Specify a value ranging from 100 through 999999999.

This parameter cannot be specified for channel types (CHLTYPE) \*CLTCN or \*SVRCN.

**Maximum message length (MAXMSGLEN)**

Specifies the maximum message length that can be transmitted on the channel. This is compared with the value for the remote channel and the actual maximum is the lower of the two values.

The possible values are:

**\*SAME**

The attribute is unchanged.

**maximum-message-length**

Specify a value ranging from 0 through 104857600. A value of 0 indicates that the maximum length is unlimited.

**Heartbeat interval (HRTBTINTVL)**

Specifies the time, in seconds, between heartbeat flows passed from the sending MCA when there are no messages on the transmission queue. The heartbeat exchange gives the receiving MCA the opportunity to quiesce the channel. This applies only to sender, server, cluster sender and cluster receiver (\*SDR, \*SVR, \*CLUSSDR and \*CLUSRCVR) channels.

The possible values are:

**\*SAME**

The attribute is unchanged.

**heart-beat-interval**

Specify a value ranging from 0 through 999999999. A value of 0 means that no heartbeat exchanges are to take place.

**Non Persistent Message Speed (NPMSPEED)**

Specifies whether the channel supports fast non persistent messages.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**\*FAST**

The channel supports fast non persistent messages.

**\*NORMAL**

The channel does not support fast non persistent messages.

This parameter cannot be specified for channel types (CHLTYPE) \*CLTCN or \*SVRCN.

**Cluster Name (CLUSTER)**

The name of the cluster to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

This parameter is valid only for \*CLUSDR and \*CLUSRCVR channels. If the CLUSNL parameter is non-blank, this parameter must be blank.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**\*NONE**

No cluster name is specified.

**cluster-name**

The name of the cluster to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

**Cluster Name List (CLUSNL)**

The name of the namelist that specifies a list of clusters to which the channel belongs

This parameter is valid only for \*CLUSDR and \*CLUSRCVR channels. If the CLUSTER parameter is non-blank, this parameter must be blank.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**\*NONE**

No cluster namelist is specified.

**cluster-name-list**

The name of the namelist specifying a list of clusters to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

**Network Connection Priority (NETPRTY)**

The priority for the network connection. Distributed queuing chooses the path with the highest priority if there are multiple paths available. The value must be in the range between 0 and 9 where 0 is the lowest priority.

This parameter is valid only for \*CLUSRCVR channels.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**network-connection-priority**

Specify a value ranging from 0 through 9 where 0 is the lowest priority.

**TLS CipherSpec (SSLCIPH)**

SSLCIPH specifies the CipherSpec used in TLS channel negotiation. The possible values are:

**\*SAME**

The value of this attribute does not change.

**cipherspec**

The name of the CipherSpec.

**Note:** From IBM MQ 8.0.0 Fix Pack 2, the SSLv3 protocol and the use of some IBM MQ CipherSpecs is deprecated. For more information, see [Deprecated CipherSpecs](#).

**TLS Client Authentication (SSLCAUTH)**

SSLCAUTH specifies whether the channel carries out client authentication over TLS. The parameter is used only for channels with SSLCIPH specified.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**\*REQUIRED**

Client authentication is required.

**\*OPTIONAL**

Client authentication is optional.

This parameter cannot be specified for channel types (CHLTYPE) \*SDR, \*CLTCN or \*CLUSSDR.

**TLS Peer name (SSLPEER)**

SSLPEER specifies the X500 peer name used in TLS channel negotiation. The possible values are:

**\*SAME**

The value of this attribute does not change.

**x500peername**

The X500 peer name to use.

**Note:** An alternative way of restricting connections into channels by matching against the TLS Subject Distinguished Name, is to use channel authentication records. With channel authentication records, different TLS Subject Distinguished Name patterns can be applied to the same channel. If both SSLPEER on the channel and a channel authentication record are used to apply to the same channel, the inbound certificate must match both patterns in order to connect. For more information, see [Channel authentication records](#).

**Local communication address (LOCLADDR)**

Specifies the local communication address for the channel.

This parameter is only valid for \*SDR, \*SVR, \*RQSTR, \*CLUSSDR, \*CLUSRCVR and \*CLTCN channels.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The connection is blank.

**local-address**

Only valid for transport type TCP/IP. Specify the optional IP address and optional port or port range used for outbound TCP/IP communications. The format is:

```
LOCLADDR([ip-addr] [(low-port[, high-port])][, [ip-addr] [(low-port[, high-port])]])
```

## Batch Heartbeat Interval (BATCHHB)

The time in milliseconds used to determine whether batch heartbeating occurs on this channel. Batch heartbeating allows channels to determine whether the remote channel instance is still active before going indoubt. A batch heartbeat will occur if a channel MCA has not communicated with the remote channel within the specified time.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **batch-heartbeat-interval**

Specify a value ranging from 0 through 999999999. A value of 0 indicates that batch heartbeating is not to be used.

This parameter cannot be specified for channel types (CHLTYPE) \*RCVR, \*RQSTR, \*CLTCN or \*SVRCN.

## Task user identifier (USERID)

This is used by the message channel agent when attempting to initiate a secure LU 6.2 session with a remote message channel agent.

This parameter is valid only for channels with a channel type (CHLTYPE) of \*SDR, \*SVR, \*RQSTR, \*CLTCN or \*CLUSSDR.

Although the maximum length of the attribute is 12 characters, only the first 10 characters are used.

The possible values are:

### **\*SAME**

The value of this attribute does not change.

### **\*NONE**

No user identifier is specified.

### **user-identifier**

Specify the task user identifier.

## Password (PASSWORD)

This is used by the message channel agent when attempting to initiate a secure LU 6.2 session with a remote message channel agent.

This parameter is valid only for channels with a channel type (CHLTYPE) of \*SDR, \*SVR, \*RQSTR, \*CLTCN or \*CLUSSDR.

Although the maximum length of the attribute is 12 characters, only the first 10 characters are used.

The possible values are:

### **\*SAME**

The value of this attribute does not change.

### **\*NONE**

No password is specified.

### **password**

Specify the password.

## Keep Alive Interval (KAINT)

Specifies the keep alive timing interval for this channel.

The possible values are:

### **\*SAME**

The attribute is unchanged.

**\*AUTO**

The keep alive interval is calculated based upon the negotiated heartbeat value as follows:

- If the negotiated HBINT is greater than 0, keep alive interval is set to that value plus 60 seconds.
- If the negotiated HBINT is 0, the value used is that specified by the KEEPALIVEOPTIONS statement in the TCP profile configuration data set.

**keep-alive-interval**

Specify a value ranging from 0 through 99999.

**Header Compression (COMPHDR)**

The list of header data compression techniques supported by the channel.

For channel types sender, server, cluster sender, cluster receiver and client connection (\*SDR, \*SVR, \*CLUSDR, \*CLUSRCVR and \*CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No header data compression is performed.

**\*SYSTEM**

Header data compression is performed.

**Message Compression (COMPMSG)**

The list of message data compression techniques supported by the channel.

For channel types sender, server, cluster sender, cluster receiver and client connection (\*SDR, \*SVR, \*CLUSDR, \*CLUSRCVR and \*CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No message data compression is performed.

**\*RLE**

Message data compression is performed using run-length encoding.

**\*ZLIBFAST**

Message data compression is performed using the zlib compression technique. A fast compression time is preferred.

**\*ZLIBHIGH**

Message data compression is performed using the zlib compression technique. A high level of compression is preferred.

**\*ANY**

Any compression technique supported by the queue manager can be used. This option is only valid for channel types receiver, requester and server connection (\*RCVR, \*RQSTR and \*SVRCN).

**Channel Monitoring (MONCHL)**

Controls the collection of online monitoring data.

Online monitoring data is not collected when the queue manager attribute MONCHL is set to \*NONE.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*QMGR**

The collection of online monitoring data is inherited from the setting of the queue manager attribute MONCHL.

**\*OFF**

Online Monitoring Data collection for this channel is switched off.

**\*LOW**

Monitoring data collection is turned on with a low ratio of data collection.

**\*MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

**\*HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for a channel type (CHLTYPE) of \*CLTCN.

**Channel Statistics (STATCHL)**

Controls the collection of statistics data.

Statistics data is not collected when the queue manager attribute STATCHL is set to \*NONE.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATCHL.

**\*OFF**

Statistics data collection for this channel is disabled.

**\*LOW**

Statistics data collection is turned on with a low ratio of data collection.

**\*MEDIUM**

Statistics data collection is turned on with a moderate ratio of data collection.

**\*HIGH**

Statistics data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for channel types (CHLTYPE) \*CLTCN or \*SVRCN.

**Cluster Workload Rank (CLWLRANK)**

Specifies the cluster workload rank of the channel.

The possible values are:

**\*SAME**

The attribute is unchanged.

**cluster-workload-rank**

The cluster workload rank of the channel in the range 0 through 9.

**Cluster Workload Priority (CLWLPRTY)**

Specifies the cluster workload priority of the channel.

The possible values are:

**\*SAME**

The attribute is unchanged.

**cluster-workload-priority**

The cluster workload priority of the channel in the range 0 through 9.

**Cluster Channel Weight (CLWLWGHT)**

Specifies the cluster workload weight of the channel.

The possible values are:

**\*SAME**

The attribute is unchanged.

**cluster-workload-weight**

The cluster workload weight of the channel in the range 1 through 99.

**Sharing Conversations (SHARECNV)**

Specifies the maximum the number of conversations which can be shared over a particular TCP/IP client channel instance (socket).

This parameter is valid for channels with CHLTYPE defined as \*CLTCN or \*SVRCN.

The possible values are:

**\*SAME**

The attribute is unchanged.

**0**

Specifies no sharing of conversations over a TCP/IP socket. The channel instance runs in a mode prior to that of IBM WebSphere MQ 7.0, with regard to:

- Administrator stop-quietse
- Heartbeating
- Read ahead

**1**

Specifies no sharing of conversations over a TCP/IP socket. Client heartbeating and read ahead are available, whether in an MQGET call or not, and channel quiescing is more controllable.

**shared-conversations**

The number of shared conversations in the range 2 through 999999999.

This parameter is only valid for client-connection and server-connection channels.

**Note:** If the client-connection SHARECNV value does not match the server-connection SHARECNV value, the lower of the two values is used.

**Property Control (PROPCTL)**

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor).

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*COMPAT**

If the message contains a property with a prefix of "mcd.", "jms.", "usr." or "mqext." then all optional message properties, except those in the message descriptor (or extension) will be placed in one or more MQRFH2 headers in the message data before the message is sent to the remote queue manager.

**\*NONE**

All properties of the message, except those in the message descriptor (or extension), will be removed from the message before the message is sent to the remote queue manager.

**\*ALL**

All properties of the message will be included with the message when it is sent to the remote queue manager. The properties, except those in the message descriptor (or extension), will be placed in one or more MQRFH2 headers in the message data.

**Maximum Instances (MAXINST)**

Specifies the maximum number of clients that can simultaneously connect to the queue manager via this server-connection channel object.

This attribute is valid only for server-connection channels.

The possible values are:

**\*SAME**

The attribute is unchanged.

**maximum-instances**

The maximum number of simultaneous instances of the channel in the range 0 through 99999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

**Maximum Instances Per Client (MAXINSTC)**

Specifies the maximum number of simultaneous instances of an individual server-connection channel which can be started from a single client.

In this context, multiple client connections originating from the same remote network address are considered to be a single client.

This attribute is valid only for server-connection channels.

The possible values are:

**\*SAME**

The attribute is unchanged.

**maximum-instances-per-client**

The maximum number of simultaneous instances of the channel which can be started from a single client in the range 0 through 99999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running from individual clients, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

**Client Channel Weight (CLNTWGHT)**

The client channel weighting attribute is used so client channel definitions can be selected at random based on their weighting when more than one suitable definition is available.

The possible values are:

**\*SAME**

The attribute is unchanged.

**client-channel-weight**

The client channel weight in the range 0 through 99.

**Connection Affinity (AFFINITY)**

The channel affinity attribute is used so client applications that connect multiple times using the same queue manager name can choose whether to use the same client channel definition for each connection.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*PREFERRED**

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any applicable CLNTWGHT(0) definitions first and in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful non CLNTWGHT(0) definitions are moved to the end of the list. CLNTWGHT(0) definitions remain at the start of the list and are selected first for each connection.

**\*NONE**

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process select an applicable definition based on the weighting with any applicable CLNTWGHT(0) definitions selected first in alphabetical order.

**Batch Data Limit (BATCHLIM)**

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

The batch is terminated when one of the following conditions is met:

- **BATCHSZ** messages have been sent.
- **BATCHLIM** bytes have been sent.
- The transmission queue is empty and **BATCHINT** is exceeded.

This parameter is valid only for channels with a channel type (**CHLTYPE**) of SDR, SVR, CLUSSDR, or CLUSRCVR.

The value must be in the range 0 - 999999. The default value is 5000.

The **BATCHLIM** parameter is supported on all platforms.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**batch-data-limit**

Specify a value ranging from 0 through 999999.

This parameter can only be specified for channel types (CHLTYPE) \*SDR, \*SVR, \*CLUSSDR, or \*CLUSRCVR.

**Default client reconnection (DFTRECON)**

Specifies whether a client connection automatically reconnects a client application if its connection breaks.

**\*SAME**

The value of this attribute does not change.

**\*NO**

Unless overridden by **MQCONN**, the client is not reconnected automatically.

**\*YES**

Unless overridden by **MQCONN**, the client reconnects automatically.

**\*QMGR**

Unless overridden by **MQCONN**, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO\_RECONNECT\_Q\_MGR.

**\*DISABLED**

Reconnection is disabled, even if requested by the client program using the **MQCONN** MQI call.

This parameter is specified for a client connection channel, (CHLTYPE) \*CLTCN

## Change Queue Manager Journal (CHGMQMJRN)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Change Queue Manager Journal command (CHGMQMJRN) changes a queue manager journal. This command can be used, for example, to change the type of remote journal replication used for a backup or multi-instance queue manager.

### Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 1
<u>JRN</u>	Queue Manager Journal	Character value, <b>*DFT</b>	Optional, Positional 2
<u>RMTJNRDB</u>	Remote Relational Database	Character value	Optional, Positional 3
<u>RMTJRNSTS</u>	Remote Journal Status	<b>*ACTIVE</b> , *INACTIVE	Optional, Positional 4
<u>RMTJRNDLV</u>	Remote Journal Delivery	<b>*SYNC</b> , *ASYN	Optional, Positional 5
<u>RMTJRNTIMO</u>	Remote Journal Sync. Timeout	1-3600, <b>*DFT</b>	Optional, Positional 6

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager associated with the journal.

#### queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

### Queue Manager Journal (JRN)

Specifies the journal name to create.

The possible values are:

#### \*DFT

The journal name is chosen by the system. If a local journal already exists for the queue manager on this system - the existing local journal name is used, otherwise a unique name is generated of the format AMQxJRN where x is a character in the range 'A - Z'.

#### journal-name

Specify the name of the journal. The name can contain up to 10 characters. Journal receiver names will be derived from this journal name by truncating at the 4th character (or at the last character if the journal name is shorter than 4 characters) and appending zeroes. If the local queue manager library already contains a local journal, its name must match that supplied. Only one local journal can exist in a queue manager library. DLTMQM will not remove journal artifacts from a queue manager library unless they are prefixed with "AMQ".

## Remote Relational Database (RMTJRNRDB)

Specifies the name of the relational database directory entry that contains the remote location name of the target system. Use the WRKRDBDIRE command to locate and existing entry or configure a new relational database directory entry for the target system.

### relational-database-directory-entry

Specify the name of the relational database directory entry. The name can contain up to 18 characters.

## Remote Journal Status (RMTJRNSTS)

Specifies whether the remote journal is ready to receive journal entries from the queue managers local journal.

The possible values are:

### \*ACTIVE

The remote journal is ready to receive journal entries from the local queue manager journal. Replication of journal entries starts with the oldest local journal receiver required to perform a full media recovery and queue manager restart. If these recovery points do not exist, replication starts with the currently attached local journal receiver.

### \*INACTIVE

The remote journal is not ready to receive journal entries from the local queue manager journal.

## Remote Journal Delivery (RMTJRNDLV)

Specifies whether the journal entries are replicated synchronously or asynchronously when the remote journal is activated. Note that this parameter is ignored when RMTJRNSTS(\*INACTIVE) is specified.

The possible values are:

### \*SYNC

The remote journal is replicated synchronously with the local queue manager journal.

### \*ASYNC

The remote journal is replicated asynchronously with the local queue manager journal.

## Remote Journal Sync. Timeout (RMTJRNTIMO)

Specifies the maximum amount of time in seconds to wait for a response from the remote system when using synchronous replication with remote journaling. If a response is not received from the remote system within the timeout period, the remote journal environment will automatically be deactivated. Note that this parameter is ignored when RMTJRNDLV(\*ASYNC) or RMTJRNSTS(\*INACTIVE) are specified.

The possible values are:

### \*DFT

The system uses the default value of 60 seconds to wait for a response from the remote system.

### 1-3600

Specify the maximum number of seconds to wait for a response from the remote system. Note that this option is only available on IBM i V6R1M0 and later operating systems.

IBM i

## Change MQ Listener (CHGMQMLSR)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Change MQ Listener (CHGMQMLSR) command changes the specified attributes of an existing MQ listener definition.

## Parameters

Table 185. Command parameters			
Keyword	Description	Choices	Notes
<u>LSRNAME</u>	Listener name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Key, Positional 2
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, <b>*SAME</b>	Optional, Positional 3
<u>CONTROL</u>	Listener control	<b>*SAME</b> , *MANUAL, *QMGR, *STARTONLY	Optional, Positional 4
<u>PORT</u>	Port number	0-65535, <b>*SAME</b>	Optional, Positional 5
<u>IPADDR</u>	IP Address	<i>Character value</i> , *BLANK, <b>*SAME</b>	Optional, Positional 6
<u>BACKLOG</u>	Listener backlog	0-999999999, <b>*SAME</b>	Optional, Positional 7

### Listener name (LSRNAME)

The name of the listener definition to be changed.

The possible values are:

#### listener-name

Specify the name of the listener definition. The maximum length of the string is 48 bytes.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

#### \*DFT

Use the default queue manager.

#### queue-manager-name

The name of a message queue manager.

### Text 'description' (TEXT)

Specifies text that briefly describes the listener definition.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

#### \*SAME

The attribute is unchanged.

#### \*BLANK

The text is set to a blank string.

#### description

Specify no more than 64 characters enclosed in apostrophes.

## Listener control (CONTROL)

Whether the listener starts automatically when the queue manager is started.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*MANUAL**

The listener is not automatically started or stopped.

### **\*QMGR**

The listener is started and stopped as the queue manager is started and stopped.

### **\*STARTONLY**

The listener is started as the queue manager is started, but is not automatically stopped when the queue manager is stopped.

## Port number (PORT)

The port number to be used by the listener.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **port-number**

The port number to be used.

## IP Address (IPADDR)

The IP address to be used by the listener.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **ip-addr**

The IP address to be used.

## Listener backlog (BACKLOG)

The number of concurrent connection requests the listener supports.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **backlog**

The number of concurrent connection requests supported.

## **Change MQ Namelist (CHGMQMNL)**

### **Where allowed to run**

All environments (\*ALL)

### **Threadsafe**

Yes

The Change MQ Namelist (CHGMQMNL) command changes a list of names in the namelist specified on the selected local queue manager.

## Parameters

Table 186. Command parameters			
Keyword	Description	Choices	Notes
<u>NAMELIST</u>	Namelist	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Key, Positional 2
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, <b>*SAME</b>	Optional, Positional 3
<u>NAMES</u>	List of Names	Values (up to 256 repetitions): <i>Character value</i> , *BLANKS, <b>*SAME</b> , *NONE	Optional, Positional 4

### Namelist (NAMELIST)

The name of the namelist to be changed.

#### namelist

Specify the name of the namelist. The maximum length of the string is 48 bytes.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

#### \*DFT

The default queue manager is used.

#### message-queue-manager-name

Specify the name of the queue manager.

### Text 'description' (TEXT)

Specifies text that briefly describes the namelist.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

#### \*SAME

The attribute is unchanged.

#### description

Specify no more than 64 characters enclosed in apostrophes.

### List of Names (NAMES)

List of names. This is the list of names to be created. The names can be of any type, but must conform to the rules for naming MQ objects.

#### \*SAME

The attribute is unchanged.

#### namelist

The list to create. An empty list is valid.

## IBM i Change MQ Process (CHGMQMPRC)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Change MQ Process (CHGMQMPRC) command changes the specified attributes of an existing MQ process definition.

### Parameters

Keyword	Description	Choices	Notes
<u>PRCNAME</u>	Process name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Key, Positional 2
<u>TEXT</u>	Text 'description'	Character value, *BLANK, <b>*SAME</b>	Optional, Positional 3
<u>APPTYPE</u>	Application type	Integer, <b>*DEF</b> , *CICS, *UNIX, *OS400, *WINDOWS, *WINDOWS_NT,	Optional, Positional 4
<u>APPID</u>	Application identifier	Character value, <b>*SAME</b>	Optional, Positional 5
<u>USRDATA</u>	User data	Character value, <b>*SAME</b> , *NONE	Optional, Positional 6
<u>ENVDATA</u>	Environment data	Character value, <b>*SAME</b> , *NONE	Optional, Positional 7

### Process name (PRCNAME)

The name of the process definition to be changed.

The possible values are:

#### process-name

Specify the name of the process definition. The maximum length of the string is 48 bytes.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

#### \*DFT

Use the default queue manager.

#### queue-manager-name

The name of a message queue manager.

### Text 'description' (TEXT)

Specifies text that briefly describes the process definition.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*BLANK**

The text is set to a blank string.

**description**

Specify no more than 64 characters enclosed in apostrophes.

## Application type (APPTYPE)

The type of application started.

The possible values are:

**\*DEF**

Specifying DEF causes the default application type for the platform at which the command is interpreted to be stored in the process definition. This default cannot be changed by the installation. If the platform supports clients, the default is interpreted as the default application type of the server.

**\*CICS**

Represents a CICS/400® application.

**\*UNIX**

Represents a UNIX or Linux application.

**\*OS400**

Represents an IBM i application.

**\*WINDOWS**

Represents a Windows application.

**\*WINDOWS\_NT**

Represents a Windows NT application.

**integer**

User-defined application type in the range 65536 through 999999999.

## Application identifier (APPID)

Application identifier. This is the name of the application to be started, on the platform for which the command is processing. It is typically a program name and library name.

The possible values are:

**\*SAME**

The attribute is unchanged.

**application-id**

The maximum length is 256 characters.

## User data (USRDATA)

A character string that contains user information pertaining to the application, as defined by APPID, to start.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The user data is blank.

**user-data**

Specify up to 128 characters of user data.

**Environment data (ENVDATA)**

A character string that contains environment information pertaining to the application, as defined by APPID, to start.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The environment data is blank.

**environment-data**

The maximum length is 128 characters.

## IBM i **Change MQ Queue (CHGMQM)**

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Change MQ Queue ( **CHGMQM** ) command changes the specified attributes of an existing MQ queue.

**Parameters**

*Table 188. Command parameters*

<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>QNAME</u>	Queue name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Key, Positional 2
<u>QTYPE</u>	Queue type	Character value	Optional, Positional 3
<u>FORCE</u>	Force	<b>*NO</b> , *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, <b>*SAME</b>	Optional, Positional 5
<u>PUTENBL</u>	Put enabled	<b>*SAME</b> , *NO, *YES	Optional, Positional 6
<u>DFTPTY</u>	Default message priority	0-9, <b>*SAME</b>	Optional, Positional 7
<u>DFTMSGPST</u>	Default message persistence	<b>*SAME</b> , *NO, *YES	Optional, Positional 8
<u>PRCNAME</u>	Process name	<i>Character value</i> , *NONE, <b>*SAME</b>	Optional, Positional 9
<u>TRGENBL</u>	Triggering enabled	<b>*SAME</b> , *NO, *YES	Optional, Positional 10
<u>GETENBL</u>	Get enabled	<b>*SAME</b> , *NO, *YES	Optional, Positional 11
<u>SHARE</u>	Sharing enabled	<b>*SAME</b> , *NO, *YES	Optional, Positional 12
<u>DFTSHARE</u>	Default share option	<b>*SAME</b> , *NO, *YES	Optional, Positional 13

Table 188. Command parameters (continued)

<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>MSGDLYSEQ</u>	Message delivery sequence	<b>*SAME</b> , *PTY, *FIFO	Optional, Positional 14
<u>HDNBKCNT</u>	Harden backout count	<b>*SAME</b> , *NO, *YES	Optional, Positional 15
<u>TRGTYPE</u>	Trigger type	<b>*SAME</b> , *FIRST, *ALL, *DEPTH, *NONE	Optional, Positional 16
<u>TRGDEPTH</u>	Trigger depth	1-999999999, <b>*SAME</b>	Optional, Positional 17
<u>TRGMSGPTY</u>	Trigger message priority	0-9, <b>*SAME</b>	Optional, Positional 18
<u>TRGDATA</u>	Trigger data	Character value, *NONE, <b>*SAME</b>	Optional, Positional 19
<u>RTNITV</u>	Retention interval	0-999999999, <b>*SAME</b>	Optional, Positional 20
<u>MAXDEPTH</u>	Maximum queue depth	0-999999999, <b>*SAME</b>	Optional, Positional 21
<u>MAXMSGLEN</u>	Maximum message length	0-104857600, <b>*SAME</b>	Optional, Positional 22
<u>BKTTHLD</u>	Backout threshold	0-999999999, <b>*SAME</b>	Optional, Positional 23
<u>BKTQNAME</u>	Backout requeue name	Character value, *NONE, <b>*SAME</b>	Optional, Positional 24
<u>INITQNAME</u>	Initiation queue	Character value, *NONE, <b>*SAME</b>	Optional, Positional 25
<u>USAGE</u>	Usage	<b>*SAME</b> , *NORMAL, *TMQ	Optional, Positional 26
<u>DFNTYPE</u>	Definition type	<b>*SAME</b> , *TEMPDYN, *PERMDYN	Optional, Positional 27
<u>TGTQNAME</u>	Target object	Character value, <b>*SAME</b>	Optional, Positional 28
<u>RMTQNAME</u>	Remote queue	Character value, <b>*SAME</b> , *NONE	Optional, Positional 29
<u>RMTMQMNAME</u>	Remote Message Queue Manager	Character value, <b>*SAME</b>	Optional, Positional 30
<u>TMQNAME</u>	Transmission queue	Character value, *NONE, <b>*SAME</b>	Optional, Positional 31
<u>HIGHTHLD</u>	Queue depth high threshold	0-100, <b>*SAME</b>	Optional, Positional 32
<u>LOWTHLD</u>	Queue depth low threshold	0-100, <b>*SAME</b>	Optional, Positional 33
<u>FULLEVT</u>	Queue full events enabled	<b>*SAME</b> , *NO, *YES	Optional, Positional 34
<u>HIGHEVT</u>	Queue high events enabled	<b>*SAME</b> , *NO, *YES	Optional, Positional 35
<u>LOWEVT</u>	Queue low events enabled	<b>*SAME</b> , *NO, *YES	Optional, Positional 36
<u>SRVITV</u>	Service interval	0-999999999, <b>*SAME</b>	Optional, Positional 37
<u>SRVEVT</u>	Service interval events	<b>*SAME</b> , *HIGH, *OK, *NONE	Optional, Positional 38
<u>DISTLIST</u>	Distribution list support	<b>*SAME</b> , *NO, *YES	Optional, Positional 39

Table 188. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>CLUSTER</u>	Cluster Name	Character value, <b>*SAME</b> , *NONE	Optional, Positional 40
<u>CLUSNL</u>	Cluster Name List	Character value, *NONE, <b>*SAME</b>	Optional, Positional 41
<u>DEFBIND</u>	Default Binding	<b>*SAME</b> , *OPEN, *NOTFIXED, *GROUP	Optional, Positional 42
<u>CLWLRANK</u>	Cluster Workload Rank	0-9, <b>*SAME</b>	Optional, Positional 43
<u>CLWLPRTY</u>	Cluster Workload Priority	0-9, <b>*SAME</b>	Optional, Positional 44
<u>CLWLUSEQ</u>	Cluster workload queue use	<b>*SAME</b> , *QMGR, *LOCAL, *ANY	Optional, Positional 45
<u>MONQ</u>	Queue Monitoring	<b>*SAME</b> , *QMGR, *OFF, *LOW, *MEDIUM, *HIGH	Optional, Positional 46
<u>STATQ</u>	Queue Statistics	<b>*SAME</b> , *QMGR, *OFF, *ON	Optional, Positional 47
<u>ACCTQ</u>	Queue Accounting	<b>*SAME</b> , *QMGR, *OFF, *ON	Optional, Positional 48
<u>NPMCLASS</u>	Non Persistent Message Class	<b>*SAME</b> , *NORMAL, *HIGH	Optional, Positional 49
<u>MSGREADAHD</u>	Message Read Ahead	<b>*SAME</b> , *DISABLED, *NO, *YES	Optional, Positional 50
<u>DFTPUTRESP</u>	Default Put Response	<b>*SAME</b> , *SYNC, *ASYN	Optional, Positional 51
<u>PROPCTL</u>	Property Control	<b>*SAME</b> , *COMPAT, *NONE, *ALL, *FORCE, *V6COMPAT	Optional, Positional 52
<u>TARGETYPE</u>	Target Type	<b>*SAME</b> , *QUEUE, *TOPIC	Optional, Positional 53
<u>CUSTOM</u>	Custom attribute	Character value, *BLANK, <b>*SAME</b>	Optional, Positional 54
<u>“CLCHNAME” on page 1026</u>	Cluster-sender channel name	Character value, *NONE, <b>*SAME</b>	Optional, Positional 55
<u>IMGRCOVQ</u>	Queue object attribute	<b>*SAME</b> , *NO, *YES, *QMGR	Optional, Positional 57

### Queue name (QNAME)

The name of the queue to be changed.

The possible values are:

#### queue-name

Specify the name of the queue.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager.

**Queue type (QTYPE)**

Specifies the type of queue that is to be changed.

The possible values are:

**\*ALS**

An alias queue.

**\*LCL**

A local queue.

**\*RMT**

A remote queue.

**\*MDL**

A model queue.

**Force (FORCE)**

Specifies whether the command should be forced to complete when conditions are such that completing the command affects an open queue. The conditions depend on the type of the queue that is being changed:

**Alias Queue**

The TGTQNAME keyword is specified with a queue name and an application has the alias queue open.

**Local Queue**

Either of the following conditions indicate that a local queue will be affected:

- SHARE(\*NO) is specified and more than one application has the local queue open for input.
- The USAGE attribute is changed and one or more applications has the local queue open, or, there are one or more messages on the queue. (The USAGE attribute should not normally be changed while there are messages on the queue; the format of messages changes when they are put on a transmission queue.)

**Remote Queue**

Either of the following conditions indicate that a remote queue will be affected:

- The TMQNAME keyword is specified with a transmission-queue name (or \*NONE) and an application with the remote queue open will be affected by this change.
- Any of the RMTQNAME, RMTMQMNAME or TMQNAME keywords is specified with a queue or queue manager name, and one or more applications has a queue open that resolves through this definition as a queue manager alias.

**Note:** FORCE(\*YES) is not required if this definition is in use as a reply-to queue definition only.

The possible values are:

**\*NO**

The command fails if the relevant conditions are true.

**\*YES**

The command is forced to complete successfully even if the relevant conditions are true.

**Text 'description' (TEXT)**

Specifies text that briefly describes the queue definition.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*BLANK**

The text is set to a blank string.

**description**

Specify no more than 64 characters enclosed in apostrophes.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

**Put enabled (PUTENBL)**

Specifies whether messages can be put on the queue.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

Messages cannot be added to the queue.

**\*YES**

Messages can be added to the queue by authorized applications.

**Default message priority (DFTPTY)**

Specifies the default priority of messages put on the queue.

The possible values are:

**\*SAME**

The attribute is unchanged.

**priority-value**

Specify a value ranging from 0 through 9, where 9 is the highest priority.

**Default message persistence (DFTMSGPST)**

Specifies the default for message-persistence on the queue. Message persistence determines whether messages are preserved across restarts of the queue manager.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

By default, messages are lost across a restart of the queue manager.

**\*YES**

By default, messages are preserved across a restart of the queue manager.

**Process name (PRCNAME)**

Specifies the local name of the MQ process that identifies the application that should be started when a trigger event occurs.

The process does not have to be available when the queue is created, but it must be available for a trigger event to occur.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The process name is blank.

**process-name**

Specify the name of the MQ process.

**Triggering enabled (TRGENBL)**

Specifies whether trigger messages are written to the initiation queue.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

Triggering is not enabled. Trigger messages are not written to the initiation queue.

**\*YES**

Triggering is enabled. Trigger messages are written to the initiation queue.

**Get enabled (GETENBL)**

Specifies whether applications are to be permitted to get messages from this queue.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

Applications cannot retrieve messages from the queue.

**\*YES**

Suitably authorized applications can retrieve messages from the queue.

**Sharing enabled (SHARE)**

Specifies whether multiple instances of applications can open this queue for input simultaneously.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

Only a single application instance can open the queue for input.

**\*YES**

More than one application instance can open the queue for input.

**Default share option (DFTSHARE)**

Specifies the default share option for applications opening this queue for input.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

By default, the open request is for exclusive use of the queue for input.

**\*YES**

By default, the open request is for shared use of the queue for input.

**Message delivery sequence (MSGDLYSEQ)**

Specifies the message delivery sequence.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*PTY**

Messages are delivered in first-in-first-out (FIFO) order within priority.

**\*FIFO**

Messages are delivered in FIFO order regardless of priority.

**Harden backout count (HDNBKTCNT)**

Specifies whether the count of backed out messages is saved (hardened) across restarts of the message queue manager.

**Note:** On IBM MQ for IBM i the count is ALWAYS hardened, regardless of the setting of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

The backout count is not hardened.

**\*YES**

The backout count is hardened.

**Trigger type (TRGTYPE)**

Specifies the condition that initiates a trigger event. When the condition is true, a trigger message is sent to the initiation queue.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*FIRST**

When the number of messages on the queue goes from 0 to 1.

**\*ALL**

Every time a message arrives on the queue.

**\*DEPTH**

When the number of messages on the queue equals the value of the TRGDEPTH attribute.

**\*NONE**

No trigger messages are written.

**Trigger depth (TRGDEPTH)**

Specifies, for TRGTYPE(\*DEPTH), the number of messages that initiate a trigger message to the initiation queue.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**depth-value**

Specify a value ranging from 1 through 999999999.

**Trigger message priority (TRGMSGPTY)**

Specifies the minimum priority that a message must have before it can result in a trigger event.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**priority-value**

Specify a value ranging from 0 through 9, where 9 is the highest priority.

**Trigger data (TRGDATA)**

Specifies up to 64 characters of user data that the queue manager includes in the trigger message. This data is made available to the monitoring application that processes the initiation queue, and to the application started by the monitor.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No trigger data is specified.

**trigger-data**

Specify up to 64 characters enclosed in apostrophes. For a transmission queue you can use this parameter to specify the name of the channel to be started.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

**Retention interval (RTNITV)**

Specifies the retention interval. This interval is the number of hours for which the queue might be needed, based on the date and time when the queue was created.

This information is available to a housekeeping application or an operator and can be used to determine when a queue is no longer required.

**Note:** The message queue manager does not delete queues, nor does it prevent your queues from being deleted if their retention interval has not expired. It is your responsibility to take any required action.

The possible values are:

**\*SAME**

The attribute is unchanged.

**interval-value**

Specify a value ranging from 0 through 999999999.

**Maximum queue depth (MAXDEPTH)**

Specifies the maximum number of messages allowed on the queue. However, other factors can cause the queue to be treated as full; for example, it appears to be full if there is no storage available for a message.

**Note:** If this value is subsequently reduced by using the CHGMQMOMQ command, any messages that are on the queue remain intact even if they cause the new maximum to be exceeded.

The possible values are:

**\*SAME**

The attribute is unchanged.

**depth-value**

Specify a value ranging from 0 through 999999999.

### **Maximum message length (MAXMSGLEN)**

Specifies the maximum length for messages on the queue.

**Note:** If this value is subsequently reduced by using the CHGMQMOMQ command, any messages that are on the queue remain intact even if they exceed the new maximum length.

Applications might use the value of this attribute to determine the size of buffer they need to retrieve messages from the queue. Therefore change the value only if you know this will not cause an application to operate incorrectly.

The possible values are:

**\*SAME**

The attribute is unchanged.

**length-value**

Specify a value ranging from 0 through 100 MB in bytes. The default is 4MB.

### **Backout threshold (BKTTHLD)**

Specifies the backout threshold.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine if a message should be backed out. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**threshold-value**

Specify a value ranging from 0 through 999999999.

### **Backout requeue name (BKTQNAME)**

Specifies the backout-queue name.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine where messages that have been backed out should go. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No backout queue is specified.

**backout-queue-name**

Specify the backout queue name.

## Initiation queue (INITQNAME)

Specifies the name of the initiation queue.

**Note:** The initiation queue must be on the same instance of a message queue manager.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*NONE**

No initiation queue is specified.

### **initiation-queue-name**

Specify the initiation queue name.

## Usage (USAGE)

Specifies whether the queue is for normal usage, or for transmitting messages to a remote message queue manager.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*NORMAL**

Normal usage (the queue is not a transmission queue)

### **\*TMQ**

The queue is a transmission queue that is used to hold messages destined for a remote message queue manager. If the queue is intended for use in situations where a transmission queue name is not explicitly specified, the queue name must be the same as the name of the remote message queue manager. For further information, see IBM MQ Intercommunication.

## Definition type (DFNTYPE)

Specifies the type of dynamic queue definition that is created when an application issues an MQOPEN API call with the name of this model queue specified in the object descriptor.

**Note:** This parameter only applies to a model queue definition.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*TEMPDYN**

A temporary dynamic queue is created. This value should not be specified with a DEFMSGPST value of \*YES.

### **\*PERMDYN**

A permanent dynamic queue is created.

## Target object (TGTQNAME)

Specifies the name of the object for which this queue is an alias.

The object can be a local or remote queue, a topic or a message queue manager.

**Note:** The target object does not need to exist at this time but it must exist when a process attempts to open the alias queue.

The possible values are:

### **\*SAME**

The attribute is unchanged.

**target-object-name**

Specify the name of the target object.

**Remote queue (RMTQNAME)**

Specifies the name of the remote queue. That is, the local name of the remote queue as defined on the queue manager specified by RMTMQMNAME.

If this definition is used for a queue manager alias definition, RMTQNAME must be blank when the open occurs.

If this definition is used for a reply-to alias, this name is the name of the queue that is to be the reply-to queue.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No remote-queue name is specified (that is, the name is blank). This can be used if the definition is a queue manager alias definition.

**remote-queue-name**

Specify the name of the queue at the remote queue manager.

**Note:** The name is not checked to ensure that it contains only those characters normally allowed for queue names.

**Remote Message Queue Manager (RMTMQMNAME)**

Specifies the name of the remote queue manager on which the queue RMTQNAME is defined.

If an application opens the local definition of a remote queue, RMTMQMNAME must not be the name of the connected queue manager. If TMQNAME is blank there must be a local queue of this name, which is to be used as the transmission queue.

If this definition is used for a queue manager alias, RMTMQMNAME is the name of the queue manager, which can be the name of the connected queue manager. Otherwise, if TMQNAME is blank, when the queue is opened there must be a local queue of this name, with USAGE(\*TMQ) specified, which is to be used as the transmission queue.

If this definition is used for a reply-to alias, this name is the name of the queue manager that is to be the reply-to queue manager.

The possible values are:

**\*SAME**

The attribute is unchanged.

**remote-queue-manager-name**

Specify the name of the remote queue manager.

**Note:** Ensure this name contains only those characters normally allowed for queue manager names.

**Transmission queue (TMQNAME)**

Specifies the local name of the transmission queue to be used for messages destined for the remote queue, for either a remote queue or for a queue manager alias definition.

If TMQNAME is blank, a queue with the same name as RMTMQMNAME is used as the transmission queue.

This attribute is ignored if the definition is being used as a queue manager alias and RMTMQMNAME is the name of the connected queue manager.

It is also ignored if the definition is used as a reply-to queue alias definition.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No specific transmission queue name is defined for this remote queue. The value of this attribute is set to all blanks.

**transmission-queue-name**

Specify the transmission queue name.

### **Queue depth high threshold (HIGHTHLD)**

Specifies the threshold against which the queue depth is compared to generate a queue depth high event.

The possible values are:

**\*SAME**

The attribute is unchanged.

**threshold-value**

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

### **Queue depth low threshold (LOWTHLD)**

Specifies the threshold against which the queue depth is compared to generate a queue depth low event.

The possible values are:

**\*SAME**

The attribute is unchanged.

**threshold-value**

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

### **Queue full events enabled (FULLEVT)**

Specifies whether queue full events are generated.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

Queue full events are not generated.

**\*YES**

Queue full events are generated.

### **Queue high events enabled (HIGHEVT)**

Specifies whether queue depth high events are generated.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

Queue depth high events are not generated.

**\*YES**

Queue depth high events are generated.

## Queue low events enabled (LOWEVT)

Specifies whether queue depth low events are generated.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*NO**

Queue depth low events are not generated.

### **\*YES**

Queue depth low events are generated.

## Service interval (SRVITV)

Specifies the service interval. This interval is used for comparison to generate service interval high and service interval OK events.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **interval-value**

Specify a value ranging from 0 through 999999999. The value is in units of milliseconds.

## Service interval events (SRVEVT)

Specifies whether service interval high or service interval OK events are generated.

A service interval high event is generated when a check indicates that no messages have been retrieved from the queue for the time indicated by the SRVITV parameter as a minimum.

A service interval OK event is generated when a check indicates that messages have been retrieved from the queue within the time indicated by the SRVITV parameter.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*HIGH**

Service interval high events are generated.

### **\*OK**

Service interval OK events are generated.

### **\*NONE**

No service interval events are generated.

## Distribution list support (DISTLIST)

Specifies whether the queue supports distribution lists.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*NO**

The queue will not support distribution lists.

### **\*YES**

The queue will support distribution lists.

## Cluster Name (CLUSTER)

The name of the cluster to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **cluster-name**

Only one of the resultant values of CLUSTER or CLUSNL can be non-blank; you cannot specify a value for both.

## Cluster Name List (CLUSNL)

The name of the namelist which specifies a list of clusters to which the queue belongs. Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **namelist-name**

Only one of the resultant values of CLUSTER or CLUSNL can be non-blank; you cannot specify a value for both.

## Default Binding (DEFBIND)

Specifies the binding to be used when the application specifies MQOO\_BIND\_AS\_Q\_DEF on the MQOPEN call and the queue is a cluster queue.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*OPEN**

The queue handle is bound to a specific instance of the cluster queue when the queue is opened.

### **\*NOTFIXED**

The queue handle is not bound to any particular instance of the cluster queue. This allows the queue manager to select a specific queue instance when the message is put using MQPUT and to change that selection subsequently if necessary.

The MQPUT1 call always behaves as if NOTFIXED had been specified.

### **\*GROUP**

When the queue is opened, the queue handle is bound to a specific instance of the cluster queue for as long as there are messages in a message group. All messages in a message group are allocated to the same destination instance.

## Cluster Workload Rank (CLWLRANK)

Specifies the cluster workload rank of the queue.

The possible values are:

**\*SAME**

The attribute is unchanged.

**cluster-workload-rank**

Specify a value ranging from 0 through 9.

**Cluster Workload Priority (CLWLPRTY)**

Specifies the cluster workload priority of the queue.

The possible values are:

**\*SAME**

The attribute is unchanged.

**cluster-workload-priority**

Specify a value ranging from 0 through 9.

**Cluster workload queue use (CLWLUSEQ)**

Specifies the behavior of an MQPUT when the target queue has both a local instance and at least one remote cluster instance. If the put originates from a cluster channel then this attribute does not apply.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*QMGR**

The value is inherited from the Queue Manager CLWLUSEQ attribute.

**\*LOCAL**

The local queue will be the sole target of the MQPUT.

**\*ANY**

The queue manager will treat such a local queue as another instance of the cluster queue for the purposes of workload distribution.

**Queue Monitoring (MONQ)**

Controls the collection of Online Monitoring Data.

Online Monitoring Data is not collected when the queue manager attribute MONQ is set to \*NONE.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*QMGR**

The collection of online monitoring data is inherited from the setting of the queue manager attribute MONQ.

**\*OFF**

Online monitoring data collection for this queue is disabled.

**\*LOW**

Monitoring data collection is turned on with a low ratio of data collection.

**\*MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

**\*HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

**Queue Statistics (STATQ)**

Controls the collection of statistics data.

Online monitoring data is not collected when the queue manager attribute STATQ is set to \*NONE.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATQ.

**\*OFF**

Statistics data collection for this queue is disabled.

**\*ON**

Statistics data collection is enabled for this queue.

## Queue Accounting (ACCTQ)

Controls the collection of accounting data.

Accounting data is not collected when the queue manager attribute ACCTQ is set to \*NONE.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*QMGR**

Accounting data collection is based upon the setting of the queue manager attribute ACCTQ.

**\*OFF**

Accounting data collection for this queue is disabled.

**\*ON**

Accounting data collection is enabled for this queue.

## Non Persistent Message Class (NPMCLASS)

Specifies the level of reliability for non-persistent messages put to this queue.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NORMAL**

Non-persistent messages put to this queue are only lost following a failure, or a queue manager shutdown. Non-persistent message put to this queue will be discarded in the event of a queue manager restart.

**\*HIGH**

Non-persistent messages put to this queue are not discarded in the event of a queue manager restart. Non-persistent messages put to this queue may still be lost in the event of a failure.

## Message Read Ahead (MSGREADAHD)

Specifies whether non persistent messages are sent to the client ahead of an application requesting them.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*DISABLED**

Read ahead is disabled for this queue. Messages are not sent to the client ahead of an application requesting them regardless of whether read ahead is requested by the client application.

**\*NO**

Non-persistent messages are not sent to the client ahead of an application requesting them. A maximum of one non-persistent message can be lost if the client ends abnormally.

**\*YES**

Non-persistent messages are sent to the client ahead of an application requesting them. Non-persistent messages can be lost if the client ends abnormally or if the client application does not consume all the messages it is sent.

**Default Put Response (DFTPUTRESP)**

The default put response type (DFTPUTRESP) attribute specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO\_RESPONSE\_AS\_Q\_DEF option.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO\_RESPONSE\_AS\_Q\_DEF are issued as if MQPMO\_SYNC\_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application. This is the default value supplied with IBM MQ, but your installation might have changed it.

**\*ASYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO\_RESPONSE\_AS\_Q\_DEF are always issued as if MQPMO\_ASYNC\_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application; but an improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

**Property Control (PROPCTL)**

Specifies what happens to properties of messages that are retrieved from queues using the MQGET call when the MQGMO\_PROPERTIES\_AS\_Q\_DEF option is specified.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*COMPAT**

If the message contains a property with a prefix of mcd . , jms . , us1 . or mqext . then all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

**\*NONE**

All properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

**\*ALL**

All properties of the message, except those contained in the message descriptor (or extension), are contained in one or more MQRFH2 headers in the message data.

**\*FORCE**

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

**\*V6COMPAT**

When set, \*V6COMPAT must be set both on one of the queue definitions resolved by MQPUT and one of the queue definitions resolved by MQGET. It must also be set on any other intervening transmission queues. It causes an MQRFH2 header to be passed unchanged from the sending application to the receiving application. It overrides other settings of **PROPCTL** found in a queue name resolution chain.

If the property is set on a cluster queue, the setting is not cached locally on other queue managers. You must set \*V6COMPAT on an alias queue that resolves to the cluster queue. Define the alias queue on the same queue manager that the putting application is connected to.

## Target Type (TARGTYPE)

Specifies the type of object to which the alias resolves.

The possible values are:

### \*SAME

The attribute is unchanged.

### \*QUEUE

Queue object.

### \*TOPIC

Topic object.

## Custom attribute (CUSTOM)

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

### \*SAME

The attribute is unchanged.

### \*BLANK

The text is set to a blank string.

### custom

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

## CLCHNAME

This parameter is supported only on transmission queues.

### \*SAME

The attribute is unchanged.

### \*NONE

The attribute is removed.

### cluster-sender channel name

ClusterChannelName is the generic name of the cluster-sender channels that use this queue as a transmission queue. The attribute specifies which cluster-sender channels send messages to a cluster-receiver channel from this cluster transmission queue.

By specifying asterisks, "\*", in **ClusterChannelName**, you can associate a transmission queue with a set of cluster-sender channels. The asterisks can be at the beginning, end, or any number of places in the middle of the channel name string. **ClusterChannelName** is limited to a length of 20 characters: MQ\_CHANNEL\_NAME\_LENGTH.

## IMGRCOVQ

Specifies whether a local or permanent dynamic queue object is recoverable from a media image, if linear logging is being used.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*YES**

These queue objects are recoverable.

**\*NO**

The “Record MQ Object Image (RCDMQMIMG)” on page 1247 and “Re-create MQ Object (RCRMQMOBJ)” on page 1249 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

**\*QMGR**

If you specify \*QMGR, and the **IMGRCOVQ** attribute for the queue manager specifies \*YES, these queue objects are recoverable.

If you specify \*QMGR and the **IMGRCOVQ** attribute for the queue manager specifies \*NO, the “Record MQ Object Image (RCDMQMIMG)” on page 1247 and “Re-create MQ Object (RCRMQMOBJ)” on page 1249 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

## IBM i **Change MQ Subscription (CHGMQMSUB)**

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Change MQ Subscription (CHGMQMSUB) command changes the specified attributes of an existing MQ subscription.

**Parameters**

Table 189. Command parameters

Keyword	Description	Choices	Notes
<u>SUBID</u>	Subscription identifier	Character value, <b>*SAME</b>	Optional, Key, Positional 2
<u>SUBNAME</u>	Subscription name	Character value, <b>*SAME</b>	Optional, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Key, Positional 3
<u>TOPICSTR</u>	Topic string	Character value, *NONE, <b>*SAME</b>	Optional, Positional 4
<u>TOPICOBJ</u>	Topic object	Character value, *NONE, <b>*SAME</b>	Optional, Positional 5
<u>DEST</u>	Destination	Character value, <b>*SAME</b>	Optional, Positional 6
<u>DESTMQM</u>	Destination Queue Manager	Character value, *NONE, <b>*SAME</b>	Optional, Positional 7
<u>DESTCRLID</u>	Destination Correlation Id	Character value, *NONE, <b>*SAME</b>	Optional, Positional 8
<u>PUBACCT</u>	Publish Accounting Token	Character value, *NONE, <b>*SAME</b>	Optional, Positional 9
<u>PUBAPPID</u>	Publish Application Id	Character value, *NONE, <b>*SAME</b>	Optional, Positional 10
<u>SUBUSER</u>	Subscription User Id	Character value, <b>*SAME</b>	Optional, Positional 11

Table 189. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>USERDATA</u>	Subscription User Data	Character value, *NONE, *SAME	Optional, Positional 12
<u>SELECTOR</u>	Selector String	Character value, *NONE, *SAME	Optional, Positional 13
<u>PSPROP</u>	PubSub Property	*SAME, *NONE, *COMPAT, *RFH2, *MSGPROP	Optional, Positional 14
<u>DESTCLASS</u>	Destination Class	*SAME, *MANAGED, *PROVIDED	Optional, Positional 15
<u>VARUSER</u>	Variable User	*SAME, *ANY, *FIXED	Optional, Positional 16
<u>REQONLY</u>	Request Publications	*SAME, *YES, *NO	Optional, Positional 17
<u>PUBPTY</u>	Publish Priority	0-9, *SAME, *ASQDEF, *ASQDEF	Optional, Positional 18
<u>WSHEMA</u>	Wildcard Schema	*SAME, *CHAR, *TOPIC	Optional, Positional 19
<u>EXPIRY</u>	Expiry Time	0-999999999, *SAME, *UNLIMITED	Optional, Positional 20

### Subscription identifier (SUBID)

The subscription identifier of the subscription to be changed.

The possible values are:

#### subscription-identifier

Specify the 48 character hexadecimal string representing the 24 byte subscription identifier.

### Subscription name (SUBNAME)

The name of the subscription to be changed.

The possible values are:

#### subscription-name

Specify a maximum of 256 bytes for the subscription name.

**Note:** Subscription names of greater than 256 bytes can be specified using MQSC.

### Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

#### \*DFT

Use the default Queue Manager.

#### queue-manager-name

The name of a Queue Manager.

### Topic string (TOPICSTR)

Specifies the topic string associated with this subscription.

The possible values are:

**topic-string**

Specify a maximum of 256 bytes for the topic string.

**Note:** Topic strings of greater than 256 bytes can be specified using MQSC.

**Topic object (TOPICOBJ)**

Specifies the topic object associated with this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**topic-object**

Specify the name of the topic object.

**Destination (DEST)**

Specifies the destination queue for messages published to this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**destination-queue**

Specify the name of the destination queue.

**Destination Queue Manager (DESTMQM)**

Specifies the destination queue manager for messages published to this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No destination queue manager is specified.

**destination-queue**

Specify the name of the destination queue manager.

**Destination Correlation Id (DESTCRLID)**

Specifies the correlation identifier for messages published to this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

Messages are placed on the destination with a correlation identifier of MQCI\_NONE.

**correlation-identifier**

Specify the 48 character hexadecimal string representing the 24 byte correlation identifier.

**Publish Accounting Token (PUBACCT)**

Specifies the accounting token for messages published to this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

Messages are placed on the destination with an accounting token of MQACT\_NONE.

**publish-accounting-token**

Specify the 64 character hexadecimal string representing the 32 byte publish accounting token.

**Publish Application Id (PUBAPPID)**

Specifies the publish application identity for messages published to this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No publish application identifier is specified.

**publish-application-identifier**

Specify the publish application identifier.

**Subscription User Id (SUBUSER)**

Specifies the user profile that owns this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**user-profile**

Specify the user profile.

**Subscription User Data (USERDATA)**

Specifies the user data associated with the subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No user data is specified.

**user-data**

Specify a maximum of 256 bytes for user data.

**Note:** User data of greater than 256 bytes can be specified using MQSC.

**Selector String (SELECTOR)**

Specifies the SQL 92 selector string to be applied to messages published on the named topic to select whether they are eligible for this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No selection string is specified.

**selection-string**

Specify a maximum of 256 bytes for selection string.

**Note:** Selection strings of greater than 256 bytes can be specified using MQSC.

## PubSub Property (PSPROP)

Specifies the manner in which publish / subscribe related message properties are added to messages sent to this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

Publish / subscribe properties are not added to the message.

**\*COMPAT**

Publish / subscribe properties are added to the message to maintain compatibility with IBM MQ V6.0 Publish / Subscribe.

**\*RFH2**

Publish / subscribe properties are added to the message within an RFH 2 header.

**\*MSGPROP**

Publish / subscribe properties are added as message properties.

## Destination Class (DESTCLASS)

Specifies whether this is a managed subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*MANAGED**

The destination is managed.

**\*PROVIDED**

The destination is a queue.

## Variable User (VARUSER)

Specifies whether user profiles other than the creator of the subscription can connect to it (subject to topic and destination authority checks).

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ANY**

Any user profiles can connect to the subscription.

**\*FIXED**

Only the user profile that created the subscription can connect to it.

## Request Publications (REQONLY)

Specifies whether the subscriber will poll for updates via MQSUBRQ API, or whether all publications are delivered to this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*YES**

Publications are only delivered to this subscription in response to an MQSUBRQ API.

**\*NO**

All publications on the topic are delivered to this subscription.

## **Publish Priority (PUBPTY)**

Specifies the priority of the message sent to this subscription.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*ASPUB**

The priority of the message sent to this subscription is taken from that supplied in the published message.

### **\*ASQDEF**

The priority of the message sent to this subscription is taken from the default priority of the queue defined as the destination.

### **priority-value**

Specify a priority ranging from 0 through 9.

## **Wildcard Schema (WSCHEMA)**

Specifies the schema to be used when interpreting wildcard characters in the topic string.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*TOPIC**

Wildcard characters represent portions of the topic hierarchy.

### **\*CHAR**

Wildcard characters represent portions of strings.

## **Expiry Time (EXPIRY)**

Specifies the expiry time of the subscription. After a subscription's expiry time has elapsed, it becomes eligible to be discarded by the queue manager and will receive no further publications.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*UNLIMITED**

The subscription does not expire.

### **expiry-time**

Specify an expiry time in tenths of a second ranging from 0 through 999999999.

IBM i

## **Change MQ Service (CHGMQMSVC)**

### **Where allowed to run**

All environments (\*ALL)

### **Threadsafe**

Yes

The Change MQ Service (CHGMQMSVC) command changes the specified attributes of an existing MQ service definition.

## Parameters

<i>Table 190. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>SVCNAME</u>	Service name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Key, Positional 2
<u>TEXT</u>	Text 'description'	<i>Character value, *BLANK, *SAME</i>	Optional, Positional 3
<u>STRCMD</u>	Start program	Single values: <b>*SAME</b> , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 4
	Qualifier 1: Start program	Name	
	Qualifier 2: Library	Name	
<u>STRARG</u>	Start program arguments	<i>Character value, *BLANK, *SAME</i>	Optional, Positional 5
<u>ENDCMD</u>	End program	Single values: <b>*SAME</b> , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 6
	Qualifier 1: End program	Name	
	Qualifier 2: Library	Name	
<u>ENDARG</u>	End program arguments	<i>Character value, *BLANK, *SAME</i>	Optional, Positional 7
<u>STDOUT</u>	Standard output	<i>Character value, *BLANK, *SAME</i>	Optional, Positional 8
<u>STDERR</u>	Standard error	<i>Character value, *BLANK, *SAME</i>	Optional, Positional 9
<u>TYPE</u>	Service type	<b>*SAME</b> , *CMD, *SVR	Optional, Positional 10
<u>CONTROL</u>	Service control	<b>*SAME</b> , *MANUAL, *QMGR, *STARTONLY	Optional, Positional 11

### **Service name (SVCNAME)**

The name of the service definition to be changed.

The possible values are:

#### **service-name**

Specify the name of the service definition. The maximum length of the string is 48 bytes.

### **Message Queue Manager name (MQMNAME)**

Specifies the name of the queue manager.

The possible values are:

#### **\*DFT**

Use the default queue manager.

**queue-manager-name**

The name of a message queue manager.

**Text 'description' (TEXT)**

Specifies text that briefly describes the service definition.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*BLANK**

The text is set to a blank string.

**description**

Specify no more than 64 characters enclosed in apostrophes.

**Start program (STRCMD)**

The name of the program to run.

The possible values are:

**\*SAME**

The attribute is unchanged.

**start-command**

The name of the start command executable.

**Start program arguments (STRARG)**

The arguments passed to the program at startup.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*BLANK**

No arguments are passed to the start command.

**start-command-arguments**

The arguments passed to the start command.

**End program (ENDCMD)**

The name of the executable to run when the service is requested to stop.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*BLANK**

No end command is executed.

**end-command**

The name of the end command executable.

**End program arguments (ENDARG)**

The arguments passed to the end program when the service is requested to stop.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*BLANK**

No arguments are passed to the end command.

**end-command-arguments**

The arguments passed to the end command.

### **Standard output (STDOUT)**

The path to a file to which the standard output of the service program is redirected.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*BLANK**

The standard output is discarded.

**stdout-path**

The standard output path.

### **Standard error (STDERR)**

The path to a file to which the standard error of the service program is redirected.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*BLANK**

The standard error is discarded.

**stderr-path**

The standard error path.

### **Service type (TYPE)**

Mode in which to run service.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*CMD**

When started the command is executed but no status is collected or displayed.

**\*SVR**

The status of the executable started will be monitored and displayed.

### **Service control (CONTROL)**

Whether the service should be started automatically at queue manager start.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*MANUAL**

The service is automatically started or stopped.

**\*QMGR**

The service is started and stopped as the queue manager is started and stopped.

**\*STARTONLY**

The service is started as the queue manager is started, but will not be requested to stop when the queue manager is stopped.

## IBM i **Change MQ Topic (CHGMQMTOP)**

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Change MQ Topic (CHGMQMTOP) command changes the specified attributes of an existing MQ topic object.

**Parameters**

<i>Table 191. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>TOPNAME</u>	Topic name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Key, Positional 2
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, <b>*SAME</b>	Optional, Positional 3
<u>TOPICSTR</u>	Topic string	<i>Character value</i> , *BLANK, <b>*SAME</b>	Optional, Positional 4
<u>DURSUB</u>	Durable subscriptions	<b>*SAME</b> , *ASPARENT, *YES, *NO	Optional, Positional 5
<u>MGDDURMDL</u>	Durable model queue	<i>Character value</i> , *NONE, <b>*SAME</b>	Optional, Positional 6
<u>MGDNDURMDL</u>	Non-durable model queue	<i>Character value</i> , *NONE, <b>*SAME</b>	Optional, Positional 7
<u>PUBENBL</u>	Publish	<b>*SAME</b> , *ASPARENT, *YES, *NO	Optional, Positional 8
<u>SUBENBL</u>	Subscribe	<b>*SAME</b> , *ASPARENT, *YES, *NO	Optional, Positional 9
<u>DFTPTY</u>	Default message priority	0-9, <b>*SAME</b> , *ASPARENT	Optional, Positional 10
<u>DFTMSGPST</u>	Default message persistence	<b>*SAME</b> , *ASPARENT, *YES, *NO	Optional, Positional 11
<u>DFTPUTRESP</u>	Default Put Response	<b>*SAME</b> , *ASPARENT, *SYNC, *ASYN	Optional, Positional 12
<u>WILDCARD</u>	Wildcard behavior	<b>*SAME</b> , *PASSTHRU, *BLOCK	Optional, Positional 13
<u>PMSGDLV</u>	Persistent message delivery	<b>*SAME</b> , *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 14

Table 191. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>NPMSGDLV</u>	Non-persistent message deliver	<b>*SAME</b> , *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 15
<u>CUSTOM</u>	Custom attribute	<i>Character value</i> , *BLANK, <b>*SAME</b>	Optional, Positional 16

### Topic name (TOPNAME)

The name of the topic object to be changed.

The possible values are:

#### topic-name

Specify the name of the topic object. The maximum length of the string is 48 bytes.

### Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

#### \*DFT

Use the default Queue Manager.

#### queue-manager-name

The name of a Queue Manager.

### Text 'description' (TEXT)

Specifies text that briefly describes the topic object.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

#### \*SAME

The attribute is unchanged.

#### \*BLANK

The text is set to a blank string.

#### description

Specify no more than 64 characters enclosed in apostrophes.

### Topic string (TOPICSTR)

Specifies the topic string represented by this topic object definition.

The possible values are:

#### \*SAME

The attribute is unchanged.

#### topic-string

Specify a maximum of 256 bytes for the topic string.

**Note:** Topic strings of greater than 256 bytes can be specified using MQSC.

### Durable subscriptions (DURSUB)

Specifies whether applications are permitted to make durable subscriptions on this topic.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPARENT**

Whether durable subscriptions can be made on this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*YES**

Durable subscriptions can be made on this topic.

**\*NO**

Durable subscriptions cannot be made on this topic.

### **Durable model queue (MGDDURMDL)**

Specifies the name of the model queue to be used for durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

**\*SAME**

The attribute is unchanged.

**durable-model-queue**

Specify the name of the model queue.

### **Non-durable model queue (MGDNDURMDL)**

Specifies the name of the model queue to be used for non-durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

**\*SAME**

The attribute is unchanged.

**non-durable-model-queue**

Specify the name of the model queue.

### **Publish (PUBENBL)**

Specifies whether messages can be published to the topic.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPARENT**

Whether messages can be published to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*YES**

Messages can be published to the topic.

**\*NO**

Messages cannot be published to the topic.

### **Subscribe (SUBENBL)**

Specifies whether applications are to be permitted to subscribe to this topic.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPARENT**

Whether applications can subscribe to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*YES**

Subscriptions can be made to this topic.

**\*NO**

Applications cannot subscribe to this topic.

**Default message priority (DFTPTY)**

Specifies the default priority of messages published to the topic.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPARENT**

The default priority is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**priority-value**

Specify a value ranging from 0 through 9.

**Default message persistence (DFTMSGPST)**

Specifies the message persistence to be used when applications specify the MQPER\_PERSISTENCE\_AS\_TOPIC\_DEF option.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPARENT**

The default persistence is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*YES**

Messages on this queue survive a restart of the queue manager.

**\*NO**

Messages on this queue are lost across a restart of the queue manager.

**Default Put Response (DFTPUTRESP)**

Specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO\_RESPONSE\_AS\_Q\_DEF option.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPARENT**

The default response type is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO\_RESPONSE\_AS\_Q\_DEF are issued as if MQPMO\_SYNC\_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application.

**\*ASYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO\_RESPONSE\_AS\_Q\_DEF are always issued as if MQPMO\_ASYNC\_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application. An improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

**Wildcard behavior (WILDCARD)**

Specifies the behavior of wildcard subscriptions with respect to this topic.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*PASSTHRU**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will receive publications made to this topic and to topic strings more specific than this topic.

**\*BLOCK**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will not receive publications made to this topic or to topic strings more specific than this topic.

**Persistent message delivery (PMSGDLV)**

Specifies the delivery mechanism for persistent messages published to this topic.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*ALL**

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

**\*ALLDUR**

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

**\*ALLAVAIL**

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

**Non-persistent message delivery (NPMSGDLV)**

Specifies the delivery mechanism for non-persistent messages published to this topic.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*ALL**

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

**\*ALLDUR**

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

**\*ALLAVAIL**

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

**Custom attribute (CUSTOM)**

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*BLANK**

The text is set to a blank string.

**custom**

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

IBM i

**Clear MQ Pub/Sub Broker (CLRMQMBRK)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Clear IBM MQ broker (CLRMQMBRK) command does not perform any function and is only provided for compatibility with previous releases of IBM MQ.

**Parameters**

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1
<u>BRKPARENT</u>	Break Parent link	<b>*NO</b> , *YES	Optional, Positional 2
<u>CHILDMQM</u>	Child Message Queue Manager	Character value	Optional, Positional 3

**Message Queue Manager name (MQMNAME)**

Specifies the name of the queue manager.

**queue-manager-name**

Specify the name of the queue manager.

## Break Parent link (BRKPARENT)

Specifies how the broker is ended.

The possible values are:

### **\*YES**

Specifies that the link is to be broken with the parent broker. If you specify this parameter you must not specify a value for CHILDMQM.

### **\*NO**

Specifies that the link is to be broken with a child broker. Use the CHILDMQM parameter to specify the name of the queue manager that hosts the child broker.

## Child Message Queue Manager (CHILDMQM)

Specifies the name of the queue manager that hosts the child broker that the link is to be broken with.

IBM I

## Clear MQ Queue (CLRMQM)

### **Where allowed to run**

All environments (\*ALL)

### **Threadsafe**

Yes

The Clear MQ Queue (CLRMQM) command deletes all of the messages from a local queue.

The command fails if the queue contains uncommitted messages, or if an application has the queue open.

## Parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2

### **Queue name (QNAME)**

The name of the queue to be cleared.

The possible values are:

#### **queue-name**

Specify the name of the queue.

### **Message Queue Manager name (MQMNAME)**

Specifies the name of the message queue manager.

The possible values are:

#### **\*DFT**

Use the default queue manager.

#### **queue-manager-name**

Specify the name of the queue manager.

## IBM i Clear MQ Topic String (CLRMQMTOP)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Clear MQ Topic String (CLRMQMTOP) command clears the specified topic string.

### Parameters

Keyword	Description	Choices	Notes
<u>TOPICSTR</u>	Topic string	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2
<u>CLRTYPE</u>	Clear type	*RETAINED	Optional, Positional 3

### Topic string (TOPICSTR)

The topic string to be cleared.

The possible values are:

#### topic-string

Specify a maximum of 256 bytes for the topic string.

**Note:** Topic strings of greater than 256 bytes can be specified using MQSC.

### Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

#### \*DFT

Use the default Queue Manager.

#### queue-manager-name

The name of a Queue Manager.

### Clear type (CLRTYPE)

The type of clear topic string to be performed.

The value must be:

#### \*RETAINED

Remove the retained publication from the specified topic string.

## IBM i Copy MQ AuthInfo object (CPYMQMAUTI)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Copy MQ AuthInfo object (CPYMQMAUTI) command creates an authentication information object of the same type and, for attributes not specified in the command, with the same attribute values as an existing object.

## Parameters

<i>Table 195. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>FROMAI</u>	From AuthInfo name	Character value	Required, Key, Positional 1
<u>TOAI</u>	To AuthInfo name	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Key, Positional 3
<u>AUTHTYPE</u>	AuthInfo type	*CRLLDAP, *OCSP, *IDPWOS, *IDPWLDAP	Optional, Positional 4
<u>CONNNAME</u>	Connection name	<i>Character value, *SAME</i>	Optional, Positional 5
<u>REPLACE</u>	Replace	<b>*NO</b> , *YES	Optional, Positional 6
<u>TEXT</u>	Text 'description'	<i>Character value, *SAME, *NONE</i>	Optional, Positional 7
<u>USERNAME</u>	User name	<i>Character value, *SAME, *NONE</i>	Optional, Positional 8
<u>PASSWORD</u>	User password	<i>Character value, *SAME, *NONE</i>	Optional, Positional 9
<u>OCSPURL</u>	OCSP Responder URL	<i>Character value, *SAME</i>	Optional, Positional 10
<u>CHKCLNT</u>	Authentication checks required	*ASQMGR, *REQUIRED, *REQADM	Optional, Positional 11
<u>CHKLOCL</u>	Authentication checks required	*NONE, *OPTIONAL, *REQUIRED, *REQADM	Optional, Positional 12
<u>FAILDELAY</u>	Failure delay	<i>Integer value</i>	Optional, Positional 13
<u>BASEDNU</u>	Base user DN	<i>Character value, *SAME</i>	Optional, Positional 14
<u>ADOPTCTX</u>	Context adoption	<i>Integer value</i>	Optional, Positional 15
<u>CLASSUSR</u>	LDAP object class	<i>Character value, *SAME</i>	Optional, Positional 16
<u>SHORTUSR</u>	Short user name	<i>Character value, *SAME</i>	Optional, Positional 17
<u>USRFIELD</u>	User field	<i>Character value, *SAME</i>	Optional, Positional 18
<u>SECCOMM</u>	LDAP communications	<i>Character value, *SAME</i>	Optional, Positional 19
<u>AUTHORMD</u>	Authorization method	<i>Character value, *OS, *SEARCHGRP, *SEARCHUSR, , *SRCHGRPSN</i>	Optional, Positional 20
<u>BASEDNG</u>	Base DN for groups	<i>Character value, *SAME</i>	Optional, Positional 21
<u>CLASSGRP</u>	Object class for group	<i>Character value, *SAME</i>	Optional, Positional 22

Table 195. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>FINDGRP</u>	Attribute to find group membership	Character value, <b>*SAME</b>	Optional, Positional 23
<u>GRPFIELD</u>	Simple name for group	Character value, <b>*SAME</b>	Optional, Positional 24
<u>NESTGRP</u>	Group nesting	<b>*NO</b> *YES	Optional, Positional 25
<u>AUTHENMD</u>	Authentication method	<b>*OS</b> Cannot be changed	Optional, Positional 26

### From AuthInfo name (FROMAI)

The name of an existing authentication information object to provide values for the attributes not specified in this command.

The possible values are:

#### **authentication-information-name**

Specify the name of the authentication information object. The maximum string length is 48 characters.

### To AuthInfo name (TOAI)

The name of the new authentication information object to create.

If an authentication information object with this name already exists, REPLACE(\*YES) must be specified.

The possible values are:

#### **authentication-information-name**

Specify the name of the authentication information object. The maximum string length is 48 characters.

### Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

#### **\*DFT**

Use the default queue manager.

#### **queue-manager-name**

The name of an existing message queue manager. The maximum string length is 48 characters.

### Adopt context (ADOPTCTX)

Whether to use the presented credentials as the context for this application. This means that they are used for authorization checks, shown on administrative displays, and appear in messages.

#### **YES**

The user ID presented in the MQCSP structure, which has been successfully validated by password, is adopted as the context to use for this application. Therefore, this user ID will be the credentials checked for authorization to use IBM MQ resources.

If the user ID presented is an LDAP user ID, and authorization checks are done using operating system user IDs, the SHORTUSR associated with the user entry in LDAP will be adopted as the credentials for authorization checks to be done against.

## NO

Authentication will be performed on the user ID and password presented in the MQCSP structure, but then the credentials will not be adopted for further use. Authorization will be performed using the user ID the application is running under.

This attribute is only valid for an AUTHTYPE of \*IDPWOS and \*IDPWLDAP.

## Authentication method (AUTHENMD)

The authentication method used for this application.

### \*OS

Use operating system groups to determine permissions associated with a user.

You can use only **\*OS** to set the authentication method.

This attribute is valid only for an AUTHTYPE of \*IDPWOS.

## Authorization method (AUTHORMD)

The authorization method used for this application.

### \*OS

Use operating system groups to determine permissions associated with a user.

This is how IBM MQ has previously worked, and is the default value.

### \*SEARCHGRP

A group entry in the LDAP repository contains an attribute listing the Distinguished Name of all the users belonging to that group. Membership is indicated by the attribute defined in [FINDGRP](#). This value is typically *member* or *uniqueMember*.

### \*SEARCHUSR

A user entry in the LDAP repository contains an attribute listing the Distinguished Name of all the groups to which the specified user belongs. The attribute to query is defined by the [FINDGRP](#) value, typically *memberOf*.

### V 9.1.0

### \*SRCHGRPSN

A group entry in the LDAP repository contains an attribute listing the short user name of all the users belonging to that group. The attribute in the user record that contains the short user name is specified by [SHORTUSR](#).

Membership is indicated by the attribute defined in [FINDGRP](#). This value is typically *memberUid*.

