES</u>	Remove Queues	*NO, *YES	Optional, Positional 5
<u>QMID</u>	Queue Manager Id for removal	Character value	Optional, Positional 6

Cluster Name (CLUSTER)

Specifies the name of cluster from which the queue manager is to be forcibly removed.

cluster-name

Specify the name of the cluster.

Queue Manager Name for removal (QMNAME)

Specifies the name of the queue manager to be forcibly removed.

The possible values are:

***QMID**

This enables you to specify the identifier of the queue manager to be forcibly removed.

queue-manager-name

Specify the name of the queue manager.

Action (ACTION)

Specifies the action to take on the specified queue manager.

***FRCRMV**

Requests that the queue manager is forcibly removed from the cluster. This might be needed to ensure correct cleanup after a queue manager has been deleted. This action can be requested by a repository queue manager only.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Remove Queues (QUEUES)

Specifies whether cluster queues should be removed from the cluster.

The possible values are:

***NO**

Do not remove the queues belonging to the queue manager being removed from the cluster.

***YES**

Remove queues belonging to the queue manager being removed from the cluster.

Queue Manager Id for removal (QMID)

Specifies the identifier of the queue manager to be forcibly removed.

queue-manager-identifier

Specify the identifier of the queue manager.

IBM i Resolve MQ Channel (RSVMQMCHL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Resolve MQ Channel (RSVMQMCHL) command requests a channel to commit or backout in-doubt messages.

This command is used when the other end of a link fails during the confirmation period, and for some reason it is not possible to reestablish the connection.

In this situation, the sending end remains in an in-doubt state, about whether the messages were received. Any outstanding units of work need to be resolved with either backout or commit.

*BCK restores messages to the transmission queue and *CMT discards them.

Use this command for sender (*SDR) and server (*SVR) channels only.

Parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>OPTION</u>	Resolve option	*CMT, *BCK	Required, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

channel-name

Specify the channel name.

Resolve option (OPTION)

Specifies whether to back out or commit the messages.

The possible values are:

***CMT**

The messages are committed, that is, they are deleted from the transmission queue.

***BCK**

The messages are backed out, that is, they are restored to the transmission queue.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

IBM i RUNMQSC (RUNMQSC)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Run IBM MQ Commands (RUNMQSC) command allows you to issue MQSC commands interactively for the specified queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

queue-manager-name

Specify the name of the queue manager.

IBM i Revoke MQ Object Authority (RVKMQMAUT)

Where allowed to run:	Threadsafe:
All environments (*ALL)	Yes

The Revoke MQ Authority (RVKMQMAUT) command is used to reset, or take away specific or all authority for the named objects from the users named in the command.

The RVKMQMAUT command can be used by anyone in the QMQMADM group, that is, anyone whose user profile specifies QMQMADM as a primary or supplemental group profile.

Parameters

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	Character value	Required, Positional 1
<u>OBJTYPE</u>	Object type	*ALL, *Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *MQM, *NMLIST, *PRC, *LSR, *SVC, *CHL, *CLTCN, *TOPIC, *RMTMQMNAME	Required, Positional 2
<u>USER</u>	User names	Single values: *PUBLIC, Other values (up to 50 repetitions): <i>Name</i>	Required, Positional 3

Keyword	Description	Choices	Notes
<u>AUT</u>	Authority	Values (up to 22 repetitions): *ALTUSR, *BROWSE, *CONNECT, *GET, *INQ, *PUT, *SET, *PUB, *SUB, *RESUME, *PASSALL, *PASSID, *SETALL, *SETID, *ADMCHG, *ADMCLR, *ADMCRRT, *ADMDLT, *ADMDSP, *ALL, *ALLADM, *ALLMQI, *REMOVE, *CTRL, *CTRLX, *SYSTEM	Required, Positional 4
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 5
<u>SRVCOMP</u>	Service Component name	<i>Character value</i> , *DFT	Optional, Positional 6

Object name (OBJ)

Specifies the name of the objects for which specific authorities are revoked.

The possible values are:

***ALL**

All objects of the type specified by the value of the OBJTYPE parameter at the time the command is issued. *ALL cannot represent a generic profile.

object-name

Specify the name of an MQ object for which specific authority is given to one or more users.

generic profile

Specify the generic profile of the objects to be selected. A generic profile is a character string containing one or more generic characters anywhere in the string. This profile is used to match the object name of the object under consideration at the time of use. The generic characters are (?), (*) and (**).

? matches a single character in an object name.

* matches any string contained within a qualifier, where a qualifier is the string between fullstops (.). For example ABC* matches ABCDEF but not ABCDEF.XYZ.

** matches one or more qualifiers. For example ABC.**.XYZ matches ABC.DEF.XYZ and ABC.DEF.GHI.XYZ, ** can only appear once in a generic profile.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

Object type (OBJTYPE)

Specifies the type of the objects for which specific authorities are revoked.

***ALL**

All MQ object types.

***Q**

All queue object types.

***ALSQ**

Alias queue.

- *LCLQ**
Local queue.
- *MDLQ**
Model queue.
- *RMTQ**
Remote queue.
- *AUTHINFO**
Authentication Information object.
- *MQM**
Message Queue Manager.
- *NMLIST**
Namelist object.
- *PRC**
Process definition.
- *CHL**
Channel object.
- *CLTCN**
Client Connection Channel object.
- *LSR**
Listener object.
- *SVC**
Service object.
- *TOPIC**
Topic object.
- *RMTMQMNAME**
Remote queue manager name.

User names (USER)

Specifies the user names of one or more users whose specific authorities to the named object are being removed. If a user was given the authority by USER(*PUBLIC) being specified in the Grant MQ Authority (GRTMQMAUT) command, the same authorities are revoked by *PUBLIC being specified in this parameter. Users given specific authority by having their names identified in the GRTMQMAUT command must have their names specified on this parameter to remove the same authorities.

The possible values are:

***PUBLIC**

The specified authorities are taken away from users who do not have specific authority for the object, who are not on the authorization list, and whose user group has no authority. Users who have specific authority still retain their authorities to the object.

user-profile-name

Specify the user names of one or more users who are having the specified authorities revoked. The authorities listed in the AUT parameter are being specifically taken away from each identified user. This parameter cannot be used to remove public authority from specific users; only authorities that were specifically given to them can be specifically revoked. You can specify up to 50 user profile names.

Authority (AUT)

Specifies the authority being reset or taken away from the users specified in the USER parameter. You can specify values for AUT as a list of specific and general authorities in any order, where the general authorities can be:

*REMOVE, which deletes the profile. It is not the same as *ALL, because *ALL leaves the profile in existence with no authorities. *REMOVE cannot be specified with user QMQMADM unless the object is a generic profile or with user QMQM when the object type is *MQM.

*ALL, which confers all authorities to the specified users.

*ALLADM, which confers all of *ADMCHG, *ADMCLR, *ADMCRRT, *ADMDLT, *ADMDSP, *CTRL and *CTRLX.

*ALLMQI, which confers all of *ALTUSR, *BROWSE, *CONNECT, *GET, *INQ, *PUT, *SET, *PUB, *SUB and *RESUME.

Authorizations for different object types

***ALL**

All authorizations. Applies to all objects.

***ADMCHG**

Change an object. Applies to all objects except remote queue manager name.

***ADMCLR**

Clear a queue. Applies to queues only.

***ADMCRRT**

Create an object. Applies to all objects except remote queue manager name.

***ADMDLT**

Delete an object. Applies to all objects except remote queue manager name.

***ADMDSP**

Display the attributes of an object. Applies to all objects except remote queue manager name.

***ALLADM**

Perform administration operations on an object. Applies to all objects except remote queue manager name.

***ALLMQI**

Use all MQI calls applicable to an object. Applies to all objects.

***ALTUSR**

Allow another user's authority to be used for MQOPEN and MQPUT1 calls. Applies to queue manager objects only.

***BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option. Applies to queue objects only.

***CONNECT**

Connect the application to a queue manager by issuing an MQCONN call. Applies to queue manager objects only.

***CTRL**

Control startup and shutdown of channels, listeners and services.

***CTRLX**

Reset sequence number and resolve indoubt channels.

***GET**

Retrieve a message from a queue using an MGET call. Applies to queue objects only.

***INQ**

Make an inquiry on an object using an MQINQ call. Applies to all objects except remote queue manager name.

***PASSALL**

Pass all context on a queue. Applies to queue objects only.

***PASSID**

Pass identity context on a queue. Applies to queue objects only.

***PUT**

Put a message on a queue using an MQPUT call. Applies to queue objects and remote queue manager names only.

***SET**

Set the attributes of an object using an MQSET call. Applies to queue, queue manager, and process objects only.

***SETALL**

Set all context on an object. Applies to queue and queue manager objects only.

***SETID**

Set identity context on an object. Applies to queue and queue manager objects only.

***SYSTEM**

Connect the application to a queue manager for system operations. Applies to queue manager objects only.

Authorizations for MQI calls

***ALTUSR**

Allow another user's authority to be used for MQOPEN and MQPUT1 calls.

***BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

***CONNECT**

Connect the application to the specified queue manager by issuing an MQCONN call.

***GET**

Retrieve a message from a queue by issuing an MQGET call.

***INQ**

Make an inquiry on a specific queue by issuing an MQINQ call.

***PUT**

Put a message on a specific queue by issuing an MQPUT call.

***SET**

Set attributes on a queue from the MQI by issuing an MQSET call.

***PUB**

Open a topic to publish a message using the MQPUT call.

***SUB**

Create, Alter or Resume a subscription to a topic using the MQSUB call.

***RESUME**

Resume a subscription using the MQSUB call.

If you open a queue for multiple options, you must be authorized for each of them.

Authorizations for context

***PASSALL**

Pass all context on the specified queue. All the context fields are copied from the original request.

***PASSID**

Pass identity context on the specified queue. The identity context is the same as that of the request.

***SETALL**

Set all context on the specified queue. This is used by special system utilities.

***SETID**

Set identity context on the specified queue. This is used by special system utilities.

Authorizations for MQSC and PCF commands

***ADMCHG**

Change the attributes of the specified object.

***ADMCLR**

Clear the specified queue (PCF Clear queue command only).

***ADMCRT**

Create objects of the specified type.

***ADMDLT**

Delete the specified object.

***ADMDSP**

Display the attributes of the specified object.

***CTRL**

Control startup and shutdown of channels, listeners and services.

***CTRLX**

Reset sequence number and resolve indoubt channels.

Authorizations for generic operations

***ALL**

Use all operations applicable to the object.

all authority is equivalent to the union of the authorities alladm, allmqi, and system appropriate to the object type.

***ALLADM**

Perform all administration operations applicable to the object.

***ALLMQI**

Use all MQI calls applicable to the object.

***REMOVE**

Delete the authority profile to the specified object.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Service Component name (SRVCOMP)

Specifies the name of the installed authorization service to which the authorizations apply.

The possible values are:

***DFT**

Use the first installed authorization component.

Authorization-service-component-name

The component name of the required authorization service as specified in the Queue manager's qm.ini file.

IBM i

Set MQM Security Policy (SETMQMSPL)**Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Set MQM Security Policy (SETMQMSPL) command sets security policies, that are used by Advanced Message Security to control how messages should be protected when being put, browsed, or destructively removed from queues.

The policy name associates digital signing and encryption protection for messages with queues matching the policy name.

Parameters

Keyword	Description	Choices	Notes
<u>POLICY</u>	Policy name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Required, Key, Positional 2
<u>SIGNALG</u>	Signature algorithm	*NONE, *MD5, *SHA1, *SHA256, *SHA384, *SHA512	Optional, Positional 3
<u>ENCALG</u>	Encryption algorithm	*NONE, *RC2, *DES, *TRIPLEDES, *AES128, *AES256	Optional, Positional 4
<u>SIGNER</u>	Authorized signers	*NONE , <i>Character value</i>	Optional, Positional 5
<u>RECIP</u>	Intended recipients	*NONE , <i>Character value</i>	Optional, Positional 6
<u>TOLERATE</u>	Tolerate unprotected	*NO , *YES	Optional, Positional 7
<u>REMOVE</u>	Remove policy	*NO , *YES	Optional, Positional 8
  <u>KEYREUSE</u>	Key reuse	*DISABLED , *UNLIMITED, <i>integer value</i>	Optional, Positional 9

Policy name (POLICY)

Name of the policy, required.

The policy name must match the name of the queue which is to be protected.

The name of the new authentication information object to create.

Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

Signature algorithm (SIGNALG)

Specifies the digital signature algorithm from one of the following values:

***NONE**

Messages are not signed.

***MD5**

Messages are signed using the MD5 message digest algorithm.

***SHA1**

Messages are signed using the SHA-1 secure hash algorithm.

***SHA256**

Messages are signed using the SHA-256 secure hash algorithm.

***SHA384**

Messages are signed using the SHA-384 secure hash algorithm.

***SHA512**

Messages are signed using the SHA-512 secure hash algorithm.

Encryption algorithm (ENCALG)

Specifies the encryption algorithm to use when protecting messages from one of the following values:

***NONE**

Messages are not encrypted.

***RC2**

Messages are encrypted using the RC2 Rivest Cipher algorithm.

***DES**

Messages are encrypted using the DES Data Encryption Standard algorithm.

***TRIPLEDES**

Messages are encrypted using the Triple DES Data Encryption Standard algorithm.

***AES128**

Messages are encrypted using the AES 128-bit key Advanced Encryption Standard algorithm.

***AES256**

Messages are encrypted using the AES 256-bit key Advanced Encryption Standard algorithm.

Authorized signers (SIGNER)

Specifies a list of *X500* distinguished names representing authorized message signers that are checked when browsing or destructively removing a message from a queue. If an authorized signer list is specified, only messages that are signed with a certificate identified in the list are accepted during message retrieval, even if the recipient keystore can verify the message signer.

This parameter is valid only when a signature algorithm ([SIGNALG](#)) has also been specified.

Note that distinguished names are case sensitive, and it is important that you enter the distinguished names exactly as they appear in the digital certificate.

The possible values are:

***NONE**

When handling signed messages, beyond checking the signers certificate validity, the policy does not restrict the identity of the message signer when retrieving messages.

x500-distinguished-name

When handling signed messages, beyond checking certificate validity, the message must have been signed by a certificate matching one of the distinguished names.

Intended recipients (RECIP)

Specifies a list of *X500* distinguished names representing the intended recipients that are used when putting a encrypted message to a queue. If a policy has specified an encryption algorithm (ENCALG) then at least one recipient distinguished name must be specified.

This parameter is valid only when an encryption algorithm ([ENCALG](#)) has also been specified.

Note that distinguished names are case sensitive, and it is important that you enter the distinguished names exactly as they appear in the digital certificate.

The possible values are:

***NONE**

Messages are not encrypted.

x500-distinguished-name

When putting messages, the message data is encrypted using the distinguished name as an intended recipient. Only the listed recipients are able to retrieve and decrypt the message.

Tolerate unprotected (TOLERATE)

Specifies whether messages that are not protected can still be browsed or destructively removed from a queue. This parameter can be used to gradually introduce a security policy for applications, allowing any messages that were created before the policy was introduced to be processed.

The possible values are:

***NO**

Messages that do not conform to the current policy are not returned to applications.

***YES**

Messages that have not been protected are allowed to be retrieved by applications.

Remove policy (REMOVE)

Specifies whether a policy is being created or removed.

The possible values are:

***NO**

The policy is created or altered if it already exists.

***YES**

The policy is removed. The only other parameters that are valid with this parameter value are policy name (POLICY) and queue manager name (MQMNAME).

Key reuse (KEYREUSE)

V 9.0.0

Specifies the number of times that an encryption key can be re-used, in the range 1-9,999,999, or the special values **DISABLED* or **UNLIMITED*.

Note that this is a maximum number of times a key can be reused, therefore a value of 1 means, at most, two messages can use the same key.

***DISABLED**

Prevents a symmetric key from being reused

***UNLIMITED**

Allows a symmetric key to be reused any number of times.

Attention: Key reuse is valid only for CONFIDENTIALITY policies, that is, **SIGNALG** set to **NONE* and **ENCALG** set to an algorithm value. For all other policy types, you must omit the parameter, or set the **KEYREUSE** value to **DISABLED*.

IBM i

Suspend Cluster Queue Manager (SPDMQMCLQM)

Where allowed to run

All environments (**ALL*)

Threadsafe

Yes

Use the SPDMQMCLQM command to inform other queue managers in a cluster that the local queue manager is not available for processing and cannot be sent messages. Its action can be reversed by the RSMMQMCLQM command.

Parameters

Keyword	Description	Choices	Notes
<u>CLUSTER</u>	Cluster Name	Character value	Optional, Positional 1
<u>CLUSNL</u>	Cluster Name List	Character value	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 3
<u>MODE</u>	Mode	*QUIESCE, *FORCE	Optional, Positional 4

Cluster Name (CLUSTER)

Specifies the name of the cluster for which the queue manager is no longer available for processing.

cluster-name

Specify the name of the cluster.

Cluster Name List (CLUSNL)

Specifies the name of the namelist specifying a list of clusters for which the queue manager is no longer available for processing.

namelist

Specify the name of the namelist.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

*DFT

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Mode (MODE)

Specifies how the suspension of availability is to take effect:

*QUIESCE

Other queue managers in the cluster are advised that the local queue manager should not be sent further messages.

*FORCE

All inbound and outbound channels to other queue managers in the cluster are stopped forcibly.

IBM i

Start Message Queue Manager (STRMQM)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start Message Queue Manager (STRMQM) command starts the local queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 1
<u>RDEFSYS</u>	Redefine system objects	*YES , *NO	Optional, Positional 2
<u>FIXDIRS</u>	Fix directories	*YES , *NO	Optional, Positional 3
<u>STRSTSDTL</u>	Startup Status Detail	*ALL , *MIN	Optional, Positional 4
<u>STRSVC</u>	Service startup	*YES , *NO	Optional, Positional 5
<u>REPLAY</u>	Perform replay only	*YES , *NO	Optional, Positional 6
<u>ACTIVATE</u>	Activate backup	*YES , *NO	Optional, Positional 7
<u>STANDBY</u>	Permit Standby Queue Manager	*YES , *NO	Optional, Positional 8

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Redefine system objects (RDEFSYS)

Specifies whether the default and system objects are redefined.

***NO**

Do not redefine the system objects.

***YES**

Starts the queue manager, redefines the default and system objects, then stops the queue manager. Any existing system and default objects belonging to the queue manager are replaced if you specify this flag.

Fix directories (FIXDIRS)

Specifies whether missing or damaged queue manager directories are re-created.

***NO**

Do not re-create any missing queue manager directories. If any damaged or missing directories are encountered during startup, the startup attempt will report an error and the STRMQM command will end immediately.

***YES**

Starts the queue manager and if required re-creates any damaged or missing directories. This option should be used when performing media recovery of a queue manager.

Startup Status Detail (STRSTSDTL)

Specifies the detail of status messages that are issued while starting the queue manager.

***ALL**

Display all startup status messages. This level of detail includes periodically displaying messages detailing transaction recovery and log replay. This level of detail can be useful in tracking queue manager startup progress following the abnormal termination of a queue manager.

***MIN**

Displays a minimum level of status messages.

Service startup (STRSVC)

Specifies whether the additional following QMGR components are started when the queue manager is started:

- The Channel Initiator
- The Command Server
- Listeners with CONTROL set to QMGR or STARTONLY
- Services with CONTROL set to QMGR or STARTONLY

***YES**

Start the channel initiator, command server, listeners and services when the queue manager is started.

***NO**

Do not start the channel initiator, command server, listeners or services when the queue manager is started.

Perform replay only (REPLAY)

Whether the queue manager is being started to perform replay only. This enables a backup copy of a queue manager on a remote machine to replay logs created by the corresponding active machine, and to allow the backup queue manager to be activated in the event of a disaster on the active machine.

***NO**

The queue manager is not being started to perform replay only.

***YES**

The queue manager is being started to perform replay only. The STRMQM command will end when replay is complete.

Activate backup (ACTIVATE)

Specifies whether to mark a queue manager as active. A queue manager that has been started with the REPLAY option is marked as a backup queue manager and cannot be started before it has been activated.

***NO**

The queue manager is not to be marked as active.

***YES**

The queue manager is to be marked as active. Once a queue manager has been activated then it can be started as a normal queue manager using the STRMQM command without the REPLAY and ACTIVATE options.

Permit Standby Queue Manager (STANDBY)

Specifies whether the queue manager can start as a standby instance if an active instance of the queue manager is already running on another system. Also specifies whether this instance of the queue manager will permit standby instances of the same queue manager on other systems in preparation for failover.

***NO**

The queue manager is started normally.

***YES**

The queue manager is permitted to start as a standby instance, and it permits other standby instances of the same queue manager to be started.

IBM i Start MQ Pub/Sub Broker (STRMQMBRK)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start IBM MQ broker (STRMQMBRK) command starts a broker for a specified queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1
<u>PARENTMQM</u>	Parent Message Queue Manager	Character value	Optional, Positional 2

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

queue-manager-name

Specify the name of the queue manager.

Parent Message Queue Manager (PARENTMQM)

Specifies the name of the queue manager that provides the parent broker function. Before you can add a broker to the network, channels in both directions must exist between the queue manager that hosts the new broker, and the queue manager that hosts the parent.

On restart, this parameter is optional. If present, it must be the same as it was when previously specified. If this is the root-node broker, the queue manager specified becomes its parent. You cannot specify the name of the parent broker when you use triggering to start a broker.

After a parent has been specified, it is only possible to change parentage in exceptional circumstances in conjunction with the CLRMQMBRK command. By changing a root node to become the child of an existing broker, two hierarchies can be joined. This causes subscriptions to be propagated across the two hierarchies, which now become one. After that, publications start to flow across them. To ensure predictable results, it is essential that you quiesce all publishing applications at this time.

If the changed broker detects a hierarchical error (that is, if the new parent is found also to be a descendant), it immediately shuts down. The administrator must then use CLRMQMBRK at both the changed broker and the new, false parent to restore the previous status. A hierarchical error is detected by propagating a message up the hierarchy, which can complete only when the relevant brokers and links are available.

IBM i Start MQ Channel (STRMQMCHL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start MQ Channel (STRMQMCHL) command starts an MQ channel.

Parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

channel-name

Specify the channel name.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

IBM i

Start MQ Channel Initiator (STRMQMCHLI)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start MQ Channel Initiator (STRMQMCHLI) command starts an MQ channel initiator.

Parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Queue name (QNAME)

Specifies the name of the initiation queue for the channel initiation process. That is, the initiation queue that is specified in the definition of the transmission queue.

The possible values are:

queue-name

Specify the name of the initiation queue.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

IBM i Start MQ Command Server (STRMQMCSVR)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start MQ Command Server (STRMQMCSVR) command starts the MQ command server for the specified queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 1

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

queue-manager-name

Specify the name of the queue manager.

IBM i Start IBM MQ DLQ Handler (STRMQMDLQ)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

Use the Start IBM MQ Dead-Letter Queue Handler (STRMQMDLQ) command to perform various actions on selected messages. The command specifies a set of rules that can both select a message and perform the action on that message.

The STRMQMDLQ command takes its input from the rules table as specified by SRCFILE and SRCMBR. When the command processes, the results and a summary are written to the printer spooler file.

Note:

The WAIT keyword, defined in the rules table, determines whether the dead-letter queue handler ends immediately after processing messages, or waits for new messages to arrive.

Parameters

Keyword	Description	Choices	Notes
<u>UDLMSGQ</u>	Undelivered message queue	<i>Character value</i> , *DFT, *NONE	Required, Positional 1
<u>SRCMBR</u>	Member containing input	<i>Name</i> , *FIRST	Required, Positional 2

Keyword	Description	Choices	Notes
<u>SRCFILE</u>	Input file	Qualified object name	Optional, Positional 3
	Qualifier 1: Input file	<i>Name</i> , QTXTSRC	
	Qualifier 2: Library	<i>Name</i> , *LIBL , *CURLIB	
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT , *NONE	Optional, Positional 4

Undelivered message queue (UDLMSGQ)

Specifies the name of the local undelivered message queue that is to be processed.

The possible values are:

***DFT**

The local undelivered-message queue used is taken from the default queue manager for the installation. If this option is specified, the INPUTQ keyword stated in the rules table is overridden by the default undelivered-message queue for the queue manager.

undelivered-message-queue-name

Specify the name of the local undelivered-message queue to be used. If this option is specified, the INPUTQ keyword stated in the rules table is overridden by the stated undelivered-message queue.

***NONE**

The queue that is named by the INPUTQ keyword in the rules table is used, or the system-default dead-letter queue if the INPUTQ keyword in the rules table is blank.

Member containing input (SRCMBR)

Specifies the name of the source member, containing the user-written rules table to be processed.

The possible values are:

***FIRST**

The first member of the file is used.

source-member-name

Specify the name of the source member.

Input file (SRCFILE)

Specifies the name of the source file and library, in the form LIBRARY/FILE, that contains the user-written rules table to be processed.

The possible values are:

***LIBL**

Search the library list for the file name.

***CURLIB**

Use the current library.

source-library-name

Specify the name of the library that is being used.

The possible values are:

QTXTSRC

Use QTXTSRC.

source-file-name

Specify the name of the source file.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

***NONE**

The queue manager that is named by the INPUTQM keyword in the rules table is used, or the system-default queue manager if the INPUTQM keyword in the rules table is blank.

IBM i Start MQ Listener (STRMQMLSR)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start MQ Listener (STRMQMLSR) command starts an MQ TCP/IP listener.

This command is valid for TCP/IP transmission protocols only.

You can specify either a listener object or specific listener attributes.

Parameters

Keyword	Description	Choices	Notes
<u>PORT</u>	Port number	1-65535, *DFT	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 2
<u>IPADDR</u>	IP Address	<i>Character value</i> , *DFT	Optional, Positional 3
<u>BACKLOG</u>	Listener backlog	0-999999999, *DFT	Optional, Positional 4
<u>LSRNAME</u>	Listener name	<i>Character value</i> , *NONE	Optional, Positional 5

Port number (PORT)

The port number to be used by the listener.

The possible values are:

***DFT**

Port number 1414 is used.

port-number

The port number to be used.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

IP Address (IPADDR)

The IP address to be used by the listener.

The possible values are:

***DFT**

The listener will listen on all IP addresses available to the TCP/IP stack.

ip-addr

The IP address to be used.

Listener backlog (BACKLOG)

The number of concurrent connection requests the listener supports.

The possible values are:

***DFT**

255 concurrent connection requests are supported.

backlog

The number of concurrent connection requests supported.

Listener name (LSRNAME)

The name of the MQ listener object to be started.

The possible values are:

***NONE**

No listener object is specified.

listener-name

Specify the name of the listener object to be started.

**Start IBM MQ Commands (STRMQMMQSC)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Start IBM MQ Commands (STRMQMMQSC) command initiates a set of IBM MQ Commands (MQSC) and writes a report to the printer spooler file.

Attention: Do not use the QTEMP library as the input library to STRMQMMQSC, as the usage of the QTEMP library is limited. You must use another library as an input file to the command.

Each report consists of the following elements:

- A header identifying MQSC as the source of the report.
- A numbered listing of the input MQSC commands.
- A syntax error message for any commands in error.
- A message indicating the outcome of running each correct command.
- Other messages for general errors running MQSC, as needed.
- A summary report at the end.

Parameters

Keyword	Description	Choices	Notes
<u>SRCMBR</u>	Member containing input	<i>Name</i> , *FIRST	Required, Positional 1
<u>SRCFILE</u>	Input file	Qualified object name	Optional, Positional 2
	Qualifier 1: Input file	<i>Name</i> , QMQSC	
	Qualifier 2: Library	<i>Name</i> , *LIBL, *CURLIB	
<u>OPTION</u>	Option	*RUN, *VERIFY, *MVS	Optional, Positional 3
<u>WAIT</u>	Wait time	1-999999	Optional, Positional 4
<u>LCLMQMNAME</u>	Local Message Queue Manager	Character value	Optional, Positional 5
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 6

Member containing input (SRCMBR)

Specifies the name of the source member, containing the MQSC, to be processed.

The possible values are:

source-member-name

Specify the name of the source member.

*FIRST

The first member of the file is used.

Input file (SRCFILE)

Specifies the qualified name of the file, in the form LIBRARY/FILE, that contains the MQSC to be processed.

The possible values are:

*LIBL

The library list is searched for the file name.

*CURLIB

The current library is used.

source-library-name

Specify the name of the library to be used.

The possible values are:

QMQSC

QMQSC is used.

source-file-name

Specify the name of the source file.

Option (OPTION)

Specifies how the MQSC commands are to be processed.

The possible values are:

***RUN**

If this value is specified and a value for the WAIT parameter is not specified the MQSC commands are processed directly by the local queue manager. If this value is specified and a value is also specified for the WAIT parameter the MQSC commands are processed indirectly by a remote queue manager,

***VERIFY**

The MQSC commands are verified and a report is written, but the commands are not run.

***MVS**

The MQSC commands are processed indirectly by a remote queue manager running under MVS/ESA. If you specify this option you must also specify a value for the WAIT parameter.

Wait time (WAIT)

Specifies the time in seconds that the STRMQMMQSC command waits for replies to indirect MQSC commands. Specifying a value for this parameter indicates that MQSC commands are executed in indirect mode by a remote queue manager. Specifying a value for this parameter is only valid when the OPTION parameter is specified as *RUN or *MVS.

In indirect mode, MQSC commands are queued on the command queue of a remote queue manager. Reports from the commands are then returned to the local queue manager specified in MQMNAME. Any replies received after this time are discarded, however, the MQSC command is still run.

The possible values are:

1 - 999999

Specify the waiting time in seconds.

Local Message Queue Manager (LCLMQMNAME)

Specifies the name of the local queue manager through which indirect mode operation is to be performed.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

message-queue-manager-name

Specify the name of the queue manager.

 **Start MQ Service (STRMQMSVC)**
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start MQ Service (STRMQMSVC) command starts an MQ service.

Parameters

Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 2

Service name (SVCNAME)

The name of the MQ service object to be started.

The possible values are:

*NONE

No service object is specified.

service-name

Specify the name of the service definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

IBM i

Start MQ Trigger Monitor (STRMQMTRM)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start MQ Trigger Monitor (STRMQMTRM) command starts the MQ trigger monitor for the specified queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>INITQNAME</u>	Initiation queue	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Initiation queue INITQNAME

Specifies the name of the initiation queue.

initiation-queue-name

Specify the name of the initiation queue

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

IBM i Trace MQ (TRCMQM)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Trace MQ (TRCMQM) command controls tracing for all MQ jobs. TRCMQM, which sets tracing on or off, can trace message queue interface (MQI) functions, function flow, and IBM MQ for IBM i components together with any messages issued by IBM MQ.

Parameters

Keyword	Description	Choices	Notes
<u>TRCEARLY</u>	Trace early	*NO , *YES	Optional, Positional 1
<u>SET</u>	Trace option setting	*ON , *OFF, *STS, *END	Optional, Positional 2
<u>OUTPUT</u>	Output	*MQM , *MQMFMT, *PEX, *ALL	Optional, Positional 3
<u>TRCLEVEL</u>	Trace level	*DFT , *DETAIL, *PARMS	Optional, Positional 4
<u>TRCTYPE</u>	Trace types	Single values: *ALL Other values (up to 14 repetitions): *API, *CMTRY, *COMMS, *CSDATA, *CSFLOW, *LQMDATA, *LQMFLOW, *OTHDATA, *OTHFLOW, *RMTDATA, *RMTFLOW, *SVCDATA, *SVCFLOW, *VSNDATA	Optional, Positional 5
<u>EXCLUDE</u>	Exclude types	Single values: *NONE Other values (up to 14 repetitions): *API, *CMTRY, *COMMS, *CSDATA, *CSFLOW, *LQMDATA, *LQMFLOW, *OTHDATA, *OTHFLOW, *RMTDATA, *RMTFLOW, *SVCDATA, *SVCFLOW, *VSNDATA	Optional, Positional 6
<u>INTERVAL</u>	Trace interval	1-32000000, *NONE	Optional, Positional 7
<u>MAXSTG</u>	Maximum storage to use	1-16, *DFT	Optional, Positional 8
<u>DATASIZE</u>	Trace data size	1-99999999, *DFT , *ALL, *NONE	Optional, Positional 9
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 10

Keyword	Description	Choices	Notes
JOB	Job information	Values (up to 8 repetitions): <i>Element list</i>	Optional, Positional 11
	Element 1: Job name	Qualified job name	
	Qualifier 1: Job name	Generic name, name	
	Qualifier 2: User	<i>Character value, X"</i>	
	Qualifier 3: Number	<i>Character value, X"</i>	
	Element 2: Thread identifier	<i>Character value, *NONE, *INITIAL</i>	
STRCTL	Trace start control	Values (up to 8 repetitions): <i>Character value, *NONE</i>	Optional, Positional 12
ENDCTL	Trace end control	Values (up to 8 repetitions): <i>Character value, *NONE</i>	Optional, Positional 13

Trace early (TRCEARLY)

Specifies whether early tracing is selected.

Early tracing applies to all jobs for all queue managers. If a queue manager is not currently active or does not exist, then early trace will become effective during start-up or creation.

***NO**

Early tracing is not enabled.

***YES**

Early tracing is enabled.

Trace option setting (SET)

Specifies the collection of trace records.

The possible values are:

***ON**

The collection of trace records is started.

For TRCEARLY(*NO), the collection of trace records will not be started until after the queue manager is available.

***OFF**

The collection of trace records is stopped. Trace records are written to files in the trace collection directory.

***STS**

The status of any active trace collections are written to a spool file. Any other parameters specified on the TRCMQM will be ignored.

***END**

The collection of trace records is stopped for all queue managers.

Output (OUTPUT)

Identifies the type of trace output that this command applies.

The possible values are:

***MQM**

This command applies to the collection of binary IBM MQ trace output in the directory specified by the TRCDIR parameter.

***MQMFMT**

This command applies to the collection of formatted IBM MQ trace output in the directory specified by the TRCDIR parameter.

***PEX**

This command applies to the collection of Performance Explorer (PEX) trace output.

***ALL**

This option applies to the collection of both IBM MQ unformatted trace and PEX trace output.

Trace level (TRCLEVEL)

Activates tracing level for flow processing trace points.

The possible values are:

***DFT**

Activates tracing at default level for flow processing trace points.

***DETAIL**

Activates tracing at high-detail level for flow processing trace points.

***PARMS**

Activates tracing at default-detail level for flow processing trace points.

Trace types (TRCTYPE)

Specifies the type of trace data to store in the trace file. If this parameter is omitted, all trace points are enabled.

The possible values are:

***ALL**

All the trace data as specified by the following keywords is stored in the trace file.

trace-type-list

You can specify more than one option from the following keywords, but each option can occur only once.

***API**

Output data for trace points associated with the MQI and major queue manager components.

***CMTRY**

Output data for trace points associated with comments in the MQ components.

***COMMS**

Output data for trace points associated with data flowing over communications networks.

***CSDATA**

Output data for trace points associated with internal data buffers in common services.

***CSFLOW**

Output data for trace points associated with processing flow in common services.

***LQMDATA**

Output data for trace points associated with internal data buffers in the local queue manager.

***LQMFLOW**

Output data for trace points associated with processing flow in the local queue manager.

***OTHDATA**

Output data for trace points associated with internal data buffers in other components.

***OTHFLOW**

Output data for trace points associated with processing flow in other components.

***RMTDATA**

Output data for trace points associated with internal data buffers in the communications component.

***RMTFLOW**

Output data for trace points associated with processing flow in the communications component.

***SVCDATA**

Output data for trace points associated with internal data buffers in the service component.

***SVCFLOW**

Output data for trace points associated with processing flow in the service component.

***VSNDATA**

Output data for trace points associated with the version of IBM MQ running.

Exclude types (EXCLUDE)

Specifies the type of trace data to omit from the trace file. If this parameter is omitted, all trace points specified in TRCTYPE are enabled.

The possible values are:

***ALL**

All the trace data as specified by the following keywords is stored in the trace file.

trace-type-list

You can specify more than one option from the following keywords, but each option can occur only once.

***API**

Output data for trace points associated with the MQI and major queue manager components.

***CMTRY**

Output data for trace points associated with comments in the MQ components.

***COMMS**

Output data for trace points associated with data flowing over communications networks.

***CSDATA**

Output data for trace points associated with internal data buffers in common services.

***CSFLOW**

Output data for trace points associated with processing flow in common services.

***LQMDATA**

Output data for trace points associated with internal data buffers in the local queue manager.

***LQMFLOW**

Output data for trace points associated with processing flow in the local queue manager.

***OTHDATA**

Output data for trace points associated with internal data buffers in other components.

***OTHFLOW**

Output data for trace points associated with processing flow in other components.

***RMTDATA**

Output data for trace points associated with internal data buffers in the communications component.

***RMTFLOW**

Output data for trace points associated with processing flow in the communications component.

***SVCDATA**

Output data for trace points associated with internal data buffers in the service component.

***SVCFLOW**

Output data for trace points associated with processing flow in the service component.

***VSNDATA**

Output data for trace points associated with the version of IBM MQ running.

Trace interval (INTERVAL)

Specifies an interval in seconds that trace should be collected for. If this parameter is omitted then trace will continue to be collected until it is stopped manually via the TRCMQM commands or an FDC with a probe identifier specified in ENDCTL is encountered.

The possible values are:

collection-interval

Specify a value in seconds ranging from 1 through 32000000.

You cannot specify a value for both INTERVAL and ENDCTL.

Maximum storage to use (MAXSTG)

Specifies the maximum size of storage to be used for the collected trace records.

The possible values are:

***DFT**

The default maximum is 1 megabyte (1024 kilobytes).

maximum-megabytes

Specify a value ranging from 1 through 16.

Trace data size (DATASIZE)

Specifies the number of bytes of user data included in the trace.

The possible values are:

***DFT**

The default trace value is used.

***ALL**

All the user data is traced.

***NONE**

This option will turn off the trace for sensitive user data.

data-size-in-bytes

Specify a value in ranging from 1 through 99999999.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

This parameter is only valid when TRCEARLY is set to *NO.

When TRCEARLY is set to *YES all queue managers are traced.

The possible values are:

***DFT**

Trace the default queue manager.

queue-manager-name

Specify the name of the queue manager to trace.

Job information (JOB)

Specifies which jobs are to be traced.

The value of this parameter can be one of the following:

generic-jobname

A generic 10 character jobname. All jobs that match the jobname will be enabled to collect trace. For example 'AMQ*' will collect trace for all jobs with a prefix of AMQ.

Job-name/User/Number

A fully qualified jobname. Only the job specified by the qualified jobname will be traced.

Job-name/User/Number/thread-identifier

A fully qualified jobname and associated thread identifier. Only the thread in the job specified by the qualified jobname will be traced. Note that the thread identifier is the internal identifier allocated by IBM MQ, it is not related to the IBM i thread identifier.

Trace start control (STRCTL)

Specifies that trace is started when an FDC with one of the specified probe identifiers is generated.

AANNNNNN

A probe identifier is an 8 character string of the format (AANNNNNN) where A represents alphabetic characters and N represents numeric digits.

Up to 8 probe identifiers may be specified.

Trace end control (ENDCTL)

Specifies that trace is ended when an FDC with one of the specified probe identifiers is generated.

AANNNNNN

A probe identifier is an 8 character string of the format (AANNNNNN) where A represents alphabetic characters and N represents numeric digits.

Up to 8 probe identifiers may be specified.

You cannot specify a value for both ENDCTL and INTERVAL.

IBM i

Work with MQ Queue Manager (WRKMQM)**Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Work with Queue Managers (WRKMQM) command allows you to work with one or more queue manager definitions, and allows you to perform the following operations:

- Change a queue manager
- Create a queue manager
- Delete a queue manager
- Start a queue manager
- Display a queue manager
- End a queue manager
- Work with channels of a queue manager
- Work with namelists of a queue manager
- Work with queues of a queue manager
- Work with processes of a queue manager

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *ALL</i>	Optional, Positional 1

Message Queue Manager name (MQMNAME)

Specifies the name or names of the message queue managers to select.

The possible values are:

***ALL**

All queue managers are selected.

generic-queue-manager-name

Specify the generic name of the queue managers to select. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all queue managers having names that start with the character string. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Note: You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered. You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

IBM i Work with MQ Authority (WRKMQMAUT)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQ Authority (WRKMQMAUT) displays a list of all the authority profile names and their types, which match the specified parameters. This enables you to delete, work with and create the authority records for an MQM authority profile record.

Parameters

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object/Profile name	<i>Character value</i> , *ALL	Optional, Positional 1
<u>OBJTYPE</u>	Object type	*Q, *PRC, *MQM, *NMLIST, *AUTHINFO, *LSR, *SVC, *CHL, *CLTCN, *ALL , *TOPIC, *RMTMQMNAME	Optional, Positional 2
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 3
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 4
<u>SRVCOMP</u>	Service Component name	<i>Character value</i> , *DFT	Optional, Positional 5

Object name (OBJ)

Specify the object name or authority profile name of the object to select.

The possible values are:

***ALL**

All authority records matching the specified object type are listed. *ALL cannot represent a generic profile.

object-name

Specify the name of an MQ object; all authority records for which the object name or generic profile name match this object name are selected.

generic profile

Specify the generic profile of an MQ object; only the authority record which exactly matches the generic profile is selected. A generic profile is a character string containing one or more generic characters anywhere in the string. The generic characters are (?), (*) and (**).

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

Object type (OBJTYPE)

Specifies the object type of the authority profile to select.

***ALL**

All MQ object types.

***Q**

All queue object types.

***AUTHINFO**

Authentication Information object.

***MQM**

Message Queue Manager.

***NMLIST**

Namelist object.

***PRC**

Process definition.

***CHL**

Channel object.

***CLTCN**

Client Connection Channel object.

***LSR**

Listener object.

***SVC**

Service object.

***TOPIC**

Topic object.

***RMTMQMNAME**

Remote queue manager name.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

A detailed list of the users and their authorities registered with the selected authority profile record is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Service Component name (SRVCOMP)

Specify the name of the installed authorization service in which to search for the authorities to display.

The possible values are:

***DFT**

All installed authorization components are searched for the specified authority profile name and object type.

Authorization-service-component-name

The component name of the authorization service as specified in the Queue manager's qm.ini file.

IBM i

Work with MQ Authority Data (WRKMQMAUTD)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQ Authority Records (WRKMQMAUTD) displays a list of all the users registered to a particular authority profile name and type. This enables you to grant, revoke, delete and create authority records.

Parameters

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object/Profile name	Character value	Required, Positional 1
<u>OBJTYPE</u>	Object type	*Q, *PRC, *MQM, *NMLIST, *AUTHINFO, *CHL, *CLTCN, *SVC, *LSR, *TOPIC	Required, Positional 2
<u>USER</u>	User name	Name, *PUBLIC, *ALL	Optional, Positional 3
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 4
<u>SRVCOMP</u>	Service Component name	Character value, *DFT	Optional, Positional 5

Object name (OBJ)

Specify the object name or authority profile name of the object to select.

object-name

Specify the name of an MQ object; all authority records for which the object name or generic profile name match this object name are selected.

generic profile

Specify the generic profile of an MQ object; only the authority record which exactly matches the generic profile is selected. A generic profile is a character string containing one or more generic characters anywhere in the string. The generic characters are (?), (*) and (**).

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

Object type (OBJTYPE)

Specifies the object type of the authority profile to select.

***Q**

All queue object types.

***AUTHINFO**

Authentication Information object.

***MQM**

Message Queue Manager.

***NMLIST**

Namelist object.

***PRC**

Process definition.

***CHL**

Channel object.

***CLTCN**

Client Connection Channel object.

***LSR**

Listener object.

***SVC**

Service object.

***TOPIC**

Topic object.

User name (USER)

Specifies the name of the user for whom authorities for the named object are displayed.

The possible values are:

***ALL**

List all relevant users.

***PUBLIC**

The user name implying all users of the system.

user-profile-name

Specify the name of the user.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Service Component name (SRVCOMP)

Specify the name of the installed authorization service in which to search for the authorities to display.

The possible values are:

***DFT**

All installed authorization components are searched for the specified authority profile name and object type.

Authorization-service-component-name

The component name of the authorization service as specified in the Queue manager's qm.ini file.

IBM i Work with AuthInfo objects (WRKMQMAUTI)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQ AuthInfo objects (WRKMQMAUTI) command allows you to work with multiple authentication information objects which are defined on the local queue manager.

This enables you to change, copy, create, delete, display, and display and change authority to an MQ authentication information object.

Parameters

Keyword	Description	Choices	Notes
<u>AINAME</u>	AuthInfo name	Character value, *ALL	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2
<u>WHERE</u>	Filter command	Single values: *NONE Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*ALTDATA, *ALTTIME, *AUTHTYPE, *CONNAME, *TEXT, *USERNAME, *OCSPURL	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

AuthInfo name (AINAME)

The name or names of the authentication information objects.

The possible values are:

***ALL or ***

All authentication information objects are selected.

generic-authinfo-name

The generic name of the authentication information objects. A generic name is a character string followed by an asterisk (*). For example ABC*, it selects all authentication information objects having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

authentication-information-name

Specify the name of a single authentication information object.

Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

Filter command (WHERE)

This parameter can be used to selectively display those AuthInfo objects with particular AuthInfo attributes only.

The parameter takes three arguments, a keyword, an operator, and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

***GT**

Greater than.

Applicable to integer and non-generic string values.

***LT**

Less than.

Applicable to integer and non-generic string values

***EQ**

Equal to.

Applicable to integer and non-generic string values.

***NE**

Not equal to.

Applicable to integer and non-generic string values.

***GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

***LE**

Less than or equal to.

Applicable to integer and non-generic string values.

***LK**

Like.

Applicable to generic string values.

***NL**

Not like.

Applicable to generic string values.

***CT**

Contains.

Applicable to non-generic list values.

***EX**

Excludes.

Applicable to non-generic list values.

***CTG**

Contains generic.

Applicable to generic list values.

***EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

***ALTDATE**

The date on which the definition or information was last altered.

The filter value is the date in the form yyyy-mm-dd.

***ALTTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

***AUTHTYPE**

The type of the authentication information object.

The filter value is one of the following:

***CRLLDAP**

The type of the authentication information object is CRLLDAP.

***OCSP**

The type of the authentication information object is OCSP.

***IDPWOS**

Connection authentication user ID and password checking is done using the operating system.

***IDPWLDAP**

Connection authentication user ID and password checking is done using an LDAP server.

***CONNAME**

The address of the host on which the LDAP server is running.

The filter value is the address name.

***TEXT**

Descriptive comment.

The filter value is the text description of the queue.

***USERNAME**

The distinguished name of the user.

The filter value is the distinguished name.

***OCSPURL**

The OCSP Responder URL.

The filter value is the URL name.

Work with MQ Channels (WRKMQMCHL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with IBM MQ Channels (WRKMQMCHL) command allows you to work with one or more channel definitions. This enables you to create, start, end, change, copy, delete, ping, display and reset channels, and resolve in-doubt units of work.

Parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	<i>Character value, *ALL</i>	Optional, Positional 1
<u>CHLTYPE</u>	Channel type	*RCVR, *SDR, *SVR, *RQSTR, *SVRCN, *CLUSSDR, *CLUSRCVR, *CLTCN, *ALL	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 3
<u>STATUS</u>	Channel status	*ALL, *INACTIVE, *STOPPED, *BINDING, *RETRYING, *RUNNING, *SWITCHING	Optional, Positional 4

Keyword	Description	Choices	Notes
<u>WHERE</u>	Filter command	Single values: *NONE Other values: <i>Element list</i>	Optional, Positional 5
	Element 1: Filter keyword	*AFFINITY, *ALTDAT, *ALTTIME, *BATCCHB, *BATCCHINT, *BATCCHLIM, *BATCCHSIZE, *CLNTWGHT, *CLUSNL, *CLUSTER, *CLWLPRTY, *CLWLRANK, *CLWLWGHT, *COMPHDR, *COMPMSG, *CONNAME, *CVTMSG, *DSCITV, *HRTBTINTVL, *KAINT, *LOCLADDR, *LONGRTY, *LONGTMR, *MAXINST, *MAXINSTC, *MAXMSGLEN, *MCANAME, *MCATYPE, *MCAUSRID, *MODENAME, *MONCHL, *MSGEXIT, *MSGRTYDATA, *MSGRTYEXIT, *MSGRTYITV, *MSGRTYNBR, *MSGUSRDATA, *NETPRTY, *NPMSPEED, *PROPCTL, *PUTAUT, *RCVEXIT, *RCVUSRDATA, *SCYEXIT, *SCYUSRDATA, *SEQNUMWRAP, *SHARECNV, *SHORTRTY, *SHORTTMR, *SNDEXIT, *SNDUSRDATA, *SSLCAUTH, *SSLCIPH, *SSLPEER, *STATCHL, *TEXT, *TGTMQMNAME, *TMQNAME, *TPNAME, *TRPTYPE, *USERID	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

Channel name (CHLNAME)

Specifies the name or names of the IBM MQ channel definitions to be selected.

The possible values are:

***ALL**

All channel definitions are selected.

generic-channel-name

Specify the generic name of the channel definitions to be selected. A generic name is a character string followed by an asterisk (*). For example ABC*, it selects all channel definitions having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

channel-name

Specify the name of the channel definition.

Channel type (CHLTYPE)

Specifies the type of channel definitions that are to be displayed.

The possible values are:

***ALL**

All the channel types are selected.

***SDR**

Sender channel

***SVR**

Server channel

***RCVR**

Receiver channel

***RQSTR**

Requester channel

***SVRCN**

Server-connection channel

***CLUSSDR**

Cluster-sender channel

***CLUSRCVR**

Cluster-receiver channel

***CLTCN**

Client-connection channel

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

Channel status (STATUS)

Specifies the status type of the IBM MQ channel definitions to be selected.

The possible values are:

***ALL**

Channels with any status are selected.

***BINDING**

Only channels with a binding status are selected.

***INACTIVE**

Only channels with an inactive status are selected.

***RETRYING**

Only channels with a retrying status are selected.

***RUNNING**

Only channels with a running status are selected.

***STOPPED**

Only channels with a stopped status are selected.

***SWITCHING**

Only channels with a switching status are selected.

Filter command (WHERE)

This parameter can be used to selectively display those channels with particular channel attributes only.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

***GT**

Greater than.

Applicable to integer and non-generic string values.

***LT**

Less than.

Applicable to integer and non-generic string values

***EQ**

Equal to.

Applicable to integer and non-generic string values.

***NE**

Not equal to.

Applicable to integer and non-generic string values.

***GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

***LE**

Less than or equal to.

Applicable to integer and non-generic string values.

***LK**

Like.

Applicable to generic string values.

***NL**

Not like.

Applicable to generic string values.

***CT**

Contains.

Applicable to non-generic list values.

***EX**

Excludes.

Applicable to non-generic list values.

***CTG**

Contains generic.

Applicable to generic list values.

***EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

***AFFINITY**

Connection Affinity.

The filter value is one of the following:

***PREFERRED**

Preferred connection affinity.

***NONE**

No connection affinity.

***ALTDATE**

The date on which the definition or information was last altered.

The filter value is the data in the form yyyy-mm-dd.

***ALTTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

***BATCHHB**

Batch heartbeat interval in milliseconds.

The filter value is the integer interval time.

***BATCHINT**

Batch interval in milliseconds.

The filter value is the integer interval time.

***BATCHLIM**

Batch data limit in kilobytes.

The limit of the amount of data that can be sent through a channel.

***BATCHSIZE**

Batch size.

The filter value is the integer batch size.

***CLNTWGHT**

Client channel weight.

The filter value is the integer client channel weight.

***CLUSNL**

Cluster namelist.

The filter value is the list of cluster names.

***CLUSTER**

The cluster to which the channel belongs.

The filter value is the name of the cluster.

***CLWLRANK**

Cluster workload rank.

The filter value is the integer rank.

***CLWLPRTY**

Cluster workload priority.

The filter value is the integer priority.

***CLWLWGHT**

Cluster workload weight.

The filter value is the integer weight.

***COMPHDR**

Header compression.

The filter value is one of the following:

***NONE**

No header data compression is performed.

***SYSTEM**

Header data compression is performed.

***COMPMSG**

Message compression.

The filter value is one of the following:

***NONE**

No message data compression is performed.

***RLE**

Message data compression is performed using RLE.

***ZLIBHIGH**

Message data compression is performed using ZLIB compression. A high level of compression is preferred.

***ZLIBFAST**

Message data compression is performed using ZLIB compression. A fast compression time is preferred.

***ANY**

Any compression technique supported by the queue manager can be used.

***CONNAME**

Remote connection name.

The filter value is the connection name string.

***CVTMSG**

Whether the message is converted before transmission.

The filter value is one of the following:

***YES**

The application data in the message is converted before sending.

***NO**

The application data in the message is not converted before sending.

***DSCITV**

Disconnect interval in seconds.

The filter value is the integer interval time.

***HRTBTINTVL**

Heartbeat interval in seconds.

The filter value is the integer interval time.

***KAINT**

Keep alive interval in seconds.

The filter value is the integer interval time.

***LOCLADDR**

Local connection name.

The filter value is the connection name string.

***LONGRTY**

Long retry count.

The filter value is the integer count.

***LONGTMR**

Long retry interval in seconds.

The filter value is the integer interval time.

***MAXINST**

Maximum instances of an individual server-connection channel.

The filter value is the integer number of instances.

***MAXINSTC**

Maximum instances of an individual server-connection channel from a single client.

The filter value is the integer number of instances.

***MAXMSGLEN**

Maximum message length.

The filter value is the integer length.

***MCANAME**

Message channel agent name.

The filter value is the agent name.

***MCATYPE**

Whether the message channel agent program should run as a thread or process.

The filter value is one of the following:

***PROCESS**

The message channel agent runs as a separate process.

***THREAD**

The message channel agent runs as a separate thread.

***MCAUSRID**

Message channel agent user identifier.

The filter value is the user identifier string.

***MODENAME**

SNA mode name.

The filter value is the mode name string.

***MONCHL**

Channel Monitoring.

The filter value is one of the following:

***QMGR**

The collection of Online Monitoring Data is inherited from the setting of the queue manager attribute MONCHL.

***OFF**

Online Monitoring Data collection for this channel is disabled.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

***MSGEXIT**

Message exit name.

The filter value is the exit name.

***MSGRTYDATA**

Message retry exit user data.

The filter value is the user data string.

***MSGRTYEXIT**

Message retry exit name.

The filter value is the exit name.

***MSGRTYITV**

Message retry interval interval in seconds.

The filter value is the integer interval time.

***MSGRTYNBR**

Number of message retries.

The filter value is the integer number of retries.

***MSGUSRDATA**

Message exit user data.

The filter value is the user data string.

***NETPRTY**

Network connection priority ranging from 0 through 9.

The filter value is the integer priority value.

***NPMSPEED**

Whether the channel supports fast nonpersistent messages.

The filter value is one of the following:

***FAST**

The channel supports fast nonpersistent messages.

***NORMAL**

The channel does not support fast nonpersistent messages.

***PROPCTL**

Message Property Control.

The filter value is one of the following:

***COMPAT**

Compatibility mode

***NONE**

No properties sent to remote queue manager.

***ALL**

All properties sent to remote queue manager.

***PUTAUT**

Whether the user identifier in the context information is used.

The filter value is one of the following:

***DFT**

No authority check is made before the message is put on the destination queue.

***CTX**

The user identifier in the message context information is used to establish authority to put the message.

***RCVEXIT**

Receive exit name.

The filter value is the exit name.

***RCVUSRDATA**

Receive exit user data.

The filter value is the user data string.

***SCYEXIT**

Security exit name.

The filter value is the exit name.

***SCYUSRDATA**

Security exit user data.

The filter value is the user data string.

***SEQNUMWRAP**

Maximum message sequence number.

The filter value is the integer sequence number.

***SHARECNV**

The number of shared conversations over a TCP/IP socket.

The filter value is the integer number of shared conversations.

***SHORTRTY**

Short retry count.

The filter value is the integer count.

***SHORTTMR**

Short retry interval in seconds.

The filter value is the integer interval time.

***SNDEXIT**

Send exit name.

The filter value is the exit name.

***SNDUSRDATA**

Send exit user data.

The filter value is the user data string.

***SSLCAUTH**

Whether the channel should carry out client authentication over TLS.

The filter value is one of the following:

***REQUIRED**

Client authentication is required.

***OPTIONAL**

Client authentication is optional.

***SSLCIPH**

The CipherSpec using in TLS channel negotiation.

The filter value is the name of the CipherSpec.

***SSLPEER**

The X500 peer name used in TLS channel negotiation.

The filter value is the peer name.

***STATCHL**

Channel Statistics.

The filter value is one of the following:

***QMGR**

The collection of statistics data is inherited from the setting of the queue manager attribute STATCHL.

***OFF**

Statistics data collection for this channel is disabled.

***LOW**

Statistics data collection is turned on with a low ratio of data collection.

***MEDIUM**

Statistics data collection is turned on with a moderate ratio of data collection.

***HIGH**

Statistics data collection is turned on with a high ratio of data collection.

***TEXT**

Descriptive comment.

The filter value is the text description of the channel.

***TGTMQMNAME**

Target queue manager name.

The filter value is the target queue manager of the channel.

***TMQNAME**

Transmission queue name.

The filter value is the name of the queue.

***TPNAME**

The SNA transaction program name.

The filter value is the program name string.

***TRPTYPE**

Transport type.

The filter value is one of the following:

***TCP**

Transmission Control Protocol / Internet Protocol (TCP/IP).

***LU62**

SNA LU 6.2.

***USERID**

Task user identifier.

The filter value is the user identifier string.

Work with MQ Channel Status (WRKMQMCHST)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQ Channel Status (WRKMQMCHST) command allows you to work with the status of one or more channel definitions.

Parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value, *ALL	Optional, Positional 1
<u>CONNNAME</u>	Connection name	Character value, *ALL	Optional, Positional 2
<u>TMQNAME</u>	Transmission queue name	Character value, *ALL	Optional, Positional 3
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 4
<u>CHLSTS</u>	Channel status	*ALL , *SAVED, *CURRENT	Optional, Positional 5
<u>WHERE</u>	Filter command	Single values: *NONE Other values: <i>Element list</i>	Optional, Positional 6
	Element 1: Filter keyword	*CHLSTS, *CHLTYPE, *COMPHDR, *COMPMSG, *CONNNAME, *INDOUBT, *INDMSGs, *INDSEQNO, *LSTSEQNO, *MONCHL, *RMTMQMNAME, *RMTVERSION, *SHARECNV, *STATUS, *SUBSTATE, *TMQNAME, *XQMSGSA, *LSTMSGDATE, *LSTMSGTIME, *MSGs	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

***ALL**

All channel definitions are selected.

generic-channel-name

Specify the generic name of the channel definitions to be selected. A generic name is a character string followed by an asterisk (*). For example ABC*, it selects all channel definitions having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

channel-name

Specify the name of the channel definition.

Connection name (CONNNAME)

Specifies the name of the machine to connect.

The possible values are:

***ALL**

All the channels are selected.

generic-connection-name

Specify the generic connection name of the required channels.

connection-name

Specify the connection name of the required channels.

Transmission queue name (TMQNAME)

Specifies the name of the transmission queue.

The possible values are:

***ALL**

All the transmission queues are selected.

generic-transmission-queue-name

Specify the generic name of the transmission queues.

transmission-queue-name

Specify the name of the transmission queue. A transmission queue name is required if the channel definition type (CHLTYPE) is *SDR or *SVR.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

Channel status (CHLSTS)

Specifies the type of channel status to display.

The possible values are:

***SAVED**

Saved channel status only is displayed. Status is not saved until a persistent message is transmitted across a channel, or a nonpersistent message is transmitted with a NPMSPEED of NORMAL. Because

status is saved at the end of each batch, a channel has no saved status until at least one batch has been transmitted.

***CURRENT**

Current channel status only is displayed. This applies to channels that have been started, or on which a client has connected, and that have not finished or disconnected normally. The current status data is updated as messages are sent or received.

***ALL**

Both saved and current channel status is displayed.

Filter command (WHERE)

This parameter can be used to selectively display the status of only those channels with particular channel status attributes.

The parameter takes three arguments, a keyword, an operator, and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

***GT**

Greater than.

Applicable to integer and non-generic string values.

***LT**

Less than.

Applicable to integer and non-generic string values

***EQ**

Equal to.

Applicable to integer and non-generic string values.

***NE**

Not equal to.

Applicable to integer and non-generic string values.

***GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

***LE**

Less than or equal to.

Applicable to integer and non-generic string values.

***LK**

Like.

Applicable to generic string values.

***NL**

Not like.

Applicable to generic string values.

***CT**

Contains.

Applicable to non-generic list values.

***EX**

Excludes.

Applicable to non-generic list values.

***CTG**

Contains generic.

Applicable to generic list values.

***EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

***CHLSTS**

The type of channel status.

The filter value is one of the following:

***CURRENT**

Current status for an active channel.

***SAVED**

Saved status for an active or inactive channel.

***CHLTYPE**

The type of channel.

The filter value is one of the following:

***SDR**

Sender channel.

***SVR**

Server channel.

***RCVR**

Receiver channel.

***RQSTR**

Requester channel.

***CLUSSDR**

Cluster-sender channel.

***CLUSRCVR**

Cluster-receiver channel.

***SVRCN**

Server-connection channel.

***COMPHDR**

Whether the channel performs header data compression.

The filter value is one of the following:

***NONE**

No header data compression is performed.

***SYSTEM**

Header data compression is performed.

***COMPMSG**

Whether the channel performs message data compression.

The filter value is one of the following:

***NONE**

No message data compression is performed.

***RLE**

Message data compression is performed using RLE.

***ZLIBHIGH**

Message data compression is performed using ZLIB compression. A high level of compression is preferred.

***ZLIBFAST**

Message data compression is performed using ZLIB compression. A fast compression time is preferred.

***CONNAME**

The connection name of the channel.

The filter value is the connection name string.

***INDOUBT**

Whether there are any in-doubt messages in the network.

The filter value is either *NO or *YES.

***INDMSGS**

The number of in-doubt messages.

The filter value is the integer number of messages.

***INDSEQNO**

The sequence number of the message that is in-doubt.

The filter value is the integer sequence number.

***LSTMSGTIME**

The time the last message was sent on the channel.

The filter value is the time in the form hh:mm:ss.

***LSTMSGDATE**

The date that the last message was sent on the channel.

The filter value is the data in the form yyyy-mm-dd

***LSTSEQNO**

The last message sequence number.

The filter value is the integer sequence number.

***MONCHL**

The current level of monitoring data collection for the channel.

The filter value is one of the following:

***NONE**

No monitoring data is collected.

***LOW**

A low ratio of monitoring data is collected.

***MEDIUM**

A medium ratio of monitoring data is collected.

***HIGH**

A high ratio of monitoring data is collected.

***MSGS**

The number of messages that have been sent on the channel.

The filter value is the integer number of messages.

***RMTMQMNAME**

The remote message queue manager.

The filter value is the message queue manager name.

***RMTVERSION**

The remote partner version.

The filter value is the integer format of the remote partner version.

***SHARECNV**

The number of shared conversations over a TCP/IP socket.

The filter value is the integer number of shared conversations.

***STATUS**

The status of the channel.

The filter value is one of the following:

***BINDING**

The channel is establishing a session.

***INACTIVE**

The channel has ended processing normally or the channel has never started.

***INITIALIZING**

The channel initiator is attempting to start the channel.

***PAUSED**

The channel is waiting for the message retry interval.

***REQUESTING**

The channel has been requested to start.

***RETRYING**

A previous attempt to establish a connection has failed. The channel will retry the connection after the specified interval.

***RUNNING**

The channel is transferring or is ready to transfer data.

***STARTING**

The channel is ready to begin negotiation with the target MCA.

***STOPPED**

The channel has been stopped.

***STOPPING**

The channel has been requested to stop.

***SWITCHING**

The channel is switching transmission queues.

***SUBSTATE**

The channel substate.

The filter value is one of the following:

***ENDBATCH**

End of batch processing.

***SEND**

Sending data.

***RECEIVE**

Receiving data.

***SERIALIZE**

Serializing with the partner channel.

***RESYNCH**

Resynchronizing with the partner channel.

***HEARTBEAT**

Heartbeat processing.

- *SCYEXIT**
Processing a security exit.
- *RCVEXIT**
Processing a receive exit.
- *SENDEXIT**
Processing a send exit.
- *MSGEXIT**
Processing a message exit.
- *MREXIT**
Processing a message-retry exit.
- *CHADEXIT**
Processing a channel auto-definition exit.
- *NETCONNECT**
Connecting to remote machine.
- *SSLHANDSHK**
Establishing a TLS connection.
- *NAMESERVER**
Requesting information from a name server.
- *MQPUT**
MQPUT processing.
- *MQGET**
MQGET processing.
- *MQICALL**
Processing an MQI call.
- *COMPRESS**
Compressing or extracting data.
- *TMQNAME**
The transmission queue of the channel.

The filter value is the queue name.
- *XQMSGSA**
The number of messages queued on the transmission queue available for MQGET. This field is valid for cluster-sender channels.

The filter value is the integer number of messages.

Work with MQ Clusters (WRKMQMCL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQ Clusters command, **WRKMQMCL**, allows you to work with multiple cluster queue manager definitions that are defined on the local queue manager.

Parameters

<i>Table 94. WRKMQMCL parameters</i>			
Keyword	Description	Choices	Notes
<u>CLUSQMGR</u>	Cluster Queue Manager name	<i>Character value, *ALL</i>	Optional, Positional 1

Table 94. **WRKMQMCL** parameters (continued)

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2
<u>WHERE</u>	Filter command	Single values: *NONE Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*ALTDATA, *ALTTIME, *BATCHHB, *BATCHINT, *BATCHLIM, *BATCHSIZE, *CHLNAME, *CLUSDATE, *CLUSQMGR, *CLUSTER, *CLUSTIME, *CLWLPRTY, *CLWLRANK, *CLWLWGHT, *COMPHDR, *COMPMSG, *CONNNAME, *CVTMSG, *DFNTYPE, *DSCITV, *HRTBTINTVL, *KAINT, *LOCLADDR, *LONGRTY, *LONGTMR, *MAXMSGLEN, *MCANAME, *MCATYPE, *MCAUSRID, *MONCHL, *MSGEXIT, *MSGRTYDATA, *MSGRTYEXIT, *MSGRTYITV, *MSGRTYNBR, *MSGUSRDATA, *NETPRTY, *NPMSPEED, *PUTAUT, *QMID, *QMTYPE, *RCVEXIT, *RCVUSRDATA, *SCYEXIT, *SCYUSRDATA, *SEQNUMWRAP, *SHORTRTY, *SHORTTMR, *SNDEXIT, *SNDUSRDATA, *SSLCAUTH, *SSLCIPH, *SSLPEER, *STATCHL, *STATUS, *SUSPEND, *TEXT, *TRPTYPE, *USERID, *XMITQ	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
Element 3: Filter value	Character value		

Cluster Queue Manager name (CLUSQMGR)

Specifies the name or names of the cluster queue manager definitions.

***ALL**

All cluster queue manager definitions are selected.

generic-cluster-queue-manager-name

Specify the generic name of the MQ cluster queue manager definitions. A generic name is a character string followed by an asterisk (*)> For example ABC*, it selects all cluster queue manager definitions having names that start with the character string. You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered. You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

cluster-queue-manager-name

Specify the name of the MQ cluster queue manager definition.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Filter command (WHERE)

This parameter can be used to selectively display only those cluster queue managers with particular attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

***GT**

Greater than.

Applicable to integer and non-generic string values.

***LT**

Less than.

Applicable to integer and non-generic string values

***EQ**

Equal to.

Applicable to integer and non-generic string values.

***NE**

Not equal to.

Applicable to integer and non-generic string values.

***GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

***LE**

Less than or equal to.

Applicable to integer and non-generic string values.

***LK**

Like.

Applicable to generic string values.

***NL**

Not like.

Applicable to generic string values.

***CT**

Contains.

Applicable to non-generic list values.

***EX**

Excludes.

Applicable to non-generic list values.

***CTG**

Contains generic.

Applicable to generic list values.

***EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

***ALTDATE**

The date on which the definition or information was last altered.

The filter value is the data in the form yyyy-mm-dd.

***ALTTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

***BATCHHB**

Batch heartbeat interval in milliseconds.

The filter value is the integer interval time.

***BATCHINT**

Batch interval in milliseconds.

The filter value is the integer interval time.

***BATHLIM**

Batch data limit in kilobytes.

The limit of the amount of data that can be sent through a channel.

***BATCHSIZE**

Batch size.

The filter value is the integer batch size.

***CHANNEL**

The channel name of the cluster queue manager.

The filter value is the name of the channel.

***CLUSDATE**

The date on which the definition became available to the local queue manager.

The filter value is the data in the form yyyy-mm-dd.

***CLUSQMGR**

The cluster queue manager name.

The filter value is the name of the cluster queue manager.

***CLUSTER**

The cluster to which the cluster queue manager belongs.

The filter value is the name of the cluster.

***CLUSTIME**

The time at which the definition became available to the local queue manager.

The filter value is the time in the form hh:mm:ss.

***CLWLKANK**

Cluster workload rank.

The filter value is the integer rank.

***CLWLPRTY**

Cluster workload priority.

The filter value is the integer priority.

***CLWLWGHT**

Cluster workload weight.

The filter value is the integer weight.

***COMPHDR**

Header compression.

The filter value is one of the following:

***NONE**

No header data compression is performed.

***SYSTEM**

Header data compression is performed.

***COMPMSG**

Message compression.

The filter value is one of the following:

***NONE**

No message data compression is performed.

***RLE**

Message data compression is performed using RLE.

***ZLIBHIGH**

Message data compression is performed using ZLIB compression. A high level of compression is preferred.

***ZLIBFAST**

Message data compression is performed using ZLIB compression. A fast compression time is preferred.

***ANY**

Any compression technique supported by the queue manager can be used.

***CONNAME**

Remote connection name.

The filter value is the connection name string.

***CVTMSG**

Whether the message should be converted before transmission.

The filter value is one of the following:

***YES**

The application data in the message is converted before sending.

***NO**

The application data in the message is not converted before sending.

***DFNTYPE**

How the cluster channel was defined.

The filter value is one of the following:

***CLUSSDR**

As a cluster-sender channel from an explicit definition.

***CLUSSDRA**

As a cluster-sender channel by auto-definition alone.

***CLUSSDRB**

As a cluster-sender channel by auto-definition and an explicit definition.

***CLUSRCVR**

As a cluster-receiver channel from an explicit definition.

***DSCITV**

Disconnect interval in seconds.

The filter value is the integer interval time.

***HRTBTINTVL**

Heartbeat interval in seconds.

The filter value is the integer interval time.

***KAINT**

Keep alive interval in seconds.

The filter value is the integer interval time.

***LOCLADDR**

Local connection name.

The filter value is the connection name string.

***LONGRTY**

Long retry count.

The filter value is the integer count.

***LONGTMR**

Long retry interval in seconds.

The filter value is the integer interval time.

***MAXMSGLEN**

Maximum message length.

The filter value is the integer length.

***MCANAME**

Message channel agent name.

The filter value is the agent name.

***MCATYPE**

Whether the message channel agent program should run as a thread or process.

The filter value is one of the following:

***PROCESS**

The message channel agent runs as a separate process.

***THREAD**

The message channel agent runs as a separate thread.

***MCAUSRID**

Message channel agent user identifier.

The filter value is the user identifier string.

***MONCHL**

Channel Monitoring.

The filter value is one of the following:

***QMGR**

The collection of Online Monitoring Data is inherited from the setting of the queue manager attribute MONCHL.

***OFF**

Online Monitoring Data collection for this channel is disabled.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

***MSGEXIT**

Message exit name.

The filter value is the exit name.

***MSGRTYDATA**

Message retry exit user data.

The filter value is the user data string.

***MSGRTYEXIT**

Message retry exit name.

The filter value is the exit name.

***MSGRTYITV**

Message retry interval interval in seconds.

The filter value is the integer interval time.

***MSGRTYNBR**

Number of message retries.

The filter value is the integer number of retries.

***MSGUSRDATA**

Message exit user data.

The filter value is the user data string.

***NETPRTY**

Network connection priority in the range 0 through 9.

The filter value is the integer priority value.

***NPMSPEED**

Whether the channel supports fast non persistent messages.

The filter value is one of the following:

***FAST**

The channel supports fast non persistent messages.

***NORMAL**

The channel does not support fast non persistent messages.

***PUTAUT**

Whether the user identifier in the context information should be used.

The filter value is one of the following:

***DFT**

No authority check is made before the message is put on the destination queue.

***CTX**

The user identifier in the message context information is used to establish authority to put the message.

***QMID**

The internally generated unique name of the cluster queue manager.

The filter value is the unique name.

***QMTYPE**

The function of the cluster queue manager in the cluster.

The filter value is one of the following:

***REPOS**

Provides a full repository service.

***NORMAL**

Does not provide a full repository service.

***RCVEXIT**

Receive exit name.

The filter value is the exit name.

***RCVUSRDATA**

Receive exit user data.

The filter value is the user data string.

***SCYEXIT**

Security exit name.

The filter value is the exit name.

***SCYUSRDATA**

Security exit user data.

The filter value is the user data string.

***SEQNUMWRAP**

Maximum message sequence number.

The filter value is the integer sequence number.

***SHORTRTY**

Short retry count.

The filter value is the integer count.

***SHORTTMR**

short retry interval in seconds.

The filter value is the integer interval time.

***SNDEXIT**

Send exit name.

The filter value is the exit name.

***SNDUSRDATA**

Send exit user data.

The filter value is the user data string.

***SSLCAUTH**

Whether the channel should carry out client authentication over TLS.

The filter value is one of the following:

***REQUIRED**

Client authentication is required.

***OPTIONAL**

Client authentication is optional.

***SSLCIPH**

The CipherSpec using in TLS channel negotiation.

The filter value is the name of the CipherSpec.

***SSLPEER**

The X500 peer name used in TLS channel negotiation.

The filter value is the peer name.

***STATCHL**

Channel Statistics.

The filter value is one of the following:

***QMGR**

The collection of statistics data is inherited from the setting of the queue manager attribute STATCHL.

***OFF**

Statistics data collection for this channel is disabled.

***LOW**

Statistics data collection is turned on with a low ratio of data collection.

***MEDIUM**

Statistics data collection is turned on with a moderate ratio of data collection.

***HIGH**

Statistics data collection is turned on with a high ratio of data collection.

***STATUS**

The current status of the channel for this cluster queue manager.

The filter value is one of the following:

***STARTING**

The channel is waiting to become active.

***BINDING**

The channel is performing channel negotiation.

***INACTIVE**

The channel is not active.

***INITIALIZING**

The channel initiator is attempting to start a channel.

***RUNNING**

The channel is either transferring messages, or is waiting for messages to arrive on the transmission queue.

***STOPPING**

The channel is stopping, or a close request has been received.

***RETRYING**

A previous attempt to establish a connection has failed. The MCA will reattempt connection after the specified time interval.

***PAUSED**

The channel is waiting for the message-retry interval to complete before retrying an MQPUT operation.

***STOPPED**

The channel has either been manually stopped, or the retry limit has been reached.

***REQUESTING**

A local requester channel is requesting services from a remote MCA.

***SUSPEND**

Whether this cluster queue manager is suspended from the cluster or not.

The filter value is either *NO or *YES.

***TEXT**

Descriptive comment.

The filter value is the text description of the channel.

***TMQNAME**

Transmission queue name.

The filter value is the name of the queue.

***USERID**

Task user identifier.

The filter value is the user identifier string.

***XMITQ**

Name of cluster transmission queue.

The filter value is the transmission queue name string.

IBM i

Work with MQ Cluster Queues (WRKMQMCLQ)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQ Cluster Queues (WRKMQMCLQ) command allows you to work with cluster queues that are defined on the local queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value, *ALL	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2
<u>CLUSTER</u>	Cluster name	Character value, *ALL	Optional, Positional 3

Keyword	Description	Choices	Notes
<u>WHERE</u>	Filter command	Single values: *NONE Other values: <i>Element list</i>	Optional, Positional 4
	Element 1: Filter keyword	*ALTDATA, *ALLTIME, *CLUSDATE, *CLUSQMGR, *CLUSQTYPE, *CLUSTER, *CLUSTIME, *DEFBIND, *DFTMSGPST, *DFTPTY, *PUTENBL, *QMID, *TEXT	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

Queue name (QNAME)

Specifies the name or names of the cluster queue definitions.

***ALL**

All cluster queue definitions are selected.

generic-queue-name

Specify the generic name of the MQ cluster queue definitions. A generic name is a character string followed by an asterisk (*). For example ABC*, it selects all cluster queue definitions having names that start with the character string. You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered. You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

queue-name

Specify the name of the MQ cluster queue definition.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Cluster name (CLUSTER)

Specifies the name of the cluster.

***ALL**

All cluster definitions are selected.

generic-cluster-name

Specify the generic name of the MQ cluster definitions. A generic name is a character string followed by an asterisk (*). For example ABC*, it selects all cluster definitions having names that start with the character string. You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered. You cannot select all the

uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

cluster-name

Specify the name of the MQ cluster definition.

Filter command (WHERE)

This parameter can be used to selectively display only those cluster queues with particular cluster queue attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

***GT**

Greater than.

Applicable to integer and non-generic string values.

***LT**

Less than.

Applicable to integer and non-generic string values

***EQ**

Equal to.

Applicable to integer and non-generic string values.

***NE**

Not equal to.

Applicable to integer and non-generic string values.

***GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

***LE**

Less than or equal to.

Applicable to integer and non-generic string values.

***LK**

Like.

Applicable to generic string values.

***NL**

Not like.

Applicable to generic string values.

***CT**

Contains.

Applicable to non-generic list values.

***EX**

Excludes.

Applicable to non-generic list values.

***CTG**

Contains generic.

Applicable to generic list values.

***EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

***ALTDATE**

The date on which the definition or information was last altered.

The filter value is the data in the form yyyy-mm-dd.

***ALTTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

***CLUSDATE**

The date on which the definition became available to the local queue manager.

The filter value is the date in the form yyyy-mm-dd.

***CLUSQMGR**

The name of the queue manager that hosts the queue.

The filter value is the name of the queue manager.

***CLUSQTYPE**

Cluster queue type.

The filter value is one of the following:

***LCL**

The cluster queue represents a local queue.

***ALS**

The cluster queue represents an alias queue.

***RMT**

The cluster queue represents a remote queue.

***MQMALS**

The cluster queue represents a queue manager alias.

***CLUSTER**

The name of the cluster that the queue is in.

The filter value is the name of the cluster.

***CLUSTIME**

The time at which the definition became available to the local queue manager.

The filter value is the time in the form hh:mm:ss.

***DEFBIND**

Default message binding.

The filter value is one of the following:

***OPEN**

The queue handle is bound to a specific instance of the cluster queue when the queue is opened.

***NOTFIXED**

The queue handle is not bound to any particular instance of the cluster queue.

***GROUP**

When the queue is opened, the queue handle is bound to a specific instance of the cluster queue for as long as there are messages in a message group. All messages in a message group are allocated to the same destination instance.

***DFTMSGPST**

Default persistence of the messages put on this queue.

The filter value is one of the following:

***NO**

Messages on this queue are lost across a restart of the queue manager.

***YES**

Messages on this queue survive a restart of the queue manager.

***DFTPTY**

Default priority of the messages put on the queue.

The filter value is the integer priority value.

***PUTENBL**

Whether applications are permitted to put messages to the queue.

The filter value is one of the following:

***NO**

Messages cannot be added to the queue.

***YES**

Messages can be added to the queue by authorized applications.

***QMID**

Internally generated unique name of the queue manager that hosts the queue.

The filter value is the name of the queue manager.

***TEXT**

Descriptive comment.

The filter value is the text description of the queue.

IBM i

Work with MQ Connections (WRKMQMCONN)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQ Connections (WRKMQMCONN) command allows you to work with connection information for applications that are connected to the queue manager.

This enables you to display connection handles and end connections to the queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>CONN</u>	Connection Identifier	<i>Character value, *ALL</i>	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Keyword	Description	Choices	Notes
<u>WHERE</u>	Filter command	Single values: *NONE Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*APPLDESC, *APPLTAG, *APPLTYPE, *CHLNAME, *CONNNAME, *PID, *TID, *UOWLOGDA, *UOWLOGTI, *UOWSTDA, *UOWSTTI, *URTYPE, *USERID	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

Connection Identifier (CONN)

The connection identifiers to work with.

The possible values are:

***ALL**

All connection identifiers are selected.

connection-id

Specify the name of a specific connection identifier. The connection identifier is a 16 character hex string.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Filter command (WHERE)

This parameter can be used to selectively display only those queue manager connections with particular connection attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

***GT**

Greater than.

Applicable to integer and non-generic string values.

***LT**

Less than.

Applicable to integer and non-generic string values

***EQ**

Equal to.

Applicable to integer and non-generic string values.

***NE**

Not equal to.

Applicable to integer and non-generic string values.

***GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

***LE**

Less than or equal to.

Applicable to integer and non-generic string values.

***LK**

Like.

Applicable to generic string values.

***NL**

Not like.

Applicable to generic string values.

***CT**

Contains.

Applicable to non-generic list values.

***EX**

Excludes.

Applicable to non-generic list values.

***CTG**

Contains generic.

Applicable to generic list values.

***EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

***APPLDESC**

The description of the application connected to the queue manager.

The filter value is the application description string.

***APPLTAG**

The tag of the application connected to the queue manager.

The filter value is the application tag string.

***APPLTYPE**

The type of application connected to the queue manager.

The filter value is one of the following:

***CICS**

CICS/400 application.

***MVS**

MVS application.

***IMS**

IMS application.

***OS2**

OS/2 application.

***DOS**

DOS application.

***UNIX**

UNIX application.

***QMGR**

Queue manager application.

***OS400**

IBM i application.

***WINDOWS**

Windows application.

***CICS_VSE**

CICS/VSE application.

***WINDOWS_NT**

Windows NT application.

***VMS**

VMS application.

***NSK**

Tandem/NSK application.

***VOS**

VOS application.

***IMS_BRIDGE**

IMS bridge application.

***XCF**

XCF application.

***CICS_BRIDGE**

CICS bridge application.

***NOTES_AGENT**

Lotus Notes application.

***BROKER**

Broker application.

***JAVA**

Java application.

***DQM**

DQM application.

***CHINIT**

Channel initiator.

***SYSTEM_EXT**

System extension application.

user-value

User-defined application.

The filter value is the integer application type.

***CHLNAME**

The name of the channel that owns the connection.

The filter value is the channel name.

***CONNNAME**

The connection name associated with the channel that owns the connection.

The filter value is the connection name.

***PID**

The process identifier of the application that is connected to the queue manager.

The filter value is the process identifier integer.

***TID**

The thread identifier of the application that is connected to the queue manager.

The filter value is the thread identifier integer.

***UOWLOGDA**

The date that the transaction associated with the connection first wrote to the log.

The filter value is the date in the form yyyy-mm-dd.

***UOWLOGTI**

The time that the transaction associated with the connection first wrote to the log.

The filter value is the time in the form hh:mm:ss.

***UOWSTDA**

The date that the transaction associated with the connection was started.

The filter value is the date in the form yyyy-mm-dd.

***UOWSTTI**

The time that the transaction associated with the connection was started.

The filter value is the time in the form hh:mm:ss.

***URTYPE**

The type of unit of recovery identifier as seen by the queue manager.

The filter value is one of the following:

***QMGR**

A queue manager transaction.

***XA**

An externally coordinated transaction. This includes units of work which have been established using IBM i Start Commitment Control (STRCMTCTL).

***USERID**

The user identifier associated with the connection.

The filter value is user identifier name.

IBM i**Work Queue Manager Journals (WRKMQMJRN)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Work With Queue Manager Journals command (WRKMQMJRN) displays a list of all the journals which are associated with a specific queue manager. This command can be used, for example, to configure remote journaling for a multi-instance queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 1

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager to work with journals.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

IBM i Work with MQ Listeners (WRKMQMLSR)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQ Listener objects (WRKMQMLSR) command allows you to work with listener objects which are defined on the local queue manager.

This enables you to change, copy, create, delete, start, stop & display listener objects display and change authority to an MQ listener object.

This command also enables you to view the current status of all running listeners on the current system.

Parameters

Keyword	Description	Choices	Notes
<u>OPTION</u>	Option	*STATUS , *OBJECT	Optional, Positional 1
<u>LSRNAME</u>	Listener name	<i>Character value, *ALL</i>	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 3
<u>WHERE</u>	Filter command	Single values: *NONE Other values: <i>Element list</i>	Optional, Positional 4
	Element 1: Filter keyword	*ALTDATA, *ALTTIME, *BACKLOG, *CONTROL, *IPADDR, *PORT, *TEXT	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

Option (OPTION)

This option enables you to select whether you want to information on listener status or listener object definitions.

The possible values are:

***STATUS**

Listener status information is displayed.

The parameters LSRNAME and WHERE are ignored. If MQMNAME is specified only the status of listeners running on the specified queue manager are displayed.

***OBJECT**

Listener object information is displayed.

Listener name (LSRNAME)

The name or names of the listener objects.

The possible values are:

***ALL or ***

All listener objects are selected.

generic-listener-name

The generic name of the listener objects. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all listener objects having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

listener-name

Specify the name of a single listener object.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Filter command (WHERE)

This parameter can be used to selectively display only those listener objects with particular listener attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

***GT**

Greater than.

Applicable to integer and non-generic string values.

***LT**

Less than.

Applicable to integer and non-generic string values

***EQ**

Equal to.

Applicable to integer and non-generic string values.

***NE**

Not equal to.

Applicable to integer and non-generic string values.

***GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

***LE**

Less than or equal to.

Applicable to integer and non-generic string values.

***LK**

Like.

Applicable to generic string values.

***NL**

Not like.

Applicable to generic string values.

***CT**

Contains.

Applicable to non-generic list values.

***EX**

Excludes.

Applicable to non-generic list values.

***CTG**

Contains generic.

Applicable to generic list values.

***EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

***ALTDATE**

The date on which the definition or information was last altered.

The filter value is the date in the form yyyy-mm-dd.

***ALTTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

***BACKLOG**

The number of concurrent connection requests supported.

The filter value is the integer backlog value.

***CONTROL**

Whether the listener is started and stopped with the queue manager.

The filter value is one of the following:

***MANUAL**

The listener is not automatically started or stopped.

***QMGR**

The listener is started and stopped as the queue manager is started and stopped.

***STARTONLY**

The listener is started as the queue manager is started, but is not requested to stop when the queue manager is stopped.

***IPADDR**

The local IP Address to be used by the listener.

The filter value is the IP Address.

***PORT**

The port number to be used by the listener.

The filter value is the integer port value.

***TEXT**

Descriptive comment.

The filter value is the text description of the listener.

IBM i Work with MQ Messages (WRKMQMMSG)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQ Messages (WRKMQMMSG) command lists the messages on a specified local queue and allows you to work with those messages. From the list of messages, you can display the contents of a message and its associated message descriptor (MQMD).

Parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 2
<u>FIRST</u>	First Message	1-30000, 1	Optional, Positional 3
<u>MAXMSG</u>	Maximum number of messages	1-30000, 48	Optional, Positional 4
<u>MAXMSGLEN</u>	Maximum message size	128-999999, 1024	Optional, Positional 5

Queue name (QNAME)

Specifies the name of the local queue.

The possible values are:

queue-name

Specify the name of the local queue.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

First Message (FIRST)

Specifies the number of the first message to display.

The possible values are:

1

The number of the first message to display is 1.

message-number

Specify the number of the first message to display ranging from 1 through 30 000.

Maximum number of messages (MAXMSG)

Specifies the maximum number of messages to display.

The possible values are:

48

Display a maximum of 48 messages.

count-value

Specify a value for the maximum number of messages to display ranging from 1 through 30 000.

Maximum message size (MAXMSGLEN)

Specifies the maximum size of message data to display.

The size of a message, greater than the value specified, is suffixed by a plus (+) character to indicate that the message data is truncated.

The possible values are:

1024

The size of the message data is 1024 bytes.

length-value

Specify a value ranging from 128 through 999999.

**Work with MQ Namelist (WRKMQMNL)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Work with MQ Namelists (WRKMQMNL) command allows you to work with multiple namelist definitions that are defined on the local queue manager. This enables you to copy, change, display, delete, display authority and edit authority of an MQ namelist object.

Parameters

Keyword	Description	Choices	Notes
<u>NAMELIST</u>	Namelist	<i>Character value</i> , *ALL	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 2

Keyword	Description	Choices	Notes
<u>WHERE</u>	Filter command	Single values: *NONE Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*ALTDAT, *ALTTIME, *NAMECNT, *NAMES, *TEXT	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

Namelist (NAMELIST)

Specifies the name or names of the namelists.

The possible values are:

***ALL**

All namelist definitions are selected.

generic-namelist-name

Specify the generic name of the MQ namelists. A generic name is a character string followed by an asterisk (*). For example ABC*, it selects all namelists having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

namelist-name

Specify the name of the MQ namelist.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used.

message-queue-manager-name

Specify the name of the queue manager.

Filter command (WHERE)

This parameter can be used to selectively display only those namelists with particular namelist attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

***GT**

Greater than.

Applicable to integer and non-generic string values.

***LT**

Less than.

Applicable to integer and non-generic string values

***EQ**

Equal to.

Applicable to integer and non-generic string values.

***NE**

Not equal to.

Applicable to integer and non-generic string values.

***GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

***LE**

Less than or equal to.

Applicable to integer and non-generic string values.

***LK**

Like.

Applicable to generic string values.

***NL**

Not like.

Applicable to generic string values.

***CT**

Contains.

Applicable to non-generic list values.

***EX**

Excludes.

Applicable to non-generic list values.

***CTG**

Contains generic.

Applicable to generic list values.

***EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

***ALTDATE**

The date on which the definition or information was last altered.

The filter value is the date in the form yyyy-mm-dd.

***ALTTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

***NAMECNT**

The number of names in the namelist.

The filter value is the integer number of names.

***NAMES**

The names in the namelist.

The filter value is the string name.

***TEXT**

Descriptive comment.

The filter value is the text description of the queue.

IBM i Work with MQ Processes (WRKMQMPCR)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQ Processes (WRKMQMPCR) command allows you to work with multiple process definitions that are defined on the local queue manager. This enables you to copy, change, display, delete, display authority, and edit authority of an MQ process object.

Parameters

Keyword	Description	Choices	Notes
<u>PRCNAME</u>	Process name	Character value, *ALL	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2
<u>WHERE</u>	Filter command	Single values: *NONE Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*ALTDATA, *ALTTIME, *APPID, *APPTYPE, *ENVDATA, *TEXT, *USRDATA	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

Process name (PRCNAME)

Specifies the name or names of the process definitions.

The possible values are:

***ALL**

All process definitions are selected.

generic-process-name

Specify the generic name of the MQ process definitions. A generic name is a character string followed by an asterisk (*). For example ABC*, it selects all process definitions having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

process-name

Specify the name of the MQ process definition.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Filter command (WHERE)

This parameter can be used to selectively display only those processes with particular process attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

***GT**

Greater than.

Applicable to integer and non-generic string values.

***LT**

Less than.

Applicable to integer and non-generic string values

***EQ**

Equal to.

Applicable to integer and non-generic string values.

***NE**

Not equal to.

Applicable to integer and non-generic string values.

***GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

***LE**

Less than or equal to.

Applicable to integer and non-generic string values.

***LK**

Like.

Applicable to generic string values.

***NL**

Not like.

Applicable to generic string values.

***CT**

Contains.

Applicable to non-generic list values.

***EX**

Excludes.

Applicable to non-generic list values.

***CTG**

Contains generic.

Applicable to generic list values.

***EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

***ALTDAT**

The date on which the definition or information was last altered.

The filter value is the date in the form yyyy-mm-dd.

***ALTTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

***APPID**

The name of the application to start.

The filter value is the name of the application.

***APPTYPE**

The type of the application to start.

The filter value is one of the following:

***CICS**

CICS/400 application.

***MVS**

MVS application.

***IMS**

IMS application.

***OS2**

OS/2 application.

***DOS**

DOS application.

***UNIX**

UNIX application.

***QMGR**

Queue manager application.

***OS400**

IBM i application.

***WINDOWS**

Windows application.

***CICS_VSE**

CICS/VSE application.

***WINDOWS_NT**

Windows NT application.

***VMS**

VMS application.

- *NSK**
Tandem/NSK application.
- *VOS**
VOS application.
- *IMS_BRIDGE**
IMS bridge application.
- *XCF**
XCF application.
- *CICS_BRIDGE**
CICS bridge application.
- *NOTES_AGENT**
Lotus Notes application.
- *BROKER**
Broker application.
- *JAVA**
Java application.
- *DQM**
DQM application.
- user-value**
User-defined application.

The filter value is the integer application type.
- *ENVDATA**
Environment data pertaining to the application.

The filter value is the environment data.
- *TEXT**
Descriptive comment.

The filter value is the text description of the queue.
- *USRDATA**
User data pertaining to the application.

The filter value is the user data.

IBM i Work with MQ Queues (WRKMQM)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQ Queues (WRKMQM) command provides the function to work with multiple queues that are defined on the local queue manager. Using this command you can copy, change, display, delete, display authority and edit authority of an MQ Queue object.

Parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	<i>Character value, *ALL</i>	Optional, Positional 1
<u>QTYPE</u>	Queue type	*ALL , *ALS, *LCL, *MDL, *RMT	Optional, Positional 2

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 3
<u>CLUSTER</u>	Cluster name	<i>Character value, *ALL</i>	Optional, Positional 4
<u>CLUSNL</u>	Cluster namelist name	<i>Character value, *ALL</i>	Optional, Positional 5

Keyword	Description	Choices	Notes
<u>WHERE</u>	Filter command	Single values: *NONE Other values: <i>Element list</i>	Optional, Positional 6
	Element 1: Filter keyword	*ACCTQ, *ALTDAT, *ALTTIME, *BKTTHLD, *BKTQNAME, *CLUSDATE, *CLUSNL, *CLUSQMGR, *CLUSQTYPE, *CLUSTER, *CLUSTIME, *CLWLPRTY, *CLWLRANK, *CLWLUSEQ, *CRDATE, *CRTIME, *CURDEPTH, *DEFBIND, *DFTPUTRESP, *DFNTYPE, *DFTMSGPST, *DFTPTY, *DFTSHARE, *DISTLIST, *FULLEVT, *GETDATE, *GETENBL, *GETTIME, *HDNBKTCNT, *HIGHEVT, *HIGHTHLD, *INITQNAME, *IPPROCS, *JOBS, *LOWEVT, *LOWTHLD, *MAXDEPTH, *MAXMSGLEN, *MEDIAREC, *MONQ, *MSGAGE, *MSGDLYSEQ, *MSGREADAHD, *NPMCLASS, *OPPROCS, *PRCNAME, *PROPCTL, *PUTDATE, *PUTENBL, *PUTTIME, *QMID, *QTYPE, *RMTMQMNAME, *RMTQNAME, *RTNITV, *SHARE, *SRVEVT, *SRVITV, *STATQ, *TARGTYPE, *TEXT, *TGTQNAME, *TMQNAME, *TRGDATA, *TRGDEPTH, *TRGENBL, *TRGMSGPTY, *TRGTYPE, *UNCOM, *USAGE	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

Queue name (QNAME)

The name or names of the queues to be selected. The queues selected by this parameter can be further limited to a particular type, if the QTYPE keyword is specified.

The possible values are:

***ALL**

All queues are selected.

generic-queue-name

Specify the generic name of the queues to be selected. A generic name is a character string, followed by an asterisk (*). For example ABC*, it selects all queues having names that start with the character string.

Specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

queue-name

Specify the name of the queue.

Queue type (QTYPE)

This parameter can be specified to limit the queues that are displayed to a particular type.

The possible values are:

***ALL**

All queue types.

***ALS**

Alias queues.

***LCL**

Local queues.

***MDL**

Model queues.

***RMT**

Remote queues.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Cluster name (CLUSTER)

This parameter can be specified to limit the queues that are displayed to be members of a particular cluster.

The possible values are:

***ALL**

All clusters.

generic-cluster-name

The generic name of a cluster.

cluster-name

The name of a cluster.

Cluster namelist name (CLUSNL)

This parameter can be specified to limit the queues that are displayed to be members of clusters within a cluster namelist.

The possible values are:

***ALL**

All cluster namelists.

generic-cluster-namelist-name

The generic name of a cluster namelist.

cluster-namelist-name

The name of a cluster namelist.

Filter command (WHERE)

This parameter can be used to selectively display only those queues with particular queue attributes.

The parameter takes three arguments, a keyword, an operator, and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

***GT**

Greater than.

Applicable to integer and non-generic string values.

***LT**

Less than.

Applicable to integer and non-generic string values

***EQ**

Equal to.

Applicable to integer and non-generic string values.

***NE**

Not equal to.

Applicable to integer and non-generic string values.

***GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

***LE**

Less than or equal to.

Applicable to integer and non-generic string values.

***LK**

Like.

Applicable to generic string values.

***NL**

Not like.

Applicable to generic string values.

***CT**

Contains.

Applicable to non-generic list values.

***EX**

Excludes.

Applicable to non-generic list values.

***CTG**

Contains generic.

Applicable to generic list values.

***EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

***ACCTQ**

Queue Accounting.

The filter value is one of the following values:

***QMGR**

Accounting data collection is based upon the setting of the queue manager attribute ACCTQ.

***OFF**

Accounting data collection for this queue is disabled.

***ON**

Accounting data collection is enabled for this queue.

***ALTDATE**

The date on which the definition or information was last altered.

The filter value is the data in the form yyyy-mm-dd.

***ALTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

***BKTTHLD**

Backout threshold.

The filter value is the integer threshold value.

***BKTQNAME**

Backout requeue name.

The filter value is the name of the queue.

***CLUSDATE**

The date on which the definition became available to the local queue manager.

The filter value is the date in the form yyyy-mm-dd.

***CLUSNL**

The namelist that defines the clusters that the queue is in.

The filter value is the name of the namelist.

***CLUSQMGR**

The name of the queue manager that hosts the queue.

The filter value is the name of the queue manager.

***CLUSQTYPE**

Cluster queue type.

The filter value is one of the following values:

***LCL**

The cluster queue represents a local queue.

***ALS**

The cluster queue represents an alias queue.

***RMT**

The cluster queue represents a remote queue.

***MQMALS**

The cluster queue represents a queue manager alias.

***CLUSTER**

The name of the cluster that the queue is in.

The filter value is the name of the cluster.

***CLUSTIME**

The time at which the definition became available to the local queue manager.

The filter value is the time in the form hh:mm:ss.

***CLWLPRTY**

Cluster workload priority.

The filter value is the integer priority.

***CLWLANK**

Cluster workload rank.

The filter value is the integer rank.

***CLWLUSEQ**

Cluster workload queue use.

The filter value is one of the following values:

***QMGR**

The value is inherited from the Queue Manager CLWLUSEQ attribute.

***LOCAL**

The local queue is the sole target of the MQPUT.

***ANY**

The queue manager treats such a local queue as another instance of the cluster queue for the purposes of workload distribution.

***CRDATE**

The date on which the queue was created.

The filter value is the date in the form yyyy-mm-dd.

***CRTIME**

The time at which the queue was created.

The filter value is the time in the form hh:mm:ss.

***CURDEPTH**

Current depth of queue.

The filter value is the integer depth value.

***DEFBIND**

Default message binding.

The filter value is one of the following values:

***OPEN**

The queue handle is bound to a specific instance of the cluster queue when the queue is opened.

***NOTFIXED**

The queue handle is not bound to any instance of the cluster queue.

***GROUP**

When the queue is opened, the queue handle is bound to a specific instance of the cluster queue for as long as there are messages in a message group. All messages in a message group are allocated to the same destination instance.

***DFTPUTRESP**

Default Put Response.

The filter value is one of the following values:

***SYNC**

The put operation is issued synchronously.

***ASYNC**

The put operation is issued asynchronously.

***DFNTYPE**

Queue definition type.

The filter value is one of the following values:

***PREDEF**

Predefined queue.

***PERMDYN**

Permanent dynamic queue.

***TEMPDYN**

Temporary dynamic queue.

***DFTMSGPST**

Default persistence of the messages put on this queue.

The filter value is one of the following values:

***NO**

Messages on this queue are lost across a restart of the queue manager.

***YES**

Messages on this queue survive a restart of the queue manager.

***DFTPTY**

Default priority of the messages put on the queue.

The filter value is the integer priority value.

***DFTSHARE**

Default share option on a queue opened for input.

The filter value is one of the following values:

***NO**

The open request is for exclusive input from the queue.

***YES**

The open request is for shared input from the queue.

***DISTLIST**

Whether distribution lists are supported by the partner queue manager.

The filter value is one of the following values:

***NO**

Distribution lists are not supported by the partner queue manager.

***YES**

Distribution lists are supported by the partner queue manager.

***FULLEVT**

Whether Queue Depth Full events are generated.

The filter value is one of the following values:

***NO**

Queue Depth Full events are not generated.

***YES**

Queue Depth Full events are generated.

***GETDATE**

The date on which the last message was got from the queue since queue manager start. This field is only present when Queue Monitoring is not set to *OFF.

The filter value is the data in the form yyyy-mm-dd.

***GETENBL**

Whether applications are permitted to get messages from the queue.

The filter value is one of the following values:

***NO**

Applications cannot retrieve messages from the queue.

***YES**

Authorized applications can retrieve messages from the queue.

***GETTIME**

The time at which the last message was got from the queue since queue manager start. This field is only present when Queue Monitoring is not set to *OFF.

The filter value is the time in the form hh:mm:ss.

***HDNBKTCNT**

Whether the backout count is hardened.

The filter value is one of the following values:

***NO**

The backout count is not hardened.

***YES**

The backout count is hardened.

***HIGHEVT**

Whether Queue Depth High events are generated.

The filter value is one of the following values:

***NO**

Queue Depth High events are not generated.

***YES**

Queue Depth High events are generated.

***HIGHTHLD**

Queue Depth High event generation threshold.

The filter value is the integer threshold value.

***INITQNAME**

Initiation queue.

The filter value is the name of the queue.

***IPPROCS**

Number of handles indicating that the queue is open for input.

The filter value is the integer number of handles.

***JOBS**

The current number of jobs that have the queue open.

The filter value is the integer number of jobs.

***LOWEVT**

Whether Queue Depth Low events are generated.

The filter value is one of the following values:

***NO**

Queue Depth Low events are not generated.

***YES**

Queue Depth Low events are generated.

***LOWTHLD**

Queue Depth Low event generation threshold.

The filter value is the integer threshold value.

***MAXDEPTH**

Maximum depth of queue.

The filter value is the integer number of messages.

***MAXMSGLEN**

Maximum message length.

The filter value is the integer message length.

***MEDIAREC**

The journal receiver containing the last media recovery image. This field is only present for local queues.

The filter value is the journal receiver string.

***MONQ**

Online Monitoring Data.

The filter value is one of the following values:

***QMGR**

The collection of Online Monitoring Data is inherited from the setting of the queue manager attribute MONQ.

***OFF**

Online Monitoring Data collection for this queue is disabled.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

***MSGAGE**

The age in seconds of the oldest message on the Queue. This field is only present when Queue Monitoring is not set to *OFF.

The filter value is the integer message age.

***MSGDLYSEQ**

Message delivery sequence.

The filter value is one of the following values:

***PTY**

Messages are delivered in FIFO order within priority.

***FIFO**

Messages are delivered in FIFO order regardless of priority.

***NPMCLASS**

Non-persistent message class.

The filter value is one of the following values:

***NORMAL**

Non-persistent message class is normal.

***HIGH**

Non-persistent message class is high.

***MSGREADAHD**

Message read ahead.

The filter value is one of the following values:

***DISABLED**

Read ahead is disabled.

***NO**

Non-persistent messages are not sent to the client ahead of an application requesting them.

***YES**

Non-persistent messages are sent to the client ahead of an application requesting them.

***OPPROCS**

Number of handles indicating that the queue is open for output.

The filter value is the integer number of handles.

***PRCNAME**

Process name.

The filter value is the name of the process.

***PROPCTL**

Message Property Control.

The filter value is one of the following values:

***COMPAT**

Compatibility mode

***NONE**

No properties are returned to the application.

***ALL**

All properties are returned to the application.

***FORCE**

Properties are returned to the application in one or more MQRFH2 headers.

***V6COMPAT**

An MQRFH2 header is returned formatted as it was sent. Its code page and encoding might be altered. If the message is a publication it might have a psc folder inserted into its contents.

***PUTDATE**

The date on which the last message was put to the queue since queue manager start. This field is only present when Queue Monitoring is not set to *OFF.

The filter value is the data in the form yyyy-mm-dd.

***PUTENBL**

Whether applications are permitted to put messages to the queue.

The filter value is one of the following values:

***NO**

Messages cannot be added to the queue.

***YES**

Messages can be added to the queue by authorized applications.

***PUTTIME**

The time at which the last message was put to the queue since queue manager start. This field is only present when Queue Monitoring is not set to *OFF.

The filter value is the time in the form hh:mm:ss.

***QMID**

Internally generated unique name of the queue manager that hosts the queue.

The filter value is the name of the queue manager.

***QTYPE**

Queue type.

The filter value is one of the following values:

***LCL**

Local queue.

***ALS**

Alias queue.

***RMT**

Remote queue.

***MDL**

Model queue.

***RMTQMNAME**

Remote queue manager name.

The filter value is the name of the queue manager.

***RMTQNAME**

Name of the local queue, as known by the remote queue manager.

The filter value is the name of the queue.

***RTNITV**

Retention interval.

The filter value is the integer interval value.

***SHARE**

Whether the queue can be shared.

The filter value is one of the following values:

***NO**

Only a single application instance can open the queue for input.

***YES**

More than one application instance can open the queue for input.

***SRVEVT**

Whether service interval events are generated.

The filter value is one of the following values:

***HIGH**

Service Interval High events are generated.

***OK**

Service Interval OK events are generated.

***NONE**

No service interval events are generated.

***SRVITV**

Service interval event generation threshold.

The filter value is the integer threshold value.

***STATQ**

Statistics data.

The filter value is one of the following values:

***QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATQ.

***OFF**

Statistics data collection for this queue is disabled.

***ON**

Statistics data collection is enabled for this queue.

***TARGTYPE**

Target Type.

The filter value is one of the following values:

***QUEUE**

Queue object.

***TOPIC**

Topic object.

***TEXT**

Descriptive comment.

The filter value is the text description of the queue.

***TGTQNAME**

Target queue for which this queue is an alias.

The filter value is the name of the queue.

***TMQNAME**

Transmission queue name.

The filter value is the name of the queue.

***TRGDATA**

Trigger data.

The filter value is the text of the trigger message.

***TRGDEPTH**

Trigger depth.

The filter value is the integer number of messages.

***TRGENBL**

Whether triggering is enabled.

The filter value is one of the following values:

***NO**

Triggering is not enabled.

***YES**

Triggering is enabled.

***TRGMSGPTY**

Threshold message priority for triggers.

The filter value is the integer priority value.

***TRGTYPE**

Trigger type.

The filter value is one of the following values:

***FIRST**

When the number of messages on the queue goes from 0 to 1.

***ALL**

Every time a message arrives on the queue.

***DEPTH**

When the number of messages on the queue equals the value of the TRGDEPTH attribute.

***NONE**

No trigger messages are written.

***UNCOM**

The number of uncommitted changes pending for the queue.

The filter value is one of the following values:

***NO**

There are no uncommitted changes pending.

***YES**

There are uncommitted changes pending.

***USAGE**

Whether the queue is a transmission queue.

The filter value is one of the following values:

***NORMAL**

The queue is not a transmission queue.

***TMQ**

The queue is a transmission queue.

IBM i

Work with Queue Status (WRKMQMSTS)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with Queue Status (WRKMQMSTS) command lists the jobs which have an IBM MQ queue currently open. The command allows you to determine what options a queue was opened with and also allows you to check to see which channels and connections have a queue open.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 1
<u>QNAME</u>	Queue name	Character value	Optional, Positional 2

Keyword	Description	Choices	Notes
<u>WHERE</u>	Filter command	Single values: *NONE Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*APPLDESC, *APPLTAG, *BROWSE, *CHLNAME, *CONNNAME, *INPUT, *INQUIRE, *JOB, *OUTPUT, *SET, *URTYPE	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Queue name (QNAME)

Specifies the name of the local queue.

The possible values are:

queue-name

Specify the name of the local queue.

Filter command (WHERE)

This parameter can be used to selectively display only the jobs with particular attributes that have the queue open.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

***GT**

Greater than.

Applicable to integer and non-generic string values.

***LT**

Less than.

Applicable to integer and non-generic string values

***EQ**

Equal to.

Applicable to integer and non-generic string values.

***NE**

Not equal to.

Applicable to integer and non-generic string values.

***GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

***LE**

Less than or equal to.

Applicable to integer and non-generic string values.

***LK**

Like.

Applicable to generic string values.

***NL**

Not like.

Applicable to generic string values.

***CT**

Contains.

Applicable to non-generic list values.

***EX**

Excludes.

Applicable to non-generic list values.

***CTG**

Contains generic.

Applicable to generic list values.

***EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

***APPLDESC**

The description of the application which has the queue open.

The filter value is the application description string.

***APPLTAG**

The tag of the application which has the queue open.

The filter value is the application tag string.

***BROWSE**

Whether the job has the queue open for browsing.

The filter value is either *NO or *YES.

***CHLNAME**

The name of the channel which has the queue open.

The filter value is the channel name.

***CONNNAME**

The connection name of the channel which has the queue open.

The filter value is the connection name.

***INPUT**

Whether the job has the queue open for input.

The filter value is one of the following:

***NO**

The job does not have the queue open for input.

***SHARED**

The job has the queue open for shared input.

***EXCL**

The job has the queue open for exclusive input.

***INQUIRE**

Whether the job has the queue open for inquiry.

The filter value is either *NO or *YES.

***JOB**

The name of the job which has the queue open.

The filter value is the job name.

***OUTPUT**

Whether the job has the queue open for output.

The filter value is either *NO or *YES.

***SET**

Whether the job has the queue open for set.

The filter value is either *NO or *YES.

***URTYPE**

The type of unit of work recovery identifier.

The filter value is one of the following:

***QMGR**

Queue manager unit of work recovery identifier.

***XA**

XA unit of work recovery identifier.

Work with MQM Security Policies (WRKMQMSPL)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQM Security Policies (WRKMQMSPL) command lists all security policies for a queue manager.

Security Policies are used by Advanced Message Security to control how messages should be protected when being put, browsed, or destructively removed from queues.

Additionally, [DSPMQM](#) displays whether security policies are enabled for the queue manager. Note that the Advanced Message Security license must be installed when the queue manager was started for this to occur.

Parameters

Keyword	Description	Choices	Notes
OUTPUT	Output	*, *PRINT	Optional, Positional 1

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

A detailed list of the users and their authorities registered with the selected authority profile record is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

IBM i

Work with MQ Subscriptions (WRKMQMSUB)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQ Subscriptions (WRKMQMSUB) command allows you to work with multiple subscriptions that are defined on the local queue manager. This enables you to copy, change, display and delete IBM MQ subscriptions.

Parameters

Keyword	Description	Choices	Notes
<u>SUBNAME</u>	Subscription name	<i>Character value, *ALL</i>	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Keyword	Description	Choices	Notes
<u>WHERE</u>	Filter command	Single values: *NONE Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*DEST, *DESTCLASS, *DESTCRLID, *DESTMQM, *EXPIRY, *PSPROP, *PUBACCT, *PUBAPPID, *PUBPTY, *REQONLY, *SELECTOR, *SELTYPE, *SUBSCOPE, *SUBID, *TOPICOBJ, *TOPICSTR, *USERDATA, *VARUSER, *WSHEMA	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

Subscription name (SUBNAME)

Specifies the name or names of the subscriptions.

The possible values are:

***ALL**

All subscriptions are selected.

generic-subscription-name

Specify the generic name of the MQ subscriptions. A generic name is a character string followed by an asterisk (*). For example ABC*, it selects all subscriptions having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

subscription-name

Specify the name of the MQ subscription.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

***DFT**

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Filter command (WHERE)

This parameter can be used to selectively display only those subscriptions with particular subscription attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

***GT**

Greater than.

Applicable to integer and non-generic string values.

***LT**

Less than.

Applicable to integer and non-generic string values

***EQ**

Equal to.

Applicable to integer and non-generic string values.

***NE**

Not equal to.

Applicable to integer and non-generic string values.

***GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

***LE**

Less than or equal to.

Applicable to integer and non-generic string values.

***LK**

Like.

Applicable to generic string values.

***NL**

Not like.

Applicable to generic string values.

***CT**

Contains.

Applicable to non-generic list values.

***EX**

Excludes.

Applicable to non-generic list values.

***CTG**

Contains generic.

Applicable to generic list values.

***EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

***DEST**

The destination queue for messages published to this subscription.

The filter value is the name of the queue.

***DESTCLASS**

Specifies whether this is a managed subscription.

The filter value is one of the following:

***MANAGED**

The destination is managed.

***PROVIDED**

The destination is a queue.

***DESTRRLID**

The correlation identifier for messages published to this subscription.

The filter value is the 48 character hexadecimal string representing the 24 byte correlation identifier.

***DESTMQM**

The destination queue manager for messages published to this subscription.

The filter value is the name of the queue manager.

***EXPIRY**

The expiry time of the subscription.

The filter value is the integer expiry time.

***PSPROP**

The manner in which publish / subscribe related message properties are added to messages sent to this subscription.

The filter value is one of the following:

***NONE**

Publish / subscribe properties are not added to the message.

***COMPAT**

Publish / subscribe properties are added to the message to maintain compatibility with V6
Publish / Subscribe.

***RFH2**

Publish / subscribe properties are added to the message within an RFH 2 header.

***PUBACCT**

The accounting token for messages published to this subscription.

The filter value is the 64 character hexadecimal string representing the 32 byte publish accounting token.

***PUBAPPID**

The publish application identity for messages published to this subscription.

The filter value is the publish application identifier.

***PUBPTY**

The priority of the message sent to this subscription.

The filter value is the integer priority.

***REQONLY**

Whether the subscriber will poll for updates via MQSUBRQ API, or whether all publications are delivered to this subscription.

The filter value is one of the following:

***YES**

Publications are only delivered to this subscription in response to an MQSUBRQ API.

***NO**

All publications on the topic are delivered to this subscription.

***SELECTOR**

The SQL 92 selector string to be applied to messages published on the named topic to select whether they are eligible for this subscription.

The filter value is the selector string.

***SELTYPE**

The type of SQL 92 selector string that has been specified.

The filter value is one of the following:

***NONE**

No selector has been specified.

***STANDARD**

A selector string has been specified that only references properties of the message and uses the standard selector syntax.

***EXTENDED**

A selector string has been specified that uses extended selectors syntax, typically by referencing the content of the message. Selector strings of this type cannot be handled internally by the queue manager; the use of extended message selectors can only be handled by another program, such as IBM Integration Bus.

***SUBSCOPE**

Determines whether this subscription is forwarded to other queue managers, so that the subscriber receives messages published at those other queue managers.

The filter value is one of the following:

***ALL**

The subscription is forwarded to all queue managers directly connected through a publish/subscribe collective or hierarchy.

***QMGR**

The subscription forwards messages published on the topic only within this queue manager.

Note: Individual subscribers can only restrict **SUBSCOPE**. If the parameter is set to ALL at topic level, then an individual subscriber can restrict it to QMGR for this subscription. However, if the parameter is set to QMGR at topic level, then setting an individual subscriber to ALL has no effect.

***SUBID**

The subscription identifier associated with the subscription.

The filter value is the 48 character hexadecimal string representing the 24 byte subscription identifier.

***TOPICOBJ**

The topic object associated with the subscription.

The filter value is the name of the topic object.

***TOPICSTR**

The topic string associated with the subscription.

The filter value is the topic string.

***USERDATA**

The user data associated with the subscription.

The filter value is the user data.

***VARUSER**

Whether user profiles other than the creator of the subscription can connect to it.

The filter value is one of the following:

***ANY**

Any user profiles can connect to the subscription.

***FIXED**

Only the user profile that created the subscription can connect to it.

***WSHEMA**

The schema to be used when interpreting wildcard characters in the topic string.

The filter value is one of the following:

***TOPIC**

Wildcard characters represent portions of the topic hierarchy.

***CHAR**

Wildcard characters represent portions of strings.

Work with MQ Service object (WRKMQMSVC)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQ Service objects (WRKMQMSVC) command allows you to work with multiple service objects that are defined on the local queue manager.

This enables you to start, stop, change, copy, create, delete, display, and display and change authority to an MQ service object.

Parameters

Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value, *ALL	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2
<u>WHERE</u>	Filter command	Single values: *NONE Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*ALTDATE, *ALTTIME, *CONTROL, *ENDARG, *ENDCMD, *STDERR, *STDOUT, *STRARG, *STRCMD, *TEXT, *TYPE	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

Service name (SVCNAME)

The name or names of the service objects.

The possible values are:

***ALL or ***

All service objects are selected.

generic-service-name

The generic name of the service objects. A generic name is a character string followed by an asterisk (*). For example ABC*, it selects all service objects having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

service-name

Specify the name of a single service object.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Filter command (WHERE)

This parameter can be used to selectively display only those service objects with particular service attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

***GT**

Greater than.

Applicable to integer and non-generic string values.

***LT**

Less than.

Applicable to integer and non-generic string values

***EQ**

Equal to.

Applicable to integer and non-generic string values.

***NE**

Not equal to.

Applicable to integer and non-generic string values.

***GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

***LE**

Less than or equal to.

Applicable to integer and non-generic string values.

***LK**

Like.

Applicable to generic string values.

***NL**

Not like.

Applicable to generic string values.

***CT**

Contains.

Applicable to non-generic list values.

***EX**

Excludes.

Applicable to non-generic list values.

***CTG**

Contains generic.

Applicable to generic list values.

***EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

***ALTDATE**

The date on which the definition or information was last altered.

The filter value is the date in the form yyyy-mm-dd.

***ALLTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

***CONTROL**

Whether the service is started and stopped with the queue manager.

The filter value is one of the following:

***MANUAL**

The service is not automatically started or stopped.

***QMGR**

The service is started and stopped as the queue manager is started and stopped.

***STARTONLY**

The service is started as the queue manager is started, is not be requested to stop when the queue manager is stopped.

***ENDARG**

The arguments passed to the end program when the service is requested to stop.

The filter value is the arguments string.

***ENDCMD**

The name of the executable to run when the service is requested to stop.

The filter value is the program name string.

***STDERR**

The standard error path.

The filter value is the path name.

***STDOUT**

The standard output path.

The filter value is the path name.

***STRARG**

The arguments passed to the program at startup.

The filter value is the arguments string.

***STRCMD**

The name of the program to run.

The filter value is the program name string.

***TEXT**

Descriptive comment.

The filter value is the text description of the service.

***TYPE**

Mode in which to run service.

The filter value is one of the following:

***CMD**

When started the command is executed but no status is collected or displayed.

***SVR**

The status of the executable started is monitored and displayed.

IBM i Work with MQ Topics (WRKMQMTOP)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQ Topics (WRKMQMTOP) command allows you to work with multiple topic objects that are defined on the local queue manager. This enables you to copy, change, display, delete, display authority, edit authority, record and recover an MQ topic object.

Parameters

Keyword	Description	Choices	Notes
<u>TOPNAME</u>	Topic name	Character value, *ALL	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2
<u>WHERE</u>	Filter command	Single values: *NONE Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*ALTDAT, *ALTTIME, *DFTMSGPST, *DFTPTY, *DFTPUTRESP, *DURSUB, *MGDDURMDL, *MGDNDURMDL, *NPMGDLV, *PMGDLV, *PUBENBL, *SUBENBL, *TEXT, *TOPNAME, *TOPICSTR, *WILDCARD	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

Topic name (TOPNAME)

Specifies the name or names of the topic objects.

The possible values are:

***ALL**

All topic objects are selected.

generic-topic-name

Specify the generic name of the MQ topic objects. A generic name is a character string followed by an asterisk (*). For example ABC*, it selects all topic objects having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

topic-name

Specify the name of the MQ topic object.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

***DFT**

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Filter command (WHERE)

This parameter can be used to selectively display only those topics with particular topic attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

***GT**

Greater than.

Applicable to integer and non-generic string values.

***LT**

Less than.

Applicable to integer and non-generic string values

***EQ**

Equal to.

Applicable to integer and non-generic string values.

***NE**

Not equal to.

Applicable to integer and non-generic string values.

***GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

***LE**

Less than or equal to.

Applicable to integer and non-generic string values.

***LK**

Like.

Applicable to generic string values.

***NL**

Not like.

Applicable to generic string values.

***CT**

Contains.

Applicable to non-generic list values.

***EX**

Excludes.

Applicable to non-generic list values.

***CTG**

Contains generic.

Applicable to generic list values.

***EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

***ALTDAT**

The date on which the object or information was last altered.

The filter value is the date in the form yyyy-mm-dd.

***ALTTIME**

The time at which the object or information was last altered.

The filter value is the time in the form hh:mm:ss.

***DFTMSGPST**

The default persistence for messages associated with this topic.

The filter value is one of the following:

***ASPARENT**

Default persistence for messages is inherited from the parent topic.

***NO**

Messages associated with this topic are lost across a restart of the queue manager.

***YES**

Messages associated with this topic survive a restart of the queue manager.

***DFTPUTRESP**

Default Put Response.

The filter value is one of the following:

***ASPARENT**

The default response type is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***SYNC**

Put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are issued as if MQPMO_SYNC_RESPONSE had been specified instead.

***ASYNC**

Put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are always issued as if MQPMO_ASYNC_RESPONSE had been specified instead.

***DFTPTY**

Default priority for messages associated with this topic.

The filter value is the integer priority value.

***DURSUB**

Specifies whether the topic permits durable subscriptions.

The filter value is one of the following:

***ASPARENT**

This topic behaves in the same way as the parent topic.

***NO**

This topic does not permit durable subscriptions.

***YES**

This topic does permit durable subscriptions.

***MGDDURMDL**

The name of the model queue for managed durable subscriptions.

The filter value is the name of the queue.

***MGDNDURMDL**

The name of the model queue for managed non-durable subscriptions.

The filter value is the name of the queue.

***NPMGDLV**

Specifies the delivery mechanism for non-persistent messages published to this topic.

The filter value is one of the following:

***ALL**

All non-persistent messages are published to this topic.

***ALLDUR**

All durable non-persistent messages are published to this topic.

***ALLAVAIL**

All available non-persistent messages are published to this topic.

***ASPARENT**

This topic behaves in the same way as the parent topic.

***PMSGDLV**

Specifies the delivery mechanism for persistent messages published to this topic.

The filter value is one of the following:

***ALL**

All persistent messages are published to this topic.

***ALLDUR**

All durable persistent messages are published to this topic.

***ALLAVAIL**

All available persistent messages are published to this topic.

***ASPARENT**

This topic behaves in the same way as the parent topic.

***PUBENBL**

Specifies whether the topic allows publications.

The filter value is one of the following:

***ASPARENT**

This topic behaves in the same way as the parent topic.

***NO**

This topic does not have publication enabled.

***YES**

This topic does have publication enabled.

***SUBENBL**

Specifies whether the topic allows subscriptions.

The filter value is one of the following:

***ASPARENT**

This topic behaves in the same way as the parent topic.

***NO**

This topic does not allow subscriptions.

***YES**

This topic allows subscriptions.

***TEXT**

Descriptive comment.

The filter value is the text description of the topic.

***TOPNAME**

The name of the topic.

The filter value is the name of the topic.

***TOPICSTR**

The topic string, used to identify the topic node.

The filter value is a character string.

***WILDCARD**

Specifies the behavior of wildcard subscriptions with respect to this topic.

The filter value is one of the following:

***PASSTHRU**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will receive publications made to this topic and to topic strings more specific than this topic.

***BLOCK**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will not receive publications made to this topic or to topic strings more specific than this topic.

Work with MQ Transactions (WRKMQMTRN)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The work with MQ transactions (WRKMQMTRN) command lists details of internally or externally coordinated in-doubt transactions.

Parameters

Keyword	Description	Choices	Notes
<u>TYPE</u>	Transaction type	*ALL , *EXT, *INT, *MQI, *XA, *OS400	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 2

Transaction type (TYPE)

Specifies the type of transactions.

***ALL**

Requests details of all the in-doubt transactions.

***EXT**

Requests details of externally coordinated, in-doubt transactions. Such transactions are those for which IBM MQ has been asked to prepare to commit, but has not yet been informed of the transaction outcome.

***INT**

Requests details of internally coordinated, in-doubt transactions. Such transactions are those for which each resource manager has been asked to prepare to commit, but IBM MQ has yet to inform the resource managers of the transaction outcome.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

message-queue-manager-name

Specify the name of the queue manager.

Programmable command formats reference

Programmable Command Formats (PCFs) define command and reply messages that can be exchanged between a program and any queue manager (that supports PCFs) in a network. PCFs simplify queue manager administration and other network administration.

For an introduction to PCFs, see [Introduction to Programmable Command Formats](#).

For the full list of PCFs, see [“Definitions of the Programmable Command Formats”](#) on page 1337.

PCF commands and responses have a consistent structure including of a header and any number of parameter structures of defined types. For information about these structures, see [“Structures for commands and responses”](#) on page 1842.

For an example PCF, see [“PCF example”](#) on page 1869.

How the definitions are shown

The definitions of the Programmable Command Formats (PCFs) including their commands, responses, parameters, constants, and error codes are shown in a consistent format.

For each PCF command or response, there is a description of what the command or response does, giving the command identifier in parentheses. See [Constants](#) for all values of the command identifier. Each command description starts with a table that identifies the platforms on which the command is valid. For additional, more detailed, usage notes for each command, see the corresponding command description in the [Definitions of the PCFs](#).

IBM MQ products, other than IBM MQ for z/OS, can use the IBM MQ Administration Interface (MQAI), which provides a simplified way for applications written in the C and Visual Basic programming language to build and send PCF commands. For information about the MQAI see the second section of this topic.

Commands

The *required parameters* and the *optional parameters* are listed.

Multi On [Multiplatforms](#), the parameters must occur in this order:

1. All required parameters, in the order stated, followed by
2. Optional parameters as required, in any order, unless noted in the PCF definition.

z/OS On z/OS, the parameters can be in any order.

Responses

The response data attribute is *always returned* whether it is requested or not. This parameter is required to identify, uniquely, the object when there is a possibility of multiple reply messages being returned.

The other attributes shown are *returned if requested* as optional parameters on the command. The response data attributes are not returned in a defined order.

Parameters and response data

Each parameter name is followed by its structure name in parentheses (details are given in “[Structures for commands and responses](#)” on page 1842). The parameter identifier is given at the beginning of the description.

Constants

For the values of constants used by PCF commands and responses see [Constants](#).

Informational messages

z/OS

On z/OS, a number of command responses return a structure, MQIACF_COMMAND_INFO, with values that provide information about the command.

MQIACF_COMMAND_INFO value	Meaning
MQCMDI_CMDSCOPE_ACCEPTED	A command that specified <i>CommandScope</i> was entered. It has been passed to the one or more requested queue managers for processing
MQCMDI_CMDSCOPE_GENERATED	A command that specified <i>CommandScope</i> was generated in response to the command originally entered

Table 95. MQIACF_COMMAND_INFO values (continued)

MQIACF_COMMAND_INFO value	Meaning
MQCMDI_CMDSCOPE_COMPLETED	Processing for the command that specified <i>CommandScope</i> - either entered or generated by another command - has completed successfully on all requested queue managers
MQCMDI_QSG_DISP_COMPLETED	Processing for the command that refers to an object with the indicated disposition has completed successfully
MQCMDI_COMMAND_ACCEPTED	Initial processing for the command has completed successfully. The command requires further action by the channel initiator, for which a request has been queued. Messages reporting the success or otherwise of the action are be sent to the command issuer later
MQCMDI_CLUSTER_REQUEST_QUEUED	Initial processing for the command has completed successfully. The command requires further action by the cluster repository manager, for which a request has been queued
MQCMDI_CHANNEL_INIT_STARTED	A Start Channel Initiator command has been issued and the channel initiator address space has been started successfully
MQCMDI_RECOVER_STARTED	The queue manager has successfully started a task to process the Recover CF Structure command for the named structure
MQCMDI_BACKUP_STARTED	The queue manager has successfully started a task to process the Backup CF Structure command for the named structure
MQCMDI_RECOVER_COMPLETED	The named CF structure has been recovered successfully. The structure is available for use again
MQCMDI_SEC_TIMER_ZERO	The Change Security command was entered with the <i>SecurityInterval</i> attribute set to 0. This means that no user timeouts occur
MQCMDI_REFRESH_CONFIGURATION	A Change Queue Manager command has been issued that enables configuration events. Event messages need to be generated to ensure that the configuration information is complete and up to date
MQCMDI_IMS_BRIDGE_SUSPENDED	The MQ-IMS bridge facility is suspended.
MQCMDI_DB2_SUSPENDED	The connection to Db2 is suspended
MQCMDI_DB2_OBSOLETE_MSGS	Obsolete Db2 messages exist in the queue sharing group

Error codes

 In z/OS, PCF commands can return MQRC reason codes instead of MQRCCF codes

MQRCCF codes are used in UNIX, Linux or Windows. At the end of most command format definitions, there is a list of error codes that might be returned by that command.

Error codes applicable to all commands

In addition to those error codes listed under each command format, any command might return the following error codes in the response format header (descriptions of the MQR*_* error codes are given in the [Messages and reason codes](#)  and [IBM MQ for z/OS messages, completion, and reason codes](#) documentation):

Reason (MQLONG)

The value can be any of the following values:

MQR*_NONE

(0, X'000') No reason to report.

MQR*_MSG_TOO_BIG_FOR_Q

(2030, X'7EE') Message length greater than maximum for queue.

MQR*_CONNECTION_BROKEN

(2009, X'7D9') Connection to queue manager lost.

MQR*_NOT_AUTHORIZED

(2035, X'7F3') Not authorized for access.

MQR*_SELECTOR_ERROR

(2067, X'813') Attribute selector not valid.

MQR*_STORAGE_NOT_AVAILABLE

(2071, X'817') Insufficient storage available.

MQR*_UNKNOWN_OBJECT_NAME

(2085, X'825') Unknown object name.

MQRCCF_ATTR_VALUE_ERROR

Attribute value not valid.

MQRCCF_CFBF_FILTER_VAL_LEN_ERROR

Filter value length not valid.

MQRCCF_CFBF_LENGTH_ERROR

Structure length not valid.

MQRCCF_CFBF_OPERATOR_ERROR

Operator error.

MQRCCF_CFBF_PARM_ID_ERROR

Parameter identifier not valid.

MQRCCF_CFBS_DUPLICATE_PARM

Duplicate parameter.

MQRCCF_CFBS_LENGTH_ERROR

Structure length not valid.

MQRCCF_CFBS_PARM_ID_ERROR

Parameter identifier not valid.

MQRCCF_CFBS_STRING_LENGTH_ERROR

String length not valid.

MQRCCF_CFGR_LENGTH_ERROR

Structure length not valid.

MQRCCF_CFGR_PARM_COUNT_ERROR

Parameter count not valid.

MQRCCF_CFGR_PARM_ID_ERROR

Parameter identifier not valid.

MQRCCF_CFH_COMMAND_ERROR
Command identifier not valid.

MQRCCF_CFH_CONTROL_ERROR
Control option not valid.

MQRCCF_CFH_LENGTH_ERROR
Structure length not valid.

MQRCCF_CFH_MSG_SEQ_NUMBER_ERR
Message sequence number not valid.

MQRCCF_CFH_PARM_COUNT_ERROR
Parameter count not valid.

MQRCCF_CFH_TYPE_ERROR
Type not valid.

MQRCCF_CFH_VERSION_ERROR
Structure version number is not valid.

MQRCCF_CFIF_LENGTH_ERROR
Structure length not valid.

MQRCCF_CFIF_OPERATOR_ERROR
Operator error.

MQRCCF_CFIF_PARM_ID_ERROR
Parameter identifier not valid.

MQRCCF_CFIL_COUNT_ERROR
Count of parameter values not valid.

MQRCCF_CFIL_DUPLICATE_VALUE
Duplicate parameter.

MQRCCF_CFIL_LENGTH_ERROR
Structure length not valid.

MQRCCF_CFIL_PARM_ID_ERROR
Parameter identifier not valid.

MQRCCF_CFIN_DUPLICATE_PARM
Duplicate parameter.

MQRCCF_CFIN_LENGTH_ERROR
Structure length not valid.

MQRCCF_CFIN_PARM_ID_ERROR
Parameter identifier not valid.

MQRCCF_CFSF_FILTER_VAL_LEN_ERROR
Filter value length not valid.

MQRCCF_CFSF_LENGTH_ERROR
Structure length not valid.

MQRCCF_CFSF_OPERATOR_ERROR
Operator error.

MQRCCF_CFSF_PARM_ID_ERROR
Parameter identifier not valid.

MQRCCF_CFSL_COUNT_ERROR
Count of parameter values not valid.

MQRCCF_CFSL_DUPLICATE_PARM
Duplicate parameter.

MQRCCF_CFSL_LENGTH_ERROR
Structure length not valid.

MQRCCF_CFSL_PARM_ID_ERROR
Parameter identifier not valid.

MQRCCF_CFSL_STRING_LENGTH_ERROR

String length value not valid.

MQRCCF_CFSL_TOTAL_LENGTH_ERROR

Total string length error.

MQRCCF_CFST_CONFLICTING_PARM

Conflicting parameters.

MQRCCF_CFST_DUPLICATE_PARM

Duplicate parameter.

MQRCCF_CFST_LENGTH_ERROR

Structure length not valid.

MQRCCF_CFST_PARM_ID_ERROR

Parameter identifier not valid.

MQRCCF_CFST_STRING_LENGTH_ERROR

String length value not valid.

MQRCCF_COMMAND_FAILED

Command failed.

MQRCCF_ENCODING_ERROR

Encoding error.

MQRCCF_MD_FORMAT_ERROR

Format not valid.

MQRCCF_MSG_SEQ_NUMBER_ERROR

Message sequence number not valid.

MQRCCF_MSG_TRUNCATED

Message truncated.

MQRCCF_MSG_LENGTH_ERROR

Message length not valid.

MQRCCF_OBJECT_NAME_ERROR

Object name not valid.

MQRCCF_OBJECT_OPEN

Object is open.

MQRCCF_PARM_COUNT_TOO_BIG

Parameter count too large.

MQRCCF_PARM_COUNT_TOO_SMALL

Parameter count too small.

MQRCCF_PARM_SEQUENCE_ERROR

Parameter sequence not valid.

MQRCCF_PARM_SYNTAX_ERROR

Syntax error found in parameter.

MQRCCF_STRUCTURE_TYPE_ERROR

Structure type not valid.

MQRCCF_UNKNOWN_OBJECT_NAME

Unknown object name.

PCF commands and responses in groups

In this product documentation, the commands and data responses are given in alphabetical order.

They can be usefully grouped as follows:

Authentication Information commands

- [“Change, Copy, and Create Authentication Information Object” on page 1351](#)

- [“Delete Authentication Information Object” on page 1482](#)
- [“Inquire Authentication Information Object” on page 1501](#)
- [“Inquire Authentication Information Object Names” on page 1507](#)

Authority Record commands

- [“Delete Authority Record on Multiplatforms” on page 1483](#)
- [“Inquire Authority Records on Multiplatforms” on page 1510](#)
- [“Inquire Authority Service on Multiplatforms” on page 1515](#)
- [“Inquire Entity Authority on Multiplatforms” on page 1625](#)
- [“Set Authority Record on Multiplatforms” on page 1809](#)

CF commands

- [“Backup CF Structure on z/OS” on page 1351](#)
- [“Change, Copy, and Create CF Structure on z/OS” on page 1360](#)
- [“Delete CF Structure on z/OS” on page 1485](#)
- [“Inquire CF Structure on z/OS” on page 1517](#)
- [“Inquire CF Structure Names on z/OS” on page 1521](#)
- [“Inquire CF Structure Status on z/OS” on page 1522](#)
- [“Recover CF Structure on z/OS” on page 1786](#)

Channel commands

- [“Change, Copy, and Create Channel” on page 1365](#)
- [“Delete Channel” on page 1485](#)
- [“Inquire Channel” on page 1527](#)
-  [“Inquire Channel Initiator on z/OS” on page 1555](#)
- [“Inquire Channel Names” on page 1566](#)
- [“Inquire Channel Status” on page 1568](#)
- [“Ping Channel” on page 1782](#)
- [“Reset Channel” on page 1793](#)
- [“Resolve Channel” on page 1802](#)
- [“Start Channel” on page 1825](#)
-  [“Start Channel Initiator” on page 1829](#)
- [“Stop Channel” on page 1833](#)
-  [“Stop Channel Initiator on z/OS” on page 1837](#)

Channel commands (MQTT)

- [“Change, Copy, and Create Channel \(MQTT\)” on page 1398](#)
- [“Delete Channel \(MQTT\)” on page 1487](#)
- [“Inquire Channel \(MQTT\)” on page 1537](#)
- [“Inquire Channel Status \(MQTT\)” on page 1581](#)
- [“Purge Channel” on page 1786](#)

- [“Start Channel \(MQTT\)” on page 1828](#)
- [“Stop Channel \(MQTT\)” on page 1836](#)

Channel Authentication commands

- [“Inquire Channel Authentication Records” on page 1550](#)
- [“Set Channel Authentication Record” on page 1813](#)

Channel Listener commands

- [“Change, Copy, and Create Channel Listener on Multiplatforms” on page 1404](#)
- [“Delete Channel Listener on Multiplatforms” on page 1487](#)
- [“Inquire Channel Listener on Multiplatforms” on page 1558](#)
- [“Inquire Channel Listener Status on Multiplatforms” on page 1562](#)
- [“Start Channel Listener” on page 1830](#)
- [“Stop Channel Listener” on page 1838](#)

Cluster commands

- [“Inquire Cluster Queue Manager” on page 1599](#)
- [“Refresh Cluster” on page 1787](#)
- [“Reset Cluster” on page 1795](#)
- [“Resume Queue Manager Cluster” on page 1804](#)
- [“Suspend Queue Manager Cluster” on page 1841](#)

Communication Information commands

- [“Change, Copy, and Create Communication Information Object on Multiplatforms” on page 1406](#)
- [“Delete Communication Information Object on Multiplatforms” on page 1487](#)
- [“Inquire Communication Information Object on Multiplatforms” on page 1611](#)

Connection commands

- [“Inquire Connection” on page 1614](#)
- [“Stop Connection on Multiplatforms” on page 1839](#)

Escape command

- [“Escape on Multiplatforms” on page 1496](#)

Namelist commands

- [“Change, Copy, and Create Namelist” on page 1409](#)
- [“Delete Namelist” on page 1488](#)
- [“Inquire Namelist” on page 1636](#)
- [“Inquire Namelist Names” on page 1640](#)

Process commands

- [“Change, Copy, and Create Process” on page 1412](#)
- [“Delete Process” on page 1489](#)
- [“Inquire Process” on page 1644](#)

- [“Inquire Process Names” on page 1647](#)

Publish/subscribe commands

- [“Change, Copy, and Create Subscription” on page 1468](#)
- [“Change, Copy, and Create Topic” on page 1472](#)
- [“Clear Topic String” on page 1481](#)
- [“Delete Subscription” on page 1494](#)
- [“Delete Topic” on page 1494](#)
- [“Inquire Pub/Sub Status” on page 1649](#)
- [“Inquire Subscription” on page 1742](#)
- [“Inquire Subscription Status” on page 1750](#)
- [“Inquire Topic” on page 1757](#)
- [“Inquire Topic Names” on page 1766](#)
- [“Inquire Topic Status” on page 1768](#)

Queue commands

- [“Change, Copy, and Create Queue” on page 1416](#)
- [“Clear Queue” on page 1480](#)
- [“Delete Queue” on page 1490](#)
- [“Inquire Queue” on page 1653](#)
- [“Inquire Queue Names” on page 1712](#)
- [“Inquire Queue Status” on page 1714](#)
-  [“Move Queue on z/OS” on page 1781](#)
- [“Reset Queue Statistics” on page 1799](#)

Queue Manager commands

- [“Change Queue Manager” on page 1433](#)
- [“Inquire Queue Manager” on page 1672](#)
- [“MQCMD_INQUIRE_Q_MGR_STATUS \(Inquire Queue Manager Status\) on Multiplatforms” on page 1707](#)
- [“Ping Queue Manager on Multiplatforms” on page 1785](#)
- [“Refresh Queue Manager” on page 1788](#)
- [“Reset Queue Manager” on page 1797](#)
-  [“Resume Queue Manager on z/OS” on page 1804](#)
-  [“Suspend Queue Manager on z/OS” on page 1841](#)

Security commands

- [“Change Security on z/OS” on page 1461](#)
- [“Inquire Security on z/OS” on page 1726](#)
- [“Refresh Security” on page 1791](#)
-  [“Reverify Security on z/OS” on page 1805](#)

Service commands

- [“Change, Copy, and Create Service on Multiplatforms” on page 1463](#)
- [“Delete Service on Multiplatforms” on page 1492](#)
- [“Inquire Service on Multiplatforms” on page 1728](#)
- [“Inquire Service Status on Multiplatforms” on page 1731](#)
- [“Start Service on Multiplatforms” on page 1832](#)
- [“Stop Service on Multiplatforms” on page 1839](#)

SMDS commands

z/OS

- [“Change SMDS on z/OS” on page 1462](#)
- [“Inquire SMDS on z/OS” on page 1734](#)
- [“Inquire SMDS Connection on z/OS” on page 1735](#)
- [“Reset SMDS on z/OS” on page 1801](#)
- [“Start SMDS Connection on z/OS” on page 1832](#)
- [“Stop SMDS Connection on z/OS” on page 1840](#)

Storage class commands

z/OS

- [“Change, Copy, and Create Storage Class on z/OS” on page 1465](#)
- [“Delete Storage Class on z/OS” on page 1493](#)
- [“Inquire Storage Class on z/OS” on page 1737](#)
- [“Inquire Storage Class Names on z/OS” on page 1740](#)

System commands

z/OS

- [“Inquire Archive on z/OS” on page 1497](#)
- [“Set Archive on z/OS” on page 1806](#)
- [“Inquire Group on z/OS” on page 1630](#)
- [“Inquire Log on z/OS” on page 1632](#)
- [“Set Log on z/OS” on page 1820](#)
- [“Inquire System on z/OS” on page 1753](#)
- [“Set System on z/OS” on page 1824](#)
- [“Inquire Usage on z/OS” on page 1776](#)

Data responses to commands

- [“Escape \(Response\) on Multiplatforms” on page 1496](#)
- [“Inquire Archive \(Response\) on z/OS” on page 1497](#)
- [“Inquire Authentication Information Object \(Response\)” on page 1504](#)
- [“Inquire Authentication Information Object Names \(Response\)” on page 1509](#)

- [“Inquire Topic Names \(Response\)” on page 1767](#)
- [“Inquire Topic Status \(Response\)” on page 1769](#)
-  [“Inquire Usage \(Response\) on z/OS” on page 1777](#)

Backup CF Structure on z/OS

The Backup CF Structure (MQCMD_BACKUP_CF_STRUC) command initiates a CF application structure backup.

Note: This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

Required parameters

CFStrucName (MQCFST)

The name of the CF application structure to be backed up (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

ExcludeInterval (MQCFIN)

Exclude interval (parameter identifier: MQIACF_EXCLUDE_INTERVAL).

Specifies a value in seconds that defines the length of time immediately before the current time where the backup starts. The backup excludes backing-up the last *n* seconds activity. For example, if 30 seconds is specified, the backup does not include the last 30 seconds worth of activity for this application-structure.

The value must be in the range 30 through 600. The default value is 30.

Change, Copy, and Create Authentication Information Object

The Change authentication information command changes attributes of an existing authentication information object. The Create and Copy authentication information commands create new authentication information objects - the Copy command uses attribute values of an existing object.

The Change authentication information (MQCMD_CHANGE_AUTH_INFO) command changes the specified attributes in an authentication information object. For any optional parameters that are omitted, the value does not change.

The Copy authentication information (MQCMD_COPY_AUTH_INFO) command creates new authentication information object using, for attributes not specified in the command, the attribute values of an existing authentication information object.

The Create authentication information (MQCMD_CREATE_AUTH_INFO) command creates an authentication information object. Any attributes that are not defined explicitly are set to the default values on the destination queue manager. A system default authentication information object exists and default values are taken from it.

Required parameters (Change authentication information)

AuthInfoName (MQCFST)

The authentication information object name (parameter identifier: MQCA_AUTH_INFO_NAME).

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

AuthInfoType (MQCFIN)

The type of authentication information object (parameter identifier: MQIA_AUTH_INFO_TYPE).

The value can be:

MQAIT_CRL_LDAP

This defines this authentication information object as specifying an LDAP server containing Certificate Revocation Lists.

MQAIT_OCSP

This value defines this authentication information object as specifying certificate revocation checking using OCSP.

AuthInfoType MQAIT_OCSP does not apply for use on IBM i or z/OS queue managers, but it can be specified on those platforms to be copied to the client channel definition table for client use.

MQAIT_IDPW_OS

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through the operating system.

MQAIT_IDPW_LDAP

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through an LDAP server.

Important: This option is not valid on z/OS.

See [Securing IBM MQ](#) for more information.

Required parameters (Copy authentication information)

FromAuthInfoName (MQCFST)

The name of the authentication information object definition to be copied from (parameter identifier: MQCACF_FROM_AUTH_INFO_NAME).

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR or MQQSGD_COPY to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToAuthInfoName* and the disposition of MQQSGD_GROUP is searched for to copy from.

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

ToAuthInfoName (MQCFST)

The name of the authentication information object to copy to (parameter identifier: MQCACF_TO_AUTH_INFO_NAME).

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

AuthInfoType (MQCFIN)

The type of authentication information object (parameter identifier: MQIA_AUTH_INFO_TYPE). The value must match the AuthInfoType of the authentication information object from which you are copying.

The value can be:

MQAIT_CRL_LDAP

This value defines this authentication information object as specifying Certificate Revocation Lists that are held on LDAP.

MQAIT_OCSP

This value defines this authentication information object as specifying certificate revocation checking using OCSP.

MQAIT_IDPW_OS

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through the operating system.

MQAIT_IDPW_LDAP

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through an LDAP server.

Important: This option is not valid on z/OS.

See [Securing IBM MQ](#) for more information.

Required parameters (Create authentication information)

AuthInfoName (MQCFST)

Authentication information object name (parameter identifier: MQCA_AUTH_INFO_NAME).

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

AuthInfoType (MQCFIN)

The type of authentication information object (parameter identifier: MQIA_AUTH_INFO_TYPE).

The following values are accepted:

MQAIT_CRL_LDAP

This value defines this authentication information object as specifying an LDAP server containing Certificate Revocation Lists.

MQAIT_OCSP

This value defines this authentication information object as specifying certificate revocation checking using OCSP.

An authentication information object with AuthInfoType MQAIT_OCSP does not apply for use on IBM i or z/OS queue managers, but it can be specified on those platforms to be copied to the client channel definition table for client use.

MQAIT_IDPW_OS

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through the operating system.

MQAIT_IDPW_LDAP

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through an LDAP server.

Important: This option is not valid on z/OS.

See [Securing IBM MQ](#) for more information.

Optional parameters (Change, Copy, and Create Authentication Information Object)

AdoptContext (MQCFIN)

Whether to use the presented credentials as the context for this application (parameter identifier MQIA_ADOPT_CONTEXT). This means that they are used for authorization checks, shown on administrative displays, and appear in messages.

MQADPCTX_YES

The user ID presented in the MQCSP structure, which has been successfully validated by password, is adopted as the context to use for this application. Therefore, this user ID will be the credentials checked for authorization to use IBM MQ resources.

If the user ID presented is an LDAP user ID, and authorization checks are done using operating system user IDs, the `ShortUser` associated with the user entry in LDAP will be adopted as the credentials for authorization checks to be done against.

MQADPCTX_NO

Authentication will be performed on the user ID and password presented in the MQCSP structure, but then the credentials will not be adopted for further use. Authorization will be performed using the user ID the application is running under.

This attribute is only valid for **AuthInfoType** of `MQAIT_IDPW_OS` and `MQAIT_IDPW_LDAP`.

The maximum length is `MQIA_ADOPT_CONTEXT_LENGTH`.

AuthInfoConnName (MQCFST)

The connection name of the authentication information object (parameter identifier: `MQCA_AUTH_INFO_CONN_NAME`).

This parameter is relevant only when `AuthInfoType` is set to `MQAIT_CRL_LDAP` or `MQAIT_IDPW_LDAP`, when it is required.

When used with an `AuthInfoType` of `MQAIT_IDPW_LDAP`, this can be a comma separated list of connection names.

Multi On [Multiplatforms](#), the maximum length is `MQ_AUTH_INFO_CONN_NAME_LENGTH`.

z/OS On z/OS, the maximum length is `MQ_LOCAL_ADDRESS_LENGTH`.

AuthInfoDesc (MQCFST)

The description of the authentication information object (parameter identifier: `MQCA_AUTH_INFO_DESC`).

The maximum length is `MQ_AUTH_INFO_DESC_LENGTH`.

AuthenticationMethod (MQCFIN)

Authentication methods for user passwords (parameter identifier: `MQIA_AUTHENTICATION_METHOD`). Possible values are:

MQAUTHENTICATE_OS

Use the traditional UNIX password verification method

This is the default value.

MQAUTHENTICATE_PAM

Use the Pluggable Authentication Method to authenticate the user passwords.

You can set the PAM value only on UNIX and Linux platforms.

This attribute is valid only for an **AuthInfoType** of `MQAIT_IDPW_OS`, and is not valid on IBM MQ for z/OS.

AuthorizationMethod (MQCFIN)

Authorization methods for the queue manager (parameter identifier: `MQIA_LDAP_AUTHORMD`). Possible values are:

MQLDAP_AUTHORMD_OS

Use operating system groups to determine permissions associated with a user.

This is how IBM MQ has previously worked, and is the default value.

MQLDAP_AUTHORMD_SEARCHGRP

A group entry in the LDAP repository contains an attribute listing the Distinguished Name of all the users belonging to that group. Membership is indicated by the attribute defined in [FindGroup](#). This value is typically *member* or *uniqueMember*.

MQLDAP_AUTHORMD_SEARCHUSR

A user entry in the LDAP repository contains an attribute listing the Distinguished Name of all the groups to which the specified user belongs. The attribute to query is defined by the [FindGroup](#) value, typically *memberOf*.

V 9.0.5

MQLDAP_AUTHORMD_SRCHGRPSN

A group entry in the LDAP repository contains an attribute listing the short user name of all the users belonging to that group. The attribute in the user record that contains the short user name is specified by [ShortUser](#).

Membership is indicated by the attribute defined in [FindGroup](#). This value is typically *memberUid*.

Note: This authorization method should only be used if all user short names are distinct.

Many LDAP servers use an attribute of the group object to determine group membership and you should, therefore, set this value to *MQLDAP_AUTHORMD_SEARCHGRP*.

Microsoft Active Directory typically stores group memberships as a user attribute. The IBM Tivoli Directory Server supports both methods.

In general, retrieving memberships through a user attribute will be faster than searching for groups that list the user as a member.

BaseDNGroup (MQCFST)

In order to be able to find group names, this parameter must be set with the base DN to search for groups in the LDAP server (parameter identifier: MQCA_LDAP_BASE_DN_GROUPS).

The maximum length is MQ_LDAP_BASE_DN_LENGTH.

BaseDNUser (MQCFST)

In order to be able to find the short user name attribute (see [ShortUser](#)) this parameter must be set with the base DN to search for users within the LDAP server (parameter identifier: MQCA_LDAP_BASE_DN_USERS).

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_LDAP* and is mandatory.

The maximum length is MQ_LDAP_BASE_DN_LENGTH.

Checkclient (MQCFIN)

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_OS* or *MQAIT_IDPW_LDAP* (parameter identifier: MQIA_CHECK_CLIENT_BINDING). The possible values are:

MQCHK_NONE

Switches off checking.

MQCHK_OPTIONAL

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

MQCHK_REQUIRED

Requires that all applications provide a valid user ID and password.

MQCHK_REQUIRED_ADMIN

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the OPTIONAL setting.

A privileged user is one that has full administrative authorities for IBM MQ. See [Privileged users](#) for more information.

z/OS (This setting is not allowed on z/OS systems.)

Checklocal (MQCFIN)

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_OS* or *MQAIT_IDPW_LDAP* (parameter identifier: MQIA_CHECK_LOCAL_BINDING). The possible values are:

MQCHK_NONE

Switches off checking.

MQCHK_OPTIONAL

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

MQCHK_REQUIRED

Requires that all applications provide a valid user ID and password.

z/OS If your user ID has UPDATE access to the BATCH profile in the MQCONN class, you can treat **MQCHK_REQUIRED** as if it is **MQCHK_OPTIONAL**. That is, you do not have to supply a password, but if you do, the password must be the correct one.

MQCHK_REQUIRED_ADMIN

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the OPTIONAL setting. **z/OS** (This setting is not allowed on z/OS systems.)

ClassGroup (MQCFST)

The LDAP object class used for group records in the LDAP repository (parameter identifier: MQCA_LDAP_GROUP_OBJECT_CLASS).

If the value is blank, **groupOfNames** is used.

Other commonly used values include *groupOfUniqueNames* or *group*.

The maximum length is MQ_LDAP_CLASS_LENGTH.

Classuser (MQCFST)

The LDAP object class used for user records in the LDAP repository (parameter identifier MQCA_LDAP_USER_OBJECT_CLASS).

If blank, the value defaults to *inetOrgPerson*, which is generally the value needed.

For Microsoft Active Directory, the value you require required is often *user*.

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_LDAP*.

z/OS CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

FailureDelay (MQCFIN)

When a user ID and password are provided for connection authentication, and the authentication fails due to the user ID or password being incorrect, this is the delay, in seconds, before the failure is returned to the application (parameter identifier: MQIA_AUTHENTICATION_FAIL_DELAY).

This can aid in avoiding busy loops from an application that simply retries, continuously, after receiving a failure.

The value must be in the range 0 - 60 seconds. The default value is 1.

This parameter is valid only for an **AuthInfoType** of *MQAIT_IDPW_OS* or *MQAIT_IDPW_LDAP*.

FindGroup (MQCFST)

Name of the attribute used within an LDAP entry to determine group membership (parameter identifier: MQCA_LDAP_FIND_GROUP_FIELD).

When `AuthorizationMethod = MQLDAP_AUTHORMD_SEARCHGRP`, this attribute is typically set to `member` or `uniqueMember`.

When `AuthorizationMethod = MQLDAP_AUTHORMD_SEARCHUSR`, this attribute is typically set to `memberOf`.

V 9.0.5 When `AuthorizationMethod = MQLDAP_AUTHORMD_SRCHGRPSN`, this attribute is typically set to `memberUid`.

When left blank, if:

- `AuthorizationMethod = MQLDAP_AUTHORMD_SEARCHGRP`, this attribute defaults to `memberOf`.
- `AuthorizationMethod = MQLDAP_AUTHORMD_SEARCHUSR`, this attribute defaults to `member`.
- **V 9.0.5** `AuthorizationMethod = MQLDAP_AUTHORMD_SRCHGRPSN`, this attribute defaults to `memberUid`.

The maximum length is MQ_LDAP_FIELD_LENGTH.

GroupField (MQCFST)

LDAP attribute that represents a simple name for the group (parameter identifier: MQCA_LDAP_GROUP_ATTR_FIELD).

If the value is blank, commands like `setmqaut` must use a qualified name for the group. The value can either be a full DN, or a single attribute.

The maximum length is MQ_LDAP_FIELD_LENGTH.

GroupNesting (MQCFIN)

Whether groups are members of other groups (parameter identifier: MQIA_LDAP_NESTGRP). The values can be:

MQLDAP_NESTGRP_NO

Only the initially discovered groups are considered for authorization.

MQLDAP_NESTGRP_YES

The group list is searched recursively to enumerate all the groups to which a user belongs.

The group's Distinguished Name is used when searching the group list recursively, regardless of the authorization method selected in `AuthorizationMethod`.

LDAPPassword (MQCFST)

The LDAP password (parameter identifier: MQCA_LDAP_PASSWORD).

This parameter is relevant only when `AuthInfoType` is set to `MQAIT_CRL_LDAP` or `MQAIT_IDPW_LDAP`.

The maximum length is MQ_LDAP_PASSWORD_LENGTH.

LDAPUserName (MQCFST)

The LDAP user name (parameter identifier: MQCA_LDAP_USER_NAME).

This parameter is relevant only when `AuthInfoType` is set to `MQAIT_CRL_LDAP` or `MQAIT_IDPW_LDAP`.

Multi On `Multiplatforms`, the maximum length is MQ_DISTINGUISHED_NAME_LENGTH.

z/OS On `z/OS`, the maximum length is MQ_SHORT_DNAME_LENGTH.

OCSPResponderURL (MQCFST)

The URL at which the OCSP responder can be contacted (parameter identifier: MQCA_AUTH_INFO_OCSP_URL).

This parameter is relevant only when `AuthInfoType` is set to `MQAIT_OCSP`, when it is required.

This field is case-sensitive. It must start with the string `http://` in lowercase. The rest of the URL might be case sensitive, depending on the OCSP server implementation.

The maximum length is `MQ_AUTH_INFO_OCSP_URL_LENGTH`.

z/OS QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: `MQIA_QSG_DISP`). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter <code>MQQSGD_COPY</code> . Any object residing in the shared repository, or any object defined using a command that had the parameter <code>MQQSGD_Q_MGR</code> , is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the <code>MQQSGD_GROUP</code> object of the same name as the <i>ToAuthInfoName</i> object (for Copy) or the <i>AuthInfoName</i> object (for Create).
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter <code>MQQSGD_GROUP</code>. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they refresh local copies on page set zero:</p> <pre>DEFINE AUTHINFO(name) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with <code>QSGDISP(COPY)</code> fails.</p>	<p>The object definition resides in the shared repository. This definition is allowed only if the queue manager is in a queue sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group so that they make or refresh local copies on page set zero:</p> <pre>DEFINE AUTHINFO(name) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with <code>QSGDISP(COPY)</code> fails.</p>
MQQSGD_PRIVATE	The object resides on the page set of the queue manager that executes the command, and was defined with <code>MQQSGD_Q_MGR</code> , or <code>MQQSGD_COPY</code> . Any object residing in the shared repository is unaffected.	Not permitted.
MQQSGD_Q_MGR	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter <code>MQQSGD_Q_MGR</code> . Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.	The object is defined on the page set of the queue manager that executes the command. This value is the default value.

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If an Authentication Information object with the same name as AuthInfoName or ToAuthInfoName exists, it specifies whether it is to be replaced. The value can be any of the following values:

MQRP_YES

Replace existing definition

MQRP_NO

Do not replace existing definition

SecureComms (MQCFIN)

Whether connectivity to the LDAP server should be done securely using TLS (parameter identifier MQIA_LDAP_SECURE_COMM).

MQSECCOMM_YES

Connectivity to the LDAP server is made securely using TLS.

The certificate used is the default certificate for the queue manager, named in CERTLABL on the queue manager object, or if that is blank, the one described in [Digital certificate labels, understanding the requirements](#).

The certificate is located in the key repository specified in SSLKEYR on the queue manager object. A cipherspec will be negotiated that is supported by both IBM MQ and the LDAP server.

If the queue manager is configured to use SSLFIPS(YES) or SUITEB cipher specs, then this is taken account of in the connection to the LDAP server as well.

MQSECCOMM_ANON

Connectivity to the LDAP server is made securely using TLS just as for MQSECCOMM_YES with one difference.

No certificate is sent to the LDAP server; the connection will be made anonymously. To use this setting, ensure that the key repository specified in SSLKEYR, on the queue manager object, does not contain a certificate marked as the default.

MQSECCOMM_NO

Connectivity to the LDAP server does not use TLS.

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_LDAP*.

ShortUser (MQCFST)

A field in the user record to be used as a short user name in IBM MQ (parameter identifier MQCA_LDAP_SHORT_USER_FIELD).

This field must contain values of 12 characters or less. This short user name is used for the following purposes:

- If LDAP authentication is enabled, but LDAP authorization is not enabled, this is used as an operating system user ID for authorization checks. In this case, the attribute must represent an operating system user ID.
- If LDAP authentication and authorization are both enabled, this is used as the user ID carried with the message in order for the LDAP user name to be rediscovered when the user ID inside the message needs to be used.

For example, on another queue manager, or when writing report messages. In this case, the attribute does not need to represent an operating system user ID, but must be a unique string. An employee serial number is an example of a good attribute for this purpose.

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_LDAP* and is mandatory.

The maximum length is MQ_LDAP_FIELD_LENGTH.

UserField (MQCFST)

If the user ID provided by an application for authentication does not contain a qualifier for the field in the LDAP user record, that is, it does not contain an '=' sign, this attribute identifies the

field in the LDAP user record that is used to interpret the provided user ID (parameter identifier MQCA_LDAP_USER_ATTR_FIELD).

This field can be blank. If this is the case, any unqualified user IDs use the ShortUser field to interpret the provided user ID.

The contents of this field will be concatenated with an '=' sign, together with the value provided by the application, to form the full user ID to be located in an LDAP user record. For example, the application provides a user of fred and this field has the value cn, then the LDAP repository will be searched for cn=fred.

The maximum length is MQ_LDAP_FIELD_LENGTH.

Change, Copy, and Create CF Structure on z/OS

The Change CF Structure command changes existing CF application structures. The Copy and Create CF Structure commands create new CF application structures - the Copy command uses attribute values of an existing CF application structure.

Note: These commands are supported only on z/OS when the queue manager is a member of a queue sharing group.

The Change CF Structure (MQCMD_CHANGE_CF_STRUC) command changes the specified attributes in a CF application structure. For any optional parameters that are omitted, the value does not change.

The Copy CF Structure (MQCMD_COPY_CF_STRUC) command creates new CF application structure using, for attributes not specified in the command, the attribute values of an existing CF application structure.

The Create CF Structure (MQCMD_CREATE_CF_STRUC) command creates a CF application structure. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameters (Change and Create CF Structure)

CFStrucName (MQCFST)

The name of the CF application structure with backup and recovery parameters that you want to define (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

Required parameters (Copy CF Structure)

FromCFStrucName (MQCFST)

The name of the CF application structure to be copied from (parameter identifier: MQCACF_FROM_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

ToCFStrucName (MQCFST)

The name of the CF application structure to copy to (parameter identifier: MQCACF_TO_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters (Change, Copy, and Create CF Structure)

CFConlos (MQCFIN)

CFConlos (parameter identifier: MQIA_CF_CFCONLOS).

Specifies the action to be taken when a queue manager loses connectivity to the CF structure. The following constant names are valid values for CFConlos:

MQCFCONLOS_ASQMGR

The action taken is based on the setting of the CFCONLOS queue manager attribute. This value is the default for newly created CF structure objects with CFLEVEL(5).

MQCFCONLOS_TERMINATE

The queue manager terminates when connectivity to the structure is lost. This value is the default if the CF structure object is not at CFLEVEL(5), and for existing CF structure objects that are changed to CFLEVEL(5).

MQCFCONLOS_TOLERATE

The queue manager tolerates loss of connectivity to the structure without terminating.

This parameter is only valid from CFLEVEL(5).

CFLevel (MQCFIN)

The functional capability level for this CF application structure (parameter identifier: MQIA_CF_LEVEL).

Specifies the functional capability level for the CF application structure. The value can be any of the following values:

1

A CF structure that can be "auto-created" by a queue manager at command level 520.

2

A CF structure at command level 520 that can only be created or deleted by a queue manager at command level 530 or greater.

3

A CF structure at command level 530. This *CFLevel* is required if you want to use persistent messages on shared queues, or for message grouping, or both. This level is the default *CFLevel* for queue managers at command level 600.

You can only increase the value of *CFLevel* to 3 if all the queue managers in the queue sharing group are at command level 530 or greater - this restriction is to ensure that there are no latent command level 520 connections to queues referencing the CF structure.

You can only decrease the value of *CFLevel* from 3 if all the queues that reference the CF structure are both empty (have no messages or uncommitted activity) and closed.

4

This *CFLevel* supports all the *CFLevel* (3) functions. *CFLevel* (4) allows queues defined with CF structures at this level to have messages with a length greater than 63 KB.

Only a queue manager with a command level of 600 can connect to a CF structure at *CFLevel* (4).

You can only increase the value of *CFLevel* to 4 if all the queue managers in the queue sharing group are at command level 600 or greater.

You can only decrease the value of *CFLevel* from 4 if all the queues that reference the CF structure are both empty (have no messages or uncommitted activity) and closed.

5

This *CFLevel* supports all the *CFLevel* (4) functions. *CFLevel* (5) allows persistent, and nonpersistent messages to be selectively stored in Db2 or shared message data sets.

Only queue managers with a command level of 710 or higher and with OPMODE set to enable IBM WebSphere MQ 7.1.0 new functions can connect to a CF structure at *CFLevel* (5).

Structures are required to be at CFLEVEL(5) to support toleration of loss of connectivity.

Z/OS

For more information, see [Where are shared queue messages held?](#)

CFStrucDesc (MQCFST)

The description of the CF structure (parameter identifier: MQCA_CF_STRUC_DESC).

The maximum length is MQ_CF_STRUC_DESC_LENGTH.

DSBlock (MQCFIN)

The logical block size for shared message data sets (parameter identifier: MQIACF_CF_SMDS_BLOCK_SIZE).

The unit in which shared message data set space is allocated to individual queues. The value can be any of the following values:

MQDSB_8K

The logical block size is set to 8 K.

MQDSB_16K

The logical block size is set to 16K.

MQDSB_32K

The logical block size is set to 32 K.

MQDSB_64K

The logical block size is set to 64 K.

MQDSB_128K

The logical block size is set to 128 K.

MQDSB_256K

The logical block size is set to 256 K.

MQDSB_512K

The logical block size is set to 512 K.

MQDSB_1024K

The logical block size is set to 1024 K.

MQDSB_1M

The logical block size is set to 1 M.

Value can not be set unless CFLEVEL(5) is defined.

The default value is 256 K unless CFLEVEL is not 5. In this case a value of 0 is used.

DSBufs (MQCFIN)

The shared message data set buffers group (parameter identifier: MQIA_CF_SMDS_BUFFERS).

Specifies the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

A value in the range 1 - 9999.

Value can not be set unless CFLEVEL(5) is defined.

DSEXPA ND (MQCFIN)

The shared message data set expand option (parameter identifier: MQIACF_CF_SMDS_EXPAND).

Specifies whether or not the queue manager should expand a shared message data set when it is nearly full, and further blocks are required in the data set. The value can be any of the following values:

MQDSE_YES

The data set can be expanded.

MQDSE_NO

The data set cannot be expanded.

MQDSE_DEFAULT

Only returned on DISPLAY CFSTRUCT when not explicitly set

Value can not be set unless CFLEVEL(5) is defined.

DSGroup (MQCFST)

The shared message data set group name (parameter identifier: MQCACF_CF_SMDS_GENERIC_NAME).

Specifies a generic data set name to be used for the group of shared message data sets associated with this CF structure.

The string must contain exactly one asterisk (*), which will be replaced with the queue manager name of up to 4 characters.

The maximum length of this parameter is 44 characters.

Value can not be set unless CFLEVEL(5) is defined.

Offload (MQCFIN)

Offload (parameter identifier: MQIA_CF_OFFLOAD).

Specifies the OFFLOAD option for large (>63 K) shared messages on z/OS. The value can be:

MQCFOFFLD_DB2

Large shared messages can be stored in Db2.

MQCFOFFLD_SMDS

Large shared messages can be stored in z/OS shared message data sets.

MQCFOFFLD_NONE

Used when the property *Offload* has not been explicitly set.

Value can not be set unless CFLEVEL(5) is defined.

The default value is MQCFOFFLD_NONE if not at CFLEVEL(5).

For existing CF structure objects that are changed to CFLEVEL(5) the default is MQCFOFFLD_DB2.

For newly created CF structure objects with CFLEVEL(5) the default is MQCFOFFLD_SMDS.

 For more information about the group of parameters (*OFFLDxSZ* and *OFFLDxTH*), see [Specifying offload options for shared message data sets](#)

OFFLD1SZ (MQCFST)

The offload size property 1 (Parameter identifier: MQCACF_CF_OFFLOAD_SIZE1)

Specifies the first offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the size of the messages to be offloaded. The property is specified as a string with values in the range 0K - 64K.

The default value is 32K. This property is used with *OFFLD1TH*.

Value can not be set unless CFLEVEL(5) is defined.

The value 64K indicates that the rule is not being used.

The maximum length is 3.

OFFLD2SZ (MQCFST)

The offload size property 2 (Parameter identifier: MQCACF_CF_OFFLOAD_SIZE2)

Specifies the second offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the size of the messages to be offloaded. The property is specified as a string with values in the range 0K - 64K.

The default value is 4K. This property is used with *OFFLD2TH*.

Value can not be set unless CFLEVEL(5) is defined.

The value 64K indicates that the rule is not being used.

The maximum length is 3.

OFFLD3SZ (MQCFST)

The offload size property 3 (Parameter identifier: MQCACF_CF_OFFLOAD_SIZE3)

Specifies the third offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the size of the messages to be offloaded. The property is specified as a string with values in the range 0K - 64K.

The default value is 0K. This property is used with *OFFLD3TH*.

Value can not be set unless CFLEVEL(5) is defined.

The value 64K indicates that the rule is not being used.

The maximum length is 3.

OFFLD1TH (MQCFIN)

The offload threshold property 1 (Parameter identifier: MQIA_CF_OFFLOAD_THRESHOLD1)

Specifies the first offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the coupling facility structure percentage full.

The default value is 70. This property is used with *OFFLD1SZ*.

Value can not be set unless CFLEVEL(5) is defined.

OFFLD2TH (MQCFIN)

The offload threshold property 2 (Parameter identifier: MQIA_CF_OFFLOAD_THRESHOLD2)

Specifies the second offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the coupling facility structure percentage full.

The default value is 80. This property is used with *OFFLD2SZ*.

Value can not be set unless CFLEVEL(5) is defined.

OFFLD3TH (MQCFIN)

The offload threshold property 3 (Parameter identifier: MQIA_CF_OFFLOAD_THRESHOLD3)

Specifies the third offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the coupling facility structure percentage full.

The default value is 90. This property is used with *OFFLD3SZ*.

Value can not be set unless CFLEVEL(5) is defined.

Recauto (MQCFIN)

Recauto (parameter identifier: MQIA_CF_RECAUTO).

Specifies the automatic recovery action to be taken, when a queue manager detects that the structure is failed or when a queue manager loses connectivity to the structure, and no systems in the SysPlex have connectivity to the Coupling Facility that the structure is allocated in. The value can be:

MQRECAUTO_YES

The structure and associated shared message data sets which also need recovery are automatically recovered. This value is the default for newly created CF structure objects with CFLEVEL(5).

MQRECAUTO_NO

The structure is not automatically recovered. This value is the default if the CF structure object is not at CFLEVEL(5), and for existing CF structure objects that are changed to CFLEVEL(5).

Recovery (MQCFIN)

Recovery (parameter identifier: MQIA_CF_RECOVER).

Specifies whether CF recovery is supported for the application structure. The value can be:

MQCFR_YES

Recovery is supported.

MQCFR_NO

Recovery is not supported.

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If a CF structure definition with the same name as *ToCFStrucName* exists, this value specifies whether it is to be replaced. The value can be any of the following values:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

Change, Copy, and Create Channel

The Change Channel command changes existing channel definitions. The Copy and Create Channel commands create new channel definitions - the Copy command uses attribute values of an existing channel definition.

The Change Channel (MQCMD_CHANGE_CHANNEL) command changes the specified attributes in a channel definition. For any optional parameters that are omitted, the value does not change.

The Copy Channel (MQCMD_COPY_CHANNEL) command creates new channel definition using, for attributes not specified in the command, the attribute values of an existing channel definition.

The Create Channel (MQCMD_CREATE_CHANNEL) command creates an IBM MQ channel definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager. If a system default channel exists for the type of channel being created, the default values are taken from there.

The following table shows the parameters that are applicable to each type of channel.

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	V 9.0.0 AMQP

Note:

1. Required parameter on Change and Create Channel commands.
2. Required parameter on Copy Channel command.
3. Required parameter on Change, Create, and Copy Channel commands.
4. PUTAUT is valid for a channel type of SVRCONN on z/OS only.
5. Required parameter on Create Channel command if TrpType is TCP.
6. Required parameter on Create Channel command for a channel type of MQTT.

Required parameters (Change, Create Channel)

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Specifies the name of the channel definition to be changed, or created

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

This parameter is required on all types of channel; on a CLUSSDR it can be different from on the other channel types. If your convention for naming channels includes the name of the queue manager, you can make a CLUSSDR definition using the +QMNAME+ construction, and IBM MQ substitutes the correct repository queue manager name in place of +QMNAME+. This facility applies only to IBM i, UNIX, Linux, and Windows only. See [Configuring a queue manager cluster](#) for more details.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

MQCHT_SENDER

Sender.

MQCHT_SERVER

Server.

MQCHT_RECEIVER

Receiver.

MQCHT_REQUESTER

Requester.

MQCHT_SVRCONN

Server-connection (for use by clients).

MQCHT_CLNTCONN

Client connection.

MQCHT_CLUSRCVR

Cluster-receiver.

MQCHT_CLUSSDR

Cluster-sender.

V 9.0.0 MQCHT_AMQP
AMQP.

Required parameters (Copy Channel)

FromChannelName (MQCFST)

From channel name (parameter identifier: MQCACF_FROM_CHANNEL_NAME).

The name of the existing channel definition that contains values for the attributes that are not specified in this command.

z/OS On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR or MQQSGD_COPY to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToChannelName* and the disposition MQQSGD_GROUP is searched for to copy from.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

MQCHT_SENDER

Sender.

MQCHT_SERVER

Server.

MQCHT_RECEIVER

Receiver.

MQCHT_REQUESTER

Requester.

MQCHT_SVRCONN

Server-connection (for use by clients).

MQCHT_CLNTCONN

Client connection.

MQCHT_CLUSRCVR

Cluster-receiver.

MQCHT_CLUSSDR

Cluster-sender.

V 9.0.0 MQCHT_AMQP
AMQP.

ToChannelName (MQCFST)

To channel name (parameter identifier: MQCACF_TO_CHANNEL_NAME).

The name of the new channel definition.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Channel names must be unique; if a channel definition with this name exists, the value of *Replace* must be MQRP_YES. The channel type of the existing channel definition must be the same as the channel type of the new channel definition otherwise it cannot be replaced.

Optional parameters (Change, Copy, and Create Channel)

V 9.0.0 AMQPKeepAlive (MQCFIN)

The AMQP channel keep alive interval (parameter identifier: MQIACH_AMQP_KEEP_ALIVE).

The keep alive time for an AMQP channel in milliseconds. If the AMQP client has not sent any frames within the keep alive interval, then the connection is closed with a `amqp:resource-limit-exceeded` AMQP error condition.

This parameter is valid only for *ChannelType* values of `MQCHT_AMQP`.

BatchHeartbeat (MQCFIN)

The batch heartbeat interval (parameter identifier: `MQIACH_BATCH_HB`).

Batch heartbeating allows sender-type channels to determine whether the remote channel instance is still active, before going in-doubt. The value can be in the range 0 - 999999. A value of 0 indicates that batch heart-beating is not to be used. Batch heartbeat is measured in milliseconds.

This parameter is valid only for *ChannelType* values of `MQCHT_SENDER`, `MQCHT_SERVER`, `MQCHT_CLUSSDR`, or `MQCHT_CLUSRCVR`.

BatchInterval (MQCFIN)

Batch interval (parameter identifier: `MQIACH_BATCH_INTERVAL`). The approximate time in milliseconds that a channel keeps a batch open, if fewer than `BatchSize` messages or `BatchDataLimit` bytes have been transmitted in the current batch.

The batch is terminated when one of the following conditions is met:

- `BatchSize` messages have been sent.
- `BatchDataLimit` bytes have been sent.
- The transmission queue is empty and `BatchInterval` milliseconds have elapsed since the start of the batch.

`BatchInterval` must be in the range 0 - 999999999. A value of zero means that the batch is terminated as soon as the transmission queue becomes empty, or the `BatchSize` or `BatchDataLimit` is reached.

This parameter applies only to channels with a *ChannelType* of: `MQCHT_SENDER`, `MQCHT_SERVER`, `MQCHT_CLUSSDR`, or `MQCHT_CLUSRCVR`.

BatchDataLimit (MQCFIN)

Batch data limit (parameter identifier: `MQIACH_BATCH_DATA_LIMIT`).

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

The value must be in the range 0 - 999999. The default value is 5000.

The **BATCHLIM** parameter is supported on all platforms.

This parameter only applies to channels with a *ChannelType* of `MQCHT_SENDER`, `MQCHT_SERVER`, `MQCHT_CLUSRCVR`, or `MQCHT_CLUSSDR`.

BatchSize (MQCFIN)

Batch size (parameter identifier: `MQIACH_BATCH_SIZE`).

The maximum number of messages that must be sent through a channel before a checkpoint is taken.

The batch size which is used is the lowest of the following:

- The *BatchSize* of the sending channel
- The *BatchSize* of the receiving channel
- The maximum number of uncommitted messages at the sending queue manager
- The maximum number of uncommitted messages at the receiving queue manager

The maximum number of uncommitted messages is specified by the **MaxUncommittedMsgs** parameter of the Change Queue Manager command.

Specify a value in the range 1 - 9999.

This parameter is not valid for channels with a *ChannelType* of MQCHT_SVRCONN or MQCHT_CLNTCONN.

CertificateLabel (MQCFST)

Certificate label (parameter identifier: MQCA_CERT_LABEL).

Certificate label for this channel to use.

The label identifies which personal certificate in the key repository is sent to the remote peer. If this attribute is blank, the certificate is determined by the queue manager **CertificateLabel** parameter.

Note that inbound channels (including receiver, requester, cluster-receiver, unqualified server, and server-connection channels) only send the configured certificate if the IBM MQ version of the remote peer fully supports certificate label configuration, and the channel is using a TLS CipherSpec.

An unqualified server channel is one that does not have the **ConnectionName** field set.

In all other cases, the queue manager **CertificateLabel** parameter determines the certificate sent. In particular, the following only ever receive the certificate configured by the **CertificateLabel** parameter of the queue manager, regardless of the channel-specific label setting:

- All current Java and JMS clients.
- Versions of IBM MQ prior to IBM MQ 8.0.

ChannelDesc (MQCFST)

Channel description (parameter identifier: MQCACH_DESC).

The maximum length of the string is MQ_CHANNEL_DESC_LENGTH.

Use characters from the character set, identified by the coded character set identifier (CCSID) for the message queue manager on which the command is executing, to ensure that the text is translated correctly.

ChannelMonitoring (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA_MONITORING_CHANNEL).

Specifies whether online monitoring data is to be collected and, if so, the rate at which the data is collected. The value can be any of the following values:

MQMON_OFF

Online monitoring data collection is turned off for this channel.

MQMON_Q_MGR

The value of the queue manager's **ChannelMonitoring** parameter is inherited by the channel.

MQMON_LOW

If the value of the queue manager's *ChannelMonitoring* parameter is not MQMON_NONE, online monitoring data collection is turned on, with a low rate of data collection, for this channel.

MQMON_MEDIUM

If the value of the queue manager's *ChannelMonitoring* parameter is not MQMON_NONE, online monitoring data collection is turned on, with a moderate rate of data collection, for this channel.

MQMON_HIGH

If the value of the queue manager's *ChannelMonitoring* parameter is not MQMON_NONE, online monitoring data collection is turned on, with a high rate of data collection, for this channel.

ChannelStatistics (MQCFIN)

Statistics data collection (parameter identifier: MQIA_STATISTICS_CHANNEL).

Specifies whether statistics data is to be collected and, if so, the rate at which the data is collected. The value can be:

MQMON_OFF

Statistics data collection is turned off for this channel.

MQMON_Q_MGR

The value of the queue manager's **ChannelStatistics** parameter is inherited by the channel.

MQMON_LOW

If the value of the queue manager's *ChannelStatistics* parameter is not MQMON_NONE, online monitoring data collection is turned on, with a low rate of data collection, for this channel.

MQMON_MEDIUM

If the value of the queue manager's *ChannelStatistics* parameter is not MQMON_NONE, online monitoring data collection is turned on, with a moderate rate of data collection, for this channel.

MQMON_HIGH

If the value of the queue manager's *ChannelStatistics* parameter is not MQMON_NONE, online monitoring data collection is turned on, with a high rate of data collection, for this channel.

 On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

ClientChannelWeight (MQCFIN)

Client Channel Weight (parameter identifier: MQIACH_CLIENT_CHANNEL_WEIGHT).

The client channel weighting attribute is used so client channel definitions can be selected at random, with the larger weightings having a higher probability of selection, when more than one suitable definition is available.

Specify a value in the range 0 - 99. The default is 0.

This parameter is only valid for channels with a ChannelType of MQCHT_CLNTCONN

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

The name of the cluster to which the channel belongs.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT_CLUSSDR
- MQCHT_CLUSRCVR

Only one of the values of *ClusterName* and *ClusterNameList* can be nonblank; the other must be blank.

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

ClusterNameList (MQCFST)

Cluster namelist (parameter identifier: MQCA_CLUSTER_NAMELIST).

The name, of the namelist, that specifies a list of clusters to which the channel belongs.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT_CLUSSDR
- MQCHT_CLUSRCVR

Only one of the values of *ClusterName* and *ClusterNameList* can be nonblank; the other must be blank.

CLWLChannelPriority (MQCFIN)

Channel priority for the purposes of cluster workload distribution (parameter identifier: MQIACH_CLWL_CHANNEL_PRIORITY).

Specify a value in the range 0 - 9 where 0 is the lowest priority and 9 is the highest.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT_CLUSSDR

- MQCHT_CLUSRCVR

CLWLChannelRank (MQCFIN)

Channel rank for the purposes of cluster workload distribution (parameter identifier: MQIACH_CLWL_CHANNEL_RANK).

Specify a value in the range 0 - 9 where 0 is the lowest priority and 9 is the highest.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT_CLUSSDR
- MQCHT_CLUSRCVR

CLWLChannelWeight (MQCFIN)

Channel weighting for the purposes of cluster workload distribution (parameter identifier: MQIACH_CLWL_CHANNEL_WEIGHT).

Specify a weighting for the channel for use in workload management. Specify a value in the range 1 - 99 where 1 is the lowest priority and 99 is the highest.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT_CLUSSDR
- MQCHT_CLUSRCVR

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

ConnectionAffinity (MQCFIN)

Channel Affinity (parameter identifier: MQIACH_CONNECTION_AFFINITY)

The channel affinity attribute specifies whether client applications that connect multiple times using the same queue manager name, use the same client channel. The value can be any of the following values:

MQCAFTY_PREFERRED

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any zero ClientChannelWeight definitions first in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful nonzero ClientChannelWeight definitions are moved to the end of the list. Zero ClientChannelWeight definitions remain at the start of the list and are selected first for each connection. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created. Each client process with the same host name creates the same list.

This value is the default value.

MQCAFTY_NONE

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process independently select an applicable definition based on the weighting with any applicable zero ClientChannelWeight definitions selected first in alphabetical order. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created.

This parameter is only valid for channels with a ChannelType of MQCHT_CLNTCONN.

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

Multi On Multiplatforms, the maximum length of the string is 264.

z/OS On z/OS, the maximum length of the string is 48.

Specify *ConnectionName* as a comma-separated list of names of machines for the stated *TransportType*. Typically, only one machine name is required. You can provide multiple machine names to configure multiple connections with the same properties. The connections are tried in the order they are specified in the connection list until a connection is successfully established. If no connection is successful, the channel starts to try processing again. Connection lists are an alternative to queue manager groups to configure connections for reconnectable clients, and also to configure channel connections to multi-instance queue managers.

Specify the name of the machine as required for the stated *TransportType*:

- For MQXPT_LU62 on IBM i, and UNIX, specify the name of the CPI-C communications side object. On Windows specify the CPI-C symbolic destination name.

z/OS On z/OS, there are two forms in which to specify the value:

Logical unit name

The logical unit information for the queue manager, comprising the logical unit name, TP name, and optional mode name. This name can be specified in one of three forms:

Form	Example
luname	IGY12355
luname/TPname	IGY12345/APING
luname/TPname/modename	IGY12345/APINGD/#!/INTER

For the first form, the TP name and mode name must be specified for the *TpName* and *ModeName* parameters; otherwise these parameters must be blank.

Note: For client-connection channels, only the first form is allowed.

Symbolic name

The symbolic destination name for the logical unit information for the queue manager, as defined in the side information data set. The **TpName** and **ModeName** parameters must be blank.

Note: For cluster-receiver channels, the side information is on the other queue managers in the cluster. Alternatively, in this case it can be a name that a channel auto-definition exit can resolve into the appropriate logical unit information for the local queue manager.

The specified or implied LU name can be that of a VTAM generic resources group.

- For MQXPT_TCP, you can specify a connection name, or a connection list, containing the host name or the network address of the remote machine. Separate connection names in a connection list with commas.

z/OS On z/OS, the connection name can include the IP_name of a z/OS dynamic DNS group or a network dispatcher input port. Do not include this parameter for channels with a *ChannelType* value of MQCHT_CLUSSDR.

Multi On Multiplatforms, the TCP/IP connection name parameter of a cluster-receiver channel is optional. If you leave the connection name blank, IBM MQ generates a connection name for you, assuming the default port and using the current IP address of the system. You can override the default port number, but still use the current IP address of the system. For each connection name leave the IP name blank, and provide the port number in parentheses; for example:

```
(1415)
```

The generated **CONNNAME** is always in the dotted decimal (IPv4) or hexadecimal (IPv6) form, rather than in the form of an alphanumeric DNS host name.

- For MQXPT_NETBIOS specify the NetBIOS station name.
- For MQXPT_SPX specify the 4 byte network address, the 6 byte node address, and the 2 byte socket number. These values must be entered in hexadecimal, with a period separating the network and node addresses. The socket number must be enclosed in brackets, for example:

```
0a0b0c0d.804abcde23a1(5e86)
```

If the socket number is omitted, the IBM MQ default value (5e86 hex) is assumed.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_REQUESTER, MQCHT_CLNTCONN, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

Note: If you are using clustering between IPv6 -only and IPv4 -only queue managers, do not specify an IPv6 network address as the *ConnectionName* for cluster-receiver channels. A queue manager that is capable only of IPv4 communication is unable to start a cluster sender channel definition that specifies the *ConnectionName* in IPv6 hexadecimal form. Consider, instead, using host names in a heterogeneous IP environment.

DataConversion (MQCFIN)

Whether sender must convert application data (parameter identifier: MQIACH_DATA_CONVERSION).

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

The value can be any of the following values:

MQCDC_NO_SENDER_CONVERSION

No conversion by sender.

MQCDC_SENDER_CONVERSION

Conversion by sender.

DefaultChannelDisposition (MQCFIN)

Intended disposition of the channel when activated or started (parameter identifier: MQIACH_DEF_CHANNEL_DISP).

This parameter applies to z/OS only.

The value can be any of the following values:

MQCHLD_PRIVATE

The intended use of the object is as a private channel.

This value is the default value.

MQCHLD_FIXSHARED

The intended use of the object is as a fixshared channel.

MQCHLD_SHARED

The intended use of the object is as a shared channel.

DefReconnect (MQCFIN)

Client channel default reconnection option (parameter identifier: MQIACH_DEF_RECONNECT).

The default automatic client reconnection option. You can configure an IBM MQ MQI client to automatically reconnect a client application. The IBM MQ MQI client tries to reconnect to a queue

manager after a connection failure. It tries to reconnect without the application client issuing an MQCONN or MQCONNX MQI call.

MQRCN_NO

MQRCN_NO is the default value.

Unless overridden by **MQCONNX**, the client is not reconnected automatically.

MQRCN_YES

Unless overridden by **MQCONNX**, the client reconnects automatically.

MQRCN_Q_MGR

Unless overridden by **MQCONNX**, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO_RECONNECT_Q_MGR.

MQRCN_DISABLED

Reconnection is disabled, even if requested by the client program using the **MQCONNX** MQI call.

Table 97. Automatic reconnection depends on the values set in the application and in the channel definition

DefReconnect	Reconnection options set in the application			
	MQCNO_RECONNE CT	MQCNO_RECONNE CT_Q_MGR	MQCNO_RECONNE CT_AS_DEF	MQCNO_RECONNE CT_DISABLED
MQRCN_NO	YES	QMGR	NO	NO
MQRCN_YES	YES	QMGR	YES	NO
MQRCN_Q_MGR	YES	QMGR	QMGR	NO
MQRCN_DISABLED	NO	NO	NO	NO

This parameter is valid only for a *ChannelType* value of MQCHT_CLNTCONN.

DiscInterval (MQCFIN)

Disconnection interval (parameter identifier: MQIACH_DISC_INTERVAL).

This interval defines the maximum number of seconds that the channel waits for messages to be put on a transmission queue before terminating the channel. A value of zero causes the message channel agent to wait indefinitely.

Specify a value in the range 0 - 999 999.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER MQCHT_SERVER, MQCHT_SVRCONN, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

For server-connection channels using the TCP protocol, this interval is the minimum time in seconds for which the server-connection channel instance remains active without any communication from its partner client. A value of zero disables this disconnect processing. The server-connection inactivity interval only applies between MQ API calls from a client, so no client is disconnected during an extended MQGET with wait call. This attribute is ignored for server-connection channels using protocols other than TCP.

HeaderCompression (MQCFIL)

Header data compression techniques supported by the channel (parameter identifier: MQIACH_HDR_COMPRESSION).

The list of header data compression techniques supported by the channel. For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The mutually supported compression techniques of the channel are passed to the message exit of the sending channel where the compression technique used can be altered on a per message basis. Compression alters the data passed to send and receive exits.

Specify one or more of:

MQCOMPRESS_NONE

No header data compression is performed. This value is the default value.

MQCOMPRESS_SYSTEM

Header data compression is performed.

HeartbeatInterval (MQCFIN)

Heartbeat interval (parameter identifier: MQIACH_HB_INTERVAL).

The interpretation of this parameter depends on the channel type, as follows:

- For a channel type of MQCHT_SENDER, MQCHT_SERVER, MQCHT_RECEIVER, MQCHT_REQUESTER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR, this interval is the time in seconds between heartbeat flows passed from the sending MCA when there are no messages on the transmission queue. This interval gives the receiving MCA the opportunity to quiesce the channel. To be useful, *HeartbeatInterval* must be less than *DiscInterval*. However, the only check is that the value is within the permitted range.

This type of heartbeat is supported on the following platforms: IBM i, UNIX, Windows, and z/OS.

- For a channel type of MQCHT_CLNTCONN or MQCHT_SVRCONN, this interval is the time in seconds between heartbeat flows passed from the server MCA when that MCA has issued an MQGET call with the MQGMO_WAIT option on behalf of a client application. This interval allows the server MCA to handle situations where the client connection fails during an MQGET with MQGMO_WAIT.

This type of heartbeat is supported on all platforms.

The value must be in the range 0 - 999 999. A value of 0 means that no heartbeat exchange occurs. The value that is used is the larger of the values specified at the sending side and receiving side.

KeepAliveInterval (MQCFIN)

KeepAlive interval (parameter identifier: MQIACH_KEEP_ALIVE_INTERVAL).

Specifies the value passed to the communications stack for KeepAlive timing for the channel.

For this attribute to be effective, TCP/IP keepalive must be enabled. On z/OS, you enable TCP/IP keepalive by issuing the Change Queue Manager command with a value of MQTCPKEEP in the *TCPKeepAlive* parameter; if the *TCPKeepAlive* queue manager parameter has a value of MQTCPKEEP_NO, the value is ignored, and the KeepAlive facility is not used. On other platforms, TCP/IP keepalive is enabled when the KEEPALIVE=YES parameter is specified in the TCP stanza in the distributed queuing configuration file, qm.ini, or through the IBM MQ Explorer. Keepalive must also be enabled within TCP/IP itself, using the TCP profile configuration data set.

Although this parameter is available on all platforms, its setting is implemented only on z/OS. On platforms other than z/OS, you can access and modify the parameter, but it is only stored and forwarded; there is no functional implementation of the parameter. This parameter is useful in a clustered environment where a value set in a cluster-receiver channel definition on AIX, for example, flows to (and is implemented by) z/OS queue managers that are in, or join, the cluster.

Specify either:

integer

The KeepAlive interval to be used, in seconds, in the range 0 - 99 999. If you specify a value of 0, the value used is that specified by the INTERVAL statement in the TCP profile configuration data set.

MQKAI_AUTO

The KeepAlive interval is calculated based upon the negotiated heartbeat value as follows:

- If the negotiated *HeartbeatInterval* is greater than zero, KeepAlive interval is set to that value plus 60 seconds.
- If the negotiated *HeartbeatInterval* is zero, the value used is that specified by the INTERVAL statement in the TCP profile configuration data set.

Multi On **Multiplatforms**, if you need the functionality provided by the **KeepAliveInterval** parameter, use the **HeartBeatInterval** parameter.

LocalAddress (MQCFST)

Local communications address for the channel (parameter identifier: MQCACH_LOCAL_ADDRESS).

The maximum length of the string is MQ_LOCAL_ADDRESS_LENGTH.

The value that you specify depends on the transport type (*TransportType*) to be used:

TCP/IP

The value is the optional IP address and optional port or port range to be used for outbound TCP/IP communications. The format for this information is as follows:

```
LOCLADDR([ip-addr][(low-port[,high-port])][, [ip-addr][(low-port[,high-port])]])
```

where *ip-addr* is specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric form, and *low-port* and *high-port* are port numbers enclosed in parentheses. All are optional.

Specify `[, [ip-addr][(low-port[,high-port])]]` multiple times for each additional local address. Use multiple local addresses if you want to specify a specific subset of local network adapters. You can also use `[, [ip-addr][(low-port[,high-port])]]` to represent a particular local network address on different servers that are part of a multi-instance queue manager configuration.

All Others

The value is ignored; no error is diagnosed.

Use this parameter if you want a channel to use a particular IP address, port, or port range for outbound communications. This parameter is useful when a machine is connected to multiple networks with different IP addresses.

Examples of use

Value	Meaning
9.20.4.98	Channel binds to this address locally
9.20.4.98 (1000)	Channel binds to this address and port 1000 locally
9.20.4.98 (1000,2000)	Channel binds to this address and uses a port in the range 1000 - 2000 locally
(1000)	Channel binds to port 1000 locally
(1000,2000)	Channel binds to a port in the range 1000 - 2000 locally

This parameter is valid for the following channel types:

- MQCHT_SENDER
- MQCHT_SERVER
- MQCHT_REQUESTER
- MQCHT_CLNTCONN
- MQCHT_CLUSRCVR
- MQCHT_CLUSSDR

Note:

- Do not confuse this parameter with *ConnectionName*. The *LocalAddress* parameter specifies the characteristics of the local communications; the *ConnectionName* parameter specifies how to reach a remote queue manager.

LongRetryCount (MQCFIN)

Long retry count (parameter identifier: MQIACH_LONG_RETRY).

When a sender or server channel is attempting to connect to the remote machine, and the count specified by *ShortRetryCount* has been exhausted, this count specifies the maximum number of further attempts that are made to connect to the remote machine, at intervals specified by *LongRetryInterval*.

If this count is also exhausted without success, an error is logged to the operator, and the channel is stopped. The channel must later be restarted with a command (it is not started automatically by the channel initiator), and it then makes only one attempt to connect, as it is assumed that the problem has now been cleared by the administrator. The retry sequence is not carried out again until after the channel has successfully connected.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

LongRetryInterval (MQCFIN)

Long timer (parameter identifier: MQIACH_LONG_TIMER).

Specifies the long retry wait interval for a sender or server channel that is started automatically by the channel initiator. It defines the interval in seconds between attempts to establish a connection to the remote machine, after the count specified by *ShortRetryCount* has been exhausted.

The time is approximate; zero means that another connection attempt is made as soon as possible.

Specify a value in the range 0 - 999 999. Values exceeding this value are treated as 999 999.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

MaxInstances (MQCFIN)

Maximum number of simultaneous instances of a server-connection channel or an AMQP channel (parameter identifier: MQIACH_MAX_INSTANCES).

Specify a value in the range 0 - 999 999 999.

The default value is 999 999 999.

A value of zero indicates that no client connections are allowed on the channel.

If the value is reduced below the number of instances of the server-connection channel that are currently running, the running channels are not affected. This parameter applies even if the value is zero. However, if the value is reduced below the number of instances of the server-connection channel that are currently running, then new instances cannot be started until sufficient existing instances have ceased to run.

V 9.0.0 If an AMQP client attempts to connect to an AMQP channel, and the number of connected clients has reached *MaxInstances*, the channel closes the connection with a close frame. The close frame contains the following message: `amqp:resource-limit-exceeded`. If a client connects with an ID that is already connected (that is, it performs a client-takeover), and the client is permitted to take over the connection, the takeover will succeed regardless of whether the number of connected clients has reached *MaxInstances*.

This parameter is valid only for channels with a *ChannelType* value of MQCHT_SVRCONN or MQCHT_AMQP.

MaxInstancesPerClient (MQCFIN)

Maximum number of simultaneous instances of a server-connection channel that can be started from a single client (parameter identifier: MQIACH_MAX_INSTS_PER_CLIENT). In this context, connections that originate from the same remote network address are regarded as coming from the same client.

Specify a value in the range 0 - 999 999 999.

The default value is 999 999 999.

A value of zero indicates that no client connections are allowed on the channel.

If the value is reduced below the number of instances of the server-connection channel that are currently running from individual clients, the running channels are not affected. This parameter applies even if the value is zero. However, if the value is reduced below the number of instances of the server-connection channel that are currently running from individual clients, new instances from those clients cannot start until sufficient existing instances have ceased to run.