**Note:** This authorization method should only be used if all user short names are distinct.

Many LDAP servers use an attribute of the group object to determine group membership and you should, therefore, set this value to *SEARCHGRP*.

Microsoft Active Directory typically stores group memberships as a user attribute. The IBM Tivoli Directory Server supports both methods.

In general, retrieving memberships through a user attribute will be faster than searching for groups that list the user as a member.

This attribute is valid only for an AUTHTYPE of \*IDPWLDAP.

## AuthInfo type (AUTHTYPE)

The type of the authentication information object. There is no default value

The possible values are:

### \*CRLLDAP

The type of the authentication information object is CRLLDAP.

**\*OCSP**

The type of the authentication information objects is OCSPURL.

**\*IDPWOS**

Connection authentication user ID and password checking is done using the operating system.

**\*IDPWLDAP**

Connection authentication user ID and password checking is done using an LDAP server.

**Base DN for groups (BASEDNG)**

In order to be able to find group names, this parameter must be set with the base DN to search for groups in the LDAP server.

This attribute is valid only for **AUTHTYPE** of *\*IDPWLDAP*.

**Base user DN (BASEDNU)**

In order to be able to find the short user name attribute (see [SHORTUSR](#) ) this parameter must be set with the base DN to search for users within the LDAP server. This attribute is valid only for **AUTHTYPE** of *\*IDPWLDAP*.

**Check client (CHCKCLNT)**

Whether connection authentication checks are required by all locally bound connections, or only checked when a user ID and password are provided in the MQCSP structure.

These attributes are valid only for an **AUTHTYPE** of *\*IDPWOS* or *\*IDPWLDAP*. The possible values are:

**\*ASQMGR**

In order for the connection to be allowed in, it must meet the connection authentication requirements defined on the queue manager. If the CONNAUTH field provides an authentication information object, and the value of CHCKCLNT is *\*REQUIRED*, the connection will not be successful unless a valid user ID and password are supplied. If the CONNAUTH field does not provide an authentication information object, or the value of CHCKCLNT is not *\*REQUIRED*, then the user ID and password are not required.

**\*REQUIRED**

Requires that all applications provide a valid user ID and password.

**\*REQDADM**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the *\*OPTIONAL* setting.

**Check local (CHCKLOCL)**

Whether connection authentication checks are required by all locally bound connections, or only checked when a user ID and password are provided in the MQCSP structure.

These attributes are valid only for an **AUTHTYPE** of *\*IDPWOS* or *\*IDPWLDAP*. The possible values are:

**\*NONE**

Switches off checking.

**\*OPTIONAL**

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

**\*REQUIRED**

Requires that all applications provide a valid user ID and password.

**\*REQDADM**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the *\*OPTIONAL* setting.

### **Class group (CLASSGRP)**

The LDAP object class used for group records in the LDAP repository.

If the value is blank, **groupOfNames** is used.

Other commonly used values include *groupOfUniqueNames* or *group*.

This attribute is valid only for **AUTHTYPE** of *\*IDPWLDAP*.

### **Class user (CLASSUSR)**

The LDAP object class used for user records in the LDAP repository.

If blank, the value defaults to *inetOrgPerson*, which is generally the value needed.

For Microsoft Active Directory, the value you require required is often *user*.

This attribute is valid only for an **AUTHTYPE** of *\*IDPWLDAP*.

### **Connection name (CONNAME)**

The DNS name or IP address of the host on which the LDAP server is running, together with an optional port number. The default port number is 389. No default is provided for the DNS name or IP address.

This field is only valid for *\*CRLLDAP* or *\*IDPWLDAP* authentication information objects, when it is required.

When used with *IDPWLDAP* authentication information objects, this can be a comma separated list of connection names.

The possible values are:

#### **\*SAME**

The connection name remains unchanged from the original authentication information object.

#### **connection-name**

Specify the fully qualified DNS name or IP address of the host together with an optional port number. The maximum string length is 264 characters.

### **Failure delay (FAILDELAY)**

When a user ID and password are provided for connection authentication, and the authentication fails due to the user ID or password being incorrect, this is the delay, in seconds, before the failure is returned to the application.

This can aid in avoiding busy loops from an application that simply retries, continuously, after receiving a failure.

The value must be in the range 0 - 60 seconds. The default value is 1.

This attribute is only valid for an **AUTHTYPE** of *\*IDPWOS* and *\*IDPWLDAP*.

### **Group membership attribute (FINDGRP)**

Name of the attribute used within an LDAP entry to determine group membership.

When AUTHORMD = *\*SEARCHGRP*, this attribute is typically set to *member* or *uniqueMember*.

When AUTHORMD = *\*SEARCHUSR*, this attribute is typically set to *memberOf*.

**V 9.1.0** When AUTHORMD = *\*SRCHGRPSN*, this attribute is typically set to *memberUid*.

When left blank, if:

- AUTHORMD = *\*SEARCHGRP*, this attribute defaults to *memberOf*
- AUTHORMD = *\*SEARCHUSR*, this attribute defaults to *member*
- **V 9.1.0** AUTHORMD = *\*SRCHGRPSN*, this attribute defaults to *memberUid*

This attribute is valid only for an **AUTHTYPE** of *\*IDPWLDAP*.

### Simple name for group (GRPFIELD)

If the value is blank, commands like `setmqaut` must use a qualified name for the group. The value can either be a full DN, or a single attribute.

This attribute is valid only for an **AUTHTYPE** of *\*IDPWLDAP*.

### Group nesting (NESTGRP)

The possible values are:

#### **\*NO**

Only the initially discovered groups are considered for authorization.

#### **\*YES**

The group list is searched recursively to enumerate all the groups to which a user belongs.

The group's Distinguished Name is used when searching the group list recursively, regardless of the authorization method selected in `AUTHORMD`.

This attribute is valid only for an **AUTHTYPE** of *\*IDPWLDAP*.

### Replace (REPLACE)

Specifies whether the new authentication information object should replace an existing authentication information object with the same name.

The possible values are:

#### **\*NO**

This definition does not replace any existing authentication information object with the same name. The command fails if the named authentication information object already exists.

#### **\*YES**

Replace an existing authentication information object. A new object is created if the named authentication information object does not exist.

### Secure comms (SECCOMM)

Whether connectivity to the LDAP server should be done securely using TLS

#### **YES**

Connectivity to the LDAP server is made securely using TLS.

The certificate used is the default certificate for the queue manager, named in `CERTLABL` on the queue manager object, or if that is blank, the one described in [Digital certificate labels, understanding the requirements](#).

The certificate is located in the key repository specified in `SSLKEYR` on the queue manager object. A cipherspec will be negotiated that is supported by both IBM MQ and the LDAP server.

If the queue manager is configured to use `SSLFIPS(YES)` or `SUITEB` cipher specs, then this is taken account of in the connection to the LDAP server as well.

#### **ANON**

Connectivity to the LDAP server is made securely using TLS just as for `SECCOMM(YES)` with one difference.

No certificate is sent to the LDAP server; the connection will be made anonymously. To use this setting, ensure that the key repository specified in `SSLKEYR`, on the queue manager object, does not contain a certificate marked as the default.

#### **NO**

Connectivity to the LDAP server does not use TLS.

This attribute is valid only for an **AUTHTYPE** of *\*IDPWLDAP*

### Short user (SHORTUSR)

A field in the user record to be used as a short user name in IBM MQ.

This field must contain values of 12 characters or less. This short user name is used for the following purposes:

- If LDAP authentication is enabled, but LDAP authorization is not enabled, this is used as an operating system user ID for authorization checks. In this case, the attribute must represent an operating system user ID.
- If LDAP authentication and authorization are both enabled, this is used as the user ID carried with the message in order for the LDAP user name to be rediscovered when the user ID inside the message needs to be used.

For example, on another queue manager, or when writing report messages. In this case, the attribute does not need to represent an operating system user ID, but must be a unique string. An employee serial number is an example of a good attribute for this purpose.

This attribute is valid only for an **AUTHTYPE** of *\*IDPWLDAP* and is mandatory.

### Text 'description' (TEXT)

A short text description of the authentication information object.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

#### **\*SAME**

The text string is unchanged.

#### **\*NONE**

The text is set to a blank string.

#### **description**

The string length can be up to 64 characters enclosed in apostrophes.

### User field (USRFIELD)

If the user ID provided by an application for authentication does not contain a qualifier for the field in the LDAP user record, that is, it does not contain an '=' sign, this attribute identifies the field in the LDAP user record that is used to interpret the provided user ID.

This field can be blank. If this is the case, any unqualified user IDs use the [SHORTUSR](#) parameter to interpret the provided user ID.

The contents of this field will be concatenated with an '=' sign, together with the value provided by the application, to form the full user ID to be located in an LDAP user record. For example, the application provides a user of fred and this field has the value cn, then the LDAP repository will be searched for cn=fred.

This attribute is valid only for an **AUTHTYPE** of *\*IDPWLDAP*.

### User name (USERNAME)

The distinguished name of the user that is binding to the directory. The default user name is blank.

This field is only valid for *\*CRLLDAP* or *\*IDPWLDAP* authentication information objects.

The possible values are:

**\*SAME**

The user name is unchanged.

**\*NONE**

The user name is blank.

**LDAP-user-name**

Specify the distinguished name of the LDAP user. The maximum string length is 1024 characters.

**User password (PASSWORD)**

The password for the LDAP user.

This field is only valid for *\*CRLLDAP* or *\*IDPWLDAP* authentication information objects.

The possible values are:

**\*SAME**

The password is unchanged.

**\*NONE**

The password is blank.

**LDAP-password**

The LDAP user password. The maximum string length is 32 characters.

**OCSP Responder URL (OCSPURL)**

The URL of the OCSP Responder used to check for certificate revocation. This must be an HTTP URL containing the host name and port number of the OCSP Responder. If the OCSP Responder is using port 80, which is the default for HTTP, then the port number may be omitted.

This field is only valid for OCSP authentication information objects.

The possible values are:

**\*SAME**

The OCSP Responder URL is unchanged.

**OCSP-Responder-URL**

The OCSP Responder URL. The maximum string length is 256 characters.

**Examples**

None

**Error messages**

Unknown

**Copy MQ Channel (CPYMQMCHL)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Copy MQ Channel (CPYMQMCHL) command creates a new MQ channel definition of the same type and, for attributes not specified in the command, with the same attribute values as an existing channel definition.

## Parameters

Table 196. Command parameters			
Keyword	Description	Choices	Notes
<u>FROMCHL</u>	From channel	Character value	Required, Key, Positional 1
<u>TOCHL</u>	To channel	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Key, Positional 3
<u>CHLTYPE</u>	Channel type	*RCVR, *SDR, *SVR, *RQSTR, *SVRCN, *CLUSSDR, *CLUSRCVR, *CLTCN	Optional, Key, Positional 4
<u>REPLACE</u>	Replace	<b>*NO</b> , *YES	Optional, Positional 5
<u>TRPTYPE</u>	Transport type	*LU62, *TCP, <b>*SAME</b>	Optional, Positional 6
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, <b>*SAME</b>	Optional, Positional 7
<u>TGTMQMNAME</u>	Target Queue Manager	<i>Character value</i> , *NONE, <b>*SAME</b>	Optional, Positional 8
<u>CONNAME</u>	Connection name	<i>Character value</i> , *NONE, <b>*SAME</b>	Optional, Positional 9
<u>TPNAME</u>	Transaction Program Name	<i>Character value</i> , *BLANK, <b>*SAME</b>	Optional, Positional 10
<u>MODENAME</u>	Mode Name	<i>Character value</i> , *BLANK, <b>*SAME</b>	Optional, Positional 11
<u>TMQNAME</u>	Transmission queue	<i>Character value</i> , <b>*SAME</b>	Optional, Positional 12
<u>MCANAME</u>	Message channel agent	Single values: <b>*SAME</b> , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 13
	Qualifier 1: Message channel agent	Name	
	Qualifier 2: Library	<i>Name</i> , <b>*CURLIB</b>	
<u>MCAUSRID</u>	Message channel agent user ID	<i>Character value</i> , *NONE, *PUBLIC, <b>*SAME</b>	Optional, Positional 14
<u>MCATYPE</u>	Message channel agent Type	*PROCESS, *THREAD, <b>*SAME</b>	Optional, Positional 15
<u>BATCHINT</u>	Batch Interval	0-999999999, <b>*SAME</b>	Optional, Positional 16
<u>BATCHSIZE</u>	Batch size	1-9999, <b>*SAME</b>	Optional, Positional 17
<u>DSCITV</u>	Disconnect interval	0-999999, <b>*SAME</b>	Optional, Positional 18
<u>SHORTTMR</u>	Short retry interval	0-999999999, <b>*SAME</b>	Optional, Positional 19
<u>SHORTRTY</u>	Short retry count	0-999999999, <b>*SAME</b>	Optional, Positional 20
<u>LONGTMR</u>	Long retry interval	0-999999999, <b>*SAME</b>	Optional, Positional 21

Table 196. Command parameters (continued)

<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>LONGRTY</u>	Long retry count	0-999999999, <b>*SAME</b>	Optional, Positional 22
<u>SCYEXIT</u>	Security exit	Single values: <b>*SAME</b> , <b>*NONE</b> Other values: <i>Qualified object name</i>	Optional, Positional 23
	Qualifier 1: Security exit	Name	
	Qualifier 2: Library	<i>Name</i> , <b>*CURLIB</b>	
<u>CSCYEXIT</u>	Security exit	<i>Character value</i> , <b>*SAME</b> , <b>*NONE</b>	Optional, Positional 24
<u>SCYUSRDATA</u>	Security exit user data	<i>Character value</i> , <b>*SAME</b> , <b>*NONE</b>	Optional, Positional 25
<u>SINDEXIT</u>	Send exit	Single values: <b>*SAME</b> , <b>*NONE</b> Other values (up to 10 repetitions): <i>Qualified object name</i>	Optional, Positional 26
	Qualifier 1: Send exit	Name	
	Qualifier 2: Library	<i>Name</i> , <b>*CURLIB</b>	
<u>CSINDEXIT</u>	Send exit	Single values: <b>*SAME</b> , <b>*NONE</b> Other values (up to 10 repetitions): <i>Character value</i>	Optional, Positional 27
<u>SNDUSRDATA</u>	Send exit user data	Values (up to 10 repetitions): <i>Character value</i> , <b>*SAME</b> , <b>*NONE</b>	Optional, Positional 28
<u>RCVEXIT</u>	Receive exit	Single values: <b>*SAME</b> , <b>*NONE</b> Other values (up to 10 repetitions): <i>Qualified object name</i>	Optional, Positional 29
	Qualifier 1: Receive exit	Name	
	Qualifier 2: Library	<i>Name</i> , <b>*CURLIB</b>	
<u>CRCVEXIT</u>	Receive exit	Single values: <b>*SAME</b> , <b>*NONE</b> Other values (up to 10 repetitions): <i>Character value</i>	Optional, Positional 30
<u>RCVUSRDATA</u>	Receive exit user data	Values (up to 10 repetitions): <i>Character value</i> , <b>*SAME</b> , <b>*NONE</b>	Optional, Positional 31
<u>MSGEXIT</u>	Message exit	Single values: <b>*SAME</b> , <b>*NONE</b> Other values (up to 10 repetitions): <i>Qualified object name</i>	Optional, Positional 32
	Qualifier 1: Message exit	Name	
	Qualifier 2: Library	<i>Name</i> , <b>*CURLIB</b>	

Table 196. Command parameters (continued)

<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>MSGUSRDATA</u>	Message exit user data	Values (up to 10 repetitions): <i>Character value</i> , <b>*SAME</b> , *NONE	Optional, Positional 33
<u>MSGRTYEXIT</u>	Message retry exit	Single values: <b>*SAME</b> , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 34
	Qualifier 1: Message retry exit	Name	
	Qualifier 2: Library	<i>Name</i> , <b>*CURLIB</b>	
<u>MSGRTYDATA</u>	Message retry exit data	<i>Character value</i> , <b>*SAME</b> , *NONE	Optional, Positional 35
<u>MSGRTYNBR</u>	Number of message retries	0-999999999, <b>*SAME</b>	Optional, Positional 36
<u>MSGRTYITV</u>	Message retry interval	0-999999999, <b>*SAME</b>	Optional, Positional 37
<u>CVTMSG</u>	Convert message	*YES, *NO, <b>*SAME</b>	Optional, Positional 38
<u>PUTAUT</u>	Put authority	*DFT, *CTX, <b>*SAME</b>	Optional, Positional 39
<u>SEQNUMWRAP</u>	Sequence number wrap	100-999999999, <b>*SAME</b>	Optional, Positional 40
<u>MAXMSGLEN</u>	Maximum message length	0-104857600, <b>*SAME</b>	Optional, Positional 41
<u>HRTBTINTVL</u>	Heartbeat interval	0-999999999, <b>*SAME</b>	Optional, Positional 42
<u>NPMSPEED</u>	Non Persistent Message Speed	*FAST, *NORMAL, <b>*SAME</b>	Optional, Positional 43
<u>CLUSTER</u>	Cluster Name	<i>Character value</i> , *NONE, <b>*SAME</b>	Optional, Positional 44
<u>CLUSNL</u>	Cluster Name List	<i>Character value</i> , *NONE, <b>*SAME</b>	Optional, Positional 45
<u>NETPRTY</u>	Network Connection Priority	0-9, <b>*SAME</b>	Optional, Positional 46

Table 196. Command parameters (continued)

Keyword	Description	Choices	Notes
<a href="#">SSLCIPH</a>	TLS CipherSpec	Character value, '*TLS_RSA_WITH_NULL_MD5', '*TLS_RSA_WITH_NULL_SHA', '*TLS_RSA_EXPORT_WITH_RC4_40_MD5', '*TLS_RSA_WITH_RC4_128_MD5', '*TLS_RSA_WITH_RC4_128_SHA', '*TLS_RSA_EXPORT_WITH_RC2_40_MD5', '*TLS_RSA_WITH_DES_CBC_SHA', '*TLS_RSA_WITH_3DES_EDE_CBC_SHA', '*TLS_RSA_WITH_AES_128_CBC_SHA', '*TLS_RSA_WITH_AES_256_CBC_SHA', *NONE, <b>*SAME</b>	Optional, Positional 47 CipherSpec TLS_RSA_WITH_3DES_EDE_CBC_SHA is deprecated.

### From channel (FROMCHL)

Specifies the name of the existing channel definition that contains values for the attributes that are not specified in this command.

The possible values are:

#### from-channel-name

Specify the name of the source MQ channel.

### To channel (TOCHL)

Specifies the name of the new channel definition. The name can contain a maximum of 20 characters. Channel names must be unique. If a channel definition with this name already exists, REPLACE(\*YES) must be specified.

The possible values are:

#### to-channel-name

Specify the name of MQ channel being created.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

#### \*DFT

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

#### message-queue-manager-name

The name of a message queue manager.

### Channel type (CHLTYPE)

Specifies the type of the channel being copied.

The possible values are:

**\*SDR**

Sender channel

**\*SVR**

Server channel

**\*RCVR**

Receiver channel

**\*RQSTR**

Requester channel

**\*SVRCN**

Server-connection channel

**\*CLUSSDR**

Cluster-sender channel

**\*CLUSRCVR**

Cluster-receiver channel

**\*CLTCN**

Client-connection channel

## Replace (REPLACE)

Specifies whether the new channel definition replaces an existing channel definition with the same name.

The possible values are:

**\*NO**

Do not replace the existing channel definition. The command fails if the named channel definition already exists.

**\*YES**

Replace the existing channel definition. If there is no definition with the same name a new definition is created.

## Transport type (TRPTYPE)

Specifies the transmission protocol.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*LU62**

SNA LU 6.2.

**\*TCP**

Transmission Control Protocol / Internet Protocol (TCP/IP).

## Text 'description' (TEXT)

Specifies text that briefly describes the channel definition.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*BLANK**

The text is set to a blank string.

**description**

Specify no more than 64 characters enclosed in apostrophes.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

## Target Queue Manager (TGTMQMNAME)

Specifies the name of the target queue manager.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*NONE**

The name of the target queue manager for a client connection channel (CHLTYPE) \*CLTCN is unspecified.

### **message-queue-manager-name**

The name of the target message queue manager for a client connection channel (CHLTYPE) \*CLTCN.

For other channel types this parameter must not be specified.

## Connection name (CONNAME)

Specifies the name of the machine to connect.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*NONE**

The connection name is blank.

### **connection-name**

Specify the connection name as required by the transmission protocol:

- For \*LU62, specify the name of the CSI object.
- For \*TCP, specify either the host name, or the network address of the remote machine (or the local machine for cluster-receiver channels). This can be followed by an optional port number enclosed in parentheses.

 On Multiplatforms, the TCP/IP connection name parameter of a cluster-receiver channel is optional. If you leave the connection name blank, IBM MQ generates a connection name for you, assuming the default port and using the current IP address of the system. You can override the default port number, but still use the current IP address of the system. For each connection name leave the IP name blank, and provide the port number in parentheses; for example:

```
(1415)
```

The generated **CONNAME** is always in the dotted decimal (IPv4) or hexadecimal (IPv6) form, rather than in the form of an alphanumeric DNS host name.

Where a port is not specified the default port 1414 is assumed.

For cluster-receiver channels the connection name relates to the local queue manager, and for other channels it relates to the target queue manager.

This parameter is required for channels with channel type (CHLTYPE) of \*SDR, \*RQSTR, \*CLTCN and \*CLUSSDR. It is optional for \*SVR and \*CLUSRCVR channels, and is not valid for \*RCVR or \*SVRCN channels.

## Transaction Program Name (TPNAME)

This parameter is valid for channels with a TRPTYPE defined as LU 6.2 only.

This parameter must be set to the SNA transaction program name, unless the CONNAME contains a side-object name in which case it must be set to blanks. The name is taken instead from the CPI-C Communications Side Object.

This parameter is not valid for channels with a CHLTYPE defined as \*RCVR.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**\*NONE**

No transaction program name is specified.

**\*BLANK**

The transaction program name is taken from CPI-C Communications Side Object. The side object name must be specified in the CONNAME parameter.

**transaction-program-name**

Specify the SNA transaction program name.

### **Mode Name (MODENAME)**

This parameter is valid for channels with a TRPTYPE defined as LU 6.2. If TRPTYPE is not defined as LU 6.2 the data is ignored and no error message is issued.

If specified, the value must be set to the SNA mode name, unless the CONNAME contains a side-object name, in which case it must be set to blanks. The name is then taken from the CPI-C Communications Side Object.

This parameter is not valid for channels with CHLTYPE defined as \*RCVR or \*SVRCONN.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**\*NONE**

No mode name is specified.

**\*BLANK**

Name will be taken from the CPI-C Communications Side Object. This must be specified in the CONNAME parameter.

**SNA-mode-name**

Specify the SNA Mode Name

### **Transmission queue (TMQNAME)**

Specifies the name of the transmission queue.

The possible values are:

**\*SAME**

The attribute is unchanged.

**transmission-queue-name**

Specify the name of the transmission queue. A transmission queue name is required if the CHLTYPE is defined as \*SDR or \*SVR.

For other channel types this parameter must not be specified.

### **Message channel agent (MCANAME)**

This parameter is reserved and should not be used.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The MCA program name is blank.

This parameter cannot be specified if the CHLTYPE is defined as \*RCVR, \*SVRCN, or \*CLTCN.

**Message channel agent user ID (MCAUSRID)**

Specifies the message channel agent user identifier which is to be used by the message channel agent for authorization to access MQ resources, including (if PUTAUT is \*DFT) authorization to put the message to the destination queue for receiver or requester channels.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The message channel agent uses its default user identifier.

**\*PUBLIC**

Uses the public authority.

**mca-user-identifier**

Specify the user identifier to be used.

This parameter cannot be specified for a channel type (CHLTYPE) of \*CLTCN.

**Message channel agent Type (MCATYPE)**

Specifies whether the message channel agent program should run as a thread or as a process.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*PROCESS**

The message channel agent runs as a separate process.

**\*THREAD**

The message channel agent runs as a separate thread.

This parameter can only be specified for channels with CHLTYPE defined as \*SDR, \*SVR, \*RQSTR, \*CLUSSDR or \*CLUSRCVR.

**Batch Interval (BATCHINT)**

The minimum amount of time, in milliseconds, that a channel will keep a batch open.

The batch is terminated by whichever of the following occurs first: BATCHSZ messages have been sent, BATCHLIM bytes have been sent, or the transmission queue is empty and BATCHINT is exceeded.

The default value is 0, which means that the batch is terminated as soon as the transmission queue becomes empty (or the BATCHSZ limit is reached).

The value must be in the range 0 through 999999999.

This parameter is valid for channels with CHLTYPE defined as \*SDR, \*SVR, \*CLUSSDR, or \*CLUSRCVR.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**batch-interval**

Specify a value ranging from 0 through 999999999

## Batch size (BATCHSIZE)

Specifies the maximum number of messages that can be sent down a channel before a checkpoint is taken.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **batch-size**

Specify a value ranging from 1 through 9999.

This parameter cannot be specified for channel types (CHLTYPE) \*CLTCN or \*SVRCN.

## Disconnect interval (DSCITV)

Specifies the disconnect interval, which defines the maximum number of seconds that the channel waits for messages to be put on a transmission queue before closing the channel.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **disconnect-interval**

Specify a value ranging from 0 through 999999.

This parameter cannot be specified for channel types (CHLTYPE) \*RCVR, \*RQSTR or \*CLTCN.

## Short retry interval (SHORTTMR)

Specifies the short retry wait interval for a sender, server or cluster channel (\*SDR, \*SVR, \*CLUSDR or \*CLUSRCVR) that is started automatically by the channel initiator. This defines the interval between attempts to establish a connection to the remote machine.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **short-retry-interval**

Specify a value ranging from 0 through 999999999.

## Short retry count (SHORTRTY)

Specifies the short retry count for a sender, server or cluster channel (\*SDR, \*SVR, \*CLUSDR or \*CLUSRCVR) that is started automatically by the channel initiator. This defines the maximum number of attempts that are made to establish a connection to the remote machine, at intervals specified by SHORTTMR, before the (normally longer) LONGRTY and LONGTMR are used.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **short-retry-count**

Specify a value ranging from 0 through 999999999. A value of 0 means that no retries are allowed.

## Long retry interval (LONGTMR)

Specifies the long retry wait interval for a sender, server or cluster channel (\*SDR, \*SVR, \*CLUSDR or \*CLUSRCVR) that is started automatically by the channel initiator. It defines the interval in seconds between attempts to establish a connection to the remote machine, after the count specified by SHORTRTY has been exhausted.

The possible values are:

**\*SAME**

The attribute is unchanged.

**long-retry-interval**

Specify a value in the range 0 through 999999999.

**Note:** For implementation reasons, the maximum retry interval that can be used is 999999; values exceeding this are treated as 999999.

**Long retry count (LONGRTY)**

Specifies the long retry count for a sender, server or cluster channel (\*SDR, \*SVR, \*CLUSDR or \*CLUSRCVR) that is started automatically by the channel initiator. This defines the maximum number of further attempts that are made to connect to the remote machine, at intervals specified by LONGTMR, after the count specified by SHORTRTY has been exhausted. An error message is logged if the connection is not established after the defined number of attempts.

The possible values are:

**\*SAME**

The attribute is unchanged.

**long-retry-count**

Specify a value in the range 0 through 999999999. A value of 0 means that no retries are allowed.

**Security exit (SCYEXIT)**

Specifies the name of the program to be called as the security exit. If a nonblank name is defined, the exit is invoked at the following times:

- Immediately after establishing a channel.

Before any messages are transferred, the exit is given the opportunity to instigate security flows to validate connection authorization.

- On receipt of a response to a security message flow.

Any security message flows received from the remote processor on the remote machine are passed to the exit.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The security exit program is not invoked.

**security-exit-name**

Specify the name of the security exit program.

**library-name**

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

**Security exit (CSCYEXIT)**

Specifies the name of the program to be called as the client security exit. If a nonblank name is defined, the exit is invoked at the following times:

- Immediately after establishing a channel.

Before any messages are transferred, the exit is given the opportunity to instigate security flows to validate connection authorization.

- On receipt of a response to a security message flow.

Any security message flows received from the remote processor on the remote machine are passed to the exit.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The client security exit program is not invoked.

**security-exit-name**

Specify the name of the client security exit program.

### **Security exit user data (SCYUSRDATA)**

Specifies a maximum of 32 characters of user data that is passed to the security exit program.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The user data for the security exit program is not specified.

**security-exit-user-data**

Specify the user data for the security exit.

### **Send exit (SNDEXIT)**

Specifies the entry point of the program to be called as the send exit. If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The send exit program is not invoked.

**send-exit-name**

Specify the name of the send exit program.

**library-name**

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

### **Send exit (CSNDEXIT)**

Specifies the entry point of the program to be called as the client send exit. If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The client send exit program is not invoked.

**send-exit-name**

Specify the name of the client send exit program.

## Send exit user data (SNDUSRDATA)

Specifies a maximum of 32 characters of user data that is passed to the send exit program.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*NONE**

The user data for the send exit program is not specified.

### **send-exit-user-data**

Specify the user data for the send exit program.

## Receive exit (RCVEXIT)

Specifies the entry point of the program to be called as the receive exit. If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*NONE**

The receive exit program is not invoked.

### **receive-exit-name**

Specify the name of the receive exit program.

### **library-name**

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

## Receive exit (CRCVEXIT)

Specifies the entry point of the program to be called as the client receive exit. If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*NONE**

The client receive exit program is not invoked.

### **receive-exit-name**

Specify the name of the client receive exit program.

## Receive exit user data (RCVUSRDATA)

Specifies a maximum of 32 characters of user data that is passed to the receive exit program.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*NONE**

The user data for the receive exit program is not specified.

### **receive-exit-user-data**

Specify a maximum of 32 characters of user data for the receive exit.

## Message exit (MSGEXIT)

Specifies the entry point of the program to be called as the message exit. If a nonblank name is defined, the exit is invoked immediately after a message has been retrieved from the transmission queue. The exit is given the entire application message and message descriptor for modification.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The message exit program is not invoked.

**message-exit-name**

Specify the name of the message exit program.

**library-name**

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

This parameter cannot be specified for channel types (CHLTYPE) \*CLTCN or \*SVRCN.

## Message exit user data (MSGUSRDATA)

Specifies user data that is passed to the message exit program.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The user data for the message exit program is not specified.

**message-exit-user-data**

Specify a maximum of 32 characters of user data that is passed to the message exit program.

This parameter cannot be specified for channel types (CHLTYPE) \*CLTCN or \*SVRCN.

## Message retry exit (MSGRTYEXIT)

Specifies the entry point of the program to be called as the message retry exit.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The message retry exit program is not invoked.

**message-retry-exit-name**

Specify the name of the message retry exit program.

**library-name**

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

This parameter cannot be specified for channel types (CHLTYPE) \*SDR, \*SVR, \*CLTCN, \*SVRCN or \*CLUSSDR.

## Message retry exit data (MSGRTYDATA)

Specifies user data that is passed to the message retry exit program.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The user data for the message retry exit program is not specified.

**message-retry-exit-user-data**

Specify a maximum of 32 characters of user data that is passed to the message retry exit program.

This parameter cannot be specified for channel types (CHLTYPE) \*SDR, \*SVR, \*CLTCN, \*SVRCN or \*CLUSSDR.

**Number of message retries (MSGRTYNBR)**

Specifies the number of times the channel will retry before it decides it cannot deliver the message.

This parameter is used by the channel as an alternative to a message retry exit when MSGRTYEXIT is defined as \*NONE.

The possible values are:

**\*SAME**

The attribute is unchanged.

**message-retry-number**

Specify a value ranging from 0 through 999999999. A value of 0 indicates no retries will be performed.

This parameter cannot be specified for channel types (CHLTYPE) \*SDR, \*SVR, \*CLTCN, \*SVRCN or \*CLUSSDR.

**Message retry interval (MSGRTYITV)**

Specifies the minimum interval of time that must pass before the channel can retry the MQPUT operation. This time is in milliseconds.

This parameter is used by the channel as an alternative to a message retry exit when MSGRTYEXIT is defined as \*NONE.

The possible values are:

**\*SAME**

The attribute is unchanged.

**message-retry-number**

Specify a value ranging from 0 through 999999999. A value of 0 indicates that the retry will be performed as soon as possible.

This parameter cannot be specified for channel types (CHLTYPE) \*SDR, \*SVR, \*CLTCN, \*SVRCN or \*CLUSSDR.

**Convert message (CVTMSG)**

Specifies whether the application data in the message should be converted before the message is transmitted.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**\*YES**

The application data in the message is converted before sending.

**\*NO**

The application data in the message is not converted before sending.

This parameter cannot be specified for channel types (CHLTYPE) \*RCVR, \*RQSTR, \*CLTCN or \*SVRCN.

## Put authority (PUTAUT)

Specifies whether the user identifier in the context information associated with a message is used to establish authority to put the message on the destination queue. This applies only to receiver and requester (\*CLUSRCVR, \*RCVR and \*RQSTR) channels.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*DFT**

No authority check is made before the message is put on the destination queue.

### **\*CTX**

The user identifier in the message context information is used to establish authority to put the message.

This parameter cannot be specified for channel types (CHLTYPE) \*SDR, \*SVR, \*CLTCN, \*SVRCN or \*CLUSSDR.

## Sequence number wrap (SEQNUMWRAP)

Specifies the maximum message sequence number. When the maximum is reached, sequence numbers wrap to start again at 1.

**Note:** The maximum message sequence number is not negotiable; the local and remote channels must wrap at the same number.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **sequence-number-wrap-value**

Specify a value ranging from 100 through 999999999.

This parameter cannot be specified for channel types (CHLTYPE) \*CLTCN or \*SVRCN.

## Maximum message length (MAXMSGLEN)

Specifies the maximum message length that can be transmitted on the channel. This is compared with the value for the remote channel and the actual maximum is the lower of the two values.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **maximum-message-length**

Specify a value ranging from 0 through 104857600. A value of 0 indicates that the maximum length is unlimited.

## Heartbeat interval (HRTBTINTVL)

Specifies the time, in seconds, between heartbeat flows passed from the sending MCA when there are no messages on the transmission queue. The heartbeat exchange gives the receiving MCA the opportunity to quiesce the channel. This applies only to sender, server, cluster sender and cluster receiver (\*SDR, \*SVR, \*CLUSSDR and \*CLUSRCVR) channels.

The possible values are:

### **\*SAME**

The attribute is unchanged.

**heart-beat-interval**

Specify a value ranging from 0 through 999999999. A value of 0 means that no heartbeat exchanges are to take place.

**Non Persistent Message Speed (NPMSPEED)**

Specifies whether the channel supports fast non persistent messages.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**\*FAST**

The channel supports fast non persistent messages.

**\*NORMAL**

The channel does not support fast non persistent messages.

This parameter cannot be specified for channel types (CHLTYPE) \*CLTCN or \*SVRCN.

**Cluster Name (CLUSTER)**

The name of the cluster to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

This parameter is valid only for \*CLUSDR and \*CLUSRCVR channels. If the CLUSNL parameter is non-blank, this parameter must be blank.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**\*NONE**

No cluster name is specified.

**cluster-name**

The name of the cluster to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

**Cluster Name List (CLUSNL)**

The name of the namelist that specifies a list of clusters to which the channel belongs

This parameter is valid only for \*CLUSDR and \*CLUSRCVR channels. If the CLUSTER parameter is non-blank, this parameter must be blank.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**\*NONE**

No cluster namelist is specified.

**cluster-name-list**

The name of the namelist specifying a list of clusters to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

**Network Connection Priority (NETPTY)**

The priority for the network connection. Distributed queuing chooses the path with the highest priority if there are multiple paths available. The value must be in the range between 0 and 9 where 0 is the lowest priority.

This parameter is valid only for \*CLUSRCVR channels.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**network-connection-priority**

Specify a value ranging from 0 through 9 where 0 is the lowest priority.

## **TLS CipherSpec (SSLCIPH)**

SSLCIPH specifies the CipherSpec used in TLS channel negotiation. The possible values are:

**\*SAME**

The value of this attribute does not change.

**cipherspec**

The name of the CipherSpec.

**Note:** From IBM MQ 8.0.0 Fix Pack 2, the SSLv3 protocol and the use of some IBM MQ CipherSpecs is deprecated. For more information, see [Deprecated CipherSpecs](#).

## **TLS Client Authentication (SSLCAUTH)**

SSLCAUTH specifies whether the channel carries out client authentication over TLS. The parameter is used only for channels with SSLCIPH specified.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**\*REQUIRED**

Client authentication is required.

**\*OPTIONAL**

Client authentication is optional.

This parameter cannot be specified for channel types (CHLTYPE) \*SDR, \*CLTCN or \*CLUSSDR.

## **TLS Peer name (SSLPEER)**

SSLPEER specifies the X500 peer name used in TLS channel negotiation. The possible values are:

**\*SAME**

The value of this attribute does not change.

**x500peername**

The X500 peer name to use.

**Note:** An alternative way of restricting connections into channels by matching against the TLS Subject Distinguished Name, is to use channel authentication records. With channel authentication records, different TLS Subject Distinguished Name patterns can be applied to the same channel. If both SSLPEER on the channel and a channel authentication record are used to apply to the same channel, the inbound certificate must match both patterns in order to connect. For more information, see [Channel authentication records](#).

## **Local communication address (LOCLADDR)**

Specifies the local communication address for the channel.

This parameter is only valid for \*SDR, \*SVR, \*RQSTR, \*CLUSSDR, \*CLUSRCVR and \*CLTCN channels.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The connection is blank.

**local-address**

Only valid for transport type TCP/IP. Specify the optional IP address and optional port or port range used for outbound TCP/IP communications. The format is:

```
LOCLADDR([ip-addr][([low-port[,high-port])][, [ip-addr][([low-port[,high-port])]])])
```

**Batch Heartbeat Interval (BATCHHB)**

The time in milliseconds used to determine whether batch heartbeating occurs on this channel. Batch heartbeating allows channels to determine whether the remote channel instance is still active before going indoubt. A batch heartbeat will occur if a channel MCA has not communicated with the remote channel within the specified time.

The possible values are:

**\*SAME**

The attribute is unchanged.

**batch-heartbeat-interval**

Specify a value ranging from 0 through 999999999. A value of 0 indicates that batch heartbeating is not to be used.

This parameter cannot be specified for channel types (CHLTYPE) \*RCVR, \*RQSTR, \*CLTCN or \*SVRCN.

**Task user identifier (USERID)**

This is used by the message channel agent when attempting to initiate a secure LU 6.2 session with a remote message channel agent.

This parameter is valid only for channels with a channel type (CHLTYPE) of \*SDR, \*SVR, \*RQSTR, \*CLTCN or \*CLUSSDR.

Although the maximum length of the attribute is 12 characters, only the first 10 characters are used.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**\*NONE**

No user identifier is specified.

**user-identifier**

Specify the task user identifier.

**Password (PASSWORD)**

This is used by the message channel agent when attempting to initiate a secure LU 6.2 session with a remote message channel agent.

This parameter is valid only for channels with a channel type (CHLTYPE) of \*SDR, \*SVR, \*RQSTR, \*CLTCN or \*CLUSSDR.

Although the maximum length of the attribute is 12 characters, only the first 10 characters are used.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**\*NONE**

No password is specified.

**password**

Specify the password.

**Keep Alive Interval (KAINT)**

Specifies the keep alive timing interval for this channel.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*AUTO**

The keep alive interval is calculated based upon the negotiated heartbeat value as follows:

- If the negotiated HBINT is greater than 0, keep alive interval is set to that value plus 60 seconds.
- If the negotiated HBINT is 0, the value used is that specified by the KEEPALIVEOPTIONS statement in the TCP profile configuration data set.

**keep-alive-interval**

Specify a value ranging from 0 through 99999.

**Header Compression (COMPHDR)**

The list of header data compression techniques supported by the channel.

For channel types sender, server, cluster sender, cluster receiver and client connection (\*SDR, \*SVR, \*CLUSSDR, \*CLUSRCVR and \*CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No header data compression is performed.

**\*SYSTEM**

Header data compression is performed.

**Message Compression (COMPMSG)**

The list of message data compression techniques supported by the channel.

For channel types sender, server, cluster sender, cluster receiver and client connection (\*SDR, \*SVR, \*CLUSSDR, \*CLUSRCVR and \*CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No message data compression is performed.

**\*RLE**

Message data compression is performed using run-length encoding.

**\*ZLIBFAST**

Message data compression is performed using the zlib compression technique. A fast compression time is preferred.

**\*ZLIBHIGH**

Message data compression is performed using the zlib compression technique. A high level of compression is preferred.

**\*ANY**

Any compression technique supported by the queue manager can be used. This option is only valid for channel types receiver, requester and server connection (\*RCVR, \*RQSTR and \*SVRCN).

**Channel Monitoring (MONCHL)**

Controls the collection of online monitoring data.

Online monitoring data is not collected when the queue manager attribute MONCHL is set to \*NONE.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*QMGR**

The collection of online monitoring data is inherited from the setting of the queue manager attribute MONCHL.

**\*OFF**

Online Monitoring Data collection for this channel is disabled.

**\*LOW**

Monitoring data collection is turned on with a low ratio of data collection.

**\*MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

**\*HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for a channel type (CHLTYPE) of \*CLTCN.

**Channel Statistics (STATCHL)**

Controls the collection of statistics data.

Statistics data is not collected when the queue manager attribute STATCHL is set to \*NONE.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATCHL.

**\*OFF**

Statistics data collection for this channel is disabled.

**\*LOW**

Statistics data collection is turned on with a low ratio of data collection.

**\*MEDIUM**

Statistics data collection is turned on with a moderate ratio of data collection.

**\*HIGH**

Statistics data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for channel types (CHLTYPE) \*CLTCN or \*SVRCN.

**Cluster Workload Rank (CLWLRANK)**

Specifies the cluster workload rank of the channel.

The possible values are:

**\*SAME**

The attribute is unchanged.

**cluster-workload-rank**

The cluster workload rank of the channel in the range 0 through 9.

**Cluster Workload Priority (CLWLPRTY)**

Specifies the cluster workload priority of the channel.

The possible values are:

**\*SAME**

The attribute is unchanged.

**cluster-workload-priority**

The cluster workload priority of the channel in the range 0 through 9.

**Cluster Channel Weight (CLWLWGHT)**

Specifies the cluster workload weight of the channel.

The possible values are:

**\*SAME**

The attribute is unchanged.

**cluster-workload-weight**

The cluster workload weight of the channel in the range 1 through 99.

**Sharing Conversations (SHARECNV)**

Specifies the maximum the number of conversations which can be shared over a particular TCP/IP client channel instance (socket).

This parameter is valid for channels with CHLTYPE defined as \*CLTCN or \*SVRCN.

The possible values are:

**\*SAME**

The attribute is unchanged.

**0**

Specifies no sharing of conversations over a TCP/IP socket. The channel instance runs in a mode prior to that of IBM WebSphere MQ 7.0, with regard to:

- Administrator stop-quiesce
- Heartbeating
- Read ahead

**1**

Specifies no sharing of conversations over a TCP/IP socket. Client heartbeating and read ahead are available, whether in an MQGET call or not, and channel quiescing is more controllable.

**shared-conversations**

The number of shared conversations in the range 2 through 999999999.

This parameter is only valid for client-connection and server-connection channels.

**Note:** If the client-connection SHARECNV value does not match the server-connection SHARECNV value, the lower of the two values is used.

**Property Control (PROPCTL)**

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor).

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*COMPAT**

If the message contains a property with a prefix of "mcd.", "jms.", "usr." or "mqext." then all optional message properties, except those in the message descriptor (or extension) will be placed in one or more MQRFH2 headers in the message data before the message is sent to the remote queue manager.

**\*NONE**

All properties of the message, except those in the message descriptor (or extension), will be removed from the message before the message is sent to the remote queue manager.

**\*ALL**

All properties of the message will be included with the message when it is sent to the remote queue manager. The properties, except those in the message descriptor (or extension), will be placed in one or more MQRFH2 headers in the message data.

**Maximum Instances (MAXINST)**

Specifies the maximum number of clients that can simultaneously connect to the queue manager via this server-connection channel object.

This attribute is valid only for server-connection channels.

The possible values are:

**\*SAME**

The attribute is unchanged.

**maximum-instances**

The maximum number of simultaneous instances of the channel in the range 0 through 99999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

**Maximum Instances Per Client (MAXINSTC)**

Specifies the maximum number of simultaneous instances of an individual server-connection channel which can be started from a single client.

In this context, multiple client connections originating from the same remote network address are considered to be a single client.

This attribute is valid only for server-connection channels.

The possible values are:

**\*SAME**

The attribute is unchanged.

**maximum-instances-per-client**

The maximum number of simultaneous instances of the channel which can be started from a single client in the range 0 through 99999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running from individual clients, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

**Client Channel Weight (CLNTWGHT)**

The client channel weighting attribute is used so client channel definitions can be selected at random based on their weighting when more than one suitable definition is available.

The possible values are:

**\*SAME**

The attribute is unchanged.

**client-channel-weight**

The client channel weight in the range 0 through 99.

**Connection Affinity (AFFINITY)**

The channel affinity attribute is used so client applications that connect multiple times using the same queue manager name can choose whether to use the same client channel definition for each connection.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*PREFERRED**

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any applicable CLNTWGHT(0) definitions first and in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful non CLNTWGHT(0) definitions are moved to the end of the list. CLNTWGHT(0) definitions remain at the start of the list and are selected first for each connection.

**\*NONE**

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process select an applicable definition based on the weighting with any applicable CLNTWGHT(0) definitions selected first in alphabetical order.

**Batch Data Limit (BATCHLIM)**

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

The batch is terminated when one of the following conditions is met:

- **BATCHSZ** messages have been sent.
- **BATCHLIM** bytes have been sent.
- The transmission queue is empty and **BATCHINT** is exceeded.

This parameter is valid only for channels with a channel type (**CHLTYPE**) of SDR, SVR, CLUSSDR, or CLUSRCVR.

The value must be in the range 0 - 999999. The default value is 5000.

The **BATCHLIM** parameter is supported on all platforms.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**batch-data-limit**

Specify a value ranging from 0 through 999999.

This parameter can only be specified for channel types (CHLTYPE) \*SDR, \*SVR, \*CLUSSDR, or \*CLUSRCVR.

**Default client reconnection (DFTRECON)**

Specifies whether a client connection automatically reconnects a client application if its connection breaks.

**\*SAME**

The value of this attribute does not change.

**\*NO**

Unless overridden by **MQCONN**, the client is not reconnected automatically.

**\*YES**

Unless overridden by **MQCONN**, the client reconnects automatically.

**\*QMGR**

Unless overridden by **MQCONN**, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO\_RECONNECT\_Q\_MGR.

**\*DISABLED**

Reconnection is disabled, even if requested by the client program using the **MQCONN** MQI call.

This parameter is specified for a client connection channel, (CHLTYPE) \*CLTCN

## IBM i Copy MQ Listener (CPYMQMLSR)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Copy MQ Listener (CPYMQMLSR) command creates an MQ listener definition of the same type and, for attributes not specified in the command, with the same attribute values as an existing listener definition.

**Parameters**

Keyword	Description	Choices	Notes
<u>FROMLSR</u>	From Listener	Character value	Required, Key, Positional 1
<u>TOLSR</u>	To Listener	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	<b>*NO</b> , *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	Character value, *BLANK, <b>*SAME</b>	Optional, Positional 5
<u>CONTROL</u>	Listener control	<b>*SAME</b> , *MANUAL, *QMGR, *STARTONLY	Optional, Positional 6
<u>PORT</u>	Port number	0-65535, <b>*SAME</b>	Optional, Positional 7
<u>IPADDR</u>	IP Address	Character value, *BLANK, <b>*SAME</b>	Optional, Positional 8
<u>BACKLOG</u>	Listener backlog	0-999999999, <b>*SAME</b>	Optional, Positional 9

**From Listener (FROMLSR)**

Specifies the name of the existing listener definition to provide values for the attributes not specified in this command.

The possible values are:

**from-listener-name**

Specify the name of the source MQ listener.

## To Listener (TOLSR)

Specifies the name of the new listener definition to be created. The name can contain a maximum of 48 characters.

If a listener definition with this name already exists, REPLACE(\*YES) must be specified.

The possible values are:

### to-listener-name

Specify the name of the new listener being created.

## Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

### \*DFT

Use the default queue manager.

### queue-manager-name

The name of a message queue manager.

## Replace (REPLACE)

Specifies whether the new listener definition will replace an existing listener definition with the same name.

The possible values are:

### \*NO

This definition does not replace any existing listener definition with the same name. The command fails if the named listener definition already exists.

### \*YES

Replace the existing listener definition. If there is no definition with the same name, a new definition is created.

## Text 'description' (TEXT)

Specifies text that briefly describes the listener definition.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

### \*SAME

The attribute is unchanged.

### \*BLANK

The text is set to a blank string.

### description

Specify no more than 64 characters enclosed in apostrophes.

## Listener control (CONTROL)

Whether the listener starts automatically when the queue manager is started.

The possible values are:

### \*SAME

The attribute is unchanged.

**\*MANUAL**

The listener is not automatically started or stopped.

**\*QMGR**

The listener is started and stopped as the queue manager is started and stopped.

**\*STARTONLY**

The listener is started as the queue manager is started, but is not automatically stopped when the queue manager is stopped.

**Port number (PORT)**

The port number to be used by the listener.

The possible values are:

**\*SAME**

The attribute is unchanged.

**port-number**

The port number to be used.

**IP Address (IPADDR)**

The IP address to be used by the listener.

The possible values are:

**\*SAME**

The attribute is unchanged.

**ip-addr**

The IP address to be used.

**Listener backlog (BACKLOG)**

The number of concurrent connection requests the listener supports.

The possible values are:

**\*SAME**

The attribute is unchanged.

**backlog**

The number of concurrent connection requests supported.

IBM i

**Copy MQ Namelist (CPYMQMNL)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Copy MQ Namelist (CPYMQMNL) command copies an MQ namelist.

**Parameters**

<i>Table 198. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>FROMNL</u>	From Namelist	Character value	Required, Key, Positional 1

Table 198. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>TONL</u>	To Namelist	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	<b>*NO</b> , <b>*YES</b>	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , <b>*BLANK</b> , <b>*SAME</b>	Optional, Positional 5
<u>NAMES</u>	List of Names	Values (up to 256 repetitions): <i>Character value</i> , <b>*BLANKS</b> , <b>*SAME</b> , <b>*NONE</b>	Optional, Positional 6

### From Namelist (FROMNL)

Specifies the name of the existing namelist, to provide values for the attributes not specified in this command.

#### from-namelist

Specify the name of the source namelist.

### To Namelist (TONL)

The name of the new namelist to be created. The name can contain a maximum of 48 characters.

If a namelist with this name already exists, REPLACE(\*YES) must be specified.

#### to-namelist

Specify the name of the MQ namelist being created.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

#### **\*DFT**

The default queue manager is used.

#### message-queue-manager-name

Specify the name of the queue manager.

### Replace (REPLACE)

Specifies whether the new namelist should replace an existing namelist with the same name.

#### **\*NO**

Do not replace the existing namelist. The command fails if the named namelist already exists.

#### **\*YES**

Replace the existing namelist. If there is no namelist with the same name, a new namelist is created.

### Text 'description' (TEXT)

Specifies text that briefly describes the namelist.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

**\*SAME**

The attribute is unchanged.

**description**

Specify no more than 64 characters enclosed in apostrophes.

**List of Names (NAMES)**

List of names. This is the list of names to be created. The names can be of any type, but must conform to the rules for naming MQ objects.

**\*SAME**

The attribute is unchanged.

**namelist**

The list to create. An empty list is valid.

## IBM i Copy MQ Process (CPYMQMPRC)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Copy MQ Process (CPYMQMPRC) command creates an MQ process definition of the same type and, for attributes not specified in the command, with the same attribute values as an existing process definition.

**Parameters**

Keyword	Description	Choices	Notes
<u>FROMPRC</u>	From process	Character value	Required, Key, Positional 1
<u>TOPRC</u>	To process	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	<b>*NO</b> , *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	Character value, *BLANK, <b>*SAME</b>	Optional, Positional 5
<u>APPTYPE</u>	Application type	Integer, <b>*DEF</b> , *CICS, *UNIX, *OS400, *WINDOWS, *WINDOWS_NT,	Optional, Positional 6
<u>APPID</u>	Application identifier	Character value, <b>*SAME</b>	Optional, Positional 7
<u>USRDATA</u>	User data	Character value, <b>*SAME</b> , *NONE	Optional, Positional 8
<u>ENVDATA</u>	Environment data	Character value, <b>*SAME</b> , *NONE	Optional, Positional 9

## From process (FROMPRC)

Specifies the name of the existing process definition to provide values for the attributes not specified in this command.

The possible values are:

### **from-process-name**

Specify the name of the source MQ process.

## To process (TOPRC)

The name of the new process definition to be created. The name can contain a maximum of 48 characters.

If a process definition with this name already exists, REPLACE(\*YES) must be specified.

The possible values are:

### **to-process-name**

Specify the name of the MQ process being created.

## Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

### **\*DFT**

Use the default queue manager.

### **queue-manager-name**

The name of a message queue manager.

## Replace (REPLACE)

Specifies whether the new process definition should replace an existing process definition with the same name.

The possible values are:

### **\*NO**

This definition does not replace any existing process definition with the same name. The command fails if the named process definition already exists.

### **\*YES**

Replace the existing process definition. If there is no definition with the same name, a new definition is created.

## Text 'description' (TEXT)

Specifies text that briefly describes the process definition.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*BLANK**

The text is set to a blank string.

### **description**

Specify no more than 64 characters enclosed in apostrophes.

## Application type (APPTYPE)

The type of application started.

The possible values are:

### **\*DEF**

Specifying DEF causes the default application type for the platform at which the command is interpreted to be stored in the process definition. This default cannot be changed by the installation. If the platform supports clients, the default is interpreted as the default application type of the server.

### **\*CICS**

Represents a CICS/400 application.

### **\*UNIX**

Represents a UNIX or Linux application.

### **\*OS400**

Represents an IBM i application.

### **\*WINDOWS**

Represents a Windows application.

### **\*WINDOWS\_NT**

Represents a Windows NT application.

### **integer**

User-defined application type in the range 65536 through 999999999.

## Application identifier (APPID)

Application identifier. This is the name of the application to be started, on the platform for which the command is processing. It is typically a program name and library name.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **application-id**

The maximum length is 256 characters.

## User data (USRDATA)

A character string that contains user information pertaining to the application, as defined by APPID, to start.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*NONE**

The user data is blank.

### **user-data**

Specify up to 128 characters of user data.

## Environment data (ENVDATA)

A character string that contains environment information pertaining to the application, as defined by APPID, to start.

The possible values are:

### **\*SAME**

The attribute is unchanged.

**\*NONE**

The environment data is blank.

**environment-data**

The maximum length is 128 characters.

**Copy MQ Queue (CPYMQMQ)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Copy MQ Queue ( **CPYMQMQ** ) command creates a queue definition of the same type and, for attributes not specified in the command, with the same attribute values as an existing queue definition.

**Parameters**

<i>Table 200. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>FROMQ</u>	From queue name	Character value	Required, Key, Positional 1
<u>TOQ</u>	To queue name	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Key, Positional 3
<u>QTYPE</u>	Queue type	Character value	Optional, Positional 4
<u>REPLACE</u>	Replace	<b>*NO</b> , *YES	Optional, Positional 5
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, <b>*SAME</b>	Optional, Positional 6
<u>PUTENBL</u>	Put enabled	<b>*SAME</b> , *NO, *YES	Optional, Positional 7
<u>DFTPTY</u>	Default message priority	0-9, <b>*SAME</b>	Optional, Positional 8
<u>DFTMSGPST</u>	Default message persistence	<b>*SAME</b> , *NO, *YES	Optional, Positional 9
<u>PRCNAME</u>	Process name	<i>Character value</i> , *NONE, <b>*SAME</b>	Optional, Positional 10
<u>TRGENBL</u>	Triggering enabled	<b>*SAME</b> , *NO, *YES	Optional, Positional 11
<u>GETENBL</u>	Get enabled	<b>*SAME</b> , *NO, *YES	Optional, Positional 12
<u>SHARE</u>	Sharing enabled	<b>*SAME</b> , *NO, *YES	Optional, Positional 13
<u>DFTSHARE</u>	Default share option	<b>*SAME</b> , *NO, *YES	Optional, Positional 14
<u>MSGDLYSEQ</u>	Message delivery sequence	<b>*SAME</b> , *PTY, *FIFO	Optional, Positional 15
<u>HDNBKCNT</u>	Harden backout count	<b>*SAME</b> , *NO, *YES	Optional, Positional 16
<u>TRGTYPE</u>	Trigger type	<b>*SAME</b> , *FIRST, *ALL, *DEPTH, *NONE	Optional, Positional 17
<u>TRGDEPTH</u>	Trigger depth	1-999999999, <b>*SAME</b>	Optional, Positional 18

Table 200. Command parameters (continued)

<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>TRGMSGPTY</u>	Trigger message priority	0-9, <b>*SAME</b>	Optional, Positional 19
<u>TRGDATA</u>	Trigger data	<i>Character value</i> , *NONE, <b>*SAME</b>	Optional, Positional 20
<u>RTNITV</u>	Retention interval	0-999999999, <b>*SAME</b>	Optional, Positional 21
<u>MAXDEPTH</u>	Maximum queue depth	0-999999999, <b>*SAME</b>	Optional, Positional 22
<u>MAXMSGLEN</u>	Maximum message length	0-104857600, <b>*SAME</b>	Optional, Positional 23
<u>BKTTHLD</u>	Backout threshold	0-999999999, <b>*SAME</b>	Optional, Positional 24
<u>BKTQNAME</u>	Backout requeue name	<i>Character value</i> , *NONE, <b>*SAME</b>	Optional, Positional 25
<u>INITQNAME</u>	Initiation queue	<i>Character value</i> , *NONE, <b>*SAME</b>	Optional, Positional 26
<u>USAGE</u>	Usage	<b>*SAME</b> , *NORMAL, *TMQ	Optional, Positional 27
<u>DFNTYPE</u>	Definition type	<b>*SAME</b> , *TEMPDYN, *PERMDYN	Optional, Positional 28
<u>TGTQNAME</u>	Target object	<i>Character value</i> , <b>*SAME</b>	Optional, Positional 29
<u>RMTQNAME</u>	Remote queue	<i>Character value</i> , <b>*SAME</b> , *NONE	Optional, Positional 30
<u>RMTMQMNAME</u>	Remote Message Queue Manager	<i>Character value</i> , <b>*SAME</b>	Optional, Positional 31
<u>TMQNAME</u>	Transmission queue	<i>Character value</i> , *NONE, <b>*SAME</b>	Optional, Positional 32
<u>HIGHTHLD</u>	Queue depth high threshold	0-100, <b>*SAME</b>	Optional, Positional 33
<u>LOWTHLD</u>	Queue depth low threshold	0-100, <b>*SAME</b>	Optional, Positional 34
<u>FULLEVT</u>	Queue full events enabled	<b>*SAME</b> , *NO, *YES	Optional, Positional 35
<u>HIGHEVT</u>	Queue high events enabled	<b>*SAME</b> , *NO, *YES	Optional, Positional 36
<u>LOWEVT</u>	Queue low events enabled	<b>*SAME</b> , *NO, *YES	Optional, Positional 37
<u>SRVITV</u>	Service interval	0-999999999, <b>*SAME</b>	Optional, Positional 38
<u>SRVEVT</u>	Service interval events	<b>*SAME</b> , *HIGH, *OK, *NONE	Optional, Positional 39
<u>DISTLIST</u>	Distribution list support	<b>*SAME</b> , *NO, *YES	Optional, Positional 40
<u>CLUSTER</u>	Cluster Name	<i>Character value</i> , <b>*SAME</b> , *NONE	Optional, Positional 41
<u>CLUSNL</u>	Cluster Name List	<i>Character value</i> , *NONE, <b>*SAME</b>	Optional, Positional 42
<u>DEFBIND</u>	Default Binding	<b>*SAME</b> , *OPEN, *NOTFIXED, *GROUP	Optional, Positional 43

Table 200. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>CLWLRANK</u>	Cluster Workload Rank	0-9, <b>*SAME</b>	Optional, Positional 44
<u>CLWLPRTY</u>	Cluster Workload Priority	0-9, <b>*SAME</b>	Optional, Positional 45
<u>CLWLUSEQ</u>	Cluster workload queue use	<b>*SAME</b> , *QMGR, *LOCAL, *ANY	Optional, Positional 46
<u>MONQ</u>	Queue Monitoring	<b>*SAME</b> , *QMGR, *OFF, *LOW, *MEDIUM, *HIGH	Optional, Positional 47
<u>STATQ</u>	Queue Statistics	<b>*SAME</b> , *QMGR, *OFF, *ON	Optional, Positional 48
<u>ACCTQ</u>	Queue Accounting	<b>*SAME</b> , *QMGR, *OFF, *ON	Optional, Positional 49
<u>NPMCLASS</u>	Non Persistent Message Class	<b>*SAME</b> , *NORMAL, *HIGH	Optional, Positional 50
<u>MSGREADAHD</u>	Message Read Ahead	<b>*SAME</b> , *DISABLED, *NO, *YES	Optional, Positional 51
<u>DFTPUTRESP</u>	Default Put Response	<b>*SAME</b> , *SYNC, *ASYN	Optional, Positional 52
<u>PROPCTL</u>	Property Control	<b>*SAME</b> , *COMPAT, *NONE, *ALL, *FORCE, *V6COMPAT	Optional, Positional 53
<u>TARGETYPE</u>	Target Type	<b>*SAME</b> , *QUEUE, *TOPIC	Optional, Positional 54
<u>CUSTOM</u>	Custom attribute	<i>Character value</i> , *BLANK, <b>*SAME</b>	Optional, Positional 55
<u>CLCHNAME</u>	Cluster-sender channel name	<i>Character value</i> , *NONE, <b>*SAME</b>	Optional, Positional 56
<u>IMGRCOVQ</u>	Queue object attribute	<b>*SAME</b> , *NO, *YES, *QMGR	Optional, Positional 58

### From queue name (FROMQ)

Specifies the name of the existing queue definition, to provide values for the attributes not specified in this command.

The possible values are:

#### from-queue-name

Specify the name of the source queue.

### To queue name (TOQ)

Specifies the name of the new queue definition. The name can contain a maximum of 48 characters. Queue name and type combinations must be unique; if a queue definition already exists with the name and type of the new queue, REPLACE(\*YES) must be specified.

**Note:** The field length is 48 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

The possible values are:

#### to-queue-name

Specify the name of the queue being created.

## Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

### **\*DFT**

Use the default queue manager.

### **queue-manager-name**

Specify the name of the queue manager.

## Queue type (QTYPE)

Specifies the type of queue that is to be copied.

The possible values are:

### **\*ALS**

An alias queue.

### **\*LCL**

A local queue.

### **\*RMT**

A remote queue.

### **\*MDL**

A model queue.

## Replace (REPLACE)

Specifies whether the new queue will replace an existing queue definition with the same name and type.

The possible values are:

### **\*NO**

Do not replace the existing queue definition. The command fails if the named queue already exists.

### **\*YES**

Replace the existing queue definition with the attributes of the FROMQ and the specified attributes.

The command fails if an application has the queue open or the USAGE attribute is changed.

**Note:** If the queue is a local queue, and a queue with the same name already exists, any messages already on that queue are retained.

## Text 'description' (TEXT)

Specifies text that briefly describes the object.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*BLANK**

The text is set to a blank string.

### **description**

Specify no more than 64 characters enclosed in apostrophes.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

## Put enabled (PUTENBL)

Specifies whether messages can be put on the queue.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

Messages cannot be added to the queue.

**\*YES**

Messages can be added to the queue by authorized applications.

### **Default message priority (DFTPTY)**

Specifies the default priority of messages put on the queue.

The possible values are:

**\*SAME**

The attribute is unchanged.

**priority-value**

Specify a value ranging from 0 through 9, where 9 is the highest priority.

### **Default message persistence (DFTMSGPST)**

Specifies the default for message-persistence on the queue. Message persistence determines whether messages are preserved across restarts of the queue manager.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

By default, messages are lost across a restart of the queue manager.

**\*YES**

By default, messages are preserved across a restart of the queue manager.

### **Process name (PRCNAME)**

Specifies the local name of the MQ process that identifies the application that should be started when a trigger event occurs.

The process does not have to be available when the queue is created, but it must be available for a trigger event to occur.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The process name is blank.

**process-name**

Specify the name of the MQ process.

### **Triggering enabled (TRGENBL)**

Specifies whether trigger messages are written to the initiation queue.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

Triggering is not enabled. Trigger messages are not written to the initiation queue.

**\*YES**

Triggering is enabled. Trigger messages are written to the initiation queue.

**Get enabled (GETENBL)**

Specifies whether applications are to be permitted to get messages from this queue.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

Applications cannot retrieve messages from the queue.

**\*YES**

Suitably authorized applications can retrieve messages from the queue.

**Sharing enabled (SHARE)**

Specifies whether multiple instances of applications can open this queue for input simultaneously.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

Only a single application instance can open the queue for input.

**\*YES**

More than one application instance can open the queue for input.

**Default share option (DFTSHARE)**

Specifies the default share option for applications opening this queue for input.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

By default, the open request is for exclusive use of the queue for input.

**\*YES**

By default, the open request is for shared use of the queue for input.

**Message delivery sequence (MSGDLYSEQ)**

Specifies the message delivery sequence.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*PTY**

Messages are delivered in first-in-first-out (FIFO) order within priority.

**\*FIFO**

Messages are delivered in FIFO order regardless of priority.

**Harden backout count (HDNBKTCNT)**

Specifies whether the count of backed out messages is saved (hardened) across restarts of the message queue manager.

**Note:** On IBM MQ for IBM i the count is ALWAYS hardened, regardless of the setting of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

The backout count is not hardened.

**\*YES**

The backout count is hardened.

**Trigger type (TRGTYPE)**

Specifies the condition that initiates a trigger event. When the condition is true, a trigger message is sent to the initiation queue.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*FIRST**

When the number of messages on the queue goes from 0 to 1.

**\*ALL**

Every time a message arrives on the queue.

**\*DEPTH**

When the number of messages on the queue equals the value of the TRGDEPTH attribute.

**\*NONE**

No trigger messages are written.

**Trigger depth (TRGDEPTH)**

Specifies, for TRIGTYPE(\*DEPTH), the number of messages that initiate a trigger message to the initiation queue.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**depth-value**

Specify a value ranging from 1 through 999999999.

**Trigger message priority (TRGMSGPTY)**

Specifies the minimum priority that a message must have before it can produce, or be counted for, a trigger event.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**priority-value**

Specify a value ranging from 0 through 9, where 9 is the highest priority.

**Trigger data (TRGDATA)**

Specifies up to 64 characters of user data that the queue manager includes in the trigger message. This data is made available to the monitoring application that processes the initiation queue, and to the application started by the monitor.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No trigger data is specified.

**trigger-data**

Specify up to 64 characters enclosed in apostrophes. For a transmission queue you can use this parameter to specify the name of the channel to be started.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

**Retention interval (RTNITV)**

Specifies the retention interval. This interval is the number of hours for which the queue might be needed, based on the date and time when the queue was created.

This information is available to a housekeeping application or an operator and can be used to determine when a queue is no longer required.

**Note:** The message queue manager does not delete queues, nor does it prevent your queues from being deleted if their retention interval has not expired. It is your responsibility to take any required action.

The possible values are:

**\*SAME**

The attribute is unchanged.

**interval-value**

Specify a value ranging from 0 through 999999999.

**Maximum queue depth (MAXDEPTH)**

Specifies the maximum number of messages allowed on the queue. However, other factors can cause the queue to be treated as full; for example, it appears to be full if there is no storage available for a message.

**Note:** If this value is subsequently reduced by using the CHGMQM command, any messages that are on the queue remain intact even if they cause the new maximum to be exceeded.

The possible values are:

**\*SAME**

The attribute is unchanged.

**depth-value**

Specify a value ranging from 0 through 999999999.

**Maximum message length (MAXMSGLEN)**

Specifies the maximum length for messages on the queue.

**Note:** If this value is subsequently reduced by using the CHGMQM command, any messages that are on the queue remain intact even if they exceed the new maximum length.

Applications might use the value of this attribute to determine the size of buffer they need to retrieve messages from the queue. Therefore change the value only if you know this will not cause an application to operate incorrectly.

The possible values are:

**\*SAME**

The attribute is unchanged.

**length-value**

Specify a value ranging from 0 through 100 MB in bytes. The default is 4MB.

## **Backout threshold (BKTTHLD)**

Specifies the backout threshold.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine if a message should be backed out. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**threshold-value**

Specify a value ranging from 0 through 999999999.

## **Backout requeue name (BKTQNAME)**

Specifies the backout-queue name.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine where messages that have been backed out should go. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No backout queue is specified.

**backout-queue-name**

Specify the backout queue name.

## **Initiation queue (INITQNAME)**

Specifies the name of the initiation queue.

**Note:** The initiation queue must be on the same instance of a message queue manager.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No initiation queue is specified.

**initiation-queue-name**

Specify the initiation queue name.

## Usage (USAGE)

Specifies whether the queue is for normal usage, or for transmitting messages to a remote message queue manager.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*NORMAL**

Normal usage (the queue is not a transmission queue)

### **\*TMQ**

The queue is a transmission queue that is used to hold messages destined for a remote message queue manager. If the queue is intended for use in situations where a transmission queue name is not explicitly specified, the queue name must be the same as the name of the remote message queue manager. For further information, see IBM MQ Intercommunication.

## Definition type (DFNTYPE)

Specifies the type of dynamic queue definition that is created when an application issues an MQOPEN API call with the name of this model queue specified in the object descriptor.

**Note:** This parameter only applies to a model queue definition.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*TEMPDYN**

A temporary dynamic queue is created. This value should not be specified with a DEFMSGPST value of \*YES.

### **\*PERMDYN**

A permanent dynamic queue is created.

## Target object (TGTQNAME)

Specifies the name of the object for which this queue is an alias.

The object can be a local or remote queue, a topic or a message queue manager.

**Note:** The target object does not need to exist at this time but it must exist when a process attempts to open the alias queue.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **target-object-name**

Specify the name of the target object.

## Remote queue (RMTQNAME)

Specifies the name of the remote queue. That is, the local name of the remote queue as defined on the queue manager specified by RMTMQMNAME.

If this definition is used for a queue manager alias definition, RMTQNAME must be blank when the open occurs.

If this definition is used for a reply-to alias, this name is the name of the queue that is to be the reply-to queue.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No remote-queue name is specified (that is, the name is blank). This can be used if the definition is a queue manager alias definition.

**remote-queue-name**

Specify the name of the queue at the remote queue manager.

**Note:** The name is not checked to ensure that it contains only those characters normally allowed for queue names.

**Remote Message Queue Manager (RMTMQMNAME)**

Specifies the name of the remote queue manager on which the queue RMTQNAME is defined.

If an application opens the local definition of a remote queue, RMTMQMNAME must not be the name of the connected queue manager. If TMQNAME is blank there must be a local queue of this name, which is to be used as the transmission queue.

If this definition is used for a queue manager alias, RMTMQMNAME is the name of the queue manager, which can be the name of the connected queue manager. Otherwise, if TMQNAME is blank, when the queue is opened there must be a local queue of this name, with USAGE(\*TMQ) specified, which is to be used as the transmission queue.

If this definition is used for a reply-to alias, this name is the name of the queue manager that is to be the reply-to queue manager.

The possible values are:

**\*SAME**

The attribute is unchanged.

**remote-queue-manager-name**

Specify the name of the remote queue manager.

**Note:** Ensure this name contains only those characters normally allowed for queue manager names.

**Transmission queue (TMQNAME)**

Specifies the local name of the transmission queue to be used for messages destined for the remote queue, for either a remote queue or for a queue manager alias definition.

If TMQNAME is blank, a queue with the same name as RMTMQMNAME is used as the transmission queue.

This attribute is ignored if the definition is being used as a queue manager alias and RMTMQMNAME is the name of the connected queue manager.

It is also ignored if the definition is used as a reply-to queue alias definition.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No specific transmission queue name is defined for this remote queue. The value of this attribute is set to all blanks.

**transmission-queue-name**

Specify the transmission queue name.

**Queue depth high threshold (HIGHTHLD)**

Specifies the threshold against which the queue depth is compared to generate a queue depth high event.

The possible values are:

**\*SAME**

The attribute is unchanged.

**threshold-value**

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

### **Queue depth low threshold (LOWTHLD)**

Specifies the threshold against which the queue depth is compared to generate a queue depth low event.

The possible values are:

**\*SAME**

The attribute is unchanged.

**threshold-value**

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

### **Queue full events enabled (FULLEVT)**

Specifies whether queue full events are generated.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

Queue full events are not generated.

**\*YES**

Queue full events are generated.

### **Queue high events enabled (HIGHEVT)**

Specifies whether queue depth high events are generated.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

Queue depth high events are not generated.

**\*YES**

Queue depth high events are generated.

### **Queue low events enabled (LOWEVT)**

Specifies whether queue depth low events are generated.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NO**

Queue depth low events are not generated.

**\*YES**

Queue depth low events are generated.

## Service interval (SRVITV)

Specifies the service interval. This interval is used for comparison to generate service interval high and service interval OK events.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **interval-value**

Specify a value ranging from 0 through 999999999. The value is in units of milliseconds.

## Service interval events (SRVEVT)

Specifies whether service interval high or service interval OK events are generated.

A service interval high event is generated when a check indicates that no messages have been retrieved from the queue for the time indicated by the SRVITV parameter as a minimum.

A service interval OK event is generated when a check indicates that messages have been retrieved from the queue within the time indicated by the SRVITV parameter.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*HIGH**

Service interval high events are generated.

### **\*OK**

Service interval OK events are generated.

### **\*NONE**

No service interval events are generated.

## Distribution list support (DISTLIST)

Specifies whether the queue supports distribution lists.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*NO**

The queue will not support distribution lists.

### **\*YES**

The queue will support distribution lists.

## Cluster Name (CLUSTER)

The name of the cluster to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **cluster-name**

Only one of the resultant values of CLUSTER or CLUSNL can be non-blank; you cannot specify a value for both.

## Cluster Name List (CLUSNL)

The name of the namelist which specifies a list of clusters to which the queue belongs. Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **namelist-name**

Only one of the resultant values of CLUSTER or CLUSNL can be non-blank; you cannot specify a value for both.

## Default Binding (DEFBIND)

Specifies the binding to be used when the application specifies MQOO\_BIND\_AS\_Q\_DEF on the MQOPEN call and the queue is a cluster queue.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*OPEN**

The queue handle is bound to a specific instance of the cluster queue when the queue is opened.

### **\*NOTFIXED**

The queue handle is not bound to any particular instance of the cluster queue. This allows the queue manager to select a specific queue instance when the message is put using MQPUT and to change that selection subsequently if necessary.

The MQPUT1 call always behaves as if NOTFIXED had been specified.

### **\*GROUP**

When the queue is opened, the queue handle is bound to a specific instance of the cluster queue for as long as there are messages in a message group. All messages in a message group are allocated to the same destination instance.

## Cluster Workload Rank (CLWLRANK)

Specifies the cluster workload rank of the queue.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **cluster-workload-rank**

Specify a value ranging from 0 through 9.

## Cluster Workload Priority (CLWLPRTY)

Specifies the cluster workload priority of the queue.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **cluster-workload-priority**

Specify a value ranging from 0 through 9.

## Cluster workload queue use (CLWLUSEQ)

Specifies the behavior of an MQPUT when the target queue has both a local instance and at least one remote cluster instance. If the put originates from a cluster channel then this attribute does not apply.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*QMGR**

The value is inherited from the Queue Manager CLWLUSEQ attribute.

**\*LOCAL**

The local queue will be the sole target of the MQPUT.

**\*ANY**

The queue manager will treat such a local queue as another instance of the cluster queue for the purposes of workload distribution.

## Queue Monitoring (MONQ)

Controls the collection of Online Monitoring Data.

Online Monitoring Data is not collected when the queue manager attribute MONQ is set to \*NONE.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*QMGR**

The collection of online monitoring data is inherited from the setting of the queue manager attribute MONQ.

**\*OFF**

Online monitoring data collection for this queue is disabled.

**\*LOW**

Monitoring data collection is turned on with a low ratio of data collection.

**\*MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

**\*HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

## Queue Statistics (STATQ)

Controls the collection of statistics data.

Online monitoring data is not collected when the queue manager attribute STATQ is set to \*NONE.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATQ.

**\*OFF**

Statistics data collection for this queue is disabled.

**\*ON**

Statistics data collection is enabled for this queue.

## Queue Accounting (ACCTQ)

Controls the collection of accounting data.

Accounting data is not collected when the queue manager attribute ACCTQ is set to \*NONE.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*QMGR**

Accounting data collection is based upon the setting of the queue manager attribute ACCTQ.

### **\*OFF**

Accounting data collection for this queue is disabled.

### **\*ON**

Accounting data collection is enabled for this queue.

## Non Persistent Message Class (NPMCLASS)

Specifies the level of reliability for non-persistent messages put to this queue.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*NORMAL**

Non-persistent messages put to this queue are only lost following a failure, or a queue manager shutdown. Non-persistent message put to this queue will be discarded in the event of a queue manager restart.

### **\*HIGH**

Non-persistent messages put to this queue are not discarded in the event of a queue manager restart. Non-persistent messages put to this queue may still be lost in the event of a failure.

## Message Read Ahead (MSGREADAHD)

Specifies whether non persistent messages are sent to the client ahead of an application requesting them.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*DISABLED**

Read ahead is disabled for this queue. Messages are not sent to the client ahead of an application requesting them regardless of whether read ahead is requested by the client application.

### **\*NO**

Non-persistent messages are not sent to the client ahead of an application requesting them. A maximum of one non-persistent message can be lost if the client ends abnormally.

### **\*YES**

Non-persistent messages are sent to the client ahead of an application requesting them. Non-persistent messages can be lost if the client ends abnormally or if the client application does not consume all the messages it is sent.

## Default Put Response (DFTPUTRESP)

The default put response type (DFTPUTRESP) attribute specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO\_RESPONSE\_AS\_Q\_DEF option.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO\_RESPONSE\_AS\_Q\_DEF are issued as if MQPMO\_SYNC\_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application. This is the default value supplied with IBM MQ, but your installation might have changed it.

**\*ASYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO\_RESPONSE\_AS\_Q\_DEF are always issued as if MQPMO\_ASYNC\_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application; but an improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

**Property Control (PROPCTL)**

Specifies what happens to properties of messages that are retrieved from queues using the MQGET call when the MQGMO\_PROPERTIES\_AS\_Q\_DEF option is specified.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*COMPAT**

If the message contains a property with a prefix of mcd . , jms . , usr . or mqext . then all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

**\*NONE**

All properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

**\*ALL**

All properties of the message, except those contained in the message descriptor (or extension), are contained in one or more MQRFH2 headers in the message data.

**\*FORCE**

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

**\*V6COMPAT**

When set, \*V6COMPAT must be set both on one of the queue definitions resolved by MQPUT and one of the queue definitions resolved by MQGET. It must also be set on any other intervening transmission queues. It causes an MQRFH2 header to be passed unchanged from the sending application to the receiving application. It overrides other settings of **PROPCTL** found in a queue name resolution chain. If the property is set on a cluster queue, the setting is not cached locally on other queue managers. You must set \*V6COMPAT on an alias queue that resolves to the cluster queue. Define the alias queue on the same queue manager that the putting application is connected to.

**Target Type (TARGTYPE)**

Specifies the type of object to which the alias resolves.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*QUEUE**

Queue object.

**\*TOPIC**

Topic object.

**Custom attribute (CUSTOM)**

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*BLANK**

The text is set to a blank string.

**custom**

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form *NAME (VALUE)* and be specified in uppercase. Single quotes must be escaped with another single quote.

**CLCHNAME**

This parameter is supported only on transmission queues.

**\*SAME**

The attribute is unchanged.

**\*NONE**

The attribute is removed.

**cluster-sender channel name**

*ClusterChannelName* is the generic name of the cluster-sender channels that use this queue as a transmission queue. The attribute specifies which cluster-sender channels send messages to a cluster-receiver channel from this cluster transmission queue.

By specifying asterisks, "\*", in **ClusterChannelName**, you can associate a transmission queue with a set of cluster-sender channels. The asterisks can be at the beginning, end, or any number of places in the middle of the channel name string. **ClusterChannelName** is limited to a length of 20 characters: *MQ\_CHANNEL\_NAME\_LENGTH*.

**IMGRCOVQ**

Specifies whether a local or permanent dynamic queue object is recoverable from a media image, if linear logging is being used.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*YES**

These queue objects are recoverable.

**\*NO**

The [“Record MQ Object Image \(RCDMQMIMG\)”](#) on page 1247 and [“Re-create MQ Object \(RCRMQMOBJ\)”](#) on page 1249 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

**\*QMGR**

If you specify \*QMGR, and the **IMGRCOVQ** attribute for the queue manager specifies \*YES, these queue objects are recoverable.

If you specify \*QMGR and the **IMGRCOVQ** attribute for the queue manager specifies \*NO, the [“Record MQ Object Image \(RCDMQMIMG\)”](#) on page 1247 and [“Re-create MQ Object \(RCRMQMOBJ\)”](#) on page

1249 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

## IBM i Copy MQ Subscription (CPYMQMSUB)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Copy MQ Subscription (CPYMQMSUB) command creates an MQ subscription of the same type and, for attributes not specified in the command, with the same attribute values as an existing subscription.

### Parameters

Keyword	Description	Choices	Notes
<u>FROMSUBID</u>	From subscription identifier	Character value, <b>*SAME</b>	Optional, Key, Positional 3
<u>FROMSUB</u>	From subscription	Character value, <b>*SAME</b>	Optional, Key, Positional 2
<u>TOSUB</u>	To subscription	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Key, Positional 4
<u>REPLACE</u>	Replace	<b>*NO</b> , *YES	Optional, Positional 5
<u>TOPICSTR</u>	Topic string	Character value, *NONE, <b>*SAME</b>	Optional, Positional 6
<u>TOPICOBJ</u>	Topic object	Character value, *NONE, <b>*SAME</b>	Optional, Positional 7
<u>DEST</u>	Destination	Character value, *NONE, <b>*SAME</b>	Optional, Positional 8
<u>DESTMQM</u>	Destination Queue Manager	Character value, *NONE, <b>*SAME</b>	Optional, Positional 9
<u>DESTRRLID</u>	Destination Correlation Id	Character value, *NONE, <b>*SAME</b>	Optional, Positional 10
<u>PUBACCT</u>	Publish Accounting Token	Character value, *NONE, <b>*SAME</b>	Optional, Positional 11
<u>PUBAPPID</u>	Publish Application Id	Character value, *NONE, <b>*SAME</b>	Optional, Positional 12
<u>SUBUSER</u>	Subscription User Id	Character value, *CURRENT, <b>*SAME</b>	Optional, Positional 13
<u>USERDATA</u>	Subscription User Data	Character value, *NONE, <b>*SAME</b>	Optional, Positional 14
<u>SELECTOR</u>	Selector String	Character value, *NONE, <b>*SAME</b>	Optional, Positional 15

Table 201. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>PSPROP</u>	PubSub Property	<b>*SAME</b> , *NONE, *COMPAT, *RFH2, *MSGPROP	Optional, Positional 16
<u>DESTCLASS</u>	Destination Class	<b>*SAME</b> , *MANAGED, *PROVIDED	Optional, Positional 17
<u>SUBSCOPE</u>	Subscription Scope	<b>*SAME</b> , *ALL, *QMGR	Optional, Positional 18
<u>VARUSER</u>	Variable User	<b>*SAME</b> , *ANY, *FIXED	Optional, Positional 19
<u>REQONLY</u>	Request Publications	<b>*SAME</b> , *YES, *NO	Optional, Positional 20
<u>PUBPTY</u>	Publish Priority	0-9, <b>*SAME</b> , *ASPUB, *ASQDEF	Optional, Positional 21
<u>WSHEMA</u>	Wildcard Schema	<b>*SAME</b> , *CHAR, *TOPIC	Optional, Positional 22
<u>EXPIRY</u>	Expiry Time	0-999999999, <b>*SAME</b> , *UNLIMITED	Optional, Positional 23

### From subscription identifier (FROMSUBID)

Specifies the subscription identifier of the existing subscription to provide values for the attributes not specified in this command.

The possible values are:

#### from-subscription-identifier

Specify the 48 character hexadecimal string representing the 24 byte subscription identifier.

### From subscription (FROMSUB)

Specifies the name of the existing subscription to provide values for the attributes not specified in this command.

The possible values are:

#### from-subscription-name

Specify a maximum of 256 bytes for the subscription name.

**Note:** Subscription names of greater than 256 bytes can be specified using MQSC.

### To subscription (TOSUB)

The name of the new subscription to be created.

**Note:** Subscription names of greater than 256 bytes can be specified using MQSC.

If a subscription with this name already exists, REPLACE(\*YES) must be specified.

The possible values are:

#### to-subscription-name

Specify a maximum of 256 bytes for name of the MQ subscription being created.

**Note:** Subscription names of greater than 256 bytes can be specified using MQSC.

### Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

**\*DFT**

Use the default Queue Manager.

**queue-manager-name**

The name of a Queue Manager.

## Replace (REPLACE)

Specifies whether the new subscription should replace an existing subscription with the same name.

The possible values are:

**\*NO**

This subscription does not replace any existing subscription with the same name or subscription identifier. The command fails if the subscription already exists.

**\*YES**

Replace the existing subscription. If there is no subscription with the same name or subscription identifier, a new subscription is created.

## Topic string (TOPICSTR)

Specifies the topic string associated with this subscription.

The possible values are:

**topic-string**

Specify a maximum of 256 bytes for the topic string.

**Note:** Topic strings of greater than 256 bytes can be specified using MQSC.

## Topic object (TOPICOBJ)

Specifies the topic object associated with this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**topic-object**

Specify the name of the topic object.

## Destination (DEST)

Specifies the destination queue for messages published to this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**destination-queue**

Specify the name of the destination queue.

## Destination Queue Manager (DESTMQM)

Specifies the destination queue manager for messages published to this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No destination queue manager is specified.

**destination-queue**

Specify the name of the destination queue manager.

**Destination Correlation Id (DESTCRLID)**

Specifies the correlation identifier for messages published to this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

Messages are placed on the destination with a correlation identifier of MQCI\_NONE.

**correlation-identifier**

Specify the 48 character hexadecimal string representing the 24 byte correlation identifier.

**Publish Accounting Token (PUBACCT)**

Specifies the accounting token for messages published to this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

Messages are placed on the destination with an accounting token of MQACT\_NONE.

**publish-accounting-token**

Specify the 64 character hexadecimal string representing the 32 byte publish accounting token.

**Publish Application Id (PUBAPPID)**

Specifies the publish application identity for messages published to this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No publish application identifier is specified.

**publish-application-identifier**

Specify the publish application identifier.

**Subscription User Id (SUBUSER)**

Specifies the user profile that owns this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*CURRENT**

The current user profile is the owner of the new subscription.

**user-profile**

Specify the user profile.

## Subscription User Data (USERDATA)

Specifies the user data associated with the subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No user data is specified.

**user-data**

Specify a maximum of 256 bytes for user data.

**Note:** User data of greater than 256 bytes can be specified using MQSC.

## Selector String (SELECTOR)

Specifies the SQL 92 selector string to be applied to messages published on the named topic to select whether they are eligible for this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

No selection string is specified.

**selection-string**

Specify a maximum of 256 bytes for selection string.

**Note:** Selection strings of greater than 256 bytes can be specified using MQSC.

## PubSub Property (PSPROP)

Specifies the manner in which publish / subscribe related message properties are added to messages sent to this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

Publish / subscribe properties are not added to the message.

**\*COMPAT**

Publish / subscribe properties are added to the message to maintain compatibility with IBM MQ V6.0  
Publish / Subscribe.

**\*RFH2**

Publish / subscribe properties are added to the message within an RFH 2 header.

**\*MSGPROP**

Publish / subscribe properties are added as message properties.

## Destination Class (DESTCLASS)

Specifies whether this is a managed subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*MANAGED**

The destination is managed.

**\*PROVIDED**

The destination is a queue.

**Subscription Scope (SUBSCOPE)**

Specifies whether this subscription should be forwarded (as a proxy subscription) to other brokers, so that the subscriber will receive messages published at those other brokers.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ALL**

The subscription will be forwarded to all queue managers directly connected via a publish / subscribe collective or hierarchy.

**\*QMGR**

The subscription will only forward messages published on the topic within this queue manager.

**Variable User (VARUSER)**

Specifies whether user profiles other than the creator of the subscription can connect to it (subject to topic and destination authority checks).

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ANY**

Any user profiles can connect to the subscription.

**\*FIXED**

Only the user profile that created the subscription can connect to it.

**Request Publications (REQONLY)**

Specifies whether the subscriber will poll for updates via MQSUBRQ API, or whether all publications are delivered to this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*YES**

Publications are only delivered to this subscription in response to an MQSUBRQ API.

**\*NO**

All publications on the topic are delivered to this subscription.

**Publish Priority (PUBPTY)**

Specifies the priority of the message sent to this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPUB**

The priority of the message sent to this subscription is taken from that supplied in the published message.

**\*ASQDEF**

The priority of the message sent to this subscription is taken from the default priority of the queue defined as the destination.

**priority-value**

Specify a priority ranging from 0 through 9.

**Wildcard Schema (WSCHEMA)**

Specifies the schema to be used when interpreting wildcard characters in the topic string.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*TOPIC**

Wildcard characters represent portions of the topic hierarchy.

**\*CHAR**

Wildcard characters represent portions of strings.

**Expiry Time (EXPIRY)**

Specifies the expiry time of the subscription. After a subscription's expiry time has elapsed, it becomes eligible to be discarded by the queue manager and will receive no further publications.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*UNLIMITED**

The subscription does not expire.

**expiry-time**

Specify an expiry time in tenths of a second ranging from 0 through 999999999.

IBM i

**Copy MQ Service (CPYMQMSVC)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Copy MQ Service (CPYMQMSVC) command creates an MQ service definition of the same type and, for attributes not specified in the command, with the same attribute values as an existing service definition.

**Parameters**

Table 202. Command parameters

Keyword	Description	Choices	Notes
<u>FROMSVC</u>	From Service	Character value	Required, Key, Positional 1
<u>TOSVC</u>	To Service	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	<b>*NO</b> , *YES	Optional, Positional 4

Table 202. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>TEXT</u>	Text 'description'	Character value, *BLANK, *SAME	Optional, Positional 5
<u>STRCMD</u>	Start program	Single values: *SAME, *NONE Other values: Qualified object name	Optional, Positional 6
	Qualifier 1: Start program	Name	
	Qualifier 2: Library	Name	
<u>STRARG</u>	Start program arguments	Character value, *BLANK, *SAME	Optional, Positional 7
<u>ENDCMD</u>	End program	Single values: *SAME, *NONE Other values: Qualified object name	Optional, Positional 8
	Qualifier 1: End program	Name	
	Qualifier 2: Library	Name	
<u>ENDARG</u>	End program arguments	Character value, *BLANK, *SAME	Optional, Positional 9
<u>STDOUT</u>	Standard output	Character value, *BLANK, *SAME	Optional, Positional 10
<u>STDERR</u>	Standard error	Character value, *BLANK, *SAME	Optional, Positional 11
<u>TYPE</u>	Service type	*SAME, *CMD, *SVR	Optional, Positional 12
<u>CONTROL</u>	Service control	*SAME, *MANUAL, *QMGR, *STARTONLY	Optional, Positional 13

### From Service (FROMSVC)

Specifies the name of the existing service definition to provide values for the attributes not specified in this command.

The possible values are:

#### from-service-name

Specify the name of the source service.

### To Service (TOSVC)

The name of the new service definition to be created. The name can contain a maximum of 48 characters.

If a service definition with this name already exists, REPLACE(\*YES) must be specified.

The possible values are:

#### to-service-name

Specify the name of the service being created.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

The name of a message queue manager.

**Replace (REPLACE)**

Specifies whether the new service definition should replace an existing service definition with the same name.

The possible values are:

**\*NO**

This definition does not replace any existing service definition with the same name. The command fails if the named service definition already exists.

**\*YES**

Replace the existing service definition. If there is no definition with the same name, a new definition is created.

**Text 'description' (TEXT)**

Specifies text that briefly describes the service definition.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*BLANK**

The text is set to a blank string.

**description**

Specify no more than 64 characters enclosed in apostrophes.

**Start program (STRCMD)**

The name of the program to run.

The possible values are:

**\*SAME**

The attribute is unchanged.

**start-command**

The name of the start command executable.

**Start program arguments (STRARG)**

The arguments passed to the program at startup.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*BLANK**

No arguments are passed to the start command.

**start-command-arguments**

The arguments passed to the start command.

## **End program (ENDCMD)**

The name of the executable to run when the service is requested to stop.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*BLANK**

No end command is executed.

### **end-command**

The name of the end command executable.

## **End program arguments (ENDARG)**

The arguments passed to the end program when the service is requested to stop.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*BLANK**

No arguments are passed to the end command.

### **end-command-arguments**

The arguments passed to the end command.

## **Standard output (STDOUT)**

The path to a file to which the standard output of the service program is redirected.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*BLANK**

The standard output is discarded.

### **stdout-path**

The standard output path.

## **Standard error (STDERR)**

The path to a file to which the standard error of the service program is redirected.

The possible values are:

### **\*SAME**

The attribute is unchanged.

### **\*BLANK**

The standard error is discarded.

### **stderr-path**

The standard error path.

## **Service type (TYPE)**

Mode in which to run service.

The possible values are:

### **\*SAME**

The attribute is unchanged.

**\*CMD**

When started the command is executed but no status is collected or displayed.

**\*SVR**

The status of the executable started will be monitored and displayed.

**Service control (CONTROL)**

Whether the service should be started automatically at queue manager start.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*MANUAL**

The service is automatically started or stopped.

**\*QMGR**

The service is started and stopped as the queue manager is started and stopped.

**\*STARTONLY**

The service is started as the queue manager is started, but will not be requested to stop when the queue manager is stopped.

**Copy MQ Topic (CPYMQMTOP)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Copy MQ Topic (CPYMQMTOP) command creates an MQ topic object of the same type and, for attributes not specified in the command, with the same attribute values as an existing topic object.

**Parameters**

<i>Table 203. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>FROMTOP</u>	From topic	Character value	Required, Key, Positional 1
<u>TOTOP</u>	To topic	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 5
<u>TOPICSTR</u>	Topic string	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 6
<u>DURSUB</u>	Durable subscriptions	*SAME, *ASPARENT, *YES, *NO	Optional, Positional 7
<u>MGDDURMDL</u>	Durable model queue	<i>Character value</i> , *NONE, *SAME	Optional, Positional 8

Table 203. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>MGDNDURMDL</u>	Non-durable model queue	<i>Character value</i> , *NONE, *SAME	Optional, Positional 9
<u>PUBENBL</u>	Publish	*SAME, *ASPARENT, *YES, *NO	Optional, Positional 10
<u>SUBENBL</u>	Subscribe	*SAME, *ASPARENT, *YES, *NO	Optional, Positional 11
<u>DFTPTY</u>	Default message priority	0-9, *SAME, *ASPARENT	Optional, Positional 12
<u>DFTMSGPST</u>	Default message persistence	*SAME, *ASPARENT, *YES, *NO	Optional, Positional 13
<u>DFTPURRESP</u>	Default Put Response	*SAME, *ASPARENT, *SYNC, *ASYN	Optional, Positional 14
<u>WILDCARD</u>	Wildcard behavior	*SAME, *PASSTHRU, *BLOCK	Optional, Positional 15
<u>PMSGDLV</u>	Persistent message delivery	*SAME, *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 16
<u>NPMSGDLV</u>	Non-persistent message deliver	*SAME, *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 17
<u>CUSTOM</u>	Custom attribute	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 18

### From topic (FROMTOP)

Specifies the name of the existing topic object to provide values for the attributes not specified in this command.

The possible values are:

#### from-topic-name

Specify the name of the source MQ topic.

### To topic (TOTOP)

The name of the new topic object to be created. The name can contain a maximum of 48 characters.

If a topic object with this name already exists, REPLACE(\*YES) must be specified.

The possible values are:

#### to-topic-name

Specify the name of the MQ topic being created.

### Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

#### \*DFT

Use the default Queue Manager.

#### queue-manager-name

The name of a Queue Manager.

## Replace (REPLACE)

Specifies whether the new topic object should replace an existing topic object with the same name.

The possible values are:

### \*NO

This object does not replace any existing topic object with the same name. The command fails if the named topic object already exists.

### \*YES

Replace the existing topic object. If there is no object with the same name, a new object is created.

## Text 'description' (TEXT)

Specifies text that briefly describes the topic object.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

### \*SAME

The attribute is unchanged.

### \*BLANK

The text is set to a blank string.

### description

Specify no more than 64 characters enclosed in apostrophes.

## Topic string (TOPICSTR)

Specifies the topic string represented by this topic object definition.

The possible values are:

### topic-string

Specify a maximum of 256 bytes for the topic string.

**Note:** Topic strings of greater than 256 bytes can be specified using MQSC.

## Durable subscriptions (DURSUB)

Specifies whether applications are permitted to make durable subscriptions on this topic.

The possible values are:

### \*SAME

The attribute is unchanged.

### \*ASPARENT

Whether durable subscriptions can be made on this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

### \*YES

Durable subscriptions can be made on this topic.

### \*NO

Durable subscriptions cannot be made on this topic.

## Durable model queue (MGDDURMDL)

Specifies the name of the model queue to be used for durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

**\*SAME**

The attribute is unchanged.

**durable-model-queue**

Specify the name of the model queue.

**Non-durable model queue (MGDNDURMDL)**

Specifies the name of the model queue to be used for non-durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

**\*SAME**

The attribute is unchanged.

**non-durable-model-queue**

Specify the name of the model queue.

**Publish (PUBENBL)**

Specifies whether messages can be published to the topic.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPARENT**

Whether messages can be published to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*YES**

Messages can be published to the topic.

**\*NO**

Messages cannot be published to the topic.

**Subscribe (SUBENBL)**

Specifies whether applications are to be permitted to subscribe to this topic.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPARENT**

Whether applications can subscribe to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*YES**

Subscriptions can be made to this topic.

**\*NO**

Applications cannot subscribe to this topic.

**Default message priority (DFTPTY)**

Specifies the default priority of messages published to the topic.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPARENT**

The default priority is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**priority-value**

Specify a value ranging from 0 through 9.

**Default message persistence (DFTMSGPST)**

Specifies the message persistence to be used when applications specify the MQPER\_PERSISTENCE\_AS\_TOPIC\_DEF option.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPARENT**

The default persistence is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*YES**

Messages on this queue survive a restart of the queue manager.

**\*NO**

Messages on this queue are lost across a restart of the queue manager.

**Default Put Response (DFTPUTRESP)**

Specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO\_RESPONSE\_AS\_Q\_DEF option.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPARENT**

The default response type is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO\_RESPONSE\_AS\_Q\_DEF are issued as if MQPMO\_SYNC\_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application.

**\*ASYNCR**

Specifying this value ensures that the put operations to the queue that specify MQPMO\_RESPONSE\_AS\_Q\_DEF are always issued as if MQPMO\_ASYNC\_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application. An improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

**Wildcard behavior (WILDCARD)**

Specifies the behavior of wildcard subscriptions with respect to this topic.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*PASSTHRU**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will receive publications made to this topic and to topic strings more specific than this topic.

**\*BLOCK**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will not receive publications made to this topic or to topic strings more specific than this topic.

**Persistent message delivery (PMSGDLV)**

Specifies the delivery mechanism for persistent messages published to this topic.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*ALL**

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

**\*ALLDUR**

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

**\*ALLAVAIL**

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

**Non-persistent message delivery (NPMSGDLV)**

Specifies the delivery mechanism for non-persistent messages published to this topic.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*ALL**

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

**\*ALLDUR**

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

**\*ALLAVAIL**

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

**Custom attribute (CUSTOM)**

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*BLANK**

The text is set to a blank string.

**custom**

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

## Create Message Queue Manager (CRTMQM)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Create Message Queue Manager (CRTMQM) command creates a local queue manager that can be started with the Start Message Queue Manager (STRMQM) command.

### Parameters

Table 204. Command parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1
<u>TEXT</u>	Text 'description'	Character value, <b>*BLANK</b>	Optional, Positional 2
<u>TRGITV</u>	Trigger interval	0-999999999, <b>999999999</b>	Optional, Positional 3
<u>UDLMSGQ</u>	Undelivered message queue	Character value, <b>*NONE</b>	Optional, Positional 4
<u>DFTTMQ</u>	Default transmission queue	Character value, <b>*NONE</b>	Optional, Positional 5
<u>MAXHDL</u>	Maximum handle limit	0-999999999, <b>256</b>	Optional, Positional 6
<u>MAXUMSG</u>	Maximum uncommitted messages	1-999999999, <b>10000</b>	Optional, Positional 7
<u>DFTQMGR</u>	Default Queue Manager	*YES, <b>*NO</b>	Optional, Positional 8
<u>MQMLIB</u>	Queue Manager Library	Name, <b>*AUTO</b>	Optional, Positional 9
<u>MQMDIRP</u>	Data Directory Prefix	Character value, <b>*DFT</b>	Optional, Positional 10
<u>ASP</u>	ASP Number	1-32, <b>*SYSTEM</b> , *ASPDEV	Optional, Positional 11
<u>ASPDEV</u>	ASP device	Character value, *ASP	Optional, Positional 12
<u>THRESHOLD</u>	Journal receiver threshold	100000-1000000000, <b>*DFT</b> , *MIN, *MAX	Optional, Positional 13
<u>JRNBUFSIZ</u>	Journal buffer size	32000-15761440, <b>*DFT</b>	Optional, Positional 14

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

**queue-manager-name**

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

**Text 'description' (TEXT)**

Specifies text that briefly describes the queue manager definition.

The possible values are:

**\*BLANK**

No text is specified.

**description**

Specify no more than 64 characters enclosed in apostrophes.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

**Trigger interval (TRGITV)**

Specifies the trigger time interval, expressed in milliseconds, for use with queues that have TRGTYPE(\*FIRST) specified.

When the arrival of a message on a queue causes a trigger message to be put on the initiation queue, then any message that arrives on the same queue within the specified interval does not cause another trigger message to be put on the initiation queue.

The possible values are:

**999999999**

The trigger time interval is 999999999 milliseconds.

**interval-value**

Specify a value in milliseconds, in the range 0 through 999999999.

**Undelivered message queue (UDLMSGQ)**

Specifies the name of the local queue that is to be used for undelivered messages. Messages are put on this queue if they cannot be routed to their correct destination.

The possible values are:

**\*NONE**

There is no undelivered-message queue. The attribute is set to a blank string.

**undelivered-message-queue-name**

Specify the name of a local queue that is to be used as the undelivered-message queue.

**Default transmission queue (DFTTMQ)**

Specifies the name of the local transmission queue that is to be used as the default transmission queue. Messages transmitted to a remote queue manager are put on the default transmission queue if there is no transmission queue defined for their destination.

The possible values are:

**\*NONE**

There is no default transmission queue. The attribute is set to a blank string.

**default-transmission-queue-name**

Specify the name of a local transmission queue that is to be used as the default transmission queue.

## Maximum handle limit (MAXHDL)

Specifies the maximum number of handles that any one job can have open at the same time.

The possible values are:

### **256**

The default number of open handles is 256.

### **maximum-handle-limit**

Specify a value in the range 0 through 999999999.

## Maximum uncommitted messages (MAXUMSG)

Specifies the maximum number of uncommitted messages. That is:

- The number of messages that can be retrieved, plus
- The number of messages that can be put on a queue, plus
- Any trigger messages generated within this unit of work,

under any one syncpoint. This limit does not apply to messages that are retrieved or put outside syncpoint.

The possible values are:

### **10000**

The default value is 10000 uncommitted messages.

### **maximum-uncommitted-messages**

Specify a value in the range 1 through 999999999.

## Default Queue Manager (DFTQMGR)

Specifies whether the queue manager being created is the default queue manager.

The possible values are:

### **\*NO**

The queue manager is not to be the default queue manager.

### **\*YES**

The queue manager is to be the default queue manager.

## Queue Manager Library (MQMLIB)

Specifies the library to be used by the queue manager.

The possible values are:

### **\*AUTO**

The library to be used by the queue manager is chosen automatically.

### **library name**

Specify the library to be used by the queue manager.

## Data Directory Prefix (MQMDIRP)

Specifies the data directory prefix to be used by the queue manager. The queue manager creates a directory here to store its data files, principally message data residing on queues.

The possible values are:

### **\*DFT**

The default data directory prefix is '/QIBM/UserData/mqm'.

## **directory-prefix**

Specify the data directory prefix to be used by the queue manager. This directory prefix may be located in a filesystem either in a local disk pool or in a networked filesystem e.g. NFS.

The queue manager directory can be placed into an independent auxiliary storage pool by setting the data directory prefix accordingly. For example specifying MQMDIRP('/MYASPDEV/QIBM/UserData/mqm/qmgrs') would store queue manager data in the MYASPDEV device.

The queue manager library, journals and journal receivers can be placed into an independent auxiliary storage pool by setting the ASP and ASPDEV parameters.

Independent auxiliary storage pools can be switched between systems to increase the availability of a queue manager. Refer to the IBM MQ documentation on configuring a queue manager for high availability.

## **ASP Number (ASP)**

Specifies the auxiliary storage pool from which the system allocates storage for the queue manager library, journal and journal receivers.

Note that the auxiliary storage pool identified in this parameter will not be used for the queue manager data files which are located in the integrated file system (IFS). To allocate queue manager data files in a specific auxiliary storage pool refer to the MQMDIRP parameter.

The possible values are:

### **\*SYSTEM**

The system auxiliary storage pool (ASP 1) provides the storage for the queue manager library, journal and journal receivers.

### **\*ASPDEV**

Storage for the queue manager library, journal and journal receivers is allocated from the primary or secondary ASP specified for the ASPDEV parameter.

### **auxiliary-storage-pool-number**

Specify a value in the range 1 through 32 to specify the number of the system or basic user ASP to provide storage for the queue manager library, journal and journal receivers.

Independent auxiliary storage pools can be switched between systems to increase the availability of a queue manager. Refer to the IBM MQ documentation on configuring a queue manager for high availability.

## **ASP device (ASPDEV)**

Specifies the auxiliary storage pool (ASP) device name where storage is allocated for the queue manager library, journal and journal receivers.

Note that the auxiliary storage pool device name identified in this parameter will not be used for the queue manager data files which are located in the integrated file system (IFS). To allocate queue manager data files in a specific auxiliary storage pool refer to the MQMDIRP parameter.

The possible values are:

### **\*ASP**

The storage for the queue manager library, journal and journal receivers is allocated from the system or basic user ASP specified for the ASP parameter.

### **device-name**

Specify the name of a primary or secondary ASP device. The storage for the queue manager library, journal and journal receivers is allocated from the primary or secondary ASP. The primary or secondary ASP must have already been activated (by varying on the ASP device) and have a status of 'Available'.

Independent auxiliary storage pools can be switched between systems to increase the availability of a queue manager. Refer to the IBM MQ documentation on configuring a queue manager for high availability.

## Journal receiver threshold (THRESHOLD)

Specifies the threshold in kilobytes for the queue managers journal receivers.

The possible values are:

### **\*DFT**

Use the default threshold of 100000 KB.

### **threshold-value**

Specify a value in the range 100000 through 1000000000 in kilobytes (KB) of storage. Each 1000 KB specifies 1024000 bytes of storage space. When the size of the space for the journal receiver is larger than the size specified by this value, a message is sent to the identified message queue if appropriate, and journaling continues.

## Journal buffer size (JRNBUFSIZ)

Specifies the journal buffer size in bytes

The possible values are:

### **\*DFT**

Use the default journal buffer size of 32000 bytes.

### **journal-buffer-size**

Specify a value in bytes, in the range 32000 through 15761440.

## Create MQ AuthInfo object (CRTMQMAUTI)

### **Where allowed to run**

All environments (\*ALL)

### **Threadsafe**

Yes

The Create MQ AuthInfo object (CRTMQMAUTI) command creates a new authentication information object, specifying those attributes that are different from the system default.

## Parameters

Table 205. Command parameters

Keyword	Description	Choices	Notes
<u>AINAME</u>	AuthInfo name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Required, Key, Positional 2
<u>AUTHTYPE</u>	AuthInfo type	*CRLLDAP, *OCSP, *IDPWOS, *IDPWLDAP	Required, Key, Positional 3
<u>CONNNAME</u>	Connection name	Character value, *SYSDFTAI	Optional, Positional 4
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 5
<u>TEXT</u>	Text 'description'	Character value, *SYSDFTAI, *NONE	Optional, Positional 6
<u>USERNAME</u>	User name	Character value, *SYSDFTAI, *NONE	Optional, Positional 7
<u>PASSWORD</u>	User password	Character value, *SYSDFTAI, *NONE	Optional, Positional 8

Table 205. Command parameters (continued)

<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>OCSPURL</u>	OCSP Responder URL	<i>Character value, *SAME</i>	Optional, Positional 9
<u>CHKCLNT</u>	Authentication checks required	*ASQMGR, *REQUIRED, *REQADM	Optional, Positional 10
<u>CHKLOCL</u>	Authentication checks required	*NONE, *OPTIONAL, *REQUIRED, *REQADM	Optional, Positional 11
<u>FAILDELAY</u>	Failure delay	<i>Integer value</i>	Optional, Positional 12
<u>BASEDNU</u>	Base user DN	<i>Character value, *SAME</i>	Optional, Positional 13
<u>ADOPTCTX</u>	Context adoption	<i>Integer value</i>	Optional, Positional 14
<u>CLASSUSR</u>	LDAP object class	<i>Character value, *SAME</i>	Optional, Positional 15
<u>SHORTUSR</u>	Short user name	<i>Character value, *SAME</i>	Optional, Positional 16
<u>USRFIELD</u>	User field	<i>Character value, *SAME</i>	Optional, Positional 17
<u>SECCOMM</u>	LDAP communications	<i>Character value, *SAME</i>	Optional, Positional 18
<u>AUTHORMD</u>	Authorization method	<i>Character value, *OS, *SEARCHGRP, *SEARCHUSR, V9.10, *SRCHGRPSN</i>	Optional, Positional 19
<u>BASEDNG</u>	Base DN for groups	<i>Character value, *SAME</i>	Optional, Positional 20
<u>CLASSGRP</u>	Object class for group	<i>Character value, *SAME</i>	Optional, Positional 21
<u>FINDGRP</u>	Attribute to find group membership	<i>Character value, *SAME</i>	Optional, Positional 22
<u>GRPFIELD</u>	Simple name for group	<i>Character value, *SAME</i>	Optional, Positional 23
<u>NESTGRP</u>	Group nesting	*NO *YES	Optional, Positional 24
<u>AUTHENMD</u>	Authentication method	*OS Cannot be changed	Optional, Positional 25

### **AuthInfo name (AINAME)**

The name of the new authentication information object to create.

The possible values are:

#### **authentication-information-name**

Specify the name of the authentication information object. The maximum string length is 48 characters.

### **Message Queue Manager name (MQMNAME)**

The name of the queue manager.

The possible values are:

#### **\*DFT**

Use the default queue manager.

#### **queue-manager-name**

The name of an existing message queue manager. The maximum string length is 48 characters.

## Adopt context (ADOPTCTX)

Whether to use the presented credentials as the context for this application. This means that they are used for authorization checks, shown on administrative displays, and appear in messages.

### YES

The user ID presented in the MQCSP structure, which has been successfully validated by password, is adopted as the context to use for this application. Therefore, this user ID will be the credentials checked for authorization to use IBM MQ resources.

If the user ID presented is an LDAP user ID, and authorization checks are done using operating system user IDs, the `SHORTUSR` associated with the user entry in LDAP will be adopted as the credentials for authorization checks to be done against.

### NO

Authentication will be performed on the user ID and password presented in the MQCSP structure, but then the credentials will not be adopted for further use. Authorization will be performed using the user ID the application is running under.

This attribute is only valid for an **AUTHTYPE** of `*IDPWOS` and `*IDPWLDAP`.

## Authentication method (AUTHENMD)

The authentication method used for this application.

### \*OS

Use operating system groups to determine permissions associated with a user.

You can use only **\*OS** to set the authentication method.

This attribute is valid only for an **AUTHTYPE** of `*IDPWOS`.

## Authorization method (AUTHORMD)

The authorization method used for this application.

### \*OS

Use operating system groups to determine permissions associated with a user.

This is how IBM MQ has previously worked, and is the default value.

### \*SEARCHGRP

A group entry in the LDAP repository contains an attribute listing the Distinguished Name of all the users belonging to that group. Membership is indicated by the attribute defined in `FINDGRP`. This value is typically `member` or `uniqueMember`.

### \*SEARCHUSR

A user entry in the LDAP repository contains an attribute listing the Distinguished Name of all the groups to which the specified user belongs. The attribute to query is defined by the `FINDGRP` value, typically `memberOf`.

### V 9.1.0 \*SRCHGRPSN

A group entry in the LDAP repository contains an attribute listing the short user name of all the users belonging to that group. The attribute in the user record that contains the short user name is specified by `SHORTUSR`.

Membership is indicated by the attribute defined in `FINDGRP`. This value is typically `memberUid`.

**Note:** This authorization method should only be used if all user short names are distinct.

Many LDAP servers use an attribute of the group object to determine group membership and you should, therefore, set this value to `SEARCHGRP`.

Microsoft Active Directory typically stores group memberships as a user attribute. The IBM Tivoli Directory Server supports both methods.

In general, retrieving memberships through a user attribute will be faster than searching for groups that list the user as a member.

This attribute is valid only for an **AUTHTYPE** of *\*IDPWLDAP*.

### **AuthInfo type (AUTHTYPE)**

The type of the authentication information object. There is no default value

The possible values are:

#### **\*CRLLDAP**

The type of the authentication information object is CRLLDAP.

#### **\*OCSP**

The type of the authentication information objects is OCSPURL.

#### **\*IDPWOS**

Connection authentication user ID and password checking is done using the operating system.

#### **\*IDPWLDAP**

Connection authentication user ID and password checking is done using an LDAP server.

### **Base DN for groups (BASEDNG)**

In order to be able to find group names, this parameter must be set with the base DN to search for groups in the LDAP server.

This attribute is valid only for **AUTHTYPE** of *\*IDPWLDAP*.

### **Base user DN (BASEDNU)**

In order to be able to find the short user name attribute (see [SHORTUSR](#)) this parameter must be set with the base DN to search for users within the LDAP server.

This attribute is valid only for **AUTHTYPE** of *\*IDPWLDAP*.

### **Check client (CHKCLNT)**

Whether connection authentication checks are required by all locally bound connections, or only checked when a user ID and password are provided in the MQCSP structure.

These attributes are valid only for an **AUTHTYPE** of *\*IDPWOS* or *\*IDPWLDAP*. The possible values are:

#### **\*ASQMGR**

In order for the connection to be allowed in, it must meet the connection authentication requirements defined on the queue manager. If the CONNAUTH field provides an authentication information object, and the value of CHKCLNT is *\*REQUIRED*, the connection will not be successful unless a valid user ID and password are supplied. If the CONNAUTH field does not provide an authentication information object, or the value of CHKCLNT is not *\*REQUIRED*, then the user ID and password are not required.

#### **\*REQUIRED**

Requires that all applications provide a valid user ID and password.

#### **\*REQDADM**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the *\*OPTIONAL* setting.

### **Check local (CHKLOCL)**

Whether connection authentication checks are required by all locally bound connections, or only checked when a user ID and password are provided in the MQCSP structure.

These attributes are valid only for an **AUTHTYPE** of *\*IDPWOS* or *\*IDPWLDAP*. The possible values are:

**\*NONE**

Switches off checking.

**\*OPTIONAL**

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

**\*REQUIRED**

Requires that all applications provide a valid user ID and password.

**\*REQDADM**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the \*OPTIONAL setting.

**Class group (CLASSGRP)**

The LDAP object class used for group records in the LDAP repository.

If the value is blank, **groupOfNames** is used.

Other commonly used values include *groupOfUniqueNames* or *group*.

This attribute is valid only for **AUTHTYPE** of \*IDPWLDAP.

**Class user (CLASSUSR)**

The LDAP object class used for user records in the LDAP repository.

If blank, the value defaults to *inetOrgPerson*, which is generally the value needed.

This attribute is valid only for an **AUTHTYPE** of \*IDPWLDAP.

**Connection name (CONNAME)**

The DNS name or IP address of the host on which the LDAP server is running, together with an optional port number. The default port number is 389. No default is provided for the DNS name or IP address.

This field is only valid for \*CRLLDAP or \*IDPWLDAP authentication information objects, when it is required.

When used with IDPWLDAP authentication information objects, this can be a comma separated list of connection names.

The possible values are:

**\*SYSDFTAI**

The connection name is set to the system default value in SYSTEM.DEFAULT.AUTHINFO.CRLLDAP.

**connection-name**

Specify the fully qualified DNS name or IP address of the host together with an optional port number. The maximum string length is 264 characters.

**Failure delay (FAILDELAY)**

When a user ID and password are provided for connection authentication, and the authentication fails due to the user ID or password being incorrect, this is the delay, in seconds, before the failure is returned to the application.

This can aid in avoiding busy loops from an application that simply retries, continuously, after receiving a failure.

The value must be in the range 0 - 60 seconds. The default value is 1.

This attribute is only valid for an AUTHTYPE of \*IDPWOS and \*IDPWLDAP.

**Group membership attribute (FINDGRP)**

Name of the attribute used within an LDAP entry to determine group membership.

When AUTHORMD = \*SEARCHGRP, this attribute is typically set to *member* or *uniqueMember*.

When AUTHORMD = \*SEARCHUSR, this attribute is typically set to *memberOf*.

**V 9.1.0** When AUTHORMD = \*SRCHGRPSN, this attribute is typically set to *memberUid*.

When left blank, if:

- AUTHORMD = \*SEARCHGRP, this attribute defaults to *memberOf*
- AUTHORMD = \*SEARCHUSR, this attribute defaults to *member*
- **V 9.1.0** AUTHORMD = \*SRCHGRPSN, this attribute defaults to *memberUid*

This attribute is valid only for an **AUTHTYPE** of \*IDPWLDAP.

### Simple name for group (GRPFIELD)

If the value is blank, commands like setmqaut must use a qualified name for the group. The value can either be a full DN, or a single attribute.

This attribute is valid only for an **AUTHTYPE** of \*IDPWLDAP.

### Group nesting (NESTGRP)

The possible values are:

#### **\*NO**

Only the initially discovered groups are considered for authorization.

#### **\*YES**

The group list is searched recursively to enumerate all the groups to which a user belongs.

The group's Distinguished Name is used when searching the group list recursively, regardless of the authorization method selected in AUTHORMD.

This attribute is valid only for an **AUTHTYPE** of \*IDPWLDAP.

### OCSP Responder URL (OCSPURL)

The URL of the OCSP Responder used to check for certificate revocation. This must be an HTTP URL containing the host name and port number of the OCSP Responder. If the OCSP Responder is using port 80, which is the default for HTTP, then the port number may be omitted.

This field is only valid for OCSP authentication information objects.

The possible values are:

#### **\*SYSDFTAI**

The OCSP Responder URL is set to the system default value in SYSTEM.DEFAULT.AUTHINFO.OCSP.

#### **OCSP-Responder-URL**

The OCSP Responder URL. The maximum string length is 256 characters.

### Replace (REPLACE)

If an authentication information object with the same name already exists, this specifies whether it is replaced.

The possible values are:

#### **\*NO**

This definition does not replace any existing authentication information object with the same name. The command fails if the named authentication information object already exists.

**\*YES**

Replace an existing authentication information object. A new object is created if the named authentication information object does not exist.

**Secure comms (SECCOMM)**

Whether connectivity to the LDAP server should be done securely using TLS

**YES**

Connectivity to the LDAP server is made securely using TLS.

The certificate used is the default certificate for the queue manager, named in CERTLABL on the queue manager object, or if that is blank, the one described in [Digital certificate labels, understanding the requirements](#).

The certificate is located in the key repository specified in SSLKEYR on the queue manager object. A cipherspec will be negotiated that is supported by both IBM MQ and the LDAP server.

If the queue manager is configured to use SSLFIPS(YES) or SUITEB cipher specs, then this is taken account of in the connection to the LDAP server as well.

**ANON**

Connectivity to the LDAP server is made securely using TLS just as for SECCOMM(YES) with one difference.

No certificate is sent to the LDAP server; the connection will be made anonymously. To use this setting, ensure that the key repository specified in SSLKEYR, on the queue manager object, does not contain a certificate marked as the default.

**NO**

Connectivity to the LDAP server does not use TLS.

This attribute is valid only for an **AUTHTYPE** of *\*IDPWLDAP*

**Short user (SHORTUSR)**

A field in the user record to be used as a short user name in IBM MQ.

This field must contain values of 12 characters or less. This short user name is used for the following purposes:

- If LDAP authentication is enabled, but LDAP authorization is not enabled, this is used as an operating system user ID for authorization checks. In this case, the attribute must represent an operating system user ID.
- If LDAP authentication and authorization are both enabled, this is used as the user ID carried with the message in order for the LDAP user name to be rediscovered when the user ID inside the message needs to be used.

For example, on another queue manager, or when writing report messages. In this case, the attribute does not need to represent an operating system user ID, but must be a unique string. An employee serial number is an example of a good attribute for this purpose.

This attribute is valid only for an **AUTHTYPE** of *\*IDPWLDAP* and is mandatory.

**Text 'description' (TEXT)**

A short text description of the authentication information object.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

**\*SYSDFTAI**

The text string is set to the system default value in SYSTEM.DEFAULT.AUTHINFO.CRLLDAP.

**\*NONE**

The text is set to a blank string.

**description**

The string length can be up to 64 characters enclosed in apostrophes.

**User field (USRFIELD)**

If the user ID provided by an application for authentication does not contain a qualifier for the field in the LDAP user record, that is, it does not contain an '=' sign, this attribute identifies the field in the LDAP user record that is used to interpret the provided user ID.

This field can be blank. If this is the case, any unqualified user IDs use the [SHORTUSR](#) parameter to interpret the provided user ID.

The contents of this field will be concatenated with an '=' sign, together with the value provided by the application, to form the full user ID to be located in an LDAP user record. For example, the application provides a user of fred and this field has the value cn, then the LDAP repository will be searched for cn=fred.

This attribute is valid only for an **AUTHTYPE** of *\*IDPWLDAP*.

**User name (USERNAME)**

The distinguished name of the user that is binding to the directory. The default user name is blank.

This field is only valid for *\*CRLLDAP* or *\*IDPWLDAP* authentication information objects.

The possible values are:

**\*SYSDFTAI**

The user name is set to the system default value in SYSTEM.DEFAULT.AUTHINFO.CRLLDAP.

**\*NONE**

The user name is blank.

**LDAP-user-name**

Specify the Distinguished name of the LDAP user. The maximum string length is 1024 characters.

**User password (PASSWORD)**

The password for the LDAP user.

This field is only valid for *\*CRLLDAP* or *\*IDPWLDAP* authentication information objects.

The possible values are:

**\*SYSDFTAI**

The password is set to the system default value in SYSTEM.DEFAULT.AUTHINFO.CRLLDAP.

**\*NONE**

The password is blank.

**LDAP-password**

The LDAP user password. The maximum string length is 32 characters.

 IBM i**Create MQ Channel (CRTMQMCHL)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Create MQ Channel (CRTMQMCHL) command creates a new MQ channel definition, specifying those attributes that are to be different from the default values.

## Parameters

Table 206. Command parameters			
Keyword	Description	Choices	Notes
<a href="#">CHLNAME</a>	Channel name	Character value	Required, Key, Positional 1
<a href="#">CHLTYPE</a>	Channel type	*RCVR, *SDR, *SVR, *RQSTR, *SVRCN, *CLUSSDR, *CLUSRCVR, *CLTCN	Required, Key, Positional 2
<a href="#">MQMNAME</a>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Key, Positional 3
<a href="#">REPLACE</a>	Replace	<b>*NO</b> , *YES	Optional, Positional 4
<a href="#">TRPTYPE</a>	Transport type	*LU62, *TCP, <b>*SYSDFTCHL</b>	Optional, Positional 5
<a href="#">TEXT</a>	Text 'description'	Character value, *BLANK, <b>*SYSDFTCHL</b>	Optional, Positional 6
<a href="#">TGTMQMNAME</a>	Target Queue Manager	Character value, *NONE, <b>*SYSDFTCHL</b>	Optional, Positional 7
<a href="#">CONNNAME</a>	Connection name	Character value, *NONE, <b>*SYSDFTCHL</b>	Optional, Positional 8
<a href="#">TPNAME</a>	Transaction Program Name	Character value, *BLANK, <b>*SYSDFTCHL</b>	Optional, Positional 9
<a href="#">MODENAME</a>	Mode Name	Character value, *BLANK, <b>*SYSDFTCHL</b>	Optional, Positional 10
<a href="#">TMQNAME</a>	Transmission queue	Character value, <b>*SYSDFTCHL</b>	Optional, Positional 11
<a href="#">MCANAME</a>	Message channel agent	Single values: <b>*SYSDFTCHL</b> , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 12
	Qualifier 1: Message channel agent	Name	
	Qualifier 2: Library	Name, <b>*CURLIB</b>	
<a href="#">MCAUSRID</a>	Message channel agent user ID	Character value, *NONE, *PUBLIC, <b>*SYSDFTCHL</b>	Optional, Positional 13
<a href="#">MCATYPE</a>	Message channel agent Type	*PROCESS, *THREAD, <b>*SYSDFTCHL</b>	Optional, Positional 14
<a href="#">BATCHINT</a>	Batch Interval	0-999999999, <b>*SYSDFTCHL</b>	Optional, Positional 15
<a href="#">BATCHSIZE</a>	Batch size	1-9999, <b>*SYSDFTCHL</b>	Optional, Positional 16
<a href="#">DSCITV</a>	Disconnect interval	0-999999, <b>*SYSDFTCHL</b>	Optional, Positional 17
<a href="#">SHORTTMR</a>	Short retry interval	0-999999999, <b>*SYSDFTCHL</b>	Optional, Positional 18

Table 206. Command parameters (continued)

Keyword	Description	Choices	Notes
<a href="#">SHORTRTY</a>	Short retry count	0-999999999, <b>*SYSDFTCHL</b>	Optional, Positional 19
<a href="#">LONGTMR</a>	Long retry interval	0-999999999, <b>*SYSDFTCHL</b>	Optional, Positional 20
<a href="#">LONGRTY</a>	Long retry count	0-999999999, <b>*SYSDFTCHL</b>	Optional, Positional 21

Table 206. Command parameters (continued)

<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>NETPRTY</u>	Network Connection Priority	0-9, <b>*SYSDFTCHL</b>	Optional, Positional 45
<u>SSLCIPH</u>	TLS CipherSpec	<i>Character value</i> , '*TLS_RSA_WITH_NULL_MD5', '*TLS_RSA_WITH_NULL_SHA', '*TLS_RSA_EXPORT_WITH_RC4_40_MD5', '*TLS_RSA_WITH_RC4_128_MD5', '*TLS_RSA_WITH_RC4_128_SHA', '*TLS_RSA_EXPORT_WITH_RC2_40_MD5', '*TLS_RSA_WITH_DES_CBC_SHA', '*TLS_RSA_WITH_3DES_EDE_CBC_SHA', '*TLS_RSA_WITH_AES_128_CBC_SHA', '*TLS_RSA_WITH_AES_256_CBC_SHA', *NONE, <b>*SYSDFTCHL</b>	Optional, Positional 46 CipherSpec TLS_RSA_WITH_3DES_EDE_CBC_SHA is deprecated.
<u>SSLCAUTH</u>	TLS Client Authentication	*REQUIRED, *OPTIONAL, <b>*SYSDFTCHL</b>	Optional, Positional 47
<u>SSLPEER</u>	TLS Peer name	<i>Character value</i> , *NONE, <b>*SYSDFTCHL</b>	Optional, Positional 48
<u>LOCLADDR</u>	Local communication address	<i>Character value</i> , *NONE, <b>*SYSDFTCHL</b>	Optional, Positional 49
<u>BATCHHB</u>	Batch Heartbeat Interval	0-999999999, <b>*SYSDFTCHL</b>	Optional, Positional 50
<u>USERID</u>	Task user identifier	<i>Character value</i> , *NONE, <b>*SYSDFTCHL</b>	Optional, Positional 51
<u>PASSWORD</u>	Password	<i>Character value</i> , *NONE, <b>*SYSDFTCHL</b>	Optional, Positional 52
<u>KAINT</u>	Keep Alive Interval	<i>Integer</i> , *AUTO, <b>*SYSDFTCHL</b>	Optional, Positional 53
<u>COMPHDR</u>	Header Compression	Values (up to 2 repetitions): *NONE, *SYSTEM, <b>*SYSDFTCHL</b>	Optional, Positional 54
<u>COMPMSG</u>	Message Compression	Single values: *ANY Other values (up to 4 repetitions): *NONE, *RLE, *ZLIBHIGH, *ZLIBFAST, <b>*SYSDFTCHL</b>	Optional, Positional 55

Table 206. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>MONCHL</u>	Channel Monitoring	*QMGR, *OFF, *LOW, *MEDIUM, *HIGH, <b>*SYSDFTCHL</b>	Optional, Positional 56
<u>STATCHL</u>	Channel Statistics	*QMGR, *OFF, *LOW, *MEDIUM, *HIGH, <b>*SYSDFTCHL</b>	Optional, Positional 57
<u>CLWLRANK</u>	Cluster Workload Rank	0-9, <b>*SYSDFTCHL</b>	Optional, Positional 58
<u>CLWLPRTY</u>	Cluster Workload Priority	0-9, <b>*SYSDFTCHL</b>	Optional, Positional 59
<u>CLWLWGHT</u>	Cluster Channel Weight	1-99, <b>*SYSDFTCHL</b>	Optional, Positional 60
<u>SHARECNV</u>	Sharing Conversations	0-999999999, <b>*SYSDFTCHL</b>	Optional, Positional 61
<u>PROPCTL</u>	Property Control	*COMPAT, *NONE, *ALL, <b>*SYSDFTCHL</b>	Optional, Positional 62
<u>MAXINST</u>	Maximum Instances	0-999999999, <b>*SYSDFTCHL</b>	Optional, Positional 63
<u>MAXINSTC</u>	Maximum Instances Per Client	0-999999999, <b>*SYSDFTCHL</b>	Optional, Positional 64
<u>CLNTWGHT</u>	Client Channel Weight	0-99, <b>*SYSDFTCHL</b>	Optional, Positional 65
<u>AFFINITY</u>	Connection Affinity	*PREFERRED, *NONE, <b>*SYSDFTCHL</b>	Optional, Positional 66
<u>BATCHLIM</u>	Batch Data Limit	0-999999, <b>*SYSDFTCHL</b>	Optional, Positional 67
<u>DFTRECON</u>	Default client reconnection	*NO, *YES, *QMGR, *DISABLED, <b>*SYSDFTCHL</b>	Optional, Positional 68

### Channel name (CHLNAME)

Specifies the name of the new channel definition; the name can contain a maximum of 20 characters. Channel names must be unique. If a channel definition with this name already exists, REPLACE(\*YES) must be specified.

### Channel type (CHLTYPE)

Specifies the type of the channel being defined.

The possible values are:

**\*SDR**

Sender channel

**\*SVR**

Server channel

**\*RCVR**

Receiver channel

**\*RQSTR**

Requester channel

**\*SVRCN**

Server-connection channel

**\*CLUSSDR**

Cluster-sender channel

**\*CLUSRCVR**

Cluster-receiver channel

**\*CLTCN**

Client-connection channel

**Message Queue Manager name (MQMNAME)**

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

**message-queue-manager-name**

The name of a message queue manager.

**Replace (REPLACE)**

Specifies whether the new channel definition should replace an existing channel definition with the same name.

The possible values are:

**\*NO**

Do not replace the existing channel definition. The command fails if the named channel definition already exists.

**\*YES**

Replace the existing channel definition. If there is no definition with the same name, a new definition is created.

**Transport type (TRPTYPE)**

Specifies the transmission protocol.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*LU62**

SNA LU 6.2.

**\*TCP**

Transmission Control Protocol / Internet Protocol (TCP/IP).

**Text 'description' (TEXT)**

Specifies text that briefly describes the channel definition.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*BLANK**

The text is set to a blank string.

**description**

Specify no more than 64 characters enclosed in apostrophes.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

## Target Queue Manager (TGTMQMNAME)

Specifies the name of the target queue manager.

The possible values are:

### \*SYSDFTCHL

The value of this attribute is taken from the system default channel of the specified type.

### \*NONE

The name of the target queue manager for a client connection channel (CHLTYPE) \*CLTCN is unspecified.

### message-queue-manager-name

The name of the target message queue manager for a client connection channel (CHLTYPE) \*CLTCN.

For other channel types this parameter must not be specified.

## Connection name (CONNAME)

Specifies the name of the machine to connect.

The possible values are:

### \*SYSDFTCHL

The value of this attribute is taken from the system default channel of the specified type.

### \*NONE

The connection name is blank.

### connection-name

Specify the connection name as required by the transmission protocol:

- For \*LU62, specify the name of the CSI object.
- For \*TCP, specify either the host name, or the network address of the remote machine (or the local machine for cluster-receiver channels). This can be followed by an optional port number enclosed in parentheses.

 On Multiplatforms, the TCP/IP connection name parameter of a cluster-receiver channel is optional. If you leave the connection name blank, IBM MQ generates a connection name for you, assuming the default port and using the current IP address of the system. You can override the default port number, but still use the current IP address of the system. For each connection name leave the IP name blank, and provide the port number in parentheses; for example:

```
(1415)
```

The generated **CONNAME** is always in the dotted decimal (IPv4) or hexadecimal (IPv6) form, rather than in the form of an alphanumeric DNS host name.

Where a port is not specified the default port 1414 is assumed.

For cluster-receiver channels the connection name relates to the local queue manager, and for other channels it relates to the target queue manager.

This parameter is required for channels with channel type (CHLTYPE) of \*SDR, \*RQSTR, \*CLTCN and \*CLUSSDR. It is optional for \*SVR and \*CLUSRCVR channels, and is not valid for \*RCVR or \*SVRCN channels.

## Transaction Program Name (TPNAME)

This parameter is valid for channels with a TRPTYPE defined as LU 6.2 only.

This parameter must be set to the SNA transaction program name, unless the CONNAME contains a side-object name in which case it must be set to blanks. The name is taken instead from the CPI-C Communications Side Object.

This parameter is not valid for channels with a CHLTYPE defined as \*RCVR.

The possible values are:

**\*SAME**

The value of this attribute does not change.

**\*NONE**

No transaction program name is specified.

**\*BLANK**

The transaction program name is taken from CPI-C Communications Side Object. The side object name must be specified in the CONNAME parameter.

**Transaction Program Name**

Specify the SNA transaction program name.

### **Mode Name (MODENAME)**

This parameter is valid for channels with a TRPTYPE defined as LU 6.2. If TRPTYPE is not defined as LU 6.2 the data is ignored and no error message is issued.

If specified, the value must be set to the SNA mode name, unless the CONNAME contains a side-object name, in which case it must be set to blanks. The name is then taken from the CPI-C Communications Side Object.

This parameter is not valid for channels with CHLTYPE defined as \*RCVR or \*SVRCONN.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*BLANK**

Name will be taken from the CPI-C Communications Side Object. This must be specified in the CONNAME parameter.

**\*NONE**

No mode name is specified.

**SNA-mode-name**

Specify the SNA Mode Name

### **Transmission queue (TMQNAME)**

Specifies the name of the transmission queue.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**transmission-queue-name**

Specify the name of the transmission queue.

A transmission queue name is required if the channel type (CHLTYPE) is \*SDR or \*SVR. For other channel types, the parameter must not be specified.

### **Message channel agent (MCANAME)**

This parameter is reserved and should not be used.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NONE**

The MCA program name is blank.

This parameter cannot be specified for a channel type (CHLTYPE) of \*RCVR, \*SVRCN, or \*CLTCN.

**Message channel agent user ID (MCAUSRID)**

Specifies the message channel agent user identifier which is to be used by the message channel agent for authorization to access MQ resources, including (if PUTAUT is \*DFT) authorization to put the message to the destination queue for receiver or requester channels.

The possible values are:

**\*SYSDFTCHL**

The value is taken from the system default channel for the type of the channel being created.

**\*NONE**

The message channel agent uses its default user identifier.

**\*PUBLIC**

Uses the public authority.

**mca-user-identifier**

Specify the user identifier to be used.

This parameter cannot be specified for a channel type (CHLTYPE) of \*CLTCN.

**Message channel agent Type (MCATYPE)**

Specifies whether the message-channel-agent program should run as a thread or a process.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*PROCESS**

The message channel agent runs as a separate process.

**\*THREAD**

The message channel agent runs as a separate thread.

This parameter can only be specified for a channel type (CHLTYPE) of \*SDR, \*SVR, \*RQSTR, \*CLUSSDR or \*CLUSRCVR.

**Batch Interval (BATCHINT)**

The minimum amount of time, in milliseconds, that a channel will keep a batch open.

The batch is terminated by which ever of the following occurs first: BATCHSZ messages have been sent, BATCHLIM bytes have been sent, or the transmission queue is empty and BATCHINT is exceeded.

The default value is 0, which means that the batch is terminated as soon as the transmission queue becomes empty (or the BATCHSZ limit is reached).

The value must be in the range 0 through 999999999.

This parameter is valid for channels with CHLTYPE defined as \*SDR, \*SVR, \*CLUSSDR, or \*CLUSRCVR.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**batch-interval**

Specify a value in the range 0 through 999999999. A value of 0 indicates the batch will be terminated as soon as the transmission queue is empty,

**Batch size (BATCHSIZE)**

Specifies the maximum number of messages that should be sent down a channel before a checkpoint is taken.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**batch-size**

Specify a value in the range 1 through 9999

This parameter cannot be specified for channel types (CHLTYPE) \*CLTCN or \*SVRCN.

**Disconnect interval (DSCITV)**

Specifies the disconnect interval, which defines the maximum number of seconds that the channel waits for messages to be put on a transmission queue before closing the channel.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**disconnect-interval**

Specify a value in the range 0 through 999999. A value of 0 indicates an indefinite wait.

This parameter cannot be specified for channel types (CHLTYPE) \*RCVR, \*RQSTR or \*CLTCN.

**Short retry interval (SHORTTMR)**

Specifies the short retry wait interval for a sender, server or cluster channel (\*SDR, \*SVR, \*CLUSDR or \*CLUSRCVR) that is started automatically by the channel initiator. This defines the interval between attempts to establish a connection to the remote machine.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**short-retry-interval**

Specify a value in the range 0 through 999999999.

**Note:** For implementation reasons, the maximum retry interval that can be used is 999999; values exceeding this are treated as 999999.

This parameter cannot be specified for channel types (CHLTYPE) \*RCVR, \*RQSTR, \*CLTCN or \*SVRCN.

**Short retry count (SHORTRTY)**

Specifies the short retry count for a sender, server or cluster channel (\*SDR, \*SVR, \*CLUSDR or \*CLUSRCVR) that is started automatically by the channel initiator. This defines the maximum number of attempts that are made to establish a connection to the remote machine, at intervals specified by SHORTTMR, before the (normally longer) LONGRTY and LONGTMR are used.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**short-retry-count**

Specify a value in the range 0 through 999999999. A value of 0 means that no retries are allowed. This parameter cannot be specified for channel types (CHLTYPE) \*RCVR, \*RQSTR, \*CLTCN or \*SVRCN.

**Long retry interval (LONGTMR)**

Specifies the long retry wait interval for a sender, server or cluster channel (\*SDR, \*SVR, \*CLUSDR or \*CLUSRCVR) that is started automatically by the channel initiator. It defines the interval in seconds between attempts to establish a connection to the remote machine, after the count specified by SHORTRTY has been exhausted.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**long-retry-interval**

Specify a value in the range 0 through 999999999.

**Note:** For implementation reasons, the maximum retry interval that can be used is 999999; values exceeding this are treated as 999999.

This parameter cannot be specified for channel types (CHLTYPE) \*RCVR, \*RQSTR, \*CLTCN or \*SVRCN.

**Long retry count (LONGRTY)**

Specifies the long retry count for a sender, server or cluster channel (\*SDR, \*SVR, \*CLUSDR or \*CLUSRCVR) that is started automatically by the channel initiator. This defines the maximum number of further attempts that are made to connect to the remote machine, at intervals specified by LONGTMR, after the count specified by SHORTRTY has been exhausted. An error message is logged if the connection is not established after the defined number of attempts.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**long-retry-count**

Specify a value in the range 0 through 999999999. A value of 0 means that no retries are allowed.

This parameter cannot be specified for channel types (CHLTYPE) \*RCVR, \*RQSTR, \*CLTCN or \*SVRCN.

**Security exit (SCYEXIT)**

Specifies the name of the program to be called as the security exit. If a nonblank name is defined, the exit is invoked at the following times:

- Immediately after establishing a channel.

Before any messages are transferred, the exit is given the opportunity to instigate security flows to validate connection authorization.

- On receipt of a response to a security message flow.

Any security message flows received from the remote processor on the remote machine are passed to the exit.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NONE**

The security exit program is not invoked.

**security-exit-name**

Specify the name of the security exit program.

**library-name**

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

**Security exit (CSCYEXIT)**

Specifies the name of the program to be called as the client security exit. If a nonblank name is defined, the exit is invoked at the following times:

- Immediately after establishing a channel.

Before any messages are transferred, the exit is given the opportunity to instigate security flows to validate connection authorization.

- On receipt of a response to a security message flow.

Any security message flows received from the remote processor on the remote machine are passed to the exit.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the SYSTEM.DEF.CLNTCONN channel.

**\*NONE**

The client security exit program is not invoked.

**security-exit-name**

Specify the name of the client security exit program.

**Security exit user data (SCYUSRDATA)**

Specifies a maximum of 32 characters of user data that is passed to the channel security exit program.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NONE**

The user data for the security exit is not specified.

**security-exit-user-data**

Specify the user data for the security exit program.

**Send exit (SNDEXIT)**

Specifies the entry point of the program to be called as the send exit. If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NONE**

The send exit is not invoked.

**send-exit-name**

Specify the name of the send exit program.

**library-name**

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

## Send exit (CSNDEXIT)

Specifies the entry point of the program to be called as the client send exit. If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The possible values are:

### **\*SYSDFTCHL**

The value of this attribute is taken from the SYSTEM.DEF.CLNTCONN channel.

### **\*NONE**

The client send exit is not invoked.

### **send-exit-name**

Specify the name of the client send exit program.

## Send exit user data (SNDUSRDATA)

Specifies a maximum of 32 characters of user data that is passed to the send exit program.

The possible values are:

### **\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

### **\*NONE**

The user data for the send exit program is not specified.

### **send-exit-user-data**

Specify a maximum of 32 characters of user data for the send exit program.

## Receive exit (RCVEXIT)

Specifies the entry point of the program to be called as the receive exit. If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The possible values are:

### **\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

### **\*NONE**

The receive exit program is not invoked.

### **receive-exit-name**

Specify the name of the receive exit program.

### **library-name**

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

## Receive exit (CRCVEXIT)

Specifies the entry point of the program to be called as the client receive exit. If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The possible values are:

### **\*SYSDFTCHL**

The value of this attribute is taken from the SYSTEM.DEF.CLNTCONN channel.

### **\*NONE**

The client receive exit program is not invoked.

**receive-exit-name**

Specify the name of the client receive exit program.

**Receive exit user data (RCVUSRDATA)**

Specifies user data that is passed to the receive exit.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NONE**

The user data for the receive exit program is not specified.

**receive-exit-user-data**

Specify a maximum of 32 characters of user data for the receive exit program.

**Message exit (MSGEXIT)**

Specifies the entry point of the program to be called as the message exit. If a nonblank name is defined, the exit is invoked immediately after a message has been retrieved from the transmission queue. The exit is given the entire application message and message descriptor for modification.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NONE**

The message exit program is not invoked.

**message-exit-name**

Specify the name of the message exit program.

**library-name**

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

This parameter cannot be specified for channel types (CHLTYPE) \*CLTCN or \*SVRCN.

**Message exit user data (MSGUSRDATA)**

Specifies user data that is passed to the message exit program.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NONE**

The user data for the message exit program is not specified.

**message-exit-user-data**

Specify a maximum of 32 characters of user data for the message exit program.

This parameter cannot be specified for channel types (CHLTYPE) \*CLTCN or \*SVRCN.

**Message retry exit (MSGRTYEXIT)**

Specifies the entry point of the program to be called as the message retry exit.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NONE**

The message retry exit program is not invoked.

**message-retry-exit-name**

Specify the name of the message retry exit program.

**library-name**

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

This parameter cannot be specified for channel types (CHLTYPE) \*SDR, \*SVR, \*CLTCN, \*SVRCN or \*CLUSSDR.

**Message retry exit data (MSGRTYDATA)**

Specifies user data that is passed to the message retry exit program.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NONE**

The user data for the message retry exit program is not specified.

**message-retry-exit-user-data**

Specify a maximum of 32 characters of user data for the message retry exit program.

This parameter cannot be specified for channel types (CHLTYPE) \*SDR, \*SVR, \*CLTCN, \*SVRCN or \*CLUSSDR.

**Number of message retries (MSGRTYNBR)**

Specifies the number of times the channel will retry before it decides it cannot deliver the message. This attribute controls the action of the MCA only if the message-retry exit name is blank, the value of MSGRTYNBR is passed to the exit for the exit's use, but the number of retries performed is controlled by the exit, and not by this attribute.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**message-retry-number**

Specify a value in the range 0 through 999999999. A value of 0 signifies no retries will be performed.

This parameter cannot be specified for channel types (CHLTYPE) \*SDR, \*SVR, \*CLTCN, \*SVRCN or \*CLUSSDR.

**Message retry interval (MSGRTYITV)**

Specifies the minimum interval of time that must pass before the channel can retry the MQPUT operation. This time is in milliseconds.

This attribute controls the action of the MCA only if the message-retry exit name is blank, the value of MSGRTYITV is passed to the exit for the exit's use, but the retry interval is controlled by the exit, and not by this attribute.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**message-retry-number**

Specify a value in the range 0 through 999999999. A value of 0 signifies that the retry will be performed as soon as possible.

This parameter cannot be specified for channel types (CHLTYPE) \*SDR, \*SVR, \*CLTCN, \*SVRCN or \*CLUSSDR.

### **Convert message (CVTMSG)**

Specifies whether the application data in the message should be converted before the message is transmitted.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel for the type of channel being created.

**\*YES**

The application data in the message is converted before sending.

**\*NO**

The application data in the message is not converted before sending.

This parameter cannot be specified for channel types (CHLTYPE) \*RCVR, \*RQSTR, \*CLTCN or \*SVRCN.

### **Put authority (PUTAUT)**

Specifies whether the user identifier in the context information associated with a message should be used to establish authority to put the message on the destination queue. This applies only to receiver and requester (\*CLUSRCVR, \*RCVR and \*RQSTR) channels.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*DFT**

No authority check is made before the message is put on the destination queue.

**\*CTX**

The user identifier in the message context information is used to establish authority to put the message.

This parameter cannot be specified for channel types (CHLTYPE) \*SDR, \*SVR, \*CLTCN, \*SVRCN or \*CLUSSDR.

### **Sequence number wrap (SEQNUMWRAP)**

Specifies the maximum message sequence number. When the maximum is reached, sequence numbers wrap to start again at 1.

**Note:** The maximum message sequence number is not negotiable; the local and remote channels must wrap at the same number.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**sequence-number-wrap-value**

Specify a value in the range 100 through 999999999.