This parameter is valid only for channels with a *ChannelType* value of MQCHT_SVRCONN.

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: MQIACH_MAX_MSG_LENGTH).

Specifies the maximum message length that can be transmitted on the channel. This value is compared with the value for the remote channel and the actual maximum is the lower of the two values.

The value zero means the maximum message length for the queue manager.

The lower limit for this parameter is 0. The maximum message length is 100 MB (104 857 600 bytes).

MCAName (MQCFST)

Message channel agent name (parameter identifier: MQCACH_MCA_NAME).

Note: An alternative way of providing a user ID for a channel to run under is to use channel authentication records. With channel authentication records, different connections can use the same channel while using different credentials. If both MCAUSER on the channel is set and channel authentication records are used to apply to the same channel, the channel authentication records take precedence. The MCAUSER on the channel definition is only used if the channel authentication record uses USERSRC(CHANNEL). For more details, see [Channel authentication records](#)

This parameter is reserved, and if specified can be set only to blanks.

The maximum length of the string is MQ_MCA_NAME_LENGTH.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_REQUESTER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

MCAType (MQCFIN)

Message channel agent type (parameter identifier: MQIACH_MCA_TYPE).

Specifies the type of the message channel agent program.

 On Multiplatforms, this parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_REQUESTER, or MQCHT_CLUSSDR.

 On z/OS, this parameter is valid only for a *ChannelType* value of MQCHT_CLURCVR.

The value can be any of the following values:

MQMCAT_PROCESS

Process.

MQMCAT_THREAD

Thread.

MCAUserIdentifier (MQCFST)

Message channel agent user identifier (parameter identifier: MQCACH_MCA_USER_ID).

If this parameter is nonblank, it is the user identifier which is to be used by the message channel agent for authorization to access IBM MQ resources, including (if *PutAuthority* is MQPA_DEFAULT) authorization to put the message to the destination queue for receiver or requester channels.

If it is blank, the message channel agent uses its default user identifier.

This user identifier can be overridden by one supplied by a channel security exit.

This parameter is not valid for channels with a *ChannelType* of MQCMT_SDR, MQCMT_SVR, MQCMT_CLNTCONN, MQCMT_CLUSSDR.

The maximum length of the MCA user identifier depends on the environment in which the MCA is running. MQ_MCA_USER_ID_LENGTH gives the maximum length for the environment for which your application is running. MQ_MAX_MCA_USER_ID_LENGTH gives the maximum for all supported environments.

On Windows, you can optionally qualify a user identifier with the domain name in the following format:

```
user@domain
```

MessageCompression (MQCFIL)

The list of message data compression techniques supported by the channel (parameter identifier: MQIACH_MSG_COMPRESSION). For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The mutually supported compression techniques of the channel are passed to the message exit of the sending channel where the compression technique used can be altered on a per message basis. Compression alters the data passed to send and receive exits.

Specify one or more of:

MQCOMPRESS_NONE

No message data compression is performed. This value is the default value.

MQCOMPRESS_RLE

Message data compression is performed using run-length encoding.

MQCOMPRESS_ZLIBFAST

Message data compression is performed using ZLIB encoding with speed prioritized.

MQCOMPRESS_ZLIBHIGH

Message data compression is performed using ZLIB encoding with compression prioritized.

MQCOMPRESS_ANY

Any compression technique supported by the queue manager can be used. This value is only valid for receiver, requester, and server-connection channels.

ModeName (MQCFST)

Mode name (parameter identifier: MQCACH_MODE_NAME).

This parameter is the LU 6.2 mode name.

The maximum length of the string is MQ_MODE_NAME_LENGTH.

- On IBM i, UNIX, and Windows, this parameter can be set only to blanks. The actual name is taken instead from the CPI-C Communications Side Object or (on Windows) from the CPI-C symbolic destination name properties.

This parameter is valid only for channels with a *TransportType* of MQXPT_LU62. It is not valid for receiver or server-connection channels.

MsgExit (MQCFSL)

Message exit name (parameter identifier: MQCACH_MSG_EXIT_NAME).

If a nonblank name is defined, the exit is invoked immediately after a message has been retrieved from the transmission queue. The exit is given the entire application message and message descriptor for modification.

For channels with a channel type (*ChannelType*) of MQCMT_SVRCONN or MQCMT_CLNTCONN, this parameter is accepted but ignored, since message exits are not invoked for such channels.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

You can specify a list of exit names by using an MQCFSL structure instead of an MQCFST structure.

- The exits are invoked in the order specified in the list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit names in the list (excluding trailing blanks in each name) must not exceed MQ_TOTAL_EXIT_NAME_LENGTH. An individual string must not exceed MQ_EXIT_NAME_LENGTH.
- On z/OS, you can specify the names of up to eight exit programs.

MsgRetryCount (MQCFIN)

Message retry count (parameter identifier: MQIACH_MR_COUNT).

Specifies the number of times that a failing message must be retried.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT_RECEIVER, MQCHT_REQUESTER, or MQCHT_CLUSRCVR.

MsgRetryExit (MQCFST)

Message retry exit name (parameter identifier: MQCACH_MR_EXIT_NAME).

If a nonblank name is defined, the exit is invoked before performing a wait before retrying a failing message.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

This parameter is valid only for *ChannelType* values of MQCHT_RECEIVER, MQCHT_REQUESTER, or MQCHT_CLUSRCVR.

MsgRetryInterval (MQCFIN)

Message retry interval (parameter identifier: MQIACH_MR_INTERVAL).

Specifies the minimum time interval in milliseconds between retries of failing messages.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT_RECEIVER, MQCHT_REQUESTER, or MQCHT_CLUSRCVR.

MsgRetryUserData (MQCFST)

Message retry exit user data (parameter identifier: MQCACH_MR_EXIT_USER_DATA).

Specifies user data that is passed to the message retry exit.

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

This parameter is valid only for *ChannelType* values of MQCHT_RECEIVER, MQCHT_REQUESTER, or MQCHT_CLUSRCVR.

MsgUserData (MQCFSL)

Message exit user data (parameter identifier: MQCACH_MSG_EXIT_USER_DATA).

Specifies user data that is passed to the message exit.

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

For channels with a channel type (*ChannelType*) of MQCHT_SVRCONN or MQCHT_CLNTCONN, this parameter is accepted but ignored, since message exits are not invoked for such channels.

You can specify a list of exit user data strings by using an MQCFSL structure instead of an MQCFST structure.

- Each exit user data string is passed to the exit at the same ordinal position in the *MsgExit* list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit user data in the list (excluding trailing blanks in each string) must not exceed MQ_TOTAL_EXIT_DATA_LENGTH. An individual string must not exceed MQ_EXIT_DATA_LENGTH.
- On z/OS, you can specify up to eight strings.

NetworkPriority (MQCFIN)

Network priority (parameter identifier: MQIACH_NETWORK_PRIORITY).

The priority for the network connection. If there are multiple paths available, distributed queuing selects the path with the highest priority.

The value must be in the range 0 (lowest) - 9 (highest).

This parameter applies only to channels with a *ChannelType* of MQCHT_CLUSRCVR

NonPersistentMsgSpeed (MQCFIN)

Speed at which nonpersistent messages are to be sent (parameter identifier: MQIACH_NPM_SPEED).

This parameter is supported in the following environments: IBM i, UNIX, Linux, and Windows.

Specifying MQNPMS_FAST means that nonpersistent messages on a channel need not wait for a syncpoint before being made available for retrieval. The advantage of this is that nonpersistent messages become available for retrieval far more quickly. The disadvantage is that because they do not wait for a syncpoint, they might be lost if there is a transmission failure.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_RECEIVER, MQCHT_REQUESTER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR. The value can be any of the following values:

MQNPMS_NORMAL

Normal speed.

MQNPMS_FAST

Fast speed.

Password (MQCFST)

Password (parameter identifier: MQCACH_PASSWORD).

This parameter is used by the message channel agent when attempting to initiate a secure SNA session with a remote message channel agent. On IBM i, HP Integrity NonStop Server, and UNIX, it is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_REQUESTER, MQCHT_CLNTCONN, or MQCHT_CLUSSDR. On z/OS, it is valid only for a *ChannelType* value of MQCHT_CLNTCONN.

The maximum length of the string is MQ_PASSWORD_LENGTH. However, only the first 10 characters are used.

Port (MQCFIN)

Port number (parameter identifier MQIACH_PORT).

The port number used to connect an AMQP channel. The default port for AMQP 1.0 connections is 5672. If you are already using port 5672, you can specify a different port.

This attribute is applicable to AMQP channels.

PropertyControl (MQCFIN)

Property control attribute (parameter identifier MQIA_PROPERTY_CONTROL).

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor). The value can be any of the following values:

MQPROP_COMPATIBILITY

If the message contains a property with a prefix of **mcd.**, **jms.**, **usr.** or **mqext.**, all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those properties contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

This value is the default value; it allows applications which expect JMS-related properties to be in an MQRFH2 header in the message data to continue to work unmodified.

MQPROP_NONE

All properties of the message, except those properties in the message descriptor (or extension), are removed from the message before the message is sent to the remote queue manager.

MQPROP_ALL

All properties of the message are included with the message when it is sent to the remote queue manager. The properties, except those properties in the message descriptor (or extension), are placed in one or more MQRFH2 headers in the message data.

This attribute is applicable to Sender, Server, Cluster Sender, and Cluster Receiver channels.

PutAuthority (MQCFIN)

Put authority (parameter identifier: MQIACH_PUT_AUTHORITY).

Specifies which user identifiers are used to establish authority to put messages to the destination queue (for message channels) or to execute an MQI call (for MQI channels).

This parameter is valid only for channels with a *ChannelType* value of MQCHT_RECEIVER, MQCHT_REQUESTER, MQCHT_CLUSRCVR, or MQCHT_SVRCONN.

The value can be any of the following values:

MQPA_DEFAULT

Default user identifier is used.

 On z/OS, MQPA_DEFAULT might involve using both the user ID received from the network and that derived from MCAUSER.

MQPA_CONTEXT

The user ID from the *UserIdentifier* field of the message descriptor is used.

 On z/OS, MQPA_CONTEXT might involve also using the user ID received from the network or that derived from MCAUSER, or both.

MQPA_ALTERNATE_OR_MCA

The user ID from the *UserIdentifier* field of the message descriptor is used. Any user ID received from the network is not used. This value is supported only on z/OS.

MQPA_ONLY_MCA

The user ID derived from MCAUSER is used. Any user ID received from the network is not used. This value is supported only on z/OS.

QMgrName (MQCFST)

Queue manager name (parameter identifier: MQCA_Q_MGR_NAME).

For channels with a *ChannelType* of MQCHT_CLNTCONN, this name is the name of a queue manager to which a client application can request connection.

For channels of other types, this parameter is not valid. The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
MQQSGD_COPY	<p>The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.</p>	<p>The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToChannelName</i> object (for Copy) or <i>ChannelName</i> object (for Create).</p>
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to attempt to refresh local copies on page set zero:</p> <pre>DEFINE CHANNEL(channel-name) CHLTYPE(type) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This definition is allowed only if the queue manager is in a queue sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group to attempt to make or refresh local copies on page set zero:</p> <pre>DEFINE CHANNEL(channel-name) CHLTYPE(type) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
MQQSGD_PRIVATE	<p>The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.</p>	<p>Not permitted.</p>
MQQSGD_Q_MGR	<p>The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.</p>	<p>The object is defined on the page set of the queue manager that executes the command. This value is the default value.</p>

ReceiveExit (MQCFSL)

Receive exit name (parameter identifier: MQCACH_RCV_EXIT_NAME).

If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

You can specify a list of exit names by using an MQCFSL structure instead of an MQCFST structure.

- The exits are invoked in the order specified in the list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit names in the list (excluding trailing blanks in each name) must not exceed MQ_TOTAL_EXIT_NAME_LENGTH. An individual string must not exceed MQ_EXIT_NAME_LENGTH.
- On z/OS, you can specify the names of up to eight exit programs.

ReceiveUserData (MQCFSL)

Receive exit user data (parameter identifier: MQCACH_RCV_EXIT_USER_DATA).

Specifies user data that is passed to the receive exit.

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

You can specify a list of exit user data strings by using an MQCFSL structure instead of an MQCFST structure.

- Each exit user data string is passed to the exit at the same ordinal position in the *ReceiveExit* list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit user data in the list (excluding trailing blanks in each string) must not exceed MQ_TOTAL_EXIT_DATA_LENGTH. An individual string must not exceed MQ_EXIT_DATA_LENGTH.
- On z/OS, you can specify up to eight strings.

Replace (MQCFIN)

Replace channel definition (parameter identifier: MQIACF_REPLACE).

The value can be any of the following values:

MQRP_YES

Replace existing definition.

If *ChannelType* is MQCHT_CLUSSDR, MQRP_YES can be specified only if the channel was created manually.

MQRP_NO

Do not replace existing definition.

SecurityExit (MQCFST)

Security exit name (parameter identifier: MQCACH_SEC_EXIT_NAME).

If a nonblank name is defined, the security exit is invoked at the following times:

- Immediately after establishing a channel.

Before any messages are transferred, the exit is enabled to instigate security flows to validate connection authorization.

- Upon receipt of a response to a security message flow.

Any security message flows received from the remote processor on the remote machine are passed to the exit.

The exit is given the entire application message and message descriptor for modification.

The format of the string depends on the platform, as follows:

- On IBM i and UNIX, it is of the form

```
libraryname(functionname)
```

Note: On IBM i systems, the following form is also supported for compatibility with older releases:

```
progrname libname
```

where *progrname* occupies the first 10 characters, and *libname* the second 10 characters (both blank-padded to the right if necessary).

- On Windows, it is of the form

```
dllname(functionname)
```

where *dllname* is specified without the suffix `.DLL`.

- On z/OS, it is a load module name, maximum length 8 characters (128 characters are allowed for exit names for client-connection channels, subject to a maximum total length of 999).

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

SecurityUserData (MQCFST)

Security exit user data (parameter identifier: MQCACH_SEC_EXIT_USER_DATA).

Specifies user data that is passed to the security exit.

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

SendExit (MQCFSL)

Send exit name (parameter identifier: MQCACH_SEND_EXIT_NAME).

If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

You can specify a list of exit names by using an MQCFSL structure instead of an MQCFST structure.

- The exits are invoked in the order specified in the list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit names in the list (excluding trailing blanks in each name) must not exceed MQ_TOTAL_EXIT_NAME_LENGTH. An individual string must not exceed MQ_EXIT_NAME_LENGTH.
- On z/OS, you can specify the names of up to eight exit programs.

SendUserData (MQCFSL)

Send exit user data (parameter identifier: MQCACH_SEND_EXIT_USER_DATA).

Specifies user data that is passed to the send exit.

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

You can specify a list of exit user data strings by using an MQCFSL structure instead of an MQCFST structure.

- Each exit user data string is passed to the exit at the same ordinal position in the *SendExit* list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit user data in the list (excluding trailing blanks in each string) must not exceed MQ_TOTAL_EXIT_DATA_LENGTH. An individual string must not exceed MQ_EXIT_DATA_LENGTH.
- On z/OS, you can specify up to eight strings.

SeqNumberWrap (MQCFIN)

Sequence wrap number (parameter identifier: MQIACH_SEQUENCE_NUMBER_WRAP).

Specifies the maximum message sequence number. When the maximum is reached, sequence numbers wrap to start again at 1.

The maximum message sequence number is not negotiable; the local and remote channels must wrap at the same number.

Specify a value in the range 100 - 999 999 999.

This parameter is not valid for channels with a *ChannelType* of MQCHT_SVRCONN or MQCHT_CLNTCONN.

SharingConversations (MQCFIN)

Maximum number of sharing conversations (parameter identifier: MQIACH_SHARING_CONVERSATIONS).

Specifies the maximum number of conversations that can share a particular TCP/IP MQI channel instance (socket).

Specify a value in the range 0 - 999 999 999. The default value is 10 and the migrated value is 10.

This parameter is valid only for channels with a *ChannelType* of MQCHT_CLNTCONN or MQCHT_SVRCONN. It is ignored for channels with a *TransportType* other than MQXPT_TCP.

The number of shared conversations does not contribute to the *MaxInstances* or *MaxInstancesPerClient* totals.

A value of:

1

Means that there is no sharing of conversations over a TCP/IP channel instance, but client heartbeating is available whether in an MQGET call or not, read ahead and client asynchronous consumption are available, and channel quiescing is more controllable.

0

Specifies no sharing of conversations over a TCP/IP channel instance. The channel instance runs in a mode before that of IBM WebSphere MQ 7.0, regarding:

- Administrator stop-quiesce
- Heartbeating
- Read ahead
- Client asynchronous consumption

ShortRetryCount (MQCFIN)

Short retry count (parameter identifier: MQIACH_SHORT_RETRY).

The maximum number of attempts that are made by a sender or server channel to establish a connection to the remote machine, at intervals specified by *ShortRetryInterval* before the (normally longer) *LongRetryCount* and *LongRetryInterval* are used.

Retry attempts are made if the channel fails to connect initially (whether it is started automatically by the channel initiator or by an explicit command), and also if the connection fails after the channel has successfully connected. However, if the cause of the failure is such that retry is unlikely to be successful, retries are not attempted.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

ShortRetryInterval (MQCFIN)

Short timer (parameter identifier: MQIACH_SHORT_TIMER).

Specifies the short retry wait interval for a sender or server channel that is started automatically by the channel initiator. It defines the interval in seconds between attempts to establish a connection to the remote machine.

The time is approximate. From IBM MQ 8.0, zero means that another connection attempt is made as soon as possible.

Specify a value in the range 0 - 999 999. Values exceeding this value are treated as 999 999.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

SSLCipherSpec (MQCFST)

CipherSpec (parameter identifier: MQCACH_SSL_CIPHER_SPEC). Specifies the CipherSpec that is used on the channel. The length of the string is MQ_SSL_CIPHER_SPEC_LENGTH.

Attention:   On IBM MQ for z/OS, you can also specify the two digit hexadecimal code of a CipherSpec, whether or not it appears in the following table. On IBM i, you can also specify the two digit hexadecimal code of a CipherSpec, whether or not it appears in the following table. Also, on IBM i, installation of AC3 is a prerequisite for the use of TLS.

The SSLCipherSpec values must specify the same CipherSpec on both ends of the channel.

This parameter is valid on all channel types that use transport type **TRPTYPE(TCP)**. If the parameter is blank, no attempt is made to use TLS on the channel. If the TRPTYPE is not TCP, the data is ignored and no error message is issued.

The value for this parameter is also used to set the value of SecurityProtocol, which is an output field on the Inquire Channel Status (Response) command.

The following table shows the CipherSpecs that can be used with IBM MQ TLS.

Platform support "1" on page 1392	CipherSpec name	Protocol used	MAC algorithm	Encryption algorithm	Encryption bits	FIPS "2" on page 1392	Suite B
 	TLS_RSA_WITH_AES_128_CBC_SHA	TLS 1.0	SHA-1	AES	128	Yes	No
 	TLS_RSA_WITH_AES_256_CBC_SHA ^{"3"} on page 1392	TLS 1.0	SHA-1	AES	256	Yes	No
All	ECDHE_ECDSA_AES_128_CBC_SHA256	TLS 1.2	SHA-256	AES	128	Yes	No

Platform support "1" on page 1392	CipherSpec name	Protocol used	MAC algorithm	Encryption algorithm	Encryption bits	FIPS "2" on page 1392	Suite B
All	ECDHE_ECDSA_AES_256_CBC_SHA384 "3" on page 1392	TLS 1.2	SHA-384	AES	256	Yes	No
 Multi	ECDHE_ECDSA_AES_128_GCM_SHA256 "4" on page 1392	TLS 1.2	AEAD AES-128 GCM	AES	128	Yes	128 bit
 Multi	ECDHE_ECDSA_AES_256_GCM_SHA384 "3" on page 1392 "4" on page 1392	TLS 1.2	AEAD AES-128 GCM	AES	256	Yes	192 bit
All	ECDHE_RSA_AES_128_CBC_SHA256	TLS 1.2	SHA-256	AES	128	Yes	No
All	ECDHE_RSA_AES_256_CBC_SHA384 "3" on page 1392	TLS 1.2	SHA-384	AES	256	Yes	No
 Multi (LTS) All (V9.0.5 and later)	ECDHE_RSA_AES_128_GCM_SHA256 "4" on page 1392	TLS 1.2	AEAD AES-128 GCM	AES	128	Yes	No
 Multi (LTS) All (V9.0.5 and later)	ECDHE_RSA_AES_256_GCM_SHA384 "3" on page 1392 "4" on page 1392	TLS 1.2	AEAD AES-128 GCM	AES	SHA384	Yes	No
 IBM i "5" on page 1392	ECDHE_ECDSA_RC4_128_SHA256	TLS 1.2	AEAD AES-128 GCM	AES	SHA256	Yes	No
 IBM i	ECDHE_ECDSA_3DES_EDE_CBC_SHA256	TLS 1.2	AEAD AES-128 GCM	3DES	SHA256	Yes	No
 IBM i	ECDHE_ECDSA_NULL_SHA256	TLS 1.2	AEAD AES-128 GCM	ECDSA	SHA256	Yes	No
 IBM i	ECDHE_ECDSA_AES_256_GCM_SHA384 "3" on page 1392 "4" on page 1392	TLS 1.2	AEAD AES-128 GCM	AES	SHA384	Yes	No
 z/OS  ULW	TLS_RSA_WITH_AES_128_CBC_SHA256	TLS 1.2	SHA-256	AES	128	Yes	No
 z/OS  ULW	TLS_RSA_WITH_AES_256_CBC_SHA256 "3" on page 1392	TLS 1.2	SHA-256	AES	256	Yes	No

Platform support "1" on page 1392	CipherSpec name	Protocol used	MAC algorithm	Encryption algorithm	Encryption bits	FIPS "2" on page 1392	Suite B
All (V9.0.5 and later and 9.0 LTS)	TLS_RSA_WITH_AES_128_GCM_SHA256 "4" on page 1392	TLS 1.2	AEAD AES-128 GCM	AES	128	Yes	No
All (V9.0.5 and later and 9.0 LTS)	TLS_RSA_WITH_AES_256_GCM_SHA384 "3" on page 1392 "4" on page 1392	TLS 1.2	AEAD AES-128 GCM	AES	256	Yes	No

Notes:

1. If no specific platform is noted, the CipherSpec is available on all platforms. For a list of platforms covered by each platform icon, see [Release and platform icons in the product documentation](#).
2. Specifies whether the CipherSpec is FIPS-certified on a FIPS-certified platform. See [Federal Information Processing Standards \(FIPS\)](#) for an explanation of FIPS.
3. This CipherSpec cannot be used to secure a connection from the IBM MQ Explorer to a queue manager unless the appropriate unrestricted policy files are applied to the JRE used by the Explorer.
4. Following a recommendation by IBM Global Security Kit (GSKit), GCM CipherSpecs have a restriction which means that after 2^{24.5} TLS records are sent, using the same session key, the connection is terminated with message AMQ9288.

  To prevent this error from happening: avoid using GCM Ciphers, enable secret key reset, or start your IBM MQ queue manager or client with the environment variable GSK_ENFORCE_GCM_RESTRICTION=GSK_FALSE set.

Notes:

- You must set this environment variable on both sides of the connection, and applies to both client to queue manager connections and queue manager to queue manager connections.
- This statement applies to IBM Global Security Kit (GSKit) libraries only, so affects unmanaged .NET clients as well but not Java or managed .NET clients.

For more information, see [AES-GCM cipher restriction](#).

This restriction does not apply to IBM MQ for z/OS.

Important: The GCM restriction is active, regardless of the FIPS mode being used.

5.  The CipherSpecs listed as supported on IBM i, apply to Versions 7.2 and 7.3 of IBM i.

When you request a personal certificate, you specify a key size for the public and private key pair. The key size that is used during the TLS handshake can depend on the size stored in the certificate and on the CipherSpec:

- On UNIX, Windows platforms, and z/OS, when a CipherSpec name includes _EXPORT, the maximum handshake key size is 512 bits. If either of the certificates exchanged during the TLS handshake has a key size greater than 512 bits, a temporary 512-bit key is generated for use during the handshake.
- On UNIX and Windows platforms, when a CipherSpec name includes _EXPORT1024, the handshake key size is 1024 bits.

- Otherwise the handshake key size is the size stored in the certificate.

SSLClientAuth (MQCFIN)

Client authentication (parameter identifier: MQIACH_SSL_CLIENT_AUTH).

The value can be any of the following values:

MQSCA_REQUIRED

Client authentication required.

MQSCA_OPTIONAL

Client authentication optional.

Defines whether IBM MQ requires a certificate from the TLS client.

The TLS client is the end of the message channel that initiates the connection. The TLS Server is the end of the message channel that receives the initiation flow.

The parameter is used only for channels with SSLCIPH specified. If SSLCIPH is blank, the data is ignored and no error message is issued.

SSLPeerName (MQCFST)

Peer name (parameter identifier: MQCACH_SSL_PEER_NAME).

Note: An alternative way of restricting connections into channels by matching against the TLS Subject Distinguished Name, is to use channel authentication records. With channel authentication records, different TLS Subject Distinguished Name patterns can be applied to the same channel. If both SSLPEER on the channel and a channel authentication record are used to apply to the same channel, the inbound certificate must match both patterns in order to connect. For more information, see [Channel authentication records](#).

 On [Multiplatforms](#), the length of the string is MQ_SSL_PEER_NAME_LENGTH.

 On z/OS, the length of the string is MQ_SSL_SHORT_PEER_NAME_LENGTH.

Specifies the filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel. (A Distinguished Name is the identifier of the TLS certificate.) If the Distinguished Name in the certificate received from the peer does not match the SSLPEER filter, the channel does not start.

This parameter is optional; if it is not specified, the Distinguished Name of the peer is not checked when the channel is started. (The Distinguished Name from the certificate is still written into the SSLPEER definition held in memory, and passed to the security exit). If SSLCIPH is blank, the data is ignored and no error message is issued.

This parameter is valid for all channel types.

The SSLPEER value is specified in the standard form used to specify a Distinguished Name. For example:
SSLPEER('SERIALNUMBER=4C:D0:49:D5:02:5F:38,CN="H1_C_FR1",O=IBM,C=GB')

You can use a semi-colon as a separator instead of a comma.

The possible attribute types supported are:

Attribute	Description
SERIALNUMBER	Certificate serial number
MAIL	Email address
E	Email address (Deprecated in preference to MAIL)
UID or USERID	User identifier
CN	Common Name
T	Title

Attribute	Description
OU	Organizational Unit name
DC	Domain component
O	Organization name
STREET	Street / First line of address
L	Locality name
ST (or SP or S)	State or Province name
PC	Postal code / zip code
C	Country
UNSTRUCTUREDNAME	Host name
UNSTRUCTUREDADDRESS	IP address
DNQ	Distinguished name qualifier

IBM MQ only accepts uppercase letters for the attribute types.

If any of the unsupported attribute types are specified in the SSLPEER string, an error is output either when the attribute is defined or at run time (depending on which platform you are running on), and the string is deemed not to have matched the Distinguished Name of the flowed certificate.

If the Distinguished Name of the flowed certificate contains multiple OU (organizational unit) attributes, and SSLPEER specifies these attributes to be compared, they must be defined in descending hierarchical order. For example, if the Distinguished Name of the flowed certificate contains the OUs OU=Large Unit,OU=Medium Unit,OU=Small Unit, specifying the following SSLPEER values work:

```
('OU=Large Unit,OU=Medium Unit') ('OU=*,OU=Medium Unit,OU=Small Unit') ('OU=*,OU=Medium Unit')
```

but specifying the following SSLPEER values fail:

```
('OU=Medium Unit,OU=Small Unit') ('OU=Large Unit,OU=Small Unit') ('OU=Medium Unit')
```

Any or all the attribute values can be generic, either an asterisk (*) on its own, or a stem with initiating or trailing asterisks. This value allows the SSLPEER to match any Distinguished Name value, or any value starting with the stem for that attribute.

If an asterisk is specified at the beginning or end of any attribute value in the Distinguished Name on the certificate, you can specify * to check for an exact match in SSLPEER. For example, if you have an attribute of CN=Test* in the Distinguished Name of the certificate, you can use the following command:

```
SSLPEER('CN=Test\*')
```

TpName (MQCFST)

Transaction program name (parameter identifier: MQCACH_TP_NAME).

This name is the LU 6.2 transaction program name.

The maximum length of the string is MQ_TP_NAME_LENGTH.

- On IBM i, HP Integrity NonStop Server, UNIX, and Windows platforms, this parameter can be set only to blanks. The actual name is taken instead from the CPI-C Communications Side Object or (on Windows) from the CPI-C symbolic destination name properties.

This parameter is valid only for channels with a *TransportType* of MQXPT_LU62. It is not valid for receiver channels.

V 9.0.0 **TPRoot (MQCFST)**

Topic root for an AMQP channel. (parameter identifier: MQCACH_TOPIC_ROOT).

The default value for TPRoot is SYSTEM.BASE.TOPIC. With this value, the topic string an AMQP client uses to publish or subscribe has no prefix, and the client can exchange messages with other MQ pub/sub applications. To have AMQP clients publish and subscribe under a topic prefix, first create an MQ topic object with a topic string set to the prefix you want, then set TPRoot to the name of the MQ topic object you created.

This parameter is valid only for AMQP channels.

TransportType (MQCFIN)

Transmission protocol type (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

No check is made that the correct transport type has been specified if the channel is initiated from the other end. The value can be any of the following values:

MQXPT_LU62

LU 6.2.

MQXPT_TCP

TCP.

MQXPT_NETBIOS

NetBIOS.

This value is supported in Windows. It also applies to z/OS for defining client-connection channels that connect to servers on the platforms supporting NetBIOS.

MQXPT_SPX

SPX.

This value is supported in Windows. It also applies to z/OS for defining client-connection channels that connect to servers on the platforms supporting SPX.

V 9.0.0 **UseCltId (MQCFIN)**

Determines how authorization checks are done for AMQP channels. (parameter identifier: MQIACH_USE_CLIENT_ID).

The value can be any of the following values:

MQUCI_NO

The MCA user ID should be used for authorization checks.

MQUCI_YES

The client ID should be used for authorization checks.

This parameter is valid only for AMQP channels.

UseDLQ (MQCFIN)

Determines whether the dead-letter queue is used when messages cannot be delivered by channels. (parameter identifier: MQIA_USE_DEAD_LETTER_Q).

The value can be any of the following values:

MQUSEDLQ_NO

Messages that cannot be delivered by a channel are treated as a failure. The channel either discards the message, or the channel ends, in accordance with the NonPersistentMsgSpeed setting.

MQUSEDLQ_YES

When the DEADQ queue manager attribute provides the name of a dead-letter queue, then it is used, else the behavior is as for MQUSEDLQ_NO.

UserIdentifier (MQCFST)

Task user identifier (parameter identifier: MQCACH_USER_ID).

This parameter is used by the message channel agent when attempting to initiate a secure SNA session with a remote message channel agent. On IBM i and UNIX, it is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_REQUESTER, MQCHT_CLNTCONN, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR. On z/OS, it is valid only for a *ChannelType* value of MQCHT_CLNTCONN.

The maximum length of the string is MQ_USER_ID_LENGTH. However, only the first 10 characters are used.

XmitQName (MQCFST)

Transmission queue name (parameter identifier: MQCACH_XMIT_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

A transmission queue name is required (either previously defined or specified here) if *ChannelType* is MQCHT_SENDER or MQCHT_SERVER. It is not valid for other channel types.

Error codes (Change, Copy, and Create Channel)

This command might return the following error codes in the response format header, in addition to those codes listed in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_BATCH_INT_ERROR

Batch interval not valid.

MQRCCF_BATCH_INT_WRONG_TYPE

Batch interval parameter not allowed for this channel type.

MQRCCF_BATCH_SIZE_ERROR

Batch size not valid.

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHANNEL_TYPE_ERROR

Channel type not valid.

MQRCCF_CLUSTER_NAME_CONFLICT

Cluster name conflict.

MQRCCF_DISC_INT_ERROR

Disconnection interval not valid.

MQRCCF_DISC_INT_WRONG_TYPE

Disconnection interval not allowed for this channel type.

MQRCCF_HB_INTERVAL_ERROR

Heartbeat interval not valid.

MQRCCF_HB_INTERVAL_WRONG_TYPE

Heartbeat interval parameter not allowed for this channel type.

MQRCCF_LONG_RETRY_ERROR

Long retry count not valid.

MQRCCF_LONG_RETRY_WRONG_TYPE

Long retry parameter not allowed for this channel type.

MQRCCF_LONG_TIMER_ERROR

Long timer not valid.

MQRCCF_LONG_TIMER_WRONG_TYPE

Long timer parameter not allowed for this channel type.

MQRCCF_MAX_INSTANCES_ERROR
Maximum instances value not valid.

MQRCCF_MAX_INSTS_PER_CLNT_ERR
Maximum instances per client value not valid.

MQRCCF_MAX_MSG_LENGTH_ERROR
Maximum message length not valid.

MQRCCF_MCA_NAME_ERROR
Message channel agent name error.

MQRCCF_MCA_NAME_WRONG_TYPE
Message channel agent name not allowed for this channel type.

MQRCCF_MCA_TYPE_ERROR
Message channel agent type not valid.

MQRCCF_MISSING_CONN_NAME
Connection name parameter required but missing.

MQRCCF_MR_COUNT_ERROR
Message retry count not valid.

MQRCCF_MR_COUNT_WRONG_TYPE
Message-retry count parameter not allowed for this channel type.

MQRCCF_MR_EXIT_NAME_ERROR
Channel message-retry exit name error.

MQRCCF_MR_EXIT_NAME_WRONG_TYPE
Message-retry exit parameter not allowed for this channel type.

MQRCCF_MR_INTERVAL_ERROR
Message retry interval not valid.

MQRCCF_MR_INTERVAL_WRONG_TYPE
Message-retry interval parameter not allowed for this channel type.

MQRCCF_MSG_EXIT_NAME_ERROR
Channel message exit name error.

MQRCCF_NET_PRIORITY_ERROR
Network priority value error.

MQRCCF_NET_PRIORITY_WRONG_TYPE
Network priority attribute not allowed for this channel type.

MQRCCF_NPM_SPEED_ERROR
Nonpersistent message speed not valid.

MQRCCF_NPM_SPEED_WRONG_TYPE
Nonpersistent message speed parameter not allowed for this channel type.

MQRCCF_PARM_SEQUENCE_ERROR
Parameter sequence not valid.

MQRCCF_PUT_AUTH_ERROR
Put authority value not valid.

MQRCCF_PUT_AUTH_WRONG_TYPE
Put authority parameter not allowed for this channel type.

MQRCCF_RCV_EXIT_NAME_ERROR
Channel receive exit name error.

MQRCCF_SEC_EXIT_NAME_ERROR
Channel security exit name error.

MQRCCF_SEND_EXIT_NAME_ERROR
Channel send exit name error.

MQRCCF_SEQ_NUMBER_WRAP_ERROR
Sequence wrap number not valid.

MQRCCF_SHARING_CONVS_ERROR

Value given for Sharing Conversations not valid.

MQRCCF_SHARING_CONVS_TYPE

Sharing Conversations parameter not valid for this channel type.

MQRCCF_SHORT_RETRY_ERROR

Short retry count not valid.

MQRCCF_SHORT_RETRY_WRONG_TYPE

Short retry parameter not allowed for this channel type.

MQRCCF_SHORT_TIMER_ERROR

Short timer value not valid.

MQRCCF_SHORT_TIMER_WRONG_TYPE

Short timer parameter not allowed for this channel type.

MQRCCF_SSL_CIPHER_SPEC_ERROR

TLS CipherSpec not valid.

MQRCCF_SSL_CLIENT_AUTH_ERROR

TLS client authentication not valid.

MQRCCF_SSL_PEER_NAME_ERROR

TLS peer name not valid.

MQRCCF_WRONG_CHANNEL_TYPE

Parameter not allowed for this channel type.

MQRCCF_XMIT_PROTOCOL_TYPE_ERR

Transmission protocol type not valid.

MQRCCF_XMIT_Q_NAME_ERROR

Transmission queue name error.

MQRCCF_XMIT_Q_NAME_WRONG_TYPE

Transmission queue name not allowed for this channel type.

Change, Copy, and Create Channel (MQTT)

The Change Channel command changes existing Telemetry channel definitions. The Copy and Create Channel commands create new Telemetry channel definitions - the Copy command uses attribute values of an existing channel definition.

The Change Channel (MQCMD_CHANGE_CHANNEL) command changes the specified attributes in a channel definition. For any optional parameters that are omitted, the value does not change.

The Copy Channel (MQCMD_COPY_CHANNEL) command creates new channel definition using, for attributes not specified in the command, the attribute values of an existing channel definition.

The Create Channel (MQCMD_CREATE_CHANNEL) command creates an IBM MQ channel definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager. If a system default channel exists for the type of channel being created, the default values are taken from there.

Required parameters (Change, Create Channel)**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Specifies the name of the channel definition to be changed, or created

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

MQCHT_MQTT
Telemetry.

TrpType (MQCFIN)

Transmission protocol type of the channel (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE). This parameter is required for a create command in telemetry.

No check is made that the correct transport type has been specified if the channel is initiated from the other end. The value is:

MQXPT_TCP
TCP.

Port (MQCFIN)

The port number to use if *TrpType* is set to MQXPT_TCP. This parameter is required for a create command in telemetry, if *TrpType* is set to MQXPT_TCP.

The value is in the range 1 - 65335.

Required parameters (Copy Channel)

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

MQCHT_MQTT
Telemetry.

Optional parameters (Change, Copy, and Create Channel)

Backlog (MQCFIN)

The number of concurrent connection requests that the telemetry channel supports at any one time (parameter identifier: MQIACH_BACKLOG).

The value is in the range 0 - 999999999.

JAASConfig (MQCFST)

The file path of the JAAS configuration (parameter identifier: MQCACH_JAAS_CONFIG).

The maximum length of this value is MQ_JAAS_CONFIG_LENGTH.

Only one of JAASCONFIG, MCAUSER, and USECLIENTID can be specified for a telemetry channel; if none is specified, no authentication is performed. If JAASConfig is specified, the client flows a user name and password. In all other cases, the flowed user name is ignored.

LocalAddress (MQCFST)

Local communications address for the channel (parameter identifier: MQCACH_LOCAL_ADDRESS).

The maximum length of the string is MQ_LOCAL_ADDRESS_LENGTH.

The value that you specify depends on the transport type (*TrpType*) to be used:

TCP/IP

The value is the optional IP address and optional port or port range to be used for outbound TCP/IP communications. The format for this information is as follows:

```
[ip-addr][(low-port[,high-port])]
```

where *ip-addr* is specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric form, and *low-port* and *high-port* are port numbers enclosed in parentheses. All are optional.

All Others

The value is ignored; no error is diagnosed.

Use this parameter if you want a channel to use a particular IP address, port, or port range for outbound communications. This parameter is useful when a machine is connected to multiple networks with different IP addresses.

Examples of use

Value	Meaning
9.20.4.98	Channel binds to this address locally
9.20.4.98 (1000)	Channel binds to this address and port 1000 locally
9.20.4.98 (1000,2000)	Channel binds to this address and uses a port in the range 1000 - 2000 locally
(1000)	Channel binds to port 1000 locally
(1000,2000)	Channel binds to a port in the range 1000 - 2000 locally

Note:

- Do not confuse this parameter with *ConnectionName*. The *LocalAddress* parameter specifies the characteristics of the local communications; the *ConnectionName* parameter specifies how to reach a remote queue manager.

MqiachProtocol (MQCFIL)

Client protocols supported by the MQTT channel (parameter identifier: MQIACH_PROTOCOL).

The value can be one or more of the following values:

MQPROTO_MQTTV311

The channel accepts connections from clients using the protocol defined by the [MQTT 3.1.1](#) Oasis standard. The functionality provided by this protocol is almost identical to that provided by the pre-existing MQTTV3 protocol.

MQPROTO_MQTTV3

The channel accepts connections from clients using the [MQTT V3.1 Protocol Specification](#) from [mqtt.org](#).

MQPROTO_HTTP

The channel accepts HTTP requests for pages, or WebSockets connections to MQ Telemetry.

If you specify no client protocols, the channel accepts connections from clients using any of the supported protocols.

If you are using IBM MQ 8.0.0 Fix Pack 3 or later, and your configuration includes an MQTT channel that was last modified in an earlier version of the product, you must explicitly change the protocol setting to prompt the channel to use the MQTTV311 option. This is so even if the channel does not specify any client protocols, because the specific protocols to use with the channel are stored at the time the channel is configured, and previous versions of the product have no awareness of the MQTTV311 option. To prompt a channel in this state to use the MQTTV311 option, explicitly add the option then save your changes. The channel definition is now aware of the option. If you subsequently change the settings again, and specify no client protocols, the MQTTV311 option is still included in the stored list of supported protocols.

SSLCipherSuite (MQCFST)

CipherSuite (parameter identifier: MQCACH_SSL_CIPHER_SUITE).

The length of the string is MQ_SSL_CIPHER_SUITE_LENGTH.

SSL CIPHER SUITE character channel parameter type.

SSLClientAuth (MQCFIN)

Client authentication (parameter identifier: MQIACH_SSL_CLIENT_AUTH).

The value can be any of the following values:

MQSCA_REQUIRED

Client authentication required

MQSCA_OPTIONAL

Client authentication is optional.

MQSCA_NEVER_REQUIRED

Client authentication is never required, and must not be provided.

Defines whether IBM MQ requires a certificate from the TLS client.

The TLS client is the end of the message channel that initiates the connection. The TLS Server is the end of the message channel that receives the initiation flow.

The parameter is used only for channels with SSLCIPH specified. If SSLCIPH is blank, the data is ignored and no error message is issued.

SSLKeyFile (MQCFST)

The store for digital certificates and their associated private keys (parameter identifier: MQCA_SSL_KEY_REPOSITORY).

If you do not specify a key file, TLS is not used.

The maximum length of this parameter is MQ_SSL_KEY_REPOSITORY_LENGTH.

SSLPassPhrase (MQCFST)

The password for the key repository (parameter identifier: MQCACH_SSL_KEY_PASSPHRASE).

If no pass phrase is entered, then unencrypted connections must be used.

The maximum length of this parameter is MQ_SSL_KEY_PASSPHRASE_LENGTH.

UseClientIdentifier (MQCFIN)

Determines whether to use the client ID of a new connection as the user ID for that connection (parameter identifier: MQIACH_USE_CLIENT_ID).

The value is either:

MQUCI_YES

Yes.

MQUCI_NO

No.

Only one of JAASCONFIG, MCAUSER, and USECLIENTID can be specified for a telemetry channel; if none is specified, no authentication is performed. If USECLIENTID is specified, the flowed user name of the client is ignored.

Error codes (Change, Copy, and Create Channel)

This command might return the following error codes in the response format header, in addition to those codes listed in [“Error codes applicable to all commands”](#) on page 1343.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_BATCH_INT_ERROR

Batch interval not valid.

MQRCCF_BATCH_INT_WRONG_TYPE

Batch interval parameter not allowed for this channel type.

MQRCCF_BATCH_SIZE_ERROR

Batch size not valid.

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHANNEL_TYPE_ERROR
Channel type not valid.

MQRCCF_CLUSTER_NAME_CONFLICT
Cluster name conflict.

MQRCCF_DISC_INT_ERROR
Disconnection interval not valid.

MQRCCF_DISC_INT_WRONG_TYPE
Disconnection interval not allowed for this channel type.

MQRCCF_HB_INTERVAL_ERROR
Heartbeat interval not valid.

MQRCCF_HB_INTERVAL_WRONG_TYPE
Heartbeat interval parameter not allowed for this channel type.

MQRCCF_LONG_RETRY_ERROR
Long retry count not valid.

MQRCCF_LONG_RETRY_WRONG_TYPE
Long retry parameter not allowed for this channel type.

MQRCCF_LONG_TIMER_ERROR
Long timer not valid.

MQRCCF_LONG_TIMER_WRONG_TYPE
Long timer parameter not allowed for this channel type.

MQRCCF_MAX_INSTANCES_ERROR
Maximum instances value not valid.

MQRCCF_MAX_INSTS_PER_CLNT_ERR
Maximum instances per client value not valid.

MQRCCF_MAX_MSG_LENGTH_ERROR
Maximum message length not valid.

MQRCCF_MCA_NAME_ERROR
Message channel agent name error.

MQRCCF_MCA_NAME_WRONG_TYPE
Message channel agent name not allowed for this channel type.

MQRCCF_MCA_TYPE_ERROR
Message channel agent type not valid.

MQRCCF_MISSING_CONN_NAME
Connection name parameter required but missing.

MQRCCF_MR_COUNT_ERROR
Message retry count not valid.

MQRCCF_MR_COUNT_WRONG_TYPE
Message-retry count parameter not allowed for this channel type.

MQRCCF_MR_EXIT_NAME_ERROR
Channel message-retry exit name error.

MQRCCF_MR_EXIT_NAME_WRONG_TYPE
Message-retry exit parameter not allowed for this channel type.

MQRCCF_MR_INTERVAL_ERROR
Message retry interval not valid.

MQRCCF_MR_INTERVAL_WRONG_TYPE
Message-retry interval parameter not allowed for this channel type.

MQRCCF_MSG_EXIT_NAME_ERROR
Channel message exit name error.

MQRCCF_NET_PRIORITY_ERROR
Network priority value error.

MQRCCF_NET_PRIORITY_WRONG_TYPE
Network priority attribute not allowed for this channel type.

MQRCCF_NPM_SPEED_ERROR
Nonpersistent message speed not valid.

MQRCCF_NPM_SPEED_WRONG_TYPE
Nonpersistent message speed parameter not allowed for this channel type.

MQRCCF_PARM_SEQUENCE_ERROR
Parameter sequence not valid.

MQRCCF_PUT_AUTH_ERROR
Put authority value not valid.

MQRCCF_PUT_AUTH_WRONG_TYPE
Put authority parameter not allowed for this channel type.

MQRCCF_RCV_EXIT_NAME_ERROR
Channel receive exit name error.

MQRCCF_SEC_EXIT_NAME_ERROR
Channel security exit name error.

MQRCCF_SEND_EXIT_NAME_ERROR
Channel send exit name error.

MQRCCF_SEQ_NUMBER_WRAP_ERROR
Sequence wrap number not valid.

MQRCCF_SHARING_CONVS_ERROR
Value given for Sharing Conversations not valid.

MQRCCF_SHARING_CONVS_TYPE
Sharing Conversations parameter not valid for this channel type.

MQRCCF_SHORT_RETRY_ERROR
Short retry count not valid.

MQRCCF_SHORT_RETRY_WRONG_TYPE
Short retry parameter not allowed for this channel type.

MQRCCF_SHORT_TIMER_ERROR
Short timer value not valid.

MQRCCF_SHORT_TIMER_WRONG_TYPE
Short timer parameter not allowed for this channel type.

MQRCCF_SSL_CIPHER_SPEC_ERROR
TLS CipherSpec not valid.

MQRCCF_SSL_CLIENT_AUTH_ERROR
TLS client authentication not valid.

MQRCCF_SSL_PEER_NAME_ERROR
TLS peer name not valid.

MQRCCF_WRONG_CHANNEL_TYPE
Parameter not allowed for this channel type.

MQRCCF_XMIT_PROTOCOL_TYPE_ERR
Transmission protocol type not valid.

MQRCCF_XMIT_Q_NAME_ERROR
Transmission queue name error.

MQRCCF_XMIT_Q_NAME_WRONG_TYPE
Transmission queue name not allowed for this channel type.

Change, Copy, and Create Channel Listener on Multiplatforms

The Change Channel Listener command changes existing channel listener definitions. The Copy and Create Channel Listener commands create new channel listener definitions - the Copy command uses attribute values of an existing channel listener definition.

The Change Channel Listener (MQCMD_CHANGE_LISTENER) command changes the specified attributes of an existing IBM MQ listener definition. For any optional parameters that are omitted, the value does not change.

The Copy Channel Listener (MQCMD_COPY_LISTENER) command creates an IBM MQ listener definition, using, for attributes not specified in the command, the attribute values of an existing listener definition.

The Create Channel Listener (MQCMD_CREATE_LISTENER) command creates an IBM MQ listener definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameters (Change and Create Channel Listener)

ListenerName (MQCFST)

The name of the listener definition to be changed or created (parameter identifier: MQCACH_LISTENER_NAME).

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

TransportType (MQCFIN)

Transmission protocol (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value can be:

MQXPT_TCP

TCP.

MQXPT_LU62

LU 6.2. This value is valid only on Windows.

MQXPT_NETBIOS

NetBIOS. This value is valid only on Windows.

MQXPT_SPX

SPX. This value is valid only on Windows.

Required parameters (Copy Channel Listener)

FromListenerName (MQCFST)

The name of the listener definition to be copied from (parameter identifier: MQCACF_FROM_LISTENER_NAME).

This parameter specifies the name of the existing listener definition that contains values for the attributes not specified in this command.

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

ToListenerName (MQCFST)

To listener name (parameter identifier: MQCACF_TO_LISTENER_NAME).

This parameter specifies the name of the new listener definition. If a listener definition with this name exists, *Replace* must be specified as MQRP_YES.

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

Optional parameters (Change, Copy, and Create Channel Listener)

Adapter (MQCFIN)

Adapter number (parameter identifier: MQIACH_ADAPTER).

The adapter number on which NetBIOS listens. This parameter is valid only on Windows.

Backlog (MQCFIN)

Backlog (parameter identifier: MQIACH_BACKLOG).

The number of concurrent connection requests that the listener supports.

Commands (MQCFIN)

Adapter number (parameter identifier: MQIACH_COMMAND_COUNT).

The number of commands that the listener can use. This parameter is valid only on Windows.

IPAddress (MQCFST)

IP address (parameter identifier: MQCACH_IP_ADDRESS).

IP address for the listener specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric host name form. If you do not specify a value for this parameter, the listener listens on all configured IPv4 and IPv6 stacks.

The maximum length of the string is MQ_LOCAL_ADDRESS_LENGTH

ListenerDesc (MQCFST)

Description of listener definition (parameter identifier: MQCACH_LISTENER_DESC).

This parameter is a plain-text comment that provides descriptive information about the listener definition. It must contain only displayable characters.

If characters are used that are not in the coded character set identifier (CCSID) for the queue manager on which the command is executing, they might be translated incorrectly.

The maximum length of the string is MQ_LISTENER_DESC_LENGTH.

LocalName (MQCFST)

NetBIOS local name (parameter identifier: MQCACH_LOCAL_NAME).

The NetBIOS local name that the listener uses. This parameter is valid only on Windows.

The maximum length of the string is MQ_CONN_NAME_LENGTH

NetbiosNames (MQCFIN)

NetBIOS names (parameter identifier: MQIACH_NAME_COUNT).

The number of names that the listener supports. This parameter is valid only on Windows.

Port (MQCFIN)

Port number (parameter identifier: MQIACH_PORT).

The port number for TCP/IP. This parameter is valid only if the value of *TransportType* is MQXPT_TCP.

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If a namelist definition with the same name as *ToListenerName* exists, this definition specifies whether it is to be replaced. The value can be:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

Sessions (MQCFIN)

NetBIOS sessions (parameter identifier: MQIACH_SESSION_COUNT).

The number of sessions that the listener can use. This parameter is valid only on Windows.

Socket (MQCFIN)

SPX socket number (parameter identifier: MQIACH_SOCKET).

The SPX socket on which to listen. This parameter is valid only if the value of *TransportType* is MQXPT_SPX.

StartMode (MQCFIN)

Service mode (parameter identifier: MQIACH_LISTENER_CONTROL).

Specifies how the listener is to be started and stopped. The value can be any of the following values:

MQSVC_CONTROL_MANUAL

The listener is not to be started automatically or stopped automatically. It is to be controlled by user command. This value is the default value.

MQSVC_CONTROL_Q_MGR

The listener being defined is to be started and stopped at the same time as the queue manager is started and stopped.

MQSVC_CONTROL_Q_MGR_START

The listener is to be started at the same time as the queue manager is started, but is not requested to stop when the queue manager is stopped.

TPName (MQCFST)

Transaction program name (parameter identifier: MQCACH_TP_NAME).

The LU 6.2 transaction program name. This parameter is valid only on Windows.

The maximum length of the string is MQ_TP_NAME_LENGTH

Change, Copy, and Create Communication Information Object on Multiplatforms

The Change Communication Information Object command changes existing communication information object definitions. The Copy and Create Communication Information Object commands create new communication information object definitions - the Copy command uses attribute values of an existing communication information object definition.

The Change communication information (MQCMD_CHANGE_COMM_INFO) command changes the specified attributes of an existing IBM MQ communication information object definition. For any optional parameters that are omitted, the value does not change.

The Copy communication information (MQCMD_COPY_COMM_INFO) command creates an IBM MQ communication information object definition, using, for attributes not specified in the command, the attribute values of an existing communication information definition.

The Create communication information (MQCMD_CREATE_COMM_INFO) command creates an IBM MQ communication information object definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameter (Change communication information)**CommInfoName (MQCFST)**

The name of the communication information definition to be changed (parameter identifier: MQCA_COMM_INFO_NAME).

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

Required parameters (Copy communication information)**FromCommInfoName (MQCFST)**

The name of the communication information object definition to be copied from (parameter identifier: MQCACF_FROM_COMM_INFO_NAME).

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

ToComminfoName (MQCFST)

The name of the communication information definition to copy to (parameter identifier: MQCACF_TO_COMM_INFO_NAME).

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

Required parameters (Create communication information)**ComminfoName (MQCFST)**

The name of the communication information definition to be created (parameter identifier: MQCA_COMM_INFO_NAME).

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

Optional parameters (Change, Copy, and Create communication information)**Bridge (MQCFIN)**

Controls whether publications from applications not using Multicast are bridged to applications using multicast (parameter identifier: MQIA_MCAST_BRIDGE).

Bridging does not apply to topics that are marked as **MCAST (ONLY)**. As these topics can only have multicast traffic, it is not applicable to bridge to the non-multicast publish/subscribe domain.

MQMCB_DISABLED

Publications from applications not using multicast are not bridged to applications that do use Multicast. This is the default for IBM i.

MQMCB_ENABLED

Publications from applications not using multicast are bridged to applications that do use Multicast. This is the default for platforms other than IBM i. This value is not valid on IBM i.

CCSID (MQCFIN)

The coded character set identifier that messages are transmitted on (parameter identifier: MQIA_CODED_CHAR_SET_ID).

Specify a value in the range 1 to 65535.

The CCSID must specify a value that is defined for use on your platform, and use a character set that is appropriate to the platform. If you use this parameter to change the CCSID, applications that are running when the change is applied continue to use the original CCSID. Because of this, you must stop and restart all running applications before you continue.

This includes the command server and channel programs. To do this, stop and restart the queue manager after making the change. The default value is ASPUB which means that the coded character set is taken from the one that is supplied in the published message.

CommEvent (MQCFIN)

Controls whether event messages are generated for multicast handles that are created using this COMMINFO object (parameter identifier: MQIA_COMM_EVENT).

Events are only generated if monitoring is also enabled using the **MonitorInterval** parameter.

MQEVR_DISABLED

Publications from applications not using multicast are not bridged to applications that do use multicast. This is the default value.

MQEVR_ENABLED

Publications from applications not using multicast are bridged to applications that do use multicast.

MQEVR_EXCEPTION

Event messages are written if the message reliability is below the reliability threshold. The reliability threshold is set to 90 by default.

Description (MQCFST)

Plain-text comment that provides descriptive information about the communication information object (parameter identifier: MQCA_COMM_INFO_DESC).

It must contain only displayable characters. The maximum length is 64 characters. In a DBCS installation, it can contain DBCS characters (subject to a maximum length of 64 bytes).

If characters are used that are not in the coded character set identifier (CCSID) for this queue manager, they might be translated incorrectly if the information is sent to another queue manager.

The maximum length is MQ_COMM_INFO_DESC_LENGTH.

Encoding (MQCFIN)

The encoding that the messages are transmitted in (parameter identifier: MQIACF_ENCODING).

MQENC_AS_PUBLISHED

The encoding of the message is taken from the one that is supplied in the published message. This is the default value.

MQENC_NORMAL**MQENC_REVERSED****MQENC_S390****MQENC_TNS****GrpAddress (MQCFST)**

The group IP address or DNS name (parameter identifier: MQCACH_GROUP_ADDRESS).

It is the administrator's responsibility to manage the group addresses. It is possible for all multicast clients to use the same group address for every topic; only the messages that match outstanding subscriptions on the client are delivered. Using the same group address can be inefficient because every client must examine and process every multicast packet in the network. It is more efficient to allocate different IP group addresses to different topics or sets of topics, but this requires careful management, especially if other non-MQ multicast applications are in use on the network. The default value is 239.0.0.0.

The maximum length is MQ_GROUP_ADDRESS_LENGTH.

MonitorInterval (MQCFIN)

How frequently monitoring information is updated and event messages are generated (parameter identifier: MQIA_MONITOR_INTERVAL).

The value is specified as a number of seconds in the range 0 to 999 999. A value of 0 indicates that no monitoring is required.

If a non-zero value is specified, monitoring is enabled. Monitoring information is updated and event messages (if enabled using *CommEvent*, are generated about the status of the multicast handles created using this communication information object.

MsgHistory (MQCFIN)

This value is the amount of message history in kilobytes that is kept by the system to handle retransmissions in the case of NACKs (parameter identifier: MQIACH_MSG_HISTORY).

The value is in the range 0 to 999 999 999. A value of 0 gives the least level of reliability. The default value is 100.

MulticastHeartbeat (MQCFIN)

The heartbeat interval is measured in milliseconds, and specifies the frequency at which the transmitter notifies any receivers that there is no further data available (parameter identifier: MQIACH_MC_HB_INTERVAL).

The value is in the range 0 to 999 999. The default value is 2000 milliseconds.

MulticastPropControl (MQCFIN)

The multicast properties control how many of the MQMD properties and user properties flow with the message (parameter identifier: MQIACH_MULTICAST_PROPERTIES).

MQMCP_ALL

All user properties and all the fields of the MQMD are transported. This is the default value.

MQMCP_REPLY

Only user properties, and MQMD fields that deal with replying to the messages, are transmitted. These properties are:

- MsgType
- MessageId
- CorrelId
- ReplyToQ
- ReplyToQmgr

MQMCP_USER

Only the user properties are transmitted.

MQMCP_NONE

No user properties or MQMD fields are transmitted.

MQMCP_COMPAT

Properties are transmitted in a format compatible with previous MQ multicast clients.

NewSubHistory (MQCFIN)

The new subscriber history controls whether a subscriber joining a publication stream receives as much data as is currently available, or receives only publications made from the time of the subscription (parameter identifier: MQIACH_NEW_SUBSCRIBER_HISTORY).

MQNSH_NONE

A value of NONE causes the transmitter to transmit only publication made from the time of the subscription. This is the default value.

MQNSH_ALL

A value of ALL causes the transmitter to retransmit as much history of the topic as is known. In some circumstances, this can give a similar behavior to retained publications.

Using the value of MQNSH_ALL might have a detrimental effect on performance if there is a large topic history because all the topic history is retransmitted.

PortNumber (MQCFIN)

The port number to transmit on (parameter identifier: MQIACH_PORT).

The default port number is 1414.

Type (MQCFIN)

The type of the communications information object (parameter identifier: MQIA_COMM_INFO_TYPE).

The only type supported is MQCIT_MULTICAST.

Change, Copy, and Create Namelist

The Change Namelist command changes existing namelist definitions. The Copy and Create Namelist commands create new namelist definitions - the Copy command uses attribute values of an existing namelist definition.

The Change Namelist (MQCMD_CHANGE_NAMELIST) command changes the specified attributes of an existing IBM MQ namelist definition. For any optional parameters that are omitted, the value does not change.

The Copy Namelist (MQCMD_COPY_NAMELIST) command creates an IBM MQ namelist definition, using, for attributes not specified in the command, the attribute values of an existing namelist definition.

The Create Namelist (MQCMD_CREATE_NAMELIST) command creates an IBM MQ namelist definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameter (Change and Create Namelist)

NamelistName (MQCFST)

The name of the namelist definition to be changed (parameter identifier: MQCA_NAMELIST_NAME).

The maximum length of the string is MQ_NAMELIST_NAME_LENGTH.

Required parameters (Copy Namelist)

FromNamelistName (MQCFST)

The name of the namelist definition to be copied from (parameter identifier: MQCACF_FROM_NAMELIST_NAME).

This parameter specifies the name of the existing namelist definition that contains values for the attributes not specified in this command.

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR or MQQSGD_COPY to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToNamelistName* and the disposition MQQSGD_GROUP is searched for to copy from.

The maximum length of the string is MQ_NAMELIST_NAME_LENGTH.

ToNamelistName (MQCFST)

To namelist name (parameter identifier: MQCACF_TO_NAMELIST_NAME).

This parameter specifies the name of the new namelist definition. If a namelist definition with this name exists, *Replace* must be specified as MQRP_YES.

The maximum length of the string is MQ_NAMELIST_NAME_LENGTH.

Optional parameters (Change, Copy, and Create Namelist)

 z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

NamelistDesc (MQCFST)

Description of namelist definition (parameter identifier: MQCA_NAMELIST_DESC).

This parameter is a plain-text comment that provides descriptive information about the namelist definition. It must contain only displayable characters.

If characters are used that are not in the coded character set identifier (CCSID) for the queue manager on which the command is executing, they might be translated incorrectly.

The maximum length of the string is MQ_NAMELIST_DESC_LENGTH.

 z/OS

NamelistType (MQCFIN)

Type of names in the namelist (parameter identifier: MQIA_NAMELIST_TYPE). This parameter applies to z/OS only.

Specifies the type of names in the namelist. The value can be any of the following values:

MQNT_NONE

The names are of no particular type.

MQNT_Q

A namelist that holds a list of queue names.

MQNT_CLUSTER

A namelist that is associated with clustering, containing a list of the cluster names.

MQNT_AUTH_INFO

The namelist is associated with TLS, and contains a list of authentication information object names.

Names (MQCFSL)

The names to be placed in the namelist (parameter identifier: MQCA_NAMES).

The number of names in the list is given by the *Count* field in the MQCFSL structure. The length of each name is given by the *StringLength* field in that structure. The maximum length of a name is MQ_OBJECT_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToNameListName</i> object (for Copy) or <i>NameListName</i> object (for Create).

QSGDisposition	Change	Copy, Create
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they refresh local copies on page set zero:</p> <pre>DEFINE NAMELIST(name) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This is allowed only if the queue manager is in a queue sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they make or refresh local copies on page set zero:</p> <pre>DEFINE NAMELIST(name) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
MQQSGD_PRIVATE	<p>The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.</p>	Not permitted.
MQQSGD_Q_MGR	<p>The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.</p>	<p>The object is defined on the page set of the queue manager that executes the command. This value is the default value.</p>

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If a namelist definition with the same name as *ToNameListName* exists, this definition specifies whether it is to be replaced. The value can be:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

Change, Copy, and Create Process

The Change Process command changes existing process definitions. The Copy and Create Process commands create new process definitions - the Copy command uses attribute values of an existing process definition.

The Change Process (MQCMD_CHANGE_PROCESS) command changes the specified attributes of an existing IBM MQ process definition. For any optional parameters that are omitted, the value does not change.

The Copy Process (MQCMD_COPY_PROCESS) command creates an IBM MQ process definition, using, for attributes not specified in the command, the attribute values of an existing process definition.

The Create Process (MQCMD_CREATE_PROCESS) command creates an IBM MQ process definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameters (Change and Create Process)

ProcessName (MQCFST)

The name of the process definition to be changed or created (parameter identifier: MQCA_PROCESS_NAME).

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

Required parameters (Copy Process)

FromProcessName (MQCFST)

The name of the process definition to be copied from (parameter identifier: MQCACF_FROM_PROCESS_NAME).

Specifies the name of the existing process definition that contains values for the attributes not specified in this command.

z/OS On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR or MQQSGD_COPY to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToProcessName* and the disposition MQQSGD_GROUP is searched for to copy from.

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

ToProcessName (MQCFST)

To process name (parameter identifier: MQCACF_TO_PROCESS_NAME).

The name of the new process definition. If a process definition with this name exists, *Replace* must be specified as MQRP_YES.

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

Optional parameters (Change, Copy, and Create Process)

ApplId (MQCFST)

Application identifier (parameter identifier: MQCA_APPL_ID).

ApplId is the name of the application to be started. The application must be on the platform for which the command is executing. The name might typically be a fully qualified file name of an executable object. Qualifying the file name is particularly important if you have multiple IBM MQ installations, to ensure the correct version of the application is run.

The maximum length of the string is MQ_PROCESS_APPL_ID_LENGTH.

ApplType (MQCFIN)

Application type (parameter identifier: MQIA_APPL_TYPE).

Valid application types are:

MQAT_OS400

IBM i application.

MQAT_DOS

DOS client application.

MQAT_WINDOWS

Windows client application.

MQAT_AIX

AIX application (same value as MQAT_UNIX).

MQAT_CICS

CICS transaction.

MQAT_ZOS

z/OS application.

MQAT_DEFAULT

Default application type.

integer: System-defined application type in the range zero through 65 535 or a user-defined application type in the range 65 536 through 999 999 999 (not checked).

Only specify application types (other than user-defined types) that are supported on the platform at which the command is executed:

-  On IBM i: MQAT_OS400, MQAT_CICS, and MQAT_DEFAULT are supported.
-  On UNIX: MQAT_UNIX, MQAT_OS2, MQAT_DOS, MQAT_WINDOWS, MQAT_CICS, and MQAT_DEFAULT are supported.
-  On Windows: MQAT_WINDOWS_NT, MQAT_OS2, MQAT_DOS, MQAT_WINDOWS, MQAT_CICS, and MQAT_DEFAULT are supported.
-  On z/OS: MQAT_DOS, MQAT_IMS, MQAT_MVS, MQAT_UNIX, MQAT_CICS, and MQAT_DEFAULT are supported.

z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. In a shared queue environment, you can provide a different queue manager name from the one you are using to enter the command. The command server must be enabled.
- An asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

EnvData (MQCFST)

Environment data (parameter identifier: MQCA_ENV_DATA).

A character string that contains environment information pertaining to the application to be started.

The maximum length of the string is MQ_PROCESS_ENV_DATA_LENGTH.

ProcessDesc (MQCFST)

Description of process definition (parameter identifier: MQCA_PROCESS_DESC).

A plain-text comment that provides descriptive information about the process definition. It must contain only displayable characters.

The maximum length of the string is MQ_PROCESS_DESC_LENGTH.

Use characters from the coded character set identifier (CCSID) for this queue manager. Other characters might be translated incorrectly if the information is sent to another queue manager.

z/OS

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToProcessName</i> object (for Copy) or <i>ProcessName</i> object (for Create).
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameters QSGDISP(GROUP). On the page set of the queue manager that executes the command, only a local copy of the object is altered by this command. If the command is successful, the following command is generated.</p> <pre>DEFINE PROCESS(process-name) REPLACE QSGDISP(COPY)</pre> <p>The command is sent to all active queue managers in the queue sharing group to attempt to refresh local copies on page set zero. The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. GROUP is allowed only if the queue manager is in a queue sharing group. If the definition is successful, the following command is generated.</p> <pre>DEFINE PROCESS(process-name) REPLACE QSGDISP(COPY)</pre> <p>The command is sent to all active queue managers in the queue sharing group to attempt to make or refresh local copies on page set zero. The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
MQQSGD_PRIVATE	The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.	Not permitted.
MQQSGD_Q_MGR	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. MQQSGD_Q_MGR is the default value.	The object is defined on the page set of the queue manager that executes the command. MQQSGD_Q_MGR is the default value.

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If a process definition with the same name as *ToProcessName* exists, specify whether to replace it.

The value can be any of the following values:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

UserData (MQCFST)

User data (parameter identifier: MQCA_USER_DATA).

A character string that contains user information pertaining to the application (defined by *AppId*) that is to be started.

For Microsoft Windows, the character string must not contain double quotation marks if the process definition is going to be passed to **runmqtrm**.

The maximum length of the string is MQ_PROCESS_USER_DATA_LENGTH.

Change, Copy, and Create Queue

The Change Queue command changes existing queue definitions. The Copy and Create Queue commands create new queue definitions - the Copy command uses attribute values of an existing queue definition.

The Change Queue command MQCMD_CHANGE_Q changes the specified attributes of an existing IBM MQ queue. For any optional parameters that are omitted, the value does not change.

The Copy Queue command MQCMD_COPY_Q creates a queue definition of the same type. For attributes not specified in the command, it uses the attribute values of an existing queue definition.

The Create Queue command MQCMD_CREATE_Q creates a queue definition with the specified attributes. All attributes that are not specified are set to the default value for the type of queue that is created.

Required parameters (Change and Create Queue)**QName (MQCFST)**

Queue name (parameter identifier: MQCA_Q_NAME).

The name of the queue to be changed. The maximum length of the string is MQ_Q_NAME_LENGTH.

Required parameters (Copy Queue)**FromQName (MQCFST)**

From queue name (parameter identifier: MQCACF_FROM_Q_NAME).

Specifies the name of the existing queue definition.

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR, MQQSGD_COPY, or MQQSGD_SHARED to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToQName* and the disposition MQQSGD_GROUP is searched for to copy from.

The maximum length of the string is MQ_Q_NAME_LENGTH.

ToQName (MQCFST)

To queue name (parameter identifier: MQCACF_TO_Q_NAME).

Specifies the name of the new queue definition.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Queue names must be unique; if a queue definition exists with the name and type of the new queue, *Replace* must be specified as MQRP_YES. If a queue definition exists with the same name as and a different type from the new queue, the command fails.

Required parameters (all commands)

QType (MQCFIN)

Queue type (parameter identifier: MQIA_Q_TYPE).

The value specified must match the type of the queue being changed.

The value can be any of the following values:

MQQT_ALIAS

Alias queue definition.

MQQT_LOCAL

Local queue.

MQQT_REMOTE

Local definition of a remote queue.

MQQT_MODEL

Model queue definition.

Optional parameters (Change, Copy, and Create Queue)

BackoutRequeueName (MQCFST) - see MQSC BOQNAME

Excessive backout requeue name (parameter identifier: MQCA_BACKOUT_REQ_Q_NAME).

Specifies the name of the queue to which a message is transferred if it is backed out more times than the value of *BackoutThreshold*. The queue does not have to be a local queue.

The backout queue does not need to exist at this time but it must exist when the *BackoutThreshold* value is exceeded.

The maximum length of the string is MQ_Q_NAME_LENGTH.

BackoutThreshold (MQCFIN)

Backout threshold (parameter identifier: MQIA_BACKOUT_THRESHOLD).

The number of times a message can be backed out before it is transferred to the backout queue specified by *BackoutRequeueName*.

If the value is later reduced, messages that are already on the queue that were backed out at least as many times as the new value remain on the queue. Those messages are transferred if they are backed out again.

Specify a value in the range 0 - 999,999,999.

BaseObjectName (MQCFST)

Name of the object to which the alias resolves (parameter identifier: MQCA_BASE_OBJECT_NAME).

This parameter is the name of a queue or topic that is defined to the local queue manager.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

BaseQName (MQCFST)

Queue name to which the alias resolves (parameter identifier: MQCA_BASE_Q_NAME).

This parameter is the name of a local or remote queue that is defined to the local queue manager.

The maximum length of the string is MQ_Q_NAME_LENGTH.

CFStructure (MQCFST)

Coupling facility structure name (parameter identifier: MQCA_CF_STRUC_NAME). This parameter applies to z/OS only.

Specifies the name of the coupling facility structure where you want to store messages when you use shared queues. The name:

- Cannot have more than 12 characters
- Must start with an uppercase letter (A - Z)

- Can include only the characters A - Z and 0 - 9

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

The name of the queue sharing group to which the queue manager is connected is prefixed to the name you supply. The name of the queue sharing group is always four characters, padded with @ symbols if necessary. For example, if you use a queue sharing group named NY03 and you supply the name PRODUCT7, the resultant coupling facility structure name is NY03PRODUCT7. Note the administrative structure for the queue sharing group (in this case NY03CSQ_ADMIN) cannot be used for storing messages.

For local and model queues, the following rules apply. The rules apply if you use the Create Queue command with a value of MQRP_YES in the **Replace** parameter. The rules also apply if you use the Change Queue command.

- On a local queue with a value of MQQSGD_SHARED in the **QSGDisposition** parameter, *CFStructure* cannot change.
If you need to change either the *CFStructure* or *QSGDisposition* value, you must delete and redefine the queue. To preserve any of the messages on the queue you must offload the messages before you delete the queue. Reload the messages after you redefine the queue, or move the messages to another queue.
- On a model queue with a value of MQQDT_SHARED_DYNAMIC in the **DefinitionType** parameter, *CFStructure* cannot be blank.
- On a local queue with a value other than MQQSGD_SHARED in the **QSGDisposition** parameter, the value of *CFStructure* does not matter. The value *CFStructure* also does not matter for a model queue with a value other than MQQDT_SHARED_DYNAMIC in the **DefinitionType** parameter.

For local and model queues, when you use the Create Queue command with a value of MQRP_NO in the **Replace** parameter, the coupling facility structure:

- On a local queue with a value of MQQSGD_SHARED in the **QSGDisposition** parameter, or a model queue with a value of MQQDT_SHARED_DYNAMIC in the **DefinitionType** parameter, *CFStructure* cannot be blank.
- On a local queue with a value other than MQQSGD_SHARED in the **QSGDisposition** parameter, the value of *CFStructure* does not matter. The value *CFStructure* also does not matter for a model queue with a value other than MQQDT_SHARED_DYNAMIC in the **DefinitionType** parameter.

Note: Before you can use the queue, the structure must be defined in the coupling facility Resource Management (CFRM) policy data set.

ClusterChannelName (MQCFST)

This parameter is supported only on transmission queues.

ClusterChannelName is the generic name of the cluster-sender channels that use this queue as a transmission queue. The attribute specifies which cluster-sender channels send messages to a cluster-receiver channel from this cluster transmission queue. (Parameter identifier: MQCA_CLUS_CHL_NAME.)

You can also set the transmission queue attribute ClusterChannelName attribute to a cluster-sender channel manually. Messages that are destined for the queue manager connected by the cluster-sender channel are stored in the transmission queue that identifies the cluster-sender channel. They are not stored in the default cluster transmission queue. If you set the ClusterChannelName attribute to blanks, the channel switches to the default cluster transmission queue when the channel restarts. The default queue is either SYSTEM.CLUSTER.TRANSMIT.ChannelName or SYSTEM.CLUSTER.TRANSMIT.QUEUE, depending on the value of the queue manager DefClusterXmitQueueType attribute.

By specifying asterisks, "*", in **ClusterChannelName**, you can associate a transmission queue with a set of cluster-sender channels. The asterisks can be at the beginning, end, or any number of places in the middle of the channel name string. **ClusterChannelName** is limited to a length of 20 characters: MQ_CHANNEL_NAME_LENGTH.

The default queue manager configuration is for all cluster-sender channels to send messages from a single transmission queue, `SYSTEM.CLUSTER.TRANSMIT.QUEUE`. The default configuration can be changed by modified by changing the queue manager attribute, **DefClusterXmitQueueType**. The default value of the attribute is `SCTQ`. You can change the value to `CHANNEL`. If you set the **DefClusterXmitQueueType** attribute to `CHANNEL`, each cluster-sender channel defaults to using a specific cluster transmission queue, `SYSTEM.CLUSTER.TRANSMIT.ChannelName`.

ClusterName (MQCFST)

Cluster name (parameter identifier: `MQCA_CLUSTER_NAME`).

The name of the cluster to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are open.

Only one of the resultant values of **ClusterName** and **ClusterNamelist** can be nonblank; you cannot specify a value for both.

The maximum length of the string is `MQ_CLUSTER_NAME_LENGTH`.

ClusterNamelist (MQCFST)

Cluster namelist (parameter identifier: `MQCA_CLUSTER_NAMELIST`).

The name of the namelist, that specifies a list of clusters to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are open.

Only one of the resultant values of **ClusterName** and **ClusterNamelist** can be nonblank; you cannot specify a value for both.

CLWLQueuePriority (MQCFIN)

Cluster workload queue priority (parameter identifier: `MQIA_CLWL_Q_PRIORITY`).

Specifies the priority of the queue in cluster workload management; see [Configuring a queue manager cluster](#). The value must be in the range 0 - 9, where 0 is the lowest priority and 9 is the highest.

CLWLQueueRank (MQCFIN)

Cluster workload queue rank (parameter identifier: `MQIA_CLWL_Q_RANK`).

Specifies the rank of the queue in cluster workload management. The value must be in the range 0 - 9, where 0 is the lowest priority and 9 is the highest.

CLWLUseQ (MQCFIN)

Cluster workload use remote queue (parameter identifier: `MQIA_CLWL_USEQ`).

Specifies whether remote and local queues are to be used in cluster workload distribution. The value can be any of the following values:

MQCLWL_USEQ_AS_Q_MGR

Use the value of the **CLWLUseQ** parameter on the definition of the queue manager.

MQCLWL_USEQ_ANY

Use remote and local queues.

MQCLWL_USEQ_LOCAL

Do not use remote queues.

CommandScope (MQCFST)

Command scope (parameter identifier: `MQCACF_COMMAND_SCOPE`). This parameter applies to z/OS only.

Specifies how the command is run when the queue manager is a member of a queue sharing group. You can specify one of the following values:

- Blank, or omit the parameter altogether. The command is run on the queue manager on which it was entered.
- A queue manager name. The command is run on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue

manager on which it was entered, you must be using a queue sharing group environment. The command server must be enabled.

- An asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Custom (MQCFST)

Custom attribute for new features (parameter identifier: MQCA_CUSTOM).

This attribute contains the values of attributes, as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE). Single quotation marks must be escaped with another single quotation mark.

CAPEXPY (integer)

The maximum time, expressed in tenths of a second, until a message put using an object handle, opened using this object on the resolution path, remains in the system until it becomes eligible for expiry processing.

For more information on message expiry processing, see [Enforcing lower expiration times](#).

The value can be one of the following:

integer

The value must be in the range one through to 999 999 999.

NOLIMIT

There is no limit on the expiry time of messages put using this object. This is the default value.

Specifying a value for CAPEXPY that is not valid, does not cause the command to fail. Instead, the default value is used.

DefaultPutResponse (MQCFIN)

Default put response type definition (parameter identifier: MQIA_DEF_PUT_RESPONSE_TYPE).

The parameter specifies the type of response to be used for put operations to the queue when an application specifies MQPMO_RESPONSE_AS_Q_DEF. The value can be any of the following values:

MQPRT_SYNC_RESPONSE

The put operation is issued synchronously, returning a response.

MQPRT_ASYNC_RESPONSE

The put operation is issued asynchronously, returning a subset of MQMD fields.

DefBind (MQCFIN)

Bind definition (parameter identifier: MQIA_DEF_BIND).

The parameter specifies the binding to be used when MQ00_BIND_AS_Q_DEF is specified on the MQOPEN call. The value can be any of the following values:

MQBND_BIND_ON_OPEN

The binding is fixed by the MQOPEN call.

MQBND_BIND_NOT_FIXED

The binding is not fixed.

MQBND_BIND_ON_GROUP

Allows an application to request that a group of messages are all allocated to the same destination instance.

Changes to this parameter do not affect instances of the queue that are open.

DefinitionType (MQCFIN)

Queue definition type (parameter identifier: MQIA_DEFINITION_TYPE).

The value can be any of the following values:

MQQDT_PERMANENT_DYNAMIC

Dynamically defined permanent queue.

MQQDT_SHARED_DYNAMIC

Dynamically defined shared queue. This option is available on z/OS only.

MQQDT_TEMPORARY_DYNAMIC

Dynamically defined temporary queue.

DefInputOpenOption (MQCFIN)

Default input open option (parameter identifier: MQIA_DEF_INPUT_OPEN_OPTION).

Specifies the default share option for applications opening this queue for input.

The value can be any of the following values:

MQOO_INPUT_EXCLUSIVE

Open queue to get messages with exclusive access.

MQOO_INPUT_SHARED

Open queue to get messages with shared access.

DefPersistence (MQCFIN)

Default persistence (parameter identifier: MQIA_DEF_PERSISTENCE).

Specifies the default for message-persistence on the queue. Message persistence determines whether messages are preserved across restarts of the queue manager.

The value can be any of the following values:

MQPER_PERSISTENT

Message is persistent.

MQPER_NOT_PERSISTENT

Message is not persistent.

DefPriority (MQCFIN)

Default priority (parameter identifier: MQIA_DEF_PRIORITY).

Specifies the default priority of messages put on the queue. The value must be in the range zero through to the maximum priority value that is supported (9).

DefReadAhead (MQCFIN)

Default read ahead (parameter identifier: MQIA_DEF_READ_AHEAD).

Specifies the default read ahead behavior for non-persistent messages delivered to the client.

The value can be any of the following values:

MQREADA_NO

Non-persistent messages are not read ahead unless the client application is configured to request read ahead.

MQREADA_YES

Non-persistent messages are sent ahead to the client before an application requests them. Non-persistent messages can be lost if the client ends abnormally or if the client does not consume all the messages it is sent.

MQREADA_DISABLED

Read ahead of non-persistent messages is not enabled for this queue. Messages are not sent ahead to the client regardless of whether read ahead is requested by the client application.

Multi DistLists (MQCFIN)

Distribution list support (parameter identifier: MQIA_DIST_LISTS).

Specifies whether distribution-list messages can be placed on the queue.

Note: This attribute is set by the sending message channel agent (MCA). The sending MCA removes messages from the queue each time it establishes a connection to a receiving MCA on a partner queue manager. The attribute is not normally set by administrators, although it can be set if the need arises.

This parameter is supported on [Multiplatforms](#).

The value can be any of the following values:

MQDL_SUPPORTED

Distribution lists supported.

MQDL_NOT_SUPPORTED

Distribution lists not supported.

Force (MQCFIN)

Force changes (parameter identifier: MQIACF_FORCE).

Specifies whether the command must be forced to complete when conditions are such that completing the command would affect an open queue. The conditions depend upon the type of the queue that is being changed:

QALIAS

BaseQName is specified with a queue name and an application has the alias queue open.

QLOCAL

Either of the following conditions indicates that a local queue would be affected:

- *Shareability* is specified as MQQA_NOT_SHAREABLE and more than one application has the local queue open for input.
- The *Usage* value is changed and one or more applications has the local queue open, or there are one or more messages on the queue. (The *Usage* value must not normally be changed while there are messages on the queue. The format of messages changes when they are put on a transmission queue.)

QREMOTE

Either of the following conditions indicates that a remote queue would be affected:

- If *XmitQName* is specified with a transmission-queue name, or blank, and an application has a remote queue open that would be affected by this change.
- If any of the following parameters are specified with a queue or queue manager name, and one or more applications has a queue open that resolved through this definition as a queue manager alias. The parameters are:
 1. *RemoteQName*
 2. *RemoteQMgrName*
 3. *XmitQName*

QMODEL

This parameter is not valid for model queues.

Note: A value of MQFC_YES is not required if this definition is in use as a reply-to queue definition only.

The value can be any of the following values:

MQFC_YES

Force the change.

MQFC_NO

Do not force the change.

HardenGetBackout (MQCFIN)

Harden the backout count, or not (parameter identifier: MQIA_HARDEN_GET_BACKOUT).

Specifies whether the count of the number of times that a message was backed out is hardened. When the count is hardened, the value of the **BackoutCount** field of the message descriptor is written to the log before the message is returned by an MQGET operation. Writing the value to the log ensures that the value is accurate across restarts of the queue manger.

Note: IBM MQ for IBM i always hardens the count, regardless of the setting of this attribute.

When the backout count is hardened, the performance of MQGET operations for persistent messages on this queue is impacted.

The value can be any of the following values:

MQQA_BACKOUT_HARDENED

The message backout count for messages on this queue is hardened to ensure that the count is accurate.

MQQA_BACKOUT_NOT_HARDENED

The message backout count for messages on this queue is not hardened and might not be accurate over queue manager restarts.

V 9.0.2 ImageRecoverQueue (MQCFST)

Specifies whether a local or permanent dynamic queue object is recoverable from a media image, if linear logging is being used (parameter identifier: MQIA_MEDIA_IMAGE_RECOVER_Q).

This parameter is not valid on z/OS. Possible values are:

MQIMGRCOV_YES

These queue objects are recoverable.

MQIMGRCOV_NO

The “[rcdmqimg \(record media image\)](#)” on page 119 and “[rcrmqobj \(re-create object\)](#)” on page 125 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

MQIMGRCOV_AS_Q_MGR

If you specify MQIMGRCOV_AS_Q_MGR , and the **ImageRecoverQueue** attribute for the queue manager specifies MQIMGRCOV_YES , these queue objects are recoverable.

If you specify MQIMGRCOV_AS_Q_MGR and the **ImageRecoverQueue** attribute for the queue manager specifies MQIMGRCOV_NO, the “[rcdmqimg \(record media image\)](#)” on page 119 and “[rcrmqobj \(re-create object\)](#)” on page 125 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

MQIMGRCOV_AS_Q_MGR is the default value.

IndexType (MQCFIN)

Index type (parameter identifier: MQIA_INDEX_TYPE). This parameter applies to z/OS only.

Specifies the type of index maintained by the queue manager to expedite MQGET operations on the queue. For shared queues, the type of index determines what type of MQGET calls can be used. The value can be any of the following values:

MQIT_NONE

No index.

MQIT_MSG_ID

The queue is indexed using message identifiers.

MQIT_CORREL_ID

The queue is indexed using correlation identifiers.

MQIT_MSG_TOKEN

Important: This index type should only be used for queues used with the IBM MQ Workflow for z/OS product.

The queue is indexed using message tokens.

MQIT_GROUP_ID

The queue is indexed using group identifiers.

Messages can be retrieved using a selection criterion only if an appropriate index type is maintained, as the following table shows:

Retrieval selection criterion	IndexType required	
	Shared queue	Other queue
None (sequential retrieval)	Any	Any

Retrieval selection criterion	IndexType required	
Message identifier	MQIT_MSG_ID or MQIT_NONE	Any
Correlation identifier	MQIT_CORREL_ID	Any
Message and correlation identifiers	MQIT_MSG_ID or MQIT_CORREL_ID	Any
Group identifier	MQIT_GROUP_ID	Any
Grouping	MQIT_GROUP_ID	MQIT_GROUP_ID
Message token	Not allowed	MQIT_MSG_TOKEN

InhibitGet (MQCFIN)

Get operations are allowed or inhibited (parameter identifier: MQIA_INHIBIT_GET).

The value can be:

MQQA_GET_ALLOWED

Get operations are allowed.

MQQA_GET_INHIBITED

Get operations are inhibited.

InhibitPut (MQCFIN)

Put operations are allowed or inhibited (parameter identifier: MQIA_INHIBIT_PUT).

Specifies whether messages can be put on the queue.

The value can be any of the following values:

MQQA_PUT_ALLOWED

Put operations are allowed.

MQQA_PUT_INHIBITED

Put operations are inhibited.

InitiationQName (MQCFST)

Initiation queue name (parameter identifier: MQCA_INITIATION_Q_NAME).

The local queue for trigger messages relating to this queue. The initiation queue must be on the same queue manager.

The maximum length of the string is MQ_Q_NAME_LENGTH.

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: MQIA_MAX_MSG_LENGTH).

The maximum length for messages on the queue. Applications might use the value of this attribute to determine the size of buffer they need to retrieve messages from the queue. If you change this value it might cause an application to operate incorrectly.

Do not set a value that is greater than the *MaxMsgLength* attribute of a queue manager.

The lower limit for this parameter is 0. The upper limit depends on the environment:

- On AIX, Linux, Windows, IBM i, and z/OS, the maximum message length is 100 MB (104,857,600 bytes).
- On other UNIX systems, the maximum message length is 4 MB (4,194,304 bytes).

MaxQDepth (MQCFIN)

Maximum queue depth (parameter identifier: MQIA_MAX_Q_DEPTH).

The maximum number of messages allowed on the queue.

Note: Other factors might cause the queue to be treated as full. For example, it appears to be full if there is no storage available for a message.

Specify a value greater than or equal to 0, and less than or equal to 999,999,999.

MsgDeliverySequence (MQCFIN)

Messages are delivered in priority order or sequence (parameter identifier: MQIA_MSG_DELIVERY_SEQUENCE).

The value can be any of the following values:

MQMDS_PRIORITY

Messages are returned in priority order.

MQMDS_FIFO

Messages are returned in FIFO order (first in, first out).

NonPersistentMessageClass (MQCFIN)

The level of reliability to be assigned to non-persistent messages that are put to the queue (parameter identifier: MQIA_NPM_CLASS).

The value can be:

MQNPM_CLASS_NORMAL

Non-persistent messages persist as long as the lifetime of the queue manager session. They are discarded in the event of a queue manager restart. This value is the default value.

MQNPM_CLASS_HIGH

The queue manager attempts to retain non-persistent messages for the lifetime of the queue. Non-persistent messages might still be lost in the event of a failure.

This parameter is valid only on local and model queues. It is not valid on z/OS.

ProcessName (MQCFST)

Name of process definition for the queue (parameter identifier: MQCA_PROCESS_NAME).

Specifies the local name of the IBM MQ process that identifies the application to be started when a trigger event occurs.

- If the queue is a transmission queue, the process definition contains the name of the channel to be started. This parameter is optional for transmission queues. If you do not specify it, the channel name is taken from the value specified for the **TriggerData** parameter.
- In other environments, the process name must be nonblank for a trigger event to occur, although it can be set after creating the queue.

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

PropertyControl (MQCFIN)

Property control attribute (parameter identifier: MQIA_PROPERTY_CONTROL).

Specifies how message properties are handled when messages are retrieved from queues using the MQGET call with the MQGMO_PROPERTIES_AS_Q_DEF option. The value can be any of the following values:

MQPROP_COMPATIBILITY

If the message contains a property with a prefix of **mcd.**, **jms.**, **usr.** or **mqext.**, all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those properties contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

This value is the default value. It allows applications which expect JMS-related properties to be in an MQRFH2 header in the message data to continue to work unmodified.

MQPROP_NONE

All properties of the message are removed from the message before the message is sent to the remote queue manager. Properties in the message descriptor, or extension, are not removed.

MQPROP_ALL

All properties of the message are included with the message when it is sent to the remote queue manager. The properties, except those properties in the message descriptor (or extension), are placed in one or more MQRFH2 headers in the message data.

MQPROP_FORCE_MQRFH2

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

A valid message handle supplied in the MsgHandle field of the MQGMO structure on the MQGET call is ignored. Properties of the message are not accessible using the message handle.

MQPROP_V6COMPAT

Any application MQRFH2 header is received as it was sent. Any properties set using MQSETMP must be retrieved using MQINQMP. They are not added to the MQRFH2 created by the application. Properties that were set in the MQRFH2 header by the sending application cannot be retrieved using MQINQMP.

This parameter is applicable to Local, Alias, and Model queues.

QDepthHighEvent (MQCFIN)

Controls whether Queue Depth High events are generated (parameter identifier: MQIA_Q_DEPTH_HIGH_EVENT).

A Queue Depth High event indicates that an application put a message on a queue. This event caused the number of messages on the queue to become greater than or equal to the queue depth high threshold. See the **QDepthHighLimit** parameter.

Note: The value of this attribute can change implicitly; see [“Definitions of the Programmable Command Formats” on page 1337](#).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

QDepthHighLimit (MQCFIN)

High limit for queue depth (parameter identifier: MQIA_Q_DEPTH_HIGH_LIMIT).

The threshold against which the queue depth is compared to generate a Queue Depth High event.

This event indicates that an application put a message to a queue. This event caused the number of messages on the queue to become greater than or equal to the queue depth high threshold. See the **QDepthHighEvent** parameter.

The value is expressed as a percentage of the maximum queue depth, *MaxQDepth*. It must be greater than or equal to 0 and less than or equal to 100.

QDepthLowEvent (MQCFIN)

Controls whether Queue Depth Low events are generated (parameter identifier: MQIA_Q_DEPTH_LOW_EVENT).

A Queue Depth Low event indicates that an application retrieved a message from a queue. This event caused the number of messages on the queue to become less than or equal to the queue depth low threshold. See the **QDepthLowLimit** parameter.

Note: The value of this attribute can change implicitly. See [“Definitions of the Programmable Command Formats” on page 1337](#).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

QDepthLowLimit (MQCFIN)

Low limit for queue depth (parameter identifier: MQIA_Q_DEPTH_LOW_LIMIT).

The threshold against which the queue depth is compared to generate a Queue Depth Low event.

This event indicates that an application retrieved a message from a queue. This event caused the number of messages on the queue to become less than or equal to the queue depth low threshold. See the **QDepthLowEvent** parameter.

Specify the value as a percentage of the maximum queue depth (**MaxQDepth** attribute), in the range 0 through 100.

QDepthMaxEvent (MQCFIN)

Controls whether Queue Full events are generated (parameter identifier: MQIA_Q_DEPTH_MAX_EVENT).

A Queue Full event indicates that an MQPUT call to a queue was rejected because the queue is full. That is, the queue depth reached its maximum value.

Note: The value of this attribute can change implicitly; see [“Definitions of the Programmable Command Formats” on page 1337](#).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

QDesc (MQCFST)

Queue description (parameter identifier: MQCA_Q_DESC).

Text that briefly describes the object.

The maximum length of the string is MQ_Q_DESC_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the message queue manager on which the command is executing. This choice ensures that the text is translated correctly if it is sent to another queue manager.

QServiceInterval (MQCFIN)

Target for queue service interval (parameter identifier: MQIA_Q_SERVICE_INTERVAL).

The service interval used for comparison to generate Queue Service Interval High and Queue Service Interval OK events. See the *QServiceIntervalEvent* parameter.

Specify a value in the range 0 through 999 999 999 milliseconds.

QServiceIntervalEvent (MQCFIN)

Controls whether Service Interval High or Service Interval OK events are generated (parameter identifier: MQIA_Q_SERVICE_INTERVAL_EVENT).

A Queue Service Interval High event is generated when a check indicates that no messages were retrieved from, or put to, the queue for at least the time indicated by the **QServiceInterval** attribute.

A Queue Service Interval OK event is generated when a check indicates that a message was retrieved from the queue within the time indicated by the **QServiceInterval** attribute.

Note: The value of this attribute can change implicitly; see [“Definitions of the Programmable Command Formats” on page 1337](#).

The value can be any of the following values:

MQQSIE_HIGH

Queue Service Interval High events enabled.

- Queue Service Interval High events are enabled and

- Queue Service Interval OK events are disabled.

MQQSIE_OK

Queue Service Interval OK events enabled.

- Queue Service Interval High events are disabled and
- Queue Service Interval OK events are enabled.

MQQSIE_NONE

No queue service interval events enabled.

- Queue Service Interval High events are disabled and
- Queue Service Interval OK events are also disabled.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToQName</i> object (for Copy) or the <i>QName</i> object (for Create). For local queues, messages are stored on the page sets of each queue manager and are available only through that queue manager.
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to attempt to refresh local copies on page set zero:</p> <pre>DEFINE QUEUE(q-name) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This value is allowed only in a shared queue manager environment.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers to attempt to make or refresh local copies on page set zero:</p> <pre>DEFINE QUEUE(q-name) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
MQQSGD_PRIVATE	The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.	Not permitted.

QSGDisposition	Change	Copy, Create
MQQSGD_Q_MGR	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.	The object is defined on the page set of the queue manager that executes the command. This value is the default value. For local queues, messages are stored on the page sets of each queue manager and are available only through that queue manager.
MQQSGD_SHARED	This value applies only to local queues. The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_SHARED. Any object residing on the page set of the queue manager that executes the command, or any object defined by a command using the parameter MQQSGD_GROUP, is not affected by this command.	This option applies only to local queues. The object is defined in the shared repository. Messages are stored in the coupling facility and are available to any queue manager in the queue sharing group. You can specify MQQSGD_SHARED only if: <ul style="list-style-type: none"> • <i>CFStructure</i> is nonblank • <i>IndexType</i> is not MQIT_MSG_TOKEN • The queue is not one of the following: <ul style="list-style-type: none"> – SYSTEM.CHANNEL.INITQ – SYSTEM.COMMAND.INPUT

QueueAccounting (MQCFIN)

Controls the collection of accounting data (parameter identifier: MQIA_ACCOUNTING_Q).

The value can be:

MQMON_Q_MGR

The collection of accounting data for the queue is performed based upon the setting of the **QueueAccounting** parameter on the queue manager.

MQMON_OFF

Accounting data collection is disabled for the queue.

MQMON_ON

If the value of the queue manager's *QueueAccounting* parameter is not MQMON_NONE, accounting data collection is enabled for the queue.

QueueMonitoring (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA_MONITORING_Q).

Specifies whether online monitoring data is to be collected and, if so, the rate at which the data is collected. The value can be any of the following values:

MQMON_OFF

Online monitoring data collection is turned off for this queue.

MQMON_Q_MGR

The value of the queue manager's **QueueMonitoring** parameter is inherited by the queue.

MQMON_LOW

If the value of the queue manager **QueueMonitoring** parameter is not MQMON_NONE, online monitoring data collection is turned on. The rate of data collection is low for this queue.

MQMON_MEDIUM

If the value of the queue manager **QueueMonitoring** parameter is not MQMON_NONE, online monitoring data collection is turned on. The rate of data collection is moderate for this queue.

MQMON_HIGH

If the value of the queue manager **QueueMonitoring** parameter is not MQMON_NONE, online monitoring data collection is turned on. The rate of data collection is high for this queue.

QueueStatistics (MQCFIN)

Statistics data collection (parameter identifier: MQIA_STATISTICS_Q).

Specifies whether statistics data collection is enabled. The value can be any of the following values:

MQMON_Q_MGR

The value of the queue manager's **QueueStatistics** parameter is inherited by the queue.

MQMON_OFF

Statistics data collection is disabled

MQMON_ON

If the value of the queue manager's *QueueStatistics* parameter is not MQMON_NONE, statistics data collection is enabled

This parameter is valid only on IBM i, UNIX, and Windows.

RemoteQMGrName (MQCFST)

Name of remote queue manager (parameter identifier: MQCA_REMOTE_Q_MGR_NAME).

If an application opens the local definition of a remote queue, *RemoteQMGrName* must not be blank or the name of the queue manager the application is connected to. If *XmitQName* is blank there must be a local queue called *RemoteQMGrName*. That queue is used as the transmission queue.

If this definition is used for a queue manager alias, *RemoteQMGrName* is the name of the queue manager. The queue manager name can be the name of the connected queue manager. If *XmitQName* is blank, when the queue is opened there must be a local queue called *RemoteQMGrName*. That queue is used as the transmission queue.

If this definition is used for a reply-to queue alias, *RemoteQMGrName* is the name of the queue manager that is to be the reply-to queue manager.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

RemoteQName (MQCFST)

Name of remote queue as known locally on the remote queue manager (parameter identifier: MQCA_REMOTE_Q_NAME).

If this definition is used for a local definition of a remote queue, *RemoteQName* must not be blank when the open occurs.

If this definition is used for a queue manager alias definition, *RemoteQName* must be blank when the open occurs.

If this definition is used for a reply-to queue alias, this name is the name of the queue that is to be the reply-to queue.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE). This parameter is not valid on a Change Queue command.

If the object exists, the effect is like issuing the Change Queue command. It is like a Change Queue command without the MQFC_YES option on the **Force** parameter, and with all of the other attributes specified. In particular, note that any messages which are on the existing queue are retained.

The Change Queue command without MQFC_YES on the **Force** parameter, and the Create Queue command with MQRP_YES on the **Replace** parameter, are different. The difference is that the Change Queue command does not change unspecified attributes. Create Queue with MQRP_YES sets all the attributes. If you use MQRP_YES, unspecified attributes are taken from the default definition, and the attributes of the object being replaced, if one exists, are ignored.)

The command fails if both of the following statements are true:

- The command sets attributes that would require the use of MQFC_YES on the **Force** parameter if you were using the Change Queue command.
- The object is open.

The Change Queue command with MQFC_YES on the **Force** parameter succeeds in this situation.

If MQSCO_CELL is specified on the **Scope** parameter on UNIX, and there is already a queue with the same name in the cell directory, the command fails. The command fails even if MQRP_YES is specified.

The value can be any of the following values:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

RetentionInterval (MQCFIN)

Retention interval (parameter identifier: MQIA_RETENTION_INTERVAL).

The number of hours for which the queue might be needed, based on the date and time when the queue was created.

This information is available to a housekeeping application or an operator and can be used to determine when a queue is no longer required. The queue manager does not delete queues nor does it prevent queues from being deleted if their retention interval is not expired. It is the responsibility of the user to take any required action.

Specify a value in the range 0 - 999,999,999.

Scope (MQCFIN)

Scope of the queue definition (parameter identifier: MQIA_SCOPE).

Specifies whether the scope of the queue definition extends beyond the queue manager which owns the queue. It does so if the queue name is contained in a cell directory, so that it is known to all the queue managers within the cell.

If this attribute is changed from MQSCO_CELL to MQSCO_Q_MGR, the entry for the queue is deleted from the cell directory.

Model and dynamic queues cannot be changed to have cell scope.

If it is changed from MQSCO_Q_MGR to MQSCO_CELL, an entry for the queue is created in the cell directory. If there is already a queue with the same name in the cell directory, the command fails. The command also fails if no name service supporting a cell directory is configured.

The value can be:

MQSCO_Q_MGR

Queue manager scope.

MQSCO_CELL

Cell scope.

This value is not supported on IBM i.

This parameter is not available on z/OS.

Shareability (MQCFIN)

The queue can be shared, or not (parameter identifier: MQIA_SHAREABILITY).

Specifies whether multiple instances of applications can open this queue for input.

The value can be any of the following values:

MQQA_SHAREABLE

Queue is shareable.

MQQA_NOT_SHAREABLE

Queue is not shareable.

 **StorageClass (MQCFST)**

Storage class (parameter identifier: MQCA_STORAGE_CLASS). This parameter applies to z/OS only.

Specifies the name of the storage class.

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

TargetType (MQCFIN)

Target type (parameter identifier: MQIA_BASE_TYPE).

Specifies the type of object to which the alias resolves.

The value can be any of the following values:

MQOT_Q

The object is a queue.

MQOT_TOPIC

The object is a topic.

TriggerControl (MQCFIN)

Trigger control (parameter identifier: MQIA_TRIGGER_CONTROL).

Specifies whether trigger messages are written to the initiation queue.

The value can be:

MQTC_OFF

Trigger messages not required.

MQTC_ON

Trigger messages required.

TriggerData (MQCFST)

Trigger data (parameter identifier: MQCA_TRIGGER_DATA).

Specifies user data that the queue manager includes in the trigger message. This data is made available to the monitoring application that processes the initiation queue and to the application that is started by the monitor.

The maximum length of the string is MQ_TRIGGER_DATA_LENGTH.

TriggerDepth (MQCFIN)

Trigger depth (parameter identifier: MQIA_TRIGGER_DEPTH).

Specifies (when *TriggerType* is MQTT_DEPTH) the number of messages that initiates a trigger message to the initiation queue. The value must be in the range 1 through 999 999 999.

TriggerMsgPriority (MQCFIN)

Threshold message priority for triggers (parameter identifier: MQIA_TRIGGER_MSG_PRIORITY).

Specifies the minimum priority that a message must have before it can cause, or be counted for, a trigger event. The value must be in the range of priority values that is supported (0 through 9).

TriggerType (MQCFIN)

Trigger type (parameter identifier: MQIA_TRIGGER_TYPE).

Specifies the condition that initiates a trigger event. When the condition is true, a trigger message is sent to the initiation queue.

The value can be any of the following values:

MQTT_NONE

No trigger messages.

MQTT EVERY

Trigger message for every message.

MQTT_FIRST

Trigger message when queue depth goes from 0 to 1.

MQTT_DEPTH

Trigger message when depth threshold exceeded.

Usage (MQCFIN)

Usage (parameter identifier: MQIA_USAGE).

Specifies whether the queue is for normal usage or for transmitting messages to a remote message queue manager.

The value can be any of the following values:

MQUS_NORMAL

Normal usage.

MQUS_TRANSMISSION

Transmission queue.

XmitQName (MQCFST)

Transmission queue name (parameter identifier: MQCA_XMIT_Q_NAME).

Specifies the local name of the transmission queue to be used for messages destined for either a remote queue or for a queue manager alias definition.

If *XmitQName* is blank, a queue with the same name as *RemoteQMgrName* is used as the transmission queue.

This attribute is ignored if the definition is being used as a queue manager alias and *RemoteQMgrName* is the name of the connected queue manager.

It is also ignored if the definition is used as a reply-to queue alias definition.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Error codes (Change, Copy, and Create Queue)

This command might return the following errors in the response format header, in addition to the values shown on in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CELL_DIR_NOT_AVAILABLE

Cell directory is not available.

MQRCCF_CLUSTER_NAME_CONFLICT

Cluster name conflict.

MQRCCF_CLUSTER_Q_USAGE_ERROR

Cluster usage conflict.

MQRCCF_DYNAMIC_Q_SCOPE_ERROR

Dynamic queue scope error.

MQRCCF_FORCE_VALUE_ERROR

Force value not valid.

MQRCCF_Q_ALREADY_IN_CELL

Queue exists in cell.

MQRCCF_Q_TYPE_ERROR

Queue type not valid.

Change Queue Manager

The Change Queue Manager (MQCMD_CHANGE_Q_MGR) command changes the specified attributes of the queue manager.

For any optional parameters that are omitted, the value does not change.

Required parameters:

None

Optional parameters (Change Queue Manager)

Multi AccountingConnOverride (MQCFIN)

Specifies whether applications can override the settings of the *QueueAccounting* and *MQIAccounting* queue manager parameters (parameter identifier: MQIA_ACCOUNTING_CONN_OVERRIDE).

The value can be any of the following values:

MQMON_DISABLED

Applications cannot override the settings of the **QueueAccounting** and **MQIAccounting** parameters.

This value is the initial default value for the queue manager.

MQMON_ENABLED

Applications can override the settings of the **QueueAccounting** and **MQIAccounting** parameters by using the options field of the MQCNO structure of the MQCONN API call.

This parameter is valid only on [Multiplatforms](#).

Multi AccountingInterval (MQCFIN)

The time interval, in seconds, at which intermediate accounting records are written (parameter identifier: MQIA_ACCOUNTING_INTERVAL).

Specify a value in the range 1 - 604,000.

This parameter is valid only on [Multiplatforms](#).

ActivityRecording (MQCFIN)

Specifies whether activity reports can be generated (parameter identifier: MQIA_ACTIVITY_RECORDING).

The value can be:

MQRECORDING_DISABLED

Activity reports cannot be generated.

MQRECORDING_MSG

Activity reports can be generated and sent to the reply queue specified by the originator in the message causing the report.

MQRECORDING_Q

Activity reports can be generated and sent to SYSTEM.ADMIN.ACTIVITY.QUEUE.

z/OS AdoptNewMCACheck (MQCFIN)

The elements checked to determine whether an MCA must be adopted (restarted) when a new inbound channel is detected. It must be adopted (restarted) if it has the same name as a currently active MCA (parameter identifier: MQIA_ADOPTNEWMCA_CHECK).

The value can be:

MQADOPT_CHECK_Q_MGR_NAME

Check the queue manager name.

MQADOPT_CHECK_NET_ADDR

Check the network address.

MQADOPT_CHECK_ALL

Check the queue manager name and network address. Perform this check to prevent your channels from being inadvertently shut down. This value is the initial default value of the queue manager.

MQADOPT_CHECK_NONE

Do not check any elements.

This parameter applies to z/OS only.

▶ z/OS

AdoptNewMCAType (MQCFIN)

Adoption of orphaned channel instances (parameter identifier: MQIA_ADOPTNEWMCA_TYPE).

Specify whether an orphaned MCA instance is to be adopted when a new inbound channel request is detected matching the **AdoptNewMCACheck** parameters.

The value can be:

MQADOPT_TYPE_NO

Do not adopt orphaned channel instances.

MQADOPT_TYPE_ALL

Adopt all channel types. This value is the initial default value of the queue manager.

This parameter applies to z/OS only.

AuthorityEvent (MQCFIN)

Controls whether authorization (Not Authorized) events are generated (parameter identifier: MQIA_AUTHORITY_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled. This value is not permitted on z/OS.

BridgeEvent (MQCFIN)

Controls whether IMS bridge events are generated (parameter identifier: MQIA_BRIDGE_EVENT). This parameter applies to z/OS only.

The value can be:

MQEVR_DISABLED

Event reporting disabled. This value is the default value.

MQEVR_ENABLED

Event reporting enabled.

CertificateLabel (MQCFST)

Specifies the certificate label for this queue manager to use. The label identifies which personal certificate in the key repository has been selected (parameter identifier: MQCA_CERT_LABEL).

The default and migrated queue manager values are:

- ▶ **ULW** On UNIX, Linux, and Windows: *ibmwebspheremqxxxx* where *xxxx* is the queue manager name folded to lowercase.
- ▶ **IBM i** On IBM i:
 - If you specified `SSLKEYR(*SYSTEM)`, the value is blank.
Note that it is forbidden to use a nonblank queue manager `CERTLABL` with `SSLKEYR(*SYSTEM)`. Attempting to do so results in an `MQRCCF_Q_MGR_ATTR_CONFLICT` error.
 - Otherwise, *ibmwebspheremqxxxx* where *xxxx* is the queue manager name folded to lowercase.
- ▶ **z/OS** On z/OS: *ibmWebSphereMQXXXX* where *XXXX* is the queue manager name.

See [z/OS systems](#) for more information.

CertificateValPolicy (MQCFIN)

Specifies which TLS certificate validation policy is used to validate digital certificates received from remote partner systems (parameter identifier: MQIA_CERT_VAL_POLICY).

This attribute can be used to control how strictly the certificate chain validation conforms to industry security standards. For more information, see [Certificate validation policies in IBM MQ](#).

The value can be any of the following values:

MQ_CERT_VAL_POLICY_ANY

Apply each of the certificate validation policies supported by the secure sockets library and accept the certificate chain if any of the policies considers the certificate chain valid. This setting can be used for maximum backwards compatibility with older digital certificates which do not comply with the modern certificate standards.

MQ_CERT_VAL_POLICY_RFC5280

Apply only the RFC 5280 compliant certificate validation policy. This setting provides stricter validation than the ANY setting, but rejects some older digital certificates.

This parameter is only valid on UNIX, Linux, and Windows and can be used only on a queue manager with a command level of 711, or higher.

Changes to **CertificateValPolicy** become effective either:

- When a new channel process is started.
- For channels that run as threads of the channel initiator, when the channel initiator is restarted.
- For channels that run as threads of the listener, when the listener is restarted.
- For channels that run as threads of a process pooling process, when the process pooling process is started or restarted and first runs a TLS channel. If the process pooling process has already run a TLS channel, and you want the change to become effective immediately, run the MQSC command **REFRESH SECURITY TYPE(SSL)**. The process pooling process is amqmpa on UNIX, Linux, and Windows.
- When a **REFRESH SECURITY TYPE(SSL)** command is issued.

CFConlos (MQCFIN)

Specifies the action to be taken when the queue manager loses connectivity to the administration structure, or any CF structure with CFConlos set to ASQMGR (parameter identifier: MQIA_QMGR_CFCONLOS).

The value can be:

MQCFCONLOS_TERMINATE

The queue manager terminates when connectivity to CF structures is lost.

MQCFCONLOS_TOLERATE

The queue manager tolerates loss of connectivity to CF structures without terminating.

This parameter applies to z/OS only.

You can select MQCFCONLOS_TOLERATE only if all the queue managers in the queue sharing group are at command level 710 or greater and have OPMODE set to NEWFUNC.

ChannelAutoDef (MQCFIN)

Controls whether receiver and server-connection channels can be auto-defined (parameter identifier: MQIA_CHANNEL_AUTO_DEF).

Auto-definition for cluster-sender channels is always enabled.

This parameter is supported in the following environments: IBM i, UNIX, Linux, and Windows systems.

The value can be:

MQCHAD_DISABLED

Channel auto-definition disabled.

MQCHAD_ENABLED

Channel auto-definition enabled.

ChannelAutoDefEvent (MQCFIN)

Controls whether channel auto-definition events are generated (parameter identifier: MQIA_CHANNEL_AUTO_DEF_EVENT), when a receiver, server-connection, or cluster-sender channel is auto-defined.

This parameter is supported in the following environments: IBM i, UNIX, Linux, and Windows systems.

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

ChannelAutoDefExit (MQCFIN)

Channel auto-definition exit name (parameter identifier: MQCA_CHANNEL_AUTO_DEF_EXIT).

This exit is invoked when an inbound request for an undefined channel is received, if:

1. The channel is a cluster-sender, or
2. Channel auto-definition is enabled (see *ChannelAutoDef*).

This exit is also invoked when a cluster-receiver channel is started.

The format of the name is the same as for the *SecurityExit* parameter described in [“Change, Copy, and Create Channel” on page 1365](#).

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

This parameter is supported in the following environments: z/OS, IBM i, UNIX, Linux, and Windows. On z/OS, it applies only to cluster-sender and cluster-receiver channels.

ChannelAuthenticationRecords (MQCFIN)

Controls whether channel authentication records are used. Channel authentication records can still be set and displayed regardless of the value of this attribute. (parameter identifier: MQIA_CHLAUTH_RECORDS).

The value can be:

MQCHLA_DISABLED

Channel authentication records are not checked.

MQCHLA_ENABLED

Channel authentication records are checked.

ChannelEvent (MQCFIN)

Controls whether channel events are generated (parameter identifier: MQIA_CHANNEL_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

MQEVR_EXCEPTION

Reporting of exception channel events enabled.

Multi ChannelInitiatorControl (MQCFIN)

Specifies whether the channel initiator is to be started when the queue manager starts (parameter identifier: MQIA_CHINIT_CONTROL).

The value can be:

MQSVC_CONTROL_MANUAL

The channel initiator is not to be started automatically.

MQSVC_CONTROL_Q_MGR

The channel initiator is to be started automatically when the queue manager starts.

This parameter is valid only on [Multiplatforms](#).

ChannelMonitoring (MQCFIN)

Default setting for online monitoring for channels (parameter identifier: MQIA_MONITORING_CHANNEL).

The value can be:

MQMON_NONE

Online monitoring data collection is turned off for channels regardless of the setting of their **ChannelMonitoring** parameter.

MQMON_OFF

Online monitoring data collection is turned off for channels specifying a value of MQMON_Q_MGR in their **ChannelMonitoring** parameter. This value is the initial default value of the queue manager.

MQMON_LOW

Online monitoring data collection is turned on, with a low ratio of data collection, for channels specifying a value of MQMON_Q_MGR in their **ChannelMonitoring** parameter.

MQMON_MEDIUM

Online monitoring data collection is turned on, with a moderate ratio of data collection, for channels specifying a value of MQMON_Q_MGR in their **ChannelMonitoring** parameter.

MQMON_HIGH

Online monitoring data collection is turned on, with a high ratio of data collection, for channels specifying a value of MQMON_Q_MGR in their **ChannelMonitoring** parameter.

ChannelStatistics (MQCFIN)

Controls whether statistics data is to be collected for channels (parameter identifier: MQIA_STATISTICS_CHANNEL).

The value can be:

MQMON_NONE

Statistics data collection is turned off for channels regardless of the setting of their **ChannelStatistics** parameter. This value is the initial default value of the queue manager.

MQMON_OFF

Statistics data collection is turned off for channels specifying a value of MQMON_Q_MGR in their *ChannelStatistics* parameter.

MQMON_LOW

Statistics data collection is turned on, with a low ratio of data collection, for channels specifying a value of MQMON_Q_MGR in their **ChannelStatistics** parameter.

MQMON_MEDIUM

Statistics data collection is turned on, with a moderate ratio of data collection, for channels specifying a value of MQMON_Q_MGR in their **ChannelStatistics** parameter.

MQMON_HIGH

Statistics data collection is turned on, with a high ratio of data collection, for channels specifying a value of MQMON_Q_MGR in their **ChannelStatistics** parameter.

 On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

ChinitAdapters (MQCFIN)

Number of adapter subtasks (parameter identifier: MQIA_CHINIT_ADAPTERS).

The number of adapter subtasks to use for processing IBM MQ calls. This parameter applies to z/OS only.

Specify a value in the range 1 - 9999. The initial default value of the queue manager is 8.

ChinitDispatchers (MQCFIN)

Number of dispatchers (parameter identifier: MQIA_CHINIT_DISPATCHERS).

The number of dispatchers to use for the channel initiator. This parameter applies to z/OS only. Specify a value in the range 1 - 9999. The initial default value of the queue manager is 5.

z/OS ChinitServiceParm (MQCFIN)

Reserved for use by IBM (parameter identifier: MQCA_CHINIT_SERVICE_PARM).

This parameter applies to z/OS only.

z/OS ChinitTraceAutoStart (MQCFIN)

Specifies whether the channel initiator trace must start automatically (parameter identifier: MQIA_CHINIT_TRACE_AUTO_START).

The value can be:

MQTRAXSTR_YES

Channel initiator trace is to start automatically.

MQTRAXSTR_NO

Channel initiator trace is not to start automatically. This value is the initial default value of the queue manager.

This parameter applies to z/OS only.

z/OS ChinitTraceTableSize (MQCFIN)

The size, in megabytes, of the trace data space of the channel initiator (parameter identifier: MQIA_CHINIT_TRACE_TABLE_SIZE).

Specify a value in the range 2 - 2048. The initial default value of the queue manager is 2.

This parameter applies to z/OS only.

ClusterSenderMonitoringDefault (MQCFIN)

Default setting for online monitoring for automatically defined cluster-sender channels (parameter identifier: MQIA_MONITORING_AUTO_CLUSSDR).

Specifies the value to be used for the *ChannelMonitoring* attribute of automatically defined cluster-sender channels. The value can be any of the following values:

MQMON_Q_MGR

Collection of online monitoring data is inherited from the setting of the queue manager's **ChannelMonitoring** parameter. This value is the initial default value of the queue manager.

MQMON_OFF

Monitoring for the channel is disabled.

MQMON_LOW

Unless *ChannelMonitoring* is MQMON_NONE, this value specifies a low rate of data collection with a minimal effect on system performance. The data collected is not likely to be the most current.

MQMON_MEDIUM

Unless *ChannelMonitoring* is MQMON_NONE, this value specifies a moderate rate of data collection with limited effect on system performance.

MQMON_HIGH

Unless *ChannelMonitoring* is MQMON_NONE, this value specifies a high rate of data collection with a likely effect on system performance. The data collected is the most current available.

z/OS On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

ClusterSenderStatistics (MQCFIN)

Controls whether statistics data is to be collected for auto-defined cluster-sender channels (parameter identifier: MQIA_STATISTICS_AUTO_CLUSSDR).

The value can be:

MQMON_Q_MGR

Collection of statistics data is inherited from the setting of the queue manager's **ChannelStatistics** parameter. This value is the initial default value of the queue manager.

MQMON_OFF

Statistics data collection for the channel is disabled.

MQMON_LOW

Unless *ChannelStatistics* is MQMON_NONE, this value specifies a low rate of data collection with a minimal effect on system performance.

MQMON_MEDIUM

Unless *ChannelStatistics* is MQMON_NONE, this value specifies a moderate rate of data collection.

MQMON_HIGH

Unless *ChannelStatistics* is MQMON_NONE, this value specifies a high rate of data collection.

 On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

ClusterWorkLoadData (MQCFST)

Cluster workload exit data (parameter identifier: MQCA_CLUSTER_WORKLOAD_DATA).

This parameter is passed to the cluster workload exit when it is called.

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

ClusterWorkLoadExit (MQCFST)

Cluster workload exit name (parameter identifier: MQCA_CLUSTER_WORKLOAD_EXIT).

If a nonblank name is defined this exit is invoked when a message is put to a cluster queue.

The format of the name is the same as for the *SecurityExit* parameter described in [“Change, Copy, and Create Channel” on page 1365](#).

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

ClusterWorkLoadLength (MQCFIN)

Cluster workload length (parameter identifier: MQIA_CLUSTER_WORKLOAD_LENGTH).

The maximum length of the message passed to the cluster workload exit.

The value of this attribute must be in the range 0 - 999,999 999.

CLWLMRUChannels (MQCFIN)

Cluster workload most recently used (MRU) channels (parameter identifier: MQIA_CLWL_MRU_CHANNELS).

The maximum number of active most recently used outbound channels.

Specify a value in the range 1 - 999,999 999.

CLWLUseQ (MQCFIN)

Use of remote queue (parameter identifier: MQIA_CLWL_USEQ).

Specifies whether a cluster queue manager is to use remote puts to other queues defined in other queue managers within the cluster during workload management.

Specify either:

MQCLWL_USEQ_ANY

Use remote queues.

MQCLWL_USEQ_LOCAL

Do not use remote queues.

CodedCharSetId (MQCFIN)

Queue manager coded character set identifier (parameter identifier: MQIA_CODED_CHAR_SET_ID).

The coded character set identifier (CCSID) for the queue manager. The CCSID is the identifier used with all character string fields defined by the application programming interface (API). If the CCSID in a message descriptor is set to the value MQCCSI_Q_MGR, it applies to the character data written into the body of a message. Data is written using MQPUT or MQPUT1. Character data is identified by the format specified for the message.

Specify a value in the range 1 - 65,535.

The CCSID must specify a value that is defined for use on the platform and use an appropriate character set. The character set must be:

- EBCDIC on IBM i
- ASCII or ASCII-related on other platforms

Stop and restart the queue manager after execution of this command so that all processes reflect the changed CCSID of the queue manager.

This parameter is not supported on z/OS.

CommandEvent (MQCFIN)

Controls whether command events are generated (parameter identifier: MQIA_COMMAND_EVENT).

The value can be any of the following values:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

MQEVR_NO_DISPLAY

Event reporting enabled for all successful commands except Inquire commands.

z/OS

CommandScope (MQCFIN)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment. The command server must be enabled.
- An asterisk " * ". The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Multi

CommandServerControl (MQCFIN)

Specifies whether the command server is to be started when the queue manager starts (parameter identifier: MQIA_CMD_SERVER_CONTROL).

The value can be:

MQSVC_CONTROL_MANUAL

The command server is not to be started automatically.

MQSVC_CONTROL_Q_MGR

The command server is to be started automatically when the queue manager starts.

This parameter is valid only on Multiplatforms.

ConfigurationEvent (MQCFIN)

Controls whether configuration events are generated (parameter identifier: MQIA_CONFIGURATION_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

ConnAuth (MQCFST)

The name of an authentication information object that is used to provide the location of user ID and password authentication (parameter identifier: MQCA_CONN_AUTH).

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH. Only authentication information objects with type IDPWOS or IDPWLDAP can be specified; other types result in an error message when the OAM (on UNIX, Linux, and Windows) or the security component (on z/OS) reads the configuration.

Custom (MQCFST)

Custom attribute for new features (parameter identifier: MQCA_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes are introduced. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE). Single quotation marks must be escaped with another single quotation mark.

This description is updated when features using this attribute are introduced. Currently there are no possible values for *Custom*.

The maximum length of the string is MQ_CUSTOM_LENGTH.

DeadLetterQName (MQCFIN)

Dead letter (undelivered message) queue name (parameter identifier: MQCA_DEAD_LETTER_Q_NAME).

Specifies the name of the local queue that is to be used for undelivered messages. Messages are put on this queue if they cannot be routed to their correct destination. The maximum length of the string is MQ_Q_NAME_LENGTH.

DefClusterXmitQueueType (MQCFIN)

The DefClusterXmitQueueType attribute controls which transmission queue is selected by default by cluster-sender channels to get messages from, to send the messages to cluster-receiver channels. (Parameter identifier: MQIA_DEF_CLUSTER_XMIT_Q_TYPE.)

The values of **DefClusterXmitQueueType** are MQCLXQ_SCTQ or MQCLXQ_CHANNEL.

MQCLXQ_SCTQ

All cluster-sender channels send messages from SYSTEM.CLUSTER.TRANSMIT.QUEUE. The correlID of messages placed on the transmission queue identifies which cluster-sender channel the message is destined for.

SCTQ is set when a queue manager is defined. This behavior is implicit in versions earlier than IBM WebSphere MQ 7.5. In earlier versions, the queue manager attribute DefClusterXmitQueueType was not present.

MQCLXQ_CHANNEL

Each cluster-sender channel sends messages from a different transmission queue. Each transmission queue is created as a permanent dynamic queue from the model queue SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE.

DefXmitQName (MQCFST)

Default transmission queue name (parameter identifier: MQCA_DEF_XMIT_Q_NAME).

This parameter is the name of the default transmission queue that is used for the transmission of messages to remote queue managers. It is selected if there is no other indication of which transmission queue to use.

The maximum length of the string is MQ_Q_NAME_LENGTH.

DNSGroup (MQCFST)

DNS group name (parameter identifier: MQCA_DNS_GROUP).

This parameter is no longer used. Refer to [z/OS: WLM/DNS no longer supported](#). This parameter applies to z/OS only.

The maximum length of the string is MQ_DNS_GROUP_NAME_LENGTH.

z/OS DNSWLM (MQCFIN)

WLM/DNS Control: (parameter identifier: MQIA_DNS_WLM).

This parameter is no longer used. Refer to [z/OS: WLM/DNS no longer supported](#).

The value can be any of the following values:

MQDNSWLM_NO

This is the only value supported by the queue manager.

This parameter applies to z/OS only.

z/OS ExpiryInterval (MQCFIN)

Interval between scans for expired messages (parameter identifier: MQIA_EXPIRY_INTERVAL). This parameter applies to z/OS only.

Specifies the frequency with which the queue manager scans the queues looking for expired messages. Specify a time interval in seconds in the range 1 - 99,999,999, or the following special value:

MQEXPI_OFF

No scans for expired messages.

The minimum scan interval used is 5 seconds, even if you specify a lower value.

EncryptionPolicySuiteB (MQCFIL)

Specifies whether Suite B-compliant cryptography is used and what level of strength is employed (parameter identifier MQIA_SUITE_B_STRENGTH).

The value can be one or more of:

MQ_SUITE_B_NONE

Suite B-compliant cryptography is not used.

MQ_SUITE_B_128_BIT

Suite B 128-bit strength security is used.

MQ_SUITE_B_192_BIT

Suite B 192-bit strength security is used.

If invalid lists are specified, such as MQ_SUITE_B_NONE with MQ_SUITE_B_128_BIT, the error MQRCCF_SUITE_B_ERROR is issued.

Force (MQCFIN)

Force changes (parameter identifier: MQIACF_FORCE).

Specifies whether the command is forced to complete if both of the following are true:

- *DefXmitQName* is specified, and
- An application has a remote queue open, the resolution for which is affected by this change.

z/OS

GroupUR (MQCFIN)

Controls whether CICS and XA client applications can establish transactions with a GROUP unit of recovery disposition.

This attribute is only valid on z/OS and can be enabled only when the queue manager is a member of a queue sharing group.

The value can be:

MQGUR_DISABLED

CICS and XA client applications must connect using a queue manager name.

MQGUR_ENABLED

CICS and XA client applications can establish transactions with a group unit of recovery disposition by specifying a queue sharing group name when they connect.

z/OS

See [Unit of recovery disposition in a queue sharing group](#).

z/OS

IGQPutAuthority (MQCFIN)

Command scope (parameter identifier: MQIA_IGQ_PUT_AUTHORITY). This parameter is valid only on z/OS when the queue manager is a member of a queue sharing group.

Specifies the type of authority checking and, therefore, the user IDs to be used by the IGQ agent (IGQA). This parameter establishes the authority to put messages to a destination queue. The value can be any of the following values:

MQIGQPA_DEFAULT

Default user identifier is used.

The user identifier used for authorization is the value of the *UserIdentifier* field. The *UserIdentifier* field is in the separate MQMD that is associated with the message when the message is on the shared transmission queue. This value is the user identifier of the program that placed the message on the shared transmission queue. It is typically the same as the user identifier under which the remote queue manager is running.

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the user identifier of the local IGQ agent (*IGQUserId*) is checked.

MQIGQPA_CONTEXT

Context user identifier is used.

The user identifier used for authorization is the value of the *UserIdentifier* field. The *UserIdentifier* field is in the separate MQMD that is associated with the message when the message is on the shared transmission queue. This value is the user identifier of the program that placed the message on the shared transmission queue. It is typically the same as the user identifier under which the remote queue manager is running.

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the user identifier of the local IGQ agent (*IGQUserId*) is checked.. The value of the *UserIdentifier* field in the embedded MQMD is also checked. The latter user identifier is typically the user identifier of the application that originated the message.

MQIGQPA_ONLY_IGQ

Only the IGQ user identifier is used.

The user identifier used for authorization is the user identifier of the local IGQ agent (*IGQUserId*).

If the RESLEVEL profile indicates that more than one user identifier is to be checked, this user identifier is used for all checks.

MQIGQPA_ALTERNATE_OR_IGQ

Alternate user identifier or IGQ-agent user identifier is used.

The user identifier used for authorization is the user identifier of the local IGQ agent (*IGQUserId*).

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the value of the *UserIdentifier* field in the embedded MQMD is also checked. The latter user identifier is typically the user identifier of the application that originated the message.

z/OS **IGQUserId (MQCFST)**

Intra-group queuing agent user identifier (parameter identifier: MQCA_IGQ_USER_ID). This parameter is valid only on z/OS when the queue manager is a member of a queue-sharing group.

Specifies the user identifier that is associated with the local intra-group queuing agent. This identifier is one of the user identifiers that might be checked for authorization when the IGQ agent puts messages on local queues. The actual user identifiers checked depend on the setting of the *IGQPutAuthority* attribute, and on external security options.

The maximum length is MQ_USER_ID_LENGTH.

V 9.0.2 **ImageInterval (MQCFIN)**

The target frequency with which the queue manager automatically writes media images, in minutes since the previous media image for an object (parameter identifier: MQIA_MEDIA_IMAGE_INTERVAL). This parameter is not valid on z/OS.

The value can be:

The time in minutes from 1 - 999 999 999, at which the queue manager automatically writes media images.

The default value is 60 minutes.

MQMEDIMGINTVL_OFF

Automatic media images are not written on a time interval basis.

V 9.0.2 **ImageLogLength (MQCFIN)**

The target size of the recovery log, written before the queue manager automatically writes media images, in number of megabytes since the previous media image for an object. This limits the amount of log to be read when recovering an object (parameter identifier: MQIA_MEDIA_IMAGE_LOG_LENGTH). This parameter is not valid on z/OS.

The value can be:

The target size of the recovery log in megabytes from 1 - 999 999 999.

MQMEDIMGLOGLN_OFF

Automatic media images are not written based on the size of log written.

MQMEDIMGLOGLN_OFF is the default value.

V 9.0.2 **ImageRecoverObject (MQCFST)**

Specifies whether authentication information, channel, client connection, listener, namelist, process, alias queue, remote queue, and service objects are recoverable from a media image, if linear logging is being used (parameter identifier: MQIA_MEDIA_IMAGE_RECOVER_OBJ). This parameter is not valid on z/OS.

The value can be:

MQIMGRCOV_NO

The “[rcdmqimg \(record media image\)](#)” on page 119 and “[rcrmqobj \(re-create object\)](#)” on page 125 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

MQIMGRCOV_YES

These objects are recoverable.

MQIMGRCOV_YES is the default value.

V 9.0.2 **ImageRecoverQueue (MQCFST)**

Specifies the default **ImageRecoverQueue** attribute for local and permanent dynamic queue objects, when used with this parameter (parameter identifier: MQIA_MEDIA_IMAGE_RECOVER_Q). This parameter is not valid on z/OS.

The value can be:

MQIMGRCOV_NO

The **ImageRecoverQueue** attribute for local and permanent dynamic queue objects is set to MQIMGRCOV_NO .

MQIMGRCOV_YES

The **ImageRecoverQueue** attribute for local and permanent dynamic queue objects is set to MQIMGRCOV_YES .

MQIMGRCOV_YES is the default value.

V 9.0.2 **ImageSchedule (MQCFST)**

Whether the queue manager automatically writes media images (parameter identifier: MQIA_MEDIA_IMAGE_SCHEDUING). This parameter is not valid on z/OS.

The value can be:

MQMEDIMGSCHED_AUTO

The queue manager attempts to automatically write a media image for an object, before **ImageInterval** minutes have elapsed, or **ImageLogLength** megabytes of recovery log have been written, since the previous media image for the object was taken.

The previous media image might have been taken manually or automatically, depending on the settings of **ImageInterval** or **ImageLogLength**.

MQMEDIMGSCHED_MANUAL

Automatic media images are not written.

MQMEDIMGSCHED_MANUAL is the default value.

InhibitEvent (MQCFIN)

Controls whether inhibit (Inhibit Get and Inhibit Put) events are generated (parameter identifier: MQIA_INHIBIT_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

z/OS **IntraGroupqueuing (MQCFIN)**

Command scope (parameter identifier: MQIA_INTRA_GROUP_QUEUING). This parameter is valid only on z/OS when the queue manager is a member of a queue sharing group.

Specifies whether intra-group queuing is used. The value can be any of the following values:

MQIGQ_DISABLED

Intra-group queuing disabled.

MQIGQ_ENABLED

Intra-group queuing enabled.

IPAddressVersion (MQCFIN)

IP address version selector (parameter identifier: MQIA_IP_ADDRESS_VERSION).

Specifies which IP address version, either IPv4 or IPv6, is used. The value can be:

MQIPADDR_IPv4

IPv4 is used.

MQIPADDR_IPv6

IPv6 is used.

This parameter is only relevant for systems that run both IPv4 and IPv6. It affects only channels defined as having a *TransportType* of MQXPY_TCP when one of the following conditions is true:

- The channel attribute *ConnectionName* is a host name that resolves to both an IPv4 and IPv6 address and its **LocalAddress** parameter is not specified.
- The channel attributes *ConnectionName* and *LocalAddress* are both host names that resolve to both IPv4 and IPv6 addresses.

z/OS ListenerTimer (MQCFIN)

Listener restart interval (parameter identifier: MQIA_LISTENER_TIMER).

The time interval, in seconds, between attempts by IBM MQ to restart the listener after an APPC or TCP/IP failure. This parameter applies to z/OS only.

Specify a value in the range 5 - 9,999. The initial default value of the queue manager is 60.

LocalEvent (MQCFIN)

Controls whether local error events are generated (parameter identifier: MQIA_LOCAL_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

Multi LoggerEvent (MQCFIN)

Controls whether recovery log events are generated (parameter identifier: MQIA_LOGGER_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled. This value is not valid on queue managers that are using circular logs.

This parameter is valid only on [Multiplatforms](#).

z/OS LUGroupName (MQCFST)

Generic LU name for the LU 6.2 listener (parameter identifier: MQCA_LU_GROUP_NAME).

The generic LU name to be used by the LU 6.2 listener that handles inbound transmissions for the queue sharing group.

This parameter applies to z/OS only.

The maximum length of the string is MQ_LU_NAME_LENGTH.

z/OS LUName (MQCFST)

LU name to use for outbound LU 6.2 transmissions (parameter identifier: MQCA_LU_NAME).

The name of the LU to use for outbound LU 6.2 transmissions. Set this parameter to be the same as the name of the LU to be used by the listener for inbound transmissions.

This parameter applies to z/OS only.

The maximum length of the string is MQ_LU_NAME_LENGTH.

z/OS LU62ARMSuffix (MQCFST)

APPCPM suffix (parameter identifier: MQCA_LU62_ARM_SUFFIX).

The suffix of the APPCPM member of SYS1.PARMLIB. This suffix nominates the LUADD for this channel initiator.

This parameter applies to z/OS only.

The maximum length of the string is MQ_ARM_SUFFIX_LENGTH.

z/OS LU62Channels (MQCFIN)

Maximum number of LU 6.2 channels (parameter identifier: MQIA_LU62_CHANNELS).

The maximum number of channels that can be current, or clients that can be connected, that use the LU 6.2 transmission protocol.

This parameter applies to z/OS only.

Specify a value in the range 0 - 9999. The initial default value of the queue manager is 200.

z/OS MaxActiveChannels (MQCFIN)

Maximum number of active channels (parameter identifier: MQIA_ACTIVE_CHANNELS).

The maximum number of channels that can be *active* at any time.

This parameter applies to z/OS only.

Sharing conversations do not contribute to the total for this parameter.

Specify a value in the range 1 - 9999. The initial default value of the queue manager is 200.

z/OS MaxChannels (MQCFIN)

Maximum number of current channels (parameter identifier: MQIA_MAX_CHANNELS).

The maximum number of channels that can be *current* (including server-connection channels with connected clients).

This parameter applies to z/OS only.

Sharing conversations do not contribute to the total for this parameter.

Specify a value in the range 1 - 9999.

MaxHandles (MQCFIN)

Maximum number of handles (parameter identifier: MQIA_MAX_HANDLES).

The maximum number of handles that any one connection can have open at the same time.

Specify a value in the range 0 - 999,999,999.

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: MQIA_MAX_MSG_LENGTH).

Specifies the maximum length of messages allowed on queues on the queue manager. No message that is larger than either the queue attribute *MaxMsgLength* or the queue manager attribute *MaxMsgLength* can be put on a queue.

If you reduce the maximum message length for the queue manager, you must also reduce the maximum message length of the SYSTEM.DEFAULT.LOCAL.QUEUE definition, and your other queues. Reduce the definitions on the queues to less than or equal to the limit of the queue manager. If you do not reduce the message lengths appropriately, and applications inquire only the value of the queue attribute *MaxMsgLength*, they might not work correctly.

The lower limit for this parameter is 32 KB (32,768 bytes). The upper limit is 100 MB (104,857,600 bytes).

This parameter is not valid on z/OS.

MaxPropertiesLength (MQCFIN)

Maximum property length (parameter identifier: MQIA_MAX_PROPERTIES_LENGTH).

Specifies the maximum length of the properties, including both the property name in bytes and the size of the property value in bytes.

Specify a value in the range 0 - 100 MB (104,857,600 bytes), or the special value:

MQPROP_UNRESTRICTED_LENGTH

The size of the properties is restricted only by the upper limit.

MaxUncommittedMsgs (MQCFIN)

Maximum uncommitted messages (parameter identifier: MQIA_MAX_UNCOMMITTED_MSGS).

Specifies the maximum number of uncommitted messages. The maximum number of uncommitted messages under any sync point is the sum of the following messages:

The number of messages that can be retrieved.

The number of messages that can be put.

The number of trigger messages generated within this unit of work.

The limit does not apply to messages that are retrieved or put outside sync point.

Specify a value in the range 1 - 10,000.

Multi

MQIAccounting (MQCFIN)

Controls whether accounting information for MQI data is to be collected (parameter identifier: MQIA_ACCOUNTING_MQI).

The value can be:

MQMON_OFF

MQI accounting data collection is disabled. This value is the initial default value of the queue manager.

MQMON_ON

MQI accounting data collection is enabled.

This parameter is valid only on [Multiplatforms](#).

Multi

MQIStatistics (MQCFIN)

Controls whether statistics monitoring data is to be collected for the queue manager (parameter identifier: MQIA_STATISTICS_MQI).

The value can be:

MQMON_OFF

Data collection for MQI statistics is disabled. This value is the initial default value of the queue manager.

MQMON_ON

Data collection for MQI statistics is enabled.

This parameter is valid only on [Multiplatforms](#).

MsgMarkBrowseInterval (MQCFIN)

Mark-browse interval (parameter identifier: MQIA_MSG_MARK_BROWSE_INTERVAL).

Specifies the time interval in milliseconds after which the queue manager can automatically unmark messages.

Specify a value up to the maximum of 999,999,999, or the special value MQMMBI_UNLIMITED. The default value is 5000.

Attention: You should not reduce the value below the default of 5000.

MQMMBI_UNLIMITED indicates that the queue manager does not automatically unmark messages.

z/OS

OutboundPortMax (MQCFIN)

The maximum value in the range for the binding of outgoing channels (parameter identifier: MQIA_OUTBOUND_PORT_MAX).

The maximum value in the range of port numbers to be used when binding outgoing channels. This parameter applies to z/OS only.

Specify a value in the range 0 - 65,535. The initial default value of the queue manager is zero.

Specify a corresponding value for *OutboundPortMin* and ensure that the value of *OutboundPortMax* is greater than or equal to the value of *OutboundPortMin* .

z/OS **OutboundPortMin (MQCFIN)**

The minimum value in the range for the binding of outgoing channels (parameter identifier: MQIA_OUTBOUND_PORT_MIN).

The minimum value in the range of port numbers to be used when binding outgoing channels. This parameter applies to z/OS only.

Specify a value in the range 0 - 65,535. The initial default value of the queue manager is zero.

Specify a corresponding value for *OutboundPortMax* and ensure that the value of *OutboundPortMin* is less than or equal to the value of *OutboundPortMax* .

Parent (MQCFST)

The name of the queue manager to which this queue manager is to connect hierarchically as its child (parameter identifier: MQCA_PARENT).

A blank value indicates that this queue manager has no parent queue manager. If there is an existing parent queue manager it is disconnected. This value is the initial default value of the queue manager.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

Note:

- The use of IBM MQ hierarchical connections requires that the queue manager attribute PSMODE is set to MQPSM_ENABLED.
- The value of *Parent* can be set to a blank value if PSMODE is set to MQPSM_DISABLED.
- Before connecting to a queue manager hierarchically as its child, channels in both directions must exist between the parent queue manager and child queue manager.
- If a parent is defined, the **Change Queue Manager** command disconnects from the original parent and sends a connection flow to the new parent queue manager.
- Successful completion of the command does not mean that the action completed or that it is going to complete successfully. Use the **Inquire Pub/Sub Status** command to track the status of the requested parent relationship.

PerformanceEvent (MQCFIN)

Controls whether performance-related events are generated (parameter identifier: MQIA_PERFORMANCE_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

PubSubClus (MQCFIN)

Controls whether the queue manager participates in publish/subscribe clustering (parameter identifier: MQIA_PUBSUB_CLUSTER).

The value can be:

MQPSCLUS_ENABLED

The creating or receipt of clustered topic definitions and cluster subscriptions is permitted.

Note: The introduction of a clustered topic into a large IBM MQ cluster can cause a degradation in performance. This degradation occurs because all partial repositories are notified of all the other members of the cluster. Unexpected subscriptions might be created at all other nodes; for example, where proxysub(FORCE) is specified. Large numbers of channels might be started from a queue manager; for example, on resync after a queue manager failure.

MQPSCLUS_DISABLED

The creating or receipt of clustered topic definitions and cluster subscriptions is inhibited. The creations or receipts are recorded as warnings in the queue manager error logs.

PubSubMaxMsgRetryCount (MQCFIN)

The number of attempts to reprocess a message when processing a failed command message under sync point (parameter identifier: MQIA_PUBSUB_MAXMSG_RETRY_COUNT).

The value can be:

0 to 999 999 999

The initial value is 5.

PubSubMode (MQCFIN)

Specifies whether the publish/subscribe engine and the queued publish/subscribe interface are running. The publish/subscribe engine enables applications to publish or subscribe by using the application programming interface. The publish/subscribe interface monitors the queues used the queued publish/subscribe interface (parameter identifier: MQIA_PUBSUB_MODE).

The value can be:

MQPSM_COMPAT

The publish/subscribe engine is running. It is therefore possible to publish or subscribe by using the application programming interface. The queued publish/subscribe interface is not running. Therefore any message that is put to the queues that are monitored by the queued publish/subscribe interface is not acted on. MQPSM_COMPAT is used for compatibility with versions of IBM Integration Bus (formerly known as WebSphere Message Broker) prior to version 7 that use this queue manager.

MQPSM_DISABLED

The publish/subscribe engine and the queued publish/subscribe interface are not running. It is therefore not possible to publish or subscribe using the application programming interface. Any publish/subscribe messages that are put to the queues that are monitored by the queued publish/subscribe interface are not acted on.

MQPSM_ENABLED

The publish/subscribe engine and the queued publish/subscribe interface are running. It is therefore possible to publish or subscribe by using the application programming interface and the queues that are monitored by the queued publish/subscribe interface. This value is the initial default value of the queue manager.

PubSubNPInputMsg (MQCFIN)

Whether to discard (or keep) an undelivered input message (parameter identifier: MQIA_PUBSUB_NP_MSG).

The value can be:

MQUNDELIVERED_DISCARD

Non-persistent input messages are discarded if they cannot be processed.

MQUNDELIVERED_KEEP

Non-persistent input messages are not discarded if they cannot be processed. In this situation, the queued publish/subscribe interface continues to try the process again at appropriate intervals and does not continue processing subsequent messages.

PubSubNPResponse (MQCFIN)

Controls the behavior of undelivered response messages (parameter identifier: MQIA_PUBSUB_NP_RESP).

The value can be:

MQUNDELIVERED_NORMAL

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If they cannot be placed on the dead letter queue they are discarded.

MQUNDELIVERED_SAFE

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If the response cannot be sent and cannot be placed on the dead letter queue the queued publish/subscribe interface rolls back the current operation. The operation is tried again at appropriate intervals and does not continue processing subsequent messages.

MQUNDELIVERED_DISCARD

Non-persistent responses that are not placed on the reply queue are discarded.

MQUNDELIVERED_KEEP

Non-persistent responses are not placed on the dead letter queue or discarded. Instead, the queued publish/subscribe interface backs out the current operation and then try it again at appropriate intervals.

PubSubSyncPoint (MQCFIN)

Whether only persistent (or all) messages must be processed under sync point (parameter identifier: MQIA_PUBSUB_SYNC_PT).

The value can be:

MQSYNCPOINT_IFPER

This value makes the queued publish/subscribe interface receive non-persistent messages outside sync point. If the interface receives a publication outside sync point, the interface forwards the publication to subscribers known to it outside sync point.

MQSYNCPOINT_YES

This value makes the queued publish/subscribe interface receive all messages under sync point.

QMGrDesc (MQCFST)

Queue manager description (parameter identifier: MQCA_Q_MGR_DESC).

This parameter is text that briefly describes the object.

The maximum length of the string is MQ_Q_MGR_DESC_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the queue manager on which the command is executing. Using this character set ensures that the text is translated correctly.

QSGCertificateLabel (MQCFST)

Specifies the certificate label for the queue sharing group to use (parameter identifier: MQCA_QSG_CERT_LABEL).

This parameter takes precedence over **CERTLABL** in the event that the queue manager is a member of a QSG.

QueueAccounting (MQCFIN)

Controls the collection of accounting (thread-level and queue-level accounting) data for queues (parameter identifier: MQIA_ACCOUNTING_Q). Note, that changes to this value are only effective for connections to the queue manager that occur after the change to the attribute.

The value can be:

MQMON_NONE

Accounting data collection for queues is disabled. This value must not be overridden by the value of the **QueueAccounting** parameter on the queue.

MQMON_OFF

Accounting data collection is disabled for queues specifying a value of MQMON_Q_MGR in the **QueueAccounting** parameter.

MQMON_ON

Accounting data collection is enabled for queues specifying a value of MQMON_Q_MGR in the **QueueAccounting** parameter.

QueueMonitoring (MQCFIN)

Default setting for online monitoring for queues (parameter identifier: MQIA_MONITORING_Q).

If the **QueueMonitoring** queue attribute is set to MQMON_Q_MGR, this attribute specifies the value which is assumed by the channel. The value can be any of the following values:

MQMON_OFF

Online monitoring data collection is turned off. This value is the initial default value of the queue manager.

MQMON_NONE

Online monitoring data collection is turned off for queues regardless of the setting of their **QueueMonitoring** attribute.

MQMON_LOW

Online monitoring data collection is turned on, with a low ratio of data collection.

MQMON_MEDIUM

Online monitoring data collection is turned on, with a moderate ratio of data collection.

MQMON_HIGH

Online monitoring data collection is turned on, with a high ratio of data collection.

Multi

QueueStatistics (MQCFIN)

Controls whether statistics data is to be collected for queues (parameter identifier: MQIA_STATISTICS_Q).

The value can be:

MQMON_NONE

Statistics data collection is turned off for queues regardless of the setting of their **QueueStatistics** parameter. This value is the initial default value of the queue manager.

MQMON_OFF

Statistics data collection is turned off for queues specifying a value of MQMON_Q_MGR in their **QueueStatistics** parameter.

MQMON_ON

Statistics data collection is turned on for queues specifying a value of MQMON_Q_MGR in their **QueueStatistics** parameter.

This parameter is valid only on [Multiplatforms](#).

z/OS

ReceiveTimeout (MQCFIN)

How long a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA_RECEIVE_TIMEOUT).

The approximate length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state.

This parameter applies to z/OS only. It applies to message channels, and not to MQI channels. This number can be qualified as follows:

- This number is a multiplier to be applied to the negotiated *HeartBeatInterval* value to determine how long a channel is to wait. Set *ReceiveTimeoutType* to MQRCVTIME_MULTIPLY. Specify a value of zero or in the range 2 - 99. If you specify zero, the channel waits indefinitely to receive data from its partner.
- This number is a value, in seconds, to be added to the negotiated *HeartBeatInterval* value to determine how long a channel is to wait. Set *ReceiveTimeoutType* to MQRCVTIME_ADD. Specify a value in the range 1 - 999,999.
- This number is a value, in seconds, that the channel is to wait, set *ReceiveTimeoutType* to MQRCVTIME_EQUAL. Specify a value in the range 0 - 999,999. If you specify 0, the channel waits indefinitely to receive data from its partner.

The initial default value of the queue manager is zero.

z/OS ReceiveTimeoutMin (MQCFIN)

The minimum length of time that a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA_RECEIVE_TIMEOUT_MIN).

The minimum length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state. This parameter applies to z/OS only.

Specify a value in the range 0 - 999,999.

z/OS ReceiveTimeoutType (MQCFIN)

The qualifier to apply to *ReceiveTimeout* (parameter identifier: MQIA_RECEIVE_TIMEOUT_TYPE).

The qualifier to apply to *ReceiveTimeoutType* to calculate how long a TCP/IP channel waits to receive data, including heartbeats, from its partner. It waits to receive data before returning to the inactive state. This parameter applies to z/OS only.

The value can be any of the following values:

MQRCVTIME_MULTIPLY

The *ReceiveTimeout* value is a multiplier to be applied to the negotiated value of *HeartbeatInterval* to determine how long a channel waits. This value is the initial default value of the queue manager.

MQRCVTIME_ADD

ReceiveTimeout is a value, in seconds, to be added to the negotiated value of *HeartbeatInterval* to determine how long a channel waits.

MQRCVTIME_EQUAL

ReceiveTimeout is a value, in seconds, representing how long a channel waits.

RemoteEvent (MQCFIN)

Controls whether remote error events are generated (parameter identifier: MQIA_REMOTE_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

RepositoryName (MQCFST)

Cluster name (parameter identifier: MQCA_REPOSITORY_NAME).

The name of a cluster for which this queue manager provides a repository manager service.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

No more than one of the resultant values of *RepositoryName* can be nonblank.

RepositoryNameList (MQCFST)

Repository namelist (parameter identifier: MQCA_REPOSITORY_NAMELIST).

The name, of a namelist of clusters, for which this queue manager provides a repository manager service.

This queue manager does not have a full repository, but can be a client of other repository services that are defined in the cluster, if

- Both *RepositoryName* and *RepositoryNameList* are blank, or
- *RepositoryName* is blank and the namelist specified by *RepositoryNameList* is empty.

No more than one of the resultant values of *RepositoryNameList* can be nonblank.

RevDns (MQCFIN)

Whether reverse lookup of the host name from a Domain Name Server is carried out. (parameter identifier: MQIA_REVERSE_DNS_LOOKUP).

This attribute has an effect only on channels using a transport type (TRPTYPE) of TCP.

The value can be:

MQRDNS_DISABLED

DNS host names are not reverse looked-up for the IP addresses of inbound channels. With this setting any CHLAUTH rules using host names are not matched.

MQRDNS_ENABLED

DNS host names are reverse looked-up for the IP addresses of inbound channels when this information is required. This setting is required for matching against CHLAUTH rules that contain host names, and for writing out error messages.

z/OS SecurityCase (MQCFIN)

Security case supported (parameter identifier: MQIA_SECURITY_CASE).

Specifies whether the queue manager supports security profile names in mixed case, or in uppercase only. The value is activated when a Refresh Security command is run with *SecurityType* (MQSECTYPE_CLASSES) specified. This parameter is valid only on z/OS.

The value can be:

MQSCYC_UPPER

Security profile names must be in uppercase.

MQSCYC_MIXED

Security profile names can be in uppercase or in mixed case.

z/OS SharedQQmgrName (MQCFIN)

Shared-queue queue manager name (parameter identifier: MQIA_SHARED_Q_Q_MGR_NAME).

A queue manager makes an MQOPEN call for a shared queue. The queue manager that is specified in the **ObjectQmgrName** parameter of the MQOPEN call is in the same queue sharing group as the processing queue manager. The SQQMNAME attribute specifies whether the **ObjectQmgrName** is used or whether the processing queue manager opens the shared queue directly. This parameter is valid only on z/OS.

The value can be any of the following values:

MQSQQM_USE

ObjectQmgrName is used and the appropriate transmission queue is opened.

MQSQQM_IGNORE

The processing queue manager opens the shared queue directly. This value can reduce the traffic in your queue manager network.

SSLCRLNameList (MQCFST)

The TLS namelist (parameter identifier: MQCA_SSL_CRL_NAMELIST).

The length of the string is MQ_NAMELIST_NAME_LENGTH.

Indicates the name of a namelist of authentication information objects which are used to provide certificate revocation locations to allow enhanced TLS certificate checking.

If *SSLCRLNameList* is blank, certificate revocation checking is not invoked.

Changes to *SSLCRLNameList*, or to the names in a previously specified namelist, or to previously referenced authentication information objects become effective:

- **Multi** On Multiplatforms, when a new channel process is started.
- **Multi** For channels that run as threads of the channel initiator on Multiplatforms, when the channel initiator is restarted.
- **Multi** For channels that run as threads of the listener on Multiplatforms, when the listener is restarted.

- **z/OS** On z/OS, when the channel initiator is restarted.
- When a **REFRESH SECURITY TYPE(SSL)** command is issued.
- **IBM i** On IBM i queue managers, this parameter is ignored. However, it is used to determine which authentication information objects are written to the AMQCLCHL .TAB file.

Only authentication information objects with types of LDAPCRL or OCSP are allowed in the namelist referred to by *SSLCRLNamelist* (MQCFST). Any other type results in an error message when the list is processed and is subsequently ignored.

SSLCryptoHardware (MQCFST)

The TLS cryptographic hardware (parameter identifier: MQCA_SSL_CRYPTO_HARDWARE).

The length of the string is MQ_SSL_CRYPTO_HARDWARE_LENGTH.

Sets the name of the parameter string required to configure the cryptographic hardware present on the system.

This parameter is valid only on UNIX, Linux, and Windows.

All supported cryptographic hardware supports the PKCS #11 interface. Specify a string of the following format:

```
GSK_PKCS11=PKCS_#11_driver_path_and_file_name;PKCS_#11_token_label;PKCS_#11_token_password;symmetric_cipher_setting;
```

The PKCS #11 driver path is an absolute path to the shared library providing support for the PKCS #11 card. The PKCS #11 driver file name is the name of the shared library. An example of the value required for the PKCS #11 driver path and file name is `/usr/lib/pkcs11/PKCS11_API.so`

To access symmetric cipher operations through IBM Global Security Kit (GSKit), specify the symmetric cipher setting parameter. The value of this parameter is either:

SYMMETRIC_CIPHER_OFF

Do not access symmetric cipher operations.

SYMMETRIC_CIPHER_ON

Access symmetric cipher operations.

If the symmetric cipher setting is not specified, this value has the same effect as specifying SYMMETRIC_CIPHER_OFF.

The maximum length of the string is 256 characters. The default value is blank.

If you specify a string in the wrong format, you get an error.

When the *SSLCryptoHardware* (MQCFST) value is changed, the cryptographic hardware parameters specified become the ones used for new TLS connection environments. The new information becomes effective:

- When a new channel process is started.
- For channels that run as threads of the channel initiator, when the channel initiator is restarted.
- For channels that run as threads of the listener, when the listener is restarted.
- When a Refresh Security command is issued to refresh the contents of the TLS key repository.

SSLEvent (MQCFIN)

Controls whether TLS events are generated (parameter identifier: MQIA_SSL_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

SSLFipsRequired (MQCFIN)

SSLFIPS specifies whether only FIPS-certified algorithms are to be used if cryptography is carried out in IBM MQ, rather than in cryptographic hardware (parameter identifier: MQIA_SSL_FIPS_REQUIRED).

If cryptographic hardware is configured, the cryptographic modules used are those modules provided by the hardware product. These modules might, or might not, be FIPS-certified to a particular level depending on the hardware product in use. This parameter applies to z/OS, UNIX, Linux, and Windows platforms only.

The value can be any of the following values:

MQSSL_FIPS_NO

IBM MQ provides an implementation of TLS cryptography which supplies some FIPS-certified modules on some platforms. If you set *SSLFIPSRequired* to MQSSL_FIPS_NO, any CipherSpec supported on a particular platform can be used. This value is the initial default value of the queue manager.

If the queue manager runs without using cryptographic hardware, refer to the CipherSpecs listed in [Specifying CipherSpecs](#) employing FIPS 140-2 certified cryptography:

MQSSL_FIPS_YES

Specifies that only FIPS-certified algorithms are to be used in the CipherSpecs allowed on all TLS connections from and to this queue manager.

For a listing of appropriate FIPS 140-2 certified CipherSpecs; see [Specifying CipherSpecs](#).

Changes to SSLFIPS become effective either:

- On UNIX, Linux, and Windows, when a new channel process is started.
- For channels that run as threads of the channel initiator on UNIX, Linux, and Windows, when the channel initiator is restarted.
- For channels that run as threads of the listener on UNIX, Linux, and Windows, when the listener is restarted.
- For channels that run as threads of a process pooling process, when the process pooling process is started or restarted and first runs a TLS channel. If the process pooling process has already run a TLS channel, and you want the change to become effective immediately, run the MQSC command **REFRESH SECURITY TYPE(SSL)**. The process pooling process is **amqzmpa** on UNIX, Linux, and Windows.
- On z/OS, when the channel initiator is restarted.
- When a **REFRESH SECURITY TYPE(SSL)** command is issued, except on z/OS.

SSLKeyRepository (MQCFST)

The TLS key repository (parameter identifier: MQCA_SSL_KEY_REPOSITORY).

The length of the string is MQ_SSL_KEY_REPOSITORY_LENGTH.

Indicates the name of the Secure Sockets Layer key repository.

The format of the name depends on the environment:

- On z/OS, it is the name of a key ring.
- On IBM i, it is of the form *pathname/keyfile*, where *keyfile* is specified without the suffix (.kdb), and identifies a GSKit key database file. The default value is /QIBM/UserData/ICSS/Cert/Server/Default.

If you specify *SYSTEM, IBM MQ uses the system certificate store as the key repository for the queue manager. As a result, the queue manager is registered as a server application in Digital Certificate Manager (DCM). You can assign any server/client certificate in the system store to this application.

If you change the SSLKEYR parameter to a value other than *SYSTEM, IBM MQ unregisters the queue manager as an application with DCM.

- On UNIX, it is of the form *pathname/keyfile* and on Windows *pathname\keyfile*, where *keyfile* is specified without the suffix (.kdb), and identifies a GSKit key database file. The default value for UNIX is /var/mqm/qmgrs/QMGR/ssl/key, and on Windows it is C:\Program Files\IBM\MQ\qmgrs\QMGR\ssl\key, where QMGR is replaced by the queue manager name (on UNIX, Linux, and Windows).

Multi On Multiplatforms, the syntax of this parameter is validated to ensure that it contains a valid, absolute, directory path.

If SSLKEYR is blank, or is a value that does not correspond to a key ring or key database file, channels using TLS fail to start.

Changes to SSLKeyRepository become effective as follows:

- **Multi** On Multiplatforms:
 - when a new channel process is started
 - for channels that run as threads of the channel initiator, when the channel initiator is restarted.
 - for channels that run as threads of the listener, when the listener is restarted.
- **z/OS** On z/OS, when the channel initiator is restarted.

SSLKeyResetCount (MQCFIN)

SSL key reset count (parameter identifier: MQIA_SSL_RESET_COUNT).

Specifies when TLS channel MCAs that initiate communication reset the secret key used for encryption on the channel. The value of this parameter represents the total number of unencrypted bytes that are sent and received on the channel before the secret key is renegotiated. This number of bytes includes control information sent by the MCA.

The secret key is renegotiated when (whichever occurs first):

- The total number of unencrypted bytes sent and received by the initiating channel MCA exceeds the specified value, or,
- If channel heartbeats are enabled, before data is sent or received following a channel heartbeat.

Specify a value in the range 0 - 999,999,999. A value of zero, the initial default value of the queue manager, signifies that secret keys are never renegotiated. If you specify a TLS secret key reset count between 1 byte through 32 KB, TLS channels use a secret key reset count of 32Kb. This count is to avoid the performance effect of excessive key resets which would occur for small TLS secret key reset values.

SSLTasks (MQCFIN)

Number of server subtasks to use for processing TLS calls (parameter identifier: MQIA_SSL_TASKS). This parameter applies to z/OS only.

The number of server subtasks to use for processing TLS calls. To use TLS channels, you must have at least two of these tasks running.

Specify a value in the range 0 - 9999. However, to avoid problems with storage allocation, do not set this parameter to a value greater than 50.

StartStopEvent (MQCFIN)

Controls whether start and stop events are generated (parameter identifier: MQIA_START_STOP_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

Multi **StatisticsInterval (MQCFIN)**

The time interval, in seconds, at which statistics monitoring data is written to the monitoring queue (parameter identifier: MQIA_STATISTICS_INTERVAL).

Specify a value in the range 1 - 604,000.

This parameter is valid only on [Multiplatforms](#).

z/OS **TCPChannels (MQCFIN)**

The maximum number of channels that can be current, or clients that can be connected, that use the TCP/IP transmission protocol (parameter identifier: MQIA_TCP_CHANNELS).

Specify a value in the range 0 - 9999. The initial default value of the queue manager is 200.

Sharing conversations do not contribute to the total for this parameter.

This parameter applies to z/OS only.

z/OS **TCPKeepAlive (MQCFIN)**

Specifies whether the TCP KEEPALIVE facility is to be used to check whether the other end of a connection is still available (parameter identifier: MQIA_TCP_KEEP_ALIVE).

The value can be:

MQTCPKEEP_YES

The TCP KEEPALIVE facility is to be used as specified in the TCP profile configuration data set. The interval is specified in the *KeepAliveInterval* channel attribute.

MQTCPKEEP_NO

The TCP KEEPALIVE facility is not to be used. This value is the initial default value of the queue manager.

This parameter applies only to z/OS.

z/OS **TCPName (MQCFST)**

The name of the TCP/IP system that you are using (parameter identifier: MQIA_TCP_NAME).

The maximum length of the string is MQ_TCP_NAME_LENGTH.

This parameter applies only to z/OS.

z/OS **TCPStackType (MQCFIN)**

Specifies whether the channel initiator can use only the TCP/IP address space specified in *TCPName* , or can optionally bind to any selected TCP/IP address (parameter identifier: MQIA_TCP_STACK_TYPE).

The value can be:

MQTCPSTACK_SINGLE

The channel initiator uses the TCP/IP address space that is specified in *TCPName* . This value is the initial default value of the queue manager.

MQTCPSTACK_MULTIPLE

The channel initiator can use any TCP/IP address space available to it. It defaults to the one specified in *TCPName* if no other is specified for a channel or listener.

This parameter applies only to z/OS.

TraceRouteRecording (MQCFIN)

Specifies whether trace-route information can be recorded and a reply message generated (parameter identifier: MQIA_TRACE_ROUTE_RECORDING).

The value can be:

MQRECORDING_DISABLED

Trace-route information cannot be recorded.

MQRECORDING_MSG

Trace-route information can be recorded and replies sent to the destination specified by the originator of the message causing the trace-route record.

MQRECORDING_Q

Trace-route information can be recorded and replies sent to SYSTEM.ADMIN.TRACE.ROUTE.QUEUE.

If participation in route tracing is enabled using this queue manager attribute, the value of the attribute is only important if a reply is generated. Route tracing is enabled by not setting *TraceRouteRecording* to MQRECORDING_DISABLED. The reply must go either to SYSTEM.ADMIN.TRACE.ROUTE.QUEUE, or to the destination specified by the message itself. Provided the attribute is not disabled then messages not yet at the final destination might have information added to them. For more information about trace-route records, see [Controlling trace-route messaging](#).

TreeLifeTime (MQCFIN)

The lifetime, in seconds, of non-administrative topics (parameter identifier: MQIA_TREE_LIFE_TIME).

Non-administrative topics are those topics created when an application publishes to, or subscribes as, a topic string that does not exist as an administrative node. When this non-administrative node no longer has any active subscriptions, this parameter determines how long the queue manager waits before removing that node. Only non-administrative topics that are in use by a durable subscription remain after the queue manager is recycled.

Specify a value in the range 0 - 604,000. A value of 0 means that non-administrative topics are not removed by the queue manager. The initial default value of the queue manager is 1800.

TriggerInterval (MQCFIN)

Trigger interval (parameter identifier: MQIA_TRIGGER_INTERVAL).

Specifies the trigger time interval, expressed in milliseconds, for use only with queues where *TriggerType* has a value of MQTT_FIRST.

In this case, trigger messages are normally generated only when a suitable message arrives on the queue, and the queue was previously empty. Under certain circumstances, however, an additional trigger message can be generated with MQTT_FIRST triggering, even if the queue was not empty. These additional trigger messages are not generated more often than every *TriggerInterval* milliseconds.

Specify a value in the range 0 - 999,999,999.

Error codes (Change Queue Manager)

This command might return the following errors in the response format header, in addition to the values shown on page [“Error codes applicable to all commands”](#) on page 1343.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CERT_LABEL_NOT_ALLOWED

Certificate label error.

MQRCCF_CHAD_ERROR

Channel automatic definition error.

MQRCCF_CHAD_EVENT_ERROR

Channel automatic definition event error.

MQRCCF_CHAD_EVENT_WRONG_TYPE

Channel automatic definition event parameter not allowed for this channel type.

MQRCCF_CHAD_EXIT_ERROR

Channel automatic definition exit name error.

MQRCCF_CHAD_EXIT_WRONG_TYPE

Channel automatic definition exit parameter not allowed for this channel type.

MQRCCF_CHAD_WRONG_TYPE

Channel automatic definition parameter not allowed for this channel type.

MQRCCF_FORCE_VALUE_ERROR

Force value not valid.

MQRCCF_PATH_NOT_VALID

Path not valid.

MQRCCF_PWD_LENGTH_ERROR

Password length error.

MQRCCF_PSCLUS_DISABLED_TOPDEF

Administrator or application attempted to define a cluster topic when **PubSubClub** is set to MQPSCLUS_DISABLED.

MQRCCF_PSCLUS_TOPIC_EXSITS

Administrator tried to set **PubSubClub** to MQPSCLUS_DISABLED when a cluster topic definition exists.

 **MQRCCF_Q_MGR_ATTR_CONFLICT**

Queue manager attribute error. A possible cause is that you attempted to specify SSLKEYR(*SYSTEM) with a nonblank queue manager CERTLABL.

MQRCCF_Q_MGR_CCSID_ERROR

Coded character set value not valid.

MQRCCF_REPOS_NAME_CONFLICT

Repository names not valid.

MQRCCF_UNKNOWN_Q_MGR

Queue manager not known.

MQRCCF_WRONG_CHANNEL_TYPE

Channel type error.

[Federal Information Processing Standards \(FIPS\) for UNIX, Linux and Windows](#)

 **Change Security on z/OS**

The Change Security command changes specified attributes of an existing security definition.

The Change Security (MQCMD_CHANGE_SECURITY) command defines system-wide security options.

Required parameters

None

Optional parameters**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.

- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

SecurityInterval (MQCFIN)

Timeout check interval (parameter identifier: MQIACF_SECURITY_INTERVAL).

Specifies the interval between checks for user IDs and associated resources to determine whether the *SecurityTimeout* has occurred. The value specifies a number of minutes in the range zero through 10080 (one week). If *SecurityInterval* is specified as zero, no user timeouts occur. If *SecurityInterval* is specified as nonzero, the user ID times out at a time between *SecurityTimeout* and *SecurityTimeout* plus *SecurityInterval*.

SecurityTimeout (MQCFIN)

Security information timeout (parameter identifier: MQIACF_SECURITY_TIMEOUT).

Specifies how long security information about an unused user ID and associated resources is retained by IBM MQ. The value specifies a number of minutes in the range zero through 10080 (one week). If *SecurityTimeout* is specified as zero, and *SecurityInterval* is nonzero, all such information is discarded by the queue manager every *SecurityInterval* number of minutes.

Change SMDS on z/OS

The Change SMDS (MQCMD_CHANGE_SMDS) command changes the attributes of shared message data set.

The Change SMDS (MQCMD_CHANGE_SMDS) command changes the current shared message data set options for the specified queue manager and CF structure.

SMDS (MQCFST)

Specifies the queue manager for which the shared message data set properties are to be changed, or an asterisk to change the properties for all shared message data sets associated with the specified CFSTRUCT.

CFStrucName (MQCFST)

The name of the CF application structure with SMDS parameters that you want to change (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters

DSBufs (MQCFIN)

The shared message data set buffers group (parameter identifier: MQIA_CF_SMDS_BUFFERS).

Specifies the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

A value in the range 1 - 9999 or MQDSB_DEFAULT.

When DEFAULT is used any previous value is overridden and the DSBUFS value from the CFSTRUCT definition is used. The size of each buffer is equal to the logical block size.

Value can not be set unless CFLEVEL(5) is defined.

DSEXPAND (MQCFIN)

The shared message data set expand option (parameter identifier: MQIACF_CF_SMDS_EXPAND).

Specifies whether or not the queue manager should expand a shared message data set when it is nearly full, and further blocks are required in the data set. The value can be any of the following values:

MQDSE_YES

The data set can be expanded.

MQDSE_NO

The data set cannot be expanded.

MQDSE_DEFAULT

Only returned on DISPLAY CFSTRUCT when not explicitly set

Value can not be set unless CFLEVEL(5) is defined.

Change, Copy, and Create Service on Multiplatforms

The Change Service command changes existing service definitions. The Copy and Create service commands create new service definitions - the Copy command uses attribute values of an existing service definition.

The Change Service (MQCMD_CHANGE_SERVICE) command changes the specified attributes of an existing IBM MQ service definition. For any optional parameters that are omitted, the value does not change.

The Copy Service (MQCMD_COPY_SERVICE) command creates an IBM MQ service definition, using, for attributes not specified in the command, the attribute values of an existing service definition.

The Create Service (MQCMD_CREATE_SERVICE) command creates an IBM MQ service definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameter (Change and Create Service)

ServiceName (MQCFST)

The name of the service definition to be changed or created (parameter identifier: MQCA_SERVICE_NAME).

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Required parameters (Copy Service)

FromServiceName (MQCFST)

The name of the service definition to be copied from (parameter identifier: MQCACF_FROM_SERVICE_NAME).

This parameter specifies the name of the existing service definition that contains values for the attributes not specified in this command.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

ToServiceName (MQCFST)

To service name (parameter identifier: MQCACF_TO_SERVICE_NAME).

This parameter specifies the name of the new service definition. If a service definition with this name exists, *Replace* must be specified as MQRP_YES.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Optional parameters (Change, Copy, and Create Service)

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If a namelist definition with the same name as *ToServiceName* exists, this specifies parameter whether it is to be replaced. The value can be:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

ServiceDesc (MQCFST)

Description of service definition (parameter identifier: MQCA_SERVICE_DESC).

This parameter is a plain-text comment that provides descriptive information about the service definition. It must contain only displayable characters.

If characters are used that are not in the coded character set identifier (CCSID) for the queue manager on which the command is executing, they might be translated incorrectly.

The maximum length of the string is MQ_SERVICE_DESC_LENGTH.

ServiceType (MQCFIN)

The mode in which the service is to run (parameter identifier: MQIA_SERVICE_TYPE).

Specify either:

MQSVC_TYPE_SERVER

Only one instance of the service can be executed at a time, with the status of the service made available by the Inquire Service Status command.

MQSVC_TYPE_COMMAND

Multiple instances of the service can be started.

StartArguments (MQCFST)

Arguments to be passed to the program on startup (parameter identifier: MQCA_SERVICE_START_ARGS).

Specify each argument within the string as you would on a command line, with a space to separate each argument to the program.

The maximum length of the string is MQ_SERVICE_ARGS_LENGTH.

StartCommand (MQCFST)

Service program name (parameter identifier: MQCA_SERVICE_START_COMMAND).

Specifies the name of the program which is to run. You must specify a fully qualified path name to the executable program.

The maximum length of the string is MQ_SERVICE_COMMAND_LENGTH.

StartMode (MQCFIN)

Service mode (parameter identifier: MQIA_SERVICE_CONTROL).

Specifies how the service is to be started and stopped. The value can be any of the following values:

MQSVC_CONTROL_MANUAL

The service is not to be started automatically or stopped automatically. It is to be controlled by user command. This value is the default value.

MQSVC_CONTROL_Q_MGR

The service being defined is to be started and stopped at the same time as the queue manager is started and stopped.

MQSVC_CONTROL_Q_MGR_START

The service is to be started at the same time as the queue manager is started, but is not requested to stop when the queue manager is stopped.

StderrDestination (MQCFST)

Specifies the path to a file to which the standard error (stderr) of the service program must be redirected (parameter identifier: MQCA_STDERR_DESTINATION).

If the file does not exist when the service program is started, the file is created.

The maximum length of the string is MQ_SERVICE_PATH_LENGTH.

StdoutDestination (MQCFST)

Specifies the path to a file to which the standard output (stdout) of the service program must be redirected (parameter identifier: MQCA_STDOUT_DESTINATION).

If the file does not exist when the service program is started, the file is created.

The maximum length of the string is MQ_SERVICE_PATH_LENGTH.

StopArguments (MQCFST)

Specifies the arguments to be passed to the stop program when instructed to stop the service (parameter identifier: MQCA_SERVICE_STOP_ARGS).

Specify each argument within the string as you would on a command line, with a space to separate each argument to the program.

The maximum length of the string is MQ_SERVICE_ARGS_LENGTH.

StopCommand (MQCFST)

Service program stop command (parameter identifier: MQCA_SERVICE_STOP_COMMAND).

This parameter is the name of the program that is to run when the service is requested to stop. You must specify a fully qualified path name to the executable program.

The maximum length of the string is MQ_SERVICE_COMMAND_LENGTH.

 **Change, Copy, and Create Storage Class on z/OS**

The Change Storage Class command changes existing storage class definitions. The Copy and Create Storage Class commands create new storage class definitions - the Copy command uses attribute values of an existing storage class definition.

The Change Storage Class (MQCMD_CHANGE_STG_CLASS) command changes the characteristics of a storage class. For any optional parameters that are omitted, the value does not change.

The Copy Storage Class (MQCMD_COPY_STG_CLASS) command creates a storage class to page set mapping using, for attributes not specified in the command, the attribute values of an existing storage class.

The Create Storage Class (MQCMD_CREATE_STG_CLASS) command creates a storage class to page set mapping. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameter (Change and Create Storage Class)**StorageClassName (MQCFST)**

The name of the storage class to be changed or created (parameter identifier: MQCA_STORAGE_CLASS).

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

Required parameters (Copy Storage Class)**FromStorageClassName (MQCFST)**

The name of the storage class to be copied from (parameter identifier: MQCACF_FROM_STORAGE_CLASS).

On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR or MQQSGD_COPY to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToStorageClassName* and the disposition MQQSGD_GROUP is searched for to copy from.

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

ToStorageClassName (MQCFST)

The name of the storage class to copy to (parameter identifier: MQCACF_TO_STORAGE_CLASS).

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

Optional parameters (Change, Copy, and Create Storage Class)

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

PageSetId (MQCFIN)

Page set identifier that the storage class is to be associated with (parameter identifier: MQIA_PAGESET_ID).

Specify a string of two numeric characters in the range 00 through 99.

If you do not specify this parameter, the default is taken from the default storage class SYSTEMST.

No check is made that the page set has been defined; an error is raised only if you try to put a message to a queue that specifies this storage class (MQRC_PAGESET_ERROR).

PassTicketApplication (MQCFST)

Pass ticket application (parameter identifier: MQCA_PASS_TICKET_APPL).

The application name that is passed to RACF when authenticating the passticket specified in the MQIIH header.

The maximum length is MQ_PASS_TICKET_APPL_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToStorageClassName</i> object (for Copy) or the <i>StorageClassName</i> object (for Create).

QSGDisposition	Change	Copy, Create
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to attempt to refresh local copies on page set zero:</p> <pre>DEFINE STGCLASS(storage-class) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This parameter is allowed only if the queue manager is in a queue sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to attempt to make or refresh local copies on page set zero:</p> <pre>DEFINE STGCLASS(storage-class) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
MQQSGD_PRIVATE	<p>The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.</p>	Not permitted.
MQQSGD_Q_MGR	<p>The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.</p>	<p>The object is defined on the page set of the queue manager that executes the command. This value is the default value.</p>

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If a storage class definition with the same name as *ToStorageClassName* exists, this parameter specifies whether it is to be replaced. The value can be:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

StorageClassDesc (MQCFST)

The description of the storage class (parameter identifier: MQCA_STORAGE_CLASS_DESC).

The maximum length is MQ_STORAGE_CLASS_DESC_LENGTH.

XCFGroupName (MQCFST)

XCF group name (parameter identifier: MQCA_XCF_GROUP_NAME).

If you are using the IMS bridge, this parameter is the name of the XCF group to which the IMS system belongs.

The maximum length is MQ_XCF_GROUP_NAME_LENGTH.

XCFMemberName (MQCFST)

XCF member name (parameter identifier: MQCA_XCF_MEMBER_NAME).

If you are using the IMS bridge, this parameter is the XCF member name of the IMS system within the XCF group specified in *XCFGroupName*.

The maximum length is MQ_XCF_MEMBER_NAME_LENGTH.

Change, Copy, and Create Subscription

The Change Subscription command changes existing subscription definitions. The Copy and Create Subscription commands create new subscription definitions - the Copy command uses attribute values of an existing subscription definition.

The Change Subscription (MQCMD_CHANGE_SUBSCRIPTION) command changes the specified attributes of an existing IBM MQ subscription. For any optional parameters that are omitted, the value does not change.

The Copy Subscription (MQCMD_COPY_SUBSCRIPTION) command creates an IBM MQ subscription, using, for attributes not specified in the command, the attribute values of an existing subscription.

The Create Subscription (MQCMD_CREATE_SUBSCRIPTION) command creates an IBM MQ administrative subscription so that existing applications can participate in publish/subscribe application.

Required parameters (Change Subscription)

SubName (MQCFST)

The name of the subscription definition to be changed (parameter identifier: MQCACF_SUB_NAME).

The maximum length of the string is MQ_SUB_NAME_LENGTH.

or

SubId (MQCFBS)

The unique identifier of the subscription definition to be changed (parameter identifier: MQBACF_SUB_ID).

The maximum length of the string is MQ_CORREL_ID_LENGTH.

Required parameters (Copy Subscription)

ToSubscriptionName (MQCFBS)

The name of the subscription to copy to (parameter identifier: MQCACF_TO_SUB_NAME).

The maximum length of the string is MQ_SUBSCRIPTION_NAME_LENGTH.

You require at least one of *FromSubscriptionName* or *SubId*.

FromSubscriptionName (MQCFST)

The name of the subscription definition to be copied from (parameter identifier: MQCACF_FROM_SUB_NAME).

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR or MQQSGD_COPY to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToSubscriptionName* and the disposition MQQSGD_GROUP is used.

The maximum length of the string is MQ_SUBSCRIPTION_NAME_LENGTH.

SubId (MQCFBS)

The unique identifier of the subscription definition to be changed (parameter identifier: MQBACF_SUB_ID).

The maximum length of the string is MQ_CORREL_ID_LENGTH.

Required parameters (Create Subscription)

You must provide the *SubName*.

SubName (MQCFST)

The name of the subscription definition to be changed (parameter identifier: MQCACF_SUB_NAME).

The maximum length of the string is MQ_SUB_NAME_LENGTH.

You require at least one of *TopicObject* or *TopicString*.

TopicObject (MQCFST)

The name of a previously defined topic object from which is obtained the topic name for the subscription (parameter identifier: MQCA_TOPIC_NAME). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

TopicString (MQCFST)

The resolved topic string (parameter identifier: MQCA_TOPIC_STRING).

The maximum length of the string is MQ_TOPIC_STR_LENGTH.

Optional parameters (Change, Copy, and Create Subscription)

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Destination (MQCFST)

Destination (parameter identifier: MQCACF_DESTINATION).

Specifies the name of the alias, local, remote, or cluster queue to which messages for this subscription are put.

This parameter is mandatory if *DestinationClass* is set to MQDC_PROVIDED, but is not applicable if *DestinationClass* is set to MQDC_MANAGED.

DestinationClass (MQCFIN)

Destination class (parameter identifier: MQIACF_DESTINATION_CLASS).

Specifies whether the destination is managed.

Specify either:

MQDC_MANAGED

The destination is managed.

MQDC_PROVIDED

The destination queue is as specified in the *Destination* field.

Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

DestinationCorrelId (MQCFBS)

Destination correlation identifier (parameter identifier: MQBACF_DESTINATION_CORREL_ID).

Provides a correlation identifier that is placed in the *CorrelId* field of the message descriptor for all the messages sent to this subscription.

The maximum length is MQ_CORREL_ID_LENGTH.

DestinationQueueManager (MQCFST)

Destination queue manager (parameter identifier: MQCACF_DESTINATION_Q_MGR).

Specifies the name of the destination queue manager, either local or remote, to which messages for the subscription are forwarded.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

Expiry (MQCFIN)

The time, in tenths of a second, at which a subscription expires after its creation date and time (parameter identifier: MQIACF_EXPIRY).

The default value of MQEI_UNLIMITED means that the subscription never expires.

After a subscription has expired it becomes eligible to be discarded by the queue manager and receives no further publications.

PublishedAccountingToken (MQCFBS)

Value of the accounting token used in the *AccountingToken* field of the message descriptor (parameter identifier: MQBACF_ACCOUNTING_TOKEN).

The maximum length of the string is MQ_ACCOUNTING_TOKEN_LENGTH.

PublishedApplicationIdentifier (MQCFST)

Value of the application identity data used in the *AppIdentityData* field of the message descriptor (parameter identifier: MQCACF_APPL_IDENTITY_DATA).

The maximum length of the string is MQ_APPL_IDENTITY_DATA_LENGTH.

PublishPriority (MQCFIN)

The priority of the message sent to this subscription (parameter identifier: MQIACF_PUB_PRIORITY).

The value can be:

MQPRI_PRIORITY_AS_PUBLISHED

Priority of messages sent to this subscription is taken from the priority supplied to the published message. This value is the supplied default value.

MQPRI_PRIORITY_AS_QDEF

Priority of messages sent to this subscription is determined by the default priority of the queue defined as a destination.

0-9

An integer value providing an explicit priority for messages sent to this subscription.

PublishSubscribeProperties (MQCFIN)

Specifies how publish/subscribe related message properties are added to messages sent to this subscription (parameter identifier: MQIACF_PUBSUB_PROPERTIES).

The value can be:

MQPSPROP_COMPAT

If the original publication is a PCF message, then the publish/subscribe properties are added as PCF attributes. Otherwise, publish/subscribe properties are added within an MQRFH version 1 header. This method is compatible with applications coded for use with previous versions of IBM MQ.

MQPSPROP_NONE

Do not add publish/subscribe properties to the messages. This value is the supplied default value.

MQPSPROP_RFH2

Publish/subscribe properties are added within an MQRFH version 2 header. This method is compatible with applications coded for use with IBM Integration Bus, formerly known as WebSphere Message Broker.

Selector (MQCFST)

Specifies the selector applied to messages published to the topic (parameter identifier: MQCACF_SUB_SELECTOR). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

Only those messages that satisfy the selection criteria are put to the destination specified by this subscription.

The maximum length of the string is MQ_SELECTOR_LENGTH.

SubscriptionLevel (MQCFIN)

The level within the subscription interception hierarchy at which this subscription is made (parameter identifier: MQIACF_SUB_LEVEL). To ensure that an intercepting application receives messages before any other subscribers, make sure that it has the highest subscription level of all subscribers.

The value can be:

0 - 9

An integer in the range 0-9. The default value is 1. Subscribers with a subscription level of 9 intercept publications before they reach subscribers with lower subscription levels.

SubscriptionScope (MQCFIN)

Determines whether this subscription is passed to other queue managers in the network (parameter identifier: MQIACF_SUBSCRIPTION_SCOPE). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The value can be:

MQTSCOPE_ALL

The subscription is forwarded to all queue managers directly connected through a publish/subscribe collective or hierarchy. This value is the supplied default value.

MQTSCOPE_QMGR

The subscription only forwards messages published on the topic within this queue manager.

SubscriptionUser (MQCFST)

The userid that 'owns' this subscription. This parameter is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription. (parameter identifier: MQCACF_SUB_USER_ID).

The maximum length of the string is MQ_USER_ID_LENGTH.

TopicString (MQCFST)

The resolved topic string (parameter identifier: MQCA_TOPIC_STRING). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The maximum length of the string is MQ_TOPIC_STR_LENGTH.

Userdata (MQCFST)

User data (parameter identifier: MQCACF_SUB_USER_DATA).

Specifies the user data associated with the subscription

The maximum length of the string is MQ_USER_DATA_LENGTH.

VariableUser (MQCFST)

Specifies whether a user other than the one who created the subscription, that is, the user shown in *SubscriptionUser* can take over the ownership of the subscription (parameter identifier: MQIACF_VARIABLE_USER_ID).

The value can be:

MQVU_ANY_USER

Any user can take over the ownership. This value is the supplied default value.

MQVU_FIXED_USER

No other user can take over the ownership.

WildcardSchema (MQCFIN)

Specifies the schema to be used when interpreting any wildcard characters contained in the *TopicString* (parameter identifier: MQIACF_WILDCARD_SCHEMA). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The value can be:

MQWS_CHAR

Wildcard characters represent portions of strings for compatibility with IBM MQ 6.0 broker.

MQWS_TOPIC

Wildcard characters represent portions of the topic hierarchy for compatibility with IBM Integration Bus. This value is the supplied default value.

Change, Copy, and Create Topic

The Change Topic command changes existing topic definitions. The Copy and Create Topic commands create new topic definitions - the Copy command uses attribute values of an existing topic definition.

The Change Topic (MQCMD_CHANGE_TOPIC) command changes the specified attributes of an existing IBM MQ administrative topic definition. For any optional parameters that are omitted, the value does not change.

The Copy Topic (MQCMD_COPY_TOPIC) command creates an IBM MQ administrative topic definition by using, for attributes not specified in the command, the attribute values of an existing topic definition.

The Create Topic (MQCMD_CREATE_TOPIC) command creates an IBM MQ administrative topic definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameter (Change Topic)

TopicName (MQCFST)

The name of the administrative topic definition to be changed (parameter identifier: MQCA_TOPIC_NAME).

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

Required parameters (Copy Topic)

FromTopicName (MQCFST)

The name of the administrative topic object definition to be copied from (parameter identifier: MQCACF_FROM_TOPIC_NAME).

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR or MQQSGD_COPY to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToTopicName* and the disposition MQQSGD_GROUP is searched for to copy from.

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

TopicString (MQCFST)

The topic string (parameter identifier: MQCA_TOPIC_STRING). This string uses the forward slash (/) character as a delimiter for elements within the topic tree.

The maximum length of the string is MQ_TOPIC_STR_LENGTH.

ToTopicName (MQCFST)

The name of the administrative topic definition to copy to (parameter identifier: MQCACF_TO_TOPIC_NAME).

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

Required parameters (Create Topic)**TopicName (MQCFST)**

The name of the administrative topic definition to be created (parameter identifier: MQCA_TOPIC_NAME).

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

TopicString (MQCFST)

The topic string (parameter identifier: MQCA_TOPIC_STRING).

This parameter is required and cannot contain the empty string. The "/" character within this string has a special meaning. It delimits the elements in the topic tree. A topic string can start with the "/" character but is not required to. A string starting with the "/" character is not the same as a string that does not start with the "/" character. A topic string cannot end with the "/" character.

The maximum length of the string is MQ_TOPIC_STR_LENGTH.

Optional parameters (Change, Copy, and Create Topic)**ClusterName (MQCFST)**

The name of the cluster to which this topic belongs. (parameter identifier: MQCA_CLUSTER_NAME). The maximum length of the string is MQ_CLUSTER_NAME_LENGTH. Setting this parameter to a cluster that this queue manager is a member of makes all queue managers in the cluster aware of this topic. Any publication to this topic or a topic string below it put to any queue manager in the cluster is propagated to subscriptions on any other queue manager in the cluster. For more details, see [Distributed publish/subscribe networks](#).

The value can be any of the following values:

Blank

If no topic object above this topic in the topic tree has set this parameter to a cluster name, then this topic does not belong to a cluster. Publications and subscriptions for this topic are not propagated to publish/subscribe cluster-connected queue managers. If a topic node higher in the topic tree has a cluster name set, publications and subscriptions to this topic are also propagated throughout the cluster.

This value is the default value for this parameter if no value is specified.

String

The topic belongs to this cluster. It is not recommended that this is set to a different cluster from a topic object above this topic object in the topic tree. Other queue managers in the cluster will honor this object's definition unless a local definition of the same name exists on those queue managers.

Additionally, if PublicationScope or SubscriptionScope are set to MQSCOPE_ALL, this value is the cluster to be used for the propagation of publications and subscriptions, for this topic, to publish/subscribe cluster-connected queue managers.

ClusterPubRoute (MQCFIN)

The routing behavior of publications between queue managers in a cluster (parameter identifier: MQIA_CLUSTER_PUB_ROUTE).

The value can be any of the following values:

MQCLROUTE_DIRECT

When you configure a direct routed clustered topic on a queue manager, all queue managers in the cluster become aware of all other queue managers in the cluster. When performing publish and

subscribe operations, each queue manager can connect direct to any other queue manager in the cluster.

MQCLROUTE_TOPIC_HOST

When you use topic host routing, all queue managers in the cluster become aware of the cluster queue managers that host the routed topic definition (that is, the queue managers on which you have defined the topic object). When performing publish and subscribe operations, queue managers in the cluster connect only to these topic host queue managers, and not directly to each other. The topic host queue managers are responsible for routing publications from queue managers on which publications are published to queue managers with matching subscriptions.

After a topic object has been clustered (through setting the **CLUSTER** property) you cannot change the value of the **CLROUTE** property. The object must be un-clustered (**CLUSTER** set to ' ') before you can change the value. Un-clustering a topic converts the topic definition to a local topic, which results in a period during which publications are not delivered to subscriptions on remote queue managers; this should be considered when performing this change. See [The effect of defining a non-cluster topic with the same name as a cluster topic from another queue manager](#). If you try to change the value of the **CLROUTE** property while it is clustered, the system generates an MQRCCF_CLROUTE_NOT_ALTERABLE exception.

See also [Routing for publish/subscribe clusters: Notes on behavior](#) and [Designing publish/subscribe clusters](#).

z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

CommunicationInformation (MQCFST)

The Multicast communication information object (parameter identifier: MQCA_COMM_INFO_NAME).

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

Custom (MQCFST)

Custom attribute for new features (parameter identifier: MQCA_CUSTOM).

This attribute contains the values of attributes, as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE) . Single quotation marks must be escaped with another single quotation mark.

CAEXPRY (integer)

The maximum time, expressed in tenths of a second, until a message published to a topic which inherits properties from this object, remains in the system until it becomes eligible for expiry processing.

For more information on message expiry processing, see [Enforcing lower expiration times](#).

The value can be one of the following:

integer

The value must be in the range one through to 999 999 999.

NOLIMIT

There is no limit on the expiry time of messages put using this object.

ASPARENT

The maximum message expiry time is based on the setting of the closest parent administrative topic object in the topic tree. This is the default value.

Specifying a value for CAPEXPY that is not valid, does not cause the command to fail. Instead, the default value is used.

DefPersistence (MQCFIN)

Default persistence (parameter identifier: MQIA_TOPIC_DEF_PERSISTENCE).

Specifies the default for message-persistence of messages published to the topic. Message persistence determines whether messages are preserved across restarts of the queue manager.

The value can be any of the following values:

MQPER_PERSISTENCE_AS_PARENT

The default persistence is based on the setting of the closest parent administrative topic object in the topic tree.

MQPER_PERSISTENT

Message is persistent.

MQPER_NOT_PERSISTENT

Message is not persistent.

DefPriority (MQCFIN)

Default priority (parameter identifier: MQIA_DEF_PRIORITY).

Specifies the default priority of messages published to the topic.

Specify either:

integer

The default priority to be used, in the range zero through to the maximum priority value that is supported (9).

MQPRI_PRIORITY_AS_PARENT

The default priority is based on the setting of the closest parent administrative topic object in the topic tree.

DefPutResponse (MQCFIN)

Default put response (parameter identifier: MQIA_DEF_PUT_RESPONSE_TYPE).

The value can be:

MQPRT_ASYNC_RESPONSE

The put operation is issued asynchronously, returning a subset of MQMD fields.

MQPRT_RESPONSE_AS_PARENT

The default put response is based on the setting of the closest parent administrative topic object in the topic tree.

MQPRT_SYNC_RESPONSE

The put operation is issued synchronously, returning a response.

DurableModelQName (MQCFST)

Name of the model queue to be used for durable subscriptions (parameter identifier: MQCA_MODEL_DURABLE_Q).

The maximum length of the string is MQ_Q_NAME_LENGTH.

DurableSubscriptions (MQCFIN)

Whether applications are permitted to make durable subscriptions (parameter identifier: MQIA_DURABLE_SUB).

The value can be:

MQSUB_DURABLE_AS_PARENT

Whether durable subscriptions are permitted is based on the setting of the closest parent administrative topic object in the topic tree.

MQSUB_DURABLE_ALLOWED

Durable subscriptions are permitted.

MQSUB_DURABLE_INHIBITED

Durable subscriptions are not permitted.

InhibitPublications (MQCFIN)

Whether publications are allowed for this topic (parameter identifier: MQIA_INHIBIT_PUB).

The value can be:

MQTA_PUB_AS_PARENT

Whether messages can be published to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

MQTA_PUB_INHIBITED

Publications are inhibited for this topic.

MQTA_PUB_ALLOWED

Publications are allowed for this topic.

InhibitSubscriptions (MQCFIN)

Whether subscriptions are allowed for this topic (parameter identifier: MQIA_INHIBIT_SUB).

The value can be:

MQTA_SUB_AS_PARENT

Whether applications can subscribe to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

MQTA_SUB_INHIBITED

Subscriptions are inhibited for this topic.

MQTA_SUB_ALLOWED

Subscriptions are allowed for this topic.

Multicast (MQCFIN)

Whether multicast is allowable in the topic tree (parameter identifier: MQIA_MULTICAST).

The value can be:

MQMC_AS_PARENT

Whether multicast is allowed on this topic is based on the setting of the closest parent administrative topic object in the topic tree.

MQMC_ENABLED

Multicast is allowed on this topic.

MQMC_DISABLED

Multicast is not allowed on this topic.

MQMC_ONLY

Only subscriptions and publications made using multicast are allowed on this topic.

NonDurableModelQName (MQCFST)

Name of the model queue to be used for non-durable subscriptions (parameter identifier: MQCA_MODEL_NON_DURABLE_Q).

The maximum length of the string is MQ_Q_NAME_LENGTH.

NonPersistentMsgDelivery (MQCFIN)

The delivery mechanism for non-persistent messages published to this topic (parameter identifier: MQIA_NPM_DELIVERY).

The value can be:

MQDLV_AS_PARENT

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQDLV_ALL

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_DUR

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a non-persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_AVAIL

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

PersistentMsgDelivery (MQCFIN)

The delivery mechanism for persistent messages published to this topic (parameter identifier: MQIA_PM_DELIVERY).

The value can be:

MQDLV_AS_PARENT

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQDLV_ALL

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_DUR

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_AVAIL

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

ProxySubscriptions (MQCFIN)

Whether a proxy subscription is to be sent for this topic to directly connected queue managers, even if no local subscriptions exist (parameter identifier: MQIA_PROXY_SUB).

The value can be:

MQTA_PROXY_SUB_FORCE

A proxy subscription is sent to connected queue managers even if no local subscriptions exist.

Note: The proxy subscription is sent when this value is set on Create or Change of the topic.

MQTA_PROXY_SUB_FIRSTUSE

For each unique topic string at or below this topic object, a proxy subscription is asynchronously sent to all neighboring queue managers in the following scenarios:

- When a local subscription is created.
- When a proxy subscription is received that must be propagated to further directly connected queue managers.

This value is the default value for this parameter if no value is specified.

PublicationScope (MQCFIN)

Whether this queue manager propagates publications for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA_PUB_SCOPE).

The value can be:

MQSCOPE_AS_PARENT

Whether this queue manager propagates publications, for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

This value is the default value for this parameter if no value is specified.

MQSCOPE_QMGR

Publications for this topic are not propagated to other queue managers.

MQSCOPE_ALL

Publications for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

Note: This behavior can be over-ridden on a publication-by-publication basis, by using MQPMO_SCOPE_QMGR on the Put Message Options.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
MQQSGD_COPY	<p>The object definition resides on the page set of the queue manager that executes the command. The object was defined by using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined by using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.</p>	<p>The object is defined on the page set of the queue manager that executes the command by using the MQQSGD_GROUP object of the same name as the <i>ToTopicName</i> object (for Copy) or <i>TopicName</i> object (for Create).</p>
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined by using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they refresh local copies on page set zero:</p> <pre>DEFINE TOPIC(name) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This definition is allowed only if the queue manager is in a queue sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group so that they make or refresh local copies on page set zero:</p> <pre>DEFINE TOPIC(name) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>

QSGDisposition	Change	Copy, Create
MQQSGD_PRIVATE	The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.	Not permitted.
MQQSGD_Q_MGR	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.	The object is defined on the page set of the queue manager that executes the command. This value is the default value.