This parameter cannot be specified for channel types (CHLTYPE) \*CLTCN or \*SVRCN.

### **Maximum message length (MAXMSGLEN)**

Specifies the maximum message length that can be transmitted on the channel. This is compared with the value for the remote channel and the actual maximum is the lower of the two values.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**maximum-message-length**

Specify a value in the range 0 through 104857600. A value of 0 signifies that the maximum length is unlimited.

**Heartbeat interval (HRTBTINTVL)**

Specifies The time, in seconds, between heartbeat flows passed from the sending MCA when there are no messages on the transmission queue. The heartbeat exchange gives the receiving MCA the opportunity to quiesce the channel.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**heart-beat-interval**

Specify a value in the range 0 through 999999999. A value of 0 means that no heartbeat exchanges are to take place.

**Note:** For implementation reasons, the maximum heartbeat interval that can be used is 999999; values exceeding this are treated as 999999.

**Non Persistent Message Speed (NPMSPEED)**

Specifies whether the channel supports Fast Non Persistent Messages.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute does not change.

**\*FAST**

The channel supports fast non persistent messages.

**\*NORMAL**

The channel does not support fast non persistent messages.

This parameter cannot be specified for channel types (CHLTYPE) \*CLTCN or \*SVRCN.

**Cluster Name (CLUSTER)**

The name of the cluster to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

This parameter is valid only for \*CLUSSDR and \*CLUSRCVR channels. If the CLUSNL parameter is non-blank, this parameter must be blank.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NONE**

No cluster name is specified.

**cluster-name**

The name of the cluster to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

**Cluster Name List (CLUSNL)**

The name of the namelist that specifies a list of clusters to which the channel belongs

This parameter is valid only for \*CLUSSDR and \*CLUSRCVR channels. If the CLUSTER parameter is non-blank, this parameter must be blank.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NONE**

No cluster namelist is specified.

**cluster-name-list**

The name of the namelist specifying a list of clusters to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

## Network Connection Priority (NETPRTY)

The priority for the network connection. Distributed queuing chooses the path with the highest priority if there are multiple paths available. The value must be in the range between 0 and 9 where 0 is the lowest priority.

This parameter is valid only for \*CLUSRCVR channels.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**network-connection-priority**

Specify a value in the range 0 through 9; 0 is the lowest priority.

## TLS CipherSpec (SSLCIPH)

SSLCIPH specifies the CipherSpec used in TLS channel negotiation. The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**cipherspec**

The name of the CipherSpec.

**Note:** From IBM MQ 8.0.0 Fix Pack 2, the SSLv3 protocol and the use of some IBM MQ CipherSpecs is deprecated. For more information, see [Deprecated CipherSpecs](#).

## TLS Client Authentication (SSLCAUTH)

SSLCAUTH specifies whether the channel should carry out client authentication over TLS. The parameter is used only for channels with SSLCIPH specified.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*REQUIRED**

Client authentication is required.

**\*OPTIONAL**

Client authentication is optional.

This parameter cannot be specified for channel types (CHLTYPE) \*SDR, \*CLTCN or \*CLUSSDR.

## TLS Peer name (SSLPEER)

SSLPEER specifies the X500 peer name used in TLS channel negotiation. The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**x500peername**

The X500 peer name to use.

**Note:** An alternative way of restricting connections into channels by matching against the TLS Subject Distinguished Name, is to use channel authentication records. With channel authentication records, different TLS Subject Distinguished Name patterns can be applied to the same channel. If both SSLPEER on the channel and a channel authentication record are used to apply to the same channel, the inbound certificate must match both patterns in order to connect. For more information, see [Channel authentication records](#).

**Local communication address (LOCLADDR)**

Specifies the local communication address for the channel.

This parameter is only valid for \*SDR, \*SVR, \*RQSTR, \*CLUSSDR, \*CLUSRCVR and \*CLTCN channels.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*NONE**

The connection is blank.

**local-address**

Only valid for transport type TCP/IP. Specify the optional IP address and optional port or port range used for outbound TCP/IP communications. The format is:

```
LOCLADDR([ip-addr][low-port[,high-port]][, [ip-addr][low-port[,high-port]])])
```

**Batch Heartbeat Interval (BATCHEHB)**

The time in milliseconds used to determine whether batch heartbeating occurs on this channel. Batch heartbeating allows sender-type channels to determine whether the remote channel instance is still active before going in-doubt. A batch heartbeat will occur if a sender-type channel has not communicated with the remote channel within the specified time.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**batch-heartbeat-interval**

Specify a value in the range 0 through 999999999. A value of 0 indicates that batch heartbeating is not to be used.

**Note:** For implementation reasons, the maximum batch heartbeat interval that can be used is 999999; values exceeding this are treated as 999999.

This parameter cannot be specified for channel types (CHLTYPE) \*RCVR, \*RQSTR, \*CLTCN or \*SVRCN.

**Task user identifier (USERID)**

This is used by the message channel agent when attempting to initiate a secure LU 6.2 session with a remote message channel agent.

This parameter is valid only for channels with a channel type (CHLTYPE) of \*SDR, \*SVR, \*RQSTR, \*CLTCN or \*CLUSSDR.

Although the maximum length of the attribute is 12 characters, only the first 10 characters are used.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NONE**

No user identifier is specified.

**user-identifier**

Specify the task user identifier.

**Password (PASSWORD)**

This is used by the message channel agent when attempting to initiate a secure LU 6.2 session with a remote message channel agent.

This parameter is valid only for channels with a channel type (CHLTYPE) of \*SDR, \*SVR, \*RQSTR, \*CLTCN or \*CLUSSDR.

Although the maximum length of the attribute is 12 characters, only the first 10 characters are used.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NONE**

No password is specified.

**Password**

Specify the password.

**Keep Alive Interval (KAINT)**

Specifies the Keep Alive timing interval for this channel.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel for the type of channel being created.

**\*AUTO**

The Keep Alive interval is calculated based upon the negotiated heartbeat value as follows:

- If the negotiated HBINT is greater than 0, Keep Alive interval is set to that value plus 60 seconds.
- If the negotiated HBINT is 0, the value used is that specified by the KEEPALIVEOPTIONS statement in the TCP profile configuration data set.

**keep-alive-interval**

Specify a value in the range 0 through 99999.

**Header Compression (COMPHDR)**

The list of header data compression techniques supported by the channel.

For channel types sender, server, cluster sender, cluster receiver and client connection (\*SDR, \*SVR, \*CLUSSDR, \*CLUSRCVR and \*CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NONE**

No header data compression is performed.

**\*SYSTEM**

Header data compression is performed.

**Message Compression (COMPMSG)**

The list of message data compression techniques supported by the channel.

For channel types sender, server, cluster sender, cluster receiver and client connection (\*SDR, \*SVR, \*CLUSSDR, \*CLUSRCVR and \*CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NONE**

No message data compression is performed.

**\*RLE**

Message data compression is performed using run-length encoding.

**\*ZLIBFAST**

Message data compression is performed using the zlib compression technique. A fast compression time is preferred.

**\*ZLIBHIGH**

Message data compression is performed using the zlib compression technique. A high level of compression is preferred.

**\*ANY**

Any compression technique supported by the queue manager can be used. Only valid for channel types Receiver, Requester and Server-Connection.

**Channel Monitoring (MONCHL)**

Controls the collection of online monitoring data.

Online monitoring data is not collected when the queue manager attribute MONCHL is set to \*NONE.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*QMGR**

The collection of Online Monitoring Data is inherited from the setting of the queue manager attribute MONCHL.

**\*NONE**

Online Monitoring Data collection for this channel is disabled.

**\*LOW**

Monitoring data collection is turned on with a low ratio of data collection.

**\*MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

**\*HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for a channel type (CHLTYPE) of \*CLTCN.

**Channel Statistics (STATCHL)**

Controls the collection of statistics data.

Statistics data is not collected when the queue manager attribute STATCHL is set to \*NONE.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATCHL.

**\*NONE**

Statistics data collection for this channel is disabled.

**\*LOW**

Statistics data collection is turned on with a low ratio of data collection.

**\*MEDIUM**

Statistics data collection is turned on with a moderate ratio of data collection.

**\*HIGH**

Statistics data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for channel types (CHLTYPE) \*CLTCN or \*SVRCN.

### **Cluster Workload Rank (CLWLRANK)**

Specifies the cluster workload rank of the channel.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**cluster-workload-rank**

The cluster workload rank of the channel in the range 0 through 9.

### **Cluster Workload Priority (CLWLPRTY)**

Specifies the cluster workload priority of the channel.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**cluster-workload-rank**

The cluster workload priority of the channel in the range 0 through 9.

### **Cluster Channel Weight (CLWLWGHT)**

Specifies the cluster workload weight of the channel.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**cluster-workload-rank**

The cluster workload weight of the channel in the range 1 through 99.

### **Sharing Conversations (SHARECNV)**

Specifies the maximum the number of conversations which can be shared over a particular TCP/IP client channel instance (socket).

This parameter is valid for channels with CHLTYPE defined as \*CLTCN or \*SVRCN.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

## 0

Specifies no sharing of conversations over a TCP/IP socket. The channel instance runs in a mode prior to that of IBM WebSphere MQ 7.0, with regard to:

- Administrator stop-quiesce
- Heartbeating
- Read ahead

## 1

Specifies no sharing of conversations over a TCP/IP socket. Client heartbeating and read ahead are available, whether in an MQGET call or not, and channel quiescing is more controllable.

### **shared-conversations**

The number of shared conversations in the range 2 through 999999999.

**Note:** If the client-connection SHARECNV value does not match the server-connection SHARECNV value, the lower of the two values is used.

## **Property Control (PROPCTL)**

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor).

The possible values are:

### **\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

### **\*COMPAT**

If the message contains a property with a prefix of "mcd.", "jms.", "usr." or "mqext." then all optional message properties, except those in the message descriptor (or extension) will be placed in one or more MQRFH2 headers in the message data before the message is sent to the remote queue manager.

### **\*NONE**

All properties of the message, except those in the message descriptor (or extension), will be removed from the message before the message is sent to the remote queue manager.

### **\*ALL**

All properties of the message will be included with the message when it is sent to the remote queue manager. The properties, except those in the message descriptor (or extension), will be placed in one or more MQRFH2 headers in the message data.

## **Maximum Instances (MAXINST)**

Specifies the maximum number of clients that can simultaneously connect to the queue manager via this server-connection channel object.

This attribute is valid only for server-connection channels.

The possible values are:

### **\*SYSDFT**

The value of this attribute is taken from the system default channel of the specified type.

### **maximum-instances**

The maximum number of simultaneous instances of the channel in the range 0 through 999999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

## **Maximum Instances Per Client (MAXINSTC)**

Specifies the maximum number of simultaneous instances of an individual server-connection channel which can be started from a single client.

In this context, multiple client connections originating from the same remote network address are considered to be a single client.

This attribute is valid only for server-connection channels.

The possible values are:

**\*SYSDFT**

The value of this attribute is taken from the system default channel of the specified type.

**maximum-instances-per-client**

The maximum number of simultaneous instances of the channel which can be in the started from a single client in the range 0 through 99999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running from individual clients, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

## Client Channel Weight (CLNTWGHT)

The client channel weighting attribute is used so client channel definitions can be selected at random based on their weighting when more than one suitable definition is available.

The possible values are:

**\*SYSDFT**

The value of this attribute is taken from the system default channel of the specified type.

**client-channel-weight**

The client channel weight in the range 0 through 99.

## Connection Affinity (AFFINITY)

The channel affinity attribute is used so client applications that connect multiple times using the same queue manager name can choose whether to use the same client channel definition for each connection.

The possible values are:

**\*SYSDFT**

The value of this attribute is taken from the system default channel of the specified type.

**\*PREFERRED**

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any applicable CLNTWGHT(0) definitions first and in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful non CLNTWGHT(0) definitions are moved to the end of the list. CLNTWGHT(0) definitions remain at the start of the list and are selected first for each connection.

**\*NONE**

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process select an applicable definition based on the weighting with any applicable CLNTWGHT(0) definitions selected first in alphabetical order.

## Batch Data Limit (BATLIM)

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

The batch is terminated when one of the following conditions is met:

- **BATCHSZ** messages have been sent.
- **BATLIM** bytes have been sent.
- The transmission queue is empty and **BATCHINT** is exceeded.

This parameter is valid only for channels with a channel type (**CHLTYPE**) of SDR, SVR, CLUSSDR, or CLUSRCVR.

The value must be in the range 0 - 999999. The default value is 5000.

The **BATCHLIM** parameter is supported on all platforms.

The possible values are:

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**batch-data-limit**

Specify a value in the range 0 through 999999.

This parameter can only be specified for channel types (CHLTYPE) \*SDR, \*SVR, \*CLUSSDR, or \*CLUSRCVR.

## Pending Reset Sequence Number (RESETSEQ)

Pending reset sequence number.

This is the sequence number from an outstanding request and it indicates a user RESET CHANNEL command request is outstanding.

The possible value is:

**pending-reset-sequence-number**

A value of zero indicates that there is no outstanding RESET CHANNEL. The value can be in the range 1 - 999999999.

## Default client reconnection (DFTRECON)

Specifies whether a client connection automatically reconnects a client application if its connection breaks.

**\*SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

**\*NO**

Unless overridden by **MQCONN**, the client is not reconnected automatically.

**\*YES**

Unless overridden by **MQCONN**, the client reconnects automatically.

**\*QMGR**

Unless overridden by **MQCONN**, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO\_RECONNECT\_Q\_MGR.

**\*DISABLED**

Reconnection is disabled, even if requested by the client program using the **MQCONN** MQI call.

This parameter is specified for a client connection channel, (CHLTYPE) \*CLTCN

IBM i

## Create MQ Listener (CRTMQMLSR)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Create MQ Listener (CRTMQMLSR) command creates a new MQ listener definition, specifying those attributes that are to be different from the default.

## Parameters

Keyword	Description	Choices	Notes
<u>LSRNAME</u>	Listener name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	<b>*NO</b> , *YES	Optional, Positional 3
<u>TEXT</u>	Text 'description'	Character value, *BLANK, <b>*SYSDFTLSR</b>	Optional, Positional 4
<u>CONTROL</u>	Listener control	<b>*SYSDFTLSR</b> , *MANUAL, *QMGR, *STARTONLY	Optional, Positional 5
<u>PORT</u>	Port number	0-65535, <b>*SYSDFTLSR</b>	Optional, Positional 6
<u>IPADDR</u>	IP Address	Character value, *BLANK, <b>*SYSDFTLSR</b>	Optional, Positional 7
<u>BACKLOG</u>	Listener backlog	0-999999999, <b>*SYSDFTLSR</b>	Optional, Positional 8

### Listener name (LSRNAME)

The name of the new MQ listener definition to be created.

The possible values are:

#### listener-name

Specify the name of the listener definition. The maximum length of the string is 48 bytes.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

#### **\*DFT**

Use the default queue manager.

#### queue-manager-name

The name of a message queue manager.

### Replace (REPLACE)

If a listener definition with the same name already exists, this specifies whether it is to be replaced.

The possible values are:

#### **\*NO**

This definition does not replace any existing listener definition with the same name. The command fails if the named listener definition already exists.

#### **\*YES**

Replace the existing listener definition. If there is no definition with the same name, a new definition is created.

### Text 'description' (TEXT)

Specifies text that briefly describes the listener definition.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

**\*SYSDFTLSR**

The value of this attribute is taken from the system default listener.

**\*BLANK**

The text is set to a blank string.

**description**

Specify the new descriptive information.

## **Listener control (CONTROL)**

Whether the listener starts automatically when the queue manager is started.

The possible values are:

**\*SYSDFTLSR**

The value for this attribute is taken from the system default listener.

**\*MANUAL**

The listener is not automatically started or stopped.

**\*QMGR**

The listener is started and stopped as the queue manager is started and stopped.

**\*STARTONLY**

The listener is started as the queue manager is started, but is not requested to stop when the queue manager is stopped.

## **Port number (PORT)**

The port number to be used by the listener.

The possible values are:

**\*SYSDFTLSR**

The value for this attribute is taken from the system default listener.

**port-number**

The port number to be used.

## **IP Address (IPADDR)**

The IP address to be used by the listener.

The possible values are:

**\*SYSDFTLSR**

The value for this attribute is taken from the system default listener.

**ip-addr**

The IP address to be used.

## **Listener backlog (BACKLOG)**

The number of concurrent connection requests the listener supports.

The possible values are:

**\*SYSDFTLSR**

The value for this attribute is taken from the system default listener.

**backlog**

The number of concurrent connection requests supported.

## Create MQ Namelist (CRTMQMNL)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Create MQ Namelist (CRTMQMNL) command creates a new MQ namelist. A namelist is an MQ object that contains a list of other MQ objects. Typically, namelists are used by applications, for example trigger monitors, where they are used to identify a group of queues. A namelist is maintained independently of applications, therefore you can update it without stopping any of the applications that use it.

### Parameters

Keyword	Description	Choices	Notes
<u>NAMELIST</u>	Namelist	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 3
<u>TEXT</u>	Text 'description'	Character value, *BLANK, *SYSDFTNL	Optional, Positional 4
<u>NAMES</u>	List of Names	Values (up to 256 repetitions): Character value, *BLANKS, *SYSDFTNL, *NONE	Optional, Positional 5

### Namelist (NAMELIST)

The name of the namelist to be created.

#### namelist

Specify the name of the namelist. The maximum length of the string is 48 bytes.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

#### \*DFT

The default queue manager is used.

#### message-queue-manager-name

Specify the name of the queue manager.

### Replace (REPLACE)

Specifies whether the new namelist should replace an existing namelist with the same name.

#### \*NO

Do not replace the existing namelist. The command fails if the named namelist already exists.

#### \*YES

Replace the existing namelist. If there is no namelist with the same name, a new namelist is created.

## Text 'description' (TEXT)

Specifies text that briefly describes the namelist.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

### \*SYSDFTNL

The value of the attribute is taken from the system default namelist.

### description

Specify no more than 64 characters enclosed in apostrophes.

## List of Names (NAMES)

List of names. This is the list of names to be created. The names can be of any type, but must conform to the rules for naming MQ objects.

### \*SYSDFTNL

The value of the attribute is taken from the system default namelist.

### namelist

The list to create. An empty list is valid.

IBM i

## Create MQ Process (CRTMQMPRC)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Create MQ Process (CRTMQMPRC) command creates a new MQ process definition, specifying those attributes that are different from the default.

## Parameters

Keyword	Description	Choices	Notes
<u>PRCNAME</u>	Process name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 3
<u>TEXT</u>	Text 'description'	Character value, *BLANK, *SYSDFTPRC	Optional, Positional 4
<u>APPTYPE</u>	Application type	Integer, *DEF, *CICS, *UNIX, *OS400, *WINDOWS, *WINDOWS_NT,	Optional, Positional 5
<u>APPID</u>	Application identifier	Character value, *SYSDFTPRC	Optional, Positional 6
<u>USRDATA</u>	User data	Character value, *SYSDFTPRC, *NONE	Optional, Positional 7
<u>ENVDATA</u>	Environment data	Character value, *SYSDFTPRC, *NONE	Optional, Positional 8

## Process name (PRCNAME)

The name of the new MQ process definition to be created.

The possible values are:

### **process-name**

Specify the name of the new MQ process definition. The name can contain up to 48 characters.

## Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

### **\*DFT**

Use the default queue manager.

### **queue-manager-name**

The name of a message queue manager.

## Replace (REPLACE)

If a process definition with the same name already exists, this specifies whether it is replaced.

The possible values are:

### **\*NO**

This definition does not replace any existing process definition with the same name. The command fails if the named process definition already exists.

### **\*YES**

Replace the existing process definition. If there is no definition with the same name, a new definition is created.

## Text 'description' (TEXT)

Specifies text that briefly describes the process definition.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

### **\*SYSDFTPRC**

The value of this attribute is taken from the system default process.

### **\*BLANK**

The text is set to a blank string.

### **description**

Specify the new descriptive information.

## Application type (APPTYPE)

The type of application started.

The possible values are:

### **\*DEF**

Specifying DEF causes the default application type for the platform at which the command is interpreted to be stored in the process definition. This default cannot be changed by the installation. If the platform supports clients, the default is interpreted as the default application type of the server.

### **\*CICS**

Represents a CICS/400 application.

**\*UNIX**

Represents a UNIX or Linux application.

**\*OS400**

Represents an IBM i application.

**\*WINDOWS**

Represents a Windows application.

**\*WINDOWS\_NT**

Represents a Windows NT application.

**integer**

User-defined application type in the range 65536 through 999999999.

**Application identifier (APPID)**

Application identifier. This is the name of the application to be started, on the platform for which the command is processing. It is typically a program name and library name.

The possible values are:

**\*SYSDFTPRC**

The value for this attribute is taken from the system default process.

**application-id**

The maximum length is 256 characters.

**User data (USRDATA)**

A character string that contains user information pertaining to the application, as defined by APPID, to start.

The possible values are:

**\*SYSDFTPRC**

The value for this attribute is taken from the system default process.

**\*NONE**

The user data is blank.

**user-data**

Specify up to 128 characters of user data.

**Environment data (ENVDATA)**

A character string that contains environment information pertaining to the application, as defined by APPID, to start.

The possible values are:

**\*SYSDFTPRC**

The value for this attribute is taken from the system default process.

**\*NONE**

The environment data is blank.

**environment-data**

The maximum length is 128 characters.

**Create MQ Queue (CRTMQMQ)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Create MQ Queue (CRTMQMQ) command creates a queue definition with the specified attributes. All attributes that are not specified are set to the default value for the type of queue that is created.

## Parameters

<i>Table 210. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>QNAME</u>	Queue name	Character value	Required, Key, Positional 1
<u>QTYPE</u>	Queue type	*ALS, *LCL, *MDL, *RMT	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SYSDFTQ	Optional, Positional 5
<u>PUTENBL</u>	Put enabled	*SYSDFTQ, *NO, *YES	Optional, Positional 6
<u>DFTPTY</u>	Default message priority	0-9, *SYSDFTQ	Optional, Positional 7
<u>DFTMSGPST</u>	Default message persistence	*SYSDFTQ, *NO, *YES	Optional, Positional 8
<u>PRCNAME</u>	Process name	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 9
<u>TRGENBL</u>	Triggering enabled	*SYSDFTQ, *NO, *YES	Optional, Positional 10
<u>GETENBL</u>	Get enabled	*SYSDFTQ, *NO, *YES	Optional, Positional 11
<u>SHARE</u>	Sharing enabled	*SYSDFTQ, *NO, *YES	Optional, Positional 12
<u>DFTSHARE</u>	Default share option	*SYSDFTQ, *NO, *YES	Optional, Positional 13
<u>MSGDLYSEQ</u>	Message delivery sequence	*SYSDFTQ, *PTY, *FIFO	Optional, Positional 14
<u>HDNBKTCNT</u>	Harden backout count	*SYSDFTQ, *NO, *YES	Optional, Positional 15
<u>TRGTYPE</u>	Trigger type	*SYSDFTQ, *FIRST, *ALL, *DEPTH, *NONE	Optional, Positional 16
<u>TRGDEPTH</u>	Trigger depth	1-999999999, *SYSDFTQ	Optional, Positional 17
<u>TRGMSGPTY</u>	Trigger message priority	0-9, *SYSDFTQ	Optional, Positional 18
<u>TRGDATA</u>	Trigger data	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 19
<u>RTNITV</u>	Retention interval	0-999999999, *SYSDFTQ	Optional, Positional 20
<u>MAXDEPTH</u>	Maximum queue depth	0-999999999, *SYSDFTQ	Optional, Positional 21
<u>MAXMSGLEN</u>	Maximum message length	0-104857600, *SYSDFTQ	Optional, Positional 22
<u>BKTTHLD</u>	Backout threshold	0-999999999, *SYSDFTQ	Optional, Positional 23
<u>BKTQNAME</u>	Backout requeue name	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 24

Table 210. Command parameters (continued)

<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>INITQNAME</u>	Initiation queue	Character value, *NONE, <b>*SYSDFTQ</b>	Optional, Positional 25
<u>USAGE</u>	Usage	<b>*SYSDFTQ</b> , *NORMAL, *TMQ	Optional, Positional 26
<u>DFNTYPE</u>	Definition type	<b>*SYSDFTQ</b> , *TEMPDYN, *PERMDYN	Optional, Positional 27
<u>TGTQNAME</u>	Target object	Character value, <b>*SYSDFTQ</b>	Optional, Positional 28
<u>RMTQNAME</u>	Remote queue	Character value, <b>*SYSDFTQ</b> , *NONE	Optional, Positional 29
<u>RMTMQMNAME</u>	Remote Message Queue Manager	Character value, <b>*SYSDFTQ</b>	Optional, Positional 30
<u>TMQNAME</u>	Transmission queue	Character value, *NONE, <b>*SYSDFTQ</b>	Optional, Positional 31
<u>HIGHTHLD</u>	Queue depth high threshold	0-100, <b>*SYSDFTQ</b>	Optional, Positional 32
<u>LOWTHLD</u>	Queue depth low threshold	0-100, <b>*SYSDFTQ</b>	Optional, Positional 33
<u>FULLEVT</u>	Queue full events enabled	<b>*SYSDFTQ</b> , *NO, *YES	Optional, Positional 34
<u>HIGHEVT</u>	Queue high events enabled	<b>*SYSDFTQ</b> , *NO, *YES	Optional, Positional 35
<u>LOWEVT</u>	Queue low events enabled	<b>*SYSDFTQ</b> , *NO, *YES	Optional, Positional 36
<u>SRVITV</u>	Service interval	0-999999999, <b>*SYSDFTQ</b>	Optional, Positional 37
<u>SRVEVT</u>	Service interval events	<b>*SYSDFTQ</b> , *HIGH, *OK, *NONE	Optional, Positional 38
<u>DISTLIST</u>	Distribution list support	<b>*SYSDFTQ</b> , *NO, *YES	Optional, Positional 39
<u>CLUSTER</u>	Cluster Name	Character value, <b>*SYSDFTQ</b> , *NONE	Optional, Positional 40
<u>CLUSNL</u>	Cluster Name List	Character value, *NONE, <b>*SYSDFTQ</b>	Optional, Positional 41
<u>DEFBIND</u>	Default Binding	<b>*SYSDFTQ</b> , *OPEN, *NOTFIXED, *GROUP	Optional, Positional 42
<u>CLWLRANK</u>	Cluster Workload Rank	0-9, <b>*SYSDFTQ</b>	Optional, Positional 43
<u>CLWLPRTY</u>	Cluster Workload Priority	0-9, <b>*SYSDFTQ</b>	Optional, Positional 44
<u>CLWLUSEQ</u>	Cluster workload queue use	<b>*SYSDFTQ</b> , *QMGR, *LOCAL, *ANY	Optional, Positional 45
<u>MONQ</u>	Queue Monitoring	<b>*SYSDFTQ</b> , *QMGR, *OFF, *LOW, *MEDIUM, *HIGH	Optional, Positional 46
<u>STATQ</u>	Queue Statistics	<b>*SYSDFTQ</b> , *QMGR, *OFF, *ON	Optional, Positional 47

Table 210. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>ACCTQ</u>	Queue Accounting	<b>*SYSDFTQ</b> , *QMGR, *OFF, *ON	Optional, Positional 48
<u>NPMCLASS</u>	Non Persistent Message Class	<b>*SYSDFTQ</b> , *NORMAL, *HIGH	Optional, Positional 49
<u>MSGREADAHD</u>	Message Read Ahead	<b>*SYSDFTQ</b> , *DISABLED, *NO, *YES	Optional, Positional 50
<u>DFTPUTRESP</u>	Default Put Response	*SYSDFTQ, <b>*SYNC</b> , *ASYNC	Optional, Positional 51
<u>PROPCTL</u>	Property Control	<b>*SYSDFTQ</b> , *COMPAT, *NONE, *ALL, *FORCE, *V6COMPAT	Optional, Positional 52
<u>TARGETYPE</u>	Target Type	<b>*SYSDFTQ</b> , *QUEUE, *TOPIC	Optional, Positional 53
<u>CUSTOM</u>	Custom attribute	<i>Character value</i> , *BLANK, <b>*SYSDFTQ</b>	Optional, Positional 54
<u>CLCHNAME</u>	Cluster-sender channel name	<i>Character value</i> , *NONE, <b>*SYSDFTQ</b>	Optional, Positional 55
<u>IMGRCOVQ</u>	Queue object attribute	<b>*SAME</b> , *NO, *YES, *QMGR	Optional, Positional 57

### Queue name (QNAME)

Specifies the name of the queue definition. Queue names must be unique. If a queue definition with this name already exists, you must specify REPLACE(\*YES).

The name can contain up to 48 characters.

**Note:** The field length is 48 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

The possible values are:

#### queue-name

Specify the name of the new queue.

### Queue type (QTYPE)

Specifies the type of queue that is to be created.

If the queue already exists, REPLACE(\*YES) must be specified, and the value specified by QTYPE must be the type of the existing queue.

The possible values are:

#### \*ALS

An alias queue.

#### \*LCL

A local queue.

#### \*RMT

A remote queue.

#### \*MDL

A model queue.

## Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

### **\*DFT**

Use the default queue manager.

### **queue-manager-name**

Specify the name of the queue manager.

## Replace (REPLACE)

Specifies whether the new queue will replace an existing queue definition with the same name and type.

The possible values are:

### **\*NO**

Do not replace the existing queue. The command fails if the named queue already exists.

### **\*YES**

Replace the existing queue definition with the attributes of the FROMQ and the specified attributes.

The command will fail if an application has the Queue open or the USAGE attribute is changed.

**Note:** If the queue is a local queue, and a queue with the same name already exists, any messages already on that queue are retained.

## Text 'description' (TEXT)

Specifies text that briefly describes the queue definition.

The possible values are:

### **\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

### **\*BLANK**

The text is set to a blank string.

### **description**

Specify no more than 64 characters enclosed in apostrophes.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

## Put enabled (PUTENBL)

Specifies whether messages can be put on the queue.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

### **\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

### **\*NO**

Messages cannot be added to the queue.

### **\*YES**

Messages can be added to the queue by authorized applications.

## Default message priority (DFTPTY)

Specifies the default priority of messages put on the queue.

The possible values are:

**\*SYSDFTQ**

The value of this attribute taken from the system default queue of the specified type.

**priority-value**

Specify a value ranging from 0 through 9.

**Default message persistence (DFTMSGPST)**

Specifies the default for message-persistence on the queue. Message persistence determines whether messages are preserved across restarts of the queue manager.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*NO**

By default, messages are lost across a restart of the queue manager.

**\*YES**

By default, messages are preserved across a restart of the queue manager.

**Process name (PRCNAME)**

Specifies the local name of the MQ process that identifies the application that should be started when a trigger event occurs.

The process does not have to be available when the queue is created, but it must be available for a trigger event to occur.

The possible values are:

**\*SYSDFTQ**

The value of this attribute taken from the system default queue of the specified type.

**\*NONE**

No process is specified.

**process-name**

Specify the name of the process.

**Triggering enabled (TRGENBL)**

Specifies whether trigger messages are written to the initiation queue.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*NO**

Do not write trigger messages to the initiation queue.

**\*YES**

Triggering is active; trigger messages are written to the initiation queue.

**Get enabled (GETENBL)**

Specifies whether applications are to be permitted to get messages from this queue.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*NO**

Applications cannot retrieve messages from the queue.

**\*YES**

Suitably authorized applications can retrieve messages from the queue.

**Sharing enabled (SHARE)**

Specifies whether multiple instances of applications can open this queue for input.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is from the system default queue of the specified type.

**\*NO**

Only a single application instance can open the queue for input.

**\*YES**

More than one application instance can open the queue for input.

**Default share option (DFTSHARE)**

Specifies the default share option for applications opening this queue for input.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*NO**

The open request is for exclusive use of the queue for input.

**\*YES**

The open request is for shared use of the queue for input.

**Message delivery sequence (MSGDLYSEQ)**

Specifies the message delivery sequence.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*PTY**

Messages are delivered in first-in-first-out (FIFO) order within priority.

**\*FIFO**

Messages are delivered in FIFO order regardless of priority.

**Harden backout count (HDNBKTCNT)**

Specifies whether the count of backed out messages should be saved (hardened) across restarts of the message queue manager.

**Note:** On IBM MQ for IBM i the count is ALWAYS hardened, regardless of the setting of this attribute.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*NO**

The backout count is not hardened.

**\*YES**

The backout count is hardened.

## Trigger type (TRGTYPE)

Specifies the condition that initiates a trigger event. When the condition is true, a trigger message is sent to the initiation queue.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

### **\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

### **\*FIRST**

When the number of messages on the queue goes from zero to one.

### **\*ALL**

Every time a message arrives on the queue.

### **\*DEPTH**

When the number of messages on the queue equals the value of the TRGDEPTH attribute.

### **\*NONE**

No trigger messages are written.

## Trigger depth (TRGDEPTH)

Specifies, for TRGTYPE(\*DEPTH), the number of messages that initiate a trigger message to the initiation queue.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

### **\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

### **depth-value**

Specify a value ranging from 1 through 999999999.

## Trigger message priority (TRGMSGPTY)

Specifies the minimum priority that a message must have before it can produce, or be counted for, a trigger event.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

### **\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

### **priority-value**

Specify a value ranging from 0 through 9.

## Trigger data (TRGDATA)

Specifies up to 64 characters of user data that the queue manager includes in the trigger message. This data is made available to the monitoring application that processes the initiation queue and to the application started by the monitor.

**Note:** An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

### **\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

### **\*NONE**

No trigger data is specified.

**trigger-data**

Specify up to 64 characters enclosed in apostrophes. For a transmission queue you can use this parameter to specify the name of the channel to be started.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

**Retention interval (RTNITV)**

Specifies the retention interval. This interval is the number of hours for which the queue might be needed, based on the date and time when the queue was created.

This information is available to a housekeeping application or an operator and can be used to determine when a queue is no longer required.

**Note:** The message queue manager does not delete queues, nor does it prevent your queues from being deleted if their retention interval has not expired. It is your responsibility to take any required action.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**interval-value**

Specify a value ranging from 0 through 999999999.

**Maximum queue depth (MAXDEPTH)**

Specifies the maximum number of messages allowed on the queue. However, other factors can cause the queue to be treated as full; for example, it appears to be full if there is no storage available for a message.

**Note:** If this value is subsequently reduced by using the CHGMQMQ command, any messages that are on the queue remain intact even if they cause the new maximum to be exceeded.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**depth-value**

Specify a value ranging from 0 through 999999999.

**Maximum message length (MAXMSGLEN)**

Specifies the maximum length for messages on the queue.

**Note:** If this value is subsequently reduced by using the CHGMQMQ command, any messages that are on the queue remain intact even if they exceed the new maximum length.

Applications might use the value of this attribute to determine the size of buffer they need to retrieve messages from the queue. Therefore change the value only if you know this will not cause an application to operate incorrectly.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified queue type.

**length-value**

Specify a value ranging from 0 through 104 857 600.

**Backout threshold (BKTTHLD)**

Specifies the backout threshold.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine if a message should be backed out. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified queue type.

**threshold-value**

Specify a value ranging from 0 through 999999999.

## **Backout requeue name (BKTQNAME)**

Specifies the backout-queue name.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine where messages that have been backed out should go. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified queue type.

**\*NONE**

No backout queue is specified.

**backout-queue-name**

Specify the backout queue name.

## **Initiation queue (INITQNAME)**

Specifies the name of the initiation queue.

**Note:** The initiation queue must be on the same instance of a message queue manager.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified queue type.

**\*NONE**

No initiation queue is specified.

**initiation-queue-name**

Specify the initiation queue name.

## **Usage (USAGE)**

Specifies whether the queue is for normal usage, or for transmitting messages to a remote message queue manager.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified queue type.

**\*NORMAL**

Normal usage (the queue is not a transmission queue)

**\*TMQ**

The queue is a transmission queue that is used to hold messages destined for a remote message queue manager. If the queue is intended for use in situations where a transmission queue name is

not explicitly specified, the queue name must be the same as the name of the remote message queue manager. For further information, see the IBM MQ Intercommunication.

### **Definition type (DFNTYPE)**

Specifies the type of dynamic queue definition that is created when an application issues an MQOPEN API call with the name of this model queue specified in the object descriptor.

**Note:** This parameter only applies to a model queue definition.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*TEMPDYN**

Creates a temporary dynamic queue. Do not specify with a DEFMSGPST value of \*YES.

**\*PERMDYN**

Creates a permanent dynamic queue.

### **Target object (TGTQNAME)**

Specifies the name of the target object for which this queue is an alias.

The object can be a local or remote queue, a topic or a message queue manager.

Do not leave this field blank. If you do so, it is possible that you will create an alias queue, that has to be subsequently modified, by the addition of a TGTNAME.

When a message queue manager name is specified, it identifies the message queue manager that handles the messages posted to the alias queue. You can specify either the local message queue manager or a transmission queue name.

**Note:** The target object does not need to exist at this time but it must exist when a process attempts to open the alias queue.

The possible values are:

**\*SYSDFTQ**

The name of the target object is taken from the SYSTEM.DEFAULT.ALIAS.QUEUE.

**target-object-name**

Specify the name of the target object.

### **Remote queue (RMTQNAME)**

Specifies the name of the remote queue. That is, the local name of the remote queue as defined on the queue manager specified by RMTQMNAME.

If this definition is used for a queue manager alias definition, RMTQNAME must be blank when the open occurs.

If this definition is used for a reply-to alias, this name is the name of the queue that is to be the reply-to queue.

The possible values are:

**\*SYSDFTQ**

The name of the remote queue is taken from the SYSTEM.DEFAULT.REMOTE.QUEUE.

**\*NONE**

No remote-queue name is specified (that is, the name is blank). This can be used if the definition is a queue manager alias definition.

**remote-queue-name**

Specify the name of the queue at the remote queue manager.

**Note:** The name is not checked to ensure that it contains only those characters normally allowed for queue names

## Remote Message Queue Manager (RMTMQMNAME)

Specifies the name of the remote queue manager on which the queue RMTQNAME is defined.

If an application opens the local definition of a remote queue, RMTMQMNAME must not be the name of the connected queue manager. If TMQNAME is blank there must be a local queue of this name, which is to be used as the transmission queue.

If this definition is used for a queue manager alias, RMTMQMNAME is the name of the queue manager, which can be the name of the connected queue manager. Otherwise, if TMQNAME is blank, when the queue is opened there must be a local queue of this name, with USAGE(\*TMQ) specified, which is to be used as the transmission queue.

If this definition is used for a reply-to alias, this name is the name of the queue manager that is to be the reply-to queue manager.

The possible values are:

### **\*SYSDFTQ**

The name of the remote queue manager is taken from the SYSTEM.DEFAULT.REMOTE.QUEUE.

### **remote-queue-manager-name**

Specify the name of the remote queue manager.

**Note:** Ensure this name contains only those characters normally allowed for queue manager names.

## Transmission queue (TMQNAME)

Specifies the local name of the transmission queue to be used for messages destined for the remote queue, for either a remote queue or for a queue manager alias definition.

If TMQNAME is blank, a queue with the same name as RMTMQMNAME is used as the transmission queue.

This attribute is ignored if the definition is being used as a queue manager alias and RMTMQMNAME is the name of the connected queue manager.

It is also ignored if the definition is used as a reply-to queue alias definition.

The possible values are:

### **\*SYSDFTQ**

The transmission queue name is taken from the SYSTEM.DEFAULT.REMOTE.QUEUE.

### **\*NONE**

No specific transmission queue name is defined for this remote queue. The value of this attribute is set to all blanks.

### **transmission-queue-name**

Specify the transmission queue name.

## Queue depth high threshold (HIGHTHLD)

Specifies the threshold against which the queue depth is compared to generate a queue depth high event.

The possible values are:

### **\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

### **threshold-value**

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

## Queue depth low threshold (LOWTHLD)

Specifies the threshold against which the queue depth is compared to generate a queue depth low event.

The possible values are:

### **\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

### **threshold-value**

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

## Queue full events enabled (FULLEVT)

Specifies whether queue full events are generated.

The possible values are:

### **\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

### **\*NO**

Queue Full events are not generated.

### **\*YES**

Queue Full events are generated.

## Queue high events enabled (HIGHEVT)

Specifies whether queue depth high events are generated.

The possible values are:

### **\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

### **\*NO**

Queue Depth High events are not generated.

### **\*YES**

Queue Depth High events are generated.

## Queue low events enabled (LOWEVT)

Specifies whether queue depth low events are generated.

The possible values are:

### **\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

### **\*NO**

Queue Depth Low events are not generated.

### **\*YES**

Queue Depth Low events are generated.

## Service interval (SRVITV)

Specifies the service interval. This interval is used for comparison to generate service interval high and service interval OK events.

The possible values are:

### **\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**interval-value**

Specify a value ranging from 0 through 999999999. The value is in units of milliseconds.

**Service interval events (SRVEVT)**

Specifies whether service interval high or service interval OK events are generated.

A service interval high event is generated when a check indicates that no messages have been retrieved from the queue for the time indicated by the SRVITV parameter as a minimum.

A service interval OK event is generated when a check indicates that messages have been retrieved from the queue within the time indicated by the SRVITV parameter.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*HIGH**

Service Interval High events are generated.

**\*OK**

Service Interval OK events are generated.

**\*NONE**

No service interval events are generated.

**Distribution list support (DISTLIST)**

Specifies whether the queue supports distribution lists.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*NO**

Distribution Lists are not supported.

**\*YES**

Distribution Lists are supported.

**Cluster Name (CLUSTER)**

The name of the cluster to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**cluster-name**

Only one of the resultant values of CLUSTER or CLUSNL can be non-blank; you cannot specify a value for both.

**Cluster Name List (CLUSNL)**

The name of the namelist which specifies a list of clusters to which the queue belongs. Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**namelist-name**

The name of the namelist that specifies a list of clusters to which the queue belongs.

### **Default Binding (DEFBIND)**

Specifies the binding to be used when the application specifies MQOO\_BIND\_AS\_Q\_DEF on the MQOPEN call and the queue is a cluster queue.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*OPEN**

The queue handle is bound to a specific instance of the cluster queue when the queue is opened.

**\*NOTFIXED**

The queue handle is not bound to any particular instance of the cluster queue. This allows the queue manager to select a specific queue instance when the message is put using MQPUT and to change that selection subsequently if necessary.

The MQPUT1 call always behaves as if NOTFIXED had been specified.

**\*GROUP**

When the queue is opened, the queue handle is bound to a specific instance of the cluster queue for as long as there are messages in a message group. All messages in a message group are allocated to the same destination instance.

### **Cluster Workload Rank (CLWLRANK)**

Specifies the cluster workload rank of the queue.

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**cluster-workload-rank**

Specify a value ranging from 0 through 9.

### **Cluster Workload Priority (CLWLPRTY)**

Specifies the cluster workload priority of the queue.

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**cluster-workload-priority**

Specify a value ranging from 0 through 9.

### **Cluster workload queue use (CLWLUSEQ)**

Specifies the behavior of an MQPUT when the target queue has both a local instance and at least one remote cluster instance. If the put originates from a cluster channel then this attribute does not apply.

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*QMGR**

The value is inherited from the Queue Manager CLWLUSEQ attribute.

**\*LOCAL**

The local queue will be the sole target of the MQPUT.

**\*ANY**

The queue manager will treat such a local queue as another instance of the cluster queue for the purposes of workload distribution.

**Queue Monitoring (MONQ)**

Controls the collection of Online Monitoring Data.

Online Monitoring Data is not collected when the queue manager attribute MONQ is set to \*NONE.

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*QMGR**

The collection of Online Monitoring Data is inherited from the setting of the queue manager attribute MONQ.

**\*OFF**

Online Monitoring Data collection for this queue is disabled.

**\*LOW**

Monitoring data collection is turned on with a low ratio of data collection.

**\*MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

**\*HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

**Queue Statistics (STATQ)**

Controls the collection of statistics data.

Online monitoring data is not collected when the queue manager attribute STATQ is set to \*NONE.

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATQ.

**\*OFF**

Statistics data collection for this queue is disabled.

**\*ON**

Statistics data collection is enabled for this queue.

**Queue Accounting (ACCTQ)**

Controls the collection of accounting data.

Accounting data is not collected when the queue manager attribute ACCTQ is set to \*NONE.

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*QMGR**

Accounting data collection is based upon the setting of the queue manager attribute ACCTQ.

**\*OFF**

Accounting data collection for this queue is disabled.

**\*ON**

Accounting data collection is enabled for this queue.

**Non Persistent Message Class (NPMCLASS)**

Specifies the level of reliability for non-persistent messages put to this queue.

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*NORMAL**

Non-persistent messages put to this queue are only lost following a failure, or a queue manager shutdown. Non-persistent message put to this queue are discarded in the event of a queue manager restart.

**\*HIGH**

Non-persistent messages put to this queue are not discarded in the event of a queue manager restart. Non-persistent messages put to this queue may still be lost in the event of a failure.

**Message Read Ahead (MSGREADAHD)**

Specifies whether nonpersistent messages are sent to the client ahead of an application requesting them.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*DISABLED**

Read ahead is disabled for this queue. Messages are not sent to the client ahead of an application requesting them regardless of whether read ahead is requested by the client application.

**\*NO**

Non-persistent messages are not sent to the client ahead of an application requesting them. A maximum of one non-persistent message can be lost if the client ends abnormally.

**\*YES**

Non-persistent messages are sent to the client ahead of an application requesting them. Non-persistent messages can be lost if the client ends abnormally or if the client application does not consume all the messages it is sent.

**Default Put Response (DFTPUTRESP)**

The default put response type (DFTPUTRESP) attribute specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO\_RESPONSE\_AS\_Q\_DEF option.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO\_RESPONSE\_AS\_Q\_DEF are issued as if MQPMO\_SYNC\_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application. This is the default value supplied with IBM MQ, but your installation might have changed it.

**\*ASYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO\_RESPONSE\_AS\_Q\_DEF are always issued as if MQPMO\_ASYNC\_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application; but an improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

**Property Control (PROPCTL)**

Specifies what happens to properties of messages that are retrieved from queues using the MQGET call when the MQGMO\_PROPERTIES\_AS\_Q\_DEF option is specified.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*COMPAT**

If the message contains a property with a prefix of `mcd.`, `jms.`, `usr.` or `mqext.` then all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

**\*NONE**

All properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

**\*ALL**

All properties of the message, except those contained in the message descriptor (or extension), are contained in one or more MQRFH2 headers in the message data.

**\*FORCE**

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

**\*V6COMPAT**

When set, `*V6COMPAT` must be set both on one of the queue definitions resolved by MQPUT and one of the queue definitions resolved by MQGET. It must also be set on any other intervening transmission queues. It causes an MQRFH2 header to be passed unchanged from the sending application to the receiving application. It overrides other settings of **PROPCTL** found in a queue name resolution chain. If the property is set on a cluster queue, the setting is not cached locally on other queue managers. You must set `*V6COMPAT` on an alias queue that resolves to the cluster queue. Define the alias queue on the same queue manager that the putting application is connected to.

**Target Type (TARGTYPE)**

Specifies the type of object to which the alias resolves.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*QUEUE**

Queue object.

**\*TOPIC**

Topic object.

**Custom attribute (CUSTOM)**

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

**\*SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

**\*BLANK**

The text is set to a blank string.

**custom**

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form `NAME (VALUE)` and be specified in uppercase. Single quotes must be escaped with another single quote.

## CLCHNAME

This parameter is supported only on transmission queues.

### \*SYSDFTQ

The value of this attribute is taken from the system default queue of the specified type.

### \*NONE

The attribute is removed.

### custom

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

By specifying asterisks, "\*", in **ClusterChannelName**, you can associate a transmission queue with a set of cluster-sender channels. The asterisks can be at the beginning, end, or any number of places in the middle of the channel name string. **ClusterChannelName** is limited to a length of 20 characters: MQ\_CHANNEL\_NAME\_LENGTH.

## IMGRCOVQ

Specifies whether a local or permanent dynamic queue object is recoverable from a media image, if linear logging is being used.

The possible values are:

### \*SAME

The attribute is unchanged.

### \*YES

These queue objects are recoverable.

### \*NO

The [“Record MQ Object Image \(RCDMQMIMG\)”](#) on page 1247 and [“Re-create MQ Object \(RCRMQMOBJ\)”](#) on page 1249 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

### \*QMGR

If you specify \*QMGR, and the **IMGRCOVQ** attribute for the queue manager specifies \*YES, these queue objects are recoverable.

If you specify \*QMGR and the **IMGRCOVQ** attribute for the queue manager specifies \*NO, the [“Record MQ Object Image \(RCDMQMIMG\)”](#) on page 1247 and [“Re-create MQ Object \(RCRMQMOBJ\)”](#) on page 1249 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

IBM i

## Create MQ Subscription (CRTMQMSUB)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Create MQ Subscription (CRTMQMSUB) command creates a new MQ subscription, specifying those attributes that are different from the default.

## Parameters

Table 211. Command parameters			
Keyword	Description	Choices	Notes
<u>SUBNAME</u>	Subscription name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	<b>*NO</b> , *YES	Optional, Key, Positional 3
<u>TOPICSTR</u>	Topic string	Character value, *NONE, <b>*SYSDFTSUB</b>	Optional, Positional 4
<u>TOPICOBJ</u>	Topic object	Character value, *NONE, <b>*SYSDFTSUB</b>	Optional, Positional 5
<u>DEST</u>	Destination	Character value, <b>*SYSDFTSUB</b>	Optional, Positional 6
<u>DESTMQM</u>	Destination Queue Manager	Character value, *NONE, <b>*SYSDFTSUB</b>	Optional, Positional 7
<u>DESTCRLID</u>	Destination Correlation Id	Character value, *NONE, <b>*SYSDFTSUB</b>	Optional, Positional 8
<u>PUBACCT</u>	Publish Accounting Token	Character value, *CURRENT, <b>*SYSDFTSUB</b>	Optional, Positional 9
<u>PUBAPPID</u>	Publish Application Id	Character value, *NONE, <b>*SYSDFTSUB</b>	Optional, Positional 10
<u>SUBUSER</u>	Subscription User Id	Character value, *CURRENT, <b>*SYSDFTSUB</b>	Optional, Positional 11
<u>USERDATA</u>	Subscription User Data	Character value, *NONE, <b>*SYSDFTSUB</b>	Optional, Positional 12
<u>SELECTOR</u>	Selector String	Character value, *NONE, <b>*SYSDFTSUB</b>	Optional, Positional 13
<u>PSPROP</u>	PubSub Property	<b>*SYSDFTSUB</b> , *NONE, *COMPAT, *RFH2, *MSGPROP	Optional, Positional 14
<u>DESTCLASS</u>	Destination Class	<b>*SYSDFTSUB</b> , *MANAGED, *PROVIDED	Optional, Positional 15
<u>SUBSCOPE</u>	Subscription Scope	<b>*SYSDFTSUB</b> , *ALL, *QMGR	Optional, Positional 16
<u>VARUSER</u>	Variable User	<b>*SYSDFTSUB</b> , *ANY, *FIXED	Optional, Positional 17
<u>REQONLY</u>	Request Publications	<b>*SYSDFTSUB</b> , *YES, *NO	Optional, Positional 18
<u>PUBPTY</u>	Publish Priority	0-9, <b>*SYSDFTSUB</b> , *ASPUB, *ASQDEF	Optional, Positional 19
<u>WSHEMA</u>	Wildcard Schema	<b>*SYSDFTSUB</b> , *TOPIC, *CHAR	Optional, Positional 20

Table 211. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>EXPIRY</u>	Expiry Time	0-9999999999, <b>*SYSDFTSUB</b> , *UNLIMITED	Optional, Positional 21

### Subscription name (SUBNAME)

The name of the new MQ subscription to be created.

The possible values are:

#### subscription-name

Specify a maximum of 256 bytes for the subscription name.

**Note:** Subscription names of greater than 256 bytes can be specified using MQSC.

### Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

#### \*DFT

Use the default Queue Manager.

#### queue-manager-name

The name of a Queue Manager.

### Replace (REPLACE)

If a subscription with the same name already exists, this specifies whether it is replaced.

The possible values are:

#### \*NO

This subscription does not replace any existing subscription with the same name or subscription identifier. The command fails if the subscription already exists.

#### \*YES

Replace the existing subscription. If there is no subscription with the same name or subscription identifier, a new subscription is created.

### Topic string (TOPICSTR)

Specifies the topic string associated with this subscription.

The possible values are:

#### \*SYSDFTSUB

The value of this attribute is taken from the system default subscription.

#### topic-string

Specify a maximum of 256 bytes for the topic string.

**Note:** Topic strings of greater than 256 bytes can be specified using MQSC.

### Topic object (TOPICOBJ)

Specifies the topic object associated with this subscription.

The possible values are:

**\*SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

**topic-object**

Specify the name of the topic object.

**Destination (DEST)**

Specifies the destination queue for messages published to this subscription.

The possible values are:

**destination-queue**

Specify the name of the destination queue.

**Destination Queue Manager (DESTMQM)**

Specifies the destination queue manager for messages published to this subscription.

The possible values are:

**\*SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

**destination-queue-manager**

Specify the name of the destination queue manager.

**Destination Correlation Id (DESTCRRID)**

Specifies the correlation identifier for messages published to this subscription.

The possible values are:

**\*SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

**destination-correlation-identifier**

Specify the 48 character hexadecimal string representing the 24 byte correlation identifier.

**Publish Accounting Token (PUBACCT)**

Specifies the accounting token for messages published to this subscription.

The possible values are:

**\*SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

**\*NONE**

Messages are placed on the destination with an accounting token of MQACT\_NONE.

**publish-accounting-token**

Specify the 64 character hexadecimal string representing the 32 byte publish accounting token.

**Publish Application Id (PUBAPPID)**

Specifies the publish application identity for messages published to this subscription.

The possible values are:

**\*SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

**\*NONE**

No publish application identifier is specified.

**publish-application-identifier**

Specify the publish application identifier.

**Subscription User Id (SUBUSER)**

Specifies the user profile that owns this subscription.

The possible values are:

**\*SAME**

The attribute is unchanged.

**\*CURRENT**

The current user profile is the owner of the new subscription.

**user-profile**

Specify the user profile.

**Subscription User Data (USERDATA)**

Specifies the user data associated with the subscription.

The possible values are:

**\*SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

**\*NONE**

No user data is specified.

**user-data**

Specify a maximum of 256 bytes for user data.

**Note:** User data of greater than 256 bytes can be specified using MQSC.

**Selector String (SELECTOR)**

Specifies the SQL 92 selector string to be applied to messages published on the named topic to select whether they are eligible for this subscription.

The possible values are:

**\*SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

**\*NONE**

No selection string is specified.

**selection-string**

Specify a maximum of 256 bytes for selection string.

**Note:** Selection strings of greater than 256 bytes can be specified using MQSC.

**PubSub Property (PSPROP)**

Specifies the manner in which publish / subscribe related message properties are added to messages sent to this subscription.

The possible values are:

**\*SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

**\*NONE**

Publish / subscribe properties are not added to the message.

**\*COMPAT**

Publish / subscribe properties are added to the message to maintain compatibility with V6 Publish / Subscribe.

**\*RFH2**

Publish / subscribe properties are added to the message within an RFH 2 header.

**\*MSGPROP**

Publish / subscribe properties are added as message properties.

**Destination Class (DESTCLASS)**

Specifies whether this is a managed subscription.

The possible values are:

**\*SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

**\*MANAGED**

The destination is managed.

**\*PROVIDED**

The destination is a queue.

**Subscription Scope (SUBSCOPE)**

Specifies whether this subscription should be forwarded (as a proxy subscription) to other brokers, so that the subscriber will receive messages published at those other brokers.

The possible values are:

**\*SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

**\*ALL**

The subscription will be forwarded to all queue managers directly connected via a publish / subscribe collective or hierarchy.

**\*QMGR**

The subscription will only forward messages published on the topic within this queue manager.

**Variable User (VARUSER)**

Specifies whether user profiles other than the creator of the subscription can connect to it (subject to topic and destination authority checks).

The possible values are:

**\*SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

**\*ANY**

Any user profiles can connect to the subscription.

**\*FIXED**

Only the user profile that created the subscription can connect to it.

**Request Publications (REQONLY)**

Specifies whether the subscriber will poll for updates via MQSUBRQ API, or whether all publications are delivered to this subscription.

The possible values are:

**\*SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

**\*YES**

Publications are only delivered to this subscription in response to an MQSUBRQ API.

**\*NO**

All publications on the topic are delivered to this subscription.

**Publish Priority (PUBPTY)**

Specifies the priority of the message sent to this subscription.

The possible values are:

**\*SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

**\*ASPUB**

The priority of the message sent to this subscription is taken from that supplied in the published message.

**\*ASQDEF**

The priority of the message sent to this subscription is taken from the default priority of the queue defined as the destination.

**priority-value**

Specify a priority ranging from 0 through 9.

**Wildcard Schema (WSCHEMA)**

Specifies the schema to be used when interpreting wildcard characters in the topic string.

The possible values are:

**\*SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

**\*TOPIC**

Wildcard characters represent portions of the topic hierarchy.

**\*CHAR**

Wildcard characters represent portions of strings.

**Expiry Time (EXPIRY)**

Specifies the expiry time of the subscription. After a subscription's expiry time has elapsed, it becomes eligible to be discarded by the queue manager and will receive no further publications.

The possible values are:

**\*SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

**\*UNLIMITED**

The subscription does not expire.

**expiry-time**

Specify an expiry time in tenths of a second ranging from 0 through 999999999.

 IBM**Create MQ Service (CRTMQMSVC)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Create MQ Service (CRTMQMSVC) command creates a new MQ service definition, specifying those attributes that are to be different from the default.

## Parameters

Table 212. Command parameters			
Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	<b>*NO</b> , *YES	Optional, Positional 3
<u>TEXT</u>	Text 'description'	Character value, *BLANK, <b>*SYSDFTSVC</b>	Optional, Positional 4
<u>STRCMD</u>	Start program	Single values: <b>*SYSDFTSVC</b> , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 5
	Qualifier 1: Start program	Name	
	Qualifier 2: Library	Name	
<u>STRARG</u>	Start program arguments	Character value, *BLANK, <b>*SYSDFTSVC</b>	Optional, Positional 6
<u>ENDCMD</u>	End program	Single values: <b>*SYSDFTSVC</b> , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 7
	Qualifier 1: End program	Name	
	Qualifier 2: Library	Name	
<u>ENDARG</u>	End program arguments	Character value, *BLANK, <b>*SYSDFTSVC</b>	Optional, Positional 8
<u>STDOUT</u>	Standard output	Character value, *BLANK, <b>*SYSDFTSVC</b>	Optional, Positional 9
<u>STDERR</u>	Standard error	Character value, *BLANK, <b>*SYSDFTSVC</b>	Optional, Positional 10
<u>TYPE</u>	Service type	<b>*SYSDFTSVC</b> , *CMD, *SVR	Optional, Positional 11
<u>CONTROL</u>	Service control	<b>*SYSDFTSVC</b> , *MANUAL, *QMGR, *STARTONLY	Optional, Positional 12

### Service name (SVCNAME)

The name of the new MQ service definition.

The possible values are:

#### service-name

Specify the name of the service definition. The maximum length of the string is 48 bytes.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

The name of a message queue manager.

## Replace (REPLACE)

If a service definition with the same name already exists, this specifies whether it is replaced.

The possible values are:

**\*NO**

This definition does not replace any existing service definition with the same name. The command fails if the named service definition already exists.

**\*YES**

Replace the existing service definition. If there is no definition with the same name, a new definition is created.

## Text 'description' (TEXT)

Specifies text that briefly describes the service definition.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

**\*SYSDFTSVC**

The value of this attribute is taken from the system default service.

**\*BLANK**

The text is set to a blank string.

**description**

Specify the new descriptive information.

## Start program (STRCMD)

The name of the program to run.

The possible values are:

**\*SYSDFTSVC**

The value of this attribute is taken from the system default service.

**start-command**

The name of the start command executable.

## Start program arguments (STRARG)

The arguments passed to the program at startup.

The possible values are:

**\*SYSDFTSVC**

The value of this attribute is taken from the system default service.

**\*BLANK**

No arguments are passed to the start command.

**start-command-arguments**

The arguments passed to the start command.

## End program (ENDCMD)

The name of the executable to run when the service is requested to stop.

The possible values are:

### **\*SYSDFTSVC**

The value of this attribute is taken from the system default service.

### **\*BLANK**

No end command is executed.

### **end-command**

The name of the end command executable.

## End program arguments (ENDARG)

The arguments passed to the end program when the service is requested to stop.

The possible values are:

### **\*SYSDFTSVC**

The value of this attribute is taken from the system default service.

### **\*BLANK**

No arguments are passed to the end command.

### **end-command-arguments**

The arguments passed to the end command.

## Standard output (STDOUT)

The path to a file to which the standard output of the service program is redirected.

The possible values are:

### **\*SYSDFTSVC**

The value of this attribute is taken from the system default service.

### **\*BLANK**

The standard output is discarded.

### **stdout-path**

The standard output path.

## Standard error (STDERR)

The path to a file to which the standard error of the service program is redirected.

The possible values are:

### **\*SYSDFTSVC**

The value of this attribute is taken from the system default service.

### **\*BLANK**

The standard error is discarded.

### **stderr-path**

The standard error path.

## Service type (TYPE)

Mode in which to run service.

The possible values are:

### **\*SYSDFTSVC**

The value for this attribute is taken from the system default service.

**\*CMD**

When started the command is executed but no status is collected or displayed.

**\*SVR**

The status of the executable started will be monitored and displayed.

**Service control (CONTROL)**

Whether the service should be started automatically at queue manager start.

The possible values are:

**\*SYSDFTSVC**

The value for this attribute is taken from the system default service.

**\*MANUAL**

The service will not be automatically started or stopped.

**\*QMGR**

The service will be started and stopped as the queue manager is started and stopped.

**\*STARTONLY**

The service will be started as the queue manager is started, but will not be requested to stop when the queue manager is stopped.

**Create MQ Topic (CRTMQMTOPTOP)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Create MQ Topic (CRTMQMTOPTOP) command creates a new MQ topic object, specifying those attributes that are different from the default.

**Parameters**

<i>Table 213. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>TOPNAME</u>	Topic name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	<b>*NO</b> , *YES	Optional, Positional 3
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, <b>*SYSDFTTOP</b>	Optional, Positional 4
<u>TOPICSTR</u>	Topic string	<i>Character value</i> , *BLANK, <b>*SYSDFTTOP</b>	Optional, Positional 5
<u>DURSUB</u>	Durable subscriptions	<b>*SYSDFTTOP</b> , *ASPARENT, *YES, *NO	Optional, Positional 6
<u>MGDDURMDL</u>	Durable model queue	<i>Character value</i> , *NONE, <b>*SYSDFTTOP</b>	Optional, Positional 7
<u>MGDNDURMDL</u>	Non-durable model queue	<i>Character value</i> , *NONE, <b>*SYSDFTTOP</b>	Optional, Positional 8

Table 213. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>PUBENBL</u>	Publish	<b>*SYSDFTTOP</b> , *ASPARENT, *YES, *NO	Optional, Positional 9
<u>SUBENBL</u>	Subscribe	<b>*SYSDFTTOP</b> , *ASPARENT, *YES, *NO	Optional, Positional 10
<u>DFTPTY</u>	Default message priority	0-9, <b>*SYSDFTTOP</b> , *ASPARENT	Optional, Positional 11
<u>DFTMSGPST</u>	Default message persistence	<b>*SYSDFTTOP</b> , *ASPARENT, *YES, *NO	Optional, Positional 12
<u>DFTPUTRESP</u>	Default Put Response	<b>*SYSDFTTOP</b> , *ASPARENT, *SYNC, *ASync	Optional, Positional 13
<u>WILDCARD</u>	Wildcard behavior	<b>*SYSDFTTOP</b> , *PASSTHRU, *BLOCK	Optional, Positional 14
<u>PMSGDLV</u>	Persistent message delivery	<b>*SYSDFTTOP</b> , *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 15
<u>NPMSGDLV</u>	Non-persistent message deliver	<b>*SYSDFTTOP</b> , *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 16
<u>CUSTOM</u>	Custom attribute	<i>Character value</i> , *BLANK, <b>*SYSDFTTOP</b>	Optional, Positional 17

### Topic name (TOPNAME)

The name of the new MQ topic object to be created.

The possible values are:

#### topic-name

Specify the name of the new MQ topic object. The name can contain up to 48 characters.

### Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

#### \*DFT

Use the default Queue Manager.

#### queue-manager-name

The name of a Queue Manager.

### Replace (REPLACE)

If a topic object with the same name already exists, this specifies whether it is replaced.

The possible values are:

#### \*NO

This object does not replace any existing topic object with the same name. The command fails if the named topic object already exists.

**\*YES**

Replace the existing topic object. If there is no object with the same name, a new object is created.

**Text 'description' (TEXT)**

Specifies text that briefly describes the topic object.

**Note:** The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

**\*SYSDFTTOP**

The value of this attribute is taken from the system default topic.

**\*BLANK**

The text is set to a blank string.

**description**

Specify the new descriptive information.

**Topic string (TOPICSTR)**

Specifies the topic string represented by this topic object definition.

The possible values are:

**topic-string**

Specify a maximum of 256 bytes for the topic string.

**Note:** Topic strings of greater than 256 bytes can be specified using MQSC.

**Durable subscriptions (DURSUB)**

Specifies whether applications are permitted to make durable subscriptions on this topic.

The possible values are:

**\*SYSDFTTOP**

The value of this attribute is taken from the system default topic.

**\*ASPARENT**

Whether durable subscriptions can be made on this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*YES**

Durable subscriptions can be made on this topic.

**\*NO**

Durable subscriptions cannot be made on this topic.

**Durable model queue (MGDDURMDL)**

Specifies the name of the model queue to be used for durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

**\*SYSDFTTOP**

The value of this attribute is taken from the system default topic.

**durable-model-queue**

Specify the name of the model queue.

## **Non-durable model queue (MGDNDURMDL)**

Specifies the name of the model queue to be used for non-durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

### **\*SYSDFTTOP**

The value of this attribute is taken from the system default topic.

### **non-durable-model-queue**

Specify the name of the model queue.

## **Publish (PUBENBL)**

Specifies whether messages can be published to the topic.

The possible values are:

### **\*SYSDFTTOP**

The value of this attribute is taken from the system default topic.

### **\*ASPARENT**

Whether messages can be published to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

### **\*YES**

Messages can be published to the topic.

### **\*NO**

Messages cannot be published to the topic.

## **Subscribe (SUBENBL)**

Specifies whether applications are to be permitted to subscribe to this topic.

The possible values are:

### **\*SYSDFTTOP**

The value of this attribute is taken from the system default topic.

### **\*ASPARENT**

Whether applications can subscribe to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

### **\*YES**

Subscriptions can be made to this topic.

### **\*NO**

Applications cannot subscribe to this topic.

## **Default message priority (DFTPTY)**

Specifies the default priority of messages published to the topic.

The possible values are:

### **\*SYSDFTTOP**

The value of this attribute is taken from the system default topic.

### **\*ASPARENT**

The default priority is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

### **priority-value**

Specify a value ranging from 0 through 9.

## Default message persistence (DFTMSGPST)

Specifies the message persistence to be used when applications specify the MQPER\_PERSISTENCE\_AS\_TOPIC\_DEF option.

The possible values are:

### **\*SYSDFTTOP**

The value of this attribute is taken from the system default topic.

### **\*ASPARENT**

The default persistence is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

### **\*YES**

Messages on this queue survive a restart of the queue manager.

### **\*NO**

Messages on this queue are lost across a restart of the queue manager.

## Default Put Response (DFTPUTRESP)

Specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO\_RESPONSE\_AS\_Q\_DEF option.

The possible values are:

### **\*SYSDFTTOP**

The value of this attribute is taken from the system default topic.

### **\*ASPARENT**

The default response type is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

### **\*SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO\_RESPONSE\_AS\_Q\_DEF are issued as if MQPMO\_SYNC\_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application.

### **\*ASYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO\_RESPONSE\_AS\_Q\_DEF are always issued as if MQPMO\_ASYNC\_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application. An improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

## Wildcard behavior (WILDCARD)

Specifies the behavior of wildcard subscriptions with respect to this topic.

The possible values are:

### **\*SYSDFTTOP**

The value of this attribute is taken from the system default topic.

### **\*PASSTHRU**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will receive publications made to this topic and to topic strings more specific than this topic.

### **\*BLOCK**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will not receive publications made to this topic or to topic strings more specific than this topic.

## Persistent message delivery (PMSGDLV)

Specifies the delivery mechanism for persistent messages published to this topic.

The possible values are:

**\*SYSDFTTOP**

The value of this attribute is taken from the system default topic.

**\*ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*ALL**

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

**\*ALLDUR**

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

**\*ALLAVAIL**

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

## Non-persistent message delivery (NPMSGDLV)

Specifies the delivery mechanism for non-persistent messages published to this topic.

The possible values are:

**\*SYSDFTTOP**

The value of this attribute is taken from the system default topic.

**\*ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*ALL**

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

**\*ALLDUR**

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

**\*ALLAVAIL**

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

## Custom attribute (CUSTOM)

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

**\*SYSDFTTOP**

The value of this attribute is taken from the system default topic.

**\*BLANK**

The text is set to a blank string.

## custom

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

## IBM i Convert MQ Data Type (CVTMQMDTA)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Convert MQ Data Type (CVTMQMDTA) command produces a fragment of code to perform data conversion on data type structures, for use by the data-conversion exit program.

For information on how to use the data-conversion exit, see the IBM MQ Application Programming Guide.

Support is provided for the C programming language only.

## Parameters

Keyword	Description	Choices	Notes
<u>FROMFILE</u>	Input file	Qualified object name	Required, Positional 1
	Qualifier 1: Input file	Name	
	Qualifier 2: Library	Name, *LIBL, *CURLIB	
<u>FROMMBR</u>	Member containing input	Name	Required, Positional 2
<u>TOFILE</u>	File to receive output	Qualified object name	Required, Positional 3
	Qualifier 1: File to receive output	Name	
	Qualifier 2: Library	Name, *LIBL, *CURLIB	
<u>TOMBR</u>	Member to receive output	Name, *FROMMBR	Optional, Positional 4
<u>RPLTOMBR</u>	Replace to member	*YES, *NO	Optional, Positional 5

### Input file (FROMFILE)

Specifies the qualified name of the file, in the form LIBRARY/FILE, that contains the data to convert.

The possible values are:

#### \*LIBL

The library list is searched for the file name.

#### \*CURLIB

The current library is used.

#### from-library-name

Specify the name of the library to be used.

#### from-file-name

Specify the name of the file containing the data to convert.

### Member containing input (FROMMBR)

Specifies the name of the member containing the data to be converted.

The possible values are:

**from-member-name**

Specifies the name of the member containing the data to convert.

**File to receive output (TOFILE)**

Specifies the qualified name of the file, in the form LIBRARY/FILE, that contains the converted data.

The possible values are:

**\*LIBL**

The library list is searched for the file name.

**\*CURLIB**

The current library is used.

**to-library-name**

Specify the name of the library to be used.

**to-file-name**

Specify the name of the file to contain the converted data.

**Member to receive output (TOMBR)**

Specifies the name of the member containing the converted data.

The possible values are:

**\*FROMMBR**

The from-member name is used.

**to-member-name**

Specify the name of the member containing the converted data.

**Replace to member (RPLTOMBR)**

Specifies whether the converted data replaces the existing member.

The possible values are:

**\*YES**

The converted data replaces the existing member.

**\*NO**

The converted data does not replace the existing member.

**IBM i Delete Message Queue Manager (DLTMQM)**

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Delete Message Queue Manager (DLTMQM) command deletes the specified local queue manager.

**Parameters**

<i>Table 215. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1

## Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

### queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

## IBM i Delete MQ AuthInfo object (DLTMQMAUTI)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Delete MQ AuthInfo object (DLTMQMAUTI) command deletes an existing MQ authentication information object.

## Parameters

Keyword	Description	Choices	Notes
<u>AINAME</u>	AuthInfo name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 2

## AuthInfo name (AINAME)

The name of the authentication information object to delete.

If an application has this open, the command fails.

The possible values are:

### authentication-information-name

Specify the name of the authentication information object. The maximum string length is 48 characters.

## Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

### \*DFT

Use the default queue manager.

### queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

## IBM i Delete MQ Pub/Sub Broker (DLTMQMBRK)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The delete IBM MQ broker command (DLTMQMBRK) is used to delete the broker. The broker must be stopped when this command is issued, and the queue manager must be running. If the broker is already started, you must issue ENDMQMBRK before issuing this command. To delete more than one broker in the

hierarchy, it is essential that you stop (using the ENDMQMBRK command) and delete each broker one at a time. You should not attempt to stop all the brokers in the hierarchy that you want to delete first and then try to delete them.

## Parameters

Table 217. Command parameters			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

#### queue-manager-name

Specify the name of the queue manager.

## IBM i Delete MQ Channel (DLTMQMCHL)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Delete MQ Channel (DLTMQMCHL) command deletes the specified channel definition.

## Parameters

Table 218. Command parameters			
Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2
<u>CHLTYPE</u>	Channel type	*RCVR, *SDR, *SVR, *RQSTR, *SVRCN, *CLUSSDR, *CLUSRCVR, *NONCLT, *CLTCN	Optional, Positional 3

### Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

#### channel-name

Specify the channel name.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

**message-queue-manager-name**

The name of a message queue manager.

**Channel type**

Specifies the type of the channel to delete.

The possible values are:

**\*NONCLT**

Any channel type, that is not a client-connection channel, that matches the channel name.

**\*SDR**

Sender channel

**\*SVR**

Server channel

**\*RCVR**

Receiver channel

**\*RQSTR**

Requester channel

**\*SVRCN**

Server-connection channel

**\*CLUSSDR**

Cluster-sender channel

**\*CLUSRCVR**

Cluster-receiver channel

**\*CLTCN**

Client-connection channel

**Delete MQ Listener (DLTMQMLSR)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Delete MQ Listener object (DSPMQMLSR) command deletes an existing MQ listener object.