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If a topic definition with the same name as *ToTopicName* exists, this parameter specifies whether it is to be replaced. The value can be as follows:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

SubscriptionScope (MQCFIN)

Whether this queue manager propagates subscriptions for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA_SUB_SCOPE).

The value can be:

MQSCOPE_AS_PARENT

Whether this queue manager propagates subscriptions, for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe-cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

This value is the default value for this parameter if no value is specified.

MQSCOPE_QMGR

Subscriptions for this topic are not propagated to other queue managers.

MQSCOPE_ALL

Subscriptions for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

Note: This behavior can be over-ridden on a subscription-by-subscription basis, by using MQSO_SCOPE_QMGR on the Subscription Descriptor or SUBSCOPE(QMGR) on DEFINE SUB.

TopicDesc (MQCFST)

Topic description (parameter identifier: MQCA_TOPIC_DESC).

Text that briefly describes the object

The maximum length is MQ_TOPIC_DESC_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the message queue manager on which the command is executing to ensure that the text is translated correctly if it is sent to another queue manager.

TopicType (MQCFIN)

Topic type (parameter identifier: MQIA_TOPIC_TYPE).

The value specified must match the type of the topic being changed. The value can be:

MQTOPT_LOCAL

Local topic object

UseDLQ (MQCFIN)

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA_USE_DEAD_LETTER_Q).

The value can be any of the following values:

MQUSEDLQ_AS_PARENT

Determines whether to use the dead-letter queue using the setting of the closest administrative topic object in the topic tree. This value is the default supplied with IBM MQ, but your installation might have changed it.

MQUSEDLQ_NO

Publication messages that cannot be delivered to their correct subscriber queue are treated as a failure to put the message. The MQPUT of an application to a topic fails in accordance with the settings of MQIA_NPM_DELIVERY and MQIA_PM_DELIVERY.

MQUSEDLQ_YES

If the DEADQ queue manager attribute provides the name of a dead-letter queue then it is used, otherwise the behavior is as for MQUSEDLQ_NO.

WildcardOperation (MQCFIN)

Behavior of subscriptions including wildcards made to this topic (parameter identifier: MQIA_WILDCARD_OPERATION).

The value can be:

MQTA_PASSTHRU

A less specific wildcard subscription is a subscription made by using wildcard topic names that are less specific than the topic string at this topic object. MQTA_PASSTHRU lets less specific wildcard subscriptions receive publications made to this topic and to topic strings more specific than this topic. This value is the default supplied with IBM MQ.

MQTA_BLOCK

A less specific wildcard subscription is a subscription made by using wildcard topic names that are less specific than the topic string at this topic object. MQTA_BLOCK stops less specific wildcard subscriptions receiving publications made to this topic or to topic strings more specific than this topic.

This value of this attribute is used when subscriptions are defined. If you alter this attribute, the set of topics covered by existing subscriptions is not affected by the modification. This value applies also, if the topology is changed when topic objects are created or deleted; the set of topics matching subscriptions created following the modification of the **WildcardOperation** attribute is created by using the modified topology. If you want to force the matching set of topics to be re-evaluated for existing subscriptions, you must restart the queue manager.

Clear Queue

The Clear Queue (MQCMD_CLEAR_Q) command deletes all the messages from a local queue.

The command fails if the queue contains uncommitted messages.

Required parameters

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

The name of the local queue to be cleared. The maximum length of the string is MQ_Q_NAME_LENGTH.

Note: The target queue must be type local.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_PRIVATE

Clear the private queue named in *QName* . The queue is private if it was created using a command with the attributes MQQSGD_PRIVATE or MQQSGD_Q_MGR. This value is the default value.

MQQSGD_SHARED

Clear the shared queue named in *QName* . The queue is shared if it was created using a command with the attribute MQQSGD_SHARED. This value applies only to local queues.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown on page [“Error codes applicable to all commands”](#) on page 1343.

Reason (MQLONG)

The value can be any of the following values:

MQRC_Q_NOT_EMPTY

(2055, X'807') Queue contains one or more messages or uncommitted put or get requests.

This reason occurs only if there are uncommitted updates.

MQRCCF_Q_WRONG_TYPE

Action not valid for the queue of specified type.

Clear Topic String

The Clear Topic String (MQCMD_CLEAR_TOPIC_STRING) command clears the retained message which is stored for the specified topic.

Required parameters

TopicString (MQCFST)

Topic String (parameter identifier: MQCA_TOPIC_STRING).

The topic string to be cleared The maximum length of the string is MQ_TOPIC_STR_LENGTH.

ClearType (MQCFIN)

Clear type (parameter identifier: MQIACF_CLEAR_TYPE).

Specifies the type of clear command being issued. The value must be:

MQCLRT_RETAINED Remove the retained publication from the specified topic string.

Optional parameters

Scope (MQCFIN)

Scope of clearance (parameter identifier: MQIACF_CLEAR_SCOPE).

Whether the topic string is to be cleared locally or globally. The value can be:

MQCLRS_LOCAL

The retained message is removed from the specified topic string at the local queue manager only.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Delete Authentication Information Object

The Delete authentication information (MQCMD_DELETE_AUTH_INFO) command deletes the specified authentication information object.

Required parameters

AuthInfoName (MQCFST)

Authentication information object name (parameter identifier: MQCA_AUTH_INFO_NAME).

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object definition resides on the page set of the queue manager which executes this command. The object was defined by a command using the parameter MQQSGD_COPY. Any object in the shared repository, or any object defined by a command using the parameter MQQSGD_Q_MGR, is not affected by this command.

MQQSGD_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE AUTHINFO(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

MQQSGD_Q_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD_Q_MGR is the default value.

Multi Delete Authority Record on Multiplatforms

The Delete Authority Record (MQCMD_DELETE_AUTH_REC) command deletes an authority record. The authorizations associated with the profile no longer apply to IBM MQ objects with names that match the profile name specified.

Required parameters

ObjectType (MQCFIN)

The type of object for which to delete authorizations (parameter identifier: MQIACF_OBJECT_TYPE).

The value can be any of the following values:

MQOT_AUTH_INFO

Authentication information.

MQOT_CHANNEL

Channel object.

MQOT_CLNTCONN_CHANNEL

Client-connection channel object.

MQOT_COMM_INFO

Communication information object

MQOT_LISTENER

Listener object.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process.

MQOT_Q

Queue, or queues, that match the object name parameter.

MQOT_Q_MGR

Queue manager.

MQOT_REMOTE_Q_MGR_NAME

Remote queue manager.

MQOT_SERVICE

Service object.

MQOT_TOPIC

Topic object.

ProfileName (MQCFST)

Name of the profile to be deleted (parameter identifier: MQCACF_AUTH_PROFILE_NAME).

If you have defined a generic profile then you can specify it here, using wildcard characters to specify a named generic profile to be removed. If you specify an explicit profile name, the object must exist.

The maximum length of the string is MQ_AUTH_PROFILE_NAME_LENGTH.

Optional parameters**GroupNames (MQCFSL)**

Group names (parameter identifier: MQCACF_GROUP_ENTITY_NAMES).

The names of groups having a profile deleted. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ_ENTITY_NAME_LENGTH.

PrincipalNames (MQCFSL)

Principal names (parameter identifier: MQCACF_PRINCIPAL_ENTITY_NAMES).

The names of principals having a profile deleted. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ_ENTITY_NAME_LENGTH.

Error codes (Delete Authority Record)

This command might return the following error codes in the response format header, in addition to the values shown on page [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRC_OBJECT_TYPE_ERROR

Invalid object type.

MQRC_UNKNOWN_ENTITY

Userid not authorized, or unknown.

MQRCCF_ENTITY_NAME_MISSING

Entity name missing.

MQRCCF_OBJECT_TYPE_MISSING

Object type missing.

MQRCCF_PROFILE_NAME_ERROR

Invalid profile name.

Delete CF Structure on z/OS

The Delete CF Structure (MQCMD_DELETE_CF_STRUC) command deletes an existing CF application structure definition.

Note: This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

Required parameters**CFStrucName (MQCFST)**

CF structure name (parameter identifier: MQCA_CF_STRUC_NAME).

The CF application structure definition to be deleted. The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

Delete Channel

The Delete Channel (MQCMD_DELETE_CHANNEL) command deletes the specified channel definition.

Required parameters**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel definition to be deleted. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Optional parameters

None of the following attributes are applicable to MQTT channels unless specifically mentioned in the parameter description.

ChannelType (MQCFIN)

The type of channel (parameter identifier: MQIACH_CHANNEL_TYPE). This parameter is currently only used with MQTT Telemetry channels, and is required when deleting a Telemetry channel. The only value that can currently be given to the parameter is **MQCHT_MQTT**.

ChannelTable (MQCFIN)

Channel table (parameter identifier: MQIACH_CHANNEL_TABLE).

Specifies the ownership of the channel definition table that contains the specified channel definition.

The value can be any of the following values:

MQCHTAB_Q_MGR

Queue manager table.

MQCHTAB_Q_MGR is the default. This table contains channel definitions for channels of all types except MQCHT_CLNTCONN.

MQCHTAB_CLNTCONN

Client-connection table.

This table only contains channel definitions for channels of type MQCHT_CLNTCONN.

This parameter is not applicable to MQ Telemetry.

z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

z/OS

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined by a command using the parameter MQQSGD_Q_MGR, is not affected by this command.

MQQSGD_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameters MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE CHANNEL(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

MQQSGD_Q_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD_Q_MGR is the default value.

This command might return the following error codes in the response format header, in addition to the values shown on page [“Error codes applicable to all commands”](#) on page 1343.

Error codes

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHANNEL_TABLE_ERROR

Channel table value not valid.

Windows

Linux

AIX

Delete Channel (MQTT)

The Delete Telemetry Channel (MQCMD_DELETE_CHANNEL) command deletes the specified channel definition.

Required parameters**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel definition to be deleted. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelType (MQCFIN)

The type of channel (parameter identifier: MQIACH_CHANNEL_TYPE). Required when deleting a Telemetry channel. The only value that can currently be given to the parameter is **MQCHT_MQTT**.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

Multi

Delete Channel Listener on Multiplatforms

The Delete Channel Listener (MQCMD_DELETE_LISTENER) command deletes an existing channel listener definition.

Required parameters**ListenerName (MQCFST)**

Listener name (parameter identifier: MQCACH_LISTENER_NAME).

This parameter is the name of the listener definition to be deleted. The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

Multi

Delete Communication Information Object on Multiplatforms

The Delete Communication Information Object (MQCMD_DELETE_COMM_INFO) command deletes the specified communication information object.

Required parameter**CommInfoName (MQCFST)**

The name of the communication information definition to be deleted (parameter identifier: MQCA_COMM_INFO_NAME).

Delete Namelist

The Delete Namelist (MQCMD_DELETE_NAMELIST) command deletes an existing namelist definition.

Required parameters

NamelistName (MQCFST)

Namelist name (parameter identifier: MQCA_NAMELIST_NAME).

This parameter is the name of the namelist definition to be deleted. The maximum length of the string is MQ_NAMELIST_NAME_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.

MQQSGD_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE NAMELIST(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

MQQSGD_Q_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD_Q_MGR is the default value.

Multi

Delete Policy on Multiplatforms

The Delete Policy (MQCMD_DELETE_PROT_POLICY) command deletes a security policy.

Required parameters

Policy-name (MQCFST)

The name of the security policy to be deleted (parameter identifier: MQCA_POLICY_NAME).

The name of the policy, or policies, to delete are the same as the name of the queue, or queues, that the policies control.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Error codes (Delete Security Policy)

This command might return the following error codes in the response format header, in addition to the values shown on page [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRC_OBJECT_TYPE_ERROR

Invalid object type.

MQRCCF_POLICY_NAME_ERROR

Invalid policy name.

Delete Process

The Delete Process (MQCMD_DELETE_PROCESS) command deletes an existing process definition.

Required parameters

ProcessName (MQCFST)

Process name (parameter identifier: MQCA_PROCESS_NAME).

The process definition to be deleted. The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

Optional parameters

z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue

manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.

MQQSGD_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE PROCESS(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

MQQSGD_Q_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD_Q_MGR is the default value.

Delete Queue

The Delete Queue (MQCMD_DELETE_Q) command deletes a queue.

Required parameters

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

The name of the queue to be deleted.

If the **Scope** attribute of the queue is MQSCO_CELL, the entry for the queue is deleted from the cell directory.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Optional parameters

Authrec (MQCFIN)

Authrec (parameter identifier: MQIACF_REMOVE_AUTHREC).

Specifies whether the associated authority record is also deleted.

This parameter does not apply to z/OS.

The value can be any of the following values:

MQRAR_YES

The authority record associated with the object is deleted. This is the default.

MQRAR_NO

The authority record associated with the object is not deleted.

z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Purge (MQCFIN)

Purge queue (parameter identifier: MQIACF_PURGE).

If there are messages on the queue MQPO_YES must be specified, otherwise the command fails. If this parameter is not present the queue is not purged.

Valid only for queue of type local.

The value can be any of the following values:

MQPO_YES

Purge the queue.

MQPO_NO

Do not purge the queue.

z/OS

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.

MQQSGD_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the deletion is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE queue(q-name) QSGDISP(COPY)
```

or, for a local queue only:

```
DELETE QLOCAL(q-name) NOPURGE QSGDISP(COPY)
```

The deletion of the group object takes effect even if the generated command with QSGDISP(COPY) fails.

Note: You always get the NOPURGE option even if you specify MQPO_YES for *Purge* . To delete messages on local copies of the queues, you must explicitly issue, for each copy, the Delete Queue command with a *QSGDisposition* value of MQQSGD_COPY and a *Purge* value of MQPO_YES.

MQQSGD_Q_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD_Q_MGR is the default value.

MQQSGD_SHARED

Valid only for queue of type local.

The object resides in the shared repository. The object was defined by a command using the parameter MQQSGD_SHARED. Any object residing on the page set of the queue manager that executes the command, or any object defined by a command using the parameter MQQSGD_GROUP, is not affected by this command.

QType (MQCFIN)

Queue type (parameter identifier: MQIA_Q_TYPE).

If this parameter is present, the queue must be of the specified type.

The value can be:

MQQT_ALIAS

Alias queue definition.

MQQT_LOCAL

Local queue.

MQQT_REMOTE

Local definition of a remote queue.

MQQT_MODEL

Model queue definition.

Error codes (Delete Queue)

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRC_Q_NOT_EMPTY

(2055, X'807') Queue contains one or more messages or uncommitted put or get requests.

Multi Delete Service on Multiplatforms

The Delete Service (MQCMD_DELETE_SERVICE) command deletes an existing service definition.

Required parameters

ServiceName (MQCFST)

Service name (parameter identifier: MQCA_SERVICE_NAME).

This parameter is the name of the service definition to be deleted.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Delete Storage Class on z/OS

The Delete Storage Class (MQCMD_DELETE_STG_CLASS) command deletes an existing storage class definition.

Required parameters

StorageClassName (MQCFST)

Storage class name (parameter identifier: MQCA_STORAGE_CLASS).

The storage class definition to be deleted. The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.

MQQSGD_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE STGCLASS(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

MQQSGD_Q_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD_Q_MGR is the default value.

Delete Subscription

The Delete Subscription (MQCMD_DELETE_SUBSCRIPTION) command deletes a subscription.

Required parameters

SubName (MQCFST)

Subscription name (parameter identifier: MQCACF_SUB_NAME).

Specifies the unique subscription name. The subscription name, if provided, must be fully specified; a wildcard is not acceptable.

The subscription name must refer to a durable subscription.

If *SubName* is not provided, *SubId* must be specified to identify the subscription to be deleted.

The maximum length of the string is MQ_SUB_NAME_LENGTH.

SubId (MQCFBS)

Subscription identifier (parameter identifier: MQBACF_SUB_ID).

Specifies the unique internal subscription identifier.

You must supply a value for *SubId* if you have not supplied a value for *SubName*.

The maximum length of the string is MQ_CORREL_ID_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter on which to filter.

Delete Topic

The Delete Topic (MQCMD_DELETE_TOPIC) command deletes the specified administrative topic object.

Required parameters

TopicName (MQCFST)

The name of the administrative topic definition to be deleted (parameter identifier: MQCA_TOPIC_NAME).

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

Optional parameters

Authrec (MQCFIN)

Authrec (parameter identifier: MQIACF_REMOVE_AUTHREC).

Specifies whether the associated authority record is also deleted.

This parameter does not apply to z/OS.

The value can be any of the following values:

MQRAR_YES

The authority record associated with the object is deleted. This is the default.

MQRAR_NO

The authority record associated with the object is not deleted.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.

MQQSGD_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the deletion is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to make, or delete, local copies on page set zero:

```
DELETE TOPIC(name) QSGDISP(COPY)
```

The deletion of the group object takes effect even if the generated command with QSGDISP(COPY) fails.

MQQSGD_Q_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD_Q_MGR is the default value.

Multi Escape on Multiplatforms

The Escape (MQCMD_ESCAPE) command conveys any IBM MQ command (MQSC) to a remote queue manager.

Use the Escape command when the queue manager (or application) sending the command does not support the particular IBM MQ command, and so does not recognize it and cannot construct the required PCF command.

The Escape command can also be used to send a command for which no Programmable Command Format has been defined.

The only type of command that can be carried is one that is identified as an MQSC, that is recognized at the receiving queue manager.

Required parameters

EscapeType (MQCFIN)

Escape type (parameter identifier: MQIACF_ESCAPE_TYPE).

The only value supported is:

MQET_MQSC

IBM MQ command.

EscapeText (MQCFST)

Escape text (parameter identifier: MQCACF_ESCAPE_TEXT).

A string to hold a command. The length of the string is limited only by the size of the message.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_ESCAPE_TYPE_ERROR

Escape type not valid.

Multi Escape (Response) on Multiplatforms

The response to the Escape (MQCMD_ESCAPE) command consists of the response header followed by two parameter structures, one containing the escape type, and the other containing the text response. More than one such message might be issued, depending upon the command contained in the Escape request.

The *Command* field in the response header MQCFH contains the MQCMD_* command identifier of the text command contained in the **EscapeText** parameter in the original Escape command. For example, if *EscapeText* in the original Escape command specified PING QMGR, *Command* in the response has the value MQCMD_PING_Q_MGR.

If it is possible to determine the outcome of the command, the *CompCode* in the response header identifies whether the command was successful. The success or otherwise can therefore be determined without the recipient of the response having to parse the text of the response.

If it is not possible to determine the outcome of the command, *CompCode* in the response header has the value MQCC_UNKNOWN, and *Reason* is MQRC_NONE.

Parameters

EscapeType (MQCFIN)

Escape type (parameter identifier: MQIACF_ESCAPE_TYPE).

The only value supported is:

MQET_MQSC

IBM MQ command.

EscapeText (MQCFST)

Escape text (parameter identifier: MQCACF_ESCAPE_TEXT).

A string holding the response to the original command.

Inquire Archive on z/OS

The Inquire Archive (MQCMD_INQUIRE_ARCHIVE) command returns archive system parameters and information.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Inquire Archive (Response) on z/OS

The response to the Inquire Archive (MQCMD_INQUIRE_ARCHIVE) command consists of the response header followed by the *ParameterType* structure and the combination of attribute parameter structures determined by the value of *ParameterType*.

Always returned:

ParameterType Specifies the type of archive information being returned. The value can be any of the following values:

MQSYSP_TYPE_INITIAL

The initial settings of the archive parameters.

MQSYSP_TYPE_SET

The settings of the archive parameters if they have been altered since their initial setting.

MQSYSP_TYPE_ARCHIVE_TAPE

Parameters relating to the tape unit (if in use). There is one such message per tape unit in use for archive logging.

Returned if *ParameterType* is MQSYSP_TYPE_INITIAL (one message is returned):

AllocPrimary, AllocSecondary, AllocUnits, ArchivePrefix1, ArchivePrefix2, ArchiveRetention, ArchiveUnit1, ArchiveUnit2, ArchiveWTOR, BlockSize, Catalog, Compact, Protect, QuiesceInterval, RoutingCode, TimeStampFormat

Returned if *ParameterType* is MQSYSP_TYPE_SET and any value is set (one message is returned):

AllocPrimary, AllocSecondary, AllocUnits, ArchivePrefix1, ArchivePrefix2, ArchiveRetention, ArchiveUnit1, ArchiveUnit2, ArchiveWTOR, BlockSize, Catalog, Compact, Protect, QuiesceInterval, RoutingCode, TimeStampFormat

Returned if *ParameterType* is MQSYSP_TYPE_ARCHIVE_TAPE (one message is returned for each tape unit in use for archive logging):

DataSetName, LogCorrelId, UnitAddress, UnitStatus, UnitVolser

Response data - archive parameter information**AllocPrimary (MQCFIN)**

Primary space allocation for DASD data sets (parameter identifier: MQIACF_SYSP_ALLOC_PRIMARY).

Specifies the primary space allocation for DASD data sets in the units specified in the **AllocUnits** parameter.

AllocSecondary (MQCFIN)

Secondary space allocation for DASD data sets (parameter identifier: MQIACF_SYSP_ALLOC_SECONDARY).

Specifies the secondary space allocation for DASD data sets in the units specified in the **AllocUnits** parameter.

AllocUnits (MQCFIN)

Allocation unit (parameter identifier: MQIACF_SYSP_ALLOC_UNIT).

Specifies the unit in which primary and secondary space allocations are made. The value can be any of the following values:

MQSYSP_ALLOC_BLK

Blocks.

MQSYSP_ALLOC_TRK

Tracks.

MQSYSP_ALLOC_CYL

Cylinders.

ArchivePrefix1 (MQCFST)

Prefix for the first archive log data set name (parameter identifier: MQCACF_SYSP_ARCHIVE_PFX1).

The maximum length of the string is MQ_ARCHIVE_PFX_LENGTH.

ArchivePrefix2 (MQCFST)

Prefix for the second archive log data set name (parameter identifier: MQCACF_SYSP_ARCHIVE_PFX2).

The maximum length of the string is MQ_ARCHIVE_PFX_LENGTH.

ArchiveRetention (MQCFIN)

Archive retention period (parameter identifier: MQIACF_SYSP_ARCHIVE_RETAIN).

Specifies the retention period, in days, to be used when the archive log data set is created.

ArchiveUnit1 (MQCFST)

Specifies the device type or unit name of the device that is used to store the first copy of the archive log data set (parameter identifier: MQCACF_SYSP_ARCHIVE_UNIT1).

The maximum length of the string is MQ_ARCHIVE_UNIT_LENGTH.

ArchiveUnit2 (MQCFST)

Specifies the device type or unit name of the device that is used to store the second copy of the archive log data set (parameter identifier: MQCACF_SYSP_ARCHIVE_UNIT2).

The maximum length of the string is MQ_ARCHIVE_UNIT_LENGTH.

ArchiveWTOR (MQCFIN)

Specifies whether a message is to be sent to the operator and a reply is received before attempting to mount an archive log data set (parameter identifier: MQIACF_SYSP_ARCHIVE_WTOR).

The value can be:

MQSYSP_YES

A message is to be sent and a reply received before an attempt to mount an archive log data set.

MQSYSP_NO

A message is not to be sent and a reply received before an attempt to mount an archive log data set.

BlockSize (MQCFIN)

Block size of the archive log data set (parameter identifier: MQIACF_SYSP_BLOCK_SIZE).

Catalog (MQCFIN)

Specifies whether archive log data sets are cataloged in the primary integrated catalog facility (parameter identifier: MQIACF_SYSP_CATALOG).

The value can be:

MQSYSP_YES

Archive log data sets are cataloged.

MQSYSP_NO

Archive log data sets are not cataloged.

Compact (MQCFIN)

Specifies whether data written to archive logs is to be compacted (parameter identifier: MQIACF_SYSP_COMPACT).

The value can be any of the following values:

MQSYSP_YES

Data is to be compacted.

MQSYSP_NO

Data is not to be compacted.

Protect (MQCFIN)

Protection by external security manager (ESM) (parameter identifier: MQIACF_SYSP_PROTECT).

Specifies whether archive log data sets are protected by ESM profiles when the data sets are created.

The value can be any of the following values:

MQSYSP_YES

Data set profiles are created when logs are offloaded.

MQSYSP_NO

Profiles are not created.

QuiesceInterval (MQCFIN)

Maximum time allowed for the quiesce (parameter identifier: MQIACF_SYSP_QUIESCE_INTERVAL).

Specifies the maximum time, in seconds, allowed for the quiesce.

RoutingCode (MQCFIL)

z/OS routing code list (parameter identifier: MQIACF_SYSP_ROUTING_CODE).

Specifies the list of z/OS routing codes for messages about the archive log data sets to the operator. There can be 1 - 14 entries in the list.

TimeStampFormat (MQCFIN)

Time stamp included (parameter identifier: MQIACF_SYSP_TIMESTAMP).

Specifies whether the archive log data set name has a time stamp in it.

The value can be:

MQSYSP_YES

Names include a time stamp.

MQSYSP_NO

Names do not include a time stamp.

MQSYSP_EXTENDED

Names include a time stamp.

Response data - tape unit status information**DataSetName (MQCFST)**

Data set name (parameter identifier: MQCACF_DATA_SET_NAME).

Specifies the data set name on the tape volume that is being processed, or was last processed.

The maximum length of the string is MQ_DATA_SET_NAME_LENGTH.

LogCorrelId (MQCFST)

Correlation identifier (parameter identifier: MQCACF_SYSP_LOG_CORREL_ID).

Specifies the correlation ID associated with the user of the tape being processed. This parameter is blank if there is no current user.

The maximum length of the string is MQ_LOG_CORREL_ID_LENGTH.

UnitAddress (MQCFIN)

Tape unit address: MQIACF_SYSP_UNIT_ADDRESS).

Specifies the physical address of the tape unit allocated to read the archive log.

UnitStatus (MQCFIN)

Status if the tape unit: MQIACF_SYSP_UNIT_STATUS).

The value can be:

MQSYSP_STATUS_BUSY

The tape unit is busy, actively processing an archive log data set.

MQSYSP_STATUS_PREMOUNT

The tape unit is active and allocated for premounting.

MQSYSP_STATUS_AVAILABLE

The tape unit is available, inactive, and waiting for work.

MQSYSP_STATUS_UNKNOWN

The tape unit status is unknown.

UnitVolser (MQCFST)

The volume serial number of the tape that is mounted (parameter identifier: MQCACF_SYSP_UNIT_VOLSER).

The maximum length of the string is MQ_VOLSER_LENGTH.

Inquire Authentication Information Object

The Inquire authentication information object (**MQCMD_INQUIRE_AUTH_INFO**) command inquires about the attributes of authentication information objects.

Required parameters

AuthInfoName (MQCFST)

Authentication information object name (parameter identifier: MQCA_AUTH_INFO_NAME).

Specifies the name of the authentication information object about which information is to be returned.

Generic authentication information object names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all authentication information objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

Optional parameters

AuthInfoAttrs (MQCFIL)

Authentication information object attributes (parameter identifier: MQIACF_AUTH_INFO_ATTRS).

The attribute list can specify the following value - the default value if the parameter is not specified):

MQIACF_ALL

All attributes.

or a combination of the following:

MQIA_ADOPT_CONTEXT

Adopt the presented credentials as the context for the application.

MQCA_ALTERATION_DATE

Date on which the definition was last altered.

MQCA_ALTERATION_TIME

Time at which the definition was last altered.

MQCA_AUTH_INFO_DESC

Description of the authentication information object.

MQCA_AUTH_INFO_NAME

Name of the authentication information object.

MQIA_AUTH_INFO_TYPE

Type of authentication information object.

MQCA_AUTH_INFO_CONN_NAME

Connection name of the authentication information object.

This attribute is relevant only when **AuthInfoType** is set to MQAIT_CRL_LDAP or MQAIT_IDPW_LDAP.

MQIA_AUTHENTICATION_FAIL_DELAY

Delay in seconds before an authentication failure is returned to an application.

MQIA_AUTHENTICATION_METHOD

Authentication method for user passwords.

MQIA_CHECK_CLIENT_BINDING

Authentication requirements for client applications.

MQIA_CHECK_LOCAL_BINDING

Authentication requirements for locally bound applications.

MQIA_LDAP_AUTHORMD

Authorization method for the queue manager.

MQCA_LDAP_BASE_DN_GROUPS

The base Distinguished Name for groups in the LDAP server.

MQCA_LDAP_BASE_DN_USERS

The base Distinguished Name for users in the LDAP server.

MQCA_LDAP_FIND_GROUP_FIELD

Name of the attribute used within an LDAP entry to determine group membership.

MQCA_LDAP_GROUP_ATTR_FIELD

LDAP attribute that represents a simple name for the group.

MQCA_LDAP_GROUP_OBJECT_CLASS

The LDAP object class used for group records in the LDAP repository.

MQIA_LDAP_NESTGRP

Whether LDAP groups are checked for membership of other groups.

MQCA_LDAP_PASSWORD

LDAP password in the authentication information object.

This attribute is relevant only when **AuthInfoType** is set to MQAIT_CRL_LDAP or MQAIT_IDPW_LDAP.

MQIA_LDAP_SECURE_COMM

Whether connectivity to the LDAP server should be done securely using TLS.

MQCA_LDAP_SHORT_USER_FIELD

The field in the LDAP user record to be used as a short user name in IBM MQ.

MQCA_LDAP_USER_ATTR_FIELD

The field in the LDAP user record to be used to interpret the user ID provided by an application, if the user ID does not contain a qualifier.

MQCA_LDAP_USER_NAME

LDAP user name in the authentication information object.

This attribute is relevant only when **AuthInfoType** is set to MQAIT_CRL_LDAP or MQAIT_IDPW_LDAP.

MQCA_LDAP_USER_OBJECT_CLASS

The LDAP object class used for user records in the LDAP repository.

MQCA_AUTH_INFO_OCSP_URL

The URL of the OCSP responder used to check for certificate revocation.

AuthInfoType (MQCFIN)

Type of authentication information object. The following values are accepted:

MQAIT_CRL_LDAP

Authentication information objects specifying Certificate Revocation Lists held on LDAP servers.

MQAIT_OCSP

Authentication information objects specifying certificate revocation checking using OCSP.

MQAIT_IDPW_OS

Authentication information objects specifying certificate revocation checking using user ID and password checking through the operating system.

MQAIT_IDPW_LDAP

Authentication information objects specifying certificate revocation checking using user ID and password checking through an LDAP server.

MQAIT_ALL

Authentication information objects of any type.

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use **CommandScope** as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in **AuthInfoAttrs**, except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1852 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

z/OS QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. This value is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. This value is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

You cannot use **QSGDisposition** as a parameter to filter on.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in **AuthInfoAttrs**, except MQCA_AUTH_INFO_NAME. Use this parameter to restrict the output from

the command by specifying a filter condition. For information about using this filter condition, see [“MQCFST - PCF string filter parameter” on page 1859](#).

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Inquire Authentication Information Object (Response)

The response of the Inquire authentication information (MQCMD_INQUIRE_AUTH_INFO) command consists of the response header followed by the *AuthInfoName* structure (and on z/OS only, the *QSGDisposition* structure), and the requested combination of attribute parameter structures (where applicable).

Always returned:

AuthInfoName , *QSGDisposition*

Returned if requested:

AdoptContext , *AlterationDate* , *AlterationTime* , *AuthInfoConnName* ,
BaseDNGroup , *BaseDNUser* , *AuthInfoType* , *CheckClient* , *CheckLocal* , *ClassUser* ,
FailureDelay , *LDAPPassword* , *LDAPUserName* , *OCSPResponderURL* , *SecureComms* ,
ShortUser , *UserField*

Response data

AdoptContext

Whether to use the presented credentials as the context for this application.

AlterationDate (MQCFST)

Alteration date of the authentication information object, in the form yyyy-mm-dd (parameter identifier: MQCA_ALTERATION_DATE).

AlterationTime (MQCFST)

Alteration time of the authentication information object, in the form hh.mm.ss (parameter identifier: MQCA_ALTERATION_TIME).

AuthInfoConnName (MQCFST)

The connection name of the authentication information object (parameter identifier: MQCA_AUTH_INFO_CONN_NAME).

The maximum length of the string is MQ_AUTH_INFO_CONN_NAME_LENGTH. On z/OS, it is MQ_LOCAL_ADDRESS_LENGTH.

This parameter is relevant only when *AuthInfoType* is set to *MQAIT_CRL_LDAP* or *MQAIT_IDPW_LDAP*.

AuthInfoDesc (MQCFST)

The description of the authentication information object (parameter identifier: MQCA_AUTH_INFO_DESC).

The maximum length is MQ_AUTH_INFO_DESC_LENGTH.

AuthInfoName (MQCFST)

Authentication information object name (parameter identifier: MQCA_AUTH_INFO_NAME).

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

AuthInfoType (MQCFIN)

The type of authentication information object (parameter identifier: MQIA_AUTH_INFO_TYPE).

The value can be:

MQAIT_CRL_LDAP

This authentication information object specifies Certificate Revocation Lists that are held on LDAP servers.

MQAIT_OCSP

This authentication information object specifies certificate revocation checking using OCSP.

MQAIT_IDPW_OS

This authentication information object specifies certificate revocation checking using user ID and password checking through the operating system.

MQAIT_IDPW_LDAP

This authentication information object specifies certificate revocation checking using user ID and password checking through an LDAP server.

See [Securing IBM MQ](#) for more information.

AuthenticationMethod (MQCFIN)

Authentication methods for user passwords (parameter identifier: MQIA_AUTHENTICATION_METHOD). Possible values are:

MQAUTHENTICATE_OS

Use the traditional UNIX password verification method.

MQAUTHENTICATE_PAM

Use the Pluggable Authentication Method to authenticate the user passwords.

You can set the PAM value only on UNIX and Linux.

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_OS*, and is not valid on IBM MQ for z/OS.

AuthorizationMethod (MQCFIN)

Authorization methods for the queue manager (parameter identifier MQIA_LDAP_AUTHORMD). Possible values are:

MQLDAP_AUTHORMD_OS

Use operating system groups to determine permissions associated with a user.

MQLDAP_AUTHORMD_SEARCHGRP

A group entry in the LDAP repository contains an attribute listing the Distinguished Name of all the users belonging to that group.

MQLDAP_AUTHORMD_SEARCHUSER

A user entry in the LDAP repository contains an attribute listing the Distinguished Name of all the groups to which the specified user belongs.

V 9.0.5 MQLDAP_AUTHORMD_SRCHGRPSN

A group entry in the LDAP repository contains an attribute listing the short user name of all the users belonging to that group.

BaseDNGroup (MQCFST)

In order to be able to find group names, this parameter must be set with the base DN to search for groups in the LDAP server (parameter identifier MQCA_LDAP_BASE_DN_GROUPS).

The maximum length of the string is MQ_LDAP_BASE_DN_LENGTH.

BaseDNUser (MQCFST)

In order to be able to find the short user name attribute (see [ShortUser](#)) this parameter must be set with the base DN to search for users within the LDAP server.

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_LDAP* and is mandatory (parameter identifier MQ_LDAP_BASE_DN_USERS).

The maximum length is MQ_LDAP_BASE_DN_LENGTH.

Checklocal or Checkclient (MQCFIN)

These attributes are valid only for an **AuthInfoType** of *MQAIT_IDPW_OS* or *MQAIT_IDPW_LDAP* (parameter identifier MQIA_CHECK_LOCAL_BINDING or MQIA_CHECK_CLIENT_BINDING). The possible values are:

MQCHK_NONE

Switches off checking.

MQCHK_OPTIONAL

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

MQCHK_REQUIRED

Requires that all applications provide a valid user ID and password.

MQCHK_REQUIRED_ADMIN

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the OPTIONAL setting. See also the following note.  (This setting is not allowed on z/OS systems.)

ClassGroup (MQCFST)

The LDAP object class used for group records in the LDAP repository (parameter identifier MQCA_LDAP_GROUP_OBJECT_CLASS).

Classuser (MQCFST)

The LDAP object class used for user records in the LDAP repository (parameter identifier MQCA_LDAP_USER_OBJECT_CLASS).

The maximum length is MQ_LDAP_CLASS_LENGTH.

FailureDelay (MQCFIN)

The failure delay (parameter identifier MQIA_AUTHENTICATION_FAIL_DELAY) when an authentication fails due to the user ID or password being incorrect, in seconds, before the failure is returned to the application.

FindGroup (MQCFST)

Name of the attribute used within an LDAP entry to determine group membership (parameter identifier MQCA_LDAP_FIND_GROUP_FIELD).

The maximum length of the string is MQ_LDAP_FIELD_LENGTH.

GroupField (MQCFST)

LDAP attribute that represents a simple name for the group (parameter identifier MQCA_LDAP_GROUP_ATTR_FIELD).

The maximum length of the string is MQ_LDAP_FIELD_LENGTH.

GroupNesting (MQCFIN)

Whether groups are members of other groups (parameter identifier MQIA_LDAP_NESTGRP). The values can be:

MQLDAP_NESTGRP_NO

Only the initially discovered groups are considered for authorization.

MQLDAP_NESTGRP_YES

The group list is searched recursively to enumerate all the groups to which a user belongs.

LDAPPassword (MQCFST)

The LDAP password (parameter identifier: MQCA_LDAP_PASSWORD).

The maximum length is MQ_LDAP_PASSWORD_LENGTH.

This parameter is relevant only when AuthInfoType is set to *MQAIT_CRL_LDAP* or *MQAIT_IDPW_LDAP*.

LDAPUserName (MQCFST)

The LDAP user name (parameter identifier: MQCA_LDAP_USER_NAME).

The Distinguished Name of the user who is binding to the directory.

The maximum length is MQ_DISTINGUISHED_NAME_LENGTH. On z/OS, it is MQ_SHORT_DNAME_LENGTH.

This parameter is relevant only when AuthInfoType is set to *MQAIT_CRL_LDAP* or *MQAIT_IDPW_LDAP*.

OCSPResponderURL (MQCFST)

The URL of the OCSP responder used to check for certificate revocation.

z/OS QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

SecureComms (MQCFIN)

Whether connectivity to the LDAP server should be done securely using TLS (parameter identifier MQIA_LDAP_SECURE_COMM).

The maximum length is MQ_LDAP_SECURE_COMM_LENGTH.

ShortUser (MQCFST)

A field in the user record to be used as a short user name in IBM MQ (parameter identifier MQCA_LDAP_SHORT_USER_FIELD)..

The maximum length is MQ_LDAP_FIELD_LENGTH.

UserField (MQCFST)

Identifies the field in the LDAP user record that is used to interpret the provided user ID, only if the user ID does not contain a qualifier (parameter identifier MQCA_LDAP_USER_ATTR_FIELD).

The maximum length is MQ_LDAP_FIELD_LENGTH.

Inquire Authentication Information Object Names

The Inquire authentication information names (MQCMD_INQUIRE_AUTH_INFO_NAMES) command asks for a list of authentication information names that match the generic authentication information name specified.

Required parameters

AuthInfoName (MQCFST)

Authentication information object name (parameter identifier: MQCA_AUTH_INFO_NAME).

Specifies the name of the authentication information object about which information is to be returned.

Generic authentication information object names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all authentication information objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

Optional parameters

AuthInfoType (MQCFIN)

Type of authentication information object. The following values are accepted:

MQAIT_CRL_LDAP

Authentication information objects specifying Certificate Revocation Lists held on LDAP servers.

MQAIT_OCSP

Authentication information objects specifying certificate revocation checking using OCSP.

MQAIT_ALL

Authentication information objects of any type. MQAIT_ALL is the default value

z/OS CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

z/OS

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

Inquire Authentication Information Object Names (Response)

The response to the inquire authentication information names (MQCMD_INQUIRE_AUTH_INFO_NAMES) command consists of the response header followed by a parameter structure giving zero or more names that match the specified authentication information name.

z/OS Additionally, on z/OS only, parameter structures, *QSGDispositions* and *AuthInfoTypes* (with the same number of entries as the *AuthInfoNames* structure), are returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *AuthInfoNames* structure.

Always returned:

AuthInfoNames **z/OS**, *QSGDispositions*, **z/OS**, *AuthInfoTypes*

Returned if requested:

None

Response data

AuthInfoNames (MQCFSL)

List of authentication information object names (parameter identifier: MQCACF_AUTH_INFO_NAMES).

z/OS

QSGDispositions (MQCFIL)

List of queue sharing group dispositions (parameter identifier: MQIACF_QSG_DISPS).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

z/OS

AuthInfoTypes (MQCFIL)

List of authentication information object types (parameter identifier: MQIACH_AUTH_INFO_TYPES).

Specifies the type of the object. This parameter is valid on z/OS only. The value can be any of the following values:

MQAIT_CRL_LDAP

This defines this authentication information object as specifying an LDAP server containing Certificate Revocation Lists.

MQAIT_OCSP

This value defines this authentication information object as specifying certificate revocation checking using OCSP.

MQAIT_IDPW_OS

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through the operating system.

Inquire Authority Records on Multiplatforms

The Inquire Authority Records (MQCMD_INQUIRE_AUTH_RECS) command retrieves authority records associated with a profile name.

Required parameters

Options (MQCFIN)

Options to control the set of authority records that is returned (parameter identifier: MQIACF_AUTH_OPTIONS).

This parameter is required and you must include one of the following two values:

MQAUTHOPT_NAME_ALL_MATCHING

Return all profiles the names of which match the specified *ProfileName*. This means that a *ProfileName* of ABCD results in the profiles ABCD, ABC*, and AB* being returned (if ABC* and AB* have been defined as profiles).

MQAUTHOPT_NAME_EXPLICIT

Return only those profiles the names of which exactly match the *ProfileName*. No matching generic profiles are returned unless the *ProfileName* is, itself, a generic profile. You cannot specify this value and MQAUTHOPT_ENTITY_SET.

and one of the following two values:

MQAUTHOPT_ENTITY_EXPLICIT

Return all profiles the entity fields of which match the specified *EntityName*. No profiles are returned for any group in which *EntityName* is a member; only the profile defined for the specified *EntityName*.

MQAUTHOPT_ENTITY_SET

Return the profile the entity field of which matches the specified *EntityName* and the profiles pertaining to any groups in which *EntityName* is a member that contribute to the cumulative authority for the specified entity. You cannot specify this value and MQAUTHOPT_NAME_EXPLICIT.

You can also optionally specify:

MQAUTHOPT_NAME_AS_WILDCARD

Interpret *ProfileName* as a filter on the profile name of the authority records. If you do not specify this attribute and *ProfileName* contains wildcard characters, it is interpreted as a generic profile and only those authority records where the generic profile names match the value of *ProfileName* are returned.

You cannot specify MQAUTHOPT_NAME_AS_WILDCARD if you also specify MQAUTHOPT_ENTITY_SET.

ProfileName (MQCFST)

Profile name (parameter identifier: MQCACF_AUTH_PROFILE_NAME).

This parameter is the name of the profile for which to retrieve authorizations. Generic profile names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all profiles having names that start with the selected character string. An asterisk on its own matches all possible names.

If you have defined a generic profile, you can return information about it by not setting MQAUTHOPT_NAME_AS_WILDCARD in *Options*.

If you set *Options* to MQAUTHOPT_NAME_AS_WILDCARD, the only valid value for *ProfileName* is a single asterisk (*). This means that all authority records that satisfy the values specified in the other parameters are returned.

Do not specify *ProfileName* if the value of *ObjectType* is MQOT_Q_MGR.

The profile name is always returned regardless of the attributes requested.

The maximum length of the string is MQ_AUTH_PROFILE_NAME_LENGTH.

ObjectType (MQCFIN)

The type of object referred to by the profile (parameter identifier: MQIACF_OBJECT_TYPE).

The value can be any of the following values:

MQOT_ALL

All object types. MQOT_ALL is the default if you do not specify a value for *ObjectType*.

MQOT_AUTH_INFO

Authentication information.

MQOT_CHANNEL

Channel object.

MQOT_CLNTCONN_CHANNEL

Client-connection channel object.

MQOT_COMM_INFO

Communication information object

MQOT_LISTENER

Listener object.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process.

MQOT_Q

Queue, or queues, that match the object name parameter.

MQOT_Q_MGR

Queue manager.

MQOT_REMOTE_Q_MGR_NAME

Remote queue manager.

MQOT_SERVICE

Service object.

MQOT_TOPIC

Topic object.

Optional parameters

EntityName (MQCFST)

Entity name (parameter identifier: MQCACF_ENTITY_NAME).

Depending on the value of *EntityType*, this parameter is either:

- A principal name. This name is the name of a user for whom to retrieve authorizations to the specified object. On IBM MQ for Windows, the name of the principal can optionally include a domain name, specified in this format: user@domain.
- A group name. This name is the name of the user group on which to make the inquiry. You can specify one name only and this name must be the name of an existing user group.

Windows For IBM MQ for Windows only, the group name can optionally include a domain name, specified in the following formats:

```
GroupName@domain  
domain\GroupName
```

The maximum length of the string is MQ_ENTITY_NAME_LENGTH.

EntityType (MQCFIN)

Entity type (parameter identifier: MQIACF_ENTITY_TYPE).

The value can be:

MQZAET_GROUP

The value of the **EntityName** parameter refers to a group name.

MQZAET_PRINCIPAL

The value of the **EntityName** parameter refers to a principal name.

ProfileAttrs (MQCFIL)

Profile attributes (parameter identifier: MQIACF_AUTH_PROFILE_ATTRS).

The attribute list might specify the following value on its own - the default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCACF_ENTITY_NAME

Entity name.

MQIACF_AUTHORIZATION_LIST

Authorization list.

MQIACF_ENTITY_TYPE

Entity type.

Note: If an entity is specified by using the parameters MQCACF_ENTITY_NAME and MQIACF_ENTITY_TYPE, then all the required parameters must be passed in first.

ServiceComponent (MQCFST)

Service component (parameter identifier: MQCACF_SERVICE_COMPONENT).

If installable authorization services are supported, this parameter specifies the name of the authorization service from which to retrieve authorization.

If you omit this parameter, the authorization inquiry is made to the first installable component for the service.

The maximum length of the string is MQ_SERVICE_COMPONENT_LENGTH.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRC_OBJECT_TYPE_ERROR

Invalid object type.

MQRC_UNKNOWN_ENTITY

User ID not authorized, or unknown.

MQRCCF_CFST_CONFLICTING_PARM

Conflicting parameters.

MQRCCF_PROFILE_NAME_ERROR

Invalid profile name.

MQRCCF_ENTITY_NAME_MISSING

Entity name missing.

MQRCCF_OBJECT_TYPE_MISSING

Object type missing.

MQRCCF_PROFILE_NAME_MISSING

Profile name missing.

Multi

Inquire Authority Records (Response) on Multiplatforms

The response to the Inquire Authority Records (MQCMD_INQUIRE_AUTH_RECS) command consists of the response header followed by the *QMgrName*, *Options*, *ProfileName*, and *ObjectType* structures and the requested combination of attribute parameter structures.

One PCF message is returned for each authority record that is found the profile name of which matches the options specified in the Inquire Authority Records request.

Always returned:

ObjectType, *Options*, *ProfileName*, *QMgrName*

Returned if requested:

AuthorizationList, *EntityName*, *EntityType*

Response data

AuthorizationList (MQCFIL)

Authorization list (parameter identifier: MQIACF_AUTHORIZATION_LIST).

This list can contain zero or more authorization values. Each returned authorization value means that any user ID in the specified group or principal has the authority to perform the operation defined by that value. The value can be any of the following values:

MQAUTH_NONE

The entity has authority set to 'none'.

MQAUTH_ALT_USER_AUTHORITY

Specify an alternate user ID on an MQI call.

MQAUTH_BROWSE

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

MQAUTH_CHANGE

Change the attributes of the specified object, using the appropriate command set.

MQAUTH_CLEAR

Clear a queue.

MQAUTH_CONNECT

Connect the application to the specified queue manager by issuing an MQCONN call.

MQAUTH_CREATE

Create objects of the specified type using the appropriate command set.

MQAUTH_DELETE

Delete the specified object using the appropriate command set.

MQAUTH_DISPLAY

Display the attributes of the specified object using the appropriate command set.

MQAUTH_INPUT

Retrieve a message from a queue by issuing an MQGET call.

MQAUTH_INQUIRE

Make an inquiry on a specific queue by issuing an MQINQ call.

MQAUTH_OUTPUT

Put a message on a specific queue by issuing an MQPUT call.

MQAUTH_PASS_ALL_CONTEXT

Pass all context.

MQAUTH_PASS_IDENTITY_CONTEXT

Pass the identity context.

MQAUTH_SET

Set attributes on a queue from the MQI by issuing an MQSET call.

MQAUTH_SET_ALL_CONTEXT

Set all context on a queue.

MQAUTH_SET_IDENTITY_CONTEXT

Set the identity context on a queue.

MQAUTH_CONTROL

For listeners and services, start and stop the specified channel, listener, or service.

For channels, start, stop, and ping the specified channel.

For topics, define, alter, or delete subscriptions.

MQAUTH_CONTROL_EXTENDED

Reset or resolve the specified channel.

MQAUTH_PUBLISH

Publish to the specified topic.

MQAUTH_SUBSCRIBE

Subscribe to the specified topic.

MQAUTH_RESUME

Resume a subscription to the specified topic.

MQAUTH_SYSTEM

Use queue manager for internal system operations.

MQAUTH_ALL

Use all operations applicable to the object.

MQAUTH_ALL_ADMIN

Use all operations applicable to the object.

MQAUTH_ALL_MQI

Use all MQI calls applicable to the object.

Use the *Count* field in the MQCFIL structure to determine how many values are returned.

EntityName (MQCFST)

Entity name (parameter identifier: MQCACF_ENTITY_NAME).

This parameter can either be a principal name or a group name.

The maximum length of the string is MQ_ENTITY_NAME_LENGTH.

EntityType (MQCFIN)

Entity type (parameter identifier: MQIACF_ENTITY_TYPE).

The value can be:

MQZAET_GROUP

The value of the **EntityName** parameter refers to a group name.

MQZAET_PRINCIPAL

The value of the **EntityName** parameter refers to a principal name.

MQZAET_UNKNOWN

On Windows, an authority record still exists from a previous queue manager which did not originally contain entity type information.

ObjectType (MQCFIN)

Object type (parameter identifier: MQIACF_OBJECT_TYPE).

The value can be:

MQOT_AUTH_INFO

Authentication information.

MQOT_CHANNEL

Channel object.

MQOT_CLNTCONN_CHANNEL

Client-connection channel object.

MQOT_COMM_INFO

Communication information object

MQOT_LISTENER

Listener object.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process.

MQOT_Q

Queue, or queues, that match the object name parameter.

MQOT_Q_MGR

Queue manager.

MQOT_REMOTE_Q_MGR_NAME

Remote queue manager.

MQOT_SERVICE

Service object.

MQOT_TOPIC

Topic object.

Options (MQCFIN)

Options used to indicate the level of information that is returned (parameter identifier: MQIACF_AUTH_OPTIONS).

ProfileName (MQCFST)

Profile name (parameter identifier: MQCACF_AUTH_PROFILE_NAME).

The maximum length of the string is MQ_AUTH_PROFILE_NAME_LENGTH.

QMgrName (MQCFST)

Name of the queue manager on which the Inquire command is issued (parameter identifier: MQCA_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

Multi Inquire Authority Service on Multiplatforms

The Inquire Authority Service (MQCMD_INQUIRE_AUTH_SERVICE) command retrieves information about the level of function supported by installed authority managers.

Required parameters**AuthServiceAttrs (MQCFIL)**

Authority service attributes (parameter identifier: MQIACF_AUTH_SERVICE_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQIACF_INTERFACE_VERSION

Current interface version of the authority service.

MQIACF_USER_ID_SUPPORT

Whether the authority service supports user IDs.

Optional parameters

ServiceComponent (MQCFST)

Name of authorization service (parameter identifier: MQCACF_SERVICE_COMPONENT).

The name of the authorization service which is to handle the Inquire Authority Service command.

If this parameter is omitted, or specified as a blank or null string, the inquire function is called in each installed authorization service in reverse order to the order in which the services have been installed, until all authorization services have been called or until one returns a value of MQZCI_STOP in the Continuation field.

The maximum length of the string is MQ_SERVICE_COMPONENT_LENGTH.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRC_SELECTOR_ERROR

Attribute selector not valid.

MQRC_UNKNOWN_COMPONENT_NAME

Unknown service component name.

Multi Inquire Authority Service (Response) on Multiplatforms

The response to the Inquire Authority Service (MQCMD_INQUIRE_AUTH_SERVICE) command consists of the response header followed by the *ServiceComponent* structure and the requested combination of attribute parameter structures.

Always returned:

ServiceComponent

Returned if requested:

InterfaceVersion, UserIDSupport

Response data

InterfaceVersion (MQCFIN)

Interface version (parameter identifier: MQIACF_INTERFACE_VERSION).

This parameter is the current interface version of the OAM.

ServiceComponent (MQCFSL)

Name of authorization service (parameter identifier: MQCACF_SERVICE_COMPONENT).

If you included a specific value for *ServiceComponent* on the Inquire Authority Service command, this field contains the name of the authorization service that handled the command. If you did not include a specific value for *ServiceComponent* on the Inquire Authority Service command, the list contains the names of all the installed authorization services.

If there is no OAM or if the OAM requested in the ServiceComponent does not exist this field is blank.

The maximum length of each element in the list is MQ_SERVICE_COMPONENT_LENGTH.

UserIDSsupport (MQCFIN)

User ID support (parameter identifier: MQIACF_USER_ID_SUPPORT).

The value can be:

MQIDSUPP_YES

The authority service supports user IDs.

MQIDSUPP_NO

The authority service does not support user IDs.

Inquire CF Structure on z/OS

The Inquire CF Structure (MQCMD_INQUIRE_CF_STRUC) command returns information about the attributes of one or more CF application structures.

Note: This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

Required parameters

CFStrucName (MQCFST)

CF Structure name (parameter identifier: MQCA_CF_STRUC_NAME).

Specifies the name of the CF application structure about which information is to be returned.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all CF application structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters

CFStrucAttrs (MQCFIL)

CF application structure attributes (parameter identifier: MQIACF_CF_STRUC_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_ALTERATION_DATE

The date on which the definition was last altered.

MQCA_ALTERATION_TIME

The time at which the definition was last altered.

MQIA_CF_CFCNLOS

The action to be taken when the queue manager loses connectivity to the CF application structure.

MQIA_CF_LEVEL

Functional capability level for the CF application structure.

MQIA_CF_OFFLOAD

The shared message data set OFFLOAD property for the CF application structure.

MQIA_CF_RECOVER

Whether CF recovery for the application structure is supported.

MQIA_CF_RECAUTO

Whether automatic recovery action is taken when a structure is failed or when a queue manager loses connectivity to the structure and no systems in the SysPlex have connectivity to the Coupling Facility the structure is located in.

MQIACF_CF_SMDS_BLOCK_SIZE

The shared message data set DSGROUP property for the CF application structure.

MQIA_CF_SMDS_BUFFERS

The shared message data set DSGROUP property for the CF application structure.

MQIACF_CF_SMDS_EXPAND

The shared message data set DSEXPAND property for the CF application structure.

MQCACF_CF_SMDS_GENERIC_NAME

The shared message data set DSBUFFS property for the CF application structure.

MQCA_CF_STRUC_DESC

Description of CF application structure.

MQCA_CF_STRUC_NAME

Name of CF application structure.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *CFStrucAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1852](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *CFStrucAttrs* except MQCA_CF_STRUC_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1859](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Inquire CF Structure (Response) on z/OS

The response to the Inquire CF Structure (MQCMD_INQUIRE_CF_STRUC) command consists of the response header followed by the *CFStrucName* structure and the requested combination of attribute parameter structures.

If a generic CF application structure name was specified, one such message is generated for each CF application structure found.

Always returned:

CFStrucName

Returned if requested:

AlterationDate, AlterationTime, CFConlos, CFLevel, CFStrucDesc, DSBLOCK, DSBUFFS, DSEXPAND, DSGROUP, OFFLD1SZ, OFFLD12SZ, OFFLD3SZ, OFFLD1TH, OFFLD2TH, OFFLD3TH, Offload, RCVDATE, RCVTIME, Recauto, Recovery

Response data**AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date on which the definition was last altered, in the form yyyy-mm-dd.

The maximum length of the string is MQ_DATE_LENGTH.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time at which the definition was last altered, in the form hh.mm.ss.

The maximum length of the string is MQ_TIME_LENGTH.

CFConlos (MQCFIN)

The CFConlos property (parameter identifier: MQIA_CF_CFCONLOS).

Specifies the action to be taken when a queue manager loses connectivity to the CF structure. The value can be any of the following values:

MQCFCONLOS_TERMINATE

The queue manager will terminate when connectivity to the structure is lost.

MQCFCONLOS_TOLERATE

The queue manager will tolerate loss of connectivity to the structure without terminating.

MQCFCONLOS_ASQMGR

The action taken is based on the setting of the CFCONLOS queue manager attribute

This parameter is only valid from CFLEVEL(5).

CFLevel (MQCFIN)

The functional capability level for this CF application structure (parameter identifier: MQIA_CF_LEVEL).

Specifies the functional capability level for the CF application structure. The value can be any of the following values:

1

A CF structure that can be "auto-created" by a queue manager at command level 520.

2

A CF structure at command level 520 that can only be created or deleted by a queue manager at command level 530 or greater. This level is the default *CFLevel* for queue managers at command level 530 or greater.

3

A CF structure at command level 530. This *CFLevel* is required if you want to use persistent messages on shared queues, or for message grouping, or both.

4

A CF structure at command level 600. This *CFLevel* can be used for persistent messages or for messages longer than 64 512 bytes.

5

A CF structure at command level 710. This *CFLevel* supports shared message data sets (SMDS) and Db2 for offloading messages.

Structures are required to be at CFLEVEL(5) to support toleration of loss of connectivity.

CFStrucDesc (MQCFST)

The description of the CF structure (parameter identifier: MQCA_CF_STRUC_DESC).

The maximum length is MQ_CF_STRUC_DESC_LENGTH.

CFStrucName (MQCFST)

CF Structure name (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length is MQ_CF_STRUC_NAME_LENGTH.

DSBLOCK (MQCFIN)

The CF DSBLOCK property (parameter identifier: MQIACF_CF_SMDS_BLOCK_SIZE).

The returned value is one of the following constants: MQDSB_8K, MQDSB_16K, MQDSB_32K, MQDSB_64K, MQDSB_128K, MQDSB_256K, MQDSB_512K, MQDSB_1024K, MQDSB_1M.

DSBUFS (MQCFIN)

The CF DSBUFS property (parameter identifier: MQIA_CF_SMDS_BUFFERS).

The returned value is in the range 0 - 9999.

The value is the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

DSEXPAND (MQCFIN)

The CF DSEXPAND property (parameter identifier: MQIACF_CF_SMDS_EXPAND).

MQDSE_YES

The data set can be expanded.

MQDSE_NO

The data set cannot be expanded.

MQDSE_DEFAULT

Only returned on Inquire CF Struct when not explicitly set

DSGROUP (MQCFST)

The CF DSGROUP property (parameter identifier: MQCACF_CF_SMDS_GENERIC_NAME).

The returned value is a string containing a generic data set name used for the group of shared message data sets associated with this CF structure.

OFFLD1SZ (MQCFST)

The CF OFFLD1SZ property (parameter identifier: MQCACF_CF_OFFLOAD_SIZE1).

The returned value is a string in the range 0K - 64K.

Returned if the MQIACF_ALL or MQIA_CF_OFFLOAD parameters are specified.

The maximum length is 3.

OFFLD2SZ (MQCFST)

The CF OFFLD2SZ property (parameter identifier: MQCACF_CF_OFFLOAD_SIZE2).

The returned value is a string in the range 0K - 64K.

Returned if the MQIACF_ALL or MQIA_CF_OFFLOAD parameters are specified.

The maximum length is 3.

OFFLD3SZ (MQCFST)

The CF OFFLD3SZ property (parameter identifier: MQCACF_CF_OFFLOAD_SIZE3).

The returned value is a string in the range 0K - 64K.

Returned if the MQIACF_ALL or MQIA_CF_OFFLOAD parameters are specified.

The maximum length is 3.

OFFLD1TH (MQCFIN)

The CF OFFLD1TH property (parameter identifier: MQIA_CF_OFFLOAD_THRESHOLD1).

The returned value is in the range 0 - 100.

Returned if the MQIACF_ALL or MQIA_CF_OFFLOAD parameters are specified.

OFFLD2TH (MQCFIN)

The CF OFFLD2TH property (parameter identifier: MQIA_CF_OFFLOAD_THRESHOLD2).

The returned value is in the range 0 - 100.

Returned if the MQIACF_ALL or MQIA_CF_OFFLOAD parameters are specified.

OFFLD3TH (MQCFIN)

The CF OFFLD3TH property (parameter identifier: MQIA_CF_OFFLOAD_THRESHOLD3).

The returned value is in the range 0 - 100.

Returned if the MQIACF_ALL or MQIA_CF_OFFLOAD parameters are specified.

Offload (MQCFIN)

The CF OFFLOAD property (parameter identifier: MQIA_CF_OFFLOAD).

The returned values can be:

MQCFOFFLD_DB2

Large shared messages can be stored in Db2.

MQCFOFFLD_SMDS

Large shared messages can be stored in z/OS shared message data sets.

MQCFOFFLD_NONE

Used when the property *Offload* has not been explicitly set.

RCVDATE (MQCFST)

The recovery start date (parameter identifier: MQCACF_RECOVERY_DATE).

If recovery is currently enabled for the data set, this indicates the date when it was activated, in the form yyyy-mm-dd. If recovery is not enabled, this is displayed as RCVDATE().

RCVTIME (MQCFST)

The recovery start time (parameter identifier: MQCACF_RECOVERY_TIME).

If recovery is currently enabled for the data set, this indicates the time when it was activated, in the form hh.mm.ss. If recovery is not enabled, this is displayed as RCVTIME().

Recauto (MQCFIN)

Recauto (parameter identifier: MQIA_CF_RECAUTO).

Indicates whether automatic recovery action is taken when a queue manager detects that the structure is failed, or when a queue manager loses connectivity to the structure and no systems in the SysPlex have connectivity to the Coupling Facility that the structure is allocated in. The value can be:

MQRECAUTO_YES

The structure and associated shared message data sets which also need recovery will be automatically recovered.

MQRECAUTO_NO

The structure will not be automatically recovered.

Recovery (MQCFIN)

Recovery (parameter identifier: MQIA_CF_RECOVER).

Specifies whether CF recovery is supported for the application structure. The value can be:

MQCFR_YES

Recovery is supported.

MQCFR_NO

Recovery is not supported.

Inquire CF Structure Names on z/OS

The Inquire CF Structure Names (MQCMD_INQUIRE_CF_STRUC_NAMES) command inquires for a list of CF application structure names that match the generic CF structure name specified.

Note: This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

Required parameters**CFStrucName (MQCFST)**

CF Structure name (parameter identifier: MQCA_CF_STRUC_NAME).

Specifies the name of the CF application structure about which information is to be returned.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all CF application structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ_CF_STRUC_NAME_LENGTH.

Inquire CF Structure Names (Response) on z/OS

The response to the Inquire CF Structure Names (MQCMD_INQUIRE_CF_STRUC_NAMES) command consists of the response header followed by a single parameter structure giving zero or more names that match the specified CF application structure name.

Always returned:

CFStrucNames

Returned if requested:

None

Response data

CFStrucNames (MQCFSL)

List of CF application structure names (parameter identifier: MQCACF_CF_STRUC_NAMES).

Inquire CF Structure Status on z/OS

The Inquire CF Structure Status (MQCMD_INQUIRE_CF_STRUC_STATUS) command inquires about the status of a CF application structure.

Note: This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

Required parameters

CFStrucName (MQCFST)

CF Structure name (parameter identifier: MQCA_CF_STRUC_NAME).

Specifies the name of the CF application structure for which status information is to be returned.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all CF application structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters

CFStatusType (MQCFIN)

Status information type (parameter identifier: MQIACF_CF_STATUS_TYPE).

Specifies the type of status information you want to be returned. You can specify one of the following:

MQIACF_CF_STATUS_SUMMARY

Summary status information for the CF application structure. MQIACF_CF_STATUS_SUMMARY is the default.

MQIACF_CF_STATUS_CONNECT

Connection status information for each CF application structure for each active queue manager.

MQIACF_CF_STATUS_BACKUP

Backup status information for each CF application structure.

MQIACF_CF_STATUS_SMDS

Shared message data set information for each CF application structure.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter in the response data except MQIACF_CF_STATUS_TYPE. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1852](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter in the response data except MQCA_CF_STRUC_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1859 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Inquire CF Structure Status (Response) on z/OS

The response to the Inquire CF Structure Status (MQCMD_INQUIRE_CF_STRUC_STATUS) command consists of the response header followed by the *CFStrucName* and *CFStatusType* structures and a set of attribute parameter structures determined by the value of *CFStatusType* in the Inquire command.

Always returned:

CFStrucName, *CFStatusType*.

CFStatusType specifies the type of status information being returned. The value can be any of the following values:

MQIACF_CF_STATUS_SUMMARY

Summary status information for the CF application structure. This is the default.

MQIACF_CF_STATUS_CONNECT

Connection status information for each CF application structure for each active queue manager.

MQIACF_CF_STATUS_BACKUP

Backup status information for each CF application structure.

MQIACF_CF_STATUS_SMDS

Shared message data set information for each CF application structure.

Returned if *CFStatusType* is MQIACF_CF_STATUS_SUMMARY:

CFStrucStatus, *CFStrucType*, *EntriesMax*, *EntriesUsed*, *FailDate*, *FailTime*, *OffLdUse*, *SizeMax*, *SizeUsed*

Returned if *CFStatusType* is MQIACF_CF_STATUS_CONNECT:

CFStrucStatus, *FailDate*, *FailTime*, *QMgrName*, *SysName*

Returned if *CFStatusType* is MQIACF_CF_STATUS_BACKUP:

BackupDate, *BackupEndRBA*, *BackupSize*, *BackupStartRBA*, *BackupTime*, *CFStrucStatus*, *FailDate*, *FailTime*, *LogQMgrNames*, *QmgrName*

Returned if *CFStatusType* is MQIACF_CF_STATUS_SMDS:

Access, *FailDate*, *FailTime*, *RcvDate*, *RcvTime*, *CFStrucStatus*

Response data

Access (MQCFIN)

Availability of the shared message data set (parameter identifier: MQIACF_CF_STRUC_ACCESS).

MQCFACCESS_ENABLED

The shared message data set is either available for use, or is to be enabled after previously being disabled, or access to the shared message data set is to be retried following an error.

MQCFACCESS_SUSPENDED

The shared message data set is unavailable because of an error.

MQCFACCESS_DISABLED

The shared message data set is either disabled, or is to be set as disabled.

BackupDate (MQCFST)

The date, in the form yyyy-mm-dd, on which the last successful backup was taken for this CF application structure (parameter identifier: MQCACF_BACKUP_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

BackupEndRBA (MQCFST)

The backup data set end RBA for the end of the last successful backup taken for this CF application structure (parameter identifier: MQCACF_CF_STRUC_BACKUP_END).

The maximum length of the string is MQ_RBA_LENGTH.

BackupSize (MQCFIN)

The size, in megabytes, of the last successful backup taken for this CF application structure (parameter identifier: MQIACF_CF_STRUC_BACKUP_SIZE).

BackupStartRBA (MQCFST)

The backup data set start RBA for the start of the last successful backup taken for this CF application structure (parameter identifier: MQCACF_CF_STRUC_BACKUP_START).

The maximum length of the string is MQ_RBA_LENGTH.

BackupTime (MQCFST)

The end time, in the form hh.mm.ss, of the last successful backup taken for this CF application structure (parameter identifier: MQCACF_BACKUP_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

CFStatusType (MQCFIN)

Status information type (parameter identifier: MQIACF_CF_STATUS_TYPE).

Specifies the type of status information being returned. The value can be any of the following values:

MQIACF_CF_STATUS_SUMMARY

Summary status information for the CF application structure. MQIACF_CF_STATUS_SUMMARY is the default.

MQIACF_CF_STATUS_CONNECT

Connection status information for each CF application structure for each active queue manager.

MQIACF_CF_STATUS_BACKUP

Back up status information for each CF application structure.

MQIACF_CF_STATUS_SMDS

Shared message data set information for each CF application structure.

CFStrucName (MQCFST)

CF Structure name (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length is MQ_CF_STRUC_NAME_LENGTH.

CFStrucStatus (MQCFIN)

CF Structure status (parameter identifier: MQIACF_CF_STRUC_STATUS).

The status of the CF application structure.

If *CFStatusType* is MQIACF_CF_STATUS_SUMMARY, the value can be:

MQCFSTATUS_ACTIVE

The structure is active.

MQCFSTATUS_FAILED

The structure has failed.

MQCFSTATUS_NOT_FOUND

The structure is not allocated in the CF, but has been defined to Db2.

MQCFSTATUS_IN_BACKUP

The structure is in the process of being backed up.

MQCFSTATUS_IN_RECOVER

The structure is in the process of being recovered.

MQCFSTATUS_UNKNOWN

The status of the CF structure is unknown because, for example, Db2 might be unavailable.

If *CFStatusType* is MQIACF_CF_STATUS_CONNECT, the value can be:

MQCFSTATUS_ACTIVE

The structure is connected to this queue manager.

MQCFSTATUS_FAILED

The queue manager connection to this structure has failed.

MQCFSTATUS_NONE

The structure has never been connected to this queue manager.

If *CFStatusType* is MQIACF_CF_STATUS_BACKUP, the value can be:

MQCFSTATUS_ACTIVE

The structure is active.

MQCFSTATUS_FAILED

The structure has failed.

MQCFSTATUS_NONE

The structure has never been backed up.

MQCFSTATUS_IN_BACKUP

The structure is in the process of being backed up.

MQCFSTATUS_IN_RECOVER

The structure is in the process of being recovered.

If *CFStatusType* is MQIACF_CF_STATUS_SMDS, the value can be:

MQCFSTATUS_ACTIVE

The shared message data set is available for normal use

MQCFSTATUS_FAILED

The shared message data set is in an unusable state and probably requires recovery.

MQCFSTATUS_IN_RECOVER

The shared message data set is in the process of being recovered (by way of a RECOVER CFSTRUCT command).

MQCFSTATUS_NOT_FOUND

The data set has never been used, or the attempt to open it for the first time failed.

MQCFSTATUS_RECOVERED

The data set has been recovered or otherwise repaired, and is ready for use again, but requires some restart processing the next time it is opened. This restart processing ensures that obsolete references to any deleted messages have been removed from the coupling facility structure before the data set is made available again. The restart processing also rebuilds the data set space map.

MQCFSTATUS_EMPTY

The data set contains no messages. The data set is put into this state if it is closed normally by the owning queue manager at a time when it does not contain any messages. It can also be put into EMPTY state when the previous data set contents are to be discarded because the application structure has been emptied (using **RECOVER CFSTRUCT** with TYPE PURGE or, for a nonrecoverable structure only, by deleting the previous instance of the structure). The next time the data set is opened by its owning queue manager, the space map is reset to empty, and the status is changed to ACTIVE. As the previous data set contents are no longer required, a data set in this state can be replaced with a newly allocated data set, for example to change the space allocation or move it to another volume.

MQCFSTATUS_NEW

The data set is being opened and initialized for the first time, ready to be made active.

CFStrucType (MQCFIN)

CF Structure type (parameter identifier: MQIACF_CF_STRUC_TYPE).

The value can be:

MQCFTYPE_ADMIN

MQCFTYPE_ADMIN is the CF administration structure.

MQCFTYPE_APPL

MQCFTYPE_APPL is a CF application structure.

EntriesMax (MQCFIN)

Number of CF list entries defined for this CF application structure (parameter identifier: MQIACF_CF_STRUC_ENTRIES_MAX).

EntriesUsed (MQCFIN)

Number of CF list entries defined for this CF application structure that are in use (parameter identifier: MQIACF_CF_STRUC_ENTRIES_USED).

FailDate (MQCFST)

The date, in the form yyyy-mm-dd, on which this CF application structure failed (parameter identifier: MQCACF_FAIL_DATE).

If *CFStatusType* is MQIACF_CF_STATUS_CONNECT, it is the date on which the queue manager lost connectivity to this application structure. For the other values of *CFStatusType*, it is the date on which this CF application structure failed. This parameter is only applicable when *CFStrucStatus* is MQCFSTATUS_FAILED or MQCFSTATUS_IN_RECOVER.

The maximum length of the string is MQ_DATE_LENGTH.

FailTime (MQCFST)

The time, in the form hh.mm.ss, that this CF application structure failed (parameter identifier: MQCACF_FAIL_TIME).

If *CFStatusType* is MQIACF_CF_STATUS_CONNECT, it is the time that the queue manager lost connectivity to this application structure. For the other values of *CFStatusType*, it is the time that this CF application structure failed. This parameter is only applicable when *CFStrucStatus* is MQCFSTATUS_FAILED or MQCFSTATUS_IN_RECOVER.

The maximum length of the string is MQ_TIME_LENGTH.

LogQMgrNames (MQCFSL)

A list of queue managers, the logs of which are required to perform a recovery (parameter identifier: MQCACF_CF_STRUC_LOG_Q_MGRS).

The maximum length of each name is MQ_Q_MGR_NAME_LENGTH.

OffLdUse (MQCFIN)

Offload usage (parameter identifier: MQIA_CF_OFFLDUSE).

Indicates whether any offloaded large message data might currently exist in shared message data sets, Db2, or both. The value can be any of the following values:

MQCFOFFLD_DB2

Large shared messages are stored in Db2.

MQCFOFFLD_SMDS

Large shared messages are stored in z/OS shared message data sets.

MQCFOFFLD_NONE

Use on DISPLAY CFSTRUCT when the property has not been explicitly set.

MQCFOFFLD_BOTH

There might be large shared messages stored in both Db2, and shared message data sets.

Value cannot be set unless CFLEVEL(5) is defined.

QMgrName (MQCFST)

Queue manager name (parameter identifier: MQCA_Q_MGR_NAME).

This parameter is the name of the queue manager. If *CFStatusType* is MQIACF_CF_STATUS_BACKUP, it is the name of the queue manager that took the last successful backup.

The maximum length is MQ_Q_MGR_NAME_LENGTH.

RcvDate (MQCFST)

The recovery start date (parameter identifier: MQCACF_RECOVERY_DATE).

If recovery is currently enabled for the data set, this indicates the date when it was activated, in the form yyyy-mm-dd.

RcvTime (MQCFST)

The recovery start time (parameter identifier: MQCACF_RECOVERY_TIME).

If recovery is currently enabled for the data set, this indicates the time when it was activated, in the form hh.mm.ss.

SizeMax (MQCFIN)

Size of the CF application structure (parameter identifier: MQIACF_CF_STRUC_SIZE_MAX).

This parameter is the size, in kilobytes, of the CF application structure.

SizeUsed (MQCFIN)

Percentage of the CF application structure that is in use (parameter identifier: MQIACF_CF_STRUC_SIZE_USED).

This parameter is the percentage of the size of the CF application structure that is in use.

SysName (MQCFST)

Queue manager name (parameter identifier: MQCACF_SYSTEM_NAME).

This parameter is the name of the z/OS image of the queue manager that last connected to the CF application structure.

The maximum length is MQ_SYSTEM_NAME_LENGTH.

SizeMax (MQCFIN)

Size of the CF application structure (parameter identifier: MQIACF_CF_STRUC_SIZE_MAX).

This parameter is the size, in kilobytes, of the CF application structure.

Inquire Channel

The Inquire Channel (MQCMD_INQUIRE_CHANNEL) command inquires about the attributes of IBM MQ channel definitions.

Required parameters**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all channels having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Optional parameters**ChannelAttrs (MQCFIL)**

Channel attributes (parameter identifier: MQIACF_CHANNEL_ATTRS).

The attribute list can specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the parameters in the following table:

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	V 9.0.0 AMQP
MQCA_ALTERATION_DATE Date on which the definition was last altered	✓	✓	✓	✓	✓	✓	✓	✓	V 9.0.0 ✓
MQCA_ALTERATION_TIME Time at which the definition was last altered	✓	✓	✓	✓	✓	✓	✓	✓	V 9.0.0 ✓
MQCA_CERT_LABEL Certificate label	✓	✓	✓	✓	✓	✓	✓	✓	V 9.0.0 ✓
MQCA_CLUSTER_NAME Name of local queue manager							✓	✓	
MQCA_CLUSTER_NAMELIST Name of local queue manager							✓	✓	
MQCA_Q_MGR_NAME Name of local queue manager					✓				
MQCACH_CHANNEL_NAME Channel name. You cannot use this attribute as a filter keyword.	✓	✓	✓	✓	✓	✓	✓	✓	V 9.0.0 ✓
MQCACH_CONNECTION_NAME Connection name	✓	✓		✓	✓		✓	✓

MQIACH_XMIT_PROTOCOL_TYPE Transport (transmission protocol) type	✓	✓	✓	✓	✓	✓	✓	✓	

Note:

1. Only one of the following parameters can be specified:

- MQCACH_JAAS_CONFIG
- MQCACH_MCA_USER_ID
- MQIACH_USE_CLIENT_ID

If none of these parameters is specified, no authentication is performed. If MQCACH_JAAS_CONFIG is specified, the client flows a user name and password, in all other cases the flowed user name is ignored.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

If this parameter is present, eligible channels are limited to the specified type. Any attribute selector specified in the *ChannelAttrs* list which is only valid for channels of a different type or types is ignored; no error is raised.

If this parameter is not present (or if MQCHT_ALL is specified), channels of all types other than MQCHT_MQTT are eligible. Each attribute specified must be a valid channel attribute selector (that is, it must be one from the following list), but it might not be applicable to all (or any) of the channels returned. Channel attribute selectors that are valid but not applicable to the channel are ignored, no error messages occur, and no attribute is returned.

The value can be:

MQCHT_SENDER

Sender.

MQCHT_SERVER

Server.

MQCHT_RECEIVER

Receiver.

MQCHT_REQUESTER

Requester.

MQCHT_SVRCONN

Server-connection (for use by clients).

MQCHT_CLNTCONN

Client connection.

MQCHT_CLUSRCVR

Cluster-receiver.

MQCHT_CLUSSDR

Cluster-sender.

V 9.0.0 MQCHT_AMQP

AMQP channel.

MQCHT_MQTT

Telemetry channel.

MQCHT_ALL

All types other than MQCHT_MQTT.

The default value if this parameter is not specified is MQCHT_ALL.

Note: If this parameter is present, it must occur immediately after the **ChannelName** parameter on platforms other than z/OS otherwise resulting in a MQRCCF_MSG_LENGTH_ERROR error message.

z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ChannelAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1852 for information about using this filter condition.

If you specify an integer filter for channel type, you cannot also specify the **ChannelType** parameter.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ChannelAttrs* except MQCACH_CHANNEL_NAME and MQCACH_MCA_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1859](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHANNEL_TYPE_ERROR

Channel type not valid.

Inquire Channel (MQTT)

The Inquire Channel (MQCMD_INQUIRE_CHANNEL) command inquires about the attributes of IBM MQ channel definitions.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all channels having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

If this parameter is present, eligible channels are limited to the specified type. Any attribute selector specified in the *ChannelAttrs* list which is only valid for channels of a different type or types is ignored; no error is raised.

If this parameter is not present (or if MQCHT_ALL is specified), channels of all types are eligible. Each attribute specified must be a valid channel attribute selector (that is, it must be one from the following list), but it might not be applicable to all (or any) of the channels returned. Channel attribute selectors that are valid but not applicable to the channel are ignored, no error messages occur, and no attribute is returned.

The value must be:

MQCHT_MQTT

Telemetry channel.

Optional parameters

ChannelAttrs (MQCFIL)

Channel attributes (parameter identifier: MQIACF_CHANNEL_ATTRS).

The attribute list can specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following parameters:

MQCA_SSL_KEY_REPOSITORY

TLS Key Repository

MQCACH_CHANNEL_NAME

Channel name. You cannot use this attribute as a filter keyword.

MQCACH_JAAS_CONFIG

The file path of the JAAS configuration

MQCACH_LOCAL_ADDRESS

Local communications address for the channel

MQCACH_MCA_USER_ID

MCA user identifier.

MQCACH_SSL_CIPHER_SPEC

TLS cipher spec.

MQCACH_SSL_KEY_PASSPHRASE

TLS key passphrase.

MQIACH_BACKLOG

The number of concurrent connection requests that the channel supports.

MQIACH_CHANNEL_TYPE

Channel type

MQIACH_PORT

Port number to use when *TransportType* is set to TCP.

MQIACH_SSL_CLIENT_AUTH

TLS client authentication.

MQIACH_USE_CLIENT_ID

Specify whether to use the *clientID* of a new connection as the *userID* for that connection

MQIACH_XMIT_PROTOCOL_TYPE

Transport (transmission protocol) type

Note:

1. Only one of the following parameters can be specified:

- MQCACH_JAAS_CONFIG
- MQCACH_MCA_USER_ID
- MQIACH_USE_CLIENT_ID

If none of these parameters are specified, no authentication is performed. If MQCACH_JAAS_CONFIG is specified, the client flows a user name and password, in all other cases the flowed user name is ignored.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHANNEL_TYPE_ERROR

Channel type not valid.

Inquire Channel (Response)

The response to the Inquire Channel (MQCMD_INQUIRE_CHANNEL) command consists of the response header followed by the *ChannelName* and *ChannelType* structures (and on z/OS only, the *DefaultChannelDisposition*, and *QSGDisposition* structure), and the requested combination of attribute parameter structures (where applicable).

If a generic channel name was specified, one such message is generated for each channel found.

Always returned:

ChannelName , *ChannelType* ,  *DefaultChannelDisposition* ,  *QSGDisposition*

Returned if requested:

AlterationDate, *AlterationTime*, *BatchDataLimit*, *BatchHeartbeat*, *BatchInterval*, *BatchSize*, *CertificateLabel*, *ChannelDesc*, *ChannelMonitoring*, *ChannelStatistics*, *ClientChannelWeight*, *ClientIdentifier*, *ClusterName*, *ClusterNameList*, *CLWLChannelPriority*, *CLWLChannelRank*, *CLWLChannelWeight*, *ConnectionAffinity*, *ConnectionName*, *DataConversion*, *DefReconnect*, *DiscInterval*, *HeaderCompression*, *HeartbeatInterval*, *InDoubtInbound*, *InDoubtOutbound*, *KeepAliveInterval*, *LastMsgTime*, *LocalAddress*, *LongRetryCount*, *LongRetryInterval*, *MaxMsgLength*, *MCAName*, *MCAType*, *MCAUserIdentifier*, *MessageCompression*, *ModeName*, *MsgExit*, *MsgRetryCount*, *MsgRetryExit*, *MsgRetryInterval*, *MsgRetryUserData*, *MsgsReceived*, *MsgsSent*, *MsgUserData*, *NetworkPriority*, *NonPersistentMsgSpeed*, *Password*, *PendingOutbound*, *PropertyControl*, *PutAuthority*, *QMGrName*, *ReceiveExit*, *ReceiveUserData*, *ResetSeq*, *SecurityExit*, *SecurityUserData*, *SendExit*, *SendUserData*, *SeqNumberWrap*, *SharingConversations*, *ShortRetryCount*, *ShortRetryInterval*, *SSLCipherSpec*, *SSLCipherSuite*, *SSLClientAuth*, *SSLPeerName*, *TpName*, *TransportType*, *UseDLQ*, *UserIdentifier*, *XmitQName*

Response data

AlterationDate (MQCFST)

Alteration date, in the form yyyy-mm-dd (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered.

AlterationTime (MQCFST)

Alteration time, in the form hh.mm.ss (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered.

BatchDataLimit (MQCFIN)

Batch data limit (parameter identifier: MQIACH_BATCH_DATA_LIMIT).

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

This parameter only applies to channels with a *ChannelType* of MQCHT_SENDER, MQCHT_SERVER, MQCHT_CLUSRCVR, or MQCHT_CLUSSDR.

BatchHeartbeat (MQCFIN)

The value being used for the batch heartbeating (parameter identifier: MQIACH_BATCH_HB).

The value can be 0 - 999999. A value of 0 indicates that heartbeating is not in use.

BatchInterval (MQCFIN)

Batch interval (parameter identifier: MQIACH_BATCH_INTERVAL).

BatchSize (MQCFIN)

Batch size (parameter identifier: MQIACH_BATCH_SIZE).

CertificateLabel (MQCFST)

Certificate label (parameter identifier: MQCA_CERT_LABEL).

Specifies the certificate label in use.

The maximum length is MQ_CERT_LABEL_LENGTH.

ChannelDesc (MQCFST)

Channel description (parameter identifier: MQCACH_DESC).

The maximum length of the string is MQ_CHANNEL_DESC_LENGTH.

ChannelMonitoring (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA_MONITORING_CHANNEL).

The value can be any of the following values:

MQMON_OFF

Online monitoring data collection is turned off for this channel.

MQMON_Q_MGR

The value of the queue manager's **ChannelMonitoring** parameter is inherited by the channel.

MQMON_LOW

Online monitoring data collection is turned on, with a low rate of data collection, for this channel unless the queue manager's **ChannelMonitoring** parameter is MQMON_NONE.

MQMON_MEDIUM

Online monitoring data collection is turned on, with a moderate rate of data collection, for this channel unless the queue manager's *ChannelMonitoring* parameter is MQMON_NONE.

MQMON_HIGH

Online monitoring data collection is turned on, with a high rate of data collection, for this channel unless the queue manager's **ChannelMonitoring** parameter is MQMON_NONE.

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelStatistics (MQCFIN)

Statistics data collection (parameter identifier: MQIA_STATISTICS_CHANNEL).

The value can be any of the following values:

MQMON_OFF

Statistics data collection is turned off for this channel.

MQMON_Q_MGR

The value of the queue manager's **ChannelStatistics** parameter is inherited by the channel.

MQMON_LOW

Statistics data collection is turned on, with a low rate of data collection, for this channel unless the queue manager's **ChannelStatistics** parameter is MQMON_NONE.

MQMON_MEDIUM

Statistics data collection is turned on, with a moderate rate of data collection, for this channel unless the queue manager's **ChannelStatistics** parameter is MQMON_NONE.

MQMON_HIGH

Statistics data collection is turned on, with a high rate of data collection, for this channel unless the queue manager's **ChannelStatistics** parameter is MQMON_NONE.

 On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

The value can be any of the following values:

MQCHT_SENDER

Sender.

MQCHT_SERVER

Server.

MQCHT_RECEIVER

Receiver.

MQCHT_REQUESTER

Requester.

MQCHT_SVRCONN

Server-connection (for use by clients).

MQCHT_CLNTCONN

Client connection.

MQCHT_CLUSRCVR

Cluster-receiver.

MQCHT_CLUSSDR

Cluster-sender.

MQCHT_MQTT

Telemetry channel.

ClientChannelWeight (MQCFIN)

Client Channel Weight (parameter identifier: MQIACH_CLIENT_CHANNEL_WEIGHT).

The client channel weighting attribute is used so client channel definitions can be selected at random, with the larger weightings having a higher probability of selection, when more than one suitable definition is available.

The value can be 0 - 99. The default is 0.

This parameter is only valid for channels with a ChannelType of MQCHT_CLNTCONN

ClientIdentifier (MQCFST)

the clientId of the client (parameter identifier: MQCACH_CLIENT_ID).

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

ClusterNamelist (MQCFST)

Cluster namelist (parameter identifier: MQCA_CLUSTER_NAMELIST).

CLWLChannelPriority (MQCFIN)

Channel priority (parameter identifier: MQIACH_CLWL_CHANNEL_PRIORITY).

CLWLChannelRank (MQCFIN)

Channel rank (parameter identifier: MQIACH_CLWL_CHANNEL_RANK).

CLWLChannelWeight (MQCFIN)

Channel weighting (parameter identifier: MQIACH_CLWL_CHANNEL_WEIGHT).

ConnectionAffinity (MQCFIN)

Channel Affinity (parameter identifier: MQIACH_CONNECTION_AFFINITY)

The channel affinity attribute specifies whether client applications that connect multiple times using the same queue manager name, use the same client channel. The value can be any of the following values:

MQCAFTY_PREFERRED

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any zero ClientChannelWeight definitions first in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful nonzero ClientChannelWeight definitions are moved to the end of the list. Zero ClientChannelWeight definitions remain at the start of the list and are selected first for each connection. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created. Each client process with the same host name creates the same list.

MQCAFTY_PREFERRED is the default value.

MQCAFTY_NONE

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process independently select an applicable definition based on the weighting with any applicable zero ClientChannelWeight definitions selected first in alphabetical order. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created.

This parameter is only valid for channels with a ChannelType of MQCHT_CLNTCONN.

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

The maximum length of the string is MQ_CONN_NAME_LENGTH. On z/OS, it is MQ_LOCAL_ADDRESS_LENGTH.

The *ConnectionName* is a comma-separated list.

DataConversion (MQCFIN)

Whether sender must convert application data (parameter identifier: MQIACH_DATA_CONVERSION).

The value can be:

MQCDC_NO_SENDER_CONVERSION

No conversion by sender.

MQCDC_SENDER_CONVERSION

Conversion by sender.

z/OS DefaultChannelDisposition (MQCFIN)

Default channel disposition (parameter identifier: MQIACH_DEF_CHANNEL_DISP).

This parameter applies to z/OS only.

Specifies the intended disposition of the channel when active. The value can be any of the following values:

MQCHLD_PRIVATE

The intended use of the object is as a private channel.

MQCHLD_FIXSHARED

The intended use of the object is as a shared channel linked to a specific queue manager.

MQCHLD_SHARED

The intended use of the object is as a shared channel.

DiscInterval (MQCFIN)

Disconnection interval (parameter identifier: MQIACH_DISC_INTERVAL).

DefReconnect (MQCFIN)

Client channel default reconnection option (parameter identifier: MQIACH_DEF_RECONNECT).

The returned values can be:

MQRCN_NO

MQRCN_NO is the default value.

Unless overridden by **MQCONNX**, the client is not reconnected automatically.

MQRCN_YES

Unless overridden by **MQCONNX**, the client reconnects automatically.

MQRCN_Q_MGR

Unless overridden by **MQCONNX**, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO_RECONNECT_Q_MGR.

MQRCN_DISABLED

Reconnection is disabled, even if requested by the client program using the **MQCONNX** MQI call.

HeaderCompression (MQCFIL)

Header data compression techniques supported by the channel (parameter identifier: MQIACH_HDR_COMPRESSION). For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference.

The value can be one, or more, of

MQCOMPRESS_NONE

No header data compression is performed.

MQCOMPRESS_SYSTEM

Header data compression is performed.

HeartbeatInterval (MQCFIN)

Heartbeat interval (parameter identifier: MQIACH_HB_INTERVAL).

InDoubtInbound (MQCFIN)

Number of inbound messages to the client that are in doubt (Parameter identifier: MQIACH_IN_DOUBT_IN).

InDoubtOutbound (MQCFIN)

Number of outbound messages from the client that are in doubt (Parameter identifier: MQIACH_IN_DOUBT_OUT).

KeepAliveInterval (MQCFIN)

KeepAlive interval (parameter identifier: MQIACH_KEEP_ALIVE_INTERVAL).

LastMsgTime (MQCFST)

The time that the last message was sent or received (parameter identifier: MQCACH_LAST_MSG_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

LocalAddress (MQCFST)

Local communications address for the channel (parameter identifier: MQCACH_LOCAL_ADDRESS).

The maximum length of the string is MQ_LOCAL_ADDRESS_LENGTH.

LongRetryCount (MQCFIN)

Long retry count (parameter identifier: MQIACH_LONG_RETRY).

LongRetryInterval (MQCFIN)

Long timer (parameter identifier: MQIACH_LONG_TIMER).

MaxInstances (MQCFIN)

Maximum number of simultaneous instances of a server-connection channel (parameter identifier: MQIACH_MAX_INSTANCES).

This parameter is returned only for server-connection channels in response to an Inquire Channel call with ChannelAttrs including MQIACF_ALL or MQIACH_MAX_INSTANCES.

MaxInstancesPerClient (MQCFIN)

Maximum number of simultaneous instances of a server-connection channel that can be started from a single client (parameter identifier: MQIACH_MAX_INSTS_PER_CLIENT).

This parameter is returned only for server-connection channels in response to an Inquire Channel call with ChannelAttrs including MQIACF_ALL or MQIACH_MAX_INSTS_PER_CLIENT.

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: MQIACH_MAX_MSG_LENGTH).

MCAName (MQCFST)

Message channel agent name (parameter identifier: MQCACH_MCA_NAME).

The maximum length of the string is MQ_MCA_NAME_LENGTH.

MCAType (MQCFIN)

Message channel agent type (parameter identifier: MQIACH_MCA_TYPE).

The value can be any of the following values:

MQMCAT_PROCESS

Process.

MQMCAT_THREAD

Thread (Windows only).

MCAUserIdentifier (MQCFST)

Message channel agent user identifier (parameter identifier: MQCACH_MCA_USER_ID).

Note: An alternative way of providing a user ID for a channel to run under is to use channel authentication records. With channel authentication records, different connections can use the same channel while using different credentials. If both MCAUSER on the channel is set and channel authentication records are used to apply to the same channel, the channel authentication records take precedence. The MCAUSER on the channel definition is only used if the channel authentication record uses USERSRC(CHANNEL). For more details, see [Channel authentication records](#)

The maximum length of the MCA user identifier depends on the environment in which the MCA is running. MQ_MCA_USER_ID_LENGTH gives the maximum length for the environment for which your application is running. MQ_MAX_MCA_USER_ID_LENGTH gives the maximum for all supported environments.

On Windows, the user identifier might be qualified with the domain name in the following format:

user@domain

MessageCompression (MQCFIL)

Message data compression techniques supported by the channel (parameter identifier: MQIACH_MSG_COMPRESSION). For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference.

The value can be one, or more, of:

MQCOMPRESS_NONE

No message data compression is performed.

MQCOMPRESS_RLE

Message data compression is performed using run-length encoding.

MQCOMPRESS_ZLIBFAST

Message data compression is performed using ZLIB encoding with speed prioritized.

MQCOMPRESS_ZLIBHIGH

Message data compression is performed using ZLIB encoding with compression prioritized.

MQCOMPRESS_ANY

Any compression technique supported by the queue manager can be used. MQCOMPRESS_ANY is only valid for receiver, requester, and server-connection channels.

ModeName (MQCFST)

Mode name (parameter identifier: MQCACH_MODE_NAME).

The maximum length of the string is MQ_MODE_NAME_LENGTH.

MsgExit (MQCFST)

Message exit name (parameter identifier: MQCACH_MSG_EXIT_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

Multi On Multiplatforms, if more than one message exit has been defined for the channel, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

MsgsReceived (MQCFIN64)

The number of messages received by the client since it last connected (parameter identifier: MQIACH_MSGS_RECEIVED / MQIACH_MSGS_RCVD).

MsgRetryCount (MQCFIN)

Message retry count (parameter identifier: MQIACH_MR_COUNT).

MsgRetryExit (MQCFST)

Message retry exit name (parameter identifier: MQCACH_MR_EXIT_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

MsgRetryInterval (MQCFIN)

Message retry interval (parameter identifier: MQIACH_MR_INTERVAL).

MsgRetryUserData (MQCFST)

Message retry exit user data (parameter identifier: MQCACH_MR_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

MsgsSent (MQCFIN64)

The number of messages sent by the client since it last connected (parameter identifier: MQIACH_MSGS_SENT).

MsgUserData (MQCFST)

Message exit user data (parameter identifier: MQCACH_MSG_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

Multi On Multiplatforms, if more than one message exit has been defined for the channel, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

NetworkPriority (MQCFIN)

Network priority (parameter identifier: MQIACH_NETWORK_PRIORITY).

NonPersistentMsgSpeed (MQCFIN)

Speed at which non-persistent messages are to be sent (parameter identifier: MQIACH_NPM_SPEED).

The value can be:

MQNPMS_NORMAL

Normal speed.

MQNPMS_FAST

Fast speed.

Password (MQCFST)

Password (parameter identifier: MQCACH_PASSWORD).

If a nonblank password is defined, it is returned as asterisks. Otherwise, it is returned as blanks.

The maximum length of the string is MQ_PASSWORD_LENGTH. However, only the first 10 characters are used.

PropertyControl (MQCFIN)

Property control attribute (parameter identifier MQIA_PROPERTY_CONTROL).

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor). The value can be any of the following values:

MQPROP_COMPATIBILITY

Message properties	Result
The message contains a property with a prefix of mcd. , jms. , usr. or mqext.	All optional message properties (where the Support value is MQPD_SUPPORT_OPTIONAL), except those properties in the message descriptor or extension, are placed in one or more MQRFH2 headers in the message data before the message is sent to the remote queue manager.
The message does not contain a property with a prefix of mcd. , jms. , usr. or mqext.	All message properties, except those properties in the message descriptor or extension, are removed from the message before the message is sent to the remote queue manager.
The message contains a property where the Support field of the property descriptor is not set to MQPD_SUPPORT_OPTIONAL	The message is rejected with reason MQRC_UNSUPPORTED_PROPERTY and treated in accordance with its report options.
The message contains one or more properties where the Support field of the property descriptor is set to MQPD_SUPPORT_OPTIONAL but other fields of the property descriptor are set to non-default values	The properties with non-default values are removed from the message before the message is sent to the remote queue manager.
The MQRFH2 folder that would contain the message property needs to be assigned with the <i>content='properties'</i> attribute	The properties are removed to prevent MQRFH2 headers with unsupported syntax flowing to a V6 or prior queue manager.

MQPROP_NONE

All properties of the message, except those properties in the message descriptor or extension, are removed from the message before the message is sent to the remote queue manager.

If the message contains a property where the **Support** field of the property descriptor is not set to MQPD_SUPPORT_OPTIONAL then the message is rejected with reason MQRC_UNSUPPORTED_PROPERTY and treated in accordance with its report options.

MQPROP_ALL

All properties of the message are included with the message when it is sent to the remote queue manager. The properties, except those properties in the message descriptor (or extension), are placed in one or more MQRFH2 headers in the message data.

This attribute is applicable to Sender, Server, Cluster Sender, and Cluster Receiver channels.

PutAuthority (MQCFIN)

Put authority (parameter identifier: MQIACH_PUT_AUTHORITY).

The value can be any of the following values:

MQPA_DEFAULT

Default user identifier is used.

MQPA_CONTEXT

Context user identifier is used.

QMgrName (MQCFST)

Queue manager name (parameter identifier: MQCA_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

z/OS QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid only on z/OS. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

ReceiveExit (MQCFST)

Receive exit name (parameter identifier: MQCACH_RCV_EXIT_NAME).

The maximum length of the exit name depends on the environment in which the exit is running.

MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

Multi On Multiplatforms, if more than one receive exit has been defined for the channel, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

ReceiveUserData (MQCFST)

Receive exit user data (parameter identifier: MQCACH_RCV_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

Multi On Multiplatforms, if more than one receive exit user data string has been defined for the channel, the list of strings is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

ResetSeq (MQCFIN)

Pending reset sequence number (parameter identifier: MQIACH_RESET_REQUESTED).

This is the sequence number from an outstanding request and it indicates a user Reset Channel command request is outstanding.

A value of zero indicates that there is no outstanding Reset Channel. The value can be in the range 1 - 999999999.

Possible return values include MQCHRR_RESET_NOT_REQUESTED.

This parameter is not applicable on z/OS.

SecurityExit (MQCFST)

Security exit name (parameter identifier: MQCACH_SEC_EXIT_NAME).

The maximum length of the exit name depends on the environment in which the exit is running.

MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

SecurityUserData (MQCFST)

Security exit user data (parameter identifier: MQCACH_SEC_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

SendExit (MQCFST)

Send exit name (parameter identifier: MQCACH_SEND_EXIT_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

Multi On Multiplatforms, if more than one send exit has been defined for the channel, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

SendUserData (MQCFST)

Send exit user data (parameter identifier: MQCACH_SEND_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

Multi On Multiplatforms, if more than one send exit user data string has been defined for the channel, the list of strings is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

SeqNumberWrap (MQCFIN)

Sequence wrap number (parameter identifier: MQIACH_SEQUENCE_NUMBER_WRAP).

SharingConversations (MQCFIN)

Number of sharing conversations (parameter identifier: MQIACH_SHARING_CONVERSATIONS).

This parameter is returned only for TCP/IP client-connection and server-connection channels.

ShortRetryCount (MQCFIN)

Short retry count (parameter identifier: MQIACH_SHORT_RETRY).

ShortRetryInterval (MQCFIN)

Short timer (parameter identifier: MQIACH_SHORT_TIMER).

SSLCipherSpec (MQCFST)

CipherSpec (parameter identifier: MQCACH_SSL_CIPHER_SPEC).

The length of the string is MQ_SSL_CIPHER_SPEC_LENGTH.

SSLCipherSuite (MQCFST)

CipherSuite (parameter identifier: MQCACH_SSL_CIPHER_SUITE).

The length of the string is MQ_SSL_CIPHER_SUITE_LENGTH.

SSLClientAuth (MQCFIN)

Client authentication (parameter identifier: MQIACH_SSL_CLIENT_AUTH).

The value can be

MQSCA_REQUIRED

Client authentication required

MQSCA_OPTIONAL

Client authentication is optional.

The following value is also valid for Channels of type MQCHT_MQTT:

MQSCA_NEVER_REQUIRED

Client authentication is never required, and must not be provided.

Defines whether IBM MQ requires a certificate from the TLS client.

SSLPeerName (MQCFST)

Peer name (parameter identifier: MQCACH_SSL_PEER_NAME).

Note: An alternative way of restricting connections into channels by matching against the TLS Subject Distinguished Name, is to use channel authentication records. With channel authentication records, different TLS Subject Distinguished Name patterns can be applied to the same channel. If both SSLPEER on the channel and a channel authentication record are used to apply to the same channel, the inbound certificate must match both patterns in order to connect. For more information, see [Channel authentication records](#).

The length of the string is MQ_SSL_PEER_NAME_LENGTH. On z/OS, it is MQ_SSL_SHORT_PEER_NAME_LENGTH.

Specifies the filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel. (A Distinguished Name is the identifier of the TLS certificate.) If the Distinguished Name in the certificate received from the peer does not match the SSLPEER filter, the channel does not start.

TpName (MQCFST)

Transaction program name (parameter identifier: MQCACH_TP_NAME).

The maximum length of the string is MQ_TP_NAME_LENGTH.

TransportType (MQCFIN)

Transmission protocol type (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value might be:

MQXPT_LU62

LU 6.2.

MQXPT_TCP

TCP.

MQXPT_NETBIOS

NetBIOS.

MQXPT_SPX

SPX.

MQXPT_DECNET

DECnet.

UseDLQ (MQCFIN)

Whether the dead-letter queue (or undelivered message queue) should be used when messages cannot be delivered by channels (parameter identifier: MQIA_USE_DEAD_LETTER_Q).

The value might be:

MQUSEDLQ_NO

Messages that cannot be delivered by a channel will be treated as a failure and either the channel will discard them, or the channel will end, in accordance with the setting of NPMSPEED.

MQUSEDLQ_YES

If the queue manager DEADQ attribute provides the name of a dead-letter queue then it will be used, otherwise the behavior will be as for MQUSEDLQ_NO.

UserIdentifier (MQCFST)

Task user identifier (parameter identifier: MQCACH_USER_ID).

The maximum length of the string is MQ_USER_ID_LENGTH. However, only the first 10 characters are used.

XmitQName (MQCFST)

Transmission queue name (parameter identifier: MQCACH_XMIT_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

Inquire Channel Authentication Records

The Inquire Channel Authentication Records (MQCMD_INQUIRE_CHLAUTH_RECS) command retrieves the allowed partner details and mappings to MCAUSER for a channel or set of channels.

Required parameters

generic-channel-name (MQCFST)

The name of the channel or set of channels on which you are inquiring (parameter identifier: MQCACH_CHANNEL_NAME).

You can use the asterisk (*) as a wildcard to specify a set of channels, unless you set Match to MQMATCH_RUNCHECK. If you set Type to BLOCKADDR, you must set the generic channel name to a single asterisk, which matches all channel names.

Optional parameters

Address (MQCFST)

The IP address to be mapped (parameter identifier: MQCACH_CONNECTION_NAME).

This parameter is valid only when **Match** is MQMATCH_RUNCHECK and must not be generic.

ByteStringFilterCommand (MQCFBF)

Byte string filter command descriptor. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFBF - PCF byte string filter parameter” on page 1847](#) for information about using this filter condition.

If you specify a byte string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter, or a string filter using the **StringFilterCommand** parameter.

ChannelAuthAttrs (MQCFIL)

Authority record attributes (parameter identifier: MQIACF_CHLAUTH_ATTRS).

You can specify the following value in the attribute list on its own. This is the default value if the parameter is not specified.

MQIACF_ALL

All attributes.

If MQIACF_ALL is not specified, specify a combination of the following values:

MQCA_ALTERATION_DATE

Alteration Date.

MQCA_ALTERATION_TIME

Alteration Time.

MQCA_CHLAUTH_DESC

Description.

MQCA_CUSTOM

Custom.

MQCACH_CONNECTION_NAME

IP address filter.

MQCACH_MCA_USER_ID

MCA User ID mapped on the record.

MQIACH_USER_SOURCE

The source of the user ID for this record.

MQIACH_WARNING

Warning mode.

CheckClient (MQCFIN)

The user ID and password requirements for the client connection to be successful. The following values are valid:

MQCHK_REQUIRED_ADMIN

A valid user ID and password are required for the connection to be allowed if you are using a privileged user ID.

Any connections using a non-privileged user ID are not required to provide a user ID and password.

The user ID and password are checked against the user repository details provided in an authentication information object, and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

A privileged user is one that has full administrative authorities for IBM MQ. See [Privileged users](#) for more information.

This option is not valid on z/OS platforms.

MQCHK_REQUIRED

A valid user ID and password are required for the connection to be allowed.

The user ID and password are checked against the user repository details provided in an authentication information object and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

MQCHK_AS_Q_MGR

In order for the connection to be allowed, it must meet the connection authentication requirements defined on the queue manager.

If the CONNAUTH field provides an authentication information object, and the value of CHCKCLNT is REQUIRED, the connection fails unless a valid user ID and password are supplied.

If the CONNAUTH field does not provide an authentication information object, or the value of CHCKCLNT is not REQUIRED, the user ID and password are not required.

Attention: If you select MQCHK_REQUIRED or MQCHK_REQUIRED_ADMIN on [Multiplatforms](#) and you have not set the **Connauth** field on the queue manager, or if the value of **CheckClient** is None, the connection fails. On Multiplatforms, you receive message AMQ9793. On z/OS, you receive message CSQX793E.

ClntUser (MQCFST)

The client asserted user ID to be mapped to a new user ID, allowed through unchanged, or blocked (parameter identifier: MQCACH_CLIENT_USER_ID).

This can be the user ID flowed from the client indicating the user ID the client side process is running under, or the user ID presented by the client on an MQCONN call using MQCSP.

This parameter is valid only with TYPE(USERMAP) and when **Match** is MQMATCH_RUNCHECK.

z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following values:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which the command was entered, you must be using a queue sharing group environment, and the command server must be enabled.

- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1852 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or a string filter using the **StringFilterCommand** parameter.

Match (MQCFIN)

Indicates the type of matching to be applied (parameter identifier MQIACH_MATCH). You can specify any one of the following values:

MQMATCH_RUNCHECK

A specific match is made against the supplied channel name and optionally supplied **Address**, **SSLPeer**, **QMName**, and **ClntUser** attributes to find the channel authentication record that will be matched by the channel at runtime if it connects into this queue manager. If the record discovered has **Warn** set to MQWARN_YES, a second record might also be displayed to show the actual record the channel will use at runtime. The channel name supplied in this case cannot be generic. This option must be combined with **Type** MQCAUT_ALL.

MQMATCH_EXACT

Return only those records which exactly match the channel profile name supplied. If there are no asterisks in the channel profile name, this option returns the same output as MQMATCH_GENERIC.

MQMATCH_GENERIC

Any asterisks in the channel profile name are treated as wildcards. If there are no asterisks in the channel profile name, this returns the same output as MQMATCH_EXACT. For example, a profile of ABC* could result in records for ABC, ABC*, and ABCD being returned.

MQMATCH_ALL

Return all possible records that match the channel profile name supplied. If the channel name is generic in this case, all records that match the channel name are returned even if more specific matches exist. For example, a profile of SYSTEM.*.SVRCONN could result in records for SYSTEM.*, SYSTEM.DEF.*, SYSTEM.DEF.SVRCONN, and SYSTEM.ADMIN.SVRCONN being returned.

QMName (MQCFST)

The name of the remote partner queue manager to be matched (parameter identifier: MQCA_REMOTE_Q_MGR_NAME).

This parameter is valid only when **Match** is MQMATCH_RUNCHECK. The value cannot be generic.

SSLCertIssuer (MQCFST)

This parameter is additional to the **SSLPeer** parameter.

SSLCertIssuer restricts matches to being within certificates issued by a particular Certificate Authority.

SSLPeer (MQCFST)

The Distinguished Name of the certificate to be matched (parameter identifier: MQCACH_SSL_PEER_NAME).

This parameter is valid only when **Match** is MQMATCH_RUNCHECK.

The **SSLPeer** value is specified in the standard form used to specify a Distinguished Name and cannot be a generic value.

The maximum length of the parameter is MQ_SSL_PEER_NAME_LENGTH.

StringFilterCommand (MQCFSF)

String filter command descriptor. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1859 for information about using this filter condition.

If you specify a string filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or an integer filter using the **IntegerFilterCommand** parameter.

Type (MQCFIN)

The type of channel authentication record for which to set allowed partner details or mappings to MCAUSER (parameter identifier: MQIACF_CHLAUTH_TYPE). The following values are valid:

MQCAUT_BLOCKUSER

This channel authentication record prevents a specified user or users from connecting.

MQCAUT_BLOCKADDR

This channel authentication record prevents connections from a specified IP address or addresses.

MQCAUT_SSLPEERMAP

This channel authentication record maps TLS Distinguished Names (DNs) to MCAUSER values.

MQCAUT_ADDRESSMAP

This channel authentication record maps IP addresses to MCAUSER values.

MQCAUT_USERMAP

This channel authentication record maps asserted user IDs to MCAUSER values.

MQCAUT_QMGRMAP

This channel authentication record maps remote queue manager names to MCAUSER values.

MQCAUT_ALL

Inquire on all types of record. This is the default value.

Related concepts

[Channel authentication records](#)

Inquire Channel Authentication Records (Response)

The response to the Inquire Channel Authentication Records (MQCMD_INQUIRE_CHLAUTH_RECS) command consists of the response header followed by the requested combination of attribute parameter structures.

Always returned:

ChlAuth, Type, Warn (yes)

Always returned if type is MQCAUT_BLOCKUSER:

UserList

Always returned if type is MQCAUT_BLOCKADDR:

AddrList

Always returned if type is MQCAUT_SSLPEERMAP:

Address (unless blanks), MCAUser (unless blanks), SSLCertIssuer, SSLPeer, UserSrc

Always returned if type is MQCAUT_ADDRESSMAP:

Address (unless blanks), MCAUser (unless blanks), UserSrc

Always returned if type is MQCAUT_USERMAP:

Address (unless blanks), CIntUser, MCAUser (unless blanks), UserSrc

Always returned if type is MQCAUT_QMGRMAP:

Address (unless blanks), MCAUser (unless blanks), QMName, UserSrc

Returned if requested:

Address, AlterationDate, AlterationTime, Custom, Description, MCAUser, SSLPeer, UserSrc, Warn

Response data

AlterationDate (MQCFST)

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered, in the form hh.mm.ss.

Address (MQCFST)

The filter used to compare with the IP address, or host name, of the partner queue manager or client at the other end of the channel (parameter identifier: MQCACH_CONNECTION_NAME).

AddrList (MQCFSL)

A list of up to 100 IP address patterns which are banned from accessing this queue manager on any channel (parameter identifier: MQCACH_CONNECTION_NAME_LIST).

Chlauth (MQCFST)

The name of the channel, or pattern that matches a set of channels, to which the channel authentication record applies (parameter identifier: MQCACH_CHANNEL_NAME).

CheckClient (MQCFIN)

The user ID and password requirements for the client connection to be successful (parameter identifier: MQIA_CHECK_CLIENT_BINDING).

ClntUser (MQCFST)

The client asserted user ID to be mapped to a new user ID, allowed through unchanged, or blocked (parameter identifier: MQCACH_CLIENT_USER_ID).

Description (MQCFST)

Descriptive information about the channel authentication record (parameter identifier: MQCA_CHLAUTH_DESC).

MCAUser (MQCFST)

The user identifier to be used when the inbound connection matches the TLS DN, IP address, client asserted user ID or remote queue manager name supplied (parameter identifier: MQCACH_MCA_USER_ID).

QMName (MQCFST)

The name of the remote partner queue manager to be mapped to a user ID, allowed through unchanged, or blocked (parameter identifier: MQCA_REMOTE_Q_MGR_NAME).

SSLCertIssuer (MQCFST)

This parameter is additional to the **SSLPeer** parameter.

SSLCertIssuer restricts matches to being within certificates issued by a particular Certificate Authority (parameter identifier: MQCA_SSL_CERT_ISSUER_NAME).

SSLPeer (MQCFST)

The filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel (parameter identifier: MQCACH_SSL_PEER_NAME).

Type (MQCFIN)

The type of channel authentication record for which to set allowed partner details or mappings to MCAUSER (parameter identifier: MQIACF_CHLAUTH_TYPE). The following values can be returned:

MQCAUT_BLOCKUSER

This channel authentication record prevents a specified user or users from connecting.

MQCAUT_BLOCKADDR

This channel authentication record prevents connections from a specified IP address or addresses.

MQCAUT_SSLPEERMAP

This channel authentication record maps TLS Distinguished Names (DNs) to MCAUSER values.

MQCAUT_ADDRESSMAP

This channel authentication record maps IP addresses to MCAUSER values.

MQCAUT_USERMAP

This channel authentication record maps asserted user IDs to MCAUSER values.

MQCAUT_QMGRMAP

This channel authentication record maps remote queue manager names to MCAUSER values.

UserList (MQCFSL)

A list of up to 100 user IDs which are banned from use of this channel or set of channels (parameter identifier: MQCACH_MCA_USER_ID_LIST). Use the special value *MQADMIN to mean privileged or administrative users. The definition of this value depends on the operating system, as follows:

- On Windows, all members of the mqm group, the Administrators group and SYSTEM.
- On UNIX and Linux, all members of the mqm group.
- On IBM i, the profiles (users) qmqm and qmqmadm and all members of the qmqmadm group, and any user defined with the *ALLOBJ special setting.
- On z/OS, the user ID that the channel initiator, queue manager and advanced message security address spaces are running under.

UserSrc (MQCFIN)

The source of the user ID to be used for MCAUSER at run time (parameter identifier: MQIACH_USER_SOURCE).

The following values can be returned:

MQUSRC_MAP

Inbound connections that match this mapping use the user ID specified in the **MCAUser** attribute.

MQUSRC_NOACCESS

Inbound connections that match this mapping have no access to the queue manager and the channel ends immediately.

MQUSRC_CHANNEL

Inbound connections that match this mapping use the flowed user ID or any user defined on the channel object in the MCAUSER field.

Warn (MQCFIN)

Indicates whether this record operates in warning mode (parameter identifier: MQIACH_WARNING).

MQWARN_NO

This record does not operate in warning mode. Any inbound connection that matches this record is blocked. This is the default value.

MQWARN_YES

This record operates in warning mode. Any inbound connection that matches this record and would therefore be blocked is allowed access. An error message is written and, if events are configured, an event message is created showing the details of what would have been blocked. The connection is allowed to continue.

Inquire Channel Initiator on z/OS

The Inquire Channel Initiator (MQCMD_INQUIRE_CHANNEL_INIT) command returns information about the channel initiator.

Optional parameters**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Inquire Channel Initiator (Response) on z/OS

The response to the Inquire Channel Initiator (MQCMD_INQUIRE_CHANNEL_INIT) command consists of one response with a series of attribute parameter structures showing the status of the channel initiator (shown by the *ChannelInitiatorStatus* parameter), and one response for each listener (shown by the **ListenerStatus** parameter).

Always returned (one message with channel initiator information):

ActiveChannels, ActiveChannelsMax, ActiveChannelsPaused, ActiveChannelsRetrying, ActiveChannelsStarted, ActiveChannelsStopped, AdaptersMax, AdaptersStarted, ChannelInitiatorStatus, CurrentChannels, CurrentChannelsLU62, CurrentChannelsMax, CurrentChannelsTCP, DispatchersMax, DispatchersStarted, SSLTasksStarted, TCPName

Always returned (one message for each listener):

InboundDisposition, ListenerStatus, TransportType

Returned if applicable for the listener:

IPAddress, LUName, Port

Response data - channel initiator information

ActiveChannels (MQCFIN)

The number of active channel connections (parameter identifier: MQIACH_ACTIVE_CHL).

ActiveChannelsMax (MQCFIN)

The requested number of active channel connections (parameter identifier: MQIACH_ACTIVE_CHL_MAX).

ActiveChannelsPaused (MQCFIN)

The number of active channel connections that have paused, waiting to become active, because the limit for active channels has been reached (parameter identifier: MQIACH_ACTIVE_CHL_PAUSED).

ActiveChannelsRetrying (MQCFIN)

The number of active channel connections that are attempting to reconnect following a temporary error (parameter identifier: MQIACH_ACTIVE_CHL_RETRY).

ActiveChannelsStarted (MQCFIN)

The number of active channel connections that have started (parameter identifier: MQIACH_ACTIVE_CHL_STARTED).

ActiveChannelsStopped (MQCFIN)

The number of active channel connections that have stopped, requiring manual intervention (parameter identifier: MQIACH_ACTIVE_CHL_STOPPED).

AdaptersMax (MQCFIN)

The requested number of adapter subtasks (parameter identifier: MQIACH_ADAPS_MAX).

AdaptersStarted (MQCFIN)

The number of active adapter subtasks (parameter identifier: MQIACH_ADAPS_STARTED).

ChannelInitiatorStatus (MQCFIN)

Status of the channel initiator (parameter identifier: MQIACF_CHINIT_STATUS).

The value can be:

MQSVC_STATUS_STOPPED

The channel initiator is not running.

MQSVC_STATUS_RUNNING

The channel initiator is fully initialized and is running.

CurrentChannels (MQCFIN)

The number of current channel connections (parameter identifier: MQIACH_CURRENT_CHL).

CurrentChannelsLU62 (MQCFIN)

The number of current LU 6.2 channel connections (parameter identifier: MQIACH_CURRENT_CHL_LU62).

CurrentChannelsMax (MQCFIN)

The requested number of channel connections (parameter identifier: MQIACH_CURRENT_CHL_MAX).

CurrentChannelsTCP (MQCFIN)

The number of current TCP/IP channel connections (parameter identifier: MQIACH_CURRENT_CHL_TCP).

DispatchersMax (MQCFIN)

The requested number of dispatchers (parameter identifier: MQIACH_DISPS_MAX).

DispatchersStarted (MQCFIN)

The number of active dispatchers (parameter identifier: MQIACH_DISPS_STARTED).

SSLTasksMax (MQCFIN)

The requested number of TLS server subtasks (parameter identifier: MQIACH_SSLTASKS_MAX).

SSLTasksStarted (MQCFIN)

The number of active TLS server subtasks (parameter identifier: MQIACH_SSLTASKS_STARTED).

TCPName (MQCFST)

TCP system name (parameter identifier: MQCACH_TCP_NAME).

The maximum length is MQ_TCP_NAME_LENGTH.

Response data - listener information**InboundDisposition (MQCFIN)**

Inbound transmission disposition (parameter identifier: MQIACH_INBOUND_DISP).

Specifies the disposition of the inbound transmissions that the listener handles. The value can be any of the following values:

MQINBD_Q_MGR

Handling for transmissions directed to the queue manager. MQINBD_Q_MGR is the default.

MQINBD_GROUP

Handling for transmissions directed to the queue sharing group. MQINBD_GROUP is permitted only if there is a shared queue manager environment.

IPAddress (MQCFST)

IP address on which the listener listens (parameter identifier: MQCACH_IP_ADDRESS).

ListenerStatus (MQCFIN)

Listener status (parameter identifier: MQIACH_LISTENER_STATUS).

The value can be:

MQSVC_STATUS_RUNNING

The listener has started.

MQSVC_STATUS_STOPPED

The listener has stopped.

MQSVC_STATUS_RETRYING

The listener is trying again.

LUName (MQCFST)

LU name on which the listener listens (parameter identifier: MQCACH_LU_NAME).

The maximum length is MQ_LU_NAME_LENGTH.

Port (MQCFIN)

Port number on which the listener listens (parameter identifier: MQIACH_PORT_NUMBER).

TransportType (MQCFIN)

Transmission protocol type that the listener is using (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value can be:

MQXPT_LU62

LU62.

MQXPT_TCP

TCP.

Multi Inquire Channel Listener on Multiplatforms

The Inquire Channel Listener (MQCMD_INQUIRE_LISTENER) command inquires about the attributes of existing IBM MQ listeners.

Required parameters**ListenerName (MQCFST)**

Listener name (parameter identifier: MQCACH_LISTENER_NAME).

This parameter is the name of the listener with attributes that are required. Generic listener names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all listeners having names that start with the selected character string. An asterisk on its own matches all possible names.

The listener name is always returned regardless of the attributes requested.

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

Optional parameters**IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ListenerAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1852](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

ListenerAttrs (MQCFIL)

Listener attributes (parameter identifier: MQIACF_LISTENER_ATTRS).

The attribute list might specify the following value on its own- default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_ALTERATION_DATE

Date on which the definition was last altered.

MQCA_ALTERATION_TIME

Time at which the definition was last altered.

MQCACH_IP_ADDRESS

IP address for the listener.

MQCACH_LISTENER_DESC

Description of listener definition.

MQCACH_LISTENER_NAME

Name of listener definition.

MQCACH_LOCAL_NAME

NetBIOS local name that the listener uses. MQCACH_LOCAL_NAME is valid only on Windows.

MQCACH_TP_NAME

The LU 6.2 transaction program name. MQCACH_TP_NAME is valid only on Windows.

MQIACH_ADAPTER

Adapter number on which NetBIOS listens. MQIACH_ADAPTER is valid only on Windows.

MQIACH_BACKLOG

Number of concurrent connection requests that the listener supports.

MQIACH_COMMAND_COUNT

Number of commands that the listener can use. MQIACH_COMMAND_COUNT is valid only on Windows.

MQIACH_LISTENER_CONTROL

Specifies when the queue manager starts and stops the listener.

MQIACH_NAME_COUNT

Number of names that the listener can use. MQIACH_NAME_COUNT is valid only on Windows.

MQIACH_PORT

Port number.

MQIACH_SESSION_COUNT

Number of sessions that the listener can use. MQIACH_SESSION_COUNT is valid only on Windows.

MQIACH_SOCKET

SPX socket on which to listen. MQIACH_SOCKET is valid only on Windows.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ListenerAttrs* except MQCACH_LISTENER_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1859](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

TransportType (MQCFIN)

Transport protocol type (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

If you specify this parameter, information is returned relating only to those listeners defined with the specified transport protocol type. If you specify an attribute in the *ListenerAttrs* list which is valid only for listeners of a different transport protocol type, it is ignored and no error is raised. If you specify this parameter, it must occur immediately after the **ListenerName** parameter.

If you do not specify this parameter, or if you specify it with a value of MQXPT_ALL, information about all listeners is returned. Valid attributes in the *ListenerAttrs* list which are not applicable to the listener are ignored, and no error messages are issued. The value can be any of the following values:

MQXPT_ALL

All transport types.

MQXPT_LU62

SNA LU 6.2. MQXPT_LU62 is valid only on Windows.

MQXPT_NETBIOS

NetBIOS. MQXPT_NETBIOS is valid only on Windows.

MQXPT_SPX

SPX. MQXPT_SPX is valid only on Windows.

MQXPT_TCP

Transmission Control Protocol/Internet Protocol (TCP/IP).

Multi Inquire Channel Listener (Response) on Multiplatforms

The response to the Inquire Channel Listener (MQCMD_INQUIRE_LISTENER) command consists of the response header followed by the *ListenerName* structure and the requested combination of attribute parameter structures.

If a generic listener name was specified, one such message is generated for each listener found.

Always returned:

ListenerName

Returned if requested:

Adapter, AlterationDate, AlterationTime, Backlog, Commands, IPAddress, ListenerDesc, LocalName, NetbiosNames, Port, Sessions, Socket, StartMode, Tpname, TransportType

Response data**AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date, in the form yyyy-mm-dd, on which the information was last altered.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time, in the form hh.mm.ss, at which the information was last altered.

Adapter (MQCFIN)

Adapter number (parameter identifier: MQIACH_ADAPTER).

The adapter number on which NetBIOS listens. This parameter is valid only on Windows.

Backlog (MQCFIN)

Backlog (parameter identifier: MQIACH_BACKLOG).

The number of concurrent connection requests that the listener supports.

Commands (MQCFIN)

Adapter number (parameter identifier: MQIACH_COMMAND_COUNT).

The number of commands that the listener can use. This parameter is valid only on Windows.

IPAddress (MQCFST)

IP address (parameter identifier: MQCACH_IP_ADDRESS).

IP address for the listener specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric host name form.

The maximum length of the string is MQ_CONN_NAME_LENGTH

ListenerDesc (MQCFST)

Description of listener definition (parameter identifier: MQCACH_LISTENER_DESC).

The maximum length of the string is MQ_LISTENER_DESC_LENGTH.

ListenerName (MQCFST)

Name of listener definition (parameter identifier: MQCACH_LISTENER_NAME).

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

LocalName (MQCFST)

NetBIOS local name (parameter identifier: MQCACH_LOCAL_NAME).

The NetBIOS local name that the listener uses. This parameter is valid only on Windows.

The maximum length of the string is MQ_CONN_NAME_LENGTH

NetbiosNames (MQCFIN)

NetBIOS names (parameter identifier: MQIACH_NAME_COUNT).

The number of names that the listener supports. This parameter is valid only on Windows.

Port (MQCFIN)

Port number (parameter identifier: MQIACH_PORT).

The port number for TCP/IP. This parameter is valid only if the value of *TransportType* is MQXPT_TCP.

Sessions (MQCFIN)

NetBIOS sessions (parameter identifier: MQIACH_SESSION_COUNT).

The number of sessions that the listener can use. This parameter is valid only on Windows.

Socket (MQCFIN)

SPX socket number (parameter identifier: MQIACH_SOCKET).

The SPX socket on which to listen. This parameter is valid only if the value of *TransportType* is MQXPT_SPX.

StartMode (MQCFIN)

Service mode (parameter identifier: MQIACH_LISTENER_CONTROL).

Specifies how the listener is to be started and stopped. The value can be any of the following values:

MQSVC_CONTROL_MANUAL

The listener is not to be started automatically or stopped automatically. It is to be controlled by user command. MQSVC_CONTROL_MANUAL is the default value.

MQSVC_CONTROL_Q_MGR

The listener being defined is to be started and stopped at the same time as the queue manager is started and stopped.

MQSVC_CONTROL_Q_MGR_START

The listener is to be started at the same time as the queue manager is started, but is not request to stop when the queue manager is stopped.

TPName (MQCFST)

Transaction program name (parameter identifier: MQCACH_TP_NAME).

The LU 6.2 transaction program name. This parameter is valid only on Windows.

The maximum length of the string is MQ_TP_NAME_LENGTH

TransportType (MQCFIN)

Transmission protocol (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value can be:

MQXPT_TCP

TCP.

MQXPT_LU62

LU 6.2. MQXPT_LU62 is valid only on Windows.

MQXPT_NETBIOS

NetBIOS. MQXPT_NETBIOS is valid only on Windows.

MQXPT_SPX

SPX. MQXPT_SPX is valid only on Windows.

Multi

Inquire Channel Listener Status on Multiplatforms

The Inquire Channel Listener Status (MQCMD_INQUIRE_LISTENER_STATUS) command inquires about the status of one or more IBM MQ listener instances.

You must specify the name of a listener for which you want to receive status information. You can specify a listener by using either a specific listener name or a generic listener name. By using a generic listener name, you can display either:

- Status information for all listener definitions, by using a single asterisk (*), or
- Status information for one or more listeners that match the specified name.

Required parameters

ListenerName (MQCFST)

Listener name (parameter identifier: MQCACH_LISTENER_NAME).

Generic listener names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all listeners having names that start with the selected character string. An asterisk on its own matches all possible names.

The listener name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

Optional parameters

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ListenerStatusAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1852](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

ListenerStatusAttrs (MQCFIL)

Listener status attributes (parameter identifier: MQIACF_LISTENER_STATUS_ATTRS).

The attribute list can specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCACH_IP_ADDRESS

IP address of the listener.

MQCACH_LISTENER_DESC

Description of listener definition.

MQCACH_LISTENER_NAME

Name of listener definition.

MQCACH_LISTENER_START_DATE

The date on which the listener was started.

MQCACH_LISTENER_START_TIME

The time at which the listener was started.

MQCACH_LOCAL_NAME

NetBIOS local name that the listener uses. MQCACH_LOCAL_NAME is valid only on Windows.

MQCACH_TP_NAME

LU6.2 transaction program name. MQCACH_TP_NAME is valid only on Windows.

MQIACF_PROCESS_ID

Operating system process identifier associated with the listener.

MQIACH_ADAPTER

Adapter number on which NetBIOS listens. MQIACH_ADAPTER is valid only on Windows.

MQIACH_BACKLOG

Number of concurrent connection requests that the listener supports.

MQIACH_COMMAND_COUNT

Number of commands that the listener can use. MQIACH_COMMAND_COUNT is valid only on Windows.

MQIACH_LISTENER_CONTROL

How the listener is to be started and stopped.

MQIACH_LISTENER_STATUS

Status of the listener.

MQIACH_NAME_COUNT

Number of names that the listener can use. MQIACH_NAME_COUNT is valid only on Windows.

MQIACH_PORT

Port number for TCP/IP.

MQIACH_SESSION_COUNT

Number of sessions that the listener can use. MQIACH_SESSION_COUNT is valid only on Windows.

MQIACH_SOCKET

SPX socket. MQIACH_SOCKET is valid only on Windows.

MQIACH_XMIT_PROTOCOL_TYPE

Transport type.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ListenerStatusAttrs* except MQCACH_LISTENER_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1859](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Error code

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_LSTR_STATUS_NOT_FOUND

Listener status not found.

Inquire Channel Listener Status (Response) on Multiplatforms

The response to the Inquire Channel Listener Status (MQCMD_INQUIRE_LISTENER_STATUS) command consists of the response header followed by the *ListenerName* structure and the requested combination of attribute parameter structures.

If a generic listener name was specified, one such message is generated for each listener found.

Always returned:

ListenerName

Returned if requested:

Adapter, Backlog, ChannelCount, Commands, IPAddress, ListenerDesc, LocalName, NetbiosNames, Port, ProcessId, Sessions, Socket, StartDate, StartMode, StartTime, Status, TPname, TransportType

Response data**Adapter (MQCFIN)**

Adapter number (parameter identifier: MQIACH_ADAPTER).

The adapter number on which NetBIOS listens.

Backlog (MQCFIN)

Backlog (parameter identifier: MQIACH_BACKLOG).

The number of concurrent connection requests that the listener supports.

Commands (MQCFIN)

Adapter number (parameter identifier: MQIACH_COMMAND_COUNT).

The number of commands that the listener can use.

IPAddress (MQCFST)

IP address (parameter identifier: MQCACH_IP_ADDRESS).

IP address for the listener specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric host name form.

The maximum length of the string is MQ_CONN_NAME_LENGTH

ListenerDesc (MQCFST)

Description of listener definition (parameter identifier: MQCACH_LISTENER_DESC).

The maximum length of the string is MQ_LISTENER_DESC_LENGTH.

ListenerName (MQCFST)

Name of listener definition (parameter identifier: MQCACH_LISTENER_NAME).

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

LocalName (MQCFST)

NetBIOS local name (parameter identifier: MQCACH_LOCAL_NAME).

The NetBIOS local name that the listener uses.

The maximum length of the string is MQ_CONN_NAME_LENGTH

NetbiosNames (MQCFIN)

NetBIOS names (parameter identifier: MQIACH_NAME_COUNT).

The number of names that the listener supports.

Port (MQCFIN)

Port number (parameter identifier: MQIACH_PORT).

The port number for TCP/IP.

ProcessId (MQCFIN)

Process identifier (parameter identifier: MQIACF_PROCESS_ID).

The operating system process identifier associated with the listener.

Sessions (MQCFIN)

NetBIOS sessions (parameter identifier: MQIACH_SESSION_COUNT).

The number of sessions that the listener can use.

Socket (MQCFIN)

SPX socket number (parameter identifier: MQIACH_SOCKET).

The SPX socket on which the listener is to listen.

StartDate (MQCFST)

Start date (parameter identifier: MQCACH_LISTENER_START_DATE).

The date, in the form yyyy-mm-dd, on which the listener was started.

The maximum length of the string is MQ_DATE_LENGTH

StartMode (MQCFIN)

Service mode (parameter identifier: MQIACH_LISTENER_CONTROL).

Specifies how the listener is to be started and stopped. The value can be any of the following values:

MQSVC_CONTROL_MANUAL

The listener is not to be started automatically or stopped automatically. It is to be controlled by user command. MQSVC_CONTROL_MANUAL is the default value.

MQSVC_CONTROL_Q_MGR

The listener being defined is to be started and stopped at the same time as the queue manager is started and stopped.

MQSVC_CONTROL_Q_MGR_START

The listener is to be started at the same time as the queue manager is started, but is not request to stop when the queue manager is stopped.

StartTime (MQCFST)

Start date (parameter identifier: MQCACH_LISTENER_START_TIME).

The time, in the form hh.mm.ss, at which the listener was started.

The maximum length of the string is MQ_TIME_LENGTH

Status (MQCFIN)

Listener status (parameter identifier: MQIACH_LISTENER_STATUS).

The status of the listener. The value can be any of the following values:

MQSVC_STATUS_STARTING

The listener is in the process of initializing.

MQSVC_STATUS_RUNNING

The listener is running.

MQSVC_STATUS_STOPPING

The listener is stopping.

TPName (MQCFST)

Transaction program name (parameter identifier: MQCACH_TP_NAME).

The LU 6.2 transaction program name.

The maximum length of the string is MQ_TP_NAME_LENGTH

TransportType (MQCFIN)

Transmission protocol (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value can be:

MQXPT_TCP

TCP.

MQXPT_LU62

LU 6.2. MQXPT_LU62 is valid only on Windows.

MQXPT_NETBIOS

NetBIOS. MQXPT_NETBIOS is valid only on Windows.

MQXPT_SPX

SPX. MQXPT_SPX is valid only on Windows.

Inquire Channel Names

The Inquire Channel Names (MQCMD_INQUIRE_CHANNEL_NAMES) command inquires a list of IBM MQ channel names that match the generic channel name, and the optional channel type specified.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Optional parameters

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

If present, this parameter limits the channel names returned to channels of the specified type.

The value can be any of the following values:

MQCHT_SENDER

Sender.

MQCHT_SERVER

Server.

MQCHT_RECEIVER

Receiver.

MQCHT_REQUESTER

Requester.

MQCHT_SVRCONN

Server-connection (for use by clients).

MQCHT_CLNTCONN

Client connection.

MQCHT_CLUSRCVR

Cluster-receiver.

MQCHT_CLUSSDR

Cluster-sender.

MQCHT_ALL

All types.

The default value if this parameter is not specified is MQCHT_ALL, which means that channels of all types except MQCHT_CLNTCONN are eligible.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined with either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

Error code

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_TYPE_ERROR

Channel type not valid.

Inquire Channel Names (Response)

The response to the Inquire Channel Names (MQCMD_INQUIRE_CHANNEL_NAMES) command consists of one response for each client connection channel (except for SYSTEM.DEF.CLNTCONN), and a final message with all the remaining channels.

Always returned:

ChannelNames, ChannelTypes

Returned if requested:

None

On z/OS only, one additional parameter structure (with the same number of entries as the *ChannelNames* structure), is returned. Each entry in the structure, *QSGDispositions*, indicates the disposition of the object with the corresponding entry in the *ChannelNames* structure.

Response data

ChannelNames (MQCFSL)

List of channel names (parameter identifier: MQCACH_CHANNEL_NAMES).

ChannelTypes (MQCFIL)

List of channel types (parameter identifier: MQIACH_CHANNEL_TYPES). Possible values for fields in this structure are those values permitted for the **ChannelType** parameter, except MQCHT_ALL.

QSGDispositions (MQCFIL)

List of queue sharing group dispositions (parameter identifier: MQIACF_QSG_DISPS). This parameter is valid only on z/OS. The value can be:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

Inquire Channel Status

The Inquire Channel Status (MQCMD_INQUIRE_CHANNEL_STATUS) command inquires about the status of one or more channel instances.

You must specify the name of the channel for which you want to inquire status information. This name can be a specific channel name or a generic channel name. By using a generic channel name, you can inquire either:

- Status information for all channels, or
- Status information for one or more channels that match the specified name.

You must also specify whether you want:

- The status data (of current channels only), or
- The saved status data of all channels, or
- On z/OS only, the short status data of the channel.

Status for all channels that meet the selection criteria is returned, whether the channels were defined manually or automatically.

Selection

The way to make a selection, is to use one of the following four options:

- **XmitQname** (MQCACH_XMIT_Q_NAME)
- **ConnectionName** (MQCACH_CONNECTION_NAME)
-  **ChannelDisposition** (MQIACH_CHANNEL_DISP)
- **ChannelInstanceType** (MQIACH_CHANNEL_INSTANCE_TYPE)

 This command includes a check on the current depth of the transmission queue for the channel, if the channel is a CLUSSDR channel. To issue this command, you must be authorized to inquire the queue depth, and to do this requires *+inq* authority on the transmission queue. Note that another name for this authority is MQZAO_INQUIRE.

 Without this authority this command runs without error, but a value of zero is output for the **MsgsAvailable** parameter of the “[Inquire Channel Status \(Response\)](#)” on page 1583 command. If you have the correct authority, the command provides the correct value for **MsgsAvailable**.

There are three classes of data available for channel status. These classes are **saved**, **current**, and **short**. The status fields available for saved data are a subset of the fields available for current data and are called **common** status fields. Although the common data *fields* are the same, the data *values* might be different for saved and current status. The rest of the fields available for current data are called **current-only** status fields.

- **Saved** data consists of the common status fields. This data is reset at the following times:
 - For all channels:
 - When the channel enters or leaves STOPPED or RETRY state
 - For a sending channel:
 - Before requesting confirmation that a batch of messages has been received
 - When confirmation has been received
 - For a receiving channel:
 - Just before confirming that a batch of messages has been received
 - For a server connection channel:
 - No data is saved

Therefore, a channel which has never been current does not have any saved status.

- **Current** data consists of the common status fields and current-only status fields. The data fields are continually updated as messages are sent or received.
- **Short** data consists of the queue manager name that owns the channel instance. This class of data is available only on z/OS.

This method of operation has the following consequences:

- An inactive channel might not have any saved status if it has never been current or has not yet reached a point where saved status is reset.
- The "common" data fields might have different values for saved and current status.
- A current channel always has current status and might have saved status.

Channels can be current or inactive:

Current channels

These are channels that have been started, or on which a client has connected, and that have not finished or disconnected normally. They might not yet have reached the point of transferring messages, or data, or even of establishing contact with the partner. Current channels have **current** status and can also have **saved** or **short** status.

The term **Active** is used to describe the set of current channels which are not stopped.

Inactive channels

These are channels that have either not been started or on which a client has not connected, or that have finished or disconnected normally. (If a channel is stopped, it is not yet considered to have finished normally and is, therefore, still current.) Inactive channels have either **saved** status or no status at all.

There can be more than one instance of a receiver, requester, cluster-sender, cluster-receiver, or server-connection channel current at the same time (the requester is acting as a receiver). This situation occurs if several senders, at different queue managers, each initiate a session with this receiver, using the same channel name. For channels of other types, there can only be one instance current at any time.

For all channel types, however, there can be more than one set of saved status information available for a particular channel name. At most one of these sets relates to a current instance of the channel, the rest relate to previously current instances. Multiple instances arise if different transmission queue names or connection names have been used with the same channel. This situation can happen in the following cases:

- At a sender or server:
 - If the same channel has been connected to by different requesters (servers only),
 - If the transmission queue name has been changed in the definition, or
 - If the connection name has been changed in the definition.
- At a receiver or requester:
 - If the same channel has been connected to by different senders or servers, or
 - If the connection name has been changed in the definition (for requester channels initiating connection).

The number of sets returned for a particular channel can be limited by using the **XmitQName**, **ConnectionName** and **ChannelInstanceType** parameters.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The channel name is always returned, regardless of the instance attributes requested.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Optional parameters

ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH_CHANNEL_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels for which information is to be returned. The value can be any of the following values:

MQCHLD_ALL

Returns requested status information for private channels.

In a shared queue environment where the command is being executed on the queue manager where it was issued, or if *ChannelInstanceType* has a value of MQOT_CURRENT_CHANNEL, this option also displays the requested status information for shared channels.

MQCHLD_PRIVATE

Returns requested status information for private channels.

MQCHLD_SHARED

Returns requested status information for shared channels.

The status information that is returned for various combinations of *ChannelDisposition* , *CommandScope* , and status type, is summarized in [Table 98 on page 1571](#), [Table 99 on page 1571](#), and [Table 100 on page 1572](#).

Table 98. ChannelDisposition and CommandScope for Inquire Channel Status, Current

ChannelDisposition	CommandScope blank or local queue manager	CommandScope (qmgr-name)	CommandScope (*)
MQCHLD_PRIVATE	Common and current-only status for current private channels on the local queue manager	Common and current-only status for current private channels on the named queue manager	Common and current-only status for current private channels on all queue managers
MQCHLD_SHARED	Common and current-only status for current shared channels on the local queue manager	Common and current-only status for current shared channels on the named queue manager	Common and current-only status for current shared channels on all queue managers
MQCHLD_ALL	Common and current-only status for current private and shared channels on the local queue manager	Common and current-only status for current private and shared channels on the named queue manager	Common and current-only status for current private and shared channels on all active queue managers

Table 99. ChannelDisposition and CommandScope for Inquire Channel Status, Short

ChannelDisposition	CommandScope blank or local queue manager	CommandScope (qmgr-name)	CommandScope (*)
MQCHLD_PRIVATE	<i>ChannelStatus</i> and short status for current private channels on the local queue manager	<i>ChannelStatus</i> and short status for current private channels on the named queue manager	<i>ChannelStatus</i> and short status for current private channels on all active queue managers
MQCHLD_SHARED	<i>ChannelStatus</i> and short status for current shared channels on all active queue managers in the queue sharing group	Not permitted	Not permitted
MQCHLD_ALL	<i>ChannelStatus</i> and short status for current private channels on the local queue manager and current shared channels in the queue sharing group(“1” on page 1571)	<i>ChannelStatus</i> and short status for current private channels on the named queue manager	<i>ChannelStatus</i> and short status for current private, and shared, channels on all active queue managers in the queue sharing group(“1” on page 1571)

Note:

1. In this case you get two separate sets of responses to the command on the queue manager where it was entered; one for MQCHLD_PRIVATE and one for MQCHLD_SHARED.

Table 100. ChannelDisposition and CommandScope for Inquire Channel Status, Saved

ChannelDisposition	CommandScope blank or local queue manager	CommandScope (qmgr-name)	CommandScope (*)
MQCHLD_PRIVATE	Common status for saved private channels on the local queue manager	Common status for saved private channels on the named queue manager	Common status for saved private channels on all active queue managers
MQCHLD_SHARED	Common status for saved shared channels on all active queue managers in the queue sharing group	Not permitted	Not permitted
MQCHLD_ALL	Common status for saved private channels on the local queue manager and saved shared channels in the queue sharing group	Common status for saved private channels on the named queue manager	Common status for saved private, and shared, channels on all active queue managers in the queue sharing group

You cannot use this parameter as a filter keyword.

ChannelInstanceAttrs (MQCFIL)

Channel instance attributes (parameter identifier: MQIACH_CHANNEL_INSTANCE_ATTRS).

The **ChannelInstanceAttrs** parameter names the list of attributes to be returned. This parameter does not provide any way to select, based upon the value of the items in that list of attributes.

If status information is requested which is not relevant for the particular channel type, it is not an error. Similarly, it is not an error to request status information that is applicable only to active channels for saved channel instances. In both of these cases, no structure is returned in the response for the information concerned.

For a saved channel instance, the MQCACH_CURRENT_LUWID, MQIACH_CURRENT_MSGS, and MQIACH_CURRENT_SEQ_NUMBER attributes have meaningful information only if the channel instance is in doubt. However, the attribute values are still returned when requested, even if the channel instance is not in-doubt.

The attribute list might specify the following value on its own:

MQIACF_ALL

All attributes.

MQIACF_ALL is the default value used if the parameter is not specified or it can specify a combination of the following:

- Relevant for common status:

The following information applies to all sets of channel status, whether the set is current.

MQCACH_CHANNEL_NAME

Channel name.

MQCACH_CONNECTION_NAME

Connection name.

MQCACH_CURRENT_LUWID

Logical unit of work identifier for current batch.

MQCACH_LAST_LUWID

Logical unit of work identifier for last committed batch.

MQCACH_XMIT_Q_NAME

Transmission queue name.

MQIACH_CHANNEL_INSTANCE_TYPE

Channel instance type.

MQIACH_CHANNEL_TYPE

Channel type.

MQIACH_CURRENT_MSGS

Number of messages sent or received in current batch.

MQIACH_CURRENT_SEQ_NUMBER

Sequence number of last message sent or received.

MQIACH_INDOUBT_STATUS

Whether the channel is currently in-doubt.

MQIACH_LAST_SEQ_NUMBER

Sequence number of last message in last committed batch.

MQCACH_CURRENT_LUWID, MQCACH_LAST_LUWID, MQIACH_CURRENT_MSGS, MQIACH_CURRENT_SEQ_NUMBER, MQIACH_INDOUBT_STATUS and MQIACH_LAST_SEQ_NUMBER do not apply to server-connection channels, and no values are returned. If specified on the command, they are ignored.

- Relevant for current-only status:

The following information applies only to current channel instances. The information applies to all channel types, except where stated.

MQCA_Q_MGR_NAME

Name of the queue manager that owns the channel instance. This parameter is valid only on z/OS.

MQCA_REMOTE_Q_MGR_NAME

Queue manager name, or queue sharing group name of the remote system. The remote queue manager name is always returned regardless of the instance attributes requested.

MQCACH_CHANNEL_START_DATE

Date channel was started.

MQCACH_CHANNEL_START_TIME

Time channel was started.

MQCACH_LAST_MSG_DATE

Date last message was sent, or MQI call was handled.

MQCACH_LAST_MSG_TIME

Time last message was sent, or MQI call was handled.

MQCACH_LOCAL_ADDRESS

Local communications address for the channel.

MQCACH_MCA_JOB_NAME

Name of MCA job.

This parameter is not valid on z/OS.

You cannot use MQCACH_MCA_JOB_NAME as a parameter to filter on.

MQCACH_MCA_USER_ID

The user ID used by the MCA.

MQCACH_REMOTE_APPL_TAG

Remote partner application name. MQCACH_REMOTE_APPL_TAG is the name of the client application at the remote end of the channel. This parameter applies only to server-connection channels.

MQCACH_REMOTE_PRODUCT

Remote partner product identifier. This is the product identifier of the IBM MQ code running at the remote end of the channel.

MQCACH_REMOTE_VERSION

Remote partner version. This is the version of the IBM MQ code running at the remote end of the channel.

MQCACH_SSL_SHORT_PEER_NAME

TLS short peer name.

MQCACH_SSL_CERT_ISSUER_NAME

The full Distinguished Name of the issuer of the remote certificate.

z/OS MQCACH_SSL_CERT_USER_ID

User ID associated with the remote certificate; valid on z/OS only.

MQCACH_TOPIC_ROOT

Topic root for AMQP channel.

MQIA_MONITORING_CHANNEL

The level of monitoring data collection.

z/OS MQIA_STATISTICS_CHANNEL

The level of statistics data collection; valid on z/OS only.

MQIACF_MONITORING

All channel status monitoring attributes. These attributes are:

MQIA_MONITORING_CHANNEL

The level of monitoring data collection.

MQIACH_BATCH_SIZE_INDICATOR

Batch size.

MQIACH_COMPRESSION_RATE

The compression rate achieved displayed to the nearest percentage.

MQIACH_COMPRESSION_TIME

The amount of time per message, displayed in microseconds, spent during compression or decompression.

MQIACH_EXIT_TIME_INDICATOR

Exit time.

MQIACH_NETWORK_TIME_INDICATOR

Network time.

MQIACH_XMITQ_MSGS_AVAILABLE

Number of messages available to the channel on the transmission queue.

MQIACH_XMITQ_TIME_INDICATOR

Time on transmission queue.

You cannot use MQIACF_MONITORING as a parameter to filter on.

MQIACH_BATCH_SIZE_INDICATOR

Batch size.

You cannot use MQIACH_BATCH_SIZE_INDICATOR as a parameter to filter on.

MQIACH_BATCHES

Number of completed batches.

MQIACH_BUFFERS_RCVD

Number of buffers received.

MQIACH_BUFFERS_SENT

Number of buffers sent.

MQIACH_BYTES_RCVD

Number of bytes received.

MQIACH_BYTES_SENT

Number of bytes sent.

MQIACH_CHANNEL_SUBSTATE

The channel substate.

MQIACH_COMPRESSION_RATE

The compression rate achieved displayed to the nearest percentage.

You cannot use MQIACH_COMPRESSION_RATE as a parameter to filter on.

MQIACH_COMPRESSION_TIME

The amount of time per message, displayed in microseconds, spent during compression or decompression.

You cannot use MQIACH_COMPRESSION_TIME as a parameter to filter on.

MQIACH_CURRENT_SHARING_CONVS

Requests information about the current number of conversations on this channel instance.

This attribute applies only to TCP/IP server-connection channels.

MQIACH_EXIT_TIME_INDICATOR

Exit time.

You cannot use MQIACH_EXIT_TIME_INDICATOR as a parameter to filter on.

MQIACH_HDR_COMPRESSION

Technique used to compress the header data sent by the channel.

MQIACH_KEEP_ALIVE_INTERVAL

The KeepAlive interval in use for this session. This parameter is significant only for z/OS.

MQIACH_LONG_RETRIES_LEFT

Number of long retry attempts remaining.

MQIACH_MAX_MSG_LENGTH

Maximum message length. MQIACH_MAX_MSG_LENGTH is valid only on z/OS.

MQIACH_MAX_SHARING_CONVS

Requests information about the maximum number of conversations on this channel instance.

This attribute applies only to TCP/IP server-connection channels.

MQIACH_MCA_STATUS

MCA status.

You cannot use MQIACH_MCA_STATUS as a parameter to filter on.

MQIACH_MSG_COMPRESSION

Technique used to compress the message data sent by the channel.

MQIACH_MSGS

Number of messages sent or received, or number of MQI calls handled.

MQIACH_NETWORK_TIME_INDICATOR

Network time.

You cannot use MQIACH_NETWORK_TIME_INDICATOR as a parameter on which to filter.

MQIACH_SECURITY_PROTOCOL

Security protocol currently in use.

This parameter does not apply to client-connection channels.

This parameter does not apply to z/OS.

MQIACH_SHORT_RETRIES_LEFT

Number of short retry attempts remaining.

MQIACH_SSL_KEY_RESETS

Number of successful TLS key resets.

MQIACH_SSL_RESET_DATE

Date of previous successful TLS secret key reset.

MQIACH_SSL_RESET_TIME

Time of previous successful TLS secret key reset.

MQIACH_STOP_REQUESTED

Whether user stop request has been received.

MQIACH_XMITQ_MSGS_AVAILABLE

Number of messages available to the channel on the transmission queue.

MQIACH_XMITQ_TIME_INDICATOR

Time on transmission queue.

You cannot use MQIACH_XMITQ_TIME_INDICATOR as a parameter to filter on.

The following value is supported on all platforms:

MQIACH_BATCH_SIZE

Batch size.

The following value is supported on all platforms:

MQIACH_HB_INTERVAL

Heartbeat interval (seconds).

MQIACH_NPM_SPEED

Speed of nonpersistent messages.

The following attributes do not apply to server-connection channels, and no values are returned. If specified on the command they are ignored:

- MQIACH_BATCH_SIZE_INDICATOR
- MQIACH_BATCH_SIZE
- MQIACH_BATCHES
- MQIACH_LONG_RETRIES_LEFT
- MQIACH_NETWORK_TIME
- MQIACH_NPM_SPEED
- MQCA_REMOTE_Q_MGR_NAME
- MQIACH_SHORT_RETRIES_LEFT
- MQIACH_XMITQ_MSGS_AVAILABLE
- MQIACH_XMITQ_TIME_INDICATOR

The following attributes apply only to server-connection channels. If specified on the command for other types of channel the attribute is ignored and no value is returned:

- MQIACH_CURRENT_SHARING_CONVS
- MQIACH_MAX_SHARING_CONVS

-  Relevant for short status:

The following parameter applies to current channels on z/OS:

MQCACH_Q_MGR_NAME

Name of the queue manager that owns the channel instance.

ChannelInstanceType (MQCFIN)

Channel instance type (parameter identifier: MQIACH_CHANNEL_INSTANCE_TYPE).

It is always returned regardless of the channel instance attributes requested.

The value can be:

MQOT_CURRENT_CHANNEL

The channel status.

MQOT_CURRENT_CHANNEL is the default, and indicates that only current status information for active channels is to be returned.

Both common status information and active-only status information can be requested for current channels.

MQOT_SAVED_CHANNEL

Saved channel status.

Specify MQOT_SAVED_CHANNEL to cause saved status information for both active and inactive channels to be returned.

Only common status information can be returned. Active-only status information is not returned for active channels if this keyword is specified.

z/OS MQOT_SHORT_CHANNEL

Short channel status (valid on z/OS only).

Specify MQOT_SHORT_CHANNEL to cause short status information for current channels to be returned.

Other common status and current-only status information are not returned for current channels if this keyword is specified.

You cannot use MQIACH_CHANNEL_INSTANCE_TYPE as a parameter to filter on.

z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

If this parameter is present, eligible channel instances are limited to those using this connection name. If it is not specified, eligible channel instances are not limited in this way.

The connection name is always returned, regardless of the instance attributes requested.

The value returned for *ConnectionName* might not be the same as in the channel definition, and might differ between the current channel status and the saved channel status. (Using *ConnectionName* for limiting the number of sets of status is therefore not recommended.)

For example, when using TCP, if *ConnectionName* in the channel definition:

- Is blank or is in *host name* format, the channel status value has the resolved IP address.
- Includes the port number, the current channel status value includes the port number (except on z/OS), but the saved channel status value does not.

The maximum length of the string is MQ_CONN_NAME_LENGTH.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ChannelInstanceAttrs* except MQIACF_ALL and others as noted. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter”](#) on page 1852 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ChannelInstanceAttrs* except MQCACH_CHANNEL_NAME and others as noted. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter”](#) on page 1859 for information about using this filter condition.

If you specify a string filter for **ConnectionName** or **XmitQName**, you cannot also specify the **ConnectionName** or **XmitQName** parameter.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

XmitQName (MQCFST)

Transmission queue name (parameter identifier: MQCACH_XMIT_Q_NAME).

If this parameter is present, eligible channel instances are limited to those using this transmission queue. If it is not specified, eligible channel instances are not limited in this way.

The transmission queue name is always returned, regardless of the instance attributes requested.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Error code

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands”](#) on page 1343.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHL_INST_TYPE_ERROR

Channel instance type not valid.

MQRCCF_CHL_STATUS_NOT_FOUND

Channel status not found.

MQRCCF_XMIT_Q_NAME_ERROR

Transmission queue name error.

ULW

Inquire Channel Status (AMQP)

The Inquire Channel Status (MQCMD_INQUIRE_CHANNEL_STATUS) (AMQP) command inquires about the status of one or more AMQP channel instances.

You must specify the name of the channel for which you want to inquire status information. This name can be a specific channel name or a generic channel name. By using a generic channel name, you can inquire either:

- Status information for all channels, or
- Status information for one or more channels that match the specified name.

If the **ClientIdentifier** parameter is not specified, the output of the **Inquire Channel Status** command is a summary of statuses of all clients connected to the channel. One PCF response message is returned per channel.

If the **ClientIdentifier** parameter is specified, separate PCF response messages are returned for each client connection. The **ClientIdentifier** parameter may be a wildcard, in which the status for all clients that match the **ClientIdentifier** string is returned.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects which have names that start with the selected character string. An asterisk on its own matches all possible names.

The channel name is always returned, regardless of the instance attributes requested.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

The value must be:

MQCHT_AMQP
AMQP

Optional parameters

ChannelInstanceAttrs (MQCFIL)

Channel instance attributes (parameter identifier: MQIACH_CHANNEL_INSTANCE_ATTRS).

The **ChannelInstanceAttrs** parameter names the list of attributes to be returned. This parameter does not provide any way to select, based upon the value of the items in that list of attributes.

The attribute list might specify the following value on its own:

MQIACF_ALL
All attributes.

MQIACF_ALL is the default value used if the parameter is not specified or it can specify a combination of the following:

- Relevant for summary status, applicable when you do not specify a **ClientIdentifier** parameter.

The following information applies:

MQCACH_CHANNEL_NAME
Channel name

MQIACH_CHANNEL_TYPE
Channel type

MQIACF_CONNECTION_COUNT
Number of connections described in the summary

MQIACH_CHANNEL_STATUS
Current status of the client

- Relevant for client details mode, applicable when you do specify a **ClientIdentifier** parameter.

The following information applies:

MQCACH_CHANNEL_NAME
Channel name

MQIACH_CHANNEL_STATUS

Current status of the client

MQIACH_CHANNEL_TYPE

Channel type

MQCACH_CONNECTION_NAME

Name of the remote connection (IP address)

MQIACH_AMQP_KEEP_ALIVE

Keep alive interval of the client

MQCACH_MCA_USER_ID

Message channel agent user Id

MQIACH_MSGS_SENT

Number of messages sent by the client since it last connected

MQIACH_MSGS_RECEIVED or MQIACH_MSGS_RCVD

Number of messages received by the client since it last connected

MQCACH_LAST_MSG_DATE

Date last message was received or sent

MQCACH_LAST_MSG_TIME

Time last message was received or sent

MQCACH_CHANNEL_START_DATE

Date channel started

MQCACH_CHANNEL_START_TIME

Time channel started

ClientIdentifier (MQCFST)

The ClientId of the client (parameter identifier: MQCACH_CLIENT_ID).

The maximum length of the string is MQ_CLIENT_ID_LENGTH.

Summary mode

If you do not specify a **ClientIdentifier** parameter, the following fields are returned:

MQCACH_CHANNEL_NAME

The channel name.

MQIACH_CHANNEL_TYPE

The channel type of AMQP.

MQIACF_CONNECTION_COUNT

The number of connections described in the summary.

MQIACH_CHANNEL_STATUS

The current status of the client.

Client details mode

If you specify a **ClientIdentifier** parameter, the following fields are returned:

MQIACH_CHANNEL_STATUS

The current status of the client.

MQCACH_CONNECTION_NAME

The name of the remote connection, that is, the IP address.

MQIACH_AMQP_KEEP_ALIVE

The keep alive interval of the client.

MQCACH_MCA_USER_ID

Message channel agent user Id.

MQIACH_MSGS_SENT

Number of messages sent by the client since it last connected.

MQIACH_MSGS_RECEIVED or MQIACH_MSGS_RCVD

Number of messages received by the client since it last connected.

MQCACH_LAST_MSG_DATE

Date last message was received or sent.

MQCACH_LAST_MSG_TIME

Time last message was received or sent.

MQCACH_CHANNEL_START_DATE

Date channel started.

MQCACH_CHANNEL_START_TIME

Time channel was started.

MQIACH_PROTOCOL

AMQP protocol supported by this channel.

Error code

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHL_INST_TYPE_ERROR

Channel instance type not valid.

MQRCCF_CHL_STATUS_NOT_FOUND

Channel status not found.

MQRCCF_XMIT_Q_NAME_ERROR

Transmission queue name error.

Inquire Channel Status (MQTT)

The Inquire Channel Status (MQCMD_INQUIRE_CHANNEL_STATUS) (MQTT) command inquires about the status of one or more Telemetry channel instances.

You must specify the name of the channel for which you want to inquire status information. This name can be a specific channel name or a generic channel name. By using a generic channel name, you can inquire either:

- Status information for all channels, or
- Status information for one or more channels that match the specified name.

Note: The **Inquire Channel Status** command for MQ Telemetry has the potential to return a far larger number of responses than if the command was run for an IBM MQ channel. For this reason, the MQ Telemetry server does not return more responses than fit on the reply-to queue. The number of responses is limited to the value of `MAXDEPTH` parameter of the `SYSTEM.MQSC.REPLY.QUEUE` queue. When an MQ Telemetry command is truncated by the MQ Telemetry server, the `AMQ8492` message is displayed specifying how many responses are returned based on the size of `MAXDEPTH`.

If the **ClientIdentifier** parameter is not specified, the output of the **Inquire Channel Status** command is a summary of statuses of all clients connected to the channel. One PCF response message is returned per channel.

If the **ClientIdentifier** parameter is specified, separate PCF response messages are returned for each client connection. The **ClientIdentifier** parameter may be a wildcard, in which the status for all clients that match the **ClientIdentifier** string is returned (within the limits of **MaxResponses** and **ResponseRestartPoint** if they are set).

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects which have names that start with the selected character string. An asterisk on its own matches all possible names.

This parameter is allowed for only when the **ResponseType** parameter is set to MQRESP_TOTAL.

The channel name is always returned, regardless of the instance attributes requested.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

The value must be:

MQCHT_MQTT

Telemetry.

Optional parameters

ClientIdentifier (MQCFST)

The ClientId of the client (parameter identifier: MQCACH_CLIENT_ID).

MaxResponses (MQCFIN)

The maximum number of clients to return status for (parameter identifier: MQIA_MAX_RESPONSES).

This parameter is only allowed when the **ClientIdentifier** parameter is specified.

ResponseRestartPoint (MQCFIN)

The first client to return status for (parameter identifier: MQIA_RESPONSE_RESTART_POINT). The combination of this parameter with **MaxResponses** enables the range of clients to be specified.

This parameter is only allowed when the **ClientIdentifier** parameter is specified.

Client details mode

STATUS

The current status of the client (parameter identifier: MQIACH_CHANNEL_STATUS).

CONNAME

The name of the remote connection (ip address) (parameter identifier: MQCACH_CONNECTION_NAME).

KAIN

The keep alive interval of the client (parameter identifier: MQIACH_KEEP_ALIVE_INTERVAL).

MCANAME

Message channel agent name (parameter identifier: MQCACH_MCA_USER_ID).

MSGSENT

Number of messages sent by the client since it last connected (parameter identifier: MQIACH_MSGS_SENT).

MSGRCVD

Number of messages received by the client since it last connected (parameter identifier: MQIACH_MSGS_RECEIVED / MQIACH_MSGS_RCVD).

INDOUBTIN

Number of in doubt, inbound messages to the client (parameter identifier: MQIACH_IN_DOUBT_IN).

INDOUBTOUT

Number of in doubt, outbound messages to the client (parameter identifier: MQIACH_IN_DOUBT_OUT).

PENDING

Number of outbound pending messages (parameter identifier: MQIACH_PENDING_OUT).

LMSGDATE

Date last message was received or sent (parameter identifier: MQCACH_LAST_MSG_DATE).

LMSGTIME

Time last message was received or sent (parameter identifier: MQCACH_LAST_MSG_TIME).

CHLSDATE

Date channel started (parameter identifier: MQCACH_CHANNEL_START_DATE).

CHLSTIME

Time channel was started (parameter identifier: MQCACH_CHANNEL_START_TIME).

Error code

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHL_INST_TYPE_ERROR

Channel instance type not valid.

MQRCCF_CHL_STATUS_NOT_FOUND

Channel status not found.

MQRCCF_XMIT_Q_NAME_ERROR

Transmission queue name error.

Inquire Channel Status (Response)

The response to the Inquire Channel Status (MQCMD_INQUIRE_CHANNEL_STATUS) command consists of the response header followed by several structures.

These structures are

- The *ChannelName* structure,
-  The *ChannelDisposition* structure (on z/OS only),
- The *ChannelInstanceType* structure
- The *ChannelStatus* structure (except on z/OS channels whose **ChannelInstanceType** parameter has a value of MQOT_SAVED_CHANNEL).
- The **ChannelType** structure
- The **ConnectionName** structure
- The **RemoteAppTag** structure
- The **RemoteQMgrName** structure
- The **StopRequested** structure
- The **XmitQName** structure

which are then followed by the requested combination of status attribute parameter structures. One such message is generated for each channel instance found that matches the criteria specified on the command.

z/OS On z/OS, if the value for any of these parameters exceeds 999999999, it is returned as 999999999:

- *Batches*
- *BuffersReceived*
- *BuffersSent*
- *BytesReceived*
- *BytesSent*
- *CompressionTime*
- *CurrentMsgs*
- *ExitTime*
- *Msgs*
- *NetTime*
- *SSLKeyResets*
- *XQTime*

Always returned:

z/OS *ChannelDisposition* , *ChannelInstanceType* , *ChannelName* , *ChannelStatus* , *ChannelType* , *ConnectionName* , *RemoteApplTag* , *RemoteQMGrName* , *StopRequested* , *SubState* , *XmitQName*

Returned if requested:

Batches, *BatchSize*, *BatchSizeIndicator*, *BuffersReceived*, *BuffersSent*, *BytesReceived*, *BytesSent*, *ChannelMonitoring*, *ChannelStartDate*, *ChannelStartTime*, *CompressionRate*, *CompressionTime*, *CurrentLUWID*, *CurrentMsgs*, *CurrentSequenceNumber*, *CurrentSharingConversations*, *ExitTime*, *HeaderCompression*, *HeartbeatInterval*, *InDoubtStatus*, *KeepAliveInterval*, *LastLUWID*, *LastMsgDate*, *LastMsgTime*, *LastSequenceNumber*, *LocalAddress*, *LongRetriesLeft*, *MaxMsgLength*, *MaxSharingConversations*, *MCAJobName*, *MCAStatus*, *MCAUserIdentifier*, *MessageCompression*, *Msgs*, *MsgsAvailable*, *NetTime*, *NonPersistentMsgSpeed*, *QMGrName*, *RemoteVersion*, *RemoteProduct*, *SecurityProtocol*, *ShortRetriesLeft*, *SSLCertRemoteIssuerName*, *SSLCertUserId*, *SSLKeyResetDate*, *SSLKeyResets*, *SSLKeyResetTime*, *SSLShortPeerName*, *XQTime*

Response data

Batches (MQCFIN)

Number of completed batches (parameter identifier: MQIACH_BATCHES).

BatchSize (MQCFIN)

Negotiated batch size (parameter identifier: MQIACH_BATCH_SIZE).

BatchSizeIndicator (MQCFIL)

Indicator of the number of messages in a batch (parameter identifier: MQIACH_BATCH_SIZE_INDICATOR). Two values are returned, in this order:

Multi

1. A value based on activity over a long period.
2. A value based on recent activity over a short period.

z/OS

1. A value based on recent activity over a short period.
2. A value based on activity over a longer period.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned.

BuffersReceived (MQCFIN)

Number of buffers received (parameter identifier: MQIACH_BUFFERS_RCVD).

BuffersSent (MQCFIN)

Number of buffers sent (parameter identifier: MQIACH_BUFFERS_SENT).

BytesReceived (MQCFIN)

Number of bytes received (parameter identifier: MQIACH_BYTES_RCVD).

BytesSent (MQCFIN)

Number of bytes sent (parameter identifier: MQIACH_BYTES_SENT).

**ChannelDisposition (MQCFIN)**

Channel disposition (parameter identifier: MQIACH_CHANNEL_DISP). This parameter is valid only on z/OS.

The value can be any of the following values:

MQCHLD_PRIVATE

Status information for a private channel.

MQCHLD_SHARED

Status information for a shared channel.

MQCHLD_FIXSHARED

Status information for a shared channel, tied to a specific queue manager.

ChannelInstanceType (MQCFIN)

Channel instance type (parameter identifier: MQIACH_CHANNEL_INSTANCE_TYPE).

The value can be any of the following values:

MQOT_CURRENT_CHANNEL

Current channel status.

MQOT_SAVED_CHANNEL

Saved channel status.

**MQOT_SHORT_CHANNEL**

Short channel status, only on z/OS.

ChannelMonitoring (MQCFIN)

Current level of monitoring data collection for the channel (parameter identifier: MQIA_MONITORING_CHANNEL).

The value can be any of the following values:

MQMON_OFF

Monitoring for the channel is disabled.

MQMON_LOW

Low rate of data collection.

MQMON_MEDIUM

Medium rate of data collection.

MQMON_HIGH

High rate of data collection.

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelStartDate (MQCFST)

Date channel started, in the form yyyy-mm-dd (parameter identifier: MQCACH_CHANNEL_START_DATE).

The maximum length of the string is MQ_CHANNEL_DATE_LENGTH.

ChannelStartTime (MQCFST)

Time channel started, in the form hh.mm.ss (parameter identifier: MQCACH_CHANNEL_START_TIME).

The maximum length of the string is MQ_CHANNEL_TIME_LENGTH.

z/OS

z/OS

ChannelStatistics (MQCFIN)

Specifies whether statistics data is to be collected for channels (parameter identifier: MQIA_STATISTICS_CHANNEL).

The value can be:

MQMON_OFF

Statistics data collection is turned off.

MQMON_LOW

Statistics data collection is turned on, with a low ratio of data collection.

MQMON_MEDIUM

Statistics data collection is turned on, with a moderate ratio of data collection.

MQMON_HIGH

Statistics data collection is turned on, with a high ratio of data collection.

On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

This parameter is valid only on z/OS.

ChannelStatus (MQCFIN)

Channel status (parameter identifier: MQIACH_CHANNEL_STATUS).

Channel status has the following values defined:

MQCHS_BINDING

Channel is negotiating with the partner.

MQCHS_STARTING

Channel is waiting to become active.

MQCHS_RUNNING

Channel is transferring or waiting for messages.

MQCHS_PAUSED

Channel is paused.

MQCHS_STOPPING

Channel is in process of stopping.

MQCHS_RETRYING

Channel is reattempting to establish connection.

MQCHS_STOPPED

Channel is stopped.

MQCHS_REQUESTING

Requester channel is requesting connection.

MQCHS_SWITCHING

Channel is switching transmission queues.

MQCHS_INITIALIZING

Channel is initializing.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

The value can be any of the following values:

MQCHT_SENDER

Sender.

MQCHT_SERVER

Server.

MQCHT_RECEIVER

Receiver.

MQCHT_REQUESTER

Requester.

MQCHT_SVRCONN

Server-connection (for use by clients).

MQCHT_CLNTCONN

Client connection.

MQCHT_CLUSRCVR

Cluster-receiver.

MQCHT_CLUSSDR

Cluster-sender.

CompressionRate (MQCFIL)

The compression rate achieved displayed to the nearest percentage (parameter identifier: MQIACH_COMPRESSION_RATE). Two values are returned, in this order:

Multi

1. A value based on activity over a long period.
2. A value based on recent activity over a short period.

z/OS

1. A value based on recent activity over a short period.
2. A value based on activity over a longer period.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned.

CompressionTime (MQCFIL)

The amount of time per message, displayed in microseconds, spent during compression or decompression (parameter identifier: MQIACH_COMPRESSION_TIME). Two values are returned, in this order:

Multi

1. A value based on activity over a long period.
2. A value based on recent activity over a short period.

z/OS

1. A value based on recent activity over a short period.
2. A value based on activity over a longer period.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned.

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

The maximum length of the string is MQ_SHORT_CONN_NAME_LENGTH.

CurrentLUWID (MQCFST)

Logical unit of work identifier for in-doubt batch (parameter identifier: MQCACH_CURRENT_LUWID).

The logical unit of work identifier associated with the current batch, for a sending or a receiving channel.

For a sending channel, when the channel is in-doubt it is the LUWID of the in-doubt batch.

It is updated with the LUWID of the next batch when it is known.

The maximum length is MQ_LUWID_LENGTH.

CurrentMsgs (MQCFIN)

Number of messages in-doubt (parameter identifier: MQIACH_CURRENT_MSGS).

For a sending channel, this parameter is the number of messages that have been sent in the current batch. It is incremented as each message is sent, and when the channel becomes in-doubt it is the number of messages that are in-doubt.

For a receiving channel, it is the number of messages that have been received in the current batch. It is incremented as each message is received.

The value is reset to zero, for both sending and receiving channels, when the batch is committed.

CurrentSequenceNumber (MQCFIN)

Sequence number of last message in in-doubt batch (parameter identifier: MQIACH_CURRENT_SEQ_NUMBER).

For a sending channel, this parameter is the message sequence number of the last message sent. It is updated as each message is sent, and when the channel becomes in-doubt it is the message sequence number of the last message in the in-doubt batch.

For a receiving channel, it is the message sequence number of the last message that was received. It is updated as each message is received.

CurrentSharingConversations (MQCFIN)

Number of conversations currently active on this channel instance (parameter identifier: MQIACH_CURRENT_SHARING_CONVS).

This parameter is returned only for TCP/IP server-connection channels.

A value of zero indicates that the channel instance is running in a mode before IBM WebSphere MQ 7.0, regarding:

- Administrator stop-quietce
- Heartbeating
- Read ahead
- Client asynchronous consumption

ExitTime (MQCFIL)

Indicator of the time taken executing user exits per message (parameter identifier: MQIACH_EXIT_TIME_INDICATOR). Amount of time, in microseconds, spent processing user exits per message. Where more than one exit is executed per message, the value is the sum of all the user exit times for a single message. Two values are returned, in this order:

Multi

1. A value based on activity over a long period.
2. A value based on recent activity over a short period.

z/OS

1. A value based on recent activity over a short period.

2. A value based on activity over a longer period.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned.

HeaderCompression (MQCFIL)

Whether the header data sent by the channel is compressed (parameter identifier: MQIACH_HDR_COMPRESSION). Two values are returned:

- The default header data compression value negotiated for this channel.
- The header data compression value used for the last message sent. The header data compression value can be altered in a sending channels message exit. If no message has been sent, the second value is MQCOMPRESS_NOT_AVAILABLE.

The values can be:

MQCOMPRESS_NONE

No header data compression is performed. MQCOMPRESS_NONE is the default value.

MQCOMPRESS_SYSTEM

Header data compression is performed.

MQCOMPRESS_NOT_AVAILABLE

No message has been sent by the channel.

HeartbeatInterval (MQCFIN)

Heartbeat interval (parameter identifier: MQIACH_HB_INTERVAL).

InDoubtStatus (MQCFIN)

Whether the channel is currently in doubt (parameter identifier: MQIACH_INDOUBT_STATUS).

A sending channel is only in doubt while the sending Message Channel Agent is waiting for an acknowledgment that a batch of messages, which it has sent, has been successfully received. It is not in doubt at all other times, including the period during which messages are being sent, but before an acknowledgment has been requested.

A receiving channel is never in doubt.

The value can be any of the following values:

MQCHIDS_NOT_INDOUBT

Channel is not in-doubt.

MQCHIDS_INDOUBT

Channel is in-doubt.

KeepAliveInterval (MQCFIN)

KeepAlive interval (parameter identifier: MQIACH_KEEP_ALIVE_INTERVAL). This parameter is valid only on z/OS.

LastLUWID (MQCFST)

Logical unit of work identifier for last committed batch (parameter identifier: MQCACH_LAST_LUWID).

The maximum length is MQ_LUWID_LENGTH.

LastMsgDate (MQCFST)

Date last message was sent, or MQI call was handled, in the form yyyy-mm-dd (parameter identifier: MQCACH_LAST_MSG_DATE).

The maximum length of the string is MQ_CHANNEL_DATE_LENGTH.

LastMsgTime (MQCFST)

Time last message was sent, or MQI call was handled, in the form hh.mm.ss (parameter identifier: MQCACH_LAST_MSG_TIME).

The maximum length of the string is MQ_CHANNEL_TIME_LENGTH.

LastSequenceNumber (MQCFIN)

Sequence number of last message in last committed batch (parameter identifier: MQIACH_LAST_SEQ_NUMBER).

LocalAddress (MQCFST)

Local communications address for the channel (parameter identifier: MQCACH_LOCAL_ADDRESS).

The maximum length of the string is MQ_LOCAL_ADDRESS_LENGTH.

LongRetriesLeft (MQCFIN)

Number of long retry attempts remaining (parameter identifier: MQIACH_LONG_RETRIES_LEFT).

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: MQIACH_MAX_MSG_LENGTH). This parameter is valid only on z/OS.

MaxSharingConversations (MQCFIN)

Maximum number of conversations permitted on this channel instance. (parameter identifier: MQIACH_MAX_SHARING_CONVS)

This parameter is returned only for TCP/IP server-connection channels.

A value of zero indicates that the channel instance is running in a mode before IBM WebSphere MQ 7.0, regarding:

- Administrator stop-quietce
- Heartbeating
- Read ahead
- Client asynchronous consumption

MCAJobName (MQCFST)

Name of MCA job (parameter identifier: MQCACH_MCA_JOB_NAME).

The maximum length of the string is MQ_MCA_JOB_NAME_LENGTH.

MCAStatus (MQCFIN)

MCA status (parameter identifier: MQIACH_MCA_STATUS).

The value can be any of the following values:

MQMCAS_STOPPED

Message channel agent stopped.

MQMCAS_RUNNING

Message channel agent running.

MCAUserIdentifier (MQCFST)

The user ID used by the MCA (parameter identifier: MQCACH_MCA_USER_ID).

This parameter applies only to server-connection, receiver, requester, and cluster-receiver channels.

The maximum length of the string is MQ_MCA_USER_ID_LENGTH.

MessageCompression (MQCFIL)

Whether the message data sent by the channel is compressed (parameter identifier: MQIACH_MSG_COMPRESSION). Two values are returned:

- The default message data compression value negotiated for this channel.
- The message data compression value used for the last message sent. The message data compression value can be altered in a sending channels message exit. If no message has been sent, the second value is MQCOMPRESS_NOT_AVAILABLE.

The values can be:

MQCOMPRESS_NONE

No message data compression is performed. MQCOMPRESS_NONE is the default value.

MQCOMPRESS_RLE

Message data compression is performed using run-length encoding.

MQCOMPRESS_ZLIBFAST

Message data compression is performed using ZLIB encoding with speed prioritized.

MQCOMPRESS_ZLIBHIGH

Message data compression is performed using ZLIB encoding with compression prioritized.

MQCOMPRESS_NOT_AVAILABLE

No message has been sent by the channel.

Msgs (MQCFIN)

Number of messages sent or received, or number of MQI calls handled (parameter identifier: MQIACH_MSGS).

MsgsAvailable (MQCFIN)

Number of messages available (parameter identifier: MQIACH_XMITQ_MSGS_AVAILABLE). Number of messages queued on the transmission queue available to the channel for MQGETs.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned.

This parameter applies to cluster sender channels only.

NetTime (MQCFIL)

Indicator of the time of a network operation (parameter identifier: MQIACH_NETWORK_TIME_INDICATOR). Amount of time, in microseconds, to send a request to the remote end of the channel and receive a response. This time only measures the network time for such an operation. Two values are returned, in this order:

Multi

1. A value based on activity over a long period.
2. A value based on recent activity over a short period.

z/OS

1. A value based on recent activity over a short period.
2. A value based on activity over a longer period.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned.

NonPersistentMsgSpeed (MQCFIN)

Speed at which nonpersistent messages are to be sent (parameter identifier: MQIACH_NPM_SPEED).

The value can be any of the following values:

MQNPMS_NORMAL

Normal speed.

MQNPMS_FAST

Fast speed.

QMgrName (MQCFST)

Name of the queue manager that owns the channel instance (parameter identifier: MQCA_Q_MGR_NAME). This parameter is valid only on z/OS.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

RemoteApplTag (MQCFST)

The remote partner application name. This parameter is the name of the client application at the remote end of the channel. This parameter applies only to server-connection channels (parameter identifier: MQCACH_REMOTE_APPL_TAG).

RemoteProduct (MQCFST)

The remote partner product identifier. This parameter is the product identifier of the IBM MQ code running at the remote end of the channel (parameter identifier: MQCACH_REMOTE_PRODUCT).

The possible values are shown in the following table:

Table 101. Product Identifier values

Product Identifier	Description
MQMM	Queue Manager (non z/OS Platform)
MQMV	Queue Manager on z/OS
MQCC	IBM MQ C client
MQNM	IBM MQ .NET fully managed client
MQJB	IBM MQ Classes for JAVA
MQJM	IBM MQ Classes for JMS (normal mode)
MQJN	IBM MQ Classes for JMS (migration mode)
MQJU	Common Java interface to the MQI
MQXC	XMS client C/C++ (normal mode)
MQXD	XMS client C/C++ (migration mode)
MQXN	XMS client .NET (normal mode)
MQXM	XMS client .NET (migration mode)
MQXU	IBM MQ .NET XMS client (unmanaged/XA)
MQNU	IBM MQ .NET unmanaged client

RemoteVersion (MQCFST)

The remote partner version. This parameter is the version of the IBM MQ code running at the remote end of the channel (parameter identifier: MQCACH_REMOTE_VERSION).

The remote version is displayed as **VVRRMMFF**, where

VV

Version

RR

Release

MM

Maintenance level

FF

Fix level

RemoteQMgrName (MQCFST)

Name of the remote queue manager, or queue sharing group (parameter identifier: MQCA_REMOTE_Q_MGR_NAME).

ShortRetriesLeft (MQCFIN)

Number of short retry attempts remaining (parameter identifier: MQIACH_SHORT_RETRIES_LEFT).

SecurityProtocol (MQCFIN)

Defines the security protocol currently in use (parameter identifier: MQIACH_SECURITY_PROTOCOL).

Does not apply to client-connection channels.

Set automatically, based on the value you set for [SSLCipherSpecification](#).

Possible values are:

MQSECPROT_NONE

No security protocol

MQSECPROT_SSLV30

SSL version 3.0

This protocol is deprecated. See [Deprecated CipherSpecs](#)

MQSECPROT_TLSV10

TLS version 1.0

MQSECPROT_TLSV12

TLS version 1.2

This parameter is not available on z/OS.

SSLCertRemoteIssuerName (MQCFST)

The full Distinguished Name of the issuer of the remote certificate. The issuer is the certificate authority that issued the certificate (parameter identifier: MQCACH_SSL_CERT_ISSUER_NAME).

The maximum length of the string is MQ_SHORT_DNAME_LENGTH.

SSLCertUserId (MQCFST)

The local user ID associated with the remote certificate (parameter identifier: MQCACH_SSL_CERT_USER_ID).

This parameter is valid only on z/OS.

The maximum length of the string is MQ_USER_ID_LENGTH.

SSLCipherSpecification (MQCFST)

The CipherSpec that is being used by the connection (parameter identifier: MQCACH_SSL_CIPHER_SPEC).

The maximum length of the string is MQ_SSL_CIPHER_SPEC_LENGTH.

For more information, see [the SSLCipherSpec property in Change, Copy, and Create Channel](#).

The value for this parameter is also used to set the value of [SecurityProtocol](#)

SSLKeyResetDate (MQCFST)

Date of the previous successful TLS secret key reset, in the form yyyy-mm-dd (parameter identifier: MQCACH_SSL_KEY_RESET_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

SSLKeyResets (MQCFIN)

TLS secret key resets (parameter identifier: MQIACH_SSL_KEY_RESETS).

The number of successful TLS secret key resets that have occurred for this channel instance since the channel started. If TLS secret key negotiation is enabled, the count is incremented whenever a secret key reset is performed.

SSLKeyResetTime (MQCFST)

Time of the previous successful TLS secret key reset, in the form hh.mm.ss (parameter identifier: MQCACH_SSL_KEY_RESET_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

SSLShortPeerName (MQCFST)

Distinguished Name of the peer queue manager or client at the other end of the channel (parameter identifier: MQCACH_SSL_SHORT_PEER_NAME).

The maximum length is MQ_SHORT_DNAME_LENGTH, so longer Distinguished Names are truncated.

StopRequested (MQCFIN)

Whether user stop request is outstanding (parameter identifier: MQIACH_STOP_REQUESTED).

The value can be any of the following values:

MQCHSR_STOP_NOT_REQUESTED

User stop request has not been received.

MQCHSR_STOP_REQUESTED

User stop request has been received.

SubState (MQCFIN)

Current action being performed by the channel (parameter identifier: MQIACH_CHANNEL_SUBSTATE).

The value can be any of the following values:

MQCHSSTATE_CHAEXIT

Running channel auto-definition exit.

MQCHSSTATE_COMPRESSING

Compressing or decompressing data.

MQCHSSTATE_END_OF_BATCH

End of batch processing.

MQCHSSTATE_HANDSHAKING

TLS handshaking.

MQCHSSTATE_HEARTBEATING

Heartbeating with partner.

MQCHSSTATE_IN_MQGET

Performing MQGET.

MQCHSSTATE_IN_MQI_CALL

Executing an IBM MQ API call, other than an MQPUT or MQGET.

MQCHSSTATE_IN_MQPUT

Performing MQPUT.

MQCHSSTATE_MREXIT

Running retry exit.

MQCHSSTATE_MSGEXIT

Running message exit.

MQCHSSTATE_NAME_SERVER

Name server request.

MQCHSSTATE_NET_CONNECTING

Network connect.

MQCHSSTATE_OTHER

Undefined state.

MQCHSSTATE_RCVEXIT

Running receive exit.

MQCHSSTATE_RECEIVING

Network receive.

MQCHSSTATE_RESYNCHING

Resynching with partner.

MQCHSSTATE_SCYEXIT

Running security exit.

MQCHSSTATE_SENDEXIT

Running send exit.

MQCHSSTATE_SENDING

Network send.

MQCHSSTATE_SERIALIZING

Serialized on queue manager access.

XmitQName (MQCFST)

Transmission queue name (parameter identifier: MQCACH_XMIT_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

XQTime (MQCFIL)

This parameter is applicable to only sender, server, and cluster-sender channels.

Transmission queue time indicator (parameter identifier: MQIACH_XMITQ_TIME_INDICATOR). The time, in microseconds, that messages remained on the transmission queue before being retrieved. The time is measured from when the message is put onto the transmission queue until it is retrieved to be sent on the channel and, therefore, includes any interval caused by a delay in the putting application. Two values are returned, in this order:

Multi

1. A value based on activity over a long period.
2. A value based on recent activity over a short period.

z/OS

1. A value based on recent activity over a short period.
2. A value based on activity over a longer period.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned.

ULW

Inquire Channel Status (Response) (AMQP)

The response to the Inquire Channel Status (MQCMD_INQUIRE_CHANNEL_STATUS) command consists of the response header followed by the *ChannelName* structure and the requested combination of attribute parameter structures.

One PCF response message is generated for each channel instance found that matches the criteria that are specified on the command.

If the **ClientIdentifier** parameter is not specified, the output of the Inquire Channel Status command is a summary of statuses of all clients that are connected to the channel. One PCF response message is returned per channel.

Always returned:

ChannelName, ChannelStatus, ChannelType,

If the **ClientIdentifier** parameter is specified, separate PCF response messages are returned for each client connection. The **ClientIdentifier** parameter might be a wildcard, in which the status for all clients that match the **ClientIdentifier** string is returned.

Always returned:

ChannelName, ChannelStatus, ChannelType, ClientIdentifier

Returned if requested:

ChannelStartDate, ChannelStartTime, ClientUser, ConnectionName, Connections, KeepAliveInterval, LastMsgDate, LastMsgTime, MCAUser, MsgsReceived, MsgsSent, Protocol

Response data

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelStartDate (MQCFST)

Date on which the channel started, in the form yyyy-mm-dd (parameter identifier: MQCACH_CHANNEL_START_DATE).

The maximum length of the string is MQ_CHANNEL_DATE_LENGTH.

ChannelStartTime (MQCFST)

Time at which the channel started, in the form hh.mm.ss (parameter identifier: MQCACH_CHANNEL_START_TIME).

The maximum length of the string is MQ_CHANNEL_TIME_LENGTH.

ChannelStatus (MQCFIN)

Channel status (parameter identifier: MQIACH_CHANNEL_STATUS).

The value can be:

MQCHS_DISCONNECTED

Channel is disconnected.

MQCHS_RUNNING

Channel is transferring or waiting for messages.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

The value must be:

MQCHT_AMQP

AMQP

ClientUser (MQCFST)

Client Id of the client (parameter identifier: MQCACH_CLIENT_USER_ID).

The maximum length of the string is MQ_CLIENT_USER_ID_LENGTH.

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

The maximum length of the string is MQ_CONN_NAME_LENGTH.

Connections (MQCFIN)

Current number of AMQP connections connected to this channel (parameter identifier: MQIACH_NAME_LENGTH).

KeepAliveInterval (MQCFIN)

Keep alive interval (parameter identifier: MQIACH_KEEP_ALIVE_INTERVAL).

The interval in milliseconds after which the client is disconnected because of inactivity.

LastMsgDate (MQCFST)

Date on which the last message was sent, or the MQI call was handled, in the form yyyy-mm-dd (parameter identifier: MQCACH_LAST_MSG_DATE).

The maximum length of the string is MQ_CHANNEL_DATE_LENGTH.

LastMsgTime (MQCFST)

Time at which the last message was sent, or the MQI call was handled, in the form hh.mm.ss (parameter identifier: MQCACH_LAST_MSG_TIME).

The maximum length of the string is MQ_CHANNEL_TIME_LENGTH.

MCAUser (MQCFST)

Message channel agent user identifier (parameter identifier: MQCACH_MCA_USER_ID).

The maximum length of the MCA user identifier is MQ_MCA_USER_ID_LENGTH.

MsgsReceived (MQCFIN64)

Number of messages received by the client since it last connected (parameter identifier: MQIACH_MSGS_RECEIVED or MQIACH_MSGS_RCVD).

MsgsSent (MQCFIN64)

Number of messages sent by the client since it last connected (parameter identifier: MQIACH_MSGS_SENT).

Protocol (MQCFST)

AMQP protocol supported by this channel (parameter identifier: MQIACH_PROTOCOL).

The value will be:

MQPROTO_AMQP

AMQP

The response to the Inquire Channel Status (MQCMD_INQUIRE_CHANNEL_STATUS) command consists of the response header followed by the *ChannelName* structure and the requested combination of attribute parameter structures.

One PCF response message is generated for each channel instance found that matches the criteria that are specified on the command.

If the **ClientIdentifier** parameter is not specified, the output of the Inquire Channel Status command is a summary of statuses of all clients that are connected to the channel. One PCF response message is returned per channel.

Always returned:

ChannelName, ChannelStatus, ChannelType, Connections,

If the **ClientIdentifier** parameter is specified, separate PCF response messages are returned for each client connection. The **ClientIdentifier** parameter might be a wildcard, in which the status for all clients that match the **ClientIdentifier** string is returned (within the limits of **MaxResponses** and **ResponseRestartPoint** if they are set).

Always returned:

ChannelName, ChannelStatus, ChannelType, ClientId

Returned if requested:

ChannelStartDate, ChannelStatusTime, ClientUser, InDoubtInput, InDoubtOutput, KeepAliveInterval, LastMessageSentDate, LastMessageSentTime, MCAUser, MessagesReceived, MessagesSent, PendingOutbound, Protocol

Response data

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelStartDate (MQCFST)

Date on which the channel started, in the form yyyy-mm-dd (parameter identifier: MQCACH_CHANNEL_START_DATE).

The maximum length of the string is MQ_CHANNEL_DATE_LENGTH.

ChannelStartTime (MQCFST)

Time at which the channel started, in the form hh.mm.ss (parameter identifier: MQCACH_CHANNEL_START_TIME).

The maximum length of the string is MQ_CHANNEL_TIME_LENGTH.

ChannelStatus (MQCFIN)

Channel status (parameter identifier: MQIACH_CHANNEL_STATUS).

The value can be:

MQCHS_DISCONNECTED

Channel is disconnected.

MQCHS_RUNNING

Channel is transferring or waiting for messages.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

The value must be:

MQCHT_MQTT

Telemetry.

ClientUser (MQCFST)

ClientID of the client (parameter identifier: MQCACH_CLIENT_USER_ID).

The maximum length of the string is MQ_CLIENT_USER_ID_LENGTH.

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

The maximum length of the string is MQ_CONN_NAME_LENGTH.

Connections (MQCFIN)

Current number of MQTT connections connected to this channel (parameter identifier: MQIACH_NAME_LENGTH).

InDoubtInput (MQCFIN)

The number of inbound messages to the client that are in doubt (parameter identifier: MQIACH_IN_DOUBT_IN).

InDoubtOutput (MQCFIN)

The number of outbound messages from the client that are in doubt (parameter identifier: MQIACH_IN_DOUBT_OUT).

KeepAliveInterval (MQCFIN)

KeepAlive interval (parameter identifier: MQIACH_KEEP_ALIVE_INTERVAL).

The interval in milliseconds after which the client is disconnected because of inactivity. If the MQXR service does not receive any communication from the client within the keep alive interval, it disconnects from the client. This interval is calculated based on the MQTT keep alive time sent by the client when it connects. The maximum size is MQ_MQTT_MAX_KEEP_ALIVE.

LastMsgDate (MQCFST)

Date on which the last message was sent, or the MQI call was handled, in the form yyyy-mm-dd (parameter identifier: MQCACH_LAST_MSG_DATE).

The maximum length of the string is MQ_CHANNEL_DATE_LENGTH.

LastMsgTime (MQCFST)

Time at which the last message was sent, or the MQI call was handled, in the form hh.mm.ss (parameter identifier: MQCACH_LAST_MSG_TIME).

The maximum length of the string is MQ_CHANNEL_TIME_LENGTH.

MCAUser (MQCFST)

Message channel agent user identifier (parameter identifier: MQCACH_MCA_USER_ID).

The maximum length of the MCA user identifier is MQ_MCA_USER_ID_LENGTH.

MsgsReceived (MQCFIN64)

Number of messages received by the client since it last connected (parameter identifier: MQIACH_MSGS_RECEIVED / MQIACH_MSGS_RCVD).

MsgsSent (MQCFIN64)

Number of messages sent by the client since it last connected (parameter identifier: MQIACH_MSGS_SENT).

PendingOutbound (MQCFIN)

The number of outbound messages pending (parameter identifier: MQIACH_PENDING_OUT).

Protocol (MQCFST)

MQTT protocol supported by this channel (parameter identifier: MQIACH_PROTOCOL).

Specify one or more of the following options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

MQTTv311 (constant: MQPROTO_MQTTV311)

MQTTv3 (constant: MQPROTO_MQTTV3)

HTTP (constant: MQPROTO_HTTP)

Inquire Cluster Queue Manager

The Inquire Cluster Queue Manager (MQCMD_INQUIRE_CLUSTER_Q_MGR) command inquires about the attributes of IBM MQ queue managers in a cluster.

Required parameters

ClusterQMgrName (MQCFST)

Queue manager name (parameter identifier: MQCA_CLUSTER_Q_MGR_NAME).

Generic queue manager names are supported. A generic name is a character string followed by an asterisk "*", for example ABC*. It selects all queue managers having names that start with the selected character string. An asterisk on its own matches all possible names.

The queue manager name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

Optional parameters

Channel (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Specifies that eligible cluster queue managers are limited to those having the specified channel name.

Generic channel names are supported. A generic name is a character string followed by an asterisk "*", for example ABC*. It selects all queue managers having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

If you do not specify a value for this parameter, channel information about *all* queue managers in the cluster is returned.

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

Specifies that eligible cluster queue managers are limited to those having the specified cluster name.

Generic cluster names are supported. A generic name is a character string followed by an asterisk "*", for example ABC*. It selects all queue managers having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

If you do not specify a value for this parameter, cluster information about *all* queue managers inquired is returned.

ClusterQMgrAttrs (MQCFIL)

Attributes (parameter identifier: MQIACF_CLUSTER_Q_MGR_ATTRS).

Some parameters are relevant only for cluster channels of a particular type or types. Attributes that are not relevant for a particular type of channel cause no output, and do not cause an error. To check which attributes apply to which channel types; see [Channel attributes and channel types](#).

The attribute list might specify the following value on its own. If the parameter is not specified, a default value is used.

MQIACF_ALL

All attributes.

Alternative, supply a combination of the following values:

MQCA_ALTERATION_DATE

The date on which the information was last altered.

MQCA_ALTERATION_TIME

The time at which the information was last altered.

MQCA_CLUSTER_DATE

The date on which the information became available to the local queue manager.

MQCA_CLUSTER_NAME

The name of the cluster to which the channel belongs.

MQCA_CLUSTER_Q_MGR_NAME

The name of the cluster to which the channel belongs.

MQCA_CLUSTER_TIME

The time at which the information became available to the local queue manager.

MQCA_Q_MGR_IDENTIFIER

The unique identifier of the queue manager.

MQCA_VERSION

The version of the IBM MQ installation that the cluster queue manager is associated with.

MQCA_XMIT_Q_NAME

The cluster transmission queue used by the queue manager.

MQCACH_CONNECTION_NAME

Connection name.

MQCACH_DESCRIPTION

Description.

MQCACH_LOCAL_ADDRESS

Local communications address for the channel.

MQCACH_MCA_NAME

Message channel agent name.

You cannot use MQCACH_MCA_NAME as a parameter to filter on.

MQCACH_MCA_USER_ID

MCA user identifier.

MQCACH_MODE_NAME

Mode name.

MQCACH_MR_EXIT_NAME

Message-retry exit name.

MQCACH_MR_EXIT_USER_DATA

Message-retry exit user data.

MQCACH_MSG_EXIT_NAME

Message exit name.

MQCACH_MSG_EXIT_USER_DATA

Message exit user data.

MQCACH_PASSWORD

Password.

This parameter is not valid on z/OS.

MQCACH_RCV_EXIT_NAME

Receive exit name.

MQCACH_RCV_EXIT_USER_DATA

Receive exit user data.

MQCACH_SEC_EXIT_NAME

Security exit name.

MQCACH_SEC_EXIT_USER_DATA

Security exit user data.

MQCACH_SEND_EXIT_NAME

Send exit name.

MQCACH_SEND_EXIT_USER_DATA

Send exit user data.

MQCACH_SSL_CIPHER_SPEC

TLS cipher spec.

MQIACH_SSL_CLIENT_AUTH

TLS client authentication.

MQCACH_SSL_PEER_NAME

TLS peer name.

MQCACH_TP_NAME

Transaction program name.

MQCACH_USER_ID

User identifier.

This parameter is not valid on z/OS.

MQIA_MONITORING_CHANNEL

Online monitoring data collection.

MQIA_USE_DEAD_LETTER_Q

Determines whether the dead-letter queue is used when messages cannot be delivered by channels.

MQIACF_Q_MGR_DEFINITION_TYPE

How the cluster queue manager was defined.

MQIACF_Q_MGR_TYPE

The function of the queue manager in the cluster.

MQIACF_SUSPEND

Specifies whether the queue manager is suspended from the cluster.

MQIACH_BATCH_HB

The value being used for the batch heartbeat.

MQIACH_BATCH_INTERVAL

Batch wait interval (seconds).

MQIACH_BATCH_DATA_LIMIT

Batch data limit (kilobytes).

MQIACH_BATCH_SIZE

Batch size.

MQIACH_CHANNEL_STATUS

Channel status.

MQIACH_CLWL_CHANNEL_PRIORITY

Cluster workload channel priority.

MQIACH_CLWL_CHANNEL_RANK

Cluster workload channel rank.

MQIACH_CLWL_CHANNEL_WEIGHT

Cluster workload channel weight.

MQIACH_DATA_CONVERSION

Specifies whether sender must convert application data.

MQIACH_DISC_INTERVAL

Disconnection interval.

MQIACH_HB_INTERVAL

Heartbeat interval (seconds).

MQIACH_HDR_COMPRESSION

The list of header data compression techniques supported by the channel.

MQIACH_KEEP_ALIVE_INTERVAL

KeepAlive interval (valid on z/OS only).

MQIACH_LONG_RETRY

Count of long duration attempts.

MQIACH_LONG_TIMER

Long duration timer.

MQIACH_MAX_MSG_LENGTH

Maximum message length.

MQIACH_MCA_TYPE

MCA type.

MQIACH_MR_COUNT

Count of send message attempts.

MQIACH_MR_INTERVAL

Interval between attempting to resend a message in milliseconds.

MQIACH_MSG_COMPRESSION

List of message data compression techniques supported by the channel.

MQIACH_NETWORK_PRIORITY

Network priority.

MQIACH_NPM_SPEED

Speed of nonpersistent messages.

MQIACH_PUT_AUTHORITY

Put authority.

MQIACH_SEQUENCE_NUMBER_WRAP

Sequence number wrap.

MQIACH_SHORT_RETRY

Count of short duration attempts.

MQIACH_SHORT_TIMER

Short duration timer.

MQIACH_XMIT_PROTOCOL_TYPE

Transmission protocol type.

z/OS

z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment. The command server must be enabled.
- An asterisk " * ". The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is `MQ_QSG_NAME_LENGTH`.

You cannot use `CommandScope` as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in `ClusterQMGrAttrs` except `MQIACF_ALL` and others as noted. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1852](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in `ClusterQMGrAttrs` except `MQCA_CLUSTER_Q_MGR_NAME` and others as noted. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1859](#) for information about using this filter condition.

If you specify a string filter for `Channel` or `ClusterName`, you cannot also specify the `Channel` or `ClusterName` parameter.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Inquire Cluster Queue Manager (Response)

The response to the Inquire Cluster Queue Manager (`MQCMD_INQUIRE_CLUSTER_Q_MGR`) command consists of three parts. The response header is followed by the `QMGrName` structure and the requested combination of attribute parameter structures.

Always returned:

`ChannelName`, `ClusterName`, `QMGrName`,

Returned if requested:

`AlterationDate` , `AlterationTime` , `BatchHeartbeat` , `BatchInterval` ,
`BatchSize` , `ChannelDesc` , `ChannelMonitoring` , `ChannelStatus` , `ClusterDate` ,
`ClusterInfo` , `ClusterTime` , `CLWLChannelPriority` , `CLWLChannelRank` ,
`CLWLChannelWeight` , `ConnectionName` , `DataConversion` , `DiscInterval` ,
`HeaderCompression` , `HeartbeatInterval` ,  `KeepAliveInterval` ,
`LocalAddress` , `LongRetryCount` , `LongRetryInterval` , `MaxMsgLength` , `MCAName` ,
`MCAType` , `MCAUserIdentifier` ,
`MessageCompression` , `ModeName` , `MsgExit` , `MsgRetryCount` , `MsgRetryExit` ,
`MsgRetryInterval` , `MsgRetryUserData` , `MsgUserData` , `NetworkPriority` ,
`NonPersistentMsgSpeed` , `Password` , `PutAuthority` , `QMGrDefinitionType` ,
`QMGrIdentifier` , `QMGrType` , `ReceiveExit` , `ReceiveUserData` , `SecurityExit` ,
`SecurityUserData` , `SendExit` , `SendUserData` , `SeqNumberWrap` , `ShortRetryCount` ,
`ShortRetryInterval` , `SSLCipherSpec` , `SSLClientAuth` , `SSLPeerName` , `Suspend` , `TpName` ,
`TransmissionQName` , `TransportType` , `UseDLQ` , `UserIdentifier` , `Version`

Response data

AlterationDate (MQCFST)

Alteration date, in the form `yyyy-mm-dd` (parameter identifier: `MQCA_ALTERATION_DATE`).

The date at which the information was last altered.

AlterationTime (MQCFST)

Alteration time, in the form `hh.mm.ss` (parameter identifier: `MQCA_ALTERATION_TIME`).

The time at which the information was last altered.

BatchHeartbeat (MQCFIN)

The value being used for the batch heartbeat (parameter identifier: MQIACH_BATCH_HB).

The value can be 0 - 999,999. A value of 0 indicates that the batch heartbeat is not being used.

BatchInterval (MQCFIN)

Batch interval (parameter identifier: MQIACH_BATCH_INTERVAL).

BatchSize (MQCFIN)

Batch size (parameter identifier: MQIACH_BATCH_SIZE).

ChannelDesc (MQCFST)

Channel description (parameter identifier: MQCACH_DESC).

The maximum length of the string is MQ_CHANNEL_DESC_LENGTH.

ChannelMonitoring (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA_MONITORING_CHANNEL).

The value can be:

MQMON_OFF

Online monitoring data collection is turned off for this channel.

MQMON_Q_MGR

The value of the queue manager's **ChannelMonitoring** parameter is inherited by the channel. MQMON_Q_MGR is the default value.

MQMON_LOW

Online monitoring data collection is turned on, with a low rate of data collection, for this channel unless the queue manager's **ChannelMonitoring** parameter is MQMON_NONE.

MQMON_MEDIUM

Online monitoring data collection is turned on, with a moderate rate of data collection, for this channel unless the queue manager's **ChannelMonitoring** parameter is MQMON_NONE.

MQMON_HIGH

Online monitoring data collection is turned on, with a high rate of data collection, for this channel unless the queue manager's **ChannelMonitoring** parameter is MQMON_NONE.

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelStatus (MQCFIN)

Channel status (parameter identifier: MQIACH_CHANNEL_STATUS).

The value can be:

MQCHS_BINDING

Channel is negotiating with the partner.

MQCHS_INACTIVE

Channel is not active.

MQCHS_STARTING

Channel is waiting to become active.

MQCHS_RUNNING

Channel is transferring or waiting for messages.

MQCHS_PAUSED

Channel is paused.

MQCHS_STOPPING

Channel is in process of stopping.

MQCHS_RETRYING

Channel is reattempting to establish connection.

MQCHS_STOPPED

Channel is stopped.

MQCHS_REQUESTING

Requester channel is requesting connection.

MQCHS_INITIALIZING

Channel is initializing.

This parameter is returned if the channel is a cluster-sender channel (CLUSSDR) only.

ClusterDate (MQCFST)

Cluster date, in the form yyyy-mm-dd (parameter identifier: MQCA_CLUSTER_DATE).

The date at which the information became available to the local queue manager.

ClusterInfo (MQCFIN)

Cluster information (parameter identifier: MQIACF_CLUSTER_INFO).

The cluster information available to the local queue manager.

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

ClusterTime (MQCFST)

Cluster time, in the form hh.mm.ss (parameter identifier: MQCA_CLUSTER_TIME).

The time at which the information became available to the local queue manager.

CLWLChannelPriority (MQCFIN)

Channel priority (parameter identifier: MQIACH_CLWL_CHANNEL_PRIORITY).

CLWLChannelRank (MQCFIN)

Channel rank (parameter identifier: MQIACH_CLWL_CHANNEL_RANK).

CLWLChannelWeight (MQCFIN)

Channel weighting (parameter identifier: MQIACH_CLWL_CHANNEL_WEIGHT).

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

The maximum length of the string is MQ_CONN_NAME_LENGTH. On z/OS, it is MQ_LOCAL_ADDRESS_LENGTH.

DataConversion (MQCFIN)

Specifies whether sender must convert application data (parameter identifier: MQIACH_DATA_CONVERSION).

The value can be:

MQCDC_NO_SENDER_CONVERSION

No conversion by sender.

MQCDC_SENDER_CONVERSION

Conversion by sender.

DiscInterval (MQCFIN)

Disconnection interval (parameter identifier: MQIACH_DISC_INTERVAL).

HeaderCompression (MQCFIL)

Header data compression techniques supported by the channel (parameter identifier: MQIACH_HDR_COMPRESSION). The values specified are in order of preference.

The value can be one, or more, of

MQCOMPRESS_NONE

No header data compression is performed.

MQCOMPRESS_SYSTEM

Header data compression is performed.

HeartbeatInterval (MQCFIN)

Heartbeat interval (parameter identifier: MQIACH_HB_INTERVAL).

**KeepAliveInterval (MQCFIN)**

KeepAlive interval (parameter identifier: MQIACH_KEEP_ALIVE_INTERVAL). This parameter applies to z/OS only.

LocalAddress (MQCFST)

Local communications address for the channel (parameter identifier: MQCACH_LOCAL_ADDRESS).

The maximum length of the string is MQ_LOCAL_ADDRESS_LENGTH.

LongRetryCount (MQCFIN)

Long retry count (parameter identifier: MQIACH_LONG_RETRY).

LongRetryInterval (MQCFIN)

Long timer (parameter identifier: MQIACH_LONG_TIMER).

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: MQIACH_MAX_MSG_LENGTH).

MCAName (MQCFST)

Message channel agent name (parameter identifier: MQCACH_MCA_NAME).

The maximum length of the string is MQ_MCA_NAME_LENGTH.

MCAType (MQCFIN)

Message channel agent type (parameter identifier: MQIACH_MCA_TYPE).

The value can be:

MQMCAT_PROCESS

Process.

MQMCAT_THREAD

Thread (Windows only).

MCAUserIdentifier (MQCFST)

Message channel agent user identifier (parameter identifier: MQCACH_MCA_USER_ID).

The maximum length of the string is MQ_USER_ID_LENGTH.

MessageCompression (MQCFIL)

Message data compression techniques supported by the channel (parameter identifier: MQIACH_MSG_COMPRESSION). The values specified are in order of preference.

The value can be one, or more, of:

MQCOMPRESS_NONE

No message data compression is performed.

MQCOMPRESS_RLE

Message data compression is performed using run-length encoding.

MQCOMPRESS_ZLIBFAST

Message data compression is performed using ZLIB encoding with speed prioritized.

MQCOMPRESS_ZLIBHIGH

Message data compression is performed using ZLIB encoding with compression prioritized.

ModeName (MQCFST)

Mode name (parameter identifier: MQCACH_MODE_NAME).

The maximum length of the string is MQ_MODE_NAME_LENGTH.

MsgExit (MQCFST)

Message exit name (parameter identifier: MQCACH_MSG_EXIT_NAME).

The maximum length of the string is MQ_EXIT_NAME_LENGTH.

Multi On [Multiplatforms](#), more than one message exit can be defined for a channel. If more than one message exit is defined, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

MsgRetryCount (MQCFIN)

Message retry count (parameter identifier: MQIACH_MR_COUNT).

MsgRetryExit (MQCFST)

Message retry exit name (parameter identifier: MQCACH_MR_EXIT_NAME).

The maximum length of the string is MQ_EXIT_NAME_LENGTH.

MsgRetryInterval (MQCFIN)

Message retry interval (parameter identifier: MQIACH_MR_INTERVAL).

MsgRetryUserData (MQCFST)

Message retry exit user data (parameter identifier: MQCACH_MR_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

MsgUserData (MQCFST)

Message exit user data (parameter identifier: MQCACH_MSG_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

Multi On [Multiplatforms](#), more than one message exit user data string can be defined for a channel. If more than one string is defined, the list of strings is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

NetworkPriority (MQCFIN)

Network priority (parameter identifier: MQIACH_NETWORK_PRIORITY).

NonPersistentMsgSpeed (MQCFIN)

Speed at which non-persistent messages are to be sent (parameter identifier: MQIACH_NPM_SPEED).

The value can be:

MQNPMS_NORMAL

Normal speed.

MQNPMS_FAST

Fast speed.

Password (MQCFST)

Password (parameter identifier: MQCACH_PASSWORD). This parameter is not available on z/OS.

If a nonblank password is defined, it is returned as asterisks. Otherwise, it is returned as blanks.

The maximum length of the string is MQ_PASSWORD_LENGTH. However, only the first 10 characters are used.

PutAuthority (MQCFIN)

Put authority (parameter identifier: MQIACH_PUT_AUTHORITY).

The value can be:

MQPA_DEFAULT

Default user identifier is used.

MQPA_CONTEXT

Context user identifier is used.

MQPA_ALTERNATE_OR_MCA

The user identifier from the *UserIdentifier* field of the message descriptor is used. Any user ID received from the network is not used. This value is valid only on z/OS.

MQPA_ONLY_MCA

The default user identifier is used. Any user ID received from the network is not used. This value is valid only on z/OS.

QMgrDefinitionType (MQCFIN)

Queue manager definition type (parameter identifier: MQIACF_Q_MGR_DEFINITION_TYPE).

The value can be:

MQQMDT_EXPLICIT_CLUSTER_SENDER

A cluster-sender channel from an explicit definition.

MQQMDT_AUTO_CLUSTER_SENDER

A cluster-sender channel by auto-definition.

MQQMDT_CLUSTER_RECEIVER

A cluster-receiver channel.

MQQMDT_AUTO_EXP_CLUSTER_SENDER

A cluster-sender channel, both from an explicit definition and by auto-definition.

QMgrIdentifier (MQCFST)

Queue manager identifier (parameter identifier: MQCA_Q_MGR_IDENTIFIER).

The unique identifier of the queue manager.

QMgrName (MQCFST)

Queue manager name (parameter identifier: MQCA_CLUSTER_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

QMgrType (MQCFIN)

Queue manager type (parameter identifier: MQIACF_Q_MGR_TYPE).

The value can be:

MQQMT_NORMAL

A normal queue manager.

MQQMT_REPOSITORY

A repository queue manager.

ReceiveExit (MQCFST)

Receive exit name (parameter identifier: MQCACH_RCV_EXIT_NAME).

The maximum length of the string is MQ_EXIT_NAME_LENGTH.

Multi On Multiplatforms, more than one receive exit can be defined for a channel. If more than one receive exit is defined, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

ReceiveUserData (MQCFST)

Receive exit user data (parameter identifier: MQCACH_RCV_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

Multi On Multiplatforms, more than one receive exit user data string can be defined for a channel. If more than one string is defined, the list of strings is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

SecurityExit (MQCFST)

Security exit name (parameter identifier: MQCACH_SEC_EXIT_NAME).

The maximum length of the string is MQ_EXIT_NAME_LENGTH.

SecurityUserData (MQCFST)

Security exit user data (parameter identifier: MQCACH_SEC_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

SendExit (MQCFST)

Send exit name (parameter identifier: MQCACH_SEND_EXIT_NAME).

The maximum length of the string is MQ_EXIT_NAME_LENGTH.

Multi On Multiplatforms, more than one send exit can be defined for a channel. If more than one send exit is defined, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

SendUserData (MQCFST)

Send exit user data (parameter identifier: MQCACH_SEND_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

Multi On Multiplatforms, more than one send exit user data string can be defined for a channel. If more than one string is defined, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

SeqNumberWrap (MQCFIN)

Sequence wrap number (parameter identifier: MQIACH_SEQUENCE_NUMBER_WRAP).

ShortRetryCount (MQCFIN)

Short retry count (parameter identifier: MQIACH_SHORT_RETRY).

ShortRetryInterval (MQCFIN)

Short timer (parameter identifier: MQIACH_SHORT_TIMER).

SSLCipherSpec (MQCFST)

CipherSpec (parameter identifier: MQCACH_SSL_CIPHER_SPEC).

The length of the string is MQ_SSL_CIPHER_SPEC_LENGTH.

SSLClientAuth (MQCFIN)

Client authentication (parameter identifier: MQIACH_SSL_CLIENT_AUTH).

The value can be:

MQSCA_REQUIRED

Client authentication required

MQSCA_OPTIONAL

Client authentication is optional.

Defines whether IBM MQ requires a certificate from the TLS client.

SSLPeerName (MQCFST)

Peer name (parameter identifier: MQCACH_SSL_PEER_NAME).

The length of the string is MQ_SSL_PEER_NAME_LENGTH. On z/OS, it is MQ_SHORT_PEER_NAME_LENGTH.

Specifies the filter to use to compare with the distinguished name of the certificate from the peer queue manager or client at the other end of the channel. (A distinguished name is the identifier of the

TLS certificate.) If the distinguished name in the certificate received from the peer does not match the SSLPEER filter, the channel does not start.

Suspend (MQCFIN)

Specifies whether the queue manager is suspended (parameter identifier: MQIACF_SUSPEND).

The value can be:

MQSUS_NO

The queue manager is not suspended from the cluster.

MQSUS_YES

The queue manager is suspended from the cluster.

TpName (MQCFST)

Transaction program name (parameter identifier: MQCACH_TP_NAME).

The maximum length of the string is MQ_TP_NAME_LENGTH.

TranmissionQName (MQCFST)

Transmission queue name (parameter identifier: MQCA_XMIT_Q_NAME). The cluster transmission queue used by the queue manager.

The maximum length of the string is MQ_Q_NAME_LENGTH.

TransportType (MQCFIN)

Transmission protocol type (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value can be:

MQXPT_LU62

LU 6.2.

MQXPT_TCP

TCP.

MQXPT_NETBIOS

NetBIOS.

MQXPT_SPX

SPX.

MQXPT_DECNET

DECnet.

UseDLQ (MQCFIN)

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA_USE_DEAD_LETTER_Q).

UserIdentifier (MQCFST)

Task user identifier (parameter identifier: MQCACH_USER_ID). This parameter is not available on z/OS.

The maximum length of the string is MQ_USER_ID_LENGTH. However, only the first 10 characters are used.

Version (MQCFST)

The version of the IBM MQ installation that the cluster queue manager is associated with. (parameter identifier: MQCA_VERSION). The version has the format VVRRMMFF:

VV: Version

RR: Release

MM: Maintenance level

FF: Fix level

Inquire Communication Information Object on Multiplatforms

The Inquire Communication Information Object (MQCMD_INQUIRE_COMM_INFO) command inquires about the attributes of existing IBM MQ communication information objects.

Required parameters:

CommInfoName

Optional parameters:

CommInfoAttrs, **IntegerFilterCommand**, **StringFilterCommand**

Required parameters

CommInfoName (MQCFST)

The name of the communication information definition about which information is to be returned (parameter identifier: MQCA_COMM_INFO_NAME).

The communication information name is always returned regardless of the attributes requested.

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

Optional parameters

CommInfoAttrs (MQCFIL)

CommInfo attributes (parameter identifier: MQIACF_COMM_INFO_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQIA_CODED_CHAR_SET_ID

CCSID for transmitted messages.

MQIA_COMM_EVENT

CommInfo event control.

MQIA_MCAST_BRIDGE

Multicast bridging.

MQIA_MONITOR_INTERVAL

Frequency of update for monitoring information.

MQIACF_ENCODING

Encoding for transmitted messages.

MQIACH_MC_HB_INTERVAL

Multicast heartbeat interval.

MQIACH_MSG_HISTORY

Amount of message history being kept.

MQIACH_MULTICAST_PROPERTIES

Multicast properties control.

MQIACH_NEW_SUBSCRIBER_HISTORY

New subscriber history.

MQIACH_PORT

Port Number.

MQCA_ALTERATION_DATE

The date on which the information was last altered.

MQCA_ALTERATION_TIME

The time at which the information was last altered.

MQCA_COMM_INFO_DESC

Comminfo description.

MQCA_COMM_INFO_TYPE

Comminfo type

MQCACH_GROUP_ADDRESS

Group Address.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ComminfoAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1852](#) for information about using this filter condition.

If you specify an integer filter for *ComminfoType* (MQIA_COMM_INFO_TYPE), you cannot also specify the **ComminfoType** parameter.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ComminfoAttrs* except MQCA_COMM_INFO_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1859](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Multi Inquire Communication Information Object (Response) on Multiplatforms

The response to the Inquire Communication Information Object (MQCMD_INQUIRE_COMM_INFO) command consists of the response header followed by the ComminfoName structure, and the requested combination of attribute parameter structures (where applicable).

If a generic communication information name was specified, one such message is generated for each object found.

Always returned:

ComminfoName

Returned if requested:

AlterationDate, AlterationTime, Bridge, CCSID, CommEvent, Description, Encoding, GrpAddress, MonitorInterval, MulticastHeartbeat, MulticastPropControl, MsgHistory, NewSubHistory, PortNumber, Type

Response data**AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered, in the form hh.mm.ss.

Bridge (MQCFIN)

Multicast Bridging (parameter identifier: MQIA_MCAST_BRIDGE).

Controls whether publications from applications not using Multicast are bridged to applications using multicast.

CCSID (MQCFIN)

CCSID that messages are transmitted in (parameter identifier: MQIA_CODED_CHAR_SET_ID).

The coded character set identifier that messages are transmitted in.

CommEvent (MQCFIN)

Event Control (parameter identifier: MQIA_COMM_EVENT).

Controls whether event messages are generated for multicast handles that are created using this COMMINFO object. The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

MQEVR_EXCEPTION

Reporting of events for message reliability below the reliability threshold enabled.

CommInfoName (MQCFST)

The name of the communication information definition (parameter identifier: MQCA_COMM_INFO_NAME).

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

Description (MQCFST)

Description of the communication information definition (parameter identifier: MQCA_COMM_INFO_DESC).

The maximum length of the string is MQ_COMM_INFO_DESC_LENGTH.

Encoding (MQCFIN)

Encoding that messages are transmitted in (parameter identifier: MQIACF_ENCODING).

The encoding that messages are transmitted in. The value can be any of the following values:

MQENC_AS_PUBLISHED

Encoding taken from published message.

MQENC_NORMAL**MQENC_REVERSED****MQENC_S390****MQENC_TNS****GrpAddress (MQCFST)**

The group IP address or DNS name (parameter identifier: MQCACH_GROUP_ADDRESS).

The maximum length of the string is MQ_GROUP_ADDRESS_LENGTH.

MonitorInterval (MQCFIN)

Frequency of monitoring (parameter identifier: MQIA_MONITOR_INTERVAL).

How frequently, in seconds, monitoring information is updated and event messages are generated.

MulticastHeartbeat (MQCFIN)

Heartbeat Interval for multicast (parameter identifier: MQIACH_MC_HB_INTERVAL).

The heartbeat interval, in milliseconds, for multicast transmitters.

MulticastPropControl (MQCFIN)

Multicast property control (parameter identifier: MQIACH_MULTICAST_PROPERTIES).

Control which MQMD properties and user properties flow with the message. The value can be any of the following values:

MQMCP_ALL

All MQMD and user properties.

MQMAP_REPLY

Properties related to replying to messages.

MQMAP_USER

Only user properties.

MQMAP_NONE

No MQMD or user properties.

MQMAP_COMPAT

Properties are transmitted in a format compatible with previous Multicast clients.

MsgHistory (MQCFIN)

Message History (parameter identifier: MQIACH_MSG_HISTORY).

The amount of message history, in kilobytes, that is kept by the system to handle retransmissions in the case of NACKS.

NewSubHistory (MQCFIN)

New Subscriber History (parameter identifier: MQIACH_NEW_SUBSCRIBER_HISTORY).

Controls how much historical data a new subscriber receives. The value can be any of the following values:

MQNSH_NONE

Only publications from the time of the subscription are sent.

MQNSH_ALL

As much history as is known is retransmitted.

PortNumber (MQCFIN)

Port Number (parameter identifier: MQIACH_PORT).

The port number to transmit on.

Type (MQCFIN)

The type of the communications information definition (parameter identifier: MQIA_COMM_INFO_TYPE).

The value can be:

MQCIT_MULTICAST

Multicast.

Inquire Connection

The Inquire connection (MQCMD_INQUIRE_CONNECTION) command inquires about the applications which are connected to the queue manager, the status of any transactions that those applications are running, and the objects which the application has open.

Required parameters**ConnectionId (MQCFBS)**

Connection identifier (parameter identifier: MQBACF_CONNECTION_ID).

This parameter is the unique connection identifier associated with an application that is connected to the queue manager. Specify either this parameter **or** *GenericConnectionId*.

All connections are assigned a unique identifier by the queue manager regardless of how the connection is established.

If you need to specify a generic connection identifier, use the **GenericConnectionId** parameter instead.

The length of the string is MQ_CONNECTION_ID_LENGTH.

GenericConnectionId (MQCFBS)

Generic specification of a connection identifier (parameter identifier: MQBACF_GENERIC_CONNECTION_ID).

Specify either this parameter **or** *ConnectionId*.

If you specify a byte string of zero length, or one which contains only null bytes, information about all connection identifiers is returned. This value is the only value permitted for *GenericConnectionId*.

The length of the string is MQ_CONNECTION_ID_LENGTH.

Optional parameters

ByteStringFilterCommand (MQCFBF)

Byte string filter command descriptor. The parameter identifier must be MQBACF_EXTERNAL_UOW_ID, MQBACF_ORIGIN_UOW_ID, or MQBACF_Q_MGR_UOW_ID. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFBF - PCF byte string filter parameter” on page 1847](#) for information about using this filter condition.

If you specify a byte string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter, or a string filter using the **StringFilterCommand** parameter.

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_Q_MGR_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

ConnectionAttrs (MQCFIL)

Connection attributes (parameter identifier: MQIACF_CONNECTION_ATTRS).

The attribute list can specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes of the selected *ConnInfoType*.

or, if you select a value of MQIACF_CONN_INFO_CONN for *ConnInfoType*, a combination of the following:

MQBACF_CONNECTION_ID

Connection identifier.

MQBACF_EXTERNAL_UOW_ID

External unit of recovery identifier associated with the connection.

MQBACF_ORIGIN_UOW_ID

Unit of recovery identifier assigned by the originator (valid on z/OS only).

MQBACF_Q_MGR_UOW_ID

Unit of recovery identifier assigned by the queue manager.

MQCACF_APPL_TAG

Name of an application that is connected to the queue manager.

MQCACF_ASID

The 4-character address-space identifier of the application identified in MQCACF_APPL_TAG (valid on z/OS only).

MQCACF_ORIGIN_NAME

Originator of the unit of recovery (valid on z/OS only).

MQCACF_PSB_NAME

The 8-character name of the program specification block (PSB) associated with the running IMS transaction (valid on z/OS only).

MQCACF_PST_ID

The 4-character IMS program specification table (PST) region identifier for the connected IMS region (valid on z/OS only).

MQCACF_TASK_NUMBER

A 7-digit CICS task number (valid on z/OS only).

MQCACF_TRANSACTION_ID

A 4-character CICS transaction identifier (valid on z/OS only).

MQCACF_UOW_LOG_EXTENT_NAME

Name of the first extent required to recover the transaction. MQCACF_UOW_LOG_EXTENT_NAME is not valid on z/OS.

MQCACF_UOW_LOG_START_DATE

Date on which the transaction associated with the current connection first wrote to the log.

MQCACF_UOW_LOG_START_TIME

Time at which the transaction associated with the current connection first wrote to the log.

MQCACF_UOW_START_DATE

Date on which the transaction associated with the current connection was started.

MQCACF_UOW_START_TIME

Time at which the transaction associated with the current connection was started.

MQCACF_USER_IDENTIFIER

User identifier of the application that is connected to the queue manager.

MQCACH_CHANNEL_NAME

Name of the channel associated with the connected application.

MQCACH_CONNECTION_NAME

Connection name of the channel associated with the application.

MQIA_APPL_TYPE

Type of the application that is connected to the queue manager.

MQIACF_CONNECT_OPTIONS

Connect options currently in force for this application connection.

You cannot use the value MQCNO_STANDARD_BINDING as a filter value.

MQIACF_PROCESS_ID

Process identifier of the application that is currently connected to the queue manager.

This parameter is not valid on z/OS.

MQIACF_THREAD_ID

Thread identifier of the application that is currently connected to the queue manager.

This parameter is not valid on z/OS.

MQIACF_UOW_STATE

State of the unit of work.

MQIACF_UOW_TYPE

Type of external unit of recovery identifier as understood by the queue manager.

or, if you select a value of MQIACF_CONN_INFO_HANDLE for *ConnInfoType*, a combination of the following:

MQCACH_OBJECT_NAME

Name of each object that the connection has open.

MQCACH_CONNECTION_NAME

Connection name of the channel associated with the application.

MQIA_QSG_DISP

Disposition of the object (valid on z/OS only).

You cannot use MQIA_QSG_DISP as a parameter to filter on.

MQIA_READ_AHEAD

The read ahead connection status.

MQIA_UR_DISP

The unit of recovery disposition associated with the connection (valid on z/OS only).

MQIACF_HANDLE_STATE

Whether an API call is in progress.

MQIACF_OBJECT_TYPE

Type of each object that the connection has open.

MQIACF_OPEN_OPTIONS

Options used by the connection to open each object.

or, if you select a value of MQIACF_CONN_INFO_ALL for *ConnInfoType*, any of the previous values.

ConnInfoType (MQCFIN)

Type of connection information to be returned (parameter identifier: MQIACF_CONN_INFO_TYPE).

The value can be any of the following values:

MQIACF_CONN_INFO_CONN

Connection information. On z/OS, MQIACF_CONN_INFO_CONN includes threads which might be logically or actually disassociated from a connection, together with those threads that are in-doubt and for which external intervention is needed to resolve them. MQIACF_CONN_INFO_CONN is the default value used if the parameter is not specified.

MQIACF_CONN_INFO_HANDLE

Information pertaining only to those objects opened by the specified connection.

MQIACF_CONN_INFO_ALL

Connection information and information about those objects that the connection has open.

You cannot use *ConnInfoType* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ConnectionAttrs* except as noted and MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. You cannot use the value MQCNO_STANDARD_BINDING on the MQIACF_CONNECT_OPTIONS parameter with either the MQCFOP_CONTAINS or MQCFOP_EXCLUDES operator. See [“MQCFIF - PCF integer filter parameter” on page 1852](#) for information about using this filter condition.

If you filter on MQIACF_CONNECT_OPTIONS or MQIACF_OPEN_OPTIONS, in each case the filter value must have only 1 bit set.

If you specify an integer filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or a string filter using the **StringFilterCommand** parameter.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ConnectionAttrs*. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1859](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or an integer filter using the **IntegerFilterCommand** parameter.

URDisposition (MQCFIN)

The unit of recovery disposition associated with the connection (parameter identifier: MQI_UR_DISP). This parameter is valid only on z/OS.

The value can be any of the following values:

MQQSGD_ALL

Specifies that all connections must be returned.

MQQSGD_GROUP

Specifies that only connections with a GROUP unit of recovery disposition must be returned.

MQQSGD_Q_MGR

Specifies that only connections with a QMGR unit of recovery disposition must be returned.

Error code

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CONNECTION_ID_ERROR

Connection identifier not valid.

Inquire Connection (Response)

The response to the Inquire Connection (MQCMD_INQUIRE_CONNECTION) command consists of the response header followed by the *ConnectionId* structure and a set of attribute parameter structures determined by the value of *ConnInfoType* in the Inquire command.

If the value of *ConnInfoType* was MQIACF_CONN_INFO_ALL, there is one message for each connection found with MQIACF_CONN_INFO_CONN, and *n* more messages per connection with MQIACF_CONN_INFO_HANDLE (where *n* is the number of objects that the connection has open).

Always returned:

ConnectionId, *ConnInfoType*

Always returned if *ConnInfoType* is MQIACF_CONN_INFO_HANDLE:

ObjectName , *ObjectType* ,  *QSGDisposition*

Returned if requested and *ConnInfoType* is MQIACF_CONN_INFO_CONN:

ApplDesc , *ApplTag* , *ApplType* ,  *ASID* , *AsynchronousState* ,
ChannelName , *ClientIdentifier* , *ConnectionName* , *ConnectionOptions* , 
OriginName ,  *OriginUOWId* ,  *ProcessId* , *PSBName* ,
 *PSTId* , *QMgrUOWId* , *StartUOWLogExtent* , *TaskNumber* , *ThreadId* ,
 *TransactionId* , *UOWIdentifier* , *UOWLogStartDate* , *UOWLogStartTime* ,
UOWStartDate , *UOWStartTime* , *UOWState* , *UOWType* ,  *URDisposition* ,
UserId

Returned if requested and ConnInfoType is MQIACF_CONN_INFO_HANDLE:

AsynchronousState, Destination, DestinationQueueManager, HandleState, OpenOptions, ReadAhead, SubscriptionID, SubscriptionName, TopicString

Response data

ApplDesc (MQCFST)

Application description (parameter identifier: MQCACF_APPL_DESC).

The maximum length is MQ_APPL_DESC_LENGTH.

ApplTag (MQCFST)

Application tag (parameter identifier: MQCACF_APPL_TAG).

The maximum length is MQ_APPL_TAG_LENGTH.

ApplType (MQCFIN)

Application type (parameter identifier: MQIA_APPL_TYPE).

The value can be any of the following values:

MQAT_QMGR

Queue manager process.

MQAT_CHANNEL_INITIATOR

Channel initiator.

MQAT_USER

User application.

MQAT_BATCH

Application using a batch connection (only on z/OS).

MQAT_RRS_BATCH

RRS-coordinated application using a batch connection (only on z/OS).

MQAT_CICS

CICS transaction (only on z/OS).

MQAT_IMS

IMS transaction (only on z/OS).

MQAT_SYSTEM_EXTENSION

Application performing an extension of function that is provided by the queue manager.

ASID (MQCFST)

Address space identifier (parameter identifier: MQCACF_ASID).

The four character address-space identifier of the application identified by *ApplTag* . It distinguishes duplicate values of *ApplTag* .

This parameter is valid only on z/OS.

The length of the string is MQ_ASID_LENGTH.

AsynchronousState (MQCFIN)

The state of asynchronous consumption on this handle (parameter identifier: MQIACF_ASYNC_STATE).

The value can be:

MQAS_NONE

If *ConnInfoType* is MQIACF_CONN_INFO_CONN, an MQCTL call has not been issued against the handle. Asynchronous message consumption cannot currently proceed on this connection. If *ConnInfoType* is MQIACF_CONN_INFO_HANDLE, an MQCB call has not been issued against this handle, so no asynchronous message consumption is configured on this handle.

MQAS_SUSPENDED

The asynchronous consumption callback has been suspended so that asynchronous message consumption cannot currently proceed on this handle. This situation can be either because an MQCB or MQCTL call with *Operation* MQOP_SUSPEND has been issued against this object handle by the application, or because it has been suspended by the system. If it has been suspended by the system, as part of the process of suspending asynchronous message consumption the callback function is called with the reason code that describes the problem resulting in suspension. This reason code is reported in the *Reason* field in the MQCBC structure passed to the callback. In order for asynchronous message consumption to proceed, the application must issue an MQCB or MQCTL call with *Operation* MQOP_RESUME. This reason code can be returned if *ConnInfoType* is MQIACF_CONN_INFO_CONN or MQIACF_CONN_INFO_HANDLE.

MQAS_SUSPENDED_TEMPORARY

The asynchronous consumption callback has been temporarily suspended by the system so that asynchronous message consumption cannot currently proceed on this object handle. As part of the process of suspending asynchronous message consumption, the callback function is called with the reason code that describes the problem resulting in suspension. MQAS_SUSPENDED_TEMPORARY is reported in the *Reason* field in the MQCBC structure passed to the callback. The callback function is called again when asynchronous message consumption is resumed by the system when the temporary condition has been resolved. MQAS_SUSPENDED_TEMPORARY is returned only if *ConnInfoType* is MQIACF_CONN_INFO_HANDLE.

MQAS_STARTED

An MQCTL call with *Operation* MQOP_START has been issued against the connection handle so that asynchronous message consumption can proceed on this connection. MQAS_STARTED is returned only if *ConnInfoType* is MQIACF_CONN_INFO_CONN.

MQAS_START_WAIT

An MQCTL call with *Operation* MQOP_START_WAIT has been issued against the connection handle so that asynchronous message consumption can proceed on this connection. MQAS_START_WAIT is returned only if *ConnInfoType* is MQIACF_CONN_INFO_CONN.

MQAS_STOPPED

An MQCTL call with *Operation* MQOP_STOP has been issued against the connection handle so that asynchronous message consumption cannot currently proceed on this connection. MQAS_STOPPED is returned only if *ConnInfoType* is MQIACF_CONN_INFO_CONN.

MQAS_ACTIVE

An MQCB call has set up a function to call back to process messages asynchronously and the connection handle has been started so that asynchronous message consumption can proceed. MQAS_ACTIVE is returned only if *ConnInfoType* is MQIACF_CONN_INFO_HANDLE.

MQAS_INACTIVE

An MQCB call has set up a function to call back to process messages asynchronously but the connection handle has not yet been started, or has been stopped or suspended, so that asynchronous message consumption cannot currently proceed. MQAS_INACTIVE is returned only if *ConnInfoType* is MQIACF_CONN_INFO_HANDLE.

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ClientId (MQCFST)

Client identifier (parameter identifier: MQCACH_CLIENT_ID). The client identifier of the client that is using the connection. If there is no client identifier associated with the connection, this attribute is blank.

The maximum length of the string is MQ_CLIENT_ID_LENGTH.

ConnectionId (MQCFBS)

Connection identifier (parameter identifier: MQBACF_CONNECTION_ID).

The length of the string is MQ_CONNECTION_ID_LENGTH.

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

The maximum length of the string is MQ_CONN_NAME_LENGTH.

ConnectionOptions (MQCFIL)

Connect options currently in force for the connection (parameter identifier: MQIACF_CONNECT_OPTIONS).

ConnInfoType (MQCFIN)

Type of information returned (parameter identifier: MQIACF_CONN_INFO_TYPE).

The value can be any of the following values:

MQIACF_CONN_INFO_CONN

Generic information for the specified connection.

MQIACF_CONN_INFO_HANDLE

Information pertinent only to those objects opened by the specified connection.

Destination (MQCFST)

The destination queue for messages published to this subscription (parameter identifier MQCACF_DESTINATION).

This parameter is relevant only for handles of subscriptions to topics.

DestinationQueueManager (MQCFST)

The destination queue manager for messages published to this subscription (parameter identifier MQCACF_DESTINATION_Q_MGR).

This parameter is relevant only for handles of subscriptions to topics. If *Destination* is a queue hosted on the local queue manager, this parameter contains the local queue manager name. If *Destination* is a queue hosted on a remote queue manager, this parameter contains the name of the remote queue manager.

HandleState (MQCFIN)

State of the handle (parameter identifier: MQIACF_HANDLE_STATE).

The value can be any of the following values:

MQHSTATE_ACTIVE

An API call from this connection is currently in progress for this object. If the object is a queue, this condition can arise when an MQGET WAIT call is in progress.

If there is an MQGET SIGNAL outstanding, then this situation does not mean, by itself, that the handle is active.

MQHSTATE_INACTIVE

No API call from this connection is currently in progress for this object. If the object is a queue, this condition can arise when no MQGET WAIT call is in progress.

ObjectName (MQCFST)

Object name (parameter identifier: MQCACF_OBJECT_NAME).

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

ObjectType (MQCFIN)

Object type (parameter identifier: MQIACF_OBJECT_TYPE).

If this parameter is a handle of a subscription to a topic, the SUBID parameter identifies the subscription and can be used with the Inquire Subscription command to find all the details about the subscription.

The value can be any of the following values:

MQOT_Q

Queue.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process.

MQOT_Q_MGR

Queue manager.

MQOT_CHANNEL

Channel.

MQOT_AUTH_INFO

Authentication information object.

MQOT_TOPIC

Topic.

OpenOptions (MQCFIN)

Open options currently in force for the object for connection (parameter identifier: MQIACF_OPEN_OPTIONS).

This parameter is not relevant for a subscription. Use the SUBID field of the DISPLAY SUB command to find all the details about the subscription.

z/OS

OriginName (MQCFST)

Origin name (parameter identifier: MQCACF_ORIGIN_NAME).

Identifies the originator of the unit of recovery, except where *ApplType* is MQAT_RRS_BATCH when it is omitted.

This parameter is valid only on z/OS.

The length of the string is MQ_ORIGIN_NAME_LENGTH.

z/OS

OriginUOWId (MQCFBS)

Origin UOW identifier (parameter identifier: MQBACF_ORIGIN_UOW_ID).

The unit of recovery identifier assigned by the originator. It is an 8-byte value.

This parameter is valid only on z/OS.

The length of the string is MQ_UOW_ID_LENGTH.

z/OS

ProcessId (MQCFIN)

Process identifier (parameter identifier: MQIACF_PROCESS_ID).

PSBName (MQCFST)

Program specification block name (parameter identifier: MQCACF_PSB_NAME).

The 8-character name of the program specification block (PSB) associated with the running IMS transaction.

This parameter is valid only on z/OS.

The length of the string is MQ_PSB_NAME_LENGTH.

z/OS

PSTId (MQCFST)

Program specification table identifier (parameter identifier: MQCACF_PST_ID).

The 4-character IMS program specification table (PST) region identifier for the connected IMS region.

This parameter is valid only on z/OS.

The length of the string is MQ_PST_ID_LENGTH.

QMgrUOWId (MQCFBS)

Unit of recovery identifier assigned by the queue manager (parameter identifier: MQBACF_Q_MGR_UOW_ID).

z/OS On z/OS platforms, this parameter is returned as an 8-byte RBA.

Multi On [Multiplatforms](#), this parameter is an 8-byte transaction identifier.

The maximum length of the string is MQ_UOW_ID_LENGTH.

z/OS

QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid only on z/OS. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED.

ReadAhead (MQCFIN)

The read ahead connection status (parameter identifier: MQIA_READ_AHEAD).

The value can be any of the following values:

MQREADA_NO

Read ahead for browsing messages, or of non-persistent messages is not enabled for the object that the connection has open.

MQREADA_YES

Read ahead for browsing messages, or of non-persistent messages is enabled for the object that the connection has open and is being used efficiently.

MQREADA_BACKLOG

Read ahead for browsing messages, or of non-persistent messages is enabled for this object. Read ahead is not being used efficiently because the client has been sent many messages which are not being consumed.

MQREADA_INHIBITED

Read ahead was requested by the application but has been inhibited because of incompatible options specified on the first MQGET call.

StartUOWLogExtent (MQCFST)

Name of the first extent needed to recover the transaction (parameter identifier: MQCACF_UOW_LOG_EXTENT_NAME).

The 8-character name of the program specification block (PSB) associated with the running IMS transaction.

This parameter is not valid on z/OS.

The maximum length of the string is MQ_LOG_EXTENT_NAME_LENGTH.

SubscriptionID (MQCFBS)

The internal, all time unique identifier of the subscription (parameter identifier MQBACF_SUB_ID).

This parameter is relevant only for handles of subscriptions to topics.

Not all subscriptions can be seen using Inquire Connection; only those subscriptions that have current handles open to the subscriptions can be seen. Use the Inquire Subscription command to see all subscriptions.

SubscriptionName (MQCFST)

The unique subscription name of the application associated with the handle (parameter identifier MQCACF_SUB_NAME).

This parameter is relevant only for handles of subscriptions to topics. Not all subscriptions have a subscription name.

ThreadId (MQCFIN)

Thread identifier (parameter identifier: MQIACF_THREAD_ID).

TopicString (MQCFST)

Resolved topic string (parameter identifier: MQCA_TOPIC_STRING).

This parameter is relevant for handles with an ObjectType of MQOT_TOPIC. For any other object type, this parameter is blank.

TransactionId (MQCFST)

Transaction identifier (parameter identifier: MQCACF_TRANSACTION_ID).

The 4-character CICS transaction identifier.

This parameter is valid only on z/OS.

The maximum length of the string is MQ_TRANSACTION_ID_LENGTH.

UOWIdentifier (MQCFBS)

External unit of recovery identifier associated with the connection (parameter identifier: MQBACF_EXTERNAL UOW_ID).

This parameter is the recovery identifier for the unit of recovery. The value of *UOWType* determines its format.

The maximum length of the byte string is MQ_UOW_ID_LENGTH.

UOWLogStartDate (MQCFST)

Logged unit of work start date, in the form yyyy-mm-dd (parameter identifier: MQCACF_UOW_LOG_START_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

UOWLogStartTime (MQCFST)

Logged unit of work start time, in the form hh.mm.ss (parameter identifier: MQCACF_UOW_LOG_START_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

UOWStartDate (MQCFST)

Unit of work creation date (parameter identifier: MQCACF_UOW_START_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

UOWStartTime (MQCFST)

Unit of work creation time (parameter identifier: MQCACF_UOW_START_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

UOWState (MQCFIN)

State of the unit of work (parameter identifier: MQIACF_UOW_STATE).

The value can be any of the following values:

MQUOWST_NONE

There is no unit of work.

MQUOWST_ACTIVE

The unit of work is active.

MQUOWST_PREPARED

The unit of work is in the process of being committed.

MQUOWST_UNRESOLVED

The unit of work is in the second phase of a two-phase commit operation. IBM MQ holds resources on behalf of the unit of work and external intervention is required to resolve it. It might be as simple as starting the recovery coordinator (such as CICS, IMS, or RRS) or it might involve a more complex operation such as using the RESOLVE INDOUBT command. This value can occur only on z/OS.

UOWType (MQCFIN)

Type of external unit of recovery identifier as perceived by the queue manager (parameter identifier: MQIACF_UOW_TYPE).

The value can be any of the following values:

MQUOWT_Q_MGR**MQUOWT_CICS****MQUOWT_RRS****MQUOWT_IMS****MQUOWT_XA**

z/OS

URDisposition (MQCFIN)

The unit of recovery disposition associated with the connection.

This parameter is valid only on z/OS.

The value can be:

MQQSGD_GROUP

This connection has a GROUP unit of recovery disposition.

MQQSGD_Q_MGR

This connection has a QMGR unit of recovery disposition.

UserId (MQCFST)

User identifier (parameter identifier: MQCACF_USER_IDENTIFIER).

The maximum length of the string is MQ_MAX_USER_ID_LENGTH.

Multi

Inquire Entity Authority on Multiplatforms

The Inquire Entity Authority (MQCMD_INQUIRE_ENTITY_AUTH) command inquires about authorizations of an entity to a specified object.

Required parameters**EntityName (MQCFST)**

Entity name (parameter identifier: MQCACF_ENTITY_NAME).

Depending on the value of *EntityType*, this parameter is either:

- A principal name. This name is the name of a user for whom to retrieve authorizations to the specified object. On IBM MQ for Windows, the name of the principal can optionally include a domain name, specified in this format: `user@domain`.
- A group name. This name is the name of the user group on which to make the inquiry. You can specify one name only and this name must be the name of an existing user group.

Windows For IBM MQ for Windows only, the group name can optionally include a domain name, specified in the following formats:

```
GroupName@domain  
domain\GroupName
```

The maximum length of the string is MQ_ENTITY_NAME_LENGTH.

EntityType (MQCFIN)

Entity type (parameter identifier: MQIACF_ENTITY_TYPE).

The value can be:

MQZAET_GROUP

The value of the **EntityName** parameter refers to a group name.

MQZAET_PRINCIPAL

The value of the **EntityName** parameter refers to a principal name.

ObjectType (MQCFIN)

The type of object referred to by the profile (parameter identifier: MQIACF_OBJECT_TYPE).

The value can be any of the following values:

MQOT_AUTH_INFO

Authentication information.

MQOT_CHANNEL

Channel object.

MQOT_CLNTCONN_CHANNEL

Client-connection channel object.

MQOT_COMM_INFO

Communication information object

MQOT_LISTENER

Listener object.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process.

MQOT_Q

Queue, or queues, that match the object name parameter.

MQOT_Q_MGR

Queue manager.

MQOT_REMOTE_Q_MGR_NAME

Remote queue manager.

MQOT_SERVICE

Service object.

MQOT_TOPIC

Topic object.

Options (MQCFIN)

Options to control the set of authority records that is returned (parameter identifier: MQIACF_AUTH_OPTIONS).

This parameter is required and you must set it to the value MQAUTHOPT_CUMULATIVE. It returns a set of authorities representing the cumulative authority that an entity has to a specified object.

If a user ID is a member of more than one group, this command displays the combined authorizations of all groups.

Optional parameters

ObjectName (MQCFST)

Object name (parameter identifier: MQCACF_OBJECT_NAME).

The name of the queue manager, queue, process definition, or generic profile on which to make the inquiry.

You must include a parameter if the *ObjectType* is not MQOT_Q_MGR. If you do not include this parameter, it is assumed that you are making an inquiry on the queue manager.

You cannot specify a generic object name although you can specify the name of a generic profile.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

ProfileAttrs (MQCFIL)

Profile attributes (parameter identifier: MQIACF_AUTH_PROFILE_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCACF_ENTITY_NAME

Entity name.

MQIACF_AUTHORIZATION_LIST

Authorization list.

MQIACF_ENTITY_TYPE

Entity type.

MQIACF_OBJECT_TYPE

Object type.

ServiceComponent (MQCFST)

Service component (parameter identifier: MQCACF_SERVICE_COMPONENT).

If installable authorization services are supported, this parameter specifies the name of the authorization service to which the authorizations apply.

If you omit this parameter, the authorization inquiry is made to the first installable component for the service.

The maximum length of the string is MQ_SERVICE_COMPONENT_LENGTH.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRC_UNKNOWN_ENTITY

User ID not authorized, or unknown.

MQRCCF_OBJECT_TYPE_MISSING

Object type missing.

Inquire Entity Authority (Response) on Multiplatforms

Each response to the Inquire Entity Authority (MQCMD_INQUIRE_AUTH_RECS) command consists of the response header followed by the *QMgrName*, *Options*, and *ObjectName* structures and the requested combination of attribute parameter structures.

Always returned:

ObjectName, *Options*, *QMgrName*

Returned if requested:

AuthorizationList, *EntityName*, *EntityType*, *ObjectType*

Response data

AuthorizationList (MQCFIL)

Authorization list(parameter identifier: MQIACF_AUTHORIZATION_LIST).

This list can contain zero or more authorization values. Each returned authorization value means that any user ID in the specified group or principal has the authority to perform the operation defined by that value. The value can be any of the following values:

MQAUTH_NONE

The entity has authority set to 'none'.

MQAUTH_ALT_USER_AUTHORITY

Specify an alternate user ID on an MQI call.

MQAUTH_BROWSE

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

MQAUTH_CHANGE

Change the attributes of the specified object, using the appropriate command set.

MQAUTH_CLEAR

Clear a queue.

MQAUTH_CONNECT

Connect the application to the specified queue manager by issuing an MQCONN call.

MQAUTH_CREATE

Create objects of the specified type using the appropriate command set.

MQAUTH_DELETE

Delete the specified object using the appropriate command set.

MQAUTH_DISPLAY

Display the attributes of the specified object using the appropriate command set.

MQAUTH_INPUT

Retrieve a message from a queue by issuing an MQGET call.

MQAUTH_INQUIRE

Make an inquiry on a specific queue by issuing an MQINQ call.

MQAUTH_OUTPUT

Put a message on a specific queue by issuing an MQPUT call.

MQAUTH_PASS_ALL_CONTEXT

Pass all context.

MQAUTH_PASS_IDENTITY_CONTEXT

Pass the identity context.

MQAUTH_SET

Set attributes on a queue from the MQI by issuing an MQSET call.

MQAUTH_SET_ALL_CONTEXT

Set all context on a queue.

MQAUTH_SET_IDENTITY_CONTEXT

Set the identity context on a queue.

MQAUTH_CONTROL

For listeners and services, start and stop the specified channel, listener, or service.

For channels, start, stop, and ping the specified channel.

For topics, define, alter, or delete subscriptions.

MQAUTH_CONTROL_EXTENDED

Reset or resolve the specified channel.

MQAUTH_PUBLISH

Publish to the specified topic.

MQAUTH_SUBSCRIBE

Subscribe to the specified topic.

MQAUTH_RESUME

Resume a subscription to the specified topic.

MQAUTH_SYSTEM

Use queue manager for internal system operations.

MQAUTH_ALL

Use all operations applicable to the object.

MQAUTH_ALL_ADMIN

Use all administration operations applicable to the object.

MQAUTH_ALL_MQI

Use all MQI calls applicable to the object.

Use the *Count* field in the MQCFIL structure to determine how many values are returned.

EntityName (MQCFST)

Entity name (parameter identifier: MQCACF_ENTITY_NAME).

This parameter can either be a principal name or a group name.

The maximum length of the string is MQ_ENTITY_NAME_LENGTH.

EntityType (MQCFIN)

Entity type (parameter identifier: MQIACF_ENTITY_TYPE).

The value can be:

MQZAET_GROUP

The value of the **EntityName** parameter refers to a group name.

MQZAET_PRINCIPAL

The value of the **EntityName** parameter refers to a principal name.

MQZAET_UNKNOWN

On Windows, an authority record still exists from a previous queue manager which did not originally contain entity type information.

ObjectName (MQCFST)

Object name (parameter identifier: MQCACF_OBJECT_NAME).

The name of the queue manager, queue, process definition, or generic profile on which the inquiry is made.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

ObjectType (MQCFIN)

Object type (parameter identifier: MQIACF_OBJECT_TYPE).

The value can be:

MQOT_AUTH_INFO

Authentication information.

MQOT_CHANNEL

Channel object.

MQOT_CLNTCONN_CHANNEL

Client-connection channel object.

MQOT_COMM_INFO

Communication information object

MQOT_LISTENER

Listener object.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process.

MQOT_Q

Queue, or queues, that match the object name parameter.

MQOT_Q_MGR

Queue manager.

MQOT_REMOTE_Q_MGR_NAME

Remote queue manager.

MQOT_SERVICE

Service object.

QMgrName (MQCFST)

Name of the queue manager on which the Inquire command is issued (parameter identifier: MQCA_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

z/OS Inquire Group on z/OS

The Inquire Group (MQCMD_INQUIRE_QSG) command inquires about the queue sharing group to which the queue manager is connected.

Note: This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

Optional parameters**ObsoleteDB2Msgs (MQCFIN)**

Whether to look for obsolete Db2 messages (parameter identifier: MQIACF_OBSOLETE_MSGS).

The value can be any of the following values:

MQOM_NO

Obsolete messages in Db2 are not looked for. MQOM_NO is the default value used if the parameter is not specified.

MQOM_YES

Obsolete messages in Db2 are looked for and messages containing information about any found are returned.

Inquire Group (Response) on z/OS

The response to the Inquire Group (MQCMD_INQUIRE_QSG) command consists of the response header followed by the *QMgrName* structure and a number of other parameter structures. One such message is generated for each queue manager in the queue-sharing group.

If there are any obsolete Db2 messages, and that information is requested, one message, identified by a value of MQCMDI_DB2_OBSOLETE_MSGS in the **CommandInformation** parameter, is returned for each such message.

Always returned for the queue manager:

CommandLevel, DB2ConnectStatus, DB2Name, QmgrCPF, QmgrName, QmgrNumber, QmgrStatus, QSGName

Always returned for obsolete Db2 messages:

CommandInformation, CFMsgIdentifier

Response data relating to the queue manager

CommandLevel (MQCFIN)

Command level supported by the queue manager (parameter identifier: MQIA_COMMAND_LEVEL). The value can be any of the following values:

MQCMDL_LEVEL_710

Level 710 of system control commands.

MQCMDL_LEVEL_800

Level 800 of system control commands.

MQCMDL_LEVEL_802

Level 802 of system control commands.

MQCMDL_LEVEL_900

Level 900 of system control commands.

MQCMDL_LEVEL_901

Level 901 of system control commands.

MQCMDL_LEVEL_902

Level 902 of system control commands.

MQCMDL_LEVEL_903

Level 903 of system control commands.

MQCMDL_LEVEL_904

Level 904 of system control commands.

MQCMDL_LEVEL_905

Level 905 of system control commands.

DB2ConnectStatus (MQCFIN)

The current status of the connection to Db2 (parameter identifier: MQIACF_DB2_CONN_STATUS).

The current status of the queue manager. The value can be any of the following values:

MQQSGS_ACTIVE

The queue manager is running and is connected to Db2.

MQQSGS_INACTIVE

The queue manager is not running and is not connected to Db2.

MQQSGS_FAILED

The queue manager is running but not connected because Db2 has terminated abnormally.

MQQSGS_PENDING

The queue manager is running but not connected because Db2 has terminated normally.

MQQSGS_UNKNOWN

The status cannot be determined.

DB2Name (MQCFST)

The name of the Db2 subsystem or group to which the queue manager is to connect (parameter identifier: MQCACF_DB2_NAME).

The maximum length is MQ_DB2_NAME_LENGTH.

QMgrCPF (MQCFST)

The command prefix of the queue manager (parameter identifier: MQCACF_Q_MGR_CPF).

The maximum length is MQ_Q_MGR_CPF_LENGTH.

QMgrName (MQCFST)

Name of the queue manager (parameter identifier: MQCA_Q_MGR_NAME).

The maximum length is MQ_Q_MGR_NAME_LENGTH.

QmgrNumber (MQCFIN)

The number, generated internally, of the queue manager in the group.(parameter identifier: MQIACF_Q_MGR_NUMBER).

QMgrStatus (MQCFIN)

Recovery (parameter identifier: MQIACF_Q_MGR_STATUS).

The current status of the queue manager. The value can be any of the following values:

MQQSGS_ACTIVE

The queue manager is running.

MQQSGS_INACTIVE

The queue manager is not running, having terminated normally.

MQQSGS_FAILED

The queue manager is not running, having terminated abnormally.

MQQSGS_CREATED

The queue manager has been defined to the group, but has not yet been started.

MQQSGS_UNKNOWN

The status cannot be determined.

QSGName (MQCFST)

The name of the queue sharing group (parameter identifier: MQCA_QSG_NAME).

The maximum length is MQ_QSG_NAME_LENGTH.

Response data relating to obsolete Db2 messages**CFMsgIdentifier (MQCFBS)**

CF list entry identifier (parameter identifier: MQBACF_CF_LEID).

The maximum length is MQ_CF_LEID_LENGTH.

CommandInformation (MQCFIN)

Command information (parameter identifier: MQIACF_COMMAND_INFO). This indicates whether queue managers in the group contain obsolete messages. The value is MQCMDI_DB2_OBSOLETE_MSGS.

 **Inquire Log on z/OS**

The Inquire Log (MQCMD_INQUIRE_LOG) command returns log system parameters and information.

Optional parameters**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

MQCMD_INQUIRE_LOG (Inquire Log) Response on z/OS

The response to the Inquire Log (MQCMD_INQUIRE_LOG) PCF command consists of the response header followed by the *ParameterType* structure and the combination of attribute parameter structures determined by the value of *ParameterType*.

Always returned:

ParameterType. Specifies the type of archive information being returned. The value can be any of the following values:

MQSYSP_TYPE_INITIAL

The initial settings of the log parameters.

MQSYSP_TYPE_SET

The settings of the log parameters if they have been altered since their initial setting.

MQSYSP_TYPE_LOG_COPY

Information relating to the active log copy.

MQSYSP_TYPE_LOG_STATUS

Information relating to the status of the logs.

Returned if *ParameterType* is MQSYSP_TYPE_INITIAL (one message is returned):

DeallocateInterval , *DualArchive* , *DualActive* , *DualBSDS* , *InputBufferSize* , *LogArchive* , *LogCompression* , *MaxArchiveLog* , *MaxConcurrentOffloads* , *MaxReadTapeUnits* , *OutputBufferCount* , *OutputBufferSize* , *ZHyperWrite*

Returned if *ParameterType* is MQSYSP_TYPE_SET and any value is set (one message is returned):

DeallocateInterval , *DualArchive* , *DualActive* , *DualBSDS* , *InputBufferSize* , *LogArchive* , *MaxArchiveLog* , *MaxConcurrentOffloads* , *MaxReadTapeUnits* , *OutputBufferCount* , *OutputBufferSize*

Returned if *ParameterType* is MQSYSP_TYPE_LOG_COPY (one message is returned for each log copy):

DataSetName , *LogCopyNumber* , *LogUsed* , *ZHyperWrite*

Returned if *ParameterType* is MQSYSP_TYPE_LOG_STATUS (one message is returned):

FullLogs , *LogCompression* , *LogRBA* , *LogSuspend* , *OffloadStatus* , *QMgrStartDate* , *QMgrStartRBA* , *QMgrStartTime* , *TotalLogs*

Response data - log parameter information

DeallocateInterval (MQCFIN)

Deallocation interval (parameter identifier: MQIACF_SYSP_DEALLOC_INTERVAL).

Specifies the length of time, in minutes, that an allocated archive read tape unit is allowed to remain unused before it is deallocated. The value can be in the range zero through 1440. If it is zero, the tape unit is deallocated immediately. If it is 1440, the tape unit is never deallocated.

DualActive (MQCFIN)

Specifies whether dual logging is being used (parameter identifier: MQIACF_SYSP_DUAL_ACTIVE).

The value can be any of the following values:

MQSYSP_YES

Dual logging is being used.

MQSYSP_NO

Dual logging is not being used.

DualArchive (MQCFIN)

Specifies whether dual archive logging is being used (parameter identifier: MQIACF_SYSP_DUAL_ARCHIVE).

The value can be any of the following values:

MQSYSP_YES

Dual archive logging is being used.

MQSYSP_NO

Dual archive logging is not being used.

DualBSDS (MQCFIN)

Specifies whether dual BSDS is being used (parameter identifier: MQIACF_SYSP_DUAL_BSDS).

The value can be any of the following values:

MQSYSP_YES

Dual BSDS is being used.

MQSYSP_NO

Dual BSDS is not being used.

InputBufferSize (MQCFIN)

Specifies the size of input buffer storage for active and archive log data sets (parameter identifier: MQIACF_SYSP_IN_BUFFER_SIZE).

LogArchive (MQCFIN)

Specifies whether archiving is on or off (parameter identifier: MQIACF_SYSP_ARCHIVE).

The value can be any of the following values:

MQSYSP_YES

Archiving is on.

MQSYSP_NO

Archiving is off.

LogCompression (MQCFIN)

Specifies which log compression parameter is used (parameter identifier: MQIACF_LOG_COMPRESSION).

The value can be any of the following values:

MQCOMPRESS_NONE

No log compression is performed.

MQCOMPRESS_RLE

Run-length encoding compression is performed.

MQCOMPRESS_ANY

Enable the queue manager to select the compression algorithm that gives the greatest degree of log record compression. Using this option currently results in RLE compression.

MaxArchiveLog (MQCFIN)

Specifies the maximum number of archive log volumes that can be recorded in the BSDS (parameter identifier: MQIACF_SYSP_MAX_ARCHIVE).

MaxConcurrentOffloads (MQCFIN)

Specifies the maximum number of concurrent log offload tasks (parameter identifier: MQIACF_SYSP_MAX_CONC_OFFLOADS).

MaxReadTapeUnits (MQCFIN)

The maximum number of dedicated tape units that can be set to read archive log tape volumes (parameter identifier: MQIACF_SYSP_MAX_READ_TAPES).

OutputBufferCount (MQCFIN)

Specifies the number of output buffers to be filled before they are written to the active log data sets (parameter identifier: MQIACF_SYSP_OUT_BUFFER_COUNT).

OutputBufferSize (MQCFIN)

Specifies the size of output buffer storage for active and archive log data sets (parameter identifier: MQIACF_SYSP_OUT_BUFFER_SIZE).

ZHyperWrite (MQCFIN)

Specifies whether the zHyperWrite feature is enabled (parameter identifier: MQIACF_SYSP_ZHYPERWRITE).

The value can be one of the following values:

MQSYSP_YES

zHyperWrite is enabled.

MQSYSP_NO

zHyperWrite is not enabled.

Response data - to log status information**DataSetName (MQCFST)**

The data set name of the active log data set (parameter identifier: MQCACF_DATA_SET_NAME).

If the copy is not currently active, this parameter is returned as blank.

The maximum length of the string is MQ_DATA_DATA_SET_NAME_LENGTH.

FullLogs (MQCFIN)

The total number of full active log data sets that have not yet been archived (parameter identifier: MQIACF_SYSP_FULL_LOGS).

LogCompression (MQCFIN)

Specifies the current log compression option (parameter identifier: MQIACF_LOG_COMPRESSION).

The value can be any of the following values:

MQCOMPRESS_NONE

Log compression is not enabled.

MQCOMPRESS_RLE

Run-length encoding log compression is enabled.

MQCOMPRESS_ANY

Any compression algorithm supported by the queue manager is enabled.

LogCopyNumber (MQCFIN)

Copy number (parameter identifier: MQIACF_SYSP_LOG_COPY).

LogRBA (MQCFST)

The RBA of the most recently written log record (parameter identifier: MQCACF_SYSP_LOG_RBA).

The maximum length of the string is MQ_RBA_LENGTH.

LogSuspend (MQCFIN)

Specifies whether logging is suspended (parameter identifier: MQIACF_SYSP_LOG_SUSPEND).

The value can be any of the following values:

MQSYSP_YES

Logging is suspended.

MQSYSP_NO

Logging is not suspended.

LogUsed (MQCFIN)

The percentage of the active log data set that has been used (parameter identifier: MQIACF_SYSP_LOG_USED).

OffloadStatus (MQCFIN)

Specifies the status of the offload task (parameter identifier: MQIACF_SYSP_OFFLOAD_STATUS).

The value can be any of the following values:

MQSYSP_STATUS_ALLOCATING_ARCHIVE

The offload task is busy, allocating the archive data set. MQSYSP_STATUS_ALLOCATING_ARCHIVE could indicate that a tape mount request is pending.

MQSYSP_STATUS_COPYING_BSDS

The offload task is busy, copying the BSDS data set.

MQSYSP_STATUS_COPYING_LOG

The offload task is busy, copying the active log data set.

MQSYSP_STATUS_BUSY

The offload task is busy with other processing.

MQSYSP_STATUS_AVAILABLE

The offload task is waiting for work.

QMgrStartDate (MQCFST)

The date on which the queue manager was started, in the form yyyy-mm-dd (parameter identifier: MQCACF_SYSP_Q_MGR_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

QMgrStartRBA (MQCFST)

The RBA from which logging began when the queue manager was started (parameter identifier: MQCACF_SYSP_Q_MGR_RBA).

The maximum length of the string is MQ_RBA_LENGTH.

QMgrStartTime (MQCFST)

The time that the queue manager was started, in the form hh.mm.ss (parameter identifier: MQCACF_SYSP_Q_MGR_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

TotalLogs (MQCFIN)

The total number of active log data sets (parameter identifier: MQIACF_SYSP_TOTAL_LOGS).

ZHyperWrite (MQCFIN)

Specifies whether the zHyperWrite feature is enabled (parameter identifier: MQIACF_SYSP_ZHYPERWRITE).

The value can be any of the following values:

MQSYSP_YES

zHyperWrite is enabled.

MQSYSP_NO

zHyperWrite is not enabled.

Inquire Namelist

The Inquire Namelist (MQCMD_INQUIRE_NAMELIST) command inquires about the attributes of existing IBM MQ namelists.

Required parameters:

NamelistName

Optional parameters:

 *CommandScope* , *IntegerFilterCommand* , *NamelistAttrs* ,  *z/OS*
QSGDisposition , *StringFilterCommand*

Required parameters

NamelistName (MQCFST)

Namelist name (parameter identifier: MQCA_NAMELIST_NAME).

This parameter is the name of the namelist with attributes that are required. Generic namelist names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all namelists having names that start with the selected character string. An asterisk on its own matches all possible names.

The namelist name is always returned regardless of the attributes requested.

The maximum length of the string is MQ_NAMELIST_NAME_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *NamelistAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1852 for information about using this filter condition.

If you specify an integer filter for *NamelistType* (MQIA_NAMELIST_TYPE), you cannot also specify the **NamelistType** parameter.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

NamelistAttrs (MQCFIL)

Namelist attributes (parameter identifier: MQIACF_NAMELIST_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_NAMELIST_NAME

Name of namelist object.

MQCA_NAMELIST_DESC

Namelist description.

MQCA_NAMES

Names in the namelist.

MQCA_ALTERATION_DATE

The date on which the information was last altered.

MQCA_ALTERATION_TIME

The time at which the information was last altered.

MQIA_NAME_COUNT

Number of names in the namelist.

MQIA_NAMELIST_TYPE

Namelist type (valid only on z/OS)

NamelistType (MQCFIN)

Namelist attributes (parameter identifier: MQIA_NAMELIST_TYPE). This parameter applies to z/OS only.

Specifies the type of names in the namelist. The value can be any of the following values:

MQNT_NONE

The names are of no particular type.

MQNT_Q

A namelist that holds a list of queue names.

MQNT_CLUSTER

A namelist that is associated with clustering, containing a list of the cluster names.

MQNT_AUTH_INFO

The namelist is associated with TLS, and contains a list of authentication information object names.

**QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *NameListAttrs* except MQCA_NAMELIST_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1859 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Inquire Namelist (Response)

The response to the Inquire Namelist (MQCMD_INQUIRE_NAMELIST) command consists of the response header followed by the *NameListName* structure and the requested combination of attribute parameter structures.

If a generic namelist name was specified, one such message is generated for each namelist found.

Always returned:

NameListName ,  *QSGDisposition*

Returned if requested:

AlterationDate , *AlterationTime* , *NameCount* , *NameListDesc* ,  *NameListType* , *Names*

Response data

AlterationDate (MQCFST)

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered, in the form hh.mm.ss.

NameCount (MQCFIN)

Number of names in the namelist (parameter identifier: MQIA_NAME_COUNT).

The number of names contained in the namelist.

NameListDesc (MQCFST)

Description of namelist definition (parameter identifier: MQCA_NAMELIST_DESC).

The maximum length of the string is MQ_NAMELIST_DESC_LENGTH.

NameListName (MQCFST)

The name of the namelist definition (parameter identifier: MQCA_NAMELIST_NAME).

The maximum length of the string is MQ_NAMELIST_NAME_LENGTH.

NameListType (MQCFIN)

Type of names in the namelist (parameter identifier: MQIA_NAMELIST_TYPE). This parameter applies to z/OS only.

Specifies the type of names in the namelist. The value can be any of the following values:

MQNT_NONE

The names are of no particular type.

MQNT_Q

A namelist that holds a list of queue names.

MQNT_CLUSTER

A namelist that is associated with clustering, containing a list of the cluster names.

MQNT_AUTH_INFO

The namelist is associated with TLS, and contains a list of authentication information object names.

Names (MQCFSL)

A list of the names contained in the namelist (parameter identifier: MQCA_NAMES).

The number of names in the list is given by the *Count* field in the MQCFSL structure. The length of each name is given by the *StringLength* field in that structure. The maximum length of a name is MQ_OBJECT_NAME_LENGTH.

QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter applies only to z/OS. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

Inquire Namelist Names

The Inquire Namelist Names (MQCMD_INQUIRE_NAMELIST_NAMES) command inquires for a list of namelist names that match the generic namelist name specified.

Required parameters

NamelistName (MQCFST)

Name of namelist (parameter identifier: MQCA_NAMELIST_NAME).

Generic namelist names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being processed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined with either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

Inquire Namelist Names (Response)

The response to the Inquire Namelist Names (MQCMD_INQUIRE_NAMELIST_NAMES) command consists of the response header followed by a single parameter structure giving zero or more names that match the specified namelist name.

Additionally, on z/OS only, the *QSGDispositions* structure (with the same number of entries as the *NamelistNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *NamelistNames* structure.

Always returned:

NamelistNames , *QSGDispositions*

Returned if requested:

None

Response data

NamelistNames (MQCFSL)

List of namelist names (parameter identifier: MQCACF_NAMELIST_NAMES).

QSGDispositions (MQCFIL)

List of queue sharing group dispositions (parameter identifier: MQIACF_QSG_DISPS). This parameter is valid only on z/OS. Possible values for fields in this structure are:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

Inquire Policy on Multiplatforms

The Inquire Policy (MQCMD_INQUIRE_PROT_POLICY) command inquires about the policy, or policies, set on a queue.

Required parameters

policy-name (MQCFST)

Policy name (parameter identifier: MQCA_POLICY_NAME).

This parameter is the name of the policy with attributes that are required. Generic policy names are not supported, however, an asterisk on its own can be used to return all policy objects.

The name of the policy, or policies (or part of the policy name or names) to inquire is the same as the name of the queue, or queues, that the policies control. The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

The policy name is always returned regardless of the attributes requested.

Optional parameters

PolicyAttrs (MQCFIL)

Policy attributes (parameter identifier: MQIACF_POLICY_ATTRS).

The attribute list might specify the following value on its own- default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_POLICY_NAME

Name of the policy.

MQIA_SIGNATURE_ALGORITHM

The digital signature algorithm.

MQIA_ENCRYPTION_ALGORITHM

The encryption algorithm.

MQCA_SIGNER_DN

The distinguished name of an authorized signer, or signers.

MQCA_RECIPIENT_DN

The distinguished name of an intended recipient, or recipients.

MQIA_TOLERATE_UNPROTECTED

Whether the policy is enforced or unprotected messages tolerated.

MQIA_KEY_REUSE_COUNT

The number of times that an encryption key can be re-used.

MQIACF_ACTION

The action taken on the command with regards to signer and recipient parameters.

Expected behavior for inquiring a policy

When inquiring a policy name, a policy object is always returned even if one does not exist. When a policy object does not exist, the policy object returned is a default policy object that specifies plain text protection, that is, no signing or encryption of message data.

To view policy objects that exist, the policy name should be set to '*'. This returns all policy objects that exist.

Related information

[Managing security policies in AMS](#)

Multi Inquire Policy (Response) on Multiplatforms

The response to the Inquire Policy (MQCMD_INQUIRE_PROT_POLICY) command consists of the response header followed by the *PolicyName* structure and the requested combination of attribute parameter structures.

If a generic security policy name was specified, one such message is generated for each policy found.

Always returned:

PolicyName

The name of the policy, or policies (or part of the policy name or names) to inquire are the same as the name of the queue, or queues, that the policies control.

Returned if requested:

Action , *EncAlg* , *Enforce* and *Tolerate* , **V 9.0.0** *KeyReuse Recipient* , *Recipient* , *SignAlg* , *Signer*

Response data

Action (MQCFIL)

Action (parameter identifier: MQIACF_ACTION).

The action taken on the command with regards to signer and recipient parameters.

EncAlg (MQCFIL)

Encryption algorithm (parameter identifier: MQIA_ENCRYPTION_ALGORITHM).

The encryption algorithm specified.

Enforce and Tolerate (MQCFST)

Indicates whether the security policy should be enforced or whether unprotected messages are tolerated (parameter identifier: MQIA_TOLERATE_UNPROTECTED).

V 9.0.0

KeyReuse (MQCFIN)

Specifies the number of times that an encryption key can be re-used (parameter identifier: MQIA_KEY_REUSE_COUNT)

Recipient (MQCFIL)

Specifies the distinguished name of the intended recipient (parameter identifier: MQCA_RECIPIENT_DN)

This parameter can be specified multiple times.

The maximum length of the string is MQ_DISTINGUISHED_NAME_LENGTH.

SignAlg (MQCFIL)

Specifies the digital signature algorithm (parameter identifier: MQIA_SIGNATURE_ALGORITHM).

Signer (MQCFST)

Specifies the distinguished name of an authorized signer (parameter identifier: MQCA_SIGNER_DN)

This parameter can be specified multiple times.

The maximum length of the string is MQ_DISTINGUISHED_NAME_LENGTH.

Inquire Process

The Inquire Process (MQCMD_INQUIRE_PROCESS) command inquires about the attributes of existing IBM MQ processes.

Required parameters

ProcessName (MQCFST)

Process name (parameter identifier: MQCA_PROCESS_NAME).

Generic process names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all processes having names that start with the selected character string. An asterisk on its own matches all possible names.

The process name is always returned regardless of the attributes requested.

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ProcessAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1852](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

ProcessAttrs (MQCFIL)

Process attributes (parameter identifier: MQIACF_PROCESS_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_ALTERATION_DATE

The date at which the information was last altered.

MQCA_ALTERATION_TIME

The time at which the information was last altered.

MQCA_APPL_ID

Application identifier.

MQCA_ENV_DATA

Environment data.

MQCA_PROCESS_DESC

Description of process definition.

MQCA_PROCESS_NAME

Name of process definition.

MQCA_USER_DATA

User data.

MQIA_APPL_TYPE

Application type.

z/OS

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ProcessAttrs* except MQCA_PROCESS_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1859](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Inquire Process (Response)

The response to the Inquire Process (MQCMD_INQUIRE_PROCESS) command consists of the response header followed by the *ProcessName* structure and the requested combination of attribute parameter structures.

If a generic process name was specified, one such message is generated for each process found.

Always returned:

ProcessName ,  *QSGDisposition*

Returned if requested:

AlterationDate, AlterationTime, ApplId, ApplType, EnvData, ProcessDesc, UserData

Response data

AlterationDate (MQCFST)

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered, in the form hh.mm.ss.

ApplId (MQCFST)

Application identifier (parameter identifier: MQCA_APPL_ID).

The maximum length of the string is MQ_PROCESS_APPL_ID_LENGTH.

ApplType (MQCFIN)

Application type (parameter identifier: MQIA_APPL_TYPE).

The value can be:

MQAT_AIX

AIX application (same value as MQAT_UNIX)

MQAT_CICS

CICS transaction

MQAT_DOS

DOS client application

MQAT_MVS

z/OS application

MQAT_OS400

IBM i application

MQAT_QMGR

Queue manager

MQAT_UNIX

UNIX application

MQAT_WINDOWS

16-bit Windows application

MQAT_WINDOWS_NT

32-bit Windows application

integer

System-defined application type in the range zero through 65 535 or a user-defined application type in the range 65 536 through 999 999 999

EnvData (MQCFST)

Environment data (parameter identifier: MQCA_ENV_DATA).

The maximum length of the string is MQ_PROCESS_ENV_DATA_LENGTH.

ProcessDesc (MQCFST)

Description of process definition (parameter identifier: MQCA_PROCESS_DESC).

The maximum length of the string is MQ_PROCESS_DESC_LENGTH.

ProcessName (MQCFST)

The name of the process definition (parameter identifier: MQCA_PROCESS_NAME).

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

**QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

UserData (MQCFST)

User data (parameter identifier: MQCA_USER_DATA).

The maximum length of the string is MQ_PROCESS_USER_DATA_LENGTH.

Inquire Process Names

The Inquire Process Names (MQCMD_INQUIRE_PROCESS_NAMES) command inquires for a list of process names that match the generic process name specified.

Required parameters**ProcessName (MQCFST)**

Name of process-definition for queue (parameter identifier: MQCA_PROCESS_NAME).

Generic process names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

Optional parameters**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined with either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

Inquire Process Names (Response)

The response to the Inquire Process Names (MQCMD_INQUIRE_PROCESS_NAMES) command consists of the response header followed by a single parameter structure giving zero or more names that match the specified process name.

Additionally, on z/OS only, a parameter structure, *QSGDispositions* (with the same number of entries as the *ProcessNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *ProcessNames* structure.

This response is not supported on Windows.

Always returned:

ProcessNames, QSGDispositions

Returned if requested:

None

Response data**ProcessNames (MQCFSL)**

List of process names (parameter identifier: MQCACF_PROCESS_NAMES).

QSGDispositions (MQCFIL)

List of queue sharing group dispositions (parameter identifier: MQIACF_QSG_DISPS). This parameter applies only to z/OS. Possible values for fields in this structure are:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

Inquire Pub/Sub Status

The Inquire Pub/Sub Status (MQCMD_INQUIRE_PUBSUB_STATUS) command inquires about the status of publish/subscribe connections.

Optional parameters **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

blank (or omit the parameter altogether)

The command is executed on the queue manager on which it was entered.

a queue manager name

The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

an asterisk (*)

The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use CommandScope as a parameter to filter on.

PubSubStatusAttrs (MQCFIL)

Publish/subscribe status attributes (parameter identifier: MQIACF_PUBSUB_STATUS_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQIA_SUB_COUNT

The total number of subscriptions against the local tree.

MQIA_TOPIC_NODE_COUNT

The total number of topic nodes in the local tree.

MQIACF_PUBSUB_STATUS

Hierarchy status.

MQIACF_PS_STATUS_TYPE

Hierarchy type.

Type (MQCFIN)

Type (parameter identifier: MQIACF_PS_STATUS_TYPE).

The type can specify one of the following:

MQPSST_ALL

Return status of both parent and child connections. MQPSST_ALL is the default value if the parameter is not specified.

MQPSST_LOCAL

Return local status information.

MQPSST_PARENT

Return status of the parent connection.

MQPSST_CHILD

Return status of the child connections.

Inquire Pub/Sub Status (Response)

The response to the Inquire publish/subscribe Status (MQCMD_INQUIRE_PUBSUB_STATUS) command consists of the response header followed by the attribute structures.

A group of parameters is returned containing the following attributes: *Type*, *QueueManagerName*, *Status*, *SubCount*, and *TopicNodeCount*.

Always returned:

QueueManagerName, *Status*, *Type*, *SubCount*, and *TopicNodeCount*.

Returned if requested:

None

Response data**QueueManagerName (MQCFST)**

Either the name of the local queue manager when TYPE is LOCAL, or the name of the hierarchically connected queue manager (parameter identifier: MQCA_Q_MGR_NAME).

Type (MQCFIN)

Type of status that is being returned (parameter identifier: MQIACF_PS_STATUS_TYPE).

The value can be:

MQPSST_CHILD

Publish/subscribe status for a child hierarchical connection.

MQPSST_LOCAL

Publish/subscribe status for the local queue manager.

MQPSST_PARENT

Publish/subscribe status for the parent hierarchical connection.

Status (MQCFIN)

The status of the publish/subscribe engine or the hierarchical connection (parameter identifier: MQIACF_PUBSUB_STATUS).

When TYPE is LOCAL the following values can be returned:

MQPS_STATUS_ACTIVE

The publish/subscribe engine and the queued publish/subscribe interface are running. It is therefore possible to publish or subscribe using the application programming interface and the queues that are monitored by the queued publish/subscribe interface appropriately.

MQPS_STATUS_COMPAT

The publish/subscribe engine is running. It is therefore possible to publish or subscribe using the application programming interface. The queued publish/subscribe interface is not running. Therefore, any message that is put to the queues monitored by the queued publish/subscribe interface is not acted upon by IBM MQ.

MQPS_STATUS_ERROR

The publish/subscribe engine has failed. Check your error logs to determine the reason for the failure.

MQPS_STATUS_INACTIVE

The publish/subscribe engine and the queued publish/subscribe interface are not running. It is therefore not possible to publish or subscribe using the application programming interface. Any publish/subscribe messages that are put to the queues that are monitored by the queued publish/subscribe interface is not acted upon by IBM MQ.

If inactive and you want to start the publish/subscribe engine, on the Change Queue Manager command set PubSubMode to **MQPSM_ENABLED**.

MQPS_STATUS_STARTING

The publish/subscribe engine is initializing and is not yet operational.

MQPS_STATUS_STOPPING

The publish/subscribe engine is stopping.

When TYPE is PARENT, the following values can be returned:

MQPS_STATUS_ACTIVE

The connection with the parent queue manager is active.

MQPS_STATUS_ERROR

This queue manager is unable to initialize a connection with the parent queue manager because of a configuration error.

A message is produced in the queue manager logs to indicate the specific error. If you receive error message AMQ5821 or on z/OS systems CSQT821E, possible causes include:

- Transmit queue is full
- Transmit queue put disabled

If you receive error message AMQ5814 or on z/OS systems CSQT814E, take the following actions:

- Check that the parent queue manager is correctly specified.
- Ensure that broker is able to resolve the queue manager name of the parent broker.

To resolve the queue manager name, at least one of the following resources must be configured:

- A transmission queue with the same name as the parent queue manager name.
- A queue manager alias definition with the same name as the parent queue manager name.
- A cluster with the parent queue manager a member of the same cluster as this queue manager.
- A cluster queue manager alias definition with the same name as the parent queue manager name.
- A default transmission queue.

After you have set up the configuration correctly, modify the parent queue manager name to blank. Then set with the parent queue manager name.

MQPS_STATUS_REFUSED

The connection has been refused by the parent queue manager.

This situation might be caused by the parent queue manager already having another child queue manager of the same name as this queue manager.

Alternatively, the parent queue manager has used the RESET QMGR TYPE(PUBSUB) CHILD command to remove this queue manager as one of its children.

MQPS_STATUS_STARTING

The queue manager is attempting to request that another queue manager is its parent.

If the parent status remains in starting status without progressing to active status, take the following actions:

- Check that the sender channel to parent queue manager is running
- Check that the receiver channel from parent queue manager is running

MQPS_STATUS_STOPPING

The queue manager is disconnecting from its parent.

If the parent status remains in stopping status, take the following actions:

- Check that the sender channel to parent queue manager is running
- Check that the receiver channel from parent queue manager is running

When TYPE is CHILD, the following values can be returned:

MQPS_STATUS_ACTIVE

The connection with the parent queue manager is active.

MQPS_STATUS_ERROR

This queue manager is unable to initialize a connection with the parent queue manager because of a configuration error.

A message is produced in the queue manager logs to indicate the specific error. If you receive error message AMQ5821 or on z/OS systems CSQT821E, possible causes include:

- Transmit queue is full
- Transmit queue put disabled

If you receive error message AMQ5814 or on z/OS systems CSQT814E, take the following actions:

- Check that the child queue manager is correctly specified.
- Ensure that broker is able to resolve the queue manager name of the child broker.

To resolve the queue manager name, at least one of the following resources must be configured:

- A transmission queue with the same name as the child queue manager name.
- A queue manager alias definition with the same name as the child queue manager name.
- A cluster with the child queue manager a member of the same cluster as this queue manager.
- A cluster queue manager alias definition with the same name as the child queue manager name.
- A default transmission queue.

After you have set up the configuration correctly, modify the child queue manager name to blank. Then set with the child queue manager name.

MQPS_STATUS_STARTING

The queue manager is attempting to request that another queue manager is its parent.

If the child status remains in starting status without progressing to active status, take the following actions:

- Check that the sender channel to child queue manager is running
- Check that the receiver channel from child queue manager is running

MQPS_STATUS_STOPPING

The queue manager is disconnecting from its parent.

If the child status remains in stopping status, take the following actions:

- Check that the sender channel to child queue manager is running
- Check that the receiver channel from child queue manager is running

SubCount (MQCFIN)

When *Type* is MQPSST_LOCAL, the total number of subscriptions against the local tree is returned. When *Type* is MQPSST_CHILD or MQPSST_PARENT, queue manager relations are not inquired and the value MQPSCT_NONE is returned. (parameter identifier: MQIA_SUB_COUNT).

TopicNodeCount (MQCFIN)

When *Type* is MQPSST_LOCAL, the total number of topic nodes in the local tree is returned. When *Type* is MQPSST_CHILD or MQPSST_PARENT, queue manager relations are not inquired and the value MQPSCT_NONE is returned. (parameter identifier: MQIA_TOPIC_NODE_COUNT).

Inquire Queue

Use the Inquire Queue command MQCMD_INQUIRE_Q to query the attributes of IBM MQ queues.

Required parameters

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

Generic queue names are supported. A generic name is a character string followed by an asterisk * ; for example ABC*. It selects all queues having names that start with the selected character string. An asterisk on its own matches all possible names.

The queue name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Optional parameters

CFStructure (MQCFST)

CF structure (parameter identifier: MQCA_CF_STRUC_NAME). Specifies the name of the CF structure. This parameter is valid only on z/OS.

This parameter specifies that eligible queues are limited to those having the specified *CFStructure* value. If this parameter is not specified, then all queues are eligible.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk * ; for example ABC*. It selects all CF structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

ClusterInfo (MQCFIN)

Cluster information (parameter identifier: MQIACF_CLUSTER_INFO).

This parameter requests that cluster information about these queues and other queues in the repository that match the selection criteria is displayed. The cluster information is displayed in addition to information about attributes of queues defined on this queue manager.

In this case, there might be multiple queues with the same name displayed. The cluster information is shown with a queue type of MQQT_CLUSTER.

You can set this parameter to any integer value, the value used does not affect the response to the command.

The cluster information is obtained locally from the queue manager.

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

This parameter specifies that eligible queues are limited to those having the specified *ClusterName* value. If this parameter is not specified, then all queues are eligible.

Generic cluster names are supported. A generic name is a character string followed by an asterisk * ; for example ABC*. It selects all clusters having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

ClusterNameList (MQCFST)

Cluster namelist (parameter identifier: MQCA_CLUSTER_NAMELIST).

This parameter specifies that eligible queues are limited to those having the specified *ClusterNameList* value. If this parameter is not specified, then all queues are eligible.

Generic cluster namelists are supported. A generic name is a character string followed by an asterisk * ; for example ABC*. It selects all cluster namelists having names that start with the selected character string. An asterisk on its own matches all possible names.

z/OS

z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment. The command server must be enabled.
- An asterisk " * ". The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *QAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1852](#) for information about using this filter condition.

If you specify an integer filter for *Qtype* or *PageSetID*, you cannot also specify the *Qtype* or *PageSetID* parameter.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

z/OS

PageSetID (MQCFIN)

Page set identifier (parameter identifier: MQIA_PAGESET_ID). This parameter applies to z/OS only.

This parameter specifies that eligible queues are limited to those having the specified *PageSetID* value. If this parameter is not specified, then all queues are eligible.

QAttrs (MQCFIL)

Queue attributes (parameter identifier: MQIACF_Q_ATTRS).

The attribute list might specify the following value on its own. If the parameter is not specified, this value is the default:

MQIACF_ALL

All attributes.

You can also specify a combination of the parameters in the following table:

<i>Table 102. Inquire Queue command, queue attributes</i>					
	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQCA_ALTERATION_DATE The date on which the information was last altered	✓	✓	✓	✓	✓
MQCA_ALTERATION_TIME The time at which the information was last altered	✓	✓	✓	✓	✓
MQCA_BACKOUT_REQ_Q_NAME Excessive backout requeue name	✓	✓			
MQCA_BASE_NAME Name of queue that alias resolves to			✓		
MQCA_CF_STRUC_NAME Coupling facility structure name. This attribute is valid on z/OS only	✓	✓			
MQCA_CLUS_CHL_NAME The generic name of the cluster-sender channels that use this queue as a transmission queue.	✓	✓			
MQCA_CLUSTER_DATE Date when the definition became available to the local queue manager					✓
MQCA_CLUSTER_NAME Cluster name	✓		✓	✓	✓
MQCA_CLUSTER_NAMELIST Cluster namelist	✓		✓	✓	
MQCA_CLUSTER_Q_MGR_NAME Queue manager name that hosts the queue					✓
MQCA_CLUSTER_TIME Time when the definition became available to the local queue manager					✓

Table 102. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQCA_CREATION_DATE Queue creation date	✓	✓			
MQCA_CREATION_TIME Queue creation time	✓	✓			
MQCA_CUSTOM The custom attribute for new features	✓	✓	✓	✓	✓
MQCA_INITIATION_Q_NAME Initiation queue name	✓	✓			
MQCA_PROCESS_NAME Name of process definition	✓	✓			
MQCA_Q_DESC Queue description	✓	✓	✓	✓	✓
MQCA_Q_MGR_IDENTIFIER Internally generated queue manager name					✓
MQCA_Q_NAME Queue name	✓	✓	✓	✓	✓
MQCA_REMOTE_Q_MGR_NAME Name of remote queue manager				✓	
MQCA_REMOTE_Q_NAME Name of remote queue as known locally on the remote queue manager				✓	
 MQCA_STORAGE_CLASS Storage class. MQCA_STORAGE_CLASS is valid on z/OS only	✓	✓			
MQCA_TPIPE_NAME The TPIPE name used for communication with OTMA using the IBM MQ IMS bridge	✓				
MQCA_TRIGGER_DATA Trigger data	✓	✓			
MQCA_XMIT_Q_NAME Transmission queue name				✓	

Table 102. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQIA_ACCOUNTING_Q Accounting data collection	✓	✓			
MQIA_BACKOUT_THRESHOLD Backout threshold	✓	✓			
MQIA_BASE_TYPE Type of object	✓	✓	✓	✓	✓
MQIA_CLUSTER_Q_TYPE Cluster queue type					✓
MQIA_CLWL_Q_PRIORITY Cluster workload queue priority	✓		✓	✓	✓
MQIA_CLWL_Q_RANK Cluster workload queue rank	✓		✓	✓	✓
MQIA_CLWL_USEQ Cluster workload use remote setting	✓				
MQIA_CURRENT_Q_DEPTH Number of messages on queue	✓				
MQIA_DEF_BIND Default binding	✓		✓	✓	✓
MQIA_DEF_INPUT_OPEN_OPTION Default open-for-input option	✓	✓			
MQIA_DEF_PERSISTENCE Default message persistence	✓	✓	✓	✓	✓
MQIA_DEF_PRIORITY Default message priority	✓	✓	✓	✓	✓
MQIA_DEF_PUT_RESPONSE_TYPE Default put response type	✓	✓	✓	✓	✓
MQIA_DEF_READ_AHEAD Default put response type	✓	✓	✓	✓	✓
MQIA_DEFINITION_TYPE Queue definition type	✓	✓			

Table 102. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQIA_DIST_LISTS Distribution list support. MQIA_DIST_LISTS is not valid on z/OS	✓	✓			
MQIA_HARDEN_GET_BACKOUT Whether to harden backout count	✓	✓			
MQIA_INDEX_TYPE Index type. This attribute is valid on z/OS only.	✓	✓			
MQIA_INHIBIT_GET Whether get operations are allowed	✓	✓	✓		
MQIA_INHIBIT_PUT Whether put operations are allowed	✓	✓	✓	✓	✓
MQIA_MAX_MSG_LENGTH Maximum message length	✓	✓			
MQIA_MAX_Q_DEPTH Maximum number of messages allowed on queue	✓	✓			
MQIA_MONITORING_Q Online monitoring data collection	✓	✓			
MQIA_MSG_DELIVERY_SEQUENCE Whether message priority is relevant	✓	✓			
MQIA_NPM_CLASS Level of reliability assigned to non-persistent messages that are put to the queue	✓	✓			
MQIA_OPEN_INPUT_COUNT Number of MQOPEN calls that have the queue open for input	✓				
MQIA_OPEN_OUTPUT_COUNT Number of MQOPEN calls that have the queue open for output	✓				
  MQIA_PAGESET_ID Page set identifier	✓				

Table 102. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQIA_PROPERTY_CONTROL Property control attribute	✓	✓	✓		
MQIA_Q_DEPTH_HIGH_EVENT Control attribute for queue depth high events. You cannot use MQIA_Q_DEPTH_HIGH_EVENT as a filter attribute.	✓	✓			
MQIA_Q_DEPTH_HIGH_LIMIT High limit for queue depth	✓	✓			
MQIA_Q_DEPTH_LOW_EVENT Control attribute for queue depth low events. You cannot use MQIA_Q_DEPTH_LOW_EVENT as a filter attribute.	✓	✓			
MQIA_Q_DEPTH_LOW_LIMIT Low limit for queue depth	✓	✓			
MQIA_Q_DEPTH_MAX_EVENT Control attribute for queue depth max events	✓	✓			
MQIA_Q_SERVICE_INTERVAL Limit for queue service interval	✓	✓			
MQIA_Q_SERVICE_INTERVAL_ EVENT Control attribute for queue service interval events	✓	✓			
MQIA_Q_TYPE Queue type	✓	✓	✓	✓	✓
MQIA_RETENTION_INTERVAL Queue retention interval	✓	✓			
MQIA_SCOPE Queue definition scope. MQIA_SCOPE is not valid on z/OS or IBM i	✓		✓	✓	
MQIA_SHAREABILITY Whether queue can be shared	✓	✓			

Table 102. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQIA_STATISTICS_Q Statistics data collection. MQIA_STATISTICS_Q is valid only on Multiplatforms.	✓	✓			
MQIA_TRIGGER_CONTROL Trigger control	✓	✓			
MQIA_TRIGGER_DEPTH Trigger depth	✓	✓			
MQIA_TRIGGER_MSG_PRIORITY Threshold message priority for triggers	✓	✓			
MQIA_TRIGGER_MTYPE Trigger type	✓	✓			
MQIA_USAGE Usage	✓	✓			

z/OS QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned. The meaning of "the disposition of an object" is where the object is defined and how it behaves. The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. In a shared queue manager environment, if the command is run on the queue manager where it was issued, MQQSGD_LIVE also returns information for objects defined with MQQSGD_SHARED. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

In a shared queue manager environment, if the command is run on the queue manager where it was issued, MQQSGD_ALL also displays information for objects defined with MQQSGD_GROUP or MQQSGD_SHARED.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names, with different dispositions.

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined with either MQQSGD_Q_MGR or MQQSGD_COPY.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED. MQQSGD_SHARED is permitted only in a shared queue environment.

You cannot use *QSGDisposition* as a parameter to filter on.

QType (MQCFIN)

Queue type (parameter identifier: MQIA_Q_TYPE).

If this parameter is present, eligible queues are limited to the specified type. Any attribute selector specified in the *QAttrs* list which is valid only for queues of a different type or types is ignored; no error is raised.

If this parameter is not present, or if MQQT_ALL is specified, queues of all types are eligible. Each attribute specified must be a valid queue attribute selector. The attribute can apply to some of the queues returned. It does not have to apply to all the queues. Queue attribute selectors that are valid but not applicable to the queue are ignored, no error messages occur and no attribute is returned. The following lists contains the value of all valid queue attribute selectors:

MQQT_ALL

All queue types.

MQQT_LOCAL

Local queue.

MQQT_ALIAS

Alias queue definition.

MQQT_REMOTE

Local definition of a remote queue.

MQQT_CLUSTER

Cluster queue.

MQQT_MODEL

Model queue definition.

Note:  On [Multiplatforms](#), if this parameter is present, it must occur immediately after the **QName** parameter.

 StorageClass (MQCFST)

Storage class (parameter identifier: MQCA_STORAGE_CLASS). Specifies the name of the storage class. This parameter is valid only on z/OS.

This parameter specifies that eligible queues are limited to those having the specified *StorageClass* value. If this parameter is not specified, then all queues are eligible.

Generic names are supported. A generic name is a character string followed by an asterisk * ; for example ABC*. It selects all storage classes having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *QAttrs* except MQCA_Q_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1859](#) for information about using this filter condition.

If you specify a string filter for *ClusterName*, *ClusterNameList*, *StorageClass*, or *CFStructure*, you cannot also specify that as a parameter.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands”](#) on page 1343.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_Q_TYPE_ERROR

Queue type not valid.

Inquire Queue (Response)

The response to the Inquire Queue command MQCMD_INQUIRE_Q consists of the response header followed by the *QName* structure. On z/OS only, response includes the *QSGDisposition* structure, and the requested combination of attribute parameter structures.

If a generic queue name was specified, or cluster queues requested, by setting either MQQT_CLUSTER or MQIACF_CLUSTER_INFO, one message is generated for each queue found.

Always returned:

QName, *QSGDisposition*, *QType*

Returned if requested:

AlterationDate, *AlterationTime*, *BackoutRequeueName*, *BackoutThreshold*, *BaseQName*, *CFStructure*, *ClusterChannelName*, *ClusterDate*, *ClusterName*, *ClusterNameList*, *ClusterQType*, *ClusterTime*, *CLWLQueuePriority*, *CLWLQueueRank*, *CLWLUseQ*, *CreationDate*, *CreationTime*, *CurrentQDepth*, *Custom*, *DefaultPutResponse*, *DefBind*, *DefinitionType*, *DefInputOpenOption*, *DefPersistence*, *DefPriority*, *DefReadAhead*, *DistLists*, *HardenGetBackout*, **V9.0.2** *Imgrcovq*, *IndexType*, *InhibitGet*, *InhibitPut*, *InitiationQName*, *MaxMsgLength*, *MaxQDepth*, *MsgDeliverySequence*, *NonPersistentMessageClass*, *OpenInputCount*, *OpenOutputCount*, *PageSetID*, *ProcessName*, *PropertyControl*, *QDepthHighEvent*, *QDepthHighLimit*, *QDepthLowEvent*, *QDepthLowLimit*, *QDepthMaxEvent*, *QDesc*, *QMgrIdentifier*, *QMgrName*, *QServiceInterval*, *QServiceIntervalEvent*, *QueueAccounting*, *QueueMonitoring*, *QueueStatistics*, *RemoteQMgrName*, *RemoteQName*, *RetentionInterval*, *Scope*, *Shareability*, *StorageClass*, *TpipeNames*, *TriggerControl*, *TriggerData*, *TriggerDepth*, *TriggerMsgPriority*, *TriggerType*, *Usage*, *XmitQName*

Response data

AlterationDate (MQCFST)

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered, in the form hh.mm.ss.

BackoutRequeueName (MQCFST)

Excessive backout requeue name (parameter identifier: MQCA_BACKOUT_REQ_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

BackoutThreshold (MQCFIN)

Backout threshold (parameter identifier: MQIA_BACKOUT_THRESHOLD).

BaseQName (MQCFST)

Queue name to which the alias resolves (parameter identifier: MQCA_BASE_Q_NAME).

The name of a queue that is defined to the local queue manager.

The maximum length of the string is MQ_Q_NAME_LENGTH.

CFStructure (MQCFST)

Coupling facility structure name (parameter identifier: MQCA_CF_STRUC_NAME). This parameter applies to z/OS only.

Specifies the name of the coupling facility structure where you want to store messages when you use shared queues.

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

ClusterChannelName (MQCFST)

Cluster-sender channel name (parameter identifier: MQCA_CLUS_CHL_NAME).

ClusterChannelName is the generic name of the cluster-sender channels that use this queue as a transmission queue.

The maximum length of the channel name is: MQ_CHANNEL_NAME_LENGTH.

ClusterDate (MQCFST)

Cluster date (parameter identifier: MQCA_CLUSTER_DATE).

The date on which the information became available to the local queue manager, in the form yyyy-mm-dd.

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

ClusterNamelist (MQCFST)

Cluster namelist (parameter identifier: MQCA_CLUSTER_NAMELIST).

ClusterQType (MQCFIN)

Cluster queue type (parameter identifier: MQIA_CLUSTER_Q_TYPE).

The value can be:

MQCQT_LOCAL_Q

The cluster queue represents a local queue.

MQCQT_ALIAS_Q

The cluster queue represents an alias queue.

MQCQT_REMOTE_Q

The cluster queue represents a remote queue.

MQCQT_Q_MGR_ALIAS

The cluster queue represents a queue manager alias.

ClusterTime (MQCFST)

Cluster time (parameter identifier: MQCA_CLUSTER_TIME).

The time at which the information became available to the local queue manager, in the form hh.mm.ss.

CLWLQueuePriority (MQCFIN)

Cluster workload queue priority (parameter identifier: MQIA_CLWL_Q_PRIORITY).

Priority of the queue in cluster workload management. The value is in the range zero through 9, where zero is the lowest priority and 9 is the highest.

CLWLQueueRank (MQCFIN)

Cluster workload queue rank (parameter identifier: MQIA_CLWL_Q_RANK).

Rank of the queue in cluster workload management. The value is in the range zero through 9, where zero is the lowest rank and 9 is the highest.

CLWLUseQ (MQCFIN)

Cluster workload queue rank (parameter identifier: MQIA_CLWL_USEQ).

The value can be:

MQCLWL_USEQ_AS_Q_MGR

Use the value of the **CLWLUseQ** parameter on the queue manager's definition.

MQCLWL_USEQ_ANY

Use remote and local queues.

MQCLWL_USEQ_LOCAL

Do not use remote queues.

CreationDate (MQCFST)

Queue creation date, in the form yyyy-mm-dd (parameter identifier: MQCA_CREATION_DATE).

The maximum length of the string is MQ_CREATION_DATE_LENGTH.

CreationTime (MQCFST)

Creation time, in the form hh.mm.ss (parameter identifier: MQCA_CREATION_TIME).

The maximum length of the string is MQ_CREATION_TIME_LENGTH.

CurrentQDepth (MQCFIN)

Current queue depth (parameter identifier: MQIA_CURRENT_Q_DEPTH).

Custom (MQCFST)

Custom attribute for new features (parameter identifier: MQCA_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes are named. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE).

This description is updated when features using this attribute are introduced.

DefaultPutResponse (MQCFIN)

Default put response type definition (parameter identifier: MQIA_DEF_PUT_RESPONSE_TYPE).

The parameter specifies the type of response to be used for put operations to the queue when an application specifies MQPMO_RESPONSE_AS_Q_DEF. The value can be any of the following values:

MQPRT_SYNC_RESPONSE

The put operation is issued synchronously, returning a response.

MQPRT_ASYNC_RESPONSE

The put operation is issued asynchronously, returning a subset of MQMD fields.

DefBind (MQCFIN)

Default binding (parameter identifier: MQIA_DEF_BIND).

The value can be:

MQBND_BIND_ON_OPEN

Binding fixed by MQOPEN call.

MQBND_BIND_NOT_FIXED

Binding not fixed.

MQBND_BIND_ON_GROUP

Allows an application to request that a group of messages are all allocated to the same destination instance.

DefinitionType (MQCFIN)

Queue definition type (parameter identifier: MQIA_DEFINITION_TYPE).

The value can be:

MQQDT_PREDEFINED

Predefined permanent queue.

MQQDT_PERMANENT_DYNAMIC

Dynamically defined permanent queue.

MQQDT_SHARED_DYNAMIC

Dynamically defined shared queue. This option is available on z/OS only.

MQQDT_TEMPORARY_DYNAMIC

Dynamically defined temporary queue.

DefInputOpenOption (MQCFIN)

Default input open option for defining whether queues can be shared (parameter identifier: MQIA_DEF_INPUT_OPEN_OPTION).

The value can be:

MQOO_INPUT_EXCLUSIVE

Open queue to get messages with exclusive access.

MQOO_INPUT_SHARED

Open queue to get messages with shared access.

DefPersistence (MQCFIN)

Default persistence (parameter identifier: MQIA_DEF_PERSISTENCE).

The value can be:

MQPER_PERSISTENT

Message is persistent.

MQPER_NOT_PERSISTENT

Message is not persistent.

DefPriority (MQCFIN)

Default priority (parameter identifier: MQIA_DEF_PRIORITY).

DefReadAhead (MQCFIN)

Default read ahead (parameter identifier: MQIA_DEF_READ_AHEAD).

Specifies the default read ahead behavior for non-persistent messages delivered to the client.

The value can be any of the following values:

MQREADA_NO

Non-persistent messages are not sent ahead to the client before an application requests them. A maximum of one non-persistent message can be lost if the client ends abnormally.

MQREADA_YES

Non-persistent messages are sent ahead to the client before an application requests them. Non-persistent messages can be lost if the client ends abnormally or if the client does not consume all the messages it is sent.

MQREADA_DISABLED

Read ahead of non-persistent messages is not enabled for this queue. Messages are not sent ahead to the client regardless of whether read ahead is requested by the client application.

Multi**DistLists (MQCFIN)**

Distribution list support (parameter identifier: MQIA_DIST_LISTS).

The value can be:

MQDL_SUPPORTED

Distribution lists supported.

MQDL_NOT_SUPPORTED

Distribution lists not supported.

This parameter is supported only on [Multiplatforms](#).

HardenGetBackout (MQCFIN)

Harden backout, or not: (parameter identifier: MQIA_HARDEN_GET_BACKOUT).

The value can be:

MQQA_BACKOUT_HARDENED

Backout count remembered.

MQQA_BACKOUT_NOT_HARDENED

Backout count may not be remembered.

V 9.0.2 ImageRecoverQueue (MQCFST)

Specifies whether a local or permanent dynamic queue object is recoverable from a media image, if linear logging is being used (parameter identifier: MQIA_MEDIA_IMAGE_RECOVER_Q).

This parameter is not valid on z/OS. Possible values are:

MQIMGRCOV_YES

These queue objects are recoverable.

MQIMGRCOV_NO

Automatic media images, if enabled, are not written for these objects.

MQIMGRCOV_AS_Q_MGR

If the **ImageRecoverQueue** attribute for the queue manager specifies MQIMGRCOV_YES , these queue objects are recoverable.

If the **ImageRecoverQueue** attribute for the queue manager specifies MQIMGRCOV_NO, the “[rcdmqimg \(record media image\)](#)” on page 119 and “[rcrmqobj \(re-create object\)](#)” on page 125 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

IndexType (MQCFIN)

Index type (parameter identifier: MQIA_INDEX_TYPE). This parameter applies to z/OS only.

Specifies the type of index maintained by the queue manager to expedite MQGET operations on the queue. The value can be any of the following values:

MQIT_NONE

No index.

MQIT_MSG_ID

The queue is indexed using message identifiers.

MQIT_CORREL_ID

The queue is indexed using correlation identifiers.

MQIT_MSG_TOKEN

The queue is indexed using message tokens.

MQIT_GROUP_ID

The queue is indexed using group identifiers.

InhibitGet (MQCFIN)

Get operations are allowed or inhibited: (parameter identifier: MQIA_INHIBIT_GET).

The value can be:

MQQA_GET_ALLOWED

Get operations are allowed.

MQQA_GET_INHIBITED

Get operations are inhibited.

InhibitPut (MQCFIN)

Put operations are allowed or inhibited: (parameter identifier: MQIA_INHIBIT_PUT).

The value can be:

MQQA_PUT_ALLOWED

Put operations are allowed.

MQQA_PUT_INHIBITED

Put operations are inhibited.

InitiationQName (MQCFST)

Initiation queue name (parameter identifier: MQCA_INITIATION_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: MQIA_MAX_MSG_LENGTH).

MaxQDepth (MQCFIN)

Maximum queue depth (parameter identifier: MQIA_MAX_Q_DEPTH).

MsgDeliverySequence (MQCFIN)

Messages ordered by priority or sequence: (parameter identifier: MQIA_MSG_DELIVERY_SEQUENCE).

The value can be:

MQMDS_PRIORITY

Messages are returned in priority order.

MQMDS_FIFO

Messages are returned in FIFO order (first in, first out).

NonPersistentMessageClass (MQCFIN)

The level of reliability assigned to non-persistent messages that are put to the queue (parameter identifier: MQIA_NPM_CLASS).

Specifies the circumstances under which non-persistent messages put to the queue may be lost. The value can be any of the following values:

MQNPM_CLASS_NORMAL

Non-persistent messages are limited to the lifetime of the queue manager session. They are discarded in the event of a queue manager restart. MQNPM_CLASS_NORMAL is the default value.

MQNPM_CLASS_HIGH

The queue manager attempts to retain non-persistent messages for the lifetime of the queue. Non-persistent messages may still be lost in the event of a failure.

OpenInputCount (MQCFIN)

Number of MQOPEN calls that have the queue open for input (parameter identifier: MQIA_OPEN_INPUT_COUNT).

OpenOutputCount (MQCFIN)

Number of MQOPEN calls that have the queue open for output (parameter identifier: MQIA_OPEN_OUTPUT_COUNT).

PageSetID (MQCFIN)

Page set identifier (parameter identifier: MQIA_PAGESET_ID).

Specifies the identifier of the page set on which the queue resides.

This parameter applies to z/OS only when the queue is actively associated with a page set.

ProcessName (MQCFST)

Name of process definition for queue (parameter identifier: MQCA_PROCESS_NAME).

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

PropertyControl (MQCFIN)

Property control attribute (parameter identifier MQIA_PROPERTY_CONTROL).

Specifies how message properties are handled for messages that are retrieved from queues using the MQGET call with the MQGMO_PROPERTIES_AS_Q_DEF option. The value can be any of the following values:

MQPROP_COMPATIBILITY

If the message contains a property with a prefix of **mcd.**, **jms.**, **usr.** or **mqext.**, all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except properties contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

MQPROP_COMPATIBILITY is the default value. It allows applications which expect JMS-related properties to be in an MQRFH2 header in the message data to continue to work unmodified.

MQPROP_NONE

All properties of the message are removed from the message before the message is sent to the remote queue manager. Properties in the message descriptor (or extension) are not removed.

MQPROP_ALL

All properties of the message are included with the message when it is sent to the remote queue manager. The properties are placed in one or more MQRFH2 headers in the message data. Properties in the message descriptor (or extension) are not placed in MQRFH2 headers.

MQPROP_FORCE_ MQRFH2

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

A valid message handle supplied in the `MsgHandle` field of the `MQGMO` structure on the `MQGET` call is ignored. Properties of the message are not accessible via the message handle.

This parameter is applicable to local, alias, and model queues.

QDepthHighEvent (MQCFIN)

Controls whether Queue Depth High events are generated (parameter identifier: `MQIA_Q_DEPTH_HIGH_EVENT`).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

QDepthHighLimit (MQCFIN)

High limit for queue depth (parameter identifier: `MQIA_Q_DEPTH_HIGH_LIMIT`).

The threshold against which the queue depth is compared to generate a Queue Depth High event.

QDepthLowEvent (MQCFIN)

Controls whether Queue Depth Low events are generated (parameter identifier: `MQIA_Q_DEPTH_LOW_EVENT`).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

QDepthLowLimit (MQCFIN)

Low limit for queue depth (parameter identifier: `MQIA_Q_DEPTH_LOW_LIMIT`).

The threshold against which the queue depth is compared to generate a Queue Depth Low event.

QDepthMaxEvent (MQCFIN)

Controls whether Queue Full events are generated (parameter identifier: `MQIA_Q_DEPTH_MAX_EVENT`).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

QDesc (MQCFST)

Queue description (parameter identifier: `MQCA_Q_DESC`).

The maximum length of the string is `MQ_Q_DESC_LENGTH`.

QMgrIdentifier (MQCFST)

Queue manager identifier (parameter identifier: MQCA_Q_MGR_IDENTIFIER).

The unique identifier of the queue manager.

QMgrName (MQCFST)

Name of local queue manager (parameter identifier: MQCA_CLUSTER_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

QServiceInterval (MQCFIN)

Target for queue service interval (parameter identifier: MQIA_Q_SERVICE_INTERVAL).

The service interval used for comparison to generate Queue Service Interval High and Queue Service Interval OK events.

QServiceIntervalEvent (MQCFIN)

Controls whether Service Interval High or Service Interval OK events are generated (parameter identifier: MQIA_Q_SERVICE_INTERVAL_EVENT).

The value can be:

MQQSIE_HIGH

Queue Service Interval High events enabled.

MQQSIE_OK

Queue Service Interval OK events enabled.

MQQSIE_NONE

No queue service interval events enabled.

QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). *QSGDisposition* is valid only on z/OS. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED.

QType (MQCFIN)

Queue type (parameter identifier: MQIA_Q_TYPE).

The value can be:

MQQT_ALIAS

Alias queue definition.

MQQT_CLUSTER

Cluster queue definition.

MQQT_LOCAL

Local queue.

MQQT_REMOTE

Local definition of a remote queue.

MQQT_MODEL

Model queue definition.

QueueAccounting (MQCFIN)

Controls the collection of accounting (thread-level and queue-level accounting) data (parameter identifier: MQIA_ACCOUNTING_Q).

The value can be:

MQMON_Q_MGR

The collection of accounting data for the queue is performed based upon the setting of the **QueueAccounting** parameter on the queue manager.

MQMON_OFF

Do not collect accounting data for the queue.

MQMON_ON

Collect accounting data for the queue.

QueueMonitoring (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA_MONITORING_Q).

The value can be:

MQMON_OFF

Online monitoring data collection is turned off for this queue.

MQMON_Q_MGR

The value of the queue manager's **QueueMonitoring** parameter is inherited by the queue.

MQMON_LOW

Online monitoring data collection is turned on, with a low rate of data collection, for this queue unless *QueueMonitoring* for the queue manager is MQMON_NONE.

MQMON_MEDIUM

Online monitoring data collection is turned on, with a moderate rate of data collection, for this queue unless *QueueMonitoring* for the queue manager is MQMON_NONE.

MQMON_HIGH

Online monitoring data collection is turned on, with a high rate of data collection, for this queue unless *QueueMonitoring* for the queue manager is MQMON_NONE.

Multi QueueStatistics (MQCFIN)

Controls the collection of statistics data (parameter identifier: MQIA_STATISTICS_Q).

The value can be:

MQMON_Q_MGR

The collection of statistics data for the queue is performed based upon the setting of the **QueueStatistics** parameter on the queue manager.

MQMON_OFF

Do not collect statistics data for the queue.

MQMON_ON

Collect statistics data for the queue unless *QueueStatistics* for the queue manager is MQMON_NONE.

This parameter is supported only on [Multiplatforms](#).

RemoteQMgrName (MQCFST)

Name of remote queue manager (parameter identifier: MQCA_REMOTE_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

RemoteQName (MQCFST)

Name of remote queue as known locally on the remote queue manager (parameter identifier: MQCA_REMOTE_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

RetentionInterval (MQCFIN)

Retention interval (parameter identifier: MQIA_RETENTION_INTERVAL).

Scope (MQCFIN)

Scope of the queue definition (parameter identifier: MQIA_SCOPE).

The value can be:

MQSCO_Q_MGR

Queue manager scope.

MQSCO_CELL

Cell scope.

This parameter is not valid on IBM i or z/OS.

Shareability (MQCFIN)

The queue can be shared, or not: (parameter identifier: MQIA_SHAREABILITY).

The value can be:

MQQA_SHAREABLE

Queue is shareable.

MQQA_NOT_SHAREABLE

Queue is not shareable.

StorageClass (MQCFST)

Storage class (parameter identifier: MQCA_STORAGE_CLASS). This parameter applies to z/OS only.

Specifies the name of the storage class.

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

TpipeNames (MQCFSL)

TPIPE names (parameter identifier: MQCA_TPIPE_NAME). This parameter applies to local queues on z/OS only.

Specifies the TPIPE names used for communication with OTMA via the IBM MQ IMS bridge, if the bridge is active.

The maximum length of the string is MQ_TPIPE_NAME_LENGTH.

TriggerControl (MQCFIN)

Trigger control (parameter identifier: MQIA_TRIGGER_CONTROL).

The value can be:

MQTC_OFF

Trigger messages not required.

MQTC_ON

Trigger messages required.

TriggerData (MQCFST)

Trigger data (parameter identifier: MQCA_TRIGGER_DATA).

The maximum length of the string is MQ_TRIGGER_DATA_LENGTH.

TriggerDepth (MQCFIN)

Trigger depth (parameter identifier: MQIA_TRIGGER_DEPTH).

TriggerMsgPriority (MQCFIN)

Threshold message priority for triggers (parameter identifier: MQIA_TRIGGER_MSG_PRIORITY).

TriggerType (MQCFIN)

Trigger type (parameter identifier: MQIA_TRIGGER_TYPE).

The value can be:

MQTT_NONE

No trigger messages.

MQTT_FIRST

Trigger message when queue depth goes from 0 to 1.

MQTT_EVERY

Trigger message for every message.

MQTT_DEPTH

Trigger message when depth threshold exceeded.

Usage (MQCFIN)

Usage (parameter identifier: MQIA_USAGE).

The value can be:

MQUS_NORMAL

Normal usage.

MQUS_TRANSMISSION

Transmission queue.

XmitQName (MQCFST)

Transmission queue name (parameter identifier: MQCA_XMIT_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

Inquire Queue Manager

The Inquire Queue Manager (**MQCMD_INQUIRE_Q_MGR**) command inquires about the attributes of a queue manager.

Optional parameters**z/OS CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment. The command server must be enabled.
- An asterisk " * ". The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

QMGrAttrs (MQCFIL)

Queue manager attributes (parameter identifier: **MQIACF_Q_MGR_ATTRS**).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

Or a combination of the following values:

MQCA_ALTERATION_DATE

Date at which the definition was last altered.

MQCA_ALTERATION_TIME

Time at which the definition was last altered.

MQCA_CERT_LABEL

Queue manager certificate label.

MQCA_CHANNEL_AUTO_DEF_EXIT

Automatic channel definition exit name. **MQCA_CHANNEL_AUTO_DEF_EXIT** is not valid on z/OS.

MQCA_CLUSTER_WORKLOAD_DATA

Data passed to the cluster workload exit.

MQCA_CLUSTER_WORKLOAD_EXIT

Name of the cluster workload exit.

MQCA_COMMAND_INPUT_Q_NAME

System command input queue name.

MQCA_CONN_AUTH

Name of the authentication information object that is used to provide the location of user ID and password authentication.

MQCA_CUSTOM

The custom attribute for new features.

MQCA_DEAD_LETTER_Q_NAME

Name of dead-letter queue.

MQCA_DEF_XMIT_Q_NAME

Default transmission queue name.

z/OS MQCA_DNS_GROUP

The name of the group that the TCP listener handling inbound transmissions for the queue-sharing group must join when using Workload Manager for Dynamic Domain Name Services support (DDNS). **MQCA_DNS_GROUP** is valid on z/OS only.

z/OS MQCA_IGQ_USER_ID

Intra-group queuing user identifier. This parameter is valid on z/OS only.

z/OS MQCA_LU_GROUP_NAME

Generic LU name for the LU 6.2 listener. **MQCA_LU_GROUP_NAME** is valid on z/OS only.

z/OS MQCA_LU_NAME

LU name to use for outbound LU 6.2 transmissions. **MQCA_LU_NAME** is valid on z/OS only.

z/OS MQCA_LU62_ARM_SUFFIX

APPCPM suffix. **MQCA_LU62_ARM_SUFFIX** is valid on z/OS only.

MQCA_PARENT

The name of the hierarchically connected queue manager that is nominated as the parent of this queue manager.

MQCA_Q_MGR_DESC

Queue manager description.

MQCA_Q_MGR_IDENTIFIER

Internally generated unique queue manager name.

MQCA_Q_MGR_NAME

Name of local queue manager.

z/OS MQCA_QSG_CERT_LABEL

Queue sharing group certificate label. This parameter attribute is valid on z/OS only.

z/OS MQCA_QSG_NAME

Queue sharing group name. This parameter attribute is valid on z/OS only.

MQCA_REPOSITORY_NAME

Cluster name for the queue manager repository.

MQCA_REPOSITORY_NAMELIST

Name of the list of clusters for which the queue manager is providing a repository manager service.

MQCA_SSL_CRL_NAMELIST

TLS certificate revocation location namelist.

ULW

MQCA_SSL_CRYPTO_HARDWARE

Parameters to configure the TLS cryptographic hardware. This parameter is supported only on UNIX, Linux, and Windows.

MQCA_SSL_KEY_REPOSITORY

Location and name of the TLS key repository.

z/OS

MQCA_TCP_NAME

Name of the TCP/IP system that you are using. **MQCA_TCP_NAME** is valid on z/OS only.

MQCA_VERSION

The version of the IBM MQ installation, the queue manager is associated with. The version has the format *VVRRMMFF*:

VV: Version

RR: Release

MM: Maintenance level

FF: Fix level

ULW

MQIA_ACCOUNTING_CONN_OVERRIDE

Specifies whether the settings of the **MQIAccounting** and **QueueAccounting** queue manager parameters can be overridden. **MQIA_ACCOUNTING_CONN_OVERRIDE** is valid only on UNIX, Linux, and Windows.

ULW

MQIA_ACCOUNTING_INTERVAL

Intermediate accounting data collection interval. **MQIA_ACCOUNTING_INTERVAL** is valid only on UNIX, Linux, and Windows.

ULW

MQIA_ACCOUNTING_MQI

Specifies whether accounting information is to be collected for MQI data. **MQIA_ACCOUNTING_MQI** is valid only on UNIX, Linux, and Windows.

MQIA_ACCOUNTING_Q

Accounting data collection for queues.

z/OS

MQIA_ACTIVE_CHANNELS

Maximum number of channels that can be active at any time. **MQIA_ACTIVE_CHANNELS** is valid on z/OS only.

MQIA_ACTIVITY_CONN_OVERRIDE

Specifies whether the value of application activity trace can be overridden.

MQIA_ACTIVITY_RECORDING

Specifies whether activity reports can be generated.

MQIA_ACTIVITY_TRACE

Specifies whether application activity trace reports can be generated.

z/OS

MQIA_ADOPTNEWMCA_CHECK

Elements checked to determine whether an MCA must be adopted when a new inbound channel is detected with the same name as an MCA that is already active. **MQIA_ADOPTNEWMCA_CHECK** is valid on z/OS only.

► **z/OS** **MQIA_ADOPTNEWMCA_TYPE**

Specifies whether an orphaned instance of an MCA must be restarted automatically when a new inbound channel request matching the **AdoptNewMCACheck** parameter is detected. **MQIA_ADOPTNEWMCA_TYPE** is valid on z/OS only.

► **V 9.0.5** ► **MQ Adv.** **MQIA_ADVANCED_CAPABILITY**

Specifies whether IBM MQ Advanced extended capabilities are available for a queue manager.

This parameter is valid as follows:

- ► **z/OS** On z/OS from IBM MQ 9.0.4.
- ► **Multi** On other platforms from IBM MQ 9.0.5.

MQIA_AUTHORITY_EVENT

Control attribute for authority events.

► **z/OS** **MQIA_BRIDGE_EVENT**

Control attribute for IMS bridge events. **MQIA_BRIDGE_EVENT** is valid only on z/OS.

► **ULW** **MQIA_CERT_VAL_POLICY**

Specifies which TLS certificate validation policy is used to validate digital certificates received from remote partner systems. This attribute controls how strictly the certificate chain validation conforms to industry security standards. **MQIA_CERT_VAL_POLICY** is valid only on UNIX, Linux, and Windows. For more information, see [Certificate validation policies in IBM MQ](#).

► **z/OS** **MQIA_CHANNEL_AUTO_DEF**

Control attribute for automatic channel definition. **MQIA_CHANNEL_AUTO_DEF** is not valid on z/OS.

► **z/OS** **MQIA_CHANNEL_AUTO_DEF_EVENT**

Control attribute for automatic channel definition events. **MQIA_CHANNEL_AUTO_DEF_EVENT** is not valid on z/OS.

MQIA_CHANNEL_EVENT

Control attribute for channel events.

► **z/OS** **MQIA_CHINIT_ADAPTERS**

Number of adapter subtasks to use for processing IBM MQ calls. **MQIA_CHINIT_ADAPTERS** is valid on z/OS only.

MQIA_CHINIT_CONTROL

Start channel initiator automatically when queue manager starts.

► **z/OS** **MQIA_CHINIT_DISPATCHERS**

Number of dispatchers to use for the channel initiator. **MQIA_CHINIT_DISPATCHERS** is valid on z/OS only.

► **z/OS** **MQIA_CHINIT_SERVICE_PARM**

Reserved for use by IBM. **MQIA_CHINIT_SERVICE_PARM** is valid only on z/OS.

► **z/OS** **MQIA_CHINIT_TRACE_AUTO_START**

Specifies whether the channel initiator trace must start automatically. **MQIA_CHINIT_TRACE_AUTO_START** is valid on z/OS only.

► **z/OS** **MQIA_CHINIT_TRACE_TABLE_SIZE**

Size, in megabytes, of the trace data space of the channel initiator. **MQIA_CHINIT_TRACE_TABLE_SIZE** is valid on z/OS only.

MQIA_CHLAUTH_RECORDS

Control attribute for checking of channel authentication records.

MQIA_CLUSTER_WORKLOAD_LENGTH

Maximum length of the message passed to the cluster workload exit.

MQIA_CLWL_MRU_CHANNELS

Cluster workload most recently used channels.

MQIA_CLWL_USEQ

Cluster workload remote queue use.

MQIA_CMD_SERVER_CONTROL

Start command server automatically when queue manager starts.

MQIA_CODED_CHAR_SET_ID

Coded character set identifier.

MQIA_COMMAND_EVENT

Control attribute for command events.

MQIA_COMMAND_LEVEL

Command level supported by queue manager.

MQIA_CONFIGURATION_EVENT

Control attribute for configuration events.

MQIA_CPI_LEVEL

Reserved for use by IBM.

MQIA_DEF_CLUSTER_XMIT_Q_TYPE

Default transmission queue type to be used for cluster-sender channels.

Multi z/OS MQIA_DIST_LISTS

Distribution list support. This parameter is not valid on z/OS.

z/OS MQIA_DNS_WLM

Specifies whether the TCP listener that handles inbound transmissions for the queue-sharing group must register with Workload Manager (WLM) for DDNS. **MQIA_DNS_WLM** is valid on z/OS only.

z/OS MQIA_EXPIRY_INTERVAL

Expiry interval. This parameter is valid on z/OS only.

z/OS MQIA_GROUP_UR

Control attribute for whether transactional applications can connect with a GROUP unit of recovery disposition. This parameter is valid only on z/OS.

z/OS MQIA_IGQ_PUT_AUTHORITY

Intra-group queuing put authority. This parameter is valid on z/OS only.

MQIA_INHIBIT_EVENT

Control attribute for inhibit events.

z/OS MQIA_INTRA_GROUP_queuing

Intra-group queuing support. This parameter is valid on z/OS only.

MQIA_IP_ADDRESS_VERSION

IP address version selector.

z/OS MQIA_LISTENER_TIMER

Listener restart interval. **MQIA_LISTENER_TIMER** is valid on z/OS only.

MQIA_LOCAL_EVENT

Control attribute for local events.

MQIA_LOGGER_EVENT

Control attribute for recovery log events.

z/OS MQIA_LU62_CHANNELS

Maximum number of LU 6.2 channels. **MQIA_LU62_CHANNELS** is valid on z/OS only.

MQIA_MSG_MARK_BROWSE_INTERVAL

Interval for which messages that were browsed, remain marked.

z/OS MQIA_MAX_CHANNELS

Maximum number of channels that can be current. **MQIA_MAX_CHANNELS** is valid on z/OS only.

MQIA_MAX_HANDLES

Maximum number of handles.

MQIA_MAX_MSG_LENGTH

Maximum message length.

MQIA_MAX_PRIORITY

Maximum priority.

MQIA_MAX_PROPERTIES_LENGTH

Maximum properties length.

MQIA_MAX_UNCOMMITTED_MSGS

Maximum number of uncommitted messages within a unit of work.

MQIA_MONITORING_AUTO_CLUSSDR

Default value of the **ChannelMonitoring** attribute of automatically defined cluster-sender channels.

MQIA_MONITORING_CHANNEL

Specifies whether channel monitoring is enabled.

MQIA_MONITORING_Q

Specifies whether queue monitoring is enabled.

z/OS MQIA_OUTBOUND_PORT_MAX

Maximum value in the range for the binding of outgoing channels. **MQIA_OUTBOUND_PORT_MAX** is valid on z/OS only.

z/OS MQIA_OUTBOUND_PORT_MIN

Minimum value in the range for the binding of outgoing channels. **MQIA_OUTBOUND_PORT_MIN** is valid on z/OS only.

MQIA_PERFORMANCE_EVENT

Control attribute for performance events.

MQIA_PLATFORM

Platform on which the queue manager resides.

MQIA_PUBSUB_CLUSTER

Controls whether this queue manager participates in the publish/subscribe clustering.

MQIA_PUBSUB_MAXMSG_RETRY_COUNT

The number of retries when processing (under sync point) a failed command message

MQIA_PUBSUB_MODE

Inquires if the publish/subscribe engine and the queued publish/subscribe interface are running, which allow applications to publish/subscribe by using the application programming interface and the queues that are being monitored by the queued publish/subscribe interface.

MQIA_PUBSUB_NP_MSG

Specifies whether to discard (or keep) an undelivered input message.

MQIA_PUBSUB_NP_RESP

The behavior of undelivered response messages.

MQIA_PUBSUB_SYNC_PT

Specifies whether only persistent (or all) messages must be processed under sync point.

z/OS MQIA_QMGR_CFCONLOS

Specifies action to be taken when the queue manager loses connectivity to the administration structure, or any CF structure with CFCONLOS set to **ASQMGR**. **MQIA_QMGR_CFCONLOS** is valid on z/OS only.

z/OS MQIA_RECEIVE_TIMEOUT

How long a TCP/IP channel waits to receive data from its partner. **MQIA_RECEIVE_TIMEOUT** is valid on z/OS only.

z/OS MQIA_RECEIVE_TIMEOUT_MIN

Minimum length of time that a TCP/IP channel waits to receive data from its partner . **MQIA_RECEIVE_TIMEOUT_MIN** is valid on z/OS only.

z/OS MQIA_RECEIVE_TIMEOUT_TYPE

Qualifier to apply to the **ReceiveTimeout** parameter. **MQIA_RECEIVE_TIMEOUT_TYPE** is valid on z/OS only.

MQIA_REMOTE_EVENT

Control attribute for remote events.

z/OS MQIA_SECURITY_CASE

Specifies whether the queue manager supports security profile names either in mixed case, or in uppercase only. **MQIA_SECURITY_CASE** is valid only on z/OS.

z/OS MQIA_SHARED_Q_Q_MGR_NAME

When a queue manager makes an MQOPEN call for a shared queue and the queue manager that is specified in the **ObjectQmgrName** parameter of the MQOPEN call is in the same queue sharing group as the processing queue manager, the SQQMNAME attribute specifies whether the **ObjectQmgrName** is used or whether the processing queue manager opens the shared queue directly. **MQIA_SHARED_Q_Q_MGR_NAME** is valid only on z/OS.

MQIA_SSL_EVENT

Control attribute for TLS events.

MQIA_SSL_FIPS_REQUIRED

Specifies whether only FIPS-certified algorithms are to be used if cryptography is executed in IBM MQ rather than in the cryptographic hardware itself.

MQIA_SSL_RESET_COUNT

TLS key reset count.

z/OS MQIA_SSL_TASKS

TLS tasks. This parameter is valid on z/OS only.

MQIA_START_STOP_EVENT

Control attribute for start stop events.

MQIA_STATISTICS_AUTO_CLUSSDR

Specifies whether statistics data is to be collected for auto-defined cluster-sender channels and, if so, the rate of data collection.

MQIA_STATISTICS_CHANNEL

Specifies whether statistics monitoring data is to be collected for channels and, if so, the rate of data collection.

ULW MQIA_STATISTICS_INTERVAL

Statistics data collection interval. **MQIA_STATISTICS_INTERVAL** is valid only on UNIX, Linux, and Windows.

ULW MQIA_STATISTICS_MQI

Specifies whether statistics monitoring data is to be collected for the queue manager. **MQIA_STATISTICS_MQI** is valid only on UNIX, Linux, and Windows.

ULW MQIA_STATISTICS_Q

Specifies whether statistics monitoring data is to be collected for queues. **MQIA_STATISTICS_Q** is valid only on UNIX, Linux, and Windows.

MQIA_SUITE_B_STRENGTH

Specifies whether Suite B-compliant cryptography is used and the level of strength employed. For more information about Suite B configuration and its effect on TLS channels, see [NSA Suite B Cryptography in IBM MQ](#).

MQIA_SYNCPOINT

Sync point availability.

MQIA_TCP_CHANNELS

Maximum number of channels that can be current, or clients that can be connected, that use the TCP/IP transmission protocol. This is valid only on z/OS.

z/OS **MQIA_TCP_KEEP_ALIVE**

Specifies whether the TCP KEEPALIVE facility is to be used to check whether the other end of a connection is still available. **MQIA_TCP_KEEP_ALIVE** is valid only on z/OS.

z/OS **MQIA_TCP_STACK_TYPE**

Specifies whether the channel initiator can use only the TCP/IP address space specified in the **TCPIName** parameter, or can optionally bind to any selected TCP/IP address. **MQIA_TCP_STACK_TYPE** is valid only on z/OS.

MQIA_TRACE_ROUTE_RECORDING

Specifies whether trace-route information can be recorded and reply messages generated.

MQIA_TREE_LIFE_TIME

The lifetime of non-administrative topics.

MQIA_TRIGGER_INTERVAL

Trigger interval.

MQIA_XR_CAPABILITY

Specifies whether telemetry commands are supported.

MQIACF_Q_MGR_CLUSTER

All clustering attributes. These attributes are:

- **MQCA_CLUSTER_WORKLOAD_DATA**
- **MQCA_CLUSTER_WORKLOAD_EXIT**
- **MQCA_CHANNEL_AUTO_DEF_EXIT**
- **MQCA_REPOSITORY_NAME**
- **MQCA_REPOSITORY_NAMELIST**
- **MQIA_CLUSTER_WORKLOAD_LENGTH**
- **MQIA_CLWL_MRU_CHANNELS**
- **MQIA_CLWL_USEQ**
- **MQIA_MONITORING_AUTO_CLUSSDR**
- **MQCA_Q_MGR_IDENTIFIER**

MQIACF_Q_MGR_DQM

All distributed queuing attributes. These attributes are:

- **MQCA_CERT_LABEL**
- **MQCA_CHANNEL_AUTO_DEF_EXIT**
- **MQCA_CHANNEL_AUTO_DEF_EXIT**
- **MQCA_DEAD_LETTER_Q_NAME**
- **MQCA_DEF_XMIT_Q_NAME**
- **MQCA_DNS_GROUP**
- **MQCA_IGQ_USER_ID**
- **MQCA_LU_GROUP_NAME**

- MQCA_LU_NAME
- MQCA_LU62_ARM_SUFFIX
- MQCA_Q_MGR_IDENTIFIER
- MQCA_QSG_CERT_LABEL
- MQCA_SSL_CRL_NAMELIST
- MQCA_SSL_CRYPTO_HARDWARE
- MQCA_SSL_KEY_REPOSITORY
- MQCA_TCP_NAME
- MQIA_ACTIVE_CHANNELS
- MQIA_ADOPTNEWMCA_CHECK
- MQIA_ADOPTNEWMCA_TYPE
- MQIA_CERT_VAL_POLICY
- MQIA_CHANNEL_AUTO_DEF
- MQIA_CHANNEL_AUTO_DEF_EVENT
- MQIA_CHANNEL_EVENT
- MQIA_CHINIT_ADAPTERS
- MQIA_CHINIT_CONTROL
- MQIA_CHINIT_DISPATCHERS
- MQIA_CHINIT_SERVICE_PARM
- MQIA_CHINIT_TRACE_AUTO_START
- MQIA_CHINIT_TRACE_TABLE_SIZE
- MQIA_CHLAUTH_RECORDS
- MQIA_INTRA_GROUP_queuing
- MQIA_IGQ_PUT_AUTHORITY
- MQIA_IP_ADDRESS_VERSION
- MQIA_LISTENER_TIMER
- MQIA_LU62_CHANNELS
- MQIA_MAX_CHANNELS
- MQIA_MONITORING_CHANNEL
- MQIA_OUTBOUND_PORT_MAX
- MQIA_OUTBOUND_PORT_MIN
- MQIA_RECEIVE_TIMEOUT
- MQIA_RECEIVE_TIMEOUT_MIN
- MQIA_RECEIVE_TIMEOUT_TYPE
- MQIA_SSL_EVENT
- MQIA_SSL_FIPS_REQUIRED
- MQIA_SSL_RESET_COUNT
- MQIA_SSL_TASKS
- MQIA_STATISTICS_AUTO_CLUSSDR
- MQIA_TCP_CHANNELS
- MQIA_TCP_KEEP_ALIVE
- MQIA_TCP_STACK_TYPE

MQIACF_Q_MGR_EVENT

All event control attributes. These attributes are:

- **MQIA_AUTHORITY_EVENT**
- **MQIA_BRIDGE_EVENT**
- **MQIA_CHANNEL_EVENT**
- **MQIA_COMMAND_EVENT**
- **MQIA_CONFIGURATION_EVENT**
- **MQIA_INHIBIT_EVENT**
- **MQIA_LOCAL_EVENT**
- **MQIA_LOGGER_EVENT**
- **MQIA_PERFORMANCE_EVENT**
- **MQIA_REMOTE_EVENT**
- **MQIA_SSL_EVENT**
- **MQIA_START_STOP_EVENT**

MQIACF_Q_MGR_PUBSUB

All queue manager publish/subscribe attributes. These attributes are:

- **MQCA_PARENT**
- **MQIA_PUBSUB_MAXMSG_RETRY_COUNT**
- **MQIA_PUBSUB_MODE**
- **MQIA_PUBSUB_NP_MSG**
- **MQIA_PUBSUB_NP_RESP**
- **MQIA_PUBSUB_SYNC_PT**
- **MQIA_TREE_LIFE_TIME**

MQIACF_Q_MGR_SYSTEM

All queue manager system attributes. These attributes are:

- **MQCA_COMMAND_INPUT_Q_NAME**
- **MQCA_CUSTOM**
- **MQCA_DEAD_LETTER_Q_NAME**
- **MQCA_Q_MGR_NAME**
- **MQCA_QSG_NAME**
- **MQCA_VERSION**
- **MQIA_ACCOUNTING_CONN_OVERRIDE**
- **MQIA_ACCOUNTING_INTERVAL**
- **MQIA_ACCOUNTING_Q**
- **MQIA_ACTIVITY_CONN_OVERRIDE**
- **MQIA_ACTIVITY_RECORDING**
- **MQIA_ACTIVITY_TRACE**
- **MQCA_ALTERATION_DATE**
- **MQCA_ALTERATION_TIME**
- **MQIA_CMD_SERVER_CONTROL**
- **MQIA_CODED_CHAR_SET_ID**
- **MQIA_COMMAND_LEVEL**
- **MQIA_CPI_LEVEL**

- MQIA_DIST_LISTS
- MQIA_EXPIRY_INTERVAL
- MQIA_MAX_HANDLES
- MQIA_MAX_MSG_LENGTH
- MQIA_MAX_PRIORITY
- MQIA_MAX_PROPERTIES_LENGTH
- MQIA_MAX_UNCOMMITTED_MSGS
- MQIA_MONITORING_Q
- MQIA_PLATFORM
- MQIA_SHARED_Q_Q_MGR_NAME
- MQIA_STATISTICS_INTERVAL
- MQIA_STATISTICS_MQI
- MQIA_STATISTICS_Q
- MQIA_SYNCPOINT
- MQIA_TRACE_ROUTE_RECORDING
- MQIA_TRIGGER_INTERVAL
- MQIA_XR_CAPABILITY

Inquire Queue Manager (Response)

The response to the Inquire Queue Manager (MQCMD_INQUIRE_Q_MGR) command consists of the response header followed by the *QMgrName* structure and the requested combination of attribute parameter structures.

Always returned:

QMgrName

Returned if requested:

AccountingConnOverride , *AccountingInterval* , *ActivityConnOverride* ,
ActivityRecording , *ActivityTrace* , *AdoptNewMCACheck* , *AdoptNewMCAType* ,

Response data

AccountingConnOverride (MQCFIN)

Specifies whether applications can override the settings of the *QueueAccounting* and *MQIAccounting* queue manager parameters (parameter identifier: MQIA_ACCOUNTING_CONN_OVERRIDE).

The value can be any of the following values:

MQMON_DISABLED

Applications cannot override the settings of the **QueueAccounting** and **MQIAccounting** parameters.

MQMON_ENABLED

Applications can override the settings of the **QueueAccounting** and **MQIAccounting** parameters by using the options field of the MQCNO structure of the MQCONN API call.

This parameter applies only to UNIX, Linux, and Windows.

AccountingInterval (MQCFIN)

The time interval, in seconds, at which intermediate accounting records are written (parameter identifier: MQIA_ACCOUNTING_INTERVAL).

It is a value in the range 1 through 604 000.

This parameter applies only to UNIX, Linux, and Windows.

ActivityConnOverride (MQCFIN)

Specifies whether applications can override the setting of the ACTVTRC value in the queue manager attribute (parameter identifier: MQIA_ACTIVITY_CONN_OVERRIDE).

The value can be any of the following values:

MQMON_DISABLED

Applications cannot override the setting of the ACTVTRC queue manager attribute using the Options field in the MQCNO structure on the MQCONN call. This is the default value.

MQMON_ENABLED

Applications can override the ACTVTRC queue manager attribute using the Options field in the MQCNO structure.

Changes to this value are only effective for connections to the queue manager after the change to the attribute.

This parameter applies only to IBM i, UNIX, and Windows.

ActivityRecording (MQCFIN)

Whether activity reports can be generated (parameter identifier: MQIA_ACTIVITY_RECORDING).

The value can be:

MQRECORDING_DISABLED

Activity reports cannot be generated.

MQRECORDING_MSG

Activity reports can be generated and sent to the destination specified by the originator of the message causing the report.

MQRECORDING_Q

Activity reports can be generated and sent to SYSTEM.ADMIN.ACTIVITY.QUEUE.

ActivityTrace (MQCFIN)

Whether activity reports can be generated (parameter identifier: MQIA_ACTIVITY_TRACE).

The value can be:

MQMON_OFF

Do not collect IBM MQ MQI application activity trace. This is the default value.

If you set the queue manager attribute ACTVCON0 to ENABLED, this value might be overridden for individual connections using the Options field in the MQCNO structure.

MQMON_ON

Collect IBM MQ MQI application activity trace.

Changes to this value are only effective for connections to the queue manager after the change to the attribute.

This parameter applies only to IBM i, UNIX, and Windows.

z/OS**AdoptNewMCACheck (MQCFIN)**

The elements checked to determine whether an MCA must be adopted (restarted) when a new inbound channel is detected. It is adopted if it has the same name as a currently active MCA (parameter identifier: MQIA_ADOPTNEWMCA_CHECK).

The value can be:

MQADOPT_CHECK_Q_MGR_NAME

Check the queue manager name.

MQADOPT_CHECK_NET_ADDR

Check the network address.

MQADOPT_CHECK_ALL

Check the queue manager name and network address.

MQADOPT_CHECK_NONE

Do not check any elements.

This parameter is valid only on z/OS.

z/OS**AdoptNewMCAType (MQCFIL)**

Adoption of orphaned channel instances (parameter identifier: MQIA_ADOPTNEWMCA_TYPE).

The value can be:

MQADOPT_TYPE_NO

Do not adopt orphaned channel instances.

MQADOPT_TYPE_ALL

Adopt all channel types.

This parameter is valid only on z/OS.

MQ Adv.**AdvancedCapability (MQCFIN)**

Whether IBM MQ Advanced extended capabilities are available for a queue manager. (parameter identifier: MQIA_ADVANCED_CAPABILITY).

z/OS**V 9.0.4**

On z/OS, the queue manager sets the value to be MQCAP_SUPPORTED, only if the value of **QMGRPROD** is ADVANCEDVUE. For any other value of **QMGRPROD**, or if **QMGRPROD** is not

set, the queue manager sets the value to MQCAP_NOTSUPPORTED. See [“START QMGR on z/OS” on page 882](#) for more information.

Multi **V 9.0.5** On other platforms, from IBM MQ 9.0.5, the queue manager sets the value to be MQCAP_SUPPORTED, only if you have installed Managed File Transfer, XR, or Advanced Message Security. If you have not installed Managed File Transfer, XR, or Advanced Message Security, **AdvancedCapability** is set to MQCAP_NOTSUPPORTED. See [IBM MQ components and features](#) for more information.

AlterationDate (MQCFST)

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date, in the form yyyy-mm-dd, on which the information was last altered.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time, in the form hh.mm.ss, at which the information was last altered.

AuthorityEvent (MQCFIN)

Controls whether authorization (Not Authorized) events are generated (parameter identifier: MQIA_AUTHORITY_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

z/OS **BridgeEvent (MQCFIN)**

Controls whether IMS bridge events are generated (parameter identifier: MQIA_BRIDGE_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

This parameter is valid only on z/OS.

CertificateLabel (MQCFST)

Certificate label for this queue manager to use. The label identifies which personal certificate in the key repository has been selected.

The maximum length of the string is MQ_CERT_LABEL_LENGTH.

CertificateValPolicy (MQCFIN)

Specifies which TLS certificate validation policy is used to validate digital certificates received from remote partner systems (parameter identifier: MQIA_CERT_VAL_POLICY).

This attribute can be used to control how strictly the certificate chain validation conforms to industry security standards. This parameter is valid only on UNIX, Linux, and Windows. For more information, see [Certificate validation policies in IBM MQ](#).

The value can be any of the following values:

MQ_CERT_VAL_POLICY_ANY

Apply each of the certificate validation policies supported by the secure sockets library and accept the certificate chain if any of the policies considers the certificate chain valid. This setting can be used for maximum backwards compatibility with older digital certificates which do not comply with the modern certificate standards.

MQ_CERT_VAL_POLICY_RFC5280

Apply only the RFC 5280 compliant certificate validation policy. This setting provides stricter validation than the ANY setting, but rejects some older digital certificates.

z/OS

CFConlos (MQCFIN)

Specifies the action to be taken when the queue manager loses connectivity to the administration structure, or any CF structures with CFCONLOS set to ASQMGR (parameter identifier: MQIA_QMGR_CFCONLOS).

The value can be:

MQCFCONLOS_TERMINATE

The queue manager terminates when connectivity to CF structures is lost.

MQCFCONLOS_TOLERATE

The queue manager tolerates loss of connectivity to CF structures without terminating.

This parameter is valid only on z/OS.

ChannelAutoDef (MQCFIN)

Controls whether receiver and server-connection channels can be auto-defined (parameter identifier: MQIA_CHANNEL_AUTO_DEF).

The value can be:

MQCHAD_DISABLED

Channel auto-definition disabled.

MQCHAD_ENABLED

Channel auto-definition enabled.

ChannelAutoDefEvent (MQCFIN)

Controls whether channel auto-definition events are generated (parameter identifier: MQIA_CHANNEL_AUTO_DEF_EVENT), when a receiver, server-connection, or cluster-sender channel is auto-defined.

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

ChannelAutoDefExit (MQCFST)

Channel auto-definition exit name (parameter identifier: MQCA_CHANNEL_AUTO_DEF_EXIT).

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

ChannelAuthenticationRecords (MQCFIN)

Controls whether channel authentication records are checked (parameter identifier: MQIA_CHLAUTH_RECORDS).

The value can be:

MQCHLA_DISABLED

Channel authentication records are not checked.

MQCHLA_ENABLED

Channel authentication records are checked.

ChannelEvent (MQCFIN)

Controls whether channel events are generated (parameter identifier: MQIA_CHANNEL_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

MQEVR_EXCEPTION

Reporting of exception channel events enabled.

ChannelInitiatorControl (MQCFIN)

Start the channel initiator during queue manager start (parameter identifier: MQIA_CHINIT_CONTROL). This parameter is not available on z/OS.

The value can be:

MQSVC_CONTROL_MANUAL

The channel initiator is not to be started automatically when the queue manager starts.

MQSVC_CONTROL_Q_MGR

The channel initiator is to be started automatically when the queue manager starts.

ChannelMonitoring (MQCFIN)

Default setting for online monitoring for channels (parameter identifier: MQIA_MONITORING_CHANNEL).

If the *ChannelMonitoring* channel attribute is set to MQMON_Q_MGR , this attribute specifies the value which is assumed by the channel. The value can be any of the following values:

MQMON_OFF

Online monitoring data collection is turned off.

MQMON_NONE

Online monitoring data collection is turned off for channels regardless of the setting of their **ChannelMonitoring** attribute.

MQMON_LOW

Online monitoring data collection is turned on, with a low ratio of data collection.

MQMON_MEDIUM

Online monitoring data collection is turned on, with a moderate ratio of data collection.

MQMON_HIGH

Online monitoring data collection is turned on, with a high ratio of data collection.

z/OS ChannelStatistics (MQCFIN)

Specifies whether statistics data is to be collected for channels (parameter identifier: MQIA_STATISTICS_CHANNEL).

The value can be:

MQMON_OFF

Statistics data collection is turned off.

MQMON_LOW

Statistics data collection is turned on, with a low ratio of data collection.

MQMON_MEDIUM

Statistics data collection is turned on, with a moderate ratio of data collection.

MQMON_HIGH

Statistics data collection is turned on, with a high ratio of data collection.

On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

This parameter is valid only on z/OS.

z/OS ChinitAdapters (MQCFIN)

Number of adapter subtasks (parameter identifier: MQIA_CHINIT_ADAPTERS).

The number of adapter subtasks to use for processing IBM MQ calls. This parameter is valid only on z/OS.

z/OS ChinitDispatchers (MQCFIN)

Number of dispatchers (parameter identifier: MQIA_CHINIT_DISPATCHERS).

The number of dispatchers to use for the channel initiator. This parameter is valid only on z/OS.

z/OS ChinitServiceParm (MQCFST)

Reserved for use by IBM (parameter identifier: MQCA_CHINIT_SERVICE_PARM).

z/OS ChinitTraceAutoStart (MQCFIN)

Specifies whether the channel initiator trace must start automatically (parameter identifier: MQIA_CHINIT_TRACE_AUTO_START).

The value can be:

MQTRAXSTR_YES

Channel initiator trace is to start automatically.

MQTRAXSTR_NO

Channel initiator trace is not to start automatically.

This parameter is valid only on z/OS.

z/OS ChinitTraceTableSize (MQCFIN)

The size, in megabytes, of the trace data space of the channel initiator (parameter identifier: MQIA_CHINIT_TRACE_TABLE_SIZE).

This parameter is valid only on z/OS.

ClusterSenderMonitoringDefault (MQCFIN)

Setting for online monitoring for automatically defined cluster-sender channels (parameter identifier: MQIA_MONITORING_AUTO_CLUSSDR).

The value can be:

MQMON_Q_MGR

Collection of online monitoring data is inherited from the setting of the queue manager's **ChannelMonitoring** parameter.

MQMON_OFF

Monitoring for the channel is disabled.

MQMON_LOW

Specifies a low rate of data collection with a minimal effect on system performance unless **ChannelMonitoring** for the queue manager is MQMON_NONE. The data collected is not likely to be the most current.

MQMON_MEDIUM

Specifies a moderate rate of data collection with limited effect on system performance unless **ChannelMonitoring** for the queue manager is MQMON_NONE.

MQMON_HIGH

Specifies a high rate of data collection with a likely effect on system performance unless **ChannelMonitoring** for the queue manager is MQMON_NONE. The data collected is the most current available.

z/OS On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

ClusterSenderStatistics (MQCFIN)

Specifies whether statistics data is to be collected for auto-defined cluster-sender channels (parameter identifier: MQIA_STATISTICS_AUTO_CLUSSDR).

The value can be:

MQMON_Q_MGR

Collection of statistics data is inherited from the setting of the queue manager's **ChannelStatistics** parameter.

MQMON_OFF

Statistics data collection for the channel is disabled.

MQMON_LOW

Specifies a low rate of data collection with a minimal effect on system performance.

MQMON_MEDIUM

Specifies a moderate rate of data collection.

MQMON_HIGH

Specifies a high rate of data collection.

 On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

ClusterWorkLoadData (MQCFST)

Data passed to the cluster workload exit (parameter identifier: MQCA_CLUSTER_WORKLOAD_DATA).

ClusterWorkLoadExit (MQCFST)

Name of the cluster workload exit (parameter identifier: MQCA_CLUSTER_WORKLOAD_EXIT).

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

ClusterWorkLoadLength (MQCFIN)

Cluster workload length (parameter identifier: MQIA_CLUSTER_WORKLOAD_LENGTH).

The maximum length of the message passed to the cluster workload exit.

CLWLMRUChannels (MQCFIN)

Cluster workload most recently used (MRU) channels (parameter identifier: MQIA_CLWL_MRU_CHANNELS).

The maximum number of active most recently used outbound channels.

CLWLUseQ (MQCFIN)

Use of remote queue (parameter identifier: MQIA_CLWL_USEQ).

Specifies whether a cluster queue manager is to use remote puts to other queues defined in other queue managers within the cluster during workload management.

The value can be any of the following values:

MQCLWL_USEQ_ANY

Use remote queues.

MQCLWL_USEQ_LOCAL

Do not use remote queues.

CodedCharSetId (MQCFIN)

Coded character set identifier (parameter identifier: MQIA_CODED_CHAR_SET_ID).

CommandEvent (MQCFIN)

Controls whether command events are generated (parameter identifier: MQIA_COMMAND_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

MQEVR_NODISPLAY

Event reporting enabled for all successful commands except Inquire commands.

CommandInputQName (MQCFST)

Command input queue name (parameter identifier: MQCA_COMMAND_INPUT_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

CommandLevel (MQCFIN)

Command level supported by queue manager (parameter identifier: MQIA_COMMAND_LEVEL).

The value can be:

MQCMDL_LEVEL_710

Level 710 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX 7.1
- IBM WebSphere MQ for HP-UX 7.1
- IBM WebSphere MQ for IBM i 7.1
- IBM WebSphere MQ for Linux 7.1
- IBM WebSphere MQ for Solaris 7.1
- IBM WebSphere MQ for Windows 7.1
- IBM WebSphere MQ for z/OS 7.1

MQCMDL_LEVEL_750

Level 750 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX 7.5
- IBM WebSphere MQ for HP-UX 7.5
- IBM WebSphere MQ for IBM i 7.5
- IBM WebSphere MQ for Linux 7.5
- IBM MQ for Solaris 7.5
- IBM WebSphere MQ for Windows 7.5

MQCMDL_LEVEL_800

Level 800 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 8.0
- IBM MQ for HP-UX 8.0
- IBM MQ for IBM i 8.0
- IBM MQ for Linux 8.0
- IBM MQ for Solaris 8.0
- IBM MQ for Windows 8.0
- IBM MQ for z/OS 8.0

MQCMDL_LEVEL_801

Level 801 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 8.0.0 Fix Pack 2
- IBM MQ for HP-UX 8.0.0 Fix Pack 2

- IBM MQ for IBM i 8.0.0 Fix Pack 2
- IBM MQ for Linux 8.0.0 Fix Pack 2
- IBM MQ for Solaris 8.0.0 Fix Pack 2

MQCMDL_LEVEL_802

Level 802 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 8.0.0 Fix Pack 3
- IBM MQ for HP-UX 8.0.0 Fix Pack 3
- IBM MQ for IBM i 8.0.0 Fix Pack 3
- IBM MQ for Linux 8.0.0 Fix Pack 3
- IBM MQ for Solaris 8.0.0 Fix Pack 3
- IBM MQ for Windows 8.0.0 Fix Pack 3
- IBM MQ for HPE NonStop 8.1.0

V 9.0.0 MQCMDL_LEVEL_900

Level 900 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.0
- IBM MQ for HP-UX 9.0
- IBM MQ for IBM i 9.0
- IBM MQ for Linux 9.0
- IBM MQ for Solaris 9.0
- IBM MQ for Windows 9.0
- IBM MQ for z/OS 9.0

MQCMDL_LEVEL_901

Level 901 of system control commands.

This value is returned by the following versions:

- IBM MQ for Linux 9.0.1
- IBM MQ for Windows 9.0.1
- IBM MQ for z/OS 9.0.1

V 9.0.2 MQCMDL_LEVEL_902

Level 902 of system control commands.

This value is returned by the following versions:

- IBM MQ for Linux 9.0.2
- IBM MQ for Windows 9.0.2
- IBM MQ for z/OS 9.0.2

MQCMDL_LEVEL_903

Level 903 of system control commands.

This value is returned by the following versions:

- IBM MQ for Linux 9.0.3
- IBM MQ for Windows 9.0.3
- IBM MQ for z/OS 9.0.3

MQCMDL_LEVEL_904

Level 904 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.0.4
- IBM MQ for Linux 9.0.4
- IBM MQ for Windows 9.0.4
- IBM MQ for z/OS 9.0.4

MQCMDL_LEVEL_905

Level 905 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.0.5
- IBM MQ for Linux 9.0.5
- IBM MQ for Windows 9.0.5
- IBM MQ for z/OS 9.0.5

The set of system control commands that corresponds to a particular value of the **CommandLevel** attribute varies. It varies according to the value of the **Platform** attribute; both must be used to decide which system control commands are supported.

CommandServerControl (MQCFIN)

Start the command server during queue manager start (parameter identifier: MQIA_CMD_SERVER_CONTROL). This parameter is not available on z/OS.

The value can be:

MQSVC_CONTROL_MANUAL

The command server is not to be started automatically when the queue manager starts.

MQSVC_CONTROL_Q_MGR

The command server is to be started automatically when the queue manager starts.

ConfigurationEvent (MQCFIN)

Controls whether configuration events are generated (parameter identifier: MQIA_CONFIGURATION_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

ConnAuth (MQCFST)

Name of the authentication information object that is used to provide the location of user ID and password authentication (parameter identifier: MQCA_CONN_AUTH).

CreationDate (MQCFST)

Queue creation date, in the form yyyy-mm-dd (parameter identifier: MQCA_CREATION_DATE).

The maximum length of the string is MQ_CREATION_DATE_LENGTH.

CreationTime (MQCFST)

Creation time, in the form hh.mm.ss (parameter identifier: MQCA_CREATION_TIME).

The maximum length of the string is MQ_CREATION_TIME_LENGTH.

Custom (MQCFST)

Custom attribute for new features (parameter identifier: MQCA_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes are introduced. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE).

This description is updated when features using this attribute are introduced.

DeadLetterQName (MQCFST)

Dead letter (undelivered message) queue name (parameter identifier: MQCA_DEAD_LETTER_Q_NAME).

Specifies the name of the local queue that is to be used for undelivered messages. Messages are put on this queue if they cannot be routed to their correct destination.

The maximum length of the string is MQ_Q_NAME_LENGTH.

DefClusterXmitQueueType (MQCFIN)

The DefClusterXmitQueueType attribute controls which transmission queue is selected by default by cluster-sender channels to get messages from, to send the messages to cluster-receiver channels. (Parameter identifier: MQIA_DEF_CLUSTER_XMIT_Q_TYPE.)

The values of **DefClusterXmitQueueType** are MQCLXQ_SCTQ or MQCLXQ_CHANNEL.

MQCLXQ_SCTQ

All cluster-sender channels send messages from SYSTEM.CLUSTER.TRANSMIT.QUEUE. The correlID of messages placed on the transmission queue identifies which cluster-sender channel the message is destined for.

SCTQ is set when a queue manager is defined. This behavior is implicit in versions earlier than IBM WebSphere MQ 7.5. In earlier versions, the queue manager attribute DefClusterXmitQueueType was not present.

MQCLXQ_CHANNEL

Each cluster-sender channel sends messages from a different transmission queue. Each transmission queue is created as a permanent dynamic queue from the model queue SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE.

DefXmitQName (MQCFST)

Default transmission queue name (parameter identifier: MQCA_DEF_XMIT_Q_NAME).

The default transmission queue is used for the transmission of messages to remote queue managers. It is used if there is no other indication of which transmission queue to use.

The maximum length of the string is MQ_Q_NAME_LENGTH.

DistLists (MQCFIN)

Distribution list support (parameter identifier: MQIA_DIST_LISTS).

The value can be:

MQDL_SUPPORTED

Distribution lists supported.

MQDL_NOT_SUPPORTED

Distribution lists not supported.

z/OS DNSGroup (MQCFST)

DNS group name (parameter identifier: MQCA_DNS_GROUP).

This parameter is no longer used. Refer to [z/OS: WLM/DNS no longer supported](#).

This parameter is valid only on z/OS.

z/OS DNSWLM (MQCFIN)

WLM/DNS Control: (parameter identifier: MQIA_DNS_WLM).

This parameter is no longer used. Refer to [z/OS: WLM/DNS no longer supported](#).

The value can be any of the following values:

MQDNSWLM_NO

MQDNSWLM_NO is the only value supported by the queue manager.

This parameter is valid only on z/OS.

EncryptionPolicySuiteB (MQCFIL)

Specifies whether Suite B-compliant cryptography is used and what level of strength is employed (parameter identifier: MQIA_SUITE_B_STRENGTH). For more information about Suite B configuration and its effect on TLS channels, see [NSA Suite B Cryptography in IBM MQ](#).

The value can be one, or more, of:

MQ_SUITE_B_NONE

Suite B-compliant cryptography is not used.

MQ_SUITE_B_128_BIT

Suite B 128-bit strength security is used.

MQ_SUITE_B_192_BIT

Suite B 192-bit strength security is used.

MQ_SUITE_B_128_BIT, MQ_SUITE_B_192_BIT

Suite B 128-bit and Suite B 192-bit strength security is used.

z/OS ExpiryInterval (MQCFIN)

Interval between scans for expired messages (parameter identifier: MQIA_EXPIRY_INTERVAL).

Specifies the frequency with which the queue manager scans the queues looking for expired messages. This parameter is a time interval in seconds in the range 1 through 99 999 999, or the following special value:

MQEXPI_OFF

No scans for expired messages.

This parameter is valid only on z/OS.

z/OS GroupUR (MQCFIN)

Identifies whether XA client applications can establish transactions with a GROUP unit of recovery disposition.

The value can be:

MQGUR_DISABLED

XA client applications must connect using a queue manager name.

MQGUR_ENABLED

XA client applications can establish transactions with a group unit of recovery disposition by specifying a queue sharing group name when they connect.

This parameter is valid only on z/OS.

z/OS IGQPutAuthority (MQCFIN)

Type of authority checking used by the intra-group queuing agent (parameter identifier: MQIA_IGQ_PUT_AUTHORITY).

The attribute indicates the type of authority checking that is performed by the local intra-group queuing agent (IGQ agent). The checking is performed when the IGQ agent removes a message from the shared transmission queue and places the message on a local queue. The value can be any of the following values:

MQIGQPA_DEFAULT

Default user identifier is used.

MQIGQPA_CONTEXT

Context user identifier is used.

MQIGQPA_ONLY_IGQ

Only the IGQ user identifier is used.

MQIGQPA_ALTERNATE_OR_IGQ

Alternate user identifier or IGQ-agent user identifier is used.

This parameter is valid only on z/OS.

z/OS **IGQUserId (MQCFST)**

User identifier used by the intra-group queuing agent (parameter identifier: MQCA_IGQ_USER_ID).

The maximum length of the string is MQ_USER_ID_LENGTH. This parameter is valid only on z/OS.

V 9.0.2 **ImageInterval (MQCFIN)**

The target frequency with which the queue manager automatically writes media images (parameter identifier: MQIA_MEDIA_IMAGE_INTERVAL). This parameter is not valid on z/OS.

The value can be:

The time interval, at which the queue manager automatically writes media images.

MQMEDIMGINTVL_OFF

Automatic media images are not written on a time interval basis.

V 9.0.2 **ImageLogLength (MQCFIN)**

The target size of the recovery log (parameter identifier: MQIA_MEDIA_IMAGE_LOG_LENGTH). This parameter is not valid on z/OS.

The value can be:

The size of the recovery log.

MQMEDIMGLOGLN_OFF

Automatic media images are not written.

V 9.0.2 **ImageRecoverObject (MQCFST)**

Specifies the recoverable objects from a media image, if linear logging is being used (parameter identifier: MQIA_MEDIA_IMAGE_RECOVER_OBJ). This parameter is not valid on z/OS.

The value can be:

MQIMGRCOV_NO

Automatic media images, if enabled, are not written for these objects.

MQIMGRCOV_YES

These objects are recoverable.

V 9.0.2 **ImageRecoverQueue (MQCFST)**

Displays the default **ImageRecoverQueue** attribute for local and permanent dynamic queue objects, when used with this parameter (parameter identifier: MQIA_MEDIA_IMAGE_RECOVER_Q). This parameter is not valid on z/OS.

The value can be:

MQIMGRCOV_NO

The **ImageRecoverQueue** attribute for local and permanent dynamic queue objects is set to MQIMGRCOV_NO .

MQIMGRCOV_YES

The **ImageRecoverQueue** attribute for local and permanent dynamic queue objects is set to MQIMGRCOV_YES .

V 9.0.2 ImageSchedule (MQCFST)

Whether the queue manager automatically writes media images (parameter identifier: MQIA_MEDIA_IMAGE_SCHEDUING). This parameter is not valid on z/OS.

The value can be:

MQMEDIMGSCHED_AUTO

The queue manager automatically writes a media image for an object.

MQMEDIMGSCHED_MANUAL

Automatic media images are not written.

InhibitEvent (MQCFIN)

Controls whether inhibit (Inhibit Get and Inhibit Put) events are generated (parameter identifier: MQIA_INHIBIT_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

z/OS IntraGroupqueuing (MQCFIN)

Specifies whether intra-group queuing is used (parameter identifier: MQIA_INTRA_GROUP_queuing).

The value can be:

MQIGQ_DISABLED

Intra-group queuing is disabled. All messages destined for other queue managers in the queue sharing group are transmitted using conventional channels.

MQIGQ_ENABLED

Intra-group queuing is enabled.

This parameter is valid only on z/OS.

IPAddressVersion (MQCFIN)

IP address version selector (parameter identifier: MQIA_IP_ADDRESS_VERSION).

Specifies which IP address version, either IPv4 or IPv6, is used. The value can be:

MQIPADDR_IPv4

IPv4 is used.

MQIPADDR_IPv6

IPv6 is used.

ListenerTimer (MQCFIN)

Listener restart interval (parameter identifier: MQIA_LISTENER_TIMER).

The time interval, in seconds, between attempts by IBM MQ to restart the listener after an APPC or TCP/IP failure.

z/OS LocalEvent (MQCFIN)

Controls whether local error events are generated (parameter identifier: MQIA_LOCAL_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

This parameter is valid only on z/OS.

LoggerEvent (MQCFIN)

Controls whether recovery log events are generated (parameter identifier: MQIA_LOGGER_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

This parameter applies only to UNIX, Linux, and Windows.

z/OS LUGroupName (MQCFST)

Generic LU name for the LU 6.2 listener (parameter identifier: MQCA_LU_GROUP_NAME).

The generic LU name to be used by the LU 6.2 listener that handles inbound transmissions for the queue sharing group. This parameter is valid only on z/OS.

z/OS LUName (MQCFST)

LU name to use for outbound LU 6.2 transmissions (parameter identifier: MQCA_LU_NAME).

The name of the LU to use for outbound LU 6.2 transmissions. This parameter is valid only on z/OS.

z/OS LU62ARMSuffix (MQCFST)

APPCPM suffix (parameter identifier: MQCA_LU62_ARM_SUFFIX).

The suffix of the APPCPM member of SYS1.PARMLIB. This suffix nominates the LUADD for this channel initiator. This parameter is valid only on z/OS.

z/OS LU62Channels (MQCFIN)

Maximum number of LU 6.2 channels (parameter identifier: MQIA_LU62_CHANNELS).

The maximum number of channels that can be current, or clients that can be connected, that use the LU 6.2 transmission protocol. This parameter is valid only on z/OS.

z/OS MaxActiveChannels (MQCFIN)

Maximum number of channels (parameter identifier: MQIA_ACTIVE_CHANNELS).

The maximum number of channels that can be active at any time. This parameter is valid only on z/OS.

z/OS MaxChannels (MQCFIN)

Maximum number of current channels (parameter identifier: MQIA_MAX_CHANNELS).

The maximum number of channels that can be current (including server-connection channels with connected clients). This parameter is valid only on z/OS.

MaxHandles (MQCFIN)

Maximum number of handles (parameter identifier: MQIA_MAX_HANDLES).

Specifies the maximum number of handles that any one connection can have open at the same time.

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: MQIA_MAX_MSG_LENGTH).

MaxPriority (MQCFIN)

Maximum priority (parameter identifier: MQIA_MAX_PRIORITY).

MaxPropertiesLength (MQCFIN)

Maximum properties length (parameter identifier: MQIA_MAX_PROPERTIES_LENGTH).

MaxUncommittedMsgs (MQCFIN)

Maximum number of uncommitted messages within a unit of work (parameter identifier: MQIA_MAX_UNCOMMITTED_MSGS).

This number is the sum of the following number of messages under any one sync point. :

- The number of messages that can be retrieved, plus

- The number of messages that can be put on a queue, plus
- Any trigger messages generated within this unit of work

The limit does not apply to messages that are retrieved or put outside sync point.

MQIAccounting (MQCFIN)

Specifies whether accounting information for MQI data is to be collected (parameter identifier: MQIA_ACCOUNTING_MQI).

The value can be:

MQMON_OFF

MQI accounting data collection is disabled.

MQMON_ON

MQI accounting data collection is enabled.

This parameter applies only to UNIX, Linux, and Windows.

MQIStatistics (MQCFIN)

Specifies whether statistics monitoring data is to be collected for the queue manager (parameter identifier: MQIA_STATISTICS_MQI).

The value can be:

MQMON_OFF

Data collection for MQI statistics is disabled. MQMON_OFF is the initial default value of the queue manager.

MQMON_ON

Data collection for MQI statistics is enabled.

This parameter applies only to UNIX, Linux, and Windows.

MsgMarkBrowseInterval (MQCFIN)

Mark-browse interval (parameter identifier: MQIA_MSG_MARK_BROWSE_INTERVAL).

The time interval in milliseconds after which the queue manager can automatically unmark messages.

Attention: This value should not be below the default of 5000.

z/OS OutboundPortMax (MQCFIN)

The maximum value in the range for the binding of outgoing channels (parameter identifier: MQIA_OUTBOUND_PORT_MAX).

The maximum value in the range of port numbers to be used when binding outgoing channels. This parameter is valid only on z/OS.

z/OS OutboundPortMin (MQCFIN)

The minimum value in the range for the binding of outgoing channels (parameter identifier: MQIA_OUTBOUND_PORT_MIN).

The minimum value in the range of port numbers to be used when binding outgoing channels. This parameter is valid only on z/OS.

Parent (MQCFST)

The name of the hierarchically connected queue manager nominated as the parent of this queue manager (parameter identifier: MQCA_PARENT).

PerformanceEvent (MQCFIN)

Controls whether performance-related events are generated (parameter identifier: MQIA_PERFORMANCE_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

Platform (MQCFIN)

Platform on which the queue manager resides (parameter identifier: MQIA_PLATFORM).

The value can be:

MQPL_AIX

AIX (same value as MQPL_UNIX).

MQPL_APPLIANCE

IBM MQ Appliance

MQPL_NSK

HP Integrity NonStop Server.

MQPL_OS400

IBM i.

MQPL_UNIX

UNIX.

MQPL_WINDOWS_NT

Windows.

MQPL_ZOS

z/OS

PubSubClus (MQCFIN)

Controls whether the queue manager participates in publish/subscribe clustering (parameter identifier: MQIA_PUBSUB_CLUSTER).

The value can be:

MQPSCLUS_ENABLED

The creating or receipt of clustered topic definitions and cluster subscriptions is permitted.

Note: The introduction of a clustered topic into a large IBM MQ cluster can cause a degradation in performance. This degradation occurs because all partial repositories are notified of all the other members of the cluster. Unexpected subscriptions might be created at all other nodes; for example, where `proxysub(FORCE)` is specified. Large numbers of channels might be started from a queue manager; for example, on resync after a queue manager failure.

MQPSCLUS_DISABLED

The creating or receipt of clustered topic definitions and cluster subscriptions is inhibited. The creations or receipts are recorded as warnings in the queue manager error logs.

PubSubMaxMsgRetryCount (MQCFIN)

The number of attempts to reprocess a failed command message under sync point (parameter identifier: MQIA_PUBSUB_MAXMSG_RETRY_COUNT).

PubSubMode (MQCFIN)

Specifies whether the publish/subscribe engine and the queued publish/subscribe interface are running. The publish/subscribe engine enables applications to publish or subscribe by using the application programming interface. The publish/subscribe interface monitors the queues used the queued publish/subscribe interface (parameter identifier: MQIA_PUBSUB_MODE).

The values can be as follows:

MQPSM_COMPAT

The publish/subscribe engine is running. It is therefore possible to publish or subscribe by using the application programming interface. The queued publish/subscribe interface is not running. Therefore any message that is put to the queues that are monitored by the queued publish/subscribe interface is not acted on. MQPSM_COMPAT is used for compatibility with versions of IBM Integration Bus, (formerly known as WebSphere Message Broker) prior to version 7 that use this queue manager.

MQPSM_DISABLED

The publish/subscribe engine and the queued publish/subscribe interface are not running. It is therefore not possible to publish or subscribe by using the application programming interface. Any publish/subscribe messages that are put to the queues that are monitored by the queued publish/subscribe interface are not acted on.

MQPSM_ENABLED

The publish/subscribe engine and the queued publish/subscribe interface are running. It is therefore possible to publish or subscribe by using the application programming interface and the queues that are being monitored by the queued publish/subscribe interface. MQPSM_ENABLED is the initial default value of the queue manager.

PubSubNPInputMsg (MQCFIN)

Specifies whether to discard or keep an undelivered input message (parameter identifier: MQIA_PUBSUB_NP_MSG).

The values can be as follows:

MQUNDELIVERED_DISCARD

Non-persistent input messages can be discarded if they cannot be processed. MQUNDELIVERED_DISCARD is the default value.

MQUNDELIVERED_KEEP

Non-persistent input messages are not discarded if they cannot be processed. The queued publish/subscribe interface continues to try the process again at appropriate intervals. It does not continue processing subsequent messages.

PubSubNPResponse (MQCFIN)

Controls the behavior of undelivered response messages (parameter identifier: MQIA_PUBSUB_NP_RESP).

The values can be as follows:

MQUNDELIVERED_NORMAL

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If they cannot be placed on the dead letter queue, they are discarded.

MQUNDELIVERED_SAFE

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If the response cannot be sent and cannot be placed on the dead letter queue the queued publish/subscribe interface rolls back the current operation. The operation is tried again at appropriate intervals and does not continue processing subsequent messages.

MQUNDELIVERED_DISCARD

Non-persistent responses that cannot be placed on the reply queue are discarded. MQUNDELIVERED_DISCARD is the default value for new queue managers.

MQUNDELIVERED_KEEP

Non-persistent responses are not placed on the dead letter queue or discarded. Instead, the queued publish/subscribe interface backs out the current operation and then tries it again at appropriate intervals.

PubSubSyncPoint (MQCFIN)

Specifies whether only persistent messages or all messages are processed under sync point (parameter identifier: MQIA_PUBSUB_SYNC_PT).

The values can be as follows:

MQSYNCPOINT_IFPER

This makes the queued publish/subscribe interface receive non-persistent messages outside sync point. If the daemon receives a publication outside sync point, the daemon forwards the publication to subscribers known to it outside sync point. MQSYNCPOINT_IFPER is the default value.

MQSYNCPOINT_YES

MQSYNCPOINT_YES makes the queued publish/subscribe interface receive all messages under sync point.

QMGrDesc (MQCFST)

Queue manager description (parameter identifier: MQCA_Q_MGR_DESC).

This parameter is text that briefly describes the object.

The maximum length of the string is MQ_Q_MGR_DESC_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the queue manager on which the command is executing. Using this character set ensures that the text is translated correctly.

QMGrIdentifier (MQCFST)

Queue manager identifier (parameter identifier: MQCA_Q_MGR_IDENTIFIER).

The unique identifier of the queue manager.

QMGrName (MQCFST)

Name of local queue manager (parameter identifier: MQCA_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

z/OS QSGCertificateLabel (MQCFST)

Certificate label for this queue sharing group to use. The label identifies which personal certificate in the key repository has been selected.

The maximum length of the string is MQ_QSG_CERT_LABEL_LENGTH. This parameter is valid only on z/OS.

z/OS QSGName (MQCFST)

Queue sharing group name (parameter identifier: MQCA_QSG_NAME).

The maximum length of the string is MQ_QSG_NAME_LENGTH. This parameter is valid only on z/OS.

QueueAccounting (MQCFIN)

Collection of accounting (thread-level and queue-level accounting) data for queues (parameter identifier: MQIA_ACCOUNTING_Q).

The value can be:

MQMON_NONE

Accounting data collection for queues is disabled.

MQMON_OFF

Accounting data collection is disabled for queues specifying a value of MQMON_Q_MGR in the **QueueAccounting** parameter.

MQMON_ON

Accounting data collection is enabled for queues specifying a value of MQMON_Q_MGR in the **QueueAccounting** parameter.

QueueMonitoring (MQCFIN)

Default setting for online monitoring for queues (parameter identifier: MQIA_MONITORING_Q).

If the **QueueMonitoring** queue attribute is set to MQMON_Q_MGR, this attribute specifies the value which is assumed by the channel. The value can be any of the following values:

MQMON_OFF

Online monitoring data collection is turned off.

MQMON_NONE

Online monitoring data collection is turned off for queues regardless of the setting of their **QueueMonitoring** attribute.

MQMON_LOW

Online monitoring data collection is turned on, with a low ratio of data collection.

MQMON_MEDIUM

Online monitoring data collection is turned on, with a moderate ratio of data collection.

MQMON_HIGH

Online monitoring data collection is turned on, with a high ratio of data collection.

Multi**QueueStatistics (MQCFIN)**

Specifies whether statistics data is to be collected for queues (parameter identifier: MQIA_STATISTICS_Q).

The value can be:

MQMON_NONE

Statistics data collection is turned off for queues regardless of the setting of their **QueueStatistics** parameter.

MQMON_OFF

Statistics data collection is turned off for queues specifying a value of MQMON_Q_MGR in their **QueueStatistics** parameter.

MQMON_ON

Statistics data collection is turned on for queues specifying a value of MQMON_Q_MGR in their **QueueStatistics** parameter.

This parameter is valid only on [Multiplatforms](#).

z/OS**ReceiveTimeout (MQCFIN)**

How long a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA_RECEIVE_TIMEOUT).

The length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state.

This parameter is valid only on z/OS.

z/OS**ReceiveTimeoutMin (MQCFIN)**

The minimum length of time that a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA_RECEIVE_TIMEOUT_MIN).

The minimum length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state. This parameter is valid only on z/OS.

z/OS**ReceiveTimeoutType (MQCFIN)**

The qualifier to apply to *ReceiveTimeout* (parameter identifier: MQIA_RECEIVE_TIMEOUT_TYPE).

The qualifier to apply to *ReceiveTimeoutType* to calculate how long a TCP/IP channel waits to receive data from its partner. The wait includes heartbeats. If the wait interval expires the channel returns to the inactive state. This parameter is valid only on z/OS.

The value can be:

MQRCVTIME_MULTIPLY

The *ReceiveTimeout* value is a multiplier to be applied to the negotiated value of *HeartbeatInterval* to determine how long a channel waits.

MQRCVTIME_ADD

ReceiveTimeout is a value, in seconds, to be added to the negotiated value of *HeartbeatInterval* to determine how long a channel waits.

MQRCVTIME_EQUAL

ReceiveTimeout is a value, in seconds, representing how long a channel waits.

RemoteEvent (MQCFIN)

Controls whether remote error events are generated (parameter identifier: MQIA_REMOTE_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

RepositoryName (MQCFST)

Repository name (parameter identifier: MQCA_REPOSITORY_NAME).

The name of a cluster for which this queue manager is to provide a repository service.

RepositoryNameList (MQCFST)

Repository name list (parameter identifier: MQCA_REPOSITORY_NAMELIST).

The name of a list of clusters for which this queue manager is to provide a repository service.

RevDns (MQCFIN)

Whether reverse lookup of the host name from a Domain Name Server is carried out. (parameter identifier: MQIA_REVERSE_DNS_LOOKUP).

This attribute has an effect only on channels using a transport type (TRPTYPE) of TCP.

The value can be:

MQRDNS_DISABLED

DNS host names are not reverse looked-up for the IP addresses of inbound channels. With this setting any CHLAUTH rules using host names are not matched.

MQRDNS_ENABLED

DNS host names are reverse looked-up for the IP addresses of inbound channels when this information is required. This setting is required for matching against CHLAUTH rules that contain host names, and for writing out error messages.

z/OS SecurityCase (MQCFIN)

Security case supported (parameter identifier: MQIA_SECURITY_CASE).

Specifies whether the queue manager supports security profile names in mixed case, or in uppercase only. The value is activated when a Refresh Security command is run with *SecurityType* (MQSECTYPE_CLASSES) specified.

The value can be:

MQSCYC_UPPER

Security profile names must be in uppercase.

MQSCYC_MIXED

Security profile names can be in uppercase or in mixed case.

This parameter is valid only on z/OS.

z/OS SharedQQmgrName (MQCFIN)

Shared-queue queue manager name (parameter identifier: MQIA_SHARED_Q_Q_MGR_NAME).

A queue manager makes an MQOPEN call for a shared queue. The queue manager that is specified in the **ObjectQmgrName** parameter of the MQOPEN call is in the same queue sharing group as the processing queue manager. The SQQMNAME attribute specifies whether the *ObjectQmgrName* is used or whether the processing queue manager opens the shared queue directly.

The value can be any of the following values:

MQSQQM_USE

ObjectQmgrName is used and the appropriate transmission queue is opened.

MQSQQM_IGNORE

The processing queue manager opens the shared queue directly.

This parameter is valid only on z/OS.

Splcap (MQCFIN)

If the AMS component is installed for the version of IBM MQ that the queue manager is running under, the attribute has a value YES (MQCAP_SUPPORTED). If the AMS component is not installed, the value is NO (MQCAP_NOT_SUPPORTED) (parameter identifier: MQIA_PROT_POLICY_CAPABILITY).

The value can be one of the following values:

MQCAP_SUPPORTED

If the AMS component is installed for the version of IBM MQ that the queue manager is running under.

MQCAP_NOT_SUPPORTED

If the AMS component is not installed.

SSLCRLNamelist (MQCFST)

The TLS certificate revocation location namelist (parameter identifier: MQCA_SSL_CRL_NAMELIST).

The length of the string is MQ_NAMELIST_NAME_LENGTH.

Indicates the name of a namelist of authentication information objects to be used for certificate revocation checking by the queue manager.

Only authentication information objects with types of LDAPCRL or OCSP are allowed in the namelist referred to by *SSLCRLNamelist* (MQCFST). Any other type results in an error message when the list is processed and is subsequently ignored.

Multi SSLCryptoHardware (MQCFST)

Parameters to configure the TLS cryptographic hardware (parameter identifier: MQCA_SSL_CRYPTOHARDWARE).

The length of the string is MQ_SSL_CRYPTOHARDWARE_LENGTH.

Sets the name of the parameter string required to configure the cryptographic hardware present on the system.

This parameter is valid only on [Multiplatforms](#).

SSLEvent (MQCFIN)

Controls whether TLS events are generated (parameter identifier: MQIA_SSL_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

SSLFipsRequired (MQCFIN)

Controls whether only FIPS-certified algorithms are to be used if cryptography is executed in IBM MQ itself (parameter identifier: MQIA_SSL_FIPS_REQUIRED). This parameter is valid only on z/OS, UNIX, Linux, and Windows.

The value can be:

MQSSL_FIPS_NO

Any supported CipherSpec can be used.

MQSSL_FIPS_YES

Only FIPS-certified cryptographic algorithms are to be used if cryptography is executed in IBM MQ rather than cryptographic hardware.

SSLKeyRepository (MQCFST)

Location and name of the TLS key repository (parameter identifier: MQCA_SSL_KEY_REPOSITORY).

The length of the string is MQ_SSL_KEY_REPOSITORY_LENGTH.

Indicates the name of the Secure Sockets Layer key repository.

The format of the name depends on the environment.

SSLKeyResetCount (MQCFIN)

TLS key reset count (parameter identifier: MQIA_SSL_RESET_COUNT).

The number of unencrypted bytes that initiating TLS channel MCAs send or receive before renegotiating the secret key.

z/OS SSLTasks (MQCFIN)

Number of server subtasks used for processing TLS calls (parameter identifier: MQIA_SSL_TASKS).

The number of server subtasks used for processing TLS calls. This parameter is valid only on z/OS.

StartStopEvent (MQCFIN)

Controls whether start and stop events are generated (parameter identifier: MQIA_START_STOP_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

Multi StatisticsInterval (MQCFIN)

The time interval, in seconds, at which statistics monitoring data is written to the monitoring queue (parameter identifier: MQIA_STATISTICS_INTERVAL).

This parameter is valid only on [Multiplatforms](#).

SyncPoint (MQCFIN)

Sync point availability (parameter identifier: MQIA_SYNCPOINT).

The value can be:

MQSP_AVAILABLE

Units of work and sync pointing available.

MQSP_NOT_AVAILABLE

Units of work and sync pointing not available.

z/OS TCPChannels (MQCFIN)

The maximum number of channels that can be current, or clients that can be connected, that use the TCP/IP transmission protocol (parameter identifier: MQIA_TCP_CHANNELS).

This parameter is valid only on z/OS.

z/OS TCPKeepAlive (MQCFIN)

Specifies whether the TCP KEEPALIVE facility is to be used to check whether the other end of the connection is still available (parameter identifier: MQIA_TCP_KEEP_ALIVE).

The value can be:

MQTCPKEEP_YES

The TCP KEEPALIVE facility is to be used as specified in the TCP profile configuration data set. The interval is specified in the *KeepAliveInterval* channel attribute.

MQTCPKEEP_NO

The TCP KEEPALIVE facility is not to be used.

This parameter is valid only on z/OS.

z/OS TCPName (MQCFST)

The name of the TCP/IP system that you are using (parameter identifier: MQIA_TCP_NAME).

This parameter is valid only on z/OS.

TCPStackType (MQCFIN)

Specifies whether the channel initiator can use only the TCP/IP address space specified in *TCPName*, or can optionally bind to any selected TCP/IP address (parameter identifier: MQIA_TCP_STACK_TYPE).

The value can be:

MQTCPSTACK_SINGLE

The channel initiator can use only the TCP/IP address space specified in *TCPName*.

MQTCPSTACK_MULTIPLE

The channel initiator can use any TCP/IP address space available to it.

This parameter is valid only on z/OS.

TraceRouteRecording (MQCFIN)

Specifies whether trace-route information can be recorded and a reply message generated (parameter identifier: MQIA_TRACE_ROUTE_RECORDING).

The value can be:

MQRECORDING_DISABLED

Trace-route information cannot be recorded.

MQRECORDING_MSG

Trace-route information can be recorded and sent to the destination specified by the originator of the message causing the trace route record.

MQRECORDING_Q

Trace-route information can be recorded and sent to SYSTEM.ADMIN.TRACE.ROUTE.QUEUE.

TreeLifeTime (MQCFIN)

The lifetime in seconds of non-administrative topics (parameter identifier: MQIA_TREE_LIFE_TIME).

Non-administrative topics are those topics created when an application publishes to, or subscribes on, a topic string that does not exist as an administrative node. When this non-administrative node no longer has any active subscriptions, this parameter determines how long the queue manager waits before removing that node. Only non-administrative topics that are in use by a durable subscription remain after the queue manager it recycled.

The value can be in the range 0 - 604,000. A value of 0 means that non-administrative topics are not removed by the queue manager. The initial default value of the queue manager is 1800.

TriggerInterval (MQCFIN)

Trigger interval (parameter identifier: MQIA_TRIGGER_INTERVAL).

Specifies the trigger time interval, expressed in milliseconds, for use only with queues where *TriggerType* has a value of MQTT_FIRST.

Version (MQCFST)

The version of the IBM MQ code (parameter identifier: MQCA_VERSION).

The version of the IBM MQ code is shown as VVRRMMFF:

VV: Version

RR: Release

MM: Maintenance level

FF: Fix level

XrCapability (MQCFIN)

Specifies whether the MQ Telemetry capability and commands are supported by the queue manager where *XrCapability* has a value of MQCAP_SUPPORTED or MQCAP_NOT_SUPPORTED (parameter identifier: MQIA_XR_CAPABILITY).

This parameter applies only to  IBM i, UNIX, and Windows.

Related tasks

Specifying that only FIPS-certified CipherSpecs are used at run time on the MQI client

Multi MQCMD_INQUIRE_Q_MGR_STATUS (Inquire Queue Manager Status) on Multiplatforms

The Inquire Queue Manager Status (MQCMD_INQUIRE_Q_MGR_STATUS) PCF command inquires about the status of the local queue manager.

Optional parameters

QMStatusAttrs (MQCFIL)

Queue manager status attributes (parameter identifier: MQIACF_Q_MGR_STATUS_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_Q_MGR_NAME

Name of the local queue manager.

MQCA_INSTALLATION_DESC

Description of the installation associated with the queue manager.

MQCA_INSTALLATION_NAME

Name of the installation associated with the queue manager.

MQCA_INSTALLATION_PATH

Path of the installation associated with the queue manager.

MQCACF_ARCHIVE_LOG_EXTENT_NAME

Name of the oldest log extent for which the queue manager is waiting for archive notification.

The maximum length of the string is MQ_LOG_EXTENT_NAME_LENGTH.

If the queue manager is not using archive log management, this attribute is blank. This parameter is not valid on IBM i.

MQCACF_CURRENT_LOG_EXTENT_NAME

Name of the log extent currently being written to by the logger.

MQCACF_CURRENT_LOG_EXTENT_NAME is available only on queue managers using linear logging. On other queue managers, MQCACF_CURRENT_LOG_EXTENT_NAME is blank.

MQCACF_LOG_PATH

Location of the recovery log extents.

MQCACF_MEDIA_LOG_EXTENT_NAME

Name of the earliest log extent required to perform media recovery.

MQCACF_MEDIA_LOG_EXTENT_NAME is available only on queue managers using linear logging. On other queue managers, MQCACF_MEDIA_LOG_EXTENT_NAME is blank.

MQCACF_RESTART_LOG_EXTENT_NAME

Name of the earliest log extent required to perform restart recovery.

MQCACF_RESTART_LOG_EXTENT_NAME is available only on queue managers using linear logging. On other queue managers, MQCACF_RESTART_LOG_EXTENT_NAME is blank.

MQCACF_Q_MGR_START_DATE

The date on which the queue manager was started (in the form yyyy-mm-dd). The length of this attribute is given by MQ_DATE_LENGTH.

MQCACF_Q_MGR_START_TIME

The time at which the queue manager was started (in the form hh.mm.ss). The length of this attribute is given by MQ_TIME_LENGTH.

MQIACF_ARCHIVE_LOG_SIZE

Current size of the amount of space occupied, in megabytes, by log extents no longer required for restart or media recovery but waiting to be archived.

This attribute is not valid on IBM i.

MQIACF_CHINIT_STATUS

Current status of the channel initiator.

MQIACF_CMD_SERVER_STATUS

Current status of the command server.

MQIACF_CONNECTION_COUNT

Current number of connections to the queue manager.

MQIACF_LDAP_CONNECTION_STATUS

Current status of the connection to the LDAP server.

MQIACF_LOG_IN_USE

Current size of the percentage of the primary log space in use for restart recovery at this point in time.

This attribute is not valid on IBM i.

MQIACF_LOG_UTILIZATION

Current percentage estimate of how well the queue manager workload is contained within the primary log space.

This attribute is not valid on IBM i.

MQIACF_MEDIA_LOG_SIZE

Current size of the log data required for media recovery in megabytes.

This attribute is not valid on IBM i.

MQIACF_PERMIT_STANDBY

Whether a standby instance is permitted.

MQIACF_Q_MGR_STATUS

Current status of the queue manager.

MQIACF_Q_MGR_STATUS_LOG

Current status of all the log attributes. The attributes can be any of the following:

- MQCACF_ARCHIVE_LOG_EXTENT_NAME
- MQIACF_ARCHIVE_LOG_SIZE
- MQCACF_CURRENT_LOG_EXTENT_NAME
- MQIACF_LOG_IN_USE
- MQIACF_LOG_UTILIZATION
- MQCACF_MEDIA_LOG_EXTENT_NAME
- MQIACF_MEDIA_LOG_SIZE
- MQCACF_RESTART_LOG_EXTENT_NAME
- MQIACF_RESTART_LOG_SIZE
- MQIACF_REUSABLE_LOG_SIZE

MQIACF_RESTART_LOG_SIZE

Size of the log data required for restart recovery in megabytes.

This attribute is not valid on IBM i.

MQIACF_REUSABLE_LOG_SIZE

The amount of space occupied, in megabytes, by log extents available to be reused.

This attribute is not valid on IBM i.

Multi

MQCMD_INQUIRE_Q_MGR_STATUS (Inquire Queue Manager Status)

Response on Multiplatforms

The response to the Inquire Queue Manager Status (MQCMD_INQUIRE_Q_MGR_STATUS) PCF command consists of the response header followed by the *QMgrName* and *QMgrStatus* structures and the requested combination of attribute parameter structures.

Always returned:

QMgrName, *QMgrStatus*

Returned if requested:

ArchiveLog, *ArchiveLogSize*, *ChannelInitiatorStatus*, *CommandServerStatus*, *ConnectionCount*, *CurrentLog*, *InstallationDesc*, *InstallationName*, *InstallationPath*, *LDAPConnectionStatus*, *LogInUse*, *LogPath*, *LogUtilization*, *MediaRecoveryLog*, *MediaRecoveryLogSize*, *PermitStandby*, *RestartRecoveryLogSize*, *ReusableLogSize*, *StartDate*, *StartTime*

Response data

ArchiveLog (MQCFST)

Name of the oldest log extent for which the queue manager is waiting for archive notification or blank if they have all been archived (parameter identifier MQCACF_ARCHIVE_LOG_EXTENT_NAME).

ArchiveLogSize (MQCFIN)

Current size of the amount of space occupied, in megabytes, by log extents no longer required for restart or media recovery but waiting to be archived (parameter identifier MQIACF_ARCHIVE_LOG_SIZE).

ChannelInitiatorStatus (MQCFIN)

Status of the channel initiator reading SYSTEM.CHANNEL.INITQ (parameter identifier: MQIACF_CHINIT_STATUS).

The value can be:

MQSVC_STATUS_STOPPED

The channel initiator is not running.

MQSVC_STATUS_STARTING

The channel initiator is in the process of initializing.

MQSVC_STATUS_RUNNING

The channel initiator is fully initialized and is running.

MQSVC_STATUS_STOPPING

The channel initiator is stopping.

CommandServerStatus (MQCFIN)

Status of the command server (parameter identifier: MQIACF_CMD_SERVER_STATUS).

The value can be:

MQSVC_STATUS_STARTING

The command server is in the process of initializing.

MQSVC_STATUS_RUNNING

The command server is fully initialized and is running.

MQSVC_STATUS_STOPPING

The command server is stopping.

ConnectionCount (MQCFIN)

Connection count (parameter identifier: MQIACF_CONNECTION_COUNT).

The current number of connections to the queue manager.

CurrentLog (MQCFST)

Log extent name (parameter identifier: MQCACF_CURRENT_LOG_EXTENT_NAME).

The name of the log extent that was being written to at the time of the Inquire command. If the queue manager is using circular logging, this parameter is blank.

The maximum length of the string is MQ_LOG_EXTENT_NAME_LENGTH.

InstallationDesc (MQCFST)

Installation Description (parameter identifier: MQCA_INSTALLATION_DESC)

The installation description for this queue manager.

InstallationName (MQCFST)

Installation Name (parameter identifier: MQCA_INSTALLATION_NAME)

The installation name for this queue manager.

InstallationPath (MQCFST)

Installation Path (parameter identifier: MQCA_INSTALLATION_PATH)

The installation path for this queue manager.

LDAPConnectionStatus (MQCFIN)

Current status of the queue manager's connection to the LDAP server (parameter identifier: MQIACF_LDAP_CONNECTION_STATUS).

The value can be:

MQLDAPC_CONNECTED

The queue manager currently has a connection to the LDAP server.

MQLDAPC_ERROR

The queue manager attempted to make a connection to the LDAP server and failed.

MQLDAPC_INACTIVE

The queue manager is not configured to use an LDAP server or has not yet made a connection to the LDAP server.

LogInUse (MQCFIN)

Current size of the percentage of the primary log space in use for restart recovery at this point in time (parameter identifier MQIACF_LOG_IN_USE).

LogPath (MQCFST)

Location of the recovery log extents (parameter identifier: MQCACF_LOG_PATH).

This parameter identifies the directory where log files are created by the queue manager.

The maximum length of the string is MQ_LOG_PATH_LENGTH.

LogUtilization (MQCFIN)

Current percentage estimate of how well the queue manager workload is contained within the primary log space (parameter identifier MQIACF_LOG_UTILIZATION).

MediaRecoveryLog (MQCFST)

Name of the oldest log extent required by the queue manager to perform media recovery (parameter identifier: MQCACF_MEDIA_LOG_EXTENT_NAME). This parameter is available only on queue managers using linear logging. If the queue manager is using circular logging, this parameter is blank.

The maximum length of the string is MQ_LOG_EXTENT_NAME_LENGTH.

MediaRecoveryLogSize (MQCFIN)

Current size of the log data required for media recovery in megabytes (parameter identifier MQIACF_MEDIA_LOG_SIZE).

PermitStandby (MQCFIN)

Whether a standby instance is permitted (parameter identifier: MQIACF_PERMIT_STANDBY).

The value can be:

MQSTDBY_NOT_PERMITTED

Standby instances are not permitted.

MQSTDBY_PERMITTED

Standby instances are permitted.

QMgrName (MQCFST)

Name of the local queue manager (parameter identifier: MQCA_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

QMgrStatus (MQCFIN)

Current execution status of the queue manager (parameter identifier: MQIACF_Q_MGR_STATUS).

The value can be:

MQQMSTA_STARTING

The queue manager is initializing.

MQQMSTA_RUNNING

The queue manager is fully initialized and is running.

MQQMSTA QUIESCING

The queue manager is quiescing.

RestartRecoveryLog (MQCFST)

Name of the oldest log extent required by the queue manager to perform restart recovery (parameter identifier: MQCACF_RESTART_LOG_EXTENT_NAME).

This parameter is available only on queue managers using linear logging. If the queue manager is using circular logging, this parameter is blank.

The maximum length of the string is MQ_LOG_EXTENT_NAME_LENGTH.

RestartRecoveryLogSize (MQCFIN)

Size of the log data required for restart recovery in megabytes (parameter identifier MQIACF_RESTART_LOG_SIZE).

ReusableLogSize (MQCFIN)

The amount of space occupied, in megabytes, by log extents available to be reused (parameter identifier MQIACF_REUSABLE_LOG_SIZE).

StartDate (MQCFST)

Date when this queue manager was started (in the form yyyy-mm-dd) (parameter identifier: MQCACF_Q_MGR_START_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

StartTime (MQCFST)

Time when this queue manager was started (in the form hh:mm:ss) (parameter identifier: MQCACF_Q_MGR_START_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

Inquire Queue Names

The Inquire Queue Names (MQCMD_INQUIRE_Q_NAMES) command inquires a list of queue names that match the generic queue name, and the optional queue type specified.

Required parameters

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

Generic queue names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_Q_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

When a value other than blank is specified, the maximum response size is limited to 32KB from each queue manager. If the response from a queue manager would be larger than this, an error response with reason code MQRCCF_COMMAND_LENGTH_ERROR (3230) is returned by that queue manager.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED. MQQSGD_SHARED is permitted only in a shared queue environment.

QType (MQCFIN)

Queue type (parameter identifier: MQIA_Q_TYPE).

If present, this parameter limits the queue names returned to queues of the specified type. If this parameter is not present, queues of all types are eligible. The value can be any of the following values:

MQQT_ALL

All queue types.

MQQT_LOCAL

Local queue.

MQQT_ALIAS

Alias queue definition.

MQQT_REMOTE

Local definition of a remote queue.

MQQT_MODEL

Model queue definition.

The default value if this parameter is not specified is MQQT_ALL.

Inquire Queue Names (Response)

The response to the Inquire Queue Names (MQCMD_INQUIRE_Q_NAMES) command consists of the response header followed by a single parameter structure giving zero or more names that match the specified queue name. The response header is followed by the *QTypes* structure, with the same number of entries as the *QNames* structure. Each entry gives the type of the queue with the corresponding entry in the *QNames* structure.

Additionally, on z/OS only, the **QSGDispositions** parameter structure (with the same number of entries as the *QNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *QNames* structure.

Always returned:

QNames ,  *QSGDispositions* , *QTypes*

Returned if requested:

None

Response data**QNames (MQCFSL)**

List of queue names (parameter identifier: MQCACF_Q_NAMES).

QSGDispositions (MQCFIL)

List of queue sharing group dispositions (parameter identifier: MQIACF_QSG_DISPS). This parameter is valid on z/OS only. Possible values for fields in this structure are:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED.

QTypes (MQCFIL)

List of queue types (parameter identifier: MQIACF_Q_TYPES). Possible values for fields in this structure are:

MQQT_ALIAS

Alias queue definition.

MQQT_LOCAL

Local queue.

MQQT_REMOTE

Local definition of a remote queue.

MQQT_MODEL

Model queue definition.

Inquire Queue Status

The Inquire Queue Status (MQCMD_INQUIRE_Q_STATUS) command inquires about the status of a local IBM MQ queue. You must specify the name of a local queue for which you want to receive status information.

Required parameters

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

Generic queue names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all queues having names that start with the selected character string. An asterisk on its own matches all possible names.

The queue name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Optional parameters (Inquire Queue Status)

ByteStringFilterCommand (MQCFBF)

Byte string filter command descriptor. The parameter identifier must be MQBACF_EXTERNAL_UOW_ID or MQBACF_Q_MGR_UOW_ID. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFBF - PCF byte string filter parameter” on page 1847](#) for information about using this filter condition.

If you specify a byte string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter, or a string filter using the **StringFilterCommand** parameter.

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is initiated when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is initiated on the queue manager on which it was entered.
- Queue manager name. The command is initiated on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be initiated.
- An asterisk (*). The command is initiated on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *QStatusAttrs* except MQIACF_ALL, MQIACF_MONITORING, and MQIACF_Q_TIME_INDICATOR. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1852 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or a string filter using the **StringFilterCommand** parameter.

OpenType (MQCFIN)

Queue status open type (parameter identifier: MQIACF_OPEN_TYPE).

It is always returned, regardless of the queue instance attributes requested.

The value can be:

MQQSOT_ALL

Selects status for queues that are open with any type of access.

MQQSOT_INPUT

Selects status for queues that are open for input.

MQQSOT_OUTPUT

Selects status for queues that are open for output.

The default value if this parameter is not specified is MQQSOT_ALL.

Filtering is not supported for this parameter.

QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid only on z/OS. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED.

You cannot use *QSGDisposition* as a parameter to filter on.

QStatusAttrs (MQCFIL)

Queue status attributes (parameter identifier: MQIACF_Q_STATUS_ATTRS).

The attribute list can specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

Where *StatusType* is MQIACF_Q_STATUS:

MQCA_Q_NAME

Queue name.

MQCACF_LAST_GET_DATE

Date of the last message successfully destructively read from the queue.

MQCACF_LAST_GET_TIME

Time of the last message successfully destructively read from the queue.

MQCACF_LAST_PUT_DATE

Date of the last message successfully put to the queue.

MQCACF_LAST_PUT_TIME

Time of the last message successfully put to the queue.

MQCACF_MEDIA_LOG_EXTENT_NAME

Identity of the oldest log extent required to perform media recovery of the queue.

On IBM i, this parameter identifies the name of the oldest journal receiver require to perform media recovery of the queue.

MQIA_CURRENT_Q_DEPTH

The current number of messages on the queue.

MQIA_MONITORING_Q

Current level of monitoring data collection.

MQIA_OPEN_INPUT_COUNT

The number of handles that are currently open for input for the queue.

MQIA_OPEN_INPUT_COUNT does not include handles that are open for browse.

MQIA_OPEN_OUTPUT_COUNT

The number of handles that are currently open for output for the queue.

MQIACF_HANDLE_STATE

Whether an API call is in progress.

MQIACF_MONITORING

All the queue status monitoring attributes. These attributes are:

- MQCACF_LAST_GET_DATE
- MQCACF_LAST_GET_TIME
- MQCACF_LAST_PUT_DATE
- MQCACF_LAST_PUT_TIME
- MQIA_MONITORING_Q
- MQIACF_OLDEST_MSG_AGE
- MQIACF_Q_TIME_INDICATOR

Filtering is not supported for this parameter.

MQIACF_OLDEST_MSG_AGE

Age of oldest message on the queue.

MQIACF_Q_TIME_INDICATOR

Indicator of the time that messages remain on the queue.

MQIACF_UNCOMMITTED_MSGS

The number of uncommitted messages on the queue.

Where *StatusType* is MQIACF_Q_HANDLE:

MQBACF_EXTERNAL_UOW_ID

Unit of recovery identifier assigned by the queue manager.

MQBACF_Q_MGR_UOW_ID

External unit of recovery identifier associated with the connection.

MQCA_Q_NAME

Queue name.

MQCACF_APPL_TAG

This parameter is a string containing the tag of the application connected to the queue manager.

MQCACF_ASID

Address-space identifier of the application identified by *ApplTag*. This parameter is valid on z/OS only.

MQCACF_PSB_NAME

Name of the program specification block (PSB) associated with the running IMS transaction. This parameter is valid on z/OS only.

MQCACF_PSTID

Identifier of the IMS program specification table (PST) for the connected IMS region. This parameter is valid on z/OS only.

MQCACF_TASK_NUMBER

CICS task number. This parameter is valid on z/OS only.

MQCACF_TRANSACTION_ID

CICS transaction identifier. This parameter is valid on z/OS only.

MQCACF_USER_IDENTIFIER

The user name of the application that has opened the specified queue.

MQCACH_CHANNEL_NAME

The name of the channel that has the queue open, if any.

MQCACH_CONNECTION_NAME

The connection name of the channel that has the queue open, if any.

MQIA_APPL_TYPE

The type of application that has the queue open.

MQIACF_OPEN_BROWSE

Open browse.

Filtering is not supported for this parameter.

MQIACF_OPEN_INPUT_TYPE

Open input type.

Filtering is not supported for this parameter.

MQIACF_OPEN_INQUIRE

Open inquire.

Filtering is not supported for this parameter.

MQIACF_OPEN_OPTIONS

The options used to open the queue.

If this parameter is requested, the following parameter structures are also returned:

- *OpenBrowse*
- *OpenInputType*

- *OpenInquire*
- *OpenOutput*
- *OpenSet*

Filtering is not supported for this parameter.

MQIACF_OPEN_OUTPUT

Open output.

Filtering is not supported for this parameter.

MQIACF_OPEN_SET

Open set.

Filtering is not supported for this parameter.

MQIACF_PROCESS_ID

The process identifier of the application that has opened the specified queue.

MQIACF_ASYNC_STATE

MQIACF_THREAD_ID

The thread identifier of the application that has opened the specified queue.

MQIACF_UOW_TYPE

Type of external unit of recovery identifier as seen by the queue manager.

StatusType (MQCFIN)

Queue status type (parameter identifier: MQIACF_Q_STATUS_TYPE).

Specifies the type of status information required.

The value can be any of the following values:

MQIACF_Q_STATUS

Selects status information relating to queues.

MQIACF_Q_HANDLE

Selects status information relating to the handles that are accessing the queues.

The default value, if this parameter is not specified, is MQIACF_Q_STATUS.

You cannot use *StatusType* as a parameter to filter on.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *QStatusAttrs* except MQCA_Q_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1859](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify a byte string filter using the

ByteStringFilterCommand parameter or an integer filter using the **IntegerFilterCommand** parameter.

Error codes

This command might return the following error code in the response format header [“Error codes applicable to all commands” on page 1343](#) along with any additional pertinent values.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_Q_TYPE_ERROR

Queue type not valid.

Inquire Queue Status (Response)

The response to the Inquire Queue Status (MQCMD_INQUIRE_Q_STATUS) command consists of the response header followed by the *QName* structure and a set of attribute parameter structures determined by the value of *StatusType* in the Inquire command.

Always returned:

QName, *ApplTag*, *ApplType*,  *QSGDisposition*, *StatusType*,
 *UserIdentifier*

Possible values of *StatusType* are:

MQIACF_Q_STATUS

Returns status information relating to queues.

MQIACF_Q_HANDLE

Returns status information relating to the handles that are accessing the queues.

Returned if requested and *StatusType* is MQIACF_Q_STATUS:

CurrentQDepth, *LastGetDate*, *LastGetTime*, *LastPutDate*, *LastPutTime*,
MediaRecoveryLogExtent, *OldestMsgAge*, *OnQTime*, *OpenInputCount*, *OpenOutputCount*,
QueueMonitoring, *UncommittedMsgs*

Returned if requested and *StatusType* is MQIACF_Q_HANDLE:

ApplDesc , *ApplTag* , *ApplType* ,  *ASId* , *AsynchronousState* ,
ChannelName , *ConnectionName* ,  *ExternalUOWId* , *HandleState* ,
OpenOptions , *ProcessId* ,  *PSBName* ,  *PSTId* , *QMgrUOWId* ,
 *TaskNumber* , *ThreadId* ,  *TransactionId* , *UOWIdentifier* ,
UOWType , *UserIdentifier*

Response data if *StatusType* is MQIACF_Q_STATUS

CurrentQDepth (MQCFIN)

Current queue depth (parameter identifier: MQIA_CURRENT_Q_DEPTH).

LastGetDate (MQCFST)

Date on which the last message was destructively read from the queue (parameter identifier: MQCACF_LAST_GET_DATE).

The date, in the form yyyy-mm-dd, on which the last message was successfully read from the queue. The date is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ_DATE_LENGTH.

LastGetTime (MQCFST)

Time at which the last message was destructively read from the queue (parameter identifier: MQCACF_LAST_GET_TIME).

The time, in the form hh.mm.ss, at which the last message was successfully read from the queue. The time is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ_TIME_LENGTH.

LastPutDate (MQCFST)

Date on which the last message was successfully put to the queue (parameter identifier: MQCACF_LAST_PUT_DATE).

The date, in the form yyyy-mm-dd, on which the last message was successfully put to the queue. The date is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ_DATE_LENGTH.

LastPutTime (MQCFST)

Time at which the last message was successfully put to the queue (parameter identifier: MQCACF_LAST_PUT_TIME).

The time, in the form hh.mm.ss, at which the last message was successfully put to the queue. The time is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ_TIME_LENGTH.

Multi

MediaRecoveryLogExtent (MQCFST)

Name of the oldest log extent required to perform media recovery of the queue (parameter identifier: MQCACF_MEDIA_LOG_EXTENT_NAME).

On IBM i, this parameter identifies the name of the oldest journal receiver required to perform media recovery of the queue.

The name returned is of the form Snnnnnnn.LOG and is not a fully qualified path name. The use of this parameter provides the ability for the name to be easily correlated with the messages issued, following an **rcdmqimg** command to identify those queues causing the media recovery LSN not to move forwards.

This parameter is valid only on [Multiplatforms](#).

The maximum length of the string is MQ_LOG_EXTENT_NAME_LENGTH.

OldestMsgAge (MQCFIN)

Age of the oldest message (parameter identifier: MQIACF_OLDEST_MSG_AGE). Age, in seconds, of the oldest message on the queue.

If the value is unavailable, MQMON_NOT_AVAILABLE is returned. If the queue is empty, 0 is returned. If the value exceeds 999 999 999, it is returned as 999 999 999.

OnQTime (MQCFIL)

Indicator of the time that messages remain on the queue (parameter identifier: MQIACF_Q_TIME_INDICATOR). Amount of time, in microseconds, that a message spent on the queue. Two values are returned, in this order:

1. A value based on recent activity over a short period.
2. A value based on activity over a longer period.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned. If the value exceeds 999 999 999, it is returned as 999 999 999.

OpenInputCount (MQCFIN)

Open input count (parameter identifier: MQIA_OPEN_INPUT_COUNT).

OpenOutputCount (MQCFIN)

Open output count (parameter identifier: MQIA_OPEN_OUTPUT_COUNT).

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

z/OS

QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Returns the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED.

QueueMonitoring (MQCFIN)

Current level of monitoring data collection for the queue (parameter identifier: MQIA_MONITORING_Q). The value can be any of the following values:

MQMON_OFF

Monitoring for the queue is disabled.

MQMON_LOW

Low rate of data collection.

MQMON_MEDIUM

Medium rate of data collection.

MQMON_HIGH

High rate of data collection.

StatusType (MQCFST)

Queue status type (parameter identifier: MQIACF_Q_STATUS_TYPE).

Specifies the type of status information.

UncommittedMsgs (MQCFIN)

The number of uncommitted changes (puts and gets) pending for the queue (parameter identifier: MQIACF_UNCOMMITTED_MSGS). The value can be any of the following values:

MQQSUM_YES

On z/OS, there are one or more uncommitted changes pending.

MQQSUM_NO

There are no uncommitted changes pending.

n

 On Multiplatforms, an integer value indicating how many uncommitted changes are pending.

Response data if StatusType is MQIACF_Q_HANDLE**ApplDesc (MQCFST)**

Application description (parameter identifier: MQCACF_APPL_DESC).

The maximum length is MQ_APPL_DESC_LENGTH.

ApplTag (MQCFST)

Open application tag (parameter identifier: MQCACF_APPL_TAG).

The maximum length of the string is MQ_APPL_TAG_LENGTH.

ApplType (MQCFIN)

Open application type (parameter identifier: MQIA_APPL_TYPE).

The value can be any of the following values:

MQAT_QMGR

A queue manager process.

MQAT_CHANNEL_INITIATOR

The channel initiator.

MQAT_USER

A user application.

MQAT_BATCH

Application using a batch connection. MQAT_BATCH applies only to z/OS.

MQAT_RRS_BATCH

RRS-coordinated application using a batch connection. MQAT_RRS_BATCH applies only to z/OS.

MQAT_CICS

A CICS transaction. MQAT_CICS applies only to z/OS.

MQAT_IMS

An IMS transaction. MQAT_IMS applies only to z/OS.

MQAT_SYSTEM_EXTENSION

Application performing an extension of function that is provided by the queue manager.

ASId (MQCFST)

Address-space identifier (parameter identifier: MQCACF_ASID).

The 4-character address-space identifier of the application identified by *AppLTag* . It distinguishes duplicate values of *AppLTag* . This parameter applies only to z/OS.

The length of the string is MQ_ASID_LENGTH.

AsynchronousState (MQCFIN)

The state of the asynchronous consumer on this queue (parameter identifier: MQIACF_ASYNC_STATE).

The value can be any of the following values:

MQAS_ACTIVE

An MQCB call has set up a function to call back to process messages asynchronously and the connection handle has been started so that asynchronous message consumption can proceed.

MQAS_INACTIVE

An MQCB call has set up a function to call back to process messages asynchronously but the connection handle has not yet been started, or has been stopped or suspended, so that asynchronous message consumption cannot currently proceed.

MQAS_SUSPENDED

The asynchronous consumption callback has been suspended so that asynchronous message consumption cannot currently proceed on this handle. This situation can be either because an MQCB or MQCTL call with *Operation* MQOP_SUSPEND has been issued against this object handle by the application, or because it has been suspended by the system. If it has been suspended by the system, as part of the process of suspending asynchronous message consumption the callback function is called with the reason code that describes the problem resulting in suspension. This situation is reported in the *Reason* field in the MQCBC structure passed to the callback. In order for asynchronous message consumption to proceed, the application must issue an MQCB or MQCTL call with *Operation* MQOP_RESUME.

MQAS_SUSPENDED_TEMPORARY

The asynchronous consumption callback has been temporarily suspended by the system so that asynchronous message consumption cannot currently proceed on this object handle. As part of the process of suspending asynchronous message consumption the callback function is called with the reason code that describes the problem resulting in suspension. This situation is reported in the *Reason* field in the MQCBC structure passed to the callback. The callback function is called again when asynchronous message consumption is resumed by the system after the temporary condition has been resolved.

MQAS_NONE

An MQCB call has not been issued against this handle, so no asynchronous message consumption is configured on this handle.

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Conname (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

The maximum length of the string is MQ_CONN_NAME_LENGTH.

ExternalUOWId (MQCFBS)

RRS unit-of-recovery identifier (parameter identifier: MQBACF_EXTERNAL_UOW_ID).

The RRS unit-of-recovery identifier associated with the handle. This parameter is valid only on z/OS only.

The length of the string is MQ_EXTERNAL_UOW_ID_LENGTH.

HandleState (MQCFIN)

State of the handle (parameter identifier: MQIACF_HANDLE_STATE).

The value can be any of the following values:

MQHSTATE_ACTIVE

An API call from a connection is currently in progress for this object. For a queue, this condition can arise when an MQGET WAIT call is in progress.

If there is an MQGET SIGNAL outstanding, it does not mean, by itself, that the handle is active.

MQHSTATE_INACTIVE

No API call from a connection is currently in progress for this object. For a queue, this condition can arise when no MQGET WAIT call is in progress.

OpenBrowse (MQCFIN)

Open browse (parameter identifier: MQIACF_OPEN_BROWSE).

The value can be any of the following values:

MQQSO_YES

The queue is open for browsing.

MQQSO_NO

The queue is not open for browsing.

OpenInputType (MQCFIN)

Open input type (parameter identifier: MQIACF_OPEN_INPUT_TYPE).

The value can be any of the following values:

MQQSO_NO

The queue is not open for inputting.

MQQSO_SHARED

The queue is open for shared input.

MQQSO_EXCLUSIVE

The queue is open for exclusive input.

OpenInquire (MQCFIN)

Open inquire (parameter identifier: MQIACF_OPEN_INQUIRE).

The value can be any of the following values:

MQQSO_YES

The queue is open for inquiring.

MQQSO_NO

The queue is not open for inquiring.

OpenOptions (MQCFIN)

Open options currently in force for the queue (parameter identifier: MQIACF_OPEN_OPTIONS).

OpenOutput (MQCFIN)

Open output (parameter identifier: MQIACF_OPEN_OUTPUT).

The value can be any of the following values:

MQQSO_YES

The queue is open for output.

MQQSO_NO

The queue is not open for output.

OpenSet (MQCFIN)

Open set (parameter identifier: MQIACF_OPEN_SET).

The value can be any of the following values:

MQQSO_YES

The queue is open for setting.

MQQSO_NO

The queue is not open for setting.

ProcessId (MQCFIN)

Open application process ID (parameter identifier: MQIACF_PROCESS_ID).

**PSBName (MQCFST)**

Program specification block (PSB) name (parameter identifier: MQCACF_PSB_NAME).

The 8-character name of the PSB associated with the running IMS transaction. This parameter is valid on z/OS only.

The length of the string is MQ_PSB_NAME_LENGTH.

**PSTId (MQCFST)**

Program specification table (PST) identifier (parameter identifier: MQCACF_PST_ID).

The 4-character identifier of the PST region identifier for the connected IMS region. This parameter is valid on z/OS only.

The length of the string is MQ_PST_ID_LENGTH.

QMgrUOWId (MQCFBS)

The unit of recovery assigned by the queue manager (parameter identifier: MQBACF_Q_MGR_UOW_ID).

On z/OS, this parameter is an 8-byte log RBA, displayed as 16 hexadecimal characters. On platforms other than z/OS, this parameter is an 8-byte transaction identifier, displayed as 16 hexadecimal characters.

The maximum length of the string is MQ_UOW_ID_LENGTH.

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

**QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Returns the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED.

StatusType (MQCFST)

Queue status type (parameter identifier: MQIACF_Q_STATUS_TYPE).

Specifies the type of status information.

▶ z/OS

TaskNumber (MQCFST)

CICS task number (parameter identifier: MQCACF_TASK_NUMBER).

A 7-digit CICS task number. This parameter is valid on z/OS only.

The length of the string is MQ_TASK_NUMBER_LENGTH.

ThreadId (MQCFIN)

The thread ID of the open application (parameter identifier: MQIACF_THREAD_ID).

A value of zero indicates that the handle was opened by a shared connection. A handle created by a shared connection is logically open to all threads.

▶ z/OS

TransactionId (MQCFST)

CICS transaction identifier (parameter identifier: MQCACF_TRANSACTION_ID).

A 4-character CICS transaction identifier. This parameter is valid on z/OS only.

The length of the string is MQ_TRANSACTION_ID_LENGTH.

UOWIdentifier (MQCFBS)

The external unit of recovery associated with the connection (parameter identifier: MQBACF_EXTERNAL_UOW_ID).

This parameter is the recovery identifier for the unit of recovery. Its format is determined by the value of *UOWType*.

The maximum length of the string is MQ_UOW_ID_LENGTH.

UOWType (MQCFIN)

Type of external unit of recovery identifier as perceived by the queue manager (parameter identifier: MQIACF_UOW_TYPE).

The value can be any of the following values:

MQUOWT_Q_MGR**MQUOWT_CICS**

▶ z/OS Valid only on z/OS.

MQUOWT_RRS

▶ z/OS Valid only on z/OS.

MQUOWT_IMS

▶ z/OS Valid only on z/OS.

MQUOWT_XA

UOWType identifies the *UOWIdentifier* type and not the type of the transaction coordinator. When the value of *UOWType* is MQUOWT_Q_MGR, the associated identifier is in *QMgrUOWId* (and not *UOWIdentifier*).

UserIdentifier (MQCFST)

Open application user name (parameter identifier: MQCACF_USER_IDENTIFIER).

The maximum length of the string is MQ_MAX_USER_ID_LENGTH.

Inquire Security on z/OS

The Inquire Security (MQCMD_INQUIRE_SECURITY) command returns information about the current settings for the security parameters.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

SecurityAttrs (MQCFIL)

Security parameter attributes (parameter identifier: MQIACF_SECURITY_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQIACF_SECURITY_SWITCH

Current setting of the switch profiles. If the subsystem security switch is off, no other switch profile settings are returned.

MQIACF_SECURITY_TIMEOUT

Timeout value.

MQIACF_SECURITY_INTERVAL

Time interval between checks.

Inquire Security (Response) on z/OS

The response to the Inquire Security (MQCMD_INQUIRE_SECURITY) command consists of the response header followed by the requested combination of attribute parameter structures.

One message is returned if either **SecurityTimeout** or **SecurityInterval** is specified on the command. If **SecuritySwitch** is specified, one message per security switch found is returned. This message includes the **SecuritySwitch**, **SecuritySwitchSetting**, and **SecuritySwitchProfile** parameter structures.

Returned if requested:

SecurityInterval, **SecuritySwitch**, **SecuritySwitchProfile**, **SecuritySwitchSetting**, **SecurityTimeout**

Response data

SecurityInterval (MQCFIN)

Time interval between checks (parameter identifier: MQIACF_SECURITY_INTERVAL).

The interval, in minutes, between checks for user IDs and their associated resources to determine whether **SecurityTimeout** has expired.

SecuritySwitch (MQCFIN)

Security switch profile (parameter identifier: MQIA_CF_LEVEL). The value can be any of the following values:

MQSECSW_SUBSYSTEM

Subsystem security switch.

MQSECSW_Q_MGR

Queue manager security switch.

MQSECSW_QSG

Queue sharing group security switch.

MQSECSW_CONNECTION

Connection security switch.

MQSECSW_COMMAND

Command security switch.

MQSECSW_CONTEXT

Context security switch.

MQSECSW_ALTERNATE_USER

Alternate user security switch.

MQSECSW_PROCESS

Process security switch.

MQSECSW_NAMELIST

Namelist security switch.

MQSECSW_TOPIC

Topic security switch.

MQSECSW_Q

Queue security switch.

MQSECSW_COMMAND_RESOURCES

Command resource security switch.

SecuritySwitchProfile (MQCFST)

Security switch profile (parameter identifier: MQCACF_SECURITY_PROFILE).

The maximum length of the string is MQ_SECURITY_PROFILE_LENGTH.

SecuritySwitchSetting (MQCFIN)

Setting of the security switch (parameter identifier: MQIACF_SECURITY_SETTING).

The value can be:

MQSECSW_ON_FOUND

Switch ON, profile found.

MQSECSW_OFF_FOUND

Switch OFF, profile found.

MQSECSW_ON_NOT_FOUND

Switch ON, profile not found.

MQSECSW_OFF_NOT_FOUND

Switch OFF, profile not found.

MQSECSW_OFF_ERROR

Switch OFF, profile error.

MQSECSW_ON_OVERRIDDEN

Switch ON, profile overridden.

SecurityTimeout (MQCFIN)

Timeout value (parameter identifier: MQIACF_SECURITY_TIMEOUT).

How long, in minutes, security information about an unused user ID and associated resources is retained.

Multi

Inquire Service on Multiplatforms

The Inquire Service (MQCMD_INQUIRE_SERVICE) command inquires about the attributes of existing IBM MQ services.

Required parameters

ServiceName (MQCFST)

Service name (parameter identifier: MQCA_SERVICE_NAME).

This parameter is the name of the service whose attributes are required. Generic service names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all services having names that start with the selected character string. An asterisk on its own matches all possible names.

The service name is always returned regardless of the attributes requested.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Optional parameters

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ServiceAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1852](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

ServiceAttrs (MQCFIL)

Service attributes (parameter identifier: MQIACF_SERVICE_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_ALTERATION_DATE

Date on which the definition was last altered.

MQCA_ALTERATION_TIME

Time at which the definition was last altered.

MQCA_SERVICE_DESC

Description of service definition.

MQCA_SERVICE_NAME

Name of service definition.

MQCA_SERVICE_START_ARGS

Arguments to be passed to the service program.

MQCA_SERVICE_START_COMMAND

Name of program to run to start the service.

MQCA_SERVICE_STOP_ARGS

Arguments to be passed to the stop program to stop the service.

MQCA_STDERR_DESTINATION

Destination of standard error for the process.

MQCA_STDOUT_DESTINATION

Destination of standard output for the process.

MQCA_SERVICE_START_ARGS

Arguments to be passed to the service program.

MQIA_SERVICE_CONTROL

When the queue manager must start the service.

MQIA_SERVICE_TYPE

Mode in which the service is to run.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ServiceAttrs* except MQCA_SERVICE_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1859](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Multi

Inquire Service (Response) on Multiplatforms

The response to the Inquire Service (MQCMD_INQUIRE_SERVICE) command consists of the response header followed by the *ServiceName* structure and the requested combination of attribute parameter structures.

If a generic service name was specified, one such message is generated for each service found.

Always returned:

ServiceName

Returned if requested:

AlterationDate, AlterationTime, Arguments, ServiceDesc, ServiceType, StartArguments, StartCommand, StartMode, StderrDestination, StdoutDestination, StopArguments, StopCommand

Response data**AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date on which the information was last altered in the form yyyy-mm-dd.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time at which the information was last altered in the form hh.mm.ss.

ServiceDesc (MQCFST)

Description of service definition (parameter identifier: MQCA_SERVICE_DESC).

The maximum length of the string is MQ_SERVICE_DESC_LENGTH.

ServiceName (MQCFST)

Name of service definition (parameter identifier: MQCA_SERVICE_NAME).

The maximum length of the string is MQ_SERVICE_NAME_LENGTH.

ServiceType (MQCFIN)

The mode in which the service is to run (parameter identifier: MQIA_SERVICE_TYPE).

The value can be:

MQSVC_TYPE_SERVER

Only one instance of the service can be executed at a time, with the status of the service made available by the Inquire Service Status command.

MQSVC_TYPE_COMMAND

Multiple instances of the service can be started.

StartArguments (MQCFST)

The arguments to be passed to the user program at queue manager startup (parameter identifier: MQCA_SERVICE_START_ARGS).

The maximum length of the string is MQ_SERVICE_ARGS_LENGTH.

StartCommand (MQCFST)

Service program name (parameter identifier: MQCA_SERVICE_START_COMMAND).

The name of the program which is to run.

The maximum length of the string is MQ_SERVICE_COMMAND_LENGTH.

StartMode (MQCFIN)

Service mode (parameter identifier: MQIA_SERVICE_CONTROL).

Specifies how the service is to be started and stopped. The value can be any of the following values:

MQSVC_CONTROL_MANUAL

The service is not to be started automatically or stopped automatically. It is to be controlled by user command.

MQSVC_CONTROL_Q_MGR

The service is to be started and stopped at the same time as the queue manager is started and stopped.

MQSVC_CONTROL_Q_MGR_START

The service is to be started at the same time as the queue manager is started, but is not requested to stop when the queue manager is stopped.

StderrDestination (MQCFST)

The path to a file to which the standard error (stderr) of the service program is to be redirected (parameter identifier: MQCA_STDERR_DESTINATION).

The maximum length of the string is MQ_SERVICE_PATH_LENGTH.

StdoutDestination (MQCFST)

The path to a file to which the standard output (stdout) of the service program is to be redirected (parameter identifier: MQCA_STDOUT_DESTINATION).

The maximum length of the string is MQ_SERVICE_PATH_LENGTH.

StopArguments (MQCFST)

The arguments to be passed to the stop program when instructed to stop the service (parameter identifier: MQCA_SERVICE_STOP_ARGS).

The maximum length of the string is MQ_SERVICE_ARGS_LENGTH.

StopCommand (MQCFST)

Service program stop command (parameter identifier: MQCA_SERVICE_STOP_COMMAND).

This parameter is the name of the program that is to run when the service is requested to stop.

The maximum length of the string is MQ_SERVICE_COMMAND_LENGTH.

Inquire Service Status on Multiplatforms

The Inquire Service Status (MQCMD_INQUIRE_SERVICE_STATUS) command inquires about the status of one or more IBM MQ service instances.

Required parameters

ServiceName (MQCFST)

Service name (parameter identifier: MQCA_SERVICE_NAME).

Generic service names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all services having names that start with the selected character string. An asterisk on its own matches all possible names.

The service name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Optional parameters (Inquire Service Status)

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ServiceStatusAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1852](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

ServiceStatusAttrs (MQCFIL)

Service status attributes (parameter identifier: MQIACF_SERVICE_STATUS_ATTRS).

The attribute list can specify the following value on its own - is the default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_SERVICE_DESC

Description of service definition.

MQCA_SERVICE_NAME

Name of service definition.

MQCA_SERVICE_START_ARGS

The arguments to pass to the service program.

MQCA_SERVICE_START_COMMAND

The name of the program to run to start the service.

MQCA_SERVICE_STOP_ARGS

The arguments to pass to the stop command to stop the service.

MQCA_SERVICE_STOP_COMMAND

The name of the program to run to stop the service.

MQCA_STDERR_DESTINATION

Destination of standard error for the process.

MQCA_STDOUT_DESTINATION

Destination of standard output for the process.

MQCACF_SERVICE_START_DATE

The date on which the service was started.

MQCACF_SERVICE_START_TIME

The time at which the service was started.

MQIA_SERVICE_CONTROL

How the service is to be started and stopped.

MQIA_SERVICE_TYPE

The mode in which the service is to run.

MQIACF_PROCESS_ID

The process identifier of the operating system task under which this service is executing.

MQIACF_SERVICE_STATUS

Status of the service.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ServiceStatusAttrs* except MQCA_SERVICE_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1859](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_SERV_STATUS_NOT_FOUND

Service status not found.

Multi**Inquire Service Status (Response) on Multiplatforms**

The response to the Inquire Service Status (MQCMD_INQUIRE_SERVICE_STATUS) command consists of the response header followed by the *ServiceName* structure and the requested combination of attribute parameter structures.

If a generic service name was specified, one such message is generated for each service found.

Always returned:

ServiceName

Returned if requested:

ProcessId, ServiceDesc, StartArguments, StartCommand, StartDate, StartMode, StartTime, Status, StderrDestination, StdoutDestination, StopArguments, StopCommand

Response data**ProcessId (MQCFIN)**

Process identifier (parameter identifier: MQIACF_PROCESS_ID).

The operating system process identifier associated with the service.

ServiceDesc (MQCFST)

Description of service definition (parameter identifier: MQCACH_SERVICE_DESC).

The maximum length of the string is MQ_SERVICE_DESC_LENGTH.

ServiceName (MQCFST)

Name of the service definition (parameter identifier: MQCA_SERVICE_NAME).

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

StartArguments (MQCFST)

Arguments to be passed to the program on startup (parameter identifier: MQCA_SERVICE_START_ARGS).

The maximum length of the string is MQ_SERVICE_ARGS_LENGTH.

StartCommand (MQCFST)

Service program name (parameter identifier: MQCA_SERVICE_START_COMMAND).

Specifies the name of the program which is to run.

The maximum length of the string is MQ_SERVICE_COMMAND_LENGTH.

StartDate (MQCFST)

Start date (parameter identifier: MQIACF_SERVICE_START_DATE).

The date, in the form yyyy-mm-dd, on which the service was started.

The maximum length of the string is MQ_DATE_LENGTH.

StartMode (MQCFIN)

Service mode (parameter identifier: MQIACH_SERVICE_CONTROL).

How the service is to be started and stopped. The value can be:

MQSVC_CONTROL_MANUAL

The service is not to be started automatically or stopped automatically. It is to be controlled by user command.

MQSVC_CONTROL_Q_MGR

The service is to be started and stopped at the same time as the queue manager is started and stopped.

MQSVC_CONTROL_Q_MGR_START

The service is to be started at the same time as the queue manager is started, but is not request to stop when the queue manager is stopped.

StartTime (MQCFST)

Start date (parameter identifier: MQIACF_SERVICE_START_TIME).

The time, in the form hh.mm.ss, at which the service was started.

The maximum length of the string is MQ_TIME_LENGTH.

Status (MQCFIN)

Service status (parameter identifier: MQIACF_SERVICE_STATUS).

The status of the service. The value can be any of the following values:

MQSVC_STATUS_STARTING

The service is in the process of initializing.

MQSVC_STATUS_RUNNING

The service is running.

MQSVC_STATUS_STOPPING

The service is stopping.

StderrDestination (MQCFST)

Specifies the path to a file to which the standard error (stderr) of the service program is to be redirected (parameter identifier: MQCA_STDERR_DESTINATION).

The maximum length of the string is MQ_SERVICE_PATH_LENGTH.

StdoutDestination (MQCFST)

Specifies the path to a file to which the standard output (stdout) of the service program is to be redirected (parameter identifier: MQCA_STDOUT_DESTINATION).

The maximum length of the string is MQ_SERVICE_PATH_LENGTH.

StopArguments (MQCFST)

Specifies the arguments to be passed to the stop program when instructed to stop the service (parameter identifier: MQCA_SERVICE_STOP_ARGS).

The maximum length of the string is MQ_SERVICE_ARGS_LENGTH.

StopCommand (MQCFST)

Service program stop command (parameter identifier: MQCA_SERVICE_STOP_COMMAND).

This parameter is the name of the program that is to run when the service is requested to stop.

The maximum length of the string is MQ_SERVICE_COMMAND_LENGTH.

Inquire SMDS on z/OS

The Inquire SMDS (MQCMD_INQUIRE_SMDS) command inquires about the attributes of shared message data sets for a CF application structure.

Required parameters

SMDS (qmgr_name)

Specifies the queue manager for which the shared message data set properties are to be displayed, or an asterisk to display the properties for all shared message data sets associated with the specified CFSTRUCT (parameter identifier: MQCACF_CF_SMDS).

CFStrucName (MQCFST)

The name of the CF application structure with SMDS properties that you want to inquire on (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters

CFSMDSAttrs (MQCFIL)

CF application structure SMDS attributes (parameter identifier: MQIACF_SMDS_ATTRS).

The default value used if this parameter is not specified is:

MQIACF_ALL

All attributes.

The attribute list might specify MQIACF_ALL on its own, or may specify a combination of the following:

MQIA_CF_SMDS_BUFFERS

The shared message data set DSBUFS property.

MQIACF_CF_SMDS_EXPAND

The shared message data set DSEXPAND property.

Inquire SMDS (Response) on z/OS

The response to the Inquire SMDS (MQCMD_INQUIRE_SMDS) command returns the attribute parameters of the shared message data set connection.

Response data

SMDS (MQCFST)

The queue manager name for which the shared message data set properties are displayed (parameter identifier: MQCACF_CF_SMDS).

CFStrucName (MQCFST)

CF Structure name (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length is MQ_CF_STRUC_NAME_LENGTH.

DSBUFS (MQCFIN)

The CF DSBUFS property (parameter identifier: MQIA_CF_SMDS_BUFFERS).

The returned value is in the range 0 - 9999.

The value is the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

DSEXPAND (MQCFIN)

The CF DSEXPAND property (parameter identifier: MQIACF_CF_SMDS_EXPAND).

MQDSE_YES

The data set can be expanded.

MQDSE_NO

The data set cannot be expanded.

MQDSE_DEFAULT

Only returned on Inquire CF Struct when not explicitly set

Inquire SMDS Connection on z/OS

The response to the Inquire SMDS Connection (MQCMD_INQUIRE_SMDSCONN) command returns status and availability information about the connection between the queue manager and the shared message data sets for the specified *CFStrucName*.

Required parameters**SMDSCONN (MQCFST)**

Specify the queue manager which owns the SMDS for which the connection information is to be returned, or an asterisk to return the connection information for all shared message data sets associated with the specified *CFStrucName* (parameter identifier: MQCACF_CF_SMDSCONN).

CFStrucName (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to inquire on (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

MQCMD_INQUIRE_SMDSCONN (Inquire SMDS Connection)

Response on z/OS

The response to the Inquire SMDS Connection (MQCMD_INQUIRE_SMDSCONN) PCF command returns status and availability information about the connection between the queue manager and the shared message data sets for the specified *CFStrucName*.

Response data

SMDSCONN (MQCFST)

The queue manager which owns the SMDS for which the connection information is returned (parameter identifier: MQCACF_CF_SMDSCONN).

CFStrucName (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to inquire on (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

Avail (MQCFIN)

The availability of this data set connection as seen by this queue manager (parameter identifier MQIACF_SMDS_AVAIL).

This is one of the following values:

MQS_AVAIL_NORMAL

The connection can be used and no error has been detected.

MQS_AVAIL_ERROR

The connection is unavailable because of an error.

The queue manager may try to enable access again automatically if the error may no longer be present, for example when recovery completes or the status is manually set to RECOVERED. Otherwise, it can be enabled again using the START SMDSCONN command in order to retry the action which originally failed.

MQS_AVAIL_STOPPED

The connection cannot be used because it has been explicitly stopped using the STOP SMDSCONN command. It can only be made available again by using a START SMDSCONN command to enable it.

ExpandST (MQCFIN)

The data set automatic expansion status (parameter identifier MQIACF_SMDS_EXPANDST).

This is one of the following values:

MQS_EXPANDST_NORMAL

No problem has been noted which would affect automatic expansion.

MQS_EXPANDST_FAILED

A recent expansion attempt failed, causing the DSEXPAND option to be set to NO for this specific data set. This status is cleared when ALTER SMDS is used to set the DSEXPAND option back to YES or DEFAULT.

MQS_EXPANDST_MAXIMUM

The maximum number of extents has been reached, so future expansion is not possible (except by taking the data set out of service and copying it to larger extents).

OpenMode (MQCFIN)

Indicates the mode in which the shared message data set is currently open by this queue manager (parameter identifier MQIACF_SMDS_OPENMODE).

This is one of the following values:

MQS_OPENMODE_NONE

The shared message data set is not open.

MQS_OPENMODE_READONLY

The shared message data set is owned by another queue manager, and is open for read-only access.

MQS_OPENMODE_UPDATE

The shared message data set is owned by this queue manager, and is open for update access.

MQS_OPENMODE_RECOVERY

The shared message data set is open for recovery processing

Status (MQCFIN)

Indicates the shared message data set connection status as seen by this queue manager parameter identifier MQIACF_SMDS_STATUS).

This is one of the following values:

MQS_STATUS_CLOSED

This data set is not currently open.

MQS_STATUS_CLOSING

This queue manager is currently in the process of closing this data set, including quiescing normal I/O activity and storing the saved space map if necessary.

MQS_STATUS_OPENING

This queue manager is currently in the process of opening and validating this data set (including space map restart processing when necessary).

MQS_STATUS_OPEN

This queue manager has successfully opened this data set and it is available for normal use.

MQS_STATUS_NOTENABLED

The SMDS definition is not in the ACCESS(ENABLED) state so the data set is not currently available for normal use. This status is only set when the SMDSCONN status does not already indicate some other form of failure.

MQS_STATUS_ALLOCFAIL

This queue manager was unable to locate or allocate this data set.

MQS_STATUS_OPENFAIL

This queue manager was able to allocate the data set but was unable to open it, so it has now been deallocated.

MQS_STATUS_STGFAIL

The data set could not be used because the queue manager was unable to allocate associated storage areas for control blocks, or for space map or header record processing.

MQS_STATUS_DATAFAIL

The data set was successfully opened but the data was found to be invalid or inconsistent, or a permanent I/O error occurred, so it has now been closed and deallocated.

This might result in the shared message data set itself being marked as STATUS(FAILED).

**Inquire Storage Class on z/OS**

The Inquire Storage Class (MQCMD_INQUIRE_STG_CLASS) command returns information about storage classes.

Required parameters**StorageClassName (MQCFST)**

Storage class name (parameter identifier: MQCA_STORAGE_CLASS).

Generic storage class names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all storage classes having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *StgClassAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1852](#) for information about using this filter condition.

If you specify an integer filter for *PageSetId*, you cannot also specify the **PageSetId** parameter.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

PageSetId (MQCFIN)

Page set identifier that the storage class is associated with (parameter identifier: MQIA_PAGESET_ID).

If you omit this parameter, storage classes with any page set identifiers qualify.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). The value can be:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined with either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

StgClassAttrs (MQCFIL)

Storage class parameter attributes (parameter identifier: MQIACF_STORAGE_CLASS_ATTRS).

The attribute list might specify the following value on its own - is the default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_STORAGE_CLASS

Storage class name.

MQCA_STORAGE_CLASS_DESC

Description of the storage class.

MQIA_PAGESET_ID

The page set identifier to which the storage class maps.

MQCA_XCF_GROUP_NAME

The name of the XCF group of which IBM MQ is a member.

MQIA_XCF_MEMBER_NAME

The XCF member name of the IMS system within the XCF group specified in MQCA_XCF_GROUP_NAME.

MQCA_ALTERATION_DATE

The date on which the definition was last altered.

MQCA_ALTERATION_TIME

The time at which the definition was last altered.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *StgClassAttrs* except MQCA_STORAGE_CLASS. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1859 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Inquire Storage Class (Response) on z/OS

The response to the Inquire Storage Class (MQCMD_INQUIRE_STG_CLASS) command consists of the response header followed by the *StgClassName* structure, the *PageSetId* structure and the *QSGDisposition* structure which are followed by the requested combination of attribute parameter structures.

Always returned:

PageSetId, *QSGDisposition*, *StgClassName*

Returned if requested:

AlterationDate, *AlterationTime*, *PassTicketApplication*, *StorageClassDesc*, *XCFGroupName*, *XCFMemberName*,

Response data**AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

This parameter is the date, in the form yyyy-mm-dd, on which the definition was last altered.

The maximum length of the string is MQ_DATE_LENGTH.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

This parameter is the time, in the form hh.mm.ss, at which the definition was last altered.

The maximum length of the string is MQ_TIME_LENGTH.

PageSetId (MQCFIN)

Page set identifier (parameter identifier: MQIA_PAGESET_ID).

The page set identifier to which the storage class maps.

PassTicketApplication (MQCFST)

PassTicket application (parameter identifier: MQCA_PASS_TICKET_APPL).

The application name that is passed to RACF when authenticating the PassTicket specified in the MQIIH header.

The maximum length is MQ_PASS_TICKET_APPL_LENGTH.

QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

StorageClassDesc (MQCFST)

Description of the storage class (parameter identifier: MQCA_STORAGE_CLASS_DESC).

The maximum length is MQ_STORAGE_CLASS_DESC_LENGTH.

StgClassName (MQCFST)

Name of the storage class (parameter identifier: MQCA_STORAGE_CLASS).

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

XCFGroupName (MQCFST)

Name of the XCF group of which IBM MQ is a member (parameter identifier: MQCA_XCF_GROUP_NAME).

The maximum length is MQ_XCF_GROUP_NAME_LENGTH.

XCFMemberName (MQCFST)

Name of the XCF group of which IBM MQ is a member (parameter identifier: MQCA_XCF_MEMBER_NAME).

The maximum length is MQ_XCF_MEMBER_NAME_LENGTH.

 **Inquire Storage Class Names on z/OS**

The Inquire Storage Class Names (MQCMD_INQUIRE_STG_CLASS_NAMES) command inquires a list of storage class names that match the generic storage class name specified.

Required parameters

StorageClassName (MQCFST)

Storage class name (parameter identifier: MQCA_STORAGE_CLASS).

Generic storage class names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all storage classes having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined with either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

Inquire Storage Class Names (Response) on z/OS

The response to the Inquire Storage Class Names (MQCMD_INQUIRE_STG_CLASS_NAMES) command consists of the response header followed by a parameter structure giving zero or more names that match the specified namelist name.

In addition to this, the *QSGDispositions* structure (with the same number of entries as the *StorageClassNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *StorageClassNames* structure.

Always returned:

StorageClassNames, QSGDispositions

Returned if requested:

None

Response data

StorageClassNames (MQCFSL)

List of storage class names (parameter identifier: MQCACF_STORAGE_CLASS_NAMES).

QSGDispositions (MQCFIL)

List of queue sharing group dispositions (parameter identifier: MQIACF_QSG_DISPS). Possible values for fields in this structure are those permitted for the *QSGDisposition* parameter (MQQSGD_*). Possible values for fields in this structure are:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

Inquire Subscription

The Inquire Subscription (MQCMD_INQUIRE_SUBSCRIPTION) command inquires about the attributes of a subscription.

Required parameters

SubName (MQCFST)

The unique identifier of the application for a subscription (parameter identifier: MQCACF_SUB_NAME).

If *SubName* is not provided, *SubId* must be specified to identify the subscription to be inquired.

The maximum length of the string is MQ_SUB_NAME_LENGTH.

SubId (MQCFBS)

Subscription identifier (parameter identifier: MQBACF_SUB_ID).

Specifies the unique internal subscription identifier. If the queue manager is generating the *CorrelId* for a subscription, then the *SubId* is used as the *DestinationCorrelId*.

You must supply a value for *SubId* if you have not supplied a value for *SubName*.

The maximum length of the string is MQ_CORREL_ID_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

Durable (MQCFIN)

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF_DURABLE_SUBSCRIPTION).

MQSUB_DURABLE_YES

Information about durable subscriptions only is displayed.

MQSUB_DURABLE_NO

Information about nondurable subscriptions only is displayed.

MQSUB_DURABLE_ALL

Information about all subscriptions is displayed.

SubscriptionAttrs (MQCFIL)

Subscription attributes (parameter identifier: MQIACF_SUB_ATTRS).

Use one of the following parameters to select the attributes you want to display:

- ALL to display all attributes.
- SUMMARY to display a subset of the attributes (see MQIACF_SUMMARY for a list).
- Any of the following parameters individually or in combination.

MQIACF_ALL

All attributes.

MQIACF_SUMMARY

Use this parameter to display:

- MQBACF_DESTINATION_CORREL_ID
- MQBACF_SUB_ID
- MQCACF_DESTINATION
- MQCACF_DESTINATION_Q_MGR
- MQCACF_SUB_NAME
- MQCA_TOPIC_STRING
- MQIACF_SUB_TYPE

MQBACF_ACCOUNTING_TOKEN

The accounting token passed by the subscriber for propagation into messages sent to this subscription in the AccountingToken field of the MQMD.

MQBACF_DESTINATION_CORREL_ID

The CorrelId used for messages sent to this subscription.

MQBACF_SUB_ID

The internal unique key identifying a subscription.

MQCA_ALTERATION_DATE

The date of the most recent MQSUB with MQSO_ALTER or ALTER SUB command.

MQCA_ALTERATION_TIME

The time of the most recent MQSUB with MQSO_ALTER or ALTER SUB command.

MQCA_CREATION_DATE

The date of the first MQSUB command that caused this subscription to be created.

MQCA_CREATION_TIME

The time of the first MQSUB that caused this subscription to be created.

MQCA_TOPIC_STRING

The resolved topic string the subscription is for.

MQCACF_APPL_IDENTITY_DATA

The identity data passed by the subscriber for propagation into messages sent to this subscription in the ApplIdentity field of the MQMD.

MQCACF_DESTINATION

The destination for messages published to this subscription.

MQCACF_DESTINATION_Q_MGR

The destination queue manager for messages published to this subscription.

MQCACF_SUB_NAME

The unique identifier of an application for a subscription.

MQCACF_SUB_SELECTOR

The SQL 92 selector string to be applied to messages published on the named topic to select whether they are eligible for this subscription.

MQCACF_SUB_USER_DATA

The user data associated with the subscription.

MQCACF_SUB_USER_ID

The userid that owns the subscription. MQCACF_SUB_USER_ID is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription.

MQCA_TOPIC_NAME

The name of the topic object that identifies a position in the topic hierarchy to which the topic string is concatenated.

MQIACF_DESTINATION_CLASS

Indicated whether this subscription is a managed subscription.

MQIACF_DURABLE_SUBSCRIPTION

Whether the subscription is durable, persisting over queue manager restart.

MQIACF_EXPIRY

The time to live from creation date and time.

MQIACF_PUB_PRIORITY

The priority of the messages sent to this subscription.

MQIACF_PUBSUB_PROPERTIES

The manner in which publish/subscribe related message properties are added to messages sent to this subscription.

MQIACF_REQUEST_ONLY

Indicates whether the subscriber polls for updates by using MQSUBRQ API, or whether all publications are delivered to this subscription.

MQIACF_SUB_TYPE

The type of subscription - how it was created.

MQIACF_SUBSCRIPTION_SCOPE

Whether the subscription forwards messages to all other queue managers directly connected by using a Publish/Subscribe collective or hierarchy, or the subscription forwards messages on this topic within this queue manager only.

MQIACF_SUB_LEVEL

The level within the subscription interception hierarchy at which this subscription is made.

MQIACF_VARIABLE_USER_ID

Users other than the creator of this subscription that can connect to it (subject to topic and destination authority checks).

MQIACF_WILDCARD_SCHEMA

The schema to be used when interpreting wildcard characters in the topic string.

MQIA_DISPLAY_TYPE

Controls the output returned in the **TOPICSTR** and **TOPICOBJ** attributes.

SubscriptionType (MQCFIN)

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF_SUB_TYPE).

MQSUBTYPE_ADMIN

Subscriptions which have been created by an admin interface or modified by an admin interface are selected.

MQSUBTYPE_ALL

All subscription types are displayed.

MQSUBTYPE_API

Subscriptions created by applications by way of the IBM MQ API are displayed.

MQSUBTYPE_PROXY

System created subscriptions relating to inter-queue manager subscriptions are displayed.

MQSUBTYPE_USER

USER subscriptions (with SUBTYPE of either ADMIN or API) are displayed. MQSUBTYPE_USER is the default value.

DisplayType (MQCFIN)

Controls the output returned in the **MQCA_TOPIC_STRING** and **MQCA_TOPIC_NAME** attributes (parameter identifier: MQIA_DISPLAY_TYPE).

MQDOPT_RESOLVED

Returns the resolved (full) topic string in the **MQCA_TOPIC_STRING** attribute. The value of the **MQCA_TOPIC_NAME** attribute is also returned.

MQDOPT_DEFINED

Returns the values of the **MQCA_TOPIC_NAME** and **MQCA_TOPIC_STRING** attributes provided when the subscription was created. The **MQCA_TOPIC_STRING** attribute will contain the application part of the topic string only. You can use the values returned with **MQCA_TOPIC_NAME** and **MQCA_TOPIC_STRING** to fully re-create the subscription by using **MQDOPT_DEFINED**.

Inquire Subscription (Response)

The response to the Inquire Subscription (MQCMD_INQUIRE_SUBSCRIPTION) command consists of the response header followed by the *SubId* and *SubName* structures, and the requested combination of attribute parameter structures (where applicable).

Always returned

SubID, SubName

Returned if requested

AlterationDate, AlterationTime, CreationDate, CreationTime, Destination, DestinationClass, DestinationCorrelId, DestinationQueueManager, Expiry, PublishedAccountingToken, PublishedApplicationIdentityData, PublishPriority, PublishSubscribeProperties, Requestonly, Selector, SelectorType, SubscriptionLevel, SubscriptionScope, SubscriptionType, SubscriptionUser, TopicObject, TopicString, Userdata, VariableUser, WildcardSchema

Response Data

AlterationDate (MQCFST)

The date of the most recent **MQSUB** or **Change Subscription** command that modified the properties of the subscription (parameter identifier: MQCA_ALTERATION_DATE).

AlterationTime (MQCFST)

The time of the most recent **MQSUB** or **Change Subscription** command that modified the properties of the subscription (parameter identifier: MQCA_ALTERATION_TIME).

CreationDate (MQCFST)

The creation date of the subscription, in the form yyyy-mm-dd (parameter identifier: MQCA_CREATION_DATE).

CreationTime (MQCFST)

The creation time of the subscription, in the form hh.mm.ss (parameter identifier: MQCA_CREATION_TIME).

Destination (MQCFST)

Destination (parameter identifier: MQCACF_DESTINATION).

Specifies the name of the alias, local, remote, or cluster queue to which messages for this subscription are put.

DestinationClass (MQCFIN)

Destination class (parameter identifier: MQIACF_DESTINATION_CLASS).

Whether the destination is managed.

The value can be any of the following values:

MQDC_MANAGED

The destination is managed.

MQDC_PROVIDED

The destination queue is as specified in the *Destination* field.

DestinationCorrelId (MQCFBS)

Destination correlation identifier (parameter identifier: MQBACF_DESTINATION_CORREL_ID).

A correlation identifier that is placed in the *CorrelId* field of the message descriptor for all the messages sent to this subscription.

The maximum length is MQ_CORREL_ID_LENGTH.

DestinationQueueManager (MQCFST)

Destination queue manager (parameter identifier: MQCACF_DESTINATION_Q_MGR).

Specifies the name of the destination queue manager, either local or remote, to which messages for the subscription are forwarded.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

DisplayType (MQCFIN)

The type of output requested for **MQCA_TOPIC_STRING** and **MQCA_TOPIC_NAME** is returned (parameter identifier: MQIA_DISPLAY_TYPE).

MQDOPT_RESOLVED

Returns the resolved (full) topic string in the **MQCA_TOPIC_STRING** attribute. The value of the **MQCA_TOPIC_NAME** attribute is also returned.

MQDOPT_DEFINED

The application portion of the topic string is returned in the **MQCA_TOPIC_STRING** attribute. **MQCA_TOPIC_NAME** contains the name of the **TOPIC** Object used when defining the subscription.

Durable (MQCFIN)

Whether this subscription is a durable subscription (parameter identifier: MQIACF_DURABLE_SUBSCRIPTION).

The value can be any of the following values:

MQSUB_DURABLE_YES

The subscription persists, even if the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. The queue manager reinstates the subscription during restart.

MQSUB_DURABLE_NO

The subscription is non-durable. The queue manager removes the subscription when the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. If the subscription has a destination class (DESTCLAS) of MANAGED, the queue manager removes any messages not yet consumed when it closes the subscription.

Expiry (MQCFIN)

The time, in tenths of a second, at which a subscription expires after its creation date and time (parameter identifier: MQIACF_EXPIRY).

A value of unlimited means that the subscription never expires.

After a subscription has expired it becomes eligible to be discarded by the queue manager and receives no further publications.

PublishedAccountingToken (MQCFBS)

Value of the accounting token used in the *AccountingToken* field of the message descriptor (parameter identifier: MQBACF_ACCOUNTING_TOKEN).

The maximum length of the string is MQ_ACCOUNTING_TOKEN_LENGTH.

PublishedApplicationIdentityData (MQCFST)

Value of the application identity data used in the *AppIdentityData* field of the message descriptor (parameter identifier: MQCACF_APPL_IDENTITY_DATA).

The maximum length of the string is MQ_APPL_IDENTITY_DATA_LENGTH.

PublishPriority (MQCFIN)

The priority of messages sent to this subscription (parameter identifier: MQIACF_PUB_PRIORITY).

The value can be any of the following values:

MQPRI_PRIORITY_AS_PUBLISHED

The priority of messages sent to this subscription is taken from that priority supplied to the published message. MQPRI_PRIORITY_AS_PUBLISHED is the supplied default value.

MQPRI_PRIORITY_AS_QDEF

The priority of messages sent to this subscription is determined by the default priority of the queue defined as a destination.

0-9

An integer value providing an explicit priority for messages sent to this subscription.

PublishSubscribeProperties (MQCFIN)

Specifies how publish/subscribe related message properties are added to messages sent to this subscription (parameter identifier: MQIACF_PUBSUB_PROPERTIES).

The value can be any of the following values:

MQPSPROP_NONE

Publish/subscribe properties are not added to the messages. MQPSPROP_NONE is the supplied default value.

MQPSPROP_MSGPROP

Publish/subscribe properties are added as PCF attributes.

MQPSPROP_COMPAT

If the original publication is a PCF message, then the publish/subscribe properties are added as PCF attributes. Otherwise, publish/subscribe properties are added within an MQRFH version 1 header. This method is compatible with applications coded for use with previous versions of IBM MQ.

MQPSPROP_RFH2

Publish/subscribe properties are added within an MQRFH version 2 header. This method is compatible with applications coded for use with IBM Integration Bus brokers.

Requestonly (MQCFIN)

Indicates whether the subscriber polls for updates using the MQSUBRQ API call, or whether all publications are delivered to this subscription (parameter identifier: MQIACF_REQUEST_ONLY).

The value can be:

MQRU_PUBLISH_ALL

All publications on the topic are delivered to this subscription.

MQRU_PUBLISH_ON_REQUEST

Publications are only delivered to this subscription in response to an MQSUBRQ API call.

Selector (MQCFST)

Specifies the selector applied to messages published to the topic (parameter identifier: MQCACF_SUB_SELECTOR).

Only those messages that satisfy the selection criteria are put to the destination specified by this subscription.

SelectorType (MQCFIN)

The type of selector string that has been specified (parameter identifier: MQIACF_SELECTOR_TYPE).

The value can be any of the following values:

MQSELTYPE_NONE

No selector has been specified.

MQSELTYPE_STANDARD

The selector references only the properties of the message, not its content, using the standard IBM MQ selector syntax. Selectors of this type are to be handled internally by the queue manager.

MQSELTYPE_EXTENDED

The selector uses extended selector syntax, typically referencing the content of the message. Selectors of this type cannot be handled internally by the queue manager; extended selectors can be handled only by another program, such as IBM Integration Bus.

SubID (MQCFBS)

The internal, unique key identifying a subscription (parameter identifier: MQBACF_SUB_ID).

SubscriptionLevel (MQCFIN)

The level within the subscription interception hierarchy at which this subscription is made (parameter identifier: MQIACF_SUB_LEVEL).

The value can be:

0 - 9

An integer in the range 0-9. The default value is 1. Subscribers with a subscription level of 9 will intercept publications before they reach subscribers with lower subscription levels.

SubscriptionScope (MQCFIN)

Determines whether this subscription is passed to other queue managers in the network (parameter identifier: MQIACF_SUBSCRIPTION_SCOPE).

The value can be:

MQTSCOPE_ALL

The subscription is forwarded to all queue managers directly connected through a publish/subscribe collective or hierarchy. MQTSCOPE_ALL is the supplied default value.

MQTSCOPE_QMGR

The subscription only forwards messages published on the topic within this queue manager.

SubscriptionType (MQCFIN)

Indicates how the subscription was created (parameter identifier: MQIACF_SUB_TYPE).

MQSUBTYPE_PROXY

An internally created subscription used for routing publications through a queue manager.

MQSUBTYPE_ADMIN

Created using **DEF SUB** MQSC or PCF command. This **SUBTYPE** also indicates that a subscription has been modified using an administrative command.

MQSUBTYPE_API

Created using an **MQSUB** API request.

SubscriptionUser (MQCFST)

The userid that 'owns' this subscription. This parameter is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription. (parameter identifier: MQCACF_SUB_USER_ID).

The maximum length of the string is MQ_USER_ID_LENGTH.

TopicObject (MQCFST)

The name of a previously defined topic object from which is obtained the topic name for the subscription (parameter identifier: MQCA_TOPIC_NAME).

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

TopicString (MQCFST)

The resolved topic string (parameter identifier: MQCA_TOPIC_STRING).

The maximum length of the string is MQ_TOPIC_STR_LENGTH.

Userdata (MQCFST)

User data (parameter identifier: MQCACF_SUB_USER_DATA).

Specifies the user data associated with the subscription

The maximum length of the string is MQ_USER_DATA_LENGTH.

VariableUser (MQCFIN)

Specifies whether a user other than the one who created the subscription, that is, the user shown in *SubscriptionUser* can take over the ownership of the subscription (parameter identifier: MQIACF_VARIABLE_USER_ID).

The value can be any of the following values:

MQVU_ANY_USER

Any user can take over the ownership. MQVU_ANY_USER is the supplied default value.

MQVU_FIXED_USER

No other user can take over the ownership.

WildcardSchema (MQCFIN)

Specifies the schema to be used when interpreting any wildcard characters contained in the *TopicString* (parameter identifier: MQIACF_WILDCARD_SCHEMA).

The value can be any of the following values:

MQWS_CHAR

Wildcard characters represent portions of strings; it is for compatibility with IBM MQ 6.0 broker.

MQWS_TOPIC

Wildcard characters represent portions of the topic hierarchy; this is for compatibility with IBM Integration Bus brokers. MQWS_TOPIC is the supplied default value.

Inquire Subscription Status

The Inquire Subscription Status (MQCMD_INQUIRE_SUB_STATUS) command inquires about the status of a subscription.

Required parameters

SubName (MQCFST)

The unique identifier of an application for a subscription (parameter identifier: MQCACF_SUB_NAME).

If *SubName* is not provided, *SubId* must be specified to identify the subscription to be inquired.

The maximum length of the string is MQ_SUB_NAME_LENGTH.

SubId (MQCFBS)

Subscription identifier (parameter identifier: MQBACF_SUB_ID).

Specifies the unique internal subscription identifier. If the queue manager is generating the CorrelId for a subscription, then the *SubId* is used as the *DestinationCorrelId*.

You must supply a value for *SubId* if you have not supplied a value for *SubName*.

The maximum length of the string is MQ_CORREL_ID_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter on which to filter.

Durable (MQCFIN)

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF_DURABLE_SUBSCRIPTION).

MQSUB_DURABLE_YES

Information about durable subscriptions only is displayed. MQSUB_DURABLE_YES is the default.

MQSUB_DURABLE_NO

Information about non-durable subscriptions only is displayed.

SubscriptionType (MQCFIN)

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF_SUB_TYPE).

MQSUBTYPE_ADMIN

Subscriptions which have been created by an admin interface or modified by an admin interface are selected.

MQSUBTYPE_ALL

All subscription types are displayed.

MQSUBTYPE_API

Subscriptions created by applications through an IBM MQ API call are displayed.

MQSUBTYPE_PROXY

System created subscriptions relating to inter-queue manager subscriptions are displayed.

MQSUBTYPE_USER

USER subscriptions (with SUBTYPE of either ADMIN or API) are displayed. MQSUBTYPE_USER is the default value.

StatusAttrs (MQCFIL)

Subscription status attributes (parameter identifier: MQIACF_SUB_STATUS_ATTRS).

To select the attributes you want to display you can specify;

- ALL to display all attributes.
- any of the following parameters individually or in combination.

MQIACF_ALL

All attributes.

MQBACF_CONNECTION_ID

The currently active *ConnectionID* that has opened the subscription.

MQIACF_DURABLE_SUBSCRIPTION

Whether the subscription is durable, persisting over queue manager restart.

MQCACF_LAST_MSG_DATE

The date that a message was last sent to the destination specified by the subscription.

MQCACF_LAST_MSG_TIME

The time when a message was last sent to the destination specified by the subscription.

MQIACF_MESSAGE_COUNT

The number of messages put to the destination specified by the subscription.

MQCA_RESUME_DATE

The date of the most recent MQSUB command that connected to the subscription.

MQCA_RESUME_TIME

The time of the most recent MQSUB command that connected to the subscription.

MQIACF_SUB_TYPE

The type of subscription - how it was created.

MQCACF_SUB_USER_ID

The userid owns the subscription.

MQCA_TOPIC_STRING

Returns the fully resolved topic string of the subscription.

Inquire Subscription Status (Response)

The response to the Inquire Subscription Status (MQCMD_INQUIRE_SUB_STATUS) command consists of the response header followed by the *SubID* and *SubName* structures, and the requested combination of attribute parameter structures (where applicable).

Always returned

SubID , *SubName*

Returned if requested

ActiveConnection , *Durable* , *LastPublishDate* , *LastPublishTime* ,
MCastRelIndicator , *NumberMsgs* , *ResumeDate* , *ResumeTime* , *SubType* , *TopicString*

Response Data

ActiveConnection (MQCFBS)

The *ConnId* of the *HConn* that currently has this subscription open (parameter identifier: MQBACF_CONNECTION_ID).

Durable (MQCFIN)

A durable subscription is not deleted when the creating application closes its subscription handle (parameter identifier: MQIACF_DURABLE_SUBSCRIPTION).

MQSUB_DURABLE_NO

The subscription is removed when the application that created it is closed or disconnected from the queue manager.

MQSUB_DURABLE_YES

The subscription persists even when the creating application is no longer running or has been disconnected. The subscription is reinstated when the queue manager restarts.

LastMessageDate (MQCFST)

The date that a message was last sent to the destination specified by the subscription (parameter identifier: MQCACF_LAST_MSG_DATE).

LastMessageTime (MQCFST)

The time when a message was last sent to the destination specified by the subscription (parameter identifier: MQCACF_LAST_MSG_TIME).

MCastRelIndicator (MQCFIN)

The multicast reliability indicator (parameter identifier: MQIACF_MCAST_REL_INDICATOR). The values are expressed as a percentage. A value of 100 indicates that all messages are being delivered without problems. A value less than 100 indicates that some of the messages are experiencing network issues. Two values are returned, in this order:

1. A value based on recent activity over a short period.
2. A value based on activity over a longer period.

NumberMsgs (MQCFIN)

The number of messages put to the destination specified by this subscription (parameter identifier: MQIACF_MESSAGE_COUNT).

ResumeDate (MQCFST)

The date of the most recent **MQSUB** API call that connected to the subscription (parameter identifier: MQCA_RESUME_DATE).

ResumeTime (MQCFST)

The time of the most recent **MQSUB** API call that connected to the subscription (parameter identifier: MQCA_RESUME_TIME).

SubscriptionUser (MQCFST)

The userid that 'owns' this subscription. This parameter is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription. (parameter identifier: MQCACF_SUB_USER_ID).

The maximum length of the string is MQ_USER_ID_LENGTH.

SubID (MQCFBS)

The internal, unique key identifying a subscription (parameter identifier: MQBACF_SUB_ID).

SubName (MQCFST)

The unique identifier of a subscription (parameter identifier: MQCACF_SUB_NAME).

SubType (MQCFIN)

Indicates how the subscription was created (parameter identifier: MQIA_SUB_TYPE).

MQSUBTYPE_PROXY

An internally created subscription used for routing publications through a queue manager.

MQSUBTYPE_ADMIN

Created using the **DEF SUB** MQSC or **Create Subscription** PCF command. This Subtype also indicates that a subscription has been modified using an administrative command.

MQSUBTYPE_API

Created using an **MQSUB** API call.

TopicString (MQCFST)

The resolved topic string (parameter identifier: MQCA_TOPIC_STRING). The maximum length of the string is MQ_TOPIC_STR_LENGTH.

z/OS Inquire System on z/OS

The Inquire System (MQCMD_INQUIRE_SYSTEM) command returns general system parameters and information.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

z/OS MQCMD_INQUIRE_SYSTEM (Inquire System) Response on z/OS

The response to the Inquire System (MQCMD_INQUIRE_SYSTEM) PCF command consists of the response header followed by the *ParameterType* structure and the combination of attribute parameter structures determined by the value of the parameter type.

Always returned:

ParameterType

Possible values of *ParameterType* are:

MQSYSP_TYPE_INITIAL

The initial settings of the system parameters.

MQSYSP_TYPE_SET

The settings of the system parameters if they have been altered since their initial setting.

Returned if *ParameterType* is MQSYSP_TYPE_INITIAL or MQSYSP_TYPE_SET (and a value is set):

CheckpointCount, ClusterCacheType, CodedCharSetId, CommandUserId, ConnSwap, DB2BlobTasks, DB2Name, DB2Tasks, DSGName, Exclmsg, ExitInterval, ExitTasks, MULCCapture, OTMADruExit, OTMAGroup, OTMAInterval, OTMAMember, OTMSTpipePrefix, QIndexDefer, QSGName, RESLEVELAudit, RoutingCode, Service, SMFAccounting, SMFstatistics, SMFInterval, Splcap, TraceClass, TraceSize, WLMInterval, WLMIntervalUnits

Response data

CheckpointCount (MQCFIN)

The number of log records written by IBM MQ between the start of one checkpoint and the next (parameter identifier: MQIACF_SYSP_CHKPOINT_COUNT).

ClusterCacheType (MQCFIN)

The type of the cluster cache (parameter identifier: MQIACF_SYSP_CLUSTER_CACHE).

The value can be any of the following values:

MQCLCT_STATIC

Static cluster cache.

MQCLCT_DYNAMIC

Dynamic cluster cache.

CodedCharSetId (MQCFIN)

Archive retention period (parameter identifier: MQIA_CODED_CHAR_SET_ID).

The coded character set identifier for the queue manager.

CommandUserId (MQCFST)

Command user ID (parameter identifier: MQCACF_SYSP_CMD_USER_ID).

Specifies the default user ID for command security checks.

The maximum length of the string is MQ_USER_ID_LENGTH.

ConnSwap (MQCFIN)

Specifies whether jobs that are issuing certain MQ API calls are swappable or non-swappable (parameter identifier: MQIACF_CONNECTION_SWAP).

This value can be either MQSYSP_YES or MQSYSP_NO.

Attention: From IBM MQ 9.0, this keyword has no effect.

DB2BlobTasks (MQCFIN)

The number of Db2 server tasks to be used for BLOBs (parameter identifier: MQIACF_SYSP_DB2_BLOB_TASKS).

DB2Name (MQCFST)

The name of the Db2 subsystem or group attachment to which the queue manager is to connect (parameter identifier: MQCACF_DB2_NAME).

The maximum length of the string is MQ_DB2_NAME_LENGTH.

DB2Tasks (MQCFIN)

The number of Db2 server tasks to use (parameter identifier: MQIACF_SYSP_DB2_TASKS).

DSGName (MQCFST)

The name of the Db2 data-sharing group to which the queue manager is to connect (parameter identifier: MQCACF_DSG_NAME).

The maximum length of the string is MQ_DSG_NAME_LENGTH.

Exclmsg (MQCFSL)

A list of message identifiers to be excluded from being written to any log (parameter identifier: MQCACF_EXCL_OPERATOR_MESSAGES).

The maximum length of each message identifier is MQ_OPERATOR_MESSAGE_LENGTH.

The list can contain a maximum of 16 message identifiers.

ExitInterval (MQCFIN)

The time, in seconds, for which queue manager exits can execute during each invocation (parameter identifier: MQIACF_SYSP_EXIT_INTERVAL).

ExitTasks (MQCFIN)

Specifies how many started server tasks to use to run queue manager exits (parameter identifier: MQIACF_SYSP_EXIT_TASKS).

MaximumAcePool (MQCFIN)

The maximum ACE storage pool size in 1 KB blocks (parameter identifier: MQIACF_SYSP_MAX_ACE_POOL).

MULCCapture (MQCFIN)

The Measured Usage Pricing property is used to control the algorithm for gathering data used by Measured Usage License Charging (MULC) (parameter identifier: MQIACF_MULC_CAPTURE).

The returned values can be MQMULC_STANDARD or MQMULC_REFINED.

OTMADruExit (MQCFST)

The name of the OTMA destination resolution user exit to be run by IMS (parameter identifier: MQCACF_SYSP_OTMA_DRU_EXIT).

The maximum length of the string is MQ_EXIT_NAME_LENGTH.

OTMAGroup (MQCFST)

The name of the XCF group to which this instance of IBM MQ belongs (parameter identifier: MQCACF_SYSP_OTMA_GROUP).

The maximum length of the string is MQ_XCF_GROUP_NAME_LENGTH.

OTMAInterval (MQCFIN)

The length of time, in seconds, that a user ID from IBM MQ is considered previously verified by IMS (parameter identifier: MQIACF_SYSP_OTMA_INTERVAL).

OTMAMember (MQCFST)

The name of the XCF member to which this instance of IBM MQ belongs (parameter identifier: MQCACF_SYSP_OTMA_MEMBER).

The maximum length of the string is MQ_XCF_MEMBER_NAME_LENGTH.

OTMSTpipePrefix (MQCFST)

The prefix to be used for Tpipe names (parameter identifier: MQCACF_SYSP_OTMA_TPIPE_PFX).

The maximum length of the string is MQ_TPIPE_PFX_LENGTH.

QIndexDefer (MQCFIN)

Specifies whether queue manager restart completes before all indexes are built deferring building to later, or waits until all indexes are built (parameter identifier: MQIACF_SYSP_Q_INDEX_DEFER).

The value can be any of the following values:

MQSYSP_YES

Queue manager restart completes before all indexes are built.

MQSYSP_NO

Queue manager restart waits until all indexes are built.

QSGName (MQCFST)

The name of the queue sharing group to which the queue manager belongs (parameter identifier: MQCA_QSG_NAME).

The maximum length of the string is MQ_QSG_NAME_LENGTH.

RESLEVELAudit (MQCFIN)

Specifies whether RACF audit records are written for RESLEVEL security checks performed during connection processing (parameter identifier: MQIACF_SYSP_RESLEVEL_AUDIT).

The value can be any of the following values:

MQSYSP_YES

RACF audit records are written.

MQSYSP_NO

RACF audit records are not written.

RoutingCode (MQCFIL)

z/OS routing code list (parameter identifier: MQIACF_SYSP_ROUTING_CODE).

Specifies the list of z/OS routing codes for messages that are not sent in direct response to an MQSC command. There can be in the range 1 through 16 entries in the list.

Service (MQCFST)

Service parameter setting (parameter identifier: MQCACF_SYSP_SERVICE).

The maximum length of the string is MQ_SERVICE_NAME_LENGTH.

SMFAccounting (MQCFIN)

Specifies whether IBM MQ sends accounting data to SMF automatically when the queue manager starts (parameter identifier: MQIACF_SYSP_SMF_ACCOUNTING).

The value can be any of the following values:

MQSYSP_YES

Accounting data is sent automatically.

MQSYSP_NO

Accounting data is not sent automatically.

SMFInterval (MQCFIN)

The default time, in minutes, between each gathering of statistics (parameter identifier: MQIACF_SYSP_SMF_INTERVAL).

SMFStatistics (MQCFIN)

Specifies whether IBM MQ sends statistics data to SMF automatically when the queue manager starts (parameter identifier: MQIACF_SYSP_SMF_STATS).

The value can be any of the following values:

MQSYSP_YES

Statistics data is sent automatically.

MQSYSP_NO

Statistics data is not sent automatically.

Splcap (MQCFIN)

If the AMS component is installed for the version of IBM MQ that the queue manager is running under, the attribute has a value YES (MQCAP_SUPPORTED). If the AMS component is not installed, the value is NO (MQCAP_NOT_SUPPORTED) (parameter identifier MQIA_PROT_POLICY_CAPABILITY).

The value can be one of the following values:

MQCAP_SUPPORTED

If the AMS component is installed for the version of IBM MQ that the queue manager is running under.

MQCAP_NOT_SUPPORTED

If the AMS component is not installed.

TraceClass (MQCFIL)

Classes for which tracing is started automatically (parameter identifier: MQIACF_SYSP_TRACE_CLASS). There can be in the range 1 through 4 entries in the list.

TraceSize (MQCFIN)

The size of the trace table, in 4 KB blocks, to be used by the global trace facility (parameter identifier: MQIACF_SYSP_TRACE_SIZE).

WLMInterval (MQCFIN)

The time between scans of the queue index for WLM-managed queues (parameter identifier: MQIACF_SYSP_WLM_INTERVAL).

WLMIntervalUnits (MQCFIN)

Whether the value of *WLMInterval* is given in seconds or minutes (parameter identifier: MQIACF_SYSP_WLM_INT_UNITS). The value can be any of the following values:

MQTIME_UNITS_SEC

The value of *WLMInterval* is given in seconds.

MQTIME_UNITS_MINS

The value of *WLMInterval* is given in minutes.

Inquire Topic

The Inquire Topic (MQCMD_INQUIRE_TOPIC) command inquires about the attributes of existing IBM MQ administrative topic objects

Required parameters

TopicName (MQCFST)

Administrative topic object name (parameter identifier: MQCA_TOPIC_NAME).

Specifies the name of the administrative topic object about which information is to be returned. Generic topic object names are supported. A generic name is a character string followed by an asterisk (*). For example, ABC* selects all administrative topic objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

Optional parameters

ClusterInfo (MQCFIN)

Cluster information (parameter identifier: MQIACF_CLUSTER_INFO).

This parameter requests that, in addition to information about attributes of topics defined on this queue manager, cluster information about these topics and other topics in the repository that match the selection criteria is returned.

In this case, there might be multiple topics with the same name returned.

You can set this parameter to any integer value: the value used does not affect the response to the command.

The cluster information is obtained locally from the queue manager.

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *TopicAttrs* except MQIACF_ALL.

Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1852](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *TopicAttrs* except MQCA_TOPIC_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1859](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

TopicAttrs (MQCFIL)

Topic object attributes (parameter identifier: MQIACF_TOPIC_ATTRS).

The attribute list can specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_ALTERATION_DATE

The date on which the information was last altered.

MQCA_ALTERATION_TIME

The time at which the information was last altered.

MQCA_CLUSTER_NAME

The cluster that is to be used for the propagation of publications and subscription to publish/subscribe cluster-connected queue managers for this topic.

MQCA_CLUSTER_DATE

The date on which this information became available to the local queue manager.

MQCA_CLUSTER_TIME

The time at which this information became available to the local queue manager.

MQCA_CLUSTER_Q_MGR_NAME

Queue manager that hosts the topic.

MQCA_CUSTOM

The custom attribute for new features.

MQCA_MODEL_DURABLE_Q

Name of the model queue for durable managed subscriptions.

MQCA_MODEL_NON_DURABLE_Q

Name of the model queue for non-durable managed subscriptions.

MQCA_TOPIC_DESC

Description of the topic object.

MQCA_TOPIC_NAME

Name of the topic object.

MQCA_TOPIC_STRING

The topic string for the topic object.

MQIA_CLUSTER_OBJECT_STATE

The current state of the clustered topic definition.

MQIA_CLUSTER_PUB_ROUTE

The routing behavior of publications between queue managers in a cluster.

MQIA_DEF_PRIORITY

Default message priority.

MQIA_DEF_PUT_RESPONSE_TYPE

Default put response.

MQIA_DURABLE_SUB

Whether durable subscriptions are permitted.

MQIA_INHIBIT_PUB

Whether publications are allowed.

MQIA_INHIBIT_SUB

Whether subscriptions are allowed.

MQIA_NPM_DELIVERY

The delivery mechanism for non-persistent messages.

MQIA_PM_DELIVERY

The delivery mechanism for persistent messages.

MQIA_PROXY_SUB

Whether a proxy subscription is to be sent for this topic, even if no local subscriptions exist.

MQIA_PUB_SCOPE

Whether this queue manager propagates publications to queue managers as part of a hierarchy or a publish/subscribe cluster.

MQIA_SUB_SCOPE

Whether this queue manager propagates subscriptions to queue managers as part of a hierarchy or a publish/subscribe cluster.

MQIA_TOPIC_DEF_PERSISTENCE

Default message persistence.

MQIA_USE_DEAD_LETTER_Q

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue.

TopicType (MQCFIN)

Cluster information (parameter identifier: MQIA_TOPIC_TYPE).

If this parameter is present, eligible queues are limited to the specified type. Any attribute selector that is specified in the TopicAttrs list and that is valid only for topics of different type is ignored; no error is raised.

If this parameter is not present (or if MQIACF_ALL is specified), queues of all types are eligible. Each attribute specified must be a valid topic attribute selector (that is, it must be in the following list), but it need not be applicable to all or any of the topics returned. Topic attribute selectors that are valid but not applicable to the queue are ignored; no error messages occur and no attribute is returned.

The value can be any of the following values:

MQTOPT_ALL

All topic types are displayed. MQTOPT_ALL includes cluster topics, if ClusterInfo is also specified. MQTOPT_ALL is the default value.

MQTOPT_CLUSTER

Topics that are defined in publish/subscribe clusters are returned.

MQTOPT_LOCAL

Locally defined topics are displayed.

Inquire Topic (Response)

The response to the Inquire Topic (MQCMD_INQUIRE_TOPIC) command consists of the response header followed by the *TopicName* structure (and on z/OS only, the *QSG Disposition* structure), and the requested combination of attribute parameter structures (where applicable).

Always returned:

TopicName , *TopicType* ,  *QSGDisposition*

Returned if requested:

AlterationDate , *AlterationTime* , *ClusterName* , *ClusterObjectState* , *ClusterPubRoute* , *CommInfo* , *Custom* , *DefPersistence* , *DefPriority* , *DefPutResponse* , *DurableModelQName* , *DurableSubscriptions* , *InhibitPublications* , *InhibitSubscriptions* , *Multicast* , *NonDurableModelQName* , *NonPersistentMsgDelivery* , *PersistentMsgDelivery* , *ProxySubscriptions* , *PublicationScope* , *QMgrName* , *SubscriptionScope* , *TopicDesc* , *TopicString* , *UseDLQ* , *WildcardOperation*

Response data**AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered, in the form hh.mm.ss.

ClusterName (MQCFST)

The name of the cluster to which this topic belongs. (parameter identifier: **MQCA_CLUSTER_NAME**).

The maximum length of the string is **MQ_CLUSTER_NAME_LENGTH**. Setting this parameter to a cluster that this queue manager is a member of makes all queue managers in the cluster aware of this topic. Any publication to this topic or a topic string below it put to any queue manager in the cluster is propagated to subscriptions on any other queue manager in the cluster. For more details, see [Distributed publish/subscribe networks](#).

The value can be any of the following values:

Blank

If no topic object above this topic in the topic tree has set this parameter to a cluster name, then this topic does not belong to a cluster. Publications and subscriptions for this topic are not propagated to publish/subscribe cluster-connected queue managers. If a topic node higher in the topic tree has a cluster name set, publications and subscriptions to this topic are also propagated throughout the cluster.

This value is the default value for this parameter if no value is specified.

String

The topic belongs to this cluster. It is not recommended that this is set to a different cluster from a topic object above this topic object in the topic tree. Other queue managers in the cluster will honor this object's definition unless a local definition of the same name exists on those queue managers.

Additionally, if **PublicationScope** or **SubscriptionScope** are set to **MQSCOPE_ALL**, this value is the cluster to be used for the propagation of publications and subscriptions, for this topic, to publish/subscribe cluster-connected queue managers.

ClusterObjectState (MQCFIN)

The current state of the clustered topic definition (parameter identifier: **MQIA_CLUSTER_OBJECT_STATE**).

The value can be any of the following values:

MQCLST_ACTIVE

The cluster topic is correctly configured and being adhered to by this queue manager.

MQCLST_PENDING

Only seen by a hosting queue manager, this state is reported when the topic has been created but the full repository has not yet propagated it to the cluster. This might be because the host queue manager is not connected to a full repository, or because the full repository has deemed the topic to be invalid.

MQCLST_INVALID

This clustered topic definition conflicts with an earlier definition in the cluster and is therefore not currently active.

MQCLST_ERROR

An error has occurred with respect to this topic object.

This parameter is typically used to aid diagnosis when multiple definitions of the same clustered topic are defined on different queue managers, and the definitions are not identical. See [Routing for publish/subscribe clusters: Notes on behavior](#).

ClusterPubRoute (MQCFIN)

The routing behavior of publications between queue managers in a cluster (parameter identifier: **MQIA_CLUSTER_PUB_ROUTE**).

The value can be any of the following values:

MQCLROUTE_DIRECT

When you configure a direct routed clustered topic on a queue manager, all queue managers in the cluster become aware of all other queue managers in the cluster. When performing publish and subscribe operations, each queue manager can connect direct to any other queue manager in the cluster.

MQCLROUTE_TOPIC_HOST

When you use topic host routing, all queue managers in the cluster become aware of the cluster queue managers that host the routed topic definition (that is, the queue managers on which you have defined the topic object). When performing publish and subscribe operations, queue managers in the cluster connect only to these topic host queue managers, and not directly to each other. The topic host queue managers are responsible for routing publications from queue managers on which publications are published to queue managers with matching subscriptions.

CommInfo (MQCFST)

The name of the communication information object (parameter identifier: MQCA_COMM_INFO_NAME).

Shows the resolved value of the name of the communication information object to be used for this topic node.

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

Custom (MQCFST)

Custom attribute for new features (parameter identifier: MQCA_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes have been introduced. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE).

This description will be updated when features using this attribute are introduced.

DefPersistence (MQCFIN)

Default persistence (parameter identifier: MQIA_TOPIC_DEF_PERSISTENCE).

The value can be:

MQPER_PERSISTENCE_AS_PARENT

The default persistence is based on the setting of the closest parent administrative topic object in the topic tree.

MQPER_PERSISTENT

Message is persistent.

MQPER_NOT_PERSISTENT

Message is not persistent.

DefPriority (MQCFIN)

Default priority (parameter identifier: MQIA_DEF_PRIORITY).

DefPutResponse (MQCFIN)

Default put response (parameter identifier: MQIA_DEF_PUT_RESPONSE_TYPE).

The value can be:

MQPRT_ASYNC_RESPONSE

The put operation is issued asynchronously, returning a subset of MQMD fields.

MQPRT_RESPONSE_AS_PARENT

The default put response is based on the setting of the closest parent administrative topic object in the topic tree.

MQPRT_SYNC_RESPONSE

The put operation is issued synchronously, returning a response.

DurableModelQName (MQCFST)

Name of the model queue to be used for durable managed subscriptions (parameter identifier: MQCA_MODEL_DURABLE_Q).

The maximum length of the string is MQ_Q_NAME_LENGTH.

DurableSubscriptions (MQCFIN)

Whether applications are permitted to make durable subscriptions (parameter identifier: MQIA_DURABLE_SUB).

The value can be:

MQSUB_DURABLE_AS_PARENT

Whether durable subscriptions are permitted is based on the setting of the closest parent administrative topic object in the topic tree.

MQSUB_DURABLE_ALLOWED

Durable subscriptions are permitted.

MQSUB_DURABLE_INHIBITED

Durable subscriptions are not permitted.

InhibitPublications (MQCFIN)

Whether publications are allowed for this topic (parameter identifier: MQIA_INHIBIT_PUB).

The value can be:

MQTA_PUB_AS_PARENT

Whether messages can be published to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

MQTA_PUB_INHIBITED

Publications are inhibited for this topic.

MQTA_PUB_ALLOWED

Publications are allowed for this topic.

InhibitSubscriptions (MQCFIN)

Whether subscriptions are allowed for this topic (parameter identifier: MQIA_INHIBIT_SUB).

The value can be:

MQTA_SUB_AS_PARENT

Whether applications can subscribe to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

MQTA_SUB_INHIBITED

Subscriptions are inhibited for this topic.

MQTA_SUB_ALLOWED

Subscriptions are allowed for this topic.

Multicast (MQCFIN)

Whether multicast is used for this topic (parameter identifier: MQIA_MULTICAST).

Returned value:

MQMC_ENABLED

Multicast can be used.

MQMC_DISABLED

Multicast is not used.

MQMC_ONLY

Only Multicast publish/subscribe can be used on this topic.

NonDurableModelQName (MQCFST)

Name of the model queue to be used for non-durable managed subscriptions (parameter identifier: MQCA_MODEL_NON_DURABLE_Q).

The maximum length of the string is MQ_Q_NAME_LENGTH.

NonPersistentMsgDelivery (MQCFIN)

The delivery mechanism for non-persistent messages published to this topic (parameter identifier: MQIA_NPM_DELIVERY).

The value can be:

MQDLV_AS_PARENT

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQDLV_ALL

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_DUR

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a non-persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_AVAIL

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

PersistentMsgDelivery (MQCFIN)

The delivery mechanism for persistent messages published to this topic (parameter identifier: MQIA_PM_DELIVERY).

The value can be:

MQDLV_AS_PARENT

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQDLV_ALL

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_DUR

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_AVAIL

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

ProxySubscriptions (MQCFIN)

Whether a proxy subscription is to be sent for this topic, even if no local subscriptions exist, to directly connected queue managers (parameter identifier: MQIA_PROXY_SUB).

The value can be:

MQTA_PROXY_SUB_FORCE

A proxy subscription is sent to connected queue managers even if no local subscriptions exist.

MQTA_PROXY_SUB_FIRSTUSE

A proxy subscription is sent for this topic only when a local subscription exists.

PublicationScope (MQCFIN)

Whether this queue manager propagates publications to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA_PUB_SCOPE).

The value can be:

MQSCOPE_ALL

Publications for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

MQSCOPE_AS_PARENT

Whether this queue manager propagates publications to queue managers as part of a hierarchy or as part of a publish/subscribe cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQSCOPE_AS_PARENT is the default value for this parameter if no value is specified.

MQSCOPE_QMGR

Publications for this topic are not propagated to other queue managers.

Note: You can override this behavior on a publication-by-publication basis, using MQPMO_SCOPE_QMGR on the Put Message Options.

QMgrName (MQCFST)

Name of local queue manager (parameter identifier: MQCA_CLUSTER_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH

SubscriptionScope (MQCFIN)

Whether this queue manager propagates subscriptions to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA_SUB_SCOPE).

The value can be:

MQSCOPE_ALL

Subscriptions for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

MQSCOPE_AS_PARENT

Whether this queue manager propagates subscriptions to queue managers as part of a hierarchy or as part of a publish/subscribe cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQSCOPE_AS_PARENT is the default value for this parameter if no value is specified.

MQSCOPE_QMGR

Subscriptions for this topic are not propagated to other queue managers.

Note: You can override this behavior on a subscription-by-subscription basis, using MQSO_SCOPE_QMGR on the Subscription Descriptor or SUBSCOPE(QMGR) on DEFINE SUB.

TopicDesc (MQCFST)

Topic description (parameter identifier: MQCA_TOPIC_DESC).

The maximum length is MQ_TOPIC_DESC_LENGTH.

TopicName (MQCFST)

Topic object name (parameter identifier: MQCA_TOPIC_NAME).

The maximum length of the string is MQ_TOPIC_NAME_LENGTH

TopicString (MQCFST)

The topic string (parameter identifier: MQCA_TOPIC_STRING).

The '/' character within this string has special meaning. It delimits the elements in the topic tree. A topic string can start with the '/' character but is not required to. A string starting with the '/' character is not the same as the string which starts without the '/' character. A topic string cannot end with the '/' character.

The maximum length of the string is MQ_TOPIC_STR_LENGTH.

TopicType (MQCFIN)

Whether this object is a local or cluster topic (parameter identifier: MQIA_TOPIC_TYPE).

The value can be:

MQTOPT_LOCAL

This object is a local topic.

MQTOPT_CLUSTER

This object is a cluster topic.

UseDLQ (MQCFIN)

Whether the dead-letter queue (or undelivered message queue) should be used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA_USE_DEAD_LETTER_Q).

The value might be:

MQUSEDLQ_NO

Publication messages that cannot be delivered to their correct subscriber queue are treated as a failure to put the message and the application's MQPUT to a topic will fail in accordance with the settings of NPMMSGDLV and PMSGDLV.

MQUSEDLQ_YES

If the queue manager DEADQ attribute provides the name of a dead-letter queue then it will be used, otherwise the behaviour will be as for MQUSEDLQ_NO.

MQUSEDLQ_AS_PARENT

Whether to use the dead-letter queue is based on the setting of the closest administrative topic object in the topic tree.

WildcardOperation (MQCFIN)

Behavior of subscriptions including wildcards made to this topic (parameter identifier: MQIA_WILDCARD_OPERATION).

The value can be:

MQTA_PASSTHRU

Subscriptions made using wildcard topic names that are less specific than the topic string at this topic object receive publications made to this topic and to topic strings more specific than this topic. MQTA_PASSTHRU is the default supplied with IBM MQ.

MQTA_BLOCK

Subscriptions made using wildcard topic names that are less specific than the topic string at this topic object do not receive publications made to this topic or to topic strings more specific than this topic.

Inquire Topic Names

The Inquire Topic Names (MQCMD_INQUIRE_TOPIC_NAMES) command inquires a list of administrative topic names that match the generic topic name specified.

Required parameters

TopicName (MQCFST)

Administrative topic object name (parameter identifier: MQCA_TOPIC_NAME).

Specifies the name of the administrative topic object that information is to be returned for.

Generic topic object names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

Inquire Topic Names (Response)

The response to the Inquire Topic Names (MQCMD_INQUIRE_TOPIC_NAMES) command consists of the response header followed by a parameter structure giving zero or more names that match the specified administrative topic name.

Additionally, on z/OS only, the **QSGDispositions** parameter structure (with the same number of entries as the *TopicNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *TopicNames* structure.

Always returned:

TopicNames ,  *QSGDispositions*

Returned if requested:

None

Response data**TopicNames (MQCFSL)**

List of topic object names (parameter identifier: MQCACF_TOPIC_NAMES).

**QSGDispositions (MQCFIL)**

List of queue sharing group dispositions (parameter identifier: MQIACF_QSG_DISPS). This parameter is valid on z/OS only. The value can be:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

Inquire Topic Status

The Inquire Topic Status (MQCMD_INQUIRE_TOPIC_STATUS) command inquires the status of a particular topic, or of a topic and its child topics. The Inquire Topic Status command has a required parameter. The Inquire Topic Status command has optional parameters.

Required parameters**TopicString (MQCFST)**

The topic string (parameter identifier: MQCA_TOPIC_STRING).

The name of the topic string to display. IBM MQ uses the topic wildcard characters ('#' and '+') and does not treat a trailing asterisk as a wildcard. For more information about using wildcard characters, refer to the related topic.

The maximum length of the string is MQ_TOPIC_STR_LENGTH.

Optional parameters**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command runs on the queue manager on which you enter it.
- A queue manager name. The command runs on the queue manager that you specify, if it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which you entered the command, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (*). The command runs on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use CommandScope as a filter parameter.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor that you use to restrict the output from the command. The parameter identifier must be an integer type and must be one of the values allowed for *MQIACF_TOPIC_SUB_STATUS*, *MQIACF_TOPIC_PUB_STATUS* or *MQIACF_TOPIC_STATUS*, except *MQIACF_ALL*.

If you specify an integer filter, you cannot also specify a string filter with the **StringFilterCommand** parameter.

StatusType (MQCFIN)

The type of status to return (parameter identifier: *MQIACF_TOPIC_STATUS_TYPE*).

The value can be:

MQIACF_TOPIC_STATUS

MQIACF_TOPIC_SUB

MQIACF_TOPIC_PUB

This command ignores any attribute selectors specified in the *TopicStatusAttrs* list that are not valid for the selected *StatusType* and the command raises no error.

The default value if this parameter is not specified is **MQIACF_TOPIC_STATUS**.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed for *MQIACF_TOPIC_SUB_STATUS*, *MQIACF_TOPIC_PUB_STATUS* or *MQIACF_TOPIC_STATUS*, except *MQIACF_ALL*, or the identifier *MQCA_TOPIC_STRING_FILTER* to filter on the topic string.

Use the parameter identifier to restrict the output from the command by specifying a filter condition. Ensure that the parameter is valid for the type selected in *StatusType*. If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

TopicStatusAttrs (MQCFIL)

Topic status attributes (parameter identifier: *MQIACF_TOPIC_STATUS_ATTRS*)

The default value used if the parameter is not specified is:

MQIACF_ALL

You can specify any of the parameter values listed in [“Inquire Topic Status \(Response\)” on page 1769](#). It is not an error to request status information that is not relevant for a particular status type, but the response contains no information for the value concerned.

Inquire Topic Status (Response)

The response of the Inquire topic (*MQCMD_INQUIRE_TOPIC_STATUS*) command consists of the response header, followed by the *TopicString* structure, and the requested combination of attribute parameter structures (where applicable). The Inquire Topic Status command returns the values requested when the *StatusType* is *MQIACF_TOPIC_STATUS*. The Inquire Topic Status command returns the values requested when the *StatusType* is *MQIACF_TOPIC_STATUS_SUB*. The Inquire Topic Status command returns the values requested when the *StatusType* is *MQIACF_TOPIC_STATUS_PUB*.

Always returned:

TopicString

Returned if requested and StatusType is MQIACF_TOPIC_STATUS:

Cluster, ClusterPubRoute, CommInfo, DefPriority, DefaultPutResponse, DefPersistence, DurableSubscriptions, InhibitPublications, InhibitSubscriptions, AdminTopicName, MCastRelIndicator, Multicast, DurableModelQName, NonDurableModelQName, PersistentMessageDelivery, NonPersistentMessageDelivery, RetainedPublication, PublishCount, SubscriptionScope, SubscriptionCount, PublicationScope, UseDLQ

Note: The Inquire Topic Status command returns only resolved values for the topic, and no AS_PARENT values.

Returned if requested and StatusType is MQIACF_TOPIC_SUB:

SubscriptionId, SubscriptionUserId, Durable, SubscriptionType, MCastRelIndicator, ResumeDate, ResumeTime, LastMessageDate, LastMessageTime, NumberOfMessages, ActiveConnection

Returned if requested and StatusType is MQIACF_TOPIC_PUB:

LastPublishDate, LastPublishTime, MCastRelIndicator, NumberOfPublishes, ActiveConnection

Response data that is always returned

TopicString (MQCFST)

The resolved topic string (parameter identifier: MQCA_TOPIC_STRING). The maximum length of the string is MQ_TOPIC_STR_LENGTH.

Response data (TOPIC_STATUS)

ClusterName (MQCFST)

The name of the cluster to which this topic belongs. (parameter identifier: MQCA_CLUSTER_NAME).

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH. Setting this parameter to a cluster that this queue manager is a member of makes all queue managers in the cluster aware of this topic. Any publication to this topic or a topic string below it put to any queue manager in the cluster is propagated to subscriptions on any other queue manager in the cluster. For more details, see [Distributed publish/subscribe networks](#).

The value can be any of the following values:

Blank

If no topic object above this topic in the topic tree has set this parameter to a cluster name, then this topic does not belong to a cluster. Publications and subscriptions for this topic are not propagated to publish/subscribe cluster-connected queue managers. If a topic node higher in the topic tree has a cluster name set, publications and subscriptions to this topic are also propagated throughout the cluster.

This value is the default value for this parameter if no value is specified.

String

The topic belongs to this cluster. It is not recommended that this is set to a different cluster from a topic object above this topic object in the topic tree. Other queue managers in the cluster will honor this object's definition unless a local definition of the same name exists on those queue managers.

Additionally, if **PublicationScope** or **SubscriptionScope** are set to MQSCOPE_ALL, this value is the cluster to be used for the propagation of publications and subscriptions, for this topic, to publish/subscribe cluster-connected queue managers.

ClusterPubRoute (MQCFIN)

The routing behavior to use for this topic in the cluster (parameter identifier: MQIA_CLUSTER_PUB_ROUTE).

The values can be as follows:

MQCLROUTE_DIRECT

A publication on this topic string, originating from this queue manager, is sent direct to any queue manager in the cluster with a matching subscription.

MQCLROUTE_TOPIC_HOST

A publication on this topic string, originating from this queue manager, is sent to one of the queue managers in the cluster that hosts a definition of the corresponding clustered topic object, and from there to any queue manager in the cluster with a matching subscription.

MQCLROUTE_NONE

This topic node is not clustered.

CommInfo (MQCFST)

The name of the communication information object (parameter identifier: MQCA_COMM_INFO_NAME).

Shows the resolved value of the name of the communication information object to be used for this topic node.

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

DefPersistence (MQCFIN)

Default persistence (parameter identifier: MQIA_TOPIC_DEF_PERSISTENCE).

Returned value:

MQPER_PERSISTENT

Message is persistent.

MQPER_NOT_PERSISTENT

Message is not persistent.

DefaultPutResponse (MQCFIN)

Default put response (parameter identifier: MQIA_DEF_PUT_RESPONSE_TYPE).

Returned value:

MQPRT_SYNC_RESPONSE

The put operation is issued synchronously, returning a response.

MQPRT_ASYNC_RESPONSE

The put operation is issued asynchronously, returning a subset of MQMD fields.

DefPriority (MQCFIN)

Default priority (parameter identifier: MQIA_DEF_PRIORITY).

Shows the resolved default priority of messages published to the topic.

DurableSubscriptions (MQCFIN)

Whether applications are permitted to make durable subscriptions (parameter identifier: MQIA_DURABLE_SUB).

Returned value:

MQSUB_DURABLE_ALLOWED

Durable subscriptions are permitted.

MQSUB_DURABLE_INHIBITED

Durable subscriptions are not permitted.

InhibitPublications (MQCFIN)

Whether publications are allowed for this topic (parameter identifier: MQIA_INHIBIT_PUB).

Returned value:

MQTA_PUB_INHIBITED

Publications are inhibited for this topic.

MQTA_PUB_ALLOWED

Publications are allowed for this topic.

InhibitSubscriptions (MQCFIN)

Whether subscriptions are allowed for this topic (parameter identifier: MQIA_INHIBIT_SUB).

Returned value:

MQTA_SUB_INHIBITED

Subscriptions are inhibited for this topic.

MQTA_SUB_ALLOWED

Subscriptions are allowed for this topic.

AdminTopicName (MQCFST)

Topic object name (parameter identifier: MQCA_ADMIN_TOPIC_NAME).

If the topic is an admin-node, the command displays the associated topic object name containing the node configuration. If the field is not an admin-node the command displays a blank.

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

MCastRelIndicator (MQCFIN)

The multicast reliability indicator (parameter identifier: MQIACF_MCAST_REL_INDICATOR). The values are expressed as a percentage. A value of 100 indicates that all messages are being delivered without problems. A value less than 100 indicates that some of the messages are experiencing network issues. Two values are returned, in this order:

1. A value based on recent activity over a short period.
2. A value based on activity over a longer period.

Multicast (MQCFIN)

Whether multicast is used for this topic (parameter identifier: MQIA_MULTICAST).

Returned value:

MQMC_ENABLED

Multicast can be used.

MQMC_DISABLED

Multicast is not used.

MQMC_ONLY

Only Multicast publish/subscribe can be used on this topic.

DurableModelQName (MQCFST)

The name of the model queue used for managed durable subscriptions (parameter identifier: MQCA_MODEL_DURABLE_Q).

Shows the resolved value of the name of the model queue to be used for durable subscriptions that request the queue manager to manage the destination of publications.

The maximum length of the string is MQ_Q_NAME_LENGTH.

NonDurableModelQName (MQCFST)

The name of the model queue for managed non-durable subscriptions (parameter identifier: MQCA_MODEL_NON_DURABLE_Q).

The maximum length of the string is MQ_Q_NAME_LENGTH.

PersistentMessageDelivery (MQCFIN)

Delivery mechanism for persistent messages published to this topic (parameter identifier: MQIA_PM_DELIVERY).

Returned value:

MQDLV_ALL

Persistent messages must be delivered to all subscribers, irrespective of durability, for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

MQDLV_ALL_DUR

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

MQDLV_ALL_AVAIL

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

NonPersistentMessageDelivery (MQCFIN)

Delivery mechanism for non-persistent messages published to this topic (parameter identifier: MQIA_NPM_DELIVERY).

Returned value:

MQDLV_ALL

Non-persistent messages must be delivered to all subscribers, irrespective of durability, for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

MQDLV_ALL_DUR

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a non-persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

MQDLV_ALL_AVAIL

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

RetainedPublication (MQCFIN)

Whether there is a retained publication for this topic (parameter identifier: MQIACF_RETAINED_PUBLICATION).

Returned value:

MQQSO_YES

There is a retained publication for this topic.

MQQSO_NO

There is no retained publication for this topic.

PublishCount (MQCFIN)

Publish count (parameter identifier: MQIA_PUB_COUNT).

The number of applications currently publishing to the topic.

SubscriptionCount (MQCFIN)

Subscription count (parameter identifier: MQIA_SUB_COUNT).

The number of subscribers for this topic string, including durable subscribers who are not currently connected.

SubscriptionScope (MQCFIN)

Determines whether this queue manager propagates subscriptions for this topic to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA_SUB_SCOPE).

Returned value:

MQSCOPE_QMGR

The queue manager does not propagate subscriptions for this topic to other queue managers.

MQSCOPE_ALL

The queue manager propagates subscriptions for this topic to hierarchically connected queue managers and to publish/subscribe cluster connected queues.

PublicationScope (MQCFIN)

Determines whether this queue manager propagates publications for this topic to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA_PUB_SCOPE).

Returned value:

MQSCOPE_QMGR

The queue manager does not propagate publications for this topic to other queue managers.

MQSCOPE_ALL

The queue manager propagates publications for this topic to hierarchically connected queue managers and to publish/subscribe cluster connected queues.

UseDLQ (MQCFIN)

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA_USE_DEAD_LETTER_Q).

The value can be any of the following values:

MQUSEDLQ_NO

Publication messages that cannot be delivered to their correct subscriber queue are treated as a failure to put the message. The MQPUT of an application to a topic fails in accordance with the settings of MQIA_NPM_DELIVERY and MQIA_PM_DELIVERY.

MQUSEDLQ_YES

If the DEADQ queue manager attribute provides the name of a dead-letter queue then it is used, otherwise the behavior is as for MQUSEDLQ_NO.

Response data (TOPIC_STATUS_SUB)

SubscriptionId (MQCFBS)

Subscription identifier (parameter identifier: MQBACF_SUB_ID).

The queue manager assigns *SubscriptionId* as an all time unique identifier for this subscription.

The maximum length of the string is MQ_CORREL_ID_LENGTH.

SubscriptionUserId (MQCFST)

The user ID that owns this subscription (parameter identifier: MQCACF_SUB_USER_ID).

The maximum length of the string is MQ_USER_ID_LENGTH.

Durable (MQCFIN)

Whether this subscription is a durable subscription (parameter identifier: MQIACF_DURABLE_SUBSCRIPTION).

MQSUB_DURABLE_YES

The subscription persists, even if the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. The queue manager reinstates the subscription during restart.

MQSUB_DURABLE_NO

The subscription is non-durable. The queue manager removes the subscription when the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. If the subscription has a destination class (DESTCLAS) of MANAGED, the queue manager removes any messages not yet consumed when it closes the subscription.

SubscriptionType (MQCFIN)

The type of subscription (parameter identifier: MQIACF_SUB_TYPE).

The value can be:

MQSUBTYPE_ADMIN

MQSUBTYPE_API

MQSUBTYPE_PROXY

MCastRelIndicator (MQCFIN)

The multicast reliability indicator (parameter identifier: MQIACF_MCAST_REL_INDICATOR). The values are expressed as a percentage. A value of 100 indicates that all messages are being delivered without problems. A value less than 100 indicates that some of the messages are experiencing network issues. Two values are returned, in this order:

1. A value based on recent activity over a short period.
2. A value based on activity over a longer period.

ResumeDate (MQCFST)

Date of the most recent MQSUB call that connected to this subscription (parameter identifier: MQCA_RESUME_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

ResumeTime (MQCFST)

Time of the most recent MQSUB call that connected to this subscription (parameter identifier: MQCA_RESUME_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

LastMessageDate (MQCFST)

Date on which an MQPUT call last sent a message to this subscription. The queue manager updates the date field after the MQPUT call successfully puts a message to the destination specified by this subscription (parameter identifier: MQCACF_LAST_MSG_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

Note: An MQSUBRQ call updates this value.

LastMessageTime (MQCFST)

Time at which an MQPUT call last sent a message to this subscription. The queue manager updates the time field after the MQPUT call successfully puts a message to the destination specified by this subscription (parameter identifier: MQCACF_LAST_MSG_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

Note: An MQSUBRQ call updates this value.

NumberOfMessages (MQCFIN)

Number of messages put to the destination specified by this subscription (parameter identifier: MQIACF_MESSAGE_COUNT).

Note: An MQSUBRQ call updates this value.

ActiveConnection (MQCFBS)

The currently active *ConnectionId* (CONNID) that opened this subscription (parameter identifier: MQBACF_CONNECTION_ID).

The maximum length of the string is MQ_CONNECTION_ID_LENGTH.

Response data (TOPIC_STATUS_PUB)**LastPublicationDate (MQCFST)**

Date on which this publisher last sent a message (parameter identifier: MQCACF_LAST_PUB_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

LastPublicationTime (MQCFST)

Time at which this publisher last sent a message (parameter identifier: MQCACF_LAST_PUB_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

MCastRelIndicator (MQCFIN)

The multicast reliability indicator (parameter identifier: MQIACF_MCAST_REL_INDICATOR). The values are expressed as a percentage. A value of 100 indicates that all messages are being delivered without problems. A value less than 100 indicates that some of the messages are experiencing network issues. Two values are returned, in this order:

1. A value based on recent activity over a short period.
2. A value based on activity over a longer period.

NumberOfPublishes (MQCFIN)

Number of publishes made by this publisher (parameter identifier: MQIACF_PUBLISH_COUNT).

ActiveConnection (MQCFBS)

The currently active *ConnectionId* (CONNID) associated with the handle that has this topic open for publish (parameter identifier: MQBACF_CONNECTION_ID).

The maximum length of the string is MQ_CONNECTION_ID_LENGTH.

 **Inquire Usage on z/OS**

The Inquire Usage (MQCMD_INQUIRE_USAGE) command inquires about the current state of a page set, or information about the log data sets.

Optional parameters**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

PageSetId (MQCFIN)

Page set identifier (parameter identifier: MQIA_PAGESET_ID). If you omit this parameter, all page set identifiers are returned.

UsageType (MQCFIN)

The type of information to be returned (parameter identifier: MQIACF_USAGE_TYPE).

The value can be any of the following values:

MQIACF_USAGE_PAGESET

Return page set (MQIACF_USAGE_PAGESET) and buffer pool information (MQIACF_USAGE_BUFFER_POOL).

MQIACF_USAGE_DATA_SET

Return data set information for log data sets (MQIACF_USAGE_DATA_SET).

MQIACF_ALL

Return page set, buffer pool, and data set information (MQIACF_USAGE_PAGESET), (MQIACF_USAGE_BUFFER_POOL), and (MQIACF_USAGE_DATA_SET).

MQIACF_USAGE_SMDS

Return shared message data set usage (MQIACF_USAGE_SMDS) and buffer pool information (MQIACF_USAGE_BUFFER_POOL).

This includes the allocated, and used space for each data set, and information about the number of buffers currently active, the number with valid contents, and the number of free buffers.

Inquire Usage (Response) on z/OS

The response to the Inquire Usage (MQCMD_INQUIRE_USAGE) command consists of the response header followed by one or more *UsageType* structure and a set of attribute parameter structures determined by the value of *UsageType* in the Inquire command.

Always returned:

UsageType

Possible values of *ParameterType* are:

MQIACF_USAGE_PAGESET

Page set information.

MQIACF_USAGE_BUFFER_POOL

Buffer pool information.

MQIACF_USAGE_DATA_SET

Data set information for log data sets.

MQIACF_USAGE_SMDS

Return shared message data set usage and buffer pool information.

This includes the allocated, and used space for each data set, and information about the number of buffers currently active, the number with valid contents, and the number of free buffers.

Returned if *UsageType* is MQIACF_USAGE_PAGESET:

BufferPoolId, ExpandCount, ExpandType, LogRBA, NonPersistentDataPages, PageSetId, PageSetStatus, PersistentDataPages, TotalPages, UnusedPages

Returned if *UsageType* is MQIACF_USAGE_BUFFER_POOL:

BufferPoolId, FreeBuffers, FreeBuffersPercentage, TotalBuffers, BufferPoolLocation, PageClass

Returned if *UsageType* is MQIACF_USAGE_DATA_SET:

DataSetName, DataSetType, LogRBA, LogLRSN

Returned if *UsageType* is MQIACF_USAGE_SMDS:

DataSetName, DataSetType

Response data if *UsageType* is MQIACF_USAGE_PAGESET

BufferPoolId (MQCFIN)

Buffer pool identifier (parameter identifier: MQIACF_BUFFER_POOL_ID).

This parameter identifies the buffer pool being used by the page set.

ExpandCount (MQCFIN)

The number of times the page set has been dynamically expanded since restart (parameter identifier: MQIACF_USAGE_EXPAND_COUNT).

ExpandType (MQCFIN)

How the queue manager expands a page set when it becomes nearly full, and further pages are required within it (parameter identifier: MQIACF_USAGE_EXPAND_TYPE).

The value can be:

MQUSAGE_EXPAND_NONE

No further page set expansion is to take place.

MQUSAGE_EXPAND_USER

The secondary extent size that was specified when the page set was defined is used. If no secondary extent size was specified, or it was specified as zero, then no dynamic page set expansion can take place.

At restart, if a previously used page set has been replaced with a data set that is smaller, it is expanded until it reaches the size of the previously used data set. Only one extent is required to reach this size.

MQUSAGE_EXPAND_SYSTEM

A secondary extent size that is approximately 10 per cent of the current size of the page set is used. MQUSAGE_EXPAND_SYSTEM can be rounded up to the nearest cylinder of DASD.

NonPersistentDataPages (MQCFIN)

The number of pages holding nonpersistent data (parameter identifier: MQIACF_USAGE_NONPERSIST_PAGES).

These pages are being used to store nonpersistent message data.

PageSetId (MQCFIN)

Page set identifier (parameter identifier: MQIA_PAGESET_ID).

The string consists of two numeric characters, in the range 00 through 99.

PageSetStatus (MQCFIN)

Current status of the page set (parameter identifier: MQIACF_PAGESET_STATUS).

The value can be any of the following values:

MQUSAGE_PS_AVAILABLE

The page set is available.

MQUSAGE_PS_DEFINED

The page set has been defined but has never been used.

MQUSAGE_PS_OFFLINE

The page set is currently not accessible by the queue manager, for example because the page set has not been defined to the queue manager.

MQUSAGE_PS_NOT_DEFINED

The command was issued for a specific page set that is not defined to the queue manager.

MQUSAGE_PS_SUSPENDED

The page set has been suspended. For further information about suspended page sets, see message [CSQP059E](#).

PersistentDataPages (MQCFIN)

The number of pages holding persistent data (parameter identifier: MQIACF_USAGE_PERSIST_PAGES).

These pages are being used to store object definitions and persistent message data.

TotalPages (MQCFIN)

The total number of 4 KB pages in the page set (parameter identifier: MQIACF_USAGE_TOTAL_PAGES).

UnusedPages (MQCFIN)

The number of pages that are not used (that is, available page sets) (parameter identifier: MQIACF_USAGE_UNUSED_PAGES).

LogRBA (MQCFST)

Log RBA (parameter identifier: MQCACF_USAGE_LOG_RBA).

The maximum length is MQ_RBA_LENGTH.

This response is returned only if PageSetStatus is set to MQUSAGE_PS_NOT_DEFINED or MQUSAGE_PS_SUSPENDED. However, the response is not always returned if PageSetStatus is set to MQUSAGE_PS_NOT_DEFINED.

A value of 'FFFFFFFFFFFFFFFF' indicates that the page set has never been online.

Response data if UsageType is MQIACF_USAGE_BUFFER_POOL**BufferPoolId (MQCFIN)**

Buffer pool identifier (parameter identifier: MQIACF_BUFFER_POOL_ID).

This parameter identifies the buffer pool being used by the page set.

FreeBuffers (MQCFIN)

Number of free buffers (parameter identifier: MQIACF_USAGE_FREE_BUFF).

FreeBuffersPercentage (MQCFIN)

Number of free buffers as a percentage of all buffers in the buffer pool (parameter identifier: MQIACF_USAGE_FREE_BUFF_PERC).

TotalBuffers (MQCFIN)

The number of buffers defined for specified buffer pool (parameter identifier: MQIACF_USAGE_TOTAL_BUFFERS).

BufferPoolLocation (MQCFIN)

The location of the buffers in this buffer pool relative to the bar. This is one of the following values:

MQBPLOCATION_ABOVE

All buffer pool buffers are above the bar.

MQBPLOCATION_BELOW

All buffer pool buffers are below the bar.

MQBPLOCATION_SWITCHING_ABOVE

Buffer pool buffers are being moved above the bar.

MQBPLOCATION_SWITCHING_BELOW

Buffer pool buffers are being moved below the bar.

PageClass (MQCFIN)

The type of virtual storage pages used for backing the buffers in the buffer pool. This is one of the following values:

MQPAGECLAS_4KB

Pageable 4 KB pages are used.

MQPAGECLAS_FIXED4KB

Fixed 4 KB pages are used.

Response data if UsageType is MQIACF_USAGE_DATA_SET**DataSetName (MQCFST)**

Data set name (parameter identifier: MQCACF_DATA_SET_NAME).

The maximum length is MQ_DATA_SET_NAME_LENGTH.

DataSetType (MQCFIN)

The type of data set, and circumstance (parameter identifier: MQIACF_USAGE_DATA_SET_TYPE).

The value can be:

MQUSAGE_DS_OLDEST_ACTIVE_UOW

The log data set containing the start RBA of the oldest active unit of work for the queue manager

MQUSAGE_DS_OLDEST_PS_RECOVERY

The log data set containing the oldest restart RBA of any page set for the queue manager.

MQUSAGE_DS_OLDEST_CF_RECOVERY

The log data set containing the LRSN which matches the time of the oldest current backup of any CF structure in the queue sharing group.

LogRBA (MQCFST)

Log RBA (parameter identifier: MQCACF_USAGE_LOG_RBA).

The maximum length is MQ_RBA_LENGTH.

LogLRSN (MQCFST)

Log LRSN (parameter identifier: MQIACF_USAGE_LOG_LRSN).

The length of the string is MQ_LRSN_LENGTH.

Response data if UsageType is MQIACF_USAGE_SMDS

SMDSStatus (MQCFIN)

SMDS status (parameter identifier: MQIACF_SMDS_STATUS).

MQUSAGE_SMDS_NO_DATA

There is no SMDS data available. Nothing further is returned.

MQUSAGE_SMDS_AVAILABLE

For each CF structure two sets of PCF data are returned:

A

CFStrucNames (MQCFSL)

List of CF application structure names (parameter identifier: MQCACF_CF_STRUC_NAME).

MQIACF_USAGE_OFFLOAD_MSGS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_OFFLOAD_MSGS).

MQIACF_USAGE_TOTAL_BLOCKS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_TOTAL_BLOCKS).

MQIACF_USAGE_DATA_BLOCKS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_DATA_BLOCKS).

MQIACF_USAGE_USED_BLOCKS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_USED_BLOCKS).

MQIACF_USAGE_USED_RATE (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_USED_RATE).

MQIACF_SMDS_STATUS (MQCFIN)

Description required (parameter identifier: MQIACF_SMDS_STATUS). The value is MQUSAGE_SMDS_AVAILABLE.

MQIACF_USAGE_TYPE (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_TYPE).

B

CFStrucNames (MQCFSL)

List of CF application structure names (parameter identifier: MQCACF_CF_STRUC_NAME).

MQIACF_USAGE_BLOCK_SIZE (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_BLOCK_SIZE).

MQIACF_USAGE_TOTAL_BUFFERS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_TOTAL_BUFFERS).

MQIACF_USAGE_INUSE_BUFFERS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_INUSE_BUFFERS).

MQIACF_USAGE_SAVED_BUFFERS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_SAVED_BUFFERS).

MQIACF_USAGE_EMPTY_BUFFERS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_EMPTY_BUFFERS).

MQIACF_USAGE_READS_SAVED (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_READS_SAVED).

MQIACF_USAGE_LOWEST_FREE (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_LOWEST_FREE).

MQIACF_USAGE_WAIT_RATE (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_WAIT_RATE).

MQIACF_SMDS_STATUS (MQCFIN)

Description required (parameter identifier: MQIACF_SMDS_STATUS). The value is MQUSAGE_SMDS_AVAILABLE.

MQIACF_USAGE_TYPE (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_TYPE).

Move Queue on z/OS

The Move Queue (MQCMD_MOVE_Q) command moves all the messages from one local queue to another.

Required parameters

FromQName (MQCFST)

From queue name (parameter identifier: MQCACF_FROM_Q_NAME).

The name of the local queue from which messages are moved. The name must be defined to the local queue manager.

The command fails if the queue contains uncommitted messages.

If an application has this queue open, or has open a queue that eventually resolves to this queue, the command fails. For example, the command fails if this queue is a transmission queue, and any queue that is, or resolves to, a remote queue that references this transmission queue, is open.

An application can open this queue while the command is in progress but the application waits until the command has completed.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Optional parameters (Move Queue)

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

MoveType (MQCFIN)

Move type (parameter identifier: MQIA_QSG_DISP).

Specifies how the messages are moved. The value can be any of the following values:

MQIACF_MOVE_TYPE_MOVE

Move the messages from the source queue to the empty target queue.

The command fails if the target queue already contains one or more messages. The messages are deleted from the source queue. MQIACF_MOVE_TYPE_MOVE is the default value.

MQIACF_MOVE_TYPE_ADD

Move the messages from the source queue and add them to any messages already on the target queue.

The messages are deleted from the source queue.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_PRIVATE

The object is defined as either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE is the default value.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED. MQQSGD_SHARED is valid only in a shared queue environment.

ToQName (MQCFST)

To queue name (parameter identifier: MQCACF_TO_Q_NAME).

The name of the local queue to which messages are moved. The name must be defined to the local queue manager.

The name of the target queue can be the same as the name of the source queue only if the queue exists as both a shared and a private queue. In this case, the command moves messages to the queue that has the opposite disposition (shared or private) from that disposition specified for the source queue on the **QSGDisposition** parameter.

If an application has this queue open, or has open a queue that eventually resolves to this queue, the command fails. The command also fails if this queue is a transmission queue, and any queue that is, or resolves to, a remote queue that references this transmission queue, is open.

No application can open this queue while the command is in progress.

If you specify a value of MQIACF_MOVE_TYPE_MOVE on the **MoveType** parameter, the command fails if the target queue already contains one or more messages.

The **DefinitionType**, **HardenGetBackout**, **Usage** parameters of the target queue must be the same as those parameters of the source queue.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Ping Channel

The Ping Channel (MQCMD_PING_CHANNEL) command tests a channel by sending data as a special message to the remote message queue manager and checking that the data is returned. The data is generated by the local queue manager.

This command can only be used for channels with a *ChannelType* value of MQCHT_SENDER, MQCHT_SERVER, or MQCHT_CLUSSDR.

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

The command is not valid if the channel is running; however it is valid if the channel is stopped or in retry mode.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel to be tested. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Optional parameters

DataCount (MQCFIN)

Data count (parameter identifier: MQIACH_DATA_COUNT).

Specifies the length of the data.

Specify a value in the range 16 through 32 768. The default value is 64 bytes.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH_CHANNEL_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be tested.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

MQCHLD_PRIVATE

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD_SHARED.

MQCHLD_SHARED

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD_SHARED.

MQCHLD_FIXSHARED

Tests shared channels, tied to a specific queue manager.

The combination of the **ChannelDisposition** and **CommandScope** parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.
- On the most suitable queue manager in the group, determined automatically by the queue manager itself.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in [Table 103 on page 1784](#)

Table 103. ChannelDisposition and CommandScope for PING CHANNEL

ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name	CommandScope (*)
MQCHLD_PRIVATE	Ping private channel on the local queue manager	Ping private channel on the named queue manager	Ping private channel on all active queue managers
MQCHLD_SHARED	<p>Ping a shared channel on the most suitable queue manager in the group</p> <p>MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted	Not permitted
MQCHLD_FIXSHARED	Ping a shared channel on the local queue manager	Ping a shared channel on the named queue manager	Not permitted

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands”](#) on page 1343.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_ALLOCATE_FAILED

Allocation failed.

MQRCCF_BIND_FAILED

Bind failed.

MQRCCF_CCSID_ERROR

Coded character-set identifier error.

MQRCCF_CHANNEL_CLOSED

Channel closed.

MQRCCF_CHANNEL_IN_USE

Channel in use.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHANNEL_TYPE_ERROR	Channel type not valid.
MQRCCF_CONFIGURATION_ERROR	Configuration error.
MQRCCF_CONNECTION_CLOSED	Connection closed.
MQRCCF_CONNECTION_REFUSED	Connection refused.
MQRCCF_DATA_TOO_LARGE	Data too large.
MQRCCF_ENTRY_ERROR	Connection name not valid.
MQRCCF_HOST_NOT_AVAILABLE	Remote system not available.
MQRCCF_NO_COMMS_MANAGER	Communications manager not available.
MQRCCF_PING_DATA_COMPARE_ERROR	Ping Channel command failed.
MQRCCF_PING_DATA_COUNT_ERROR	Data count not valid.
MQRCCF_PING_ERROR	Ping error.
MQRCCF_RECEIVE_FAILED	Receive failed.
MQRCCF_RECEIVED_DATA_ERROR	Received data error.
MQRCCF_REMOTE_QM_TERMINATING	Remote queue manager terminating.
MQRCCF_REMOTE_QM_UNAVAILABLE	Remote queue manager not available.
MQRCCF_SEND_FAILED	Send failed.
MQRCCF_STRUCTURE_TYPE_ERROR	Structure type not valid.
MQRCCF_TERMINATED_BY_SEC_EXIT	Channel terminated by security exit.
MQRCCF_UNKNOWN_REMOTE_CHANNEL	Remote channel not known.
MQRCCF_USER_EXIT_NOT_AVAILABLE	User exit not available.

Ping Queue Manager on Multiplatforms

The Ping Queue Manager (MQCMD_PING_Q_MGR) command tests whether the queue manager and its command server is responsive to commands. If the queue manager is responding a positive reply is returned.

Required parameters:

None

Optional parameters:

None

The Purge Channel (MQCMD_PURGE_CHANNEL) command stops and purges an IBM MQ telemetry channel.

This command can only be issued to an MQTT channel type.

Purging a telemetry channel disconnects all the MQTT clients connect to it, cleans up the state of the MQTT clients, and stops the telemetry channel. Cleaning the state of a client deletes all the pending publications and removes all the subscriptions from the client.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel to be stopped and purged. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelType (MQCFIN)

Channel type. This parameter must follow immediately after the **ChannelName** parameter, and the value must be MQTT.

Optional parameters

ClientIdentifier (MQCFST)

Client identifier. The client identifier is a 23-byte string that identifies an MQ Telemetry Transport client. When the Purge Channel command specifies a *ClientIdentifier*, only the connection for the specified client identifier is purged. If the *ClientIdentifier* is not specified, all the connections on the channel are purged.

The maximum length of the string is MQ_CLIENT_ID_LENGTH.

Recover CF Structure on z/OS

The Recover CF Structure (MQCMD_RECOVER_CF_STRUC) command initiates recovery of CF application structures.

Note: This command is valid only on z/OS when the queue manager is a member of a queue sharing group.

Required parameters

CFStrucName (MQCFST)

CF application structure name (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_Q_MGR_NAME_LENGTH.

Purge (MQCFIN)

Recover to empty CF structure (parameter identifier: MQIACF_PURGE).

Specifies whether the CF application structure is emptied. The value can be any of the following values:

MQPO_YES

Recover to empty CF structure. Any messages in the CF structure are lost.

MQPO_NO

Performs a true recovery of the CF structure. MQPO_NO is the default value.

Refresh Cluster

The Refresh Cluster (MQCMD_REFRESH_CLUSTER) command discards all locally held cluster information, including any auto-defined channels that are not in doubt, and forces the repository to be rebuilt.

Note: For large clusters, use of the **REFRESH CLUSTER** command can be disruptive to the cluster while it is in progress, and again at 27 day intervals thereafter when the cluster objects automatically send status updates to all interested queue managers. See [Refreshing in a large cluster can affect performance and availability of the cluster](#).

Required parameters

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

The name of the cluster to be refreshed.

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

This parameter is the name of the cluster to be refreshed. If an asterisk (*) is specified for the name, the queue manager is refreshed in all the clusters to which it belongs.

If an asterisk (*) is specified with *RefreshRepository* set to MQCFO_REFRESH_REPOSITORY_YES, the queue manager restarts its search for repository queue managers, using information in the local cluster-sender channel definitions.

Optional parameters

 z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

RefreshRepository (MQCFIN)

Whether repository information is refreshed (parameter identifier: MQIACF_REFRESH_REPOSITORY).

This parameter indicates whether the information about repository queue managers is refreshed.

The value can be:

MQCFO_REFRESH_REPOSITORY_YES

Refresh repository information.

This value cannot be specified if the queue manager is itself a repository queue manager.

MQCFO_REFRESH_REPOSITORY_YES specifies that in addition to MQCFO_REFRESH_REPOSITORY_NO behavior, objects representing full repository cluster queue managers are also refreshed. Do not use this option if the queue manager is itself a full repository.

If it is a full repository, you must first alter it so that it is not a full repository for the cluster in question.

The full repository location is recovered from the manually defined cluster-sender channel definitions. After the refresh with MQCFO_REFRESH_REPOSITORY_YES has been issued the queue manager can be altered so that it is once again a full repository.

MQCFO_REFRESH_REPOSITORY

Do not refresh repository information. MQCFO_REFRESH_REPOSITORY is the default.

If you select MQCFO_REFRESH_REPOSITORY_YES, check that all cluster-sender channels in the relevant cluster are inactive or stopped before you issue the Refresh Cluster command. If there are cluster-sender channels running at the time when the Refresh is processed, and they are used exclusively by the cluster or clusters being refreshed and MQCFO_REFRESH_REPOSITORY_YES is used, the channels are stopped, by using the Stop Channel command with a value of MQMODE_FORCE in the **Mode** parameter if necessary.

This scenario ensures that the Refresh can remove the channel state and that the channel will run with the refreshed version after the Refresh has completed. If the state of a channel cannot be deleted, for example because it is in doubt, or because it is also running as part of another cluster, its state is not new after the refresh and it does not automatically restart if it was stopped.

Related information

[Clustering: Using REFRESH CLUSTER best practices](#)

Refresh Queue Manager

Use the Refresh Queue Manager (MQCMD_REFRESH_Q_MGR) command to perform special operations on queue managers.

Required parameters

RefreshType (MQCFIN)

Type of information to be refreshed (parameter identifier: MQIACF_REFRESH_TYPE).

Use this parameter to specify the type of information to be refreshed. The value can be any of the following values:

MQRT_CONFIGURATION

MQRT_CONFIGURATION causes the queue manager to generate configuration event messages for every object definition that matches the selection criteria specified by the **ObjectType**, **ObjectName**, and **RefreshInterval** parameters.

A Refresh Queue Manager command with a **RefreshType** value of MQRT_CONFIGURATION is generated automatically when the value of the queue manager's **ConfigurationEvent** parameter changes from MQEVR_DISABLED to MQEVR_ENABLED.

Use this command with a **RefreshType** of MQRT_CONFIGURATION to recover from problems such as errors on the event queue. In such cases, use appropriate selection criteria, to avoid excessive processing time and event message generation.

MQRT_EXPIRY

This requests that the queue manager performs a scan to discard expired messages for every queue that matches the selection criteria specified by the **ObjectName** parameter.

Note:  Valid only on z/OS.

MQRT_EARLY

Requests that the subsystem function routines (generally known as early code) for the queue manager replace themselves with the corresponding routines in the linkpack area (LPA).

You need to use this command only after you install new subsystem function routines (provided as corrective maintenance or with a new version or release of IBM MQ). This command instructs the queue manager to use the new routines.

 See [Task 3: Update the z/OS link list and LPA](#) for more information about IBM MQ early code routines.

MQRT_PROXYSUB

Requests that the queue manager resynchronizes the proxy subscriptions that are held with, and on behalf of, queue managers that are connected in a hierarchy or publish/subscribe cluster.

You should only resynchronize the proxy subscriptions in exceptional circumstances. See [Resynchronization of proxy subscriptions](#).

Optional parameters (Refresh Queue Manager)

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

ObjectName (MQCFST)

Name of object to be included in the processing of this command (parameter identifier: MQCACF_OBJECT_NAME).

Use this parameter to specify the name of the object to be included in the processing of this command.

Generic names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ_OBJECT_NAME_LENGTH.

ObjectType (MQCFIN)

Object type for which configuration data is to be refreshed (parameter identifier: MQIACF_OBJECT_TYPE).

Use this parameter to specify the object type for which configuration data is to be refreshed. This parameter is valid only if the value of *RefreshType* is MQRT_CONFIGURATION. The default value, in that case, is MQOT_ALL. The value can be one of:

MQOT_AUTH_INFO

Authentication information object.

MQOT_CF_STRUC

CF structure.

MQOT_CHANNEL

Channel.

MQOT_CHLAUTH

Channel authentication

MQOT_LISTENER

Listener.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process definition.

MQOT_Q

Queue.

MQOT_LOCAL_Q

Local queue.

MQOT_MODEL_Q

Model queue.

MQOT_ALIAS_Q

Alias queue.

MQOT_REMOTE_Q

Remote queue.

MQOT_Q_MGR

Queue manager.

MQOT_CFSTRUC

CF structure.

MQOT_SERVICE

Service.

Note:  Not valid on z/OS.**MQOT_STORAGE_CLASS**

Storage class.

MQOT_TOPIC

Topic name.

RefreshInterval (MQCFIN)

Refresh interval (parameter identifier: MQIACF_REFRESH_INTERVAL).

Use this parameter to specify a value, in minutes, defining a period immediately before the current time. This requests that only objects that have been created or altered within that period (as defined by their *AlterationDate* and **AlterationTime** attributes) are included.

Specify a value in the range zero through 999 999. A value of zero means there is no time limit (0 is the default).

This parameter is valid only if the value of *RefreshType* is MQRT_CONFIGURATION.

Usage Notes for Refresh Queue Manager

1. Issue this command with *RefreshType* (MQRT_CONFIGURATION) after setting the MQRT_CONFIGURATION queue manager attribute to ENABLED, to bring the queue manager configuration up to date. To ensure that complete configuration information is generated, include all objects; if you have many objects, it might be preferable to use several commands, each with a different selection of objects, but such that all are included.

2. You can also use the command with *RefreshType* (MQRT_CONFIGURATION) to recover from problems such as errors on the event queue. In such cases, use appropriate selection criteria, to avoid excessive processing time and event messages generation.
3. Issue the command with *RefreshType* (MQRT_EXPIRY) at any time when you believe that a queue could contain numbers of expired messages.
4. If *RefreshType* (MQRT_EARLY) is specified, no other keywords are allowed and the command can be issued only from the z/OS console and only if the queue manager is not active.
5. You are unlikely to use **Refresh Queue Manager RefreshType (MQRT_PROXYSUB)** other than in exceptional circumstances. See [Resynchronization of proxy subscriptions](#).
6. If a **Refresh Queue Manager Object Type(MQRT_PROXYSUB)** command is issued on z/OS when the CHINIT is not running, the command is queued up and will be processed when the CHINIT starts.
7. Running the command Refresh Queue Manager RefreshType (MQRT_CONFIGURATION) Object Type(MQOT_ALL) includes authority records.

You cannot specify the **Refresh Interval** and **Object Name** parameters if you explicitly specify Authority Record events. If you specify **Object Type(MQOT_ALL)** the **Refresh Interval** and **Object Name** parameters are ignored.

Refresh Security

The Refresh Security (MQCMD_REFRESH_SECURITY) command refreshes the list of authorizations held internally by the authorization service component.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

SecurityItem (MQCFIN)

Resource class for which the security refresh is to be performed (parameter identifier: MQIACF_SECURITY_ITEM). This parameter applies to z/OS only.

Use this parameter to specify the resource class for which the security refresh is to be performed. The value can be any of the following values:

MQSECITEM_ALL

A full refresh of the type specified is performed. MQSECITEM_ALL is the default value.

MQSECITEM_MQADMIN

Specifies that administration type resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MQNLIST

Specifies that namelist resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MQPROC

Specifies that process resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MQQUEUE

Specifies that queue resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MXADMIN

Specifies that administration type resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MXNLIST

Specifies that namelist resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MXPROC

Specifies that process resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MXQUEUE

Specifies that queue resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MXTOPIC

Specifies that topic resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

SecurityType (MQCFIN)

Security type (parameter identifier: MQIACF_SECURITY_TYPE).

Use this parameter to specify the type of security refresh to be performed. The value can be any of the following values:

MQSECTYPE_AUTHSERV

The list of authorizations held internally by the authorization services component is refreshed. MQSECTYPE_AUTHSERV is not valid on z/OS.

MQSECTYPE_AUTHSERV is the default on platforms other than z/OS.

MQSECTYPE_CLASSES

Permits you to select specific resource classes for which to perform the security refresh.

 MQSECTYPE_CLASSES is valid only on z/OS where it is the default.

MQSECTYPE_CONNAUTH

Refreshes the cached view of the configuration for connection authentication.

 On [Multiplatforms](#) this is also a synonym for MQSECTYPE_AUTHSERV.

MQSECTYPE_SSL

MQSECTYPE_SSL refreshes the locations of the LDAP servers to be used for Certified Revocation Lists and the key repository. It also refreshes any cryptographic hardware parameters specified through IBM MQ and the cached view of the Secure Sockets Layer key repository. It also allows updates to become effective on successful completion of the command.

MQSECTYPE_SSL updates all TLS channels currently running, as follows:

- Sender, server, and cluster-sender channels using TLS are allowed to complete the current batch. In general, they then run the TLS handshake again with the refreshed view of the TLS key repository. However, you must manually restart a requester-server channel on which the server definition has no CONNAME parameter.

- **V 9.0.0** AMQP channels using TLS are restarted, with any currently connected clients being forcibly disconnected. The client receives an `amqp:connection:forced` AMQP error message.
- All other channel types using TLS are stopped with a `STOP CHANNEL MODE(FORCE) STATUS(INACTIVE)` command. If the partner end of the stopped message channel has retry values defined, the channel tries again and the new TLS handshake uses the refreshed view of the contents of the TLS key repository, the location of the LDAP server to be used for Certification Revocation Lists, and the location of the key repository. If there is a server-connection channel, the client application loses its connection to the queue manager and must reconnect in order to continue.

Reset CF Structure on z/OS

The Reset coupling facility (CF) Structure (`MQCMD_RESET_CF_STRUC`) command modifies the status of a specific application structure.

Required parameters

CFStructName (MQCFST)

The name of the coupling facility application structure that you want to reset (parameter identifier: `MQCA_CF_STRUC_NAME`). The maximum length of the string is `MQ_CF_STRUC_NAME_LENGTH`.

Action (MQCFIN)

The action to perform to reset the named application structure (parameter identifier: `MQIACF_ACTION`).

MQACT_FAIL

A structure failure is simulated and the status of the application structure is set to `FAILED`.

Reset Channel

The Reset Channel (`MQCMD_RESET_CHANNEL`) command resets the message sequence number for an IBM MQ channel with, optionally, a specified sequence number to be used the next time that the channel is started.

This command can be issued to a channel of any type (except `MQCHT_SVRCONN` and `MQCHT_CLNTCONN`). However, if it is issued to a sender (`MQCHT_SENDER`), server (`MQCHT_SERVER`), or cluster-sender (`MQCHT_CLUSSDR`) channel, the value at both ends (issuing end and receiver or requester end), is reset when the channel is next initiated or resynchronized. The value at both ends is reset to be equal.

If the command is issued to a receiver (`MQCHT_RECEIVER`), requester (`MQCHT_REQUESTER`), or cluster-receiver (`MQCHT_CLUSRCVR`) channel, the value at the other end is not reset as well; this step must be done separately if necessary.

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: `MQCACH_CHANNEL_NAME`).

The name of the channel to be reset. The maximum length of the string is `MQ_CHANNEL_NAME_LENGTH`.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH_CHANNEL_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be reset.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

MQCHLD_PRIVATE

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD_SHARED.

MQCHLD_SHARED

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD_SHARED.

The combination of the **ChannelDisposition** and **CommandScope** parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in [Table 104 on page 1794](#)

ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name
MQCHLD_PRIVATE	Reset private channel on the local queue manager	Reset private channel on the named queue manager

<i>Table 104. ChannelDisposition and CommandScope for RESET CHANNEL (continued)</i>		
ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name
MQCHLD_SHARED	<p>Reset a shared channel on all active queue managers.</p> <p>MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted

MsgSeqNumber (MQCFIN)

Message sequence number (parameter identifier: MQIACH_MSG_SEQUENCE_NUMBER).

Specifies the new message sequence number.

The value must be in the range 1 through 999 999 999. The default value is one.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands”](#) on page 1343.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

Reset Cluster

The Reset Cluster (MQCMD_RESET_CLUSTER) command forces a queue manager to leave a cluster.

Required parameters

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

The name of the cluster to be reset.

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

QMgrIdentifier (MQCFST)

Queue manager identifier (parameter identifier: MQCA_Q_MGR_IDENTIFIER).

This parameter is the unique identifier of the queue manager to be forcibly removed from the cluster. Only one of QMgrIdentifier and QMgrName can be specified. Use QMgrIdentifier in preference to QmgrName, because QmgrName might not be unique.

QMgrName (MQCFST)

Queue manager name (parameter identifier: MQCA_Q_MGR_NAME).

This parameter is the name of the queue manager to be forcibly removed from the cluster. Only one of `QMgrIdentifier` and `QMgrName` can be specified. Use `QMgrIdentifier` in preference to `QMgrName`, because `QMgrName` might not be unique.

Action (MQCFIN)

Action (parameter identifier: `MQIACF_ACTION`).

Specifies the action to take place. This parameter can be requested only by a repository queue manager.

The value can be any of the following values:

MQACT_FORCE_REMOVE

Requests that a queue manager is forcibly removed from a cluster.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: `MQCACF_COMMAND_SCOPE`). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is `MQ_QSG_NAME_LENGTH`.

RemoveQueues (MQCFIN)

Whether cluster queues are removed from the cluster (parameter identifier: `MQIACF_REMOVE_QUEUES`).

This parameter indicates whether the cluster queues that belong to the queue manager being removed from the cluster are to be removed from the cluster. This parameter can be specified even if the queue manager identified by the `QMgrName` parameter is not currently in the cluster.

The value can be any of the following values:

MQCFO_REMOVE_QUEUES_YES

Remove queues belonging to the queue manager being removed from the cluster.

MQCFO_REMOVE_QUEUES_NO

Do not remove queues belonging to the queue manager being removed.
`MQCFO_REMOVE_QUEUES_NO` is the default.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands”](#) on page 1343.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_ACTION_VALUE_ERROR

Value not valid.

Reset Queue Manager

Use the Reset Queue Manager (MQCMD_RESET_Q_MGR) command as part of your backup and recovery procedures. **V 9.0.2** The **Archive** option enables you to notify the queue manager that all log extents, up to the specified one, have been archived. If the log management type is not **ArchivedLog** the command fails. The **ReduceLog** option enables you to request that the queue manager reduces the number of log extents, provided they are no longer required.

You can use this command to request that the queue manager starts writing to a new log extent, making the previous log extent available for archiving.

Use the Reset Queue Manager (MQCMD_RESET_Q_MGR) command to forcibly remove a publish/subscribe hierarchical connection for which this queue manager is nominated as either the parent or the child in a hierarchical connection. Valid on all supported platforms.

Archive option

V 9.0.2

This option requires change authority on the queue manager object.

The command fails if the log extent is not recognized, or is being written.

If, for some reason, the programmatic way that your enterprise notifies your log extents are archived is not working, and the disk is filling up with log extents, your administrator can use this command.

You need to determine yourself, the name to pass in from your archiving process, as to what has already been archived.

ReduceLog option

V 9.0.2

This option requires change authority on the queue manager object.

You should not need this command in normal circumstances. In general, when using automatic management of log files, you should leave it up to the queue manager to reduce the number of log extents as necessary.

For circular logging, this can remove inactive secondary log extents. The increase in secondary log extents is usually noticed by an increase in disk usage, often due to some specific issue in the past.

Note: For circular logging the command might not be able reduce the log extents by the required number immediately. In that case, the command returns, and the reduction takes place asynchronously at some later point.

For linear logging this can remove log extents that are not required for recovery (and have been archived) as noticed by a high value for [ReusableLogSize](#) on the Inquire Queue Manager Status command.

You should run this command only after some specific event that has caused the number of log extents to be extraordinarily large.

The command blocks until the chosen number of extents have been deleted. Note that the command does not return the number of extents that have been removed, but a queue manager error log message is written, indicating what has taken place.

Required parameters

Action (MQCFIN)

Action (parameter identifier: MQIACF_ACTION).

Specifies the action to take place.

The value can be any of the following values, but you can specify one only:

MQACT_ADVANCE_LOG

Requests that the queue manager starts writing to a new log extent, making the previous log extent available for archiving. This command is accepted only if the queue manager is configured to use linear logging.

MQACT_COLLECT_STATISTICS

Requests that the queue manager ends the current statistics collection period, and writes the statistics collected.

MQACT_PUBSUB

Requests a publish/subscribe reset. This value requires that one of the optional parameters, ChildName or ParentName, is specified.

V 9.0.2 MQACT_ARCHIVE_LOG (11)

Requests that log extents are archived.

The command fails if the log extent is not recognized, or is the current log.

If, for some reason, the programmatic way that your enterprise notifies your log extents are archived is not working, and the disk is filling up with log extents, your administrator can use this command.

V 9.0.2 MQACT_REDUCE_LOG (10)

You should not need this command in normal circumstances. In general, when using automatic management of log files, you should leave it up to the queue manager to reduce the number of log extents as necessary.

For circular logging, you can use this option to remove inactive secondary log extents. A growth in secondary log extents is usually noticed by an increase in disk usage, often due to some specific issue in the past.

You should run this command only after some specific event that has caused the number of log extents to be extraordinarily large.

The command blocks until the chosen number of extents have been deleted. Note that the command does not return the number of extents that have been removed, but a queue manager error log message is written, indicating what has taken place.

Optional parameters

V 9.0.2 ArchivedLog (MQCFST)

Specifies the name of the log extent to be archived (parameter identifier: MQCACF_ARCHIVE_LOG_EXTENT_NAME).

The maximum length of the string is MQ_LOG_EXTENT_NAME_LENGTH.

ChildName (MQCFST)

The name of the child queue manager for which the hierarchical connection is to be forcibly canceled (parameter identifier: MQCA_CHILD).

This attribute is valid only when the Action parameter has the value MQACT_PUBSUB.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

ParentName (MQCFST)

The name of the parent queue manager for which the hierarchical connection is to be forcibly canceled (parameter identifier: MQCA_PARENT).

This attribute is valid only when the Action parameter has the value MQACT_PUBSUB.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

V 9.0.2 LogReduction (MQCFIN)

Specifies that the type of log reduction (parameter identifier: MQIACF_LOG_REDUCTION).

The value can be one of:

MQLR_AUTO

-1. The default value. Reduce the log extents by an amount chosen by the queue manager.

MQLR_ONE

1. Reduce the log extents by one extent, if possible.

MQLR_MAX

-2. Reduce the log extents by the maximum number possible.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

 **MQRCCF_CURRENT_LOG_EXTENT**

The specified log extent is the current log extent, and cannot have been validly archived yet.

 **MQRCCF_LOG_EXTENT_NOT_FOUND**

The specified log extent was not found or is not valid.

 **MQRCCF_LOG_NOT_REDUCED**

No log events could be removed.

MQRC_RESOURCE_PROBLEM

Insufficient system resources available.

Reset Queue Statistics

The Reset Queue Statistics (MQCMD_RESET_Q_STATS) command reports the performance data for a queue and then resets the performance data. Performance data is maintained for each local queue (including transmission queues).

Performance data is reset at the following times:

- When a Reset Queue Statistics command is issued
- When the queue manager is restarted
- When a performance event is generated for a queue

Required parameters

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

The name of the local queue to be tested and reset.

Generic queue names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_Q_WRONG_TYPE

Action not valid for the queue of specified type.

MQRCCF_EVENTS_DISABLED

The queue manager performance events are disabled (PERFMEV). On z/OS, it is necessary to enable queue manager performance events to use this command. For more details, see the PerformanceEvent property in the [“Change Queue Manager” on page 1433](#) command.

Reset Queue Statistics (Response)

The response to the Reset Queue Statistics (MQCMD_RESET_Q_STATS) command consists of the response header followed by the *QName* structure and the attribute parameter structures shown in the following sections.

If a generic queue name was specified, one such message is generated for each queue found.

Always returned:

HighQDepth , *MsgDeqCount* , *MsgEnqCount* , *QName* ,  *QSGDisposition* ,
TimeSinceReset

Response data

HighQDepth (MQCFIN)

Maximum number of messages on a queue (parameter identifier: MQIA_HIGH_Q_DEPTH).

This count is the peak value of the *CurrentQDepth* local queue attribute since the last reset. The *CurrentQDepth* is incremented during an MQPUT call, and during backout of an MQGET call, and is decremented during a (nonbrowse) MQGET call, and during backout of an MQPUT call.

MsgDeqCount (MQCFIN)

Number of messages dequeued (parameter identifier: MQIA_MSG_DEQ_COUNT).

This count includes messages that have been successfully retrieved (with a nonbrowse MQGET) from the queue, even though the MQGET has not yet been committed. The count is not decremented if the MQGET is later backed out.

 On z/OS, if the value exceeds 999 999 999, it is returned as 999 999 999

MsgEnqCount (MQCFIN)

Number of messages enqueued (parameter identifier: MQIA_MSG_ENQ_COUNT).

This count includes messages that have been put to the queue, but have not yet been committed. The count is not decremented if the put is later backed out.

z/OS On z/OS, if the value exceeds 999 999 999, it is returned as 999 999 999

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

z/OS

QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

TimeSinceReset (MQCFIN)

Time since statistics reset in seconds (parameter identifier: MQIA_TIME_SINCE_RESET).

z/OS Reset SMDS on z/OS

The Reset SMDS (MQCMD_RESET_SMDS) command modifies the availability or status information relating to one or more shared message data sets associated with a specific application structure

Required parameters

SMDS (MQCFST)

Specifies the queue manager for which the shared message data set availability or status information is to be modified or an asterisk to modify the information for all data sets associated with the specified CFSTRUCT. (parameter identifier: MQCACF_CF_SMDS).

The maximum length of the string is 4 characters.

CFStrucName (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to reset (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters

Access (MQCFIN)

Availability of the share message data set (parameter identifier: MQIACF_CF_STRUC_ACCESS).

MQCFACCESS_ENABLED

The shared message data set is available for use.

MQCFACCESS_DISABLED

The shared message data set is disabled.

Status (MQCFIN)

Status information indicates the state of a resource (parameter identifier: MQIACF_CF_STRUC_STATUS).

MQCFSTATUS_FAILED

The shared message data set is in an unusable state.

MQCFSTATUS_RECOVERED

The data set is set to recovered, and is ready for use again, but requires some restart processing the next time it is opened. This restart processing ensures that obsolete references to any deleted messages have been removed from the coupling facility structure before the data set is made available again. The restart processing also rebuilds the data set space map.

Resolve Channel

The Resolve Channel (MQCMD_RESOLVE_CHANNEL) command requests a channel to commit or back out in-doubt messages. This command is used when the other end of a link fails during the confirmation stage, and for some reason it is not possible to reestablish the connection. In this situation the sending end remains in an in-doubt state, whether the messages were received. Any outstanding units of work must be resolved using Resolve Channel with either backout or commit.

Care must be exercised in the use of this command. If the resolution specified is not the same as the resolution at the receiving end, messages can be lost or duplicated.

This command can only be used for channels with a *ChannelType* value of MQCHT_SENDER, MQCHT_SERVER, or MQCHT_CLUSSDR.

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel to be resolved. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

InDoubt (MQCFIN)

Indoubt resolution (parameter identifier: MQIACH_IN_DOUBT).

Specifies whether to commit or back out the in-doubt messages.

The value can be:

MQIDO_COMMIT

Commit.

MQIDO_BACKOUT

Backout.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue

manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH_CHANNEL_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be resolved.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

MQCHLD_PRIVATE

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD_SHARED.

MQCHLD_SHARED

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD_SHARED.

The combination of the **ChannelDisposition** and **CommandScope** parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in [Table 105 on page 1803](#)

<i>Table 105. ChannelDisposition and CommandScope for RESOLVE CHANNEL</i>		
ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name
MQCHLD_PRIVATE	Resolve private channel on the local queue manager	Resolve private channel on the named queue manager
MQCHLD_SHARED	Resolve a shared channel on all active queue managers. MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails. The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.	Not permitted

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_INDOUBT_VALUE_ERROR

In-doubt value not valid.

Resume Queue Manager on z/OS

The Resume Queue Manager (MQCMD_RESUME_Q_MGR) command renders the queue manager available again for the processing of IMS or Db2 messages. It reverses the action of the Suspend Queue Manager (MQCMD_SUSPEND_Q_MGR) command.

Required parameters

Facility (MQCFIN)

Facility (parameter identifier: MQIACF_Q_MGR_FACILITY).

The type of facility for which activity is to be resumed. The value can be:

MQQMFACT_DB2

Resumes normal activity with Db2.

MQQMFACT_IMS_BRIDGE

Resumes normal IMS bridge activity.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

Resume Queue Manager Cluster

The Resume Queue Manager Cluster (MQCMD_RESUME_Q_MGR_CLUSTER) command informs other queue managers in a cluster that the local queue manager is again available for processing, and can be sent messages. It reverses the action of the Suspend Queue Manager Cluster (MQCMD_SUSPEND_Q_MGR_CLUSTER) command.

Required parameters

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

The name of the cluster for which availability is to be resumed.

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

ClusterNamelist (MQCFST)

Cluster Namelist (parameter identifier: MQCA_CLUSTER_NAMELIST).

The name of the namelist specifying a list of clusters for which availability is to be resumed.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CLUSTER_NAME_CONFLICT

Cluster name conflict.

Reverify Security on z/OS

The Reverify Security (MQCMD_REVERIFY_SECURITY) to set a reverification flag for all specified users. The user is reverified the next time that security is checked for that user.

Required parameters

UserId (MQCFST)

User ID (parameter identifier: MQCACF_USER_IDENTIFIER).

Use this parameter to specify one or more user IDs. Each user ID specified is signed off and signed back on again the next time that a request requiring a security check is issued on behalf of that user.

The maximum length of the string is MQ_USER_ID_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.

- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Set Archive on z/OS

Use the Set Archive (MQCMD_SET_ARCHIVE) to dynamically change certain archive system parameter values initially set by your system parameter module at queue manager startup.

Required parameters

ParameterType (MQCFIN)

Parameter type (parameter identifier: MQIACF_SYSP_TYPE).

Specifies how the parameters are to be reset:

MQSYSP_TYPE_INITIAL

The initial settings of the archive system parameters. MQSYSP_TYPE_INITIAL resets all the archive system parameters to the values set at queue manager startup.

MQSYSP_TYPE_SET

MQSYSP_TYPE_SET indicates that you intend to change one, or more, of the archive system parameter settings.

Optional parameters

AllocPrimary (MQCFIN)

Primary space allocation for DASD data sets (parameter identifier: MQIACF_SYSP_ALLOC_PRIMARY).

Specifies the primary space allocation for DASD data sets in the units specified in the **AllocUnits** parameter.

Specify a value greater than zero. This value must be sufficient for a copy of either the log data set or its corresponding BSDS, whichever is the larger.

AllocSecondary (MQCFIN)

Secondary space allocation for DASD data sets (parameter identifier: MQIACF_SYSP_ALLOC_SECONDARY).

Specifies the secondary space allocation for DASD data sets in the units specified in the **AllocUnits** parameter.

Specify a value greater than zero.

AllocUnits (MQCFIN)

Allocation unit (parameter identifier: MQIACF_SYSP_ALLOC_UNIT).

Specifies the unit in which primary and secondary space allocations are made. The value can be any of the following values:

MQSYSP_ALLOC_BLK

Blocks.

MQSYSP_ALLOC_TRK

Tracks.

MQSYSP_ALLOC_CYL

Cylinders.

ArchivePrefix1 (MQCFST)

Specifies the prefix for the first archive log data set name (parameter identifier: MQCACF_SYSP_ARCHIVE_PFX1).

The maximum length of the string is MQ_ARCHIVE_PFX_LENGTH.

ArchivePrefix2 (MQCFST)

Specifies the prefix for the second archive log data set name (parameter identifier: MQCACF_SYSP_ARCHIVE_PFX2).

The maximum length of the string is MQ_ARCHIVE_PFX_LENGTH.

ArchiveRetention (MQCFIN)

Archive retention period (parameter identifier: MQIACF_SYSP_ARCHIVE_RETAIN).

Specifies the retention period, in days, to be used when the archive log data set is created. Specify a value in the range zero through 9999.

For more information, see [Discarding archive log data sets](#).

ArchiveUnit1 (MQCFST)

Specifies the device type or unit name of the device that is used to store the first copy of the archive log data set (parameter identifier: MQCACF_SYSP_ARCHIVE_UNIT1).

Specify a device type or unit name of 1-8 characters.

If you archive to DASD, you can specify a generic device type with a limited volume range.

The maximum length of the string is MQ_ARCHIVE_UNIT_LENGTH.

ArchiveUnit2 (MQCFST)

Specifies the device type or unit name of the device that is used to store the second copy of the archive log data set (parameter identifier: MQCACF_SYSP_ARCHIVE_UNIT2).

Specify a device type or unit name of 1-8 characters.

If this parameter is blank, the value set for the **ArchiveUnit1** parameter is used.

The maximum length of the string is MQ_ARCHIVE_UNIT_LENGTH.

ArchiveWTOR (MQCFIN)

Specifies whether a message is to be sent to the operator and a reply is received before attempting to mount an archive log data set (parameter identifier: MQIACF_SYSP_ARCHIVE_WTOR).

Other IBM MQ users might be forced to wait until the data set is mounted, but they are not affected while IBM MQ is waiting for the reply to the message.

The value can be any of the following values:

MQSYSP_YES

A message is to be sent and a reply received before an attempt to mount an archive log data set.

MQSYSP_NO

A message is not to be sent and a reply received before an attempt to mount an archive log data set.

BlockSize (MQCFIN)

Block size of the archive log data set (parameter identifier: MQIACF_SYSP_BLOCK_SIZE).

The block size you specify must be compatible with the device type you specify in the **ArchiveUnit1** and **ArchiveUnit2** parameters.

Specify a value in the range 4 097 through 28 672. The value you specify is rounded up to a multiple of 4 096.

This parameter is ignored for data sets that are managed by the storage management system (SMS).

Catalog (MQCFIN)

Specifies whether archive log data sets are cataloged in the primary integrated catalog facility (parameter identifier: MQIACF_SYSP_CATALOG).

The value can be:

MQSYSP_YES

Archive log data sets are cataloged.

MQSYSP_NO

Archive log data sets are not cataloged.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Compact (MQCFIN)

Specifies whether data written to archive logs is to be compacted (parameter identifier: MQIACF_SYSP_COMPACT).

This parameter applies to a 3480 or 3490 device that has the improved data recording capability (IDRC) feature. When this feature is turned on, hardware in the tape control unit writes data at a much higher density than normal, allowing for more data on each volume. Specify MQSYSP_NO if you do not use a 3480 device with the IDRC feature or a 3490 base model, except for the 3490E. Specify MQSYSP_YES if you want the data to be compacted.

The value can be:

MQSYSP_YES

Data is to be compacted.

MQSYSP_NO

Data is not to be compacted.

Protect (MQCFIN)

Protection by external security manager (ESM) (parameter identifier: MQIACF_SYSP_PROTECT).

Specifies whether archive log data sets are protected by ESM profiles when the data sets are created.

If you specify MQSYSP_YES, ensure that:

- ESM protection is active for IBM MQ.
- The user ID associated with the IBM MQ address space has authority to create these profiles.
- The TAPEVOL class is active if you are archiving to tape.

otherwise, offload processing fails.

The value can be any of the following values:

MQSYSP_YES

Data set profiles are created when logs are offloaded.

MQSYSP_NO

Profiles are not created.

QuiesceInterval (MQCFIN)

Maximum time allowed for the quiesce (parameter identifier: MQIACF_SYSP_QUIESCE_INTERVAL).

Specifies the maximum time, in seconds, allowed for the quiesce.

Specify a value in the range 1 through 999.

RoutingCode (MQCFIL)

z/OS routing code list (parameter identifier: MQIACF_SYSP_ROUTING_CODE).

Specifies the list of z/OS routing codes for messages about the archive log data sets to the operator.

Specify up to 14 routing codes, each with a value in the range zero through 16. You must specify at least one code.

TimeStampFormat (MQCFIN)

Time stamp included (parameter identifier: MQIACF_SYSP_TIMESTAMP).

Specifies whether the archive log data set name has a time stamp in it.

The value can be:

MQSYSP_YES

Names include a time stamp. The archive log data sets are named:

```
arcpxi.cyyddd.T hhmsst.A nnnnnn
```

where *c* is 'D' for the years up to and including 1999 or 'E' for the year 2000 and later, and *arcpxi* is the data set name prefix specified by *ArchivePrefix1* or *ArchivePrefix2*. *arcpxi* can have up to 19 characters.

MQSYSP_NO

Names do not include a time stamp. The archive log data sets are named:

```
arcpxi.A nnnnnn
```

Where *arcpxi* is the data set name prefix specified by *ArchivePrefix1* or *ArchivePrefix2*. *arcpxi* can have up to 35 characters.

MQSYSP_EXTENDED

Names include a time stamp. The archive log data sets are named:

```
arcpxi.D yyyyddd.T hhmsst.A nnnnnn
```

Where *arcpxi* is the data set name prefix specified by *ArchivePrefix1* or *ArchivePrefix2*. *arcpxi* can have up to 17 characters.

Multi

Set Authority Record on Multiplatforms

The Set Authority Record (MQCMD_SET_AUTH_REC) command sets the authorizations of a profile, object, or class of objects. Authorizations can be granted to, or revoked from, any number of principals or groups.

Required parameters

ProfileName (MQCFST)

Profile name (parameter identifier: MQCACF_AUTH_PROFILE_NAME).

The authorizations apply to all IBM MQ objects with names that match the profile name specified. You can define a generic profile. If you specify an explicit profile name, the object must exist.

The maximum length of the string is MQ_AUTH_PROFILE_NAME_LENGTH.

ObjectType (MQCFIN)

The type of object for which to set authorizations (parameter identifier: MQIACF_OBJECT_TYPE).

The value can be any of the following values:

MQOT_AUTH_INFO

Authentication information.

MQOT_CHANNEL

Channel object.

MQOT_CLNTCONN_CHANNEL

Client-connection channel object.

MQOT_COMM_INFO

Communication information object

MQOT_LISTENER

Listener object.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process.

MQOT_Q

Queue, or queues, that match the object name parameter.

MQOT_Q_MGR

Queue manager.

MQOT_REMOTE_Q_MGR_NAME

Remote queue manager.

MQOT_SERVICE

Service object.

MQOT_TOPIC

Topic object.

Note: The required parameters must be in the order **ProfileName** followed by **ObjectType**.

Optional parameters

AuthorityAdd (MQCFIL)

Authority values to set (parameter identifier: MQIACF_AUTH_ADD_AUTHS).

This parameter is a list of authority values to set for the named profile. The values can be:

MQAUTH_NONE

The entity has authority set to 'none'.

MQAUTH_ALT_USER_AUTHORITY

Specify an alternate user ID on an MQI call.

MQAUTH_BROWSE

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

MQAUTH_CHANGE

Change the attributes of the specified object, using the appropriate command set.

MQAUTH_CLEAR

Clear a queue.

MQAUTH_CONNECT

Connect the application to the specified queue manager by issuing an MQCONN call.

MQAUTH_CREATE

Create objects of the specified type using the appropriate command set.

MQAUTH_DELETE

Delete the specified object using the appropriate command set.

MQAUTH_DISPLAY

Display the attributes of the specified object using the appropriate command set.

MQAUTH_INPUT

Retrieve a message from a queue by issuing an MQGET call.

MQAUTH_INQUIRE

Make an inquiry on a specific queue by issuing an MQINQ call.

MQAUTH_OUTPUT

Put a message on a specific queue by issuing an MQPUT call.

MQAUTH_PASS_ALL_CONTEXT

Pass all context.

MQAUTH_PASS_IDENTITY_CONTEXT

Pass the identity context.

MQAUTH_SET

Set attributes on a queue from the MQI by issuing an MQSET call.

MQAUTH_SET_ALL_CONTEXT

Set all context on a queue.

MQAUTH_SET_IDENTITY_CONTEXT

Set the identity context on a queue.

MQAUTH_CONTROL

For listeners and services, start and stop the specified channel, listener, or service.

For channels, start, stop, and ping the specified channel.

For topics, define, alter, or delete subscriptions.

MQAUTH_CONTROL_EXTENDED

Reset or resolve the specified channel.

MQAUTH_PUBLISH

Publish to the specified topic.

MQAUTH_SUBSCRIBE

Subscribe to the specified topic.

MQAUTH_RESUME

Resume a subscription to the specified topic.

MQAUTH_SYSTEM

Use queue manager for internal system operations.

MQAUTH_ALL

Use all operations applicable to the object.

MQAUTH_ALL_ADMIN

Use all administration operations applicable to the object.

MQAUTH_ALL_MQI

Use all MQI calls applicable to the object.

The contents of the *AuthorityAdd* and *AuthorityRemove* lists must be mutually exclusive. You must specify a value for either *AuthorityAdd* or *AuthorityRemove*. An error occurs if you do not specify either.

AuthorityRemove (MQCFIL)

Authority values to remove (parameter identifier: MQIACF_AUTH_REMOVE_AUTHS).

This parameter is a list of authority values to remove from the named profile. The values can be:

MQAUTH_NONE

The entity has authority set to 'none'.

MQAUTH_ALT_USER_AUTHORITY

Specify an alternate user ID on an MQI call.

MQAUTH_BROWSE

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

MQAUTH_CHANGE

Change the attributes of the specified object, using the appropriate command set.

MQAUTH_CLEAR

Clear a queue.

MQAUTH_CONNECT

Connect the application to the specified queue manager by issuing an MQCONN call.

MQAUTH_CREATE

Create objects of the specified type using the appropriate command set.

MQAUTH_DELETE

Delete the specified object using the appropriate command set.

MQAUTH_DISPLAY

Display the attributes of the specified object using the appropriate command set.

MQAUTH_INPUT

Retrieve a message from a queue by issuing an MQGET call.

MQAUTH_INQUIRE

Make an inquiry on a specific queue by issuing an MQINQ call.

MQAUTH_OUTPUT

Put a message on a specific queue by issuing an MQPUT call.

MQAUTH_PASS_ALL_CONTEXT

Pass all context.

MQAUTH_PASS_IDENTITY_CONTEXT

Pass the identity context.

MQAUTH_SET

Set attributes on a queue from the MQI by issuing an MQSET call.

MQAUTH_SET_ALL_CONTEXT

Set all context on a queue.

MQAUTH_SET_IDENTITY_CONTEXT

Set the identity context on a queue.

MQAUTH_CONTROL

For listeners and services, start and stop the specified channel, listener, or service.

For channels, start, stop, and ping the specified channel.

For topics, define, alter, or delete subscriptions.

MQAUTH_CONTROL_EXTENDED

Reset or resolve the specified channel.

MQAUTH_PUBLISH

Publish to the specified topic.

MQAUTH_SUBSCRIBE

Subscribe to the specified topic.

MQAUTH_RESUME

Resume a subscription to the specified topic.

MQAUTH_SYSTEM

Use queue manager for internal system operations.

MQAUTH_ALL

Use all operations applicable to the object.

MQAUTH_ALL_ADMIN

Use all administration operations applicable to the object.

MQAUTH_ALL_MQI

Use all MQI calls applicable to the object.

The contents of the *AuthorityAdd* and *AuthorityRemove* lists must be mutually exclusive. You must specify a value for either *AuthorityAdd* or *AuthorityRemove*. An error occurs if you do not specify either.

GroupNames (MQCFSL)

Group names (parameter identifier: MQCACF_GROUP_ENTITY_NAMES).

The names of groups having their authorizations set. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ_ENTITY_NAME_LENGTH.

PrincipalNames (MQCFSL)

Principal names (parameter identifier: MQCACF_PRINCIPAL_ENTITY_NAMES).

The names of principals having their authorizations set. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ_ENTITY_NAME_LENGTH.

ServiceComponent (MQCFST)

Service component (parameter identifier: MQCACF_SERVICE_COMPONENT).

If installable authorization services are supported, this parameter specifies the name of the authorization service to which the authorizations apply.

If you omit this parameter, the authorization inquiry is made to the first installable component for the service.

The maximum length of the string is MQ_SERVICE_COMPONENT_LENGTH.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRC_UNKNOWN_ENTITY

Userid not authorized, or unknown.

MQRCCF_AUTH_VALUE_ERROR

Invalid authorization.

MQRCCF_AUTH_VALUE_MISSING

Authorization missing.

MQRCCF_ENTITY_NAME_MISSING

Entity name missing.

MQRCCF_OBJECT_TYPE_MISSING

Object type missing.

MQRCCF_PROFILE_NAME_ERROR

Invalid profile name.

Set Channel Authentication Record

The Set Channel Authentication Record (MQCMD_SET_CHLAUTH_REC) command sets the allowed partner details and mappings to MCAUSER for a channel or set of channels.

Syntax diagram

See the syntax diagram in the MQSC [“SET CHLAUTH” on page 857](#) command for combinations of parameters and values that are allowed.

Required parameters

The required parameters are valid for the **Action** values of:

- MQACT_ADD or MQACT_REPLACE
- MQACT_REMOVE
- MQACT_REMOVEALL

ProfileName (MQCFST)

The name of the channel or set of channels for which you are setting channel authentication configuration (parameter identifier: MQCACH_CHANNEL_NAME). You can use one or more asterisks (*), in any position, as wildcards to specify a set of channels. If you set Type to MQCAUT_BLOCKADDR, you must set the generic channel name to a single asterisk, which matches all channel names.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Type (MQCFIN)

The **Type** parameter must follow the **ProfileName** parameter.

The type of channel authentication record for which to set allowed partner details or mappings to MCAUSER (parameter identifier: MQIACF_CHLAUTH_TYPE). The following values are valid:

MQCAUT_BLOCKUSER

This channel authentication record prevents a specified user or users from connecting. The MQCAUT_BLOCKUSER parameter must be accompanied by a **UserList**.

MQCAUT_BLOCKADDR

This channel authentication record prevents connections from a specified IP address or addresses. The MQCAUT_BLOCKADDR parameter must be accompanied by an **AddrList**.

MQCAUT_SSLPEERMAP

This channel authentication record maps TLS Distinguished Names (DNs) to MCAUSER values. The MQCAUT_SSLPEERMAP parameter must be accompanied by an **SSLPeer**.

MQCAUT_ADDRESSMAP

This channel authentication record maps IP addresses to MCAUSER values. The MQCAUT_ADDRESSMAP parameter must be accompanied by an **Address**.

MQCAUT_USERMAP

This channel authentication record maps asserted user IDs to MCAUSER values. The MQCAUT_USERMAP parameter must be accompanied by a **ClntUser**.

MQCAUT_QMGRMAP

This channel authentication record maps remote queue manager names to MCAUSER values. The MQCAUT_QMGRMAP parameter must be accompanied by a **QMName**.

Optional parameters

The following table shows which parameters are valid for each value of **Action**:

Parameter	MQACT_ADD or MQACT_REPLACE	MQACT_REMOVE	MQACT_REMOVEALL
  CommandScope	✓	✓	✓
Action	✓	✓	✓
Address	✓	✓	
Addrlist	✓	✓	
CheckClient	✓	✓	
ClntUser	✓	✓	

Parameter	MQACT_ADD or MQACT_REPLACE	MQACT_REMOVE	MQACT_REMOVEALL
MCAUser	✓		
QMName	✓	✓	
SSLCertIssuer	✓	✓	
SSLPeer	✓	✓	
UserList	✓	✓	
UserSrc	✓		
Warn	✓		
Description	✓		

Action (MQCFIN)

The action to perform on the channel authentication record (parameter identifier: MQIACF_ACTION). The following values are valid:

MQACT_ADD

Add the specified configuration to a channel authentication record. This is the default value.

For types MQCAUT_SSLPEERMAP, MQCAUT_ADDRESSMAP, MQCAUT_USERMAP and MQCAUT_QMGRMAP, if the specified configuration exists, the command fails.

For types MQCAUT_BLOCKUSER and MQCAUT_BLOCKADDR, the configuration is added to the list.

MQACT_REPLACE

Replace the current configuration of a channel authentication record.

For types MQCAUT_SSLPEERMAP, MQCAUT_ADDRESSMAP, MQCAUT_USERMAP and MQCAUT_QMGRMAP, if the specified configuration exists, it is replaced with the new configuration. If it does not exist it is added.

For types MQCAUT_BLOCKUSER and MQCAUT_BLOCKADDR, the configuration specified replaces the current list, even if the current list is empty. If you replace the current list with an empty list, this acts like MQACT_REMOVEALL.

MQACT_REMOVE

Remove the specified configuration from the channel authentication records. If the configuration does not exist the command fails. If you remove the last entry from a list, this acts like MQACT_REMOVEALL.

MQACT_REMOVEALL

Remove all members of the list and thus the whole record (for MQCAUT_BLOCKADDR and MQCAUT_BLOCKUSER) or all previously defined mappings (for MQCAUT_ADDRESSMAP, MQCAUT_SSLPEERMAP, MQCAUT_QMGRMAP and MQCAUT_USERMAP) from the channel authentication records. This option cannot be combined with specific values supplied in **AddrList**, **UserList**, **Address**, **SSLPeer**, **QMName** or **CIntUser**. If the specified type has no current configuration the command still succeeds.

Address (MQCFST)

Attention: Host names can be specified in this parameter, only on queue managers that have IBM MQ 8.0 new functions enabled with OPMODE.

The filter to be used to compare with the IP address, or host name, of the partner queue manager or client at the other end of the channel (parameter identifier: MQCACH_CONNECTION_NAME).

This parameter is mandatory when **Type** is MQCAUT_ADESSMAP and is also valid when **Type** is MQCAUT_SSLPEERMAP, MQCAUT_USERMAP, or MQCAUT_QMGRMAP and **Action** is MQACT_ADD, MQACT_REPLACE, or MQACT_REMOVE. You can define more than one channel authentication object with the same main identity, for example the same TLS peer name, with different addresses. See [“Generic IP addresses for channel authentication records”](#) on page 864 for more information about filtering IP addresses.

The maximum length of the string is MQ_CONN_NAME_LENGTH.

AddrList (MQCFSL)

A list of up to 100 generic IP addresses which are banned from accessing this queue manager on any channel (parameter identifier: MQCACH_CONNECTION_NAME_LIST).

This parameter is only valid when **Type** is MQCAUT_BLOCKADDR.

The maximum length of each address is MQ_CONN_NAME_LENGTH.

CheckClient (MQCFIN)

Attention: This parameter is valid only on queue managers that have IBM MQ 8.0 new functions enabled with OPMODE.

The user ID and password requirements for the client connection to be successful. The following values are valid:

MQCHK_REQUIRED_ADMIN

A valid user ID and password are required for the connection to be allowed if you are using a privileged user ID. The password cannot contain single quotation marks (').

Any connections using a non-privileged user ID are not required to provide a user ID and password.

The user ID and password are checked against the user repository details provided in an authentication information object, and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

A privileged user is one that has full administrative authorities for IBM MQ. See [Privileged users](#) for more information.

This option is not valid on z/OS platforms.

MQCHK_REQUIRED

A valid user ID and password are required for the connection to be allowed. The password cannot contain single quotation marks (').

The user ID and password are checked against the user repository details provided in an authentication information object and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

MQCHK_AS_Q_MGR

In order for the connection to be allowed, it must meet the connection authentication requirements defined on the queue manager.

If the CONNAUTH field provides an authentication information object, and the value of CHCKCLNT is REQUIRED, the connection fails unless a valid user ID and password are supplied.

If the CONNAUTH field does not provide an authentication information object, or the value of CHCKCLNT is not REQUIRED, the user ID and password are not required.

ClntUser (MQCFST)

The client asserted user ID to be mapped to a new user ID, allowed through unchanged, or blocked (parameter identifier: MQCACH_CLIENT_USER_ID).

This can be the user ID flowed from the client indicating the user ID the client side process is running under, or the user ID presented by the client on an MQCONNX call using MQCSP.

This parameter is valid only with TYPE(USERMAP) and when **Match** is MQMATCH_RUNCHECK.

The maximum length of the string is MQ_CLIENT_USER_ID_LENGTH.

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is run when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is run on the queue manager on which it was entered.
- a queue manager name. The command is run on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which the command was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is run on the local queue manager and is also passed to every active queue manager in the queue sharing group.

Custom (MQCFST)

Reserved for future use.

Description (MQCFST)

Provides descriptive information about the channel authentication record, which is displayed when you issue the Inquire Channel Authentication Records command (parameter identifier: MQCA_CHLAUTH_DESC).

This parameter must contain only displayable characters. In a DBCS installation, it can contain DBCS characters. The maximum length of the string is MQ_CHLAUTH_DESC_LENGTH.

Note: Use characters from the coded character set identifier (CCSID) for this queue manager. Other characters might be translated incorrectly if the information is sent to another queue manager.

MCAUser (MQCFST)

The user identifier to be used when the inbound connection matches the TLS DN, IP address, client asserted user ID or remote queue manager name supplied (parameter identifier: MQCACH_MCA_USER_ID).

This parameter is mandatory when **UserSrc** is MQUSRC_MAP and is valid when **Type** is MQCAUT_SSLPEERMAP, MQCAUT_ADDRESSMAP, MQCAUT_USERMAP, or MQCAUT_QMGRMAP.

This parameter is valid only when **Action** is MQACT_ADD or MQACT_REPLACE.

The maximum length of the string is MQ_MCA_USER_ID_LENGTH.

QMName (MQCFST)

The name of the remote partner queue manager, or pattern that matches a set of queue manager names, to be mapped to a user ID or blocked (parameter identifier: MQCA_REMOTE_Q_MGR_NAME).

This parameter is valid only when **Type** is MQCAUT_QMGRMAP

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

SSLCertIssuer (MQCFST)

This parameter is additional to the **SSLPeer** parameter.

SSLCertIssuer restricts matches to being within certificates issued by a particular Certificate Authority.

Attention: This parameter is valid only on queue managers that have IBM MQ 8.0 new functions enabled with OPMODE.

SSLPeer (MQCFST)

The filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel (parameter identifier: MQCACH_SSL_PEER_NAME).

The **SSLPeer** value is specified in the standard form used to specify a Distinguished Name. See [Distinguished Names and IBM MQ rules for SSLPEER values](#).

The maximum length of the string is MQ_SSL_PEER_NAME_LENGTH .

UserList (MQCFSL)

A list of up to 100 user IDs which are banned from using this channel or set of channels (parameter identifier: MQCACH_MCA_USER_ID_LIST).

The following special value can be used:

*MQADMIN

The exact meaning of this value is determined at runtime. If you are using the OAM supplied with IBM MQ, the meaning depends on platform, as follows:

- On Windows, all members of the mqm group, the Administrators group and SYSTEM
- On UNIX and Linux, all members of the mqm group
- On IBM i, the profiles (users) qmqm and qmqmadm and all members of the qmqmadm group, and any user defined with the *ALLOBJ special setting
-  On z/OS, the user ID that the CHINIT and the user ID that the MSTR address spaces are running under

This parameter is only valid when **TYPE** is MQCAUT_BLOCKUSER.

The maximum length of each user ID is MQ_MCA_USER_ID_LENGTH .

UserSrc (MQCFIN)

The source of the user ID to be used for MCAUSER at run time (parameter identifier: MQIACH_USER_SOURCE).

The following values are valid:

MQUSRC_MAP

Inbound connections that match this mapping use the user ID specified in the **MCAUser** attribute. This is the default value.

MQUSRC_NOACCESS

Inbound connections that match this mapping have no access to the queue manager and the channel ends immediately.

MQUSRC_CHANNEL

Inbound connections that match this mapping use the flowed user ID or any user defined on the channel object in the MCAUSER field.

Note that *Warn* and MQUSRC_CHANNEL, or MQUSRC_MAP are incompatible. This is because channel access is never blocked in these cases, so there is never a reason to generate a warning.

Warn (MQCFIN)

Indicates whether this record operates in warning mode (parameter identifier: MQIACH_WARNING).

MQWARN_NO

This record does not operate in warning mode. Any inbound connection that matches this record is blocked. This is the default value.

MQWARN_YES

This record operates in warning mode. Any inbound connection that matches this record and would therefore be blocked is allowed access. An error message is written and, if events are configured, an event message is created showing the details of what would have been blocked. The connection is allowed to continue. An attempt is made to find another record that is set to WARN(NO) to set the credentials for the inbound channel.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown at [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHLAUTH_TYPE_ERROR

Channel authentication record type not valid.

MQRCCF_CHLAUTH_ACTION_ERROR

Channel authentication record action not valid.

MQRCCF_CHLAUTH_USERSRC_ERROR

Channel authentication record user source not valid.

MQRCCF_WRONG_CHLAUTH_TYPE

Parameter not allowed for this channel authentication record type.

MQRCCF_CHLAUTH_ALREADY_EXISTS

Channel authentication record already exists

Related concepts

[Channel authentication records](#)

Multi V 9.0.2 Set Log

The Set Log (MQCMD_SET_LOG) command on Multiplatforms enables you to notify the queue manager that archiving of a log is complete. If the log management type is not **Archive** the command fails. This command requires change authority on the queue manager object.

Required parameters:

ParameterType

Optional parameters:

Archive

Required parameters

ParameterType (MQCFIN)

Specifies the type of the log (parameter identifier: MQIACF_SYSP_TYPE).

The value must be MQSYSP_TYPE_SET

Optional parameters

Archive (MQCFST)

Specifies the log extent that is being marked as archived (parameter identifier: MQCACF_ARCHIVE_LOG_EXTENT_NAME).

The command fails if the log extent is not recognized, or is the current log. The command does not fail if the extent has already been marked as having been archived.

A message is written to the error log if the queue manager is notified about an extent more than once.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown at [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_LOG_EXTENT_NOT_FOUND

The specified log extent was not found or is not valid.

MQRCCF_CURRENT_LOG_EXTENT

The specified log extent is the current log extent, and cannot have been validly archived yet.

MQRCCF_LOG_TYPE_ERROR

The command has been run on a log that is not an archive log.

MQRCCF_LOG_EXTENT_ERROR

The specified log extent is corrupt.

Set Log on z/OS

Use the Set Log (MQCMD_SET_LOG) command to dynamically change certain log system parameter values initially set by your system parameter module at queue manager startup.

Required parameters:

ParameterType

Optional parameters (if the value of *ParameterType* is MQSYSP_TYPE_SET:

CommandScope , *DeallocateInterval* , *LogCompression* , *MaxArchiveLog* ,
MaxConcurrentOffloads , *MaxReadTapeUnits* , *OutputBufferCount*

Optional parameters if *ParameterType* type is MQSYSP_TYPE_INITIAL:

CommandScope

Required parameters

ParameterType (MQCFIN)

Parameter type (parameter identifier: MQIACF_SYSP_TYPE).

Specifies how the parameters are to be set:

MQSYSP_TYPE_INITIAL

The initial settings of the log system parameters. This MQSYSP_TYPE_INITIAL resets all the log system parameters to the values at queue manager startup.

MQSYSP_TYPE_SET

This MQSYSP_TYPE_SET indicates that you intend to change one, or more, of the archive log system parameter settings.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

DeallocateInterval (MQCFIN)

Deallocation interval (parameter identifier: MQIACF_SYSP_DEALLOC_INTERVAL).

Specifies the length of time, in minutes, that an allocated archive read tape unit is allowed to remain unused before it is deallocated. This parameter, together with the **MaxReadTapeUnits** parameter, allows IBM MQ to optimize archive log reading from tape devices. You are recommended to specify

the maximum values, within system constraints, for both parameters, in order to achieve the optimum performance for reading archive tapes.

Specify a value in the range zero and 1440. Zero means that a tape unit is deallocated immediately. If you specify a value of 1440, the tape unit is never deallocated.

LogCompression (MQCFIN)

Log compression parameter (parameter identifier: MQIACF_LOG_COMPRESSION).

Specifies the log compression algorithm to enable.

The possible values are:

MQCOMPRESS_NONE

Log compression is disabled.

MQCOMPRESS_RLE

Enable run-length encoding log compression.

MQCOMPRESS_ANY

Enable the queue manager to select the compression algorithm that gives the greatest degree of log record compression.

 For more details see [The log files](#).

MaxArchiveLog (MQCFIN)

Specifies the maximum number of archive log volumes that can be recorded in the BSDS (parameter identifier: MQIACF_SYSP_MAX_ARCHIVE).

When this value is exceeded, recording recommences at the start of the BSDS.

Specify a value in the range 10 through 100.

MaxConcurrentOffloads (MQCFIN)

Specifies the maximum number of concurrent log offload tasks (parameter identifier: MQIACF_SYSP_MAX_CONC_OFFLOADS).

Specify a decimal number between 1 and 31. If no value is specified the default of 31 applies.

Configure a number lower than the default if your archive logs are allocated on a tape device, and there are constraints on the number of such devices that can be concurrently allocated to the queue manager.

MaxReadTapeUnits (MQCFIN)

Specifies the maximum number of dedicated tape units that can be allocated to read archive log tape volumes (parameter identifier: MQIACF_SYSP_MAX_READ_TAPES).

This parameter, together with the *DeallocateInterval* parameter, allows IBM MQ to optimize archive log reading from tape devices.

Specify a value in the range 1 through 99.

If you specify a value that is greater than the current specification, the maximum number of tape units allowable for reading archive logs increases. If you specify a value that is less than the current specification, tape units that are not being used are immediately deallocated to adjust to the new value. Active, or premounted, tapes remain allocated.

OutputBufferCount (MQCFIN)

Specifies the number of 4 KB output buffers to be filled before they are written to the active log data sets (parameter identifier: MQIACF_SYSP_OUT_BUFFER_COUNT).

Specify the number of buffers in the range 1 through 256.

The larger the number of buffers and the less often the write takes place improves the performance of IBM MQ. The buffers might be written before this number is reached if significant events, such as a commit point, occur.

Multi **Set Policy**

The Set Policy (MQCMD_CHANGE_PROT_POLICY) command sets the protection policy.

Important: You must have an Advanced Message Security (AMS) license installed to issue this command. If you attempt to issue the **Set Policy** command without an AMS license installed, you receive message AMQ7155 - License file not found or not valid.

Syntax diagram

See the syntax diagram in the MQSC [“SET POLICY” on page 868](#) command for combinations of parameters and values that are allowed.

Required parameters

PolicyName (MQCFST)

Specifies the name of the policy. The policy name must match the name of the queue which is to be protected (parameter identifier: MQCA_POLICY_NAME).

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Optional parameters

SignAlg (MQCFIN)

Specifies the digital signature algorithm (parameter identifier: MQIA_SIGNATURE_ALGORITHM). The following values are valid:

MQMLP_SIGN_ALG_NONE

No digital signature algorithm specified. This is the default value.

MQMLP_SIGN_ALG_MD5

MD5 digital signature algorithm specified.

MQMLP_SIGN_ALG_SHA1

SHA1 digital signature algorithm specified.

MQMLP_SIGN_ALG_SHA256

SHA256 digital signature algorithm specified.

MQMLP_SIGN_ALG_SHA384

SHA384 digital signature algorithm specified.

MQMLP_SIGN_ALG_SHA512

SHA512 digital signature algorithm specified.

EncAlg (MQCFIN)

Specifies the encryption algorithm (parameter identifier: MQIA_ENCRYPTION_ALGORITHM). The following values are valid:

MQMLP_ENCRYPTION_ALG_NONE

No encryption algorithm specified. This is the default value.

MQMLP_ENCRYPTION_ALG_RC2

RC2 encryption algorithm specified.

MQMLP_ENCRYPTION_ALG_DES

DES encryption algorithm specified.

MQMLP_ENCRYPTION_ALG_3DES

3DES encryption algorithm specified.

MQMLP_ENCRYPTION_ALG_AES128

AES128 encryption algorithm specified.

MQMLP_ENCRYPTION_ALG_AES256

AES256 encryption algorithm specified.

Signer (MQCFST)

Specifies the distinguished name of an authorized signer. This parameter can be specified multiple times (parameter identifier: MQCA_SIGNER_DN).

Recipient (MQCFST)

Specifies the distinguished name of the intended recipient. This parameter can be specified multiple times (parameter identifier: MQCA_RECIPIENT_DN).

Enforce and Tolerate (MQCFST)

Indicates whether the security policy should be enforced or whether unprotected messages are tolerated (parameter identifier: MQIA_TOLERATE_UNPROTECTED). The following values are valid:

MQMLP_TOLERATE_NO

Specifies that all message must be protected when retrieved from the queue. Any unprotected message encountered is moved to the SYSTEM.PROTECTION.ERROR.QUEUE. This is the default value.

MQMLP_TOLERATE_YES

Specifies that the messages that are not protected when retrieved from the queue can ignore the policy.

Toleration is optional and exists to facilitate staged implementation, where:

- Policies have been applied to queues, but those queues might already contain unprotected messages, or
- Queues might still receive messages from remote systems that do not yet have the policy set.

V 9.0.0

KeyReuse (MQCFIN)

Specifies the number of times that an encryption key can be re-used, in the range 1-9,999,999, or the special values *MQKEY_REUSE_DISABLED* or *MQKEY_REUSE_UNLIMITED* (parameter identifier: MQIA_KEY_REUSE_COUNT). The following values are valid:

MQKEY_REUSE_DISABLED

Prevents a symmetric key from being reused. This is the default value.

MQKEY_REUSE_UNLIMITED

Allows a symmetric key to be reused any number of times.

Attention: Key reuse is valid only for CONFIDENTIALITY policies, that is, **SignAlg** set to *MQESE_SIGN_ALG_NONE* and **EncAlg** set to an algorithm value. For all other policy types, you must omit the parameter, or set the **Keyreuse** value to *MQKEY_REUSE_DISABLED*.

Action (MQCFIN)

Specifies the action for the parameters supplied, as they apply to any existing policy (parameter identifier: MQIACF_ACTION). The following values are valid:

MQACT_REPLACE

Has the effect of replacing any existing policy with the parameters supplied. This is the default value.

MQACT_ADD

Has the effect that signers and recipients parameters have an additive effect. That is, if a signer or recipient is specified, and does not already exist in a preexisting policy, the signer or recipient value is added to the existing policy definition.

MQACT_REMOVE

Has the opposite effect of *MQACT_ADD*. That is, if any of the signer or recipient values specified exist in a preexisting policy, those values are removed from the policy definition.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown at [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_POLICY_TYPE_ERROR

Policy type not valid.

z/OS Set System on z/OS

Use the Set System (MQCMD_SET_SYSTEM) command to dynamically change certain general system parameter values initially set from your system parameter module at queue manager startup.

Required parameters:

ParameterType

Optional parameters (if the value of *ParameterType* is MQSYSP_TYPE_SET:

CheckpointCount, CommandScope, Exclmsg, MaxConnects, MaxConnectsBackground, MaxConnectsForeground, Service, SMFInterval, TraceSize

Optional parameters if *ParameterType* type is MQSYSP_INITIAL:

CommandScope

Required parameters

ParameterType (MQCFIN)

Parameter type (parameter identifier: MQIACF_SYSP_TYPE).

Specifies how the parameters are to be set:

MQSYSP_TYPE_INITIAL

The initial settings of the system parameters. MQSYSP_TYPE_INITIAL resets the parameters to the values specified in the system parameters at queue manager startup.

MQSYSP_TYPE_SET

MQSYSP_TYPE_SET indicates that you intend to change one, or more, of the system parameter settings.

Optional parameters

CheckpointCount (MQCFIN)

The number of log records written by IBM MQ between the start of one checkpoint and the next (parameter identifier: MQIACF_SYSP_CHKPOINT_COUNT).

IBM MQ starts a new checkpoint after the number of records that you specify has been written.

Specify a value in the range 200 through 16 000 000.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Exclmsg (MQCFSL)

A list of message identifiers to be excluded from being written to any log (parameter identifier: MQCACF_EXCL_OPERATOR_MESSAGES).

Specify a list of error message identifiers to be excluded from being written to any log. For example, to exclude message CSQX500I, add X500 to this list. Messages in this list are not sent to the z/OS console and hardcopy log. As a result using the EXCLMSG parameter to exclude messages is more efficient from a CPU perspective than using z/OS mechanisms such as the message processing facility list and should be used instead where possible.

The maximum length of each message identifier is MQ_OPERATOR_MESSAGE_LENGTH.

The list can contain a maximum of 16 message identifiers.

Service (MQCFST)

Service parameter setting (parameter identifier: MQCACF_SYSP_SERVICE).

This parameter is reserved for use by IBM.

SMFInterval (MQCFIN)

The default time, in minutes, between each gathering of statistics (parameter identifier: MQIACF_SYSP_SMF_INTERVAL).

Specify a value in the range zero through 1440.

If you specify a value of zero, statistics data and accounting data are both collected at the SMF data collection broadcast.

TraceSize (MQCFIN)

The size of the trace table, in 4 KB blocks, to be used by the global trace facility (parameter identifier: MQIACF_SYSP_TRACE_SIZE).

Specify a value in the range zero through 999.

Start Channel

The Start Channel (MQCMD_START_CHANNEL) command starts an IBM MQ channel. This command can be issued to a channel of any type (except MQCHT_CLNTCONN). If, however, it is issued to a channel with a *ChannelType* value of MQCHT_RECEIVER, MQCHT_SVRCONN, or MQCHT_CLUSRCVR, the only action is to enable the channel, not start it.

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

None of the following attributes are applicable to MQTT channels unless specifically mentioned in the parameter description.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel to be started. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

This parameter is required for all channel types including MQTT channels.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH_CHANNEL_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be started.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be:

MQCHLD_PRIVATE

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD_SHARED.

MQCHLD_SHARED

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD_SHARED.

MQCHLD_FIXSHARED

Shared channels tied to a specific queue manager.

The combination of the **ChannelDisposition** and **CommandScope** parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.
- On every active queue manager in the group.
- On the most suitable queue manager in the group, determined automatically by the queue manager itself.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in [Table 106 on page 1826](#)

ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name	CommandScope (*)
MQCHLD_PRIVATE	Start as a private channel on the local queue manager	Start as a private channel on the named queue manager	Start as a private channel on all active queue managers

Table 106. ChannelDisposition and CommandScope for START CHANNEL (continued)

ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name	CommandScope (*)
MQCHLD_SHARED	<p>For channels of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, start as a shared channel on the most suitable queue manager in the group.</p> <p>For a shared channel of <i>ChannelType</i> MQCHT_RECEIVER and MQCHT_SVRCONN, start the channel on all active queue managers.</p> <p>For a shared channel of <i>ChannelType</i> MQCHT_CLUSSDR and MQCHT_CLUSRCVR, this option is not permitted.</p> <p>MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted	Not permitted
MQCHLD_FIXSHARED	<p>For a shared channel of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, with a nonblank <i>ConnectionName</i> , start as a shared channel on the local queue manager.</p>	<p>For a shared channel of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, with a nonblank <i>ConnectionName</i> , start as a shared channel on the named queue manager.</p>	Not permitted

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands”](#) on page 1343.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_INDOUBT

Channel in-doubt.

MQRCCF_CHANNEL_IN_USE

Channel in use.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHANNEL_TYPE_ERROR

Channel type not valid.

MQRCCF_MQCONN_FAILED

MQCONN call failed.

MQRCCF_MQINQ_FAILED

MQINQ call failed.

MQRCCF_MQOPEN_FAILED

MQOPEN call failed.

MQRCCF_NOT_XMIT_Q

Queue is not a transmission queue.

The Start Channel (MQCMD_START_CHANNEL) command starts an IBM MQ channel. This command can be issued to a channel of type MQCHT_MQTT.

Required parameters**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel to be started. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

This parameter is required for all channel types including MQTT channels.

ChannelType (MQCFIN)

The type of channel (parameter identifier: MQIACH_CHANNEL_TYPE). This parameter is currently only used with MQTT Telemetry channels, and is required when starting a Telemetry channel. The only value that can currently be given to the parameter is MQCHT_MQTT.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_PARM_SYNTAX_ERROR

The parameter specified contained a syntax error.

MQRCCF_PARM_MISSING

Parameters are missing.

MQRCCF_CHANNEL_NOT_FOUND

The channel specified does not exist.

MQRCCF_CHANNEL_IN_USE

The command did not specify a parameter or parameter value that was required.

MQRCCF_NO_STORAGE

Insufficient storage is available.

MQRCCF_COMMAND_FAILED

The command has failed.

MQRCCF_PORT_IN_USE

The port is in use.

MQRCCF_BIND_FAILED

The bind to a remote system during session negotiation has failed.

MQRCCF_SOCKET_ERROR

Socket error has occurred.

MQRCCF_HOST_NOT_AVAILABLE

An attempt to allocate a conversation to a remote system was unsuccessful. The error might be transitory, and the allocate might succeed later. This reason can occur if the listening program at the remote system is not running.

Start Channel Initiator

The Start Channel Initiator (MQCMD_START_CHANNEL_INIT) command starts an IBM MQ channel initiator.

Required parameters

InitiationQName (MQCFST)

Initiation queue name (parameter identifier: MQCA_INITIATION_Q_NAME).

The name of the initiation queue for the channel initiation process. That is, the initiation queue that is specified in the definition of the transmission queue.

This parameter is not valid on z/OS.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

EnvironmentInfo (MQCFST)

Environment information (parameter identifier: MQCACF_ENV_INFO).

The parameters and values to be substituted in the JCL procedure (xxxxCHIN, where xxxx is the queue manager name) that is used to start the channel initiator address space. This parameter applies to z/OS only.

The maximum length of the string is MQ_ENV_INFO_LENGTH.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_MQCONN_FAILED

MQCONN call failed.

MQRCCF_MQGET_FAILED

MQGET call failed.

MQRCCF_MQOPEN_FAILED

MQOPEN call failed.

Start Channel Listener

The Start Channel Listener (MQCMD_START_CHANNEL_LISTENER) command starts an IBM MQ listener. On z/OS, this command is valid for any transmission protocol; on other platforms, it is valid only for TCP transmission protocols.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_Q_MGR_NAME_LENGTH.

InboundDisposition (MQCFIN)

Inbound transmission disposition (parameter identifier: MQIACH_INBOUND_DISP). This parameter applies to z/OS only.

Specifies the disposition of the inbound transmissions that are to be handled. The value can be any of the following values:

MQINBD_Q_MGR

Listen for transmissions directed to the queue manager. MQINBD_Q_MGR is the default.

MQINBD_GROUP

Listen for transmissions directed to the queue sharing group. MQINBD_GROUP is permitted only if there is a shared queue manager environment.

IPAddress (MQCFST)

IP address (parameter identifier: MQCACH_IP_ADDRESS). This parameter applies to z/OS only.

The IP address for TCP/IP specified in IPv4 dotted decimal, IPv6 hexadecimal, or alphanumeric form. This parameter is valid only for channels that have a *TransportType* of MQXPT_TCP.

The maximum length of the string is MQ_IP_ADDRESS_LENGTH.

ListenerName (MQCFST)

Listener name (parameter identifier: MQCACH_LISTENER_NAME). This parameter does not apply to z/OS.

The name of the listener definition to be started. On those platforms on which this parameter is valid, if this parameter is not specified, the default listener SYSTEM.DEFAULT.LISTENER is assumed. If this parameter is specified, no other parameters can be specified.

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

z/OS

LUName (MQCFST)

LU name (parameter identifier: MQCACH_LU_NAME). This parameter applies to z/OS only.

The symbolic destination name for the logical unit (LU) as specified in the APPC side information data set. The LU must be the same LU that is specified in the channel initiator parameters to be used for outbound transmissions. This parameter is valid only for channels with a *TransportType* of MQXPT_LU62.

The maximum length of the string is MQ_LU_NAME_LENGTH.

z/OS

Port (MQCFIN)

Port number for TCP (parameter identifier: MQIACH_PORT_NUMBER). This parameter applies to z/OS only.

The port number for TCP. This parameter is valid only for channels with a *TransportType* of MQXPT_TCP.

z/OS

TransportType (MQCFIN)

Transmission protocol type (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value can be:

MQXPT_LU62

LU 6.2.

MQXPT_TCP

TCP.

MQXPT_NETBIOS

NetBIOS.

MQXPT_SPX

SPX.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_COMMS_LIBRARY_ERROR

Communications protocol library error.

MQRCCF_LISTENER_NOT_STARTED

Listener not started.

MQRCCF_LISTENER_RUNNING

Listener already running.

MQRCCF_NETBIOS_NAME_ERROR

NetBIOS listener name error.

Multi

Start Service on Multiplatforms

The Start Service (MQCMD_START_SERVICE) command starts an existing IBM MQ service definition.

Required parameters

ServiceName (MQCFST)

Service name (parameter identifier: MQCA_SERVICE_NAME).

This parameter is the name of the service definition to be started. The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_NO_START_CMD

The **StartCommand** parameter of the service is blank.

MQRCCF_SERVICE_RUNNING

Service is already running.

z/OS

Start SMDS Connection on z/OS

Use the Start SMDS Connection (MQCMD_INQUIRE_SMDSCONN) command after connections have been put into the AVAIL(STOPPED) state by a previous STOP SMDSCONN command. It can also be used to signal to the queue manager to retry a connection which is in the AVAIL(ERROR) state after a previous error.

Required parameters

SMDSConn (MQCFST)

Specifies the queue manager name relating to the connection between the shared message data set and the queue manager (parameter identifier: MQCACF_CF_SMDSCONN).

An asterisk value can be used to denote all shared message data sets associated with a specific CFSTRUCT name.

The maximum length of the string is 4 characters.

CFStrucName (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to start (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.

- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Stop Channel

The Stop Channel (MQCMD_STOP_CHANNEL) command stops an IBM MQ channel.

This command can be issued to a channel of any type (except MQCHT_CLNTCONN).

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

None of the following attributes are applicable to MQTT channels unless specifically mentioned in the parameter description.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel to be stopped. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

This parameter is required for all channel types..

Optional parameters

ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH_CHANNEL_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be stopped.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

MQCHLD_PRIVATE

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD_SHARED.

MQCHLD_SHARED

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD_SHARED.

The combination of the **ChannelDisposition** and **CommandScope** parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.

- On every active queue manager in the group.
- On the most suitable queue manager in the group, determined automatically by the queue manager itself.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in [Table 107 on page 1834](#)

<i>Table 107. ChannelDisposition and CommandScope for STOP CHANNEL</i>			
ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name	CommandScope (*)
MQCHLD_PRIVATE	Stop as a private channel on the local queue manager	Stop as a private channel on the named queue manager	Stop as a private channel on all active queue managers
MQCHLD_SHARED	<p>For channels of <i>ChannelType</i> MQCHT_RECEIVER or MQCHT_SVRCONN, stop as shared channel on all active queue managers.</p> <p>For channels of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, stop as a shared channel on the queue manager where it is running. If the channel is in an inactive state (not running), or if it is in RETRY state because the channel initiator on which it was running has stopped, a STOP request for the channel is issued on the local queue manager.</p> <p>MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted	Not permitted

ChannelStatus (MQCFIN)

The new state of the channel after the command is executed (parameter identifier: MQIACH_CHANNEL_STATUS).

The value can be any of the following values:

MQCHS_INACTIVE

Channel is inactive.

MQCHS_STOPPED

Channel is stopped. MQCHS_STOPPED is the default if nothing is specified.

z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

ConnectionName (MQCFST)

Connection name of channel to be stopped (parameter identifier: MQCACH_CONNECTION_NAME).

This parameter is the connection name of the channel to be stopped. If this parameter is omitted, all channels with the specified channel name and remote queue manager name are stopped.

On Multiplatforms, the maximum length of the string is MQ_CONN_NAME_LENGTH. On z/OS, the maximum length of the string is MQ_LOCAL_ADDRESS_LENGTH.

If this parameter is specified, ChannelStatus must be MQCHS_INACTIVE.

Mode (MQCFIN)

How the channel must be stopped (parameter identifier: MQIACF_MODE).

The value can be:

MQMODE QUIESCE

Quiesce the channel. MQMODE QUIESCE is the default.

If you issue a `Stop Channel channelname Mode(MQMODE QUIESCE)` command on a server-connection channel with the sharing conversations feature enabled, the IBM MQ client infrastructure becomes aware of the stop request in a timely manner; this time is dependent upon the speed of the network. The client application becomes aware of the stop request as a result of issuing a subsequent call to IBM MQ.

MQMODE FORCE

Stop the channel immediately; the thread or process of the channel is not terminated. Stops transmission of any current batch.

For server-connection channels, breaks the current connection, returning MQRC_CONNECTION_BROKEN.

For other types of channels, this situation is likely to result in in-doubt situations.

z/OS

On z/OS, this option interrupts any message reallocation in progress, which can leave BIND_NOT_FIXED messages partially reallocated or out of order.

MQMODE TERMINATE

Multi

On Multiplatforms, stop the channel immediately; the thread or process of the channel is terminated.

z/OS

On z/OS, MQMODE_TERMINATE is synonymous with FORCE.

 On z/OS, this option interrupts any message reallocation in progress, which can leave BIND_NOT_FIXED messages partially reallocated or out of order.

Note: This parameter was previously called *Quiesce* (MQIACF_QUIESCE), with values MQQO_YES and MQQO_NO. The old names can still be used.

QMgrName (MQCFST)

Name of remote queue manager (parameter identifier: MQCA_Q_MGR_NAME).

This parameter is the name of the remote queue manager to which the channel is connected. If this parameter is omitted, all channels with the specified channel name and connection name are stopped. The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

If this parameter is specified, ChannelStatus must be MQCHS_INACTIVE.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_DISABLED

Channel disabled.

MQRCCF_CHANNEL_NOT_ACTIVE

Channel not active.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_MODE_VALUE_ERROR

Mode value not valid.

MQRCCF_MQCONN_FAILED

MQCONN call failed.

MQRCCF_MQOPEN_FAILED

MQOPEN call failed.

MQRCCF_MQSET_FAILED

MQSET call failed.

Stop Channel (MQTT)

The Stop Channel (MQCMD_STOP_CHANNEL) command stops an MQ Telemetry channel.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

This parameter is required.

The name of the channel to be stopped. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelType (MQCFIN)

The type of channel (parameter identifier: MQIACH_CHANNEL_TYPE). This parameter is currently only used with MQTT Telemetry channels, and is required when stopping a Telemetry channel. The only value that can currently be given to the parameter is **MQCHT_MQTT**.

Optional parameters

ClientIdentifier (MQCFST)

Client identifier. The client identifier is a 23-byte string that identifies an MQ Telemetry Transport client. When the Stop Channel command specifies a *ClientIdentifier*, only the connection for the specified client identifier is stopped. If the CLIENTID is not specified, all the connections on the channel are stopped.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_DISABLED

Channel disabled.

MQRCCF_CHANNEL_NOT_ACTIVE

Channel not active.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_MODE_VALUE_ERROR

Mode value not valid.

MQRCCF_MQCONN_FAILED

MQCONN call failed.

MQRCCF_MQOPEN_FAILED

MQOPEN call failed.

MQRCCF_MQSET_FAILED

MQSET call failed.

Stop Channel Initiator on z/OS

The Stop Channel Initiator (MQCMD_STOP_CHANNEL_INIT) command stops an IBM MQ channel initiator.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

SharedChannelRestart (MQCFIN)

Shared channel restart (parameter identifier: MQIACH_SHARED_CHL_RESTART).

Specifies whether the channel initiator attempts to restart any active sending channels, started with the **ChannelDisposition** parameter set to MQCHLD_SHARED, that it owns on another queue manager. The value can be:

MQCHSH_RESTART_YES

Shared sending channels are to be restarted. MQCHSH_RESTART_YES is the default.

MQCHSH_RESTART_NO

Shared sending channels are not to be restarted, so become inactive.

Active channels started with the **ChannelDisposition** parameter set to MQCHLD_FIXSHARED are not restarted, and always become inactive.

Stop Channel Listener

The Stop Channel Listener (MQCMD_STOP_CHANNEL_LISTENER) command stops an IBM MQ listener.

Required parameters

ListenerName (MQCFST)

Listener name (parameter identifier: MQCACH_LISTENER_NAME). This parameter does not apply to z/OS.

The name of the listener definition to be stopped. If this parameter is specified, no other parameters can be specified.

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

This parameter is valid only on z/OS.

The maximum length is MQ_QSG_NAME_LENGTH.

InboundDisposition (MQCFIN)

Inbound transmission disposition (parameter identifier: MQIACH_INBOUND_DISP).

Specifies the disposition of the inbound transmissions that the listener handles. The value can be any of the following values:

MQINBD_Q_MGR

Handling for transmissions directed to the queue manager. MQINBD_Q_MGR is the default.

MQINBD_GROUP

Handling for transmissions directed to the queue sharing group. MQINBD_GROUP is permitted only if there is a shared queue manager environment.

This parameter is valid only on z/OS.

IPAddress (MQCFST)

IP address (parameter identifier: MQCACH_IP_ADDRESS).

The IP address for TCP/IP specified in dotted decimal or alphanumeric form. This parameter is valid on z/OS only where channels have a *TransportType* of MQXPT_TCP.

The maximum length of the string is MQ_IP_ADDRESS_LENGTH.

Port (MQCFIN)

Port number for TCP (parameter identifier: MQIACH_PORT_NUMBER).

The port number for TCP. This parameter is valid only on z/OS where channels have a *TransportType* of MQXPT_TCP.

TransportType (MQCFIN)

Transmission protocol type (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value can be:

MQXPT_LU62

LU 6.2.

MQXPT_TCP

TCP.

This parameter is valid only on z/OS.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_LISTENER_STOPPED

Listener not running.

Multi Stop Connection on Multiplatforms

The Stop Connection (MQCMD_STOP_CONNECTION) command attempts to break a connection between an application and the queue manager. There might be circumstances in which the queue manager cannot implement this command.

Required parameters

ConnectionId (MQCFBS)

Connection identifier (parameter identifier: MQBACF_CONNECTION_ID).

This parameter is the unique connection identifier associated with an application that is connected to the queue manager.

The length of the byte string is MQ_CONNECTION_ID_LENGTH.

Multi Stop Service on Multiplatforms

The Stop Service (MQCMD_STOP_SERVICE) command stops an existing IBM MQ service definition that is running.

Required parameters

ServiceName (MQCFST)

Service name (parameter identifier: MQCA_SERVICE_NAME).

This parameter is the name of the service definition to be stopped. The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown on page “Error codes applicable to all commands” on page 1343.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_NO_STOP_CMD

The **StopCommand** parameter of the service is blank.

MQRCCF_SERVICE_STOPPED

Service is not running.

Stop SMDS Connection on z/OS

Use the Stop SMDS Connection (MQCMD_STOP_SMDSCONN) command to terminate the connection from this queue manager to one or more specified shared message data sets (causing them to be closed and deallocated) and to mark the connection as STOPPED.

Required parameters

SMDSConn (MQCFST)

Specifies the queue manager name relating to the connection between the shared message data set and the queue manager (parameter identifier: MQCACF_CF_SMDSCONN).

An asterisk value can be used to denote all shared message data sets associated with a specific CFSTRUCT name.

The maximum length of the string is 4 characters.

CFStrucName (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to stop (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Suspend Queue Manager on z/OS

The Suspend Queue Manager (MQCMD_SUSPEND_Q_MGR) command renders the local queue manager unavailable for the processing of IMS or Db2 messages. Its action can be reversed by the Resume Queue Manager command (MQCMD_RESUME_Q_MGR) command.

Required parameters

Facility (MQCFIN)

Facility (parameter identifier: MQIACF_Q_MGR_FACILITY).

The type of facility for which activity is to be suspended. The value can be:

MQQMFACT_DB2

The existing connection to Db2 is terminated.

Any in-flight or subsequent MQGET or MQPUT requests are suspended and applications wait until the Db2 connection is re-established by the Resume Queue Manager command, or if the queue manager is stopped.

MQQMFACT_IMS_BRIDGE

Resumes normal IMS bridge activity.

Stops the sending of messages from IMS bridge queues to OTMA. No further messages are sent to IMS until one of these events occurs:

- OTMA is stopped and restarted
- IMS or IBM MQ is stopped or restarted
- A Resume Queue Manager command is processed

Messages returning from IMS OTMA to the queue manager are unaffected.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

Suspend Queue Manager Cluster

The Suspend Queue Manager Cluster (MQCMD_SUSPEND_Q_MGR_CLUSTER) command informs other queue managers in a cluster that the local queue manager is not available for processing, and cannot be sent messages. Its action can be reversed by the Resume Queue Manager Cluster (MQCMD_RESUME_Q_MGR_CLUSTER) command.

Required parameters

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

The name of the cluster for which availability is to be suspended.

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

ClusterNamelist (MQCFST)

Cluster Namelist (parameter identifier: MQCA_CLUSTER_NAMELIST).

The name of the namelist specifying a list of clusters for which availability is to be suspended.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

Mode (MQCFIN)

How the local queue manager is suspended from the cluster (parameter identifier: MQIACF_MODE).

The value can be:

MQMODE_QUIESCE

Other queue managers in the cluster are told not to send further messages to the local queue manager.

MQMODE_FORCE

All inbound and outbound channels to other queue managers in the cluster are stopped forcibly.

Note: This parameter was previously called *Quiesce* (MQIACF_QUIESCE), with values MQQO_YES and MQQO_NO. The old names can still be used.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1343](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CLUSTER_NAME_CONFLICT

Cluster name conflict.

MQRCCF_MODE_VALUE_ERROR

Mode value not valid.

Structures for commands and responses

PCF commands and responses have a consistent structure including of a header and any number of parameter structures of defined types.

Commands and responses have the form:

- PCF header (MQCFH) structure (described in topic [“MQCFH - PCF header” on page 1844](#)), followed by
- Zero or more parameter structures. Each of these is one of the following:

- PCF byte string filter parameter (MQCFBF, see topic [“MQCFBF - PCF byte string filter parameter”](#) on page 1847)
- PCF byte string parameter (MQCFBS, see topic [“MQCFBS - PCF byte string parameter”](#) on page 1850)
- PCF integer filter parameter (MQCFIF, see topic [“MQCFIF - PCF integer filter parameter”](#) on page 1852)
- PCF integer list parameter (MQCFIL, see topic [“MQCFIL - PCF integer list parameter”](#) on page 1855)
- PCF integer parameter (MQCFIN, see topic [“MQCFIN - PCF integer parameter”](#) on page 1857)
- PCF string filter parameter (MQCFSF, see topic [“MQCFSF - PCF string filter parameter”](#) on page 1859)
- PCF string list parameter (MQCFSL, see topic [“MQCFSL - PCF string list parameter”](#) on page 1863)
- PCF string parameter (MQCFST, see topic [“MQCFST - PCF string parameter”](#) on page 1866)

How the structures are shown

The structures are described in a language-independent form.

The declarations are shown in the following programming languages:

- C
- COBOL
- PL/I
- S/390 assembler
- Visual Basic

Data types

For each field of the structure, the data type is given in brackets after the field name. These data types are the elementary data types described in [Data types used in the MQI](#).

Initial values and default structures

See [IBM MQ COPY, header, include, and module files](#) for details of the supplied header files that contain the structures, constants, initial values, and default structures.

Usage notes

The format of the strings in the PCF message determines the settings of the character set fields in the message descriptor to enable conversion of strings within the message.

If all of the strings in a PCF message have the same coded character-set identifier, the *CodedCharSetId* field in the message descriptor MQMD should be set to that identifier when the message is put, and the *CodedCharSetId* fields in the MQCFST, MQCFSL, and MQCFSF structures within the message should be set to MQCCSI_DEFAULT.

If the format of the PCF message is MQFMT_ADMIN, MQFMT_EVENT, or MQFMT_PCF and some of the strings in the message have different character-set identifiers, the *CodedCharSetId* field in MQMD should be set to MQCCSI_EMBEDDED when the message is put, and the *CodedCharSetId* fields in the MQCFST, MQCFSL, and MQCFSF structures within the message should all be set to the identifiers that apply.

This enables conversions of the strings within the message, to the *CodedCharSetId* value in the MQMD specified on the MQGET call, if the MQGMO_CONVERT option is also specified.

For more information about the MQEPH structure, see [MQEPH - Embedded PCF header](#).

Note: If you request conversion of the internal strings in the message, the conversion will occur only if the value of the *CodedCharSetId* field in the MQMD of the message is different from the *CodedCharSetId* field of the MQMD specified on the MQGET call.

Do not specify MQCCSI_EMBEDDED in MQMD when the message is put, with MQCCSI_DEFAULT in the MQCFST, MQCFSL, or MQCFSF structures within the message, as this will prevent conversion of the message.

MQCFH - PCF header

The MQCFH structure describes the information that is present at the start of the message data of a command message, or a response to a command message. In either case, the message descriptor *Format* field is MQFMT_ADMIN.

The PCF structures are also used for event messages. In this case the message descriptor *Format* field is MQFMT_EVENT.

The PCF structures can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT_PCF (see [Message descriptor for a PCF command](#)). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *StrucLength* and *ParameterCount* fields to the values appropriate to the data.

Fields for MQCFH

Type (MQLONG)

Structure type.

This field indicates the content of the message. The following values are valid for commands:

MQCFT_COMMAND

Message is a command.

MQCFT_COMMAND_XR

Message is a command to which standard or extended responses might be sent.

This value is required on z/OS.

MQCFT_RESPONSE

Message is a response to a command.

MQCFT_XR_MSG

Message is an extended response to a command. It contains informational or error details.

MQCFT_XR_ITEM

Message is an extended response to an Inquire command. It contains item data.

MQCFT_XR_SUMMARY

Message is an extended response to a command. It contains summary information.

MQCFT_USER

User-defined PCF message.

StrucLength (MQLONG)

Structure length.

This field is the length in bytes of the MQCFH structure. The value must be:

MQCFH_STRUC_LENGTH

Length of command format header structure.

Version (MQLONG)

Structure version number.

For z/OS, the value must be:

MQCFH_VERSION_3

Version number for command format header structure.

The following constant specifies the version number of the current version:

MQCFH_CURRENT_VERSION

Current version of command format header structure.

Command (MQLONG)

Command identifier.

For a command message, this field identifies the function to be performed. For a response message, it identifies the command to which this field is the reply. See the description of each command for the value of this field.

MsgSeqNumber (MQLONG)

Message sequence number.

This field is the sequence number of the message within a set of related messages. For a command, this field must have the value one (because a command is always contained within a single message). For a response, the field has the value one for the first (or only) response to a command, and increases by one for each successive response to that command.

The last (or only) message in a set has the MQCFC_LAST flag set in the *Control* field.

Control (MQLONG)

Control options.

The following values are valid:

MQCFC_LAST

Last message in the set.

For a command, this value must always be set.

MQCFC_NOT_LAST

Not the last message in the set.

CompCode (MQLONG)

Completion code.

This field is meaningful only for a response; its value is not significant for a command. The following values are possible:

MQCC_OK

Command completed successfully.

MQCC_WARNING

Command completed with warning.

MQCC_FAILED

Command failed.

MQCC_UNKNOWN

Whether command succeeded is not known.

Reason (MQLONG)

Reason code qualifying completion code.

This field is meaningful only for a response; its value is not significant for a command.

The possible reason codes that can be returned in response to a command are listed in, [“Definitions of the Programmable Command Formats” on page 1337](#) and in the description of each command.

ParameterCount (MQLONG)

Count of parameter structures.

This field is the number of parameter structures (MQCFBF, MQCFBS, MQCFIF, MQCFIL, MQCFIN, MQCFSL, MQCFSF, and MQCFST) that follow the MQCFH structure. The value of this field is zero or greater.

MQCFBF - PCF byte string filter parameter

The MQCFBF structure describes a byte string filter parameter. The format name in the message descriptor is MQFMT_ADMIN.

The MQCFBF structure is used in Inquire commands to provide a filter description. This filter description is used to filter the results of the Inquire command and return to the user only those objects that satisfy the filter description.

On z/OS, a single filter parameter only is allowed. If multiple MQCFIF, MQCFSF and MQCFBF, or MQCFBF parameters are specified, the PCF command fails with error MQRCCF_TOO_MANY_FILTERS (MQRCCF 3248).

When an MQCFBF structure is present, the Version field in the MQCFH structure at the start of the PCF must be MQCFH_VERSION_3 or higher.

Fields for MQCFBF

Type (MQLONG)

Structure type.

This indicates that the structure is a MQCFBF structure describing a byte string filter parameter. The value must be:

MQCFT_BYTE_STRING_FILTER

Structure defining a byte string filter.

StrucLength (MQLONG)

Structure length.

This is the length, in bytes, of the MQCFBF structure, including the string at the end of the structure (the *FilterValue* field). The length must be a multiple of 4, and must be sufficient to contain the string. Bytes between the end of the string and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *FilterValue* field:

MQCFBF_STRUC_LENGTH_FIXED

Length of fixed part of command format filter string-parameter structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter that is to be filtered on. The value of this identifier depends on the parameter to be filtered on.

The parameter is one of the following:

- MQBACF_EXTERNAL_UOW_ID
- MQBACF_Q_MGR_UOW_ID
- MQBACF_ORIGIN_UOW_ID (on z/OS only)

Operator (MQLONG)

Operator identifier.

This identifies the operator that is being used to evaluate whether the parameter satisfies the filter-value.

Possible values are:

MQCFOP_GREATER

Greater than

MQCFOP_LESS

Less than

MQCFOP_EQUAL

Equal to

MQCFOP_NOT_EQUAL

Not equal to

MQCFOP_NOT_LESS

Greater than or equal to

MQCFOP_NOT_GREATER

Less than or equal to

FilterValueLength (MQLONG)

Length of filter-value string.

This is the length, in bytes, of the data in the *FilterValue* field. This must be zero or greater, and does not need to be a multiple of 4.

FilterValue (MQBYTE x *FilterValueLength*)

Filter value.

This specifies the filter-value that must be satisfied. Use this parameter where the response type of the filtered parameter is a byte string.

Note: If the specified byte string is shorter than the standard length of the parameter in MQFMT_ADMIN command messages, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.

C language declaration