**Parameters**

<i>Table 219. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>LSRNAME</u>	Listener name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2

**Listener name (LSRNAME)**

The name of the listener object to delete.

The possible values are:

**listener-name**

Specify the name of the listener definition. The maximum length of the string is 48 bytes.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

The name of a message queue manager.

## IBM i Delete MQ Namelist (DLTMQMNL)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Delete MQ Namelist (DLTMQMNL) command deletes the specified namelist on the selected local queue manager.

**Parameters**

<i>Table 220. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>NAMELIST</u>	Namelist	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

**Namelist (NAMELIST)**

The name of the namelist to delete.

**namelist**

Specify the name of the namelist. The maximum length of the string is 48 bytes.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

The default queue manager is used.

**message-queue-manager-name**

Specify the name of the queue manager.

## IBM i Delete MQ Process (DLTMQMPRC)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Delete MQ Process (DLTMQMPC) command deletes an existing MQ process definition.

## Parameters

Table 221. Command parameters			
Keyword	Description	Choices	Notes
<u>PRCNAME</u>	Process name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2

### Process name (PRCNAME)

The name of the process definition to delete. If an application has this process open, the command fails.

The possible values are:

#### process-name

Specify the name of the process definition. The maximum length of the string is 48 bytes.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

#### \*DFT

Use the default queue manager.

#### queue-manager-name

The name of a message queue manager.

## IBM i Delete MQ Queue (DLTMQM)Q

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Delete MQ Queue (DLTMQM)Q command deletes an MQ queue.

If the queue is a local queue, it must be empty for the command to succeed. CLRMQM)Q can be used to clear all of the messages from a local queue.

The command fails if an application has:

- This queue open
- A queue that resolves to this queue open
- A queue open that resolves through this definition as a queue manager alias.

An application using the definition as a reply-to queue alias, however, does not cause this command to fail.

## Parameters

Table 222. Command parameters			
Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value	Required, Positional 1

Table 222. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2

### Queue name (QNAME)

The name of the queue.

The possible values are:

#### queue-name

Specify the name of the queue.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

#### \*DFT

Use the default queue manager.

#### queue-manager-name

Specify the name of the queue manager.

IBM I

## Delete MQ Subscription (DLTMQMSUB)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Delete MQ Subscription (DLTMQMSUB) command deletes an existing MQ subscription.

### Parameters

Table 223. Command parameters

Keyword	Description	Choices	Notes
<u>SUBID</u>	Subscription identifier	Character value, <b>*NONE</b>	Optional, Positional 1
<u>SUBNAME</u>	Subscription name	Character value, <b>*NONE</b>	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 3

### Subscription identifier (SUBID)

The subscription identifier of the subscription to delete.

The possible values are:

#### subscription-name

Specify a maximum of 256 bytes for the subscription name.

**Note:** Subscription names of greater than 256 bytes can be specified using MQSC.

## Subscription name (SUBNAME)

The name of the subscription to delete.

The possible values are:

### subscription-name

Specify a maximum of 256 bytes for the subscription name.

**Note:** Subscription names of greater than 256 bytes can be specified using MQSC.

## Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

### \*DFT

Use the default Queue Manager.

### queue-manager-name

The name of a Queue Manager.

IBM I

## Delete MQ Service (DLTMQMSVC)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Delete MQ Service object (DLTMQMSVC) command deletes an existing MQ service object.

## Parameters

Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2

## Service name (SVCNAME)

The name of the service object to delete.

The possible values are:

### service-name

Specify the name of the service definition. The maximum length of the string is 48 bytes.

## Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

### \*DFT

Use the default queue manager.

### queue-manager-name

The name of a message queue manager.

## IBM i Delete MQ Topic (DLTMQMTOP)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Delete MQ Topic (DLTMQMTOP) command deletes an existing MQ topic object.

### Parameters

Keyword	Description	Choices	Notes
<u>TOPNAME</u>	Topic name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2

### Topic name (TOPNAME)

The name of the topic object to delete. If an application has this topic open, the command fails.

The possible values are:

#### topic-name

Specify the name of the topic object. The maximum length of the string is 48 bytes.

### Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

#### \*DFT

Use the default Queue Manager.

#### queue-manager-name

The name of a Queue Manager.

## IBM i Dump MQ Configuration (DMPMQMCFG)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Dump MQ Configuration (DMPMQMCFG) command is used to dump the configuration objects and authorities for a queue manager.

### Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *ALL	Optional, Positional 1
<u>OBJ</u>	Object name	Character value, *ALL	Optional, Positional 2

Table 226. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>OBJTYPE</u>	Object type	<b>*ALL</b> , *AUTHINFO, *CHL, *CLTCN, *COMMINFO, *LSR, *NMLIST, *PRC, *Q, *MQM, *SVC, *SUB, *TOPIC	Optional, Positional 3
<u>EXPTYPE</u>	Export type	<b>*ALL</b> , *OBJECT, *AUTHREC, *CHLAUTH	Optional, Positional 4
<u>EXPATTR</u>	Export attributes	<b>*NONDEF</b> , *ALL	Optional, Positional 5
<u>WARN</u>	Warnings	<b>*NO</b> , *YES	Optional, Positional 6
<u>OUTPUT</u>	Output	<b>*MQSC</b> , *ONELINE, *SETMQAUT, *GRMQMAUT	Optional, Positional 7
<u>CLIENT</u>	Client connection	<b>*NO</b> , *YES, *CHL	Optional, Positional 8
<u>CLIENTCHL</u>	MQSC Channel Definition	Character value, <b>*NONE</b>	Optional, Positional 9
<u>MSGSEQNUM</u>	Message sequence number	1-999999999, <b>*NORESET</b>	Optional, Positional 10
<u>RPLYQ</u>	Reply Queue	Character value, <b>'SYSTEM.DEFAULT.MODEL.QUEUE'</b>	Optional, Positional 11
<u>RMTMQMNAME</u>	Remote Message Queue Manager	Character value, <b>*NONE</b>	Optional, Positional 12
<u>TOFILE</u>	File to receive output	Qualified object name	Optional, Positional 13
	Qualifier 1: File to receive output	Name	
	Qualifier 2: Library	Name, <b>*LIBL</b>	
<u>TOMBR</u>	Member to receive output	Name	Optional, Positional 14

### Message Queue Manager name (MQMNAME)

Specifies the name of the IBM MQ queue manager for which object information is to displayed.

The possible values are:

#### **\*DFT**

#### **queue-manager-name**

The name of an existing message queue manager. The maximum string length is 48 characters.

### Object name (OBJ)

Specifies the name of the objects to dump. It is a 48-character MQ object or generic object name.

The possible values are:

#### **\*ALL**

All objects of the specified type (OBJTYPE) are dumped.

#### **generic-object-name**

Specify the generic name of the objects. A generic name is a character string followed by an asterisk (\*). For example, ABC\*. It selects all objects having names that start with the selected character string.

Specifying the required name within quotation marks ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

***object-name***

The name of an object for which the corresponding name and type is to be displayed.

**Object type (OBJTYPE)**

Specifies the type of the objects to be dumped.

The possible values are:

**\*ALL**

All MQ Objects with names specified by OBJ.

**\*AUTHINFO**

All MQ authentication information objects with names specified by OBJ.

**\*CHL**

All MQ channel objects with names specified by OBJ.

**\*CLTCN**

All MQ client connection objects with names specified by OBJ.

**\*COMMINFO**

All MQ communication information objects with names specified by OBJ.

**\*LSR**

All MQ listener objects with names specified by OBJ.

**\*NMLIST**

All MQ namelist objects with names specified by OBJ.

**\*PRC**

All MQ process objects with names specified by OBJ.

**\*Q**

All MQ queue objects with names specified by OBJ.

**\*MQM**

The queue manager object.

**\*SVC**

All MQ service objects with names specified by OBJ.

**\*TOPIC**

All MQ topic objects with names specified by OBJ.

**Export type (EXPTYPE)**

Specifies the type of the export.

The possible values are:

**\*ALL**

All MQ object, authority and subscription configuration information is dumped.

**\*OBJECT**

Only MQ object information is dumped.

**\*AUTHREC**

Only MQ authority information is dumped.

**\*CHLAUTH**

Only MQ channel authority records are dumped.

**\*SUB**

Only MQ durable subscription information is dumped.

## **Export attributes (EXPATTR)**

Specifies the attributes to export.

The possible values are:

### **\*NONDEF**

Only non-default attribute values are dumped.

### **\*ALL**

All attribute values are dumped.

## **Warnings (WARN)**

Specifies whether warnings should be generated during the dump, for example if the command is issued against a newer queue manager or encounters a damaged object.

The possible values are:

### **\*NO**

No warnings messages will be issued during the dump.

### **\*YES**

Warning messages may be issued during the dump.

## **Output (OUTPUT)**

Specifies the output format from the dump.

The possible values are:

### **\*MQSC**

The output format is in the form of MQSC commands that could be used as input to the RUNMQSC or STRMQMMQSC commands.

### **\*ONELINE**

The output format is in the form of MQSC commands formatted into single line records, suitable for use with line comparison tools.

### **\*SETMQAUT**

The output format is in the form of setmqaut commands, suitable for use with Windows or UNIX.

### **\*GRMQMAUT**

The output format is in the form of GRMQMAUT commands, suitable for use generating a CL program on the IBM i platform.

## **Client connection (CLIENT)**

Specifies whether to use a client connection to the queue manager.

The possible values are:

### **\*NO**

The command will first attempt a server bindings connection, if this connection fails a client connection will be attempted.

### **\*YES**

The command will attempt to connect via a client connection using the default client connection process. If the MQSERVER environment variable is set it will override use of a client connection channel table.

### **\*CHL**

The command will attempt to connect to the queue manager using a temporary channel definition defined by the MQSC string specified in the CLIENTCHL parameter.

## MQSC Channel Definition (CLIENTCHL)

Specifies, via MQSC syntax, a temporary client channel definition to use in connecting to the queue manager.

The possible values are:

### **\*NONE**

Do not use a temporary client channel definition when connecting to the queue manager.

### **mqsc-define-channel-string**

The command will attempt to construct a temporary client channel definition from the using the MQSC command supplied on this parameter. The MQSC command must define all required attributes for a client connection channel, for example:

```
"DEFINE CHANNEL(MY.CHL) CHLTYPE(CLNTCONN) CONNAME(MYHOST.MYCORP.COM(1414))"
```

## Message sequence number (MSGSEQNUM)

Specifies whether to generate reset channel commands for sender, server and cluster sender channel types when dumping channel objects.

The possible values are:

### **\*NORESET**

Do not include any reset channel commands in the dumped output.

### **1 - 999999999**

Specify a message sequence number for the reset channel commands included in the dump.

## Reply Queue (RPLYQ)

Specifies the name of the queue to use for receiving PCF replies when inquiring configuration information.

The possible values are:

### **SYSTEM.DEFAULT.MODEL.QUEUE**

The default model queue, a dynamic queue will be generated to receive replies.

### **reply-to-queue-name**

Specify the name of the reply to queue.

## Remote Message Queue Manager (RMTMQMNAME)

Specifies the name of a remote MQ queue manager for which object information is to be displayed.

The possible values are:

### **\*NONE**

The configuration information is collected from the queue manager specified in the MQMNAME parameter.

### **remote-queue-manager-name**

Specify the name of the remote queue manager. PCF inquiry commands are issued to the queue manager specified in RMTMQMNAME via the queue manager specified in MQMNAME, this is known as queued mode. \

## File to receive output (TOFILE)

Specifies the qualified name of the file, in the form LIBRARY/FILE, that will be used to store the dumped configuration data. The FILE should have been created with a record length of 240, otherwise the configuration information might be truncated.

The possible values are:

### **\*LIBL**

The library list is searched for the file name.

**\*CURLIB**

The current library is used.

**to-library-name**

Specify the name of the library to be used.

**to-file-name**

Specify the name of the file to contain the configuration data.

**Member to receive output (TOMBR)**

Specifies the name of the member to store the dumped configuration data.

The possible values are:

**to-member-name**

Specify the name of the member to contain the configuration data.

**Examples**

To make these examples work you need to ensure that your system is set up for remote MQSC operation. See [Configuring queue managers for remote administration](#).

```
DMPMQMCFG MQMNAME('MYQMGR') CLIENT(*YES) CLIENTCHL(''DEFINE CHANNEL(SYSTEM.ADMIN.SVRCONN)
CHLTYPE(CLNTCONN) CONNAME('myhost.mycorp.com(1414)')''')
```

umps all the configuration information from remote queue manager *MYQMGR* in MQSC format and creates an ad-hoc client connection to the queue manager using a client channel called *SYSTEM.ADMIN.SVRCONN*.

**Note:** You need to ensure that a server-connection channel with the same name exists.

```
DMPMQMCFG MQMNAME('LOCALQM') RMTMQMNAME('MYQMGR')
```

umps all configuration information from remote queue manager *MYQMGR*, in MQSC format, connects initially to local queue manager *LOCALQM*, and sends inquiry messages through this local queue manager.

**Note:** You need to ensure that the local queue manager has a transmission queue named *MYQMGR*, with channel pairings defined in both directions, to send and receive replies between queue managers.

**Related tasks**

 [Backing up queue manager configuration](#)

 [Restoring queue manager configuration](#)

**IBM i Disconnect MQ (DSCMQM)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Disconnect Message Queue Manager (DSCMQM) command does not perform any function and is provided only for compatibility with previous releases of IBM MQ and MQSeries.

**Parameters**

None

## Display Message Queue Manager (DSPMQM)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Display Message Queue Manager (DSPMQM) command displays the attributes of the specified local queue manager.

**Parameters**

Table 227. Command parameters			
Keyword	Description	Choices	Notes
<u>OUTPUT</u>	Output	<b>*</b> , *PRINT	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 2

**Output (OUTPUT)**

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

**\***

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

**\*PRINT**

The output is printed with the job's spooled output.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

## Display MQ Object Authority (DSPMQMAUT)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Display MQ Authority (DSPMQMAUT) command shows, for the specified object, the current authorizations to the object. If a user ID is a member of more than one group, this command displays the combined authorizations of all of the groups.

- The 48-character MQ object name
- The MQ object type
- Authorizations for object, context and MQI calls

## Parameters

Table 228. Command parameters			
Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	Character value	Required, Positional 1
<u>OBJTYPE</u>	Object type	*Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *MQM, *NMLIST, *PRC, *LSR, *SVC, *CHL, *CLTCN, *TOPIC, *RMTMQMNAME	Required, Positional 2
<u>USER</u>	User name	Name, <b>*PUBLIC</b>	Optional, Positional 3
<u>OUTPUT</u>	Output	<b>*</b> , *PRINT	Optional, Positional 4
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 5
<u>SRVCOMP</u>	Service Component name	Character value, <b>*DFT</b>	Optional, Positional 6

### Object name (OBJ)

Specifies the name of the MQ object for which the authorizations are displayed.

### Object type (OBJTYPE)

Specifies the type of the object for which the authorizations are displayed.

#### **\*Q**

All queue object types.

#### **\*ALSQ**

Alias queue.

#### **\*LCLQ**

Local queue.

#### **\*MDLQ**

Model queue.

#### **\*RMTQ**

Remote queue.

#### **\*AUTHINFO**

Authentication Information object.

#### **\*MQM**

Message Queue Manager.

#### **\*NMLIST**

Namelist object.

#### **\*PRC**

Process definition.

#### **\*CHL**

Channel object.

#### **\*CLTCN**

Client Connection Channel object.

#### **\*LSR**

Listener object.

#### **\*SVC**

Service object.

**\*TOPIC**

Topic object.

**\*RMTMQMNAME**

Remote queue manager name.

**User name (USER)**

Specifies the name of the user for whom authorities for the named object are displayed.

The possible values are:

**\*PUBLIC**

All users of the system.

**user-profile-name**

Specify the name of the user.

**Output (OUTPUT)**

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

**\***

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

**\*PRINT**

The output is printed with the job's spooled output.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the queue manager.

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager.

**Service Component name (SRVCOMP)**

Specifies the name of the installed authorization service in which to search for the authority to display.

The possible values are:

**\*DFT**

All installed authorization components are searched for the specified object name, object type and user.

**Authorization-service-component-name**

The component name of the required authorization service as specified in the Queue manager's qm.ini file.

IBM i

**Display MQ AuthInfo object (DSPMQMAUTI)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Display MQ AuthInfo object (DSPMQMAUTI) command displays the attributes of an existing MQ authentication information object.

## Parameters

Keyword	Description	Choices	Notes
<u>AINAME</u>	AuthInfo name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2
<u>OUTPUT</u>	Output	Character value, <b>*</b> , <b>*PRINT</b>	Optional, Positional 3

### AuthInfo name (AINAME)

The name of the authentication information object to display.

The possible values are:

#### authentication-information-name

Specify the name of the authentication information object. The maximum string length is 48 characters.

### Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

#### **\*DFT**

Use the default queue manager.

#### queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

### Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

#### **\***

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

#### **\*PRINT**

The output is printed with the job's spooled output.

IBM i

## Display MQ Pub/Sub Broker (DSPMQMBRK)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Display IBM MQ broker (DSPMQMBRK) command does not perform any function and is only provided for compatibility with previous releases of IBM MQ.

## Parameters

Table 230. Command parameters			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1

### Message Queue Manager name (MQMNAME)

The name of the queue manager.

The value is:

#### queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

IBM i

## Display MQ Channel (DSPMQMCHL)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Display MQ Channel (DSPMQMCHL) command displays the attributes of an existing MQ channel definition.

## Parameters

Table 231. Command parameters			
Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>OUTPUT</u>	Output	*, *PRINT	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 3
<u>CHLTYPE</u>	Channel type	*RCVR, *SDR, *SVR, *RQSTR, *SVRCN, *CLUSSDR, *CLUSRCVR, *NONCLT, *CLTCN	Optional, Positional 4

### Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

#### channel-name

Specify the channel name.

### Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

\*

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

**\*PRINT**

The output is printed with the job's spooled output.

### **Message Queue Manager name (MQMNAME)**

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

**message-queue-manager-name**

The name of a message queue manager.

### **Channel type (CHLTYPE)**

Specifies the type of the channel to be displayed.

The possible values are:

**\*NONCLT**

Any channel type, that is not a client-connection channel, that matches the channel name.

**\*SDR**

Sender channel

**\*SVR**

Server channel

**\*RCVR**

Receiver channel

**\*RQSTR**

Requester channel

**\*SVRCN**

Server-connection channel

**\*CLUSSDR**

Cluster-sender channel

**\*CLUSRCVR**

Cluster-receiver channel

**\*CLTCN**

Client-connection channel

 IBM i

## **Display MQ Command Server (DSPMQMCSVR)**

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Display MQ Command Server (DSPMQMCSVR) command displays the status of the MQ command server.

The status of the command server can be one of the following:

**Enabled**

Available to process messages

**Disabled**

Not available to process messages

**Starting**

STRMQMCSVR command in progress

**Stopping**

ENDMQMCSVR command in progress

**Stopped**

ENDMQMCSVR command completed

**Running**

Processing a message

**Waiting**

Waiting for a message

**Parameters**

<i>Table 232. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 1

**Message Queue Manager name (MQMNAME)**

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager.

**Display MQ Listener (DSPMQMLSR)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Display MQ Listener object (DSPMQMLSR) command displays the attributes of an existing MQ listener object.

**Parameters**

<i>Table 233. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>LSRNAME</u>	Listener name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Key, Positional 2
<u>OUTPUT</u>	Output	<b>*</b> , *PRINT	Optional, Positional 3

## Listener name (LSRNAME)

The name of the listener object to display.

The possible values are:

### listener-name

Specify the name of the listener definition. The maximum length of the string is 48 bytes.

## Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

### \*DFT

Use the default queue manager.

### queue-manager-name

The name of a message queue manager.

## Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

### \*

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

### \*PRINT

The output is printed with the job's spooled output.

IBM i

## Display MQ Namelist (DSPMQMNL)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Display MQ Namelist (DSPMQMNL) command displays an MQ namelist.

## Parameters

Keyword	Description	Choices	Notes
<u>NAMELIST</u>	Namelist	Character value	Required, Positional 1
<u>OUTPUT</u>	Output	*, *PRINT	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 3

## Namelist (NAMELIST)

The name of the namelist to be displayed.

### namelist

Specify the name of the namelist. The maximum length of the string is 48 bytes.

## Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

**\***

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

**\*PRINT**

The output is printed with the job's spooled output.

## Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

The default queue manager is used.

**message-queue-manager-name**

Specify the name of the queue manager.

IBM i

## Display MQ Object Names (DSPMQOBJN)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Display MQ Object Names (DSPMQOBJN) command is used to provide the name, type, and fully-qualified file name for a specified MQ object.

## Parameters

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	Character value, *ALL	Required, Positional 1
<u>OBJTYPE</u>	Object type	<b>*ALLMQM</b> , *Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *CTLG, *CHL, *CLTCN, *SVC, *MQM, *NMLIST, *PRC, *LSR, *TOPIC	Optional, Positional 2
<u>OUTPUT</u>	Output	<b>*</b> , *PRINT	Optional, Positional 3
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 4

## Object name (OBJ)

Specifies the name of the objects for which the corresponding name, type and file name to display. It is a 48-character MQ object or generic object name.

The possible values are:

**\*ALL**

All objects of the specified type (OBJTYPE) are displayed.

**generic-object-name**

Specify the generic name of the objects. A generic name is a character string followed by an asterisk (\*). For example, ABC\*. It selects all objects having names that start with the selected character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

**object-name**

The name of an object for which the corresponding name and type is to be displayed.

**Object type (OBJTYPE)**

Specifies the type of the objects to be displayed.

The possible values are:

**\*ALLMQM**

All MQ Objects with names specified by OBJ.

**\*Q**

All MQ queues with names specified by OBJ.

**\*ALSQ**

All MQ alias queues with names specified by OBJ.

**\*LCLQ**

All MQ local queues with names specified by OBJ.

**\*MDLQ**

All MQ model queues with names specified by OBJ.

**\*RMTQ**

All MQ remote queues with names specified by OBJ.

**\*AUTHINFO**

All MQ authentication information objects with names specified by OBJ.

**\*CHL**

All MQ channel objects with names specified by OBJ.

**\*CLTCN**

All MQ MQI client connection channel objects with names specified by OBJ.

**\*SVC**

All MQ service objects with names specified by OBJ.

**\*LSR**

All MQ listener objects with names specified by OBJ.

**\*CTLG**

The MQ queue manager catalog object with name specified by OBJ. This has the same name as the queue manager object.

**\*MQM**

The Message Queue Manager object with name specified by OBJ.

**\*NMLIST**

All MQ namelists with names specified by OBJ.

**\*PRC**

All MQ process definitions with names specified by OBJ.

**\*LOBJ**

All MQ listener objects with names specified by OBJ.

**\*TOPIC**

All MQ topic objects with names specified by OBJ.

**Output (OUTPUT)**

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

**\***

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

**\*PRINT**

The output is printed with the job's spooled output.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the MQ queue manager for which object information is to displayed.

The possible values are:

**\*DFT**

The default queue manager.

**queue-manager-name**

Specify the name of the queue manager.

IBM i

**Display MQ Process (DSPMQMPRC)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Display MQ Process (DSPMQMPRC) command displays the attributes of an existing MQ process definition.

**Parameters**

Keyword	Description	Choices	Notes
<u>PRCNAME</u>	Process name	Character value	Required, Positional 1
<u>OUTPUT</u>	Output	<b>*</b> , *PRINT	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 3

**Process name (PRCNAME)**

The name of the process definition to be displayed.

The possible values are:

**process-name**

Specify the name of the process definition. The maximum length of the string is 48 bytes.

## Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

**\***

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

**\*PRINT**

The output is printed with the job's spooled output.

## Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

The name of a message queue manager.

IBM i

## Display MQ Queue (DSPMQMQ)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Display MQ Queue (DSPMQMQ) command displays the attributes of an existing MQ queue definition.

## Parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value	Required, Positional 1
<u>OUTPUT</u>	Output	<b>*</b> , <b>*PRINT</b>	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 3

## Queue name (QNAME)

The name of the queue.

The possible values are:

**queue-name**

Specify the name of the queue.

## Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

\*

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

**\*PRINT**

The output is printed with the job's spooled output.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager.

**IBM i Display MQ Route Information (DSPMQMRTE)**

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The DSPMQMRTE command generates a trace route message based on user specified parameters and puts it to a specified queue. One or more reports about the route the message takes to its final destination might be generated, as well as a reply. These will be got from a specified reply queue and the information contained within them will be written to the job's spooled output when it is received.

**Parameters**

Table 238. Command parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Target object	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2
<u>CRRLID</u>	Correlation Identifier	Character value, <b>*NONE</b>	Optional, Positional 3
<u>MSGPST</u>	Message Persistence	*YES, <b>*NO</b> , *QUEUE	Optional, Positional 4
<u>MSGPRTY</u>	Message Priority	0-9, <b>*QUEUE</b>	Optional, Positional 5
<u>OPTION</u>	Report Option	Single values: <b>*DFT</b> , *NONE Other values (up to 6 repetitions): *ACTIVITY, *COA, *COD, *DISCARD, *EXCEPTION, *EXPIRATION	Optional, Positional 6
<u>RPLYQ</u>	Reply Queue	Character value, <b>*DFT</b>	Optional, Positional 7
<u>RPLYMQM</u>	Reply Queue Manager	Character value, <b>*DFT</b>	Optional, Positional 8
<u>EXPIRY</u>	Message Expiry	0-999999999, <b>*DFT</b>	Optional, Positional 9
<u>EXPRPT</u>	Pass Expiry	<b>*YES</b> , *NO	Optional, Positional 10
<u>RTEINF</u>	Route Accumulation	*YES, <b>*NO</b>	Optional, Positional 11

Table 238. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>RPLYMSG</u>	Reply Message	*YES, *NO	Optional, Positional 12
<u>DLVRMSG</u>	Deliver Message	*YES, *NO	Optional, Positional 13
<u>FWDMSG</u>	Forward Message	*SUPPORT, *ALL	Optional, Positional 14
<u>MAXACTS</u>	Maximum Activities	1-999999999, *NOMAX	Optional, Positional 15
<u>DETAIL</u>	Route Detail	*LOW, *MEDIUM, *HIGH	Optional, Positional 16
<u>BROWSE</u>	Browse Only	*YES, *NO	Optional, Positional 17
<u>DSPMSG</u>	Display Message	*YES, *NO	Optional, Positional 18
<u>TGTMQM</u>	Target Queue Manager	Character value, *DFT	Optional, Positional 19
<u>DSPINF</u>	Display Information	Single values: *ALL, *SUMMARY, *NONE Other values (up to 6 repetitions): *ACTGRP, *ID, *MSGGRP, *MSGDELTA, *OPGRP, *TRGRP	Optional, Positional 20
<u>WAIT</u>	Wait Time	0-999999999, *DFT	Optional, Positional 21
<u>BIND</u>	Bind Option	*OPEN, *NOTFIXED	Optional, Positional 22

### Target object (QNAME)

Specifies the name of the target queue of the trace route message or, if displaying previously gathered information, the name of the queue storing the information.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

#### \*DFT

Use the default queue manager.

#### message-queue-manager-name

Specify the name of the queue manager.

### Correlation Identifier (CRRLID)

Specifies the CorrelId to use when retrieving previously gathered information. The format of the 24 byte CorrelId is a 48 character hexadecimal string. You must supply a CorrelId if you are retrieving previously gathered information, rather than generating a trace route message.

The possible values are:

#### \*NONE

No CorrelId is supplied.

#### correlation-identifier

The 48 character hexadecimal string representing the 24 byte CorrelId.

## Message Persistence (MSGPST)

Specifies the persistence of the trace route message.

The possible values are:

**\*NO**

The message will be put with MQPER\_NOT\_PERSISTENT.

**\*YES**

The message will be put with MQPER\_PERSISTENT.

**\*QUEUE**

The message will be put with MQPER\_PERSISTENCE\_AS\_Q\_DEF.

## Message Priority (MSGPRTY)

Specifies the priority of the trace route message.

The possible values are:

**\*QUEUE**

The message will be put with MQPRI\_PRIORITY\_AS\_Q\_DEF.

**message-priority**

The priority of the message ranging 0 through 9.

## Report Option (OPTION)

Specifies the report options of the trace route message. Reports generated on a non trace route enabled queue manager can potentially remain in the network undelivered, which is why most report options are disabled by default. By requesting full data to be returned, it allows the trace route information contained in the message to be returned in the result of a problem.

The possible values are:

**\*DFT**

Turns on MQRO\_ACTIVITY and MQRO\_DISCARD\_MSG.

**\*NONE**

No report options are set.

**\*ACTIVITY**

Turns on MQRO\_ACTIVITY.

**\*COA**

Turns on MQRO\_COA\_WITH\_FULL\_DATA.

**\*COD**

Turns on MQRO\_COD\_WITH\_FULL\_DATA.

**\*DISCARD**

Turns on MQRO\_DISCARD\_MSG.

**\*EXCEPTION**

Turns on MQRO\_EXCEPTION\_WITH\_FULL\_DATA.

**\*EXPIRATION**

Turns on MQRO\_EXPIRATION\_WITH\_FULL\_DATA.

## Reply Queue (RPLYQ)

Specifies the name of the reply queue to which the reply and all report messages should be sent. This must exist on the local queue manager unless the RPLYMQM parameter is also specified. The reply queue should not be a temporary queue if the trace route message is to be persistent.

The possible values are:

**\*DFT**

The SYSTEM.DEFAULT.MODEL.QUEUE is used and the reply queue is by default a temporary dynamic queue.

**reply-queue**

The name of the reply queue to use.

**Reply Queue Manager (RPLYMQM)**

Specifies the queue manager to which replies are sent.

The possible values are:

**\*DFT**

Replies are sent to the local queue manager.

**reply-queue-manager**

The name of the reply to queue manager.

**Message Expiry (EXPIRY)**

Specifies the Expiry time, in seconds, of the trace route message.

The possible values are:

**\*DFT**

The default expiry time of 60 seconds is used.

**expiry-time**

The expiry time of the message ranging from 0 through 999999999.

**Pass Expiry (EXPRPT)**

Specifies whether the expiry of the trace route message is passed to reports or the reply message. This effectively turns MQRO\_PASS\_DISCARD\_AND\_EXPIRY on and off. This allows users to keep the reports indefinitely if required.

The possible values are:

**\*YES**

Expiry is passed to reports or the reply message.

**\*NO**

Expiry is not passed to reports or the reply message.

**Route Accumulation (RTEINF)**

Specifies that the route information is accumulated within the trace route message as it flows through the queue manager network.

The possible values are:

**\*NO**

No information is accumulated within the trace route message.

**\*YES**

Information is accumulated within the trace route message.

**Reply Message (RPLYMSG)**

Requests that a reply message containing all accumulated information is returned to the reply to queue when the trace route message reaches its final destination (if this is permitted by the queue manager hosting the final destination queue).

The possible values are:

**\*NO**

No reply message is returned.

**\*YES**

A reply message is returned to the the reply to queue.

**Deliver Message (DLVRMSG)**

Specifies whether the trace route message is delivered to getting applications if the message successfully arrives at the destination queue.

The possible values are:

**\*NO**

If the trace route message successfully arrives at the target queue it is not delivered to getting applications.

**\*YES**

The trace route message is delivered to a getting application if the message successfully arrives at the target queue. Specifying this option effectively gives permission for the message to arrive on a queue manager, whether it supports trace route or not.

**Forward Message (FWDMSG)**

Specifies whether the trace route message is forwarded to the next queue manager in the route.

The possible values are:

**\*SUPPORT**

The trace route message is forwarded only to queue managers that can ensure that the delivery option is honoured.

**\*ALL**

The trace route message is forwarded on without any regard given to the next queue manager in the route. This option can be used to force a non-trace route enabled queue manager to accept trace route messages, even when they cannot process them in line with the delivery option.

**Maximum Activities (MAXACTS)**

Specifies the maximum number of activities that can take place on the trace route message before it is discarded.

The possible values are:

**\*NOMAX**

No maximum number of activities are specified.

**maximum-activities**

The maximum number of activities ranging from 1 through 999999999.

**Route Detail (DETAIL)**

Specifies how much detail about the route is requested.

The possible values are:

**\*LOW**

At this level of detail no information about queue manager activities is requested. This gives a very high level view of what user activity has taken place on the message.

**\*MEDIUM**

Low detail information, as well as information on the movements of the message within the queue manager is requested. This includes the work of the MCA.

**\*HIGH**

Low and medium detail, as well as more detailed information about the route the message took is requested. For example, in clustering this might include detail about why the route was chosen.

**Browse Only (BROWSE)**

Specifies whether messages returned are browsed only. This means that the information remains on the queue for future display operations.

The possible values are:

**\*NO**

Messages returned are not browse only.

**\*YES**

Messages returned are browse only.

**Display Message (DSPMSG)**

Specifies whether when a trace route message is generated the information returned is displayed.

The possible values are:

**\*YES**

The returned information is displayed.

**\*NO**

The returned information is not displayed. This allows DSPMQMRTE to exit as soon as the trace route message has been put to the target queue. On exit, a 48 character hexadecimal string is output, which is the MsgId on the trace route message that was generated and can be used as the CRRLID supplied to a subsequent DSPMQMRTE call.

**Target Queue Manager (TGTMQM)**

Specifies the target queue manager for the trace route message.

The possible values are:

**\*DFT**

No target queue manager is specified. Either the destination queue is a local queue, or there is a local definition of the queue.

**target-queue-manager**

The target queue manager for the trace route message.

**Display Information (DSPINF)**

Specifies how much of the information gathered should be displayed.

The possible values are:

**\*ALL**

All available information is displayed.

**\*SUMMARY**

Displays only the queues which the message was routed through.

**\*NONE**

None of the available information will be displayed.

**\*ACTGRP**

All non-group parameters in the Activity groups will be displayed.

**\*ID**

Values with parameters identifiers MQBACF\_MSG\_ID or MQBACF\_CORREL\_ID are always displayed. This overrides \*MSGDELTA which normally prevents certain values in the Message groups from being displayed.

**\*MSGGRP**

All non-group parameters in the Message groups are displayed.

**\*MSGDELTA**

Like \*MSGGRP, except that information in the Message groups is only displayed where it has changed since the last operation took place.

**\*OPGRP**

All non-group parameters in the Operation groups are displayed.

**\*TRGRP**

All parameters in the TraceRoute groups are displayed.

**Wait Time (WAIT)**

Specifies how long, in seconds, that DSPMQMRTE should wait before assuming that all a reply message or all the reports (depending on the options specified) that were generated en route that can be delivered to the reply queue have now done so.

The possible values are:

**\*DFT**

DSPMQMRTE waits for 60 seconds longer than the Expiry time of the trace route message.

**wait-time**

The time that DSPMQMRTE should wait.

**Bind Option (BIND)**

Specifies whether the target queue is bound to a specific destination.

The possible values are:

**\*OPEN**

The target queue is bound to a specific destination. The queue is opened with option MQOO\_BIND\_ON\_OPEN.

**\*NOTFIXED**

The target queue is not bound to a specific destination. Typically this parameter is used when the trace route message is to be put across a cluster. The queue is opened with option MQOO\_BIND\_NOT\_FIXED.

 IBM i**Display Queue Manager Status (DSPMQMSTS)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Display Message Queue Manager Status (DSPMQMSTS) command displays the status attributes of the specified local queue manager.

## Parameters

Keyword	Description	Choices	Notes
<a href="#">MQMNAME</a>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Key, Positional 1
<a href="#">OUTPUT</a>	Output	<b>*</b> , <b>*PRINT</b>	Optional, Positional 2
<a href="#">“STARTDA” on page 1227</a>	Start Date		Optional, Positional 3
<a href="#">“STARTTI” on page 1227</a>	Start Time		Optional, Positional 4

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

#### **\*DFT**

Use the default queue manager.

#### **queue-manager-name**

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

### Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

#### **\***

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

#### **\*PRINT**

The output is printed with the job's spooled output.

### STARTDA

The date on which the queue manager was started (in the form yyyy-mm-dd).

### STARTTI

The time at which the queue manager was started (in the form hh.mm.ss).

IBM i

## Display MQ Service (DSPMQMSVC)

#### Where allowed to run

All environments (\*ALL)

#### Threadsafe

Yes

The Display MQ Service object (DSPMQMSVC) command displays the attributes of an existing MQ service object.

## Parameters

Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Key, Positional 2
<u>OUTPUT</u>	Output	<b>*</b> , *PRINT	Optional, Positional 3

### Service name (SVCNAME)

The name of the service object to display.

The possible values are:

#### **service-name**

Specify the name of the service definition. The maximum length of the string is 48 bytes.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

#### **\*DFT**

Use the default queue manager.

#### **queue-manager-name**

The name of a message queue manager.

### Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

#### **\***

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

#### **\*PRINT**

The output is printed with the job's spooled output.

IBM i

## Display MQM Security Policy (DSPMQMSPL)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Display MQM Security Policies (DSPMQMSPL) command displays security policies, that are used by Advanced Message Security to control how messages should be protected when being put, browsed, or destructively removed from queues.

The policy name associates digital signing and encryption protection for messages with queues matching the policy name.

## Parameters

Keyword	Description	Choices	Notes
<u>OUTPUT</u>	Output	<b>*</b> , *PRINT	Optional, Positional 1
<u>POLICY</u>	Policy name	Character value	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 3

### Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

**\***

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

**\*PRINT**

The output is printed with the job's spooled output.

### Policy name (POLICY)

Specifies the name of the security policy, the name of the policy matches the name of the queue that the policy applies to.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

IBM i

## Display MQ Subscription (DSPMQMSUB)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Display MQ Subscription (DSPMQMSUB) command displays the attributes of an existing MQ subscription.

## Parameters

Keyword	Description	Choices	Notes
<u>SUBID</u>	Subscription identifier	<i>Character value</i> , <b>*NONE</b>	Optional, Positional 1

Table 242. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>SUBNAME</u>	Subscription name	Character value, <b>*NONE</b>	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 3
<u>OUTPUT</u>	Output	<b>*</b> , <b>*PRINT</b>	Optional, Positional 4

### Subscription identifier (SUBID)

The subscription identifier of the subscription to be displayed.

The possible values are:

#### subscription-name

Specify a maximum of 256 bytes for the subscription name.

**Note:** Subscription names of greater than 256 bytes can be specified using MQSC.

### Subscription name (SUBNAME)

The name of the subscription to be displayed.

The possible values are:

#### subscription-name

Specify a maximum of 256 bytes for the subscription name.

**Note:** Subscription names of greater than 256 bytes can be specified using MQSC.

### Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

#### \*DFT

Use the default Queue Manager.

#### queue-manager-name

The name of a Queue Manager.

### Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

#### \*

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

#### \*PRINT

The output is printed with the job's spooled output.

## Display MQ Topic (DSPMQMTOP)

#### Where allowed to run

All environments (\*ALL)

#### Threadsafe

Yes

The Display MQ Topic (DSPMQMTOPTOP) command displays the attributes of an existing MQ topic object.

## Parameters

Keyword	Description	Choices	Notes
<u>TOPNAME</u>	Topic name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 2
<u>OUTPUT</u>	Output	<b>*</b> , <b>*PRINT</b>	Optional, Positional 3

### Topic name (TOPNAME)

The name of the topic object to be displayed.

The possible values are:

#### **topic-name**

Specify the name of the topic object. The maximum length of the string is 48 bytes.

### Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

#### **\*DFT**

Use the default Queue Manager.

#### **queue-manager-name**

The name of a Queue Manager.

### Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

#### **\***

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

#### **\*PRINT**

The output is printed with the job's spooled output.

## Display MQ Version (DSPMQMVER)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Display MQ Version (DSPMQMVER) command provides the current MQ version.

## Parameters

Table 244. Command parameters			
Keyword	Description	Choices	Notes
<u>OUTPUT</u>	Output	<b>*</b> , *PRINT	Optional, Positional 1

### Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

**\***

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

**\*PRINT**

The output is printed with the job's spooled output.

## IBM i End Message Queue Manager (ENDMQM)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The End Message Queue Manager (**ENDMQM**) command ends the specified local message queue manager or all queue managers. The attributes of the message queue managers are not affected and it can be restarted using the Start Message Queue Manager (**STRMQM**) command.

You can also use this command to fully quiesce all application programs connected to the queue manager or all queue managers.

The **ENDMQM** command's default parameters should not be changed with the CHGCMDDFT (Change Command Default) command.

## Parameters

Table 245. Command parameters			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 1
<u>OPTION</u>	Option	<b>*CNTRLD</b> , *IMMED, *WAIT, *PREEMPT	Optional, Positional 2
<u>INSTANCE</u>	Instance To End	<b>*ALL</b> , *STANDBY	Optional, Positional 3
<u>ALWSWITCH</u>	Allow Switchover	<b>*NO</b> , *YES	Optional, Positional 4
<u>RECONN</u>	Reconnect	<b>*NO</b> , *YES	Optional, Positional 5
<u>ENDCCTJOB</u>	End connected jobs	<b>*NO</b> , *YES	Optional, Positional 6
<u>RCDMQMIMG</u>	Record MQ Object Image	*NO, <b>*YES</b>	Optional, Positional 7
<u>TIMEOUT</u>	Timeout interval (seconds)	0-3600, <b>30</b>	Optional, Positional 8

## Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

### **\*DFT**

Use the default queue manager.

### **queue-manager-name**

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

### **\*ALL**

All queue managers are ended.

## Option (OPTION)

Specifies whether processes that are connected to the queue manager are allowed to complete.

The possible values are:

### **\*CNTRLD**

Allow programs currently being processed to complete. An MQCONN call (or an MQOPEN or MQPUT1, which perform an implicit connection) fails. If ENDCCTJOB(\*YES) is specified, a controlled shutdown of the queue manager is attempted ten times. If the queue manager shuts down successfully, it is followed by immediate termination of the processes that are still connected to it.

### **\*IMMED**

End the queue manager immediately. All current MQI calls complete, but subsequent requests for MQI calls fail. Incomplete units of work are rolled back when the queue manager is next started. If ENDCCTJOB(\*YES) is specified, a controlled shutdown of the queue manager is followed if necessary, after an interval of TIMEOUT seconds, by an immediate shutdown of the queue manager. This is followed by immediate termination of processes connected to it.

### **\*WAIT**

End the queue manager in the same way as the \*CNTRLD option. However, control is returned only after the queue manager has stopped. This option is not allowed with MQMNAME(\*ALL). If ENDCCTJOB(\*YES) is specified, a single controlled shutdown of the queue manager is issued, which waits for all processes to disconnect. When this completes it is followed by the actions described in the ENDCCTJOB parameter.

### **\*PREEMPT**

**Use this type of shutdown only in exceptional circumstances** The queue manager stops without waiting for applications to disconnect or for MQI calls to complete. This can give unpredictable results for IBM MQ applications. All processes in the queue manager that fail to stop are ended 30 seconds after the command is issued. This option is not allowed with ENDCCTJOB(\*YES).

## Instance To End (INSTANCE)

Specifies whether to end all instances of a queue manager, or to end just a standby queue manager instance.

The possible values are:

### **\*ALL**

All instances of a queue manager are to be ended. This option can only be requested against a non-standby queue manager instance.

If a standby instance is running elsewhere, the ALWSWITCH parameter on the ENDMQM command will control whether the standby instance is itself ended.

**\*STANDBY**

Only the standby queue manager instance should be ended, any active queue manager instance will continue to run. This option can only be requested against a standby queue manager instance.

**Allow Switchover (ALWSWITCH)**

Specifies whether switchover to a standby instance of the queue manager is allowed when the active queue manager instance has ended.

The possible values are:

**\*NO**

Switchover to a standby queue manager instance is not allowed. Any standby instances that are running will also end on successful completion of this command. P.: Reconnectable client applications connected to this queue manager are instructed to disconnect.

**\*YES**

Switchover to a standby queue manager instance is attempted, if a standby queue manager instance is not running this command will fail and the active queue manager instance will remain active.

Reconnectable client applications connected to this queue manager instance are instructed to begin reconnect processing, to maintain connectivity.

**Reconnect (RECONN)**

Specifies whether client applications currently connected to this queue manager should attempt to reconnect to a queue manager instance.

The possible values are:

**\*NO**

Reconnectable client applications connected to this queue manager are instructed to disconnect.

**\*YES**

Reconnectable client applications connected to this queue manager are instructed to begin reconnect processing, to maintain connectivity.

**End connected jobs (ENDCCTJOB)**

Specifies whether all processes connected to the queue manager are forcibly terminated.

The possible values are:

**\*NO**

The queue manager or queue managers are ended but no further action is taken.

**\*YES**

The following steps are taken for each queue manager to be ended:

- If the queue manager is running and RCDMQMIMG(\*YES) has been specified, media images for all objects defined for the queue manager are recorded.
- The queue manager is ended in the appropriate manner (\*CNTRLD, \*WAIT, or \*IMMED).
- All shared memory and semaphores used by the queue manager are deleted irrespective of whether applications have disconnected from the queue manager. Applications that have not disconnected from a shared memory resource when this option is specified receive a return code of MQRC\_CONNECTION\_BROKEN (2009) the next time an MQI call is issued with an existing connection handle.

**Record MQ Object Image (RCDMQMIMG)**

Specifies whether media images are recorded for a queue manager.

The possible values are:

**\*YES**

If the queue manager is running, media images for all queue manager objects are recorded.

**\*NO**

Media images of queue manager objects are not recorded as part of the quiesce.

**Timeout interval (seconds) (TIMEOUT)**

Specifies the time interval in seconds between the controlled and immediate shutdowns of the queue manager when \*IMMED is specified. It also determines the number of seconds between attempts to shut down the queue manager when \*CNTRLD is specified.

The possible values are:

**30**

The default value is 30 seconds.

**timeout-interval**

Specify a value in seconds, in the range 0 through 3600.

**End MQ Pub/Sub Broker (ENDMQMBRK)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The End IBM MQ Broker (ENDMQMBRK) command is used to stop a broker.

**Parameters**

<i>Table 246. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1
<u>OPTION</u>	Option	<b>*CNTRLD</b> , *IMMED	Optional, Positional 2

**Message Queue Manager name (MQMNAME)**

Specifies the name of the queue manager.

**queue-manager-name**

Specify the name of the queue manager.

**Option (OPTION)**

Specifies how the broker is ended.

The possible values are:

**\*CNTRLD**

Allows the broker to complete processing for any message that it has already started.

**\*IMMED**

Ends the broker immediately. The broker does not attempt any further gets or puts, and backs out any in-flight units-of-work. This might mean that a nonpersistent input message is published only to a subset of subscribers, or lost, depending on the broker configuration parameters.

## IBM i End MQ Channel (ENDMQMCHL)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The End MQ Channel (ENDMQMCHL) command closes an MQ channel, and the channel is no longer enabled for automatic restarts.

### Parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>OPTION</u>	Option	<b>*CNTRLD</b> , *IMMED, *ABNORMAL	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 3
<u>STATUS</u>	Channel status	<b>*STOPPED</b> , *INACTIVE	Optional, Positional 4
<u>CONNAME</u>	Connection name	<i>Character value</i> , <b>*NONE</b>	Optional, Positional 5
<u>RQMNAME</u>	Remote queue manager	<i>Character value</i> , <b>*NONE</b>	Optional, Positional 6

### Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

#### channel-name

Specify the channel name.

### Option (OPTION)

Specifies whether processing for the current batch of messages is allowed to finish in a controlled manner.

The possible values are:

#### \*CNTRLD

Allows processing of the current batch of messages to complete. No new batch is allowed to start.

#### \*IMMED

Ends processing of the current batch of messages immediately. This is likely to result in 'in-doubt' situations.

#### \*ABNORMAL

Ends processing of the current batch of messages immediately and terminates the channel thread or job. This is likely to result in 'in-doubt' situations.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

**message-queue-manager-name**

The name of a message queue manager.

**Channel status (STATUS)**

Specifies the required status of the channel after successful completion of the command.

The possible values are:

**\*STOPPED**

The channel status is set to STOPPED.

**\*INACTIVE**

The channel status is set to INACTIVE.

**Connection name (CONNAME)**

Specifies the connection name of the channel instance that you want to end.

**Remote queue manager (RQMNAME)**

Specifies the name of the remote queue manager of the channel instance that you want to end.

IBM i

**End Queue Manager Connection (ENDMQMCONN)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The End MQ Connections (ENDMQMCONN) command allows you to end a connection to the queue manager.

**Parameters**

Keyword	Description	Choices	Notes
<u>CONN</u>	Connection Identifier	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2

**Connection Identifier (CONN)**

The connection identifier to end.

The connection identifier is a 16 character hex string.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

The name of a message queue manager.

**End MQ Command Server (ENDMQMCSVR)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The End MQ Command Server (ENDMQMCSVR) command stops the MQ command server for the specified local queue manager.

**Parameters**

<i>Table 249. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1
<u>OPTION</u>	Option	<b>*CNTRLD</b> , *IMMED	Optional, Positional 2

**Message Queue Manager name (MQMNAME)**

Specifies the name of the message queue manager.

**queue-manager-name**

Specify the name of the queue manager.

**Option (OPTION)**

Specifies whether the command message currently being processed is allowed to complete.

The possible values are:

**\*CNTRLD**

Allows the command server to complete processing any command message that it has already started. No new message is read from the queue.

**\*IMMED**

Ends the command server immediately. Any action associated with a command message currently being processed might not be completed.

**End MQ Listeners (ENDMQMLSR)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The End MQ Listener (ENDMQMLSR) command ends an MQ TCP/IP listener.

This command is valid only for TCP/IP transmission protocols.

Either a listener object or specific port can be specified.

## Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 1
<u>PORT</u>	Port number	1-65535, *ALL	Optional, Positional 2
<u>OPTION</u>	Option	<b>*CNTRLD</b> , *WAIT, *FORCE	Optional, Positional 3
<u>LSRNAME</u>	Listener name	<i>Character value</i> , <b>*NONE</b>	Optional, Positional 4

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

#### **\*DFT**

Use the default queue manager.

#### **queue-manager-name**

The name of a message queue manager.

### Port number (PORT)

The port number to be used by the listener.

The possible values are:

#### **\*SAME**

The attribute is unchanged.

#### **port-number**

The port number to be used.

### Option (OPTION)

Specifies the action taken after processes to end the listeners have been started.

#### **\*CNTRLD**

Processes are started to end all the listeners for the specified queue manager and control is returned before the listeners actually end.

#### **\*WAIT**

End the listeners for the specified queue manager in the same way as the \*CNTRLD option. However, control is returned only after all the listeners have ended.

### Listener name (LSRNAME)

The name of the MQ listener object to end.

The possible values are:

#### **\*NONE**

No listener object is specified.

#### **listener-name**

Specify the name of the listener definition. The maximum length of the string is 48 bytes.

## IBM i End MQ Service (ENDMQMSVC)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The End MQ Service (ENDMQMSVC) command ends an MQ service.

### Parameters

Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2

### Service name (SVCNAME)

The name of the MQ service object to end.

The possible values are:

#### \*NONE

No service object is specified.

#### service-name

Specify the name of the service definition. The maximum length of the string is 48 bytes.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

#### \*DFT

Use the default queue manager.

#### queue-manager-name

The name of a message queue manager.

## IBM i Grant MQ Object Authority (GRTMQMAUT)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Grant MQ Authority (GRTMQMAUT) command is used to grant specific authority for the MQ objects named in the command to another user or group of users.

Authority can be given to:

- Named users.
- Users (\*PUBLIC) who do not have authority specifically given to them.
- Groups of users who do not have any authority to the object.

The GRTMQMAUT command can be used by anyone in the QMQMADM group, that is, anyone whose user profile specifies QMQMADM as a primary or supplemental group profile.

## Parameters

Table 252. Command parameters			
Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	Character value	Required, Positional 1
<u>OBJTYPE</u>	Object type	*ALL, *Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *MQM, *NMLIST, *PRC, *LSR, *SVC, *CHL, *CLTCN, *TOPIC, *RMTMQMNAME	Required, Positional 2
<u>USER</u>	User names	Single values: *PUBLIC, Other values (up to 50 repetitions): <i>Name</i>	Required, Positional 3
<u>AUT</u>	Authority	Values (up to 22 repetitions): *ALTUSR, *BROWSE, *CONNECT, *GET, *INQ, *PUT, *SET, *PUB, *SUB, *RESUME, *PASSALL, *PASSID, *SETALL, *SETID, *ADMCHG, *ADMCLR, *ADMCRRT, *ADMDLT, *ADMDSP, *ALL, *ALLADM, *ALLMQI, *NONE, *CTRL, *CTRLX, *SYSTEM	Required, Positional 4
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 5
<u>SRVCOMP</u>	Service Component name	Character value, <b>*DFT</b>	Optional, Positional 6

### Object name (OBJ)

Specifies the name of the objects for which specific authorities are granted.

The possible values are:

#### **\*ALL**

All objects of the type specified by the value of the OBJTYPE parameter at the time the command is issued. \*ALL cannot represent a generic profile.

#### **object-name**

Specify the name of an MQ object for which specific authority is given to one or more users.

#### **generic profile**

Specify the generic profile of the objects to be selected. A generic profile is a character string containing one or more generic characters anywhere in the string. This profile is used to match the object name of the object under consideration at the time of use. The generic characters are (?), (\*) and (\*\*).

? matches a single character in an object name.

\* matches any string contained within a qualifier, where a qualifier is the string between periods (.). For example ABC\* matches ABCDEF but not ABCDEF.XYZ.

\*\* matches one or more qualifiers. For example ABC.\*\*.XYZ matches ABC.DEF.XYZ and ABC.DEF.GHI.XYZ, \*\* can appear only once in a generic profile.

Specify the name required within quotation marks to ensure that your selection is precisely what you entered.

## Object type (OBJTYPE)

Specifies the type of the objects for which specific authorities are granted.

### **\*ALL**

All MQ object types.

### **\*Q**

All queue object types.

### **\*ALSQ**

Alias queue.

### **\*LCLQ**

Local queue.

### **\*MDLQ**

Model queue.

### **\*RMTQ**

Remote queue.

### **\*AUTHINFO**

Authentication Information object.

### **\*MQM**

Message Queue Manager.

### **\*NMLIST**

Namelist object.

### **\*PRC**

Process definition.

### **\*CHL**

Channel object.

### **\*CLTCN**

Client Connection Channel object.

### **\*LSR**

Listener object.

### **\*SVC**

Service object.

### **\*TOPIC**

Topic object.

### **\*RMTMQMNAME**

Remote queue manager name.

## User names (USER)

Specifies the name or names of users to whom authorities for the named object are being given. If user names are specified, the authorities are given specifically to those users. Authority given by this command can be revoked specifically by the Revoke MQ Authority (RVKMQMAUT) command.

### **\*PUBLIC**

All users of the system.

### **user-profile-name**

Specify the names of one or more users who are to be granted specific authority for the object. These names can also be group names. You can specify up to 50 user profile names.

## Authority (AUT)

Specifies the authority being given to the named users. Values for AUT can be specified as a list of specific and general authorities in any order, where the general authorities can be:

\*NONE, which creates a profile for the user with no authority to the specified object, or leaves the authority unchanged if a profile already exists.

\*ALL, which confers all authorities to the specified users.

\*ALLADM, which confers all of \*ADMCHG, \*ADMCLR, \*ADMCRRT, \*ADMDLT, \*ADMDSP, \*CTRL and \*CTRLX.

\*ALLMQI, which confers all of \*ALTUSR, \*BROWSE, \*CONNECT, \*GET, \*INQ, \*PUT, \*SET, \*PUB, \*SUB and \*RESUME.

Authorizations for different object types

### **\*ALL**

All authorizations. Applies to all objects.

### **\*ADMCHG**

Change an object. Applies to all objects except remote queue manager name.

### **\*ADMCLR**

Clear a queue. Applies to queues only.

### **\*ADMCRRT**

Create an object. Applies to all objects except remote queue manager name.

### **\*ADMDLT**

Delete an object. Applies to all objects except remote queue manager name.

### **\*ADMDSP**

Display the attributes of an object. Applies to all objects except remote queue manager name.

### **\*ALLADM**

Perform administration operations on an object. Applies to all objects except remote queue manager name.

### **\*ALLMQI**

Use all MQI calls applicable to an object. Applies to all objects.

### **\*ALTUSR**

Allow another user's authority to be used for MQOPEN and MQPUT1 calls. Applies to queue manager objects only.

### **\*BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option. Applies to queue objects only.

### **\*CONNECT**

Connect the application to a queue manager by issuing an MQCONN call. Applies to queue manager objects only.

### **\*CTRL**

Control startup and shutdown of channels, listeners and services.

### **\*CTRLX**

Reset sequence number and resolve indoubt channels.

### **\*GET**

Retrieve a message from a queue using an MGET call. Applies to queue objects only.

### **\*INQ**

Make an inquiry on an object using an MQINQ call. Applies to all objects except remote queue manager name.

### **\*PASSALL**

Pass all context on a queue. Applies to queue objects only.

**\*PASSID**

Pass identity context on a queue. Applies to queue objects only.

**\*PUT**

Put a message on a queue using an MQPUT call. Applies to queue objects and remote queue manager names only.

**\*SET**

Set the attributes of an object using an MQSET call. Applies to queue, queue manager, and process objects only.

**\*SETALL**

Set all context on an object. Applies to queue and queue manager objects only.

**\*SETID**

Set identity context on an object. Applies to queue and queue manager objects only.

**\*SYSTEM**

Connect the application to a queue manager for system operations. Applies to queue manager objects only.

Authorizations for MQI calls

**\*ALTUSR**

Allow another user's authority to be used for MQOPEN and MQPUT1 calls.

**\*BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

**\*CONNECT**

Connect the application to the specified queue manager by issuing an MQCONN call.

**\*GET**

Retrieve a message from a queue by issuing an MQGET call.

**\*INQ**

Make an inquiry on a specific queue by issuing an MQINQ call.

**\*PUT**

Put a message on a specific queue by issuing an MQPUT call.

**\*SET**

Set attributes on a queue from the MQI by issuing an MQSET call.

**\*PUB**

Open a topic to publish a message using the MQPUT call.

**\*SUB**

Create, Alter or Resume a subscription to a topic using the MQSUB call.

**\*RESUME**

Resume a subscription using the MQSUB call.

If you open a queue for multiple options, you must be authorized for each of them.

Authorizations for context

**\*PASSALL**

Pass all context on the specified queue. All the context fields are copied from the original request.

**\*PASSID**

Pass identity context on the specified queue. The identity context is the same as that of the request.

**\*SETALL**

Set all context on the specified queue. This is used by special system utilities.

**\*SETID**

Set identity context on the specified queue. This is used by special system utilities.

Authorizations for MQSC and PCF commands

**\*ADMCHG**

Change the attributes of the specified object.

**\*ADMCLR**

Clear the specified queue (PCF Clear queue command only).

**\*ADMCR**

Create objects of the specified type.

**\*ADMDLT**

Delete the specified object.

**\*ADMDS**

Display the attributes of the specified object.

**\*CTRL**

Control startup and shutdown of channels, listeners and services.

**\*CTRLX**

Reset sequence number and resolve indoubt channels.

Authorizations for generic operations

**\*ALL**

Use all operations applicable to the object.

all authority is equivalent to the union of the authorities alladm, allmqi, and system appropriate to the object type.

**\*ALLADM**

Perform all administration operations applicable to the object.

**\*ALLMQI**

Use all MQI calls applicable to the object.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the queue manager.

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager.

**Service Component name (SRVCOMP)**

Specifies the name of the installed authorization service to which the authorizations apply.

The possible values are:

**\*DFT**

Use the first installed authorization component.

**Authorization-service-component-name**

The component name of the required authorization service as specified in the queue manager qm.ini file.

IBM i

**Ping MQ Channel (PNGMQMCHL)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Ping MQ Channel (PNGMQMCHL) command tests a channel by sending data as a special message, to the remote message queue manager and checks that the data is returned. This command is successful

only from the sending end of an inactive channel, and the data used is generated by the local message queue manager.

## Parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 2
<u>DATACNT</u>	Data count	16-32768, <b>64</b>	Optional, Positional 3
<u>CNT</u>	Count	1-16, <b>1</b>	Optional, Positional 4

### Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

#### **channel-name**

Specify the channel name.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

#### **\*DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

#### **message-queue-manager-name**

The name of a message queue manager.

### Data count (DATACNT)

Specifies the length of the data in bytes. The actual number of bytes might be less than the amount requested depending on the operating system and communication protocol being used.

The possible values are:

#### **64**

The default value is 64 bytes.

*data-count* Specify a value ranging from 16 through 32768.

### Count (CNT)

Specifies the number of times that the channel is to be pinged.

The possible values are:

#### **1**

The channel is pinged once.

*ping-count* Specify a value ranging from 1 through 16.

## Record MQ Object Image (RCDMQMIMG)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Record MQ Object Image (RCDMQMIMG) command is used to provide a marker for the selected set of MQ objects, so that the Re-create MQM Object (RCRMQMOBJ) command can recover this set of objects from journal data recorded subsequently.

This command is intended to enable journal receivers, detached prior to the current date, to be disconnected. On successful completion of this command those journals are no longer required to be present for a Re-create MQ Object (RCRMQMOBJ) command on this set of MQM Objects to succeed.

### Parameters

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	Character value, *ALL	Required, Positional 1
<u>OBJTYPE</u>	Object type	*ALL, *Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *CTLG, *MQM, *NMLIST, *PRC, *CHL, *CLTCN, *LSR, *SVC, *SYNCFILE, *TOPIC	Required, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 3
<u>DSPJRNDTA</u>	Display Journal Receiver Data	*YES, *NO	Optional, Positional 4

### Object name (OBJ)

Specifies the name of the objects that should be recorded. This is a 48-character MQ object or generic object name.

The possible values are:

#### \*ALL

All MQ objects of the specified type (OBJTYPE) are recorded.

#### generic-object-name

Specify the generic name of the objects to be recorded. A generic name is a character string followed by an asterisk (\*). For example, ABC\*. It selects all objects that have names which start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

#### object-name

The name of an MQ object to be recorded.

### Object type (OBJTYPE)

Specifies the type of the objects to be re-created.

The possible values are:

**\*ALL**

Specifies all MQ object types.

**\*Q**

Specifies MQ queue objects with names specified by OBJ.

**\*ALSQ**

Specifies MQ alias queue objects with names specified by OBJ.

**\*LCLQ**

Specifies MQ local queue objects with names specified by OBJ.

**\*MDLQ**

Specifies MQ model queues objects with names specified by OBJ.

**\*RMTQ**

Specifies MQ remote queue objects with names specified by OBJ.

**\*AUTHINFO**

Specifies MQ authentication information objects with names specified by OBJ.

**\*CTLG**

Specifies the MQ queue manager catalog object. This has the same name as the queue manager object.

**\*MQM**

Specifies the Message Queue Manager object.

**\*CHL**

Specifies MQ channel objects with names specified by OBJ.

**\*CLTCN**

Specifies MQ MQI client connection channel objects with names specified by OBJ.

**\*NMLIST**

Specifies MQ namelist objects with names specified by OBJ.

**\*PRC**

Specifies MQ process objects with names specified by OBJ.

**\*LSR**

Specifies MQ listener objects with names specified by OBJ.

**\*SVC**

Specifies MQ service objects with names specified by OBJ.

**\*SYNCFILE**

Specifies the MQ channel synchronisation file.

**\*TOPIC**

Specifies the MQ topic objects with names specified by OBJ.

### **Message Queue Manager name (MQMNAME)**

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**message-queue-manager-name**

Specify the name of the queue manager.

### **Display Journal Receiver Data (DSPJRNDTA)**

Specifies whether additional messages should be written to the job log when the command completes to inform the user which journal receivers are still required by IBM MQ.

The possible values are:

**\*NO**

No messages are written to the job log.

**\*YES**

Messages will be sent to the job log when the command completes. The messages will contain details about which journal receivers are required by IBM MQ.

## IBM i Re-create MQ Object (RCRMQMOBJ)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Re-create MQ Object (RCRMQMOBJ) command is used to provide a recovery mechanism for damaged MQ objects. The command completely re-creates the objects from information recorded in the MQ journals. If no damaged objects exist, no action is performed.

### Parameters

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	<i>Character value</i> , *ALL	Required, Positional 1
<u>OBJTYPE</u>	Object type	*ALL, *Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *CTLG, *MQM, *NMLIST, *PRC, *CHL, *CLTCN, *LSR, *SVC, *SYNCFILE, *CLCHLTAB, *TOPIC	Required, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3

### Object name (OBJ)

Specifies the name of the objects which should be re-created if they are damaged. This is a 48-character MQ object or generic object name.

The possible values are:

**\*ALL**

All damaged MQ objects of the specified type (OBJTYPE) are re-created.

**generic-object-name**

Specify the generic name of the objects to be re-created. A generic name is a character string followed by an asterisk (\*). For example, ABC\*. It selects all objects that have names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

**object-name**

The name of an MQ object to be re-created if it is damaged.

## Object type (OBJTYPE)

Specifies the object type of the objects to be re-created.

The possible values are:

### **\*ALL**

Specifies all MQ object types.

### **\*Q**

Specifies MQ queue objects with names specified by OBJ.

### **\*ALSQ**

Specifies MQ alias queue objects with names specified by OBJ.

### **\*LCLQ**

Specifies MQ local queue objects with names specified by OBJ.

### **\*MDLQ**

Specifies MQ model queues with names specified by OBJ.

### **\*RMTQ**

Specifies MQ remote queue objects with names specified by OBJ.

### **\*AUTHINFO**

Specifies MQ authentication information objects with names specified by OBJ.

### **\*CTLG**

Specifies the message queue manager catalog object. The catalog object has the same name as the message queue manager object. It holds the names of MQ objects. A user needs authorities on this object to be able to start or stop the message queue manager, or, to create or delete MQ queues and process definitions.

### **\*MQM**

Specifies the message queue manager. This object holds the attributes of the message queue manager.

### **\*CHL**

Specifies MQ channel objects with names specified by OBJ.

### **\*CLTCN**

Specifies MQ MQI client connection channel objects with names specified by OBJ.

### **\*NMLIST**

Specifies MQ namelist objects with names specified by OBJ.

### **\*PRC**

Specifies MQ process objects with names specified by OBJ.

### **\*LSR**

Specifies MQ listener objects with names specified by OBJ.

### **\*SVC**

Specifies MQ service objects with names specified by OBJ.

### **\*SYNCFILE**

Specifies the MQ channel synchronisation file.

### **\*SYNCFILE**

Specifies the MQ MQI client channel table file.

### **\*TOPIC**

Specifies MQ topic objects with names specified by OBJ.

## Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**message-queue-manager-name**

Specify the name of the queue manager.

**Refresh IBM MQ Authority (RFRMQMAUT)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The IBM MQ security cache refresh (RFRMQMAUT) command refreshes the IBM MQ object authority manager security cache.

**Parameters**

<i>Table 256. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 1
<u>TYPE</u>	Refresh Type	<b>*AUTHSERV</b> , *SSL	Optional, Positional 2

**Message Queue Manager name (MQMNAME)**

Specifies the name of the queue manager to perform the security refresh.

The possible values are:

**queue-manager-name**

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

**\*DFT**

Specifies that the default queue manager should be used.

**Refresh Type (TYPE)**

The type of security refresh to be performed. The possible values are:

**\*AUTHSERV**

Refreshes the list of authorizations held internally by the authorization services component.

**\*SSL**

Refreshes the cached view of the TLS Key Repository allowing updates to become effective when the command has completed successfully. Also refreshes the locations of the LDAP servers to be used for Certificate Revocation Lists and the Key Repository.

**Refresh MQ Cluster (RFRMQMCL)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Refresh MQ Cluster (RFRMQMCL) command refreshes locally held cluster information (including any autodefined channels that are in doubt), and forces it to be rebuilt. This enables you to perform a "cold-start" on the cluster.

## Parameters

Keyword	Description	Choices	Notes
<u>CLUSTER</u>	Cluster Name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2
<u>REPOS</u>	Refresh Repository	<b>*NO</b> , *YES	Optional, Positional 3

### Cluster Name (CLUSTER)

The name of the cluster to be refreshed.

The possible values are:

**\*\***

The queue manager is refreshed in all of the clusters to which it belongs.

If Refresh Repository is also set to \*YES, then the queue manager restarts its search for repository queue managers, using information in the local cluster-sender channel definitions.

**name**

Specify the name of the cluster.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager.

### Refresh Repository (REPOS)

Specifies whether the information about repository queue managers should be refreshed.

The possible values are:

**\*NO**

Do not refresh repository information.

**\*YES**

Refresh repository information. This value cannot be specified if the queue manager is itself a repository manager.

IBM i

## Refresh Message Queue Manager (RFRMQM)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Refresh Message Queue manager (RFRMQM) performs special operations on queue managers.

## Parameters

Table 258. Command parameters			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Required, Positional 1
<u>TYPE</u>	Refresh Type	<b>*CONFIGEV</b> , <i>*PROXYSUB</i>	Required, Positional 2
<u>OBJECT</u>	Object Type	<b>*ALL</b> , <i>Specified objects</i>	Optional, Positional 3
<u>NAME</u>	Object Name	<b>*ALL</b> , <i>generic- object-name, object-name</i>	Optional, Positional 4
<u>INCLINT</u>	Include Interval	<b>*NONE</b> , <i>include- interval</i>	Optional, Positional 5

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

#### **\*DFT**

Use the default queue manager.

#### ***queue\_manager\_name***

Specify the name of the queue manager.

### Refresh Type (TYPE)

The type of queue manager refresh to be performed.

The possible values are:

#### **\*CONFIGEV**

Requests that the queue manager generates a configuration event message for every object that matches the selection criteria specified by the OBJECT, NAME, and INCLINT parameters.

#### **\*PROXYSUB**

Requests that the queue manager resynchronizes the proxy subscriptions that are held with, and on behalf of, queue managers that are connected in a hierarchy or publish/subscribe cluster.

### Object Type (OBJECT)

Requests that only objects of the specified type are included in the refresh.

This parameter is only valid for TYPE(\*CONFIGEV)

The possible values are:

#### **\*ALL**

All specified objects.

#### **Specific objects**

Select from:

- \*QUEUE
- \*QLOCAL
- \*QMODEL
- \*QALIAS
- \*QREMOTE
- \*CHANNEL
- \*NAMELIST

- \*POLICY
- \*PROCESS
- \*QMGR
- \*AUTHINFO
- \*AUTHREC

## Object Name (NAME)

Requests that only objects whose names match the name specified are included in the refresh.

This parameter is only valid for TYPE(\*CONFIGEV)

The possible values are:

### **\*ALL**

All object names are included.

### ***generic-object-name***

Specify the generic name of the objects to be included. A generic name is a character string, followed by an asterisk (\*), for example ABC\*, and it selects all queues having names that start with the character string.

### ***object-name***

Specify the object name to be included.

## Include Interval (INCLINT)

Specifies a value in minutes, defining a period immediately before the current time, and requests that only objects that have been created or changed within that period are included in the refresh.

This parameter is only valid for TYPE(\*CONFIGEV)

The possible values are:

### **\*NONE**

No time limit is used.

### ***include-interval***

Specify the include interval in minutes (0-999999).

IBM i

## Remove Queue Manager Info. (RMVMQMINF)

### **Where allowed to run**

All environments (\*ALL)

### **Threadsafe**

Yes

The Remove Message Queue Manager Information (RMVMQMINF) command removes configuration information for a queue manager. This command can be used, for example, to remove a secondary queue manager instance by removing reference to shared queue manager data.

## Parameters

<i>Table 259. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>MQMNAME</u>	Message Queue Manager name	Character value	Optional, Positional 1

## Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager to remove information for.

### queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

IBM i

## Remove Queue Manager Journal (RMVMQMJRN)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Remove Queue Manager Journal command (RMVMQMJRN) removes a queue manager journal. This command can be used, for example, to remove a remote journal previously used for a standby or multi-instance queue manager.

## Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 1
<u>JRN</u>	Queue Manager Journal	Character value, *DFT	Optional, Positional 2
<u>RMTJRNRDB</u>	Remote Relational Database	Character value	Optional, Positional 3

## Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager associated with the journal.

### queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

## Queue Manager Journal (JRN)

Specifies the journal name to create.

The possible values are:

### \*DFT

The journal name is chosen by the system. If a local journal already exists for the queue manager on this system - the existing local journal name is used, otherwise a unique name is generated of the format AMQxJRN where x is a character in the range 'A - Z'.

### journal-name

Specify the name of the journal. The name can contain up to 10 characters. Journal receiver names will be derived from this journal name by truncating at the 4th character (or at the last character if the journal name is shorter than 4 characters) and appending zeroes. If the local queue manager library already contains a local journal, its name must match that supplied. Only one local journal can exist in a queue manager library. DLTMQM will not remove journal artifacts from a queue manager library unless they are prefixed with "AMQ".

## Remote Relational Database (RMTJRNRDB)

Specifies the name of the relational database directory entry that contains the remote location name of the target system. Use the WRKRDBDIRE command to locate and existing entry or configure a new relational database directory entry for the target system.

### relational-database-directory-entry

Specify the name of the relational database directory entry. The name can contain up to 18 characters.

IBM i

## Resume Cluster Queue Manager (RSMMQMCLQM)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

Use the RSMMQMCLQM command to inform other queue managers in a cluster that the local queue manager is again available for processing and can be sent messages. It reverses the action of the SPDMQMCLQM command.

## Parameters

Keyword	Description	Choices	Notes
<u>CLUSTER</u>	Cluster Name	Character value	Optional, Positional 1
<u>CLUSNL</u>	Cluster Name List	Character value	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 3

### Cluster Name (CLUSTER)

Specifies the name of the cluster for which the queue manager is available for processing.

#### cluster-name

Specify the name of the cluster.

### Cluster Name List (CLUSNL)

Specifies the namelist specifying a list of clusters for which the queue manager is available for processing.

#### namelist

Specify the name of the namelist.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

#### \*DFT

Use the default queue manager.

#### queue-manager-name

Specify the name of the queue manager.