```
typedef struct tagMQCFBF {
    MQLONG Type;           /* Structure type */
    MQLONG StrucLength;    /* Structure length */
    MQLONG Parameter;     /* Parameter identifier */
    MQLONG Operator;      /* Operator identifier */

MQCFBS - PCF byte string parameter

The MQCFBS structure describes a byte-string parameter in a PCF message. The format name in the message descriptor is MQFMT_ADMIN.

When an MQCFBS structure is present, the *Version* field in the MQCFH structure at the start of the PCF must be MQCFH_VERSION_2 or greater.

In a user PCF message, the *Parameter* field has no significance, and can be used by the application for its own purposes.

The structure ends with a variable-length byte string; see the *String* field in the following section for further details.

Fields for MQCFBS

Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFBS structure describing byte string parameter. The value must be:

MQCFT_BYTE_STRING

Structure defining a byte string.

StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFBS structure, including the variable-length string at the end of the structure (the *String* field). The length must be a multiple of four, and must be sufficient to contain the string; any bytes between the end of the string and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *String* field:

MQCFBS_STRUC_LENGTH_FIXED

Length of fixed part of MQCFBS structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter with a value that is contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see “MQCFH - PCF header” on page 1844 for details. In user PCF messages (MQCFT_USER), this field has no significance.

The parameter is from the MQBACF_* group of parameters.

StringLength (MQLONG)

Length of string.

This is the length in bytes of the data in the *string* field; it must be zero or greater. This length does not need to be a multiple of four.

String (MQBYTE x StringLength)

String value.

This is the value of the parameter identified by the *parameter* field. The string is a byte string, and so is not subject to character-set conversion when sent between different systems.

Note: A null character in the string is treated as normal data, and does not act as a delimiter for the string

For MQFMT_ADMIN messages, if the specified string is shorter than the standard length of the *parameter*, the omitted characters are assumed to be nulls. If the specified string is longer than the standard length, it is an error.

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For other programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, you must include MQCFBS in a larger structure, and declare additional fields following MQCFBS, to represent the *String* field as required.

C language declaration

```
typedef struct tagMQCFBS {
    MQLONG   Type;          /* Structure type */
    MQLONG   StrucLength;   /* Structure length */
    MQLONG   Parameter;     /* Parameter identifier */
    MQLONG   StringLength; /* Length of string */
    MQBYTE   String[1];    /* String value - first byte */

} MQCFBS;
```

COBOL language declaration

MQCFIF - PCF integer filter parameter

The MQCFIF structure describes an integer filter parameter. The format name in the message descriptor is MQFMT_ADMIN.

The MQCFIF structure is used in Inquire commands to provide a filter condition. This filter condition is used to filter the results of the Inquire command and return to the user only those objects that satisfy the filter condition.

When an MQCFIF structure is present, the Version field in the MQCFH structure at the start of the PCF must be MQCFH_VERSION_3 or higher.

On z/OS, a single filter parameter only is allowed. If multiple MQCFIF, MQCFSF and MQCFBF, or MQCFBF parameters are specified, the PCF command fails with error MQRCCF_TOO_MANY_FILTERS (MQRCCF 3248).

Fields for MQCFIF

Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFIF structure describing an integer filter parameter. The value must be:

MQCFT_INTEGER_FILTER

Structure defining an integer filter.

StructLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFIF structure. The value must be:

MQCFIF_STRUC_LENGTH

Length of command format integer-parameter structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter that is to be filtered on. The value of this identifier depends on the parameter to be filtered on. Any of the parameters which can be used in the Inquire command can be used in this field.

The parameter is from the following groups of parameters:

- MQIA_*
- MQIACF_*
- MQIAMO_*
- MQIACH_*

Operator (MQLONG)

Operator identifier.

This identifies the operator that is being used to evaluate whether the parameter satisfies the filter-value.

Possible values are:

MQCFOP_GREATER

Greater than

MQCFOP_LESS

Less than

MQCFOP_EQUAL

Equal to

MQCFOP_NOT_EQUAL

Not equal to

MQCFOP_NOT_LESS

Greater than or equal to

MQCFOP_NOT_GREATER

Less than or equal to

MQCFOP_CONTAINS

Contains a specified value. Use MQCFOP_CONTAINS when filtering on lists of values or integers.

MQCFOP_EXCLUDES

Does not contain a specified value. Use MQCFOP_EXCLUDES when filtering on lists of values or integers.

See the *FilterValue* description for details telling you which operators can be used in which circumstances.

FilterValue (MQLONG)

Filter value identifier.

This specifies the filter-value that must be satisfied.

Depending on the parameter, the value and the permitted operators can be:

- An explicit integer value, if the parameter takes a single integer value.

You can only use the following operators:

- MQCFOP_GREATER
- MQCFOP_LESS
- MQCFOP_EQUAL
- MQCFOP_NOT_EQUAL
- MQCFOP_NOT_GREATER
- MQCFOP_NOT_LESS

- An MQ constant, if the parameter takes a single value from a possible set of values (for example, the value MQCHT_SENDER on the **ChannelType** parameter). You can only use MQCFOP_EQUAL or MQCFOP_NOT_EQUAL.
- An explicit value or an MQ constant, as the case might be, if the parameter takes a list of values. You can use either MQCFOP_CONTAINS or MQCFOP_EXCLUDES. For example, if the value 6 is specified with the operator MQCFOP_CONTAINS, all items where one of the parameter values is 6 are listed.

For example, if you need to filter on queues that are enabled for put operations in your Inquire Queue command, the parameter would be MQIA_INHIBIT_PUT and the filter-value would be MQQA_PUT_ALLOWED.

The filter value must be a valid value for the parameter being tested.

C language declaration

```
typedef struct tagMQCFIF {
    MQLONG Type; /* Structure type */
    MQLONG StrucLength; /* Structure length */
    MQLONG Parameter; /* Parameter identifier */
    MQLONG Operator; /* Operator identifier */
    MQLONG FilterValue; /* Filter value */
} MQCFIF;

MQCFIL - PCF integer list parameter

The MQCFIL structure describes an integer-list parameter in a message that is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT_ADMIN.

The MQCFIL structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT_PCF (see [Message descriptor for a PCF command](#)). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *StrucLength*, *Count*, and *Values* fields to the values appropriate to the data.

The structure ends with a variable-length array of integers; see the *Values* field in the following section for further details.

Fields for MQCFIL

Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFIL structure describing an integer-list parameter. The value must be:

MQCFT_INTEGER_LIST

Structure defining an integer list.

StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFIL structure, including the array of integers at the end of the structure (the *Values* field). The length must be a multiple of four, and must be sufficient to contain the array; any bytes between the end of the array and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *Values* field:

MQCFIL_STRUC_LENGTH_FIXED

Length of fixed part of command format integer-list parameter structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter with values that are contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see [“MQCFH - PCF header” on page 1844](#) for details.

The parameter is from the following groups of parameters:

- MQIA_*
- MQIACF_*
- MQIAMO_*
- MQIACH_*

Count (MQLONG)

Count of parameter values.

This is the number of elements in the *Values* array; it must be zero or greater.

Values (MQLONG x Count)

Parameter values.

This is an array of values for the parameter identified by the *Parameter* field. For example, for MQIACF_Q_ATTRS, this field is a list of attribute selectors (MQCA_* and MQIA_* values).

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For the COBOL, PL/I, RPG, and System/390 assembler programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, you must include MQCFIL in a larger structure, and declare additional fields following MQCFIL, to represent the *Values* field as required.

C language declaration

```
typedef struct tagMQCFIL {
    MQLONG Type; /* Structure type */
    MQLONG StrucLength; /* Structure length */
    MQLONG Parameter; /* Parameter identifier */
    MQLONG Count; /* Count of parameter values */
    MQLONG Values[1]; /* Parameter values - first element */
} MQCFIL;
```

MQCFIN - PCF integer parameter

The MQCFIN structure describes an integer parameter in a message that is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT_ADMIN.

The MQCFIN structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT_PCF (see Message descriptor for a PCF command). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *Value* field to the value appropriate to the data.

Fields for MQCFIN

Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFIN structure describing an integer parameter. The value must be:

MQCFT_INTEGER

Structure defining an integer.

StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFIN structure. The value must be:

MQCFIN_STRUC_LENGTH

Length of command format integer-parameter structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter with a value that is contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see [“MQCFH - PCF header” on page 1844](#) for details.

The parameter is from the following groups of parameters:

- MQIA_*

- MQIACF_*
- MQIAMO_*
- MQIACH_*

Value (MQLONG)

Parameter value.

This is the value of the parameter identified by the *Parameter* field.

C language declaration

```
typedef struct tagMQCFIN {
    MQLONG Type;          /* Structure type */
    MQLONG StrucLength;   /* Structure length */

MQCFSF - PCF string filter parameter

The MQCFSF structure describes a string filter parameter. The format name in the message descriptor is MQFMT_ADMIN.

The MQCFSF structure is used in Inquire commands to provide a filter condition. This filter condition is used to filter the results of the Inquire command and return to the user only those objects that satisfy the filter condition.

On z/OS, a single filter parameter only is allowed. If multiple MQCFIF, MQCFSF and MQCFBF, or MQCFBF parameters are specified, the PCF command fails with error MQRCCF_TOO_MANY_FILTERS (MQRCCF 3248).

The results of filtering character strings on EBCDIC-based systems might be different from those results achieved on ASCII-based systems. This difference is because comparison of character strings is based on the collating sequence of the internal built-in values representing the characters.

When an MQCFSF structure is present, the Version field in the MQCFH structure at the start of the PCF must be MQCFH_VERSION_3 or higher.

Fields for MQCFSF

Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFSF structure describing a string filter parameter. The value must be:

MQCFT_STRING_FILTER

Structure defining a string filter.

StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFSF structure. The value must be:

MQCFSF_STRUC_LENGTH

MQCFSF_STRUC_LENGTH is the length, in bytes, of the MQCFSF structure, including the string at the end of the structure (the *FilterValue* field). The length must be a multiple of 4, and must be sufficient to contain the string. Bytes between the end of the string and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *FilterValue* field:

MQCFSF_STRUC_LENGTH_FIXED

Length of fixed part of command format filter string-parameter structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter that is to be filtered on. The value of this identifier depends on the parameter to be filtered on. Any of the parameters which can be used in the Inquire command can be used in this field.

The parameter is from the following groups of parameters:

- MQCA_*
- MQCACF_*
- MQCAMO_*
- MQCACH_*

Operator (MQLONG)

Operator identifier.

This identifies the operator that is being used to evaluate whether the parameter satisfies the filter-value.

Possible values are:

MQCFOP_GREATER

Greater than

MQCFOP_LESS

Less than

MQCFOP_EQUAL

Equal to

MQCFOP_NOT_EQUAL

Not equal to

MQCFOP_NOT_LESS

Greater than or equal to

MQCFOP_NOT_GREATER

Less than or equal to

MQCFOP_LIKE

Matches a generic string

MQCFOP_NOT_LIKE

Does not match a generic string

MQCFOP_CONTAINS

Contains a specified string. Use MQCFOP_CONTAINS when filtering on lists of strings.

MQCFOP_EXCLUDES

Does not contain a specified string. Use MQCFOP_EXCLUDES when filtering on lists of strings.

MQCFOP_CONTAINS_GEN

Contains an item which matches a generic string. Use MQCFOP_CONTAINS_GEN when filtering on lists of strings.

MQCFOP_EXCLUDES_GEN

Does not contain any item which matches a generic string. Use MQCFOP_EXCLUDES_GEN when filtering on lists of strings.

See the *FilterValue* description for details telling you which operators can be used in which circumstances.

CodedCharSetId (MQLONG)

Coded character set identifier.

This specifies the coded character set identifier of the data in the *FilterValue* field. The following special value can be used:

MQCCSI_DEFAULT

Default character set identifier.

The string data is in the character set defined by the *CodedCharSetId* field in the MQ header structure that *precedes* the MQCFH structure, or by the *CodedCharSetId* field in the MQMD if the MQCFH structure is at the start of the message.

FilterValueLength (MQLONG)

Length of filter-value string.

This is the length, in bytes, of the data in the *FilterValue* field. This parameter must be zero or greater, and does not need to be a multiple of 4.

Note:  On z/OS there is a 256 character limit for the filter-value of the MQSC **WHERE** clause. This limit is not in place for other platforms.

FilterValue (MQCHAR x FilterValueLength)

Filter value.

This specifies the filter-value that must be satisfied. Depending on the parameter, the value and the permitted operators can be:

- An explicit string value.

You can only use the following operators:

- MQCFOP_GREATER
- MQCFOP_LESS
- MQCFOP_EQUAL
- MQCFOP_NOT_EQUAL
- MQCFOP_NOT_GREATER
- MQCFOP_NOT_LESS

- A generic string value. This field is a character string with an asterisk at the end, for example ABC*. The operator must be either MQCFOP_LIKE or MQCFOP_NOT_LIKE. The characters must be valid for the attribute you are testing. If the operator is MQCFOP_LIKE, all items where the attribute value begins with the string (ABC in the example) are listed. If the operator is MQCFOP_NOT_LIKE, all items where the attribute value does not begin with the string are listed.
- If the parameter takes a list of string values, the operator can be:

- MQCFOP_CONTAINS
- MQCFOP_EXCLUDES
- MQCFOP_CONTAINS_GEN
- MQCFOP_EXCLUDES_GEN

An item in a list of values. The value can be explicit or generic. If it is explicit, use MQCFOP_CONTAINS or MQCFOP_EXCLUDES as the operator. For example, if the value DEF is specified with the operator MQCFOP_CONTAINS, all items where one of the attribute values is DEF are listed. If it is generic, use MQCFOP_CONTAINS_GEN or MQCFOP_EXCLUDES_GEN as the operator. If ABC* is specified with the operator MQCFOP_CONTAINS_GEN, all items where one of the attribute values begins with ABC are listed.

Note:

1. If the specified string is shorter than the standard length of the parameter in MQFMT_ADMIN command messages, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.
2. When the queue manager reads an MQCFSF structure in an MQFMT_ADMIN message from the command input queue, the queue manager processes the string as though it had been specified on an MQI call. This processing means that within the string, the first null and the characters following it (up to the end of the string) are treated as blanks.
3. On z/OS there is a 256 character limit for the filter-value of the MQSC **WHERE** clause. This limit is not in place for other platforms.

The filter value must be a valid value for the parameter being tested.

C language declaration

```
typedef struct tagMQCFSF {

MQCFSL - PCF string list parameter

The MQCFSL structure describes a string-list parameter in a message which is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT_ADMIN.

The MQCFSL structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT_PCF (see [Message descriptor for a PCF command](#)). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *StrucLength*, *Count*, *StringLength*, and *Strings* fields to the values appropriate to the data.

The structure ends with a variable-length array of character strings; see the *Strings* field section for further details.

See [“Usage notes” on page 1843](#) for further information about how to use the structure.

Fields for MQCFSL

Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFSL structure describing a string-list parameter. The value must be:

MQCFT_STRING_LIST

Structure defining a string list.

StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFSL structure, including the data at the end of the structure (the *Strings* field). The length must be a multiple of four, and must be sufficient to contain all the strings; any bytes between the end of the strings and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *Strings* field:

MQCFSL_STRUC_LENGTH_FIXED

Length of fixed part of command format string-list parameter structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter with values that are contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see “MQCFH - PCF header” on page 1844 for details.

The parameter is from the following groups of parameters:

- MQCA_*
- MQCACF_*
- MQCAMO_*
- MQCACH_*

CodedCharSetId (MQLONG)

Coded character set identifier.

This specifies the coded character set identifier of the data in the *Strings* field. The following special value can be used:

MQCCSI_DEFAULT

Default character set identifier.

The string data is in the character set defined by the *CodedCharSetId* field in the MQ header structure that *precedes* the MQCFH structure, or by the *CodedCharSetId* field in the MQMD if the MQCFH structure is at the start of the message.

Count (MQLONG)

Count of parameter values.

This is the number of strings present in the *Strings* field; it must be zero or greater.

StringLength (MQLONG)

Length of one string.

This is the length in bytes of one parameter value, that is the length of one string in the *Strings* field; all the strings are this length. The length must be zero or greater, and need not be a multiple of four.

Strings (MQCHAR x StringLength x Count)

String values.

This is a set of string values for the parameter identified by the *Parameter* field. The number of strings is given by the *Count* field, and the length of each string is given by the *StringLength* field. The strings are concatenated together, with no bytes skipped between adjacent strings. The total length of the strings is the length of one string multiplied by the number of strings present (that is, $StringLength \times Count$).

- In MQFMT_ADMIN command messages, if the specified string is shorter than the standard length of the parameter, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.
- In MQFMT_ADMIN response messages, string parameters might be returned padded with blanks to the standard length of the parameter.
- In MQFMT_EVENT messages, trailing blanks might be omitted from string parameters (that is, the string might be shorter than the standard length of the parameter).

In all cases, *StringLength* gives the length of the string present in the message.

The strings can contain any characters that are in the character set defined by *CodedCharSetId*, and that are valid for the parameter identified by *Parameter*.

Note: When the queue manager reads an MQCFSL structure in an MQFMT_ADMIN message from the command input queue, the queue manager processes each string in the list as though it had been specified on an MQI call. This processing means that within each string, the first null, and the characters following it (up to the end of the string) are treated as blanks.

In responses and all other cases, a null character in a string is treated as normal data, and does not act as a delimiter for the string. This treatment means that when a receiving application reads a MQFMT_PCF, MQFMT_EVENT, or MQFMT_ADMIN message, the receiving application receives all the data specified by the sending application.

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For the COBOL, PL/I, RPG, and System/390 assembler programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, you must include MQCFSL in a larger structure, and declare additional fields following MQCFSL, to represent the *Strings* field as required.

C language declaration

```
typedef struct tagMQCFSL {
    MQLONG   Type;           /* Structure type */
    MQLONG   StrucLength;    /* Structure length */
    MQLONG   Parameter;      /* Parameter identifier */
    MQLONG   CodedCharSetId; /* Coded character set identifier */
    MQLONG   Count;         /* Count of parameter values */
    MQLONG   StringLength;   /* Length of one string */
    MQCHAR   Strings[1];    /* String values - first
                             character */
} MQCFSL;
```

COBOL language declaration

MQCFST - PCF string parameter

The MQCFST structure describes a string parameter in a message that is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT_ADMIN.

The MQCFST structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT_PCF (see [Message descriptor for a PCF command](#)). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *StrucLength*, *StringLength*, and *String* fields to the values appropriate to the data.

The structure ends with a variable-length character string; see the *String* field section for further details.

See [“Usage notes” on page 1843](#) for further information about how to use the structure.

Fields for MQCFST

Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFST structure describing a string parameter. The value must be:

MQCFST_STRING

Structure defining a string.

StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFST structure, including the string at the end of the structure (the *String* field). The length must be a multiple of four, and must be sufficient to contain the string; any bytes between the end of the string and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *String* field:

MQCFST_STRUC_LENGTH_FIXED

Length of fixed part of command format string-parameter structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter with a value that is contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see [“MQCFH - PCF header” on page 1844](#) for details.

The parameter is from the following groups of parameters:

- MQCA_*
- MQCACF_*
- MQCAMO_*
- MQCACH_*

CodedCharSetId (MQLONG)

Coded character set identifier.

This specifies the coded character set identifier of the data in the *String* field. The following special value can be used:

MQCCSI_DEFAULT

Default character set identifier.

The string data is in the character set defined by the *CodedCharSetId* field in the MQ header structure that *precedes* the MQCFH structure, or by the *CodedCharSetId* field in the MQMD if the MQCFH structure is at the start of the message.

StringLength (MQLONG)

Length of string.

This is the length in bytes of the data in the *String* field; it must be zero or greater. This length does not need to be a multiple of four.

String (MQCHAR x StringLength)

String value.

This is the value of the parameter identified by the *Parameter* field:

- In MQFMT_ADMIN command messages, if the specified string is shorter than the standard length of the parameter, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.
- In MQFMT_ADMIN response messages, string parameters might be returned padded with blanks to the standard length of the parameter.
- In MQFMT_EVENT messages, trailing blanks might be omitted from string parameters (that is, the string can be shorter than the standard length of the parameter).

The value of *StringLength* depends on whether, when the specified string is shorter than the standard length, padding blanks have been added to the string. If so, the value of *StringLength* is the sum of the actual length of the string plus the padded blanks.

The string can contain any characters that are in the character set defined by *CodedCharSetId*, and that are valid for the parameter identified by *Parameter*.

Note: When the queue manager reads an MQCFST structure in an MQFMT_ADMIN message from the command input queue, the queue manager processes the string as though it had been specified on an MQI call. This processing means that within the string, the first null and the characters following it (up to the end of the string) are treated as blanks.

In responses and all other cases, a null character in the string is treated as normal data, and does not act as a delimiter for the string. This treatment means that when a receiving application reads a

MQFMT_PCF, MQFMT_EVENT, or MQFMT_ADMIN message, the receiving application receives all the data specified by the sending application.

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For the COBOL, PL/I, and System/390 assembler programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, the user must include MQCFST in a larger structure, and declare an additional field or additional fields following MQCFST, to represent the *String* field as required.

C language declaration

```
typedef struct tagMQCFST {
    MQLONG   Type;           /* Structure type */
    MQLONG   StrucLength;    /* Structure length */

PCF example

The compiled program, written in C language, in the example uses IBM MQ for Windows. It inquires of the default queue manager about a subset of the attributes for all local queues defined to it. It then produces an output file, SAVEQMGR.TST, in the directory from which it was run for use with RUNMQSC.

Inquire local queue attributes

This following section provides an example of how Programmable Command Formats can be used in a program for administration of IBM MQ queues.

The program is given as an example of using PCFs and has been limited to a simple case. This program is of most use as an example if you are considering the use of PCFs to manage your IBM MQ environment.

Program listing

```

/*=====*/
/*
/* This is a program to inquire of the default queue manager about the
/* local queues defined to it.
/*
/* The program takes this information and appends it to a file
/* SAVEQMGR.TST which is of a format suitable for RUNMQSC. It could,
/* therefore, be used to re-create or clone a queue manager.
/*
/* It is offered as an example of using Programmable Command Formats (PCFs)
/* as a method for administering a queue manager.
/*
/*=====*/

}

```

Administrative REST API reference

Reference information about the administrative REST API.

For more information about using the administrative REST API, see [Administration using the REST API](#).

REST API resources

This collection of topics provides reference information for each of the administrative REST API resources.

For more information about using the administrative REST API, see [Administration using the REST API](#).

V 9.0.4 **/admin/action/qmgr/{qmgrName}/mqsc**

You can use the HTTP POST method with the `/admin/action/qmgr/{qmgrName}/mqsc` resource to execute an arbitrary MQSC command on a queue manager.

V 9.0.5 From IBM MQ 9.0.5, you can use the administrative REST API gateway with this resource URL.

V 9.0.4 **POST**

Use the HTTP POST method with this resource to submit administrative commands directly to a queue manager.

You can use this REST API command with HTTP to run any MQSC command that is not part of the administrative REST API.

On UNIX, Linux, and Windows, this REST API command is similar to the **Escape** PCF command.

On z/OS, this REST API command is similar to submitting commands directly to the command server:

- Messages are put to a request queue. These messages have:
 - `MsgType` set to `MQMT_REQUEST`.
 - `Format` set to `MQFMT_STRING` or `MQFMT_NONE`.
 - `Payload` set to the text of an MQSC command.
- The command server running in the queue manager:
 - Reads the messages.
 - Validates them.
 - Passes valid commands to the command processor.
- The command processor:
 - Executes the commands.
 - Puts replies to the commands as messages on the reply-to queues specified in the incoming messages.

This REST API is deliberately lightweight in approach. Commands are submitted to the specified queue manager and the results are returned in an unprocessed format. For examples of this format, see the [“Example - z/OS” on page 1883](#) section.

- [“Resource URL” on page 1880](#)
- [“Request headers” on page 1881](#)
- [“Request body format” on page 1881](#)
- [“Security requirements” on page 1882](#)
- [“Response status codes” on page 1882](#)
- [“Response headers” on page 1882](#)
- [“Response body format” on page 1882](#)
- [“Example - z/OS” on page 1883](#)

Resource URL

IBM MQ 9.0.4 and later:

```
https://host:port/ibmmq/rest/v1/admin/action/qmgr/qmgrName/mqsc
```

qmgrName

Specifies the name of the queue manager on which to execute the command.

V 9.0.5 From IBM MQ 9.0.5, you can use the administrative REST API gateway with this resource URL. That is, you can specify a remote queue manager as the queue manager name.

The queue manager name is case-sensitive.

If the queue manager name includes a forward slash, a period, or a percent sign, these characters must be URL encoded:

- A forward slash (/) must be encoded as %2F.
- A percent sign (%) must be encoded as %25.

V 9.0.1 You can use HTTP instead of HTTPS if you enable HTTP connections. For more information about enabling HTTP, see [Configuring HTTP and HTTPS ports](#).

Request headers

The following headers must be sent with the request:

Content-Type

This header must be sent with a value of `application/json;charset=utf-8`.

ibm-mq-rest-csrf-token

This header must be sent with a value that is the content of the `csrfToken` cookie. The content of the `csrfToken` cookie is used to confirm that the credentials that are being used to authenticate the request are being used by the owner of the credentials. That is, the token is used to prevent cross-site request forgery attacks.

The `csrfToken` cookie is returned after a request is made with an HTTP GET method. You cannot use a cached version of the content of the cookie because the content of the cookie can change. You must use the latest value of the cookie for each request.

V 9.0.5 The preceding information applies to releases up to and including IBM MQ 9.0.4. From IBM MQ 9.0.5, this header must be set, but the value can be anything, including being blank.

The `csrfToken` cookie is no longer sent in responses from the REST API in IBM MQ 9.0.5 and later.

Authorization

This header must be sent if you are using basic authentication. For more information, see [Using HTTP basic authentication with the REST API](#).

Request body format

The request body must be in JSON format in UTF-8 encoding. Within the request body attributes are defined, and named JSON objects are created to specify extra attributes. Any attributes that are not specified use the default value.

The following attributes can be included in the request body:

type

Required.

String.

Specifies the type of action to be performed.

runCommand

Specifies that an MQSC command is to be executed

parameters

Required.

Nested JSON Object.

Specifies the parameters for the action.

This nested object contains only one attribute.

command

Required.

A valid MQSC command to be executed.

Security requirements

The caller must be authenticated to the mqweb server and must be a member of one or more of the MQWebAdmin, MQWebAdminRO, or MQWebUser roles. For more information about security for the administrative REST API, see [IBM MQ Console and REST API security](#).

The security principal of the caller must be granted the ability to issue such MQSC commands against the specified queue manager as they specify.

 On UNIX, Linux, and Windows, you can grant authority to security principals to use IBM MQ resources by using the **mqsetaut** command. For more information, see [mqsetaut](#).

 On z/OS, see [Setting up security on z/OS](#).

Response status codes**200**

The specified command was executed successfully.

400

Invalid data provided.

For example, an invalid MQSC command is specified.

401

Not authenticated.

The caller must be authenticated to the mqweb server and must be a member of one or more of the MQWebAdmin, MQWebAdminRO, or MQWebUser roles. The `ibm-mq-rest-csrf-token` header must also be specified. For more information, see [“Security requirements” on page 1882](#).

403

Not authorized.

The caller is authenticated to the mqweb server and is associated with a valid principal. However, the principal does not have access to all, or a subset of the required IBM MQ resources. For more information about the access that is required, see [“Security requirements” on page 1882](#).

500

Server issue or error code from IBM MQ.

503

Queue manager not running.

Response headers

None.

Response body format

If an error occurs, the response body contains an error message. For more information, see [REST API error handling](#).

The format of the response body is standardized, with a consistent JSON schema. However, the content is platform-dependent, reflecting the underlying mechanism for executing MQSC commands.

The response body has the following JSON structure:

```
{
  "commandResponse" : [
    {
      "completionCode" : number,
```

```

    "reasonCode" : number,
    "text" : [
      "string",
      ...
    ]
  },
  ...
]
"overallCompletionCode" : number,
"overallReasonCode" : number
}

```

The fields in the response have the following meanings:

commandResponse

A JSON array of JSON objects that represent individual responses from the execution of the command.

Each response contains the following data:

completionCode

The completion code that is associated with the operation for this instance.

reasonCode

The reason code that is associated with the operation for this instance.

text

A JSON array of strings that contain the response text that is associated with the operation for this instance. Note that embedded newlines will be stripped from this text.

On UNIX, Linux, and Windows, this field contains a single string that contains the response from the command, with any newlines escaped in the usual JSON manner.

On z/OS, this field contains multiple entries. For further information, see [Interpreting the reply messages from the command server](#).

overallCompletionCode

The completion code that is associated with the operation as a whole.

overallReasonCode

The reason code that is associated with the operation for this instance.

Example - z/OS

The following sequence shows how to create a new server-connection channel that is called NEWSVRCONN on a z/OS queue manager - our example queue manager is called QM21.

- First check that the channel does not exist. The following URL is used with the HTTP POST method:

IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/action/qmgr/QM21/mqsc
```

The following JSON payload is sent:

```

{
  "type": "runCommand",
  "parameters": {
    "command": "DISPLAY CHANNEL(NEWSVRCONN)"
  }
}

```

A response code of 200 is returned, as the REST command succeeded. The response body that is returned contains the following JSON.

```

{
  "commandResponse": [
    {
      "completionCode": 0,
      "reasonCode": 0,
      "text": [
        "CSQN205I  COUNT=          3, RETURN=00000000, REASON=00000000",

```

```

        "CSQM297I ]MQ21 CSQMDRTS NO CHANNEL FOUND MATCHING REQUEST CRITERIA ",
        "CSQ9022I ]MQ21 CSQMDRTS ' DISPLAY CHANNEL ' NORMAL COMPLETION "
    ]
  }
],
"overallCompletionCode": 0,
"overallReasonCode": 0
}

```

The completion and reason codes here are zero, as on z/OS the command is regarded as succeeding, although no matching channel was found.

- Now create the channel. The same URL is used with the HTTP POST method:

IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/action/qmgr/QM21/mqsc
```

The following JSON payload is sent:

```

{
  "type": "runCommand",
  "parameters": {
    "command": "DEFINE CHANNEL(NEWSVRCONN) CHLTYPE(SVRCONN)"
  }
}

```

A response code of 200 is returned, as the REST command succeeded. The response body that is returned contains the following JSON.

```

{
  "commandResponse": [
    {
      "completionCode": 0,
      "reasonCode": 0,
      "text": [
        "CSQN205I  COUNT=          2, RETURN=00000000, REASON=00000000",
        "CSQ9022I ]MQ21 CSQMACHL ' DEFINE CHANNEL ' NORMAL COMPLETION"
      ]
    }
  ],
  "overallCompletionCode": 0,
  "overallReasonCode": 0
}

```

- Finally, check that the channel does exist. Again the same URL is used with the HTTP POST method:

IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/action/qmgr/QM21/mqsc
```

The following JSON payload is sent:

```

{
  "type": "runCommand",
  "parameters": {
    "command": "DISPLAY CHANNEL(NEWSVRCONN) ALL"
  }
}

```

A response code of 200 is returned, as the REST command succeeded. The response body that is returned contains the following JSON. The response body is edited for brevity after the TRPTYPE attribute.

```

{
  "commandResponse": [
    {
      "completionCode": 0,
      "reasonCode": 0,
      "text": [
        "CSQN205I  COUNT=          3, RETURN=00000000, REASON=00000000",
        "CSQM415I ]MQ21 CHANNEL(NEWSVRCONN          ) CHLTYPE(SVRCONN          ) QSGDISP(QMGR          )",
        DEFCDISP(PRIVATE          ) TRPTYPE(LU62          )",
        "CSQ9022I ]MQ21 CSQMDRTS ' DISPLAY CHANNEL ' NORMAL COMPLETION "
      ]
    }
  ]
}

```

```
}
],
"overallCompletionCode": 0,
"overallReasonCode": 0
}
```

Example - UNIX, Linux, and Windows

The following sequence shows how to create a new server-connection channel that is called NEWSVRCONN on UNIX, Linux, and Windows queue managers - our example queue manager is called QM_T1.

- First check that the channel does not exist. The following URL is used with the HTTP POST method:
IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/action/qmgr/QM_T1/mqsc
```

The following JSON payload is sent:

```
{
  "type": "runCommand",
  "parameters": {
    "command": "DISPLAY CHANNEL(NEWSVRCONN)"
  }
}
```

A response code of 200 is returned, as the REST command succeeded. The response body that is returned contains the following JSON.

```
{
  "commandResponse": [
    {
      "completionCode": 2,
      "reasonCode": 2085,
      "text": [
        "AMQ8147: IBM MQ object NEWSVRCONN not found."
      ]
    }
  ],
  "overallCompletionCode": 2,
  "overallReasonCode": 3008
}
```

The individual response shows a reason code of 2085 (MQRC_UNKNOWN_OBJECT_NAME) and the MQSC command has an overall reason code of 3008 (MQRCCF_COMMAND_FAILED) as it failed to display the requested channel's details.

- Now create the channel. The same URL is used with the HTTP POST method:
IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/action/qmgr/QM_T1/mqsc
```

The following JSON payload is sent:

```
{
  "type": "runCommand",
  "parameters": {
    "command": "DEFINE CHANNEL(NEWSVRCONN) CHLTYPE(SVRCONN)"
  }
}
```

A response code of 200 is returned, as the REST command succeeded. The response body that is returned contains the following JSON.

```
{
  "commandResponse": [
    {
      "completionCode": 0,
      "reasonCode": 0,
      "text": [
        "AMQ8014: IBM MQ channel created."
      ]
    }
  ]
}
```

```

    }
  ],
  "overallCompletionCode": 0,
  "overallReasonCode": 0
}

```

- Finally, check that the channel does exist. Again the same URL is used with the HTTP POST method: IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/action/qmgr/QM_T1/mqsc
```

The following JSON payload is sent:

```

{
  "type": "runCommand",
  "parameters": {
    "command": "DISPLAY CHANNEL(NEWSVRCONN) ALL"
  }
}

```

A response code of 200 is returned, as the REST command succeeded. The response body that is returned contains the following JSON. The response body is edited for brevity after the CHLTYPE attribute.

```

{
  "commandResponse": [
    {
      "completionCode": 0,
      "reasonCode": 0,
      "text": [
        "AMQ8414: Display Channel details.    CHANNEL(NEWSVRCONN)
CHLTYPE(SVRCONN)"
      ]
    }
  ],
  "overallCompletionCode": 0,
  "overallReasonCode": 0
}

```

V 9.0.1 /admin/installation

You can use the HTTP GET method with the `installation` resource to request information about installations.

V 9.0.4 You cannot use the administrative REST API gateway with this resource URL.

V 9.0.1 GET

Use the HTTP GET method with the `installation` resource to request information about the installation that the administrative REST API runs in.

The information that is returned is similar to the information that is returned by the [dspmqver](#) control command.

- [Resource URL](#)
- [Optional query parameters](#)
- [V 9.0.2](#) [“Request headers” on page 1888](#)
- [Request body format](#)
- [V 9.0.2](#) [“Security requirements” on page 1888](#)
- [Response status codes](#)
- [“Response headers” on page 1888](#)
- [Response body format](#)
- [Examples](#)

Resource URL

V 9.0.4 IBM MQ 9.0.4 and later:

`https://host:port/ibmmq/rest/v1/admin/installation/{installationName}`

IBM MQ 9.0.3 and earlier:

`https://host:port/ibmmq/rest/v1/installation/{installationName}`

installationName

Optionally specifies the name of the installation to query. This name must be the name of the installation that the REST API is running in.

V 9.0.1 You can use HTTP instead of HTTPS if you enable HTTP connections. For more information about enabling HTTP, see [Configuring HTTP and HTTPS ports](#).

Optional query parameters

attributes={extended|*|extended.attributeName,...}

extended

Specifies that all extended attributes are returned.

*

Specifies all attributes. This parameter is equivalent to **extended**.

extended.attributeName,...

Specifies a comma-separated list of extended attributes to return:

level

String.

IBM MQ build level.

operatingSystem

ULW **z/OS** This attribute is only available on z/OS, UNIX, Linux, and Windows.

String.

Full descriptive text of the operating system.

hostName

String.

System host name.

If the system has multiple hosts, only one name is returned.

description

ULW This attribute is only available on UNIX, Linux, and Windows.

String.

Installation description.

installationPath

ULW This attribute is only available on UNIX, Linux, and Windows.

String.

The path to the installation.

dataPath

ULW This attribute is only available on UNIX, Linux, and Windows.

String.

The path to where the data for the installation is stored.

maximumCommandLevel

  This attribute is only available on the IBM MQ Appliance, UNIX, Linux, and Windows.

Integer.

Maximum command level that is supported.

primary

 This attribute is only available on UNIX, Linux, and Windows.

Boolean.

Primary installation status.

Request headers

The following headers must be sent with the request:

Authorization

This header must be sent if you are using basic authentication. For more information, see [Using HTTP basic authentication with the REST API](#).

Request body format

None.

Security requirements

 The caller must be authenticated to the mqweb server and must be a member of one or more of the MQWebAdmin, MQWebAdminRO, or MQWebUser roles. For more information about security for the administrative REST API, see [IBM MQ Console and REST API security](#).

There are no specific authorization requirements for an HTTP GET on the `installation` resource.

Response status codes

200

Installation information retrieved successfully.

400

Invalid data provided.

For example, invalid installation attributes specified.

401

Not authenticated.

The caller must be authenticated to the mqweb server and must be a member of one or more of the MQWebAdmin, MQWebAdminRO, or MQWebUser roles. For more information, see [“Security requirements” on page 1888](#).

404

Installation does not exist.

500

Server issue or error code from IBM MQ.

Response headers

The following headers are returned with the response:

Content-Type

This header is returned with a value of `application/json; charset=utf-8`.

Response body format

The response is in JSON format in UTF-8 encoding. The response contains an outer JSON object that contains a single JSON array called `installation`. Each element in the array is a JSON object that represents information about an installation. Each JSON object contains the following attributes:

name

 This attribute is only available on UNIX, Linux, and Windows.

String.

The installation name.

version

String.

The version of IBM MQ for the installation.

platform

String.

One of the following values:

- appliance
- ibm-i
- unix
- windows
- z/os

extended

JSON object.

If requested, contains one or more of the following extra properties:

level

String.

IBM MQ build level.

operatingSystem

  This attribute is only available on z/OS, UNIX, Linux, and Windows.

String.

Full descriptive text of the operating system.

hostName

String.

System host name.

If the system has multiple hosts, only one name is returned.

description

 This attribute is only available on UNIX, Linux, and Windows.

String.

Installation description.

installationPath

 This attribute is only available on UNIX, Linux, and Windows.

String.

The path to the installation.

dataPath

 This attribute is only available on UNIX, Linux, and Windows.

String.

The path to where the data for the installation is stored.

maximumCommandLevel

  This attribute is only available on the IBM MQ Appliance, UNIX, Linux, and Windows.

Integer.

Maximum command level that is supported.

primary

 This attribute is only available on UNIX, Linux, and Windows.

Boolean.

Primary installation status.

If an error occurs, the response body contains an error message. For more information, see [REST API error handling](#).

Examples for UNIX, Linux, and Windows

- The following example gets basic information about the installation that the REST API is running in. The following URL is used with the HTTP GET method:

 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/installation
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/installation
```

The following JSON response is returned:

```
{
  "installation":
  [
    {
      "name": "Installation1",
      "platform": "windows",
      "version": "9.0.0.0"
    }
  ]
}
```

- The following example gets extended information about the installation Installation1. The following URL is used with the HTTP GET method:

 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/installation/Installation1?attributes=*
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/installation/Installation1?attributes=*
```

The following JSON response is returned:

```
{
  "installation":
  [
    {
      "extended": {
        "dataPath": "C:\\Program Files (x86)\\IBM\\WebSphere MQ",

```

```

        "description": "My MQ installation",
        "hostName": "exampleHost",
        "installationPath": "C:\\Program Files\\IBM\\WebSphere MQ",
        "level": "p900-L160614",
        "maximumCommandLevel": 900,
        "operatingSystem": "Windows 7 Professional x64 Edition, Build 7601: SP1",
        "primary": true
    },
    {
        "name": "Installation1",
        "platform": "windows",
        "version": "9.0.0.0"
    }
}

```

- The following example gets the installation path and host name for Installation1. The following URL is used with the HTTP GET method:

V 9.0.4 IBM MQ 9.0.4 and later:

```

https://localhost:9443/ibmmq/rest/v1/admin/installation/Installation1?
attributes=extended.installationPath,extended.hostName

```

IBM MQ 9.0.3 and earlier:

```

https://localhost:9443/ibmmq/rest/v1/installation/Installation1?
attributes=extended.installationPath,extended.hostName

```

The following JSON response is returned:

```

{
  "installation": [{
    "extended": {
      "hostName": "exampleHost",
      "installationPath": "C:\\Program Files\\IBM\\MQ"
    },
    "name": "Installation1",
    "platform": "windows",
    "version": "9.0.1.0"
  }
}]
}

```

Examples for z/OS

z/OS

- The following example gets basic information about the installation. The following URL is used with the HTTP GET method:

V 9.0.4 IBM MQ 9.0.4 and later:

```

https://REST.example.com:9443/ibmmq/rest/v1/admin/installation

```

IBM MQ 9.0.3 and earlier:

```

https://REST.example.com:9443/ibmmq/rest/v1/installation

```

The following JSON response is returned:

```

{
  "installation": [{
    "platform": "z/os",
    "version": "9.0.1"
  }
}]
}

```

- The following example gets extended information about the installation. The following URL is used with the HTTP GET method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://REST.example.com:9443/ibmmq/rest/v1/admin/installation?attributes=extended
```

IBM MQ 9.0.3 and earlier:

```
https://REST.example.com:9443/ibmmq/rest/v1/installation?attributes=extended
```

The following JSON response is returned:

```
{
  "installation": [{
    "extended": {
      "hostName": "REST.example.com",
      "level": "V901-L161011",
      "operatingSystem": "z/OS 01.00 02"
    },
    "platform": "z/os",
    "version": "9.0.1"
  }]
}
```

V 9.0.2 /login

You can use the HTTP GET method together with the `login` resource to get information about the user that is logged in. You can use the HTTP POST method to log in a user and get an LTPA token and **V 9.0.5**, for releases before IBM MQ 9.0.5, a CSRF token. You can use the HTTP DELETE method to log out a user and end the session.

V 9.0.2 **POST**

Use the HTTP POST method with the `login` resource to log in a user and start a token-based authentication session. An LTPA token is returned for the user to authenticate further REST requests.

For more information about how to use token based authentication, see [Using token based authentication with the REST API](#).

- [Resource URL](#)
- [Optional query parameters](#)
- [“Request headers” on page 1892](#)
- [Request body format](#)
- [Response status codes](#)
- [“Response headers” on page 1893](#)
- [Response body format](#)
- [Examples](#)

Resource URL

```
https://host:port/ibmmq/rest/v1/login
```

Optional query parameters

None.

Request headers

The following headers must be sent with the request:

Content-Type

This header must be sent with a value of `application/json; charset=utf-8`.

Request body format

The request body must be in JSON format in UTF-8 encoding. Within the request body attributes are defined. The following attributes can be included in the request body:

username

String.

Specifies the user name to authenticate with.

The user name that is specified must be defined within the mqweb server user registry, and must be a member of one or more of the MQWebAdmin, MQWebAdminRO, or MQWebUser roles.

Note: If the user name specified has the MQWebUser role, ensure that the user name is entered in the same case as it is defined in the user registry. If the user name is specified in the request body in a different case to the case used in the registry, the user is authenticated by the REST API, but might not be authorized to use IBM MQ resources.

password

String.

Specifies the password of the user that is specified by the **username** attribute.

Response status codes

204

User logged in successfully.

400

Invalid data provided.

For example, an integer value is specified for the user name.

401

Not authenticated.

An invalid user name or password was provided.

500

Server issue or error code from IBM MQ.

Response headers

None.

Response body format

The response body is empty if the login is successful. If an error occurs, the response body contains an error message. For more information, see [REST API error handling](#).

V 9.0.5 From IBM MQ 9.0.5, with a successful login, a security token, LtpaToken2, which is used to authenticate all further REST requests, is returned.

For IBM MQ 9.0.4 and earlier, with a successful login, two cookies are returned:

- A security token, LtpaToken2, which is used to authenticate all further REST requests.
- A CSRF token, csrfToken, which is used in the `ibm-mq-rest-csrf-token` HTTP header for REST requests that use the POST, PATCH, or DELETE HTTP methods.

Examples

The following example logs in a user called mqadmin with the password mqadmin. The following URL is used with the HTTP POST method:

```
https://localhost:9443/ibmmq/rest/v1/login
```

The following JSON payload is sent:

```
{
  "username" : "mqadmin",
  "password" : "mqadmin"
}
```

In cURL, the log in request might look like the following Windows example. The LTPA token is stored in the `cookiejar.txt` file by using the `-c` flag:

```
curl -k "https://localhost:9443/ibmmq/rest/v1/login" -X POST
-H "Content-Type: application/json" --data
"{\"username\": \"mqadmin\", \"password\": \"mqadmin\"}"
-c c:\cookiejar.txt
```

After the user is logged in, the LTPA token and `ibm-mq-rest-csrf-token` HTTP header are used to authenticate further requests. For example, to create a local queue, `Q1`, the following cURL might be used. The LTPA token is retrieved from the `cookiejar.txt` file by using the `-b` flag. The required contents of the `ibm-mq-rest-csrf-token` HTTP header varies depending on the version of IBM MQ.

V 9.0.5 From IBM MQ 9.0.5, its value can be anything including blank.

For IBM MQ 9.0.4 and earlier, after the user is logged in, the LTPA token and CSRF token are used to authenticate further requests. For example, to create a local queue, `Q1`, the following cURL might be used. The LTPA token is retrieved from the `cookiejar.txt` file by using the `-b` flag. The CSRF token is included in an `ibm-mq-rest-csrf-token` HTTP header. The value of the CSRF token is copied from the `cookiejar.txt` file:

V 9.0.5 IBM MQ 9.0.5

```
curl -k "https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/queue" -X POST
-b c:\cookiejar.txt
-H "ibm-mq-rest-csrf-token: value" -H "Content-Type: application/json"
--data "{\"name\": \"Q1\"}"
```

V 9.0.4 IBM MQ 9.0.4:

```
curl -k "https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/queue" -X POST -b c:\cookiejar.txt
-H "ibm-mq-rest-csrf-token:
416E144A02E19E515ED5709A77FB07B4EF550FD1FE1CC44CF82C5774088A041928486A

--data "{\"name\": \"Q1\"}"
```

V 9.0.2 GET

Use the HTTP GET method with the `login` resource to request information about the user that is authenticated.

- [Resource URL](#)
- [Optional query parameters](#)
- [“Request headers” on page 1895](#)
- [Request body format](#)
- [“Security requirements” on page 1895](#)
- [Response status codes](#)
- [“Response headers” on page 1896](#)
- [Response body format](#)
- [Examples](#)

Resource URL

`https://host:port/ibmmq/rest/v1/login`

Optional query parameters

None.

Request headers

The following headers must be sent with the request:

Authorization

This header must be sent if you are using basic authentication. For more information, see [Using HTTP basic authentication with the REST API](#).

Request body format

None.

Security requirements

The request must be authenticated by using one of the following authentication mechanisms:

- For HTTP basic authentication, you must provide the user name and password to authenticate. For more information, see [Using HTTP basic authentication with the REST API](#).
- For token based authentication, you must provide the LTPA token to authenticate. For more information, see [Using token based authentication with the REST API](#).
- For client certificate authentication, you must provide the client certificate to authenticate. For more information, see [Using client certificate authentication with the REST API](#).

Response status codes

200

User queried successfully.

400

Invalid data provided.

401

Not authenticated.

An invalid credential was provided.

404

Resource was not found.

500

Server issue or error code from IBM MQ.

Response headers

The following headers are returned with the response:

Content-Type

This header is returned with a value of `application/json; charset=utf-8`.

Response body format

The response is in JSON format in UTF-8 encoding. The response contains an outer JSON object that contains a single JSON array called `user`. This array contains the following attributes:

authenticationMechanism

String.

Specifies how the user was authenticated.

The value is one of the following values:

form

The user is authenticated with token authentication.

basic

The user is authenticated with HTTP basic authentication.

clientCertificate

The user is authenticated with client certificate authentication (X.509).

noSecurity

Security is not enabled.

name

String.

Specifies the name of the user that is used to check for authorization.

This name might be different from the credentials that are specified using, for example, LDAP user mapping or client certificate user mapping.

role

JSON array.

Specifies which roles the user is granted.

The value is one or more of the following values:

- MQWebAdmin
- MQWebAdminRO
- MQWebUser

Examples

The following example queries the user. The following URL is used with the HTTP GET method:

```
https://localhost:9443/ibmmq/rest/v1/login
```

The following JSON response is returned:

```
{
  "user" :
  [ {
    "name" : "reader",
    "role" : [
```

```
        "MQWebAdminRO",
        "MQWebUser"
    ],
    "authenticationMechanism" : "form"
}
}]
}
```

In cURL, the log in query might look like the following Windows example that uses token based authentication. The LTPA token is retrieved from the `cookiejar.txt` file by using the `-b` flag:

```
curl -k "https://localhost:9443/ibmmq/rest/v1/login" -X GET
-b c:\cookiejar.txt
```

V 9.0.2 DELETE

Use the HTTP DELETE method with the `login` resource to log out a user and end a token-based authentication session.

For more information about how to use token based authentication, see [Using token based authentication with the REST API](#).

- [Resource URL](#)
- [Optional query parameters](#)
- [“Request headers” on page 1897](#)
- [Request body format](#)
- [“Security requirements” on page 1898](#)
- [Response status codes](#)
- [“Response headers” on page 1898](#)
- [Response body format](#)
- [Examples](#)

Resource URL

`https://host:port/ibmmq/rest/v1/login`

Optional query parameters

None.

Request headers

The following headers must be sent with the request:

ibm-mq-rest-csrf-token

This header must be sent with a value that is the content of the `csrfToken` cookie. The content of the `csrfToken` cookie is used to confirm that the credentials that are being used to authenticate the request are being used by the owner of the credentials. That is, the token is used to prevent cross-site request forgery attacks.

The `csrfToken` cookie is returned after a request is made with an HTTP GET method. You cannot use a cached version of the content of the cookie because the content of the cookie can change. You must use the latest value of the cookie for each request.

V 9.0.5 The preceding information applies to releases up to and including IBM MQ 9.0.4. From IBM MQ 9.0.5, this header must be set, but the value can be anything, including being blank.

The `csrfToken` cookie is no longer sent in responses from the REST API in IBM MQ 9.0.5 and later.

Request body format

None.

Security requirements

The following tokens must be provided with the request to authenticate:

- The LTPA token that is used to authenticate the user must be provided as a cookie.

With the response to the REST request, an instruction to delete the LTPA token from the local cookie store is included. Ensure that you process this instruction. If the instruction is not processed, and the LTPA token remains in the local cookie store, then the LTPA token can be used to authenticate future REST requests. That is, when the user attempts to authenticate with the LTPA token after the session is ended, a new session is created that uses the existing token.

Response status codes

204

User logged out successfully.

400

Invalid data provided.

401

Not authenticated.

An invalid LTPA token was provided; the contents of the `ibm-mq-rest-csrf-token` HTTP header was incorrect, or the `ibm-mq-rest-csrf-token` header was missing.

404

Resource was not found.

500

Server issue or error code from IBM MQ.

Response headers

None.

Response body format

The response body is empty if the logout is successful. If an error occurs, the response body contains an error message. For more information, see [REST API error handling](#).

Examples

The following cURL example for Windows logs out a user.

V 9.0.5 From IBM MQ 9.0.5, the LTPA token is retrieved from the `cookiejar.txt` file by using the `-b` flag. CSRF protection is provided by the presence of the `ibm-mq-rest-csrf-token` HTTP header. The location of the `cookiejar.txt` file is specified by the `-c` flag so that the LTPA token is deleted from the file:

```
curl -k "https://localhost:9443/ibmmq/rest/v1/login" -X DELETE
-H "ibm-mq-rest-csrf-token: value" -b c:\cookiejar.txt
-c c:\cookiejar.txt
```

For IBM MQ 9.0.4 and earlier, the LTPA token is retrieved from the `cookiejar.txt` file by using the `-b` flag. The CSRF token is included in an `ibm-mq-rest-csrf-token` HTTP header. The value of the CSRF token is copied from the `cookiejar.txt` file. The location of the `cookiejar.txt` file is specified by the `-c` flag so that the LTPA token is deleted from the file:

```
curl -k "https://localhost:9443/ibmmq/rest/v1/login" -X DELETE
-H "ibm-mq-rest-csrf-token: 416E144A02E19E515ED5709A77FB07B4EF550FD1FE1
CC44CF82C5774088A041928486ABE9597618938B9F51D12FE4A0DFC1CB41D0C7567E9AB8
90F0FDB0EE43A27756F32341E712EFB82305F8603E566D3F1D0412BADD60AEEE656A2F3

-c c:\cookiejar.txt
```

V 9.0.5 /admin/mft/agent

You can use the HTTP GET method with the agent resource, to request information about the status of agents, and other attribute details.

Related reference

["/admin/mft/transfer" on page 1909](#)

You can use the HTTP GET method with the transfer resource, to request information about transfers, and other status details.

V 9.0.5 GET

Use the HTTP GET method with the agent resource to request information about agents.

The information that is returned is similar to the information returned by the [fteListAgents](#) and [fteShowAgentDetails](#) commands.

- [Resource URL](#)
- [Optional query parameters](#)
- ["Request headers" on page 1901](#)
- [Request body format](#)
- ["Security requirements" on page 1901](#)
- [Response status codes](#)
- ["Response headers" on page 1902](#)
- [Response body format](#)
- [Examples](#)

Resource URL

```
https://host:port/ibmmq/rest/v1/admin/mft/agent/{agentname}
```

agentName

Optionally specifies the name of the agent to query.

The agent name is not case-sensitive, but agent names that are entered in lowercase or mixed case are converted to uppercase. The agent name value that is received as a response from the REST service is always in uppercase.

The agent name can contain a maximum of 28 characters, and must conform to the IBM MQ [rules for naming objects](#). In addition to the IBM MQ object naming conventions, the percent (%) character cannot be used in agent names.

You can use HTTP instead of HTTPS if you enable HTTP connections. For more information about enabling HTTP, see [Configuring the HTTP and HTTPS ports](#).

Optional query parameters

attributes={object,...|*|object.attributeName,...}

object

Specifies a comma-separated list of JSON objects that are added to a JSON object, which is a subsection of the complete details.

For example to return:

- All general details of all agents or a particular agent, specify *general*.

- All queue manager connection details of all agents or a particular agent specify *qmgrConnection*.
- Details of connect direct bridge agent, specify *connectDirectBridge*. (applicable only for agent of type “connect direct bridge”)
- Details of protocol agent, specify *protocolBridge*. (applicable only for agents of type “protocol bridge”)

For a full list of attributes see [“Response body attributes for agents”](#) on page 1904

Specifies all attributes.

object.attributeName,...

Specifies a comma-separated list of agent attributes to return.

Each attribute must specify the JSON object that contains the attribute, in the form `object.attributeName`. For example, to return the `statusAge` attribute, which is contained in the `general` object, specify `general.statusAge`.

You cannot specify the same attribute more than once. If you request attributes that are not valid for a particular agent, the attributes are not returned for that agent.

You can query details for a set of agents for a particular type, state or name having a specified patterns:

```
name=validPattern
state=valid agent State
type=validType
```

name=name

This query parameter cannot be used if you specify an agent name in the resource URL. Specifies a wildcard agent name to filter on.

The name specified must include an asterisk, `*`, as a wildcard. You can specify one of the following combinations:

Specifies that all agents are returned

prefix*

Specifies that all agents with the specified prefix in the agent name are returned.

***suffix**

Specifies that all agents with the specified suffix in the agent name are returned.

prefix*suffix

Specifies that all agents with the specified prefix and the specified suffix in the agent name are returned.

type=validAgentType

Specifies the type of the agent to return information about. The value can be one of the following values:

all

Specifies that information about all agents, that include `standard`, `connectDirectBridge` and `protocolBridge`, is returned.

This is the default value.

standard

Specifies that information about agent of type `standard` is returned.

connectDirectBridge

Specifies that information about agents of type `connect direct bridge` is returned.

protocolBridge

Specifies that information about agents of type `protocol bridge` is returned.

state=validAgentState

Specifies the state of the agent to return information about. The value can be one of the following values:

all

Specifies that information about all agents, which includes all the valid states listed in the following text.

This is the default value.

active

Specifies that information about agents that are in an active state is returned.

ready

Specifies that information about agents that are in a ready state is returned.

starting

Specifies that information about agents that are in a starting state is returned.

unreachable

Specifies that information about agents that are in an unreachable state is returned.

stopped

Specifies that information about agents that are in a stopped state is returned.

endedUnexpectedly

Specifies that information about agents that are in an endedUnexpectedly state is returned.

noInformation

Specifies that information about agents that are in a noInformation state is returned.

unknown

Specifies that information about agents that are in an unknown state is returned.

problem

Specifies that information about agents that are in a problem state is returned.

Request headers

The following header must be sent with the request:

Authorization

This header must be sent if you are using basic authentication. For more information, see [Using HTTP basic authentication with the REST API](#).

Request body format

None.

Security requirements

The caller must be authenticated to the mqweb server and must be a member of one or more of the MFTWebAdmin, or MFTWebAdminRO roles. For more information about security for the administrative REST API, see [IBM MQ Console and REST API security](#).

Response status codes

200

Agent information retrieved successfully.

400

Invalid data provided.

For example, invalid agent attributes specified.

401

Not authenticated.

The caller must be authenticated to the mqweb server and must be a member of one or more of the MFTWebAdmin or MFTWebAdminRO roles. For more information, see [Security Requirements](#).

403

Not authorized.

The caller is authenticated to the mqweb server and is associated with a valid principal. However, the principal does not have access to all, or a subset of the required IBM MQ resources. For more information about the access that is required, see [Security Requirements](#).

404

Agent does not exist.

500

Server issue or error code from IBM MQ.

503

Queue manager not running.

Response headers**Content-Type**

This header is returned with a value of `application/json; charset=utf-8`.

Response body format

The response is in JSON format in UTF-8 encoding. The response contains an outer JSON object that contains a single JSON array called `agent`. Each element in the array is a JSON object that represents information about an agent. Each of these JSON objects contains the following attributes:

name

String.

Specifies the name of the agent.

This attribute is always returned.

type

String.

Specifies the type of agent.

The value is one of the following values:

- `standard`
- `connectDirectBridge`
- `protocolBridge`

state

Specifies the state of the agent. The value can be one of the following values:

- `active`
- `ready`
- `starting`
- `unreachable`
- `stopped`

For more information, see [“Response body attributes for transfers” on page 1913](#).

If an error occurs, see [REST API error handling](#).

Examples

The following example returns the basic details of all agents, that is, only the following information is displayed:

- agent name
- agent type

- agent state

The following URL is used with the HTTP GET method:

```
https://localhost:9443/ibmmq/rest/v1/admin/mft/agent/
```

The following JSON response is returned:

```
{
  "agent": [
    { "name": "AGENT1",
      "state": "ready",
      "type": "standard" },
    { "name": "AGENT2",
      "state": "ready",
      "type": "standard" },
    { "name": "BRIDGE_AGENT3",
      "type": "protocolBridge",
      "state": "ready" },
    { "name": "CD_AGENT",
      "type": "connectDirectBridge",
      "state": "ready" } ]
}
```

The following example lists all the agent of type **standard**, along with the **general** object. The following URL is used with the HTTP GET method:

```
https://localhost:9443/ibmmq/rest/v1/admin/mft/agent?attributes=general&type=standard
```

The following JSON response is returned:

```
{
  "agent": [
    { "name": "AGENT1",
      "state": "ready",
      "type": "standard",
      "general": { "description": "Standard connected to the qmgr in client mode",
                  "statusAge": "06:31:00",
                  "version": "9.0.3.0",
                  "level": "p903-L170513",
                  "statusPublicationRate": 300,
                  "statusPublishTime": "2017-10-31T06:57:07.000Z",
                  "maximumQueuedTransfers": 1000,
                  "maximumDestinationTransfers": 25,
                  "maximumSourceTransfers": 25,
                  "operatingSystem": "Windows7" } },
    { "name": "AGENT2",
      "state": "ready",
      "type": "standard",
      "general": { "description": "Standard connected to qmgr in Binding mode",
                  "statusAge": "05:00:00",
                  "version": "9.0.3.0",
                  "level": "p903-L170513",
                  "statusPublicationRate": 300,
                  "statusPublishTime": "2017-09-13T09:10:09.000Z",
                  "maximumQueuedTransfers": 1000,
                  "maximumDestinationTransfers": 25,
                  "maximumSourceTransfers": 25,
                  "operatingSystem": "Windows7" } } ]
}
```

The following example lists all the agents starting with the name AGENT, in a **ready** state, and of type **standard**, along with the **general** object of *statusAge*. The following URL is used with the HTTP GET method:

```
https://localhost:9443/ibmmq/rest/v1/admin/mft/agent?
name=AGENT*&state=ready&type=standard&attributes=general.statusAge
```

The following JSON response is returned:

```
{ "agent": [
  { "name": "AGENT1",
```

```

        "state" : "ready",
        "type": "standard",
        "general":
          { "statusAge" : "05:00:00" }
      },
      { "name": "AGENT2",
        "state" : "ready",
        "type": "standard",
        "general" :
          { "statusAge": "03:00:00"}
      },
      { "name": "AGENT3",
        "state" : "ready",
        "type" : "standard" ,
        "general":
          { "statusAge " : "05:00:00"}
      }
    ]

```

[“Response body attributes for agents” on page 1904](#)

When you use the HTTP GET method with the agent object to request information about agents, the following attributes are returned within named JSON objects.

V 9.0.5 *Response body attributes for agents*

When you use the HTTP GET method with the agent object to request information about agents, the following attributes are returned within named JSON objects.

The following objects are the default attributes found in the response, and are always returned:

name

String

Specifies the name of the agent, registered under the coordination queue manager.

type

String

Specifies the type of the agent, see [“GET” on page 1899](#) for more information.

state

String

Specifies the state of the agent, see [“GET” on page 1899](#) for more information.

The following objects are available:

- [“general” on page 1904](#)
- [“qmgrConnection” on page 1906](#)
- [“connectDirectBridge” on page 1908](#)
- [“protocolBridge” on page 1909](#)

general

description

String

Specifies the description of the agent, if you have set a description during agent creation

There is no default value for this attribute

This attribute is returned only when the any of the following is set during the query:

- attributes=**general**
- attributes=*
- attributes=**general.description**

statusAge

String

Specifies the age of the agent. The age is calculated as the difference in time between the system time of the machine where the coordination queue manager is running, and the time the last status was published by an agent.

There is no default value for this attribute

This attribute is returned only when the any of the following is set during the query:

- `attributes=general`
- `attributes=*`
- `attributes=general.statusAge`

version

String

Specifies the version of the queue manager

There is no default value for this attribute

This attribute is returned only when the any of the following is set during the query:

- `attributes=general`
- `attributes=*`
- `attributes=general.version`

level

String

Specifies the build level on which the queue manager is running

There is no default value for this attribute

This attribute is returned only when the any of the following is set during the query:

- `attributes=general`
- `attributes=*`
- `attributes=general.level`

statusPublicationRate

Integer

Specifies the rate in seconds that the agent publishes its status.

The default value for this attribute is 300 seconds

This attribute is returned only when the any of the following is set during the query:

- `attributes=general`
- `attributes=*`
- `attributes=general.statusPublicationRate`

statusPublishTime

String

Specifies the time at which the agent published its status, in Universal Time Constant format

There is no default value for this attribute

This attribute is returned only when the any of the following is set during the query:

- `attributes=general`
- `attributes=*`
- `attributes=general.statusPublishTime`

maximumQueuedTransfers

Integer

Specifies the maximum number of pending transfers that can be queued by an agent until the agent rejects a new transfer request.

The default value for this attribute is 1000

This attribute is returned only when the any of the following is set during the query:

- attributes=**general**
- attributes=*
- attributes=**general**.*maximumQueuedTransfers*

maximumQueuedTransfers

Integer

Specifies the maximum number of pending transfers that can be queued by an agent until the agent rejects a new transfer request.

The default value for this attribute is 1000

This attribute is returned only when the any of the following is set during the query:

- attributes=**general**
- attributes=*
- attributes=**general**.*maximumQueuedTransfers*

maximumDestinationTransfers

Integer

Specifies the maximum number of concurrent transfers that the destination agent processes at any given point in time.

The default value for this attribute is 25

This attribute is returned only when the any of the following is set during the query:

- attributes=**general**
- attributes=*
- attributes=**general**.*maximumDestinationTransfers*

maximumSourceTransfers

Integer

Specifies the maximum number of concurrent transfers that the source agent processes at any given point in time.

The default value for this attribute is 25

This attribute is returned only when the any of the following is set during the query:

- attributes=**general**
- attributes=*
- attributes=**general**.*maximumSourceTransfers*

operatingSystem

String

Specifies the operating system where the agent queue manager is created

There is no default value for this attribute

This attribute is returned only when the any of the following is set during the query:

- attributes=**general**
- attributes=*
- attributes=**general**.*operatingSystem*

qmgrConnection

This object provides information about the queue manager connections.

qmgrName

String

Specifies the name of the agent queue manager

There is no default value for this attribute

This attribute is returned only when the any of the following is set during the query:

- attributes=**qmgrConnection**
- attributes=*
- attributes=**qmgrConnection.qmgrName**

transportType

String

Specifies the transport type in which the agent is connecting with the queue manager; the transport type can be client or bindings

The default value is *bindings*

This attribute is returned only when the any of the following is set during the query:

- attributes=**qmgrConnection**
- attributes=*
- attributes=**qmgrConnection.transportType**

host

String

Specifies the agent queue manager host name; applicable only if **transportType** is client

There is no default value for this attribute

This attribute is returned only when the any of the following is set during the query:

- attributes=**qmgrConnection**
- attributes=*
- attributes=**qmgrConnection.host**

port

integer

Specifies the agent queue manager channel communication port; applicable only if **transportType** is client

There is no default value for this attribute

This attribute is returned only when the any of the following is set during the query:

- attributes=**qmgrConnection**
- attributes=*
- attributes=**qmgrConnection.port**

channelName

String

Specifies the agent queue manager channel; applicable only if **transportType** is client

The default value for this attribute is set to SYSTEM.DEF.SVRCONN

This attribute is returned only when the any of the following is set during the query:

- attributes=**qmgrConnection**
- attributes=*
- attributes=**qmgrConnection.channelName**

standbyHost

String

Specifies the host name used by client connections, to connect to the standby instance of a multi-instance agent queue manager

There is no default value for this attribute

This attribute is returned only when the any of the following is set during the query:

- **attributes=qmgrConnection**
- **attributes=***
- **attributes=qmgrConnection.standbyHost**

standbyPort

Integer

Specifies the port number through which a client can connect to the standby instance of a multi-instance agent queue manager

The default value for this attribute is set to -1

This attribute is returned only when the any of the following is set during the query:

- **attributes=qmgrConnection**
- **attributes=***
- **attributes=qmgrConnection.standbyPort**

connectDirectBridge

This object provides information about to connect direct bridge type agent. For other type of agents this object is not added.

nodeName

String

Specifies the name of the Connect:Direct node to use, to transfer messages from this agent to the destination Connect:Direct nodes.

There is no default value for this attribute

This attribute is returned only when the any of the following is set during the query:

- **attributes=connectDirectBridge**
- **attributes=***
- **attributes=connectDirectBridge.nodeName**

host

String

Specifies the host name or IP address of the system where the Connect:Direct node, specified by the **-cdNode** parameter, is located.

If you do not specify the **-cdNodeHost** parameter, a default of the host name or IP address of the local system is used.

The default value for this attribute are the details of the host where it is configured, for example, localhost

This attribute is returned only when the any of the following is set during the query:

- **attributes=connectDirectBridge**
- **attributes=***
- **attributes=connectDirectBridge.host**

port

Integer

Specifies the port number of the Connect:Direct node that client applications use to communicate with the node.

The default value for this attribute is 1363

This attribute is returned only when the any of the following is set during the query:

- attributes=**connectDirectBridge**
- attributes=*
- attributes=**connectDirectBridge.port**

protocolBridge

This object provides information about protocol bridge type agent. For other type of agents this object is not added.

endpoints

String

Specifies the number of endpoints the bridge can support.

Note: If you have not set the default protocol server, the **defaultServer** field is not available.

The default value for this attribute is *multiple* from IBM WebSphere MQ 7.0.1

This attribute is returned only when the any of the following is set during the query:

- attributes=**protocolBridge**
- attributes=*
- attributes=**protocolBridge.endpoints**

defaultServer

String

Specifies the host name or IP address of the default protocol server if it is set. If the default protocol field is not set, this value is blank.

The value is a complete string containing the protocol type, server, and port, in the following format:

```
<protocolType>://<serverName or IP address>:<port>
```

For example:

```
"ftp://localhost:21"
```

There are no default values for this attribute

This attribute is returned only when the any of the following is set during the query:

- attributes=**protocolBridge**
- attributes=*
- attributes=**protocolBridge.defaultServer**

Related reference

[“GET” on page 1899](#)

Use the HTTP GET method with the agent resource to request information about agents.

/admin/mft/transfer

You can use the HTTP GET method with the transfer resource, to request information about transfers, and other status details.

Related reference

[“/admin/mft/agent” on page 1899](#)

You can use the HTTP GET method with the `agent` resource, to request information about the status of agents, and other attribute details.

V 9.0.5 GET

Use the HTTP GET method with the `transfer` resource to request information about transfers and transfer status. You can query only the transfers that are initiated after the mqweb server is started.

The information that is returned is similar to the information returned by the [fteListScheduledTransfers](#) command.

Note: You must set a coordination queue manager before you can use the `transfer` resource. For more information, see [Configuring the REST API for MFT](#).

- [Resource URL](#)
- [Optional query parameters](#)
- [“Request headers” on page 1911](#)
- [Request body format](#)
- [“Security requirements” on page 1911](#)
- [Response status codes](#)
- [“Response headers” on page 1911](#)
- [Response body format](#)
- [Examples](#)

Resource URL

`https://host:port/ibmmq/rest/v1/admin/mft/transfer/{transferID}`

transferID

Optionally specifies the ID of the transfer to query.

If you do not specify a transfer ID, a list of transfers is returned.

You can use HTTP instead of HTTPS if you enable HTTP connections. For more information about enabling HTTP, see [Configuring the HTTP and HTTPS ports](#).

Optional query parameters

attributes

This query parameter is valid only when a transfer ID is specified.

Specifies a comma-separated list of attributes to return.

If you do not specify **attributes**, the default set of attributes is returned. See [“Response body attributes for transfers” on page 1913](#) for a list of the available attributes.

Requesting the same attribute multiple times is an error.

If you make a request specifying attributes that are not valid for some of the transfers, or you set **attributes** to `*` this is permitted. However, if you request information on specific attributes which are not valid for that transfer, an error results.

limit

This query parameter is valid only when no transfer ID is specified.

The maximum number of transfers to be retrieved. For example, if the `limit=200`, the REST API returns a maximum of 200 transfers.

after

This query parameter is valid only when no transfer ID is specified.

Specifies the `transferId` of the transfer from where the transfer list has to be fetched. All the transfers that are initiated after that particular transfer are fetched.

before

This query parameter is valid only when no transfer ID is specified.

Specifies the `transferId` of the transfer from where the transfer list has to be fetched. All the transfers that are initiated before that particular transfer are fetched.

Request headers

The following header must be sent with the request:

Authorization

This header must be sent if you are using basic authentication. For more information, see [Using HTTP basic authentication with the REST API](#).

Request body format

None.

Security requirements

The caller must be authenticated to the mqweb server and must be a member of one or more of the MFTWebAdmin, or MFTWebAdminRO roles. For more information about security for the administrative REST API, see [IBM MQ Console and REST API security](#).

Response status codes**200**

Transfer information retrieved successfully.

400

Invalid data provided.

For example, invalid attributes specified.

401

Not authenticated.

The caller must be authenticated to the mqweb server and must be a member of one or more of the MFTWebAdmin or MFTWebAdminRO roles. For more information, see [Security Requirements](#).

403

Not authorized.

The caller is authenticated to the mqweb server and is associated with a valid principal. However, the principal does not have access to all, or a subset of the required IBM MQ resources. For more information about the access that is required, see [Security Requirements](#).

404

A transfer with the specified ID does not exist.

500

Server issue or error code from IBM MQ.

503

Queue manager not running.

Response headers**Content-Type**

This header is returned with a value of `application/json; charset=utf-8`.

Response body format

The response is in JSON format in UTF-8 encoding. The response contains an outer JSON object that contains a single JSON array called `transfer`. Each element in the array is a JSON object that represents information about a transfer.

For more information, see [“ Response body attributes for transfers” on page 1913](#).

If an error occurs, see [REST API error handling](#).

Examples

The following example returns a default set of data in the response

The following URL is used with the HTTP GET method:

```
https://localhost:9443/ibmmq/ibmmq/rest/v1/admin/mft/transfer/414d512050524d465444454d4f312020f5189c5921f22302
```

The following JSON response is returned:

```
{
  "transfer": [{
    "id": "414D512050524D465444454D4F312020F5189C5921F22302",
    "destinationAgent": { "name": "AGENT.TRI.BANK" },
    "originator": {
      "host": "192.168.99.1",
      "userId": "johndoe"
    },
    "sourceAgent": { "name": "TESTAGENT" },
    "statistics": {
      "endTime": "2018-01-08T16:22:15.569Z",
      "numberOfFileFailures": 0,
      "numberOfFileSuccesses": 2,
      "numberOfFileWarnings": 0,
      "numberOfFiles": 2,
      "startTime": "2018-01-08T16:22:15.242Z"
    },
    "status": {
      "state": "successful"
    }
  }
]}
}
```

The following example lists all the attributes for the specified transfer ID, on the coordination queue manager. The following URL is used with the HTTP GET method:

```
https://localhost:9443/ibmmq/rest/v1/admin/mft/transfer/414d512050524d465444454d4f312020c5c6705924cf9e02?attributes=*
```

The following JSON response is returned:

```
{
  "transfer": [{
    "id": "414D512050524D465444454D4F312020C5C6705924CF9E02",
    "sourceAgent": {
      "qmgrName": "PRMFTDEM01",
      "name": "AGENT2"
    },
    "destinationAgent": {
      "qmgrName": "PRMFTDEM01",
      "name": "AGENT1"
    },
    "originator": {
      "host": "192.168.56.1",
      "userId": "johndoe",
      "mqmdUserId": "johndoe"
    },
    "transferSet": {
      "item": [
        {
          "source": {

```

job

Job Name for the transfer (if specified)

sourceAgent

Specifies the name of the agent (along with other details) on the system where the source file is located

destinationAgent

Specifies the name of the agent (along with other details) on the system to which the file has been transferred

originator

Group element that contains the elements specifying the originator of the request

transferSet

Contains an array of items, that consists of all the information about the transfers, such as source filename, destination filename, along with each of their path location, size of file, and so on.

userProperties

Contains some additional meta data information about the transfer (if you provided this information before starting the transfer). For example: `"userProperties": {"key1": "value1"}`

status

The state and description messages for the status of the transfer

statistics

Group element for statistical information for the transfer (when available)

Inner object attributes

Attention: The attributes marked default are always returned, and are part of the default JSON response. All other attributes are returned only if queried.

sourceAgent**qmgrName**

The name of the queue manager on the source system

name (default)

The name of the agent on the source system.

destinationAgent**qmgrName**

The name of the queue manager on the destination system

name (default)

The name of the agent on the destination system.

originator

Group element that contains the elements specifying the originator of the request.

host (default)

The host name of the system where the source file is located.

userID (default)

The user ID that originated the file transfer

mqmdUserId

The IBM MQ user ID that was supplied in the message descriptor (MQMD)

transferSet

Specifies a group of file transfers you want to perform together. During transmission, **transferSet** is a group element containing an array of item objects.

item

Group element that contains elements specifying the source and destination file names and locations

bytesSent

Total bytes sent

startTime

Records the time that the set of transfers started, expressed in UTC format

item

source

Group element that contains the **file** element or the **queue** element, and the **checksum** element for the file on the source system

destination

Group element that contains the **file** element or the **queue** element, and the **checksum** element for the file on the destination system

Only one of **file** and **queue** is present as a child element of destination

status

The state for a transfer; that is for a particular item object inside the **transferSet**

mode

Specifies the transfer mode as either binary or text

source

recursive

Specifies that files are transferred recursively in sub-directories, when the source element is a directory or contains wildcard characters.

disposition

Specifies the action that is taken on the source element when source has successfully been transferred to its destination. The valid options are as follows:

leave

The source files are left unchanged

delete

The source files are deleted from the source system after the source file is successfully transferred

file

Specifies the absolute path of the file that was transferred. The fully-qualified path is in the format consistent with your operating system, for example C:/from/here.txt. Note that a file URI is not used.

The valid options are as follows:

lastModified

Last modified date and time for the file (UTC format)

size

File size

path

Path location for the file

encoding

The encoding for a text file transfer

endOfLine

Specifies the end of line marker. The permitted values are:

- LF - line feed character only
- CRLF - carriage return and line feed character sequence

checksum

checksum does not appear if a checksum was not performed.

Specifies the type of hash algorithm that generated the message digest to create the digital signature. Managed File Transfer supports Message Digest algorithm 5 (md5) only. The checksum provides a way for you to confirm the integrity of transferred files is intact.

The valid options are:

method

Method used for generating **checksum**

value

Checksum value generated

type

Specifies the type of source. The valid options are as follows:

queue

Specifies an IBM MQ queue as the source

file

Specifies a file as the source, if the source is a file or directory

dataset

Specifies a z/OS dataset as the source

dataset

Specifies a z/OS dataset. The valid options are as follows:

attributes

Attributes related to the dataset

size

File size

name

Name of the dataset

queue when used with the **source** element

Specifies the name of the queue that the transferred messages were read from, which is located on the source agent queue manager.

messageCount

The number of messages that were read from the queue

name

Name of the queue along with the queue manager name, as shown

```
queueName@queueManagerName
```

setMqProperties

A boolean operator specifying whether IBM MQ message properties are set on the first message in a file, and any messages written to the queue when an error occurs.

destination

actionIfExists

Specifies the action that is taken if a destination file exists on the destination system. The valid options are as follows:

error

Reports an error and the file is not transferred

overwrite

Overwrites the existing destination file

file

Specifies the absolute path of the file that was transferred. The fully-qualified path is in the format consistent with your operating system, for example C:/from/here.txt. Note that a file URI is not used.

The valid options are as follows:

lastModified

Last modified date and time for the file (UTC format)

size

File size

path

Path location for the file

checksum

checksum does not appear if a checksum was not performed.

Specifies the type of hash algorithm that generated the message digest to create the digital signature. Managed File Transfer supports Message Digest algorithm 5 (md5) only. The checksum provides a way for you to confirm the integrity of transferred files is intact.

The valid options are:

method

Method used for generating **checksum**

value

Checksum value generated

type

Specifies the type of source. The valid options are as follows:

queue

Specifies an IBM MQ queue as the source

file

Specifies a file as the source, if the source is a file or directory

dataset

Specifies a z/OS dataset as the source

dataset

Specifies a z/OS dataset. The valid options are as follows:

attributes

Attributes related to the dataset

size

File size

name

Name of the dataset

queue when used with the **destination** element

Specifies the name of the queue that was transferred to, which is located on any queue manager that is connected to the destination agent queue manager.

messageCount

The number of messages that were written to the queue

messageLength

The length of the message written to the queue

name

Name of the queue along with the queue manager name, as shown

```
queueName@queueManagerName
```

messageOrGroupId

If the transfer request did not specify that the file is split into multiple messages, the value of this attribute is the IBM MQ message ID of the message written to the queue.

If the transfer request specified that the file is split into multiple messages, the value of this attribute is the IBM MQ group ID of the messages written to the queue.

delimiter

If **delimiterType.size**, for example 1K

If **delimiterType.binary**, for example 12

If **delimiter** is an empty string, that is, "", the field is not set while initiating the transfer

delimiterType

Type of delimiter being used to split the messages. The valid values are:

size

Split by size

binary

Split by delimiter bytes

If **delimiterType** is an empty string, that is, "", the field is not set while initiating the transfer

includeDelimiterInMessage

Valid only for **delimiterType.binary**.

This option can be *true* or *false*. For example:

```
"includeDelimiterInMessage" : true
```

delimiterPosition

Valid only for **delimiterType.binary**. The valid values are:

"prefix"

Before each message

"postfix"

After each message

If **delimiterPosition** is an empty string, that is, "", the field is not set while initiating the transfer

Note, that if **delimiterType** is *size*, both **includeDelimiterInMessage**, and **delimiterPosition** are not included in the JSON.

status

Group element for status information for the transfer.

state (default)

The state of the transfer. The value can be one of the following:

- started
- inProgress
- successful
- failed
- partiallySuccessful
- cancelled
- malformed - indicates that the file transfer request message content can not be interpreted
- notAuthorized

- deleted
- inProgressWithFailures
- inProgressWithWarnings

lastStatusUpdate

Most recent time when the transfer status was captured, expressed in UTC format

description

More detailed information about the status completion. Whether it is:

- Partially successful
- Successful
- Failed, or
- Any other relevant information

statistics

Group element for statistical information for the transfer (when available).

startTime (default)

The time when the transfer was submitted (UTC format)

retryCount

The number of times that the transfer went into the recovery state and was retried by the agent.

A transfer can go into a recovery state because the source and destination agents lose communication, either because of an IBM MQ network error, or because the agents are not receiving data or acknowledgment messages for a period.

This period is determined by the agent properties: **transferAckTimeout** and **transferAckTimeoutRetries**.

numberOfFilefailures (default)

The number of files in the **transferSet** that failed to transfer successfully

numberOfFileWarnings (default)

The number of files in the **transferSet** that generated warnings while being transferred, but otherwise transferred successfully

numberOfFiles (default)

This number denotes the total number of files included in the current transfer request. This number includes all the files considered for the transfer operation

endTime (default)

The time when the transfer was completed. This field gets updated only when the transfer is complete.

If the transfer is in any other state, then **"endTime"** will be an empty string

numberOfFileSuccesses (default)

The number of files successfully transferred

Related reference

["/admin/mft/agent"](#) on page 1899

You can use the HTTP GET method with the agent resource, to request information about the status of agents, and other attribute details.

V 9.0.1 [/admin/qmgr](#)

You can use the HTTP GET method with the `qmgr` resource to request information about queue managers **V 9.0.3**, including status information.

V 9.0.4 You can use the administrative REST API gateway with this resource URL.

For more information about the PCF equivalents to the queue manager REST API parameters and attributes, see [“REST API and PCF equivalents for queue managers” on page 2028](#).

V 9.0.1 GET

Use the HTTP GET method with the `qmgr` resource to request basic information and status information about queue managers.

The information that is returned is similar to the information that is returned by the `dspmq` control command, the `DISPLAY QMSTATUS` MQSC command, and the `Inquire Queue Manager Status` PCF command.

- [Request body format](#)
- [V 9.0.2 “Security requirements” on page 1922](#)
- [Response status codes](#)
- [“Response headers” on page 1923](#)
- [Response body format](#)
- [Examples](#)

Resource URL

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://host:port/ibmmq/rest/v1/admin/qmgr/{qmgrName}
```

IBM MQ 9.0.3 and earlier:

```
https://host:port/ibmmq/rest/v1/qmgr/{qmgrName}
```

qmgrName

Optionally specifies the name of the queue manager to query.

V 9.0.4 You can specify a remote queue manager as the `qmgrName`. If you specify a remote queue manager, you must configure a gateway queue manager. For more information, see [Remote administration using the REST API](#).

If you specify a remote queue manager, only the following attributes are returned:

- name
- started
- channelInitiatorState
- ldapConnectionState
- connectionCount
- publishSubscribeState

The queue manager name is case-sensitive.

If the queue manager name includes a forward slash, a period, or a percent sign, these characters must be URL encoded:

- A forward slash (/) must be encoded as %2F.
- A percent sign (%) must be encoded as %25.

V 9.0.1 You can use HTTP instead of HTTPS if you enable HTTP connections. For more information about enabling HTTP, see [Configuring HTTP and HTTPS ports](#).

Optional query parameters

attributes={extended}|*|extended.attributeName,...}

ULW **MQ Appliance** This parameter is only available on the IBM MQ Appliance, UNIX, Linux, and Windows.

This parameter is not valid if you specify a remote queue manager in the resource URL.

extended

Specifies that all extended attributes are retrieved.

Specifies all attributes. This parameter is equivalent to **extended**.

extended.attributeName,...

Specifies a comma-separated list of extended attributes to return.

For example, to return the `installationName` attribute, specify `extended.installationName`.

For a full list of extended attributes, see [Extended attributes for queue managers](#).

V 9.0.3 **status={status}|*|status.attributeName,...}**

Note: In IBM MQ 9.0.1, the **status** optional query parameter was used to filter returned queues based on the running state of the queue. From IBM MQ 9.0.2, this optional query parameter is known as **state**.

status

Specifies that all status attributes are returned.

Specifies all attributes. This parameter is equivalent to **status**.

status.attributeName,...

Specifies a comma-separated list of queue manager status attributes to return.

The queue manager must be running to return the status attributes.

For example, to return the `connectionCount` attribute, specify `status.connectionCount`.

For a full list of status attributes, see [Status attributes for queue managers](#).

V 9.0.2 **state=state**

Note: In IBM MQ 9.0.1, the **state** optional query parameter was known as **status**. From IBM MQ 9.0.3, the **status** optional query parameter is used to retrieve status attributes for the queue manager.

Specifies that only queue managers with the specified state are returned. The following values are valid values:

On all platforms:

- running
- ended

ULW On UNIX, Linux, and Windows:

- endedImmediately
- endedPreemptively
- endedUnexpectedly
- starting

- quiescing
- endingImmediately
- endingPreemptively
- beingDeleted
- stateNotAvailable
- runningAsStandby
- runningElsewhere

You can specify the `state=state` optional query parameter only if you do not specify a queue manager name within the resource URL. That is, you cannot request information about a specific queue manager in a specific state.

Request headers

The following headers must be sent with the request:

Authorization

This header must be sent if you are using basic authentication. For more information, see [Using HTTP basic authentication with the REST API](#).

V 9.0.4

The following headers can optionally be sent with the request:

ibm-mq-rest-gateway-qmgr

This header specifies the queue manager that is to be used as the gateway queue manager. The gateway queue manager is used to connect to a remote queue manager. For more information, see [Remote administration using the REST API](#).

Request body format

None.

Security requirements

V 9.0.2

The caller must be authenticated to the mqweb server and must be a member of one or more of the MQWebAdmin, MQWebAdminRO, or MQWebUser roles. For more information about security for the administrative REST API, see [IBM MQ Console and REST API security](#).

When the **status** optional query parameter is specified, the ability to issue certain PCF commands is required. If only a subset of the status attributes is to be returned, only the permissions for the corresponding PCF commands are required. The security principal of the caller must be granted the ability to issue the following PCF commands for the specified queue manager:

- **U/LW** **MQ Appliance** On the IBM MQ Appliance, UNIX, Linux, and Windows:
 - To return the `started`, `channelInitiatorState`, `ldapConnectionState`, or `connectionCount` attributes, authority to issue the **MQCMD_INQUIRE_Q_MGR_STATUS** PCF command must be granted.
 - To return the `publishSubscribeState` attribute, authority to issue the **MQCMD_INQUIRE_PUBSUB_STATUS** PCF command must be granted.
- **z/OS** On z/OS:
 - To return the `started` attribute, authority to issue the **MQCMD_INQUIRE_LOG** PCF command must be granted.
 - To return the `channelInitiatorState` attribute, authority to issue the **MQCMD_INQUIRE_CHANNEL_INIT** PCF command must be granted.
 - To return the `connectionCount` attribute, authority to issue the **MQCMD_INQUIRE_CONNECTION** PCF command must be granted.

- To return the `publishSubscribeState` attribute, authority to issue the **MQCMD_INQUIRE_PUBSUB_STATUS** PCF command must be granted.

ULW On UNIX, Linux, and Windows, you can grant authority to security principals to use IBM MQ resources by using the **mqsetaut** command. For more information, see [mqsetaut](#).

z/OS On z/OS, see [Setting up security on z/OS](#).

Response status codes

200

Queue manager information retrieved successfully.

400

Invalid data provided.

For example, invalid queue manager specified.

401

Not authenticated.

The caller must be authenticated to the mqweb server and must be a member of one or more of the `MQWebAdmin`, `MQWebAdminRO`, or `MQWebUser` roles. For more information, see [“Security requirements” on page 1922](#).

404

Queue manager does not exist.

500

Server issue or error code from IBM MQ.

Response headers

The following headers are returned with the response:

Content-Type

This header is returned with a value of `application/json;charset=utf-8`.

V 9.0.4 `ibm-mq-rest-gateway-qmgr`

This header is returned if a remote queue manager is specified in the resource URL. The value of this header is the name of the queue manager that is used as the gateway queue manager.

Response body format

The response is in JSON format in UTF-8 encoding. The response contains an outer JSON object that contains a single JSON array called `qmgr`. Each element in the array is a JSON object that represents information about a queue manager. Each JSON object contains the following attributes:

name

String.

The queue manager name.

V 9.0.2 `state`

String.

Note: In IBM MQ 9.0.1, the **state** attribute was known as **status**. From IBM MQ 9.0.3, the **status** object contains status attributes for the queue manager.

This attribute is not returned if the queue manager that is specified in the resource URL is a remote queue manager.

One of the following values:

On all platforms:

- `running`

- ended

ULW On UNIX, Linux, and Windows:

- endedImmediately
- endedPreemptively
- endedUnexpectedly
- starting
- quiescing
- endingImmediately
- endingPreemptively
- beingDeleted
- stateNotAvailable
- runningAsStandby
- runningElsewhere

The following objects can be included in the JSON object that represents information about a queue. Which objects and attributes are returned depends on the URL that was specified for the request:

V 9.0.3 status

Contains attributes that are related to status information for the queue manager.

Note: In IBM MQ 9.0.1, the **status** attribute returned information about the running state of the queue. From IBM MQ 9.0.2, this attribute is known as **state**.

extended

ULW **MQ Appliance** These attributes are only available on the IBM MQ Appliance, UNIX, Linux, and Windows.

These attributes are not returned if the queue manager that is specified in the resource URL is a remote queue manager.

Contains extended attributes.

For more information, see [“Response body attributes for queue managers” on page 1926](#).

If an error occurs, the response body contains an error message. For more information, see [REST API error handling](#).

Examples for UNIX, Linux, and Windows

ULW

- The following example gets basic information about all queue managers. The following URL is used with the HTTP GET method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr
```

IBM MQ 9.0.3:

```
https://localhost:9443/ibmmq/rest/v1/qmgr
```

The following JSON response is returned:

```
{
  "qmgr": [
    {
      "name": "QM_T1",
      "state": "endedImmediately"
    },
    {
      "name": "RESTQM0",
```

```
    "state": "endedUnexpectedly"
  }
}
```

- The following example gets extended information about the queue manager QM_T1. The following URL is used with the HTTP GET method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM_T1?attributes=extended
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr/QM_T1?attributes=extended
```

The following JSON response is returned:

```
{
  "qmgr": [
    {
      "extended": {
        "installationName": "Installation1",
        "isDefaultQmgr": false,
        "permitStandby": "notApplicable"
      },
      "name": "QM_T1",
      "state": "endedImmediately"
    }
  ]
}
```

- The following example gets specific information about all queue managers. The following URL is used with the HTTP GET method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr?attributes=extended.permitStandby
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr?attributes=extended.permitStandby
```

The following JSON response is returned:

```
{
  "qmgr": [
    {
      "extended": {
        "permitStandby": "notApplicable"
      },
      "name": "QM_T1",
      "state": "endedImmediately"
    },
    {
      "extended": {
        "permitStandby": "notApplicable"
      },
      "name": "RESTQM0",
      "state": "endedUnexpectedly"
    }
  ]
}
```

- **V 9.0.3** The following example gets status for the queue manager QM1. The following URL is used with the HTTP GET method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
http://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1?status=*
```

IBM MQ 9.0.3 and earlier:

```
http://localhost:9443/ibmmq/rest/v1/qmgr/QM1?status=*
```

The following JSON response is returned:

```
{
  "qmgr": [
    {
      "name": "QM1",
      "state": "running",
      "status": {
        "started": "2016-11-08T11:02:29.000Z",
        "channelInitiatorState": "running",
        "ldapConnectionState": "disconnected",
        "connectionCount": 23,
        "publishSubscribeState": "running"
      }
    }
  ]
}
```

Examples for z/OS

- The following example gets basic information about all queue managers. The following URL is used with the HTTP GET method:

IBM MQ 9.0.4 and later:

```
https://REST.example.com:9443/ibmmq/rest/v1/admin/qmgr
```

IBM MQ 9.0.3 and earlier:

```
https://REST.example.com:9443/ibmmq/rest/v1/qmgr
```

The following JSON response is returned:

```
{
  "qmgr": [
    {
      "name": "MQ5B",
      "state": "ended"
    }
  ]
}
```

Response body attributes for queue managers

When you use the HTTP GET method with the `qmgr` object to request information about queue managers, the following attributes are returned within named JSON objects.

The following objects are available:

- “[status](#)” on page 1926
- “[extended](#)” on page 1928

For more information about the PCF equivalents to the queue manager REST API parameters and attributes, see “[REST API and PCF equivalents for queue managers](#)” on page 2028.

status

The status object contains status information about queue managers:

started

String.

Specifies the date and time at which the queue manager was started.

For more information about the time stamp format that is used to return the date and time, see [REST API time stamps](#).

channelInitiatorState

String.

Specifies the current state of the channel initiator.

On all platforms, the value is one of the following values:

- stopped
- running

 On the IBM MQ Appliance, UNIX, Linux, and Windows, the value can also be one of the following values:

- starting
- stopping

 On z/OS, the value can also be one of the following values:

- unknown

This value indicates that the channel initiator did not return a response to the status request. The channel initiator might be running, but busy. Retry the request after a short time to resolve the issue.

ldapConnectionState

 This attribute is only available on the IBM MQ Appliance, UNIX, Linux, and Windows.

String.

Specifies the current state of the connection to the LDAP server.

The value is one of the following values:

- connected
- error
- disconnected

connectionCount

Integer.

Specifies the current number of connections to the queue manager.

On z/OS, this attribute includes threads that might be disassociated from a connection, together with connections that are in-doubt and connections where external intervention is required.

publishSubscribeState

String.

Specifies the current state of the publish/subscribe engine of the queue manager.

The value is one of the following values:

stopped

Specifies that the publish/subscribe engine, and the queued publish/subscribe interface is not running.

starting

Specifies that the publish/subscribe engine is initializing.

running

Specifies that the publish/subscribe engine, and the queued publish/subscribe interface are running.

compatibility

Specifies that the publish/subscribe engine is running, but that the publish/subscribe interface is not running. Therefore, it is possible to publish or subscribe by using the application programming interface. However, any message that is put to the queues that are monitored by the queued publish/subscribe interface are not acted upon.

error

The publish/subscribe engine failed.

stopping

The publish/subscribe engine is stopping.

extended

ULW **MQ Appliance** This object is only available on the IBM MQ Appliance, UNIX, Linux, and Windows. This object is not returned if the queue manager that is specified in the resource URL is a remote queue manager. The extended object contains extended information about queue managers:

isDefaultQmgr

Boolean.

Specifies whether the queue manager is the default queue manager.

The value is `true` if the queue manager is the default queue manager.

permitStandby

ULW This attribute is only available on UNIX, Linux, and Windows.

String.

Specifies the permissible standby state.

The value can be one of the following values:

- `permitted`
- `notPermitted`
- `notApplicable`

installationName

String.

Specifies the name of the installation that the queue manager is associated with.

V 9.0.4 **/admin/qmgr/{qmgrName}/channel**

You can use the HTTP GET method with the `channel` resource to request information about channels.

V 9.0.5 From IBM MQ 9.0.5, you can use the administrative REST API gateway with this resource URL.

For more information about the PCF equivalents to the channel REST API parameters and attributes, see [“REST API and PCF equivalents for channels” on page 2039](#).

V 9.0.4 **GET**

Use the HTTP GET method with the `channel` resource to request information about channels.

The information that is returned is similar to the information returned by the [“Inquire Channel” on page 1527](#) and [“Inquire Channel Status” on page 1568](#) PCF commands, and the [“DISPLAY CHANNEL” on page 598](#) and [“DISPLAY CHSTATUS” on page 623](#) MQSC commands.

Note: **z/OS** On z/OS, the channel initiator must be running before you use the `channel` resource with the HTTP GET method specifying the **status** parameter.

Note: The REST API supports only the following channels:

- Channels that have a transport type of TCP.
- Sender, receiver, server, requester, cluster-sender, and cluster-receiver channels.

Other channels are not returned.

- [“Resource URL” on page 1929](#)
- [“Optional query parameters” on page 1929](#)
- [“Request headers” on page 1933](#)

- [“Request body format” on page 1933](#)
- [“Security requirements” on page 1933](#)
- [“Response status codes” on page 1934](#)
- [“Response headers” on page 1934](#)
- [Response body format](#)
- [“Examples” on page 1936](#)

Resource URL

`https://host:port/ibmmq/rest/v1/admin/qmgr/{qmgrName}/channel/{channelName}`

qmgrName

Specifies the name of the queue manager on which to query the channels.

V 9.0.5 From IBM MQ 9.0.5, you can use the administrative REST API gateway with this resource URL. That is, you can specify a remote queue manager as the queue manager name.

The queue manager name is case-sensitive.

If the queue manager name includes a forward slash, a period, or a percent sign, these characters must be URL encoded:

- A forward slash (/) must be encoded as %2F.
- A percent sign (%) must be encoded as %25.

channelName

Optionally specifies the name of a channel to query. This channel must exist on the specified queue manager.

The channel name is case-sensitive.

If the channel name includes a forward slash or a percent sign, these characters must be URL encoded:

- A forward slash, /, must be encoded as %2F.
- A percent sign, %, must be encoded as %25.

You can use HTTP instead of HTTPS if you enable HTTP connections. For more information about enabling HTTP, see [Configuring HTTP and HTTPS ports](#).

Optional query parameters

attributes={object,...[*|object.attributeName,...]}

object,...

Specifies a comma-separated list of JSON objects that contain related channel configuration attributes to return.

For example, to return all channel configuration attributes that are related to time stamps, specify `timestamps`. To return all channel configuration attributes that are related to compression and to connection management, specify `compression,connectionManagement`.

The status objects cannot be specified with this query parameter. Use the **status** query parameter to return these attributes.

You cannot specify the same object more than once. If you request objects that are not valid for a particular channel, the attributes are not returned for that channel. However, if you specify a value for the **type** parameter that is not `all`, and request objects that are not valid for that channel type, an error is returned.

For a full list of objects and associated attributes, see [Attributes for channels](#).

*

Specifies all attributes.

object.attributeName,...

Specifies a comma-separated list of channel configuration attributes to return.

Each attribute must specify the JSON object that contains the attribute, in the form `object.attributeName`. For example, to return the `keepAliveInterval` attribute, which is contained in the `connectionManagement` object, specify `connectionManagement.keepAliveInterval`.

Attributes can be nested inside multiple JSON objects, such as `exits.message.name`, which is an attribute inside a message object inside an exits object.

The keyword `[type]` can be used as a wildcard to include multiple channel-type-specific sections that contain the same attribute. For example, `[type].clusterName` is equivalent to `clusterSender.clusterName,clusterReceiver.clusterName`.

Attributes from the `status` object cannot be specified with this query parameter. Use the **status** query parameter to return these attributes.

You cannot specify the same attribute more than once. If you request attributes that are not valid for a particular channel, the attributes are not returned for that channel. However, if you specify the **type** parameter and request attributes that are not valid for that channel type, an error is returned.

For a full list of attributes and associated objects, see [Attributes for channels](#).

status={*|currentStatus|savedStatus|currentStatus.attributeName,savedStatus.attributeName,...}

Specifies that all `savedStatus` and `currentStatus` attributes are returned.

currentStatus

Specifies that all `currentStatus` attributes are returned.

savedStatus

Specifies that all `savedStatus` attributes are returned.

currentStatus.attributeName,savedStatus.attributeName,...

Specifies a comma-separated list of current status and saved status attributes to return.

For example, to return the `state` attribute, specify `currentStatus.state`.

For a full list of status attributes, see [Current status attributes for channels](#) and [Saved status attributes for channels](#).

filter=filterValue

Specifies a filter for the channel definitions that are returned.

If you specify a channel name in the resource URL, you can only filter on status attributes.

If you filter on a current status attribute, the only current status objects returned are those that match the filter parameter. All saved status objects for the corresponding channels are returned, if requested.

If you filter on a saved status attribute, the only saved status objects returned are those that match the filter parameter. All current status objects for the corresponding channels are returned, if requested.

You can specify only one filter. If you filter on a status attribute, you must specify the corresponding **status** query parameter.

filterValue has the following format:

```
attribute:operator:value
```

where:

attribute

Specifies one of the applicable attributes. For a full list of attributes, see [Attributes for channels](#).

The following attributes cannot be specified:

- name

- type
- `z/OS` queueSharingGroup.disposition
- [type].connection.port
- connectionManagement.localAddress.port
- connectionManagement.localAddress.portRange
- currentStatus.general.connection.port
- currentStatus.connectionManagement.localAddress.port

The keyword [type] can be used as a wildcard to include multiple channel-type-specific sections that contain the same attribute, such as `sender.connection` and `clusterReceiver.connection`.

To filter on any attributes that are time stamps, the filter can specify any portion of the time stamp, with a trailing asterisk, *. The format of a time stamp is, YYYY-MM-DDThh:mm:ss. For example, you can specify `2001-11-1*` to filter on dates in the range 2001-11-10 to 2001-11-19, or `2001-11-12T14:*` to filter any minute in the specified hour of the specified day.

Valid values for the YYYY section of the date are in the range 1900 - 9999.

The time stamp is a string. Therefore, only the `equalTo` and `notEqualTo` operators can be used with the time stamp.

operator

Specifies one of the following operators:

lessThan

Use this operator only with integer attributes.

greaterThan

Use this operator only with integer attributes.

equalTo

Use this operator with any attribute except string array attributes and integer array attributes.

notEqualTo

Use this operator with any attribute except string array attributes and integer array attributes.

lessThanOrEqualTo

Use this operator only with integer attributes.

greaterThanOrEqualTo

Use this operator only with integer attributes.

contains

Use this operator only with integer array attributes and string array attributes.

doesNotContain

Use this operator only with integer array attributes and string array attributes.

value

Specifies the constant value to test against the attribute.

The value type is determined by the attribute type.

For string and boolean attributes, you can omit the value field after the colon. For string attributes, omit the value to return channels with no value for the specified attribute. For boolean attributes, omit the value to return any channels that have the specified attribute set to false. For example, the following filter returns all channels where the description attribute is not specified:

```
filter=general.description:equalTo:
```

You can use a single asterisk, *, at the end of the value as a wildcard. You cannot use only an asterisk.

If the value includes a space, a forward slash, a percent sign, or an asterisk that is not a wildcard, these characters must be URL encoded:

- A space must be encoded as %20
- A plus, +, must be encoded as %2B
- A forward slash, /, must be encoded as %2F.
- A percent sign, %, must be encoded as %25.
- An asterisk, *, must be encoded as %2A.

name=*name*

This query parameter cannot be used if you specify a channel name in the resource URL.

Specifies a wildcard channel name to filter on.

The *name* specified must include an asterisk, *, as a wildcard. You can specify one of the following combinations:

Specifies that all channels are returned.

prefix*

Specifies that all channels with the specified prefix in the channel name are returned.

***suffix**

Specifies that all channels with the specified suffix in the channel name are returned.

prefix*suffix

Specifies that all channels with the specified prefix and the specified suffix in the channel name are returned.

type=*type*

Specifies the type of channel to return information about.

The value can be one of the following values:

all

Specifies that information about all channels is returned.

sender

Specifies that information about sender channels is returned.

receiver

Specifies that information about receiver channels is returned.

server

Specifies that information about server channels is returned.

requester

Specifies that information about requester channels is returned.

clusterSender

Specifies that information about cluster sender channels is returned.

clusterReceiver

Specifies that information about cluster receiver channels is returned.

The default value is all.

queueSharingGroupDisposition=*disposition*

 This parameter is only available on z/OS.

Specifies the disposition of the channels for which information is to be returned.

The value can be one of the following values:

live

Return channels defined with qmgr or copy disposition.

all

Return channels defined with qmgr, copy or group disposition.

copy

Return channels defined with copy disposition.

group

Return channels defined with `group` disposition.

private

Return channels defined with `copy` or `qmgr` disposition.

qmgr

Return channels defined with `qmgr` disposition.

The default value is `live`.

Request headers

The following headers must be sent with the request:

Authorization

This header must be sent if you are using basic authentication. For more information, see [Using HTTP basic authentication with the REST API](#).

V 9.0.5

The following headers can optionally be sent with the request:

ibm-mq-rest-gateway-qmgr

This header specifies the queue manager that is to be used as the gateway queue manager. The gateway queue manager is used to connect to a remote queue manager. For more information, see [Remote administration using the REST API](#).

Request body format

None.

Security requirements

The caller must be authenticated to the mqweb server and must be a member of one or more of the `MQWebAdmin`, `MQWebAdminRO`, or `MQWebUser` roles. For more information about security for the administrative REST API, see [IBM MQ Console and REST API security](#).

The security principal of the caller must be granted the ability to issue the following PCF commands for the specified queue manager:

- If the **status** query parameter is not specified:
 - For the channel that is specified by the *{channelName}* portion of the resource URL, or for channels that match the specified query parameters, authority to issue the **MQCMD_INQUIRE_CHANNEL** PCF command must be granted.
- If the **status** query parameter is specified:
 - For the channel that is specified by the *{channelName}* portion of the resource URL, or for channels that match the specified query parameters, authority to issue the **MQCMD_INQUIRE_CHANNEL** PCF command must be granted.
 - For the channel that is specified by the *{channelName}* portion of the resource URL, or for channels that match the specified query parameters, authority to issue the **MQCMD_INQUIRE_CHSTATUS** PCF command must be granted.

A principal has display authority if the principal can issue one or both of the **MQCMD_INQUIRE_CHANNEL** and **MQCMD_INQUIRE_CHSTATUS** PCF commands. If the principal has display authority for only some of the channels that are specified by the resource URL and query parameters, then the array of channels that is returned from the REST request is limited to those channels that the principal has authority to display. No information is returned about channels that cannot be displayed. If the principal does not have display authority for any of the channels that are specified by the resource URL and query parameters, an HTTP status code of 403 is returned.

Multi On Multiplatforms, if the attribute `currentStatus.monitoring.messagesAvailable` is to be returned, authority to issue the `MQCMD_INQUIRE_Q` on the transmission queues used by cluster sender channels is required.

ULW On UNIX, Linux, and Windows, you can grant authority to security principals to use IBM MQ resources by using the `mqsetaut` command. For more information, see [mqsetaut](#).

z/OS On z/OS, see [Setting up security on z/OS](#).

Response status codes

200

Channel information retrieved successfully.

400

Invalid data provided.

For example, invalid channel attributes specified.

401

Not authenticated.

The caller must be authenticated to the mqweb server and must be a member of one or more of the `MQWebAdmin`, `MQWebAdminRO`, or `MQWebUser` roles. For more information, see [“Security requirements” on page 1933](#).

403

Not authorized.

The caller is authenticated to the mqweb server and is associated with a valid principal. However, the principal does not have access to all, or a subset of the required IBM MQ resources. For more information about the access that is required, see [“Security requirements” on page 1933](#).

404

Channel does not exist.

500

Server issue or error code from IBM MQ.

503

Queue manager not running.

Response headers

The following headers are returned with the response:

Content-Type

This header is returned with a value of `application/json; charset=utf-8`.

Response body format

The response is in JSON format in UTF-8 encoding. The response contains an outer JSON object that contains a single JSON array called `channel`. Each element in the array is a JSON object that represents information about a channel. Each of these JSON objects contains the following attributes:

name

String.

Specifies the name of the channel.

This attribute is always returned.

type

String.

Specifies the type of channel.

The value is one of the following values:

- sender
- receiver
- server
- requester
- clusterSender
- clusterReceiver

This attribute is always returned.

The following objects can be included in the JSON object that represents information about a channel. Which objects and attributes are returned depends on the URL that was specified for the request:

sender

Contains attributes that are related to sender channels.

server

Contains attributes that are related to server channels.

requester

Contains attributes that are related to requester channels.

clusterSender

Contains attributes that are related to cluster sender channels.

clusterReceiver

Contains attributes that are related to cluster receiver channels.

clusterRouting

Contains attributes that are related to the routing of messages in a cluster.

connectionManagement

Contains attributes that are related to connection management including:

- A JSON array of connection objects that are labeled connectionManagement, which contain host and port information
- longRetry and shortRetry objects, containing count and interval attributes

compression

Contains attributes that are related to compression

dataCollection

Contains attributes that are related to monitoring and statistics

exits

Contains exit objects and arrays of exit objects, each containing:

- Exit name attribute
- User data attribute

extended

Contains attributes that are related to extended channel properties, such as data conversion, and sequence numbers.

failedDelivery

Contains attributes that are related to message delivery failure, such as retry options.

general

Contains attributes that are related to general channel properties, such as the description of the channel.

batch

Contains attributes that are related to message batches.

queueSharingGroup

Contains attributes that are related to queue sharing groups on z/OS.

receiverSecurity

Contains attributes that are related to security for receiving channels.

transmissionSecurity

Contains attributes that are related to transmission security and encryption.

For more information, see [“Response body attributes for channels” on page 1938](#).

If a damaged object is found, and the REST request did not specify a channel name within the resource URL, an extra JSON array that is called `damaged` is returned. This JSON array contains a list of the objects that are damaged, specifying the object names. If the REST request specifies a channel name within the resource URL, but the object is damaged, an error is returned.

If an error occurs, the response body contains an error message. For more information, see [REST API error handling](#).

Examples

- The following example lists all channels on the queue manager QM1. The following URL is used with the HTTP GET method:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/channel
```

The following JSON response is returned:

```
{
  "channel": [
    {
      "name": "RECEIVER.CHL",
      "type": "receiver"
    },
    {
      "name": "SENDER.CHL",
      "type": "sender",
      "sender": {
        "connection": [
          {
            "host": "example.com",
            "port": "1414"
          }
        ],
        "transmissionQueueName": "XMIT.Q"
      }
    },
    {
      "name": "SERVER.CHL",
      "type": "server",
      "server": {
        "transmissionQueueName": "XMIT.Q"
      }
    },
    {
      "name": "REQUESTER.CHL",
      "type": "requester",
      "requester": {
        "connection": [
          {
            "host": "example.com",
            "port": 1414
          }
        ]
      }
    },
    {
      "name": "CLUSSDR.CHL",
      "type": "clusterSender",
      "clusterSender": {
        "connection": [
          {
            "host": "example.com",
            "port": 1414
          }
        ],
        "clusterName": "CUSTER1"
      }
    },
    {
      "name": "CLUSRCVR.CHL",
      "type": "clusterReceiver",
      "clusterReceiver": {
        "connection": [
          {
            "host": "example.com",
            "port": 1414
          }
        ],
        "clusterName": "CUSTER1"
      }
    }
  ]
}
```

```
}
  {}]
}
```

- The following example lists all receiver channels on the queue manager QM1, showing their connection retry attempts information. The following URL is used with the HTTP GET method:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QMGR2/channel?
type=sender&attributes=connectionManagement.shortRetry,connectionManagement.longRetry
```

The following JSON response is returned:

```
{
  "channel":
  [{}
    {
      "name": "SENDER.CHL",
      "type": "sender",
      "connectionManagement": {
        "longRetry": {
          "count": 999999999,
          "interval": 1200
        },
        "shortRetry": {
          "count": 10,
          "interval": 60
        }
      },
      "sender": {
        "connection": [{
          "host": "example.com",
          "port": 1414
        }],
        "transmissionQueueName": "XMIT.Q"
      }
    },
    {
      "name": "SYSTEM.DEF.SENDER",
      "type": "sender",
      "connectionManagement": {
        "longRetry": {
          "count": 999999999,
          "interval": 1200
        },
        "shortRetry": {
          "count": 10,
          "interval": 60
        }
      },
      "sender": {
        "connection": [],
        "transmissionQueueName": ""
      }
    }
  ],
  {}
}
```

- The following example lists some status attributes for the channel CHL1, on channel manager QM1. The following URL is used with the HTTP GET method:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/channel/CHL1?
status=currentStatus.timestamps,currentStatus.batch.currentMessages,savedStatus.batch.currentM
essages
```

The following JSON response is returned:

```
{
  "channel":
  [{}
    {
      "name": "CHL1",
      "type": "sender",
      "currentStatus": [{
        "inDoubt": false,
        "state": "running",
        "batch": {
          "currentMessages": 10
        }
      }],
      "timestamps": {
        "lastMessage": "2017-10-02T09:17:42.314Z",
        "started": "1993-12-31T23:59:59.000Z"
      }
    },
    {}
  ],
  "savedStatus": [{}
    {}
  ]
}
```

```

        "inDoubt": false,
        "batch": {
            "currentMessages": 5
        },
        {
            "inDoubt": false,
            "batch": {
                "currentMessages": 7
            }
        }
    ]
}

```

- The following example shows how to get all information, including current status and saved status, for the channel CHL2 on queue manager QM1. The following URL is used with the HTTP GET method:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/channel/CHL2?attributes=* & status=*
```

- The following example shows how to get all channel configuration and status information for channels that are currently running, for the queue manager QM1. The following URL is used with the HTTP GET method:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/channel?
attributes=* & status=* & filter=currentStatus.state:equalTo:running
```

V 9.0.4 *Response body attributes for channels*

When you receive the response body from using the HTTP verb GET with the channel object to request information about channels, attributes for the channels are returned within named JSON objects.

The following objects are available:

- [“sender” on page 1939](#)
- [“server” on page 1939](#)
- [“requester” on page 1939](#)
- [“clusterSender” on page 1940](#)
- [“clusterReceiver” on page 1940](#)
- [“clusterRouting” on page 1941](#)
- [“connectionManagement” on page 1941](#)
- [“compression” on page 1943](#)
- [“dataCollection” on page 1943](#)
- [“exits” on page 1944](#)
- [“extended” on page 1945](#)
- [“failedDelivery” on page 1946](#)
- [“general” on page 1946](#)
- [“batch” on page 1947](#)
- [“queueSharingGroup” on page 1947](#)
- [“receiverSecurity” on page 1948](#)
- [“transmissionSecurity” on page 1948](#)
- [“currentStatus” on page 1949](#)
- [“savedStatus” on page 1958](#)

For more information about the PCF equivalents to the queue REST API parameters and attributes, see [REST API and PCF equivalents for channels](#).

Note: The REST API supports only channels that have TCP as their transport type, and are of type sender, receiver, server, requester, cluster-sender, or cluster-receiver. Other channels are not returned.

sender

The `sender` object contains information about sender channels and is returned only for sender channels:

connection

An array of JSON objects that can contain the following attributes that define the channel connection:

host

String.

Specifies the host that this channel connects to.

port

Integer.

Specifies the port that this channel uses on this host.

This attribute cannot be used to filter results.

These attributes are always returned if they are available. If no connection information is available, an empty array is returned. If the connection does not conform to the expected syntax, an array containing a single host attribute having the value of the entire connection is returned.

transmissionQueueName

String.

Specifies the name of the transmission queue in use by this channel.

This attribute is always returned.

server

The `server` object contains information about server channels and is returned only for server channels:

connection

An array of JSON objects that can contain the following attributes that define the channel connection:

host

String.

Specifies the host that this channel connects to.

port

Integer.

Specifies the port that this channel uses on this host.

This attribute cannot be used to filter results.

These attributes are always returned if they are available. If no connection information is available, an empty array is returned. If the connection does not conform to the expected syntax, an array containing a single host attribute having the value of the entire connection is returned.

transmissionQueueName

String.

Specifies the name of the transmission queue in use by this channel.

This attribute is always returned.

requester

The `requester` object contains information about requester channels and is returned only for requester channels:

connection

An array of JSON objects that can contain the following attributes that define the channel connection:

host

String.

Specifies the host that this channel connects to.

port

Integer.

Specifies the port that this channel uses on this host.

This attribute cannot be used to filter results.

If no connection information is available, an empty array is returned.

If the connection does not conform to the expected syntax, an array containing a single host attribute having the value of the entire connection is returned.

clusterSender

The `clusterSender` object contains information about cluster sender channels and is returned only for cluster sender channels:

connection

An array of JSON objects that can contain the following attributes that define the channel connections:

host

String.

Specifies the host that this channel connects to.

port

Integer.

Specifies the port that this channel uses on this host.

This attribute cannot be used to filter results.

These attributes are always returned if they are not empty. If no connection information is available, an empty array is returned.

If the connection does not conform to the expected syntax, an array containing a single host attribute having the value of the entire connection is returned.

clusterName

String.

Specifies the name of the cluster to which the channel belongs.

This attribute is always returned if it is not empty.

clusterNameList

String.

Specifies a list of clusters to which the channel belongs.

This attribute is always returned if it is not empty.

clusterReceiver

The `clusterReceiver` object contains information about cluster receiver channels and is returned only for cluster receiver channels:

connection

An array of JSON objects that can contain the following attributes that define the channel connections:

host

String.

Specifies the host that this channel connects to.

port

Integer.

Specifies the port that this channel uses on this host.

This attribute cannot be used to filter results.

These attributes are always returned if they are not empty. If no connection information is available, an empty array is returned.

If the connection does not conform to the expected syntax, an array containing a single host attribute having the value of the entire connection is returned.

clusterName

String.

Specifies the name of the cluster to which the channel belongs.

This attribute is always returned if it is not empty.

clusterNameList

String.

Specifies a list of clusters to which the channel belongs.

This attribute is always returned if it is not empty.

clusterRouting

The `clusterRouting` object contains information about routing within clusters and is returned only for cluster receiver and cluster sender channels:

workloadPriority

Integer.

Specifies the channel priority for cluster workload distribution.

A value of 0 specifies the lowest priority and a value of 9 specifies the highest priority.

workloadRank

Integer.

Specifies the channel rank for cluster workload distribution.

A value of 0 specifies the lowest rank and a value of 9 specifies the highest rank.

workloadWeight

Integer.

Specifies channel weighting for cluster workload distribution.

A value of 1 specifies the lowest weight and a value of 99 specifies the highest weight.

networkPriority

Integer.

Specifies priority for the network connection. If there are multiple paths available, distributed queuing selects the path with the highest priority.

A value of 0 specifies the lowest priority and a value of 9 specifies the highest priority.

connectionManagement

The `connectionManagement` object contains information about connection management:

heartbeatInterval

Integer.

Specifies the time, in seconds, between heartbeat flows that are passed from the sending MCA when there are no messages on the transmission queue. This interval gives the receiving MCA the opportunity to quiesce the channel.

disconnectInterval

Integer.

Specifies the maximum number of seconds that the channel waits for messages to be put on a transmission queue before the channel ends.

A value of zero causes the message channel agent to wait indefinitely.

keepAliveInterval

Integer.

Specifies the value that is passed to the communications stack for KeepAlive timing for the channel.

localAddress

An array of JSON objects that can contain the following attributes that define the local communications address of the channel:

host

String.

Specifies the local IP address or host name.

This value is returned if the local address in the channel definition contains a host name or IP address.

port

Integer.

Specifies the local port number.

This value is returned if the local address in the channel definition contains a port number.

This attribute cannot be used to filter results.

portRange

JSON object that contains a range of local ports:

low

Integer.

Specifies the start of the port range.

high

Integer.

Specifies the end of the port range.

Returned if a port range is specified in the local address in the channel definition.

This attribute cannot be used to filter results.

If no local address information is available, an empty array is returned.

If the local address does not conform to the expected syntax, an array containing a single host attribute having the value of the entire local address is returned.

shortRetry

JSON object.

Specifies the maximum number and interval of attempts that are made to establish a connection to the remote machine before the `longRetry.count` and `longRetry.interval` are used:

count

Integer.

Specifies the maximum number of attempts to connect to the remote machine.

interval

Integer.

Specifies the interval in seconds between attempts to connect to the remote machine.

longRetry

JSON object.

Specifies the maximum number of attempts and interval of attempts that are made to establish a connection to the remote machine after the count by `shortRetry.count` is exhausted:

count

Integer.

Specifies the maximum number of attempts to connect to the remote machine.

interval

Integer.

Specifies the interval in seconds between attempts to connect to the remote machine.

compression

The `compression` object contains attributes that are related to data compression:

header

String array.

Specifies the header data compression techniques that are supported by the channel. The values that are returned are in order of preference.

The value is one of the following values:

none

Specifies that no header data compression is performed.

system

Specifies that header data compression is performed.

message

String array.

Specifies the message data compression techniques that are supported by the channel. The values that are returned are in order of preference.

The value is one of the following values:

none

Specifies that no header data compression is performed.

runLengthEncoding

Specifies that message data compression is performed by using run-length encoding.

zlibFast

Specifies that message data compression is performed by using ZLIB encoding with speed prioritized.

zlibHigh

Specifies that message data compression is performed by using ZLIB encoding with compression prioritized.

any

Specifies that any compression technique that is supported by the queue manager can be used.

This value is only valid for channels of type receiver and requester.

dataCollection

The `dataCollection` object contains attributes that are related to data collection, monitoring, and statistics:

monitoring

String.

Specifies whether online monitoring data is collected, and if so, the rate at which the data is collected.

The value is one of the following values:

off

Specifies that online monitoring data is not collected for the channel.

asQmgr

Specifies that the queue inherits the value from the queue manager `MONCHL MQSC` parameter.

low

Specifies that online monitoring data is collected for the channel if the `MONCHL MQSC` parameter on the queue manager is not set to none. The rate of data collection is low.

medium

Specifies that online monitoring data is collected for the channel if the MONCHL MQSC parameter on the queue manager is not set to none. The rate of data collection is moderate.

high

Specifies that online monitoring data is collected for the channel if the MONCHL MQSC parameter on the queue manager is not set to none. The rate of data collection is high.

statistics

String.

Specifies whether statistics data is collected for the channel.

The value is one of the following values:

off

Specifies that statistics data is not collected for the channel.

asQmgr

Specifies that the channel inherits the value from the queue manager STATCHL MQSC parameter.

low

Specifies that statistics data is collected for the channel if the STATCHL MQSC parameter on the channel manager is not set to none. The rate of data collection is low.

medium

Specifies that statistics data is collected for the channel if the STATCHL MQSC parameter on the channel manager is not set to none. The rate of data collection is moderate.

high

Specifies that statistics data is collected for the channel if the STATCHL MQSC parameter on the channel manager is not set to none. The rate of data collection is high.

exits

The `exits` object contains information about channel exits:

message

An array of JSON objects that contain the following attributes that define the channel message exits:

name

String.

Specifies the message exit name.

userData

String.

Specifies the user data that is passed to the message exit.

messageRetry

A JSON object that contains the following attributes that define the channel message retry exit:

name

String.

Specifies the message retry exit name.

userData

String.

Specifies the user data that is passed to the message retry exit.

receive

An array of JSON objects that contain the following attributes that define the channel receive exits:

name

String.

Specifies the receive exit name.

userData

String.

Specifies the user data that is passed to the receive exit.

security

A JSON object that contains the following attributes that define the channel security exit:

name

String.

Specifies the security exit name.

userData

String.

Specifies the user data that is passed to the security exit.

send

An array of JSON objects that contain the following attributes that define the channel send exits:

name

String.

Specifies the send exit name.

userData

String.

Specifies the user data that is passed to the send exit.

extended

The extended object contains attributes that are related to extended channel properties, such as data conversion and sequence number settings:

channelAgentType

String.

Specifies the type of the message channel agent program.

The value is one of the following values:

process**thread****messagePropertyControl**

String.

Specifies what happens to message properties when the message is about to be sent to a V6 or earlier queue manager, which does not understand the concept of a property descriptor.

The value is one of the following values:

compatible

If the message contains a property with a prefix of mcd., jms., usr. or mqext., all message properties are delivered to the application in an MQRFH2 header. Otherwise, all properties of the message, except those properties that are contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

none

All properties of the message, except those properties in the message descriptor (or extension), are removed from the message before the message is sent to the remote queue manager.

all

All properties of the message are included with the message when it is sent to the remote queue manager. The properties, except those properties in the message descriptor (or extension), are placed in one or more MQRFH2 headers in the message data.

senderDataConversion

Boolean.

Specifies whether the sender must convert application data.

sequenceNumberWrap

Integer.

Specifies the maximum message sequence number.

When the maximum is reached, sequence numbers wrap to start again at 1.

resetSequenceNumber

Integer.

Specifies the pending reset sequence number.

A nonzero value indicates that a reset channel request is outstanding. The value is in the range 1 - 999999999.

failedDelivery

The `failedDelivery` object contains attributes that are related to channel behavior when delivery of a message fails:

retry

JSON object.

Specifies the maximum number of attempts and the interval of attempts that are made to establish a connection to the remote machine before the `longRetry.count` and `longRetry.interval` are used:

count

Integer.

Specifies the maximum number of attempts to redeliver the message.

interval

Integer.

Specifies the interval, in milliseconds, between attempts to redeliver the message.

This attribute is only returned for channels of type receiver, requester, and clusterReceiver.

useDeadLetterQueue

Boolean.

Specifies whether the dead-letter queue is used when messages cannot be delivered by channels:

false

Specifies that messages that cannot be delivered by a channel are treated as a failure. The channel either discards the message, or the channel ends, in accordance with the `nonPersistentMessageSpeedFast` setting.

true

Specifies that when the DEADQ attribute of a queue manager provides the name of a dead-letter queue, then the dead letter queue is used. Otherwise, the behavior is as for `false`.

general

The `general` object contains attributes that are related to more generic channel properties, such as description:

description

String.

Specifies the description of the channel.

maximumMessageLength

Integer.

Specifies the maximum message length that can be transmitted on the channel. This value is compared with the value for the remote channel, and the actual maximum is the lower of the two values.

batch

The `batch` object contains attributes that are related to batches of messages that are sent through the channel:

preCommitHeartbeat

Integer.

Specifies whether batch heartbeats are used.

The value is the length of the heartbeat in milliseconds.

timeExtend

Integer.

Specifies the approximate time, in milliseconds, that a channel keeps a batch open if fewer than `batch.messageLimit` messages have been transmitted in the current batch.

dataLimit

Integer.

Specifies the limit, in KB, of the amount of data that can be sent through a channel before a sync point is taken.

messageLimit

Integer.

Specifies the maximum number of messages that can be sent through a channel before a sync point is taken.

nonPersistentMessageSpeedFast

Boolean.

Specifies whether fast speed is used to send nonpersistent messages.

Fast speed means that nonpersistent messages on a channel need not wait for a syncpoint before the messages are made available for retrieval.

queueSharingGroup

The `queueSharingGroup` object contains attributes that are related to queue sharing groups on z/OS:

disposition

String.

 This attribute is only available on z/OS.

Specifies the disposition of the channel. That is, where it is defined and how it behaves.

This value is always returned if the queue manager is a member of the queue sharing group.

The value is one of the following values:

qmgr

Specifies that the channel definition exists on the page set of the queue manager that runs the command.

group

Specifies that the channel definition exists in the shared repository.

copy

Specifies that the channel definition exists on the page set of the queue manager that runs the command, copying its definition from the channel of the same name defined in the shared repository.

This attribute cannot be used to filter results.

defaultChannelDisposition

String.

 This attribute is only available on z/OS.

Specifies the intended disposition of a channel when it is activated or started.

The value is one of the following values:

private

Specifies that the intended use of the object is as a private channel.

fixShared

Specifies that the intended use of the object is as a fixshared channel.

shared

Specifies that the intended use of the object is as a shared channel.

receiverSecurity

The `receiverSecurity` object contains attributes that are related to security for receiving channels:

channelAgentUserId

String.

Specifies the user identifier that is to be used by the message channel agent for authorization to access IBM MQ resources, including authorization to put the message to the destination queue for receiver or requester channels.

If the value is blank, the message channel agent uses its default user identifier.

putAuthority

String.

Specifies which user identifiers are used to establish authority to put messages to the destination queue.

The value is one of the following values:

default

Specifies that the default user identifier is used.

context

Specifies that the user ID from the `UserIdentifier` field of the message descriptor is used.

alternateOrChannelAgent

Specifies that the user ID from the `UserIdentifier` field of the message descriptor is used.

 This value is only supported on z/OS.

onlyChannelAgent

Specifies that the user ID derived from `MCAUSER` is used.

transmissionSecurity

The `transmissionSecurity` object contains attributes that are related to security for message transmission:

certificateLabel

String.

Specifies which personal certificate in the key repository is sent to the remote peer.

If this attribute is blank, the certificate is determined by the queue manager **CERTLABL** parameter.

cipherSpecification

String.

Specifies the name of the `CipherSpec` for the channel to use.

requirePartnerCertificate

Boolean.

Specifies whether IBM MQ requires a certificate from the TLS client.

certificatePeerName

String.

Specifies the filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel. A Distinguished Name is the identifier of the TLS certificate.

currentStatus

The `currentStatus` object contains attributes that are related to current status information:

inDoubt

Boolean.

Specifies whether the channel is in doubt.

A sending channel is in doubt only while the sending message channel agent is waiting for an acknowledgment that a batch of sent messages has been successfully received.

state

String.

Specifies the current status of the channel.

The value is one of the following values:

binding

Specifies that the channel is negotiating with the partner.

starting

Specifies that the channel is waiting to become active.

running

Specifies that the channel is transferring or waiting for messages.

paused

Specifies that the channel is paused.

stopping

Specifies that the channel is in process of stopping.

retrying

Specifies that the channel is reattempting to establish connection.

stopped

Specifies that the channel is stopped.

requesting

Specifies that the requester channel is requesting connection.

switching

Specifies that the channel is switching transmission queues.

initializing

Specifies that the channel is initializing.

agent

A JSON object that contains attributes that are related to the message channel agent:

jobName

String.

Specifies the name of the MCA job.

running

Boolean.

Specifies whether the MCA is running or not.

state

String.

Specifies the current action being performed by the MCA.

The value is one of the following values:

runningChannelAutoDefinitionExit

Specifies that the MCA is running a channel auto-definition exit.

compressingData

Specifies that the MCA is compressing or decompressing data.

processingEndOfBatch

Specifies that the MCA is performing end of batch processing.

performingSecurityHandshake

Specifies that the MCA is performing TLS handshaking.

heartbeating

Specifies that the MCA is heartbeating with a partner.

executingMQGET

Specifies that the MCA is performing an MQGET.

executingMQI

Specifies that the MCA is executing an IBM MQ API call, other than an MQPUT or MQGET.

executingMQPUT

Specifies that the MCA is performing an MQPUT.

runningRetryExit

Specifies that the MCA is running a retry exit.

runningMessageExit

Specifies that the MCA is running a message exit.

communicatingWithNameServer

Specifies that the MCA is processing a name server request.

connectingToNetwork

Specifies that the MCA is connecting to the network.

undefined

Specifies that the MCA is in an undefined state.

runningReceiveExit

Specifies that the MCA is running a receive exit.

receivingFromNetwork

Specifies that the MCA is receiving from the network.

resynchingWithPartner

Specifies that the MCA is resynching with a partner.

runningSecurityExit

Specifies that the MCA is running a security exit.

runningSendExit

Specifies that the MCA is running a send exit.

sendingToNetwork

Specifies that the MCA is performing a network send.

serializingAccessToQmgr

Specifies that the MCA is serialized on queue manager access.

userId

Specifies the user ID that is in use by the MCA.

This attribute is only applicable to receiver, requester, and cluster receiver channels.

batch

JSON Object containing attributes that are related to batches of messages:

count

Integer.

Specifies the number of completed batches.

currentMessages

Integer.

Specifies the number of messages that are sent or received in the current batch.

When a sending channel becomes in-doubt, it specifies the number of the messages that are in-doubt.

The number is reset to 0 when the batch is committed.

luwid

JSON object that contains attributes that are related to logical units of work:

current

Hex string.

Specifies the logical unit of work identifier that is associated with the current batch.

For a sending channel, when the channel is in-doubt it is the LUWID of the in-doubt batch.

last

String. This identifier is represented as 2 hexadecimal digits for each byte.

Specifies the logical unit of work identifier that is associated with the last committed batch.

nonPersistentMessageSpeedFast

Boolean.

Specifies whether non-persistent messages are to be sent at fast speed.

sequenceNumber

JSON object that contains attributes that are related to sequence numbers:

current

Integer.

Specifies the message sequence number of the last message sent or received.

When a sending channel becomes in-doubt, it is the message sequence number of the last message in the in-doubt batch.

last

Integer.

Specifies the sequence number of last message in last committed batch.

size

Integer.

Specifies the negotiated batch size.

compression

JSON Object that contains attributes that are related to data compression:

header

JSON object that contains attributes that are related to header data compression:

default

String.

Specifies the default header data compression value that is negotiated for this channel.

The value is one of the following values:

none

Specifies that no header data compression is performed.

system

Specifies that header data compression is performed.

lastMessage

String.

Specifies the header data compression value that was used for the last message sent.

The value is one of the following values:

none

Specifies that no header data compression was performed.

system

Specifies that header data compression was performed.

unavailable

Specifies that no message was sent.

message

JSON object that contains attributes that are related to message data compression:

default

String.

Specifies the default message data compression value that was negotiated for this channel.

The value is one of the following values:

none

Specifies that no message data compression is performed.

runLengthEncoding

Specifies that message data compression is performed by using run-length encoding.

zlibFast

Specifies that message data compression is performed by using ZLIB encoding with speed prioritized.

zlibHigh

Specifies that message data compression is performed by using ZLIB encoding with compression prioritized.

lastMessage

String.

Specifies the message data compression value that was used for the last message sent.

The value is one of the following values:

none

Specifies that no message data compression was performed.

runLengthEncoding

Specifies that message data compression was performed by using run-length encoding.

zlibFast

Specifies that message data compression was performed by using ZLIB encoding with speed prioritized.

zlibHigh

Specifies that message data compression was performed by using ZLIB encoding with compression prioritized.

unavailable

Specifies that no message was sent.

connectionManagement

JSON Object that contains attributes that are related to connection management:

heartbeatInterval

Integer.

Specifies the heartbeat interval in seconds.

keepAliveInterval

Integer.

Specifies the value that is passed to the communications stack for KeepAlive timing for the channel.

 This parameter is only available on the z/OS

localAddress

An array of JSON objects that can contain the following attributes that define the local communications address of the channel:

host

String.

Specifies the IP address or host name that is used for local communications.

port

Integer.

Specifies the port number that is used for local communications.

This attribute cannot be used to filter results.

If no local address information is available, an empty array is returned.

remainingRetries

JSON object that contains attributes that are related to connection retry attempts:

long

Integer.

Specifies the number of long retry attempts remaining.

last

Integer.

Specifies the number of short retry attempts remaining.

This object is applicable only to sender, server, and cluster-sender channels.

extended

JSON object that contains attributes that are related to extended channel status properties:

buffers

JSON object that contains the following attributes that are related to buffers:

received

Integer.

Specifies the number of buffers received.

sent

Integer.

Specifies the number of buffers sent.

bytes

JSON object that contains the following attributes that are related to data transmission:

received

Integer.

Specifies the number of bytes received.

sent

Integer.

Specifies the number of bytes sent.

messageCount

Integer.

Specifies the total number of messages that are sent or received, or the number of MQI calls handled.

general

JSON Object containing more generic attributes that are related to channels:

heartbeatInterval

Integer.

Specifies the heartbeat interval in seconds.

keepAliveInterval

Integer.

Specifies the value that is passed to the communications stack for KeepAlive timing for the channel.

 This parameter is only available on the z/OS

connection

An array of JSON objects that can contain the following attributes that define the remote communications address of the channel:

host

String.

Specifies the remote IP address or host name.

port

Integer.

Specifies the remote port number.

This attribute cannot be used to filter results.

If no connection information is available, an empty array is returned.

If the connection does not conform to the expected syntax, an array containing a single host attribute having the value of the entire connection is returned.

maximumMessageLength

Integer.

Specifies the maximum length of a message.

statistics

String.

Specifies the rate at which statistics data is collected for the channel.

The value is one of the following values:

off

Specifies that no data is collected.

low

Specifies a low rate of data collection.

medium

Specifies a medium rate of data collection.

high

Specifies a high rate of data collection.

stopRequested

Boolean.

Specifies whether a stop request from the user has been received.

transmissionQueueName

String.

Specifies the name of the transmission queue in use by the channel.

monitoring

JSON object that contains more generic attributes that are related to channel monitoring:

messagesInBatch

JSON object that contains information about the number of messages in a batch:

shortSamplePeriod

Specifies the number of messages in a batch, based on recent activity over a short period.

longSamplePeriod

Specifies the number of messages in a batch, based on activity over a long period.

rate

String.

Specifies the rate at which monitoring data is collected for the channel.

The value is one of the following values:

off

Specifies that no data is collected.

low

Specifies a low rate of data collection.

medium

Specifies a medium rate of data collection.

high

Specifies a high rate of data collection.

compressionRate

JSON object that contains information about data compression rates:

shortSamplePeriod

Specifies the compression rate as a percentage, based on recent activity over a short period.

If no measurement is available, a value of -1 is returned.

longSamplePeriod

Specifies the compression rate as a percentage, based on activity over a long period.

If no measurement is available, a value of -1 is returned.

compressionTime

JSON object that contains information about data compression rates:

shortSamplePeriod

Specifies the compression speed as the time in microseconds spent compressing or decompressing each message, based on recent activity over a short period.

If no measurement is available, a value of -1 is returned.

longSamplePeriod

Specifies the compression speed as the time in microseconds spent compressing or decompressing each message, based on activity over a long period.

If no measurement is available, a value of -1 is returned.

exitTime

JSON object that contains information about exit processing speed:

shortSamplePeriod

Specifies the exit processing speed as the time in microseconds spent processing user exits for each message, based on recent activity over a short period.

If no measurement is available, a value of -1 is returned.

longSamplePeriod

Specifies the exit processing speed as the time in microseconds spent processing user exits for each message, based on activity over a long period.

If no measurement is available, a value of -1 is returned.

messagesAvailable

Integer.

Specifies the number of messages currently queued on the transmission queue and available for MQGETs.

networkTime

JSON object that contains information about network performance:

shortSamplePeriod

Specifies the time, in microseconds, to send a request to the remote end of the channel and receive a response, based on recent activity over a short period.

If no measurement is available, a value of -1 is returned.

longSamplePeriod

Specifies the time, in microseconds, to send a request to the remote end of the channel and receive a response, based on activity over a long period.

If no measurement is available, a value of -1 is returned.

transmissionQueueTime

JSON object that contains information about transmission queue delay:

shortSamplePeriod

Specifies the time, in microseconds, that messages remain on the transmission queue before being retrieved, based on recent activity over a short period.

If no measurement is available, a value of -1 is returned.

longSamplePeriod

Specifies the time, in microseconds, that messages remain on the transmission queue before being retrieved, based on activity over a long period.

If no measurement is available, a value of -1 is returned.

This attribute is only applicable to sender, server, and cluster sender channels.

partner

JSON Object that contains attributes that are related to the remote end queue manager:

productIdentifier

String.

Specifies the product identifier for the IBM MQ version that is running at the remote end of the channel.

The value is one of the following values:

MQMM

Queue Manager (non z/OS Platform)

MQMV

Queue Manager on z/OS

MQCC

IBM MQ C client

MQNM

IBM MQ .NET fully managed client

MQJB

IBM MQ Classes for Java

MQJM

IBM MQ Classes for JMS (normal mode)

MQJN

IBM MQ Classes for JMS (migration mode)

MQJU

Common Java interface to the MQI

MQXC

XMS client C/C++ (normal mode)

MQXD

XMS client C/C++ (migration mode)

MQXN

XMS client .NET (normal mode)

MQXM

XMS client .NET (migration mode)

MQXU

IBM MQ .NET XMS client (unmanaged/XA)

MQNU

IBM MQ .NET unmanaged client

qmgrName

String.

Specifies the name of the remote queue manager or queue sharing group.

version

String.

Specifies the version of IBM MQ running at the remote end of the channel, in the form V.R.M.F.

maximumMessageLength

Integer.

Specifies the maximum length of a message.

queueSharingGroup

JSON Object that contains attributes that are related to the queue sharing group this channel belongs to:

channelDisposition

String.

 This attribute is only available on z/OS.

Specifies the disposition of the channel. That is, where it is defined and how it behaves.

The value is one of the following values:

qmgr

Specifies that the channel definition exists on the page set of the queue manager that runs the command.

group

Specifies that the channel definition exists in the shared repository.

copy

Specifies that the channel definition exists on the page set of the queue manager that runs the command, copying its definition from the channel of the same name defined in the shared repository.

timestamps

JSON object that contains attributes that are related to date and time information:

started

String.

Specifies the date and time at which the channel was started.

For more information about the time stamp format that is used to return the date and time, see [REST API time stamps](#).

lastMessage

String.

Specifies the date and time at which the last message was sent over the channel.

For more information about the time stamp format that is used to return the date and time, see [REST API time stamps](#).

transmissionSecurity

JSON object that contains attributes that are related to transmission security:

certificateIssuerName

String.

Specifies the full Distinguished Name of the issuer of the remote certificate.

certificateUserId

String.

Specifies the local user ID that is associated with the remote certificate.

keyLastReset

String.

Specifies the date and time of the last successful TLS secret key reset.

For more information about the time stamp format that is used to return the date and time, see [REST API time stamps](#).

keyResetCount

String.

Specifies the number of successful TLS secret key resets since the channel started.

protocol

String.

 This parameter is only available on the IBM MQ Appliance, UNIX, Linux, and Windows.

Specifies the security protocol currently in use.

The value is one of the following values:

none

Specifies that no security protocol is in use.

sslV30

Specifies that SSL version 3.0 is in use.

tlsV10

Specifies that TLS version 1.0 is in use.

tlsV12

Specifies that TLS version 1.2 is in use.

shortPeerName

String.

Specifies the Distinguished Name of the peer queue manager or client at the other end of the channel.

savedStatus

The savedStatus object contains attributes that are related to saved status information:

inDoubt

Boolean.

Specifies whether the channel was in doubt.

A sending channel is only in doubt while the sending message channel agent is waiting for an acknowledgment that a batch of messages, which it has sent, has been successfully received.

batch

JSON Object that contains attributes that are related to batches of messages:

currentMessages

Integer.

Specifies the number of messages that are sent or received in the current batch or, if the channel was in-doubt, the number of messages that were in-doubt.

In the context of saved status, this number is only meaningful if the channel was in-doubt, but this value is returned regardless.

luwid

JSON object that contains attributes that are related to logical units of work:

current

String. This identifier is represented as 2 hexadecimal digits for each byte.

Specifies the logical unit of work identifier that is associated with the current batch.

For a sending channel, if the channel was in-doubt, it specifies the LUWID of the in-doubt batch.

In the context of saved status, this number is only meaningful if the channel was in-doubt, but this value is returned regardless.

last

Hex string.

Specifies the logical unit of work identifier that is associated with the last committed batch.

sequenceNumber

JSON object that contains attributes that are related to sequence numbers:

current

Integer.

Specifies the message sequence number of the last message that is sent or received.

When a sending channel is in-doubt, it specifies the sequence number of the last message in the in-doubt batch.

last

Integer.

Specifies the sequence number of the last message in the last committed batch.

general

JSON Object that contains more generic attributes that are related to channels:

connection

An array of JSON objects that can contain the following attributes that define the remote communications address of the channel:

host

String.

Specifies the remote IP address or host name.

port

Integer.

Specifies the remote port number.

This attribute cannot be used to filter results.

If no connection information is available, an empty array is returned.

If the connection does not conform to the expected syntax, an array containing a single host attribute having the value of the entire connection is returned.

transmissionQueueName

String.

Specifies the name of the transmission queue in use by the channel.

queueSharingGroup

JSON Object that contains attributes that are related to the queue sharing group this channel belonged to:

channelDisposition

String.

 This attribute is only available on z/OS.

Specifies the disposition of the channel. That is, where it was defined and how it behaved.

The value is one of the following values:

qmgr

Specifies that the channel definition existed on the page set of the queue manager that runs the command.

group

Specifies that the channel definition existed in the shared repository.

copy

Specifies that the channel definition existed on the page set of the queue manager that runs the command, copying its definition from the channel of the same name defined in the shared repository.

V 9.0.2

/admin/qmgr/{qmgrName}/queue

You can use the HTTP GET method with the queue resource to request information about queues. You can use the HTTP POST method to create queues, the PATCH method to modify queues, and the DELETE method to delete queues.

V 9.0.4

You can use the administrative REST API gateway with this resource URL.

For more information about the PCF equivalents to the queue REST API parameters and attributes, see [REST API and PCF equivalents for queues](#).

V 9.0.2

POST

Use the HTTP POST method with the queue resource to create a queue on a specified queue manager.

This REST API command is similar to the [Create Queue](#) PCF command, and the [DEFINE queues](#) MQSC commands.

- [Resource URL](#)
- [Optional query parameters](#)
- [“Request headers” on page 1962](#)
- [Request body format](#)
- [“Security requirements” on page 1964](#)
- [Response status codes](#)
- [“Response headers” on page 1964](#)
- [Response body format](#)
- [Examples](#)

Resource URL

V 9.0.4

IBM MQ 9.0.4 and later:

```
https://host:port/ibmmq/rest/v1/admin/qmgr/{qmgrName}/queue
```

IBM MQ 9.0.3 and earlier:

```
https://host:port/ibmmq/rest/v1/qmgr/{qmgrName}/queue
```

qmgrName

Specifies the name of the queue manager on which to create the queue.

V 9.0.4

You can specify a remote queue manager as the **qmgrName**. If you specify a remote queue manager, you must configure a gateway queue manager. For more information, see [Remote administration using the REST API](#).

The queue manager name is case-sensitive.

If the queue manager name includes a forward slash, a period, or a percent sign, these characters must be URL encoded:

- A forward slash (/) must be encoded as %2F.
- A percent sign (%) must be encoded as %25.

V 9.0.1 You can use HTTP instead of HTTPS if you enable HTTP connections. For more information about enabling HTTP, see [Configuring HTTP and HTTPS ports](#).

Optional query parameters

commandScope=scope

z/OS This parameter is only available on z/OS.

Specifies how the command is run when the queue manager is a member of a queue-sharing group. You cannot specify this parameter if the queue manager is not a member of a queue-sharing group. *scope* can be one of the following values:

The name of a queue manager

Specifies that the command is run on the queue manager that is named. The queue manager must be active within the same queue sharing group as the queue manager that is specified in the resource URL.

You cannot specify the queue manager name that is the queue manager that is specified in the resource URL.

If the queue manager name includes a percent sign, %, this character must be URL encoded as %25.

Specifies that the command is run on the local queue manager and also passed to every active queue manager in the queue sharing group.

If this option is used, an `ibm-mq-qmgrs` response header is returned with a comma-separated list of the queue managers that generated a response. For example, the header might look like the following header:

```
ibm-mq-qmgrs: MQ21, MQ22
```

like=qName

Specifies an existing queue definition to copy.

z/OS On z/OS, the way that a queue is copied depends on the value that is specified for the **disposition** parameter in the request body:

- If copy is specified, the **like** parameter is ignored. The queue to copy is a queue with the name that is specified by the **name** parameter in the request body and with a disposition of `group`.
- If copy is not specified, the queue to copy is a queue with the name that is specified by the **like** parameter and a disposition of `qmgr`, `copy`, or `shared`.

noReplace

Specifies that the queue is not replaced if it exists. If this flag is not specified, the queue is replaced. If a queue is replaced, any messages that are on the existing queue are retained.

The queue is not replaced in the following scenarios:

- The queue is a local queue. **allowedSharedInput** is changed to `false`, and more than one application has the local queue open for input.
- The queue is a local queue. The value of **isTransmissionQueue** is changed, and one or more applications has the local queue open, or if one or more messages are on the queue.

- The queue is a remote queue. The value of **transmissionQueueName** is changed, and an application has a remote queue open that would be affected by this change.
- The queue is a remote queue. The value of **queueName**, **qmgrName**, or **transmissionQueueName** is changed, and one or more applications has a queue open that resolved through this definition as a queue manager alias.

Request headers

The following headers must be sent with the request:

Content-Type

This header must be sent with a value of `application/json; charset=utf-8`.

ibm-mq-rest-csrf-token

This header must be sent with a value that is the content of the `csrfToken` cookie. The content of the `csrfToken` cookie is used to confirm that the credentials that are being used to authenticate the request are being used by the owner of the credentials. That is, the token is used to prevent cross-site request forgery attacks.

The `csrfToken` cookie is returned after a request is made with an HTTP GET method. You cannot use a cached version of the content of the cookie because the content of the cookie can change. You must use the latest value of the cookie for each request.

V 9.0.5 The preceding information applies to releases up to and including IBM MQ 9.0.4. From IBM MQ 9.0.5, this header must be set, but the value can be anything, including being blank.

The `csrfToken` cookie is no longer sent in responses from the REST API in IBM MQ 9.0.5 and later.

Authorization

This header must be sent if you are using basic authentication. For more information, see [Using HTTP basic authentication with the REST API](#).

V 9.0.4 The following headers can optionally be sent with the request:

ibm-mq-rest-gateway-qmgr

This header specifies the queue manager that is to be used as the gateway queue manager. The gateway queue manager is used to connect to a remote queue manager. For more information, see [Remote administration using the REST API](#).

Request body format

The request body must be in JSON format in UTF-8 encoding. Within the request body attributes are defined, and named JSON objects are created to specify extra attributes. Any attributes that are not specified use the default value. These default values are as specified for the `SYSTEM.DEFAULT` queues on the queue manager. For example, a local queue inherits the values that are defined in `SYSTEM.DEFAULT.LOCAL.QUEUE`.

For example, the following JSON contains some attributes, and then the named JSON objects, `events` and `storage`. These named JSON objects define the extra attributes to create a local queue with queue depth high events enabled, and a maximum queue depth of 1000:

```
{
  "name": "queue1",
  "type": "local",
  "events": {
    "depth": {
      "highEnabled": true,
      "highPercentage": 75
    }
  },
  "storage": {
    "maximumDepth": 1000
  }
}
```

For more examples, see [examples](#).

The following attributes can be included in the request body:

name

Required.

String.

Specifies the name of the queue to create.

type

String.

Specifies the type of queue.

The value can be one of the following values:

- local
- alias
- model
- remote

The default value is local.

The following objects can be included in the request body to specify extra attributes:

remote

Contains attributes that are related to remote queues. The attributes in this object are supported only for remote queues.

alias

Contains attributes that are related to alias queues. The attributes in this object are supported only for alias queues.

model

Contains attributes that are related to model queues. The attributes in this object are supported only for model queues.

cluster

Contains attributes that are related to clusters.

trigger

Contains attributes that are related to triggering.

events

Contains two objects, one for queue depth and one for queue service interval events. Each object contains attributes that are related to the event type.

applicationDefaults

Contains attributes that are related to default behavior such as message persistence, message priority, shared input settings, and read ahead settings.

queueSharingGroup

Contains attributes that are related to queue sharing groups on z/OS.

dataCollection

Contains attributes that are related to data collection, monitoring, and statistics.

storage

Contains attributes that are related to message storage, such as the maximum depth of the queue, and the maximum length of messages that are allowed on the queue.

general

Contains attributes that are related to general queue properties, such as whether get or put operations are inhibited, the description of the queue, and transmission queue settings.

extended

Contains attributes that are related to extended queue properties, such as backout queue settings, and shared input settings.

For more information, see [“Request body attributes for queues” on page 1967](#).

Security requirements

The caller must be authenticated to the mqweb server and must be a member of one or more of the MQWebAdmin, MQWebAdminRO, or MQWebUser roles. For more information about security for the administrative REST API, see [IBM MQ Console and REST API security](#).

The security principal of the caller must be granted the ability to issue the following PCF commands for the specified queue manager:

- If the **like** optional query parameter is not specified:
 - For the queue that is specified by the **name** attribute in the request body, authority to issue the **MQCMD_CREATE_Q** PCF command must be granted.
 - For the relevant SYSTEM.DEFAULT.*.QUEUE, authority to issue the **MQCMD_INQUIRE_Q** PCF command must be granted.
- If the **like** optional query parameter is specified:
 - For the queue that is specified by the **name** attribute in the request body, authority to issue the **MQCMD_COPY_Q** PCF command must be granted.
 - For the queue that is specified by the **like** optional query parameter, authority to issue the **MQCMD_INQUIRE_Q** PCF command must be granted.

 On UNIX, Linux, and Windows, you can grant authority to security principals to use IBM MQ resources by using the **mqsetaut** command. For more information, see [mqsetaut](#).

 On z/OS, see [Setting up security on z/OS](#).

Response status codes

201

Queue created successfully.

400

Invalid data provided.

For example, invalid queue data is specified.

401

Not authenticated.

The caller must be authenticated to the mqweb server and must be a member of one or more of the MQWebAdmin, MQWebAdminRO, or MQWebUser roles. The `ibm-mq-rest-csrf-token` header must also be specified. For more information, see [“Security requirements” on page 1964](#).

403

Not authorized.

The caller is authenticated to the mqweb server and is associated with a valid principal. However, the principal does not have access to all, or a subset of the required IBM MQ resources. For more information about the access that is required, see [“Security requirements” on page 1964](#).

500

Server issue or error code from IBM MQ.

503

Queue manager not running.

Response headers

The following headers are returned with the response:

location

If the request was successful, this header specifies the URL for the new queue.

If the optional query parameter `commandScope=*` is used, the URL that is returned is the URL for the local copy of the queue. If the optional query parameter `commandScope=qmgrName` is used, the URL that is returned is a partial URL that does not include information about the host and port.

z/OS **ibm-mq-qmgrs**

On z/OS, if the optional query parameter `commandScope=*` is used, this header is returned with a comma-separated list of the queue managers that generated a response. For example, the header might look like the following header:

```
ibm-mq-qmgrs: MQ21, MQ22
```

If an error occurs before the command is issued to the queue managers, the response header does not contain the list of queue managers. For example, a request that generates a 200 or 201 status code has the header because the command was successful. A request that generates a 401 (not authenticated) status code does not have the header because the request was rejected. A request that generates a 403 (not authorized) status code has the header because individual queue managers decide whether the command is authorized.

V 9.0.4 **ibm-mq-rest-gateway-qmgr**

This header is returned if a remote queue manager is specified in the resource URL. The value of this header is the name of the queue manager that is used as the gateway queue manager.

Response body format

The response body is empty if the queue is created successfully. If an error occurs, the response body contains an error message. For more information, see [REST API error handling](#).

Examples

- The following example creates a local queue called `localQueue`. The following URL is used with the HTTP POST method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/queue/
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr/QM1/queue/
```

The following JSON payload is sent:

```
{
  "name": "localQueue"
}
```

- The following example creates a remote queue called `remoteQueue`. The following URL is used with the HTTP POST method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/queue/
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr/QM1/queue/
```

The following JSON payload is sent:

```
{
  "name": "remoteQueue",
  "type": "remote",
  "remote": {
```

```
    "queueName": "localQueue",
    "qmgrName": "QM2"
  }
}
```

- The following example creates an alias queue called `aliasQueue`. The following URL is used with the HTTP POST method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/queue/
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr/QM1/queue/
```

The following JSON payload is sent:

```
{
  "name": "aliasQueue",
  "type": "alias",
  "alias": {
    "targetName": "localQueue"
  }
}
```

- The following example creates a model queue called `modelQueue`. The following URL is used with the HTTP POST method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/queue/
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr/QM1/queue/
```

The following JSON payload is sent:

```
{
  "name": "modelQueue",
  "type": "model",
  "model": {
    "type": "permanentDynamic"
  }
}
```

- The following example creates a clustered remote queue that is called `remoteQueue1`. The following URL is used with the HTTP POST method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/queue/
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr/QM1/queue/
```

The following JSON payload is sent:

```
{
  "name": "remoteQueue1",
  "type": "remote",
  "remote": {
    "queueName": "aLocalQueue1",
    "qmgrName": "QM2",
    "transmissionQueueName": "MY.XMITQ"
  },
  "general": {

```

```

      "description" : "My clustered remote queue"
    },
    "cluster" : {
      "name": "Cluster1",
      "workloadPriority": 9
    }
  }
}

```

- The following example creates a clustered remote queue, `remoteQueue2`, based on another queue, `remoteQueue1`. All the attributes from `remoteQueue1` are used, except for the queue name and the remote queue name. The following URL is used with the HTTP POST method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/queue/?like=remoteQueue1
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr/QM1/queue/?like=remoteQueue1
```

The following JSON payload is sent:

```

{
  "name": "remoteQueue2",
  "type": "remote",
  "remote": {
    "queueName": "aLocalQueue2"
  }
}

```

V 9.0.2 *Request body attributes for queues*

When you create the request body for creating or modifying a queue with the administrative REST API, you can specify attributes for the queue within named JSON objects. A number of objects and attributes are available.

The following objects are available:

- [“remote” on page 1967](#)
- [“alias” on page 1968](#)
- [“model” on page 1969](#)
- [“cluster” on page 1969](#)
- [“trigger” on page 1970](#)
- [“events” on page 1971](#)
- [“applicationDefaults” on page 1972](#)
- [“queueSharingGroup” on page 1974](#)
- [“dataCollection” on page 1976](#)
- [“storage” on page 1976](#)
- [“general” on page 1978](#)
- [“extended” on page 1978](#)

For more information about the PCF equivalents to the queue REST API parameters and attributes, see [REST API and PCF equivalents for queues](#).

remote

Note: The `remote` object and the `qmgrName` attribute are required when you create a remote queue by using the HTTP POST method. You cannot use the `remote` object unless you are creating a remote queue, or updating a remote queue.

The `remote` object can contain the following attributes that relate to remote queues:

queueName

String.

Specifies the name of the queue as it is known on the remote queue manager.

If this attribute is omitted, a queue manager alias or reply-to queue alias is created.

qmgrName

String.

Specifies the name of the remote queue manager.

Required when you create a queue by using the HTTP POST method, unless you use the **like** optional query parameter.

If this remote queue is used as a queue manager alias, this attribute is the name of the queue manager. The value can be the name of the queue manager in the resource URL.

If this remote queue is used as a reply-to queue alias, this attribute is the name of the queue manager that is to be the reply-to queue manager.

transmissionQueueName

String.

Specifies the name of the transmission queue that is to be used for messages that are destined for either a remote queue or for a queue manager alias definition.

This attribute is ignored in the following cases:

- The remote queue is used as a queue manager alias and **qmgrName** attribute is the name of the queue manager in the resource URL.
- The remote queue is used as a reply-to queue alias.

If this attribute is omitted, a local queue with the name that is specified by the **qmgrName** attribute must exist. This queue is used as the transmission queue.

alias

Note: The **alias** object and the **targetName** attribute are required when you create an alias queue by using the HTTP POST method. You cannot use the **alias** object unless you are creating an alias queue, or updating an alias queue.

The **alias** object can contain the following attributes that relate to alias queues:

targetName

String.

Specifies the name of the queue or topic that the alias resolves to.

Required when you create a queue by using the HTTP POST method, unless you use the **like** optional query parameter.

targetType

String.

Specifies the type of object that the alias resolves to.

The value must be one of the following values:

queue

Specifies that the object is a queue.

topic

Specifies that the object is a topic.

The default value is queue.

model

Note: The `model` object and the `type` attribute are required when you create a model queue by using the HTTP POST method. You cannot use the `model` object unless you are creating a model queue, or updating a model queue.

The `model` object can contain the following attributes that relate to model queues:

type

String.

Specifies the model queue definition type.

The value must be one of the following values:

permanentDynamic

Specifies that the queue is a dynamically defined permanent queue.

sharedDynamic

 This attribute is only available on z/OS.

Specifies that the queue is a dynamically defined shared queue.

temporaryDynamic

Specifies that the queue is a dynamically defined temporary queue.

The default value is `temporaryDynamic`.

cluster

The `cluster` object can contain the following attributes that relate to clusters:

name

String.

Specifies the name of the cluster that the queue belongs to.

Specify either the **name** or **namelist** cluster attributes. You cannot specify both attributes.

namelist

String.

Specifies the namelist that lists the clusters that the queue belongs to.

Specify either the **name** or **namelist** cluster attributes. You cannot specify both attributes.

transmissionQueueForChannelName

String.

Specifies the generic name of the cluster-sender channels that use the queue as a transmission queue. The attribute specifies which cluster-sender channels send messages to a cluster-receiver channel from the cluster transmission queue.

You can also set this attribute to a cluster-sender channel manually. Messages that are destined for the queue manager that is connected by the cluster-sender channel are stored in the transmission queue that identifies the cluster-sender channel. The messages are not stored in the default cluster transmission queue.

If you set the **transmissionQueueForChannelName** attribute to blanks, the channel switches to the default cluster transmission queue when the channel restarts. The default cluster transmission queue is `SYSTEM.CLUSTER.TRANSMIT.QUEUE` if the queue manager **DefClusterXmitQueueType** attribute is set to `SCTQ`. A specific cluster transmission queue, `SYSTEM.CLUSTER.TRANSMIT.ChannelName`, is used for each cluster-sender channel if the queue manager **DefClusterXmitQueueType** attribute is set to `CHANNEL`.

By specifying asterisks, `*`, in **transmissionQueueForChannelName**, you can associate a transmission queue with a set of cluster-send channels. The asterisks can be at the beginning, end, or any number of places in the channel name string.

workloadPriority

Integer.

Specifies the priority of the queue in cluster workload management.

The value must be in the range 0 - 9, where 0 is the lowest priority and 9 is the highest.

workloadRank

Integer.

Specifies the rank of the queue in cluster workload management.

The value must be in the range 0 - 9, where 0 is the lowest priority and 9 is the highest.

workloadQueueUse

String.

Specifies whether remote and local instances of the clustered queues are to be used in cluster workload distribution.

The value must be one of the following values:

asQmgr

Use the value that is defined on the queue manager.

any

Use remote and local instances of the queues.

local

Use only local instances of the queues.

trigger

The `trigger` object can contain the following attributes that relate to triggering:

data

String.

Specifies the user data that is included in the trigger message. This data is made available to the monitoring application that processes the initiation queue and to the application that is started by the monitor.

depth

Integer.

Specifies the number of messages that initiates a trigger message to the initiation queue.

The value must be in the range 1 - 999,999,999.

This attribute is required when **type** is set to `depth`.

enabled

Boolean.

Specifies whether trigger messages are written to the initiation queue.

If the value is set to `true`, trigger messages are written to the initiation queue.

initiationQueueName

String.

Specifies the local queue for trigger messages that relate to the queue. The queues must be on the same queue manager.

messagePriority

Integer.

Specifies the minimum priority that a message must have before it can cause, or be counted for, a trigger event.

The value must be in the range 0 - 9.

processName

String.

Specifies the local name of the IBM MQ process that identifies the application to be started when a trigger event occurs.

If the queue is a transmission queue, the process definition contains the name of the channel to be started.

type

String.

Specifies the condition that initiates a trigger event. When the condition is true, a trigger message is sent to the initiation queue.

The value must be one of the following values:

none

Send no trigger messages.

every

Send a trigger message for every message that arrives on the queue.

first

Send a trigger message when the queue depth goes from 0 to 1.

depth

Send a trigger message when the queue depth exceeds the value of the **depth** attribute.

events

The events object can contain the following objects and attributes that relate to queue depth and queue service interval events:

depth

JSON object.

A JSON object that can contain the following attributes that related to queue depth events:

fullEnabled

Boolean.

Specifies whether queue full events are generated.

A queue full event indicates that no more messages can be put on a queue because the queue is full. That is, the queue depth reached the maximum queue depth, as specified by the **maximumDepth** attribute in the `storage` object.

If the value is set to `true`, queue full events are enabled.

highEnabled

Boolean.

Specifies whether queue depth high events are generated.

A queue depth high event indicates that the number of messages on the queue is greater than or equal to the queue depth high limit, **highPercentage**.

If the value is set to `true`, queue depth high events are enabled.

highPercentage

Integer.

Specifies the threshold against which the queue depth is compared to generate a queue depth high event.

This value is expressed as a percentage of the maximum queue depth, as specified by the **maximumDepth** attribute in the `storage` object. The value must be a value in the range 0 - 100.

lowEnabled

Boolean.

Specifies whether queue depth low events are generated.

A queue depth low event indicates that the number of messages on the queue is less than or equal to the queue depth low limit, **lowPercentage**.

If the value is set to `true`, queue depth low events are enabled.

lowPercentage

Integer.

Specifies the threshold against which the queue depth is compared to generate a queue depth low event.

This value is expressed as a percentage of the maximum queue depth, as specified by the **maximumDepth** attribute in the storage object. The value must be a value in the range 0 - 100.

serviceInterval

JSON object.

A JSON object that can contain the following attributes that are related to queue service interval events:

duration

Integer.

Specifies the service interval duration that is used for comparison to generate queue service interval high and queue service interval OK events.

The value must be a value in the range 0 - 999,999,999 milliseconds.

highEnabled

Boolean.

Specifies whether queue service interval high events are generated.

A queue service interval high event is generated when a check indicates that no messages were put to, or retrieved from, the queue for at least the amount of time specified by the **duration** attribute.

If the value is set to `true`, queue service interval high events are enabled.

If you set the **highEnabled** attribute to `false`, you must also specify a value for the **okEnabled** attribute. You cannot set both the **highEnabled** attribute and the **okEnabled** attribute to `true` at the same time.

okEnabled

Boolean.

Specifies whether queue service interval OK events are generated.

A queue service interval OK event is generated when a check indicates that a message was retrieved from the queue within the amount of time that is specified by the **duration** attribute.

If the value is set to `true`, queue service interval OK events are enabled.

If you set the **okEnabled** attribute to `false`, you must also specify a value for **highEnabled**. You cannot set both the **highEnabled** attribute and the **okEnabled** attribute to `true` at the same time.

applicationDefaults

The `applicationDefaults` object can contain the following attributes that relate to default behavior such as message persistence:

clusterBind

String.

Specifies the binding to be used when `MQ00_BIND_AS_Q_DEF` is specified on the `MQOPEN` call.

The value must be one of the following values:

onOpen

Specifies that the binding is fixed by the `MQOPEN` call.

notFixed

Specifies that the binding is not fixed.

onGroup

Specifies that the application can request that a group of messages is allocated to the same destination instance.

messagePersistence

String.

Specifies the default for message persistence on the queue. Message persistence determines whether messages are preserved across restarts of the queue manager.

The value must be one of the following values:

persistent

Specifies that the messages on the queue are persistent, and are preserved when the queue manager restarts.

nonPersistent

Specifies that the messages on the queue are not persistent, and are lost when the queue manager restarts.

messagePriority

Integer.

Specifies the default priority of messages that are put on the queue.

The value must be in the range 0 - 9, where 0 represents the lowest priority, and 9 represents the highest priority.

messagePropertyControl

String.

Specifies how message properties are handled when messages are retrieved from queues when MQGMO_PROPERTIES_AS_Q_DEF is specified on the MQGET call.

This attribute is applicable to local, alias, and model queues.

The value must be one of the following values:

all

Specifies that all properties of the message are included when the message is sent to the remote queue manager. The properties, except those properties in the message descriptor or extension, are placed in one or more MQRFH2 headers in the message data.

compatible

Specifies that if the message contains a property with the prefix mcd., jms., usr., or mqext., all message properties are delivered to the application in an MQRFH2 header. Otherwise, all properties, except those properties in the message descriptor or extension, are discarded and are no longer accessible.

force

Specifies that properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle. A valid message handle that is included in the MsgHandle field of the MQGMO structure on the MQGET call is ignored. Properties of the message are not accessible by using the message handle.

none

Specifies that all properties of the message are removed from the message before the message is sent to the remote queue manager. Properties in the message descriptor, or extension, are not removed.

version6Compatible

Any application MQRFH2 header is received as it was sent. Any properties set by using MQSETMP must be retrieved by using MQINQMP. They are not added to the MQRFH2 created by the application. Properties that were set in the MQRFH2 header by the sending application cannot be retrieved by using MQINQMP.

putResponse

String.

Specifies the type of response that is to be used for put operations to the queue when an application specifies MQPMO_RESPONSE_AS_Q_DEF.

The value must be one of the following values:

synchronous

The put operation is run synchronously, returning a response.

asynchronous

The put operation is run asynchronously, returning a subset of MQMD fields.

readAhead

String.

Specifies the default read-ahead behavior for non-persistent messages that are delivered to the client.

The value must be one of the following values:

no

Specifies that non-persistent messages are not read ahead unless the client application is configured to request read ahead.

yes

Specifies that non-persistent messages are sent ahead to the client before an application requests them. Non-persistent messages can be lost if the client ends abnormally or if the client does not consume all the messages that it is sent.

disabled

Specifies that non-persistent messages are not read ahead, regardless of whether read ahead is requested by the client application.

sharedInput

Boolean.

Specifies the default share option for applications that open this queue for input.

If the value is set to true, queues are enabled to get messages with shared access.

queueSharingGroup

 The queueSharingGroup object can contain the following attributes that relate to queue sharing groups:

disposition

String.

 This attribute is only available on z/OS.

Specifies where the queue is defined and how it behaves. That is, it specifies the disposition of the queue.

The value must be one of the following values:

copy

Specifies that the queue definition exists on the page set of the queue manager that runs the command. The group object of the same name as the **name** attribute is used to create the queue.

For local queues, messages are stored on the page sets of each queue manager and are available only through that queue manager.

group

Specifies that the queue definition exists in the shared repository.

This value is allowed only in a shared queue manager environment.

If the creation is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group. The command attempts to make or refresh local copies on page set zero:

```
DEFINE queue(q-name) REPLACE QSGDISP(COPY)
```

The creation of the group object takes effect even if the generated command with QSGDISP(COPY) fails.

qmgr

Specifies that the queue definition exists on the page set of the queue manager that runs the command.

For local queues, messages are stored on the page sets of each queue manager and are available only through that queue manager.

shared

This value is only valid for local queues.

Specifies that the queue exists in the shared repository.

Messages are stored in the coupling facility and are available to any queue manager in the queue sharing group. You can specify shared only if the following things are true:

- The value of **structureName** is not blank.
- The value of **indexType** is not messageToken.
- The queue is not SYSTEM.CHANNEL.INITQ or SYSTEM.COMMAND.INPUT.

The default value is qmgr.

structureName

String.

 This attribute is only available on z/OS.

Specifies the name of the coupling facility structure where you want to store messages when you used shared queues.

The value cannot have more than 12 characters, it must start with an uppercase letter (A - Z), and can include only the characters A - Z and 0 - 9.

The name of the queue sharing group to which the queue manager is connected is prefixed to the name you supply. The name of the queue sharing group is always 4 characters, padded with the at sign, @, if necessary. For example, if you use a queue sharing group that is named NY03 and you supply the name PRODUCT7, the resultant coupling facility structure name is NY03PRODUCT7. Note the administrative structure for the queue sharing group (in this case NY03CSQ_ADMIN) cannot be used for storing messages.

For local and model queues, the following rules apply. The rules apply if you create a queue without specifying the **noReplace** optional query parameter, or if you change the queue:

- On a local queue with a **disposition** value of shared, **structureName** cannot change. If you need to change the **structureName** or the **disposition**, you must delete and redefine the queue. To preserve any of the messages on the queue, you must offload the messages before you delete the queue. Reload the messages after you redefine the queue, or move the messages to another queue.
- On a model queue with a **definitionType** value of sharedDynamic, the **structureName** cannot be blank.

For local and model queues, when you create a queue with the **noReplace** optional query parameter, the following rules apply:

- On a local queue with a **disposition** value of shared, or a model queue with a **definitionType** value of sharedDynamic, the **structureName** cannot be blank.

dataCollection

The `dataCollection` object can contain the following attributes that relate to the collection of data, monitoring, and statistics:

accounting

String.

Specifies whether accounting data is collected for the queue.

The value must be one of the following values:

asQmgr

Specifies that the queue inherits the value from the queue manager MQSC parameter ACCTQ.

off

Specifies that accounting data is not collected for the queue.

on

Specifies that accounting data is collected for the queue if the ACCTQ MQSC parameter on the queue manager is not set to none.

monitoring

String.

Specifies whether online monitoring data is to be collected, and if so, the rate at which the data is collected.

The value must be one of the following values:

off

Specifies that online monitoring data is not collected for the queue.

asQmgr

Specifies that the queue inherits the value from the queue manager MQSC parameter MONQ.

low

Specifies that online monitoring data is collected for the queue if the MONQ MQSC parameter on the queue manager is not set to none. The rate of data collection is low.

medium

Specifies that online monitoring data is collected for the queue if the MONQ MQSC parameter on the queue manager is not set to none. The rate of data collection is moderate.

high

Specifies that online monitoring data is collected for the queue if the MONQ MQSC parameter on the queue manager is not set to none. The rate of data collection is high.

statistics

 This attribute is only available on the IBM MQ Appliance, UNIX, Linux, and

Windows.

String.

Specifies whether statistics data is to be collected for the queue.

The value must be one of the following values:

asQmgr

Specifies that the queue inherits the value from the queue manager STATQ MQSC parameter.

off

Specifies that statistics data is not collected for the queue.

on

Specifies that statistics data is collected for the queue if the STATQ MQSC parameter on the queue manager is not set to none.

storage

The `storage` object can contain the following attributes that relate to message storage:

indexType

This attribute is only available on z/OS.

String.

Specifies the type of index that is maintained by the queue manager to expedite MQGET operations on the queue. For shared queues, the type of index determines what type of MQGET calls can be used.

The value must be one of the following values:

none

Specifies that there is no index. Messages are retrieved sequentially.

correlationId

Specifies that the queue is indexed by using correlation identifiers.

groupId

Specifies that the queue is indexed by using group identifiers.

messageId

Specifies that the queue is indexed by using message identifiers.

messageToken

Specifies that the queue is indexed by using message tokens.

The default value is none.

maximumDepth

Integer.

Specifies the maximum number of messages that are allowed on the queue.

The value must be in the range 0 - 999,999,999.

maximumMessageLength

Integer.

Specifies the maximum message length that is allowed for messages on the queue.

Do not set a value that is greater than the **maximumMessageLength** attribute for the queue manager.

The value must be in the range 0 - 104,857,600 bytes.

messageDeliverySequence

String.

Specifies whether messages are delivered in priority order or by sequence.

The value must be one of the following values:

priority

Specifies that messages are returned in priority order.

fifo

Specifies that messages are returned in first in, first out order.

nonPersistentMessageClass

This attribute is only available on the IBM MQ Appliance, UNIX, Linux, and Windows.

String.

This attribute is valid only on local and model queues.

Specifies the level of reliability to be assigned to non-persistent messages that are put to the queue.

The value must be one of the following values:

normal

Specifies that non-persistent messages persist for the lifetime of the queue manager session. They are discarded if the queue manager restarts.

high

Specifies that the queue manager attempts to retain non-persistent messages for the lifetime of the queue. Non-persistent messages might still be lost if a failure occurs.

storageClass

This attribute is only available on z/OS.

String.

Specifies the name of the storage class.

general

The `general` object can contain the following attributes that relate to general queue properties:

description

String.

Specifies a description for the queue.

The characters in the description field are converted from UTF-8 into the CCSID of the queue manager. Ensure that you use only the characters that can be converted. Certain characters must be escaped:

- Double quotation marks, `"`, must be escaped as `\ "`
- A backslash, `\`, must be escaped as `\\`
- A forward slash, `/`, must be escaped as `\/`

inhibitGet

Boolean.

Specifies whether `get` operations are allowed on the queue.

If the value is set to `true`, `get` operations are not allowed on the queue.

inhibitPut

Boolean.

Specifies whether `put` operations are allowed on the queue.

If the value is set to `true`, `put` operations are not allowed on the queue.

isTransmissionQueue

String.

Specifies whether the queue is for normal usage or for transmitting messages to a remote queue manager.

If the value is set to `true`, the queue is a transmission queue for transmitting messages to a remote queue manager.

The `isTransmissionQueue` attribute must not normally be changed while messages are on the queue. The format of messages changes when they are put on a transmission queue.

extended

The `extended` object can contain the following attributes that relate to extended queue properties:

allowSharedInput

Boolean.

Specifies whether multiple instances of applications can open the queue for input.

If the value is set to `true`, multiple instances of applications can open the queue for input.

backoutRequeueQueueName

String.

Specifies the name of the queue to which a message is transferred if it is backed out more times than the value of **backoutThreshold**.

The backout queue does not need to exist when the queue is created, but it must exist when the **backoutThreshold** value is exceeded.

backoutThreshold

Integer.

Specifies the number of times that a message can be backed out before it is transferred to the backout queue that is specified by the **backoutRequeueQueueName** attribute.

If the **backoutThreshold** value is later reduced, messages that are already on the queue that were backed out at least as many times as the new value remain on the queue. Those messages are transferred if they are backed out again.

The value must be a value in the range 0 - 999,999,999.

custom

String.

Specifies custom attributes for new features.

This attribute contains the values of attributes, as pairs of attribute name and value, which are separated by at least one space. The attribute name-value pairs have the form NAME (VALUE) . Single quotation marks, ' , must be escaped with another single quotation mark.

V 9.0.4

enableMediaImageOperations

ULW

MQ Appliance

This attribute is available only on the IBM MQ Appliance, UNIX, Linux, and Windows.

Specifies whether a local or permanent dynamic queue object is recoverable from a media image, if linear logging is being used.

String.

The value must be one of the following values:

yes

Specifies that this queue object is recoverable.

no

The `rcdmqimg` and `rcrmqobj` commands are not permitted for these objects. If automatic media images are enabled, the media images are not written for these objects.

asQmgr

Specifies that the queue inherits the value from the queue manager `ImageRecoverQueue` attribute.

This is the default value for this attribute.

hardenGetBackout

z/OS

This attribute is only available on z/OS.

Boolean.

Specifies whether the count of the number of times that a message was backed out is saved, to ensure that it is accurate across restarts of the queue manager.

If the value is set to `true`, the backout count is always accurate across restarts of the queue manager.

supportDistributionLists

ULW

MQ Appliance

This attribute is only available on the IBM MQ Appliance, UNIX, Linux, and Windows.

Boolean.

Specifies whether distribution-list messages can be placed on the queue.

If the value is set to `true`, distribution lists can be placed on the queue.

V 9.0.2

PATCH

Use the HTTP PATCH method with the queue resource to modify a queue on a specified queue manager.

This REST API command is similar to the **Change Queue** PCF command, and the **ALTER queues** MQSC commands.

- [Resource URL](#)
- [Optional query parameters](#)

- [Response body format](#)
- [Examples](#)

Resource URL

V 9.0.4 IBM MQ 9.0.4 and later:

`https://host:port/ibmmq/rest/v1/admin/qmgr/{qmgrName}/queue/{queueName}`

IBM MQ 9.0.3 and earlier:

`https://host:port/ibmmq/rest/v1/qmgr/{qmgrName}/queue/{queueName}`

qmgrName

Specifies the name of the queue manager on which the queue to modify exists.

The queue manager name is case sensitive.

If the queue manager name includes a forward slash, a period, or a percent sign, these characters must be URL encoded:

- A forward slash (/) must be encoded as %2F.
- A period (.) must be encoded as %2E.
- A percent sign (%) must be encoded as %25.

queueName

Specifies the name of the queue to modify.

V 9.0.4 You can specify a remote queue manager as the **qmgrName**. If you specify a remote queue manager, you must configure a gateway queue manager. For more information, see [Remote administration using the REST API](#).

The queue manager name is case-sensitive.

If the queue manager name includes a forward slash, a period, or a percent sign, these characters must be URL encoded:

- A forward slash (/) must be encoded as %2F.
- A percent sign (%) must be encoded as %25.

V 9.0.1 You can use HTTP instead of HTTPS if you enable HTTP connections. For more information about enabling HTTP, see [Configuring HTTP and HTTPS ports](#).

Optional query parameters

commandScope=scope

z/OS This parameter is only available on z/OS.

Specifies how the command is run when the queue manager is a member of a queue-sharing group.

You cannot specify this parameter if the queue manager is not a member of a queue-sharing group.

scope can be one of the following values:

The name of a queue manager

Specifies that the command is run on the queue manager that is named. The queue manager must be active within the same queue sharing group as the queue manager that is specified in the resource URL.

You cannot specify the queue manager name that is the queue manager that is specified in the resource URL.

If the queue manager name includes a percent sign, %, this character must be URL encoded as %25.

Specifies that the command is run on the local queue manager and also passed to every active queue manager in the queue sharing group.

If this option is used, an `ibm-mq-qmgrs` response header is returned with a comma-separated list of the queue managers that generated a response. For example, the header might look like the following header:

```
ibm-mq-qmgrs: MQ21, MQ22
```

force

Specifies that the command is forced to complete, regardless of whether completing affects an open queue.

This parameter is not valid for model queues.

An open queue is affected in the following cases:

- The queue is an alias queue. The **targetName** is modified, and an application has the alias queue open.
- The queue is a local queue. The **allowedSharedInput** attribute is modified, and more than one application has the queue open for input.
- The queue is a local queue. The **isTransmissionQueue** attribute is modified, and messages are on the queue, or applications have the queue open.
- The queue is a remote queue. The **transmissionQueueName** attribute is modified, and an application has a remote queue open that would be affected by this change.
- The queue is remote queue. The **queueName**, **qmgrName**, or **transmissionQueueName** attributes are modified, and one or more applications has a queue open that resolved through this definition as a queue manager alias.

Request headers

The following headers must be sent with the request:

Content-Type

This header must be sent with a value of `application/json; charset=utf-8`.

ibm-mq-rest-csrf-token

This header must be sent with a value that is the content of the `csrfToken` cookie. The content of the `csrfToken` cookie is used to confirm that the credentials that are being used to authenticate the request are being used by the owner of the credentials. That is, the token is used to prevent cross-site request forgery attacks.

The `csrfToken` cookie is returned after a request is made with an HTTP GET method. You cannot use a cached version of the content of the cookie because the content of the cookie can change. You must use the latest value of the cookie for each request.

V 9.0.5 The preceding information applies to releases up to and including IBM MQ 9.0.4. From IBM MQ 9.0.5, this header must be set, but the value can be anything, including being blank.

The `csrfToken` cookie is no longer sent in responses from the REST API in IBM MQ 9.0.5 and later.

Authorization

This header must be sent if you are using basic authentication. For more information, see [Using HTTP basic authentication with the REST API](#).

V 9.0.4

The following headers can optionally be sent with the request:

ibm-mq-rest-gateway-qmgr

This header specifies the queue manager that is to be used as the gateway queue manager. The gateway queue manager is used to connect to a remote queue manager. For more information, see [Remote administration using the REST API](#).

Request body format

The request body must be in JSON format in UTF-8 encoding. Within the request body attributes are specified, and named JSON objects are created to specify extra attributes to modify. Any attributes that are not specified are not changed.

For example, the following JSON contains the attribute **type**, and then the named JSON objects, **events** and **storage**. The named JSON objects define the additional attributes to modify the queue to disable queue depth high events, and change the maximum queue depth to 2000:

```
{
  "type": "local",
  "events" : {
    "serviceInterval" : {
      "highEnabled" : false,
      "okEnabled" : false
    }
  },
  "storage" : {
    "maximumDepth" : 2000
  }
}
```

For more examples, see [examples](#).

The following attributes can be included in the request body:

type

String.

Specifies the type of queue.

The value can be one of the following values:

- local
- alias
- model
- remote

The default value is local.

The following objects can be included in the request body to specify extra attributes:

remote

Contains attributes that are related to remote queues. The attributes in this object are supported only for remote queues.

alias

Contains attributes that are related to alias queues. The attributes in this object are supported only for alias queues.

model

Contains attributes that are related to model queues. The attributes in this object are supported only for model queues.

cluster

Contains attributes that are related to clusters.

trigger

Contains attributes that are related to triggering.

events

Contains two objects, one for queue depth and one for queue service interval events. Each object contains attributes that are related to the event type.

applicationDefaults

Contains attributes that are related to default behavior such as message persistence, message priority, shared input settings, and read ahead settings.

queueSharingGroup

Contains attributes that are related to queue sharing groups on z/OS.

dataCollection

Contains attributes that are related to data collection, monitoring, and statistics.

storage

Contains attributes that are related to message storage, such as the maximum depth of the queue, and the maximum length of messages that are allowed on the queue.

general

Contains attributes that are related to general queue properties, such as whether get or put operations are inhibited, the description of the queue, and transmission queue settings.

extended

Contains attributes that are related to extended queue properties, such as backout queue settings, and shared input settings.

For more information, see [“Request body attributes for queues” on page 1967](#).

Security requirements

The caller must be authenticated to the mqweb server and must be a member of one or more of the MQWebAdmin, MQWebAdminRO, or MQWebUser roles. For more information about security for the administrative REST API, see [IBM MQ Console and REST API security](#).

The security principal of the caller must be granted the ability to issue the following PCF commands for the specified queue manager:

- For the queue that is specified by the *{queueName}* portion of the resource URL, authority to issue the **MQCMD_CHANGE_Q** PCF command must be granted.

 On UNIX, Linux, and Windows, you can grant authority to security principals to use IBM MQ resources by using the **mqsetaut** command. For more information, see [mqsetaut](#).

 On z/OS, see [Setting up security on z/OS](#).

Response status codes**204**

Queue modified successfully.

400

Invalid data provided.

For example, invalid queue data is specified.

401

Not authenticated.

The caller must be authenticated to the mqweb server and must be a member of one or more of the MQWebAdmin, MQWebAdminRO, or MQWebUser roles. The `ibm-mq-rest-csrf-token` header must also be specified.. For more information, see [“Security requirements” on page 1983](#).

403

Not authorized.

The caller is authenticated to the mqweb server and is associated with a valid principal. However, the principal does not have access to all, or a subset of the required IBM MQ resources. For more information about the access that is required, see [“Security requirements” on page 1983](#).

404

Queue does not exist.

500

Server issue or error code from IBM MQ.

503

Queue manager not running.

Response headers

The following headers are returned with the response:

ibm-mq-qmgrs

On z/OS, if the optional query parameter `commandScope=*` is used, this header is returned with a comma-separated list of the queue managers that generated a response. For example, the header might look like the following header:

```
ibm-mq-qmgrs: MQ21, MQ22
```

If an error occurs before the command is issued to the queue managers, the response header does not contain the list of queue managers. For example, a request that generates a 200 or 201 status code has the header because the command was successful. A request that generates a 401 (not authenticated) status code does not have the header because the request was rejected. A request that generates a 403 (not authorized) status code has the header because individual queue managers decide whether the command is authorized.

ibm-mq-rest-gateway-qmgr

This header is returned if a remote queue manager is specified in the resource URL. The value of this header is the name of the queue manager that is used as the gateway queue manager.

Response body format

The response body is empty if the queue is modified successfully. If an error occurs, the response body contains an error message. For more information, see [REST API error handling](#).

Examples

- The following example modifies an alias queue called `aliasQueue`. The following URL is used with the HTTP PATCH method:

IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/queue/aliasQueue
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr/QM1/queue/aliasQueue
```

The following JSON payload is sent:

```
{
  "type": "alias",
  "alias": {
    "targetName": "aDifferentLocalQueue"
  }
}
```

V 9.0.2 GET

Use the HTTP GET method with the queue resource to request information about queues.