IBM i

## Reset MQ Channel (RSTMQMCHL)

### Where allowed to run

All environments (\*ALL)

## Threadsafe

Yes

The Reset MQ Channel (RSTMQMCHL) command resets the message sequence number for an MQ channel to a specified sequence number for use the next time that the channel is started.

You are recommended to use this command for Sender(\*SDR), Server (\*SVR) and Cluster-sender (\*CLUSSDR) channels only.

If you use this command for a Receiver (\*RCVR), Requester (\*RQSTR) or Cluster-receiver (\*CLUSRCVR) channel, the value at the other end of the channel is NOT reset. You must reset the values separately.

The command does not work for Server-connection (\*SVRCN) channels.

## Parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>MSGSEQNUM</u>	Message sequence number	1-999999999, <b>1</b>	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 3

### Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

#### channel-name

Specify the channel name.

### Message sequence number (MSGSEQNUM)

Specifies the new message sequence number.

The possible values are:

#### 1

The new message sequence number is 1.

#### message-sequence-number

Specify the new message sequence number ranging from 1 through 999999999.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

#### \*DFT

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

#### message-queue-manager-name

The name of a message queue manager.

## IBM i **Reset Cluster (RSTMQMCL)**

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

Use the Reset Cluster (RSTMQMCL) command to forcibly remove a queue manager from a cluster.

### Parameters

Keyword	Description	Choices	Notes
<u>CLUSTER</u>	Cluster Name	Character value	Required, Positional 1
<u>QMNAME</u>	Queue Manager Name for removal	Character value, *QMID	Required, Positional 2
<u>ACTION</u>	Action	*FRCRMV	Optional, Positional 3
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 4
<u>QUEUES</u>	Remove Queues	*NO, *YES	Optional, Positional 5
<u>QMID</u>	Queue Manager Id for removal	Character value	Optional, Positional 6

### Cluster Name (CLUSTER)

Specifies the name of cluster from which the queue manager is to be forcibly removed.

#### cluster-name

Specify the name of the cluster.

### Queue Manager Name for removal (QMNAME)

Specifies the name of the queue manager to be forcibly removed.

The possible values are:

#### \*QMID

This enables you to specify the identifier of the queue manager to be forcibly removed.

#### queue-manager-name

Specify the name of the queue manager.

### Action (ACTION)

Specifies the action to take on the specified queue manager.

#### \*FRCRMV

Requests that the queue manager is forcibly removed from the cluster. This might be needed to ensure correct cleanup after a queue manager has been deleted. This action can be requested by a repository queue manager only.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager.

**Remove Queues (QUEUES)**

Specifies whether cluster queues should be removed from the cluster.

The possible values are:

**\*NO**

Do not remove the queues belonging to the queue manager being removed from the cluster.

**\*YES**

Remove queues belonging to the queue manager being removed from the cluster.

**Queue Manager Id for removal (QMID)**

Specifies the identifier of the queue manager to be forcibly removed.

**queue-manager-identifier**

Specify the identifier of the queue manager.

 **Resolve MQ Channel (RSVMQMCHL)**
**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Resolve MQ Channel (RSVMQMCHL) command requests a channel to commit or backout in-doubt messages.

This command is used when the other end of a link fails during the confirmation period, and for some reason it is not possible to reestablish the connection.

In this situation, the sending end remains in an in-doubt state, about whether the messages were received. Any outstanding units of work need to be resolved with either backout or commit.

\*BCK restores messages to the transmission queue and \*CMT discards them.

Use this command for sender (\*SDR) and server (\*SVR) channels only.

**Parameters**

<i>Table 264. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>OPTION</u>	Resolve option	*CMT, *BCK	Required, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3

**Channel name (CHLNAME)**

Specifies the name of the channel definition.

The possible values are:

**channel-name**

Specify the channel name.

**Resolve option (OPTION)**

Specifies whether to back out or commit the messages.

The possible values are:

**\*CMT**

The messages are committed, that is, they are deleted from the transmission queue.

**\*BCK**

The messages are backed out, that is, they are restored to the transmission queue.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

**message-queue-manager-name**

The name of a message queue manager.

## IBM i **RUNMQSC (RUNMQSC)**

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Run IBM MQ Commands (RUNMQSC) command allows you to issue MQSC commands interactively for the specified queue manager.

**Parameters**

Keyword	Description	Choices	Notes
MQMNAME	Message Queue Manager name	Character value	Required, Positional 1

**Message Queue Manager name (MQMNAME)**

Specifies the name of the message queue manager.

**queue-manager-name**

Specify the name of the queue manager.

## IBM i **Revoke MQ Object Authority (RVKMQMAUT)**

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

? matches a single character in an object name.

\* matches any string contained within a qualifier, where a qualifier is the string between fullstops (.). For example ABC\* matches ABCDEF but not ABCDEF.XYZ.

\*\* matches one or more qualifiers. For example ABC.\*\*.XYZ matches ABC.DEF.XYZ and ABC.DEF.GHI.XYZ, \*\* can only appear once in a generic profile.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

## Object type (OBJTYPE)

Specifies the type of the objects for which specific authorities are revoked.

### **\*ALL**

All MQ object types.

### **\*Q**

All queue object types.

### **\*ALSQ**

Alias queue.

### **\*LCLQ**

Local queue.

### **\*MDLQ**

Model queue.

### **\*RMTQ**

Remote queue.

### **\*AUTHINFO**

Authentication Information object.

### **\*MQM**

Message Queue Manager.

### **\*NMLIST**

Namelist object.

### **\*PRC**

Process definition.

### **\*CHL**

Channel object.

### **\*CLTCN**

Client Connection Channel object.

### **\*LSR**

Listener object.

### **\*SVC**

Service object.

### **\*TOPIC**

Topic object.

### **\*RMTMQMNAME**

Remote queue manager name.

## User names (USER)

Specifies the user names of one or more users whose specific authorities to the named object are being removed. If a user was given the authority by USER(\*PUBLIC) being specified in the Grant MQ Authority (GRTMQMAUT) command, the same authorities are revoked by \*PUBLIC being specified in this parameter. Users given specific authority by having their names identified in the GRTMQMAUT command must have their names specified on this parameter to remove the same authorities.

The possible values are:

**\*PUBLIC**

The specified authorities are taken away from users who do not have specific authority for the object, who are not on the authorization list, and whose user group has no authority. Users who have specific authority still retain their authorities to the object.

**user-profile-name**

Specify the user names of one or more users who are having the specified authorities revoked. The authorities listed in the AUT parameter are being specifically taken away from each identified user. This parameter cannot be used to remove public authority from specific users; only authorities that were specifically given to them can be specifically revoked. You can specify up to 50 user profile names.

## Authority (AUT)

Specifies the authority being reset or taken away from the users specified in the USER parameter. You can specify values for AUT as a list of specific and general authorities in any order, where the general authorities can be:

\*REMOVE, which deletes the profile. It is not the same as \*ALL, because \*ALL leaves the profile in existence with no authorities. \*REMOVE cannot be specified with user QMQMADM unless the object is a generic profile or with user QMQM when the object type is \*MQM.

\*ALL, which confers all authorities to the specified users.

\*ALLADM, which confers all of \*ADMCHG, \*ADMCLR, \*ADMCRRT, \*ADMDLT, \*ADMDSPP, \*CTRL and \*CTRLX.

\*ALLMQI, which confers all of \*ALTUSR, \*BROWSE, \*CONNECT, \*GET, \*INQ, \*PUT, \*SET, \*PUB, \*SUB and \*RESUME.

Authorizations for different object types

**\*ALL**

All authorizations. Applies to all objects.

**\*ADMCHG**

Change an object. Applies to all objects except remote queue manager name.

**\*ADMCLR**

Clear a queue. Applies to queues only.

**\*ADMCRRT**

Create an object. Applies to all objects except remote queue manager name.

**\*ADMDLT**

Delete an object. Applies to all objects except remote queue manager name.

**\*ADMDSPP**

Display the attributes of an object. Applies to all objects except remote queue manager name.

**\*ALLADM**

Perform administration operations on an object. Applies to all objects except remote queue manager name.

**\*ALLMQI**

Use all MQI calls applicable to an object. Applies to all objects.

**\*ALTUSR**

Allow another user's authority to be used for MQOPEN and MQPUT1 calls. Applies to queue manager objects only.

**\*BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option. Applies to queue objects only.

**\*CONNECT**

Connect the application to a queue manager by issuing an MQCONN call. Applies to queue manager objects only.

**\*CTRL**

Control startup and shutdown of channels, listeners and services.

**\*CTRLX**

Reset sequence number and resolve indoubt channels.

**\*GET**

Retrieve a message from a queue using an MGET call. Applies to queue objects only.

**\*INQ**

Make an inquiry on an object using an MQINQ call. Applies to all objects except remote queue manager name.

**\*PASSALL**

Pass all context on a queue. Applies to queue objects only.

**\*PASSID**

Pass identity context on a queue. Applies to queue objects only.

**\*PUT**

Put a message on a queue using an MQPUT call. Applies to queue objects and remote queue manager names only.

**\*SET**

Set the attributes of an object using an MQSET call. Applies to queue, queue manager, and process objects only.

**\*SETALL**

Set all context on an object. Applies to queue and queue manager objects only.

**\*SETID**

Set identity context on an object. Applies to queue and queue manager objects only.

**\*SYSTEM**

Connect the application to a queue manager for system operations. Applies to queue manager objects only.

Authorizations for MQI calls

**\*ALTUSR**

Allow another user's authority to be used for MQOPEN and MQPUT1 calls.

**\*BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

**\*CONNECT**

Connect the application to the specified queue manager by issuing an MQCONN call.

**\*GET**

Retrieve a message from a queue by issuing an MQGET call.

**\*INQ**

Make an inquiry on a specific queue by issuing an MQINQ call.

**\*PUT**

Put a message on a specific queue by issuing an MQPUT call.

**\*SET**

Set attributes on a queue from the MQI by issuing an MQSET call.

**\*PUB**

Open a topic to publish a message using the MQPUT call.

**\*SUB**

Create, Alter or Resume a subscription to a topic using the MQSUB call.

**\*RESUME**

Resume a subscription using the MQSUB call.

If you open a queue for multiple options, you must be authorized for each of them.

Authorizations for context

**\*PASSALL**

Pass all context on the specified queue. All the context fields are copied from the original request.

**\*PASSID**

Pass identity context on the specified queue. The identity context is the same as that of the request.

**\*SETALL**

Set all context on the specified queue. This is used by special system utilities.

**\*SETID**

Set identity context on the specified queue. This is used by special system utilities.

Authorizations for MQSC and PCF commands

**\*ADMCHG**

Change the attributes of the specified object.

**\*ADMCLR**

Clear the specified queue (PCF Clear queue command only).

**\*ADMCR**

Create objects of the specified type.

**\*ADMDLT**

Delete the specified object.

**\*ADMDS**

Display the attributes of the specified object.

**\*CTRL**

Control startup and shutdown of channels, listeners and services.

**\*CTRLX**

Reset sequence number and resolve indoubt channels.

Authorizations for generic operations

**\*ALL**

Use all operations applicable to the object.

all authority is equivalent to the union of the authorities alladm, allmqi, and system appropriate to the object type.

**\*ALLADM**

Perform all administration operations applicable to the object.

**\*ALLMQI**

Use all MQI calls applicable to the object.

**\*REMOVE**

Delete the authority profile to the specified object.

## Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager.

## Service Component name (SRVCOMP)

Specifies the name of the installed authorization service to which the authorizations apply.

The possible values are:

**\*DFT**

Use the first installed authorization component.

**Authorization-service-component-name**

The component name of the required authorization service as specified in the Queue manager's qm.ini file.

## Set MQM Security Policy (SETMQMSPL)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Set MQM Security Policy (SETMQMSPL) command sets security policies, that are used by Advanced Message Security to control how messages should be protected when being put, browsed, or destructively removed from queues.

The policy name associates digital signing and encryption protection for messages with queues matching the policy name.

### Parameters

Keyword	Description	Choices	Notes
<u>POLICY</u>	Policy name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Required, Key, Positional 2
<u>SIGNALG</u>	Signature algorithm	*NONE, *MD5, *SHA1, *SHA256, *SHA384, *SHA512	Optional, Positional 3
<u>ENCALG</u>	Encryption algorithm	*NONE, *RC2, *DES, *TRIPLEDES, *AES128, *AES256	Optional, Positional 4
<u>SIGNER</u>	Authorized signers	<b>*NONE</b> , <i>Character value</i>	Optional, Positional 5
<u>RECIP</u>	Intended recipients	<b>*NONE</b> , <i>Character value</i>	Optional, Positional 6
<u>TOLERATE</u>	Tolerate unprotected	<b>*NO</b> , *YES	Optional, Positional 7
<u>REMOVE</u>	Remove policy	<b>*NO</b> , *YES	Optional, Positional 8
<u>KEYREUSE</u>	Key reuse	<b>*DISABLED</b> , *UNLIMITED, <i>integer value</i>	Optional, Positional 9

### Policy name (POLICY)

Name of the policy, required.

The policy name must match the name of the queue which is to be protected.

The name of the new authentication information object to create.

### Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

The name of an existing message queue manager. The maximum string length is 48 characters.

### Signature algorithm (SIGNALG)

Specifies the digital signature algorithm from one of the following values:

**\*NONE**

Messages are not signed.

**\*MD5**

Messages are signed using the MD5 message digest algorithm.

**\*SHA1**

Messages are signed using the SHA-1 secure hash algorithm.

**\*SHA256**

Messages are signed using the SHA-256 secure hash algorithm.

**\*SHA384**

Messages are signed using the SHA-384 secure hash algorithm.

**\*SHA512**

Messages are signed using the SHA-512 secure hash algorithm.

### Encryption algorithm (ENCALG)

Specifies the encryption algorithm to use when protecting messages from one of the following values:

**\*NONE**

Messages are not encrypted.

**\*RC2**

Messages are encrypted using the RC2 Rivest Cipher algorithm.

**\*DES**

Messages are encrypted using the DES Data Encryption Standard algorithm.

**\*TRIPLEDES**

Messages are encrypted using the Triple DES Data Encryption Standard algorithm.

**\*AES128**

Messages are encrypted using the AES 128-bit key Advanced Encryption Standard algorithm.

**\*AES256**

Messages are encrypted using the AES 256-bit key Advanced Encryption Standard algorithm.

### Authorized signers (SIGNER)

Specifies a list of *X500* distinguished names representing authorized message signers that are checked when browsing or destructively removing a message from a queue. If an authorized signer list is specified, only messages that are signed with a certificate identified in the list are accepted during message retrieval, even if the recipient keystore can verify the message signer.

This parameter is valid only when a signature algorithm ( [SIGNALG](#) ) has also been specified.

Note that distinguished names are case sensitive, and it is important that you enter the distinguished names exactly as they appear in the digital certificate.

The possible values are:

**\*NONE**

When handling signed messages, beyond checking the signers certificate validity, the policy does not restrict the identity of the message signer when retrieving messages.

### ***x500-distinguished-name***

When handling signed messages, beyond checking certificate validity, the message must have been signed by a certificate matching one of the distinguished names.

## **Intended recipients (RECIP)**

Specifies a list of *X500* distinguished names representing the intended recipients that are used when putting a encrypted message to a queue. If a policy has specified an encryption algorithm (ENCALG) then at least one recipient distinguished name must be specified.

This parameter is valid only when an encryption algorithm ( [ENCALG](#) ) has also been specified.

Note that distinguished names are case sensitive, and it is important that you enter the distinguished names exactly as they appear in the digital certificate.

The possible values are:

### **\*NONE**

Messages are not encrypted.

### ***x500-distinguished-name***

When putting messages, the message data is encrypted using the distinguished name as an intended recipient. Only the listed recipients are able to retrieve and decrypt the message.

## **Tolerate unprotected (TOLERATE)**

Specifies whether messages that are not protected can still be browsed or destructively removed from a queue. This parameter can be used to gradually introduce a security policy for applications, allowing any messages that were created before the policy was introduced to be processed.

The possible values are:

### **\*NO**

Messages that do not conform to the current policy are not returned to applications.

### **\*YES**

Messages that have not been protected are allowed to be retrieved by applications.

## **Remove policy (REMOVE)**

Specifies whether a policy is being created or removed.

The possible values are:

### **\*NO**

The policy is created or altered if it already exists.

### **\*YES**

The policy is removed. The only other parameters that are valid with this parameter value are policy name ( [POLICY](#) ) and queue manager name ( [MQMNAME](#) ).

## **Key reuse (KEYREUSE)**

Specifies the number of times that an encryption key can be re-used, in the range 1-9,999,999, or the special values *\*DISABLED* or *\*UNLIMITED*.

Note that this is a maximum number of times a key can be reused, therefore a value of 1 means, at most, two messages can use the same key.

### **\*DISABLED**

Prevents a symmetric key from being reused

### **\*UNLIMITED**

Allows a symmetric key to be reused any number of times.

**Attention:** Key reuse is valid only for CONFIDENTIALITY policies, that is, **SIGNALG** set to *\*NONE* and **ENCALG** set to an algorithm value. For all other policy types, you must omit the parameter, or set the **KEYREUSE** value to *\*DISABLED*.

IBM i

## Suspend Cluster Queue Manager (SPDMQMCLQM)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

Use the SPDMQMCLQM command to inform other queue managers in a cluster that the local queue manager is not available for processing and cannot be sent messages. Its action can be reversed by the RSMMQMCLQM command.

### Parameters

Keyword	Description	Choices	Notes
<u>CLUSTER</u>	Cluster Name	Character value	Optional, Positional 1
<u>CLUSNL</u>	Cluster Name List	Character value	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 3
<u>MODE</u>	Mode	<b>*QUIESCE</b> , *FORCE	Optional, Positional 4

### Cluster Name (CLUSTER)

Specifies the name of the cluster for which the queue manager is no longer available for processing.

#### cluster-name

Specify the name of the cluster.

### Cluster Name List (CLUSNL)

Specifies the name of the namelist specifying a list of clusters for which the queue manager is no longer available for processing.

#### namelist

Specify the name of the namelist.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

#### \*DFT

Use the default queue manager.

#### queue-manager-name

Specify the name of the queue manager.

### Mode (MODE)

Specifies how the suspension of availability is to take effect:

#### \*QUIESCE

Other queue managers in the cluster are advised that the local queue manager should not be sent further messages.

**\*FORCE**

All inbound and outbound channels to other queue managers in the cluster are stopped forcibly.

## IBM i Start Message Queue Manager (STRMQM)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Start Message Queue Manager (STRMQM) command starts the local queue manager.

**Parameters**

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 1
<u>RDEFSYS</u>	Redefine system objects	*YES, <b>*NO</b>	Optional, Positional 2
<u>FIXDIRS</u>	Fix directories	*YES, <b>*NO</b>	Optional, Positional 3
<u>STRSTDTL</u>	Startup Status Detail	<b>*ALL</b> , *MIN	Optional, Positional 4
<u>STRSVC</u>	Service startup	<b>*YES</b> , *NO	Optional, Positional 5
<u>REPLAY</u>	Perform replay only	*YES, <b>*NO</b>	Optional, Positional 6
<u>ACTIVATE</u>	Activate backup	*YES, <b>*NO</b>	Optional, Positional 7
<u>STANDBY</u>	Permit Standby Queue Manager	*YES, <b>*NO</b>	Optional, Positional 8

**Message Queue Manager name (MQMNAME)**

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

**Redefine system objects (RDEFSYS)**

Specifies whether the default and system objects are redefined.

**\*NO**

Do not redefine the system objects.

**\*YES**

Starts the queue manager, redefines the default and system objects, then stops the queue manager. Any existing system and default objects belonging to the queue manager are replaced if you specify this flag.

**Fix directories (FIXDIRS)**

Specifies whether missing or damaged queue manager directories are re-created.

**\*NO**

Do not re-create any missing queue manager directories. If any damaged or missing directories are encountered during startup, the startup attempt will report an error and the STRMQM command will end immediately.

**\*YES**

Starts the queue manager and if required re-creates any damaged or missing directories. This option should be used when performing media recovery of a queue manager.

**Startup Status Detail (STRSTSDL)**

Specifies the detail of status messages that are issued while starting the queue manager.

**\*ALL**

Display all startup status messages. This level of detail includes periodically displaying messages detailing transaction recovery and log replay. This level of detail can be useful in tracking queue manager startup progress following the abnormal termination of a queue manager.

**\*MIN**

Displays a minimum level of status messages.

**Service startup (STRSVC)**

Specifies whether the additional following QMGR components are started when the queue manager is started:

- The Channel Initiator
- The Command Server
- Listeners with CONTROL set to QMGR or STARTONLY
- Services with CONTROL set to QMGR or STARTONLY

**\*YES**

Start the channel initiator, command server, listeners and services when the queue manager is started.

**\*NO**

Do not start the channel initiator, command server, listeners or services when the queue manager is started.

**Perform replay only (REPLAY)**

Whether the queue manager is being started to perform replay only. This enables a backup copy of a queue manager on a remote machine to replay logs created by the corresponding active machine, and to allow the backup queue manager to be activated in the event of a disaster on the active machine.

**\*NO**

The queue manager is not being started to perform replay only.

**\*YES**

The queue manager is being started to perform replay only. The STRMQM command will end when replay is complete.

**Activate backup (ACTIVATE)**

Specifies whether to mark a queue manager as active. A queue manager that has been started with the REPLAY option is marked as a backup queue manager and cannot be started before it has been activated.

**\*NO**

The queue manager is not to be marked as active.

**\*YES**

The queue manager is to be marked as active. Once a queue manager has been activated then it can be started as a normal queue manager using the STRMQM command without the REPLAY and ACTIVATE options.

**Permit Standby Queue Manager (STANDBY)**

Specifies whether the queue manager can start as a standby instance if an active instance of the queue manager is already running on another system. Also specifies whether this instance of the queue manager will permit standby instances of the same queue manager on other systems in preparation for failover.

**\*NO**

The queue manager is started normally.

**\*YES**

The queue manager is permitted to start as a standby instance, and it permits other standby instances of the same queue manager to be started.

**IBM i Start MQ Pub/Sub Broker (STRMQMBRK)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Start IBM MQ broker (STRMQMBRK) command starts a broker for a specified queue manager.

**Parameters**

<i>Table 270. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1
<u>PARENTMQM</u>	Parent Message Queue Manager	Character value	Optional, Positional 2

**Message Queue Manager name (MQMNAME)**

Specifies the name of the queue manager.

**queue-manager-name**

Specify the name of the queue manager.

**Parent Message Queue Manager (PARENTMQM)**

Specifies the name of the queue manager that provides the parent broker function. Before you can add a broker to the network, channels in both directions must exist between the queue manager that hosts the new broker, and the queue manager that hosts the parent.

On restart, this parameter is optional. If present, it must be the same as it was when previously specified. If this is the root-node broker, the queue manager specified becomes its parent. You cannot specify the name of the parent broker when you use triggering to start a broker.

After a parent has been specified, it is only possible to change parentage in exceptional circumstances in conjunction with the CLRMQMBRK command. By changing a root node to become the child of an existing broker, two hierarchies can be joined. This causes subscriptions to be propagated across the two hierarchies, which now become one. After that, publications start to flow across them. To ensure predictable results, it is essential that you quiesce all publishing applications at this time.

If the changed broker detects a hierarchical error (that is, if the new parent is found also to be a descendant), it immediately shuts down. The administrator must then use CLRMQMBRK at both the changed broker and the new, false parent to restore the previous status. A hierarchical error is detected by propagating a message up the hierarchy, which can complete only when the relevant brokers and links are available.

## IBM i Start MQ Channel (STRMQMCHL)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Start MQ Channel (STRMQMCHL) command starts an MQ channel.

### Parameters

Table 271. Command parameters			
Keyword	Description	Choices	Notes
CHLNAME	Channel name	Character value	Required, Positional 1
MQMNAME	Message Queue Manager name	Character value, *DFT	Optional, Positional 2

### Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

#### channel-name

Specify the channel name.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

#### \*DFT

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

#### message-queue-manager-name

The name of a message queue manager.

## IBM i Start MQ Channel Initiator (STRMQMCHLI)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Start MQ Channel Initiator (STRMQMCHLI) command starts an MQ channel initiator.

## Parameters

Table 272. Command parameters			
Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2

### Queue name (QNAME)

Specifies the name of the initiation queue for the channel initiation process. That is, the initiation queue that is specified in the definition of the transmission queue.

The possible values are:

#### queue-name

Specify the name of the initiation queue.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

#### \*DFT

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

#### message-queue-manager-name

The name of a message queue manager.

IBM i

## Start MQ Command Server (STRMQMCSVR)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Start MQ Command Server (STRMQMCSVR) command starts the MQ command server for the specified queue manager.

## Parameters

Table 273. Command parameters			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 1

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

#### queue-manager-name

Specify the name of the queue manager.

## Start IBM MQ DLQ Handler (STRMQMDLQ)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

Use the Start IBM MQ Dead-Letter Queue Handler (STRMQMDLQ) command to perform various actions on selected messages. The command specifies a set of rules that can both select a message and perform the action on that message.

The STRMQMDLQ command takes its input from the rules table as specified by SRCFILE and SRCMBR. When the command processes, the results and a summary are written to the printer spooler file.

### Note:

The WAIT keyword, defined in the rules table, determines whether the dead-letter queue handler ends immediately after processing messages, or waits for new messages to arrive.

## Parameters

Table 274. Command parameters

Keyword	Description	Choices	Notes
<u>UDLMSGQ</u>	Undelivered message queue	Character value, *DFT, *NONE	Required, Positional 1
<u>SRCMBR</u>	Member containing input	Name, *FIRST	Required, Positional 2
<u>SRCFILE</u>	Input file	Qualified object name	Optional, Positional 3
	Qualifier 1: Input file	Name, <b>QXTSRC</b>	
	Qualifier 2: Library	Name, *LIBL, *CURLIB	
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT, *NONE	Optional, Positional 4

### Undelivered message queue (UDLMSGQ)

Specifies the name of the local undelivered message queue that is to be processed.

The possible values are:

#### \*DFT

The local undelivered-message queue used is taken from the default queue manager for the installation. If this option is specified, the INPUTQ keyword stated in the rules table is overridden by the default undelivered-message queue for the queue manager.

#### undelivered-message-queue-name

Specify the name of the local undelivered-message queue to be used. If this option is specified, the INPUTQ keyword stated in the rules table is overridden by the stated undelivered-message queue.

#### \*NONE

The queue that is named by the INPUTQ keyword in the rules table is used, or the system-default dead-letter queue if the INPUTQ keyword in the rules table is blank.

### Member containing input (SRCMBR)

Specifies the name of the source member, containing the user-written rules table to be processed.

The possible values are:

**\*FIRST**

The first member of the file is used.

**source-member-name**

Specify the name of the source member.

**Input file (SRCFILE)**

Specifies the name of the source file and library, in the form LIBRARY/FILE, that contains the user-written rules table to be processed.

The possible values are:

**\*LIBL**

Search the library list for the file name.

**\*CURLIB**

Use the current library.

**source-library-name**

Specify the name of the library that is being used.

The possible values are:

**QTXTSRC**

Use QTXTSRC.

**source-file-name**

Specify the name of the source file.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

**\*NONE**

The queue manager that is named by the INPUTQM keyword in the rules table is used, or the system-default queue manager if the INPUTQM keyword in the rules table is blank.

 IBM i**Start MQ Listener (STRMQMLSR)****Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Start MQ Listener (STRMQMLSR) command starts an MQ TCP/IP listener.

This command is valid for TCP/IP transmission protocols only.

You can specify either a listener object or specific listener attributes.

## Parameters

Keyword	Description	Choices	Notes
<u>PORT</u>	Port number	1-65535, <b>*DFT</b>	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 2
<u>IPADDR</u>	IP Address	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 3
<u>BACKLOG</u>	Listener backlog	0-999999999, <b>*DFT</b>	Optional, Positional 4
<u>LSRNAME</u>	Listener name	<i>Character value</i> , <b>*NONE</b>	Optional, Positional 5

### Port number (PORT)

The port number to be used by the listener.

The possible values are:

#### **\*DFT**

Port number 1414 is used.

#### **port-number**

The port number to be used.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

#### **\*DFT**

Use the default queue manager.

#### **queue-manager-name**

The name of a message queue manager.

### IP Address (IPADDR)

The IP address to be used by the listener.

The possible values are:

#### **\*DFT**

The listener will listen on all IP addresses available to the TCP/IP stack.

#### **ip-addr**

The IP address to be used.

### Listener backlog (BACKLOG)

The number of concurrent connection requests the listener supports.

The possible values are:

#### **\*DFT**

255 concurrent connection requests are supported.

#### **backlog**

The number of concurrent connection requests supported.

## Listener name (LSRNAME)

The name of the MQ listener object to be started.

The possible values are:

### \*NONE

No listener object is specified.

### listener-name

Specify the name of the listener object to be started.

## IBM i Start IBM MQ Commands (STRMQMMQSC)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Start IBM MQ Commands (STRMQMMQSC) command initiates a set of IBM MQ Commands (MQSC) and writes a report to the printer spooler file.

**Attention:** Do not use the QTEMP library as the input library to STRMQMMQSC, as the usage of the QTEMP library is limited. You must use another library as an input file to the command.

Each report consists of the following elements:

- A header identifying MQSC as the source of the report.
- A numbered listing of the input MQSC commands.
- A syntax error message for any commands in error.
- A message indicating the outcome of running each correct command.
- Other messages for general errors running MQSC, as needed.
- A summary report at the end.

## Parameters

Keyword	Description	Choices	Notes
<u>SRCMBR</u>	Member containing input	<i>Name</i> , *FIRST	Required, Positional 1
<u>SRCFILE</u>	Input file	Qualified object name	Optional, Positional 2
	Qualifier 1: Input file	<i>Name</i> , <b>QMQSC</b>	
	Qualifier 2: Library	<i>Name</i> , *LIBL, *CURLIB	
<u>OPTION</u>	Option	*RUN, *VERIFY, *MVS	Optional, Positional 3
<u>WAIT</u>	Wait time	1-999999	Optional, Positional 4
<u>LCLMQMNAME</u>	Local Message Queue Manager	Character value	Optional, Positional 5
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 6

### Member containing input (SRCMBR)

Specifies the name of the source member, containing the MQSC, to be processed.

The possible values are:

**source-member-name**

Specify the name of the source member.

**\*FIRST**

The first member of the file is used.

**Input file (SRCFILE)**

Specifies the qualified name of the file, in the form LIBRARY/FILE, that contains the MQSC to be processed.

The possible values are:

**\*LIBL**

The library list is searched for the file name.

**\*CURLIB**

The current library is used.

**source-library-name**

Specify the name of the library to be used.

The possible values are:

**QMQSC**

QMQSC is used.

**source-file-name**

Specify the name of the source file.

**Option (OPTION)**

Specifies how the MQSC commands are to be processed.

The possible values are:

**\*RUN**

If this value is specified and a value for the WAIT parameter is not specified the MQSC commands are processed directly by the local queue manager. If this value is specified and a value is also specified for the WAIT parameter the MQSC commands are processed indirectly by a remote queue manager,

**\*VERIFY**

The MQSC commands are verified and a report is written, but the commands are not run.

**\*MVS**

The MQSC commands are processed indirectly by a remote queue manager running under MVS™/ESA. If you specify this option you must also specify a value for the WAIT parameter.

**Wait time (WAIT)**

Specifies the time in seconds that the STRMQMMQSC command waits for replies to indirect MQSC commands. Specifying a value for this parameter indicates that MQSC commands are executed in indirect mode by a remote queue manager. Specifying a value for this parameter is only valid when the OPTION parameter is specified as \*RUN or \*MVS.

In indirect mode, MQSC commands are queued on the command queue of a remote queue manager. Reports from the commands are then returned to the local queue manager specified in MQMNAME. Any replies received after this time are discarded, however, the MQSC command is still run.

The possible values are:

**1 - 999999**

Specify the waiting time in seconds.

## Local Message Queue Manager (LCLMQMNAME)

Specifies the name of the local queue manager through which indirect mode operation is to be performed.

## Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

### **\*DFT**

Use the default queue manager.

### **message-queue-manager-name**

Specify the name of the queue manager.

## IBM i Start MQ Service (STRMQMSVC)

### **Where allowed to run**

All environments (\*ALL)

### **Threadsafe**

Yes

The Start MQ Service (STRMQMSVC) command starts an MQ service.

## Parameters

Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2

## Service name (SVCNAME)

The name of the MQ service object to be started.

The possible values are:

### **\*NONE**

No service object is specified.

### **service-name**

Specify the name of the service definition. The maximum length of the string is 48 bytes.

## Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

### **\*DFT**

Use the default queue manager.

### **queue-manager-name**

The name of a message queue manager.

## IBM i Start MQ Trigger Monitor (STRMQMTRM)

### **Where allowed to run**

All environments (\*ALL)

## Threadsafe

Yes

The Start MQ Trigger Monitor (STRMQMTRM) command starts the MQ trigger monitor for the specified queue manager.

## Parameters

Table 278. Command parameters

Keyword	Description	Choices	Notes
<u>INITQNAME</u>	Initiation queue	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2

### Initiation queue **INITQNAME**

Specifies the name of the initiation queue.

#### **initiation-queue-name**

Specify the name of the initiation queue

### Message Queue Manager name (**MQMNAME**)

Specifies the name of the message queue manager.

The possible values are:

#### **\*DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

#### **message-queue-manager-name**

The name of a message queue manager.

## Trace MQ (**TRCMQM**)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Trace MQ (TRCMQM) command controls tracing for all MQ jobs. TRCMQM, which sets tracing on or off, can trace message queue interface (MQI) functions, function flow, and IBM MQ for IBM i components together with any messages issued by IBM MQ.

## Parameters

Table 279. Command parameters

Keyword	Description	Choices	Notes
<u>TRCEARLY</u>	Trace early	<b>*NO</b> , *YES	Optional, Positional 1
<u>SET</u>	Trace option setting	<b>*ON</b> , *OFF, *STS, *END	Optional, Positional 2
<u>OUTPUT</u>	Output	<b>*MQM</b> , *MQMFMT, *PEX, *ALL	Optional, Positional 3
<u>TRCLEVEL</u>	Trace level	<b>*DFT</b> , *DETAIL, *PARMS	Optional, Positional 4

Table 279. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>TRCTYPE</u>	Trace types	Single values: <b>*ALL</b> Other values (up to 14 repetitions): <b>*API, *CMTRY, *COMMS, *CSDATA, *CSFLOW, *LQMDATA, *LQMFLOW, *OTHDATA, *OTHFLOW, *RMTDATA, *RMTFLOW, *SVCDATA, *SVCFLOW, *VSNDATA</b>	Optional, Positional 5
<u>EXCLUDE</u>	Exclude types	Single values: <b>*NONE</b> Other values (up to 14 repetitions): <b>*API, *CMTRY, *COMMS, *CSDATA, *CSFLOW, *LQMDATA, *LQMFLOW, *OTHDATA, *OTHFLOW, *RMTDATA, *RMTFLOW, *SVCDATA, *SVCFLOW, *VSNDATA</b>	Optional, Positional 6
<u>INTERVAL</u>	Trace interval	1-32000000, <b>*NONE</b>	Optional, Positional 7
<u>MAXSTG</u>	Maximum storage to use	1-16, <b>*DFT</b>	Optional, Positional 8
<u>DATASIZE</u>	Trace data size	1-99999999, <b>*DFT, *ALL, *NONE</b>	Optional, Positional 9
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 10
<u>JOB</u>	Job information	Values (up to 8 repetitions): <i>Element list</i>	Optional, Positional 11
	Element 1: Job name	Qualified job name	
	Qualifier 1: Job name	Generic name, name	
	Qualifier 2: User	<i>Character value, X"</i>	
	Qualifier 3: Number	<i>Character value, X"</i>	
	Element 2: Thread identifier	<i>Character value, *NONE, *INITIAL</i>	
<u>STRCTL</u>	Trace start control	Values (up to 8 repetitions): <i>Character value, *NONE</i>	Optional, Positional 12
<u>ENDCTL</u>	Trace end control	Values (up to 8 repetitions): <i>Character value, *NONE</i>	Optional, Positional 13

### Trace early (TRCEARLY)

Specifies whether early tracing is selected.

Early tracing applies to all jobs for all queue managers. If a queue manager is not currently active or does not exist, then early trace will become effective during start-up or creation.

**\*NO**

Early tracing is not enabled.

**\*YES**

Early tracing is enabled.

**Trace option setting (SET)**

Specifies the collection of trace records.

The possible values are:

**\*ON**

The collection of trace records is started.

For TRCEARLY(\*NO), the collection of trace records will not be started until after the queue manager is available.

**\*OFF**

The collection of trace records is stopped. Trace records are written to files in the trace collection directory.

**\*STS**

The status of any active trace collections are written to a spool file. Any other parameters specified on the TRCMQM will be ignored.

**\*END**

The collection of trace records is stopped for all queue managers.

**Output (OUTPUT)**

Identifies the type of trace output that this command applies.

The possible values are:

**\*MQM**

This command applies to the collection of binary IBM MQ trace output in the directory specified by the TRCDIR parameter.

**\*MQMFMFMT**

This command applies to the collection of formatted IBM MQ trace output in the directory specified by the TRCDIR parameter.

**\*PEX**

This command applies to the collection of Performance Explorer (PEX) trace output.

**\*ALL**

This option applies to the collection of both IBM MQ unformatted trace and PEX trace output.

**Trace level (TRCLEVEL)**

Activates tracing level for flow processing trace points.

The possible values are:

**\*DFT**

Activates tracing at default level for flow processing trace points.

**\*DETAIL**

Activates tracing at high-detail level for flow processing trace points.

**\*PARMS**

Activates tracing at default-detail level for flow processing trace points.

## Trace types (TRCTYPE)

Specifies the type of trace data to store in the trace file. If this parameter is omitted, all trace points are enabled.

The possible values are:

### **\*ALL**

All the trace data as specified by the following keywords is stored in the trace file.

### **trace-type-list**

You can specify more than one option from the following keywords, but each option can occur only once.

### **\*API**

Output data for trace points associated with the MQI and major queue manager components.

### **\*CMTRY**

Output data for trace points associated with comments in the MQ components.

### **\*COMMS**

Output data for trace points associated with data flowing over communications networks.

### **\*CSDATA**

Output data for trace points associated with internal data buffers in common services.

### **\*CSFLOW**

Output data for trace points associated with processing flow in common services.

### **\*LQMDATA**

Output data for trace points associated with internal data buffers in the local queue manager.

### **\*LQMFLOW**

Output data for trace points associated with processing flow in the local queue manager.

### **\*OTHDATA**

Output data for trace points associated with internal data buffers in other components.

### **\*OTHFLOW**

Output data for trace points associated with processing flow in other components.

### **\*RMTDATA**

Output data for trace points associated with internal data buffers in the communications component.

### **\*RMTFLOW**

Output data for trace points associated with processing flow in the communications component.

### **\*SVCDATA**

Output data for trace points associated with internal data buffers in the service component.

### **\*SVCFLOW**

Output data for trace points associated with processing flow in the service component.

### **\*VSNDATA**

Output data for trace points associated with the version of IBM MQ running.

## Exclude types (EXCLUDE)

Specifies the type of trace data to omit from the trace file. If this parameter is omitted, all trace points specified in TRCTYPE are enabled.

The possible values are:

### **\*ALL**

All the trace data as specified by the following keywords is stored in the trace file.

### **trace-type-list**

You can specify more than one option from the following keywords, but each option can occur only once.

**\*API**

Output data for trace points associated with the MQI and major queue manager components.

**\*CMTRY**

Output data for trace points associated with comments in the MQ components.

**\*COMMS**

Output data for trace points associated with data flowing over communications networks.

**\*CSDATA**

Output data for trace points associated with internal data buffers in common services.

**\*CSFLOW**

Output data for trace points associated with processing flow in common services.

**\*LQMDATA**

Output data for trace points associated with internal data buffers in the local queue manager.

**\*LQMFLOW**

Output data for trace points associated with processing flow in the local queue manager.

**\*OTHDATA**

Output data for trace points associated with internal data buffers in other components.

**\*OTHFLOW**

Output data for trace points associated with processing flow in other components.

**\*RMTDATA**

Output data for trace points associated with internal data buffers in the communications component.

**\*RMTFLOW**

Output data for trace points associated with processing flow in the communications component.

**\*SVCDATA**

Output data for trace points associated with internal data buffers in the service component.

**\*SVCFLOW**

Output data for trace points associated with processing flow in the service component.

**\*VSNDATA**

Output data for trace points associated with the version of IBM MQ running.

**Trace interval (INTERVAL)**

Specifies an interval in seconds that trace should be collected for. If this parameter is omitted then trace will continue to be collected until it is stopped manually via the TRCMQM commands or an FDC with a probe identifier specified in ENDCTL is encountered.

The possible values are:

**collection-interval**

Specify a value in seconds ranging from 1 through 32000000.

You cannot specify a value for both INTERVAL and ENDCTL.

**Maximum storage to use (MAXSTG)**

Specifies the maximum size of storage to be used for the collected trace records.

The possible values are:

**\*DFT**

The default maximum is 1 megabyte (1024 kilobytes).

**maximum-megabytes**

Specify a value ranging from 1 through 16.

## Trace data size (DATASIZE)

Specifies the number of bytes of user data included in the trace.

The possible values are:

### **\*DFT**

The default trace value is used.

### **\*ALL**

All the user data is traced.

### **\*NONE**

This option will turn off the trace for sensitive user data.

### **data-size-in-bytes**

Specify a value in ranging from 1 through 99999999.

## Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

This parameter is only valid when TRCEARLY is set to \*NO.

When TRCEARLY is set to \*YES all queue managers are traced.

The possible values are:

### **\*DFT**

Trace the default queue manager.

### **queue-manager-name**

Specify the name of the queue manager to trace.

## Job information (JOB)

Specifies which jobs are to be traced.

The value of this parameter can be one of the following:

### **generic-jobname**

A generic 10 character jobname. All jobs that match the jobname will be enabled to collect trace. For example 'AMQ\*' will collect trace for all jobs with a prefix of AMQ.

### **Job-name/User/Number**

A fully qualified jobname. Only the job specified by the qualified jobname will be traced.

### **Job-name/User/Number/thread-identifier**

A fully qualified jobname and associated thread identifier. Only the thread in the job specified by the qualified jobname will be traced. Note that the thread identifier is the internal identifier allocated by IBM MQ, it is not related to the IBM i thread identifier.

## Trace start control (STRCTL)

Specifies that trace is started when an FDC with one of the specified probe identifiers is generated.

### **AANNNNNN**

A probe identifier is an 8 character string of the format (AANNNNNN) where A represents alphabetic characters and N represents numeric digits.

Up to 8 probe identifiers may be specified.

## Trace end control (ENDCTL)

Specifies that trace is ended when an FDC with one of the specified probe identifiers is generated.

## AANNNNNN

A probe identifier is an 8 character string of the format (AANNNNNN) where A represents alphabetic characters and N represents numeric digits.

Up to 8 probe identifiers may be specified.

You cannot specify a value for both ENDCTL and INTERVAL.

IBM i

## Work with MQ Queue Manager (WRKMQM)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Work with Queue Managers (WRKMQM) command allows you to work with one or more queue manager definitions, and allows you to perform the following operations:

- Change a queue manager
- Create a queue manager
- Delete a queue manager
- Start a queue manager
- Display a queue manager
- End a queue manager
- Work with channels of a queue manager
- Work with namelists of a queue manager
- Work with queues of a queue manager
- Work with processes of a queue manager

## Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *ALL	Optional, Positional 1

### Message Queue Manager name (MQMNAME)

Specifies the name or names of the message queue managers to select.

The possible values are:

#### \*ALL

All queue managers are selected.

#### generic-queue-manager-name

Specify the generic name of the queue managers to select. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all queue managers having names that start with the character string. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

**Note:** You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered. You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

### queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

## IBM i Work with MQ Authority (WRKMQMAUT)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Work with MQ Authority (WRKMQMAUT) displays a list of all the authority profile names and their types, which match the specified parameters. This enables you to delete, work with and create the authority records for an MQM authority profile record.

### Parameters

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object/Profile name	<i>Character value</i> , *ALL	Optional, Positional 1
<u>OBJTYPE</u>	Object type	*Q, *PRC, *MQM, *NMLIST, *AUTHINFO, *LSR, *SVC, *CHL, *CLTCN, *ALL, *TOPIC, *RTMQMNAME	Optional, Positional 2
<u>OUTPUT</u>	Output	*, *PRINT	Optional, Positional 3
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 4
<u>SRVCOMP</u>	Service Component name	<i>Character value</i> , *DFT	Optional, Positional 5

### Object name (OBJ)

Specify the object name or authority profile name of the object to select.

The possible values are:

#### \*ALL

All authority records matching the specified object type are listed. \*ALL cannot represent a generic profile.

#### object-name

Specify the name of an MQ object; all authority records for which the object name or generic profile name match this object name are selected.

#### generic profile

Specify the generic profile of an MQ object; only the authority record which exactly matches the generic profile is selected. A generic profile is a character string containing one or more generic characters anywhere in the string. The generic characters are (?), (\*) and (\*\*).

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

### Object type (OBJTYPE)

Specifies the object type of the authority profile to select.

**\*ALL**

All MQ object types.

**\*Q**

All queue object types.

**\*AUTHINFO**

Authentication Information object.

**\*MQM**

Message Queue Manager.

**\*NMLIST**

Namelist object.

**\*PRC**

Process definition.

**\*CHL**

Channel object.

**\*CLTCN**

Client Connection Channel object.

**\*LSR**

Listener object.

**\*SVC**

Service object.

**\*TOPIC**

Topic object.

**\*RMTMQMNAME**

Remote queue manager name.

**Output (OUTPUT)**

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

**\***

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

**\*PRINT**

A detailed list of the users and their authorities registered with the selected authority profile record is printed with the job's spooled output.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the queue manager.

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager.

**Service Component name (SRVCOMP)**

Specify the name of the installed authorization service in which to search for the authorities to display.

The possible values are:

**\*DFT**

All installed authorization components are searched for the specified authority profile name and object type.

**Authorization-service-component-name**

The component name of the authorization service as specified in the Queue manager's qm.ini file.

## Work with MQ Authority Data (WRKMQMAUTD)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Work with MQ Authority Records (WRKMQMAUTD) displays a list of all the users registered to a particular authority profile name and type. This enables you to grant, revoke, delete and create authority records.

### Parameters

<i>Table 282. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>OBJ</u>	Object/Profile name	Character value	Required, Positional 1
<u>OBJTYPE</u>	Object type	*Q, *PRC, *MQM, *NMLIST, *AUTHINFO, *CHL, *CLTCN, *SVC, *LSR, *TOPIC	Required, Positional 2
<u>USER</u>	User name	Name, *PUBLIC, <b>*ALL</b>	Optional, Positional 3
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 4
<u>SRVCOMP</u>	Service Component name	Character value, <b>*DFT</b>	Optional, Positional 5

### Object name (OBJ)

Specify the object name or authority profile name of the object to select.

**object-name**

Specify the name of an MQ object; all authority records for which the object name or generic profile name match this object name are selected.

**generic profile**

Specify the generic profile of an MQ object; only the authority record which exactly matches the generic profile is selected. A generic profile is a character string containing one or more generic characters anywhere in the string. The generic characters are (?), (\*) and (\*\*).

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

### Object type (OBJTYPE)

Specifies the object type of the authority profile to select.

**\*Q**

All queue object types.

**\*AUTHINFO**

Authentication Information object.

**\*MQM**

Message Queue Manager.

**\*NMLIST**

Namelist object.

**\*PRC**

Process definition.

**\*CHL**

Channel object.

**\*CLTCN**

Client Connection Channel object.

**\*LSR**

Listener object.

**\*SVC**

Service object.

**\*TOPIC**

Topic object.

**User name (USER)**

Specifies the name of the user for whom authorities for the named object are displayed.

The possible values are:

**\*ALL**

List all relevant users.

**\*PUBLIC**

The user name implying all users of the system.

**user-profile-name**

Specify the name of the user.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the queue manager.

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager.

**Service Component name (SRVCOMP)**

Specify the name of the installed authorization service in which to search for the authorities to display.

The possible values are:

**\*DFT**

All installed authorization components are searched for the specified authority profile name and object type.

**Authorization-service-component-name**

The component name of the authorization service as specified in the Queue manager's qm.ini file.

IBM i

**Work with AuthInfo objects (WRKMQMAUTI)****Where allowed to run**

All environments (\*ALL)

## Threadsafe

Yes

The Work with MQ AuthInfo objects (WRKMQMAUTI) command allows you to work with multiple authentication information objects which are defined on the local queue manager.

This enables you to change, copy, create, delete, display, and display and change authority to an MQ authentication information object.

## Parameters

Keyword	Description	Choices	Notes
<u>AINAME</u>	AuthInfo name	Character value, <b>*ALL</b>	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2
<u>WHERE</u>	Filter command	Single values: <b>*NONE</b> Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*ALTDATA, *ALTTIME, *AUTHTYPE, *CONNAME, *TEXT, *USERNAME, *OCSPURL	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

### AuthInfo name (AINAME)

The name or names of the authentication information objects.

The possible values are:

#### **\*ALL or \***

All authentication information objects are selected.

#### **generic-authinfo-name**

The generic name of the authentication information objects. A generic name is a character string followed by an asterisk (\*). For example ABC\*, it selects all authentication information objects having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

#### **authentication-information-name**

Specify the name of a single authentication information object.

### Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

#### **\*DFT**

Use the default queue manager.

**queue-manager-name**

The name of an existing message queue manager. The maximum string length is 48 characters.

**Filter command (WHERE)**

This parameter can be used to selectively display those AuthInfo objects with particular AuthInfo attributes only.

The parameter takes three arguments, a keyword, an operator, and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

**\*GT**

Greater than.

Applicable to integer and non-generic string values.

**\*LT**

Less than.

Applicable to integer and non-generic string values

**\*EQ**

Equal to.

Applicable to integer and non-generic string values.

**\*NE**

Not equal to.

Applicable to integer and non-generic string values.

**\*GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

**\*LE**

Less than or equal to.

Applicable to integer and non-generic string values.

**\*LK**

Like.

Applicable to generic string values.

**\*NL**

Not like.

Applicable to generic string values.

**\*CT**

Contains.

Applicable to non-generic list values.

**\*EX**

Excludes.

Applicable to non-generic list values.

**\*CTG**

Contains generic.

Applicable to generic list values.

**\*EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

**\*ALTDATE**

The date on which the definition or information was last altered.

The filter value is the date in the form yyyy-mm-dd.

**\*ALTTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

**\*AUTHTYPE**

The type of the authentication information object.

The filter value is one of the following:

**\*CRLLDAP**

The type of the authentication information object is CRLLDAP.

**\*OCSP**

The type of the authentication information object is OCSP.

**\*IDPWOS**

Connection authentication user ID and password checking is done using the operating system.

**\*IDPWLDAP**

Connection authentication user ID and password checking is done using an LDAP server.

**\*CONNAME**

The address of the host on which the LDAP server is running.

The filter value is the address name.

**\*TEXT**

Descriptive comment.

The filter value is the text description of the queue.

**\*USERNAME**

The distinguished name of the user.

The filter value is the distinguished name.

**\*OCSPURL**

The OCSP Responder URL.

The filter value is the URL name.

IBM i

## Work with MQ Channels (WRKMQMCHL)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Work with IBM MQ Channels (WRKMQMCHL) command allows you to work with one or more channel definitions. This enables you to create, start, end, change, copy, delete, ping, display and reset channels, and resolve in-doubt units of work.

## Parameters

<i>Table 284. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>CHLNAME</u>	Channel name	<i>Character value, *ALL</i>	Optional, Positional 1
<u>CHLTYPE</u>	Channel type	*RCVR, *SDR, *SVR, *RQSTR, *SVRCN, *CLUSSDR, *CLUSRCVR, *CLTCN, *ALL	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 3
<u>STATUS</u>	Channel status	*ALL, *INACTIVE, *STOPPED, *BINDING, *RETRYING, *RUNNING, *SWITCHING	Optional, Positional 4

Table 284. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>WHERE</u>	Filter command	Single values: <b>*NONE</b> Other values: <i>Element list</i>	Optional, Positional 5
	Element 1: Filter keyword	*AFFINITY, *ALTDATA, *ALTTIME, *BATCHHB, *BATCHINT, *BATCHLIM, *BATCHSIZE, *CLNTWGHT, *CLUSNL, *CLUSTER, *CLWLPRTY, *CLWLKANK, *CLWLWGHT, *COMPHDR, *COMPMSG, *CONNAME, *CVTMSG, *DSCITV, *HRTBTINTVL, *KAINT, *LOCLADDR, *LONGRTY, *LONGTMR, *MAXINST, *MAXINSTC, *MAXMSGLEN, *MCANAME, *MCATYPE, *MCAUSRID, *MODENAME, *MONCHL, *MSGEXIT, *MSGRTYDATA, *MSGRTYEXIT, *MSGRTYITV, *MSGRTYNBR, *MSGUSRDATA, *NETPRTY, *NPMSPEED, *PROPCTL, *PUTAUT, *RCVEXIT, *RCVUSRDATA, *SCYEXIT, *SCYUSRDATA, *SEQNUMWRAP, *SHARECNV, *SHORTRTY, *SHORTTMR, *SNDEXIT, *SNDUSRDATA, *SSLCAUTH, *SSLCIPH, *SSLPEER, *STATCHL, *TEXT, *TGTMQNAME, *TMQNAME, *TPNAME, *TRPTYPE, *USERID	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

### Channel name (CHLNAME)

Specifies the name or names of the IBM MQ channel definitions to be selected.

The possible values are:

**\*ALL**

All channel definitions are selected.

**generic-channel-name**

Specify the generic name of the channel definitions to be selected. A generic name is a character string followed by an asterisk (\*). For example ABC\*, it selects all channel definitions having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

**channel-name**

Specify the name of the channel definition.

**Channel type (CHLTYPE)**

Specifies the type of channel definitions that are to be displayed.

The possible values are:

**\*ALL**

All the channel types are selected.

**\*SDR**

Sender channel

**\*SVR**

Server channel

**\*RCVR**

Receiver channel

**\*RQSTR**

Requester channel

**\*SVRCN**

Server-connection channel

**\*CLUSSDR**

Cluster-sender channel

**\*CLUSRCVR**

Cluster-receiver channel

**\*CLTCN**

Client-connection channel

**Message Queue Manager name (MQMNAME)**

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

**message-queue-manager-name**

The name of a message queue manager.

**Channel status (STATUS)**

Specifies the status type of the IBM MQ channel definitions to be selected.

The possible values are:

**\*ALL**

Channels with any status are selected.

**\*BINDING**

Only channels with a binding status are selected.

**\*INACTIVE**

Only channels with an inactive status are selected.

**\*RETRYING**

Only channels with a retrying status are selected.

**\*RUNNING**

Only channels with a running status are selected.

**\*STOPPED**

Only channels with a stopped status are selected.

**\*SWITCHING**

Only channels with a switching status are selected.

**Filter command (WHERE)**

This parameter can be used to selectively display those channels with particular channel attributes only.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

**\*GT**

Greater than.

Applicable to integer and non-generic string values.

**\*LT**

Less than.

Applicable to integer and non-generic string values

**\*EQ**

Equal to.

Applicable to integer and non-generic string values.

**\*NE**

Not equal to.

Applicable to integer and non-generic string values.

**\*GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

**\*LE**

Less than or equal to.

Applicable to integer and non-generic string values.

**\*LK**

Like.

Applicable to generic string values.

**\*NL**

Not like.

Applicable to generic string values.

**\*CT**

Contains.

Applicable to non-generic list values.

**\*EX**

Excludes.

Applicable to non-generic list values.

**\*CTG**

Contains generic.

Applicable to generic list values.

**\*EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

**\*AFFINITY**

Connection Affinity.

The filter value is one of the following:

**\*PREFERRED**

Preferred connection affinity.

**\*NONE**

No connection affinity.

**\*ALTDATE**

The date on which the definition or information was last altered.

The filter value is the data in the form yyyy-mm-dd.

**\*ALTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

**\*BATCHHB**

Batch heartbeat interval in milliseconds.

The filter value is the integer interval time.

**\*BATCHINT**

Batch interval in milliseconds.

The filter value is the integer interval time.

**\*BATCHLIM**

Batch data limit in kilobytes.

The limit of the amount of data that can be sent through a channel.

**\*BATCHSIZE**

Batch size.

The filter value is the integer batch size.

**\*CLNTWGHT**

Client channel weight.

The filter value is the integer client channel weight.

**\*CLUSNL**

Cluster namelist.

The filter value is the list of cluster names.

**\*CLUSTER**

The cluster to which the channel belongs.

The filter value is the name of the cluster.

**\*CLWLKANK**

Cluster workload rank.

The filter value is the integer rank.

**\*CLWLPRTY**

Cluster workload priority.

The filter value is the integer priority.

**\*CLWLWGHT**

Cluster workload weight.

The filter value is the integer weight.

**\*COMPHDR**

Header compression.

The filter value is one of the following:

**\*NONE**

No header data compression is performed.

**\*SYSTEM**

Header data compression is performed.

**\*COMPMSG**

Message compression.

The filter value is one of the following:

**\*NONE**

No message data compression is performed.

**\*RLE**

Message data compression is performed using RLE.

**\*ZLIBHIGH**

Message data compression is performed using ZLIB compression. A high level of compression is preferred.

**\*ZLIBFAST**

Message data compression is performed using ZLIB compression. A fast compression time is preferred.

**\*ANY**

Any compression technique supported by the queue manager can be used.

**\*CONNAME**

Remote connection name.

The filter value is the connection name string.

**\*CVTMSG**

Whether the message is converted before transmission.

The filter value is one of the following:

**\*YES**

The application data in the message is converted before sending.

**\*NO**

The application data in the message is not converted before sending.

**\*DSCITV**

Disconnect interval in seconds.

The filter value is the integer interval time.

**\*HRTBTINTVL**

Heartbeat interval in seconds.

The filter value is the integer interval time.

**\*KAINT**

Keep alive interval in seconds.

The filter value is the integer interval time.

**\*LOCLADDR**

Local connection name.

The filter value is the connection name string.

**\*LONGRTY**

Long retry count.

The filter value is the integer count.

**\*LONGTMR**

Long retry interval in seconds.

The filter value is the integer interval time.

**\*MAXINST**

Maximum instances of an individual server-connection channel.

The filter value is the integer number of instances.

**\*MAXINSTC**

Maximum instances of an individual server-connection channel from a single client.

The filter value is the integer number of instances.

**\*MAXMSGLEN**

Maximum message length.

The filter value is the integer length.

**\*MCANAME**

Message channel agent name.

The filter value is the agent name.

**\*MCATYPE**

Whether the message channel agent program should run as a thread or process.

The filter value is one of the following:

**\*PROCESS**

The message channel agent runs as a separate process.

**\*THREAD**

The message channel agent runs as a separate thread.

**\*MCAUSRID**

Message channel agent user identifier.

The filter value is the user identifier string.

**\*MODENAME**

SNA mode name.

The filter value is the mode name string.

**\*MONCHL**

Channel Monitoring.

The filter value is one of the following:

**\*QMGR**

The collection of Online Monitoring Data is inherited from the setting of the queue manager attribute MONCHL.

**\*OFF**

Online Monitoring Data collection for this channel is disabled.

**\*LOW**

Monitoring data collection is turned on with a low ratio of data collection.

**\*MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

**\*HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

**\*MSGEXIT**

Message exit name.

The filter value is the exit name.

**\*MSGRTYDATA**

Message retry exit user data.

The filter value is the user data string.

**\*MSGRTYEXIT**

Message retry exit name.

The filter value is the exit name.

**\*MSGRTYITV**

Message retry interval interval in seconds.

The filter value is the integer interval time.

**\*MSGRTYNBR**

Number of message retries.

The filter value is the integer number of retries.

**\*MSGUSRDATA**

Message exit user data.

The filter value is the user data string.

**\*NETPRTY**

Network connection priority ranging from 0 through 9.

The filter value is the integer priority value.

**\*NPMSPEED**

Whether the channel supports fast nonpersistent messages.

The filter value is one of the following:

**\*FAST**

The channel supports fast nonpersistent messages.

**\*NORMAL**

The channel does not support fast nonpersistent messages.

**\*PROPCTL**

Message Property Control.

The filter value is one of the following:

**\*COMPAT**

Compatibility mode

**\*NONE**

No properties sent to remote queue manager.

**\*ALL**

All properties sent to remote queue manager.

**\*PUTAUT**

Whether the user identifier in the context information is used.

The filter value is one of the following:

**\*DFT**

No authority check is made before the message is put on the destination queue.

**\*CTX**

The user identifier in the message context information is used to establish authority to put the message.

**\*RCVEXIT**

Receive exit name.

The filter value is the exit name.

**\*RCVUSRDATA**

Receive exit user data.

The filter value is the user data string.

**\*SCYEXIT**

Security exit name.

The filter value is the exit name.

**\*SCYUSRDATA**

Security exit user data.

The filter value is the user data string.

**\*SEQNUMWRAP**

Maximum message sequence number.

The filter value is the integer sequence number.

**\*SHARECNV**

The number of shared conversations over a TCP/IP socket.

The filter value is the integer number of shared conversations.

**\*SHORTRTY**

Short retry count.

The filter value is the integer count.

**\*SHORTTMR**

Short retry interval in seconds.

The filter value is the integer interval time.

**\*SNDEXIT**

Send exit name.

The filter value is the exit name.

**\*SNDUSRDATA**

Send exit user data.

The filter value is the user data string.

**\*SSLCAUTH**

Whether the channel should carry out client authentication over TLS.

The filter value is one of the following:

**\*REQUIRED**

Client authentication is required.

**\*OPTIONAL**

Client authentication is optional.

**\*SSLCIPH**

The CipherSpec using in TLS channel negotiation.

The filter value is the name of the CipherSpec.

**\*SSLPEER**

The X500 peer name used in TLS channel negotiation.

The filter value is the peer name.

**\*STATCHL**

Channel Statistics.

The filter value is one of the following:

**\*QMGR**

The collection of statistics data is inherited from the setting of the queue manager attribute STATCHL.

**\*OFF**

Statistics data collection for this channel is disabled.

**\*LOW**

Statistics data collection is turned on with a low ratio of data collection.

**\*MEDIUM**

Statistics data collection is turned on with a moderate ratio of data collection.

**\*HIGH**

Statistics data collection is turned on with a high ratio of data collection.

**\*TEXT**

Descriptive comment.

The filter value is the text description of the channel.

**\*TGTMQMNAME**

Target queue manager name.

The filter value is the target queue manager of the channel.

**\*TMQNAME**

Transmission queue name.

The filter value is the name of the queue.

**\*TPNAME**

The SNA transaction program name.

The filter value is the program name string.

**\*TRPTYPE**

Transport type.

The filter value is one of the following:

**\*TCP**

Transmission Control Protocol / Internet Protocol (TCP/IP).

**\*LU62**

SNA LU 6.2.

**\*USERID**

Task user identifier.

The filter value is the user identifier string.

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Work with MQ Channel Status (WRKMQMCHST) command allows you to work with the status of one or more channel definitions.

**Parameters**

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value, <b>*ALL</b>	Optional, Positional 1
<u>CONNNAME</u>	Connection name	Character value, <b>*ALL</b>	Optional, Positional 2
<u>TMQNAME</u>	Transmission queue name	Character value, <b>*ALL</b>	Optional, Positional 3
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 4
<u>CHLSTS</u>	Channel status	<b>*ALL</b> , *SAVED, *CURRENT	Optional, Positional 5
<u>WHERE</u>	Filter command	Single values: <b>*NONE</b> Other values: <i>Element list</i>	Optional, Positional 6
	Element 1: Filter keyword	*CHLSTS, *CHLTYPE, *COMPHDR, *COMPMSG, *CONNNAME, *INDOUBT, *INDMSGGS, *INDSEQNO, *LSTSEQNO, *MONCHL, *RMTMQMNAME, *RMTVERSION, *SHARECNV, *STATUS, *SUBSTATE, *TMQNAME, *XQMSGSA, *LSTMSGDATE, *LSTMSGTIME, *MSGGS	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

**Channel name (CHLNAME)**

Specifies the name of the channel definition.

The possible values are:

**\*ALL**

All channel definitions are selected.

**generic-channel-name**

Specify the generic name of the channel definitions to be selected. A generic name is a character string followed by an asterisk (\*). For example ABC\*, it selects all channel definitions having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

**channel-name**

Specify the name of the channel definition.

**Connection name (CONNNAME)**

Specifies the name of the machine to connect.

The possible values are:

**\*ALL**

All the channels are selected.

**generic-connection-name**

Specify the generic connection name of the required channels.

**connection-name**

Specify the connection name of the required channels.

**Transmission queue name (TMQNAME)**

Specifies the name of the transmission queue.

The possible values are:

**\*ALL**

All the transmission queues are selected.

**generic-transmission-queue-name**

Specify the generic name of the transmission queues.

**transmission-queue-name**

Specify the name of the transmission queue. A transmission queue name is required if the channel definition type (CHLTYPE) is \*SDR or \*SVR.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

**message-queue-manager-name**

The name of a message queue manager.

**Channel status (CHLSTS)**

Specifies the type of channel status to display.

The possible values are:

**\*SAVED**

Saved channel status only is displayed. Status is not saved until a persistent message is transmitted across a channel, or a nonpersistent message is transmitted with a NPMSPEED of NORMAL. Because status is saved at the end of each batch, a channel has no saved status until at least one batch has been transmitted.

**\*CURRENT**

Current channel status only is displayed. This applies to channels that have been started, or on which a client has connected, and that have not finished or disconnected normally. The current status data is updated as messages are sent or received.

**\*ALL**

Both saved and current channel status is displayed.

**Filter command (WHERE)**

This parameter can be used to selectively display the status of only those channels with particular channel status attributes.

The parameter takes three arguments, a keyword, an operator, and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

**\*GT**

Greater than.

Applicable to integer and non-generic string values.

**\*LT**

Less than.

Applicable to integer and non-generic string values

**\*EQ**

Equal to.

Applicable to integer and non-generic string values.

**\*NE**

Not equal to.

Applicable to integer and non-generic string values.

**\*GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

**\*LE**

Less than or equal to.

Applicable to integer and non-generic string values.

**\*LK**

Like.

Applicable to generic string values.

**\*NL**

Not like.

Applicable to generic string values.

**\*CT**

Contains.

Applicable to non-generic list values.

**\*EX**

Excludes.

Applicable to non-generic list values.

**\*CTG**

Contains generic.

Applicable to generic list values.

**\*EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

**\*CHLSTS**

The type of channel status.

The filter value is one of the following:

**\*CURRENT**

Current status for an active channel.

**\*SAVED**

Saved status for an active or inactive channel.

**\*CHLTYPE**

The type of channel.

The filter value is one of the following:

**\*SDR**

Sender channel.

**\*SVR**

Server channel.

**\*RCVR**

Receiver channel.

**\*RQSTR**

Requester channel.

**\*CLUSSDR**

Cluster-sender channel.

**\*CLUSRCVR**

Cluster-receiver channel.

**\*SVRCN**

Server-connection channel.

**\*COMPHDR**

Whether the channel performs header data compression.

The filter value is one of the following:

**\*NONE**

No header data compression is performed.

**\*SYSTEM**

Header data compression is performed.

**\*COMPMSG**

Whether the channel performs message data compression.

The filter value is one of the following:

**\*NONE**

No message data compression is performed.

**\*RLE**

Message data compression is performed using RLE.

**\*ZLIBHIGH**

Message data compression is performed using ZLIB compression. A high level of compression is preferred.

**\*ZLIBFAST**

Message data compression is performed using ZLIB compression. A fast compression time is preferred.

**\*CONNAME**

The connection name of the channel.

The filter value is the connection name string.

**\*INDOUBT**

Whether there are any in-doubt messages in the network.

The filter value is either \*NO or \*YES.

**\*INDMSGS**

The number of in-doubt messages.

The filter value is the integer number of messages.

**\*INDSEQNO**

The sequence number of the message that is in-doubt.

The filter value is the integer sequence number.

**\*LSTMSGTIME**

The time the last message was sent on the channel.

The filter value is the time in the form hh:mm:ss.

**\*LSTMSGDATE**

The date that the last message was sent on the channel.

The filter value is the data in the form yyyy-mm-dd

**\*LSTSEQNO**

The last message sequence number.

The filter value is the integer sequence number.

**\*MONCHL**

The current level of monitoring data collection for the channel.

The filter value is one of the following:

**\*NONE**

No monitoring data is collected.

**\*LOW**

A low ratio of monitoring data is collected.

**\*MEDIUM**

A medium ratio of monitoring data is collected.

**\*HIGH**

A high ratio of monitoring data is collected.

**\*MSGS**

The number of messages that have been sent on the channel.

The filter value is the integer number of messages.

**\*RMTMQMNAME**

The remote message queue manager.

The filter value is the message queue manager name.

**\*RMTVERSION**

The remote partner version.

The filter value is the integer format of the remote partner version.

**\*SHARECNV**

The number of shared conversations over a TCP/IP socket.

The filter value is the integer number of shared conversations.

**\*STATUS**

The status of the channel.

The filter value is one of the following:

**\*BINDING**

The channel is establishing a session.

**\*INACTIVE**

The channel has ended processing normally or the channel has never started.

**\*INITIALIZING**

The channel initiator is attempting to start the channel.

**\*PAUSED**

The channel is waiting for the message retry interval.

**\*REQUESTING**

The channel has been requested to start.

**\*RETRYING**

A previous attempt to establish a connection has failed. The channel will retry the connection after the specified interval.

**\*RUNNING**

The channel is transferring or is ready to transfer data.

**\*STARTING**

The channel is ready to begin negotiation with the target MCA.

**\*STOPPED**

The channel has been stopped.

**\*STOPPING**

The channel has been requested to stop.

**\*SWITCHING**

The channel is switching transmission queues.

**\*SUBSTATE**

The channel substate.

The filter value is one of the following:

**\*ENDBATCH**

End of batch processing.

**\*SEND**

Sending data.

**\*RECEIVE**

Receiving data.

**\*SERIALIZE**

Serializing with the partner channel.

**\*RESYNCH**

Resynchronizing with the partner channel.

**\*HEARTBEAT**

Heartbeat processing.

**\*SCYEXIT**

Processing a security exit.

**\*RCVEXIT**

Processing a receive exit.

**\*SENDEXIT**

Processing a send exit.

**\*MSGEXIT**

Processing a message exit.

**\*MREXIT**

Processing a message-retry exit.

**\*CHADEXIT**

Processing a channel auto-definition exit.

**\*NETCONNECT**

Connecting to remote machine.

**\*SSLHANDSHK**

Establishing a TLS connection.

**\*NAMESERVER**

Requesting information from a name server.

**\*MQPUT**

MQPUT processing.

**\*MQGET**

MQGET processing.

**\*MQICALL**

Processing an MQI call.

**\*COMPRESS**

Compressing or extracting data.

**\*TMQNAME**

The transmission queue of the channel.

The filter value is the queue name.

**\*XQMSGSA**

The number of messages queued on the transmission queue available for MQGET. This field is valid for cluster-sender channels.

The filter value is the integer number of messages.

IBM i

## Work with MQ Clusters (WRKMQMCL)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Work with MQ Clusters command, **WRKMQMCL**, allows you to work with multiple cluster queue manager definitions that are defined on the local queue manager.

### Parameters

<i>Table 286. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>CLUSQMGR</u>	Cluster Queue Manager name	<i>Character value</i> , <b>*ALL</b>	Optional, Positional 1

Table 286. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2
<u>WHERE</u>	Filter command	Single values: <b>*NONE</b> Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*ALTDATA, *ALTTIME, *BATCHHB, *BATCHINT, *BATCHLIM, *BATCHSIZE, *CHLNAME, *CLUSDATE, *CLUSQMGR, *CLUSTER, *CLUSTIME, *CLWLPRTY, *CLWLRRANK, *CLWLWGHT, *COMPHDR, *COMPMSG, *CONNAME, *CVTMSG, *DFNTYPE, *DSCITV, *HRTBTINTVL, *KAINT, *LOCLADDR, *LONGRTY, *LONGTMR, *MAXMSGLEN, *MCANAME, *MCATYPE, *MCAUSRID, *MONCHL, *MSGEXIT, *MSGRTYDATA, *MSGRTYEXIT, *MSGRTYITV, *MSGRTYNBR, *MSGUSRDATA, *NETPRTY, *NPMSPEED, *PUTAUT, *QMID, *QMTYPE, *RCVEXIT, *RCVUSRDATA, *SCYEXIT, *SCYUSRDATA, *SEQNUMWRAP, *SHORTRTY, *SHORTTMR, *SNDEXIT, *SNDUSRDATA, *SSLCAUTH, *SSLCIPH, *SSLPEER, *STATCHL, *STATUS, *SUSPEND, *TEXT, *TRPTYPE, *USERID, *XMITQ	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

### Cluster Queue Manager name (CLUSQMGR)

Specifies the name or names of the cluster queue manager definitions.

**\*ALL**

All cluster queue manager definitions are selected.

**generic-cluster-queue-manager-name**

Specify the generic name of the MQ cluster queue manager definitions. A generic name is a character string followed by an asterisk (\*)> For example ABC\*, it selects all cluster queue manager definitions having names that start with the character string. You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered. You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

**cluster-queue-manager-name**

Specify the name of the MQ cluster queue manager definition.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the queue manager.

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager.

**Filter command (WHERE)**

This parameter can be used to selectively display only those cluster queue managers with particular attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

**\*GT**

Greater than.

Applicable to integer and non-generic string values.

**\*LT**

Less than.

Applicable to integer and non-generic string values

**\*EQ**

Equal to.

Applicable to integer and non-generic string values.

**\*NE**

Not equal to.

Applicable to integer and non-generic string values.

**\*GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

**\*LE**

Less than or equal to.

Applicable to integer and non-generic string values.

**\*LK**

Like.

Applicable to generic string values.

**\*NL**

Not like.

Applicable to generic string values.

**\*CT**

Contains.

Applicable to non-generic list values.

**\*EX**

Excludes.

Applicable to non-generic list values.

**\*CTG**

Contains generic.

Applicable to generic list values.

**\*EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

**\*ALTDATE**

The date on which the definition or information was last altered.

The filter value is the data in the form yyyy-mm-dd.

**\*ALTTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

**\*BATCHHB**

Batch heartbeat interval in milliseconds.

The filter value is the integer interval time.

**\*BATCHINT**

Batch interval in milliseconds.

The filter value is the integer interval time.

**\*BATCLIM**

Batch data limit in kilobytes.

The limit of the amount of data that can be sent through a channel.

**\*BATCSIZE**

Batch size.

The filter value is the integer batch size.

**\*CHANNEL**

The channel name of the cluster queue manager.

The filter value is the name of the channel.

**\*CLUSDATE**

The date on which the definition became available to the local queue manager.

The filter value is the data in the form yyyy-mm-dd.

**\*CLUSQGR**

The cluster queue manager name.

The filter value is the name of the cluster queue manager.

**\*CLUSTER**

The cluster to which the cluster queue manager belongs.

The filter value is the name of the cluster.

**\*CLUSTIME**

The time at which the definition became available to the local queue manager.

The filter value is the time in the form hh:mm:ss.

**\*CLWLRANK**

Cluster workload rank.

The filter value is the integer rank.

**\*CLWLPRTY**

Cluster workload priority.

The filter value is the integer priority.

**\*CLWLWGHT**

Cluster workload weight.

The filter value is the integer weight.

**\*COMPHDR**

Header compression.

The filter value is one of the following:

**\*NONE**

No header data compression is performed.

**\*SYSTEM**

Header data compression is performed.

**\*COMPMSG**

Message compression.

The filter value is one of the following:

**\*NONE**

No message data compression is performed.

**\*RLE**

Message data compression is performed using RLE.

**\*ZLIBHIGH**

Message data compression is performed using ZLIB compression. A high level of compression is preferred.

**\*ZLIBFAST**

Message data compression is performed using ZLIB compression. A fast compression time is preferred.

**\*ANY**

Any compression technique supported by the queue manager can be used.

**\*CONNAME**

Remote connection name.

The filter value is the connection name string.

**\*CVTMSG**

Whether the message should be converted before transmission.

The filter value is one of the following:

**\*YES**

The application data in the message is converted before sending.

**\*NO**

The application data in the message is not converted before sending.

**\*DFNTYPE**

How the cluster channel was defined.

The filter value is one of the following:

**\*CLUSSDR**

As a cluster-sender channel from an explicit definition.

**\*CLUSSDRA**

As a cluster-sender channel by auto-definition alone.

**\*CLUSSDRB**

As a cluster-sender channel by auto-definition and an explicit definition.

**\*CLUSRCVR**

As a cluster-receiver channel from an explicit definition.

**\*DSCITV**

Disconnect interval in seconds.

The filter value is the integer interval time.

**\*HRTBTINTVL**

Heartbeat interval in seconds.

The filter value is the integer interval time.

**\*KAINT**

Keep alive interval in seconds.

The filter value is the integer interval time.

**\*LOCLADDR**

Local connection name.

The filter value is the connection name string.

**\*LONGRTY**

Long retry count.

The filter value is the integer count.

**\*LONGTMR**

Long retry interval in seconds.

The filter value is the integer interval time.

**\*MAXMSGLEN**

Maximum message length.

The filter value is the integer length.

**\*MCANAME**

Message channel agent name.

The filter value is the agent name.

**\*MCATYPE**

Whether the message channel agent program should run as a thread or process.

The filter value is one of the following:

**\*PROCESS**

The message channel agent runs as a separate process.

**\*THREAD**

The message channel agent runs as a separate thread.

**\*MCAUSRID**

Message channel agent user identifier.

The filter value is the user identifier string.

**\*MONCHL**

Channel Monitoring.

The filter value is one of the following:

**\*QMGR**

The collection of Online Monitoring Data is inherited from the setting of the queue manager attribute MONCHL.

**\*OFF**

Online Monitoring Data collection for this channel is disabled.

**\*LOW**

Monitoring data collection is turned on with a low ratio of data collection.

**\*MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

**\*HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

**\*MSGEXIT**

Message exit name.

The filter value is the exit name.

**\*MSGRTYDATA**

Message retry exit user data.

The filter value is the user data string.

**\*MSGRTYEXIT**

Message retry exit name.

The filter value is the exit name.

**\*MSGRTYITV**

Message retry interval interval in seconds.

The filter value is the integer interval time.

**\*MSGRTYNBR**

Number of message retries.

The filter value is the integer number of retries.

**\*MSGUSRDATA**

Message exit user data.

The filter value is the user data string.

**\*NETPRTY**

Network connection priority in the range 0 through 9.

The filter value is the integer priority value.

**\*NPMSPEED**

Whether the channel supports fast non persistent messages.

The filter value is one of the following:

**\*FAST**

The channel supports fast non persistent messages.

**\*NORMAL**

The channel does not support fast non persistent messages.

**\*PUTAUT**

Whether the user identifier in the context information should be used.

The filter value is one of the following:

**\*DFT**

No authority check is made before the message is put on the destination queue.

**\*CTX**

The user identifier in the message context information is used to establish authority to put the message.

**\*QMID**

The internally generated unique name of the cluster queue manager.

The filter value is the unique name.

**\*QMTYPE**

The function of the cluster queue manager in the cluster.

The filter value is one of the following:

**\*REPOS**

Provides a full repository service.

**\*NORMAL**

Does not provide a full repository service.

**\*RCVEXIT**

Receive exit name.

The filter value is the exit name.

**\*RCVUSRDATA**

Receive exit user data.

The filter value is the user data string.

**\*SCYEXIT**

Security exit name.

The filter value is the exit name.

**\*SCYUSRDATA**

Security exit user data.

The filter value is the user data string.

**\*SEQNUMWRAP**

Maximum message sequence number.

The filter value is the integer sequence number.

**\*SHORTRTY**

Short retry count.

The filter value is the integer count.

**\*SHORTTMR**

short retry interval in seconds.

The filter value is the integer interval time.

**\*SNDEXIT**

Send exit name.

The filter value is the exit name.

**\*SNDUSRDATA**

Send exit user data.

The filter value is the user data string.

**\*SSLCAUTH**

Whether the channel should carry out client authentication over TLS.

The filter value is one of the following:

**\*REQUIRED**

Client authentication is required.

**\*OPTIONAL**

Client authentication is optional.

**\*SSLCIPH**

The CipherSpec using in TLS channel negotiation.

The filter value is the name of the CipherSpec.

**\*SSLPEER**

The X500 peer name used in TLS channel negotiation.

The filter value is the peer name.

**\*STATCHL**

Channel Statistics.

The filter value is one of the following:

**\*QMGR**

The collection of statistics data is inherited from the setting of the queue manager attribute STATCHL.

**\*OFF**

Statistics data collection for this channel is disabled.

**\*LOW**

Statistics data collection is turned on with a low ratio of data collection.

**\*MEDIUM**

Statistics data collection is turned on with a moderate ratio of data collection.

**\*HIGH**

Statistics data collection is turned on with a high ratio of data collection.

**\*STATUS**

The current status of the channel for this cluster queue manager.

The filter value is one of the following:

**\*STARTING**

The channel is waiting to become active.

**\*BINDING**

The channel is performing channel negotiation.

**\*INACTIVE**

The channel is not active.

**\*INITIALIZING**

The channel initiator is attempting to start a channel.

**\*RUNNING**

The channel is either transferring messages, or is waiting for messages to arrive on the transmission queue.

**\*STOPPING**

The channel is stopping, or a close request has been received.

**\*RETRYING**

A previous attempt to establish a connection has failed. The MCA will reattempt connection after the specified time interval.

**\*PAUSED**

The channel is waiting for the message-retry interval to complete before retrying an MQPUT operation.

**\*STOPPED**

The channel has either been manually stopped, or the retry limit has been reached.

**\*REQUESTING**

A local requester channel is requesting services from a remote MCA.

**\*SUSPEND**

Whether this cluster queue manager is suspended from the cluster or not.

The filter value is either \*NO or \*YES.

**\*TEXT**

Descriptive comment.

The filter value is the text description of the channel.

**\*TMQNAME**

Transmission queue name.

The filter value is the name of the queue.

**\*USERID**

Task user identifier.

The filter value is the user identifier string.

**\*XMITQ**

Name of cluster transmission queue.

The filter value is the transmission queue name string.

## Work with MQ Cluster Queues (WRKMQMCLQ)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Work with MQ Cluster Queues (WRKMQMCLQ) command allows you to work with cluster queues that are defined on the local queue manager.

### Parameters

*Table 287. Command parameters*

Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value, *ALL	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2
<u>CLUSTER</u>	Cluster name	Character value, *ALL	Optional, Positional 3

Table 287. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>WHERE</u>	Filter command	Single values: <b>*NONE</b> Other values: <i>Element list</i>	Optional, Positional 4
	Element 1: Filter keyword	*ALTDAT, *ALTTIME, *CLUSDATE, *CLUSQMGR, *CLUSQTYPE, *CLUSTER, *CLUSTIME, *DEFBIND, *DFTMSGPST, *DFTPTY, *PUTENBL, *QMID, *TEXT	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

### Queue name (QNAME)

Specifies the name or names of the cluster queue definitions.

#### **\*ALL**

All cluster queue definitions are selected.

#### **generic-queue-name**

Specify the generic name of the MQ cluster queue definitions. A generic name is a character string followed by an asterisk (\*). For example ABC\*, it selects all cluster queue definitions having names that start with the character string. You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered. You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

#### **queue-name**

Specify the name of the MQ cluster queue definition.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

#### **\*DFT**

Use the default queue manager.

#### **queue-manager-name**

Specify the name of the queue manager.

### Cluster name (CLUSTER)

Specifies the name of the cluster.

#### **\*ALL**

All cluster definitions are selected.

#### **generic-cluster-name**

Specify the generic name of the MQ cluster definitions. A generic name is a character string followed by an asterisk (\*). For example ABC\*, it selects all cluster definitions having names that start with the character string. You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered. You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

**cluster-name**

Specify the name of the MQ cluster definition.

**Filter command (WHERE)**

This parameter can be used to selectively display only those cluster queues with particular cluster queue attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

**\*GT**

Greater than.

Applicable to integer and non-generic string values.

**\*LT**

Less than.

Applicable to integer and non-generic string values

**\*EQ**

Equal to.

Applicable to integer and non-generic string values.

**\*NE**

Not equal to.

Applicable to integer and non-generic string values.

**\*GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

**\*LE**

Less than or equal to.

Applicable to integer and non-generic string values.

**\*LK**

Like.

Applicable to generic string values.

**\*NL**

Not like.

Applicable to generic string values.

**\*CT**

Contains.

Applicable to non-generic list values.

**\*EX**

Excludes.

Applicable to non-generic list values.

**\*CTG**

Contains generic.

Applicable to generic list values.

**\*EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

**\*ALTDATE**

The date on which the definition or information was last altered.

The filter value is the data in the form yyyy-mm-dd.

**\*ALTTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

**\*CLUSDATE**

The date on which the definition became available to the local queue manager.

The filter value is the date in the form yyyy-mm-dd.

**\*CLUSQMGR**

The name of the queue manager that hosts the queue.

The filter value is the name of the queue manager.

**\*CLUSQTYPE**

Cluster queue type.

The filter value is one of the following:

**\*LCL**

The cluster queue represents a local queue.

**\*ALS**

The cluster queue represents an alias queue.

**\*RMT**

The cluster queue represents a remote queue.

**\*MQMALS**

The cluster queue represents a queue manager alias.

**\*CLUSTER**

The name of the cluster that the queue is in.

The filter value is the name of the cluster.

**\*CLUSTIME**

The time at which the definition became available to the local queue manager.

The filter value is the time in the form hh:mm:ss.

**\*DEFBIND**

Default message binding.

The filter value is one of the following:

**\*OPEN**

The queue handle is bound to a specific instance of the cluster queue when the queue is opened.

**\*NOTFIXED**

The queue handle is not bound to any particular instance of the cluster queue.

**\*GROUP**

When the queue is opened, the queue handle is bound to a specific instance of the cluster queue for as long as there are messages in a message group. All messages in a message group are allocated to the same destination instance.

**\*DFTMSGPST**

Default persistence of the messages put on this queue.

The filter value is one of the following:

**\*NO**

Messages on this queue are lost across a restart of the queue manager.

**\*YES**

Messages on this queue survive a restart of the queue manager.

**\*DFTPTY**

Default priority of the messages put on the queue.

The filter value is the integer priority value.

**\*PUTENBL**

Whether applications are permitted to put messages to the queue.

The filter value is one of the following:

**\*NO**

Messages cannot be added to the queue.

**\*YES**

Messages can be added to the queue by authorized applications.

**\*QMID**

Internally generated unique name of the queue manager that hosts the queue.

The filter value is the name of the queue manager.

**\*TEXT**

Descriptive comment.

The filter value is the text description of the queue.

## Work with MQ Connections (WRKMQMCONN)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Work with MQ Connections (WRKMQMCONN) command allows you to work with connection information for applications that are connected to the queue manager.

This enables you to display connection handles and end connections to the queue manager.

### Parameters

<i>Table 288. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>CONN</u>	Connection Identifier	<i>Character value, *ALL</i>	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Table 288. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>WHERE</u>	Filter command	Single values: <b>*NONE</b> Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*APPLDESC, *APPLTAG, *APPTYPE, *CHLNAME, *CONNAME, *PID, *TID, *UOWLOGDA, *UOWLOGTI, *UOWSTDA, *UOWSTTI, *URTYPE, *USERID	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

### Connection Identifier (CONN)

The connection identifiers to work with.

The possible values are:

**\*ALL**

All connection identifiers are selected.

**connection-id**

Specify the name of a specific connection identifier. The connection identifier is a 16 character hex string.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

The name of a message queue manager.

### Filter command (WHERE)

This parameter can be used to selectively display only those queue manager connections with particular connection attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

**\*GT**

Greater than.

Applicable to integer and non-generic string values.

**\*LT**

Less than.

Applicable to integer and non-generic string values

**\*EQ**

Equal to.

Applicable to integer and non-generic string values.

**\*NE**

Not equal to.

Applicable to integer and non-generic string values.

**\*GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

**\*LE**

Less than or equal to.

Applicable to integer and non-generic string values.

**\*LK**

Like.

Applicable to generic string values.

**\*NL**

Not like.

Applicable to generic string values.

**\*CT**

Contains.

Applicable to non-generic list values.

**\*EX**

Excludes.

Applicable to non-generic list values.

**\*CTG**

Contains generic.

Applicable to generic list values.

**\*EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

**\*APPLDESC**

The description of the application connected to the queue manager.

The filter value is the application description string.

**\*APPLTAG**

The tag of the application connected to the queue manager.

The filter value is the application tag string.

**\*APPTYPE**

The type of application connected to the queue manager.

The possible values are:

**\*DEF**

The attribute is unchanged.

**\*CICS**

Represents a CICS/400 application.

**\*UNIX**

Represents a UNIX or Linux application.

**\*OS400**

Represents an IBM i application.

**\*WINDOWS**

Represents a Windows application.

**\*WINDOWS\_NT**

Represents a Windows NT application.

**integer**

User-defined application type in the range 65536 through 999999999.

**\*CHLNAME**

The name of the channel that owns the connection.

The filter value is the channel name.

**\*CONNAME**

The connection name associated with the channel that owns the connection.

The filter value is the connection name.

**\*PID**

The process identifier of the application that is connected to the queue manager.

The filter value is the process identifier integer.

**\*TID**

The thread identifier of the application that is connected to the queue manager.

The filter value is the thread identifier integer.

**\*UOWLOGDA**

The date that the transaction associated with the connection first wrote to the log.

The filter value is the date in the form yyyy-mm-dd.

**\*UOWLOGTI**

The time that the transaction associated with the connection first wrote to the log.

The filter value is the time in the form hh:mm:ss.

**\*UOWSTDA**

The date that the transaction associated with the connection was started.

The filter value is the date in the form yyyy-mm-dd.

**\*UOWSTTI**

The time that the transaction associated with the connection was started.

The filter value is the time in the form hh:mm:ss.

**\*URTYPE**

The type of unit of recovery identifier as seen by the queue manager.

The filter value is one of the following:

**\*QMGR**

A queue manager transaction.

**\*XA**

An externally coordinated transaction. This includes units of work which have been established using IBM i Start Commitment Control (STRCMTCTL).

**\*USERID**

The user identifier associated with the connection.

The filter value is user identifier name.

## Work Queue Manager Journals (WRKMQMJRN)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Work With Queue Manager Journals command (WRKMQMJRN) displays a list of all the journals which are associated with a specific queue manager. This command can be used, for example, to configure remote journaling for a multi-instance queue manager.

### Parameters

Table 289. Command parameters			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 1

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager to work with journals.

#### queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

## Work with MQ Listeners (WRKMQMLSR)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Work with MQ Listener objects (WRKMQMLSR) command allows you to work with listener objects which are defined on the local queue manager.

This enables you to change, copy, create, delete, start, stop & display listener objects display and change authority to an MQ listener object.

This command also enables you to view the current status of all running listeners on the current system.

### Parameters

Table 290. Command parameters			
Keyword	Description	Choices	Notes
<u>OPTION</u>	Option	*STATUS, *OBJECT	Optional, Positional 1
<u>LSRNAME</u>	Listener name	Character value, *ALL	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 3

Table 290. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>WHERE</u>	Filter command	Single values: <b>*NONE</b> Other values: <i>Element list</i>	Optional, Positional 4
	Element 1: Filter keyword	*ALTDATA, *ALTTIME, *BACKLOG, *CONTROL, *IPADDR, *PORT, *TEXT	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

### Option (OPTION)

This option enables you to select whether you want to information on listener status or listener object definitions.

The possible values are:

#### **\*STATUS**

Listener status information is displayed.

The parameters LSRNAME and WHERE are ignored. If MQMNAME is specified only the status of listeners running on the specified queue manager are displayed.

#### **\*OBJECT**

Listener object information is displayed.

### Listener name (LSRNAME)

The name or names of the listener objects.

The possible values are:

#### **\*ALL or \***

All listener objects are selected.

#### **generic-listener-name**

The generic name of the listener objects. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all listener objects having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

#### **listener-name**

Specify the name of a single listener object.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

#### **\*DFT**

Use the default queue manager.

**queue-manager-name**

The name of a message queue manager.

**Filter command (WHERE)**

This parameter can be used to selectively display only those listener objects with particular listener attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

**\*GT**

Greater than.

Applicable to integer and non-generic string values.

**\*LT**

Less than.

Applicable to integer and non-generic string values

**\*EQ**

Equal to.

Applicable to integer and non-generic string values.

**\*NE**

Not equal to.

Applicable to integer and non-generic string values.

**\*GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

**\*LE**

Less than or equal to.

Applicable to integer and non-generic string values.

**\*LK**

Like.

Applicable to generic string values.

**\*NL**

Not like.

Applicable to generic string values.

**\*CT**

Contains.

Applicable to non-generic list values.

**\*EX**

Excludes.

Applicable to non-generic list values.

**\*CTG**

Contains generic.

Applicable to generic list values.

**\*EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

**\*ALTDATE**

The date on which the definition or information was last altered.

The filter value is the date in the form yyyy-mm-dd.

**\*ALTTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

**\*BACKLOG**

The number of concurrent connection requests supported.

The filter value is the integer backlog value.

**\*CONTROL**

Whether the listener is started and stopped with the queue manager.

The filter value is one of the following:

**\*MANUAL**

The listener is not automatically started or stopped.

**\*QMGR**

The listener is started and stopped as the queue manager is started and stopped.

**\*STARTONLY**

The listener is started as the queue manager is started, but is not requested to stop when the queue manager is stopped.

**\*IPADDR**

The local IP Address to be used by the listener.

The filter value is the IP Address.

**\*PORT**

The port number to be used by the listener.

The filter value is the integer port value.

**\*TEXT**

Descriptive comment.

The filter value is the text description of the listener.

## IBM i Work with MQ Messages (WRKMQMSG)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Work with MQ Messages (WRKMQMSG) command lists the messages on a specified local queue and allows you to work with those messages. From the list of messages, you can display the contents of a message and its associated message descriptor (MQMD).

### Parameters

Table 291. Command parameters

Keyword	Description	Choices	Notes
QNAME	Queue name	Character value	Required, Positional 1

Table 291. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2
<u>FIRST</u>	First Message	1-30000, <b>1</b>	Optional, Positional 3
<u>MAXMSG</u>	Maximum number of messages	1-30000, <b>48</b>	Optional, Positional 4
<u>MAXMSGLEN</u>	Maximum message size	128-999999, <b>1024</b>	Optional, Positional 5

### Queue name (QNAME)

Specifies the name of the local queue.

The possible values are:

#### queue-name

Specify the name of the local queue.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

#### \*DFT

Use the default queue manager.

#### queue-manager-name

Specify the name of the queue manager.

### First Message (FIRST)

Specifies the number of the first message to display.

The possible values are:

#### 1

The number of the first message to display is 1.

#### message-number

Specify the number of the first message to display ranging from 1 through 30 000.

### Maximum number of messages (MAXMSG)

Specifies the maximum number of messages to display.

The possible values are:

#### 48

Display a maximum of 48 messages.

#### count-value

Specify a value for the maximum number of messages to display ranging from 1 through 30 000.

### Maximum message size (MAXMSGLEN)

Specifies the maximum size of message data to display.

The size of a message, greater than the value specified, is suffixed by a plus (+) character to indicate that the message data is truncated.

The possible values are:

**1024**

The size of the message data is 1024 bytes.

**length-value**

Specify a value ranging from 128 through 999999.

**IBM i Work with MQ Namelist (WRKMQMNL)**

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Work with MQ Namelists (WRKMQMNL) command allows you to work with multiple namelist definitions that are defined on the local queue manager. This enables you to copy, change, display, delete, display authority and edit authority of an MQ namelist object.

**Parameters**

Table 292. Command parameters

Keyword	Description	Choices	Notes
<u>NAMELIST</u>	Namelist	Character value, <b>*ALL</b>	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2
<u>WHERE</u>	Filter command	Single values: <b>*NONE</b> Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*ALTDATA, *ALTTIME, *NAMECNT, *NAMES, *TEXT	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

**Namelist (NAMELIST)**

Specifies the name or names of the namelists.

The possible values are:

**\*ALL**

All namelist definitions are selected.

**generic-namelist-name**

Specify the generic name of the MQ namelists. A generic name is a character string followed by an asterisk (\*). For example ABC\*, it selects all namelists having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

**namelist-name**

Specify the name of the MQ namelist.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

The default queue manager is used.

**message-queue-manager-name**

Specify the name of the queue manager.

**Filter command (WHERE)**

This parameter can be used to selectively display only those namelists with particular namelist attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

**\*GT**

Greater than.

Applicable to integer and non-generic string values.

**\*LT**

Less than.

Applicable to integer and non-generic string values

**\*EQ**

Equal to.

Applicable to integer and non-generic string values.

**\*NE**

Not equal to.

Applicable to integer and non-generic string values.

**\*GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

**\*LE**

Less than or equal to.

Applicable to integer and non-generic string values.

**\*LK**

Like.

Applicable to generic string values.

**\*NL**

Not like.

Applicable to generic string values.

**\*CT**

Contains.

Applicable to non-generic list values.

**\*EX**

Excludes.

Applicable to non-generic list values.

**\*CTG**

Contains generic.

Applicable to generic list values.

**\*EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

**\*ALTDATE**

The date on which the definition or information was last altered.

The filter value is the date in the form yyyy-mm-dd.

**\*ALTTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

**\*NAMECNT**

The number of names in the namelist.

The filter value is the integer number of names.

**\*NAMES**

The names in the namelist.

The filter value is the string name.

**\*TEXT**

Descriptive comment.

The filter value is the text description of the queue.

IBM i

## Work with MQ Processes (WRKMQMPRC)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Work with MQ Processes (WRKMQMPRC) command allows you to work with multiple process definitions that are defined on the local queue manager. This enables you to copy, change, display, delete, display authority, and edit authority of an MQ process object.

### Parameters

<i>Table 293. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>PRCNAME</u>	Process name	<i>Character value</i> , <b>*ALL</b>	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 2

Table 293. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>WHERE</u>	Filter command	Single values: <b>*NONE</b> Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*ALTDATA, *ALTTIME, *APPID, *APPTYPE, *ENVDATA, *TEXT, *USRDATA	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

### Process name (PRCNAME)

Specifies the name or names of the process definitions.

The possible values are:

#### **\*ALL**

All process definitions are selected.

#### **generic-process-name**

Specify the generic name of the MQ process definitions. A generic name is a character string followed by an asterisk (\*). For example ABC\*, it selects all process definitions having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

#### **process-name**

Specify the name of the MQ process definition.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

#### **\*DFT**

Use the default queue manager.

#### **queue-manager-name**

The name of a message queue manager.

### Filter command (WHERE)

This parameter can be used to selectively display only those processes with particular process attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

#### **\*GT**

Greater than.

Applicable to integer and non-generic string values.

**\*LT**

Less than.

Applicable to integer and non-generic string values

**\*EQ**

Equal to.

Applicable to integer and non-generic string values.

**\*NE**

Not equal to.

Applicable to integer and non-generic string values.

**\*GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

**\*LE**

Less than or equal to.

Applicable to integer and non-generic string values.

**\*LK**

Like.

Applicable to generic string values.

**\*NL**

Not like.

Applicable to generic string values.

**\*CT**

Contains.

Applicable to non-generic list values.

**\*EX**

Excludes.

Applicable to non-generic list values.

**\*CTG**

Contains generic.

Applicable to generic list values.

**\*EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

**\*ALTDATE**

The date on which the definition or information was last altered.

The filter value is the date in the form yyyy-mm-dd.

**\*ALLTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

**\*APPID**

The name of the application to start.

The filter value is the name of the application.

**\*APPTYPE**

The type of application connected to the queue manager.

The possible values are:

**\*DEF**

The attribute is unchanged.

**\*CICS**

Represents a CICS/400 application.

**\*UNIX**

Represents a UNIX or Linux application.

**\*OS400**

Represents an IBM i application.

**\*WINDOWS**

Represents a Windows application.

**\*WINDOWS\_NT**

Represents a Windows NT application.

**integer**

User-defined application type in the range 65536 through 999999999.

**\*ENVDATA**

Environment data pertaining to the application.

The filter value is the environment data.

**\*TEXT**

Descriptive comment.

The filter value is the text description of the queue.

**\*USRDATA**

User data pertaining to the application.

The filter value is the user data.

**IBM i Work with MQ Queues (WRKMQM)**

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Work with MQ Queues (WRKMQM) command provides the function to work with multiple queues that are defined on the local queue manager. Using this command you can copy, change, display, delete, display authority and edit authority of an MQ Queue object.

**Parameters**

Table 294. Command parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value, *ALL	Optional, Positional 1
<u>QTYPE</u>	Queue type	*ALL, *ALS, *LCL, *MDL, *RMT	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 3

Table 294. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>CLUSTER</u>	Cluster name	Character value, <b>*ALL</b>	Optional, Positional 4
<u>CLUSNL</u>	Cluster namelist name	Character value, <b>*ALL</b>	Optional, Positional 5
<u>WHERE</u>	Filter command	Single values: <b>*NONE</b> Other values: <i>Element list</i>	Optional, Positional 6
	Element 1: Filter keyword	*ACCTQ, *ALTDATE, *ALTTIME, *BKTTHLD, *BKTQNAME, *CLUSDATE, *CLUSNL, *CLUSQMGR, *CLUSQTYPE, *CLUSTER, *CLUSTIME, *CLWLPRTY, *CLWLRANK, *CLWLUSEQ, *CRDATE, *CRTIME, *CURDEPTH, *DEFBIND, *DFTPUTRESP, *DFNTYPE, *DFTMSGPST, *DFTPTY, *DFTSHARE, *DISTLIST, *FULLEVT, *GETDATE, *GETENBL, *GETTIME, *HDNBKTCNT, *HIGHEVT, *HIGHTHLD, *INITQNAME, *IPPROCS, *JOBS, *LOWEVT, *LOWTHLD, *MAXDEPTH, *MAXMSGLEN, *MEDIAREC, *MONQ, *MSGAGE, *MSGDLYSEQ, *MSGREADAHD, *NPMCLASS, *OPPROCS, *PRCNAME, *PROPCTL, *PUTDATE, *PUTENBL, *PUTTIME, *QMID, *QTYPE, *RMTMQMNAME, *RMTQNAME, *RTNITV, *SHARE, *SRVEVT, *SRVITV, *STATQ, *TARGTYPE, *TEXT, *TGTQNAME, *TMQNAME, *TRGDATA, *TRGDEPTH, *TRGENBL, *TRGMSGPTY, *TRGTYPE, *UNCOM, *USAGE	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
Element 3: Filter value	Character value		

### Queue name (QNAME)

The name or names of the queues to be selected. The queues selected by this parameter can be further limited to a particular type, if the QTYPE keyword is specified.

The possible values are:

**\*ALL**

All queues are selected.

**generic-queue-name**

Specify the generic name of the queues to be selected. A generic name is a character string, followed by an asterisk (\*). For example ABC\*, it selects all queues having names that start with the character string.

Specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

**queue-name**

Specify the name of the queue.

## Queue type (QTYPE)

This parameter can be specified to limit the queues that are displayed to a particular type.

The possible values are:

**\*ALL**

All queue types.

**\*ALS**

Alias queues.

**\*LCL**

Local queues.

**\*MDL**

Model queues.

**\*RMT**

Remote queues.

## Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager.

## Cluster name (CLUSTER)

This parameter can be specified to limit the queues that are displayed to be members of a particular cluster.

The possible values are:

**\*ALL**

All clusters.

**generic-cluster-name**

The generic name of a cluster.

**cluster-name**

The name of a cluster.

## Cluster namelist name (CLUSNL)

This parameter can be specified to limit the queues that are displayed to be members of clusters within a cluster namelist.

The possible values are:

### **\*ALL**

All cluster namelists.

### **generic-cluster-namelist-name**

The generic name of a cluster namelist.

### **cluster-namelist-name**

The name of a cluster namelist.

## Filter command (WHERE)

This parameter can be used to selectively display only those queues with particular queue attributes.

The parameter takes three arguments, a keyword, an operator, and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

### **\*GT**

Greater than.

Applicable to integer and non-generic string values.

### **\*LT**

Less than.

Applicable to integer and non-generic string values

### **\*EQ**

Equal to.

Applicable to integer and non-generic string values.

### **\*NE**

Not equal to.

Applicable to integer and non-generic string values.

### **\*GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

### **\*LE**

Less than or equal to.

Applicable to integer and non-generic string values.

### **\*LK**

Like.

Applicable to generic string values.

### **\*NL**

Not like.

Applicable to generic string values.

### **\*CT**

Contains.

Applicable to non-generic list values.

**\*EX**

Excludes.

Applicable to non-generic list values.

**\*CTG**

Contains generic.

Applicable to generic list values.

**\*EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

**\*ACCTQ**

Queue Accounting.

The filter value is one of the following values:

**\*QMGR**

Accounting data collection is based upon the setting of the queue manager attribute ACCTQ.

**\*OFF**

Accounting data collection for this queue is disabled.

**\*ON**

Accounting data collection is enabled for this queue.

**\*ALTDATE**

The date on which the definition or information was last altered.

The filter value is the data in the form yyyy-mm-dd.

**\*ALTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

**\*BKTTHLD**

Backout threshold.

The filter value is the integer threshold value.

**\*BKTQNAME**

Backout requeue name.

The filter value is the name of the queue.

**\*CLUSDATE**

The date on which the definition became available to the local queue manager.

The filter value is the date in the form yyyy-mm-dd.

**\*CLUSNL**

The namelist that defines the clusters that the queue is in.

The filter value is the name of the namelist.

**\*CLUSQMGR**

The name of the queue manager that hosts the queue.

The filter value is the name of the queue manager.

**\*CLUSQTYPE**

Cluster queue type.

The filter value is one of the following values:

- \*LCL**  
The cluster queue represents a local queue.
- \*ALS**  
The cluster queue represents an alias queue.
- \*RMT**  
The cluster queue represents a remote queue.
- \*MQMALS**  
The cluster queue represents a queue manager alias.
- \*CLUSTER**  
The name of the cluster that the queue is in.  
The filter value is the name of the cluster.
- \*CLUSTIME**  
The time at which the definition became available to the local queue manager.  
The filter value is the time in the form hh:mm:ss.
- \*CLWLPRTY**  
Cluster workload priority.  
The filter value is the integer priority.
- \*CLWLANK**  
Cluster workload rank.  
The filter value is the integer rank.
- \*CLWLUSEQ**  
Cluster workload queue use.  
The filter value is one of the following values:
  - \*QMGR**  
The value is inherited from the Queue Manager CLWLUSEQ attribute.
- \*LOCAL**  
The local queue is the sole target of the MQPUT.
- \*ANY**  
The queue manager treats such a local queue as another instance of the cluster queue for the purposes of workload distribution.
- \*CRDATE**  
The date on which the queue was created.  
The filter value is the date in the form yyyy-mm-dd.
- \*CRTIME**  
The time at which the queue was created.  
The filter value is the time in the form hh:mm:ss.
- \*CURDEPTH**  
Current depth of queue.  
The filter value is the integer depth value.
- \*DEFBIND**  
Default message binding.  
The filter value is one of the following values:
  - \*OPEN**  
The queue handle is bound to a specific instance of the cluster queue when the queue is opened.
- \*NOTFIXED**  
The queue handle is not bound to any instance of the cluster queue.

**\*GROUP**

When the queue is opened, the queue handle is bound to a specific instance of the cluster queue for as long as there are messages in a message group. All messages in a message group are allocated to the same destination instance.

**\*DFTPUTRESP**

Default Put Response.

The filter value is one of the following values:

**\*SYNC**

The put operation is issued synchronously.

**\*ASYNC**

The put operation is issued asynchronously.

**\*DFNTYPE**

Queue definition type.

The filter value is one of the following values:

**\*PREDEF**

Predefined queue.

**\*PERMDYN**

Permanent dynamic queue.

**\*TEMPDYN**

Temporary dynamic queue.

**\*DFTMSGPST**

Default persistence of the messages put on this queue.

The filter value is one of the following values:

**\*NO**

Messages on this queue are lost across a restart of the queue manager.

**\*YES**

Messages on this queue survive a restart of the queue manager.

**\*DFTPTY**

Default priority of the messages put on the queue.

The filter value is the integer priority value.

**\*DFTSHARE**

Default share option on a queue opened for input.

The filter value is one of the following values:

**\*NO**

The open request is for exclusive input from the queue.

**\*YES**

The open request is for shared input from the queue.

**\*DISTLIST**

Whether distribution lists are supported by the partner queue manager.

The filter value is one of the following values:

**\*NO**

Distribution lists are not supported by the partner queue manager.

**\*YES**

Distribution lists are supported by the partner queue manager.

**\*FULLEVT**

Whether Queue Depth Full events are generated.

The filter value is one of the following values:

**\*NO**

Queue Depth Full events are not generated.

**\*YES**

Queue Depth Full events are generated.

**\*GETDATE**

The date on which the last message was got from the queue since queue manager start. This field is only present when Queue Monitoring is not set to \*OFF.

The filter value is the data in the form yyyy-mm-dd.

**\*GETENBL**

Whether applications are permitted to get messages from the queue.

The filter value is one of the following values:

**\*NO**

Applications cannot retrieve messages from the queue.

**\*YES**

Authorized applications can retrieve messages from the queue.

**\*GETTIME**

The time at which the last message was got from the queue since queue manager start. This field is only present when Queue Monitoring is not set to \*OFF.

The filter value is the time in the form hh:mm:ss.

**\*HDNBKTCNT**

Whether the backout count is hardened.

The filter value is one of the following values:

**\*NO**

The backout count is not hardened.

**\*YES**

The backout count is hardened.

**\*HIGHEVT**

Whether Queue Depth High events are generated.

The filter value is one of the following values:

**\*NO**

Queue Depth High events are not generated.

**\*YES**

Queue Depth High events are generated.

**\*HIGHTHLD**

Queue Depth High event generation threshold.

The filter value is the integer threshold value.

**\*INITQNAME**

Initiation queue.

The filter value is the name of the queue.

**\*IPPROCS**

Number of handles indicating that the queue is open for input.

The filter value is the integer number of handles.

**\*JOBS**

The current number of jobs that have the queue open.

The filter value is the integer number of jobs.

**\*LOWEVT**

Whether Queue Depth Low events are generated.

The filter value is one of the following values:

**\*NO**

Queue Depth Low events are not generated.

**\*YES**

Queue Depth Low events are generated.

**\*LOWTHLD**

Queue Depth Low event generation threshold.

The filter value is the integer threshold value.

**\*MAXDEPTH**

Maximum depth of queue.

The filter value is the integer number of messages.

**\*MAXMSGLEN**

Maximum message length.

The filter value is the integer message length.

**\*MEDIAREC**

The journal receiver containing the last media recovery image. This field is only present for local queues.

The filter value is the journal receiver string.

**\*MONQ**

Online Monitoring Data.

The filter value is one of the following values:

**\*QMGR**

The collection of Online Monitoring Data is inherited from the setting of the queue manager attribute MONQ.

**\*OFF**

Online Monitoring Data collection for this queue is disabled.

**\*LOW**

Monitoring data collection is turned on with a low ratio of data collection.

**\*MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

**\*HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

**\*MSGAGE**

The age in seconds of the oldest message on the Queue. This field is only present when Queue Monitoring is not set to \*OFF.

The filter value is the integer message age.

**\*MSGDLYSEQ**

Message delivery sequence.

The filter value is one of the following values:

**\*PTY**

Messages are delivered in FIFO order within priority.

**\*FIFO**

Messages are delivered in FIFO order regardless of priority.

**\*NPMCLASS**

Non-persistent message class.

The filter value is one of the following values:

**\*NORMAL**

Non-persistent message class is normal.

**\*HIGH**

Non-persistent message class is high.

**\*MSGREADAHD**

Message read ahead.

The filter value is one of the following values:

**\*DISABLED**

Read ahead is disabled.

**\*NO**

Non-persistent messages are not sent to the client ahead of an application requesting them.

**\*YES**

Non-persistent messages are sent to the client ahead of an application requesting them.

**\*OPPROCS**

Number of handles indicating that the queue is open for output.

The filter value is the integer number of handles.

**\*PRCNAME**

Process name.

The filter value is the name of the process.

**\*PROPCTL**

Message Property Control.

The filter value is one of the following values:

**\*COMPAT**

Compatibility mode

**\*NONE**

No properties are returned to the application.

**\*ALL**

All properties are returned to the application.

**\*FORCE**

Properties are returned to the application in one or more MQRFH2 headers.

**\*V6COMPAT**

An MQRFH2 header is returned formatted as it was sent. Its code page and encoding might be altered. If the message is a publication it might have a psc folder inserted into its contents.

**\*PUTDATE**

The date on which the last message was put to the queue since queue manager start. This field is only present when Queue Monitoring is not set to \*OFF.

The filter value is the data in the form yyyy-mm-dd.

**\*PUTENBL**

Whether applications are permitted to put messages to the queue.

The filter value is one of the following values:

**\*NO**

Messages cannot be added to the queue.

**\*YES**

Messages can be added to the queue by authorized applications.

**\*PUTTIME**

The time at which the last message was put to the queue since queue manager start. This field is only present when Queue Monitoring is not set to \*OFF.

The filter value is the time in the form hh:mm:ss.

**\*QMID**

Internally generated unique name of the queue manager that hosts the queue.

The filter value is the name of the queue manager.

**\*QTYPE**

Queue type.

The filter value is one of the following values:

**\*LCL**

Local queue.

**\*ALS**

Alias queue.

**\*RMT**

Remote queue.

**\*MDL**

Model queue.

**\*RMTMQMNAME**

Remote queue manager name.

The filter value is the name of the queue manager.

**\*RMTQNAME**

Name of the local queue, as known by the remote queue manager.

The filter value is the name of the queue.

**\*RTNITV**

Retention interval.

The filter value is the integer interval value.

**\*SHARE**

Whether the queue can be shared.

The filter value is one of the following values:

**\*NO**

Only a single application instance can open the queue for input.

**\*YES**

More than one application instance can open the queue for input.

**\*SRVEVT**

Whether service interval events are generated.

The filter value is one of the following values:

**\*HIGH**

Service Interval High events are generated.

**\*OK**

Service Interval OK events are generated.

**\*NONE**

No service interval events are generated.

**\*SRVITV**

Service interval event generation threshold.

The filter value is the integer threshold value.

**\*STATQ**

Statistics data.

The filter value is one of the following values:

**\*QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATQ.

**\*OFF**

Statistics data collection for this queue is disabled.

**\*ON**

Statistics data collection is enabled for this queue.

**\*TARGTYPE**

Target Type.

The filter value is one of the following values:

**\*QUEUE**

Queue object.

**\*TOPIC**

Topic object.

**\*TEXT**

Descriptive comment.

The filter value is the text description of the queue.

**\*TGTQNAME**

Target queue for which this queue is an alias.

The filter value is the name of the queue.

**\*TMQNAME**

Transmission queue name.

The filter value is the name of the queue.

**\*TRGDATA**

Trigger data.

The filter value is the text of the trigger message.

**\*TRGDEPTH**

Trigger depth.

The filter value is the integer number of messages.

**\*TRGENBL**

Whether triggering is enabled.

The filter value is one of the following values:

**\*NO**

Triggering is not enabled.

**\*YES**

Triggering is enabled.

**\*TRGMSGPTY**

Threshold message priority for triggers.

The filter value is the integer priority value.

**\*TRGTYPE**

Trigger type.

The filter value is one of the following values:

**\*FIRST**

When the number of messages on the queue goes from 0 to 1.

**\*ALL**

Every time a message arrives on the queue.

**\*DEPTH**

When the number of messages on the queue equals the value of the TRGDEPTH attribute.

**\*NONE**

No trigger messages are written.

**\*UNCOM**

The number of uncommitted changes pending for the queue.

The filter value is one of the following values:

**\*NO**

There are no uncommitted changes pending.

**\*YES**

There are uncommitted changes pending.

**\*USAGE**

Whether the queue is a transmission queue.

The filter value is one of the following values:

**\*NORMAL**

The queue is not a transmission queue.

**\*TMQ**

The queue is a transmission queue.

## Work with Queue Status (WRKMQMSTS)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Work with Queue Status (WRKMQMSTS) command lists the jobs which have an IBM MQ queue currently open. The command allows you to determine what options a queue was opened with and also allows you to check to see which channels and connections have a queue open.

### Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 1
<u>QNAME</u>	Queue name	Character value	Optional, Positional 2

Table 295. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>WHERE</u>	Filter command	Single values: <b>*NONE</b> Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*APPLDESC, *APPLTAG, *BROWSE, *CHLNAME, *CONNAME, *INPUT, *INQUIRE, *JOB, *OUTPUT, *SET, *URTYPE	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager.

### Queue name (QNAME)

Specifies the name of the local queue.

The possible values are:

**queue-name**

Specify the name of the local queue.

### Filter command (WHERE)

This parameter can be used to selectively display only the jobs with particular attributes that have the queue open.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

**\*GT**

Greater than.

Applicable to integer and non-generic string values.

**\*LT**

Less than.

Applicable to integer and non-generic string values

**\*EQ**

Equal to.

Applicable to integer and non-generic string values.

**\*NE**

Not equal to.

Applicable to integer and non-generic string values.

**\*GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

**\*LE**

Less than or equal to.

Applicable to integer and non-generic string values.

**\*LK**

Like.

Applicable to generic string values.

**\*NL**

Not like.

Applicable to generic string values.

**\*CT**

Contains.

Applicable to non-generic list values.

**\*EX**

Excludes.

Applicable to non-generic list values.

**\*CTG**

Contains generic.

Applicable to generic list values.

**\*EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

**\*APPLDESC**

The description of the application which has the queue open.

The filter value is the application description string.

**\*APPLTAG**

The tag of the application which has the queue open.

The filter value is the application tag string.

**\*BROWSE**

Whether the job has the queue open for browsing.

The filter value is either \*NO or \*YES.

**\*CHLNAME**

The name of the channel which has the queue open.

The filter value is the channel name.

**\*CONNAME**

The connection name of the channel which has the queue open.

The filter value is the connection name.

**\*INPUT**

Whether the job has the queue open for input.

The filter value is one of the following:

**\*NO**

The job does not have the queue open for input.

**\*SHARED**

The job has the queue open for shared input.

**\*EXCL**

The job has the queue open for exclusive input.

**\*INQUIRE**

Whether the job has the queue open for inquiry.

The filter value is either \*NO or \*YES.

**\*JOB**

The name of the job which has the queue open.

The filter value is the job name.

**\*OUTPUT**

Whether the job has the queue open for output.

The filter value is either \*NO or \*YES.

**\*SET**

Whether the job has the queue open for set.

The filter value is either \*NO or \*YES.

**\*URTYPE**

The type of unit of work recovery identifier.

The filter value is one of the following:

**\*QMGR**

Queue manager unit of work recovery identifier.

**\*XA**

XA unit of work recovery identifier.

 IBM i

## Work with MQM Security Policies (WRKMQMSPL)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Work with MQM Security Policies (WRKMQMSPL) command lists all security policies for a queue manager.

Security Policies are used by Advanced Message Security to control how messages should be protected when being put, browsed, or destructively removed from queues.

Additionally, [DSPMQM](#) displays whether security policies are enabled for the queue manager. Note that the Advanced Message Security license must be installed when the queue manager was started for this to occur.

## Parameters

Keyword	Description	Choices	Notes
<u>OUTPUT</u>	Output	<b>*</b> , *PRINT	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 2

### Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

**\***

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

**\*PRINT**

A detailed list of the users and their authorities registered with the selected authority profile record is printed with the job's spooled output.

### Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

**\*DFT**

Use the default queue manager.

**queue-manager-name**

Specify the name of the queue manager.

IBM i

## Work with MQ Subscriptions (WRKMQMSUB)

### Where allowed to run

All environments (\*ALL)

### Threadsafe

Yes

The Work with MQ Subscriptions (WRKMQMSUB) command allows you to work with multiple subscriptions that are defined on the local queue manager. This enables you to copy, change, display and delete IBM MQ subscriptions.

## Parameters

Keyword	Description	Choices	Notes
<u>SUBNAME</u>	Subscription name	<i>Character value</i> , <b>*ALL</b>	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 2

Table 297. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>WHERE</u>	Filter command	Single values: <b>*NONE</b> Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*DEST, *DESTCLASS, *DESTCRLID, *DESTMQM, *EXPIRY, *PSPROP, *PUBACCT, *PUBAPPID, *PUBPTY, *REQONLY, *SELECTOR, *SELTYPE, *SUBSCOPE, *SUBID, *TOPICOBJ, *TOPICSTR, *USERDATA, *VARUSER, *WSHEMA	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

### Subscription name (SUBNAME)

Specifies the name or names of the subscriptions.

The possible values are:

#### **\*ALL**

All subscriptions are selected.

#### **generic-subscription-name**

Specify the generic name of the MQ subscriptions. A generic name is a character string followed by an asterisk (\*). For example ABC\*, it selects all subscriptions having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

#### **subscription-name**

Specify the name of the MQ subscription.

### Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

#### **\*DFT**

Use the default Queue Manager.

#### **queue-manager-name**

The name of a Queue Manager.

### Filter command (WHERE)

This parameter can be used to selectively display only those subscriptions with particular subscription attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

**\*GT**

Greater than.

Applicable to integer and non-generic string values.

**\*LT**

Less than.

Applicable to integer and non-generic string values

**\*EQ**

Equal to.

Applicable to integer and non-generic string values.

**\*NE**

Not equal to.

Applicable to integer and non-generic string values.

**\*GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

**\*LE**

Less than or equal to.

Applicable to integer and non-generic string values.

**\*LK**

Like.

Applicable to generic string values.

**\*NL**

Not like.

Applicable to generic string values.

**\*CT**

Contains.

Applicable to non-generic list values.

**\*EX**

Excludes.

Applicable to non-generic list values.

**\*CTG**

Contains generic.

Applicable to generic list values.

**\*EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

**\*DEST**

The destination queue for messages published to this subscription.

The filter value is the name of the queue.

**\*DESTCLASS**

Specifies whether this is a managed subscription.

The filter value is one of the following:

**\*MANAGED**

The destination is managed.

**\*PROVIDED**

The destination is a queue.

**\*DESTRRLID**

The correlation identifier for messages published to this subscription.

The filter value is the 48 character hexadecimal string representing the 24 byte correlation identifier.

**\*DESTMQM**

The destination queue manager for messages published to this subscription.

The filter value is the name of the queue manager.

**\*EXPIRY**

The expiry time of the subscription.

The filter value is the integer expiry time.

**\*PSPROP**

The manner in which publish / subscribe related message properties are added to messages sent to this subscription.

The filter value is one of the following:

**\*NONE**

Publish / subscribe properties are not added to the message.

**\*COMPAT**

Publish / subscribe properties are added to the message to maintain compatibility with V6  
Publish / Subscribe.

**\*RFH2**

Publish / subscribe properties are added to the message within an RFH 2 header.

**\*PUBACCT**

The accounting token for messages published to this subscription.

The filter value is the 64 character hexadecimal string representing the 32 byte publish accounting token.

**\*PUBAPPID**

The publish application identity for messages published to this subscription.

The filter value is the publish application identifier.

**\*PUBPTY**

The priority of the message sent to this subscription.

The filter value is the integer priority.

**\*REQONLY**

Whether the subscriber will poll for updates via MQSUBRQ API, or whether all publications are delivered to this subscription.

The filter value is one of the following:

**\*YES**

Publications are only delivered to this subscription in response to an MQSUBRQ API.

**\*NO**

All publications on the topic are delivered to this subscription.

**\*SELECTOR**

The SQL 92 selector string to be applied to messages published on the named topic to select whether they are eligible for this subscription.

The filter value is the selector string.

**\*SELTYPE**

The type of SQL 92 selector string that has been specified.

The filter value is one of the following:

**\*NONE**

No selector has been specified.

**\*STANDARD**

A selector string has been specified that only references properties of the message and uses the standard selector syntax.

**\*EXTENDED**

A selector string has been specified that uses extended selectors syntax, typically by referencing the content of the message. Selector strings of this type cannot be handled internally by the queue manager; the use of extended message selectors can only be handled by another program, such as IBM Integration Bus.

**\*SUBSCOPE**

Determines whether this subscription is forwarded to other queue managers, so that the subscriber receives messages published at those other queue managers.

The filter value is one of the following:

**\*ALL**

The subscription is forwarded to all queue managers directly connected through a publish/subscribe collective or hierarchy.

**\*QMGR**

The subscription forwards messages published on the topic only within this queue manager.

**Note:** Individual subscribers can only restrict **SUBSCOPE**. If the parameter is set to ALL at topic level, then an individual subscriber can restrict it to QMGR for this subscription. However, if the parameter is set to QMGR at topic level, then setting an individual subscriber to ALL has no effect.

**\*SUBID**

The subscription identifier associated with the subscription.

The filter value is the 48 character hexadecimal string representing the 24 byte subscription identifier.

**\*TOPICOBJ**

The topic object associated with the subscription.

The filter value is the name of the topic object.

**\*TOPICSTR**

The topic string associated with the subscription.

The filter value is the topic string.

**\*USERDATA**

The user data associated with the subscription.

The filter value is the user data.

**\*VARUSER**

Whether user profiles other than the creator of the subscription can connect to it.

The filter value is one of the following:

**\*ANY**

Any user profiles can connect to the subscription.

**\*FIXED**

Only the user profile that created the subscription can connect to it.

**\*WSHEMA**

The schema to be used when interpreting wildcard characters in the topic string.

The filter value is one of the following:

**\*TOPIC**

Wildcard characters represent portions of the topic hierarchy.

**\*CHAR**

Wildcard characters represent portions of strings.

## Work with MQ Service object (WRKMQMSVC)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Work with MQ Service objects (WRKMQMSVC) command allows you to work with multiple service objects that are defined on the local queue manager.

This enables you to start, stop, change, copy, create, delete, display, and display and change authority to an MQ service object.

### Parameters

<i>Table 298. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>SVCNAME</u>	Service name	<i>Character value</i> , <b>*ALL</b>	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 2
<u>WHERE</u>	Filter command	Single values: <b>*NONE</b> Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*ALTDATA, *ALTTIME, *CONTROL, *ENDARG, *ENDCMD, *STDERR, *STDOUT, *STRARG, *STRCMD, *TEXT, *TYPE	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

### Service name (SVCNAME)

The name or names of the service objects.

The possible values are:

**\*ALL or \***

All service objects are selected.

**generic-service-name**

The generic name of the service objects. A generic name is a character string followed by an asterisk (\*). For example ABC\*, it selects all service objects having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

**service-name**

Specify the name of a single service object.

**Message Queue Manager name (MQMNAME)**

Specifies the name of the queue manager.

The possible values are:

**\*DFT**

Use the default queue manager.

**queue-manager-name**

The name of a message queue manager.

**Filter command (WHERE)**

This parameter can be used to selectively display only those service objects with particular service attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

**\*GT**

Greater than.

Applicable to integer and non-generic string values.

**\*LT**

Less than.

Applicable to integer and non-generic string values

**\*EQ**

Equal to.

Applicable to integer and non-generic string values.

**\*NE**

Not equal to.

Applicable to integer and non-generic string values.

**\*GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

**\*LE**

Less than or equal to.

Applicable to integer and non-generic string values.

**\*LK**

Like.

Applicable to generic string values.

**\*NL**

Not like.

Applicable to generic string values.

**\*CT**

Contains.

Applicable to non-generic list values.

**\*EX**

Excludes.

Applicable to non-generic list values.

**\*CTG**

Contains generic.

Applicable to generic list values.

**\*EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

**\*ALTDATE**

The date on which the definition or information was last altered.

The filter value is the date in the form yyyy-mm-dd.

**\*ALLTIME**

The time at which the definition or information was last altered.

The filter value is the time in the form hh:mm:ss.

**\*CONTROL**

Whether the service is started and stopped with the queue manager.

The filter value is one of the following:

**\*MANUAL**

The service is not automatically started or stopped.

**\*QMGR**

The service is started and stopped as the queue manager is started and stopped.

**\*STARTONLY**

The service is started as the queue manager is started, is not be requested to stop when the queue manager is stopped.

**\*ENDARG**

The arguments passed to the end program when the service is requested to stop.

The filter value is the arguments string.

**\*ENDCMD**

The name of the executable to run when the service is requested to stop.

The filter value is the program name string.

**\*STDERR**

The standard error path.

The filter value is the path name.

**\*STDOUT**

The standard output path.

The filter value is the path name.

**\*STRARG**

The arguments passed to the program at startup.

The filter value is the arguments string.

**\*STRCMD**

The name of the program to run.

The filter value is the program name string.

**\*TEXT**

Descriptive comment.

The filter value is the text description of the service.

**\*TYPE**

Mode in which to run service.

The filter value is one of the following:

**\*CMD**

When started the command is executed but no status is collected or displayed.

**\*SVR**

The status of the executable started is monitored and displayed.

**IBM i Work with MQ Topics (WRKMQMTOP)**

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The Work with MQ Topics (WRKMQMTOP) command allows you to work with multiple topic objects that are defined on the local queue manager. This enables you to copy, change, display, delete, display authority, edit authority, record and recover an MQ topic object.

**Parameters**

<i>Table 299. Command parameters</i>			
<b>Keyword</b>	<b>Description</b>	<b>Choices</b>	<b>Notes</b>
<u>TOPNAME</u>	Topic name	Character value, <b>*ALL</b>	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, <b>*DFT</b>	Optional, Positional 2
<u>WHERE</u>	Filter command	Single values: <b>*NONE</b> Other values: <i>Element list</i>	Optional, Positional 3
	Element 1: Filter keyword	*ALTDAT, *ALTTIME, *DFTMSGPST, *DFTPTY, *DFTPUTRESP, *DURSUB, *MGDDURMDL, *MGDNDURMDL, *NPMSGDLV, *PMSGDLV, *PUBENBL, *SUBENBL, *TEXT, *TOPNAME, *TOPICSTR, *WILDCARD	
	Element 2: Filter operator	*GT, *LT, *EQ, *NE, *GE, *LE, *LK, *NL, *CT, *EX, *CTG, *EXG	
	Element 3: Filter value	Character value	

## Topic name (TOPNAME)

Specifies the name or names of the topic objects.

The possible values are:

### **\*ALL**

All topic objects are selected.

### **generic-topic-name**

Specify the generic name of the MQ topic objects. A generic name is a character string followed by an asterisk (\*). For example ABC\*, it selects all topic objects having names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

### **topic-name**

Specify the name of the MQ topic object.

## Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

### **\*DFT**

Use the default Queue Manager.

### **queue-manager-name**

The name of a Queue Manager.

## Filter command (WHERE)

This parameter can be used to selectively display only those topics with particular topic attributes.

The parameter takes three arguments, a keyword, an operator and a value.

Generic strings are allowed for values which are names.

The operator can take one of the following values:

### **\*GT**

Greater than.

Applicable to integer and non-generic string values.

### **\*LT**

Less than.

Applicable to integer and non-generic string values

### **\*EQ**

Equal to.

Applicable to integer and non-generic string values.

### **\*NE**

Not equal to.

Applicable to integer and non-generic string values.

### **\*GE**

Greater than or equal to.

Applicable to integer and non-generic string values.

**\*LE**

Less than or equal to.

Applicable to integer and non-generic string values.

**\*LK**

Like.

Applicable to generic string values.

**\*NL**

Not like.

Applicable to generic string values.

**\*CT**

Contains.

Applicable to non-generic list values.

**\*EX**

Excludes.

Applicable to non-generic list values.

**\*CTG**

Contains generic.

Applicable to generic list values.

**\*EXG**

Excludes generic.

Applicable to generic list values.

The keyword can take one of the following values:

**\*ALTDATE**

The date on which the object or information was last altered.

The filter value is the date in the form yyyy-mm-dd.

**\*ALTTIME**

The time at which the object or information was last altered.

The filter value is the time in the form hh:mm:ss.

**\*DFTMSGPST**

The default persistence for messages associated with this topic.

The filter value is one of the following:

**\*ASPARENT**

Default persistence for messages is inherited from the parent topic.

**\*NO**

Messages associated with this topic are lost across a restart of the queue manager.

**\*YES**

Messages associated with this topic survive a restart of the queue manager.

**\*DFTPUTRESP**

Default Put Response.

The filter value is one of the following:

**\*ASPARENT**

The default response type is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**\*SYNC**

Put operations to the queue that specify MQPMO\_RESPONSE\_AS\_Q\_DEF are issued as if MQPMO\_SYNC\_RESPONSE had been specified instead.

**\*ASYNC**

Put operations to the queue that specify MQPMO\_RESPONSE\_AS\_Q\_DEF are always issued as if MQPMO\_ASYNC\_RESPONSE had been specified instead.

**\*DFTPTY**

Default priority for messages associated with this topic.

The filter value is the integer priority value.

**\*DURSUB**

Specifies whether the topic permits durable subscriptions.

The filter value is one of the following:

**\*ASPARENT**

This topic behaves in the same way as the parent topic.

**\*NO**

This topic does not permit durable subscriptions.

**\*YES**

This topic does permit durable subscriptions.

**\*MGDDURMDL**

The name of the model queue for managed durable subscriptions.

The filter value is the name of the queue.

**\*MGDNDURMDL**

The name of the model queue for managed non-durable subscriptions.

The filter value is the name of the queue.

**\*NPMGDLV**

Specifies the delivery mechanism for non-persistent messages published to this topic.

The filter value is one of the following:

**\*ALL**

All non-persistent messages are published to this topic.

**\*ALLDUR**

All durable non-persistent messages are published to this topic.

**\*ALLAVAIL**

All available non-persistent messages are published to this topic.

**\*ASPARENT**

This topic behaves in the same way as the parent topic.

**\*PMSGDLV**

Specifies the delivery mechanism for persistent messages published to this topic.

The filter value is one of the following:

**\*ALL**

All persistent messages are published to this topic.

**\*ALLDUR**

All durable persistent messages are published to this topic.

**\*ALLAVAIL**

All available persistent messages are published to this topic.

**\*ASPARENT**

This topic behaves in the same way as the parent topic.

**\*PUBENBL**

Specifies whether the topic allows publications.

The filter value is one of the following:

**\*ASPARENT**

This topic behaves in the same way as the parent topic.

**\*NO**

This topic does not have publication enabled.

**\*YES**

This topic does have publication enabled.

**\*SUBENBL**

Specifies whether the topic allows subscriptions.

The filter value is one of the following:

**\*ASPARENT**

This topic behaves in the same way as the parent topic.

**\*NO**

This topic does not allow subscriptions.

**\*YES**

This topic allows subscriptions.

**\*TEXT**

Descriptive comment.

The filter value is the text description of the topic.

**\*TOPNAME**

The name of the topic.

The filter value is the name of the topic.

**\*TOPICSTR**

The topic string, used to identify the topic node.

The filter value is a character string.

**\*WILDCARD**

Specifies the behavior of wildcard subscriptions with respect to this topic.

The filter value is one of the following:

**\*PASSTHRU**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will receive publications made to this topic and to topic strings more specific than this topic.

**\*BLOCK**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will not receive publications made to this topic or to topic strings more specific than this topic.

## Work with MQ Transactions (WRKMQMTRN)

**Where allowed to run**

All environments (\*ALL)

**Threadsafe**

Yes

The work with MQ transactions (WRKMQMTRN) command lists details of internally or externally coordinated in-doubt transactions.

## Parameters

Keyword	Description	Choices	Notes
<a href="#">TYPE</a>	Transaction type	<b>*ALL</b> , *EXT, *INT, *MQI, *XA, *OS400	Optional, Positional 1
<a href="#">MQMNAME</a>	Message Queue Manager name	<i>Character value</i> , <b>*DFT</b>	Optional, Positional 2

### Transaction type (TYPE)

Specifies the type of transactions.

#### **\*ALL**

Requests details of all the in-doubt transactions.

#### **\*EXT**

Requests details of externally coordinated, in-doubt transactions. Such transactions are those for which IBM MQ has been asked to prepare to commit, but has not yet been informed of the transaction outcome.

#### **\*INT**

Requests details of internally coordinated, in-doubt transactions. Such transactions are those for which each resource manager has been asked to prepare to commit, but IBM MQ has yet to inform the resource managers of the transaction outcome.

### Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

#### **\*DFT**

Use the default queue manager.

#### **message-queue-manager-name**

Specify the name of the queue manager.

## Programmable command formats reference

---

Programmable Command Formats (PCFs) define command and reply messages that can be exchanged between a program and any queue manager (that supports PCFs) in a network. PCFs simplify queue manager administration and other network administration.

For an introduction to PCFs, see [Introduction to Programmable Command Formats](#).

For the full list of PCFs, see [“Definitions of the Programmable Command Formats”](#) on page 1368.

PCF commands and responses have a consistent structure including of a header and any number of parameter structures of defined types. For information about these structures, see [“Structures for commands and responses”](#) on page 1886.

For an example PCF, see [“PCF example”](#) on page 1913.

### **Related concepts**

[“IBM MQ control commands reference”](#) on page 20  
Reference information about the IBM MQ control commands.

### **Related reference**

[“CL commands reference for IBM i”](#) on page 940

A list of CL commands for IBM i, grouped according to command type.

[“MQSC commands” on page 225](#)

Use MQSC commands to manage queue manager objects, including the queue manager itself, queues, process definitions, channels, client connection channels, listeners, services, namelists, clusters, and authentication information objects.

## Definitions of the Programmable Command Formats

All the available Programmable Command Formats (PCFs) are listed including their parameters (required and optional), response data and error codes.

Following is the reference information for the Programmable Command Formats (PCFs) of commands and responses sent between an IBM MQ systems management application program and an IBM MQ queue manager.

## How the definitions are shown

The definitions of the Programmable Command Formats (PCFs) including their commands, responses, parameters, constants, and error codes are shown in a consistent format.

For each PCF command or response, there is a description of what the command or response does, giving the command identifier in parentheses. See [Constants](#) for all values of the command identifier. Each command description starts with a table that identifies the platforms on which the command is valid. For additional, more detailed, usage notes for each command, see the corresponding command description in the “Definitions of the Programmable Command Formats” on page 1368.

IBM MQ products, other than IBM MQ for z/OS, can use the IBM MQ Administration Interface (MQAI), which provides a simplified way for applications written in the C and Visual Basic programming language to build and send PCF commands. For information about the MQAI see the second section of this topic.

## Commands

The *required parameters* and the *optional parameters* are listed.

**Multi** On [Multiplatforms](#), the parameters must occur in this order:

1. All required parameters, in the order stated, followed by
2. Optional parameters as required, in any order, unless noted in the PCF definition.

**z/OS** On z/OS, the parameters can be in any order.

## Responses

The response data attribute is *always returned* whether it is requested or not. This parameter is required to identify, uniquely, the object when there is a possibility of multiple reply messages being returned.

The other attributes shown are *returned if requested* as optional parameters on the command. The response data attributes are not returned in a defined order.

## Parameters and response data

Each parameter name is followed by its structure name in parentheses (details are given in “[Structures for commands and responses](#)” on page 1886 ). The parameter identifier is given at the beginning of the description.

## Constants

For the values of constants used by PCF commands and responses see [Constants](#).

## Informational messages

**z/OS**

On z/OS, a number of command responses return a structure, MQIACF\_COMMAND\_INFO, with values that provide information about the command.

MQIACF_COMMAND_INFO value	Meaning
MQCMDI_CMDSCOPE_ACCEPTED	A command that specified <i>CommandScope</i> was entered. It has been passed to the one or more requested queue managers for processing
MQCMDI_CMDSCOPE_GENERATED	A command that specified <i>CommandScope</i> was generated in response to the command originally entered

Table 301. MQIACF\_COMMAND\_INFO values (continued)

MQIACF_COMMAND_INFO value	Meaning
MQCMDI_CMDScope_COMPLETED	Processing for the command that specified <i>CommandScope</i> - either entered or generated by another command - has completed successfully on all requested queue managers
MQCMDI_QSG_DISP_COMPLETED	Processing for the command that refers to an object with the indicated disposition has completed successfully
MQCMDI_COMMAND_ACCEPTED	Initial processing for the command has completed successfully. The command requires further action by the channel initiator, for which a request has been queued. Messages reporting the success or otherwise of the action are be sent to the command issuer later
MQCMDI_CLUSTER_REQUEST_QUEUED	Initial processing for the command has completed successfully. The command requires further action by the cluster repository manager, for which a request has been queued
MQCMDI_CHANNEL_INIT_STARTED	A Start Channel Initiator command has been issued and the channel initiator address space has been started successfully
MQCMDI_RECOVER_STARTED	The queue manager has successfully started a task to process the Recover CF Structure command for the named structure
MQCMDI_BACKUP_STARTED	The queue manager has successfully started a task to process the Backup CF Structure command for the named structure
MQCMDI_RECOVER_COMPLETED	The named CF structure has been recovered successfully. The structure is available for use again
MQCMDI_SEC_TIMER_ZERO	The Change Security command was entered with the <i>SecurityInterval</i> attribute set to 0. This means that no user timeouts occur
MQCMDI_REFRESH_CONFIGURATION	A Change Queue Manager command has been issued that enables configuration events. Event messages need to be generated to ensure that the configuration information is complete and up to date
MQCMDI_IMS_BRIDGE_SUSPENDED	The MQ-IMS bridge facility is suspended.
MQCMDI_DB2_SUSPENDED	The connection to Db2 is suspended
MQCMDI_DB2_OBSOLETE_MSGS	Obsolete Db2 messages exist in the queue sharing group

## Error codes

 In z/OS, PCF commands can return MQRC reason codes instead of MQRCCF codes

MQRCCF codes are used in UNIX, Linux or Windows. At the end of most command format definitions, there is a list of error codes that might be returned by that command.

## Error codes applicable to all commands

In addition to those error codes listed under each command format, any command might return the following error codes in the response format header (descriptions of the MQR\*\_\* error codes are given in the [Messages and reason codes](#)  and [IBM MQ for z/OS messages, completion, and reason codes](#) documentation):

### Reason (MQLONG)

The value can be any of the following values:

**MQR\*\_NONE**

(0, X'000') No reason to report.

**MQR\*\_MSG\_TOO\_BIG\_FOR\_Q**

(2030, X'7EE') Message length greater than maximum for queue.

**MQR\*\_CONNECTION\_BROKEN**

(2009, X'7D9') Connection to queue manager lost.

**MQR\*\_NOT\_AUTHORIZED**

(2035, X'7F3') Not authorized for access.

**MQR\*\_SELECTOR\_ERROR**

(2067, X'813') Attribute selector not valid.

**MQR\*\_STORAGE\_NOT\_AVAILABLE**

(2071, X'817') Insufficient storage available.

**MQR\*\_UNKNOWN\_OBJECT\_NAME**

(2085, X'825') Unknown object name.

**MQRCCF\_ATTR\_VALUE\_ERROR**

Attribute value not valid.

**MQRCCF\_CFBF\_FILTER\_VAL\_LEN\_ERROR**

Filter value length not valid.

**MQRCCF\_CFBF\_LENGTH\_ERROR**

Structure length not valid.

**MQRCCF\_CFBF\_OPERATOR\_ERROR**

Operator error.

**MQRCCF\_CFBF\_PARM\_ID\_ERROR**

Parameter identifier not valid.

**MQRCCF\_CFBS\_DUPLICATE\_PARM**

Duplicate parameter.

**MQRCCF\_CFBS\_LENGTH\_ERROR**

Structure length not valid.

**MQRCCF\_CFBS\_PARM\_ID\_ERROR**

Parameter identifier not valid.

**MQRCCF\_CFBS\_STRING\_LENGTH\_ERROR**

String length not valid.

**MQRCCF\_CFGR\_LENGTH\_ERROR**

Structure length not valid.

**MQRCCF\_CFGR\_PARM\_COUNT\_ERROR**

Parameter count not valid.

**MQRCCF\_CFGR\_PARM\_ID\_ERROR**

Parameter identifier not valid.

**MQRCCF\_CFH\_COMMAND\_ERROR**  
Command identifier not valid.

**MQRCCF\_CFH\_CONTROL\_ERROR**  
Control option not valid.

**MQRCCF\_CFH\_LENGTH\_ERROR**  
Structure length not valid.

**MQRCCF\_CFH\_MSG\_SEQ\_NUMBER\_ERR**  
Message sequence number not valid.

**MQRCCF\_CFH\_PARM\_COUNT\_ERROR**  
Parameter count not valid.

**MQRCCF\_CFH\_TYPE\_ERROR**  
Type not valid.

**MQRCCF\_CFH\_VERSION\_ERROR**  
Structure version number is not valid.

**MQRCCF\_CFIF\_LENGTH\_ERROR**  
Structure length not valid.

**MQRCCF\_CFIF\_OPERATOR\_ERROR**  
Operator error.

**MQRCCF\_CFIF\_PARM\_ID\_ERROR**  
Parameter identifier not valid.

**MQRCCF\_CFIL\_COUNT\_ERROR**  
Count of parameter values not valid.

**MQRCCF\_CFIL\_DUPLICATE\_VALUE**  
Duplicate parameter.

**MQRCCF\_CFIL\_LENGTH\_ERROR**  
Structure length not valid.

**MQRCCF\_CFIL\_PARM\_ID\_ERROR**  
Parameter identifier not valid.

**MQRCCF\_CFIN\_DUPLICATE\_PARM**  
Duplicate parameter.

**MQRCCF\_CFIN\_LENGTH\_ERROR**  
Structure length not valid.

**MQRCCF\_CFIN\_PARM\_ID\_ERROR**  
Parameter identifier not valid.

**MQRCCF\_CFSF\_FILTER\_VAL\_LEN\_ERROR**  
Filter value length not valid.

**MQRCCF\_CFSF\_LENGTH\_ERROR**  
Structure length not valid.

**MQRCCF\_CFSF\_OPERATOR\_ERROR**  
Operator error.

**MQRCCF\_CFSF\_PARM\_ID\_ERROR**  
Parameter identifier not valid.

**MQRCCF\_CFSL\_COUNT\_ERROR**  
Count of parameter values not valid.

**MQRCCF\_CFSL\_DUPLICATE\_PARM**  
Duplicate parameter.

**MQRCCF\_CFSL\_LENGTH\_ERROR**  
Structure length not valid.

**MQRCCF\_CFSL\_PARM\_ID\_ERROR**  
Parameter identifier not valid.

**MQRCCF\_CFSL\_STRING\_LENGTH\_ERROR**  
String length value not valid.

**MQRCCF\_CFSL\_TOTAL\_LENGTH\_ERROR**  
Total string length error.

**MQRCCF\_CFST\_CONFLICTING\_PARM**  
Conflicting parameters.

**MQRCCF\_CFST\_DUPLICATE\_PARM**  
Duplicate parameter.

**MQRCCF\_CFST\_LENGTH\_ERROR**  
Structure length not valid.

**MQRCCF\_CFST\_PARM\_ID\_ERROR**  
Parameter identifier not valid.

**MQRCCF\_CFST\_STRING\_LENGTH\_ERROR**  
String length value not valid.

**MQRCCF\_COMMAND\_FAILED**  
Command failed.

**MQRCCF\_ENCODING\_ERROR**  
Encoding error.

**MQRCCF\_MD\_FORMAT\_ERROR**  
Format not valid.

**MQRCCF\_MSG\_SEQ\_NUMBER\_ERROR**  
Message sequence number not valid.

**MQRCCF\_MSG\_TRUNCATED**  
Message truncated.

**MQRCCF\_MSG\_LENGTH\_ERROR**  
Message length not valid.

**MQRCCF\_OBJECT\_NAME\_ERROR**  
Object name not valid.

**MQRCCF\_OBJECT\_OPEN**  
Object is open.

**MQRCCF\_PARM\_COUNT\_TOO\_BIG**  
Parameter count too large.

**MQRCCF\_PARM\_COUNT\_TOO\_SMALL**  
Parameter count too small.

**MQRCCF\_PARM\_SEQUENCE\_ERROR**  
Parameter sequence not valid.

**MQRCCF\_PARM\_SYNTAX\_ERROR**  
Syntax error found in parameter.

**MQRCCF\_STRUCTURE\_TYPE\_ERROR**  
Structure type not valid.

**MQRCCF\_UNKNOWN\_OBJECT\_NAME**  
Unknown object name.

## **PCF commands and responses in groups**

In this product documentation, the commands and data responses are given in alphabetical order.