The information that is returned is similar to the information returned by the **Inquire Queue**, and **Inquire Queue Status** PCF commands, and the **DISPLAY QUEUE** and **DISPLAY QSTATUS** MQSC commands.

Note:  On z/OS, the channel initiator must be running before you use the queue resource with the HTTP GET method in either of the following situations:

- The **type** optional query parameter is not specified.
- The **type** optional query parameter is specified as either `all` or `cluster`.
- [Resource URL](#)
- [Optional query parameters](#)
- [“Request headers” on page 1990](#)
- [Request body format](#)
- [“Security requirements” on page 1991](#)
- [Response status codes](#)
- [“Response headers” on page 1992](#)
- [Response body format](#)
- [Examples](#)

Resource URL

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://host:port/ibmmq/rest/v1/admin/qmgr/{qmgrName}/queue/{queueName}
```

IBM MQ 9.0.3 and earlier:

```
https://host:port/ibmmq/rest/v1/qmgr/{qmgrName}/queue/{queueName}
```

qmgrName

Specifies the name of the queue manager on which to query the queues.

V 9.0.4 You can specify a remote queue manager as the **qmgrName**. If you specify a remote queue manager, you must configure a gateway queue manager. For more information, see [Remote administration using the REST API](#).

The queue manager name is case-sensitive.

If the queue manager name includes a forward slash, a period, or a percent sign, these characters must be URL encoded:

- A forward slash (/) must be encoded as %2F.
- A percent sign (%) must be encoded as %25.

queueName

Optionally specifies the name of a queue that exists on the queue manager specified.

The queue name is case-sensitive.

If the queue name includes a forward slash or a percent sign, these characters must be URL encoded:

- A forward slash, /, must be encoded as %2F.
- A percent sign, %, must be encoded as %25.

You can use HTTP instead of HTTPS if you enable HTTP connections. For more information about enabling HTTP, see [Configuring HTTP and HTTPS ports](#).

Optional query parameters

attributes={object,...|*|object.attributeName,...}

object,...

Specifies a comma-separated list of JSON objects that contain related queue configuration attributes to return.

For example, to return all queue configuration attributes that are related to time stamps, specify `timestamps`. To return all queue configuration attributes that are related to storage and to data collection, specify `storage,dataCollection`.

The `status` and `applicationHandle` objects cannot be specified with this query parameter. Use the **status** and **applicationHandle** query parameters to return these attributes.

You cannot specify the same object more than once. If you request objects that are not valid for a particular queue, the attributes are not returned for that queue. However, if you specify a value for the **type** parameter that is not `all`, and request objects that are not valid for that queue type, an error is returned.

For a full list of objects and associated attributes, see [Attributes for queues](#).

Specifies all attributes.

object.attributeName,...

Specifies a comma-separated list of queue configuration attributes to return.

Each attribute must specify the JSON object that contains the attribute, in the form `object.attributeName`. For example, to return the `maximumDepth` attribute, which is contained in the `storage` object, specify `storage.maximumDepth`.

Attributes from the `status` and `applicationHandle` objects cannot be specified with this query parameter. Use the **status** and **applicationHandle** query parameters to return these attributes.

You cannot specify the same attribute more than once. If you request attributes that are not valid for a particular queue, the attributes are not returned for that queue. However, if you specify the **type** parameter and request attributes that are not valid for that queue type, an error is returned.

For a full list of attributes and associated objects, see [Attributes for queues](#).

status={status|*|status.attributeName,...}

status

Specifies that all status attributes are returned.

Specifies all attributes. This parameter is equivalent to **status**.

status.attributeName,...

Specifies a comma-separated list of status attributes to return.

For example, to return the `currentDepth` attribute, specify `status.currentDepth`.

For a full list of status attributes, see [Status attributes for queues](#).

If you specify the **status** optional query parameter, you can specify the **type** parameter only with the `all` or `local` values. You cannot specify the **queueSharingGroupDisposition** parameter with the `group` value.

applicationHandle={applicationHandle|*|applicationHandle.attributeName,...}

applicationHandle

Specifies that all application handle attributes are returned.

Specifies all attributes. This parameter is equivalent to **applicationHandle**.

applicationHandle.attributeName,...

Specifies a comma-separated list of application handle attributes to return.

For example, to return the `handleState` attribute, specify `applicationHandle.handleState`.

For a full list of application handle attributes, see [Application handle attributes for queues](#).

If you specify the **applicationHandle** optional query parameter, you can specify the **type** parameter only with the `all` or `local` values. You cannot specify the **queueSharingGroupDisposition** parameter with the `group` value.

commandScope=scope

 This parameter is only available on z/OS.

Specifies how the command is run when the queue manager is a member of a queue-sharing group.

You cannot specify this parameter if the queue manager is not a member of a queue-sharing group.

scope can be one of the following values:

The name of a queue manager

Specifies that the command is run on the queue manager that is named. The queue manager must be active within the same queue sharing group as the queue manager that is specified in the resource URL.

You cannot specify the queue manager name that is the queue manager that is specified in the resource URL.

If the queue manager name includes a percent sign, %, this character must be URL encoded as %25.

*

Specifies that the command is run on the local queue manager and also passed to every active queue manager in the queue sharing group.

If this option is used, an `ibm-mq-qmgrs` response header is returned with a comma-separated list of the queue managers that generated a response. For example, the header might look like the following header:

```
ibm-mq-qmgrs: MQ21, MQ22
```

filter=filterValue

Specifies a filter for the queue definitions that are returned.

If you specify a queue name in the resource URL, you can only filter on application handle attributes.

If you filter on an application handle attribute, the only application handles returned are those that match the filter parameter.

You can specify only one filter. If you filter on an application handle attribute, you must specify the **applicationHandle** query parameter. If you filter on a status attribute, you must specify the **status** query parameter.

filterValue has the following format:

```
attribute:operator:value
```

where:

attribute

Specifies one of the applicable attributes. For a full list of attributes, see [Attributes for queues](#). The following attributes cannot be specified:

- name
- type
-  `queueSharingGroup.disposition`
- `status.onQueueTime`

- `status.tpipeName`
- `applicationHandle.qmgrTransactionId`
- `applicationHandle.unitOfWorkId`
- `applicationHandle.openOptions`

To filter on any attributes that are time stamps, the filter can specify any portion of the time stamp, with a trailing asterisk, *. The format of a time stamp is, YYYY-MM-DDThh:mm:ss. For example, you can specify 2001-11-1* to filter on dates in the range 2001-11-10 to 2001-11-19, or 2001-11-12T14:* to filter any minute in the specified hour of the specified day.

Valid values for the YYYY section of the date are in the range 1900 - 9999.

The time stamp is a string. Therefore, only the `equalTo` and `notEqualTo` operators can be used with the time stamp.

Note:  If either the **filter** query parameter, or the **name** query parameter with a wildcard, are used with the **commandScope=*** query parameter, and there are no matching queues on at least one of the active queue managers in the queue sharing group, then an error message is returned.

operator

Specifies one of the following operators:

lessThan

Use this operator only with integer attributes.

greaterThan

Use this operator only with integer attributes.

equalTo

Use this operator with any attribute.

notEqualTo

Use this operator with any attribute.

lessThanOrEqualTo

Use this operator only with integer attributes.

greaterThanOrEqualTo

Use this operator only with integer attributes.

value

Specifies the constant value to test against the attribute.

The value type is determined by the attribute type.

For string and boolean attributes, you can omit the value field after the colon. For string attributes, omit the value to return queues with no value for the specified attribute. For boolean attributes, omit the value to return any queues that have the specified attribute set to false. For example, the following filter returns all queues where the description attribute is not specified:

```
filter=general.description:equalTo:
```

You can use a single asterisk, *, at the end of the value as a wildcard. You cannot use only an asterisk.

If the value includes a space, a forward slash, a percent sign, or an asterisk that is not a wildcard, these characters must be URL encoded:

- A space must be encoded as %20
- A forward slash, /, must be encoded as %2F.
- A percent sign, %, must be encoded as %25.
- An asterisk, *, must be encoded as %2A.

z/OS If the filter query parameter is used with the **commandScope=*** query parameter, and there are no matching values on at least one of the active queue managers in the queue sharing group, an error message is returned.

name=name

This query parameter cannot be used if you specify a queue name in the resource URL.

Specifies a wildcard queue name to filter on.

The *name* specified must include an asterisk, *, as a wildcard. You can specify one of the following combinations:

Specifies that all queues are returned.

prefix*

Specifies that all queues with the specified prefix in the queue name are returned.

***suffix**

Specifies that all queues with the specified suffix in the queue name are returned.

prefix*suffix

Specifies that all queues with the specified prefix and the specified suffix in the queue name are returned.

z/OS If the name query parameter is used with a wildcard, the **commandScope=*** query parameter is specified, and there are no matching values on at least one of the active queue managers in the queue sharing group, an error message is returned.

queueSharingGroupDisposition=disposition

z/OS This parameter is only available on z/OS.

Specifies where the queue for which information is to be returned is defined and how it behaves. That is, it specifies the disposition of the queue for which information is to be returned.

You cannot specify the **queueSharingGroupDisposition** parameter if you specify **type=cluster** for the **type** parameter.

The value can be one of the following values:

live

Specifies that the queue is defined as **qmgr** or **copy**.

In a shared queue manager environment, **live** also displays information for queues that are defined with **shared**.

If the **commandScope** optional query parameter is specified with the **live** option, then any queue definitions with a disposition of **shared** are returned only by the queue manager that received the REST request. Other queue managers in the group do not return these queue definitions.

If you specify **live** with the **attributes** parameter, and specify the **commandScope** parameter with a queue manager name, queue attributes are not returned for shared queues.

all

Specifies that the queue is defined as **qmgr** or **copy**.

In a shared queue manager environment, **all** also displays information for queues that are defined with **group** or **shared**.

If the **commandScope** optional query parameter is specified with **all**, then any queue definitions with a disposition of **group** or **shared** are returned only by the queue manager that received the REST request. Other queue managers in the group do not return these queue definitions.

If you specify **all** with the **attributes** parameter, and specify the **commandScope** parameter with a queue manager name, queue attributes are not returned for shared queues.

If you specify **all** and specify **type=all**, no cluster queues are returned.

copy

Specifies that the queue is defined as **copy**.

group

Specifies that the queue is defined as `group`.

If you specify **group**, you cannot specify the **commandScope** optional query parameter.

private

Specifies that the queue is defined as `copy` or `qmgr`.

qmgr

Specifies that the queue is defined as `qmgr`.

shared

Specifies that the queue is defined as `shared`.

You cannot specify the **commandScope** optional query parameter with this option, unless the **status** or **applicationHandle** optional query parameter is also specified.

You cannot specify this option with the **attributes** parameter if you also specify the **commandScope** parameter with a queue manager name.

If you specify **shared** and specify **type=all**, all shared queues are returned, including cluster queues with a disposition of `shared`.

The default value is `live`.

type=type

Specifies the type of queue to return information about.

The value can be one of the following values:

all

Specifies that information about all queues, including cluster queues, is returned.

 On z/OS, ensure that the channel initiator is running when you use this option.

local

Specifies that information about local queues is returned.

alias

Specifies that information about alias queues is returned.

remote

Specifies that information about remote queues is returned.

cluster

Specifies that information about cluster queues is returned.

 You cannot specify **type=cluster** if you specify the **queueSharingGroupDisposition** parameter.

 On z/OS, ensure that the channel initiator is running when you use this option.

model

Specifies that information about model queues is returned.

The default value is `all`.

Request headers

The following headers must be sent with the request:

Authorization

This header must be sent if you are using basic authentication. For more information, see [Using HTTP basic authentication with the REST API](#).

Authorization

This header must be sent if you are using basic authentication. For more information, see [Using HTTP basic authentication with the REST API](#).

 The following headers can optionally be sent with the request:

ibm-mq-rest-gateway-qmgr

This header specifies the queue manager that is to be used as the gateway queue manager. The gateway queue manager is used to connect to a remote queue manager. For more information, see [Remote administration using the REST API](#).

Request body format

None.

Security requirements

The caller must be authenticated to the mqweb server and must be a member of one or more of the MQWebAdmin, MQWebAdminRO, or MQWebUser roles. For more information about security for the administrative REST API, see [IBM MQ Console and REST API security](#).

The security principal of the caller must be granted the ability to issue the following PCF commands for the specified queue manager:

- If the **status** or **applicationHandle** query parameters are not specified:
 - For the queue that is specified by the *{queueName}* portion of the resource URL, or for queues that match the specified query parameters, authority to issue the **MQCMD_INQUIRE_Q** PCF command must be granted.
- If the **status** or **applicationHandle** query parameters are specified:
 - For the queue that is specified by the *{queueName}* portion of the resource URL, or for queues that match the specified query parameters, authority to issue the **MQCMD_INQUIRE_Q** PCF command must be granted.
 - For the queue that is specified by the *{queueName}* portion of the resource URL, or for queues that match the specified query parameters, authority to issue the **MQCMD_INQUIRE_QSTATUS** PCF command must be granted.

A principal has display authority if the principal can issue one or both of the **MQCMD_INQUIRE_Q** and **MQCMD_INQUIRE_QSTATUS** PCF commands. If the principal has display authority for only some of the queues that are specified by the resource URL and query parameters, then the array of queues that is returned from the REST request is limited to those queues that the principal has authority to display. No information is returned about queues that cannot be displayed. If the principal does not have display authority for any of the queues that are specified by the resource URL and query parameters, an HTTP status code of 403 is returned.

 On UNIX, Linux, and Windows, you can grant authority to security principals to use IBM MQ resources by using the **mqsetaut** command. For more information, see [mqsetaut](#).

 On z/OS, see [Setting up security on z/OS](#).

Response status codes

200

Queue information retrieved successfully.

400

Invalid data provided.

For example, invalid queue attributes specified.

401

Not authenticated.

The caller must be authenticated to the mqweb server and must be a member of one or more of the MQWebAdmin, MQWebAdminRO, or MQWebUser roles. For more information, see [“Security requirements” on page 1991](#).

403

Not authorized.

The caller is authenticated to the mqweb server and is associated with a valid principal. However, the principal does not have access to all, or a subset of the required IBM MQ resources. For more information about the access that is required, see [“Security requirements” on page 1991](#).

404

Queue does not exist.

500

Server issue or error code from IBM MQ.

503

Queue manager not running.

Response headers

The following headers are returned with the response:

Content-Type

This header is returned with a value of `application/json; charset=utf-8`.

ibm-mq-qmgrs

On z/OS, if the optional query parameter `commandScope=*` is used, this header is returned with a comma-separated list of the queue managers that generated a response. For example, the header might look like the following header:

```
ibm-mq-qmgrs: MQ21, MQ22
```

If an error occurs before the command is issued to the queue managers, the response header does not contain the list of queue managers. For example, a request that generates a 200 or 201 status code has the header because the command was successful. A request that generates a 401 (not authenticated) status code does not have the header because the request was rejected. A request that generates a 403 (not authorized) status code has the header because individual queue managers decide whether the command is authorized.

ibm-mq-rest-gateway-qmgr

This header is returned if a remote queue manager is specified in the resource URL. The value of this header is the name of the queue manager that is used as the gateway queue manager.

Response body format

The response is in JSON format in UTF-8 encoding. The response contains an outer JSON object that contains a single JSON array called `queue`. Each element in the array is a JSON object that represents information about a queue. Each of these JSON objects contains the following attributes:

name

String.

Specifies the name of the queue.

This attribute is always returned.

type

String.

Specifies the type of queue.

The value is one of the following values:

- `local`
- `alias`
- `remote`
- `cluster`

- model

This attribute is always returned.

The following objects can be included in the JSON object that represents information about a queue. Which objects and attributes are returned depends on the URL that was specified for the request:

remote

Contains attributes that are related to remote queues.

alias

Contains attributes that are related to alias queues.

dynamic

Contains attributes that are related to dynamic queues.

model

Contains attributes that are related to model queues.

cluster

Contains attributes that are related to clusters.

trigger

Contains attributes that are related to triggering.

events

Contains two objects, one for queue depth and one for queue service interval events. Each object contains attributes that are related to the event type.

applicationDefaults

Contains attributes that are related to default behavior such as message persistence, message priority, shared input settings, and read ahead settings.

queueSharingGroup

Contains attributes that are related to queue sharing groups on z/OS.

dataCollection

Contains attributes that are related to data collection, monitoring, and statistics.

storage

Contains attributes that are related to message storage, such as the maximum depth of the queue, and the maximum length of messages that are allowed on the queue.

general

Contains attributes that are related to general queue properties, such as whether get or put operations are inhibited, the description of the queue, and transmission queue settings.

extended

Contains attributes that are related to extended queue properties, such as backout queue settings, and shared input settings.

timestamps

Contains attributes that are related to date and time information, such as the time stamp of when a queue was created.

status

Contains attributes that are related to queue status information.

applicationHandle

Contains attributes that are related to application handle information.

If a queue has no application handles, but information about application handles is requested, an empty object is returned.

For more information, see [“Response body attributes for queues”](#) on page 1997.

If a damaged object is found, and the REST request did not specify a queue, an extra JSON array that is called `damaged` is returned. This JSON array contains a list of the objects that are damaged, specifying the object names. If the REST request specifies a queue name within the resource URL, but the object is damaged, an error is returned.

If an error occurs, the response body contains an error message. For more information, see [REST API error handling](#).

Examples

Note: Information about the SYSTEM.* queues is returned. It is expected that all queues are returned. However, for brevity, the results shown in the following examples do not include all the expected results.

- The following example lists all queues on the queue manager QM1. The following URL is used with the HTTP GET method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/queue
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr/QM1/queue
```

The following JSON response is returned:

```
{
  "queue": [
    {
      "name": "localQueue",
      "type": "local"
    },
    {
      "name": "remoteQueue",
      "type": "remote",
      "remote": {
        "queueName": "queueOnQM1",
        "qmgrName": "QM1"
      }
    },
    {
      "name": "aliasQueue",
      "type": "alias",
      "alias": {
        "targetName": "localQueue"
      }
    },
    {
      "name": "modelQueue",
      "type": "model",
      "model": {
        "type": "permanentDynamic"
      }
    },
    {
      "name": "permanentDynamicQueue",
      "type": "local",
      "dynamic": {
        "type": "permanentDynamic"
      }
    },
    {
      "name": "aliasQueue2",
      "type": "cluster",
      "cluster": {
        "name": "CLUSTER1",
        "qmgrName": "QM2",
        "queueType": "alias"
      }
    }
  ]
}
```

- The following example lists all local queues on the queue manager QM1, showing whether they are get or put enabled. The following URL is used with the HTTP GET method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QMGR2/queue?
type=local&attributes=general.inhibitPut,general.inhibitGet
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr/QMGR2/queue?
type=local&attributes=general.inhibitPut,general.inhibitGet
```

The following JSON response is returned:

```
{
  "queue":
  [ {
    "name": "localQueue",
    "type": "local",
    "general": {
      "inhibitPut": true,
      "inhibitGet": false,
    }
  }, {
    "name": "permanentDynamicQueue",
    "type": "local",
    "dynamic": {
      "type": "permanentDynamic"
    },
    "general": {
      "inhibitPut": false,
      "inhibitGet": false,
    }
  }
]
}
```

- The following example lists the status attributes for the queue Q1, on queue manager QM1. The following URL is used with the HTTP GET method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/queue/Q1?status=*
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr/QM1/queue/Q1?status=*
```

The following JSON response is returned:

```
{
  "queue":
  [ {
    "name": "Q1",
    "status": {
      "currentDepth": 0,
      "lastGet": "2016-12-05T15:56:28.000Z",
      "lastPut": "2016-12-05T15:56:28.000Z",
      "mediaRecoveryLogExtent": "",
      "oldestMessageAge": 42,
      "onQueueTime": {
        "longSamplePeriod": 3275,
        "shortSamplePeriod": 3275
      },
      "openInputCount": 1,
      "openOutputCount": 1,
      "uncommittedMessages": 2
    },
    "type": "local"
  }
]
}
```

- The following example lists the application handle attributes for a queue Q1, on queue manager QM1. The following URL is used with the HTTP GET method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/queue/Q1?applicationHandle=*
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr/QM1/queue/Q1?applicationHandle=*
```

The following JSON response is returned:

```
{
  "queue":
  [
    {
      "applicationHandle":
      [
        {
          "asynchronousState": "none",
          "channelName": "",
          "connectionName": "",
          "description": "",
          "state": "inactive",
          "openOptions": [
            "MQOO_INPUT_SHARED",
            "MQOO_BROWSE",
            "MQOO_INQUIRE",
            "MQOO_SAVE_ALL_CONTEXT",
            "MQOO_FAIL_IF QUIESCING"
          ],
          "processID": 9388,
          "qmgrTransactionID": "AAAAAAhAAAA=",
          "recoveryID": "AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA====",
          "tag": "IBM\\Java70\\jre\\bin\\javaw.exe",
          "threadID": 0,
          "transactionType": "qmgr",
          "type": "userApplication",
          "userID": "myID"
        },
        {
          "asynchronousState": "none",
          "channelName": "",
          "connectionName": "",
          "description": "",
          "state": "inactive",
          "openOptions": [
            "MQOO_OUTPUT",
            "MQOO_FAIL_IF QUIESCING"
          ],
          "processID": 9388,
          "qmgrTransactionID": "AAAAAAhAAAA=",
          "recoveryID": "AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA====",
          "tag": "IBM\\Java70\\jre\\bin\\javaw.exe",
          "threadID": 0,
          "transactionType": "qmgr",
          "type": "userApplication",
          "userID": "myID"
        }
      ],
      "name": "Q1",
      "type": "local"
    }
  ]
}
```

- The following example shows how to get all information, including status and application handles, for the queue Q2 on queue manager QM1. The following URL is used with the HTTP GET method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/queue/Q2?
attributes=*&status=*&applicationHandle=*
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr/QM1/queue/Q2?
attributes=*&status=*&applicationHandle=*
```

- The following example shows how to get all queue configuration and status information for queues with an **openInputCount** greater than three, for the queue manager QM1. The following URL is used with the HTTP GET method:

V 9.0.4 IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/queue?
attributes=*&status=*&filter=status.openInputCount:greaterThan:3
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr/QM1/queue?
attributes=*&status=*&filter=status.openInputCount:greaterThan:3
```

V 9.0.2 *Response body attributes for queues*

When you use the HTTP GET method with the queue object to request information about queues, the following attributes are returned within named JSON objects.

The following objects are available:

- [“remote” on page 1997](#)
- [“alias” on page 1998](#)
- [“dynamic” on page 1998](#)
- [“model” on page 1998](#)
- [“cluster” on page 1999](#)
- [“trigger” on page 2000](#)
- [“events” on page 2001](#)
- [“applicationDefaults” on page 2002](#)
- [“queueSharingGroup” on page 2004](#)
- [“dataCollection” on page 2004](#)
- [“storage” on page 2005](#)
- [“general” on page 2006](#)
- [“extended” on page 2007](#)
- [“timestamps” on page 2008](#)
- [“status” on page 2008](#)
- [“applicationHandle” on page 2010](#)

For more information about the PCF equivalents to the queue REST API parameters and attributes, see [REST API and PCF equivalents for queues](#).

remote

The `remote` object contains information about remote queues and is returned only for remote queues:

qmgrName

String.

Specifies the name of the remote queue manager.

If this remote queue is used as a queue manager alias, this attribute is the name of the queue manager.

If this remote queue is used as a reply-to queue alias, this attribute is the name of the queue manager that is to be the reply-to queue manager.

This attribute is always returned.

queueName

String.

Specifies the name of the queue as it is known on the remote queue manager.

This attribute is always returned.

transmissionQueueName

String.

Specifies the name of the transmission queue that is used for messages that are destined for either a remote queue or for a queue manager alias definition.

alias

The `alias` object contains information about alias queues and is returned only for alias queues:

targetName

String.

Specifies the name of the queue or topic that the alias resolves to.

This attribute is always returned.

targetType

String.

Specifies the type of object that the alias resolves to.

The value is one of the following values:

queue

Specifies that the object is a queue.

topic

Specifies that the object is a topic.

dynamic

The `dynamic` object contains information about dynamic queues and is returned only for local queues that are programmatically created from a model queue:

type

String.

Specifies the type of dynamic queue.

This attribute is always returned.

The value is one of the following values:

permanentDynamic

Specifies that the queue is a dynamically defined permanent queue.

sharedDynamic

 This attribute is only available on z/OS.

Specifies that the queue is a dynamically defined shared queue.

temporaryDynamic

Specifies that the queue is a dynamically defined temporary queue.

model

The `model` object contains information about model queues and is returned only for model queues:

type

String.

Specifies the model queue definition type.

This attribute is always returned.

The value is one of the following values:

permanentDynamic

Specifies that the queue is a dynamically defined permanent queue.

sharedDynamic

 This attribute is only available on z/OS.

Specifies that the queue is a dynamically defined shared queue.

temporaryDynamic

Specifies that the queue is a dynamically defined temporary queue.

cluster

The `cluster` object contains information about queues that are part of one or more clusters. The object is returned only for queues when `type=cluster` is specified, or if requested by the attributes query parameter:

name

String.

Specifies the name of the cluster that the queue belongs to.

This attribute, or the **namelist** attribute, is always returned.

namelist

String.

Specifies the namelist that lists the clusters that the queue belongs to.

This attribute, or the **name** attribute, is always returned.

qmgrId

String.

Specifies the unique identifier of the queue manager.

This attribute is returned only when `type=cluster` is specified.

qmgrName

String.

Specifies the name of the local queue manager.

This attribute is returned only when `type=cluster` is specified.

queueType

String.

Specifies the type of queue.

This attribute is returned only when `type=cluster` is specified.

The value is one of the following values:

local

Specifies that the cluster queue represents a local queue.

alias

Specifies that the cluster queue represents an alias queue.

remote

Specifies that the cluster queue represents a remote queue.

qmgrAlias

Specifies that the cluster queue represents a queue manager alias.

transmissionQueueForChannelName

String.

Specifies the generic name of the cluster-sender channels that use the queue as a transmission queue. The attribute specifies which cluster-sender channels send messages to a cluster-receiver channel from the cluster transmission queue.

workloadPriority

Integer.

Specifies the priority of the queue in cluster workload management.

A value of 0 specifies the lowest priority and 9 specifies the highest priority.

workloadQueueUse

String.

Specifies whether remote and local instances of the clustered queues are used in cluster workload distribution.

The value is one of the following values:

asQmgr

Use the value that is defined on the queue manager.

any

Use remote and local instances of the queues.

local

Use only local instances of the queues.

workloadRank

Integer.

Specifies the rank of the queue in cluster workload management.

A value of 0 specifies the lowest priority and 9 specifies the highest priority.

trigger

The `trigger` object contains information about triggering:

enabled

Boolean.

Specifies whether trigger messages are written to the initiation queue.

data

String.

Specifies the user data that is included in the trigger message.

depth

Integer.

Specifies the number of messages that initiates a trigger message to the initiation queue.

initiationQueueName

String.

Specifies the local queue for trigger messages that relate to the queue.

messagePriority

Integer.

Specifies the minimum priority that a message must have before it can cause, or be counted for, a trigger event.

processName

String.

Specifies the local name of the IBM MQ process that identifies the application to be started when a trigger event occurs.

If the queue is a transmission queue, the process definition contains the name of the channel to be started.

type

String.

Specifies the condition that initiates a trigger event. When the condition is true, a trigger message is sent to the initiation queue.

The value is one of the following values:

none

Send no trigger messages.

every

Send a trigger message for every message that arrives on the queue.

first

Send a trigger message when the queue depth goes from 0 to 1.

depth

Send a trigger message when the queue depth exceeds the value of the **depth** attribute.

events

The events object contains two objects, one for queue depth and one for queue service interval events. Each object contains attributes that are related to the event type:

depth

JSON object.

A JSON object that can contain the following attributes that related to queue depth events:

highEnabled

Boolean.

Specifies whether queue depth high events are generated.

A queue depth high event indicates that the number of messages on the queue is greater than or equal to the queue depth high limit, **highPercentage**.

highPercentage

Integer.

Specifies the threshold against which the queue depth is compared to generate a queue depth high event.

This value is expressed as a percentage of the maximum queue depth.

lowEnabled

Boolean.

Specifies whether queue depth low events are generated.

A queue depth low event indicates that the number of messages on the queue is less than or equal to the queue depth low limit, **lowPercentage**.

lowPercentage

Integer.

Specifies the threshold against which the queue depth is compared to generate a queue depth low event.

This value is expressed as a percentage of the maximum queue depth.

fullEnabled

Boolean.

Specifies whether queue full events are generated.

A queue full event indicates that no more messages can be put on a queue because the queue is full. That is, the queue depth reached the maximum queue depth.

serviceInterval

JSON object.

A JSON object that can contain the following attributes that are related to queue service interval events:

highEnabled

Boolean.

Specifies whether queue service interval high events are generated.

A queue service interval high event is generated when no messages were put to, or retrieved from, the queue for at least the amount of time specified by the **duration** attribute.

okEnabled

Boolean.

Specifies whether queue service interval OK events are generated.

A queue service interval OK event is generated when a message was retrieved from the queue within the amount of time that is specified by the **duration** attribute.

duration

Integer.

Specifies the service interval duration, in milliseconds, that is used to generate queue service interval high and queue service interval OK events.

applicationDefaults

The `applicationDefaults` object contains attributes that are related to default behavior such as message persistence, message priority, shared input settings, and read ahead settings:

clusterBind

String.

Specifies the binding to be used when `MQOO_BIND_AS_Q_DEF` is specified on the `MQOPEN` call.

The value is one of the following values:

onOpen

Specifies that the binding is fixed by the `MQOPEN` call.

notFixed

Specifies that the binding is not fixed.

onGroup

Specifies that the application can request that a group of messages is allocated to the same destination instance.

messagePropertyControl

String.

Specifies how message properties are handled when messages are retrieved from queues when `MQGMO_PROPERTIES_AS_Q_DEF` is specified on the `MQGET` call.

This attribute is applicable to local, alias, and model queues.

The value is one of the following values:

all

Specifies that all properties of the message are included when the message is sent to the remote queue manager. The properties, except those properties in the message descriptor or extension, are placed in one or more `MQRFH2` headers in the message data.

compatible

Specifies that if the message contains a property with the prefix `mcd.`, `jms.`, `usr.`, or `mqext.`, all message properties are delivered to the application in an `MQRFH2` header. Otherwise, all properties, except those properties in the message descriptor or extension, are discarded and are no longer accessible.

force

Specifies that properties are always returned in the message data in an `MQRFH2` header regardless of whether the application specifies a message handle. A valid message handle that is included in the `MsgHandle` field of the `MQGMO` structure on the `MQGET` call is ignored. Properties of the message are not accessible by using the message handle.

none

Specifies that all properties of the message are removed from the message before the message is sent to the remote queue manager. Properties in the message descriptor, or extension, are not removed.

version6Compatible

Any application MQRFH2 header is received as it was sent. Any properties set by using MQSETMP must be retrieved by using MQINQMP. They are not added to the MQRFH2 created by the application. Properties that were set in the MQRFH2 header by the sending application cannot be retrieved by using MQINQMP.

messagePersistence

String.

Specifies the default for message persistence on the queue. Message persistence determines whether messages are preserved across restarts of the queue manager.

The value is one of the following values:

persistent

Specifies that the messages on the queue are persistent, and are preserved when the queue manager restarts.

nonPersistent

Specifies that the messages on the queue are not persistent, and are lost when the queue manager restarts.

messagePriority

Integer.

Specifies the default priority of messages that are put on the queue.

putResponse

String.

Specifies the type of response that is used for put operations to the queue when an application specifies MQPMO_RESPONSE_AS_Q_DEF.

The value is one of the following values:

synchronous

The put operation is run synchronously, returning a response.

asynchronous

The put operation is run asynchronously, returning a subset of MQMD fields.

readAhead

String.

Specifies the default read-ahead behavior for non-persistent messages that are delivered to the client.

The value is one of the following values:

no

Specifies that non-persistent messages are not read ahead unless the client application is configured to request read ahead.

yes

Specifies that non-persistent messages are sent ahead to the client before an application requests them. Non-persistent messages can be lost if the client ends abnormally or if the client does not consume all the messages that it is sent.

disabled

Specifies that non-persistent messages are not read ahead, regardless of whether read ahead is requested by the client application.

sharedInput

Boolean.

Specifies the default share option for applications that open this queue for input.

If the value is set to `true`, queues are enabled to get messages with shared access.

queueSharingGroup

The queueSharingGroup object contains attributes that are related to queue sharing groups on z/OS:

disposition

String.

 This attribute is only available on z/OS.

Specifies where the queue is defined and how it behaves. That is, it specifies the disposition of the queue.

This value is always returned if the queue manager is a member of the queue sharing group.

The value is one of the following values:

copy

Specifies that the queue definition exists on the page set of the queue manager that runs the command. For local queues, messages are stored on the page sets of each queue manager and are available only through that queue manager.

group

Specifies that the queue definition exists in the shared repository.

qmgr

Specifies that the queue definition exists on the page set of the queue manager that runs the command. For local queues, messages are stored on the page sets of each queue manager and are available only through that queue manager.

shared

This value is only valid for local queues.

Specifies that the queue exists in the shared repository. Messages are stored in the coupling facility and are available to any queue manager in the queue sharing group.

qmgrName

String.

 This attribute is only available on z/OS.

Specifies the name of the queue manager that generates the response to the REST request.

This attribute is only returned if the queue manager to which the REST request is made is part of a queue sharing group, and the **commandScope** optional query parameter is specified.

structureName

String.

 This attribute is only available on z/OS.

Specifies the name of the coupling facility structure where messages are stored when you used shared queues.

dataCollection

The dataCollection object contains attributes that are related to data collection, monitoring, and statistics:

accounting

String.

Specifies whether accounting data is collected for the queue.

The value is one of the following values:

asQmgr

Specifies that the queue inherits the value from the queue manager MQSC parameter ACCTQ.

off

Specifies that accounting data is not collected for the queue.

on

Specifies that accounting data is collected for the queue if the ACCTQ MQSC parameter on the queue manager is not set to none.

monitoring

String.

Specifies whether online monitoring data is collected, and if so, the rate at which the data is collected. The value is one of the following values:

off

Specifies that online monitoring data is not collected for the queue.

asQmgr

Specifies that the queue inherits the value from the queue manager MONQ MQSC parameter.

low

Specifies that online monitoring data is collected for the queue if the MONQ MQSC parameter on the queue manager is not set to none. The rate of data collection is low.

medium

Specifies that online monitoring data is collected for the queue if the MONQ MQSC parameter on the queue manager is not set to none. The rate of data collection is moderate.

high

Specifies that online monitoring data is collected for the queue if the MONQ MQSC parameter on the queue manager is not set to none. The rate of data collection is high.

statistics

This attribute is only available on the IBM MQ Appliance, UNIX, Linux, and Windows.

String.

Specifies whether statistics data is collected for the queue.

The value is one of the following values:

asQmgr

Specifies that the queue inherits the value from the queue manager STATQ MQSC parameter.

off

Specifies that statistics data is not collected for the queue.

on

Specifies that statistics data is collected for the queue if the STATQ MQSC parameter on the queue manager is not set to none.

storage

The `storage` object contains attributes that are related to message storage, such as the maximum depth of the queue, and the maximum length of messages that are allowed on the queue:

indexType

This attribute is only available on z/OS.

String.

Specifies the type of index that is maintained by the queue manager to expedite MQGET operations on the queue. For shared queues, the type of index determines what type of MQGET calls can be used.

The value is one of the following values:

none

Specifies that there is no index. Messages are retrieved sequentially.

correlationId

Specifies that the queue is indexed by using correlation identifiers.

groupId

Specifies that the queue is indexed by using group identifiers.

messageId

Specifies that the queue is indexed by using message identifiers.

messageToken

Specifies that the queue is indexed by using message tokens.

maximumMessageLength

Integer.

Specifies the maximum message length that is allowed, in bytes, for messages on the queue.

maximumDepth

Integer.

Specifies the maximum number of messages that are allowed on the queue.

messageDeliverySequence

String.

Specifies whether messages are delivered in priority order or by sequence.

The value is one of the following values:

priority

Specifies that messages are returned in priority order.

fifo

Specifies that messages are returned in first in, first out order.

nonPersistentMessageClass

 This attribute is only available on the IBM MQ Appliance, UNIX, Linux, and Windows.

String.

This attribute is valid only on local and model queues.

Specifies the level of reliability that is assigned to non-persistent messages that are put to the queue.

The value is one of the following values:

normal

Specifies that non-persistent messages persist for the lifetime of the queue manager session. They are discarded if the queue manager restarts.

high

Specifies that the queue manager attempts to retain non-persistent messages for the lifetime of the queue. Non-persistent messages might still be lost if a failure occurs.

pageSet

 This attribute is only available on z/OS.

Integer.

Specifies the ID of the page set.

storageClass

 This attribute is only available on z/OS.

String.

Specifies the name of the storage class.

general

The `general` object contains attributes that are related to general queue properties, such as whether get or put operations are inhibited, the description of the queue, and transmission queue settings:

description

String.

Specifies the description of the queue.

inhibitGet

Boolean.

Specifies whether `get` operations are allowed on the queue.

If the value is set to `true`, `get` operations are not allowed on the queue.

inhibitPut

Boolean.

Specifies whether `put` operations are allowed on the queue.

If the value is set to `true`, `put` operations are not allowed on the queue.

isTransmissionQueue

String.

Specifies whether the queue is for normal usage or for transmitting messages to a remote queue manager.

If the value is set to `true`, the queue is a transmission queue for transmitting messages to a remote queue manager.

extended

The `extended` object contains attributes that are related to extended queue properties, such as backout queue settings, and shared input settings:

allowSharedInput

Boolean.

Specifies whether multiple instances of applications can open the queue for input.

If the value is set to `true`, multiple instances of applications can open the queue for input.

backoutRequeueQueueName

String.

Specifies the name of the queue to which a message is transferred if it is backed out more times than the value of **backoutThreshold**.

backoutThreshold

Integer.

Specifies the number of times that a message can be backed out before it is transferred to the backout queue that is specified by the **backoutRequeueQueueName** attribute.

custom

String.

Specifies custom attributes for new features.

V 9.0.4

enableMediaImageOperations

ULW

MQ Appliance

This attribute is available only on the IBM MQ Appliance, UNIX, Linux, and Windows.

Specifies whether a local or permanent dynamic queue object is recoverable from a media image, if linear logging is being used.

String.

The value is one of the following values:

yes

Specifies that this queue object is recoverable.

no

The `rcdmqimg` and `rcrmqobj` commands are not permitted for these objects. If automatic media images are enabled, the media images are not written for these objects.

asQmgr

Specifies that the queue inherits the value from the queue manager `ImageRecoverQueue` attribute.

This is the default value for this attribute.

hardenGetBackout

 This attribute is only available on z/OS.

Boolean.

Specifies whether the count of the number of times that a message was backed out is saved, to ensure that it is accurate across restarts of the queue manager.

If the value is set to `true`, the backout count is always accurate across restarts of the queue manager.

supportDistributionLists

  This attribute is only available on the IBM MQ Appliance, UNIX, Linux, and Windows.

Boolean.

Specifies whether distribution-list messages can be placed on the queue.

If the value is set to `true`, distribution lists can be placed on the queue.

timestamps

The `timestamps` object contains attributes that are related to date and time information.

altered

String.

Specifies the date and time at which the queue was last altered.

For more information about the time stamp format that is used to return the date and time, see [REST API time stamps](#).

clustered

String.

Specifies the date and time at which the information became available to the local queue manager.

For more information about the time stamp format that is used to return the date and time, see [REST API time stamps](#).

created

String.

Specifies the date and time at which the queue was created.

For more information about the time stamp format that is used to return the date and time, see [REST API time stamps](#).

status

The `status` object contains attributes that are related to queue status information:

currentDepth

Integer.

Specifies the current queue depth.

lastGet

String.

Specifies the date and time at which the last message was destructively read from the queue.

For more information about the time stamp format that is used to return the date and time, see [REST API time stamps](#).

lastPut

String.

Specifies the date and time at which the last message was successfully put to the queue.

For more information about the time stamp format that is used to return the date and time, see [REST API time stamps](#).

mediaRecoveryLogExtent

 This attribute is only available on the IBM MQ Appliance, UNIX, Linux, and Windows.

String.

Specifies the name of the oldest log extent that is required to perform media recovery of the queue.

The name that is returned is of the form Snnnnnnn.LOG and is not a fully qualified path name.

oldestMessageAge

Integer.

Specifies the age, in seconds, of the oldest message on the queue.

If the queue is empty, 0 is returned. If the value is greater than 999 999 999, it is returned as 999 999 999. If no data is available, -1 is returned.

onQueueTime

JSON object.

A JSON object that can contain the following attributes that related to the amount of time that a message remains on the queue:

longSamplePeriod

Integer.

Specifies an indication of the time, in microseconds, that a message remains on the queue based on activity over a long period.

shortSamplePeriod

Integer.

Specifies an indication of the time, in microseconds, that a message remains on the queue based on activity over a short period.

This attribute cannot be used to filter results.

openInputCount

Integer.

Specifies the number of handles that are currently valid for removing messages from the queue by using the MQGET call.

openOutputCount

Integer.

Specifies the number of handles that are currently valid for putting messages to the queue by using the MQPUT call.

monitoringRate

String.

Specifies the rate at which monitoring data is collected for the queue.

The value is one of the following values:

off

Specifies that no data is collected.

low

Specifies a low rate of data collection.

medium

Specifies a medium rate of data collection.

high

Specifies a high rate of data collection.

tpipeName

 This attribute is only available on z/OS.

Array.

Specifies the TPIPE names that are used for communication with OTMA by using the IBM MQ IMS bridge, if the bridge is active.

This attribute cannot be used to filter results.

uncommittedMessages

Integer.

Specifies the number of uncommitted changes that are pending for the queue.

On z/OS, the value can be only either 0 or 1. A value of 1 indicates that there is at least one uncommitted message on the queue.

applicationHandle

The `applicationHandle` object contains attributes that are related to application handle information:

description

String.

Specifies a description for the application.

tag

 This attribute is only available on z/OS.

String.

Specifies the tag of the open application.

type

String.

Specifies the type of application.

This value is one of the following values:

queueManagerProcess

Specifies that the open application is a queue manager process.

channelInitiator

Specifies that the open application is a channel initiator.

userApplication

Specifies that the open application is a user application.

batchConnection

 This attribute is only available on z/OS.

Specifies that the open application is using a batch connection.

rrsBatchConnection

 This attribute is only available on z/OS.

Specifies that the open application is an RRS-coordinated application that uses a batch connection.

cicsTransaction

 This attribute is only available on z/OS.

Specifies that the open application is a CICS transaction.

imsTransaction

 This attribute is only available on z/OS.

Specifies that the open application is an IMS transaction.

systemExtension

Specifies that the open application is an application that performs an extension of function that is provided by the queue manager.

asynchronousConsumerState

String.

Specifies the state of the asynchronous consumer on the queue.

The value is one of the following values:

active

Specifies that an MQCB call set up a function to call back to process messages asynchronously, and the connection handle has started so that asynchronous message consumption can proceed.

inactive

Specifies that an MQCB call set up a function to call back to process messages asynchronously, but the connection handle is not started, or is stopped or suspended.

suspended

Specifies that the asynchronous consumption callback is suspended so that asynchronous message consumption cannot proceed on the handle.

This situation can be either because an MQCB or MQCTL call with *Operation* MQOP_SUSPEND was issued against this object handle by the application, or because it was suspended by the system. If it was suspended by the system, as part of the process of suspending asynchronous message consumption the callback function is called with the reason code that describes the problem that resulted in suspension. This situation is reported in the reason field in the MQCBC structure passed to the callback. In order for asynchronous message consumption to proceed, the application must issue an MQCB or MQCTL call with *Operation* MQOP_RESUME.

suspendedTemporarily

Specifies that the asynchronous consumption callback is temporarily suspended by the system so that asynchronous message consumption cannot proceed on this handle.

As part of the process of suspending asynchronous message consumption the callback function is called with the reason code that describes the problem that resulted in suspension. This situation is reported in the reason field in the MQCBC structure passed to the callback. The callback function is called again when asynchronous message consumption is resumed by the system after the temporary condition is resolved.

none

Specifies that an MQCB call was not issued against this handle, so asynchronous message consumption is not configured on the handle.

addressSpaceId

 This attribute is only available on z/OS.

String.

Specifies a four character address space identifier for the application.

channelName

String.

Specifies the channel name.

connectionName

String.

Specifies the connection name.

state

String.

Specifies the state of the handle.

This value is one of the following values:

active

Specifies that an API call from a connection is in progress for the queue. This state can occur when an MQGET WAIT call is in progress.

inactive

Specifies that no API call from a connection is in progress for the queue. This state can occur when no MQGET WAIT call is in progress.

openOptions

JSON array.

Specifies the open options that are in force for the queue.

Any of the valid MQOO options can be present in the array. For more information about the MQOO_* options, see [MQOO_* \(Open Options\)](#).

processId

 This attribute is only available on the IBM MQ Appliance, UNIX, Linux, and Windows.

Integer.

Specifies the process ID of the open application.

processSpecificationBlockName

 This attribute is only available on z/OS.

String.

Specifies the eight character name of the program specification block that is associated with the running IMS transaction.

processSpecificationTableId

 This attribute is only available on z/OS.

String.

Specifies the four character identifier of the program specification table region identifier for the connected IMS region.

qmgrTransactionId

String.

Specifies the unit of recovery that is assigned by the queue manager.

 This identifier is represented as 2 hexadecimal digits for each byte of the recovery identifier.

This attribute cannot be used to filter results.

cicsTaskNumber

 This attribute is only available on z/OS.

Integer.

Specifies a seven digit CICS task number.

threadId

 This attribute is only available on the IBM MQ Appliance, UNIX, Linux, and Windows.

Integer.

Specifies the thread ID of the open application.

A value of 0 indicates that the handle was opened by a shared connection. A handle that is created by a shared connection is logically open to all threads.

cicsTransactionId

 This attribute is only available on z/OS.

String.

Specifies a four character CICS transaction ID.

unitOfWorkId

String.

Specifies the recovery identifier for the unit of recovery. The format of this value is determined by the value of **unitOfWorkType**.

 This identifier is represented as 2 hexadecimal digits for each byte of the recovery identifier.

This attribute cannot be used to filter results.

unitOfWorkType

String.

Specifies the type of external unit of recovery identifier as perceived by the queue manager.

The value is one of the following values:

qmgr

cics

 This value is only available on z/OS.

ims

 This value is only available on z/OS.

rrs

 This value is only available on z/OS.

xa

userId

String.

Specifies the user identifier of the open application.

DELETE

Use the HTTP DELETE method with the queue resource to delete a specified queue on a specified queue manager.

This REST API command is similar to the [Delete Queue](#) PCF command, and the [DELETE queues](#) MQSC commands.

- [Resource URL](#)
- [Optional query parameters](#)
- [“Request headers” on page 2016](#)
- [Request body format](#)
- [“Security requirements” on page 2016](#)
- [Response status codes](#)
- [“Response headers” on page 2017](#)
- [Response body format](#)
- [Examples](#)

Resource URL

 IBM MQ 9.0.4 and later:

`https://host:port/ibmmq/rest/v1/admin/qmgr/{qmgrName}/queue/{queueName}`

IBM MQ 9.0.3 and earlier:

`https://host:port/ibmmq/rest/v1/qmgr/{qmgrName}/queue/{queueName}`

qmgrName

Specifies the name of the queue manager on which the queue to delete exists.

V 9.0.4 You can specify a remote queue manager as the **qmgrName**. If you specify a remote queue manager, you must configure a gateway queue manager. For more information, see [Remote administration using the REST API](#).

The queue manager name is case-sensitive.

If the queue manager name includes a forward slash, a period, or a percent sign, these characters must be URL encoded:

- A forward slash (/) must be encoded as %2F.
- A percent sign (%) must be encoded as %25.

queueName

Specifies the name of the queue to delete.

The queue name is case-sensitive.

If the queue name includes a forward slash or a percent sign, these characters must be URL encoded:

- A forward slash, /, must be encoded as %2F.
- A percent sign, %, must be encoded as %25.

V 9.0.1 You can use HTTP instead of HTTPS if you enable HTTP connections. For more information about enabling HTTP, see [Configuring HTTP and HTTPS ports](#).

Optional query parameters

keepAuthorityRecords

ULW **MQ Appliance** This parameter is only available on the IBM MQ Appliance, UNIX, Linux, and Windows.

Specifies that the associated authority records are not deleted.

commandScope=scope

z/OS This parameter is only available on z/OS.

Specifies how the command is run when the queue manager is a member of a queue-sharing group.

You cannot specify this parameter if the queue manager is not a member of a queue-sharing group.

scope can be one of the following values:

The name of a queue manager

Specifies that the command is run on the queue manager that is named. The queue manager must be active within the same queue sharing group as the queue manager that is specified in the resource URL.

You cannot specify the queue manager name that is the queue manager that is specified in the resource URL.

If the queue manager name includes a percent sign, %, this character must be URL encoded as %25.

Specifies that the command is run on the local queue manager and also passed to every active queue manager in the queue sharing group.

If this option is used, an `ibm-mq-qmgrs` response header is returned with a comma-separated list of the queue managers that generated a response. For example, the header might look like the following header:

```
ibm-mq-qmgrs: MQ21, MQ22
```

purge

Specifies that all messages are purged from the queue.

If messages are on the queue, you must specify **purge**, or the queue cannot be deleted.

queueSharingGroupDisposition=disposition

 This parameter is only available on z/OS.

Specifies where the queue is defined and how it behaves. That is, it specifies the disposition of the queue.

disposition can be one of the following values:

copy

Specifies that the queue definition exists on the page set of the queue manager that runs the command. The queue was defined by a command that used the **MQQSGD_COPY** PCF parameter, or the **copy** REST API parameter.

Any queue in the shared repository, or any queue that is defined by using the **MQQSGD_Q_MGR** PCF parameter, or **qmgr** REST API parameter, is not affected by this command.

group

Specifies that the queue definition exists in the shared repository. The queue was defined by a command that used the **MQQSGD_GROUP** PCF parameter, or the **group** REST API parameter.

Any queue that exists on the page set of the queue manager that runs the command, except for a local copy of the queue, is not affected by this command.

If the deletion is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE queue(q-name) QSGDISP(COPY)
```

or for a local queue only:

```
DELETE QLOCAL(q-name) NOPURGE QSGDISP(COPY)
```

The deletion of the group object takes effect even if the generated command with QSGDISP(COPY) fails.

Note: You always get the NOPURGE option even if you specify the **purge** flag. To delete messages on local copies of the queues you must explicitly run, for each copy, a command to delete the queue with the **purge** flag, and a **queueSharingGroupDisposition** value of copy.

qmgr

Specifies that the queue definition exists on the page set of the queue manager that runs the command. The object was defined by a command that used the **MQQSGD_Q_MGR** PCF parameter or the **qmgr** REST API parameter.

Any queue that exists in the shared repository, or any local copy of such a queue, is not affected by this command.

shared

This value is only valid for local queues.

Specifies that the queue exists in the shared repository. The object was defined by a command that used the **MQQSGD_SHARED** PCF parameter or the **shared** REST API parameter.

Any queue that exists on the page set of the queue manager that runs the command, or any queue that is defined by a command that uses the parameter **MQQSGD_GROUP** is not affected by this command.

The default value is `qmgr`.

Request headers

The following headers must be sent with the request:

ibm-mq-rest-csrf-token

This header must be sent with a value that is the content of the `csrfToken` cookie. The content of the `csrfToken` cookie is used to confirm that the credentials that are being used to authenticate the request are being used by the owner of the credentials. That is, the token is used to prevent cross-site request forgery attacks.

The `csrfToken` cookie is returned after a request is made with an HTTP GET method. You cannot use a cached version of the content of the cookie because the content of the cookie can change. You must use the latest value of the cookie for each request.

V 9.0.5 The preceding information applies to releases up to and including IBM MQ 9.0.4. From IBM MQ 9.0.5, this header must be set, but the value can be anything, including being blank.

The `csrfToken` cookie is no longer sent in responses from the REST API in IBM MQ 9.0.5 and later.

Authorization

This header must be sent if you are using basic authentication. For more information, see [Using HTTP basic authentication with the REST API](#).

V 9.0.4 The following headers can optionally be sent with the request:

ibm-mq-rest-gateway-qmgr

This header specifies the queue manager that is to be used as the gateway queue manager. The gateway queue manager is used to connect to a remote queue manager. For more information, see [Remote administration using the REST API](#).

Request body format

None.

Security requirements

The caller must be authenticated to the `mqweb` server and must be a member of one or more of the `MQWebAdmin`, `MQWebAdminRO`, or `MQWebUser` roles. For more information about security for the administrative REST API, see [IBM MQ Console and REST API security](#).

The security principal of the caller must be granted the ability to issue the following PCF commands for the specified queue manager:

- For the queue that is specified by the `{queueName}` portion of the resource URL, authority to issue the `MQCMD_DELETE_Q` PCF command must be granted.

ULW On UNIX, Linux, and Windows, you can grant authority to security principals to use IBM MQ resources by using the `mqsetaut` command. For more information, see [mqsetaut](#).

z/OS On z/OS, see [Setting up security on z/OS](#).

Response status codes

204

Queue deleted successfully.

400

Invalid data provided.

For example, invalid queue data is specified, or the queue is not empty.

401

Not authenticated.

The caller must be authenticated to the mqweb server and must be a member of one or more of the MQWebAdmin, MQWebAdminRO, or MQWebUser roles. The `ibm-mq-rest-csrf-token` header must also be specified. For more information, see [“Security requirements” on page 2016](#).

403

Not authorized.

The caller is authenticated to the mqweb server and is associated with a valid principal. However, the principal does not have access to all, or a subset of the required IBM MQ resources. For more information about the access that is required, see [“Security requirements” on page 2016](#).

404

Queue does not exist.

500

Server issue or error code from IBM MQ.

503

Queue manager not running.

Response headers

The following headers are returned with the response:

ibm-mq-qmgrs

On z/OS, if the optional query parameter `commandScope=*` is used, this header is returned with a comma-separated list of the queue managers that generated a response. For example, the header might look like the following header:

```
ibm-mq-qmgrs: MQ21, MQ22
```

If an error occurs before the command is issued to the queue managers, the response header does not contain the list of queue managers. For example, a request that generates a 200 or 201 status code has the header because the command was successful. A request that generates a 401 (not authenticated) status code does not have the header because the request was rejected. A request that generates a 403 (not authorized) status code has the header because individual queue managers decide whether the command is authorized.

ibm-mq-rest-gateway-qmgr

This header is returned if a remote queue manager is specified in the resource URL. The value of this header is the name of the queue manager that is used as the gateway queue manager.

Response body format

The response body is empty if the queue is deleted successfully. If an error occurs, the response body contains an error message. For more information, see [REST API error handling](#).

Examples

The following example deletes the queue Q1 from the queue manager QM1, and purges all messages from the queue when used with the HTTP DELETE method:

IBM MQ 9.0.4 and later:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/queue/Q1?purge
```

IBM MQ 9.0.3 and earlier:

```
https://localhost:9443/ibmmq/rest/v1/qmgr/QM1/queue/Q1?purge
```

V 9.0.4 /admin/qmgr/{qmgrName}/subscription

You can use the HTTP GET method with the subscription resource to request information about subscriptions.

You can use the administrative REST API gateway with this resource URL.

For more information about the PCF equivalents to the subscription REST API parameters and attributes, see [“REST API and PCF equivalents for subscriptions” on page 2037](#).

V 9.0.4 GET

Use the HTTP GET method with the subscription resource to request information about subscriptions.

The information that is returned is similar to the information returned by the **Inquire Subscription** PCF command, and the **DISPLAY SUB** MQSC command.

- [“Resource URL” on page 2018](#)
- [“Optional query parameters” on page 2019](#)
- [“Request headers” on page 2020](#)
- [“Request body format” on page 2021](#)
- [“Security requirements” on page 2021](#)
- [“Response status codes” on page 2021](#)
- [“Response headers” on page 2022](#)
- [“Response body format” on page 2022](#)
- [“Examples” on page 2023](#)

Resource URL

`https://host:port/ibmmq/rest/v1/admin/qmgr/{qmgrName}/subscription/{subscriptionName}`

qmgrName

Specifies the name of the queue manager on which to query the subscriptions.

V 9.0.4 You can specify a remote queue manager as the **qmgrName**. If you specify a remote queue manager, you must configure a gateway queue manager. For more information, see [Remote administration using the REST API](#).

The queue manager name is case-sensitive.

If the queue manager name includes a forward slash, a period, or a percent sign, these characters must be URL encoded:

- A forward slash (/) must be encoded as %2F.
- A percent sign (%) must be encoded as %25.

subscriptionName

Optionally specifies the name of a subscription that exists on the specified queue manager.

The subscription name is case-sensitive.

If the subscription name includes any non-alphanumeric characters, they must be URL encoded.

You can use HTTP instead of HTTPS if you enable HTTP connections. For more information about enabling HTTP, see [Configuring HTTP and HTTPS ports](#).

Optional query parameters

attributes={object,...[*|object.attributeName,...]}

object,...

Specifies a comma-separated list of JSON objects that contain related subscription attributes to return.

For example, to return all subscription attributes that are related to time stamps, specify `timestamps`. To return all subscription attributes that are related to the destination and user, specify `destination,user`.

You cannot specify the same object more than once.

For a full list of objects and associated attributes, see [Attributes for subscriptions](#).

Specifies all attributes.

object.attributeName,...

Specifies a comma-separated list of queue configuration attributes to return.

Each attribute must specify the JSON object that contains the attribute, in the form `object.attributeName`. For example, to return the `correlationId` attribute, which is contained in the destination object, specify `destination.correlationId`.

You cannot specify the same attribute more than once.

For a full list of attributes and associated objects, see [Attributes for subscriptions](#).

filter=filterValue

Specifies a filter for the subscription definitions that are returned.

This query parameter cannot be used if you specify a subscription name in the resource URL or if you use the ID query parameter.

You can specify only one filter.

filterValue has the following format:

```
attribute:operator:value
```

where:

attribute

Specifies one of the applicable attributes. For a full list of attributes, see [Attributes for subscriptions](#). The following attributes cannot be specified:

- `name`
- `id`

To filter on any attributes that are time stamps, the filter can specify any portion of the time stamp, with a trailing asterisk, `*`. The format of a time stamp is, `YYYY-MM-DDThh:mm:ss`. For example, you can specify `2001-11-11-1*` to filter on dates in the range `2001-11-10` to `2001-11-19`, or `2001-11-12T14:*` to filter any minute in the specified hour of the specified day.

Valid values for the `YYYY` section of the date are in the range `1900 - 9999`.

The time stamp is a string. Therefore, only the `equalTo` and `notEqualTo` operators can be used with the time stamp.

operator

Specifies one of the following operators:

lessThan

Use this operator only with integer attributes.

greaterThan

Use this operator only with integer attributes.

equalTo

Use this operator with any attribute.

notEqualTo

Use this operator with any attribute.

lessThanOrEqualTo

Use this operator only with integer attributes.

greaterThanOrEqualTo

Use this operator only with integer attributes.

value

Specifies the constant value to test against the attribute.

The value type is determined by the attribute type.

For string and boolean attributes, you can omit the value field after the colon. For string attributes, omit the value to return subscriptions with no value for the specified attribute. For boolean attributes, omit the value to return any subscriptions that have the specified attribute set to false. For example, the following filter returns all subscriptions where the topic name attribute is not specified:

```
filter=topic.name:equalTo:
```

A single asterisk, *, can be used for string attributes specified at the end of the value as a wildcard.

If the value includes non-alphanumeric characters, then they must be URL encoded. If the value contains a percent character or any asterisk that is not intended to be a wildcard, then the value must be URL encoded a second time. That is, a percent character must be encoded as %2525. An asterisk must be encoded as %252A.

id=id

Specifies the ID of a subscription that exists on the queue manager specified.

This query parameter cannot be used if you specify a subscription name in the resource URL or the name query parameter.

The ID is a string that contains a hexadecimal number. It can be comprised of a mixture of uppercase and lowercase characters.

name=name

Specifies a wildcard subscription name to filter on.

This query parameter cannot be used if you specify a subscription name in the resource URL or the id query parameter.

The *name* specified must either be blank or include an asterisk, *, as a wildcard. You can specify one of the following combinations:

Specifies that subscriptions that do have a blank name attribute are returned.

Specifies that all subscriptions are returned.

prefix*

Specifies that all subscriptions with the specified prefix in the subscription name are returned.

***suffix**

Specifies that all subscriptions with the specified suffix in the subscription name are returned.

prefix*suffix

Specifies that all subscriptions with the specified prefix and the specified suffix in the subscription name are returned.

Request headers

The following headers must be sent with the request:

Authorization

This header must be sent if you are using basic authentication. For more information, see [Using HTTP basic authentication with the REST API](#).

The following headers can optionally be sent with the request:

ibm-mq-rest-gateway-qmgr

This header specifies the queue manager that is to be used as the gateway queue manager. The gateway queue manager is used to connect to a remote queue manager. For more information, see [Remote administration using the REST API](#).

Request body format

None.

Security requirements

The caller must be authenticated to the mqweb server and must be a member of one or more of the MQWebAdmin, MQWebAdminRO, or MQWebUser roles. For more information about security for the administrative REST API, see [IBM MQ Console and REST API security](#).

The security principal of the caller must be granted the ability to issue the following PCF commands for the specified queue manager:

- For the subscription that is specified by the *{subscriptionName}* portion of the resource URL, the *id* query parameter, or for subscriptions that match the specified query parameters, authority to issue the **MQCMD_INQUIRE_SUBSCRIPTION** PCF command must be granted.

A principal has display authority if the principal can issue the **MQCMD_INQUIRE_SUBSCRIPTION** PCF command. If the principal has display authority for only some of the subscriptions that are specified by the resource URL and query parameters, then the array of subscriptions that is returned from the REST request is limited to those subscriptions that the principal has authority to display. No information is returned about subscriptions that cannot be displayed. If the principal does not have display authority for any of the subscriptions that are specified by the resource URL and query parameters, an HTTP status code of 403 is returned.

 On UNIX, Linux, and Windows, you can grant authority to security principals to use IBM MQ resources by using the **mqsetaut** command. For more information, see [mqsetaut](#).

 On z/OS, see [Setting up security on z/OS](#).

Response status codes

200

Subscriptions retrieved successfully.

400

Invalid data provided.

For example, invalid subscription attributes specified.

401

Not authenticated.

The caller must be authenticated to the mqweb server and must be a member of one or more of the MQWebAdmin, MQWebAdminRO, or MQWebUser roles. For more information, see [“Security requirements” on page 2021](#).

403

Not authorized.

The caller is authenticated to the mqweb server and is associated with a valid principal. However, the principal does not have access to all, or a subset of the required IBM MQ resources. For more information about the access that is required, see [“Security requirements” on page 2021](#).

404

Subscription does not exist.

500

Server issue or error code from IBM MQ.

503

Queue manager not running.

Response headers

The following headers are returned with the response:

Content-Type

This header is returned with a value of `application/json; charset=utf-8`.

ibm-mq-rest-gateway-qmgr

This header is returned if a remote queue manager is specified in the resource URL. The value of this header is the name of the queue manager that is used as the gateway queue manager.

Response body format

The response is in JSON format in UTF-8 encoding. The response contains an outer JSON object that contains a single JSON array called `subscription`. Each element in the array is a JSON object that represents information about a subscription. Each of these JSON objects contains the following attributes:

id

Hexadecimal string

Specifies the unique key that identifies the subscription.

This attribute is always returned.

name

String

Specifies the name of the subscription.

This attribute is always returned.

resolvedTopicString

String

Specifies the fully resolved topic string using the combined values from the topic name and defined string when the subscription was created.

This attribute is always returned.

The following objects can be included in the JSON object that represents information about a subscription. Which objects and attributes are returned depends on the URL that was specified for the request:

topic

Contains attributes that are related to a defined topic.

selector

Contains attributes that are related to the message selector.

destination

Contains attributes that are related to the destination queue / queue manager.

user

Contains attributes that are related to user, such as the accounting token, the user ID that owns the subscription and the user data.

general

Contains attributes that are related to general subscription properties, such whether the subscription is durable, how the subscription was created and whether wildcards should be interpreted in the topic string.

extended

Contains attributes that are related to extended subscription properties, such as the expiry time, the message priority, and the network scope.

timestamps

Contains attributes that are related to date and time information, such as the time stamp of when the subscription was created.

For more information, see [“Response body attributes for subscriptions” on page 2024](#).

If an error occurs, the response body contains an error message. For more information, see [REST API error handling](#).

Examples

- The following example lists all subscriptions on the queue manager QM1. The following URL is used with the HTTP GET method:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/subscription
```

The following JSON response is returned:

```
{
  "subscription":
  [
    {
      "id": "414D5120514D332020202020202020A878195911AFD206",
      "name": "SYSTEM.DEFAULT.SUB",
      "resolvedTopicString": ""
    },
    {
      "id": "414D5120514D3320202020202020202C0740592162214A",
      "name": "MySubscription",
      "resolvedTopicString": "sports/golf"
    },
    {
      "id": "414D5120514D3320202020202020202C07405921621307",
      "name": "QM1 SYSTEM.BROKER.INTER.BROKER.COMMUNICATIONS
414D51590101000000000000000000000000000000000000 SYSTEM.BROKER.ADMIN.STREAM MQ/QM1 /
StreamSupport",
      "resolvedTopicString": "SYSTEM.BROKER.ADMIN.STREAM/MQ/QM1 /StreamSupport"
    }
  ]
}
```

- The following example lists all subscriptions on the queue manager QM1, showing their topic properties. The following URL is used with the HTTP GET method:

```
https://localhost:9443/ibmmq/rest/v1/admin/qmgr/QM1/subscription?attributes=topic
```

The following JSON response is returned:

```
{
  "subscription":
  [
    {
      "id": "414D5120514D332020202020202020A878195911AFD206",
      "name": "SYSTEM.DEFAULT.SUB",
      "resolvedTopicString": "",
      "topic": {
        "definedString": "",
        "name": ""
      }
    },

      "name": "QM1 SYSTEM.BROKER.INTER.BROKER.COMMUNICATIONS"
    }
  ]
}
```

standard

Specifies that the selector references only the properties of the message, not its content, using the standard IBM MQ selector syntax. Selectors of this type are to be handled internally by the queue manager.

extended

Specifies that the selector uses extended selector syntax, typically referencing the content of the message. Selectors of this type cannot be handled internally by the queue manager; extended selectors can be handled only by another program such as IBM Integration Bus.

destination

The `destination` object contains attributes that are related to the destination queue / queue manager.

isManaged

Boolean.

Specifies whether the destination is managed.

qmgrName

String.

Specifies the name of the destination queue manager, either local or remote, to which messages for the subscription are forwarded.

name

String.

Specifies the name of the alias, local, remote, or cluster queue to which messages for this subscription are put.

correlationId

Hexadecimal.

Specifies the correlation identifier that is placed in the `CorrelId` field of the message descriptor for all the messages sent to this subscription.

user

The `user` object contains attributes that are related to user that created the subscription, such as the accounting token, the user ID that owns the subscription and the user data.

accountingToken

Hexadecimal.

Specifies the accounting token used in the `AccountingToken` field of the message descriptor.

applicationIdentityData

String.

Specifies the application identity data used in the `ApplIdentityData` field of the message descriptor.

data

String.

Specifies the user data associated with the subscription.

name

String.

Specifies the `userid` that 'owns' this subscription. This parameter is either the `userid` associated with the creator of the subscription, or, if subscription takeover is permitted, the `userid` which last took over the subscription.

isVariable

Boolean.

Specifies whether any user other than the one who created the subscription can take over ownership.

general

The `general` object contains attributes that are related to general subscription properties, such as whether the subscription is durable, how the subscription was created and whether wildcards should be interpreted in the topic string.

isDurable

Boolean.

Specifies whether this subscription is a durable subscription.

If the subscription is durable, the subscription persists, even if the creating application disconnects from the queue manager or issues an `MQCLOSE` call for the subscription. The queue manager reinstates the subscription during restart.

If the subscription is non-durable, the queue manager removes the subscription when the creating application disconnects from the queue manager or issues an `MQCLOSE` call for the subscription. If the subscription has a **`destination.class`** of `managed`, the queue manager removes any messages not yet consumed when it closes the subscription.

type

String.

Specifies how the subscription was created.

The value is one of the following values:

administrative

Created using `DEF SUB MQSC`, `REST` or `PCF` command. It also indicates that a subscription has been modified using an administrative command.

api

Created using an `MQSUB` API request.

proxy

Created internally and used for routing publications through a queue manager.

usesCharacterWildcard

Boolean.

Specifies the schema to be used when any wildcard characters that are contained in the topic string are interpreted.

If the value is set to `true`, wildcard characters represent portions of strings; this is for compatibility with IBM MQ 6.0 brokers.

If the value is set to `false`, wildcard characters represent portions of the topic hierarchy; this value is for compatibility with IBM Integration Bus brokers.

extended

The `extended` object contains attributes that are related to extended subscription properties, such as the expiry time, the message priority and the network scope.

expiry

Integer.

Specifies the time, in tenths of seconds, at which a subscription expires after its creation date.

A value of `-1` can be used to represent unlimited.

level

Integer.

Specifies the level within the subscription interception hierarchy at which this subscription is made.

messagePriority

String.

Specifies the priority of messages sent to this subscription. It has the range 0-9.

Additionally, the value can be one of the following values:

asPublished

The priority of messages sent to this subscription is taken from that priority supplied to the published message.

asQueue

The priority of messages sent to this subscription is determined by the default priority of the queue defined as a destination.

messagePropertyControl

String.

Specifies how publish/subscribe related message properties are added to messages sent to this subscription.

The value is one of the following values:

none

Specifies that publish/subscribe properties are not added to the messages.

compatible

Specifies that if the original publication is a PCF message, then the publish/subscribe properties are added as PCF attributes. Otherwise, publish/subscribe properties are added within an MQRFH version 1 header. This method is compatible with applications coded for use with previous versions of IBM MQ.

pcf

Specifies that publish/subscribe properties are added as PCF attributes.

rfh2

Specifies that publish/subscribe properties are added within an MQRFH version 2 header. This method is compatible with applications coded for use with IBM Integration Bus brokers.

deliverOnRequest

Boolean.

Specifies whether the subscriber polls for updates using the MQSUBRQ API call, or whether all publications are delivered to this subscription.

If the value is set to `true`, publications are only delivered to this subscription in response to an MQSUBRQ API call.

If the value is set to `false`, all publications on the topic are delivered to this subscription.

networkScope

String.

Specifies whether this subscription is passed to other queue managers in the network.

The value is one of the following values:

all

Specifies that the subscription is forwarded to all queue managers directly connected through a publish/subscribe collective or hierarchy.

qmgr

Specifies that the subscription forwards only messages that are published on the topic within this queue manager.

timestamps

The `timestamps` object contains attributes that are related to date and time information.

altered

String.

Specifies the date and time at which the subscription was last altered.

For more information about the time stamp format that is used to return the date and time, see [REST API time stamps](#).

created

String.

Specifies the date and time at which the subscription was created.

For more information about the time stamp format that is used to return the date and time, see [REST API time stamps](#).

V 9.0.2 REST API and PCF equivalents

For most REST API optional query parameters and attributes, an equivalent PCF parameter or attribute exists. Use these topics to understand these equivalents.

V 9.0.3 REST API and PCF equivalents for queue managers

For most REST API optional query parameters and attributes for queue managers, an equivalent PCF parameter or attribute exists. Use the tables that are provided to understand these equivalents.

- “Queue manager attribute equivalents” on page 2028
- “Unsupported PCF attributes” on page 2028

Queue manager attribute equivalents

<i>Table 108. Queue manager attributes for the REST API and equivalent PCF attributes.</i>			
REST API attribute	PCF attribute	Related values (REST API)	Related values (PCF)
name	MQCA_Q_MGR_NAME		
state	MQIACF_Q_MGR_STATU S		
status.started	MQCACF_Q_MGR_START _DATE MQCACF_Q_MGR_START _TIME		
status.channelInit iatorState	MQIACF_CHINIT_STAT US	MQSVC_STATUS_STOP PED MQSVC_STATUS_START ING MQSVC_STATUS_RUNN ING MQSVC_STATUS_STOP PING	stopped starting running stopping
status.ldapConnect ionState	MQIACF_LDAP_CONNEC TION_STATUS	MQLDAPC_CONNECTED MQLDAPC_ERROR MQLDAPC_INACTIVE	connected error disconnected
status.connectionC ount	MQIACF_CONNECTION_ COUNT		

Unsupported PCF attributes

The following queue manager PCF attributes are not supported by the administrative REST API qmgr resource:

- MQCA_INSTALLATION_DESC
- MQCA_INSTALLATION_NAME
- MQCA_INSTALLATION_PATH
- MQCACF_CURRENT_LOG_EXTENT_NAME
- MQCACF_LOG_PATH
- MQCACF_MEDIA_LOG_EXTENT_NAME
- MQCACF_RESTART_LOG_EXTENT_NAME

V 9.0.2 REST API and PCF equivalents for queues

For most REST API optional query parameters and attributes for queues, an equivalent PCF parameter or attribute exists. Use the tables that are provided to understand these equivalents.

- [“Optional query parameter equivalents” on page 2029](#)
- [“Queue attribute equivalents” on page 2030](#)
- [“Unsupported PCF attributes” on page 2037](#)

Optional query parameter equivalents

<i>Table 109. Queue optional query parameters for the REST API and equivalent PCF parameters.</i>			
REST API optional query parameter	PCF parameter	Related values (REST API)	Related values (PCF)
<code>commandScope=scope</code>	MQCACF_COMMAND_SCOPE	None.	None.

MQAI calls

Reference information for MQAI calls.

A list of reference information for the MQAI.

There are two types of selector: *user selector* and *system selector*. These are described in [“MQAI selectors”](#) on page 2130.

There are three types of call:

- Data-bag manipulation calls for configuring data bags:
 - [“mqAddBag”](#) on page 2053
 - [“mqAddByteString”](#) on page 2055
 - [“mqAddByteStringFilter”](#) on page 2056
 - [“mqAddInquiry”](#) on page 2058
 - [“mqAddInteger”](#) on page 2060
 - [“mqAddInteger64”](#) on page 2062
 - [“mqAddIntegerFilter”](#) on page 2063
 - [“mqAddString”](#) on page 2065
 - [“mqAddStringFilter”](#) on page 2067
 - [“mqClearBag”](#) on page 2072
 - [“mqCountItems”](#) on page 2073
 - [“mqCreateBag”](#) on page 2075
 - [“mqDeleteBag”](#) on page 2078
 - [“mqDeleteItem”](#) on page 2079
 - [“mqInquireBag”](#) on page 2087
 - [“mqInquireByteString”](#) on page 2089
 - [“mqInquireByteStringFilter”](#) on page 2091

- [“mqInquireInteger” on page 2094](#)
- [“mqInquireInteger64” on page 2096](#)
- [“mqInquireIntegerFilter” on page 2098](#)
- [“mqInquireItemInfo” on page 2100](#)
- [“mqInquireString” on page 2103](#)
- [“mqInquireStringFilter” on page 2105](#)
- [“mqSetByteString” on page 2111](#)
- [“mqSetByteStringFilter” on page 2113](#)
- [“mqSetInteger” on page 2116](#)
- [“mqSetInteger64” on page 2118](#)
- [“mqSetIntegerFilter” on page 2120](#)
- [“mqSetString” on page 2123](#)
- [“mqSetStringFilter” on page 2125](#)
- [“mqTruncateBag” on page 2129](#)
- Command calls for sending and receiving administration commands and PCF messages:
 - [“mqBagToBuffer” on page 2069](#)
 - [“mqBufferToBag” on page 2071](#)
 - [“mqExecute” on page 2081](#)
 - [“mqGetBag” on page 2084](#)
 - [“mqPutBag” on page 2109](#)
- Utility calls for handling blank-padded and null-terminated strings:
 - [“mqPad” on page 2108](#)
 - [“mqTrim” on page 2128](#)

These calls are described in alphabetical order in the following sections.

mqAddBag

The mqAddBag call nests a bag in another bag.

Syntax for mqAddBag

mqAddBag (*Bag, Selector, ItemValue, CompCode, Reason*)

Parameters for mqAddBag

Bag (MQHBAG) - input

Bag handle into which the item is to be added.

The bag must be a user bag. This means that it must have been created using the MQCBO_USER_BAG option on the mqCreateBag call. If the bag was not created in this way, MQRC_WRONG_BAG_TYPE results.

Selector (MQLONG) - input

Selector identifying the item to be nested.

If the selector is less than zero (that is, a system selector), MQRC_SELECTOR_OUT_OF_RANGE results.

If the selector is zero or greater (that is, a user selector) and the bag was created with the MQCBO_CHECK_SELECTORS option, the selector must be in the range MQGA_FIRST through MQGA_LAST; if not, again MQRC_SELECTOR_OUT_OF_RANGE results.

If MQCBO_CHECK_SELECTORS was not specified, the selector can be any value of zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence; MQRC_INCONSISTENT_ITEM_TYPE results if it is not.

ItemValue (MQHBAG) - input

The bag which is to be nested.

If the bag is not a group bag, MQRC_BAG_WRONG_TYPE results. If an attempt is made to add a bag to itself, MQRC_HBAG_ERROR results.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicate error conditions that can be returned from the mqAddBag call:

MQRC_BAG_WRONG_TYPE

Wrong type of bag for intended use (either Bag or ItemValue).

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INCONSISTENT_ITEM_TYPE

Data type of this occurrence of selector differs from data type of first occurrence.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

Usage notes for mqAddBag

If a bag with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily adjacent to the existing instance.

C language invocation for mqAddBag

```
mqAddBag (Bag, Selector, ItemValue, &CompCode, &Reason)
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */
MQLONG   Selector;      /* Selector */
MQHBAG   ItemValue;     /* Nested bag handle */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqAddBag

(Supported on Windows only.)

```
mqAddGroup Bag, Selector, ItemValue, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag       As Long 'Bag handle'
Dim Selector  As Long 'Selector'
Dim ItemValue As Long 'Nested bag handle'
```

```
Dim CompCode As Long 'Completion code'  
Dim Reason As Long 'Reason code qualifying CompCode'
```

Note: The `mqAddBag` call can be used with user bags only; you cannot add nested bags to administration or command bags. You can only nest group bags.

mqAddByteString

The `mqAddByteString` call adds a byte string identified by a user selector to the end of a specified bag.

Syntax for mqAddByteString

`mqAddByteString (Bag, Selector, BufferLength, Buffer, CompCode, Reason)`

Parameters for mqAddByteString

Bag (MQHBAG) - input

Handle of the bag to be modified.

This value must be the handle of a bag created by the user, not the handle of a system bag. `MQRC_SYSTEM_BAG_NOT_ALTERABLE` results if the value you specify relates to a system bag.

Selector (MQLONG) - input

Selector identifying the item to be added to the bag.

If the selector is less than zero (that is, a system selector), `MQRC_SELECTOR_OUT_OF_RANGE` results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the `MQCBO_CHECK_SELECTORS` option or as an administration bag (`MQCBO_ADMIN_BAG`), the selector must be in the range `MQBA_FIRST` through `MQBA_LAST`. `MQRC_SELECTOR_OUT_OF_RANGE` results if it is not in the correct range.

If `MQCBO_CHECK_SELECTORS` was not specified, the selector can be any value zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence; `MQRC_INCONSISTENT_ITEM_TYPE` results if it is not.

BufferLength (MQLONG) - input

The length in bytes of the string contained in the **Buffer** parameter. The value must be zero or greater.

Buffer (MQBYTE - BufferLength) - input

Buffer containing the byte string.

The length is given by the **BufferLength** parameter. If zero is specified for **BufferLength**, the null pointer can be specified for the address of the **Buffer** parameter. In all other cases, a valid (nonnull) address must be specified for the **Buffer** parameter.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqAddByteString` call:

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INCONSISTENT_ITEM_TYPE

Data type of this occurrence of selector differs from data type of first occurrence.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

Usage notes for mqAddByteString

1. If a data item with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily adjacent to the existing instance.
2. This call cannot be used to add a system selector to a bag.

C language invocation for mqAddByteString

```
mqAddByteString (hBag, Selector, BufferLength, Buffer, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */
MQLONG   Selector;      /* Selector */
MQLONG   BufferLength;  /* Buffer length */
PMQBYTE  Buffer;        /* Buffer containing item value */
MQLONG   CompCode;     /* Completion code */
MQLONG   Reason;       /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqAddByteString

(Supported on Windows only.)

```
mqAddByteString Bag, Selector, BufferLength, Buffer, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long 'Bag handle'
Dim Selector      As Long 'Selector'
Dim BufferLength  As Long 'Buffer length'
Dim Buffer        As Byte  'Buffer containing item value'
Dim CompCode     As Long  'Completion code'
Dim Reason       As Long  'Reason code qualifying CompCode'
```

mqAddByteStringFilter

The mqAddByteStringFilter call adds a byte string filter identified by a user selector to the end of a specified bag.

Syntax for mqAddByteStringFilter

mqAddByteStringFilter (*Bag, Selector, BufferLength, Buffer, Operator, CompCode, Reason*)

Parameters for mqAddByteStringFilter

Bag (MQHBAG) - input

Handle of the bag to be modified.

This value must be the handle of a bag created by the user, not the handle of a system bag. MQRC_SYSTEM_BAG_NOT_ALTERABLE results if the value you specify relates to a system bag.

Selector (MQLONG) - input

Selector identifying the item to be added to the bag.

If the selector is less than zero (that is, a system selector), MQRC_SELECTOR_OUT_OF_RANGE results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO_CHECK_SELECTORS option or as an administration bag (MQCBO_ADMIN_BAG), the selector must be in the range MQBA_FIRST through MQBA_LAST. MQRC_SELECTOR_OUT_OF_RANGE results if it is not in the correct range.

If MQCBO_CHECK_SELECTORS was not specified, the selector can be any value zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence; MQRC_INCONSISTENT_ITEM_TYPE results if it is not.

BufferLength (MQLONG) - input

The length in bytes of the condition byte string contained in the **Buffer** parameter. The value must be zero or greater.

Buffer (MQBYTE x BufferLength) - input

Buffer containing the condition byte string.

The length is given by the **BufferLength** parameter. If zero is specified for **BufferLength**, the null pointer can be specified for the address of the **Buffer** parameter. In all other cases, a valid (nonnull) address must be specified for the **Buffer** parameter.

Operator (MQLONG) - input

The byte string filter operator to be placed in the bag. Valid operators are of the form MQCFOP_*

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqAddByteStringFilter call:

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid.

MQRC_FILTER_OPERATOR_ERROR

Filter operator not valid.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INCONSISTENT_ITEM_TYPE

Data type of this occurrence of selector differs from data type of first occurrence.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

Usage notes for mqAddByteStringFilter

1. If a data item with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily adjacent to the existing instance.
2. This call cannot be used to add a system selector to a bag.

C language invocation for mqAddByteStringFilter

```
mqAddByteStringFilter (hBag, Selector, BufferLength, Buffer, Operator,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG    hBag;           /* Bag handle */  
MQLONG    Selector;      /* Selector */  
MQLONG    BufferLength;  /* Buffer length */  
PMQBYTE   Buffer;        /* Buffer containing item value */  
MQLONG    Operator;     /* Operator */  
PMQLONG   CompCode;     /* Completion code */  
PMQLONG   Reason;       /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqAddByteStringFilter

(Supported on Windows only.)

```
mqAddByteStringFilter Bag, Selector, BufferLength, Buffer, Operator, CompCode,  
Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long 'Bag handle'  
Dim Selector      As Long 'Selector'  
Dim BufferLength  As Long 'Buffer length'  
Dim Buffer        As String 'Buffer containing item value'  
Dim Operator     As Long 'Operator'  
Dim CompCode     As Long 'Completion code'  
Dim Reason       As Long 'Reason code qualifying CompCode'
```

mqAddInquiry

The mqAddInquiry call can be used with administration bags only; it is specifically for administration purposes.

The mqAddInquiry call adds a selector to an administration bag. The selector refers to an IBM MQ object attribute that is to be returned by a PCF INQUIRE command. The value of the **Selector** parameter specified on this call is added to the end of the bag, as the value of a data item that has the selector value MQIACF_INQUIRY.

Syntax for mqAddInquiry

mqAddInquiry (Bag, Selector, CompCode, Reason)

Parameters for mqAddInquiry

Bag (MQHBAG) - input

Bag handle.

The bag must be an administration bag; that is, it must have been created with the MQCBO_ADMIN_BAG option on the mqCreateBag call. If the bag was not created this way, MQRC_BAG_WRONG_TYPE results.

Selector (MQLONG) - input

Selector of the IBM MQ object attribute that is to be returned by the appropriate INQUIRE administration command.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicate error conditions that can be returned from the mqAddInquiry call:

MQRC_BAG_WRONG_TYPE

Wrong type of bag for intended use.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

Usage notes for mqAddInquiry

1. When the administration message is generated, the MQAI constructs an integer list with the MQIACF_*_ATTRS or MQIACH_*_ATTRS selector that is appropriate to the Command value specified on the mqExecute, mqPutBag, or mqBagToBuffer call. It then adds the values of the attribute selectors specified by the mqAddInquiry call.
2. If the Command value specified on the mqExecute, mqPutBag, or mqBagToBuffer call is not recognized by the MQAI, MQRC_INQUIRY_COMMAND_ERROR results. Instead of using the mqAddInquiry call, this can be overcome by using the mqAddInteger call with the appropriate MQIACF_*_ATTRS or MQIACH_*_ATTRS selector and the **ItemValue** parameter of the selector being inquired.

C language invocation for mqAddInquiry

```
mqAddInquiry (Bag, Selector, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */
MQLONG   Selector;      /* Selector */
MQLONG   CompCode;     /* Completion code */
MQLONG   Reason;       /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqAddInquiry

(Supported on Windows only.)

```
mqAddInquiry Bag, Selector, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'
Dim Selector As Long 'Selector'
```

```
Dim CompCode As Long 'Completion code'  
Dim Reason As Long 'Reason code qualifying CompCode'
```

Supported INQUIRE command codes

- MQCMD_INQUIRE_AUTH_INFO
- MQCMD_INQUIRE_AUTH_RECS
- MQCMD_INQUIRE_AUTH_SERVICE
- MQCMD_INQUIRE_CHANNEL
- MQCMD_INQUIRE_CHANNEL_STATUS
- MQCMD_INQUIRE_CLUSTER_Q_MGR
- MQCMD_INQUIRE_CONNECTION
- MQCMD_INQUIRE_LISTENER
- MQCMD_INQUIRE_LISTENER_STATUS
- MQCMD_INQUIRE_NAMELIST
- MQCMD_INQUIRE_PROCESS
- MQCMD_INQUIRE_Q
- MQCMD_INQUIRE_Q_MGR
- MQCMD_INQUIRE_Q_MGR_STATUS
- MQCMD_INQUIRE_Q_STATUS
- MQCMD_INQUIRE_SECURITY

For an example that demonstrates the use of supported INQUIRE command codes, see [Inquiring about queues and printing information \(amqsailq.c\)](#).

mqAddInteger

The `mqAddInteger` call adds an integer item identified by a user selector to the end of a specified bag.

Syntax for `mqAddInteger`

`mqAddInteger (Bag, Selector, ItemValue, CompCode, Reason)`

Parameters for `mqAddInteger`

Bag (MQHBAG) - input

Handle of the bag to be modified.

This must be the handle of a bag created by the user, not the handle of a system bag. MQRC_SYSTEM_BAG_NOT_ALTERABLE results if the value you specify identifies a system bag.

Selector (MQLONG)

Selector identifying the item to be added to the bag.

If the selector is less than zero (that is, a system selector), MQRC_SELECTOR_OUT_OF_RANGE results.

If the selector is zero or greater (that is, a user selector) and the bag was created with the MQCBO_CHECK_SELECTORS option or as an administration bag (MQCBO_ADMIN_BAG), the selector must be in the range MQIA_FIRST through MQIA_LAST; if not, again MQRC_SELECTOR_OUT_OF_RANGE results.

If MQCBO_CHECK_SELECTORS was not specified, the selector can be any value of zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence; MQRC_INCONSISTENT_ITEM_TYPE results if it is not.

ItemValue (MQLONG) - input

The integer value to be placed in the bag.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicate error conditions that can be returned from the `mqAddInteger` call:

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INCONSISTENT_ITEM_TYPE

Data type of this occurrence of selector differs from data type of first occurrence.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

Usage notes for `mqAddInteger`

1. If a data item with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily next to the existing instance.
2. This call cannot be used to add a system selector to a bag.

C language invocation for `mqAddInteger`

```
mqAddInteger (Bag, Selector, ItemValue, &CompCode, &Reason)
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */
MQLONG   Selector;      /* Selector */
MQLONG   ItemValue;     /* Integer value */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for `mqAddInteger`

(Supported on Windows only.)

```
mqAddInteger Bag, Selector, ItemValue, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long 'Bag handle'
Dim Selector      As Long 'Selector'
Dim ItemValue     As Long 'Integer value'
```

```
Dim CompCode As Long 'Completion code'
Dim Reason As Long 'Reason code qualifying CompCode'
```

mqAddInteger64

The mqAddInteger64 call adds a 64-bit integer item identified by a user selector to the end of a specified bag.

Syntax for mqAddInteger64

mqAddInteger64 (*Bag, Selector, ItemValue, CompCode, Reason*)

Parameters for mqAddInteger64

Bag (MQHBAG) - input

Handle of the bag to be modified.

This must be the handle of a bag created by the user, not the handle of a system bag. MQRC_SYSTEM_BAG_NOT_ALTERABLE results if the value you specify identifies a system bag.

Selector (MQLONG) - input

Selector identifying the item to be added to the bag.

If the selector is less than zero (that is, a system selector), MQRC_SELECTOR_OUT_OF_RANGE results.

If the selector is zero or greater (that is, a user selector) and the bag was created with the MQCBO_CHECK_SELECTORS option or as an administration bag (MQCBO_ADMIN_BAG), the selector must be in the range MQIA_FIRST through MQIA_LAST; if not, again MQRC_SELECTOR_OUT_OF_RANGE results.

If MQCBO_CHECK_SELECTORS was not specified, the selector can be any value of zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence; MQRC_INCONSISTENT_ITEM_TYPE results if it is not.

ItemValue (MQINT64) - input

The 64-bit integer value to be placed in the bag.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicate error conditions that can be returned from the mqAddInteger64 call:

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INCONSISTENT_ITEM_TYPE

Data type of this occurrence of selector differs from data type of first occurrence.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

Usage notes for mqAddInteger64

1. If a data item with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily adjacent to the existing instance.
2. This call cannot be used to add a system selector to a bag.

C language invocation for mqAddInteger64

```
mqAddInteger64 (Bag, Selector, ItemValue, &CompCode, &Reason)
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */
MQLONG   Selector;      /* Selector */
MQINT64  ItemValue;     /* Integer value */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqAddInteger64

(Supported on Windows only.)

```
mqAddInteger64 Bag, Selector, ItemValue, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long 'Bag handle'
Dim Selector      As Long 'Selector'
Dim Item Value    As Long 'Integer value'
Dim CompCode      As Long 'Completion code'
Dim Reason        As Long 'Reason code qualifying CompCode'
```

mqAddIntegerFilter

The mqAddIntegerFilter call adds an integer filter identified by a user selector to the end of a specified bag.

Syntax for mqAddIntegerFilter

mqAddIntegerFilter (*Bag, Selector, ItemValue, Operator, CompCode, Reason*)

Parameters for mqAddIntegerFilter

Bag (MQHBAG) - input

Handle of the bag to be modified.

This must be the handle of a bag created by the user, not the handle of a system bag.

MQRC_SYSTEM_BAG_NOT_ALTERABLE results if the value you specify identifies a system bag.

Selector (MQLONG) - input

Selector identifying the item to be added to the bag.

If the selector is less than zero (that is, a system selector), MQRC_SELECTOR_OUT_OF_RANGE results.

If the selector is zero or greater (that is, a user selector) and the bag was created with the MQCBO_CHECK_SELECTORS option or as an administration bag (MQCBO_ADMIN_BAG), the selector must be in the range MQIA_FIRST through MQIA_LAST; if not, again MQRC_SELECTOR_OUT_OF_RANGE results.

If MQCBO_CHECK_SELECTORS was not specified, the selector can be any value of zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence; MQRC_INCONSISTENT_ITEM_TYPE results if it is not.

ItemValue (MQLONG) - input

The integer condition value to be placed in the bag.

Operator (MQLONG) - input

The integer filter operator to be placed in the bag. Valid operators take the form MQCFOP_*

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicate error conditions that can be returned from the mqAddIntegerFilter call:

MQRC_FILTER_OPERATOR_ERROR

Filter operator not valid.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INCONSISTENT_ITEM_TYPE

Data type of this occurrence of selector differs from data type of first occurrence.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

Usage notes for mqAddIntegerFilter

1. If a data item with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily adjacent to the existing instance.
2. This call cannot be used to add a system selector to a bag.

C language invocation for mqAddIntegerFilter

```
mqAddIntegerFilter (Bag, Selector, ItemValue, Operator, &CompCode, &Reason)
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */
MQLONG   Selector;      /* Selector */
MQLONG   ItemValue;     /* Integer value */
MQLONG   Operator;      /* Item operator */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqAddIntegerFilter

(Supported on Windows only.)

```
mqAddIntegerFilter Bag, Selector, ItemValue, Operator, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long 'Bag handle'  
Dim Selector      As Long 'Selector'  
Dim ItemValue     As Long 'Integer value'  
Dim Operator      As Long 'Item Operator'  
Dim CompCode     As Long 'Completion code'  
Dim Reason       As Long 'Reason code qualifying CompCode'
```

mqAddString

The mqAddString call adds a character data item identified by a user selector to the end of a specified bag.

Syntax for mqAddString

mqAddString (*Bag*, *Selector*, *BufferLength*, *Buffer*, *CompCode*, *Reason*)

Parameters for mqAddString

Bag (MQHBAG) - input

Handle of the bag to be modified.

This value must be the handle of a bag created by the user, not the handle of a system bag. MQRC_SYSTEM_BAG_NOT_ALTERABLE results if the value you specify relates to a system bag.

Selector (MQLONG) - input

Selector identifying the item to be added to the bag.

If the selector is less than zero (that is, a system selector), MQRC_SELECTOR_OUT_OF_RANGE results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO_CHECK_SELECTORS option or as an administration bag (MQCBO_ADMIN_BAG), the selector must be in the range MQCA_FIRST through MQCA_LAST. MQRC_SELECTOR_OUT_OF_RANGE results if it is not in the correct range.

If MQCBO_CHECK_SELECTORS was not specified, the selector can be any value zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence; MQRC_INCONSISTENT_ITEM_TYPE results if it is not.

BufferLength (MQLONG) - input

The length in bytes of the string contained in the **Buffer** parameter. The value must be zero or greater, or the special value MQBL_NULL_TERMINATED:

- If MQBL_NULL_TERMINATED is specified, the string is delimited by the first null encountered in the string. The null is not added to the bag as part of the string.
- If MQBL_NULL_TERMINATED is not specified, *BufferLength* characters are inserted into the bag, even if null characters are present. Nulls do not delimit the string.

Buffer (MQCHAR x BufferLength) - input

Buffer containing the character string.

The length is given by the **BufferLength** parameter. If zero is specified for **BufferLength**, the null pointer can be specified for the address of the **Buffer** parameter. In all other cases, a valid (nonnull) address must be specified for the **Buffer** parameter.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqAddString` call:

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid.

MQRC_CODED_CHAR_SET_ID_ERROR

Bag CCSID is MQCCSI_EMBEDDED.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INCONSISTENT_ITEM_TYPE

Data type of this occurrence of selector differs from data type of first occurrence.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

Usage notes for `mqAddString`

1. If a data item with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily adjacent to the existing instance.
2. This call cannot be used to add a system selector to a bag.
3. The Coded Character Set ID associated with this string is copied from the current CCSID of the bag.

C language invocation for `mqAddString`

```
mqAddString (hBag, Selector, BufferLength, Buffer, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG    hBag;           /* Bag handle */
MQLONG    Selector;      /* Selector */
MQLONG    BufferLength;   /* Buffer length */
PMQCHAR   Buffer;        /* Buffer containing item value */
MQLONG    CompCode;      /* Completion code */
MQLONG    Reason;       /* Reason code qualifying CompCode */
```

Visual Basic invocation for `mqAddString`

(Supported on Windows only.)

```
mqAddString Bag, Selector, BufferLength, Buffer, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long 'Bag handle'  
Dim Selector      As Long 'Selector'  
Dim BufferLength  As Long 'Buffer length'  
Dim Buffer        As String 'Buffer containing item value'  
Dim CompCode     As Long 'Completion code'  
Dim Reason       As Long 'Reason code qualifying CompCode'
```

mqAddStringFilter

The mqAddStringFilter call adds a string filter identified by a user selector to the end of a specified bag.

Syntax for mqAddStringFilter

mqAddStringFilter (*Bag, Selector, BufferLength, Buffer, Operator, CompCode, Reason*)

Parameters for mqAddStringFilter

Bag (MQHBAG) - input

Handle of the bag to be modified.

This value must be the handle of a bag created by the user, not the handle of a system bag. MQRC_SYSTEM_BAG_NOT_ALTERABLE results if the value you specify relates to a system bag.

Selector (MQLONG) - input

Selector identifying the item to be added to the bag.

If the selector is less than zero (that is, a system selector), MQRC_SELECTOR_OUT_OF_RANGE results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO_CHECK_SELECTORS option or as an administration bag (MQCBO_ADMIN_BAG), the selector must be in the range MQCA_FIRST through MQCA_LAST. MQRC_SELECTOR_OUT_OF_RANGE results if it is not in the correct range.

If MQCBO_CHECK_SELECTORS was not specified, the selector can be any value zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence; MQRC_INCONSISTENT_ITEM_TYPE results if it is not.

BufferLength (MQLONG) - input

The length in bytes of the character condition string contained in the **Buffer** parameter. The value must be zero or greater, or the special value MQBL_NULL_TERMINATED:

- If MQBL_NULL_TERMINATED is specified, the string is delimited by the first null encountered in the string. The null is not added to the bag as part of the string.
- If MQBL_NULL_TERMINATED is not specified, *BufferLength* characters are inserted into the bag, even if null characters are present. Nulls do not delimit the string.

Buffer (MQCHAR x BufferLength) - input

Buffer containing the character condition string.

The length is given by the **BufferLength** parameter. If zero is specified for **BufferLength**, the null pointer can be specified for the address of the **Buffer** parameter. In all other cases, a valid (nonnull) address must be specified for the **Buffer** parameter.

Operator (MQLONG) - input

The string filter operator to be placed in the bag. Valid operators are of the form MQCFOP_*

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqAddStringFilter` call:

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid.

MQRC_CODED_CHAR_SET_ID_ERROR

Bag CCSID is MQCCSI_EMBEDDED.

MQRC_FILTER_OPERATOR_ERROR

Filter operator not valid.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INCONSISTENT_ITEM_TYPE

Data type of this occurrence of selector differs from data type of first occurrence.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

Usage notes for `mqAddStringFilter`

1. If a data item with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily adjacent to the existing instance.
2. This call cannot be used to add a system selector to a bag.
3. The Coded Character Set ID associated with this string is copied from the current CCSID of the bag.

C language invocation for `mqAddStringFilter`

```
mqAddStringFilter (hBag, Selector, BufferLength, Buffer, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG    hBag;           /* Bag handle */
MQLONG    Selector;       /* Selector */
MQLONG    BufferLength;    /* Buffer length */
PMQCHAR   Buffer;         /* Buffer containing item value */
MQLONG    Operator;       /* Operator */
MQLONG    CompCode;      /* Completion code */
MQLONG    Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for `mqAddStringFilter`

(Supported on Windows only.)

```
mqAddStringFilter Bag, Selector, BufferLength, Buffer, Operator, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long 'Bag handle'  
Dim Selector     As Long 'Selector'  
Dim BufferLength  As Long 'Buffer length'  
Dim Buffer        As String 'Buffer containing item value'  
Dim Operator     As Long 'Item operator'  
Dim CompCode     As Long 'Completion code'  
Dim Reason       As Long 'Reason code qualifying CompCode'
```

mqBagToBuffer

The mqBagToBuffer call converts the bag into a PCF message in the supplied buffer.

Syntax for mqBagToBuffer

mqBagToBuffer (*OptionsBag*, *DataBag*, *BufferLength*, *Buffer*, *DataLength*, *CompCode*, *Reason*)

Parameters for mqBagToBuffer

OptionsBag (MQHBAG) - input

Handle of the bag containing options that control the processing of the call. This is a reserved parameter; the value must be MQHB_NONE.

DataBag (MQHBAG) - input

The handle of the bag to convert.

If the bag contains an administration message and mqAddInquiry was used to insert values into the bag, the value of the MQIASY_COMMAND data item must be an INQUIRE command that is recognized by the MQAI; MQRC_INQUIRY_COMMAND_ERROR results if it is not.

If the bag contains nested system bags, MQRC_NESTED_BAG_NOT_SUPPORTED results.

BufferLength (MQLONG) - input

Length in bytes of the buffer supplied.

If the buffer is too small to accommodate the message generated, MQRC_BUFFER_LENGTH_ERROR results.

Buffer (MQBYTE x BufferLength) - output

The buffer to hold the message.

DataLength (MQLONG) - output

The length in bytes of the buffer required to hold the entire bag. If the buffer is not long enough, the contents of the buffer are undefined but the DataLength is returned.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqBagToBuffer call:

MQRC_BAG_WRONG_TYPE

Input data bag is a group bag.

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid or buffer too small. (Required length returned in *DataLength*.)

MQRC_DATA_LENGTH_ERROR

DataLength parameter not valid (invalid parameter address).

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INQUIRY_COMMAND_ERROR

mqAddInquiry used with a command code that is not recognized as an INQUIRE command.

MQRC_NESTED_BAG_NOT_SUPPORTED

Input data bag contains one or more nested system bags.

MQRC_OPTIONS_ERROR

Options bag contains unsupported data items or a supported option has an invalid value.

MQRC_PARAMETER_MISSING

An administration message requires a parameter that is not present in the bag.

Note: This reason code occurs for bags created with the MQCBO_ADMIN_BAG or MQCBO_REORDER_AS_REQUIRED options only.

MQRC_SELECTOR_WRONG_TYPE

mqAddString or mqSetString was used to add the MQIACF_INQUIRY selector to the bag.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

Usage notes for mqBagToBuffer

1. The PCF message is generated with an encoding of MQENC_NATIVE for the numeric data.
2. The buffer that holds the message can be null if the BufferLength is zero. This is useful if you use the mqBagToBuffer call to calculate the size of buffer necessary to convert your bag.

C language invocation for mqBagToBuffer

```
mqBagToBuffer (OptionsBag, DataBag, BufferLength, Buffer, &DataLength,
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG OptionsBag;      /* Options bag handle */
MQHBAG DataBag;        /* Data bag handle */
MQLONG BufferLength;    /* Buffer length */
MQBYTE Buffer[n];      /* Buffer to contain PCF */
MQLONG DataLength;     /* Length of PCF returned in buffer */
MQLONG CompCode;      /* Completion code */
MQLONG Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqBagToBuffer

(Supported on Windows only.)

```
mqBagToBuffer OptionsBag, DataBag, BufferLength, Buffer, DataLength,
CompCode, Reason
```

Declare the parameters as follows:

```
Dim OptionsBag As Long 'Options bag handle'
Dim DataBag As Long 'Data bag handle'
Dim BufferLength As Long 'Buffer length'
Dim Buffer As Long 'Buffer to contain PCF'
Dim DataLength As Long 'Length of PCF returned in buffer'
Dim CompCode As Long 'Completion code'
Dim Reason As Long 'Reason code qualifying CompCode'
```

mqBufferToBag

The mqBufferToBag call converts the supplied buffer into bag form.

Syntax for mqBufferToBag

mqBufferToBag (*OptionsBag*, *BufferLength*, *Buffer*, *DataBag*, *CompCode*, *Reason*)

Parameters for mqBufferToBag

OptionsBag (MQHBAG) - input

Handle of the bag containing options that control the processing of the call. This is a reserved parameter; the value must be MQHB_NONE.

BufferLength (MQLONG) - input

Length in bytes of the buffer.

Buffer (MQBYTE x BufferLength) - input

Pointer to the buffer containing the message to be converted.

Databag (MQHBAG) - input/output

Handle of the bag to receive the message. The MQAI performs an mqClearBag call on the bag before placing the message in the bag.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqBufferToBag call:

MQRC_BAG_CONVERSION_ERROR

Data could not be converted into a bag. This indicates a problem with the format of the data to be converted into a bag (for example, the message is not a valid PCF).

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INCONSISTENT_ITEM_TYPE

Data type of second occurrence of selector differs from data type of first occurrence.

MQRC_OPTIONS_ERROR

Options bag contains unsupported data items, or a supported option has a value that is not valid.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

Usage notes for mqBufferToBag

The buffer must contain a valid PCF message. The encoding of numeric data in the buffer must be MQENC_NATIVE.

The Coded Character Set ID of the bag is unchanged by this call.

C language invocation for mqBufferToBag

```
mqBufferToBag (OptionsBag, BufferLength, Buffer, DataBag,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  OptionsBag;    /* Options bag handle */  
MQLONG  BufferLength;  /* Buffer length */  
MQBYTE  Buffer[n];     /* Buffer containing PCF */  
MQHBAG  DataBag;      /* Data bag handle */  
MQLONG  CompCode;     /* Completion code */  
MQLONG  Reason;       /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqBufferToBag

(Supported on Windows only.)

```
mqBufferToBag OptionsBag, BufferLength, Buffer, DataBag,  
CompCode, Reason
```

Declare the parameters as follows:

```
Dim OptionsBag As Long 'Options bag handle'  
Dim BufferLength As Long 'Buffer length'  
Dim Buffer As Long 'Buffer containing PCF'  
Dim DataBag As Long 'Data bag handle'  
Dim CompCode As Long 'Completion code'  
Dim Reason As Long 'Reason code qualifying CompCode'
```

mqClearBag

The mqClearBag call deletes all user items from the bag, and resets system items to their initial values.

Syntax for mqClearBag

mqClearBag (Bag, CompCode, Reason)

Parameters for mqClearBag

Bag (MQHBAG) - input

Handle of the bag to be cleared. This must be the handle of a bag created by the user, not the handle of a system bag. MQRC_SYSTEM_BAG_NOT_ALTERABLE results if you specify the handle of a system bag.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqClearBag call:

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

Usage notes for mqClearBag

1. If the bag contains system bags, they are also deleted.
2. The call cannot be used to clear system bags.

C language invocation for mqClearBag

```
mqClearBag (Bag, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqClearBag

(Supported on Windows only.)

```
mqClearBag Bag, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

mqCountItems

The mqCountItems call returns the number of occurrences of user items, system items, or both, that are stored in a bag with the same specific selector.

Syntax for mqCountItems

mqCountItems (Bag, Selector, ItemCount, CompCode, Reason)

Parameters for mqCountItems

Bag (MQHBAG) - input

Handle of the bag with items that are to be counted. This can be a user bag or a system bag.

Selector (MQLONG) - input

Selector of the data items to count.

If the selector is less than zero (a system selector), the selector must be one that is supported by the MQAI. MQRC_SELECTOR_NOT_SUPPORTED results if it is not.

If the specified selector is not present in the bag, the call succeeds and zero is returned for *ItemCount*.

The following special values can be specified for *Selector*:

MQSEL_ALL_SELECTORS

All user and system items are to be counted.

MQSEL_ALL_USER_SELECTORS

All user items are to be counted; system items are excluded from the count.

MQSEL_ALL_SYSTEM_SELECTORS

All system items are to be counted; user items are excluded from the count.

ItemCount (MQLONG) - output

Number of items of the specified type in the bag (can be zero).

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqCountItems` call:

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_ITEM_COUNT_ERROR

ItemCount parameter not valid (invalid parameter address).

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

Usage notes for mqCountItems

This call counts the number of data items, not the number of unique selectors in the bag. A selector can occur multiple times, so there might be fewer unique selectors in the bag than data items.

C language invocation for mqCountItems

```
mqCountItems (Bag, Selector, &ItemCount, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG Bag;           /* Bag handle */
MQLONG Selector;      /* Selector */
MQLONG ItemCount;     /* Number of items */
MQLONG CompCode;     /* Completion code */
MQLONG Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqCountItems

(Supported on Windows only.)

```
mqCountItems Bag, Selector, ItemCount, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag;           As Long 'Bag handle'
Dim Selector       As Long 'Selector'
Dim ItemCount      As Long 'Number of items'
Dim CompCode       As Long 'Completion code'
Dim Reason         As Long 'Reason code qualifying CompCode'
```

mqCreateBag

The mqCreateBag call creates a new bag.

Syntax for mqCreateBag

mqCreateBag (*Options, Bag, CompCode, Reason*)

Parameters for mqCreateBag

Options (MQLONG) - input

Options for creation of the bag.

The following values are valid:

MQCBO_ADMIN_BAG

Specifies that the bag is for administering IBM MQ objects. MQCBO_ADMIN_BAG automatically implies the MQCBO_LIST_FORM_ALLOWED, MQCBO_REORDER_AS_REQUIRED, and MQCBO_CHECK_SELECTORS options.

Administration bags are created with the MQIASY_TYPE system item set to MQCFT_COMMAND.

MQCBO_COMMAND_BAG

Specifies that the bag is a command bag. MQCBO_COMMAND_BAG is an alternative to the administration bag (MQCBO_ADMIN_BAG) and MQRC_OPTIONS_ERROR results if both are specified.

A command bag is processed in the same way as a user bag except that the value of the MQIASY_TYPE system item is set to MQCFT_COMMAND when the bag is created.

The command bag is also created for administering objects but they are not used to send administration messages to a command server as an administration bag is. The bag options assume the following default values:

- MQCBO_LIST_FORM_INHIBITED
- MQCBO_DO_NOT_REORDER
- MQCBO_DO_NOT_CHECK_SELECTORS

Therefore, the MQAI does not change the order of data items or create lists within a message as with administration bags.

MQCBO_GROUP_BAG

Specifies that the bag is a group bag. This means that the bag is used to hold a set of grouped items. Group bags cannot be used for the administration of IBM MQ objects. The bag options assume the following default values:

- MQCBO_LIST_FORM_ALLOWED
- MQCBO_REORDER_AS_REQUIRED
- MQCBO_DO_NOT_CHECK_SELECTORS

Therefore, the MQAI can change the order of data items or create lists within a bag of grouped items.

Group bags are created with two system selectors: MQIASY_BAG_OPTIONS and MQIASY_CODED_CHAR_SET_ID.

If a group bag is nested in a bag in which MQCBO_CHECK_SELECTORS was specified, the group bag to be nested has its selectors checked at that point whether MQCBO_CHECK_SELECTORS was specified when the group bag was created.

MQCBO_USER_BAG

Specifies that the bag is a user bag. MQCBO_USER_BAG is the default bag-type option. User bags can also be used for the administration of IBM MQ objects, but the MQCBO_LIST_FORM_ALLOWED and MQCBO_REORDER_AS_REQUIRED options must be specified to ensure correct generation of the administration messages.

User bags are created with the MQIASY_TYPE system item set to MQCFT_USER.

For user bags, one or more of the following options can be specified:

MQCBO_LIST_FORM_ALLOWED

Specifies that the MQAI can use the more compact list form in the message sent whenever there are two or more adjacent occurrences of the same selector in the bag. However, the items cannot be reordered if this option is used. Therefore, if the occurrences of the selector are not adjacent in the bag, and MQCBO_REORDER_AS_REQUIRED is not specified, the MQAI cannot use the list form for that particular selector.

If the data items are character strings, these strings must have the same Character Set ID and the same selector, in order to be compacted into list form. If the list form is used, the shorter strings are padded with blanks to the length of the longest string.

This option must be specified if the message to be sent is an administration message but MQCBO_ADMIN_BAG is not specified.

Note: MQCBO_LIST_FORM_ALLOWED does not imply that the MQAI definitely uses the list form. The MQAI considers various factors in deciding whether to use the list form.

MQCBO_LIST_FORM_INHIBITED

Specifies that the MQAI cannot use the list form in the message sent, even if there are adjacent occurrences of the same selector in the bag. MQCBO_LIST_FORM_INHIBITED is the default list-form option.

MQCBO_REORDER_AS_REQUIRED

Specifies that the MQAI can change the order of the data items in the message sent. This option does not affect the order of the items in the sending bag.

This option means that you can insert items into a data bag in any order. That is, the items do not need to be inserted in the way that they must be in the PCF message, because the MQAI can reorder these items as required.

If the message is a user message, the order of the items in the receiving bag is the same as the order of the items in the message. This order can be different from the order of the items in the sending bag.

If the message is an administration message, the order of the items in the receiving bag is determined by the message received.

This option must be specified if the message to be sent is an administration message but MQCBO_ADMIN is not specified.

MQCBO_DO_NOT_REORDER

Specifies that the MQAI cannot change the order of data items in the message sent. Both the message sent and the receiving bag contain the items in the same order as they occur in the sending bag. This option is the default ordering option.

MQCBO_CHECK_SELECTORS

Specifies that user selectors (selectors that are zero or greater) must be checked to ensure that the selector is consistent with the data type implied by the mqAddInteger, mqAddInteger64, mqAddIntegerFilter, mqAddString, mqAddStringFilter, mqAddByteString, mqAddByteStringFilter, mqSetInteger, mqSetInteger64, mqSetIntegerFilter, mqSetString, mqSetStringFilter, mqSetByteString, or mqSetByteStringFilter call:

- For the integer, 64-bit integer, and integer filter calls, the selector must be in the range MQIA_FIRST through MQIA_LAST.

- For the string and string filter calls, the selector must be in the range MQCA_FIRST through MQCA_LAST.
- For byte string and byte string filter calls, the selector must be in the range MQBA_FIRST through MQBA_LAST
- For group bag calls, the selector must be in the range MQGA_FIRST through MQGA_LAST
- For the handle calls, the selector must be in the range MQHA_FIRST through MQHA_LAST.

The call fails if the selector is outside the valid range. System selectors (selectors less than zero) are always checked, and if a system selector is specified, it must be one that is supported by the MQAI.

MQCBO_DO_NOT_CHECK_SELECTORS

Specifies that user selectors (selectors that are zero or greater) are not checked. Any selector that is zero or positive can be used with any call. This option is the default selectors option. System selectors (selectors less than zero) are always checked.

MQCBO_NONE

Specifies that all options must have their default values. This option is provided to aid program documentation, and must not be specified with any of the options that have a nonzero value.

The following list summarizes the default option values:

- MQCBO_USER_BAG
 - MQCBO_LIST_FORM_INHIBITED
 - MQCBO_DO_NOT_REORDER
 - MQCBO_DO_NOT_CHECK_SELECTORS

Bag (MQHBAG) - output

The handle of the bag created by the call.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqCreateBag call:

MQRC_HBAG_ERROR

Bag handle not valid (invalid parameter address or the parameter location is read-only).

MQRC_OPTIONS_ERROR

Options not valid or not consistent.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

Usage notes for mqCreateBag

Any options used for creating your bag are contained in a system item within the bag when it is created.

C language invocation for mqCreateBag

```
mqCreateBag (Options, &Bag, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQLONG  Options;          /* Bag options */
MQHBAG  Bag;             /* Bag handle */
```

```
MQLONG  CompCode;      /* Completion code */
MQLONG  Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqCreateBag

(Supported on Windows only.)

```
mqCreateBag Options, Bag, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Options As Long 'Bag options'
Dim Bag As Long 'Bag handle'
Dim CompCode As Long 'Completion code'
Dim Reason As Long 'Reason code qualifying CompCode'
```

mqDeleteBag

The mqDeleteBag call deletes the specified bag.

Syntax for mqDeleteBag

mqDeleteBag (*Bag*, *CompCode*, *Reason*)

Parameters for mqDeleteBag

Bag (MQHBAG) - input/output

The handle of the bag to be deleted. This must be the handle of a bag created by the user, not the handle of a system bag. MQRC_SYSTEM_BAG_NOT_DELETABLE results if you specify the handle of a system bag. The handle is reset to MQHB_UNUSABLE_HBAG.

If the bag contains system-generated bags, they are also deleted.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqDeleteBag call:

MQRC_HBAG_ERROR

Bag handle not valid, or invalid parameter address, or parameter location is read only.

MQRC_SYSTEM_BAG_NOT_DELETABLE

System bag cannot be deleted.

Usage notes for mqDeleteBag

1. Delete any bags created with mqCreateBag.
2. Nested bags are deleted automatically when the containing bag is deleted.

C language invocation for mqDeleteBag

```
mqDeleteBag (&Bag, CompCode, Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */
MQLONG  CompCode;     /* Completion code */
MQLONG  Reason;       /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqDeleteBag

(Supported on Windows only.)

```
mqDeleteBag Bag, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag;           As Long 'Bag handle'
Dim CompCode As Long 'Completion code'
Dim Reason As Long 'Reason code qualifying CompCode'
```

mqDeleteItem

The mqDeleteItem call removes one or more user items from a bag.

Syntax for mqDeleteItem

mqDeleteItem (*Bag, Selector, ItemIndex, CompCode, Reason*)

Parameters for mqDeleteItem

Hbag (MQHBAG) - input

Handle of the bag to be modified.

This must be the handle of a bag created by the user, and not the handle of a system bag; MQRC_SYSTEM_BAG_NOT_ALTERABLE results if it is a system bag.

Selector (MQLONG) - input

Selector identifying the user item to be deleted.

If the selector is less than zero (that is, a system selector), MQRC_SELECTOR_OUT_OF_RANGE results.

The following special values are valid:

MQSEL_ANY_SELECTOR

The item to be deleted is a user item identified by the **ItemIndex** parameter, the index relative to the set of items that contains both user and system items.

MQSEL_ANY_USER_SELECTOR

The item to be deleted is a user item identified by the **ItemIndex** parameter, the index relative to the set of user items.

If an explicit selector value is specified, but the selector is not present in the bag, the call succeeds if MQIND_ALL is specified for ItemIndex, and fails with reason code MQRC_SELECTOR_NOT_PRESENT if MQIND_ALL is not specified.

ItemIndex (MQLONG) - input

Index of the data item to be deleted.

The value must be zero or greater, or one of the following special values:

MQIND_NONE

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results. If MQIND_NONE is specified with one of the MQSEL_XXX_SELECTOR values, MQRC_INDEX_ERROR results.

MQIND_ALL

This specifies that all occurrences of the selector in the bag are to be deleted. If MQIND_ALL is specified with one of the MQSEL_XXX_SELECTOR values, MQRC_INDEX_ERROR results. If MQIND_ALL is specified when the selector is not present within the bag, the call succeeds.

If MQSEL_ANY_SELECTOR is specified for the **Selector** parameter, the **ItemIndex** parameter is the index relative to the set of items that contains both user items and system items, and must be zero or greater. If ItemIndex identifies a system selector MQRC_SYSTEM_ITEM_NOT_DELETABLE results. If MQSEL_ANY_USER_SELECTOR is specified for the **Selector** parameter, the **ItemIndex** parameter is the index relative to the set of user items, and must be zero or greater.

If an explicit selector value is specified, ItemIndex is the index relative to the set of items that have that selector value, and can be MQIND_NONE, MQIND_ALL, zero, or greater.

If an explicit index is specified (that is, not MQIND_NONE or MQIND_ALL) and the item is not present in the bag, MQRC_INDEX_NOT_PRESENT results.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqDeleteItem call:

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

MQIND_NONE or MQIND_ALL specified with one of the MQSEL_ANY_XXX_SELECTOR values.

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag.

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_UNIQUE

MQIND_NONE specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag is read only and cannot be altered.

MQRC_SYSTEM_ITEM_NOT_DELETABLE

System item is read only and cannot be deleted.

Usage notes for mqDeleteItem

1. Either a single occurrence of the specified selector can be removed, or all occurrences of the specified selector.
2. The call cannot remove system items from the bag, or remove items from a system bag. However, the call can remove the handle of a system bag from a user bag. This way, a system bag can be deleted.

C language invocation for mqDeleteItem

```
mqDeleteItem (Bag, Selector, ItemIndex, &CompCode, &Reason)
```

Declare the parameters as follows:

```
MQHBAG   Hbag;           /* Bag handle */
MQLONG   Selector;       /* Selector */
MQLONG   ItemIndex;     /* Index of the data item */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqDeleteItem

(Supported on Windows only.)

```
mqDeleteItem Bag, Selector, ItemIndex, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'
Dim Selector As Long 'Selector'
Dim ItemIndex As Long 'Index of the data item'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

mqExecute

The mqExecute call sends an administration command message and waits for the reply (if expected).

Syntax for mqExecute

mqExecute (*Hconn*, *Command*, *OptionsBag*, *AdminBag*, *ResponseBag*, *AdminQ*, *ResponseQ*, *CompCode*, *Reason*)

Parameters for mqExecute

Hconn (MQHCONN) - input

MQI Connection handle.

This is returned by a preceding MQCONN call issued by the application.

Command (MQLONG) - input

The command to be executed.

This should be one of the MQCMD_* values. If it is a value that is not recognized by the MQAI servicing the mqExecute call, the value is still accepted. However, if mqAddInquiry was used to insert values in the bag, the **Command** parameter must be an INQUIRE command recognized by the MQAI; MQRC_INQUIRY_COMMAND_ERROR results if it is not.

OptionsBag (MQHBAG) - input

Handle of a bag containing options that affect the operation of the call.

This must be the handle returned by a preceding mqCreateBag call or the following special value:

MQHB_NONE

No options bag; all options assume their default values.

Only the options listed in this topic can be present in the options bag (MQRC_OPTIONS_ERROR results if other data items are present).

The appropriate default value is used for each option that is not present in the bag. The following option can be specified:

MQIACF_WAIT_INTERVAL

This data item specifies the maximum time in milliseconds that the MQAI should wait for each reply message. The time interval must be zero or greater, or the special value MQWI_UNLIMITED; the default is thirty seconds. The mqExecute call completes either when all of the reply messages

are received or when the specified wait interval expires without the expected reply message having been received.

Note: The time interval is an approximate quantity.

If the MQIACF_WAIT_INTERVAL data item has the wrong data type, or there is more than one occurrence of that selector in the options bag, or the value of the data item is not valid, MQRC_WAIT_INTERVAL_ERROR results.

AdminBag (MQHBAG) - input

Handle of the bag containing details of the administration command to be issued.

All user items placed in the bag are inserted into the administration message that is sent. It is the application's responsibility to ensure that only valid parameters for the command are placed in the bag.

If the value of the MQIASY_TYPE data item in the command bag is not MQCFT_COMMAND, MQRC_COMMAND_TYPE_ERROR results. If the bag contains nested system bags, MQRC_NESTED_BAG_NOT_SUPPORTED results.

ResponseBag (MQHBAG) - input

Handle of the bag where reply messages are placed.

The MQAI performs an mqClearBag call on the bag before placing reply messages in the bag. To retrieve the reply messages, the selector, MQIACF_CONVERT_RESPONSE, can be specified.

Each reply message is placed into a separate system bag, with a handle that is then placed in the response bag. Use the mqInquireBag call with selector MQHA_BAG_HANDLE to determine the handles of the system bags within the reply bag, and those bags can then be inquired to determine their contents.

If some but not all of the expected reply messages are received, MQCC_WARNING with MQRC_NO_MSG_AVAILABLE results. If none of the expected reply messages is received, MQCC_FAILED with MQRC_NO_MSG_AVAILABLE results.

Group bags cannot be used as response bags.

AdminQ (MQHOBJ) - input

Object handle of the queue on which the administration message is to be placed.

This handle was returned by a preceding MQOPEN call issued by the application. The queue must be open for output.

The following special value can be specified:

MQHO_NONE

This indicates that the administration message should be placed on the SYSTEM.ADMIN.COMMAND.QUEUE belonging to the currently connected queue manager. If MQHO_NONE is specified, the application need not use MQOPEN to open the queue.

ResponseQ

Object handle of the queue on which reply messages are placed.

This handle was returned by a preceding MQOPEN call issued by the application. The queue must be open for input and for inquiry.

The following special value can be specified:

MQHO_NONE

This indicates that the reply messages should be placed on a dynamic queue created automatically by the MQAI. The queue is created by opening SYSTEM.DEFAULT.MODEL.QUEUE, that must therefore have suitable characteristics. The queue created exists for the duration of the call only, and is deleted by the MQAI on exit from the mqExecute call.

CompCode

Completion code.

Reason

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqExecute` call:

MQRC_*

Anything from the `MQINQ`, `MQPUT`, `MQGET`, or `MQOPEN` calls.

MQRC_BAG_WRONG_TYPE

Input data bag is a group bag.

MQRC_CMD_SERVER_NOT_AVAILABLE

The command server that processes administration commands is not available.

MQRC_COMMAND_TYPE_ERROR

The value of the `MQIASY_TYPE` data item in the request bag is not `MQCFT_COMMAND`.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INQUIRY_COMMAND_ERROR

`mqAddInteger` call used with a command code that is not a recognized `INQUIRE` command.

MQRC_NESTED_BAG_NOT_SUPPORTED

Input data bag contains one or more nested system bags.

MQRC_NO_MSG_AVAILABLE

Some reply messages received, but not all. Reply bag contains system-generated bags for messages that were received.

MQRC_NO_MSG_AVAILABLE

No reply messages received during the specified wait interval.

MQRC_OPTIONS_ERROR

Options bag contains unsupported data items, or a supported option has a value which is not valid.

MQRC_PARAMETER_MISSING

Administration message requires a parameter which is not present in the bag. This reason code occurs for bags created with the `MQCBO_ADMIN_BAG` or `MQCBO_REORDER_AS_REQUIRED` options only.

MQRC_SELECTOR_NOT_UNIQUE

Two or more instances of a selector exist within the bag for a mandatory parameter that permits one instance only.

MQRC_SELECTOR_WRONG_TYPE

`mqAddString` or `mqSetString` was used to add the `MQIACF_INQUIRY` selector to the bag.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_COMMAND_FAILED

Command failed; details of failure are contained in system-generated bags within the reply bag.

Usage notes for `mqExecute`

1. If no *AdminQ* is specified, the MQAI checks to see if the command server is active before sending the administration command message. However, if the command server is not active, the MQAI does not start it. If you are sending many administration command messages, you are recommended to open the `SYSTEM.ADMIN.COMMAND.QUEUE` yourself and pass the handle of the administration queue on each administration request.

2. Specifying the MQHO_NONE value in the **ResponseQ** parameter simplifies the use of the mqExecute call, but if mqExecute is issued repeatedly by the application (for example, from within a loop), the response queue will be created and deleted repeatedly. In this situation, it is better for the application itself to open the response queue before any mqExecute call, and close it after all mqExecute calls have been issued.
3. If the administration command results in a message being sent with a message type of MQMT_REQUEST, the call waits for the time given by the MQIACF_WAIT_INTERVAL data item in the options bag.
4. If an error occurs during the processing of the call, the response bag might contain some data from the reply message, but the data will typically be incomplete.

C language invocation for mqExecute

```
mqExecute (Hconn, Command, OptionsBag, AdminBag, ResponseBag,
AdminQ, ResponseQ, CompCode, Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;           /* MQI connection handle */
MQLONG   Command;        /* Command to be executed */
MQHBAG   OptionsBag;     /* Handle of a bag containing options */
MQHBAG   AdminBag;       /* Handle of administration bag containing
                          /* details of administration command */
MQHBAG   ResponseBag;    /* Handle of bag for response messages */
MQHOBJ   AdminQ;         /* Handle of administration queue for
                          /* administration messages */
MQHOBJ   ResponseQ;      /* Handle of response queue for response
                          /* messages */
MQLONG   pCompCode;      /* Completion code */
MQLONG   pReason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqExecute

(Supported on Windows only.)

```
mqExecute (Hconn, Command, OptionsBag, AdminBag, ResponseBag,
AdminQ, ResponseQ, CompCode, Reason);
```

Declare the parameters as follows:

```
Dim HConn      As Long 'MQI connection handle'
Dim Command    As Long 'Command to be executed'
Dim OptionsBag As Long 'Handle of a bag containing options'
Dim AdminBag   As Long 'Handle of command bag containing details of
                        administration command'
Dim ResponseBag As Long 'Handle of bag for reply messages'
Dim AdminQ     As Long 'Handle of command queue for
                        administration messages'
Dim ResponseQ  As Long 'Handle of response queue for reply messages'
Dim CompCode   As Long 'Completion code'
Dim Reason     As Long 'Reason code qualifying CompCode'
```

mqGetBag

The mqGetBag call removes a message from the specified queue and converts the message data into a data bag.

Syntax for mqGetBag

```
mqGetBag (Hconn, Hobj, MsgDesc, GetMsgOpts, Bag, CompCode, Reason)
```

Parameters for mqGetBag

Hconn (MQHCONN) - input

MQI connection handle.

Hobj (MQHOBJ) - input

Object handle of the queue from which the message is to be retrieved. This handle was returned by a preceding MQOPEN call issued by the application. The queue must be open for input.

MsgDesc (MQMD) - input/output

Message descriptor (for more information, see [MQMD - Message descriptor](#)).

If the *Format* field in the message has a value other than MQFMT_ADMIN, MQFMT_EVENT, or MQFMT_PCF, MQRC_FORMAT_NOT_SUPPORTED results.

If, on entry to the call, the *Encoding* field in the application's MQMD has a value other than MQENC_NATIVE and MQGMO_CONVERT is specified, MQRC_ENCODING_NOT_SUPPORTED results. Also, if MQGMO_CONVERT is not specified, the value of the **Encoding** parameter must be the retrieving application's MQENC_NATIVE; if not, again MQRC_ENCODING_NOT_SUPPORTED results.

GetMsgOpts (MQGMO) - input/output

Get-message options (for more information, see [MQGMO - Get-message options](#)).

MQGMO_ACCEPT_TRUNCATED_MSG cannot be specified; MQRC_OPTIONS_ERROR results if it is. MQGMO_LOCK and MQGMO_UNLOCK are not supported in a 16-bit or 32-bit Window environment. MQGMO_SET_SIGNAL is supported in a 32-bit Window environment only.

Bag (MQHBAG) - input/output

Handle of a bag into which the retrieved message is placed. The MQAI performs an mqClearBag call on the bag before placing the message in the bag.

MQHB_NONE

Gets the retrieved message. This provides a means of deleting messages from the queue.

If an option of MQGMO_BROWSE_* is specified, this value sets the browse cursor to the selected message; it is not deleted in this case.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating warning and error conditions can be returned from the mqGetBag call:

MQRC_*

Anything from the MQGET call or bag manipulation.

MQRC_BAG_CONVERSION_ERROR

Data could not be converted into a bag.

This indicates a problem with the format of the data to be converted into a bag (for example, the message is not a valid PCF).

If the message was retrieved destructively from the queue (that is, not browsing the queue), this reason code indicates that it has been discarded.

MQRC_BAG_WRONG_TYPE

Input data bag is a group bag.

MQRC_ENCODING_NOT_SUPPORTED

Encoding not supported; the value in the *Encoding* field of the MQMD must be MQENC_NATIVE.

MQRC_FORMAT_NOT_SUPPORTED

Format not supported; the *Format* name in the message is not MQFMT_ADMIN, MQFMT_EVENT, or MQFMT_PCF. If the message was retrieved destructively from the queue (that is, not browsing the queue), this reason code indicates that it has been discarded.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INCONSISTENT_ITEM_TYPE

Data type of second occurrence of selector differs from data type of first occurrence.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

Usage notes for mqGetBag

1. Only messages that have a supported format can be returned by this call. If the message has a format that is not supported, the message is discarded, and the call completes with an appropriate reason code.
2. If the message is retrieved within a unit of work (that is, with the MQGMO_SYNCPOINT option), and the message has an unsupported format, the unit of work can be backed out, reinstating the message on the queue. This allows the message to be retrieved by using the MQGET call in place of the mqGetBag call.

C language invocation for mqGetBag

```
mqGetBag (hConn, hObj, &MsgDesc, &GetMsgOpts, hBag, CompCode, Reason);
```

Declare the parameters as follows:

```
MQHCONN  hConn;           /* MQI connection handle */
MQHOBJ   hObj;           /* Object handle */
MQMD     MsgDesc;        /* Message descriptor */
MQGMO    GetMsgOpts;     /* Get-message options */
MQHBAG   hBag;          /* Bag handle */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqGetBag

(Supported on Windows only.)

```
mqGetBag (HConn, HObj, MsgDesc, GetMsgOpts, Bag, CompCode, Reason);
```

Declare the parameters as follows:

```
Dim HConn      As Long 'MQI connection handle'
Dim HObj       As Long 'Object handle'
Dim MsgDesc    As Long 'Message descriptor'
Dim GetMsgOpts As Long 'Get-message options'
Dim Bag        As Long 'Bag handle'
Dim CompCode   As Long 'Completion code'
Dim Reason     As Long 'Reason code qualifying CompCode'
```

mqInquireBag

The mqInquireBag call inquires the value of a bag handle that is present in the bag. The data item can be a user item or a system item.

Syntax for mqInquireBag

mqInquireBag (*Bag, Selector, ItemIndex, ItemValue, CompCode, Reason*)

Parameters for mqInquireBag

Bag (MQHBAG) - input

Bag handle to be inquired. The bag can be a user bag or a system bag.

Selector (MQLONG) - input

Selector identifying the item to be inquired.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC_SELECTOR_NOT_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

The data type of the item must agree with the data type implied by the call; MQRC_SELECTOR_WRONG_TYPE results if it is not.

The following special values can be specified for **Selector**:

MQSEL_ANY_SELECTOR

The item to be inquired is a user or system item identified by the **ItemIndex** parameter.

MQSEL_ANY_USER_SELECTOR

The item to be inquired is a user item identified by the **ItemIndex** parameter.

MQSEL_ANY_SYSTEM_SELECTOR

The item to be inquired is a system item identified by the **ItemIndex** parameter.

ItemIndex (MQLONG) - input

Index of the data item to be inquired.

The value must be zero or greater, or the special value MQIND_NONE. If the value is less than zero and not MQIND_NONE, MQRC_INDEX_ERROR results. If the item is not already present in the bag, MQRC_INDEX_NOT_PRESENT results.

The following special value can be specified:

MQIND_NONE

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

If MQSEL_ANY_SELECTOR is specified for the **Selector** parameter, the **ItemIndex** parameter is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL_ANY_USER_SELECTOR is specified for the **Selector** parameter, the **ItemIndex** parameter is the index relative to the set of system items, and must be zero or greater.

If MQSEL_ANY_SYSTEM_SELECTOR is specified for the **Selector** parameter, the **ItemIndex** parameter is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, the **ItemIndex** parameter is the index relative to the set of items that have that selector value and can be MQIND_NONE, zero, or greater.

ItemValue (MQHBAG) - output

Value of the item in the bag.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqInquireBag` call:

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

Index not valid (index negative and not MQIND_NONE, or MQIND_NONE specified with one of the MQSEL_ANY_xxx_SELECTOR values).

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_ITEM_VALUE_ERROR

The **ItemValue** parameter is not valid (invalid parameter address).

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

MQIND_NONE specified when more than one occurrence of the specified selector is present within the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_SELECTOR_WRONG_TYPE

Data item has wrong data type for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

C language invocation for mqInquireBag

```
mqInquireBag (Bag, Selector, ItemIndex, &ItemValue, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */
MQLONG   Selector;      /* Selector */
MQLONG   ItemIndex;     /* Index of the data item to be inquired */
MQHBAG   ItemValue;     /* Value of item in the bag */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqInquireBag

(Supported on Windows only.)

```
mqInquireBag (Bag, Selector, ItemIndex, ItemValue, CompCode, Reason
```

Declare the parameters as follows:

```

Dim Bag      As Long 'Bag handle'
Dim Selector As Long 'Selector'
Dim ItemIndex As Long 'Index of the data item to be inquired'
Dim ItemValue As Long 'Value of item in the bag'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'

```

mqInquireByteString

The mqInquireByteString call requests the value of a byte string data item that is present in the bag. The data item can be a user item or a system item.

Syntax for mqInquireByteString

mqInquireByteString (*Bag, Selector, ItemIndex, Bufferlength, Buffer, ByteStringLength, CompCode, Reason*)

Parameters for mqInquireByteString

Bag (MQHBAG) - input

Handle of the bag to which the inquiry relates. The bag can be a user bag or a system bag.

Selector (MQLONG) - input

Selector of the item to which the inquiry relates.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC_SELECTOR_NOT_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

The data type of the item must be the same as the data type implied by the call; MQRC_SELECTOR_WRONG_TYPE results if it is not.

The following special values can be specified for *Selector*:

MQSEL_ANY_SELECTOR

The item to be inquired about is a user or system item identified by *ItemIndex*.

MQSEL_ANY_USER_SELECTOR

The item to be inquired about is a user item identified by *ItemIndex*.

MQSEL_ANY_SYSTEM_SELECTOR

The item to be inquired about is a system item identified by *ItemIndex*.

ItemIndex (MQLONG) - input

Index of the data item to which the inquiry relates. The value must be zero or greater, or the special value MQIND_NONE. If the value is less than zero and not MQIND_NONE, MQRC_INDEX_ERROR results. If the item is not already present in the bag, MQRC_INDEX_NOT_PRESENT results. The following special value can be specified:

MQIND_NONE

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

If MQSEL_ANY_SELECTOR is specified for the **Selector** parameter, **ItemIndex** is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL_ANY_USER_SELECTOR is specified for the **Selector** parameter, **ItemIndex** is the index relative to the set of user items, and must be zero or greater.

If MQSEL_ANY_SYSTEM_SELECTOR is specified for **Selector**, **ItemIndex** is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, **ItemIndex** is the index relative to the set of items that have that selector value, and can be MQIND_NONE, zero, or greater.

BufferLength (MQLONG) - input

Length in bytes of the buffer to receive the byte string. Zero is a valid value.

Buffer (MQBYTE x BufferLength) - output

Buffer to receive the byte string. The length is given by the **BufferLength** parameter. If zero is specified for **BufferLength**, the null pointer can be specified for the address of the **Buffer** parameter; in all other cases, a valid (non-null) address must be specified for the **Buffer** parameter.

The string is padded with nulls to the length of the buffer. If the string is longer than the buffer, the string is truncated to fit; in this case *ByteStringLength* indicates the size of the buffer needed to accommodate the string without truncation.

ByteStringLength (MQLONG) - output

The length in bytes of the string contained in the bag. If the **Buffer** parameter is too small, the length of the string returned is less than *ByteStringLength*.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the mqInquireByteString call:

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

Index not valid (index negative and not MQIND_NONE, or MQIND_NONE specified with one of the MQSEL_ANY_xxx_SELECTOR values).

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

MQIND_NONE specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_SELECTOR_WRONG_TYPE

Data item has wrong data type for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_STRING_LENGTH_ERROR

ByteStringLength parameter not valid (invalid parameter address).

MQRC_STRING_TRUNCATED

Data too long for output buffer and has been truncated.

C language invocation for mqInquireByteString

```
mqInquireByteString (Bag, Selector, ItemIndex,  
BufferLength, Buffer, &StringLength, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */  
MQLONG   Selector;     /* Selector */  
MQLONG   ItemIndex;    /* Item index */  
MQLONG   BufferLength; /* Buffer length */  
PMQBYTE  Buffer;        /* Buffer to contain string */  
MQLONG   ByteStringLength; /* Length of byte string returned */  
MQLONG   CompCode;     /* Completion code */  
MQLONG   Reason;      /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqInquireByteString

(Supported on Windows only.)

```
mqInquireByteString Bag, Selector, ItemIndex,  
BufferLength, Buffer, StringLength, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long   'Bag handle'  
Dim Selector      As Long   'Selector'  
Dim ItemIndex     As Long   'Item index'  
Dim BufferLength   As Long   'Buffer length'  
Dim Buffer         As Byte    'Buffer to contain string'  
Dim ByteStringLength As Long 'Length of byte string returned'  
Dim CompCode      As Long   'Completion code'  
Dim Reason        As Long   'Reason code qualifying CompCode'
```

mqInquireByteStringFilter

The `mqInquireByteStringFilter` call requests the value and operator of a byte string filter item that is present in the bag. The data item can be a user item or a system item.

Syntax for mqInquireByteStringFilter

mqInquireByteStringFilter (*Bag, Selector, ItemIndex, Bufferlength, Buffer, ByteStringLength, Operator, CompCode, Reason*)

Parameters for mqInquireByteStringFilter

Bag (MQHBAG) - input

Handle of the bag to which the inquiry relates. The bag can be a user bag or a system bag.

Selector (MQLONG) - input

Selector of the item to which the inquiry relates.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; `MQRC_SELECTOR_NOT_SUPPORTED` results if it is not.

The specified selector must be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

The data type of the item must be the same as the data type implied by the call; MQRC_SELECTOR_WRONG_TYPE results if it is not.

The following special values can be specified for *Selector*:

MQSEL_ANY_SELECTOR

The item to be inquired about is a user or system item identified by *ItemIndex*.

MQSEL_ANY_USER_SELECTOR

The item to be inquired about is a user item identified by *ItemIndex*.

MQSEL_ANY_SYSTEM_SELECTOR

The item to be inquired about is a system item identified by *ItemIndex*.

ItemIndex (MQLONG) - input

Index of the data item to which the inquiry relates. The value must be zero or greater, or the special value MQIND_NONE. If the value is less than zero and not MQIND_NONE, MQRC_INDEX_ERROR results. If the item is not already present in the bag, MQRC_INDEX_NOT_PRESENT results. The following special value can be specified:

MQIND_NONE

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

If MQSEL_ANY_SELECTOR is specified for the **Selector** parameter, **ItemIndex** is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL_ANY_USER_SELECTOR is specified for the **Selector** parameter, **ItemIndex** is the index relative to the set of user items, and must be zero or greater.

If MQSEL_ANY_SYSTEM_SELECTOR is specified for **Selector**, **ItemIndex** is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, **ItemIndex** is the index relative to the set of items that have that selector value, and can be MQIND_NONE, zero, or greater.

BufferLength (MQLONG) - input

Length in bytes of the buffer to receive the condition byte string. Zero is a valid value.

Buffer (MQBYTE x BufferLength) - output

Buffer to receive the condition byte string. The length is given by the **BufferLength** parameter. If zero is specified for **BufferLength**, the null pointer can be specified for the address of the **Buffer** parameter; in all other cases, a valid (non-null) address must be specified for the **Buffer** parameter.

The string is padded with blanks to the length of the buffer; the string is not null-terminated. If the string is longer than the buffer, the string is truncated to fit; in this case **ByteStringLength** indicates the size of the buffer needed to accommodate the string without truncation.

ByteStringLength (MQLONG) - output

The length in bytes of the condition string contained in the bag. If the **Buffer** parameter is too small, the length of the string returned is less than **StringLength**.

Operator (MQLONG) - output

Byte string filter operator in the bag.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the `mqInquireByteStringFilter` call:

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid.

MQRC_FILTER_OPERATOR_ERROR

Filter operator not valid.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

Index not valid (index negative and not `MQIND_NONE`, or `MQIND_NONE` specified with one of the `MQSEL_ANY_xxx_SELECTOR` values).

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

`MQIND_NONE` specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_SELECTOR_WRONG_TYPE

Data item has wrong data type for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_STRING_LENGTH_ERROR

`ByteStringLength` parameter not valid (invalid parameter address).

MQRC_STRING_TRUNCATED

Data too long for output buffer and has been truncated.

C language invocation for `mqInquireByteStringFilter`

```
mqInquireByteStringFilter (Bag, Selector, ItemIndex,  
BufferLength, Buffer, &ByteStringLength, &Operator, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */  
MQLONG   Selector;     /* Selector */  
MQLONG   ItemIndex;    /* Item index */  
MQLONG   BufferLength;  /* Buffer length */  
PMQBYTE  Buffer;        /* Buffer to contain string */  
MQLONG   ByteStringLength; /* Length of string returned */  
MQLONG   Operator;     /* Item operator */  
PMQLONG  CompCode;     /* Completion code */  
PMQLONG  Reason;       /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqInquireByteStringFilter

(Supported on Windows only.)

```
mqInquireByteStringFilter Bag, Selector, ItemIndex,  
BufferLength, Buffer, ByteStringLength,  
Operator, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long   'Bag handle'  
Dim Selector     As Long   'Selector'  
Dim ItemIndex    As Long   'Item index'  
Dim BufferLength  As Long   'Buffer length'  
Dim Buffer        As String  'Buffer to contain string'  
Dim ByteStringLength As Long 'Length of byte string returned'  
Dim Operator     As Long   'Operator'  
Dim CompCode     As Long   'Completion code'  
Dim Reason       As Long   'Reason code qualifying CompCode'
```

mqInquireInteger

The mqInquireInteger call requests the value of an integer data item that is present in the bag. The data item can be a user item or a system item.

Syntax for mqInquireInteger

mqInquireInteger (*Bag, Selector, ItemIndex, ItemValue, CompCode, Reason*)

Parameters for mqInquireInteger

Bag (MQHBAG) - input

Handle of the bag to which the inquiry relates. The bag can be a user bag or a system bag.

Selector (MQLONG) - input

Selector identifying the item to which the inquiry relates.

If the selector is less than zero (a system selector), the selector must be one that is supported by the MQAI; MQRC_SELECTOR_NOT_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

The data type of the item must agree with the data type implied by the call; MQRC_SELECTOR_WRONG_TYPE results if it is not.

The following special values can be specified for *Selector*:

MQSEL_ANY_SELECTOR

The item to be inquired about is a user or system item identified by *ItemIndex*.

MQSEL_ANY_USER_SELECTOR

The item to be inquired about is a user item identified by *ItemIndex*.

MQSEL_ANY_SYSTEM_SELECTOR

The item to be inquired about is a system item identified by *ItemIndex*.

ItemIndex (MQLONG) - input

Index of the data item to which the inquiry relates. The value must be zero or greater, or the special value MQIND_NONE. If the value is less than zero and is not MQIND_NONE, MQRC_INDEX_ERROR results. If the item is not already present in the bag, MQRC_INDEX_NOT_PRESENT results. The following special value can be specified:

MQIND_NONE

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

If MQSEL_ANY_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL_ANY_USER_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of user items, and must be zero or greater.

If MQSEL_ANY_SYSTEM_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, *ItemIndex* is the index relative to the set of items that have that selector value, and can be MQIND_NONE, zero, or greater.

ItemValue (MQLONG) - output

The value of the item in the bag.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqInquireInteger call:

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

Index not valid (index negative and not MQIND_NONE, or MQIND_NONE specified with one of the MQSEL_ANY_xxx_SELECTOR values).

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_ITEM_VALUE_ERROR

ItemValue parameter not valid (invalid parameter address).

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

MQIND_NONE specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_SELECTOR_WRONG_TYPE

Data item has wrong data type for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

C language invocation for mqInquireInteger

```
mqInquireInteger (Bag, Selector, ItemIndex, &ItemValue,
&CompCode, &Reason);
```

Declare the parameters as follows:

```

MQHBAG  Bag;          /* Bag handle */
MQLONG  Selector;     /* Selector */
MQLONG  ItemIndex;   /* Item index */
MQLONG  ItemValue;   /* Item value */
MQLONG  CompCode;    /* Completion code */
MQLONG  Reason;      /* Reason code qualifying CompCode */

```

Visual Basic invocation for mqInquireInteger

(Supported on Windows only.)

```

mqInquireInteger Bag, Selector, ItemIndex, ItemValue,
CompCode, Reason

```

Declare the parameters as follows:

```

Dim Bag      As Long 'Bag handle'
Dim Selector As Long 'Selector'
Dim ItemIndex As Long 'Item index'
Dim ItemValue As Long 'Item value'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'

```

mqInquireInteger64

The mqInquireInteger64 call requests the value of a 64-bit integer data item that is present in the bag. The data item can be a user item or a system item.

Syntax for mqInquireInteger64

mqInquireInteger64 (*Bag, Selector, ItemIndex, ItemValue, CompCode, Reason*)

Parameters for mqInquireInteger64

Bag (MQHBAG) - input

Handle of the bag to which the inquiry relates. The bag can be a user bag or a system bag.

Selector (MQLONG) - input

Selector identifying the item to which the inquiry relates.

If the selector is less than zero (a system selector), the selector must be one that is supported by the MQAI; MQRC_SELECTOR_NOT_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

The data type of the item must agree with the data type implied by the call; MQRC_SELECTOR_WRONG_TYPE results if it is not.

The following special values can be specified for *Selector*:

MQSEL_ANY_SELECTOR

The item to be inquired about is a user or system item identified by *ItemIndex*.

MQSEL_ANY_USER_SELECTOR

The item to be inquired about is a user item identified by *ItemIndex*.

MQSEL_ANY_SYSTEM_SELECTOR

The item to be inquired about is a system item identified by *ItemIndex*.

ItemIndex (MQLONG) - input

Index of the data item to which the inquiry relates. The value must be zero or greater, or the special value MQIND_NONE. If the value is less than zero and is not MQIND_NONE, MQRC_INDEX_ERROR

results. If the item is not already present in the bag, MQRC_INDEX_NOT_PRESENT results. The following special value can be specified:

MQIND_NONE

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

If MQSEL_ANY_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL_ANY_USER_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of user items, and must be zero or greater.

If MQSEL_ANY_SYSTEM_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, *ItemIndex* is the index relative to the set of items that have that selector value, and can be MQIND_NONE, zero, or greater.

ItemValue (MQINT64) - output

The value of the item in the bag.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqInquireInteger64 call:

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

Index not valid (index negative and not MQIND_NONE, or MQIND_NONE specified with one of the MQSEL_ANY_XXX_SELECTOR values).

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_ITEM_VALUE_ERROR

ItemValue parameter not valid (invalid parameter address).

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

MQIND_NONE specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_SELECTOR_WRONG_TYPE

Data item has wrong data type for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

C language invocation for mqInquireInteger64

```
mqInquireInteger64 (Bag, Selector, ItemIndex, &ItemValue,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */
MQLONG   Selector;      /* Selector */
MQLONG   ItemIndex;     /* Item index */
MQINT64  ItemValue;     /* Item value */
MQLONG   CompCode;     /* Completion code */
MQLONG   Reason;       /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqInquireInteger64

(Supported on Windows only.)

```
mqInquireInteger64 Bag, Selector, ItemIndex, ItemValue,
CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'
Dim Selector As Long 'Selector'
Dim ItemIndex As Long 'Item index'
Dim ItemValue As Long 'Item value'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

mqInquireIntegerFilter

The mqInquireIntegerFilter call requests the value and operator of an integer filter item that is present in the bag. The data item can be a user item or a system item.

Syntax for mqInquireIntegerFilter

mqInquireIntegerFilter (*Bag*, *Selector*, *ItemIndex*, *ItemValue*, *Operator*, *CompCode*, *Reason*)

Parameters for mqInquireIntegerFilter

Bag (MQHBAG) - input

Handle of the bag to which the inquiry relates. The bag can be a user bag or a system bag.

Selector (MQLONG) - input

Selector identifying the item to which the inquiry relates.

If the selector is less than zero (a system selector), the selector must be one that is supported by the MQAI; MQRC_SELECTOR_NOT_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

The data type of the item must agree with the data type implied by the call; MQRC_SELECTOR_WRONG_TYPE results if it is not.

The following special values can be specified for *Selector*:

MQSEL_ANY_SELECTOR

The item to be inquired about is a user or system item identified by *ItemIndex*.

MQSEL_ANY_USER_SELECTOR

The item to be inquired about is a user item identified by *ItemIndex*.

MQSEL_ANY_SYSTEM_SELECTOR

The item to be inquired about is a system item identified by *ItemIndex*.

ItemIndex (MQLONG) - input

Index of the data item to which the inquiry relates. The value must be zero or greater, or the special value MQIND_NONE. If the value is less than zero and is not MQIND_NONE, MQRC_INDEX_ERROR results. If the item is not already present in the bag, MQRC_INDEX_NOT_PRESENT results. The following special value can be specified:

MQIND_NONE

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

If MQSEL_ANY_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL_ANY_USER_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of user items, and must be zero or greater.

If MQSEL_ANY_SYSTEM_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, *ItemIndex* is the index relative to the set of items that have that selector value, and can be MQIND_NONE, zero, or greater.

ItemValue (MQLONG) - output

The condition value.

Operator (MQLONG) - output

Integer filter operator in the bag.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqInquireIntegerFilter call:

MQRC_FILTER_OPERATOR_ERROR

Filter operator not valid.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

Index not valid (index negative and not MQIND_NONE, or MQIND_NONE specified with one of the MQSEL_ANY_XXX_SELECTOR values).

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_ITEM_VALUE_ERROR

ItemValue parameter not valid (invalid parameter address).

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

MQIND_NONE specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_SELECTOR_WRONG_TYPE

Data item has wrong data type for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

C language invocation for mqInquireIntegerFilter

```
mqInquireIntegerFilter (Bag, Selector, ItemIndex, &ItemValue,  
&Operator, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */  
MQLONG   Selector;      /* Selector */  
MQLONG   ItemIndex;     /* Item index */  
MQLONG   ItemValue;     /* Item value */  
MQLONG   Operator;      /* Item operator */  
MQLONG   CompCode;      /* Completion code */  
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqInquireIntegerFilter

(Supported on Windows only.)

```
mqInquireIntegerFilter Bag, Selector, ItemIndex, ItemValue,  
Operator, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'  
Dim Selector As Long 'Selector'  
Dim ItemIndex As Long 'Item index'  
Dim ItemValue As Long 'Item value'  
Dim Operator As Long 'Item operator'  
Dim CompCode As Long 'Completion code'  
Dim Reason   As Long 'Reason code qualifying CompCode'
```

mqInquireItemInfo

The mqInquireItemInfo call returns information about a specified item in a bag. The data item can be a user item or a system item.

Syntax for mqInquireItemInfo

mqInquireItemInfo (*Bag, Selector, ItemIndex, ItemType, OutSelector, CompCode, Reason*)

Parameters for mqInquireItemInfo

Bag (MQHBAG) - input

Handle of the bag to be inquired.

The bag can be a user bag or a system bag.

Selector (MQLONG) - input

Selector identifying the item to be inquired.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC_SELECTOR_NOT_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

The following special values can be specified for **Selector**:

MQSEL_ANY_SELECTOR

The item to be inquired is a user or system item identified by the **ItemIndex** parameter.

MQSEL_ANY_USER_SELECTOR

The item to be inquired is a user item identified by the **ItemIndex** parameter.

MQSEL_ANY_SYSTEM_SELECTOR

The item to be inquired is a system item identified by the **ItemIndex** parameter.

ItemIndex (MQLONG) - input

Index of the data item to be inquired.

The item must be present within the bag; MQRC_INDEX_NOT_PRESENT results if it is not. The value must be zero or greater, or the following special value:

MQIND_NONE

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

If MQSEL_ANY_SELECTOR is specified for the **Selector** parameter, the **ItemIndex** parameter is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL_ANY_USER_SELECTOR is specified for the **Selector** parameter, the **ItemIndex** parameter is the index relative to the set of system items, and must be zero or greater.

If MQSEL_ANY_SYSTEM_SELECTOR is specified for the **Selector** parameter, the **ItemIndex** parameter is the index relative to the set of system items, and must be zero or greater. If an explicit selector value is specified, the **ItemIndex** parameter is the index relative to the set of items that have that selector value and can be MQIND_NONE, zero, or greater.

ItemType (MQLONG) - output

The data type of the specified data item.

The following can be returned:

MQITEM_BAG

Bag handle item.

MQITEM_BYTE_STRING

Byte string.

MQITEM_INTEGER

Integer item.

MQITEM_INTEGER_FILTER

Integer filter.

MQITEM_INTEGER64

64-bit integer item.

MQITEM_STRING

Character-string item.

MQITEM_STRING_FILTER

String filter.

OutSelector (MQLONG) - output

Selector of the specified data item.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqInquireItemInfo` call:

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

MQIND_NONE specified with one of the MQSEL_ANY_XXX_SELECTOR values.

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_ITEM_TYPE_ERROR

ItemType parameter not valid (invalid parameter address).

MQRC_OUT_SELECTOR_ERROR

OutSelector parameter not valid (invalid parameter address).

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

MQIND_NONE specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

C language invocation for `mqInquireItemInfo`

```
mqInquireItemInfo (Bag, Selector, ItemIndex, &OutSelector, &ItemType,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */  
MQLONG   Selector;     /* Selector identifying item */  
MQLONG   ItemIndex;    /* Index of data item */  
MQLONG   OutSelector;  /* Selector of specified data item */  
MQLONG   ItemType;     /* Data type of data item */  
MQLONG   CompCode;    /* Completion code */  
MQLONG   Reason;      /* Reason code qualifying CompCode */
```

Visual Basic invocation for `mqInquireItemInfo`

(Supported on Windows only.)

```
mqInquireItemInfo Bag, Selector, ItemIndex, OutSelector, ItemType,  
CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long 'Bag handle'  
Dim Selector      As Long 'Selector identifying item'  
Dim ItemIndex     As Long 'Index of data item'  
Dim OutSelector  As Long 'Selector of specified data item'  
Dim ItemType      As Long 'Data type of data item'  
Dim CompCode     As Long 'Completion code'  
Dim Reason       As Long 'Reason code qualifying CompCode'
```

mqInquireString

The mqInquireString call requests the value of a character data item that is present in the bag. The data item can be a user item or a system item.

Syntax for mqInquireString

mqInquireString (*Bag, Selector, ItemIndex, Bufferlength, Buffer, StringLength, CodedCharSetId, CompCode, Reason*)

Parameters for mqInquireString

Bag (MQHBAG) - input

Handle of the bag to which the inquiry relates. The bag can be a user bag or a system bag.

Selector (MQLONG) - input

Selector of the item to which the inquiry relates.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC_SELECTOR_NOT_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

The data type of the item must be the same as the data type implied by the call; MQRC_SELECTOR_WRONG_TYPE results if it is not.

The following special values can be specified for *Selector*:

MQSEL_ANY_SELECTOR

The item to be inquired about is a user or system item identified by *ItemIndex*.

MQSEL_ANY_USER_SELECTOR

The item to be inquired about is a user item identified by *ItemIndex*.

MQSEL_ANY_SYSTEM_SELECTOR

The item to be inquired about is a system item identified by *ItemIndex*.

ItemIndex (MQLONG) - input

Index of the data item to which the inquiry relates. The value must be zero or greater, or the special value MQIND_NONE. If the value is less than zero and not MQIND_NONE, MQRC_INDEX_ERROR results. If the item is not already present in the bag, MQRC_INDEX_NOT_PRESENT results. The following special value can be specified:

MQIND_NONE

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

If MQSEL_ANY_SELECTOR is specified for the **Selector** parameter, **ItemIndex** is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL_ANY_USER_SELECTOR is specified for the **Selector** parameter, **ItemIndex** is the index relative to the set of user items, and must be zero or greater.

If MQSEL_ANY_SYSTEM_SELECTOR is specified for **Selector**, **ItemIndex** is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, **ItemIndex** is the index relative to the set of items that have that selector value, and can be MQIND_NONE, zero, or greater.

BufferLength (MQLONG) - input

Length in bytes of the buffer to receive the string. Zero is a valid value.

Buffer (MQCHAR x BufferLength) - output

Buffer to receive the character string. The length is given by the **BufferLength** parameter. If zero is specified for **BufferLength**, the null pointer can be specified for the address of the **Buffer** parameter; in all other cases, a valid (non-null) address must be specified for the **Buffer** parameter.

The string is padded with blanks to the length of the buffer; the string is not null-terminated. If the string is longer than the buffer, the string is truncated to fit; in this case **StringLength** indicates the size of the buffer needed to accommodate the string without truncation.

StringLength (MQLONG) - output

The length in bytes of the string contained in the bag. If the **Buffer** parameter is too small, the length of the string returned is less than *StringLength*.

CodedCharSetId (MQLONG) - output

The coded character set identifier for the character data in the string. This parameter can be set to a null pointer if not required.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the *mqInquireString* call:

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

Index not valid (index negative and not MQIND_NONE, or MQIND_NONE specified with one of the MQSEL_ANY_XXX_SELECTOR values).

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

MQIND_NONE specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_SELECTOR_WRONG_TYPE

Data item has wrong data type for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_STRING_LENGTH_ERROR

StringLength parameter not valid (invalid parameter address).

MQRC_STRING_TRUNCATED

Data too long for output buffer and has been truncated.

C language invocation for mqInquireString

```
mqInquireString (Bag, Selector, ItemIndex,  
BufferLength, Buffer, &StringLength, &CodedCharSetId,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */  
MQLONG   Selector;     /* Selector */  
MQLONG   ItemIndex;    /* Item index */  
MQLONG   BufferLength; /* Buffer length */  
PMQCHAR  Buffer;       /* Buffer to contain string */  
MQLONG   StringLength; /* Length of string returned */  
MQLONG   CodedCharSetId /* Coded Character Set ID */  
MQLONG   CompCode;    /* Completion code */  
MQLONG   Reason;      /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqInquireString

(Supported on Windows only.)

```
mqInquireString Bag, Selector, ItemIndex,  
BufferLength, Buffer, StringLength, CodedCharSetId,  
CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long 'Bag handle'  
Dim Selector      As Long 'Selector'  
Dim ItemIndex     As Long 'Item index'  
Dim BufferLength  As Long 'Buffer length'  
Dim Buffer         As String 'Buffer to contain string'  
Dim StringLength As Long 'Length of string returned'  
Dim CodedCharSetId As Long 'Coded Character Set ID'  
Dim CompCode     As Long 'Completion code'  
Dim Reason       As Long 'Reason code qualifying CompCode'
```

mqInquireStringFilter

The `mqInquireStringFilter` call requests the value and operator of a string filter item that is present in the bag. The data item can be a user item or a system item.

Syntax for mqInquireStringFilter

```
mqInquireStringFilter (Bag, Selector, ItemIndex, Bufferlength, Buffer, StringLength, CodedCharSetId, Operator, CompCode, Reason)
```

Parameters for mqInquireStringFilter

Bag (MQHBAG) - input

Handle of the bag to which the inquiry relates. The bag can be a user bag or a system bag.

Selector (MQLONG) - input

Selector of the item to which the inquiry relates.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC_SELECTOR_NOT_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

The data type of the item must be the same as the data type implied by the call; MQRC_SELECTOR_WRONG_TYPE results if it is not.

The following special values can be specified for *Selector*:

MQSEL_ANY_SELECTOR

The item to be inquired about is a user or system item identified by *ItemIndex*.

MQSEL_ANY_USER_SELECTOR

The item to be inquired about is a user item identified by *ItemIndex*.

MQSEL_ANY_SYSTEM_SELECTOR

The item to be inquired about is a system item identified by *ItemIndex*.

ItemIndex (MQLONG) - input

Index of the data item to which the inquiry relates. The value must be zero or greater, or the special value MQIND_NONE. If the value is less than zero and not MQIND_NONE, MQRC_INDEX_ERROR results. If the item is not already present in the bag, MQRC_INDEX_NOT_PRESENT results. The following special value can be specified:

MQIND_NONE

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

If MQSEL_ANY_SELECTOR is specified for the **Selector** parameter, *ItemIndex* is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL_ANY_USER_SELECTOR is specified for the **Selector** parameter, *ItemIndex* is the index relative to the set of user items, and must be zero or greater.

If MQSEL_ANY_SYSTEM_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, *ItemIndex* is the index relative to the set of items that have that selector value, and can be MQIND_NONE, zero, or greater.

BufferLength (MQLONG) - input

Length in bytes of the buffer to receive the condition string. Zero is a valid value.

Buffer (MQCHAR x BufferLength) - output

Buffer to receive the character condition string. The length is given by the **BufferLength** parameter. If zero is specified for **BufferLength**, the null pointer can be specified for the address of the **Buffer** parameter; in all other cases, a valid (nonnull) address must be specified for the **Buffer** parameter.

The string is padded with blanks to the length of the buffer; the string is not null-terminated. If the string is longer than the buffer, the string is truncated to fit; in this case *StringLength* indicates the size of the buffer needed to accommodate the string without truncation.

StringLength (MQLONG) - output

The length in bytes of the condition string contained in the bag. If the **Buffer** parameter is too small, the length of the string returned is less than *StringLength*.

CodedCharSetId (MQLONG) - output

The coded character set identifier for the character data in the string. This parameter can be set to a null pointer if not required.

Operator (MQLONG) - output

String filter operator in the bag.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the `mqInquireStringFilter` call:

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid.

MQRC_FILTER_OPERATOR_ERROR

Filter operator not valid.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

Index not valid (index negative and not MQIND_NONE, or MQIND_NONE specified with one of the MQSEL_ANY_XXX_SELECTOR values).

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

MQIND_NONE specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_SELECTOR_WRONG_TYPE

Data item has wrong data type for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_STRING_LENGTH_ERROR

StringLength parameter not valid (invalid parameter address).

MQRC_STRING_TRUNCATED

Data too long for output buffer and has been truncated.

C language invocation for `mqInquireStringFilter`

```
mqInquireStringFilter (Bag, Selector, ItemIndex,
    BufferLength, Buffer, &StringLength, &CodedCharSetId,
    &Operator, &CompCode, &Reason);
```

Declare the parameters as follows:

```

MQHBAG  Bag;           /* Bag handle */
MQLONG  Selector;     /* Selector */
MQLONG  ItemIndex;   /* Item index */
MQLONG  BufferLength; /* Buffer length */
PMQCHAR Buffer;       /* Buffer to contain string */
MQLONG  StringLength; /* Length of string returned */
MQLONG  CodedCharSetId /* Coded Character Set ID */
MQLONG  Operator;    /* Item operator */
MQLONG  CompCode;    /* Completion code */
MQLONG  Reason;      /* Reason code qualifying CompCode */

```

Visual Basic invocation for mqInquireStringFilter

(Supported on Windows only.)

```

mqInquireStringFilter Bag, Selector, ItemIndex,
BufferLength, Buffer, StringLength, CodedCharSetId,
Operator, CompCode, Reason

```

Declare the parameters as follows:

```

Dim Bag           As Long   'Bag handle'
Dim Selector      As Long   'Selector'
Dim ItemIndex     As Long   'Item index'
Dim BufferLength   As Long   'Buffer length'
Dim Buffer         As String 'Buffer to contain string'
Dim StringLength  As Long   'Length of string returned'
Dim CodedCharSetId As Long  'Coded Character Set ID'
Dim Operator      As Long   'Item operator'
Dim CompCode      As Long   'Completion code'
Dim Reason        As Long   'Reason code qualifying CompCode'

```

mqPad

The mqPad call pads a null-terminated string with blanks.

Syntax for mqPad

mqPad (*String*, *BufferLength*, *Buffer*, *CompCode*, *Reason*)

Parameters for mqPad

String (PMQCHAR) - input

Null-terminated string. The null pointer is valid for the address of the **String** parameter, and denotes a string of zero length.

BufferLength (MQLONG) - input

Length in bytes of the buffer to receive the string padded with blanks. Must be zero or greater.

Buffer (MQCHAR x BufferLength) - output

Buffer to receive the blank-padded string. The length is given by the **BufferLength** parameter. If zero is specified for **BufferLength**, the null pointer can be specified for the address of the **Buffer** parameter; in all other cases, a valid (nonnull) address must be specified for the **Buffer** parameter.

If the number of characters preceding the first null in the **String** parameter is greater than the **BufferLength** parameter, the excess characters are omitted and MQRC_DATA_TRUNCATED results.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the mqPad call:

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid.

MQRC_STRING_ERROR

String parameter not valid (invalid parameter address or buffer not completely accessible).

MQRC_STRING_TRUNCATED

Data too long for output buffer and has been truncated.

Usage notes for mqPad

1. If the buffer pointers are the same, the padding is done in place. If not, at most *BufferLength* characters are copied into the second buffer; any space remaining, including the null-termination character, is overwritten with spaces.
2. If the *String* and **Buffer** parameters partially overlap, the result is undefined.

C language invocation for mqPad

```
mqPad (String, BufferLength, Buffer, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQCHAR   String;           /* String to be padded */
MQLONG   BufferLength;     /* Buffer length */
PMQCHAR   Buffer           /* Buffer to contain padded string */
MQLONG   CompCode;        /* Completion code */
MQLONG   Reason;          /* Reason code qualifying CompCode */
```

Note: This call is not supported in Visual Basic.

mqPutBag

The mqPutBag call converts the contents of the specified bag into a PCF message and sends the message to the specified queue. The contents of the bag are unchanged after the call.

Syntax for mqPutBag

mqPutBag (Hconn, Hobj, MsgDesc, PutMsgOpts, Bag, CompCode, Reason)

Parameters for mqPutBag

Hconn (MQHCONN) - input

MQI connection handle.

Hobj (MQHOBJ) - input

Object handle of the queue on which the message is to be placed. This handle was returned by a preceding MQOPEN call issued by the application. The queue must be open for output.

MsgDesc (MQMD) - input/output

Message descriptor. (For more information, see [MQMD - Message descriptor](#).)

If the *Format* field has a value other than MQFMT_ADMIN, MQFMT_EVENT, or MQFMT_PCF, MQRC_FORMAT_NOT_SUPPORTED results.

If the *Encoding* field has a value other than MQENC_NATIVE, MQRC_ENCODING_NOT_SUPPORTED results.

PutMsgOpts (MQPMO) - input/output

Put-message options. (For more information, see [MQPMO - Put-message options](#).)

Bag (MQHBAG) - input

Handle of the data bag to be converted to a message.

If the bag contains an administration message, and mqAddInquiry was used to insert values into the bag, the value of the MQIASY_COMMAND data item must be an INQUIRE command recognized by the MQAI; MQRC_INQUIRY_COMMAND_ERROR results if it is not.

If the bag contains nested system bags, MQRC_NESTED_BAG_NOT_SUPPORTED results.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*. The following reason codes indicating error and warning conditions can be returned from the mqPutBag call:

MQRC_*

Anything from the MQPUT call or bag manipulation.

MQRC_BAG_WRONG_TYPE

Input data bag is a group bag.

MQRC_ENCODING_NOT_SUPPORTED

Encoding not supported (value in *Encoding* field in MQMD must be MQENC_NATIVE).

MQRC_FORMAT_NOT_SUPPORTED

Format not supported (name in *Format* field in MQMD must be MQFMT_ADMIN, MQFMT_EVENT, or MQFMT_PCF).

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INQUIRY_COMMAND_ERROR

mqAddInquiry call used with a command code that is not a recognized INQUIRE command.

MQRC_NESTED_BAG_NOT_SUPPORTED

Input data bag contains one or more nested system bags.

MQRC_PARAMETER_MISSING

Administration message requires a parameter that is not present in the bag. This reason code occurs for bags created with the MQCBO_ADMIN_BAG or MQCBO_REORDER_AS_REQUIRED options only.

MQRC_SELECTOR_WRONG_TYPE

mqAddString or mqSetString was used to add the MQIACF_INQUIRY selector to the bag.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

C language invocation for mqPutBag

```
mqPutBag (HConn, HObj, &MsgDesc, &PutMsgOpts, Bag,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```

MQHCONN  HConn;          /* MQI connection handle */
MQHOBJ   HObj;          /* Object handle */
MQMD     MsgDesc;       /* Message descriptor */
MQPMO    PutMsgOpts;    /* Put-message options */
MQHBAG   Bag;           /* Bag handle */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */

```

Visual Basic invocation for mqPutBag

(Supported on Windows only.)

```
mqPutBag (HConn, HObj, MsgDesc, PutMsgOpts, Bag,
CompCode, Reason);
```

Declare the parameters as follows:

```

Dim HConn      As Long  'MQI connection handle'
Dim HObj       As Long  'Object handle'
Dim MsgDesc    As MQMD  'Message descriptor'
Dim PutMsgOpts As MQPMO 'Put-message options'
Dim Bag        As Long  'Bag handle'
Dim CompCode   As Long  'Completion code'
Dim Reason     As Long  'Reason code qualifying CompCode'

```

mqSetByteString

The mqSetByteString call either modifies a byte string data item that is already present in the bag, or deletes all existing occurrences of the specified selector and adds a new occurrence at the end of the bag. The data item is usually a user item, but certain system-data items can also be modified.

Syntax for mqSetByteString

mqSetByteString (*Bag*, *Selector*, *ItemIndex*, *Bufferlength*, *Buffer*, *CompCode*, *Reason*)

Parameters for mqSetByteString

Bag (MQHBAG) - input

Handle of the bag to be set. This must be the handle of a bag created by the user, not the handle of a system bag; MQRC_SYSTEM_BAG_NOT_ALTERABLE results if you specify the handle of a system bag.

Selector (MQLONG) - input

Selector of the item to be modified.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC_SELECTOR_NOT_SUPPORTED results if it is not.

If the selector is a supported system selector, but is one that is read only, MQRC_SYSTEM_ITEM_NOT_ALTERABLE results.

If the selector is an alterable system selector, but is always a single-instance selector and the application attempts to create a second instance in the bag, MQRC_MULTIPLE_INSTANCE_ERROR results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO_CHECK_SELECTORS option or as an administration bag (MQCBO_ADMIN_BAG), the selector must be in the range MQBA_FIRST through MQBA_LAST; MQRC_SELECTOR_OUT_OF_RANGE results if it is not. If MQCBO_CHECK_SELECTORS was not specified, the selector can be any value zero or greater.

If MQIND_ALL is not specified for the **ItemIndex** parameter, the specified selector must already be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

If MQIND_ALL is not specified for the **ItemIndex** parameter, the data type of the item must be the same as the data type implied by the call; MQRC_SELECTOR_WRONG_TYPE results if it is not.

ItemIndex (MQLONG) - input

This identifies which occurrence of the item with the specified selector is to be modified. The value must be zero or greater, or one of the special values described in this topic; if it is none of these, MQRC_INDEX_ERROR results.

Zero or greater

The item with the specified index must already be present in the bag; MQRC_INDEX_NOT_PRESENT results if it is not. The index is counted relative to the items in the bag that have the specified selector. For example, if there are five items in the bag with the specified selector, the valid values for *ItemIndex* are 0 through 4.

MQIND_NONE

This specifies that there must be only one occurrence of the specified selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

MQIND_ALL

This specifies that all existing occurrences of the specified selector (if any) are to be deleted from the bag, and a new occurrence of the selector created at the end of the bag.

BufferLength (MQLONG) - input

The length in bytes of the byte string contained in the **Buffer** parameter. The value must be zero or greater.

Buffer (MQBYTE x BufferLength) - input

Buffer containing the byte string. The length is given by the **BufferLength** parameter. If zero is specified for **BufferLength**, the null pointer can be specified for the address of the **Buffer** parameter; in all other cases, a valid (nonnull) address must be specified for the **Buffer** parameter.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqSetByteString call:

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

Index not valid (index negative and not MQIND_NONE or MQIND_ALL).

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_MULTIPLE_INSTANCE_ERROR

Multiple instances of system selector not valid.

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

MQIND_NONE specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_SELECTOR_WRONG_TYPE

Data item has wrong data type for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

MQRC_SYSTEM_ITEM_NOT_ALTERABLE

System item is read-only and cannot be altered.

C language invocation for mqSetByteString

```
mqSetByteString (Bag, Selector, ItemIndex, BufferLength, Buffer,
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG    Bag;           /* Bag handle */
MQLONG    Selector;     /* Selector */
MQLONG    ItemIndex;    /* Item index */
MQLONG    BufferLength;  /* Buffer length */
PMQBYTE   Buffer;       /* Buffer containing string */
MQLONG    CompCode;     /* Completion code */
MQLONG    Reason;       /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqSetByteString

(Supported on Windows only.)

```
mqSetByteString Bag, Selector, ItemIndex, BufferLength, Buffer,
CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long   'Bag handle'
Dim Selector      As Long   'Selector'
Dim ItemIndex     As Long   'Item index'
Dim BufferLength   As Long   'Buffer length'
Dim Buffer         As Byte   'Buffer containing string'
Dim CompCode      As Long   'Completion code'
Dim Reason        As Long   'Reason code qualifying CompCode'
```

mqSetByteStringFilter

The mqSetByteStringFilter call either modifies a byte string filter item that is already present in the bag, or deletes all existing occurrences of the specified selector and adds a new occurrence at the end of the bag. The data item is usually a user item, but certain system-data items can also be modified.

Syntax for mqSetByteStringFilter

```
mqSetByteStringFilter (Bag, Selector, ItemIndex, Bufferlength, Buffer, Operator,
CompCode, Reason)
```

Parameters for mqSetByteStringFilter

Bag (MQHBAG) - input

Handle of the bag to be set. This must be the handle of a bag created by the user, not the handle of a system bag; MQRC_SYSTEM_BAG_NOT_ALTERABLE results if you specify the handle of a system bag.

Selector (MQLONG) - input

Selector of the item to be modified.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC_SELECTOR_NOT_SUPPORTED results if it is not.

If the selector is a supported system selector, but is one that is read only, MQRC_SYSTEM_ITEM_NOT_ALTERABLE results.

If the selector is an alterable system selector, but is always a single-instance selector and the application attempts to create a second instance in the bag, MQRC_MULTIPLE_INSTANCE_ERROR results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO_CHECK_SELECTORS option or as an administration bag (MQCBO_ADMIN_BAG), the selector must be in the range MQBA_FIRST through MQBA_LAST; MQRC_SELECTOR_OUT_OF_RANGE results if it is not. If MQCBO_CHECK_SELECTORS was not specified, the selector can be any value zero or greater.

If MQIND_ALL is not specified for the **ItemIndex** parameter, the specified selector must already be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

If MQIND_ALL is not specified for the **ItemIndex** parameter, the data type of the item must be the same as the data type implied by the call; MQRC_SELECTOR_WRONG_TYPE results if it is not.

ItemIndex (MQLONG) - input

This identifies which occurrence of the item with the specified selector is to be modified. The value must be zero or greater, or one of the special values described in this topic; if it is none of these, MQRC_INDEX_ERROR results.

Zero or greater

The item with the specified index must already be present in the bag; MQRC_INDEX_NOT_PRESENT results if it is not. The index is counted relative to the items in the bag that have the specified selector. For example, if there are five items in the bag with the specified selector, the valid values for *ItemIndex* are 0 through 4.

MQIND_NONE

This specifies that there must be only one occurrence of the specified selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

MQIND_ALL

This specifies that all existing occurrences of the specified selector (if any) are to be deleted from the bag, and a new occurrence of the selector created at the end of the bag.

BufferLength (MQLONG) - input

The length in bytes of the condition byte string contained in the **Buffer** parameter. The value must be zero or greater.

Buffer (MQBYTE x BufferLength) - input

Buffer containing the condition byte string. The length is given by the **BufferLength** parameter. If zero is specified for **BufferLength**, the null pointer can be specified for the address of the **Buffer** parameter; in all other cases, a valid (nonnull) address must be specified for the **Buffer** parameter.

Operator (MQLONG x Operator) - input

Byte string filter operator to be placed in the bag. Valid operators are of the form MQCFOP_*

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqSetByteStringFilter` call:

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid.

MQRC_FILTER_OPERATOR_ERROR

Bag handle not valid.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

Index not valid (index negative and not MQIND_NONE or MQIND_ALL).

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_MULTIPLE_INSTANCE_ERROR

Multiple instances of system selector not valid.

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

MQIND_NONE specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_SELECTOR_WRONG_TYPE

Data item has wrong data type for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

MQRC_SYSTEM_ITEM_NOT_ALTERABLE

System item is read-only and cannot be altered.

C language invocation for `mqSetByteStringFilter`

```
mqSetByteStringFilter (Bag, Selector, ItemIndex, BufferLength, Buffer,  
Operator, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */  
MQLONG   Selector;      /* Selector */  
MQLONG   ItemIndex;     /* Item index */  
MQLONG   BufferLength;  /* Buffer length */  
PMQBYTE  Buffer;        /* Buffer containing string */  
MQLONG   Operator;     /* Operator */
```

```

PMQLONG  CompCode;      /* Completion code */
PMQLONG  Reason;       /* Reason code qualifying CompCode */

```

Visual Basic invocation for mqSetByteStringFilter

(Supported on Windows only.)

```

mqSetByteStringFilter Bag, Selector, ItemIndex, BufferLength, Buffer,
Operator, CompCode, Reason

```

Declare the parameters as follows:

```

Dim Bag           As Long   'Bag handle'
Dim Selector      As Long   'Selector'
Dim ItemIndex     As Long   'Item index'
Dim BufferLength  As Long   'Buffer length'
Dim Buffer        As String  'Buffer containing string'
Dim Operator      As Long   'Item operator'
Dim CompCode     As Long   'Completion code'
Dim Reason       As Long   'Reason code qualifying CompCode'

```

mqSetInteger

The mqSetInteger call either modifies an integer item that is already present in the bag, or deletes all existing occurrences of the specified selector and adds a new occurrence at the end of the bag. The data item is usually a user item, but specific system-data items can also be modified.

Syntax for mqSetInteger

mqSetInteger (*Bag*, *Selector*, *ItemIndex*, *ItemValue*, *CompCode*, *Reason*)

Parameters for mqSetInteger

Bag (MQHBAG) - input

Handle of the bag to be set. This must be the handle of a bag created by the user, and not the handle of a system bag; MQRC_SYSTEM_BAG_NOT_ALTERABLE results if the handle you specify refers to a system bag.

Selector (MQLONG) - input

Selector of the item to be modified. If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC_SELECTOR_NOT_SUPPORTED results if it is not.

If the selector is a supported system selector, but is one that is read-only, MQRC_SYSTEM_ITEM_NOT_ALTERABLE results.

If the selector is an alterable system selector, but is always a single-instance selector and the application attempts to create a second instance in the bag, MQRC_MULTIPLE_INSTANCE_ERROR results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO_CHECK_SELECTORS option or as an administration bag (MQCBO_ADMIN_BAG), the selector must be in the range MQIA_FIRST through MQIA_LAST; MQRC_SELECTOR_OUT_OF_RANGE results if it is not. If MQCBO_CHECK_SELECTORS was not specified, the selector can be any value zero or greater.

If MQIND_ALL is not specified for the **ItemIndex** parameter, the specified selector must already be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

If MQIND_ALL is not specified for the **ItemIndex** parameter, the data type of the item must agree with the data type implied by the call; MQRC_SELECTOR_WRONG_TYPE results if it is not.

ItemIndex (MQLONG) - input

This value identifies the occurrence of the item with the specified selector that is to be modified. The value must be zero or greater, or one of the special values described in this topic; if it is none of these, MQRC_INDEX_ERROR results.

Zero or greater

The item with the specified index must already be present in the bag; MQRC_INDEX_NOT_PRESENT results if it is not. The index is counted relative to the items in the bag that have the specified selector. For example, if there are five items in the bag with the specified selector, the valid values for *ItemIndex* are 0 through 4.

MQIND_NONE

This specifies that there must be one occurrence only of the specified selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

MQIND_ALL

This specifies that all existing occurrences of the specified selector (if any) are to be deleted from the bag, and a new occurrence of the selector created at the end of the bag.

Note: For system selectors, the order is not changed.

ItemValue (MQLONG) - input

The integer value to be placed in the bag.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the mqSetInteger call:

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

Index not valid (index negative and not MQIND_NONE or MQIND_ALL).

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_MULTIPLE_INSTANCE_ERROR

Multiple instances of system selector not valid.

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

MQIND_NONE specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not in valid range for call.

MQRC_SELECTOR_WRONG_TYPE

Data item has wrong data type for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

MQRC_SYSTEM_ITEM_NOT_ALTERABLE

System item is read only and cannot be altered.

C language invocation for mqSetInteger

```
mqSetInteger (Bag, Selector, ItemIndex, ItemValue, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */
MQLONG   Selector;      /* Selector */
MQLONG   ItemIndex;     /* Item index */
MQLONG   ItemValue;     /* Integer value */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqSetInteger

(Supported on Windows only.)

```
mqSetInteger Bag, Selector, ItemIndex, ItemValue, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'
Dim Selector As Long 'Selector'
Dim ItemIndex As Long 'Item index'
Dim ItemValue As Long 'Integer value'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

mqSetInteger64

The `mqSetInteger64` call either modifies a 64-bit integer item that is already present in the bag, or deletes all existing occurrences of the specified selector and adds a new occurrence at the end of the bag. The data item is usually a user item, but specific system-data items can also be modified.

Syntax for mqSetInteger64

mqSetInteger64 (*Bag, Selector, ItemIndex, ItemValue, CompCode, Reason*)

Parameters for mqSetInteger64

Bag (MQHBAG) - input

Handle of the bag to be set. This must be the handle of a bag created by the user, and not the handle of a system bag; `MQRC_SYSTEM_BAG_NOT_ALTERABLE` results if the handle you specify refers to a system bag.

Selector (MQLONG) - input

Selector of the item to be modified. If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; `MQRC_SELECTOR_NOT_SUPPORTED` results if it is not.

If the selector is a supported system selector, but is one that is read-only, `MQRC_SYSTEM_ITEM_NOT_ALTERABLE` results.

If the selector is an alterable system selector, but is always a single-instance selector and the application attempts to create a second instance in the bag, `MQRC_MULTIPLE_INSTANCE_ERROR` results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the `MQCBO_CHECK_SELECTORS` option or as an administration bag (`MQCBO_ADMIN_BAG`), the selector

must be in the range MQIA_FIRST through MQIA_LAST; MQRC_SELECTOR_OUT_OF_RANGE results if it is not. If MQCBO_CHECK_SELECTORS was not specified, the selector can be any value zero or greater.

If MQIND_ALL is not specified for the **ItemIndex** parameter, the specified selector must already be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

If MQIND_ALL is not specified for the **ItemIndex** parameter, the data type of the item must agree with the data type implied by the call; MQRC_SELECTOR_WRONG_TYPE results if it is not.

ItemIndex (MQLONG) - input

This value identifies the occurrence of the item with the specified selector that is to be modified. The value must be zero or greater, or one of the special values described in this topic; if it is none of these, MQRC_INDEX_ERROR results.

Zero or greater

The item with the specified index must already be present in the bag; MQRC_INDEX_NOT_PRESENT results if it is not. The index is counted relative to the items in the bag that have the specified selector. For example, if there are five items in the bag with the specified selector, the valid values for *ItemIndex* are 0 through 4.

MQIND_NONE

This specifies that there must be one occurrence only of the specified selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

MQIND_ALL

This specifies that all existing occurrences of the specified selector (if any) are to be deleted from the bag, and a new occurrence of the selector created at the end of the bag.

Note: For system selectors, the order is not changed.

ItemValue (MQINT64) - input

The integer value to be placed in the bag.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the mqSetInteger64 call:

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

Index not valid (index negative and not MQIND_NONE or MQIND_ALL).

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_MULTIPLE_INSTANCE_ERROR

Multiple instances of system selector not valid.

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

MQIND_NONE specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not in valid range for call.

MQRC_SELECTOR_WRONG_TYPE

Data item has wrong data type for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

MQRC_SYSTEM_ITEM_NOT_ALTERABLE

System item is read only and cannot be altered.

C language invocation for mqSetInteger64

```
mqSetInteger64 (Bag, Selector, ItemIndex, ItemValue, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */
MQLONG   Selector;      /* Selector */
MQLONG   ItemIndex;     /* Item index */
MQINT64  ItemValue;     /* Integer value */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqSetInteger64

(Supported on Windows only.)

```
mqSetInteger64 Bag, Selector, ItemIndex, ItemValue, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'
Dim Selector As Long 'Selector'
Dim ItemIndex As Long 'Item index'
Dim ItemValue As Long 'Integer value'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

mqSetIntegerFilter

The `mqSetIntegerFilter` call either modifies an integer filter item that is already present in the bag, or deletes all existing occurrences of the specified selector and adds a new occurrence at the end of the bag. The data item is usually a user item, but specific system-data items can also be modified.

Syntax for mqSetIntegerFilter

mqSetIntegerFilter (*Bag, Selector, ItemIndex, ItemValue, Operator, CompCode, Reason*)

Parameters for mqSetIntegerFilter**Bag (MQHBAG) - input**

Handle of the bag to be set. This must be the handle of a bag created by the user, and not the handle of a system bag; `MQRC_SYSTEM_BAG_NOT_ALTERABLE` results if the handle you specify refers to a system bag.

Selector (MQLONG) - input

Selector of the item to be modified. If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC_SELECTOR_NOT_SUPPORTED results if it is not.

If the selector is a supported system selector, but is one that is read-only, MQRC_SYSTEM_ITEM_NOT_ALTERABLE results.

If the selector is an alterable system selector, but is always a single-instance selector and the application attempts to create a second instance in the bag, MQRC_MULTIPLE_INSTANCE_ERROR results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO_CHECK_SELECTORS option or as an administration bag (MQCBO_ADMIN_BAG), the selector must be in the range MQIA_FIRST through MQIA_LAST; MQRC_SELECTOR_OUT_OF_RANGE results if it is not. If MQCBO_CHECK_SELECTORS was not specified, the selector can be any value zero or greater.

If MQIND_ALL is not specified for the **ItemIndex** parameter, the specified selector must already be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

If MQIND_ALL is not specified for the **ItemIndex** parameter, the data type of the item must agree with the data type implied by the call; MQRC_SELECTOR_WRONG_TYPE results if it is not.

ItemIndex (MQLONG) - input

This value identifies the occurrence of the item with the specified selector that is to be modified. The value must be zero or greater, or one of the special values described in this topic; if it is none of these, MQRC_INDEX_ERROR results.

Zero or greater

The item with the specified index must already be present in the bag; MQRC_INDEX_NOT_PRESENT results if it is not. The index is counted relative to the items in the bag that have the specified selector. For example, if there are five items in the bag with the specified selector, the valid values for *ItemIndex* are 0 through 4.

MQIND_NONE

This specifies that there must be one occurrence only of the specified selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

MQIND_ALL

This specifies that all existing occurrences of the specified selector (if any) are to be deleted from the bag, and a new occurrence of the selector created at the end of the bag.

Note: For system selectors, the order is not changed.

ItemValue (MQLONG) - input

The integer condition value to be placed in the bag.

Operator (MQLONG) - input

The integer filter operator to be placed in the bag. Valid operators are of the form MQCFOP_*

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the mqSetIntegerFilter call:

MQRC_FILTER_OPERATOR_ERROR

Filter operator not valid.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

Index not valid (index negative and not MQIND_NONE or MQIND_ALL).

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_MULTIPLE_INSTANCE_ERROR

Multiple instances of system selector not valid.

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

MQIND_NONE specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not in valid range for call.

MQRC_SELECTOR_WRONG_TYPE

Data item has wrong data type for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

MQRC_SYSTEM_ITEM_NOT_ALTERABLE

System item is read only and cannot be altered.

C language invocation for mqSetIntegerFilter

```
mqSetIntegerFilter (Bag, Selector, ItemIndex, ItemValue, Operator,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */  
MQLONG   Selector;      /* Selector */  
MQLONG   ItemIndex;     /* Item index */  
MQLONG   ItemValue;     /* Integer value */  
MQLONG   Operator;      /* Item operator */  
MQLONG   CompCode;      /* Completion code */  
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqSetIntegerFilter

(Supported on Windows only.)

```
mqSetIntegerFilter Bag, Selector, ItemIndex, ItemValue, Operator,  
CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'  
Dim Selector As Long 'Selector'  
Dim ItemIndex As Long 'Item index'  
Dim ItemValue As Long 'Integer value'  
Dim Operator As Long 'Item operator'  
Dim CompCode As Long 'Completion code'  
Dim Reason   As Long 'Reason code qualifying CompCode'
```

mqSetString

The mqSetString call either modifies a character data item that is already present in the bag, or deletes all existing occurrences of the specified selector and adds a new occurrence at the end of the bag. The data item is usually a user item, but certain system-data items can also be modified.

Syntax for mqSetString

mqSetString (*Bag*, *Selector*, *ItemIndex*, *Bufferlength*, *Buffer*, *CompCode*, *Reason*)

Parameters for mqSetString

Bag (MQHBAG) - input

Handle of the bag to be set. This must be the handle of a bag created by the user, not the handle of a system bag; MQRC_SYSTEM_BAG_NOT_ALTERABLE results if you specify the handle of a system bag.

Selector (MQLONG) - input

Selector of the item to be modified.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC_SELECTOR_NOT_SUPPORTED results if it is not.

If the selector is a supported system selector, but is one that is read only, MQRC_SYSTEM_ITEM_NOT_ALTERABLE results.

If the selector is an alterable system selector, but is always a single-instance selector and the application attempts to create a second instance in the bag, MQRC_MULTIPLE_INSTANCE_ERROR results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO_CHECK_SELECTORS option or as an administration bag (MQCBO_ADMIN_BAG), the selector must be in the range MQCA_FIRST through MQCA_LAST; MQRC_SELECTOR_OUT_OF_RANGE results if it is not. If MQCBO_CHECK_SELECTORS was not specified, the selector can be any value zero or greater.

If MQIND_ALL is not specified for the **ItemIndex** parameter, the specified selector must already be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

If MQIND_ALL is not specified for the **ItemIndex** parameter, the data type of the item must be the same as the data type implied by the call; MQRC_SELECTOR_WRONG_TYPE results if it is not.

ItemIndex (MQLONG) - input

This identifies which occurrence of the item with the specified selector is to be modified. The value must be zero or greater, or one of the special values described in this topic; if it is none of these, MQRC_INDEX_ERROR results.

Zero or greater

The item with the specified index must already be present in the bag; MQRC_INDEX_NOT_PRESENT results if it is not. The index is counted relative to the items in the bag that have the specified selector. For example, if there are five items in the bag with the specified selector, the valid values for *ItemIndex* are 0 through 4.

MQIND_NONE

This specifies that there must be only one occurrence of the specified selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

MQIND_ALL

This specifies that all existing occurrences of the specified selector (if any) are to be deleted from the bag, and a new occurrence of the selector created at the end of the bag.

BufferLength (MQLONG) - input

The length in bytes of the string contained in the **Buffer** parameter. The value must be zero or greater, or the special value MQBL_NULL_TERMINATED.

If MQBL_NULL_TERMINATED is specified, the string is delimited by the first null encountered in the string.

If MQBL_NULL_TERMINATED is not specified, *BufferLength* characters are inserted into the bag, even if null characters are present; the nulls do not delimit the string.

Buffer (MQCHAR x BufferLength) - input

Buffer containing the character string. The length is given by the **BufferLength** parameter. If zero is specified for **BufferLength**, the null pointer can be specified for the address of the **Buffer** parameter; in all other cases, a valid (nonnull) address must be specified for the **Buffer** parameter.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqSetString call:

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

Index not valid (index negative and not MQIND_NONE or MQIND_ALL).

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_MULTIPLE_INSTANCE_ERROR

Multiple instances of system selector not valid.

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

MQIND_NONE specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_SELECTOR_WRONG_TYPE

Data item has wrong data type for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

MQRC_SYSTEM_ITEM_NOT_ALTERABLE

System item is read-only and cannot be altered.

Usage notes for mqSetString

The Coded Character Set ID (CCSID) associated with this string is copied from the current CCSID of the bag.

C language invocation for mqSetString

```
mqSetString (Bag, Selector, ItemIndex, BufferLength, Buffer,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */  
MQLONG   Selector;     /* Selector */  
MQLONG   ItemIndex;    /* Item index */  
MQLONG   BufferLength;  /* Buffer length */  
PMQCHAR  Buffer;       /* Buffer containing string */  
MQLONG   CompCode;     /* Completion code */  
MQLONG   Reason;      /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqSetString

(Supported on Windows only.)

```
mqSetString Bag, Selector, ItemIndex, BufferLength, Buffer,  
CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long   'Bag handle'  
Dim Selector      As Long   'Selector'  
Dim ItemIndex     As Long   'Item index'  
Dim BufferLength  As Long   'Buffer length'  
Dim Buffer         As String  'Buffer containing string'  
Dim CompCode     As Long   'Completion code'  
Dim Reason       As Long   'Reason code qualifying CompCode'
```

mqSetStringFilter

The mqSetStringFilter call either modifies a string filter item that is already present in the bag, or deletes all existing occurrences of the specified selector and adds a new occurrence at the end of the bag. The data item is usually a user item, but certain system-data items can also be modified.

Syntax for mqSetStringFilter

mqSetStringFilter (Bag, Selector, ItemIndex, BufferLength, Buffer, Operator, CompCode, Reason)

Parameters for mqSetStringFilter

Bag (MQHBAG) - input

Handle of the bag to be set. This must be the handle of a bag created by the user, not the handle of a system bag; MQRC_SYSTEM_BAG_NOT_ALTERABLE results if you specify the handle of a system bag.

Selector (MQLONG) - input

Selector of the item to be modified.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC_SELECTOR_NOT_SUPPORTED results if it is not.

If the selector is a supported system selector, but is one that is read only, MQRC_SYSTEM_ITEM_NOT_ALTERABLE results.

If the selector is an alterable system selector, but is always a single-instance selector and the application attempts to create a second instance in the bag, MQRC_MULTIPLE_INSTANCE_ERROR results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO_CHECK_SELECTORS option or as an administration bag (MQCBO_ADMIN_BAG), the selector must be in the range MQCA_FIRST through MQCA_LAST; MQRC_SELECTOR_OUT_OF_RANGE results if it is not. If MQCBO_CHECK_SELECTORS was not specified, the selector can be any value zero or greater.

If MQIND_ALL is not specified for the **ItemIndex** parameter, the specified selector must already be present in the bag; MQRC_SELECTOR_NOT_PRESENT results if it is not.

If MQIND_ALL is not specified for the **ItemIndex** parameter, the data type of the item must be the same as the data type implied by the call; MQRC_SELECTOR_WRONG_TYPE results if it is not.

ItemIndex (MQLONG) - input

This identifies which occurrence of the item with the specified selector is to be modified. The value must be zero or greater, or one of the special values described in this topic; if it is none of these, MQRC_INDEX_ERROR results.

Zero or greater

The item with the specified index must already be present in the bag; MQRC_INDEX_NOT_PRESENT results if it is not. The index is counted relative to the items in the bag that have the specified selector. For example, if there are five items in the bag with the specified selector, the valid values for *ItemIndex* are 0 through 4.

MQIND_NONE

This specifies that there must be only one occurrence of the specified selector in the bag. If there is more than one occurrence, MQRC_SELECTOR_NOT_UNIQUE results.

MQIND_ALL

This specifies that all existing occurrences of the specified selector (if any) are to be deleted from the bag, and a new occurrence of the selector created at the end of the bag.

BufferLength (MQLONG) - input

The length in bytes of the condition string contained in the **Buffer** parameter. The value must be zero or greater, or the special value MQBL_NULL_TERMINATED.

If MQBL_NULL_TERMINATED is specified, the string is delimited by the first null encountered in the string.

If MQBL_NULL_TERMINATED is not specified, *BufferLength* characters are inserted into the bag, even if null characters are present; the nulls do not delimit the string.

Buffer (MQCHAR x BufferLength) - input

Buffer containing the character condition string. The length is given by the **BufferLength** parameter. If zero is specified for **BufferLength**, the null pointer can be specified for the address of the **Buffer** parameter; in all other cases, a valid (nonnull) address must be specified for the **Buffer** parameter.

Operator (MQLONG x Operator) - input

String filter operator to be placed in the bag. Valid operators are of the form MQCFOP_*

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqSetStringFilter` call:

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid.

MQRC_FILTER_OPERATOR_ERROR

Bag handle not valid.

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_INDEX_ERROR

Index not valid (index negative and not `MQIND_NONE` or `MQIND_ALL`).

MQRC_INDEX_NOT_PRESENT

No item with the specified index is present within the bag for the selector given.

MQRC_MULTIPLE_INSTANCE_ERROR

Multiple instances of system selector not valid.

MQRC_SELECTOR_NOT_PRESENT

No item with the specified selector is present within the bag.

MQRC_SELECTOR_NOT_SUPPORTED

Specified system selector not supported by the MQAI.

MQRC_SELECTOR_NOT_UNIQUE

`MQIND_NONE` specified when more than one occurrence of the specified selector is present in the bag.

MQRC_SELECTOR_OUT_OF_RANGE

Selector not within valid range for call.

MQRC_SELECTOR_WRONG_TYPE

Data item has wrong data type for call.

MQRC_STORAGE_NOT_AVAILABLE

Insufficient storage available.

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

MQRC_SYSTEM_ITEM_NOT_ALTERABLE

System item is read-only and cannot be altered.

Usage notes for `mqSetStringFilter`

The Coded Character Set ID (CCSID) associated with this string is copied from the current CCSID of the bag.

C language invocation for `mqSetStringFilter`

```
mqSetStringFilter (Bag, Selector, ItemIndex, BufferLength, Buffer,  
Operator, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   Bag;           /* Bag handle */  
MQLONG   Selector;      /* Selector */  
MQLONG   ItemIndex;     /* Item index */  
MQLONG   BufferLength;  /* Buffer length */  
PMQCHAR  Buffer;        /* Buffer containing string */  
MQLONG   Operator;      /* Item operator */  
MQLONG   CompCode;     /* Completion code */  
MQLONG   Reason;       /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqSetStringFilter

(Supported on Windows only.)

```
mqSetStringFilter Bag, Selector, ItemIndex, BufferLength, Buffer,  
Operator, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long   'Bag handle'  
Dim Selector     As Long   'Selector'  
Dim ItemIndex    As Long   'Item index'  
Dim BufferLength  As Long   'Buffer length'  
Dim Buffer        As String 'Buffer containing string'  
Dim Operator     As Long   'Item operator'  
Dim CompCode     As Long   'Completion code'  
Dim Reason       As Long   'Reason code qualifying CompCode'
```

mqTrim

The mqTrim call trims the blanks from a blank-padded string, then terminates it with a null.

Syntax for mqTrim

mqTrim (*BufferLength*, *Buffer*, *String*, *CompCode*, *Reason*)

Parameters for mqTrim

BufferLength (MQLONG) - input

Length in bytes of the buffer containing the string padded with blanks. Must be zero or greater.

Buffer (MQCHAR × BufferLength) - input

Buffer containing the blank-padded string. The length is given by the **BufferLength** parameter. If zero is specified for **BufferLength**, the null pointer can be specified for the address of the **Buffer** parameter; in all other cases, a valid (nonnull) address must be specified for the **Buffer** parameter.

String (MQCHAR × (BufferLength + 1)) - output

Buffer to receive the null-terminated string. The length of this buffer must be at least one byte greater than the value of the **BufferLength** parameter.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqTrim call:

MQRC_BUFFER_ERROR

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

MQRC_BUFFER_LENGTH_ERROR

Buffer length not valid.

MQRC_STRING_ERROR

String parameter not valid (invalid parameter address or buffer not completely accessible).

Usage notes for mqTrim

1. If the two buffer pointers are the same, the trimming is done in place. If they are not the same, the blank-padded string is copied into the null-terminated string buffer. After copying, the buffer is scanned backwards from the end until a non-space character is found. The byte following the non-space character is then overwritten with a null character.

2. If *String* and *Buffer* partially overlap, the result is undefined.

C language invocation for mqTrim

```
mqTrim (BufferLength, Buffer, String, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQLONG  BufferLength;    /* Buffer length */
PMQCHAR Buffer;         /* Buffer containing blank-padded string */
MQCHAR  String[n+1];   /* String with blanks discarded */
MQLONG  CompCode;      /* Completion code */
MQLONG  Reason;        /* Reason code qualifying CompCode */
```

Note: This call is not supported in Visual Basic.

mqTruncateBag

The `mqTruncateBag` call reduces the number of user items in a user bag to the specified value, by deleting user items from the end of the bag.

Syntax for mqTruncateBag

`mqTruncateBag (Bag, ItemCount, CompCode, Reason)`

Parameters for mqTruncateBag

Bag (MQHBAG) - input

Handle of the bag to be truncated. This must be the handle of a bag created by the user, not the handle of a system bag; `MQRC_SYSTEM_BAG_NOT_ALTERABLE` results if you specify the handle of a system bag.

ItemCount (MQLONG) - input

The number of user items to remain in the bag after truncation. Zero is a valid value.

Note: The **ItemCount** parameter is the number of data items, not the number of unique selectors. (If there are one or more selectors that occur multiple times in the bag, there will be fewer selectors than data items before truncation.) Data items are deleted from the end of the bag, in the opposite order to which they were added to the bag.

If the number specified exceeds the number of user items currently in the bag, `MQRC_ITEM_COUNT_ERROR` results.

CompCode (MQLONG) - output

Completion code.

Reason (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqTruncateBag` call:

MQRC_HBAG_ERROR

Bag handle not valid.

MQRC_ITEM_COUNT_ERROR

ItemCount parameter not valid (value exceeds the number of user data items in the bag).

MQRC_SYSTEM_BAG_NOT_ALTERABLE

System bag cannot be altered or deleted.

Usage notes for mqTruncateBag

1. System items in a bag are not affected by mqTruncateBag; the call cannot be used to truncate system bags.
2. mqTruncateBag with an *ItemCount* of zero is not the same as the mqClearBag call. The former deletes all of the user items but leaves the system items intact, and the latter deletes all of the user items and resets the system items to their initial values.

C language invocation for mqTruncateBag

```
mqTruncateBag (Bag, ItemCount, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG    hBag;           /* Bag handle */
MQLONG    ItemCount;      /* Number of items to remain in bag */
MQLONG    CompCode;       /* Completion code */
MQLONG    Reason;         /* Reason code qualifying CompCode */
```

Visual Basic invocation for mqTruncateBag

(Supported on Windows only.)

```
mqTruncateBag Bag, ItemCount, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long 'Bag handle'
Dim ItemCount     As Long 'Number of items to remain in bag'
Dim CompCode      As Long 'Completion code'
Dim Reason        As Long 'Reason code qualifying CompCode'
```

MQAI selectors

Items in bags are identified by a *selector* that acts as an identifier for the item. There are two types of selector, *user selector* and *system selector*.

User selectors

User selectors have values that are zero or positive. For the administration of MQSeries objects, valid user selectors are already defined by the following constants:

- MQCA_* and MQIA_* (object attributes)
- MQCACF_* and MQIACF_* (items relating specifically to PCF)
- MQCACH_* and MQIACH_* (channel attributes)

For user messages, the meaning of a user selector is defined by the application.

The following additional user selectors are introduced by the MQAI:

MQIACF_INQUIRY

Identifies an IBM MQ object attribute to be returned by an Inquire command.

MQHA_BAG_HANDLE

Identifies a bag handle residing within another bag.

MQHA_FIRST

Lower limit for handle selectors.

MQHA_LAST

Upper limit for handle selectors.

MQHA_LAST_USED

Upper limit for last handle selector allocated.

MQCA_USER_LIST

Default user selector. Supported on Visual Basic only. This selector supports character type and represents the default value used if the **Selector** parameter is omitted on the mqAdd*, mqSet*, or mqInquire* calls.

MQIA_USER_LIST

Default user selector. Supported on Visual Basic only. This selector supports integer type and represents the default value used if the **Selector** parameter is omitted on the mqAdd*, mqSet*, or mqInquire* calls.

System selectors

System selectors have negative values. The following system selectors are included in the bag when it is created:

MQIASY_BAG_OPTIONS

Bag-creation options. A summation of the options used to create the bag. This selector cannot be changed by the user.

MQIASY_CODED_CHAR_SET_ID

Character-set identifier for the character data items in the bag. The initial value is the queue manager's character set.

The value in the bag is used on entry to the mqExecute call and set on exit from the mqExecute call. This also applies when character strings are added to or modified in the bag.

MQIASY_COMMAND

PCF command identifier. Valid values are the MQCMD_* constants. For user messages, the value MQCMD_NONE should be used. The initial value is MQCMD_NONE.

The value in the bag is used on entry to the mqPutBag and mqBagToBuffer calls, and set on exit from the mqExecute, mqGetBag and mqBufferToBag calls.

MQIASY_COMP_CODE

Completion code. Valid values are the MQCC_* constants. The initial value is MQCC_OK.

The value in the bag is used on entry to the mqExecute, mqPutBag, and mqBagToBuffer calls, and set on exit from the mqExecute, mqGetBag, and mqBufferToBag calls.

MQIASY_CONTROL

PCF control options. Valid values are the MQCFC_* constants. The initial value is MQCFC_LAST.

The value in the bag is used on entry to the mqExecute, mqPutBag, and mqBagToBuffer calls, and set on exit from the mqExecute, mqGetBag, and mqBufferToBag calls.

MQIASY_MSG_SEQ_NUMBER

PCF message sequence number. Valid values are 1 or greater. The initial value is 1.

The value in the bag is used on entry to the mqExecute, mqPutBag, and mqBagToBuffer calls, and set on exit from the mqExecute, mqGetBag, and mqBufferToBag calls.

MQIASY_REASON

Reason code. Valid values are the MQRC_* constants. The initial value is MQRC_NONE.

The value in the bag is used on entry to the mqExecute, mqPutBag, and mqBagToBuffer calls, and set on exit from the mqExecute, mqGetBag, and mqBufferToBag calls.

MQIASY_TYPE

PCF command type. Valid values are the MQCFT_* constants. For user messages, the value MQCFT_USER should be used. The initial value is MQCFT_USER for bags created as user bags and MQCFT_COMMAND for bags created as administration or command bags.

The value in the bag is used on entry to the mqExecute, mqPutBag, and mqBagToBuffer calls, and set on exit from the mqExecute, mqGetBag, and mqBufferToBag calls.

MQIASY_VERSION

PCF version. Valid values are the MQCFH_VERSION_* constants. The initial value is MQCFH_VERSION_1.

If the value in the bag is set to a value other than MQCFH_VERSION_1, the value is used on entry to the mqExecute, mqPutBag, and mqBagToBuffer calls. If the value in the bag in MQCFH_VERSION_1, the PCF version is the lowest value required for the parameter structures that are present in the message.

The value in the bag is set on exit from the mqExecute, mqGetBag, and mqBufferToBag calls.

Example code

Here are some example uses of the mqExecute call.

The example shown in figure [Figure 1 on page 2132](#) creates a local queue (with a maximum message length of 100 bytes) on a queue manager:

```
/* Create a bag for the data you want in your PCF message */
mqCreateBag(MQCBO_ADMIN_BAG, &hbagRequest)

/* Create a bag to be filled with the response from the command server */
mqCreateBag(MQCBO_ADMIN_BAG, &hbagResponse)

/* Create a queue */
/* Supply queue name */
mqAddString(hbagRequest, MQCA_Q_NAME, "QBERT")

/* Supply queue type */
mqAddString(hbagRequest, MQIA_Q_TYPE, MQQT_LOCAL)

/* Maximum message length is an optional parameter */
mqAddString(hbagRequest, MQIA_MAX_MSG_LENGTH, 100)

/* Ask the command server to create the queue */
mqExecute(MQCMD_CREATE_Q, hbagRequest, hbagResponse)

/* Tidy up memory allocated */
mqDeleteBag(hbagRequest)
mqDeleteBag(hbagResponse)
```

Figure 1. Using mqExecute to create a local queue

The example shown in figure [Figure 2 on page 2132](#) inquires about all attributes of a particular queue. The mqAddInquiry call identifies all IBM MQ object attributes of a queue to be returned by the Inquire parameter on mqExecute.

```
/* Create a bag for the data you want in your PCF message */
mqCreateBag(MQCBO_ADMIN_BAG, &hbagRequest)

/* Create a bag to be filled with the response from the command server */
mqCreateBag(MQCBO_ADMIN_BAG, &hbagResponse)

/* Inquire about a queue by supplying its name */
/* (other parameters are optional) */
mqAddString(hbagRequest, MQCA_Q_NAME, "QBERT")

/* Request the command server to inquire about the queue */
mqExecute(MQCMD_INQUIRE_Q, hbagRequest, hbagResponse)

/* If it worked, the attributes of the queue are returned */
/* in a system bag within the response bag */
mqInquireBag(hbagResponse, MQHA_BAG_HANDLE, 0, &hbagAttributes)

/* Inquire the name of the queue and its current depth */
mqInquireString(hbagAttributes, MQCA_Q_NAME, &stringAttribute)
mqInquireString(hbagAttributes, MQIA_CURRENT_Q_DEPTH, &integerAttribute)

/* Tidy up memory allocated */
mqDeleteBag(hbagRequest)
mqDeleteBag(hbagResponse)
```

Figure 2. Using mqExecute to inquire about queue attributes

Using mqExecute is the simplest way of administering IBM MQ, but lower-level calls, mqBagToBuffer and mqBufferToBag, can be used. For more information about the use of these calls, see [The IBM MQ Administration Interface \(MQAI\)](#).

z/OS Using the IBM MQ utilities on z/OS

Reference information about the syntax, and usage of the various IBM MQ utility programs.

z/OS An overview of the IBM MQ utilities for z/OS

Use this topic as a reference to the different categories of utilities.

This topic introduces the IBM MQ utility programs that are provided to help you perform various administrative tasks. The utility programs are described in the subsequent sections:

[The IBM MQ CSQUTIL utility program: Managing page sets](#)

[The IBM MQ CSQUTIL utility program: Issuing commands](#)

[The IBM MQ CSQUTIL utility program: Managing queues](#)

[The IBM MQ CSQUTIL utility program: Migrating CSQXPARM](#)

[The IBM MQ CSQJU003 Change log inventory utility](#)

[The remaining IBM MQ utilities](#) summarizes what you can do with these utilities.

Table 115. The IBM MQ CSQUTIL utility program: Managing page sets

Purpose	Function	See topic
Format VSAM data sets as IBM MQ page sets.	FORMAT	“Formatting page sets (FORMAT) on z/OS” on page 2141
Control recovery processing used for IBM MQ page sets.	FORMAT	“Formatting page sets (FORMAT) on z/OS” on page 2141
Extract page set information.	PAGEINFO	“Page set information (PAGEINFO) on z/OS” on page 2144
Copy IBM MQ page sets.	COPYPAGE	“Expanding a page set (COPYPAGE) on z/OS” on page 2145
Copy IBM MQ page sets and reset the log information.	RESETPAGE	“Copying a page set and resetting the log (RESETPAGE) on z/OS” on page 2147

Table 116. The IBM MQ CSQUTIL utility program: Issuing commands

Purpose	Function	See topic
Issue IBM MQ commands.	COMMAND	“Using the COMMAND function of CSQUTIL on z/OS” on page 2149
Produce a set of DEFINE, ALTER or DELETE commands for objects.	COMMAND	Making a list of DEFINE commands
Produce a client channel definition file.	COMMAND	Making a client channel definition file
Produce a set of DEFINE commands for objects (offline).	SDEFS	“Producing a list of IBM MQ define commands (SDEFS) on z/OS” on page 2156

Table 117. The IBM MQ CSQUTIL utility program: Managing queues

Purpose	Function	See topic
Copy contents of a queue to a data set.	COPY	“Copying queues into a data set while the queue manager is running (COPY) on z/OS” on page 2159
Copy contents of a queue to a data set (offline).	SCOPY	“Copying queues into a data set while the queue manager is not running (SCOPY) on z/OS” on page 2161
Delete contents of a queue.	EMPTY	“Emptying a queue of all messages (EMPTY) on z/OS” on page 2164
Restore contents of a queue.	LOAD	“Restoring messages from a data set to a queue (LOAD) on z/OS” on page 2165

Table 118. The IBM MQ CSQUTIL utility program: Migrating CSQXPARM

Purpose	Function	See topic
Produce an ALTER QMGR command from a channel initiator parameter module.	XPARM	“Migrating a channel initiator parameter module (XPARM) on z/OS” on page 2169

Table 119. The IBM MQ CSQJU003 Change log inventory utility

Purpose	Function	See topic
Add active or archive log data sets.	NEWLOG	“Adding information about a data set to the BSDS (NEWLOG) on z/OS” on page 2173
Delete active or archive log data sets.	DELETE	“Deleting information about a data set from the BSDS (DELETE) on z/OS” on page 2176
Supply passwords for archive logs.	ARCHIVE	“Supplying a password for archive log data sets (ARCHIVE) on z/OS” on page 2177
Control the next restart of the queue manager.	CRESTART	“Controlling the next restart (CRESTART) on z/OS” on page 2177
Set checkpoint records.	CHECKPT	“Setting checkpoint records (CHECKPT) on z/OS” on page 2178
Update the highest written log RBA.	HIGHRBA	“Updating the highest written log RBA (HIGHRBA) on z/OS” on page 2179

Table 120. The remaining IBM MQ utilities

Name	Purpose	See topic
CSQJU004 (Print log map utility)	List information about the log.	“The print log map utility (CSQJU004) on z/OS” on page 2180
CSQ1LOGP (Log print utility)	Print the log. Extract log records into sequential files.	“The log print utility (CSQ1LOGP) on z/OS” on page 2181

Table 120. The remaining IBM MQ utilities (continued)		
Name	Purpose	See topic
CSQ5PQSG (IBM MQ table update utility)	Add and remove queue sharing group and queue manager entries in the IBM MQ tables held in the shared Db2 data-sharing group.	“The queue sharing group utility (CSQ5PQSG) on z/OS” on page 2191
CSQJUFMT (Active log preformat utility)	Preformat log data sets Preformat Shared Message Data Sets (SMDS)	“The active log preformat utility (CSQJUFMT) on z/OS” on page 2195
CSQUDLQH (Dead-letter queue handler utility)	Process messages on the dead-letter queue.	“The dead-letter queue handler utility (CSQUDLQH) on z/OS” on page 2195
CSQUCVX (Data conversion exit utility)	Generate data conversion exit routines.	Writing a data-conversion exit program for IBM MQ for z/OS
V 9.0.1 V 9.0.1 CSQUDSPM (Display queue manager utility)	Display information about queue managers. The equivalent function on Multiplatforms is dspm .	“Display queue manager information utility (CSQUDSPM)” on page 2213

These utilities are located in the thlqual.SCSQAUTH or thlqual.SCSQLOAD IBM MQ load libraries. Concatenate the appropriate IBM MQ language load library thlqual.SCSQANLx (where x is the language letter) in the STEPLIB with the thlqual.SCSQAUTH and thlqual.SCSQLOAD. The utility control statements are available only in U.S. English. In some cases, the Db2 library db2qual.SDSNLOAD is also needed.

z/OS Syntax diagrams

The syntax for a command and its options is presented in the form of a syntax diagram called a railroad diagram. Railroad diagrams are a visual format suitable for sighted users. It tells you what options you can supply with the command, how to enter them, indicates relationships between different options, and sometimes different values of an option.

Each railroad diagram begins with a double right arrow and ends with a right and left arrow pair. Lines beginning with a single right arrow are continuation lines. You read a railroad diagram from left to right and from top to bottom, following the direction of the arrows.

Other conventions used in railroad diagrams are:

Table 121. How to read railroad diagrams	
Convention	Meaning
	You must specify values A, B, and C. Required values are shown on the main line of a railroad diagram.
	You may specify value A. Optional values are shown below the main line of a railroad diagram.

Table 121. How to read railroad diagrams (continued)

Convention	Meaning
	<p>Values A, B, and C are alternatives, one of which you must specify.</p>
	<p>Values A, B, and C are alternatives, one of which you might specify.</p>
	<p>This shows that a value (for example, A, or B, or C) must be selected, and if another is to be selected then a comma must be used between the values.</p>
	<p>You might specify value A multiple times. The separator in this example is optional.</p>
	<p>Values A, B, and C are alternatives, one of which you might specify. If you specify none of the values shown, the default A (the value shown above the main line) is used.</p>
	<p>The railroad fragment Name is shown separately from the main railroad diagram.</p>
<p>Punctuation and uppercase values</p>	<p>Specify exactly as shown.</p>

IBM MQ utility program (CSQUTIL) on z/OS

The CSQUTIL utility program is provided with IBM MQ to help you to perform backup, restoration, and reorganization tasks, and to issue IBM MQ commands.

Through this utility program, you can invoke functions in these groups:

Page set management

These functions enable you to manage IBM MQ page sets. You can format data sets as page sets, change the recovery processing performed against page sets, extract page set information, increase the size of page sets and reset the log information contained in a page set. The page set must not belong to a queue manager that is currently running.

Command management

These functions enable you to:

- Issue commands to IBM MQ
- Produce a list of DEFINE, ALTER, or DELETE commands for your IBM MQ objects

Queue management

These functions enable you to back up and restore queues and page sets, copy queues and page sets to another queue manager, reset your queue manager, or to migrate from one queue manager to another.

Specifically, you can:

- Copy messages from a queue to a data set
- Delete messages from a queue
- Restore previously copied messages to their appropriate queues

The scope of these functions can be either:

- A *queue*, in which case the function operates on all messages in the specified queue.
- A *page set*, in which case the function operates on all the messages, in all the queues, on the specified page set.

Use these functions only for your own queues; do not use them for system queues (those with names beginning SYSTEM).

All the page set management functions, and some of the other functions, operate while the queue manager is not running, so you do not need any special authorization other than the appropriate access to the page set data sets. For the functions that operate while the queue manager is running, CSQUTIL runs as an ordinary z/OS batch IBM MQ program, issuing commands through the command server, and using the IBM MQ API to access queues.

You need the necessary authority to use the command server queues (SYSTEM.COMMAND.INPUT, SYSTEM.COMMAND.REPLY.MODEL, and SYSTEM.CSQUTIL.*), to use the IBM MQ DISPLAY commands, and to use the IBM MQ API to access any queues that you want to manage. See the usage notes for each function for more information.

Attention: If you use CSQUTIL to define a channel, and the connection name contains two parts (the host name and port number) you must enclose the host name and port number within single quotation marks to maintain the limit on the number of permissible parameters. Similarly, if your connection name consists of an IP address and port number, you must enclose these parameters within single quotation marks.

Invoking the IBM MQ utility program on z/OS

Use this topic to understand how to invoke CSQUTIL, the format of its parameters, and its return codes.

The CSQUTIL utility program runs as a z/OS batch program, below the 16 MB storage line. Specify the resources that the utility is to work with in the PARM parameter of the EXEC statement of the JCL.

```
// EXEC PGM=CSQUTIL,PARM=
```

Figure 3. How to invoke the CSQUTIL utility program

where PARM= expands to:

- [PARM parameters](#)
- [Return codes](#)

PARM parameters

QMGRname

Specifies the 1- to 4-character name of the queue manager or queue sharing group to which CSQUTIL is to connect.

If you specify the name of a queue sharing group, CSQUTIL connects to any queue manager in that group

QSGname

Specifies the 1- to 4-character name of the queue sharing group from which CSQUTIL is to extract definitions.

DSGname

Specifies the 8-character name of the Db2 data-sharing group from which CSQUTIL is to extract definitions.

db2ssid

Specifies the 4-character name, or group attach name, of the Db2 database subsystem to which CSQUTIL is to attach for stand-alone functions.

Which PARM parameters do you need?

Figure 3 on page 2138 shows that you can specify one of four options on the PARM statement. The option you specify depends on the function you need to implement, as follows:

- Use PARM= (or omit it all together) if you are using only offline functions, and not QSGDISP(GROUP) or QSGDISP(SHARED).
- Use PARM= ' QMGRname ' only if you intend to use functions that require the queue manager to be running, such as COPY and COMMAND.
- Use PARM= ' QSGname , DSGname , db2ssid ' if you intend to use the SDEFS function with either QSGDISP(GROUP) or QSGDISP(SHARED) specified. This is because CSQUTIL requires access to Db2 to perform the SDEFS function in this situation.
- Use PARM= ' QMGRname , QSGname , DSGname , db2ssid ' if you intend to combine the previous two functions in one CSQUTIL job.

If you specify a queue manager name as blanks, CSQUTIL uses the name of the default queue manager specified for z/OS batch programs in CSQBDEFV. The utility then uses this queue manager for the whole job step. When the utility connects to the queue manager, the authorization of the "signed-on user name" is checked to see which functions the invocation is allowed to use.

You specify the functions required by statements in the SYSIN data set according to these rules:

- The data set must have a record length of 80.
- Only columns 1 through 72 are significant. Columns 73 through 80 are ignored.
- Records with an asterisk (*) in column 1 are interpreted as comments and are ignored.
- Blank records are ignored.
- Each statement must start on a new line.

- A trailing - means continue from column 1 of the next record.
- A trailing + means continue from the first non-blank column of the next record.
- The keywords of statements are not case-sensitive. However, some arguments, such as queue name, are case sensitive.

The utility statements refer to the default or explicitly named DDnames for input and output. Your job can use the COPY and LOAD functions repeatedly and process different page sets or queues during a single run of the utility.

All output messages are sent to the SYSPRINT data set, which must have a record format of VBA and a record length of 125.

While running, CSQUTIL uses temporary dynamic queues with names of the form SYSTEM.CSQUTIL.*

Return codes

When you are using the COMMAND verb to issue MQSC commands, you must use FAILURE(CONTINUE) so any failure in the commands that are issued give a non-zero return code. The default is FAILURE(IGNORE) and the return code from the command is always zero.

When CSQUTIL returns to the operating system, the return code can be:

0

All functions completed successfully.

4

Some functions completed successfully, some did not, or forced a sync point.

8

All the attempted functions failed.

12

No functions attempted; there was a syntax error in the statements or the expected data sets were missing.

In most cases, if a function fails or is forced to take a sync point, no further functions are attempted. In this case, the message CSQU147I replaces the normal completion message CSQU148I.

See the usage notes for each function for more information about success or failure.

Syncpoints

The queue management functions used when the queue manager is running operate within a syncpoint so that, if a function fails, its effects can be backed out. The queue manager attribute, MAXUMSGS, specifies the maximum number of messages that a task can get or put within a single unit of recovery.

The utility issues an MQCMIT call when the MAXUMSGS limit is reached and issues the warning message CSQU087I. If the utility later fails, the changes already committed are not backed out.

Do not just rerun the utility to correct the problem or you might get duplicate messages on your queues.

Instead, use the current depth of the queue to work out, from the utility output, which messages have not been backed out. Then determine the most appropriate course of action. For example, if the function is LOAD, you can empty the queue and start again, or you can choose to accept duplicate messages on the queues.

To avoid such difficulties if the function fails, there are two options:

1. Temporarily increase the value of MAXUMSGS to be greater than the number of messages in the:
 - Queue, if you are working with a single queue.
 - Longest queue in the page set, if you are working with an entire page set.

Use the `DISPLAY QSTATUS` command to find out the value of the `CURDEPTH` attribute, which is the current depth of the queue.

To find out the value of `MAXUMSGS`, use the `DISPLAY QMGR MAXUMSGS` command.

Then rerun the command, and after the utility has successfully run change `MAXUMSGS` back to what it was before.

Note: This approach is simpler but having a large number of messages in a single unit of work can incur a high CPU cost.

2. Use the utility to `LOAD` the messages to a temporary queue.

Note that you can delete the temporary queue in the event of failure and the job rerun.

Then use the `MQSC MOVE` command to move the messages from the temporary queue to the target queue. For example:

```
MOVE QL(tempq) TOQLLOCAL(targetq) TYPE(ADD)
```

Once the command has completed successfully, you can delete the temporary queue.

This approach takes longer, but moves the messages in a number of small units of work so is more efficient in terms of CPU cost.

Monitoring the progress of the IBM MQ utility program on z/OS

You can monitor the progress of the `CSQUTIL` program by monitoring statements output to `SYSPRINT`.

To record the progress of `CSQUTIL`, every `SYSIN` statement is echoed to `SYSPRINT`.

The utility first checks the syntax of the statements in the `SYSIN`. The requested functions are started only if all the statements are syntactically correct.

Messages giving a commentary on the progress of each function are sent to `SYSPRINT`. When the processing of the utility is complete, statistics are printed with an indication of how the functions completed.

Formatting page sets (FORMAT) on z/OS

You can use the `CSQUTIL` program to format page sets.

Use the `FORMAT` function to format page sets on all data sets specified by DDnames `CSQP0000` through `CSQP0099`. In this way, you can format up to 100 page sets in a single invocation of the utility program. Use the `FORCE` keyword to reuse existing data sets.

You can also use the `FORMAT` function to change the recovery processing that is performed against page sets when the queue manager starts, using the `TYPE` keyword. This can assist in changing or recovering page sets, or reintroducing page sets that have been offline or suspended.

In summary:

- to reinstate a page set with no data, use `FORMAT` with the `TYPE(NEW)` option
- to reinstate a page set with old data, use `FORMAT` with the `TYPE(REPLACE)` option
- to reinstate a page set with old data made up-to-date, do not use `FORMAT` but start the queue manager with a backed-up copy of the page set

Page sets have identifiers (PSIDs, in the range 00 through 99) which are established by the DDnames used for the data sets in the queue manager started task procedure; DDname `CSQP00nn` specifies the page set with identifier `nn`. The DDnames you use for the `FORMAT` function do not have to correspond to those used in the queue manager started task procedure, and do not therefore have any significance regarding page set identifiers.

- [Keywords and parameters](#)
- [Example](#)
- [Usage notes](#)

Keywords and parameters

FORCE

Specifies that existing data sets are to be reused without having to delete and redefine them first. You must define any page sets you want to reuse with the REUSE attribute in the AMS DEFINE CLUSTER statement.

See the [Optional Parameters](#) section of the DEFINE CLUSTER command for more information on REUSE.

The following code is an example on how you set REUSE:

```

//IDCAMS EXEC PGM=IDCAMS,REGION=0M
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
ALTER VICY.MQOM.PSID04 REUSE
/*
  
```

To undo the REUSE option, use the ALTER attribute to change the REUSE parameter to NOREUSE.

The FORCE keyword is not valid if TYPE(REPLACE) is specified.

PAGES (*nnn*)

Specifies the minimum number of pages to format in each page set. This enables a data set that spans more than one volume to be formatted.

Formatting of the data set is always done in whole space allocations, as specified as primary or secondary quantities when the data set is defined. The number of space allocations formatted is the minimum necessary to provide the requested number of pages; if there is insufficient data set space available, as many extents as can be obtained are formatted. If an existing page set is being reused (with the FORCE keyword), the whole page set is formatted, if that is larger.

The number of pages must be in the range 1 through 16 777 213 (because the maximum page set size is 64 GB (gigabytes)). The default is 1.

The PAGES keyword is not valid if TYPE(REPLACE) is specified.

TYPE

Specifies the type of recovery processing that is performed against queue manager page sets. Values are:

RECOVER

Use RECOVER for a data set that is to be a new page set for a queue manager (that is, to have a PSID which was never been used before).

This is the default.

The data set is formatted, and any messages or other data are erased. If a DDname is added to the queue manager's started task procedure for the new PSID that specifies this data set, it will be recognized as a new page set when the queue manager is restarted.

If such a data set was used as a page set with a PSID that has been used before, on restart the queue manager attempts to recover all queues and their messages that use storage classes that reference the page set from the time the page set was first used. This may make restart a lengthy process, and is unlikely to be what is wanted.

NEW

Use NEW for a data set that is to be a page set with a PSID that has been used before for a queue manager and with data that can be discarded, to restart a failed queue manager quickly or to reintroduce the page set after it has been offline or suspended.

The data set is formatted, and any messages or other data are erased. When the queue manager is restarted, with a DDname for the old PSID that specifies this data set, it does not recover the page set but treats it as if it has been newly added to the queue manager, and any historical information about it is discarded. All queues that use storage classes referencing this page set are cleared of all messages, in a similar fashion to the way that nonpersistent messages are cleared during restart processing. This means that there will be no effect on restart time.

REPLACE

Use REPLACE for a data set with a PSID that has been used before for a queue manager and with data that is known to be consistent and up to date, to reintroduce the page set after being offline or suspended.

The data set is not formatted, and any messages or other data are preserved. When the queue manager is restarted with a DDname for the PSID that specifies this data set, it does not recover the page set but treats it as if it has never been offline, or suspended, and any historical information about it is retained. All queues that use storage classes that reference the page set keep their messages. This means that there will be no effect on restart time.

This option will only be successful if the page set is in a consistent state; that is, on its last use the queue manager was terminated normally by a STOP QMGR MODE(FORCE) or MODE(QUIESCE) command.

Example

Figure 4 on page 2143 illustrates how the FORMAT command is invoked from CSQUTIL. In this example, two page sets, referenced by CSQP0000 and CSQP0003, are formatted by CSQUTIL.

```
//FORMAT EXEC PGM=CSQUTIL
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//CSQP0000 DD DISP=OLD,DSN=pageset.dsname0
//CSQP0003 DD DISP=OLD,DSN=pageset.dsname3
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
FORMAT
/*
```

Figure 4. Sample JCL for the FORMAT function of CSQUTIL

Figure 5 on page 2144 illustrates how the FORMAT command with the TYPE option is invoked from CSQUTIL. In this example, the page set referenced by CSQP0003 is formatted by CSQUTIL.

```

//FORMAT EXEC PGM=CSQUTIL
//STEPLIB DD DISP=SHR,DSN=th1qua1.SCSQANLE
// DD DISP=SHR,DSN=th1qua1.SCSQAUTH
//CSQP0003 DD DISP=OLD,DSN=page set.dsname3
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
FORMAT TYPE(RECOVER)
/*

```

Figure 5. Sample JCL for the FORMAT function of CSQUTIL with the TYPE option

Usage notes

1. You cannot format page sets that belong to a queue manager that is still running.
2. When you use FORMAT, it is not necessary to specify a queue manager name.
3. If you use TYPE(REPLACE), recovery logs starting from when the page set was first used with the queue manager, or from when the page set was last formatted, must be available.
4. If you use data set names in which the queue manager name is a high-level qualifier, you can more easily identify which page sets are used by which queue manager, if more than one queue manager is defined.
5. Any update to a resource due to the resolution of an incomplete unit of work, where the update relates to a page on a page set that has been formatted with TYPE(REPLACE) or TYPE(NEW), is not honored. The update to the resource is lost.
6. If there is an error when formatting a page set, it does not prevent other page sets from being formatted, although the FORMAT function is considered to have failed.
7. Failure of this function does not prevent other CSQUTIL functions being attempted.

Page set information (PAGEINFO) on z/OS

Use the PAGEINFO function to extract page set information from one or more page sets, specified by DDnames in the range CSQP0000 through CSQP0099, for the source data sets from which page set information is required.

Page set management (PAGEINFO)

► PAGEINFO ◄

Keywords and parameters

There are no keywords or parameters.

Example

In [Figure 6](#) on page 2145, page set information is required from two existing page sets.

```

//PAGEINFO EXEC PGM=CSQUTIL
//STEPLIB DD DISP=SHR,DSN=thlqual.SCSQANLE
// DD DISP=SHR,DSN=thlqual.SCSQAUTH
//CSQP0001 DD DISP=OLD,DSN=page set.existing.name1
//CSQP0006 DD DISP=OLD,DSN=page set.existing.name6
//SYSPRINT DD SYSOUT=*
//SYSIN DD
* Extract page set information for 2 existing page sets (CSQS0001 and CSQS0006)
PAGEINFO
/*

```

Figure 6. Sample JCL showing the use of the PAGEINFO function

where:

CSQP0001, CSQP0006

Are the DDnames of the source data sets from which you want to extract page set information.

Information returned from PAGEINFO might include:

- Page set number
- Number of pages in a page set
- Queue manager associated with a page set
- Utility status information
- Page set recovery RBA for each page set
- System recovery RBA for all the page sets reported on by the PAGEINFO function

Usage notes

1. You cannot use PAGEINFO on the page sets of a queue manager that is running.
2. Failure of this function does not prevent other CSQUTIL functions from being attempted.
3. If you attempt to use the PAGEINFO function after the queue manager has terminated abnormally, the page sets might not have been closed properly. If a page set has not been closed properly, you cannot successfully run the PAGEINFO function against it. To avoid this problem, run the AMS VERIFY command before using the PAGEINFO function. The AMS VERIFY command might produce error messages. However, it does close the page sets properly so that the PAGEINFO function can complete successfully.

For more information about the AMS [VERIFY](#) command, see the *z/OS DFSMS Access Method Services for VSAM* manual.

4. The system recovery RBA relates only to those page sets processed; it does not relate to the whole queue manager unless all the page sets for the queue manager are included. If the page sets are from more than one queue manager, no system recovery RBA can be determined.

Expanding a page set (COPYPAGE) on z/OS

Use the COPYPAGE function to copy one or more page sets to a larger page set.

Note: The COPYPAGE function is only used for *expanding* page sets. It is not used for making backup copies of page sets. If you want to do this, use AMS REPRO as described in [How to back up and recover page sets](#). When you have used the COPYPAGE function, the page sets cannot be used by a queue manager with a different name, so do not rename your queue manager.

Use the COPYPAGE function to copy one or more page sets to a larger page set. All queues and messages on the page set are copied. If you copy page set zero, all the IBM MQ object definitions are also copied. Each page set is copied to a destination data set that must be formatted as a page set. Copying to a smaller page set is not supported.

If you use this function, you must modify the page set definition in the started task procedure to reflect the change of the name of the data set on which the new page set resides.

To use the COPYPAGE function, define DDnames in the range CSQS0000 through CSQS0099 for the source data sets, and define DDnames for the target data sets from CSQT0000 through CSQT0099.

For more information, see [Managing page sets](#).

Page set management (COPYPAGE)

►► COPYPAGE ◄◄

Keywords and parameters

There are no keywords or parameters.

Example

In [Sample JCL](#) showing the use of the COPYPAGE function, two existing page sets are copied onto two new page sets. The procedure for this is:

1. Set up the required DDnames, where:

CSQP0005, CSQP0006

Identify the destination data sets. These DDnames are used by the FORMAT function.

CSQS0005, CSQS0006

Identify the source data sets containing the two page sets you want to copy.

CSQT0005, CSQT0006

Identify the destination data sets (page sets), but this time for the COPYPAGE function.

2. Format the destination data sets, referenced by DDnames CSQP0005 and CSQP0006, as page sets using the FORMAT function.
3. Copy the two existing page sets onto the new page sets using the COPYPAGE function.

```
//JOB LIB DD DISP=SHR,DSN=ANTZ.MQ.&VER..&LVL..OUT.SCSQANLE
// DD DISP=SHR,DSN=ANTZ.MQ.&VER..&LVL..OUT.SCSQAUTH
//*
//S1 EXEC PGM=IDCAMS
//* Delete any prior attempt, then allocate a new larger pageset
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
DELETE 'VICY.MQ38.PAGE01.NEW' CLUSTER
DEFINE CLUSTER (NAME('VICY.MQ38.PAGE01.NEW') +
MODEL('VICY.MQ38.PAGE01') +
DATA CLAS(EXTENDED) +
LINEAR CYLINDERS(100,50))
//*
//MQMUTIL EXEC PGM=CSQUTIL,PARM='',REGION=4M
//* CSQUTIL
//* FORMAT acts on DDNAME like CSQPnnnn
//* optional, FORMAT PAGES(nnn) to force allocation and format of
//* secondary extents.
//* COPYPAGE copies from source, CSQSnnnn
//* to target, CSQTnnnn
//SYSPRINT DD SYSOUT=*
//CSQP0001 DD DISP=SHR,DSN=VICY.MQ38.PAGE01.NEW
//CSQS0001 DD DISP=SHR,DSN=VICY.MQ38.PAGE01
//CSQT0001 DD DISP=SHR,DSN=VICY.MQ38.PAGE01.NEW
//SYSIN DD *
FORMAT
COPYPAGE
//*
//RENAME EXEC PGM=IDCAMS
//* the cluster and data components must be renamed independently
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
ALTER 'VICY.MQ38.PAGE01' NEWNAME('VICY.MQ38.PAGE01.OLD')
ALTER 'VICY.MQ38.PAGE01.DATA' +
NEWNAME('VICY.MQ38.PAGE01.OLD.DATA')
ALTER 'VICY.MQ38.PAGE01.NEW' +
NEWNAME('VICY.MQ38.PAGE01')
ALTER 'VICY.MQ38.PAGE01.NEW.DATA' +
NEWNAME('VICY.MQ38.PAGE01.DATA')
/*
```

Figure 7. Sample JCL showing the use of the COPYPAGE function

Usage notes

1. You cannot use COPYPAGE on page sets of a queue manager that is running.
2. Using COPYPAGE involves stopping the queue manager. This results in the loss of nonpersistent messages.
3. Before you use COPYPAGE, the new data sets must be preformatted as page sets. To do this, use the FORMAT function, as shown in [Figure 7 on page 2146](#).
4. Ensure that the new (destination) data sets are larger than the old (source) data sets.
5. You cannot change the page set identifier (PSID) associated with a page set. For example, you cannot 'make' page set 03 become page set 05.
6. Failure of this function does not prevent other CSQUTIL functions from being attempted.
7. If you attempt to use the COPYPAGE function after the queue manager has terminated abnormally, the page sets might not have been closed properly. If a page set has not been closed properly, you cannot successfully run the COPYPAGE function against it.

To avoid this problem, run the AMS VERIFY command before using the COPYPAGE function. The AMS VERIFY command might produce error messages. However, it does close the page sets properly, so that the COPYPAGE function can complete successfully.

For more information about the AMS [VERIFY](#) command, see the *z/OS DFSMS Access Method Services for VSAM* manual.

8. See [Defining a page set to be larger than 4 GB](#) for information on using the EXTENDED attribute on the **DATACLAS** parameter.

Copying a page set and resetting the log (RESETPAGE) on z/OS

The RESETPAGE function is like the COPYPAGE function except that it also resets the log information in the new page sets.

RESETPAGE lets you restart the queue manager from a known, valid set of page sets, even if the corresponding log data sets have been corrupted.

The source page sets for RESETPAGE must be in a consistent state. They must be either:

- Page sets that have been through a successful queue manager shutdown using the IBM MQ command STOP QMGR.
- Copies of page sets that have been through a successful stop.

The RESETPAGE function must not be run against copies of page sets made using fuzzy backup (see [Method 2: Fuzzy backup](#)), or against page sets that are from a queue manager that has terminated abnormally.

RESETPAGE either:

- Copies page sets on all data sets referenced by DDnames CSQS0000 through CSQS0099 to new data sets referenced by DDnames CSQT0000 through CSQT0099. If you use this function, modify the page set definition in the started task procedure to reflect the change of the name of the data set on which the new page set resides.
- Resets the log information in the page set referenced by DDnames CSQP0000 through CSQP0099.

For more information, see [Managing page sets](#).

Using the RESETPAGE function

You can use the RESETPAGE function to update a set of consistent page sets so that they can be used with a set of new (clean) BSDS and log data sets to start the queue manager. You only have to use the RESETPAGE function if both copies of the log have been lost or damaged; you can restart from backup copies of page sets (and accept the resulting loss of data from the time the copies were made), or from your existing page sets.

In this situation, use the RESETPAGE function on **all** the page sets of the affected queue manager. You must also create new BSDS and log data sets.

Note: Do not use the RESETPAGE function on a subset of the page sets known to IBM MQ.

If you run the RESETPAGE function against any page sets, but do not provide clean BSDS and log data sets for the queue manager, IBM MQ attempts to recover the logs from RBA zero, and treats the page sets as empty. For example, the following messages are produced if you attempt to use the RESETPAGE function to generate page sets zero, 1, 2, and 3 without providing a clean set of BSDS and log data sets:

```
CSQI021I +CSQ1 CSQIECUR PAGE SET 0 IS EMPTY. MEDIA RECOVERY STARTED
CSQI021I +CSQ1 CSQIECUR PAGE SET 1 IS EMPTY. MEDIA RECOVERY STARTED
CSQI021I +CSQ1 CSQIECUR PAGE SET 2 IS EMPTY. MEDIA RECOVERY STARTED
CSQI021I +CSQ1 CSQIECUR PAGE SET 3 IS EMPTY. MEDIA RECOVERY STARTED
```

Page set management (RESETPAGE)

Keywords and parameters

FORCE

Specifies that the page sets specified by DDnames CSQP0000 through CSQP00nn are to be reset in place.

If FORCE is not specified, the page sets specified by DDnames CSQS0000 through CSQS00nn are copied to new page sets specified by DDnames CSQT0000 through CSQT00nn. This is the default.

You should take a copy of the page sets first. See [backing up page sets](#) for sample JCL to perform this operation.

Example

An existing page set, referenced by DDname CSQS0007, is copied to a new data set referenced by DDname CSQT0007. The new data set, which is also referenced by DDname CSQP0007, is already formatted as a page set before the RESETPAGE function is called.

```
//RESTPAGE EXEC PGM=CSQUTIL
//STEPLIB DD DISP=SHR,DSN=thlqual.SCSQANLE
// DD DISP=SHR,DSN=thlqual.SCSQAUT
//CSQP0007 DD DISP=OLD,DSN=pageset.newname7
//CSQS0007 DD DISP=OLD,DSN=pageset.oldname7
//CSQT0007 DD DISP=OLD,DSN=pageset.newname7
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
* Format new data set, CSQP0007, as page set
FORMAT
* Copy page set CSQS0007 to CSQT0007 and reset it
RESETPAGE
/*
```

Figure 8. Sample JCL showing the use of the RESETPAGE function

Usage notes

1. Do not use the RESETPAGE function against page sets after the queue manager has terminated abnormally. Page sets from a queue manager that terminated abnormally will probably contain inconsistent data; using RESETPAGE on page sets in this state leads to data integrity problems.
2. You cannot use RESETPAGE on page sets belonging to a queue manager that is running.

3. Before you use RESETPAGE, the new data sets must be pre-formatted as page sets. To do this, use the FORMAT function, as shown in [Figure 8 on page 2148](#).
4. Ensure that the new (destination) data sets are larger than the old (source) data sets.
5. You cannot change the page set identifier (PSID) associated with a page set. For example, you cannot 'make' page set 03 become page set 05.
6. Failure of this function does not prevent other CSQUTIL functions from being attempted.

z/OS Using the **COMMAND** function of **CSQUTIL** on **z/OS**

You can use the COMMAND function of CSQUTIL to direct commands to the queue manager.

Use the COMMAND function to:

1. Pass commands from an input data set to the queue manager.
2. Produce a list of DEFINE commands that describe the objects in a queue manager. The commands can be used to keep a record of the object definitions or to regenerate all or part of a queue manager's objects as part of a migration from one queue manager to another.
3. Produce a list of commands to change or delete a set of objects in a queue manager.
4. Make a client channel definition file.

The queue manager specified in the PARM parameter of the EXEC statement must be running.

- [Keywords and parameters](#)
- [Examples](#)
- [Usage notes for CSQUTIL COMMAND](#)

If you use **FAILURE (IGNORE)** the job step always obtains return code 0.

If you use **FAILURE (STOP)** or **FAILURE (CONTINUE)** the job step obtains return code 8 if there were any non zero return codes from the statements.

You should use **FAILURE (STOP)** or **FAILURE (CONTINUE)** to report any errors in the definitions.

Keywords and parameters

DDNAME(ddname1)

Specifies that the commands are to be read from a named input data set. If this keyword is omitted, the default DDname, CSQUCMD, is used.

ddname1 specifies the DDname that identifies the input data set from which commands are to be read.

MAKEDEF(*ddname2*), MAKEDEL(*ddname2*), MAKEREP(*ddname2*), MAKEALT(*ddname2*)

Specify that commands are to be generated from any DISPLAY object commands in the input data set.

The commands that are generated are:

MAKEDEF

DEFINE NOREPLACE, with all the attributes and values returned by the DISPLAY commands. For the queue manager object, an ALTER command is generated with all the attributes and values. For channel authentication records, a SET command is generated.

Both CSQUTIL SDEFS and the CSQUTIL COMMAND with the MAKEDEF option can be used to produce a set of MQSC commands to re-create the objects currently defined in the queue manager.

The difference between the two is that CSQUTIL COMMAND must be run against an active queue manager and is most appropriate for regular backup of object definitions, whereas CSQUTIL SDEFS can be used to re-create definitions for a queue manager that is not currently running. This makes the CSQUTIL SDEFS option more appropriate for recovery scenarios.

MAKEDEL

DELETE. For local queues, NOPURGE is used. For channel authentication records, a SET command with ACTION(REMOVE) is used

MAKEREP

DEFINE REPLACE, with any keywords and values from the data set specified by the DATA keyword. For channel authentication records, a SET command with ACTION(REPLACE) is used.

MAKEALT

ALTER, with any keywords and values from the data set specified by the DATA keyword. For channel authentication records, a SET command with ACTION(REPLACE) is used.

Only one of these keywords may be specified. If these keywords are omitted, no commands are generated.

ddname2 specifies the DDname that identifies the output data set in which the DEFINE, DELETE or ALTER commands are to be stored. The data set should be RECFM=FB, LRECL=80. This data set can then be used as input for a later invocation of the COMMAND function or it can be incorporated into the initialization data sets CSQINP1 and CSQINP2.

DATA(*ddname4*)

ddname4 specifies a data set from which command keywords and values are to be read, and appended to each command generated for MAKEREP or MAKEALT.

TGTQMGR(*qmgrname*)

Specifies the name of the z/OS queue manager where you want the commands to be performed. This option is not supported for use with queue managers on distributed platforms. You can specify a target queue manager that is not the one you connect to. In this case, you would normally specify the name of a remote queue manager object that provides a queue manager alias definition (the name is used as the *ObjectQMgrName* when opening the command input queue). To do this, you must have suitable queues and channels set up to access the remote queue manager.

The default is that commands are performed on the queue manager to which you are connected, as specified in the PARM field of the EXEC statement.

RESPTIME(*nnn*)

Specifies the time in seconds to wait for a response to each command, in the range 5 through 999.

The default is 30 seconds.

MAKECLNT(*ddname3*)

Specifies that a client channel definition file is generated from any DISPLAY CHANNEL commands in the input data set that return information about client-connection channels, and any DISPLAY

AUTHINFO commands that return information about authentication information objects for which the LDAPUSER and LDAPPWD attributes are not set.

If this keyword is omitted, no file is generated.

Important: The MAKECLNT utility is now stabilized at the IBM WebSphere MQ 7.1 level. You should use the **runmqsc** command using the **-n** option; see [“runmqsc \(run MQSC commands\)”](#) on page 150 for further information.

ddname3 specifies the DDname that identifies the output data set in which the generated file is to be stored; the data set should be RECFM=U, LRECL=6144. The file can then be downloaded as binary data to the client machine by a suitable file transfer program.

CCSID(ccsid)

Specifies the coded character set identifier (CCSID) that is to be used for the data in a client channel definition file. The value must be in the range 1 through 65535; the default is 437. You can only specify CCSID if you also specify MAKECLNT.

Note: IBM MQ assumes that the data is to be in ASCII, and that the encoding for numeric data is to be MQENC_INTEGER_REVERSED.

FAILURE

Specifies what action to take if an IBM MQ command that is issued fails to execute successfully. Values are:

IGNORE

Ignore the failure; continue reading and issuing commands, and treat the COMMAND function as being successful. This is the default.

CONTINUE

Read and issue any remaining commands in the input data set, but treat the COMMAND function as being unsuccessful.

STOP

Do not read or issue any more commands, and treat the COMMAND function as being unsuccessful.

Examples

This section gives examples of using the COMMAND function for the following:

- [“Issuing commands”](#) on page 2151
- [“Making a list of DEFINE commands”](#) on page 2152
- [“Making a list of ALTER commands”](#) on page 2153
- [“Making a client channel definition file”](#) on page 2153

Issuing commands

In [Figure 9](#) on page 2152, the data sets referenced by DDnames CSQUCMD and OTHER contain sets of commands. The first COMMAND statement takes commands from the default input data set MY.COMMANDS(COMMAND1) and passes them to the queue manager. The second COMMAND statement takes commands from the input data set MY.COMMANDS(OTHER1), which is referenced by DDname OTHER, and passes them to the queue manager.

```

//COMMAND EXEC PGM=CSQUTIL,PARM='CSQ1'
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//CSQUCMD DD DSN=MY.COMMANDS(COMMAND1),DISP=SHR
//OTHER DD DSN=MY.COMMANDS(OTHER1),DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
* THE NEXT STATEMENT CAUSES COMMANDS TO BE READ FROM CSQUCMD DDNAME
COMMAND
* THE NEXT SET OF COMMANDS WILL COME FROM 'OTHER' DDNAME
COMMAND DDNAME(OTHER)
* THE NEXT STATEMENT CAUSES COMMANDS TO BE READ FROM CSQUCMD
* DDNAME AND ISSUED ON QUEUE MANAGER CSQ2 WITH A RESPONSE TIME
* OF 10 SECONDS
COMMAND TGTQMR(CSQ2) RESPTIME(10)
/*

```

Figure 9. Sample JCL for issuing IBM MQ commands using CSQUTIL

Making a list of DEFINE commands

In Figure 10 on page 2153, the data set referenced by DDname CMDINP contains a set of DISPLAY commands. These DISPLAY commands specify generic names for each object type (except the queue manager itself). If you run these commands, a list is produced containing all the IBM MQ objects. In these DISPLAY commands, the ALL keyword is specified to ensure that all the attributes of all the objects are included in the list, and that all queue sharing group dispositions are included.

Note: Failing to issue DISPLAY STGCLASS as the first command can result in a set of definitions that will not be successfully processed by the queue manager, as STGCLASS definitions must be defined before the associated queue objects are defined. MAKEDEFS generate output based on the order of the input DISPLAY commands.

The MAKEDEF keyword causes this list to be converted into a corresponding set of DEFINE NOREPLACE commands (ALTER for the queue manager). These commands are put into a data set referenced by the **ddname2** parameter of the MAKEDEF keyword, that is, OUTPUT1. If you run this set of commands, IBM MQ regenerates all the object definitions in the queue manager.

```

//QDEFS EXEC PGM=CSQUTIL,PARM='CSQ1'
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//OUTPUT1 DD DISP=OLD,DSN=MY.COMMANDS(DEFS)
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
COMMAND DDNAME(CMDINP) MAKEDEF(OUTPUT1)
/*
//CMDINP DD *
DISPLAY STGCLASS(*) ALL QSGDISP(QMGR)
DISPLAY STGCLASS(*) ALL QSGDISP(GROUP)
DISPLAY CFSTRUCT(*) ALL

DISPLAY QUEUE(*) ALL QSGDISP(QMGR)
DISPLAY QUEUE(*) ALL QSGDISP(GROUP)
DISPLAY QUEUE(*) ALL QSGDISP(SHARED)
DISPLAY TOPIC(*) ALL QSGDISP(QMGR)
DISPLAY TOPIC(*) ALL QSGDISP(GROUP)
DISPLAY NAMELIST(*) ALL QSGDISP(QMGR)
DISPLAY NAMELIST(*) ALL QSGDISP(GROUP)
DISPLAY PROCESS(*) ALL QSGDISP(QMGR)
DISPLAY PROCESS(*) ALL QSGDISP(GROUP)
DISPLAY CHANNEL(*) ALL QSGDISP(QMGR)
DISPLAY CHANNEL(*) ALL QSGDISP(GROUP)
DISPLAY AUTHINFO(*) ALL QSGDISP(QMGR)
DISPLAY AUTHINFO(*) ALL QSGDISP(GROUP)
DISPLAY CHLAUTH('*') ALL
DIS SUB(*) SUBTYPE(ADMIN) ALL DISTYPE(DEFINED)

DISPLAY QMGR ALL

/*

```

Figure 10. Sample JCL for using the MAKEDEF option of the COMMAND function

Making a list of ALTER commands

In Figure 11 on page 2153, the data set referenced by DDname CMDINP contains a DISPLAY command that will produce a list of all local queues with names beginning "ABC".

The MAKEALT keyword causes this list to be converted into a corresponding set of ALTER commands, each of which includes the data from the data set referenced by DDname CMDALT. These commands are put into a data set referenced by the ddname2 parameter of the MAKEALT keyword, that is, OUTPUTA. If you run this set of commands, all the local queues with names beginning "ABC" will be disabled for PUT and GET.

```

//QALTS EXEC PGM=CSQUTIL,PARM='CSQ1 '
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//OUTPUTA DD DISP=OLD,DSN=MY.COMMANDS(ALTS)
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
COMMAND DDNAME(CMDINP) MAKEALT(OUTPUTA) DATA(CMDALT)
/*
//CMDINP DD *
DISPLAY QLOCAL(ABC*)
/*
//CMDALT DD *
PUT(DISABLED) +
GET(DISABLED)
/*

```

Figure 11. Sample JCL for using the MAKEALT option of the COMMAND function

Making a client channel definition file

In Figure 12 on page 2154, the data set referenced by DDname CMDCHL contains a DISPLAY CHANNEL command and a DISPLAY AUTHINFO command. The DISPLAY commands specify a generic name and the ALL keyword is specified to ensure that all the attributes are included.

The MAKECLNT keyword converts these attributes into a corresponding set of client channel definitions. These are put into a data set referenced by the *ddname3* parameter of the MAKECLNT keyword, that is, OUTCLNT, which is ready to be downloaded to the client machine.

```
//CLIENT EXEC PGM=CSQUTIL,PARM='CSQ1'
//STEPLIB DD DISP=SHR,DSN=th1qua1.SCSQANLE
// DD DISP=SHR,DSN=th1qua1.SCSQAUTH
//OUTCLNT DD DISP=OLD,DSN=MY.CLIENTS
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
COMMAND DDNAME(CMDCHL) MAKECLNT(OUTCLNT)
/*
//CMDCHL DD *
DISPLAY CHANNEL(*) ALL TYPE(CLNTCONN)
DISPLAY AUTHINFO(*) ALL
/*
```

Figure 12. Sample JCL for using the MAKECLNT option of the COMMAND function

Usage notes for CSQUTIL COMMAND

1. The rules for specifying commands in the input data set are the same as for the initialization data sets:

- The data set must have a record length of 80.
- Only columns 1 through 72 are significant. Columns 73 through 80 are ignored.
- Records with an asterisk (*) in column 1 are interpreted as comments and are ignored.
- Blank records are ignored.
- Each command must start on a new record.
- A trailing - means continue from column 1 of the next record.
- A trailing + means continue from the first non-blank column of the next record.
- The maximum number of characters permitted in a command is 32 762.

With the additional rule:

- A semicolon (;) can be used to terminate a command; the remaining data in the record is ignored.

See [“Building command scripts” on page 209](#) for more information about the rules for building IBM MQ commands.

2. The output from a [“DISPLAY QMGR” on page 701](#) command contains all the queue manager attributes. Using the **DISPLAY QMGR** command as part of MAKEDEF might generate an ALTER command that cannot be issued before the channel initiator is active.

Since setting PSCLUS(DISABLED) can only be done if the channel initiator is active, it might be necessary to modify the resulting ALTER command so that it does not attempt to set PSCLUS(DISABLED) until the channel initiator is active.

3. If you specify the MAKEDEF keyword:

- In the input data set, the DISPLAY commands for objects must contain the ALL parameter so that the complete definition of each object is produced. See [Figure 10 on page 2153](#).
- To obtain a complete definition, you must DISPLAY the following:
 - queues
 - topic
 - namelists
 - process definitions
 - channels

- storage classes
- authentication information objects
- CF structures
- channel authentication records
- queue manager

Note: DEFINE commands are not generated for any local queues that can be identified as dynamic, or for channels that were defined automatically.

- Do not specify the same MAKEDEF data set for more than one COMMAND function, unless its DD statement specifies a sequential data set with DISP=MOD.
4. If you specify the MAKEREP, MAKEALT, or MAKEDEL keywords:
- In the input data set, include DISPLAY commands that select the set of objects for which you want to generate commands.
 - For MAKEREP and MAKEALT, the data (if any) from the data set specified by the DATA keyword is appended to each generated command, exactly as entered. The format of the data set and the rules for specifying command data are the same as for the command input data set. Because the same data is appended to each command, if you want to process several sets of objects, you will need to use several separate COMMAND functions, each with a different DATA data set.
 - Commands are not generated for channels that were defined automatically.
5. If you specify the MAKEDEF, MAKEREP, MAKEALT, or MAKEDEL keywords, commands are generated only for objects reported by the target queue manager (as specified by the TGTQMGR keyword or defaulted), even if CMDSCOPE is used in the DISPLAY commands. To generate commands for several queue managers in a queue sharing group, use a separate COMMAND function for each.
- In a queue sharing group, queues, processes, channels, storage classes and authentication information objects should each have two DISPLAY commands, one with QSGDISP(QMGR) and one with QSGDISP(GROUP). Queues should have a third with QSGDISP(SHARED). It is not necessary to specify QSGDISP(COPY) because the required commands will be generated automatically when the commands for objects with QSGDISP(GROUP) are issued.
6. Do not specify the same MAKEDEF, MAKEREP, MAKEALT, or MAKEDEL data set for more than one COMMAND function, unless its DD statement specifies a sequential data set with DISP=MOD.
7. If you specify the MAKECLNT keyword:
- In the input data set, the display commands for channels and authentication information objects must contain the ALL parameter so that the complete definition of each channel and authentication information object is produced.
 - If the DISPLAY commands return information for a particular channel more than once, only the last set of information is used.
 - Do not specify the same client definition file data set for more than one COMMAND function, unless its DD statement specifies a sequential data set with DISP=MOD.
8. The results of DISPLAY commands used in conjunction with MAKEDEF, MAKEREP, MAKEALT, MAKEDEL or MAKECLNT are also sent to SYSPRINT.
9. If you specify the FAILURE keyword, a command is determined to be a success or failure according to the codes returned in message CSQN205I. If the return code is 00000000 and the reason code is 00000000 or 00000004, it is a success; for all other values it is a failure.
10. The COMMAND function is determined to be a success only if both:
- All the commands in the input data set are read and issued and get a response from IBM MQ, regardless of whether the response indicates successful execution of the command or not.
 - Every command issued executes successfully, if FAILURE(CONTINUE) or FAILURE(STOP) is specified.

If COMMAND fails, no further CSQUTIL functions are attempted.

11. You need the necessary authority to use command server queues (SYSTEM.COMMAND.INPUT, SYSTEM.COMMAND.REPLY.MODEL, and SYSTEM.CSQUTIL.*) and to use the IBM MQ commands that you want to issue.

z/OS Producing a list of IBM MQ define commands (SDEFS) on z/OS

You can use the SDEFS function of CSQUTIL to produce a list of DEFINE commands describing the objects in your queue manager or queue sharing group.

Both CSQUTIL SDEFS and the CSQUTIL COMMAND with the MAKEDEF option can be used to produce a set of MQSC commands to re-create the objects currently defined in the queue manager.

The difference between the two is that CSQUTIL COMMAND must be run against an active queue manager and is most appropriate for regular backup of object definitions, whereas CSQUTIL SDEFS can be used to re-create definitions for a queue manager that is not currently running. This makes the CSQUTIL SDEFS option more appropriate for recovery scenarios.

- [Keywords and parameters](#)
- [Examples](#)
- [Usage notes](#)

Keywords and parameters

OBJECT

Specifies the type of object to be listed.

A value of QUEUE lists queues of all types, as if you had specified QALIAS, QLOCAL, QMODEL and QREMOTE.

QSGDISP

Specifies from where the object definition information is obtained. Depending on how the object has been defined, this information is either:

- On the page set zero referred to by the CSQP0000 DD statement, or
- In a Db2 shared repository.

Permitted values are shown in [Table 122 on page 2157](#).

<i>Table 122. SDEFS QSGDISP parameters and their actions</i>	
QSGDISP parameter	What the SDEFS utility does
QMGR	Creates DEFINE statements for the specified object type from definitions held on the page set zero referred to by the CSQP0000 DD statement. (1) Only objects defined with QSGDISP(QMGR) are included.
COPY	Creates DEFINE statements for the specified object type from definitions held on the page set zero referred to by the CSQP0000 DD statement. (1) Only objects defined with QSGDISP(COPY) are included.
PRIVATE	Creates DEFINE statements for the specified object type from definitions held on the page set zero referred to by the CSQP0000 DD statement. (1) Both QSGDISP(QMGR) and QSGDISP(COPY) objects are included.
GROUP	Creates DEFINE statements for the specified object type from definitions held on Db2 resource definition tables for the specified queue sharing group. Only objects defined with QSGDISP(GROUP) are included. No CSQP0000 DD statement is required; the Db2 subsystem specified at object definition is accessed. The Db2 library db2qual.SDSNLOAD is required.
SHARED	Creates DEFINE statements for all local queues defined with QSGDISP(SHARED) by accessing the Db2 resource definition table for the specified queue sharing group. This parameter is permitted only with OBJECT(QLOCAL) or OBJECT(Queue). No CSQP0000 DD statement is required; the Db2 subsystem specified at object definition is accessed. The Db2 library db2qual.SDSNLOAD is required.

Notes:

1. Because only page set zero is accessed, you must ensure that the queue manager is not running.

MAKEDEF(*ddname2*)

Specifies that define commands generated for the object are to be placed in the output data set identified by the DDname. The data set should be RECFM=FB, LRECL=80. This data set can then be used as input for a later invocation of the COMMAND function or it can be incorporated into the initialization data sets CSQINP1 and CSQINP2.

The commands generated are DEFINE NOREPLACE, with all the attributes and values for the object.

Note: DEFINE commands are not generated for any local queues that can be identified as dynamic, or for channels that were defined automatically.

Examples

```

Figure 15. Sample JCL for the SDEFS function of CSQUTIL, when recovering all objects from a valid page set zero

Usage notes

1. For local definitions, do not use SDEFS for a queue manager that is running because results will be unpredictable. You can avoid doing this accidentally by using DISP=OLD in the CSQP0000 DD statement. For shared or group queue definitions, this does not matter because the information is derived from Db2.

2. When you use SDEFS for local queues you do not need to specify a queue manager name. However, for shared and group queue definitions, a queue manager name is required to access Db2.
3. To use the SDEFS function more than once in a job, specify different DDnames and data sets for each invocation of the function, or specify a sequential data set and DISP=MOD in the DD statements.
4. If the SDEFS function fails, no further CSQUTIL functions are attempted.
5. The SDEFS function does not support the CHLAUTH, SUB, CFSTRUCT or QMGR objects. To back these objects up, use the CSQUTIL COMMAND function.

Related concepts

[“IBM MQ utility program \(CSQUTIL\) on z/OS” on page 2137](#)

The CSQUTIL utility program is provided with IBM MQ to help you to perform backup, restoration, and reorganization tasks, and to issue IBM MQ commands.

z/OS Copying queues into a data set while the queue manager is running (COPY) on z/OS

You can use the COPY function of CSQUTIL to copy queued messages to a sequential data set while the queue manager is running, without destroying any messages in the original queues.

The scope of the COPY function is determined by the keyword that you specify in the first parameter. You can either copy all the messages from a named queue, or all the messages from all the queues on a named page set.

Use the complementary function, LOAD, to restore the messages to their appropriate queues.

Note:

1. If you want to copy the object definitions from the named page set, use COPYPAGE.
2. If you want to copy messages to a data set when the queue manager is stopped, use SCOPY.
3. See [Syncpoints](#) for information about how to avoid problems with duplicate messages if this function fails.
4. An alternative approach to the COPY function is to use the [“dmpmqmsg \(queue load and unload\)” on page 58](#) utility which is more flexible in many cases.

- [Keywords and parameters](#)
- [Example](#)
- [Usage notes](#)
- [Syncpoints](#)

Keywords and parameters

QUEUE(*q-name*)

Specifies that messages in the named queue are to be copied. The keyword QUEUE can be abbreviated to Q.

q-name specifies the name of the queue to be copied. This name is case-sensitive.

PSID(*psid-number*)

Specifies that all the messages in all the queues in the specified page set are to be copied.

psid-number is the page set identifier, which specifies the page set to be used. This identifier is a two-digit integer (whole number) representing a single page set.

DEFTYPE

Specifies whether to copy dynamic queues:

ALL

Copy all queues; this is the default.

PREDEFINED

Do not include dynamic queues; this is the same set of queues that are selected by the COMMAND and SDEFS functions with the MAKEDEF parameter.

DDNAME(*ddname*)

Specifies that the messages are to be copied to a named data set. If this keyword is omitted, the default DDname, CSQUOUT, is used. The keyword DDname can be abbreviated to DD.

ddname specifies the DDname of the destination data set, which is used to store the messages. The record format of this data set must be variable block spanned (VBS).

Example

```
//COPY EXEC PGM=CSQUTIL,PARM='CSQ1',REGION=0M
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//OUTPUTA DD DSN=SAMPLE.UTILITY.COPYA,DISP=(NEW,CATLG),
// SPACE=(CYL,(5,1),RLSE),UNIT=SYSDA,
// DCB=(RECFM=VBS,BLKSIZE=23200)
//CSQUOUT DD DSN=SAMPLE.UTILITY.COPY3,DISP=(NEW,CATLG),
// SPACE=(CYL,(5,1),RLSE),UNIT=SYSDA,
// DCB=(RECFM=VBS,BLKSIZE=23200)
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
* COPY WHOLE PAGE SET TO 'CSQUOUT'
COPY PSID(03)
* COPY ONE QUEUE TO 'OUTPUT'
COPY QUEUE(ABC123A) DDNAME(OUTPUTA)
/*
```

Figure 16. Sample JCL for the CSQUTIL COPY functions

Usage notes

1. The queues involved must not be in use when the function is started.
2. If you want to operate on a range of page sets, repeat the COPY function for each page set.
3. The function operates only on local queues.
4. A COPY PSID function is considered successful only if it successfully copies all the queues on the page set.
5. If you try to copy an empty queue (either explicitly by COPY QUEUE or because there are one or more empty queues on a page set that you are copying), data indicating this is written to the sequential data set, and the copy is considered to be a success. However, if you attempt to copy a nonexistent queue, or a page set containing no queues, the COPY function fails, and no data is written to the data set.

6. If COPY fails, no further CSQUTIL functions are attempted.
7. To use the COPY function more than once in the job, specify different DDnames and data sets for each invocation of the function, or specify a sequential data set and DISP=MOD in the DD statements.
8. You need the necessary authority to use the command server queues (SYSTEM.COMMAND.INPUT, SYSTEM.COMMAND.REPLY.MODEL, and SYSTEM.CSQUTIL.*), to use the DISPLAY QUEUE and DISPLAY STGCLASS MQSC commands, and to open the queues that you want to copy with the MQOO_INPUT_EXCLUSIVE and MQOO_BROWSE options.
9. For the **REGION** parameter, a value of 0M means that the job is allowed to have the amount of storage it needs. However, if a job tries to acquire too much storage, it might impact other jobs in the system. You must ideally look to limit the REGION size and specify an absolute maximum value that the job is allowed to acquire.

Copying queues into a data set while the queue manager is not running (SCOPY) on z/OS

You can use the SCOPY function of CSQUTIL to copy queued messages to a sequential data set when the queue manager is not running, without destroying any messages in the original queues.

The scope of the SCOPY function is determined by the keyword that you specify in the first parameter. You can either copy all the messages from a named queue, or all the messages from all the queues on a named page set.

Use the complementary function, LOAD, to restore the messages to their queues.

To use the SCOPY function, DDname CSQP0000 must specify the data set with page set zero for the subsystem required.

Note: The SCOPY function does not operate on shared queues.

- [Keywords and parameters](#)
- [Example](#)
- [Usage notes](#)

Keywords and parameters

QUEUE(*q-name*)

Specifies that messages in the named queue are to be copied. The keyword QUEUE can be abbreviated to Q.

q-name specifies the name of the queue to be copied. This name is case-sensitive.

DDname CSQP00 *nn* must specify the data set with page set *nn* for the subsystem required, where *nn* is the number of the page set where the queue resides.

PSID(*psid-number*)

Specifies that all the messages in all the queues in the specified page set are to be copied.

psid-number is the page set identifier, which specifies the page set to be used. This identifier is a two-digit integer (whole number) representing a single page set.

DDname CSQP00 *psid-number* must specify the data set with the required page set for the subsystem required.

DEFTYPE

Specifies whether to copy dynamic queues:

ALL

Copy all queues; this is the default.

PREDEFINED

Do not include dynamic queues; this is the same set of queues that are selected by the COMMAND and SDEFS functions with the MAKEDEF parameter.

This parameter is only valid if you specify PSID.

DDNAME(*ddname*)

Specifies that the messages are to be copied to a named data set. If this keyword is omitted, the default DDname, CSQUOUT, is used. The keyword DDname can be abbreviated to DD.

ddname specifies the DDname of the destination data set, which is used to store the messages. The record format of this data set must be variable block spanned (VBS).

Do not specify the same DDname on more than one SCOPY statement, unless its DD statement specifies a sequential data set with DISP=MOD.

Example

```
//SCOPY EXEC PGM=CSQUTIL,REGION=0M
//STEPLIB DD DISP=SHR,DSN=th1qua1.SCSQANLE
// DD DISP=SHR,DSN=th1qua1.SCSQAUTH
//OUTPUTA DD DSN=SAMPLE.UTILITY.COPYA,DISP=(NEW,CATLG),
// SPACE=(CYL,(5,1),RLSE),UNIT=SYSDA,
// DCB=(RECFM=VBS,BLKSIZE=23200)
//CSQUOUT DD DSN=SAMPLE.UTILITY.COPY3,DISP=(NEW,CATLG),
// SPACE=(CYL,(5,1),RLSE),UNIT=SYSDA,
// DCB=(RECFM=VBS,BLKSIZE=23200)
//CSQP0000 DD DISP=OLD,DSN=pageset.dsname0
//CSQP0003 DD DISP=OLD,DSN=pageset.dsname3
//CSQP0006 DD DISP=OLD,DSN=pageset.dsname6
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
* COPY WHOLE PAGE SET TO 'CSQUOUT'
SCOPY PSID(03)
* COPY ONE QUEUE TO 'OUTPUT' - QUEUE IS ON PAGE SET 6
SCOPY QUEUE(ABC123A) DDNAME(OUTPUTA)
/*
```

Figure 17. Sample JCL for the CSQUTIL SCOPY functions

Usage notes

1. Do not use SCOPY for a queue manager that is running because results are unpredictable. You can avoid doing this accidentally by using DISP=OLD in the page set DD statement.
2. When you use SCOPY, you do not need to specify a queue manager name.
3. If you want to operate on a range of page sets, repeat the SCOPY function for each page set.
4. The function operates only on local queues and only for persistent messages.

5. An SCOPY PSID function is considered successful only if it successfully copies all the queues on the page set. If an empty queue is processed, data indicating this is written to the sequential data set. If the page set has no queues, the SCOPY function fails, and no data is written to the data set.
6. If you try to copy an empty queue explicitly by SCOPY QUEUE, data indicating this is written to the sequential data set, and the copy is considered to be a success. However, if you attempt to copy a nonexistent queue, the SCOPY function fails, and no data is written to the data set.
7. If the SCOPY function fails, no further CSQUTIL functions are attempted.
8. To use the SCOPY function more than once in the job, specify different DDnames and data sets for each invocation of the function, or specify a sequential data set and DISP=MOD in the DD statements.
9. For the **REGION** parameter, a value of 0M means that the job is allowed to have the amount of storage it needs. However, if a job tries to acquire too much storage, it might impact other jobs in the system. You must ideally look to limit the REGION size and specify an absolute maximum value that the job is allowed to acquire.

Analyzing the queue data copied to a data set by COPY or SCOPY using ANALYZE on z/OS

Use this topic to understand analyzing the queue data copied to a data set by COPY or SCOPY.

This function reads and analyzes a data set (created using COPY or SCOPY), and for each queue, displays:

- queue name
- number of messages for the queue
- total length of the messages

- [“Keywords and parameters” on page 2163](#)
- [“Example” on page 2164](#)
- [“Usage notes” on page 2164](#)

Keywords and parameters

DDNAME(*ddname*)

Specifies the data set to be processed. This keyword can be abbreviated to DD.

ddname specifies the DDname that identifies the destination data set of a prior COPY or SCOPY operation. This name is not case sensitive, and can be up to eight characters long.

Example

```
//LOAD EXEC PGM=CSQUTIL
//STEPLIB DD DISP=SHR,DSN=thlqual.SCSQANLE
// DD DISP=SHR,DSN=thlqual.SCSQAUTH
//OUTPUTA DD DSN=MY.UTILITY.OUTPUTA,DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
ANALYZE DDNAME(OUTPUTA)
```

Figure 18. Sample JCL for the CSQUTIL ANALYZE function

Usage notes

1. If you omit DDname(ddname) the default DDname, CSQUINP, is used.

Emptying a queue of all messages (EMPTY) on z/OS

You can use the EMPTY function of CSQUTIL to delete all messages from a named queue or all the queues on a page set.

The queue manager must be running. The scope of the function is determined by the keyword that you specify in the first parameter.

Use this function with care. Only delete messages of which copies have already been made.

Note: See “[Syncpoints](#)” on page 2140 for information about how to avoid problems with duplicate messages if this function fails.

Queue management (EMPTY)

►► EMPTY — Object Selection ►►

Object Selection

►► — QUEUE — (— *q-name* —) — ►►
 └── PSID — (— *psid-number* —) ──┘

- [Keywords and parameters](#)
- [Example](#)
- [Usage notes](#)

Keywords and parameters

You must specify the scope of the EMPTY function. Choose one of these:

QUEUE(*q-name*)

Specifies that messages are to be deleted from a named queue. This keyword can be abbreviated to Q.

q-name specifies the name of the queue from which messages are to be deleted. This name is case sensitive.

PSID(*psid-number*)

Specifies that all the messages are to be deleted from all queues in the named page set.

psid-number specifies the page-set identifier. This identifier is a two-digit integer (whole number) representing a single page set.

Example

```
//EMPTY EXEC PGM=CSQUTIL,PARM=('CSQ1')
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
EMPTY QUEUE(SPARE)
EMPTY PSID(66)
/*
```

Figure 19. Sample JCL for the CSQUTIL EMPTY function

Usage notes

1. The queues involved must not be in use when the function is invoked.
2. This function operates only on local queues.
3. If you want to operate on a range of page sets, repeat the EMPTY function for each page set.
4. You cannot empty the system-command input queue (SYSTEM.COMMAND.INPUT).
5. An EMPTY PSID function is considered successful only if it successfully empties all the queues on the page set.
6. If you empty a queue that is already empty (either explicitly by EMPTY QUEUE or because there are one or more empty queues on a page set that you are emptying), the EMPTY function is considered to be a success. However, if you attempt to empty a nonexistent queue, or a page set containing no queues, the EMPTY function fails.
7. If EMPTY fails or is forced to take a syncpoint, no further CSQUTIL functions are attempted.
8. You need the necessary authority to use the command server queues (SYSTEM.COMMAND.INPUT, SYSTEM.COMMAND.REPLY.MODEL, and SYSTEM.CSQUTIL.*), to use the DISPLAY QUEUE and DISPLAY STGCLASS MQSC commands, and to use the IBM MQ API to get messages from the queues that you want to empty.

Related concepts

[“Invoking the IBM MQ utility program on z/OS” on page 2138](#)

Use this topic to understand how to invoke CSQUTIL, the format of its parameters, and its return codes.

Restoring messages from a data set to a queue (LOAD) on z/OS

The LOAD function of CSQUTIL is complementary to the COPY or SCOPY function. LOAD restores messages from the destination data set of an earlier COPY or SCOPY operation. The queue manager must be running.

The data set can contain messages from one queue only if it was created by COPY or SCOPY QUEUE, or from a number of queues if it was created by COPY PSID or several successive COPY or SCOPY QUEUE operations. Messages are restored to queues with the same name as those from which they were copied. You can specify that the first or only queue is loaded to a queue with a different name. (This would normally be used with a data set created with a single COPY queue operation to restore the messages to a queue with a different name.)

Notes:

1. See [“Syncpoints” on page 2140](#) for information about how to avoid problems with duplicate messages if this function fails.
2. An alternative approach to the LOAD function is to use the [“dmpmqmsg \(queue load and unload\)” on page 58](#) utility which is more flexible in many cases.

Messages are restored to queues with the same name as those from which they were copied. You can specify that the first or only queue is loaded to a queue with a different name using the **QUEUE** parameter. (This would normally be used with a data set created with a single COPY queue operation to restore the

messages to a queue with a different name.) For a data set containing multiple queues, the first queue to be processed can be specified using the **FROMQUEUE** parameter. Messages are restored to this queue and all subsequent queues in the data set.

- [Keywords and parameters](#)
- [Example](#)
- [Usage notes](#)

Keywords and parameters

QUEUE(*q-name*)

This parameter specifies that the messages from the first or only queue on the destination data set of a prior COPY or SCOPY operation are loaded to a named queue. Messages from any subsequent queues are loaded to queues with the same names as those they came from. The keyword QUEUE can be abbreviated to Q.

q-name specifies the name of the queue to which the messages are to be loaded. This name is case sensitive. It must not be a model queue.

FROMQUEUE(*q_name*)

Specifies the name of the first queue to process on the destination data set of a prior COPY or SCOPY operation. Messages from this queue and any subsequent queues on the data set are loaded to queues with the same names as those that they came from. If this parameter is removed, the LOAD function starts with the first queue on the data set and processes all queues. The keyword FROMQUEUE can be abbreviated to FROMQ.

DDNAME(*ddname*)

Specifies that messages are loaded from a named data set. This keyword can be abbreviated to DD.

ddname specifies the **DDNAME** that identifies the destination data set of a prior COPY or SCOPY operation, from which the messages are to be loaded. This name is not case sensitive, and can be up to 8 characters long.

If you omit **DDNAME** (*ddname*) the default **DDNAME**, CSQUINP, is used.

SKIPMSGS(*n*)

Specifies that the first *n* messages in the sequential data set are to be skipped before commencing the load of the queue.

If you omit SKIPMSGS(*n*) no messages are skipped; the load starts at the first message.

MSGCOUNT(*m*)

Specifies that only *m* messages are read from the data set and loaded to the queue.

If you omit MSGCOUNT(*m*) the number of messages read is unlimited.

Example

```
//LOAD EXEC PGM=CSQUTIL,PARM=('CSQ1'),REGION=0M
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//OUTPUTA DD DSN=MY.UTILITY.OUTPUTA,DISP=SHR
//CSQUINP DD DSN=MY.UTILITY.COPYA,DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
LOAD QUEUE(ABC123) DDNAME(OUTPUTA)
LOAD QUEUE(TOQ) FROMQUEUE(QUEUEA) SKIPMSGS(55)
/*
```

Figure 20. Sample JCL for the CSQUTIL LOAD function

Note:

REGION - A value of 0M means that the job is allowed to have the amount of storage it needs. However, if a job tries to acquire too much storage, it might impact other jobs in the system. You must ideally look to limit the REGION size and specify an absolute maximum value that the job is allowed to acquire.

LOAD QUEUE(ABC123) DDNAME(OUTPUTA) - Reloads all queues from the input data set MY.UTILITY.OUTPUTA. The names of the queues loaded are the same as the queue names from which the data was copied, apart from the first queue on the data set which is reloaded to queue ABC123.

LOAD QUEUE(TOQ) FROMQUEUE(QUEUEA) SKIPMSGS(55) - Reloads all queues from the input data set MY.UTILITY.COPYA, starting from queue QUEUEA. The names of the queues loaded are the same as the queue names from which the data was copied, apart from the first queue QUEUEA, which is reloaded to queue TOQ. In processing the messages in QUEUEA, the first 55 messages are ignored, and loading starts from the 56th message.

Usage notes

1. To use the LOAD function, the queues or page sets involved must not be in use when the function is invoked.
2. If the data set contains multiple queues, the LOAD function is considered successful only if it successfully loads all the queues on the data set. (or all those following the starting queue specified with FROMQUEUE, if this is set).
3. If LOAD fails, or is forced to take a syncpoint, no further CSQUTIL functions are attempted.
4. CSQUTIL uses MQPMO_SET_ALL_CONTEXT to ensure that the message descriptor fields remain the same as the original copy. It therefore needs an access of CONTROL in the CONTEXT profile of the queue. For full details, see [Profiles for context security](#).

Restoring messages from a data set to a queue (SLOAD) on z/OS

The SLOAD function of CSQUTIL is complementary to the COPY or SCOPY function. SLOAD restores messages from the destination data set of an earlier COPY or SCOPY operation. SLOAD processes a single queue.

To use SLOAD the queue manager must be running.

If the data set was created by COPY or SCOPY QUEUE it contains messages from one queue only. If the data set was created by COPY PSID or several successive COPY or SCOPY QUEUE operations, it might contain messages from a number of queues.

By default, SLOAD processes the first queue on the data set. You can specify a particular queue to process using the **FROMQUEUE** parameter.

By default, messages are restored to a queue with the same name as the one from which it was copied. You can specify that the queue is loaded to a queue with a different name using the **QUEUE** parameter.

Note: See “Syncpoints” on page 2140 for information about how to avoid problems with duplicate messages if this function fails.

- [“Keywords and parameters” on page 2168](#)
- [“Example” on page 2169](#)
- [“Usage notes” on page 2169](#)

Keywords and parameters

QUEUE(*q-name*)

This parameter specifies that the messages from the first or only queue on the destination data set of a prior COPY or SCOPY operation are to be loaded to a named queue. The keyword QUEUE can be abbreviated to Q.

q-name specifies the name of the queue to which the messages are to be loaded. This name is case sensitive. It must not be a model queue.

FROMQUEUE(*q-name*)

Specifies the name of the queue to process. If this parameter is omitted, the first queue is processed. The keyword FROMQUEUE can be abbreviated to FROMQ.

q-name specifies the name of the queue to be processed. This name is case sensitive.

DDNAME(*ddname*)

Specifies that messages are to be loaded from a named data set. This keyword can be abbreviated to DD.

ddname specifies the **DDNAME** that identifies the destination data set of a prior COPY or SCOPY operation, from which the messages are to be loaded. This name is not case sensitive, and can be up to 8 characters long.

If you omit **DDNAME** (*ddname*) the default **DDNAME**, CSQUINP, is used.

SKIPMSGS(*n*)

Specifies that the first *n* messages in the sequential data set are to be skipped before commencing the load of the queue.

If you omit SKIPMSGS(*n*) no messages are skipped; the load starts at the first message.

MSGCOUNT(*m*)

Specifies that only *m* messages are to be read from the data set and loaded to the queue.

If you omit MSGCOUNT(*m*) the number of messages read is unlimited.

Example

```
//SLOAD EXEC PGM=CSQUTIL,PARM=('CSQ1'),REGION=0M
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//OUTPUTA DD DSN=MY.UTILITY.OUTPUTA,DISP=SHR
//CSQUINP DD DSN=MY.UTILITY.COPYA,DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
SLOAD DDNAME(OUTPUTA)
SLOAD QUEUE(TOQ) FROMQUEUE(QUEUEA) SKIPMSGS(55)
/*
```

Figure 21. Sample JCL for the CSQUTIL SLOAD function

Note:

- REGION - A value of 0M means that the job is allowed to have the amount of storage it needs. However, if a job tries to acquire too much storage, it might impact other jobs in the system. You must ideally look to limit the REGION size and specify an absolute maximum value that the job is allowed to acquire.
- SLOAD DDNAME(OUTPUTA) - Reloads the first queue from the input data set MY.UTILITY.OUTPUTA. The name of the queue loaded is the same as the queue name from which the data was copied.
- SLOAD QUEUE(TOQ) FROMQUEUE(QUEUEA) SKIPMSGS(55) - Reloads the messages that were copied from the queue QUEUEA (from the input data set MY.UTILITY.COPYA). The messages are reloaded to the queue called TOQ. In processing the messages in QUEUEA, the first 55 messages are ignored, and loading starts from the 56th message.

Usage notes

1. To use the SLOAD function, the queues or page sets involved must not be in use when the function is invoked.
2. If SLOAD fails, or is forced to take a syncpoint, no further CSQUTIL functions are attempted.
3. CSQUTIL uses MQPMO_SET_ALL_CONTEXT to ensure that the message descriptor fields remain the same as the original copy. It therefore needs an access of CONTROL in the CONTEXT profile of the queue. For full details, see [Profiles for context security](#).

Migrating a channel initiator parameter module (XPARM) on z/OS

You can use the XPARM function of CSQUTIL to generate ALTER QMGR command that can be used to migrate to IBM WebSphere MQ 7.0.

In versions of IBM MQ for z/OS before IBM WebSphere MQ 6.0, you could tailor the channel initiator by creating a channel initiator parameter load module. In IBM WebSphere MQ 7.0, you do it by setting queue manager attributes. To make it easier to migrate to IBM WebSphere MQ 7.0, this command generates an ALTER QMGR command from a pre-IBM WebSphere MQ 6.0 channel initiator parameter module.

Keywords and parameters

CHANNEL (*channel name*)

Specifies the name of a cluster-sender channel, or a generic channel name.

If a generic channel name is specified each cluster-sender channel that matches the generic name is processed.

If a single asterisk is specified all cluster-sender channels are processed.

MOVEMSGS

Specifies whether messages queued for the channel should be moved from the old transmission queue to the new transmission queue during the switching process. Values are:

YES

Messages are moved from the old transmission queue to the new transmission queue. This is the default.

NO

Messages are not moved from the old transmission queue to the new transmission queue. If this option is selected it is the responsibility of the system programmer to resolve any messages for the channel on the old transmission queue after the switch has completed.

STATUS

Display the switching status for matching cluster-sender channels. If this keyword is not specified the command switches the transmission queue for stopped or inactive cluster-sender channels that require switching.

Examples

Figure 1 illustrates how the SWITCH function can be used to query the switching status of all cluster-sender channels whose names match the generic name CLUSTER.*.

```
//SWITCH EXEC PGM=CSQUTIL,PARM=('CSQ1')
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
//        DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
SWITCH CHANNEL(CLUSTER.*) STATUS
/*
```

Figure 23. Sample JCL for querying the switching status of cluster-sender channels using the CSQUTIL SWITCH function

Figure 2 illustrates how the SWITCH function can be used to switch the transmission queue for the cluster-sender channel CLUSTER.TO.QM1.

```
//SWITCH EXEC PGM=CSQUTIL,PARM=('CSQ1')
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
//        DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
SWITCH CHANNEL(CLUSTER.TO.QM1)
/*
```

Figure 24. Sample JCL for switching the transmission queue associated with a cluster-sender channel using the CSQUTIL SWITCH function

Usage notes

1. The channel initiator must be running to initiate a switch of transmission queue for cluster-sender channels.
2. The transmission queue associated with a cluster-sender channel can only be switched if the channel is STOPPED or INACTIVE.
3. You need the necessary authority to use the command server queues (SYSTEM.COMMAND.INPUT, SYSTEM.COMMAND.REPLY.MODEL, and SYSTEM.CSQUTIL.*)
4. You need the necessary authority to issue the START CHANNEL command.
5. To initiate a switch of transmission queue for a cluster-sender channel, you also need command resource authority for the channel.
6. You cannot use the SWITCH function to query the status of, or switch the transmission queue for, a cluster-sender channel that has not been started since version 8 new function has been enabled using the OPMODE parameter in the CSQ6SYSP macro.

Related tasks

Clustering: [Switching cluster transmission queues](#)

z/OS

The change log inventory utility (CSQJU003) on z/OS

The IBM MQ change log inventory utility runs as a z/OS batch job to change the bootstrap data set (BSDS).

Through this utility, you can invoke these functions:

NEWLOG

Add active or archive log data sets.

DELETE

Delete active or archive log data sets.

ARCHIVE

Supply passwords for archive logs.

CRESTART

Control the next restart of IBM MQ.

CHECKPT

Set checkpoint records.

HIGHRBA

Update the highest written log RBA.

Only run this utility when IBM MQ is stopped. This is because the active log data sets named in the BSDS are dynamically added for exclusive use to IBM MQ and remain allocated exclusively to IBM MQ until it terminates. You can add new active log data sets to an active queue manager with the [“DEFINE LOG on z/OS” on page 484](#) command.

The DEFINE LOG command can be used to update a BSDS of any version. However, you must use the CSQJUCNV utility to convert the BSDS from version 1 to version 2. A version 1 BSDS has space for up to 31 active log data sets in each log copy ring, whereas a version 2, or higher, BSDS has space for up to 310 active log data sets in each log copy ring.

z/OS

Invoking the CSQJU003 utility on z/OS

Use this topic to understand how to invoke the CSQJU003 utility.

The utility runs as a z/OS batch program. [Figure 25 on page 2173](#) gives an example of the JCL required.

```

//JU003 EXEC PGM=CSQJU003
//STEPLIB DD DISP=SHR,DSN=th1qua1.SCSQANLE
// DD DISP=SHR,DSN=th1qua1.SCSQAUTH
//SYSPRINT DD SYSOUT=*,DCB=BLKSIZE=629
//SYSUT1 DD DISP=SHR,DSN=bsds.dsname
//SYSIN DD *
NEWLOG DSN=CSQREPAL.A0001187,COPY1VOL=CSQV04,UNIT=SYSDA,
STARTRBA=3A190000,ENDRBA=3A1F0FFF,CATALOG=YES,PASSWORD=PASSWRD
/*

```

Figure 25. Sample JCL to invoke the CSQJU003 utility

Data definition (DD) statements

CSQJU003 requires DD statements with these DDnames:

SYSUT1

This statement is required; it names the BSDS.

SYSUT2

This statement is required if you use dual BSDSs; it names the second copy of the BSDS.

Dual BSDSs and CSQJU003

Each time you run the CSQJU003 utility, the BSDS time stamp field is updated with the current system time. If you run CSQJU003 separately for each copy of a dual copy BSDS, the time stamp fields are not synchronized, so the queue manager fails at startup, issuing error message CSQJ120E. Therefore, if CSQJU003 is used to update dual copy BSDSs, both BSDSs must be updated within a single run of CSQJU003.

SYSPRINT

This statement is required; it names a data set for print output. The logical record length (LRECL) is 125. The block size (BLKSIZE) must be 629.

SYSIN

This statement is required; it names the input data set for statements that specify what the utility is to do. The logical record length (LRECL) is 80.

You can use more than one statement of each type. In each statement, separate the operation name (NEWLOG, DELETE, ARCHIVE, CRESTART) from the first parameter by one or more blanks. You can use parameters in any order; separate them by commas with no blanks. Do not split a parameter description across two SYSIN records.

A statement containing an asterisk (*) in column 1 is considered to be a comment, and is ignored. However, it appears in the output listing. To include a comment or sequence number in a SYSIN record, separate it from the last comma by a blank. When a blank follows a comma, the rest of the record is ignored.

Multiple statement operation

When running CSQJU003, a significant error in any statement causes the control statements for the statement in error and all following statements to be skipped. Therefore, BSDS updates cannot occur for any operation specified in the statement in error, or any following statements. However, all the remaining statements are checked for syntax errors.

Adding information about a data set to the BSDS (NEWLOG) on z/OS

You can use the NEWLOG function of CSQJU003 to add information about a data set to BSDS.

The NEWLOG function declares one of the following data sets:

- A VSAM data set that is available for use as an active log data set.

Use the keywords DSNAME, COPY1, COPY2, and PASSWORD.

- An active log data set that is replacing one that encountered an I/O error.

Use the keywords DSNAME, COPY1, COPY2, STARTRBA, ENDRBA, and PASSWORD.

- An archive log data set volume.

Use the keywords DSNAME, COPY1VOL, COPY2VOL, STARTRBA, ENDRBA, STRTLRSN, ENDLRSN, UNIT, CATALOG, and PASSWORD.

In a queue sharing group environment, you should always supply LRSN information. Run the print log map utility (CSQJU004) to find RBAs and LRSNs to use for archive log data sets.

A maximum of 310 data sets can be defined for each log copy, either by this NEWLOG function or the MQSC DEFINE LOG command.

Keywords and parameters

DSNAME= *dsname*

Names a log data set.

dsname can be up to 44 characters long.

PASSWORD= *password*

Assigns a password to the data set. It is stored in the BSDS and later used in any access to the active or archive log data sets.

The password is a data set password, and should follow standard VSAM convention: 1 through 8 alphanumeric characters (A through Z, 0 through 9) or special characters (& * + - . ; ' /).

We recommend that you use an ESM such as RACF to provide your data set security requirements.

COPY1

Makes the data set an active log copy-1 data set.

COPY2

Makes the data set an active log copy-2 data set.

STARTRBA= *startrba*

Gives the log RBA (relative byte address within the log) of the beginning of the replacement active log data set or the archive log data set volume specified by DSNAME.

startrba is a hexadecimal number of up to 16 characters. The value must end with 000. If you use fewer than 16 characters, leading zeros are added. The RBA can be obtained from messages or by printing the log map.

The value of STARTRBA must be a multiple of 4096. (The hexadecimal value must end in 000.)

A value higher than FFFFFFFF000 cannot be specified for a version 1 format BSDS.

ENDRBA= *endrba*

Gives the log RBA (relative byte address within the log) of the end of the replacement active log data set or the archive log data set volume specified by DSNAME.

endrba is a hexadecimal number of up to 16 characters. The value must end with FFF. If you use fewer than 16 characters, leading zeros are added.

A value higher than FFFFFFFFFF cannot be specified for a version 1 format BSDS.

STARTIME= *starttime*

Start time of the RBA in the BSDS. This is an optional field. The time stamp format (with valid values in parentheses) is yyyydddhhmmsst, where:

yyyy

Indicates the year (1993 through 2099)

ddd

Indicates the day of the year (1 through 365; 366 in leap years)

hh

Indicates the hour (zero through 23)

mm

Indicates the minutes (zero through 59)

ss

Indicates the seconds (zero through 59)

t

Indicates tenths of a second

If fewer than 14 digits are specified for the STARTIME and ENDTIME parameter, trailing zeros are added.

STARTRBA is required when STARTIME is specified.

ENDTIME= *endtime*

End time of the RBA in the BSDS. This is an optional field. For time stamp format, see the STARTIME option. The ENDTIME value must be greater than or equal to the value of STARTIME.

STRTLRSN= *strtlrsn*

Gives the LRSN (logical record sequence number) of the first complete log record on the new archive data set.

strtlrsn is a hexadecimal number of up to 12 characters. If you use fewer than 12 characters, leading zeros are added.

ENDLRSN= *endlrsn*

Gives the LRSN (logical record sequence number) of the last log record on the new archive data set.

endlrsn is a hexadecimal number of up to 12 characters. If you use fewer than 12 characters, leading zeros are added.

COPY1VOL= *vol-id*

The volume serial of the copy-1 archive log data set named after DSNAME.

COPY2VOL= *vol-id*

The volume serial of the copy-2 archive log data set named after DSNAME.

UNIT= *unit-id*

The device type of the archive log data set named after DSNAME.

CATALOG

Specifies whether the archive log data set is cataloged:

NO

The archive log data set is not cataloged. All subsequent allocations of the data set are made using the unit and volume information specified on the function. This is the default.

YES

The archive log data set is cataloged. A flag is set in the BSDS indicating this, and all subsequent allocations of the data set are made using the catalog.

IBM MQ requires that all archive log data sets on DASD be cataloged. Select CATALOG=YES if the archive log data set is on DASD.

z/OS Deleting information about a data set from the BSDS (DELETE) on z/OS

You can use the DELETE function of CSQJU003 to delete all information about a specified log data set or data set volume from the bootstrap data sets.

For example, you can use this function to delete outdated archive log data sets.

Keywords and parameters

DSNAME= *dsname*

Specifies the name of the log data set.

dsname can be up to 44 characters long.

COPY1VOL= *vol-id*

The volume serial number of the copy-1 archive log data set named after DSNAME.

COPY2VOL= *vol-id*

The volume serial number of the copy-2 archive log data set named after DSNAME.

Supplying a password for archive log data sets (ARCHIVE) on z/OS

You can use the ARCHIVE function of CSQJU003 to assign a password to all archive data sets created after this operation.

This password is added to the z/OS password data set each time a new archive log data set is created.

Use the NOPASSWD keyword to remove the password protection for all archives created after the archive operation.

Note: Typically, use an external security manager (ESM), such as RACF, if you want to implement security on any IBM MQ data sets.

Keywords and parameters

PASSWORD= *password*

Specifies that a password is to be assigned to the archive log data sets.

password specifies the password, which is a data set password and it must follow the standard VSAM convention; that is, 1 through 8 alphanumeric characters (A through Z, 0 through 9) or special characters (& * + - . ; ' /).

NOPASSWD

Specifies that archive password protection is not to be active for all archives created after this operation. No other keyword can be used with NOPASSWD.

Controlling the next restart (CRESTART) on z/OS

You can use the CRESTART function of CSQJU003 to control the next restart of the queue manager, either by creating a new conditional restart control record or by canceling the one currently active.

These records limit the scope of the log data used during restart (truncating the log, in effect). Any existing conditional restart control record governs every restart until one of these events occurs:

- A restart operation completes
- A CRESTART CANCEL is issued
- A new conditional restart control record is created

Attention: This can override IBM MQ efforts to maintain data in a consistent state. Only use this function when implementing the disaster recovery process described in [Recovering a single queue manager at an alternative site](#) and [Recovering a queue sharing group at the alternative site](#), or under the guidance of IBM service.

Keywords and parameters

CREATE

Creates a new conditional restart control record. When the new record is created, the previous control record becomes inactive.

CANCEL

Makes the currently active conditional restart control record inactive. The record remains in the BSDS as historical information.

No other keyword can be used with CANCEL.

ENDRBA= *endrba*

Gives the last RBA of the log to be used during restart (the point at which the log is to be truncated), and the starting RBA of the next active log to be written after restart. Any log information in the bootstrap data set and the active logs, with an RBA greater than *endrba*, is discarded.

endrba is a hexadecimal number of up to 16 digits. If you use fewer than 16 digits, leading zeros are added.

The value of ENDRBA must be a multiple of 4096. (The hexadecimal value must end in 000.)

A value higher than FFFFFFFF000 cannot be specified for a version 1 format BSDS.

ENDLRSN= *endlrsn*

Gives the LRSN of the last log record to be used during restart (the point at which the log is to be truncated). Any log information in the bootstrap data set and the active logs with an LRSN greater than *endlrsn* is discarded.

Setting checkpoint records (CHECKPT) on z/OS

You can use the CHECKPT function of CSQJU003 to add or delete a record in the BSDS checkpoint queue.

Use the STARTRBA and ENDRBA keywords to add a record, or the STARTRBA and CANCEL keywords to delete a record.

Attention: This can override IBM MQ efforts to maintain data in a consistent state. Only use this function when implementing the disaster recovery process described in [Recovering a single queue manager at an alternative site](#) and [Recovering a queue sharing group at the alternative site](#), or under the guidance of IBM service.

CHECKPT

```
▶▶ CHECKPT — STARTRBA — = — startrba →  
  
    , — ENDRBA — = — offlrba — , — TIME — = — time ▶▶  
    , — CANCEL —
```

Keywords and parameters

STARTRBA= *startrba*

Indicates the start checkpoint log record.

startrba is a hexadecimal number of up to 16 digits. If you use fewer than 16 digits, leading zeros are added. The RBA can be obtained from messages or by printing the log map.

A value higher than FFFFFFFFFF cannot be specified for a version 1 format BSDS.

ENDRBA= *endrba*

Indicates the end checkpoint log record corresponding to the start checkpoint record.

endrba is a hexadecimal number of up to 16 digits. If you use fewer than 16 digits, leading zeros are added. The RBA can be obtained from messages or by printing the log map.

A value higher than FFFFFFFFFF cannot be specified for a version 1 format BSDS.

TIME= *time*

Gives the time the start checkpoint record was written. The time stamp format (with valid values in parentheses) is yyyydddhhmmsst, where:

yyyy

Indicates the year (1993 through 2099)

ddd

Indicates the day of the year (1 through 365; 366 in leap years)

hh

Indicates the hour (zero through 23)

mm

Indicates the minutes (zero through 59)

ss

Indicates the seconds (zero through 59)

t

Indicates tenths of a second

If fewer than 14 digits are specified for the TIME parameter, trailing zeros are added.

CANCEL

Deletes the checkpoint queue record containing a starting RBA that matches the RBA specified by STARTRBA.

z/OS Updating the highest written log RBA (HIGHRBA) on z/OS

You can use the HIGHRBA function of CSQJU003 to update the highest written log RBA recorded in the BSDS for either the active or archive log data sets.

Use the STARTRBA keyword to update the active log, and the OFFLRBA keyword to update the archive log.

Attention: This can override IBM MQ efforts to maintain data in a consistent state. Only use this function when implementing the disaster recovery process described in [Recovering a single queue manager at an alternative site](#), or under the guidance of IBM service personnel.

Keywords and parameters

STARTRBA= *startrba*

Indicates the log RBA of the highest written log record in the active log data set.

startrba is a hexadecimal number of up to 16 digits. If you use fewer than 16 digits, leading zeros are added. The RBA can be obtained from messages or by printing the log map.

A value higher than FFFFFFFFFF cannot be specified for a version 1 format BSDS.

TIME= *time*

Specifies when the log record with the highest RBA was written to the log. The time stamp format (with valid values in parentheses) is yyyydddhhmmsst, where:

yyyy

Indicates the year (1993 through 2099)

ddd

Indicates the day of the year (1 through 365; 366 in leap years)

hh

Indicates the hour (zero through 23)

mm

Indicates the minutes (zero through 59)

ss

Indicates the seconds (zero through 59)

t

Indicates tenths of a second

If fewer than 14 digits are specified for the TIME parameter, trailing zeros are added.

OFFLRBA= *offlrba*

Specifies the highest offloaded RBA in the archive log.

offlrba is a hexadecimal number of up to 16 digits. If you use fewer than 16 digits, leading zeros are added. The value must end with hexadecimal 'FFF'.

A value higher than FFFFFFFFFFFFFF cannot be specified for a version 1 format BSDS.

 z/OS

The print log map utility (CSQJU004) on z/OS

CSQJU004 is the batch utility program used to print log data information from the BSDS.

The IBM MQ print log map utility runs as a z/OS batch program to list the following information:

- The BSDS version
- Log data set name and log RBA association for both copies of all active and archive log data sets
- Active log data sets available for new log data
- Contents of the queue of checkpoint records in the bootstrap data set (BSDS)
- Contents of the quiesce history record
- System and utility time stamps
- Passwords for the active and archive log data sets, if provided

You can run the CSQJU004 program regardless of whether the queue manager is running. However, if the queue manager is running, consistent results from the utility can be ensured only if both the utility and the queue manager are running under control of the same z/OS system.

For further information, see

- [Invoking the CSQJU004 utility](#)
- [Data definition statements required for the CSQJU004 utility](#)

To use this utility, the user ID of the job must have the requisite security authorization, or, if the BSDS is password protected, the appropriate VSAM password for the data set.

Invoking the CSQJU004 utility

The following example shows the JCL used to invoke the CSQJU004 utility:

```
//JU004 EXEC PGM=CSQJU004
//STEPLIB DD DISP=SHR,DSN=th1qua1.SCSQANLE
// DD DISP=SHR,DSN=th1qua1.SCSQAUTH
//SYSPRINT DD SYSOUT=*
//SYSUT1 DD DISP=SHR,DSN=bsds.dsname
```

Figure 26. Sample JCL to invoke the CSQJU004 utility

The EXEC statement can use an optional parameter TIME(RAW) which changes the way timestamps are formatted.

```
//JU004 EXEC PGM=CSQJU004,PARM='TIME(RAW)'
```

This parameter causes timestamps to be formatted without applying timezone or leap second offsets for the formatting system. You can use this mode of operation when formatting a BSDS created at a remote site, or before a daylight saving time change, for example. The default, no parameter specified, is to format timestamps using the current formatting system's timezone and leap second corrections.

Formatted times affected by this parameter are:

- highest RBA written
- archive log command times
- checkpoint times
- conditional restart record times

Data definition statements

The CSQJU004 utility requires DD statements with the following DDnames:

SYSUT1

This statement is required to specify and allocate the bootstrap data set. If the BSDS must be shared with a concurrently running queue manager subsystem, use DISP=SHR on the DD statement.

SYSPRINT

This statement is required to specify a data set or print spool class for print output. The logical record length (LRECL) is 125 and the record format (RECFM) is VBA.

[Finding out what the BSDS contains](#) describes the output.

The log print utility (CSQ1LOGP) on z/OS

Use this utility to print information contained in the IBM MQ log data sets or the BSDS.

- [Invoking the CSQ1LOGP utility](#)
- [Input control parameters](#)
- [Usage notes](#)
- [The EXTRACT function](#)
 - [Example of processing EXTRACT data](#)
- [CSQ1LOGP output](#)
 - [Detail report](#)
 - [Record layouts for the output data sets](#)

Invoking the CSQ1LOGP utility

You run the IBM MQ log print utility as a z/OS batch program. You can specify:

- A bootstrap data set (BSDS)
- Active log data sets (with no BSDS)
- Archive log data sets (with no BSDS)

Sample JCL to invoke the CSQ1LOGP utility is shown in [Figure 27 on page 2183](#), [Figure 28 on page 2183](#), [Figure 29 on page 2183](#) and [Figure 30 on page 2183](#).

These data definition statements must be provided:

SYSPRINT

All error messages, exception conditions, and the detail report are written to this data set. The logical record length (LRECL) is 131.

SYSIN

Input selection criteria can be specified in this data set. See [“Input control parameters” on page 2184](#) for more information.

The logical record length (LRECL) must be 80, but only columns 1 through 72 are significant; columns 73 through 80 are ignored. At most 50 records can be used. Records with an asterisk (*) in column 1 are interpreted as comments and are ignored.

SYSSUMRY

If a summary report is requested, by specifying the parameter **SUMMARY (YES)** or **SUMMARY (ONLY)**, the output is written to this data set. The logical record length (LRECL) is 131.

BSDS

Name of the bootstrap data set (BSDS).

ACTIVE_n

Name of an active log data set you want to print (n=number).

ARCHIVE

Name of an archive log data set you want to print.

If you specify the keyword **EXTRACT (YES)**, provide one or more of the following DD statements, depending on what types of data you want to extract. Do not specify an LRECL, as it is set internally by the utility. These DDs are the required DCB parameters for the output data set.

CSQBACK

This data set contains persistent messages written to the log by units of work that were rolled back during the log range specified.

CSQCMT

This data set contains persistent messages written to the log by units of work that were committed during the log range specified.

CSQBOTH

This data set contains persistent messages written to the log by units of work that were either committed or rolled back during the log range specified.

CSQINFLT

This data set contains persistent messages written to the log by units of work that remained in flight during the log range specified.

CSQOBS

This data set contains information about object alterations that occurred during the log range specified.

For each DD statement, the record format (RECFM) is VB, the logical record length (LRECL) is 32756, and the block size (BLKSIZE) must be 32760.

If you are processing active log data sets, the utility runs even if IBM MQ is running, if the BSDS and active log data sets are defined by using at least SHAREOPTIONS(2 3).

```

//PRTLOG EXEC PGM=CSQ1LOGP
//STEPLIB DD DISP=SHR,DSN=thlqual.SCSQANLE
//        DD DISP=SHR,DSN=thlqual.SCSQLOAD
//BSDS   DD DSN=qmgr.bsds.dsname,DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSSUMRY DD SYSOUT=*
//SYSIN   DD *
* extract records for pageset 3. Produce both summary and detail reports
PAGESET(3)
SUMMARY(YES)
/*

```

//CSQINFLT DD DSN=inflight.dataset,DISP=(NEW,CATLG)
//CSQOBSJ DD DSN=objects.dataset,DISP=(NEW,CATLG)

```

Figure 30. Sample JCL showing additional statements for the EXTRACT keyword

The EXEC statement can use an optional parameter TIME(RAW) which changes the way timestamps are formatted.

```
//PRTLOG EXEC PGM=CSQ1LOGP,PARM='TIME(RAW)'
```

This causes timestamps to be formatted without applying timezone or leap second offsets for the formatting system. You can use this mode of operation when formatting log data created at a remote site, or before a daylight saving time change, for example.

If no parameter is specified, the default behavior is to format timestamps using the timezone and leap second corrections of the system doing the formatting.

Formatted times affected by this parameter are those associated with:

- checkpoint time
- restart time
- UR start time

Input control parameters

The keywords that you can use in the SYSIN data set are described in the following list.

You can specify various selection criteria to limit the log records that are processed. These are:

- log range, using RBASTART-RBAEND or LRSNSTART-LRSNEND
- page sets, using PAGESET
- units of recovery, using URID
- record contents, using DATA
- resource manager, using RM

Different types of selection criteria can be combined; only records meeting all the criteria are processed.

LRSNSTART (hexadecimal-constant)

Specifies the logical record sequence number (LRSN) from which to begin processing. You cannot use this keyword together with RBASTART. Use this keyword only if your queue manager is in a queue sharing group.

LRSN values are always greater than A00000000000; this value is used as the start value if a lower value is specified.

You can also use the forms STARTLRSN or STRTLRSN or LRSNSTRT. Specify this keyword only once.

LRSNEND (hexadecimal-constant)

Specifies the logical record sequence number (LRSN) of the last record to be scanned. The default is FFFFFFFFFF (the end of the data sets). You can use this keyword only with LRSNSTART.

You can also use the form ENDLRSN.

Specify this keyword only once.

RBASTART (hexadecimal-constant)

Specifies the log RBA from which to begin processing. You cannot use this keyword together with LRSNSTART.

You can also use the forms STARTRBA or ST. Specify this keyword only once.

RBAEND (hexadecimal-constant)

Specifies the last valid log RBA that is to be processed. If this keyword is omitted, processing continues to the end of the log (FFFFFFFFFFFF if 6 byte RBAs are in use, or FFFFFFFFFFFFFFFF if 8 byte RBAs are in use). You can use this keyword only with RBASTART.

You can also use the forms ENDRBA or EN. Specify this keyword only once.

PAGESET (decimal-integer)

Specifies a page set identifier. The number must be in the range 00 through 99. You can specify a maximum of 10 PAGESET keywords. If PAGESET keywords are specified, only log records associated with the page sets you specify are processed.

URID (hexadecimal-constant)

Specifies a hexadecimal unit of recovery identifier. Changes to data occur in the context of an IBM MQ unit of recovery. A unit of recovery is identified on the log by a BEGIN UR record. The log RBA of that BEGIN UR record is the URID value you must use. If you know the URID for a particular UR that you are interested in, you can limit the extraction of information from the log to that URID.

The hexadecimal constant can consist of 1 through 16 characters (8 bytes), and leading zeros are not required.

You can specify a maximum of 10 URID keywords.

DATA (hexadecimal-string)

Specifies a data string in hexadecimal.

The string can consist of 2 through 48 characters (24 bytes), and must have an even number of characters.

You can specify a maximum of 10 DATA keywords.

If DATA keywords are specified, only log records that contain at least one of the strings are processed.

Note: Though you can use the DATA and EXTRACT parameters together, it is difficult to reliably derive meaning from the output, unless you have a good understanding of the internal implementation of IBM MQ. This is because only the low level individual log records that contain the requested DATA are processed so you do not extract the full output that is logically associated with the data, only the records where that DATA sequence actually appears. For example you might get only records associated with putting messages and not with getting messages, or you might get only the first part of the data for long messages because the rest of the data is in other log records that do not contain the requested DATA string.

RM (resource_manager)

Specifies a particular resource manager. Only records associated with this resource manager are processed. Valid values for this keyword are:

RECOVERY

Recovery log manager

DATA

Data manager

BUFFER

Buffer manager

IMSBRIDGE

IMS bridge

SUMMARY (YES|NO|ONLY)

Specifies whether a summary report is to be produced or not:

YES

Produce a summary report in addition to the detail report.

NO

Do not produce a summary report.

ONLY

Produce only a summary report (no detail report).

The default is NO.

EXTRACT (YES|NO)

Specifying EXTRACT(YES) causes each log record that meets the input selection criteria to be written to the appropriate output file, as explained on page [“The EXTRACT function” on page 2186](#). The default is NO.

Note: Though you can use the DATA and EXTRACT parameters together, it is difficult to reliably derive meaning from the output, unless you have a good understanding of the internal implementation of IBM MQ. This is because only the low level individual log records that contain the requested DATA are processed so you do not extract the full output that is logically associated with the data, only the records where that DATA sequence actually appears. For example you might get only records associated with putting messages and not with getting messages, or you might get only the first part of the data for long messages because the rest of the data is in other log records that do not contain the requested DATA string.

DECOMPRESS (YES|NO)

Specifies whether any compressed log records will be expanded:

YES

Any compressed log records will be expanded before a Search, Print or Extract function is performed

NO

Any compressed log records will not be expanded before a Search or Print function is performed. Do not use DECOMPRESS(NO) with the Extract function

The default is YES.

Usage notes

1. If your queue manager is in a queue sharing group, you can specify the log range required by either LRSNSTART (optionally with LRSNEND) or RBASTART (optionally with RBAEND). You cannot mix LRSN and RBA specifications.

If you need to coordinate the log information from the different queue managers in the queue sharing group, use LRSN specifications. Note that processing logs simultaneously from different queue managers in a queue sharing group is not supported.
2. If your queue manager is not in a queue sharing group, you cannot use LRSN specifications; you must use RBA specifications.
3. If you are using a BSDS, RBASTART or LRSNSTART must be specified.
4. CSQ1LOGP starts its processing on the first record containing an LRSN or RBA value greater than or equal to the value specified on LRSNSTART or RBASTART.
5. Normally you are only interested in the most recent additions to the log. Take care to choose a suitable value for the start of the log range, and do not use the defaults. Otherwise, you create an enormous amount of data, most of which is of no interest to you.

The EXTRACT function

Typical uses of the EXTRACT parameter are to:

- Review which persistent messages were put to or got from a queue and whether the request was committed. This allows messages to be replayed.
- Review persistent messages that were put or got, but the request was backed out.
- Display which applications backed out rather than committed.
- Discover the volume of persistent data processed by queues, to identify the high use queues.
- Identify which applications set object attributes.
- Re-create object definitions for recovery purposes after a major failure, for private queues only.

When CSQ1LOGP with the EXTRACT parameter set is run against a log data set it processes all records in the data set, or all those within a specified range. Processing is as follows:

1. When a commit request is found, if the CSQCMT ddname is present then the data is written to this data set. If the CSQBOTH ddname is present the data is also written to this data set.
2. When a backout request is found, if the CSQBACK ddname is present then the data is written to this data set. If the CSQBOTH ddname is present the data is also written to this data set.
3. When changes to objects are detected, the information is written to the data set identified by the CSQOBS ddname.
4. When the last record has been processed, information about remaining units of work is written to the data set identified by the CSQINFLT ddname.

If you do not want to collect one or more of these classes of information, then omit the appropriate DD statements.

Example of processing EXTRACT data

The following job uses DFSORT facilities to process the file of committed records to add up the number of bytes put to each queue.

```
//TOOLRUN EXEC PGM=ICETOOL,REGION=1024K
//TOOLMSG DD SYSOUT=*
//DFSMSG DD SYSOUT=*
//TOOLIN DD *
SORT FROM(IN) TO(TEMP1) USING(CTL1)
DISPLAY FROM(TEMP1) LIST(OUT1) ON(5,48,CH) ON(53,4,BI)
/*
//CTL1 DD *
* SELECT THE RECORDS WHICH WERE PUT
  INCLUDE COND=(180,5,CH,EQ,C'MQPUT')
* SORT BY QUEUE NAME
  SORT FIELDS=(112,48,CH,A)
* ONLY COPY THE QUEUE NAME AND SIZE OF USER DATA TO OUTPUT REC
  OUTREC FIELDS=(1,4,112,48,104,4)
* ADD UP THE NUMBER OF BYTES PROCESSED
  SUM FIELDS=(104,4,FI)
/*
//IN DD DISP=SHR,DSN=commit.dataset
//TEMP1 DD DISP=(NEW,DELETE),DSN=&TEMP1,SPACE=(CYL,(10,10))
//OUT1 DD SYSOUT=*
```

Figure 31. Accumulating bytes put to each queue

This produces output in the following format:

BA1	3605616
BA10	3572328
BA2	3612624
BA3	3579336
BA4	3572328
BA5	3491736
BA6	3574080
BA7	3532032
BA8	3577584
BA9	3539040
SYSTEM.ADMIN.CHANNEL.EVENT	186120
SYSTEM.ADMIN.QMGR.EVENT	384
SYSTEM.CHANNEL.SYNCQ	46488312

The following table lists the samples that are provided to allow you to print and interpret the data generated when EXTRACT(YES) is used

Sample	Description
thlqual.SCSQLOAD(CSQ4LOGS)	Sample C program to: <ul style="list-style-type: none"> Report on the UOW activity and object defines and alters Optionally, replay messages.
thlqual.SCSQC37S(CSQ4LOGS)	Source for sample C program

Sample	Description
thlqual.SCSQC370(CSQ4LOGD)	C header file to map records generated when using the EXTRACT(YES) function of CSQ1LOGP
thlqual.SCSQPROC(CSQ4LOGJ)	Sample JCL to run program CSQ4LOGS

Note: You should not run the CSQ4LOGS program from an APF authorized library. In some circumstances you receive an abend code if you do so.

CSQ1LOGP output

Detail report

The detail report begins by echoing the input selection criteria specified by SYSIN, and then prints each valid log record encountered. Definitions of keywords in the detail report are as follows:

RM

Resource manager that wrote the log record.

TYPE

Type of log record.

URID

BEGIN UR for this unit of recovery, see the previous description.

LRID

Logical record identifier in the form: AAAAAAAA .BBBBBBCC where:

AAAAAAA

Is the page set number.

BBBBBB

Is the relative page number in the page set.

CC

Is the relative record number on the page.

LRSN

Logical record sequence number (LRSN) of the log record scanned.

SUBTYPE

Subtype of the log record type.

CHANGE LENGTH

Length of the logged change.

CHANGE OFFSET

Start position of the change.

BACKWARD CHAIN

Pointer to the previous page.

FORWARD CHAIN

Pointer to the next page.

RECORD LENGTH

Length of the inserted record.

Record layouts for the output data sets

The data sets produced when the EXTRACT keyword is specified contains information about persistent messages. Messages are identified by their queue name and an eight character key. Once a message has been got, the key can be reused by another message, so it is important to ensure that time sequence is maintained. In the records are times. A time stamp can be extracted only from a Begin-UR record or from an MQPUT request. Thus if there is only a long running transaction which is getting messages, the times when the gets occurred are the time the transaction started (the Begin-UR record). If there are many short units of work, or many messages being put, the time is reasonably accurate (within milliseconds). Otherwise the times become less and less accurate.

Note: There is a 4 byte Record Descriptor Word at the front of each record because the files are Variable Blocked format. The first data byte of a variable-length record has relative position 5 and the first 4 bytes contain the record descriptor word. The field names correspond to those in the C header file CSQ4LOGD in thlqual.SCSQC370.

The information in the data sets has the following layout:

Off set		Type	Length	Name	Description
Dec	Hex				
0	0	Character	21	csrecorddate	The approximate time the log was written, in the format yyyy.ddd hh:mm:ss.thm
21	15	Character	7	cstimedelta	Approximate time difference in milliseconds from the start of the unit of work. Right-aligned and padded with blanks.
28	1C	64-bit integer	8	dtodout	Estimated time that the log record was created, in STCK format.
36	24	Character	8	csurid	Queue manager-specific unique identifier of the unit of work that created the log record.
44	2C	Character	12	cscorrelator	Thread correlation identifier
56	38	Character	8	csauth	Authorization identifier (Userid associated with unit of work)
64	40	64-bit integer	8	dtime	Time that the unit of work was started, in STCK format
72	48	Character	8	csresource	Resource name
80	50	Character	8	cscnty	Connection type: one of BATCH, RRSBATCH, IMS, CICS, CHIN, or nulls for an internal task
88	58	Character	8	cscnid	Connection ID of thread that created this unit of work
96	60	Character	3	csstatus	Unit of work type: BUR for begin or CP for checkpoint information
99	63	Integer	4	ldataen	Length of the message data (if any)
103	67	Character	4	csqmgrname	Name of queue manager
107	6B	Character	48	csqueuname	Name of queue, for get, put, or expired messages. This field can be question marks. Question marks appear when it is not possible to determine the object name or queue name associated with the entry. This typically happens when the begin_ur record or the checkpoint record from which you might get the URID is not in the log range specified in the job, nor on the log data sets used.
155	9B	Character	12	cssqdmcp	Shared queue message key. Blank if not a shared queue
167	A7	Character	8	csdmcp	Non-shared queue message key. Blank if a shared queue.

Off set		Type	Length	Name	Description
175	AF	Character	8	csverb	Activity: ALTER the object was changed DEFINE the object was created MQGET the message was got MQPUT the message was put MQPUTRP the message was put with properties EXPIRE the message expired ABORT2 the message was backed out PHASE1 the first phase of two-phase commit PHASE2 the second phase of two-phase commit, or the only phase of one phase commit
183	B7	Character	1	cscmitstatus	Status of unit of work: B backed out C committed I inflight
184	B8	Character	1	csshunt	Shunted indicator: S shunted record N not shunted
185	B9	Character	8	cslogrba	RBA of log record
193	C1	Character	8	csshuntrba	RBA of shunted log record
201	C9	Character	1	csuowscope	UOW scope in hexadecimal: 01 local 02 shared
202	CA	Integer	4	lsegment	The segment number of the data, starting from 1.
206	CE		Variable		Data part

Off set		Type	Length	Name	Description
206	CE	Character	1	csbora	If csverb is ALTER, indicates whether the data is the 'before' or 'after' copy of the object. B before A after
207	CF	Character	Variable	csvardata	Message or object data. Length as given in ldatalen.

z/OS

The queue sharing group utility (CSQ5PQSG) on z/OS

You can use the CSQ5PQSG utility program to add queue sharing group and queue manager definitions to the IBM MQ Db2 tables, and to remove them.

The CSQ5PQSG utility can also be used to verify the consistency of Db2 object definitions for queue manager, CF structure, and shared queue objects, within a queue sharing group.

- [Invoking the queue sharing group utility](#)
- [Syntax, keywords, and parameters](#)
- [Example](#)

Invoking the queue sharing group utility

Figure 32 on page 2191 shows an example of the JCL used to invoke the CSQ5PQSG utility.

```
//S001 EXEC PGM=CSQ5PQSG,REGION=4M,
//      PARM='function,function parameters'
//STEPLIB DD DSN=th1qua1.SCSQANLE,DISP=SHR
//        DD DSN=th1qua1.SCSQAUTH,DISP=SHR
//        DD DSN=db2qua1.SDSNLOAD,DISP=SHR
//SYSPRINT DD SYSOUT=*
```

Figure 32. Sample JCL to invoke the CSQ5PQSG utility

Data definition statements

The CSQ5PQSG utility requires data definition statements with the following DDname:

SYSPRINT

This statement is required; it names the data set for print output. The logical record length (LRECL) is 125.

Syntax, keywords, and parameters

A queue sharing group name (*qsg-name*) can have up to 4 characters, comprising uppercase A-Z, 0-9, \$, #, @. It must not start with a numeric. For implementation reasons, names of less than 4 characters are padded internally with @ symbols, so do not use names ending in @.

The queue sharing group name must be different from any of the queue manager names within the queue sharing group.

PARM

This field contains the function request followed by the function-specific parameters. These are described in the following text:

ADD QMGR

Add a queue manager record into the CSQ.ADMIN_B_QMGR table. This operation completes successfully only if all the following conditions are met:

- A corresponding queue sharing group record exists in the CSQ.ADMIN_B_QSG table.
- The queue manager entry does not exist in the CSQ.ADMIN_B_QMGR table as the member of a different queue sharing group.
- There is no member entry in the XCF group with a different QMGR number value than the one created by the utility when you add a record to the CSQ.ADMIN_B_QMGR table.

Note that it does not matter whether the queue manager being added is active or inactive when the ADD QMGR function is being performed.

If there are members in the XCF group without the corresponding entries in the Db2 table, you can use the utility to add them. Add queue managers in the order that is indicated by the CSQU524I messages that are issued by the queue sharing group utility (CSQ5PQSG) when it is run with the **VERIFY QSG** parameter.

If a queue manager exists in Db2 table CSQ.ADMIN_B_QMGR, but is missing from MVS XCF group, you can run this utility to restore the appropriate XCF group entry, as indicated by CSQ5010E message.

qmgr-name

The queue manager name

qsg-name

The queue sharing group name

dsg-name

The Db2 data-sharing group name

DB2-ssid

The Db2 subsystem ID

ADD QSG

Add a queue sharing group record into the CSQ.ADMIN_B_QSG table.

qsg-name

The queue sharing group name

dsg-name

The Db2 data-sharing group name

DB2-ssid

The Db2 subsystem ID

REMOVE QMGR

Remove a queue manager record from the CSQ.ADMIN_B_QMGR table. This only completes successfully if the queue manager has either never been started, or terminated normally from its last execution.

qmgr-name

The queue manager name

qsg-name

The queue sharing group name

dsg-name

The Db2 data-sharing group name

DB2-ssid

The Db2 subsystem ID

REMOVE QSG

Remove a queue sharing group record from the CSQ.ADMIN_B_QSG table. This only completes successfully if no queue managers are defined to the queue sharing group.

qsg-name

The queue sharing group name

dsg-name

The Db2 data-sharing group name

DB2-ssid

The Db2 subsystem ID

Attention: This step will cause the shared object definitions to be deleted from IBM MQ's Db2 tables.

MIGRATE DSG

Verify that all the queue managers in the data-sharing group are at a version that is compatible with IBM MQ 9.0.0.

dsg-name

The Db2 data-sharing group name

DB2-ssid

The Db2 subsystem ID

This function does not do the migration, which involves several steps.

Migration requires that a migration PTF is installed on **all** queue managers in the data-sharing group.

MIGRATE QSG

Verify that all the queue managers in the data-sharing group are at a version that is compatible with IBM MQ 9.0.0.

The MIGRATE QSG and MIGRATE DSG functions perform the same function. The only difference is in the scope of the processing. MIGRATE QSG works on a single queue sharing group only, MIGRATE DSG works on all queue sharing groups that are defined within the data-sharing group.

qsg-name

The queue sharing group name

dsg-name

The Db2 data-sharing group name

DB2-ssid

The Db2 subsystem ID

This function does not do the migration, which involves several steps.

Migration requires that a migration PTF is installed on **all** queue managers in the queue sharing group.

FORCE QMGR

Remove a queue manager record from the CSQ.ADMIN_B_QMGR table, even if the queue manager has terminated abnormally.

Use the **FORCE** option, rather than **REMOVE**, to remove the last queue manager in a queue sharing group.

Attention: This can override IBM MQ efforts to maintain data in a consistent state. Only use this function when you cannot carry out the procedure for removing a queue manager from a queue sharing group on page [Removing a queue manager from a queue sharing group](#).

qmgr-name

The queue manager name

qsg-name

The queue sharing group name

dsg-name

The Db2 data-sharing group name

DB2-ssid

The Db2 subsystem ID

VERIFY QSG

Validate the consistency of the Db2 object definitions for queue manager, CF structure, and shared queue objects, within the queue sharing group.

qsg-name

The queue sharing group name

dsg-name

The Db2 data-sharing group name

DB2-ssid

The Db2 subsystem ID

Example

The following sample JCL adds an entry for queue manager QM01 into queue sharing group QSG1. It specifies a connection to Db2 subsystem DB2A, which is a member of Db2 data-sharing group DSN510PG.

```
//S001 EXEC PGM=CSQ5PQSG,REGION=4M,
//      PARM='ADD QMGR,QM01,QSG1,DSN510PG,DB2A'
//STEPLIB DD DSN=th1qua1.SCSQANLE,DISP=SHR
//          DD DSN=th1qua1.SCSQAUTH,DISP=SHR
//          DD DSN=db2qua1.SDSNLOAD,DISP=SHR
//SYSPRINT DD SYSOUT=*
```

Figure 33. Using the queue sharing group utility to add a queue manager into a queue-sharing group

The active log preformat utility (CSQJUFMT) on z/OS

You can use the CSQJUFMT utility to format active log data sets before they are used by a queue manager.

If the active log data sets are preformatted by the utility, log write performance is improved on the queue manager's first pass through the active logs. If the utility is not used, the queue manager must format each log control interval at log write time before it is used. On the second and subsequent passes through the active log data sets, the log control intervals already contain data, so need no further formatting, and no performance benefit accrues.

Invoking the CSQJUFMT utility

You can only run the CSQJUFMT program before starting the queue manager that use the logs.

Note: Do not use this utility to format a log data set after the queue manager has started, or data will be lost.

```
EXEC PGM=CSQJUFMT
```

Each step running the CSQJUFMT utility formats a single active log data set. Add additional CSQJUFMT steps for each active log being created.

Attention: JCL limits the number of steps in a single job to 255. If you are formatting more than 255 active log data sets, you will need to run multiple jobs.

These DD statements should be provided:

SYSPRINT

This statement is required to specify a data set or print spool class for print output.

SYSUT1

This statement identifies the log data set to be preformatted.

```
//JOB LIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//*
//JUFMT11 EXEC PGM=CSQJUFMT
//SYSPRINT DD SYSOUT=*
//SYSUT1 DD DISP=OLD,DSN=h1q.LOGCOPY1.DS01
//*
//JUFMT21 EXEC PGM=CSQJUFMT
//SYSPRINT DD SYSOUT=*
//SYSUT1 DD DISP=OLD,DSN=h1q.LOGCOPY2.DS01
```

Figure 34. Example of the JCL used to invoke the CSQJUFMT utility

Sample JCL is supplied in thlqua1.SCSQPROC (CSQ4LFMT) for preformatting a newly defined dual log data set. It contains two steps, one step to format each of the copies of the log data set.

The dead-letter queue handler utility (CSQUDLQH) on z/OS

You can use the default dead-letter utility (CSQUDLQH) to handle message written to the dead-letter queue.

A *dead-letter queue* (DLQ) is a holding queue for messages that cannot be delivered to their destination queues. Every queue manager in a network can have an associated DLQ.

Queue managers, message channel agents, and applications can put messages on the DLQ. All messages on the DLQ can be prefixed with a *dead-letter header* structure, MQDLH. Messages put on the DLQ by a queue manager or by a message channel agent always have a dead-letter header; ensure that applications putting messages on the DLQ also supply a dead-letter header structure. The *Reason* field of the MQDLH structure contains a reason code that identifies why the message is on the DLQ.

Implement a routine that runs regularly to process messages on the DLQ. Such a routine is called a *dead-letter queue handler*. IBM MQ supplies a default *dead-letter queue handler* (DLQ handler) called CSQUDLQH. A user-written *rules table* supplies instructions to the DLQ handler, for processing messages on the DLQ. That is, the DLQ handler matches messages on the DLQ against entries in the rules table. When a DLQ message matches an entry in the rules table, the DLQ handler performs the action associated with that entry.

Invoking the DLQ handler on z/OS

Use this topic to understand how to invoke the CSQUDLQH utility program, and its data definition statements.

The CSQUDLQH utility program runs as a z/OS batch program. Specify the name of the dead-letter queue that you want to process and the queue manager on which it resides. You can do this in one of the following two ways (in these examples, the dead-letter queue is called CSQ1.DEAD.QUEUE and the queue manager is called CSQ1):

1. The names can be specified as positional parameters in the PARM parameter of the EXEC statement within the submitted JCL, for example:

```
//READQ EXEC PGM=CSQUDLQH,  
// PARM='CSQ1.DEAD.QUEUE CSQ1'
```

Figure 35. Specifying the queue manager and dead-letter queue names for the dead-letter queue handler in the JCL

2. The names can be specified in the rules table, for example:

```
INPUTQ(CSQ1.DEAD.QUEUE) INPUTQM(CSQ1)
```

Figure 36. Specifying the queue manager and dead-letter queue names for the dead-letter queue handler in the rules table

Any parameters that you specify in the PARM parameter override those in the rules table. If you specify only one parameter in the PARM statement, it is used as the name of the dead-letter queue. The rules table is taken from the SYSIN data set.

For further information on the keywords you can specify, to match and process pattern and action keywords, see [“Rules \(patterns and actions\) on z/OS” on page 2198](#).

Stopping the DLQ handler

The CSQUDLQH utility is stopped when any of the following conditions is true:

- The dead letter queue is empty for a specified amount of time as configured by the WAIT control data keyword.
- The dead letter queue is set to GET(DISABLED).
- The queue manager is quiesced.
- The CSQUDLQH job is cancelled.

Messages generated during the handling of the queue are written to the standard output when the CSQUDLQH utility ends in a controlled manner. If the handler is cancelled, it does not generate these messages.

Data definition statements

CSQUDLQH requires DD statements with these DDnames:

SYSOUT

This statement is required; it names the data set for print output. You can specify the logical record length (LRECL) and block size (BLKSIZE) for this output data set.

SYSIN

This statement is required; it names the input data set containing the rules table that specifies what the utility is to do. The logical record length (LRECL) is 80.

Sample JCL

```
//READQ EXEC PGM=CSQUDLQH,  
//      PARM='CSQ1.DEAD.QUEUE CSQ1'  
//STEPLIB DD DSN=thlqual.SCSQAUTH,DISP=SHR  
//      DD DSN=thlqual.SCSQLOAD,DISP=SHR  
//      DD DSN=thlqual.SCSQANLE,DISP=SHR  
//SYSOUT DD SYSOUT=*  
//SYSIN  DD *  
INPUTQM(CSQ2) INPUTQ('CSQ2.DEAD.QUEUE')  
ACTION(RETRY)  
/*
```

Figure 37. Sample JCL to invoke the CSQUDLQH utility

The DLQ handler rules table on z/OS

The DLQ handler rules table defines how the DLQ handler is to process messages that arrive on the DLQ.

There are two types of entry in a rules table:

- The first entry in the table, which is optional, contains “Control data” on page 2197.
- All other entries in the table are *rules* for the DLQ handler to follow. Each rule consists of a *pattern* (a set of message characteristics) that a message is matched against, and an *action* to be taken when a message on the DLQ matches the specified pattern. There must be at least one rule in a rules table.

Each entry in the rules table comprises one or more keywords.

See “Rules table conventions on z/OS” on page 2201 for information about the syntax of the rules table.

See [Rules \(patterns and actions\)](#) for information about how the pattern-matching, and action keywords control the CSQUDLQH utility

Control data

This section describes the keywords that you can include in a control-data entry in a DLQ handler rules table.

- All keywords are optional.
- If a control-data entry is included in the rules table, it must be the first entry in the table.
- The default value for a keyword, if any, is underlined>.
- The vertical line (|) separates alternatives. You can specify only one of these.

INPUTQ (QueueName | ' ' (default))

Specifies the name of the DLQ that you want to process:

1. If you specify a queue name in the PARM parameter of the EXEC statement, this overrides any INPUTQ value in the rules table.
2. If you do not specify a queue name in the PARM parameter of the EXEC statement, the INPUTQ value in the rules table is used.
3. If you do not specify a queue name in the PARM parameter of the EXEC statement or the rules table, the dead-letter queue named *qmgr-name.DEAD.QUEUE* is used if it has been defined. If this

queue does not exist, the program fails and returns error message CSQU224E, giving the reason code for the error.

INPUTQM (QueueManagerName| ' ' (default))

Specifies the name of the queue manager that owns the DLQ named on the INPUTQ keyword.

1. If you specify a queue manager name in the PARM parameter of the EXEC statement, this overrides any INPUTQM value in the rules table.
2. If you do not specify a queue manager name in the PARM parameter of the EXEC statement, the INPUTQM value in the rules table is used.
3. If you do not specify a queue manager name in the PARM parameter of the EXEC statement or the rules table, the default queue manager is used (if one has been defined using CSQBDEFV). If not, the program fails and returns error message CSQU220E, giving the reason code for the error.

RETRYINT (Interval|60 (default))

Specifies the interval, in seconds, at which the DLQ handler should attempt to reprocess messages on the DLQ that could not be processed at the first attempt, and for which repeated attempts have been requested. The DLQ handler reprocesses messages after it has first browsed to the end of the queue.

The default is 60 seconds.

WAIT (YES (default) |NO|nnn)

Specifies whether the DLQ handler should wait for further messages to arrive on the DLQ when it detects that there are no further messages that it can process.

YES

The DLQ handler waits indefinitely.

NO

The DLQ handler terminates when it detects that the DLQ is either empty or contains no messages that it can process.

nnn

The DLQ handler waits for *nnn* seconds for new work to arrive after it detects that the queue is either empty or contains no messages that it can process, before terminating.

Specify a value in the range 1 through 999 999.

Specify WAIT (YES) for busy DLQs, and WAIT (NO) or WAIT (*nnn*) for DLQs that have a low level of activity. If the DLQ handler is allowed to terminate, you can use triggering to invoke it when needed.

 **Rules (patterns and actions) on z/OS**

The DLQ handler is controlled with a series of pattern-matching and action keywords described here.

Figure 38 on page 2198 shows an example rule from a DLQ handler rules table.

```
PERSIST(MOPER_PERSISTENT) REASON (MQRC_PUT_INHIBITED) +  
ACTION (RETRY) RETRY (3)
```

Figure 38. An example rule from a DLQ handler rules table

This section describes the keywords that you can include in a rules table. It begins with a description of the pattern-matching keywords (those keywords against which messages on the DLQ are matched). It then describes the action keywords (those keywords that determine how the DLQ handler is to process a matching message).

- All keywords except ACTION are optional.
- The default value for a keyword, if any, is underlined. For most keywords, the default value is asterisk (*), which matches any value.
- The vertical line (|) separates alternatives. You can specify only one of these keywords.

The keywords can be grouped as follows:

- [The pattern-matching keywords](#)
- [The action keywords](#)

The pattern-matching keywords

The pattern-matching keywords, are described in the following table. You use these keywords to specify values against which messages on the DLQ are matched. All pattern-matching keywords are optional.

APPLIDAT (*ApplIdentityData*|* (default))

The *ApplIdentityData* value of the message on the DLQ, specified in the message descriptor, MQMD.

APPLNAME (*PutAppName*|* (default))

The name of the application that issued the MQPUT or MQPUT1 call, as specified in the *PutAppName* field of the message descriptor, MQMD, of the message on the DLQ.

APPLTYPE (*PutApplType*|* (default))

The *PutApplType* value specified in the message descriptor, MQMD, of the message on the DLQ.

DESTQ (*QueueName*|* (default))

The name of the message queue for which the message is destined.

DESTQM (*QueueManagerName*|* (default))

The queue manager name for the message queue for which the message is destined.

FEEDBACK (*Feedback*|* (default))

Describes the nature of the report when the *MsgType* value is MQMT_REPORT.

You can use symbolic names. For example, you can use the symbolic name MQFB_COA to identify those messages on the DLQ that require confirmation of their arrival on their destination queues. A few symbolic names are not accepted by the utility and lead to a syntax error. In these cases, you can use the corresponding numeric value.

FORMAT (*Format*|* (default))

The name that the sender of the message uses to describe the format of the message data.

MSGTYPE (*MsgType*|* (default))

The message type of the message on the DLQ.

You can use symbolic names. For example, you can use the symbolic name MQMT_REQUEST to identify those messages on the DLQ that require replies.

PERSIST (*Persistence*|* (default))

The persistence value of the message. (The persistence of a message determines whether it survives restarts of the queue manager.)

You can use symbolic names. For example, you can use the symbolic name MQPER_PERSISTENT to identify those messages on the DLQ that are persistent.

REASON (*ReasonCode*|* (default))

The reason code that describes why the message was put to the DLQ.

You can use symbolic names. For example, you can use the symbolic name MQRC_Q_FULL to identify those messages placed on the DLQ because their destination queues were full. A few symbolic names are not accepted by the utility and lead to a syntax error. In these cases, you can use the corresponding numeric value.

REPLYQ (*QueueName*|* (default))

The reply-to queue name specified in the message descriptor, MQMD, of the message on the DLQ.

REPLYQM (*QueueManagerName*|* (default))

The queue manager name of the reply-to queue specified in the REPLYQ keyword.

USERID (*UserIdentifier*|* (default))

The user ID of the user who originated the message on the DLQ, as specified in the message descriptor, MQMD.

The action keywords

The action keywords are described in the following table. You use these keywords to describe how a matching message is processed.

ACTION (DISCARD | IGNORE | RETRY | FWD)

The action taken for any message on the DLQ that matches the pattern defined in this rule.

DISCARD

Causes the message to be deleted from the DLQ.

IGNORE

Causes the message to be left on the DLQ.

RETRY

Causes the DLQ handler to try again to put the message on its destination queue.

FWD

Causes the DLQ handler to forward the message to the queue named on the FWDQ keyword.

You must specify the ACTION keyword. The number of attempts made to implement an action is governed by the RETRY keyword. The RETRYINT keyword of the control data controls the interval between attempts.

CONVERT (YES (default) |NO)

By default, this keyword is set to CONVERT(YES). When forwarding or retrying a message, the DLQ handler performs an MQGET with MQGMO_CONVERT; that is, it converts the message data to the CCSID and encoding of the queue manager.

However, setting CONVERT(NO) forwards or retries the message without converting the message contents.

FWDQ (QueueName | &DESTQ | &REPLYQ)

The name of the message queue to which the message is forwarded when you select the ACTION keyword.

QueueName

This parameter is the name of a message queue. FWDQ(' ') is not valid.

&DESTQ

Takes the queue name from the *DestQName* field in the MQDLH structure.

&REPLYQ

Takes the name from the *ReplyToQ* field in the message descriptor, MQMD. You can specify REPLYQ (?*) in the message pattern to avoid error messages, when a rule specifying FWDQ (&REPLYQ), matches a message with a blank *ReplyToQ* field.

FWDQM (QueueManagerName|&DESTQM|&REPLYQM| ' ' (default))

The queue manager of the queue to which a message is forwarded.

QueueManagerName

This parameter defines the queue manager name for the queue to which the message is forwarded when you select the ACTION (FWD) keyword.

&DESTQM

Takes the queue manager name from the *DestQMGrName* field in the MQDLH structure.

&REPLYQM

Takes the name from the *ReplyToQMGr* field in the message descriptor, MQMD.

..

The local queue manager.

HEADER (YES (default) |NO)

Whether the MQDLH should remain on a message for which ACTION (FWD) is requested. By default, the MQDLH remains on the message. The HEADER keyword is not valid for actions other than FWD.

PUTAUT (DEF (default) | CTX)

The authority with which messages should be put by the DLQ handler:

DEF

Puts messages with the authority of the DLQ handler itself.

CTX

Causes the messages to be put with the authority of the user ID in the message context. You must be authorized to assume the identity of other users, if you specify PUTAUT (CTX).

RETRY (RetryCount|1 (default))

The number of times that an action should be attempted (at the interval specified on the RETRYINT keyword of the control data). Specify a value in the range 1 through 999 999 999.

Note: The count of attempts made by the DLQ handler to implement any particular rule is specific to the current instance of the DLQ handler; the count does not persist across restarts. If you restart the DLQ handler, the count of attempts made to apply a rule is reset to zero.

Rules table conventions on z/OS

Use this topic to understand the conventions used in the CSQUDLQH rule table.

The rules table must adhere to the following conventions regarding its syntax, structure, and contents:

- A rules table must contain at least one rule.
- Keywords can occur in any order.
- A keyword can be included once only in any rule.
- Keywords are not case-sensitive.
- A keyword and its parameter value can be separated from other keywords by at least one blank or comma.
- Any number of blanks can occur at the beginning or end of a rule, and between keywords, punctuation, and values.
- Each rule must begin on a new line.
- For reasons of portability, the significant length of a line should not be greater than 72 characters.
- Use the plus sign (+) as the last nonblank character on a line to indicate that the rule continues from the first nonblank character in the next line. Use the minus sign (-) as the last nonblank character on a line to indicate that the rule continues from the start of the next line. Continuation characters can occur within keywords and parameters.

For example:

```
APPLNAME('ABC+
D')
```

results in 'ABCD'.

```
APPLNAME('ABC-
D')
```

results in 'ABC D'.

- Comment lines, which begin with an asterisk (*), can occur anywhere in the rules table.
- Blank lines are ignored.

Each entry in the DLQ handler rules table comprises one or more keywords and their associated parameters. The parameters must follow these syntax rules:

- Each parameter value must include at least one significant character. The delimiting quotation marks in following examples are not considered significant. For example, these parameters are valid:

FORMAT('ABC')

3 significant characters

FORMAT(ABC)

3 significant characters

FORMAT('A')

1 significant character

FORMAT(A)

1 significant character

FORMAT(' ')

1 significant character

These parameters are not valid because they contain no significant characters:

- FORMAT('')
- FORMAT()
- FORMAT()
- FORMAT
- Wildcard characters are supported. You can use the question mark (?) instead of any single character, except a trailing blank. You can use the asterisk (*) instead of zero or more adjacent characters. The asterisk (*) and the question mark (?) are *always* interpreted as wildcard characters in parameter values.
- You cannot include wildcard characters in the parameters of these keywords: ACTION, HEADER, RETRY, FWDQ, FWDQM, and PUTAUT.
- Trailing blanks in parameter values, and in the corresponding fields in the message on the DLQ, are not significant when performing wildcard matches. However, leading and embedded blanks within strings in quotation marks are significant to wildcard matches.
- Numeric parameters cannot include the question mark (?) wildcard character. You can include the asterisk (*) instead of an entire numeric parameter, but the asterisk cannot be included as part of a numeric parameter. For example, these are valid numeric parameters:

MSGTYPE(2)

Only reply messages are eligible

MSGTYPE(*)

Any message type is eligible

MSGTYPE(' *')

Any message type is eligible

However, MSGTYPE('2*') is not valid, because it includes an asterisk (*) as part of a numeric parameter.

- Numeric parameters must be in the range zero through 999 999 999 unless otherwise stated. If the parameter value is in this range, it is accepted, even if it is not currently valid in the field to which the keyword relates. You can use symbolic names for numeric parameters.
- If a string value is shorter than the field in the MQDLH or MQMD to which the keyword relates, the value is padded with blanks to the length of the field. If the value, excluding asterisks, is longer than the field, an error is diagnosed. For example, these are all valid string values for an eight character field:

'ABCDEFGH'

8 characters

'A*C*E*G*I'

5 characters excluding asterisks

'*A*C*E*G*I*K*M*O*'

8 characters excluding asterisks

- Strings that contain blanks, lowercase characters, or special characters other than period (.), forward slash (/), underscore (_), and percent sign (%) must be enclosed in single quotation marks. Lowercase characters not enclosed in quotation marks are folded to uppercase. If the string includes a quotation, two single quotation marks must be used to denote both the beginning and the end of the quotation. When the length of the string is calculated, each occurrence of double quotation marks is counted as a single character.

Processing the rules table on z/OS

Use this topic to understand how the CSQUDLQH utility processes the rules table.

The DLQ handler searches the rules table for a rule with a pattern that matches a message on the DLQ. The search begins with the first rule in the table, and continues sequentially through the table. When a rule with a matching pattern is found, the rules table attempts the action from that rule. The DLQ handler increments the retry count for a rule by 1 whenever it attempts to apply that rule. If the first attempt fails, the attempt is repeated until the count of attempts made matches the number specified on the RETRY keyword. If all attempts fail, the DLQ handler searches for the next matching rule in the table.

This process is repeated for subsequent matching rules until an action is successful. When each matching rule has been attempted the number of times specified on its RETRY keyword, and all attempts have failed, ACTION (IGNORE) is assumed. ACTION (IGNORE) is also assumed if no matching rule is found.

For further information, see [Ensuring that all DLQ messages are processed](#).

Note:

1. Matching rule patterns are sought only for messages on the DLQ that begin with an MQDLH. If the dead-letter queue handler encounters one or more messages that are not prefixed by an MQDLH, it issues an information message to report this. Messages that do not contain an MQDLH are not processed by the DLQ handler and remain on the dead-letter queue until dealt with by another method.
2. All pattern keywords can default, so that a rule can consist of an action only. Note, however, that action-only rules are applied to all messages on the queue that have MQDLHs and that have not already been processed in accordance with other rules in the table.
3. The rules table is validated when the DLQ handler starts, and errors flagged at that time. You can change the rules table at any time, but those changes do not come into effect until the DLQ handler is restarted.
4. The DLQ handler does not alter the content of messages, of the MQDLH, or of the message descriptor. The DLQ handler always puts messages to other queues with the message option MQPMO_PASS_ALL_CONTEXT.
5. Consecutive syntax errors in the rules table might not be recognized because the validation of the rules table is designed to eliminate the generation of repetitive errors.
6. The DLQ handler opens the DLQ with the MQOO_INPUT_AS_Q_DEF option.
7. Do not run applications that perform MQGET calls against the queue at the same time as the DLQ handler. This includes multiple instances of the DLQ handler. There is typically a one-to-one relationship between the dead-letter queue and the DLQ handler.

Ensuring that all DLQ messages are processed

The DLQ handler keeps a record of all messages on the DLQ that have been seen but not removed. If you use the DLQ handler as a filter to extract a small subset of the messages from the DLQ, the DLQ handler still keeps a record of those messages on the DLQ that it did not process. Also, the DLQ handler cannot guarantee that new messages arriving on the DLQ will be seen, even if the DLQ is defined as first-in first-out (FIFO). Therefore, if the queue is not empty, the DLQ is periodically rescanned to check all messages. For these reasons, ensure that the DLQ contains as few messages as possible. If messages that cannot be discarded or forwarded to other queues (for whatever reason) are allowed to accumulate on the queue, the workload of the DLQ handler increases and the DLQ itself is in danger of filling up.

You can take specific measures to enable the DLQ handler to empty the DLQ. For example, do not use ACTION (IGNORE), which leaves messages on the DLQ. (Remember that ACTION (IGNORE) is assumed for messages that are not explicitly addressed by other rules in the table.) Instead, for those messages that you would otherwise ignore, use an action that moves the messages to another queue. For example:

```
ACTION (FWD) FWDQ (IGNORED.DEAD.QUEUE) HEADER (YES)
```

Similarly, the final rule in the table should be a catchall to process messages that have not been addressed by earlier rules in the table. For example, the final rule in the table could be something like this:

```
ACTION (FWD) FWDQ (REALLY.DEAD.QUEUE) HEADER (YES)
```

This forwards messages that fall through to the final rule in the table to the queue `REALLY.DEAD.QUEUE`, where they can be processed manually. If you do not have such a rule, messages are likely to remain on the DLQ indefinitely.

An example DLQ handler rules table on z/OS

Use this topic as an example of the DLQ handler rules table.

Here is an example rules table that contains a single control-data entry and several rules:

```
*****
*           An example rules table for the CSQUDLQH utility           *
*****
* Control data entry
* -----
* If no queue manager name is supplied as an explicit parameter to CSQUDLQH,
* use the default queue manager.
* If no queue name is supplied as an explicit parameter to CSQUDLQH, use the
* DLQ defined for the queue manager.
*
inputqm(' ') inputq(' ')

* Rules
* -----

* The first check deals with attempted security violations.
* If a message was placed on the DLQ because the putter did not have the
* appropriate authority for the target queue, forward the message to a queue
* for manual inspection.

REASON(MQRC_NOT_AUTHORIZED) ACTION(FWD) +
FWDQ(DEADQ.MANUAL.SECURITY)

* The next set of rules with ACTION (RETRY) try to deliver the message to the
* intended destination.

* If a message is placed on the DLQ because its destination queue is full,
* attempt to forward the message to its destination queue. Make 5 attempts at
* approximately 60-second intervals (the default value for RETRYINT).

REASON(MQRC_Q_FULL) ACTION(RETRY) RETRY(5)

* If a message is placed on the DLQ because there has been a problem starting the
* application by triggering, forward the message to another queue for manual
* inspection.

REASON(MQFB_APPL_CANNOT_BE_STARTED) ACTION(FWD) +
FWDQ(DEADQ.MANUAL.TRIGGER)

* If a message is placed on the DLQ because of a put inhibited condition, attempt
* to forward the message to its destination queue. Make 5 attempts at
* approximately 60-second intervals (the default value for RETRYINT).

REASON(MQRC_PUT_INHIBITED) ACTION(RETRY) RETRY(5)

* The AAAA corporation often send messages with incorrect addresses. When we find
* a request from the AAAA corporation, we return it to the DLQ (DEADQ) of the
* reply-to queue manager (&REPLYQM). The AAAA DLQ handler attempts to
* redirect the message.

MSGTYPE(MQMT_REQUEST) REPLYQM(AAAA.*) +
ACTION(FWD) FWDQ(DEADQ) FWDQM(&REPLYQM)

* The BBBB corporation requests that we try sending messages to queue manager
* BBB2 if queue manager BBB1 is unavailable.

DESTQM(BBB1) +
ACTION(FWD) FWDQ(&DESTQ) FWDQM(BBB2) HEADER(NO)

* The CCCC corporation is very security conscious, and believes that none of its
* messages will ever end up on one of our DLQs. If we do see a message from a
* CCCC queue manager on our DLQ, we send it to a special destination in the CCCC
```

* organization where the problem is investigated.

```
REPLYQM(CCCC.*) +  
  ACTION(FWD) FWDQ(ALARM) FWDQM(CCCC.SYSTEM)
```

* Messages that are not persistent risk being lost when a queue manager terminates.
* If an application is sending nonpersistent messages, it will be able to cope with
* the message being lost, so we can afford to discard the message.

```
PERSIST(MQPER_NOT_PERSISTENT) ACTION(DISCARD)
```

* For performance and efficiency reasons, we like to keep the number of messages on
* the DLQ small. If we receive a message that has not been processed by an earlier
* rule in the table, we assume that it requires manual intervention to resolve the
* problem.

* Some problems are best solved at the node where the problem was detected, and
* others are best solved where the message originated. We do not have the message
* origin, but we can use the REPLYQM to identify a node that has some interest
* in this message. Attempt to put the message onto a manual intervention queue
* at the appropriate node. If this fails, put the message on the manual
* intervention queue at this node.

```
REPLYQM('?*') +  
  ACTION(FWD) FWDQ(DEADQ.MANUAL.INTERVENTION) FWDQM(&REPLYQM)
```

```
ACTION(FWD) FWDQ(DEADQ.MANUAL.INTERVENTION)
```

z/OS

The BSDS conversion utility (CSQJUCNV) on z/OS

You can use the CSQJUCNV BSDS conversion utility to convert a version 1 bootstrap data set (BSDS) to version 2. CSQJUCNV runs as a batch job.

A version 1 BSDS supports 6 byte log RBA (Relative Byte Address) values. A version 2 BSDS can be used by queue managers running IBM MQ 8.0, and supports 8 byte log RBA values. For more information about the change from 6 byte to 8 byte log RBA, see [Larger log Relative Byte Address](#).

CD

A version 2 BSDS can be used only by queue managers that have IBM MQ 8.0 new functions enabled with OPMODE. If the queue manager is in a queue sharing group, all queue managers in the queue sharing group must either have been started with OPMODE=(NEWFUNC,800), or OPMODE=(NEWFUNC,900), or added into the queue sharing group at IBM MQ 8.0 or 9.0, before the BSDS can be converted to version 2.

If the parameters provided specify that the queue manager is in a queue sharing group, the utility checks that the queue managers are at the correct level, before allowing the conversion of the BSDS to proceed. For queue managers that are not in a queue sharing group, the utility does not check that the queue manager has been started in IBM MQ 8.0 new function mode.

The converted BSDSs are written to new data sets. These new data sets must be allocated with similar attributes to the current BSDS before the utility is run, and must be empty. A version 2 BSDS contains more data than a version 1 BSDS, therefore, you must ensure that the new data sets are allocated with sufficient available space. See [Planning your logging environment](#), and the associated topics, for the recommended values when defining a new BSDS.

The current BSDSs are not modified and can be used to start the queue manager, should the attempt to convert the BSDSs and restart the queue manager with the new BSDS be unsuccessful.

Important:

1. Only run this utility when the queue manager that owns the BSDS is stopped.
2. Do not attempt to start the queue manager with the new BSDS until the utility has completed successfully. If a queue manager is started with a BSDS that is the output of an unsuccessful or incomplete conversion, it terminates with reason code 00D10121.
3. To use this utility, your user ID of the job must have read and write access to both the old and new BSDSs.
4. If you are using queue sharing groups, for each user ID that might use the CSQJUCNV utility GRANTS are needed for Db2 plans.

Run CSQ45GEX in hlq.SCSQPROC to grant execute authority for the Db2 plans before you use CSQJUCNV, or CSQJUCNV receives SQL error -981 and REASON code 00C12219. See [Preparing to migrate a single IBM MQ for z/OS queue manager](#) for more information on CSQ45GEX.

- “Invoking the CSQJUCNV utility” on page 2206
- “Syntax, keywords, and parameters” on page 2206
- “Data definition (DD) statements” on page 2207

Invoking the CSQJUCNV utility

The utility runs as a z/OS batch program. Figure 1 shows an example of the JCL used to invoke the CSQJUCNV utility for a queue manager that is a member of a queue sharing group.

```
//CONVERT EXEC PGM=CSQJUCNV,REGION=32M,
//          PARM=(' INQSG,qsgname,dsgname,db2ssid')
//STEPLIB DD DSN=thlqual.SCSQAUTH,DISP=SHR
//          DD DSN=thlqual.SCSQANLE,DISP=SHR
//          DD DSN=db2qual.SDSNLOAD,DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSUT1 DD DSN=hlq.BSDS01,DISP=SHR
//SYSUT2 DD DSN=hlq.BSDS02,DISP=SHR
//SYSUT3 DD DSN=newhlq.BSDS01,DISP=OLD
//SYSUT4 DD DSN=newhlq.BSDS02,DISP=OLD
```

Figure 39. Sample JCL to invoke the CSQJUCNV utility

Sample JCL to run the utility is also provided in thlqual.SCSQPROC (CSQ4BCNV).

Syntax, keywords, and parameters

BSDS conversion utility

►► PARM=(
 INQSG — ,qsgname,dsgname,db2ssid
 NOQSG
)

PARM

This field must contain one of the following parameters to indicate whether the queue manager is a member of a queue sharing group or not, followed by any function-specific parameters described in the following text:

INQSG

CD The queue manager that owns the BSDS is a member of a queue sharing group. Specifying this parameter causes the utility to verify that all members of the queue sharing group have either been started with OPMODE=(NEWFUNC,800), or OPMODE=(NEWFUNC,900), or been added into the queue sharing group at IBM MQ 8.0 or 9.0.

See [Implementing the larger log Relative Byte Address](#) for details on how you perform this task.

The utility terminates with a nonzero reason code, without writing anything to the output BSDS, if this condition is not met.

qsgname

The queue sharing group name

dsgname

The Db2 data-sharing group name

db2ssid

The Db2 subsystem ID

NOQSG

 The queue manager that owns the BSDS is not a member of a queue sharing group. The BSDS is converted, regardless of whether the queue manager has been started with IBM MQ 8.0 new functions enabled.

Attention: Do not specify this parameter for a queue manager that is a member of a queue sharing group.

Data definition (DD) statements

CSQJUCNV recognizes DD statements with the following DD names:

SYSUT1

Specifies the old BSDS that is to be converted. This statement is required.

SYSUT2

Specifies the second copy of the old BSDS that is to be converted. If you are using dual BSDS, you should specify this.

SYSUT3

Specifies the new, converted BSDS. This statement is required.

SYSUT4

Specifies the second copy of the converted BSDS. This statement is required if the installation uses dual BSDSs; otherwise, it is optional.

SYSPRINT

Contains the output messages from the conversion utility. This statement is required.

 z/OS

The message security policy utility (CSQOUTIL)

The Advanced Message Security policy utility is provided to manage security policies that specify the cryptographic encryption and signature algorithms for encrypting and authenticating messages that flow through queues.

Using this utility program, you can display, define, alter, delete and export security policies.

The CSQOUTIL utility program runs as a z/OS batch utility that accepts **SYSIN** command input. Sample JCL to run the utility is provided in member CSQ40CFG of thlqual.SCSQPROC.

```
-----  
//CSQ40CFG JOB 1,CSQ0,CLASS=A,MSGCLASS=X  
//CSQ40CFG EXEC PGM=CSQ0UTIL,  
// PARM='ENVAR("_CEE_ENVFILE_S=DD:ENVAR") /'  
//STEPLIB DD DSN=thlqual.SCSQANLE,DISP=SHR  
// DD DSN=thlqual.SCSQAUTH,DISP=SHR  
//ENVAR DD DSN=thlqual.SCSQPROC(CSQ40ENV),DISP=SHR  
//SYSPRINT DD SYSOUT=*  
//SYSIN DD *  
dspmqspl -m qmgr  
/*  
-----
```

The utility accepts the following commands:

dspmqspl

Display or export information about one or more security policies.

setmqspl

Define, alter or remove a security policy

For information on how to use these commands to manage security policies see [Managing security policies](#).

General usage notes

When specifying distinguished names (DNs) that have embedded blanks, you must enclose the entire DN in double quotes ("). For example:

```
-a "CN=John Smith,O=IBM,C=US"  
-r "CN=JSmith,O=IBM Australia,C=AU"
```

Arguments that would exceed column 80 of a SYSIN input record can be continued on subsequent SYSIN records provided those arguments are enclosed in double quotes ("), and relevant continuations resume in column 1 of subsequent SYSIN records.

When exporting policy information using **dspmqsp1** with the **-export** parameter the output is written to an additional DD named EXPORT. The EXPORT DD can be SYSOUT=*, a sequential data set, or the member of a partitioned data set. The record format is fixed block and the logical record length is 80. The output is in the form of one or more **setmqsp1** commands that can subsequently be used as input to CSQOUTIL.

To use this utility you need connect authority to the queue manager and access to the queue SYSTEM.PROTECTION.POLICY.QUEUE. If command events have been enabled for the queue manager you need put authority to the queue SYSTEM.ADMIN.COMMAND.EVENT. If configuration events have been enabled for the queue manager you need put authority to the queue SYSTEM.ADMIN.CONFIG.EVENT.

Related concepts

[Security policies](#)

dspmqsp1 (display security policy)

Use the **dspmqsp1** command to display a list of all policies and details of a named policy.

Before you begin

- The queue manager on which you want to operate must be running.
- You must grant the necessary **+connect**, **+inq** and **+chg** authorities, using the [setmqaut](#) command, to connect to the queue manager and create a security policy.

For more information about configuring security see [Setting up security](#).

Syntax

Command flag	Explanation
-m	Queue manager name (mandatory).
-p	Policy name.
-export	The output is written to a DD named EXPORT. Adding this flag generates output which can easily be applied to a different queue manager.

Examples

```
▶ V 9.0.0
```

Table 124. `setmqsp1` command flags

Command flag	Explanation
-m	Queue manager name. This flag is mandatory for all actions on security policies.
-p	Policy name. Set the policy name to the name of the queue you want the policy to apply to.

Table 124. `setmqsp` command flags (continued)

Command flag	Explanation
<p>-s</p>	<p>Digital signature algorithm.</p> <p>Advanced Message Security supports the following values: MD5, SHA1, SHA256, SHA384, and SHA512. All must be in uppercase. The default value is NONE.</p> <p>Important:</p> <ul style="list-style-type: none"> • For the SHA384 and SHA512 cryptographic hash functions, keys used for signing must be longer than 768 bits. • The name of the signature algorithm must be provided in uppercase. • V9.0.0 From IBM MQ 9.0, with the Confidentiality policy, the signature algorithm must be NONE. For more information about the Confidentiality policy, see Qualities of protection available with AMS.
<p>-e</p>	<p>Digital encryption algorithm.</p> <p>Advanced Message Security supports the following encryption algorithms: RC2, DES, 3DES, AES128, AES256. The default value is NONE.</p> <p>Important:</p> <ul style="list-style-type: none"> • The name of the encryption algorithm must be provided in uppercase • z/OS On z/OS encryption algorithm RC2 is not supported for confidentiality policies.
<p>-r</p>	<p>The distinguished name (DN) of the message recipient (if provided, the certificate pertaining to the DN is used to encrypt a given message). Recipients can be specified, only if the encryption algorithm is different from NONE. Multiple recipients can be included for a message. Each DN must be provided with a separate -r flag.</p> <p>Important:</p> <ul style="list-style-type: none"> • DN attribute names must be in uppercase. • Commas must be used as a name separators. • To avoid command interpreter errors, place quotation marks around the DNs. <p>For example:</p> <pre data-bbox="873 1738 1208 1772">-r "CN=alice, O=ibm, C=US"</pre>

Table 124. `setmqsp1` command flags (continued)

Command flag	Explanation
<p>-a</p>	<p>Signature DN that is validated during message retrieval. Only messages signed by a user with a provided DN are accepted during the retrieval. Signature DNs can be specified only if the signature algorithm is different from NONE. Multiple authorized signers can be specified, each authorized signer needs to have a separate -a flag.</p> <p>Important: The attribute in the DN name must be in uppercase. Specify CN= rather than cn=.</p> <p>The attribute values in the DN are case sensitive so, for example, CN=USERID1 is different from CN=userid1.</p>
<p>-t</p>	<p>The toleration flag indicates whether messages that do not meet the requirements of the policy can still be successfully browsed or retrieved by an application. Toleration may be useful for example when introducing a policy to a queue which already contains unprotected messages. Valid values include:</p> <ul style="list-style-type: none"> • 0 (default) Toleration flag off. • 1 Toleration flag on. <p>Toleration is optional and facilitates staged implementation, where policies were applied to queues but those queues may already contain messages that have no policy, or still receive messages from remote systems that do not have the security policy set.</p>
 <p>-c</p>	<p>The key reuse count can be provided as an integer from 1 through 9,999,999. Special values are:</p> <ul style="list-style-type: none"> • 0 Keys are not reused. • * Allows applications to reuse an encryption key an unlimited number of times. <p>If you omit the -c parameter when defining a policy, a key reuse count of 0 is assumed for backwards compatibility with previous versions of Advanced Message Security and IBM WebSphere MQ Extended Security Edition.</p> <p>Note that a non-zero key reuse count is only valid for a confidentiality policy. If you attempt to create or modify an integrity or privacy policy, with a non-zero key reuse count, you receive error message AMQ9091: Key reuse is not valid for policy and the policy operation fails.</p>

Table 124. `setmqsp1` command flags (continued)

Command flag	Explanation
<code>-remove</code>	Delete policy. Only the policy name flag, <code>-p</code> is valid for use in combination with this flag.

Examples

V 9.0.0

The following list shows examples of some valid `setmqsp1` commands on [Multiplatforms](#):

```
setmqsp1 -m QMGR -p PROT -s SHA256
setmqsp1 -m QMGR -p PROT -s SHA256 -a "CN=Alice, O=IBM, C=US"
setmqsp1 -m QMGR -p PROT -s SHA256 -e AES128 -a "CN=Alice, O=IBM, C=US" -r "CN=Bob, O=IBM, C=GB"
setmqsp1 -m QMGR -p PROT -e AES128 -r "CN=Bob, O=IBM, C=GB" -c 50
```

The following list shows examples of `setmqsp1` commands that are not valid:

- No recipients specified:

```
setmqsp1 -m QMGR -p PROT -e AES128
```

- Key reuse not valid for an Integrity policy:

```
setmqsp1 -m QMGR -p PROT -s SHA256 -c 1
```

- Key reuse is not valid for a Privacy policy:

```
setmqsp1 -m QMGR -p PROT -s SHA256 -e AES128 -r "CN=Bob, O=IBM, C=GB" -c 1
```

z/OS

On z/OS, you can use the `setmqsp1` command with the CSQOUTIL utility. For more information, see [The message security policy utility \(CSQOUTIL\)](#).

z/OS

V 9.0.1

Display queue manager information utility (CSQUDSPM)

CSQUDSPM displays information about queue managers and provides the equivalent function to `dspmq` on Multiplatforms.

Purpose

You use the CSQUDSPM utility to list all IBM MQ subsystems on the LPAR, regardless of what version of IBM MQ they are associated with. You do this by searching for IBM MQ subsystems in the z/OS SSCT (Subsystem Communications Table).

Sample JCL, CSQ4DSPM, is provided for this purpose. The JCL is in the SCSQPROC data set.

Packaging

The CSQUDSPM load module is provided in the SCSQAUTH data set with an alias called DSPMQ.

If you need to run CSQUDSPM from USS, you can follow this procedure:

1. Create an empty file in USS with the name `csqudspm` or `dspmq`. For example, issue the following command:

```
touch dspmq
```

2. Set the file permissions so that it is executable:

```
chmod 755 dspmq
```

3. Enable the sticky bit:

```
chmod +t dspmq
```

4. Set the APF authorized attribute:

```
extattr +a dspmq
```

To be authorized to issue the **extattr** command with the `+a` option, you must have at least read access to the BPX.FILEATTR.APF resource in the FACILITY class profile.

5. Ensure that the SCSQAUTH library is in the STEPLIB environment variable, and that all libraries in the STEPLIB concatenation are APF authorized. For example, to set the STEPLIB concatenation to contain the SCSQANLE and SCSQAUTH libraries, issue the following command:

```
export STEPLIB=thqual.SCSQANLE:thqual.SCSQAUTH
```

You can now execute the file you created to run CSQUDSPM from USS.

Syntax

Required parameters

None

Optional parameters

-a

Displays information about running queue managers only.

-m QMgrName

The queue manager for which to display details. If you do not specify a name, all queue managers on the LPAR are displayed.

-s

The operational status of the queue managers is displayed. This parameter is the default status setting.

The parameter **-o status** is equivalent to **-s**.

-o all

All details about the queue manager, or queue managers, are displayed.

-o status

The operational status of the queue managers is displayed.

-su

Suppress information about queue managers whose version is unknown.

An unknown version displays an INSTVER V . R . M of 0 . 0 . 0.

Command output

Output name	Details
QMNAME	The name of the queue manager consisting of up to four characters. If the queue manager name is less than four characters the string is not padded. This parameter is always output. Examples: QMNAME(MQ21), QMNAME(MQ1)
STATUS	The status of the queue manager. Either Running or Stopped. This parameter is always output. Examples: STATUS(Running), STATUS(Stopped)
INSTVER	The version that the queue manager was last started up with, in the format V . R . M. Note: In the case of a queue manager that has not been started since the last IPL of the LPAR, the version of that queue manager cannot be obtained. In that situation, the INSTVER attribute displays a V . R . M of 0 . 0 . 0. Examples: INSTVER(8.0.0), INSTVER(9.0.1)
ERLYVER	The version of early code associated with the queue manager. This should be the same for all queue managers in the LPAR in the format V . R . M. Examples: ERLYVER(9.0.1)
CMDPFX	The command prefix for the queue manager subsystem. This can be from one to eight characters long, and is not padded. Examples: CMDPFX(!MQ21), CMDPFX(MQ90ATST)
V 9.0.2 QSGNAME	The name of the queue sharing group, that the queue manager is a member of, consisting of up to four characters. If the queue manager name is less than four characters the string is not padded. This parameter is always output.

Output name	Details
	<p>If the queue manager is not a member of a queue sharing group then QSGNAME() is displayed.</p> <p>QSGNAME information can only be obtained when the queue manager is running, that is, STATUS(Running). If the queue manager is stopped QSGNAME(Unknown) is displayed.</p> <p>Example: QSGNAME(QSG1)</p>

Examples

1. Input:

```
dspmqr
```

Output:

```
QMNAME(QM01) STATUS(Stopped)
QMNAME(QM02) STATUS(Running)
QMNAME(QM03) STATUS(Stopped)
QMNAME(QM04) STATUS(Running)
```

2. Input:

```
dspmqr -o all
```

Output:

```
QMNAME(QM01) STATUS(Stopped) INSTVER(0.0.0) ERLYVER(9.0.1) CMDPFX(!QM01) QSGNAME(Unknown)
QMNAME(QM02) STATUS(Running) INSTVER(9.0.1) ERLYVER(9.0.1) CMDPFX(!QM02) QSGNAME(QSG1)
QMNAME(QM03) STATUS(Stopped) INSTVER(9.0.1) ERLYVER(9.0.1) CMDPFX(!QM03) QSGNAME(Unknown)
QMNAME(QM04) STATUS(Running) INSTVER(9.0.1) ERLYVER(9.0.1) CMDPFX(!QM04) QSGNAME()
```

3. Input:

```
dspmqr -o all -su
```

Output:

```
QMNAME(QM02) STATUS(Running) INSTVER(9.0.1) ERLYVER(9.0.1) CMDPFX(!QM02) QSGNAME(QSG1)
QMNAME(QM03) STATUS(Stopped) INSTVER(9.0.1) ERLYVER(9.0.1) CMDPFX(!QM03) QSGNAME(Unknown)
QMNAME(QM04) STATUS(Running) INSTVER(9.0.1) ERLYVER(9.0.1) CMDPFX(!QM04) QSGNAME()
```

Notices

This information was developed for products and services offered in the U.S.A.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
U.S.A.

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

Intellectual Property Licensing
Legal and Intellectual Property Law
IBM Japan, Ltd.
19-21, Nihonbashi-Hakozakicho, Chuo-ku
Tokyo 103-8510, Japan

The following paragraph does not apply to the United Kingdom or any other country where such provisions are inconsistent with local law: INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM Web sites are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this IBM product and use of those Web sites is at your own risk.

IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

IBM Corporation
Software Interoperability Coordinator, Department 49XA
3605 Highway 52 N
Rochester, MN 55901
U.S.A.

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this information and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement, or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

All statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs.

If you are viewing this information softcopy, the photographs and color illustrations may not appear.

Programming interface information

Programming interface information, if provided, is intended to help you create application software for use with this program.

This book contains information on intended programming interfaces that allow the customer to write programs to obtain the services of WebSphere MQ.

However, this information may also contain diagnosis, modification, and tuning information. Diagnosis, modification and tuning information is provided to help you debug your application software.

Important: Do not use this diagnosis, modification, and tuning information as a programming interface because it is subject to change.