They can be usefully grouped as follows:

### **Authentication Information commands**

- [“Change, Copy, and Create Authentication Information Object” on page 1382](#)

- [“Delete Authentication Information Object” on page 1517](#)
- [“Inquire Authentication Information Object” on page 1540](#)
- [“Inquire Authentication Information Object Names” on page 1546](#)

## Authority Record commands

- [“Delete Authority Record on Multiplatforms” on page 1518](#)
- [“Inquire Authority Records on Multiplatforms” on page 1549](#)
- [“Inquire Authority Service on Multiplatforms” on page 1554](#)
- [“Inquire Entity Authority on Multiplatforms” on page 1665](#)
- [“Set Authority Record on Multiplatforms” on page 1851](#)

## CF commands

- [“Backup CF Structure on z/OS” on page 1382](#)
- [“Change, Copy, and Create CF Structure on z/OS” on page 1391](#)
- [“Delete CF Structure on z/OS” on page 1519](#)
- [“Inquire CF Structure on z/OS” on page 1556](#)
- [“Inquire CF Structure Names on z/OS” on page 1560](#)
- [“Inquire CF Structure Status on z/OS” on page 1561](#)
- [“Recover CF Structure on z/OS” on page 1828](#)

## Channel commands

- [“Change, Copy, and Create Channel” on page 1396](#)
- [“Delete Channel” on page 1520](#)
- [“Inquire Channel” on page 1566](#)
-  [“Inquire Channel Initiator on z/OS” on page 1596](#)
- [“Inquire Channel Names” on page 1606](#)
- [“Inquire Channel Status” on page 1609](#)
- [“Ping Channel” on page 1823](#)
- [“Reset Channel” on page 1835](#)
- [“Resolve Channel” on page 1843](#)
- [“Start Channel” on page 1867](#)
-  [“Start Channel Initiator” on page 1871](#)
- [“Stop Channel” on page 1875](#)
-  [“Stop Channel Initiator on z/OS” on page 1880](#)

## Channel commands (MQTT)

- [“Change, Copy, and Create Channel \(MQTT\)” on page 1431](#)
- [“Delete Channel \(MQTT\)” on page 1521](#)
- [“Inquire Channel \(MQTT\)” on page 1576](#)
- [“Inquire Channel Status \(MQTT\)” on page 1622](#)
- [“Purge Channel” on page 1827](#)

- [“Start Channel \(MQTT\)” on page 1870](#)
- [“Stop Channel \(MQTT\)” on page 1879](#)

## **Channel Authentication commands**

- [“Inquire Channel Authentication Records” on page 1590](#)
- [“Set Channel Authentication Record” on page 1855](#)

## **Channel Listener commands**

- [“Change, Copy, and Create Channel Listener on Multiplatforms” on page 1437](#)
- [“Delete Channel Listener on Multiplatforms” on page 1522](#)
- [“Inquire Channel Listener on Multiplatforms” on page 1598](#)
- [“Inquire Channel Listener Status on Multiplatforms” on page 1602](#)
- [“Start Channel Listener” on page 1872](#)
- [“Stop Channel Listener” on page 1881](#)

## **Cluster commands**

- [“Inquire Cluster Queue Manager” on page 1638](#)
- [“Refresh Cluster” on page 1828](#)
- [“Reset Cluster” on page 1837](#)
- [“Resume Queue Manager Cluster” on page 1846](#)
- [“Suspend Queue Manager Cluster” on page 1885](#)

## **Communication Information commands**

- [“Change, Copy, and Create Communication Information Object on Multiplatforms” on page 1439](#)
- [“Delete Communication Information Object on Multiplatforms” on page 1522](#)
- [“Inquire Communication Information Object on Multiplatforms” on page 1650](#)

## **Connection commands**

- [“Inquire Connection” on page 1654](#)
- [“Stop Connection on Multiplatforms” on page 1882](#)

## **Escape command**

- [“Escape on Multiplatforms” on page 1530](#)

## **Namelist commands**

- [“Change, Copy, and Create Namelist” on page 1443](#)
- [“Delete Namelist” on page 1522](#)
- [“Inquire Namelist” on page 1676](#)
- [“Inquire Namelist Names” on page 1680](#)

## **Process commands**

- [“Change, Copy, and Create Process” on page 1446](#)
- [“Delete Process” on page 1524](#)
- [“Inquire Process” on page 1684](#)

- [“Inquire Process Names” on page 1687](#)

## **Publish/subscribe commands**

- [“Change, Copy, and Create Subscription” on page 1502](#)
- [“Change, Copy, and Create Topic” on page 1506](#)
- [“Clear Topic String” on page 1516](#)
- [“Delete Subscription” on page 1528](#)
- [“Delete Topic” on page 1529](#)
- [“Inquire Pub/Sub Status” on page 1689](#)
- [“Inquire Subscription” on page 1784](#)
- [“Inquire Subscription Status” on page 1792](#)
- [“Inquire Topic” on page 1798](#)
- [“Inquire Topic Names” on page 1808](#)
- [“Inquire Topic Status” on page 1810](#)

## **Queue commands**

- [“Change, Copy, and Create Queue” on page 1449](#)
- [“Clear Queue” on page 1515](#)
- [“Delete Queue” on page 1525](#)
- [“Inquire Queue” on page 1693](#)
- [“Inquire Queue Names” on page 1754](#)
- [“Inquire Queue Status” on page 1756](#)
-  [“Move Queue on z/OS” on page 1822](#)
- [“Reset Queue Statistics” on page 1841](#)

## **Queue Manager commands**

- [“Change Queue Manager” on page 1467](#)
- [“Inquire Queue Manager” on page 1712](#)
- [“MQCMD\\_INQUIRE\\_Q\\_MGR\\_STATUS \(Inquire Queue Manager Status\) on Multiplatforms” on page 1749](#)
- [“Ping Queue Manager on Multiplatforms” on page 1827](#)
- [“Refresh Queue Manager” on page 1830](#)
- [“Reset Queue Manager” on page 1838](#)
-  [“Resume Queue Manager on z/OS” on page 1845](#)
-  [“Suspend Queue Manager on z/OS” on page 1884](#)

## **Security commands**

- [“Change Security on z/OS” on page 1495](#)
- [“Inquire Security on z/OS” on page 1768](#)
- [“Refresh Security” on page 1832](#)
-  [“Reverify Security on z/OS” on page 1847](#)

## Service commands

- [“Change, Copy, and Create Service on Multiplatforms” on page 1497](#)
- [“Delete Service on Multiplatforms” on page 1527](#)
- [“Inquire Service on Multiplatforms” on page 1770](#)
- [“Inquire Service Status on Multiplatforms” on page 1773](#)
- [“Start Service on Multiplatforms” on page 1874](#)
- [“Stop Service on Multiplatforms” on page 1883](#)

## SMDS commands

### z/OS

- [“Change SMDS on z/OS” on page 1496](#)
- [“Inquire SMDS on z/OS” on page 1776](#)
- [“Inquire SMDS Connection on z/OS” on page 1777](#)
- [“Reset SMDS on z/OS” on page 1843](#)
- [“Start SMDS Connection on z/OS” on page 1875](#)
- [“Stop SMDS Connection on z/OS” on page 1883](#)

## Storage class commands

### z/OS

- [z/OS “Change, Copy, and Create Storage Class on z/OS” on page 1499](#)
- [“Delete Storage Class on z/OS” on page 1527](#)
- [“Inquire Storage Class on z/OS” on page 1779](#)
- [“Inquire Storage Class Names on z/OS” on page 1782](#)

## System commands

### z/OS

- [“Inquire Archive on z/OS” on page 1536](#)
- [“Set Archive on z/OS” on page 1847](#)
- [“Inquire Group on z/OS” on page 1670](#)
- [“Inquire Log on z/OS” on page 1672](#)
- [“Set Log on z/OS” on page 1861](#)
- [“Inquire System on z/OS” on page 1795](#)
- [“Set System on z/OS” on page 1865](#)
- [“Inquire Usage on z/OS” on page 1817](#)

## Data responses to commands

- [“Escape \(Response\) on Multiplatforms” on page 1531](#)
- [z/OS “Inquire Archive \(Response\) on z/OS” on page 1537](#)
- [“Inquire Authentication Information Object \(Response\)” on page 1543](#)
- [“Inquire Authentication Information Object Names \(Response\)” on page 1548](#)
- [“Inquire Authority Records \(Response\) on Multiplatforms” on page 1552](#)
- [“Inquire Authority Service \(Response\) on Multiplatforms” on page 1555](#)

-  [“Inquire CF Structure \(Response\) on z/OS” on page 1557](#)
-  [“Inquire CF Structure Names \(Response\) on z/OS” on page 1561](#)
-  [“Inquire CF Structure Status \(Response\) on z/OS” on page 1562](#)
- [“Inquire Channel \(Response\)” on page 1578](#)
- [“Inquire Channel Authentication Records \(Response\)” on page 1593](#)
- [“Inquire Channel Initiator \(Response\) on z/OS” on page 1596](#)
- [“Inquire Channel Listener \(Response\) on Multiplatforms” on page 1600](#)
- [“Inquire Channel Listener Status \(Response\) on Multiplatforms” on page 1604](#)

## **Backup CF Structure on z/OS**

The Backup CF Structure (MQCMD\_BACKUP\_CF\_STRUC) command initiates a CF application structure backup.

**Note:** This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

### **Required parameters**

#### **CFStrucName (MQCFST)**

The name of the CF application structure to be backed up (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length is MQ\_CF\_STRUC\_NAME\_LENGTH.

### **Optional parameters**

#### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### **ExcludeInterval (MQCFIN)**

Exclude interval (parameter identifier: MQIACF\_EXCLUDE\_INTERVAL).

Specifies a value in seconds that defines the length of time immediately before the current time where the backup starts. The backup excludes backing-up the last *n* seconds activity. For example, if 30 seconds is specified, the backup does not include the last 30 seconds worth of activity for this application-structure.

The value must be in the range 30 through 600. The default value is 30.

## **Change, Copy, and Create Authentication Information Object**

The Change authentication information command changes attributes of an existing authentication information object. The Create and Copy authentication information commands create new authentication information objects - the Copy command uses attribute values of an existing object.

The Change authentication information (MQCMD\_CHANGE\_AUTH\_INFO) command changes the specified attributes in an authentication information object. For any optional parameters that are omitted, the value does not change.

The Copy authentication information (MQCMD\_COPY\_AUTH\_INFO) command creates new authentication information object using, for attributes not specified in the command, the attribute values of an existing authentication information object.

The Create authentication information (MQCMD\_CREATE\_AUTH\_INFO) command creates an authentication information object. Any attributes that are not defined explicitly are set to the default values on the destination queue manager. A system default authentication information object exists and default values are taken from it.

## Required parameters (Change authentication information)

### AuthInfoName (MQCFST)

The authentication information object name (parameter identifier: MQCA\_AUTH\_INFO\_NAME).

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

### AuthInfoType (MQCFIN)

The type of authentication information object (parameter identifier: MQIA\_AUTH\_INFO\_TYPE).

The value can be:

#### MQAIT\_CRL\_LDAP

This defines this authentication information object as specifying an LDAP server containing Certificate Revocation Lists.

#### MQAIT\_OCSP

This value defines this authentication information object as specifying certificate revocation checking using OCSP.

AuthInfoType MQAIT\_OCSP does not apply for use on IBM i or z/OS queue managers, but it can be specified on those platforms to be copied to the client channel definition table for client use.

#### MQAIT\_IDPW\_OS

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through the operating system.

#### MQAIT\_IDPW\_LDAP

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through an LDAP server.

**Important:** This option is not valid on z/OS.

See [Securing IBM MQ](#) for more information.

## Required parameters (Copy authentication information)

### FromAuthInfoName (MQCFST)

The name of the authentication information object definition to be copied from (parameter identifier: MQCACF\_FROM\_AUTH\_INFO\_NAME).

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR or MQQSGD\_COPY to copy from. This parameter is ignored if a value of MQQSGD\_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToAuthInfoName* and the disposition of MQQSGD\_GROUP is searched for to copy from.

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

### ToAuthInfoName (MQCFST)

The name of the authentication information object to copy to (parameter identifier: MQCACF\_TO\_AUTH\_INFO\_NAME).

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

### AuthInfoType (MQCFIN)

The type of authentication information object (parameter identifier: MQIA\_AUTH\_INFO\_TYPE). The value must match the AuthInfoType of the authentication information object from which you are copying.

The value can be:

**MQAIT\_CRL\_LDAP**

This value defines this authentication information object as specifying Certificate Revocation Lists that are held on LDAP.

**MQAIT\_OCSP**

This value defines this authentication information object as specifying certificate revocation checking using OCSP.

**MQAIT\_IDPW\_OS**

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through the operating system.

**MQAIT\_IDPW\_LDAP**

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through an LDAP server.

**Important:** This option is not valid on z/OS.

See [Securing IBM MQ](#) for more information.

**Required parameters (Create authentication information)****AuthInfoName (MQCFST)**

Authentication information object name (parameter identifier: MQCA\_AUTH\_INFO\_NAME).

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

**AuthInfoType (MQCFIN)**

The type of authentication information object (parameter identifier: MQIA\_AUTH\_INFO\_TYPE).

The following values are accepted:

**MQAIT\_CRL\_LDAP**

This value defines this authentication information object as specifying an LDAP server containing Certificate Revocation Lists.

**MQAIT\_OCSP**

This value defines this authentication information object as specifying certificate revocation checking using OCSP.

An authentication information object with AuthInfoType MQAIT\_OCSP does not apply for use on IBM i or z/OS queue managers, but it can be specified on those platforms to be copied to the client channel definition table for client use.

**MQAIT\_IDPW\_OS**

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through the operating system.

**MQAIT\_IDPW\_LDAP**

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through an LDAP server.

**Important:** This option is not valid on z/OS.

See [Securing IBM MQ](#) for more information.

**Optional parameters (Change, Copy, and Create Authentication Information Object)****AdoptContext (MQCFIN)**

Whether to use the presented credentials as the context for this application (parameter identifier MQIA\_ADOPT\_CONTEXT). This means that they are used for authorization checks, shown on administrative displays, and appear in messages.

**MQADPCTX\_YES**

The user ID presented in the MQCSP structure, which has been successfully validated by password, is adopted as the context to use for this application. Therefore, this user ID will be the credentials checked for authorization to use IBM MQ resources.

If the user ID presented is an LDAP user ID, and authorization checks are done using operating system user IDs, the `ShortUser` associated with the user entry in LDAP will be adopted as the credentials for authorization checks to be done against.

### **MQADPCTX\_NO**

Authentication will be performed on the user ID and password presented in the MQCSP structure, but then the credentials will not be adopted for further use. Authorization will be performed using the user ID the application is running under.

This attribute is only valid for **AuthInfoType** of `MQAIT_IDPW_OS` and `MQAIT_IDPW_LDAP`.

The maximum length is `MQIA_ADOPT_CONTEXT_LENGTH`.

### **AuthInfoConnName (MQCFST)**

The connection name of the authentication information object (parameter identifier: `MQCA_AUTH_INFO_CONN_NAME`).

This parameter is relevant only when `AuthInfoType` is set to `MQAIT_CRL_LDAP` or `MQAIT_IDPW_LDAP`, when it is required.

When used with an `AuthInfoType` of `MQAIT_IDPW_LDAP`, this can be a comma separated list of connection names.

 On [Multiplatforms](#), the maximum length is `MQ_AUTH_INFO_CONN_NAME_LENGTH`.

 On z/OS, the maximum length is `MQ_LOCAL_ADDRESS_LENGTH`.

### **AuthInfoDesc (MQCFST)**

The description of the authentication information object (parameter identifier: `MQCA_AUTH_INFO_DESC`).

The maximum length is `MQ_AUTH_INFO_DESC_LENGTH`.

### **AuthenticationMethod (MQCFIN)**

Authentication methods for user passwords (parameter identifier: `MQIA_AUTHENTICATION_METHOD`). Possible values are:

#### **MQAUTHENTICATE\_OS**

Use the traditional UNIX password verification method

This is the default value.

#### **MQAUTHENTICATE\_PAM**

Use the Pluggable Authentication Method to authenticate the user passwords.

You can set the PAM value only on UNIX and Linux platforms.

This attribute is valid only for an **AuthInfoType** of `MQAIT_IDPW_OS`, and is not valid on IBM MQ for z/OS.

### **AuthorizationMethod (MQCFIN)**

Authorization methods for the queue manager (parameter identifier: `MQIA_LDAP_AUTHORMD`). Possible values are:

#### **MQLDAP\_AUTHORMD\_OS**

Use operating system groups to determine permissions associated with a user.

This is how IBM MQ has previously worked, and is the default value.

#### **MQLDAP\_AUTHORMD\_SEARCHGRP**

A group entry in the LDAP repository contains an attribute listing the Distinguished Name of all the users belonging to that group. Membership is indicated by the attribute defined in [FindGroup](#). This value is typically *member* or *uniqueMember*.

### **MQLDAP\_AUTHORMD\_SEARCHUSR**

A user entry in the LDAP repository contains an attribute listing the Distinguished Name of all the groups to which the specified user belongs. The attribute to query is defined by the [FindGroup](#) value, typically *memberOf*.

### **V 9.1.0 MQLDAP\_AUTHORMD\_SRCHGRPSN**

A group entry in the LDAP repository contains an attribute listing the short user name of all the users belonging to that group. The attribute in the user record that contains the short user name is specified by [ShortUser](#).

Membership is indicated by the attribute defined in [FindGroup](#). This value is typically *memberUid*.

**Note:** This authorization method should only be used if all user short names are distinct.

Many LDAP servers use an attribute of the group object to determine group membership and you should, therefore, set this value to *MQLDAP\_AUTHORMD\_SEARCHGRP*.

Microsoft Active Directory typically stores group memberships as a user attribute. The IBM Tivoli Directory Server supports both methods.

In general, retrieving memberships through a user attribute will be faster than searching for groups that list the user as a member.

### **BaseDNGroup (MQCFST)**

In order to be able to find group names, this parameter must be set with the base DN to search for groups in the LDAP server (parameter identifier: MQCA\_LDAP\_BASE\_DN\_GROUPS).

The maximum length is MQ\_LDAP\_BASE\_DN\_LENGTH.

### **BaseDNUser (MQCFST)**

In order to be able to find the short user name attribute (see [ShortUser](#)) this parameter must be set with the base DN to search for users within the LDAP server (parameter identifier: MQCA\_LDAP\_BASE\_DN\_USERS).

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* and is mandatory.

The maximum length is MQ\_LDAP\_BASE\_DN\_LENGTH.

### **Checkclient (MQCFIN)**

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_OS* or *MQAIT\_IDPW\_LDAP* (parameter identifier: MQIA\_CHECK\_CLIENT\_BINDING). The possible values are:

#### **MQCHK\_NONE**

Switches off checking.

#### **MQCHK\_OPTIONAL**

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

#### **MQCHK\_REQUIRED**

Requires that all applications provide a valid user ID and password.

#### **MQCHK\_REQUIRED\_ADMIN**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the OPTIONAL setting.  (This setting is not allowed on z/OS systems.)

A privileged user is one that has full administrative authorities for IBM MQ. See [Privileged users](#) for more information.

### **Checklocal (MQCFIN)**

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_OS* or *MQAIT\_IDPW\_LDAP* (parameter identifier: MQIA\_CHECK\_LOCAL\_BINDING). The possible values are:

#### **MQCHK\_NONE**

Switches off checking.

### **MQCHK\_OPTIONAL**

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

### **MQCHK\_REQUIRED**

Requires that all applications provide a valid user ID and password.

**z/OS** If your user ID has UPDATE access to the BATCH profile in the MQCONN class, you can treat **MQCHK\_REQUIRED** as if it is **MQCHK\_OPTIONAL**. That is, you do not have to supply a password, but if you do, the password must be the correct one.

### **MQCHK\_REQUIRED\_ADMIN**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the OPTIONAL setting. **z/OS** (This setting is not allowed on z/OS systems.)

A privileged user is one that has full administrative authorities for IBM MQ. See [Privileged users](#) for more information.

### **ClassGroup (MQCFST)**

The LDAP object class used for group records in the LDAP repository (parameter identifier: MQCA\_LDAP\_GROUP\_OBJECT\_CLASS).

If the value is blank, **groupOfNames** is used.

Other commonly used values include *groupOfUniqueNames* or *group*.

The maximum length is MQ\_LDAP\_CLASS\_LENGTH.

### **Classuser (MQCFST)**

The LDAP object class used for user records in the LDAP repository (parameter identifier MQCA\_LDAP\_USER\_OBJECT\_CLASS).

If blank, the value defaults to *inetOrgPerson*, which is generally the value needed.

For Microsoft Active Directory, the value you require required is often *user*.

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP*.

### **z/OS CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **FailureDelay (MQCFIN)**

When a user ID and password are provided for connection authentication, and the authentication fails due to the user ID or password being incorrect, this is the delay, in seconds, before the failure is returned to the application (parameter identifier: MQIA\_AUTHENTICATION\_FAIL\_DELAY).

This can aid in avoiding busy loops from an application that simply retries, continuously, after receiving a failure.

The value must be in the range 0 - 60 seconds. The default value is 1.

This parameter is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_OS* or *MQAIT\_IDPW\_LDAP*.

### FindGroup (MQCFST)

Name of the attribute used within an LDAP entry to determine group membership (parameter identifier: MQCA\_LDAP\_FIND\_GROUP\_FIELD).

When AuthorizationMethod = *MQLDAP\_AUTHORMD\_SEARCHGRP*, this attribute is typically set to *member* or *uniqueMember*.

When AuthorizationMethod = *MQLDAP\_AUTHORMD\_SEARCHUSR*, this attribute is typically set to *memberOf*.

**V 9.1.0** When AuthorizationMethod = *MQLDAP\_AUTHORMD\_SRCHGRPSN*, this attribute is typically set to *memberUid*.

When left blank, if:

- AuthorizationMethod = *MQLDAP\_AUTHORMD\_SEARCHGRP*, this attribute defaults to *memberOf*.
- AuthorizationMethod = *MQLDAP\_AUTHORMD\_SEARCHUSR*, this attribute defaults to *member*.
- **V 9.1.0** AuthorizationMethod = *MQLDAP\_AUTHORMD\_SRCHGRPSN*, this attribute defaults to *memberUid*.

The maximum length is MQ\_LDAP\_FIELD\_LENGTH.

### GroupField (MQCFST)

LDAP attribute that represents a simple name for the group (parameter identifier: MQCA\_LDAP\_GROUP\_ATTR\_FIELD).

If the value is blank, commands like setmqaut must use a qualified name for the group. The value can either be a full DN, or a single attribute.

The maximum length is MQ\_LDAP\_FIELD\_LENGTH.

### GroupNesting (MQCFIN)

Whether groups are members of other groups (parameter identifier: MQIA\_LDAP\_NESTGRP). The values can be:

#### MQLDAP\_NESTGRP\_NO

Only the initially discovered groups are considered for authorization.

#### MQLDAP\_NESTGRP\_YES

The group list is searched recursively to enumerate all the groups to which a user belongs.

The group's Distinguished Name is used when searching the group list recursively, regardless of the authorization method selected in AuthorizationMethod.

### LDAPPassword (MQCFST)

The LDAP password (parameter identifier: MQCA\_LDAP\_PASSWORD).

This parameter is relevant only when **AuthInfoType** is set to *MQAIT\_CRL\_LDAP* or *MQAIT\_IDPW\_LDAP*.

The maximum length is MQ\_LDAP\_PASSWORD\_LENGTH.

### LDAPUserName (MQCFST)

The LDAP user name (parameter identifier: MQCA\_LDAP\_USER\_NAME).

This parameter is relevant only when **AuthInfoType** is set to *MQAIT\_CRL\_LDAP* or *MQAIT\_IDPW\_LDAP*.

**Multi** On Multiplatforms, the maximum length is MQ\_DISTINGUISHED\_NAME\_LENGTH.

**z/OS** On z/OS, the maximum length is MQ\_SHORT\_DNAME\_LENGTH.

### OCSPResponderURL (MQCFST)

The URL at which the OCSP responder can be contacted (parameter identifier: MQCA\_AUTH\_INFO\_OCSP\_URL).

This parameter is relevant only when AuthInfoType is set to MQAIT\_OCSP, when it is required.

This field is case-sensitive. It must start with the string http:// in lowercase. The rest of the URL might be case sensitive, depending on the OCSP server implementation.

The maximum length is MQ\_AUTH\_INFO\_OCSP\_URL\_LENGTH.

**z/OS QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

Table 302. QSGDisposition: Where objects are defined and how they behave		
QSGDisposition	Change	Copy, Create
<b>MQQSGD_COPY</b>	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameter MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToAuthInfoName</i> object (for Copy) or the <i>AuthInfoName</i> object (for Create).
<b>MQQSGD_GROUP</b>	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they refresh local copies on page set zero:</p> <pre>DEFINE AUTHINFO(name) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This definition is allowed only if the queue manager is in a queue sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they make or refresh local copies on page set zero:</p> <pre>DEFINE AUTHINFO(name) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
<b>MQQSGD_PRIVATE</b>	The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR, or MQQSGD_COPY. Any object residing in the shared repository is unaffected.	Not permitted.

Table 302. QSGDisposition: Where objects are defined and how they behave (continued)

QSGDisposition	Change	Copy, Create
<b>MQQSGD_Q_MGR</b>	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.	The object is defined on the page set of the queue manager that executes the command. This value is the default value.

### Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If an Authentication Information object with the same name as AuthInfoName or ToAuthInfoName exists, it specifies whether it is to be replaced. The value can be any of the following values:

#### MQRP\_YES

Replace existing definition

#### MQRP\_NO

Do not replace existing definition

### SecureComms (MQCFIN)

Whether connectivity to the LDAP server should be done securely using TLS (parameter identifier MQIA\_LDAP\_SECURE\_COMM).

#### MQSECCOMM\_YES

Connectivity to the LDAP server is made securely using TLS.

The certificate used is the default certificate for the queue manager, named in CERTLABL on the queue manager object, or if that is blank, the one described in [Digital certificate labels, understanding the requirements](#).

The certificate is located in the key repository specified in SSLKEYR on the queue manager object. A cipherspec will be negotiated that is supported by both IBM MQ and the LDAP server.

If the queue manager is configured to use SSLFIPS(YES) or SUITEB cipher specs, then this is taken account of in the connection to the LDAP server as well.

#### MQSECCOMM\_ANON

Connectivity to the LDAP server is made securely using TLS just as for MQSECCOMM\_YES with one difference.

No certificate is sent to the LDAP server; the connection will be made anonymously. To use this setting, ensure that the key repository specified in SSLKEYR, on the queue manager object, does not contain a certificate marked as the default.

#### MQSECCOMM\_NO

Connectivity to the LDAP server does not use TLS.

This attribute is valid only for an **AuthInfoType** of MQAIT\_IDPW\_LDAP.

### ShortUser (MQCFST)

A field in the user record to be used as a short user name in IBM MQ (parameter identifier MQCA\_LDAP\_SHORT\_USER\_FIELD).

This field must contain values of 12 characters or less. This short user name is used for the following purposes:

- If LDAP authentication is enabled, but LDAP authorization is not enabled, this is used as an operating system user ID for authorization checks. In this case, the attribute must represent an operating system user ID.

- If LDAP authentication and authorization are both enabled, this is used as the user ID carried with the message in order for the LDAP user name to be rediscovered when the user ID inside the message needs to be used.

For example, on another queue manager, or when writing report messages. In this case, the attribute does not need to represent an operating system user ID, but must be a unique string. An employee serial number is an example of a good attribute for this purpose.

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* and is mandatory.

The maximum length is *MQ\_LDAP\_FIELD\_LENGTH*.

### UserField (MQCFST)

If the user ID provided by an application for authentication does not contain a qualifier for the field in the LDAP user record, that is, it does not contain an '=' sign, this attribute identifies the field in the LDAP user record that is used to interpret the provided user ID (parameter identifier *MQCA\_LDAP\_USER\_ATTR\_FIELD*).

This field can be blank. If this is the case, any unqualified user IDs use the ShortUser field to interpret the provided user ID.

The contents of this field will be concatenated with an '=' sign, together with the value provided by the application, to form the full user ID to be located in an LDAP user record. For example, the application provides a user of *fred* and this field has the value *cn*, then the LDAP repository will be searched for *cn=fred*.

The maximum length is *MQ\_LDAP\_FIELD\_LENGTH*.

## Change, Copy, and Create CF Structure on z/OS

The Change CF Structure command changes existing CF application structures. The Copy and Create CF Structure commands create new CF application structures - the Copy command uses attribute values of an existing CF application structure.

**Note:** These commands are supported only on z/OS when the queue manager is a member of a queue sharing group.

The Change CF Structure (*MQCMD\_CHANGE\_CF\_STRUC*) command changes the specified attributes in a CF application structure. For any optional parameters that are omitted, the value does not change.

The Copy CF Structure (*MQCMD\_COPY\_CF\_STRUC*) command creates new CF application structure using, for attributes not specified in the command, the attribute values of an existing CF application structure.

The Create CF Structure (*MQCMD\_CREATE\_CF\_STRUC*) command creates a CF application structure. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

### Required parameters (Change and Create CF Structure)

#### CFStrucName (MQCFST)

The name of the CF application structure with backup and recovery parameters that you want to define (parameter identifier: *MQCA\_CF\_STRUC\_NAME*).

The maximum length of the string is *MQ\_CF\_STRUC\_NAME\_LENGTH*.

### Required parameters (Copy CF Structure)

#### FromCFStrucName (MQCFST)

The name of the CF application structure to be copied from (parameter identifier: *MQCACF\_FROM\_CF\_STRUC\_NAME*).

The maximum length of the string is *MQ\_CF\_STRUC\_NAME\_LENGTH*.

#### ToCFStrucName (MQCFST)

The name of the CF application structure to copy to (parameter identifier: *MQCACF\_TO\_CF\_STRUC\_NAME*).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

## Optional parameters (Change, Copy, and Create CF Structure)

### CFConlos (MQCFIN)

Specifies the action to be taken when a queue manager loses connectivity to the CF structure (parameter identifier: MQIA\_CF\_CFCONLOS).

The value can be any of the following values:

#### MQCFCONLOS\_ASQMGR

The action taken is based on the setting of the CFCONLOS queue manager attribute. This value is the default for newly created CF structure objects with CFLEVEL(5).

#### MQCFCONLOS\_TERMINATE

The queue manager terminates when connectivity to the structure is lost. This value is the default if the CF structure object is not at CFLEVEL(5), and for existing CF structure objects that are changed to CFLEVEL(5).

#### MQCFCONLOS\_TOLERATE

The queue manager tolerates loss of connectivity to the structure without terminating.

This parameter is only valid from CFLEVEL(5).

### CFLevel (MQCFIN)

The functional capability level for this CF application structure (parameter identifier: MQIA\_CF\_LEVEL).

Specifies the functional capability level for the CF application structure. The value can be any of the following values:

**1**

A CF structure that can be "auto-created" by a queue manager at command level 520.

**2**

A CF structure at command level 520 that can only be created or deleted by a queue manager at command level 530 or greater.

**3**

A CF structure at command level 530. This *CFLevel* is required if you want to use persistent messages on shared queues, or for message grouping, or both. This level is the default *CFLevel* for queue managers at command level 600.

You can only increase the value of *CFLevel* to 3 if all the queue managers in the queue sharing group are at command level 530 or greater - this restriction is to ensure that there are no latent command level 520 connections to queues referencing the CF structure.

You can only decrease the value of *CFLevel* from 3 if all the queues that reference the CF structure are both empty (have no messages or uncommitted activity) and closed.

**4**

This *CFLevel* supports all the *CFLevel* (3) functions. *CFLevel* (4) allows queues defined with CF structures at this level to have messages with a length greater than 63 KB.

Only a queue manager with a command level of 600 can connect to a CF structure at *CFLevel* (4).

You can only increase the value of *CFLevel* to 4 if all the queue managers in the queue sharing group are at command level 600 or greater.

You can only decrease the value of *CFLevel* from 4 if all the queues that reference the CF structure are both empty (have no messages or uncommitted activity) and closed.

**5**

This *CFLevel* supports all the *CFLevel* (4) functions. *CFLevel* (5) allows persistent, and nonpersistent messages to be selectively stored in Db2 or shared message data sets.

Structures are required to be at CFLEVEL(5) to support toleration of loss of connectivity.

 For more information, see [Where are shared queue messages held?](#).

### **CFStrucDesc (MQCFST)**

The description of the CF structure (parameter identifier: MQCA\_CF\_STRUC\_DESC).

The maximum length is MQ\_CF\_STRUC\_DESC\_LENGTH.

### **DSBlock (MQCFIN)**

The logical block size for shared message data sets (parameter identifier: MQIACF\_CF\_SMDS\_BLOCK\_SIZE).

The unit in which shared message data set space is allocated to individual queues. The value can be any of the following values:

#### **MQDSB\_8K**

The logical block size is set to 8 K.

#### **MQDSB\_16K**

The logical block size is set to 16K.

#### **MQDSB\_32K**

The logical block size is set to 32 K.

#### **MQDSB\_64K**

The logical block size is set to 64 K.

#### **MQDSB\_128K**

The logical block size is set to 128 K.

#### **MQDSB\_256K**

The logical block size is set to 256 K.

#### **MQDSB\_512K**

The logical block size is set to 512 K.

#### **MQDSB\_1024K**

The logical block size is set to 1024 K.

#### **MQDSB\_1M**

The logical block size is set to 1 M.

Value can not be set unless CFLEVEL(5) is defined.

The default value is 256 K unless CFLEVEL is not 5. In this case a value of 0 is used.

### **DSBufs (MQCFIN)**

The shared message data set buffers group (parameter identifier: MQIA\_CF\_SMDS\_BUFFERS).

Specifies the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

A value in the range 1 - 9999.

Value can not be set unless CFLEVEL(5) is defined.

### **DSEXPAND (MQCFIN)**

The shared message data set expand option (parameter identifier: MQIACF\_CF\_SMDS\_EXPAND).

Specifies whether or not the queue manager should expand a shared message data set when it is nearly full, and further blocks are required in the data set. The value can be any of the following values:

#### **MQDSE\_YES**

The data set can be expanded.

#### **MQDSE\_NO**

The data set cannot be expanded.

**MQDSE\_DEFAULT**

Only returned on DISPLAY CFSTRUCT when not explicitly set

Value can not be set unless CFLEVEL(5) is defined.

**DSGroup (MQCFST)**

The shared message data set group name (parameter identifier: MQCACF\_CF\_SMDS\_GENERIC\_NAME).

Specifies a generic data set name to be used for the group of shared message data sets associated with this CF structure.

The string must contain exactly one asterisk (\*), which will be replaced with the queue manager name of up to 4 characters.

The maximum length of this parameter is 44 characters.

Value can not be set unless CFLEVEL(5) is defined.

**Offload (MQCFIN)**

Specifies whether offloaded message data is to be stored in a group of shared message data sets or in Db2 (parameter identifier: MQIA\_CF\_OFFLOAD).

The value can be:

**MQCFOFFLD\_DB2**

Large shared messages can be stored in Db2.

**MQCFOFFLD\_SMDS**

Large shared messages can be stored in z/OS shared message data sets.

Value can not be set unless CFLEVEL(5) is defined.

For existing CF structure objects that are changed to CFLEVEL(5) the default is MQCFOFFLD\_DB2.

For newly created CF structure objects with CFLEVEL(5) the default is MQCFOFFLD\_SMDS.

For more information about the group of parameters (*OFFLDxSZ* and *OFFLDxTH*), see [Specifying offload options for shared message data sets](#)

**OFFLD1SZ (MQCFST)**

The offload size property 1 (parameter identifier: MQCACF\_CF\_OFFLOAD\_SIZE1)

Specifies the first offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the size of the messages to be offloaded. The property is specified as a string with values in the range 0K - 64K.

The default value is 32K. This property is used with *OFFLD1TH*.

Value can not be set unless CFLEVEL(5) is defined.

The value 64K indicates that the rule is not being used.

The maximum length is 3.

**OFFLD2SZ (MQCFST)**

The offload size property 2 (parameter identifier: MQCACF\_CF\_OFFLOAD\_SIZE2)

Specifies the second offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the size of the messages to be offloaded. The property is specified as a string with values in the range 0K - 64K.

The default value is 4K. This property is used with *OFFLD2TH*.

Value can not be set unless CFLEVEL(5) is defined.

The value 64K indicates that the rule is not being used.

The maximum length is 3.

**OFFLD3SZ (MQCFST)**

The offload size property 3 (parameter identifier: MQCACF\_CF\_OFFLOAD\_SIZE3)

Specifies the third offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the size of the messages to be offloaded. The property is specified as a string with values in the range 0K - 64K.

The default value is 0K. This property is used with *OFFLD3TH*.

Value can not be set unless CFLEVEL(5) is defined.

The value 64K indicates that the rule is not being used.

The maximum length is 3.

**OFFLD1TH (MQCFIN)**

The offload threshold property 1 (parameter identifier: MQIA\_CF\_OFFLOAD\_THRESHOLD1)

Specifies the first offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the coupling facility structure percentage full.

The default value is 70. This property is used with *OFFLD1SZ*.

Value can not be set unless CFLEVEL(5) is defined.

**OFFLD2TH (MQCFIN)**

The offload threshold property 2 (parameter identifier: MQIA\_CF\_OFFLOAD\_THRESHOLD2)

Specifies the second offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the coupling facility structure percentage full.

The default value is 80. This property is used with *OFFLD2SZ*.

Value can not be set unless CFLEVEL(5) is defined.

**OFFLD3TH (MQCFIN)**

The offload threshold property 3 (parameter identifier: MQIA\_CF\_OFFLOAD\_THRESHOLD3)

Specifies the third offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the coupling facility structure percentage full.

The default value is 90. This property is used with *OFFLD3SZ*.

Value can not be set unless CFLEVEL(5) is defined.

**Recauto (MQCFIN)**

Specifies the automatic recovery action to be taken when a queue manager detects that the structure is failed, or when a queue manager loses connectivity to the structure and no systems in the sysplex have connectivity to the coupling facility that the structure is allocated in (parameter identifier: MQIA\_CF\_RECAUTO).

The value can be:

**MQRECAUTO\_YES**

The structure and associated shared message data sets which also need recovery are automatically recovered. This value is the default for newly created CF structure objects with CFLEVEL(5).

**MQRECAUTO\_NO**

The structure is not automatically recovered. This value is the default if the CF structure object is not at CFLEVEL(5), and for existing CF structure objects that are changed to CFLEVEL(5).

This parameter is only valid from CFLEVEL(5).

**Recovery (MQCFIN)**

Specifies whether CF recovery is supported for the application structure (parameter identifier: MQIA\_CF\_RECOVER).

The value can be:

**MQCFR\_YES**

Recovery is supported.

**MQCFR\_NO**

Recovery is not supported.

**Replace (MQCFIN)**

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If a CF structure definition with the same name as *ToCFStructName* exists, this value specifies whether it is to be replaced. The value can be any of the following values:

**MQRP\_YES**

Replace existing definition.

**MQRP\_NO**

Do not replace existing definition.

**Change, Copy, and Create Channel**

The Change Channel command changes existing channel definitions. The Copy and Create Channel commands create new channel definitions - the Copy command uses attribute values of an existing channel definition.

The Change Channel (MQCMD\_CHANGE\_CHANNEL) command changes the specified attributes in a channel definition. For any optional parameters that are omitted, the value does not change.

The Copy Channel (MQCMD\_COPY\_CHANNEL) command creates new channel definition using, for attributes not specified in the command, the attribute values of an existing channel definition.

The Create Channel (MQCMD\_CREATE\_CHANNEL) command creates an IBM MQ channel definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager. If a system default channel exists for the type of channel being created, the default values are taken from there.

The following table shows the parameters that are applicable to each type of channel.

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	AMQP
<i>AMQPKeepAlive</i>									✓
<i>BatchHeartBeat</i>	✓	✓					✓	✓	
<i>BatchInterval</i>	✓	✓					✓	✓	
<i>BatchDataLimit</i>	✓	✓					✓	✓	
<i>BatchSize</i>	✓	✓	✓	✓			✓	✓

<u>UserIdentifier</u>	✓	✓		✓	✓		✓		
<u>XmitQName</u>	✓	✓							

**Note:**

1. Required parameter on Change and Create Channel commands.
2. Required parameter on Copy Channel command.
3. Required parameter on Change, Create, and Copy Channel commands.
4. PUTAUT is valid for a channel type of SVRCONN on z/OS only.
5. Required parameter on Create Channel command if TrpType is TCP.
6. Required parameter on Create Channel command for a channel type of MQTT.

**Required parameters (Change, Create Channel)**

**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Specifies the name of the channel definition to be changed, or created

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

This parameter is required on all types of channel; on a CLUSSDR it can be different from on the other channel types. If your convention for naming channels includes the name of the queue manager, you can make a CLUSSDR definition using the +QMNAME+ construction, and IBM MQ substitutes the correct repository queue manager name in place of +QMNAME+. This facility applies only to IBM i, UNIX, Linux, and Windows only. See [Configuring a queue manager cluster](#) for more details.

 On CLUSRCVR channels when using automatic cluster setup, this parameter can use some additional inserts:

- +AUTOCL+ resolves to the automatic cluster name
- +QMNAME+ resolves to the local queue manager name.

When using these inserts, both the unexpanded string and the string with the replaced values must fit inside the maximum size of the field. If there are configured automatic cluster full repositories in the AutoCluster configuration, the channel name must also fit in the maximum channel name length when +QMNAME+ is replaced with each of the configured full repository names.

**ChannelType (MQCFIN)**

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

**MQCHT\_SENDER**

Sender.

**MQCHT\_SERVER**

Server.

**MQCHT\_RECEIVER**

Receiver.

**MQCHT\_REQUESTER**

Requester.

**MQCHT\_SVRCONN**

Server-connection (for use by clients).

**MQCHT\_CLNTCONN**

Client connection.

**MQCHT\_CLUSRCVR**

Cluster-receiver.

**MQCHT\_CLUSSDR**

Cluster-sender.

**MQCHT\_AMQP**

AMQP.

**Required parameters (Copy Channel)****FromChannelName (MQCFST)**

From channel name (parameter identifier: MQCACF\_FROM\_CHANNEL\_NAME).

The name of the existing channel definition that contains values for the attributes that are not specified in this command.

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR or MQQSGD\_COPY to copy from. This parameter is ignored if a value of MQQSGD\_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToChannelName* and the disposition MQQSGD\_GROUP is searched for to copy from.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

**ChannelType (MQCFIN)**

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

**MQCHT\_SENDER**

Sender.

**MQCHT\_SERVER**

Server.

**MQCHT\_RECEIVER**

Receiver.

**MQCHT\_REQUESTER**

Requester.

**MQCHT\_SVRCONN**

Server-connection (for use by clients).

**MQCHT\_CLNTCONN**

Client connection.

**MQCHT\_CLUSRCVR**

Cluster-receiver.

**MQCHT\_CLUSSDR**

Cluster-sender.

**MQCHT\_AMQP**

AMQP.

**ToChannelName (MQCFST)**

To channel name (parameter identifier: MQCACF\_TO\_CHANNEL\_NAME).

The name of the new channel definition.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

Channel names must be unique; if a channel definition with this name exists, the value of *Replace* must be `MQRP_YES`. The channel type of the existing channel definition must be the same as the channel type of the new channel definition otherwise it cannot be replaced.

## Optional parameters (Change, Copy, and Create Channel)

### AMQPKeepAlive (MQCFIN)

The AMQP channel keep alive interval (parameter identifier: `MQIACH_AMQP_KEEP_ALIVE`).

The keep alive time for an AMQP channel in milliseconds. If the AMQP client has not sent any frames within the keep alive interval, then the connection is closed with a `amqp:resource-limit-exceeded` AMQP error condition.

This parameter is valid only for *ChannelType* values of `MQCHT_AMQP`.

### BatchHeartbeat (MQCFIN)

The batch heartbeat interval (parameter identifier: `MQIACH_BATCH_HB`).

Batch heartbeating allows sender-type channels to determine whether the remote channel instance is still active, before going in-doubt. The value can be in the range 0 - 999999. A value of 0 indicates that batch heart-beating is not to be used. Batch heartbeat is measured in milliseconds.

This parameter is valid only for *ChannelType* values of `MQCHT_SENDER`, `MQCHT_SERVER`, `MQCHT_CLUSSDR`, or `MQCHT_CLUSRCVR`.

### BatchInterval (MQCFIN)

Batch interval (parameter identifier: `MQIACH_BATCH_INTERVAL`). The approximate time in milliseconds that a channel keeps a batch open, if fewer than `BatchSize` messages or `BatchDataLimit` bytes have been transmitted in the current batch.

The batch is terminated when one of the following conditions is met:

- `BatchSize` messages have been sent.
- `BatchDataLimit` bytes have been sent.
- The transmission queue is empty and `BatchInterval` milliseconds have elapsed since the start of the batch.

`BatchInterval` must be in the range 0 - 999999999. A value of zero means that the batch is terminated as soon as the transmission queue becomes empty, or the `BatchSize` or `BatchDataLimit` is reached.

This parameter applies only to channels with a *ChannelType* of: `MQCHT_SENDER`, `MQCHT_SERVER`, `MQCHT_CLUSSDR`, or `MQCHT_CLUSRCVR`.

### BatchDataLimit (MQCFIN)

Batch data limit (parameter identifier: `MQIACH_BATCH_DATA_LIMIT`).

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

The value must be in the range 0 - 999999. The default value is 5000.

The **BATCHLIM** parameter is supported on all platforms.

This parameter only applies to channels with a *ChannelType* of `MQCHT_SENDER`, `MQCHT_SERVER`, `MQCHT_CLUSRCVR`, or `MQCHT_CLUSSDR`.

### BatchSize (MQCFIN)

Batch size (parameter identifier: `MQIACH_BATCH_SIZE`).

The maximum number of messages that must be sent through a channel before a checkpoint is taken.

The batch size which is used is the lowest of the following:

- The *BatchSize* of the sending channel
- The *BatchSize* of the receiving channel
- The maximum number of uncommitted messages at the sending queue manager
- The maximum number of uncommitted messages at the receiving queue manager

The maximum number of uncommitted messages is specified by the **MaxUncommittedMsgs** parameter of the Change Queue Manager command.

Specify a value in the range 1 - 9999.

This parameter is not valid for channels with a *ChannelType* of MQCHT\_SVRCONN or MQCHT\_CLNTCONN.

### **CertificateLabel (MQCFST)**

Certificate label (parameter identifier: MQCA\_CERT\_LABEL).

Certificate label for this channel to use.

The label identifies which personal certificate in the key repository is sent to the remote peer. If this attribute is blank, the certificate is determined by the queue manager **CertificateLabel** parameter.

Note that inbound channels (including receiver, requester, cluster-receiver, unqualified server, and server-connection channels) only send the configured certificate if the IBM MQ version of the remote peer fully supports certificate label configuration, and the channel is using a TLS CipherSpec.

An unqualified server channel is one that does not have the **ConnectionName** field set.

In all other cases, the queue manager **CertificateLabel** parameter determines the certificate sent. In particular, the following only ever receive the certificate configured by the **CertificateLabel** parameter of the queue manager, regardless of the channel-specific label setting:

- All current Java and JMS clients.
- Versions of IBM MQ prior to IBM MQ 8.0.

### **ChannelDesc (MQCFST)**

Channel description (parameter identifier: MQCACH\_DESC).

The maximum length of the string is MQ\_CHANNEL\_DESC\_LENGTH.

Use characters from the character set, identified by the coded character set identifier (CCSID) for the message queue manager on which the command is executing, to ensure that the text is translated correctly.

### **ChannelMonitoring (MQCFIN)**

Online monitoring data collection (parameter identifier: MQIA\_MONITORING\_CHANNEL).

Specifies whether online monitoring data is to be collected and, if so, the rate at which the data is collected. The value can be any of the following values:

#### **MQMON\_OFF**

Online monitoring data collection is turned off for this channel.

#### **MQMON\_Q\_MGR**

The value of the queue manager's **ChannelMonitoring** parameter is inherited by the channel.

#### **MQMON\_LOW**

If the value of the queue manager's *ChannelMonitoring* parameter is not MQMON\_NONE, online monitoring data collection is turned on, with a low rate of data collection, for this channel.

#### **MQMON\_MEDIUM**

If the value of the queue manager's *ChannelMonitoring* parameter is not MQMON\_NONE, online monitoring data collection is turned on, with a moderate rate of data collection, for this channel.

**MQMON\_HIGH**

If the value of the queue manager's *ChannelMonitoring* parameter is not MQMON\_NONE, online monitoring data collection is turned on, with a high rate of data collection, for this channel.

**ChannelStatistics (MQCFIN)**

Statistics data collection (parameter identifier: MQIA\_STATISTICS\_CHANNEL).

Specifies whether statistics data is to be collected and, if so, the rate at which the data is collected. The value can be:

**MQMON\_OFF**

Statistics data collection is turned off for this channel.

**MQMON\_Q\_MGR**

The value of the queue manager's **ChannelStatistics** parameter is inherited by the channel.

**MQMON\_LOW**

If the value of the queue manager's *ChannelStatistics* parameter is not MQMON\_NONE, online monitoring data collection is turned on, with a low rate of data collection, for this channel.

**MQMON\_MEDIUM**

If the value of the queue manager's *ChannelStatistics* parameter is not MQMON\_NONE, online monitoring data collection is turned on, with a moderate rate of data collection, for this channel.

**MQMON\_HIGH**

If the value of the queue manager's *ChannelStatistics* parameter is not MQMON\_NONE, online monitoring data collection is turned on, with a high rate of data collection, for this channel.

 On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

**ClientChannelWeight (MQCFIN)**

Client Channel Weight (parameter identifier: MQIACH\_CLIENT\_CHANNEL\_WEIGHT).

The client channel weighting attribute is used so client channel definitions can be selected at random, with the larger weightings having a higher probability of selection, when more than one suitable definition is available.

Specify a value in the range 0 - 99. The default is 0.

This parameter is only valid for channels with a ChannelType of MQCHT\_CLNTCONN

**ClusterName (MQCFST)**

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

The name of the cluster to which the channel belongs.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT\_CLUSSDR
- MQCHT\_CLUSRCVR

Only one of the values of *ClusterName* and *ClusterNameList* can be nonblank; the other must be blank.

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH.

**ClusterNameList (MQCFST)**

Cluster namelist (parameter identifier: MQCA\_CLUSTER\_NAMELIST).

The name, of the namelist, that specifies a list of clusters to which the channel belongs.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT\_CLUSSDR
- MQCHT\_CLUSRCVR

Only one of the values of *ClusterName* and *ClusterNameList* can be nonblank; the other must be blank.

#### **CLWLChannelPriority (MQCFIN)**

Channel priority for the purposes of cluster workload distribution (parameter identifier: MQIACH\_CLWL\_CHANNEL\_PRIORITY).

Specify a value in the range 0 - 9 where 0 is the lowest priority and 9 is the highest.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT\_CLUSSDR
- MQCHT\_CLUSRCVR

#### **CLWLChannelRank (MQCFIN)**

Channel rank for the purposes of cluster workload distribution (parameter identifier: MQIACH\_CLWL\_CHANNEL\_RANK).

Specify a value in the range 0 - 9 where 0 is the lowest priority and 9 is the highest.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT\_CLUSSDR
- MQCHT\_CLUSRCVR

#### **CLWLChannelWeight (MQCFIN)**

Channel weighting for the purposes of cluster workload distribution (parameter identifier: MQIACH\_CLWL\_CHANNEL\_WEIGHT).

Specify a weighting for the channel for use in workload management. Specify a value in the range 1 - 99 where 1 is the lowest priority and 99 is the highest.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT\_CLUSSDR
- MQCHT\_CLUSRCVR

#### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### **ConnectionAffinity (MQCFIN)**

Channel Affinity (parameter identifier: MQIACH\_CONNECTION\_AFFINITY)

The channel affinity attribute specifies whether client applications that connect multiple times using the same queue manager name, use the same client channel. The value can be any of the following values:

## MQCAFTY\_PREFERRED

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any zero ClientChannelWeight definitions first in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful nonzero ClientChannelWeight definitions are moved to the end of the list. Zero ClientChannelWeight definitions remain at the start of the list and are selected first for each connection. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created. Each client process with the same host name creates the same list.

This value is the default value.

## MQCAFTY\_NONE

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process independently select an applicable definition based on the weighting with any applicable zero ClientChannelWeight definitions selected first in alphabetical order. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created.

This parameter is only valid for channels with a ChannelType of MQCHT\_CLNTCONN.

## ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

**Multi** **V 9.1.4** On CLUSRCVR channels when using automatic cluster setup, this parameter can use some additional inserts:

- +AUTOCL+ resolves to the automatic cluster name
- +QMNAME+ resolves to the local queue manager name

In addition, any variable configured at queue manager create time, see the `crtmqm -iv` option, can be used surrounded by '+', for example +CONNAME+. When using these inserts, both the unexpanded inserts and the expanded values must fit inside the field maximum size.

**Multi** On [Multiplatforms](#), the maximum length of the string is 264.

**z/OS** On z/OS, the maximum length of the string is 48.

Specify *ConnectionName* as a comma-separated list of names of machines for the stated *TransportType*. Typically, only one machine name is required. You can provide multiple machine names to configure multiple connections with the same properties. The connections are tried in the order they are specified in the connection list until a connection is successfully established. If no connection is successful, the channel starts to try processing again. Connection lists are an alternative to queue manager groups to configure connections for reconnectable clients, and also to configure channel connections to multi-instance queue managers.

Specify the name of the machine as required for the stated *TransportType*:

- For MQXPT\_LU62 on IBM i, and UNIX, specify the name of the CPI-C communications side object. On Windows specify the CPI-C symbolic destination name.

**z/OS** On z/OS, there are two forms in which to specify the value:

### Logical unit name

The logical unit information for the queue manager, comprising the logical unit name, TP name, and optional mode name. This name can be specified in one of three forms:

Form	Example
luname	IGY12355
luname/TPname	IGY12345/APING

Table 304. Logical unit names and forms (continued)	
Form	Example
luname/TPname/modename	IGY12345/APINGD/#INTER

For the first form, the TP name and mode name must be specified for the *TpName* and *ModeName* parameters; otherwise these parameters must be blank.

**Note:** For client-connection channels, only the first form is allowed.

### Symbolic name

The symbolic destination name for the logical unit information for the queue manager, as defined in the side information data set. The **TpName** and **ModeName** parameters must be blank.

**Note:** For cluster-receiver channels, the side information is on the other queue managers in the cluster. Alternatively, in this case it can be a name that a channel auto-definition exit can resolve into the appropriate logical unit information for the local queue manager.

The specified or implied LU name can be that of a VTAM generic resources group.

- For MQXPT\_TCP, you can specify a connection name, or a connection list, containing the host name or the network address of the remote machine. Separate connection names in a connection list with commas.

**z/OS** On z/OS, the connection name can include the IP\_name of a z/OS dynamic DNS group or a network dispatcher input port. Do not include this parameter for channels with a *ChannelType* value of MQCHT\_CLUSSDR.

**Multi** On Multiplatforms, the TCP/IP connection name parameter of a cluster-receiver channel is optional. If you leave the connection name blank, IBM MQ generates a connection name for you, assuming the default port and using the current IP address of the system. You can override the default port number, but still use the current IP address of the system. For each connection name leave the IP name blank, and provide the port number in parentheses; for example:

```
(1415)
```

The generated **CONNNAME** is always in the dotted decimal (IPv4) or hexadecimal (IPv6) form, rather than in the form of an alphanumeric DNS host name.

- For MQXPT\_NETBIOS specify the NetBIOS station name.
- For MQXPT\_SPX specify the 4 byte network address, the 6 byte node address, and the 2 byte socket number. These values must be entered in hexadecimal, with a period separating the network and node addresses. The socket number must be enclosed in brackets, for example:

```
0a0b0c0d.804abcde23a1(5e86)
```

If the socket number is omitted, the IBM MQ default value (5e86 hex) is assumed.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_REQUESTER, MQCHT\_CLNTCONN, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

**Note:** If you are using clustering between IPv6 -only and IPv4 -only queue managers, do not specify an IPv6 network address as the *ConnectionName* for cluster-receiver channels. A queue manager that is capable only of IPv4 communication is unable to start a cluster sender channel definition that specifies the *ConnectionName* in IPv6 hexadecimal form. Consider, instead, using host names in a heterogeneous IP environment.

### DataConversion (MQCFIN)

Whether sender must convert application data (parameter identifier: MQIACH\_DATA\_CONVERSION).

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

The value can be any of the following values:

**MQCDC\_NO\_SENDER\_CONVERSION**

No conversion by sender.

**MQCDC\_SENDER\_CONVERSION**

Conversion by sender.

**DefaultChannelDisposition (MQCFIN)**

Intended disposition of the channel when activated or started (parameter identifier: MQIACH\_DEF\_CHANNEL\_DISP).

This parameter applies to z/OS only.

The value can be any of the following values:

**MQCHLD\_PRIVATE**

The intended use of the object is as a private channel.

This value is the default value.

**MQCHLD\_FIXSHARED**

The intended use of the object is as a fixshared channel.

**MQCHLD\_SHARED**

The intended use of the object is as a shared channel.

**DefReconnect (MQCFIN)**

Client channel default reconnection option (parameter identifier: MQIACH\_DEF\_RECONNECT).

The default automatic client reconnection option. You can configure an IBM MQ MQI client to automatically reconnect a client application. The IBM MQ MQI client tries to reconnect to a queue manager after a connection failure. It tries to reconnect without the application client issuing an MQCONN or MQCONNX MQI call.

**MQRCN\_NO**

MQRCN\_NO is the default value.

Unless overridden by **MQCONNX**, the client is not reconnected automatically.

**MQRCN\_YES**

Unless overridden by **MQCONNX**, the client reconnects automatically.

**MQRCN\_Q\_MGR**

Unless overridden by **MQCONNX**, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO\_RECONNECT\_Q\_MGR.

**MQRCN\_DISABLED**

Reconnection is disabled, even if requested by the client program using the **MQCONNX** MQI call.

*Table 305. Automatic reconnection depends on the values set in the application and in the channel definition*

DefReconnect	Reconnection options set in the application			
	MQCNO_RECONNE CT	MQCNO_RECONNE CT_Q_MGR	MQCNO_RECONNE CT_AS_DEF	MQCNO_RECONNE CT_DISABLED
MQRCN_NO	YES	QMGR	NO	NO
MQRCN_YES	YES	QMGR	YES	NO
MQRCN_Q_MGR	YES	QMGR	QMGR	NO
MQRCN_DISABLED	NO	NO	NO	NO

This parameter is valid only for a *ChannelType* value of MQCHT\_CLNTCONN.

### **DiscInterval (MQCFIN)**

Disconnection interval (parameter identifier: MQIACH\_DISC\_INTERVAL).

This interval defines the maximum number of seconds that the channel waits for messages to be put on a transmission queue before terminating the channel. A value of zero causes the message channel agent to wait indefinitely.

Specify a value in the range 0 - 999 999.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER MQCHT\_SERVER, MQCHT\_SVRCONN, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

For server-connection channels using the TCP protocol, this interval is the minimum time in seconds for which the server-connection channel instance remains active without any communication from its partner client. A value of zero disables this disconnect processing. The server-connection inactivity interval only applies between MQ API calls from a client, so no client is disconnected during an extended MQGET with wait call. This attribute is ignored for server-connection channels using protocols other than TCP.

### **HeaderCompression (MQCFIL)**

Header data compression techniques supported by the channel (parameter identifier: MQIACH\_HDR\_COMPRESSION).

The list of header data compression techniques supported by the channel. For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The mutually supported compression techniques of the channel are passed to the message exit of the sending channel where the compression technique used can be altered on a per message basis. Compression alters the data passed to send and receive exits.

Specify one or more of:

#### **MQCOMPRESS\_NONE**

No header data compression is performed. This value is the default value.

#### **MQCOMPRESS\_SYSTEM**

Header data compression is performed.

### **HeartbeatInterval (MQCFIN)**

Heartbeat interval (parameter identifier: MQIACH\_HB\_INTERVAL).

The interpretation of this parameter depends on the channel type, as follows:

- For a channel type of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_RECEIVER, MQCHT\_REQUESTER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR, this interval is the time in seconds between heartbeat flows passed from the sending MCA when there are no messages on the transmission queue. This interval gives the receiving MCA the opportunity to quiesce the channel. To be useful, *HeartbeatInterval* must be less than *DiscInterval*. However, the only check is that the value is within the permitted range.

This type of heartbeat is supported on the following platforms: IBM i, UNIX, Windows, and z/OS.

- For a channel type of MQCHT\_CLNTCONN or MQCHT\_SVRCONN, this interval is the time in seconds between heartbeat flows passed from the server MCA when that MCA has issued an MQGET call with the MQGMO\_WAIT option on behalf of a client application. This interval allows the server MCA to handle situations where the client connection fails during an MQGET with MQGMO\_WAIT.

This type of heartbeat is supported on all platforms.

The value must be in the range 0 - 999 999. A value of 0 means that no heartbeat exchange occurs. The value that is used is the larger of the values specified at the sending side and receiving side.

### **KeepAliveInterval (MQCFIN)**

KeepAlive interval (parameter identifier: MQIACH\_KEEP\_ALIVE\_INTERVAL).

Specifies the value passed to the communications stack for KeepAlive timing for the channel.

For this attribute to be effective, TCP/IP keepalive must be enabled. On z/OS, you enable TCP/IP keepalive by issuing the Change Queue Manager command with a value of MQTCPKEEP in the *TCPKeepAlive* parameter; if the *TCPKeepAlive* queue manager parameter has a value of MQTCPKEEP\_NO, the value is ignored, and the KeepAlive facility is not used. On other platforms, TCP/IP keepalive is enabled when the KEEPALIVE=YES parameter is specified in the TCP stanza in the distributed queuing configuration file, qm.ini, or through the IBM MQ Explorer. Keepalive must also be enabled within TCP/IP itself, using the TCP profile configuration data set.

Although this parameter is available on all platforms, its setting is implemented only on z/OS. On platforms other than z/OS, you can access and modify the parameter, but it is only stored and forwarded; there is no functional implementation of the parameter. This parameter is useful in a clustered environment where a value set in a cluster-receiver channel definition on AIX, for example, flows to (and is implemented by) z/OS queue managers that are in, or join, the cluster.

Specify either:

#### **integer**

The KeepAlive interval to be used, in seconds, in the range 0 - 99 999. If you specify a value of 0, the value used is that specified by the INTERVAL statement in the TCP profile configuration data set.

#### **MQKAI\_AUTO**

The KeepAlive interval is calculated based upon the negotiated heartbeat value as follows:

- If the negotiated *HeartbeatInterval* is greater than zero, KeepAlive interval is set to that value plus 60 seconds.
- If the negotiated *HeartbeatInterval* is zero, the value used is that specified by the INTERVAL statement in the TCP profile configuration data set.

 On Multiplatforms, if you need the functionality provided by the **KeepAliveInterval** parameter, use the **HeartBeatInterval** parameter.

#### **LocalAddress (MQCFST)**

Local communications address for the channel (parameter identifier: MQCACH\_LOCAL\_ADDRESS).

The maximum length of the string is MQ\_LOCAL\_ADDRESS\_LENGTH.

The value that you specify depends on the transport type (*TransportType*) to be used:

#### **TCP/IP**

The value is the optional IP address and optional port or port range to be used for outbound TCP/IP communications. The format for this information is as follows:

```
LOCLADDR([ip-addr][(low-port[,high-port])][, [ip-addr][(low-port[,high-port])]])
```

where *ip-addr* is specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric form, and *low-port* and *high-port* are port numbers enclosed in parentheses. All are optional.

Specify `[, [ip-addr][(low-port[,high-port])]]` multiple times for each additional local address. Use multiple local addresses if you want to specify a specific subset of local network adapters. You can also use `[, [ip-addr][(low-port[,high-port])]]` to represent a particular local network address on different servers that are part of a multi-instance queue manager configuration.

#### **All Others**

The value is ignored; no error is diagnosed.

Use this parameter if you want a channel to use a particular IP address, port, or port range for outbound communications. This parameter is useful when a machine is connected to multiple networks with different IP addresses.

Examples of use

Table 306. Meanings of example IP addresses, ports, and port ranges

Value	Meaning
9.20.4.98	Channel binds to this address locally
9.20.4.98 (1000)	Channel binds to this address and port 1000 locally
9.20.4.98 (1000,2000)	Channel binds to this address and uses a port in the range 1000 - 2000 locally
(1000)	Channel binds to port 1000 locally
(1000,2000)	Channel binds to a port in the range 1000 - 2000 locally

This parameter is valid for the following channel types:

- MQCHT\_SENDER
- MQCHT\_SERVER
- MQCHT\_REQUESTER
- MQCHT\_CLNTCONN
- MQCHT\_CLUSRCVR
- MQCHT\_CLUSSDR

**Note:**

- Do not confuse this parameter with *ConnectionName*. The *LocalAddress* parameter specifies the characteristics of the local communications; the *ConnectionName* parameter specifies how to reach a remote queue manager.

**LongRetryCount (MQCFIN)**

Long retry count (parameter identifier: MQIACH\_LONG\_RETRY).

When a sender or server channel is attempting to connect to the remote machine, and the count specified by *ShortRetryCount* has been exhausted, this count specifies the maximum number of further attempts that are made to connect to the remote machine, at intervals specified by *LongRetryInterval*.

If this count is also exhausted without success, an error is logged to the operator, and the channel is stopped. The channel must later be restarted with a command (it is not started automatically by the channel initiator), and it then makes only one attempt to connect, as it is assumed that the problem has now been cleared by the administrator. The retry sequence is not carried out again until after the channel has successfully connected.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

**LongRetryInterval (MQCFIN)**

Long timer (parameter identifier: MQIACH\_LONG\_TIMER).

Specifies the long retry wait interval for a sender or server channel that is started automatically by the channel initiator. It defines the interval in seconds between attempts to establish a connection to the remote machine, after the count specified by *ShortRetryCount* has been exhausted.

The time is approximate; zero means that another connection attempt is made as soon as possible.

Specify a value in the range 0 - 999 999. Values exceeding this value are treated as 999 999.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

### **MaxInstances (MQCFIN)**

Maximum number of simultaneous instances of a server-connection channel or an AMQP channel (parameter identifier: MQIACH\_MAX\_INSTANCES).

Specify a value in the range 0 - 999 999 999.

The default value is 999 999 999.

A value of zero indicates that no client connections are allowed on the channel.

If the value is reduced below the number of instances of the server-connection channel that are currently running, the running channels are not affected. This parameter applies even if the value is zero. However, if the value is reduced below the number of instances of the server-connection channel that are currently running, then new instances cannot be started until sufficient existing instances have ceased to run.

If an AMQP client attempts to connect to an AMQP channel, and the number of connected clients has reached MaxInstances, the channel closes the connection with a close frame. The close frame contains the following message: `amqp:resource-limit-exceeded`. If a client connects with an ID that is already connected (that is, it performs a client-takeover), and the client is permitted to take over the connection, the takeover will succeed regardless of whether the number of connected clients has reached MaxInstances.

This parameter is valid only for channels with a *ChannelType* value of MQCHT\_SVRCONN or MQCHT\_AMQP.

### **MaxInstancesPerClient (MQCFIN)**

Maximum number of simultaneous instances of a server-connection channel that can be started from a single client (parameter identifier: MQIACH\_MAX\_INSTS\_PER\_CLIENT). In this context, connections that originate from the same remote network address are regarded as coming from the same client.

Specify a value in the range 0 - 999 999 999.

The default value is 999 999 999.

A value of zero indicates that no client connections are allowed on the channel.

If the value is reduced below the number of instances of the server-connection channel that are currently running from individual clients, the running channels are not affected. This parameter applies even if the value is zero. However, if the value is reduced below the number of instances of the server-connection channel that are currently running from individual clients, new instances from those clients cannot start until sufficient existing instances have ceased to run.

This parameter is valid only for channels with a *ChannelType* value of MQCHT\_SVRCONN.

### **MaxMsgLength (MQCFIN)**

Maximum message length (parameter identifier: MQIACH\_MAX\_MSG\_LENGTH).

Specifies the maximum message length that can be transmitted on the channel. This value is compared with the value for the remote channel and the actual maximum is the lower of the two values.

The value zero means the maximum message length for the queue manager.

The lower limit for this parameter is 0. The maximum message length is 100 MB (104 857 600 bytes).

### **MCAName (MQCFST)**

Message channel agent name (parameter identifier: MQCACH\_MCA\_NAME).

**Note:** An alternative way of providing a user ID for a channel to run under is to use channel authentication records. With channel authentication records, different connections can use the same channel while using different credentials. If both MCAUSER on the channel is set and channel authentication records are used to apply to the same channel, the channel authentication records take precedence. The MCAUSER on the channel definition is only used if the channel authentication record uses USERSRC(CHANNEL). For more details, see [Channel authentication records](#)

This parameter is reserved, and if specified can be set only to blanks.

The maximum length of the string is MQ\_MCA\_NAME\_LENGTH.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_REQUESTER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

### MCAType (MQCFIN)

Message channel agent type (parameter identifier: MQIACH\_MCA\_TYPE).

Specifies the type of the message channel agent program.

**Multi** On Multiplatforms, this parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_REQUESTER, or MQCHT\_CLUSSDR.

**z/OS** On z/OS, this parameter is valid only for a *ChannelType* value of MQCHT\_CLURCVR.

The value can be any of the following values:

#### MQMCAT\_PROCESS

Process.

#### MQMCAT\_THREAD

Thread.

### MCAUserIdentifier (MQCFST)

Message channel agent user identifier (parameter identifier: MQCACH\_MCA\_USER\_ID).

If this parameter is nonblank, it is the user identifier which is to be used by the message channel agent for authorization to access IBM MQ resources, including (if *PutAuthority* is MQPA\_DEFAULT) authorization to put the message to the destination queue for receiver or requester channels.

If it is blank, the message channel agent uses its default user identifier.

This user identifier can be overridden by one supplied by a channel security exit.

This parameter is not valid for channels with a *ChannelType* of MQCHT\_SDR, MQCHT\_SVR, MQCHT\_CLNTCONN, MQCHT\_CLUSSDR.

The maximum length of the MCA user identifier depends on the environment in which the MCA is running. MQ\_MCA\_USER\_ID\_LENGTH gives the maximum length for the environment for which your application is running. MQ\_MAX\_MCA\_USER\_ID\_LENGTH gives the maximum for all supported environments.

On Windows, you can optionally qualify a user identifier with the domain name in the following format:

```
user@domain
```

### MessageCompression (MQCFIL)

The list of message data compression techniques supported by the channel (parameter identifier: MQIACH\_MSG\_COMPRESSION). For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The mutually supported compression techniques of the channel are passed to the message exit of the sending channel where the compression technique used can be altered on a per message basis. Compression alters the data passed to send and receive exits.

Specify one or more of:

#### MQCOMPRESS\_NONE

No message data compression is performed. This value is the default value.

#### MQCOMPRESS\_RLE

Message data compression is performed using run-length encoding.

#### MQCOMPRESS\_ZLIBFAST

Message data compression is performed using ZLIB encoding with speed prioritized.

### **MQCOMPRESS\_ZLIBHIGH**

Message data compression is performed using ZLIB encoding with compression prioritized.

### **MQCOMPRESS\_ANY**

Any compression technique supported by the queue manager can be used. This value is only valid for receiver, requester, and server-connection channels.

### **ModeName (MQCFST)**

Mode name (parameter identifier: MQCACH\_MODE\_NAME).

This parameter is the LU 6.2 mode name.

The maximum length of the string is MQ\_MODE\_NAME\_LENGTH.

- On IBM i, UNIX, and Windows, this parameter can be set only to blanks. The actual name is taken instead from the CPI-C Communications Side Object or (on Windows ) from the CPI-C symbolic destination name properties.

This parameter is valid only for channels with a *TransportType* of MQXPT\_LU62. It is not valid for receiver or server-connection channels.

### **MsgExit (MQCFSL)**

Message exit name (parameter identifier: MQCACH\_MSG\_EXIT\_NAME).

If a nonblank name is defined, the exit is invoked immediately after a message has been retrieved from the transmission queue. The exit is given the entire application message and message descriptor for modification.

For channels with a channel type (*ChannelType*) of MQCHT\_SVRCONN or MQCHT\_CLNTCONN, this parameter is accepted but ignored, since message exits are not invoked for such channels.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

You can specify a list of exit names by using an MQCFSL structure instead of an MQCFST structure.

- The exits are invoked in the order specified in the list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit names in the list (excluding trailing blanks in each name) must not exceed MQ\_TOTAL\_EXIT\_NAME\_LENGTH. An individual string must not exceed MQ\_EXIT\_NAME\_LENGTH.
- On z/OS, you can specify the names of up to eight exit programs.

### **MsgRetryCount (MQCFIN)**

Message retry count (parameter identifier: MQIACH\_MR\_COUNT).

Specifies the number of times that a failing message must be retried.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT\_RECEIVER, MQCHT\_REQUESTER, or MQCHT\_CLUSRCVR.

### **MsgRetryExit (MQCFST)**

Message retry exit name (parameter identifier: MQCACH\_MR\_EXIT\_NAME).

If a nonblank name is defined, the exit is invoked before performing a wait before retrying a failing message.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

This parameter is valid only for *ChannelType* values of MQCHT\_RECEIVER, MQCHT\_REQUESTER, or MQCHT\_CLUSRCVR.

#### **MsgRetryInterval (MQCFIN)**

Message retry interval (parameter identifier: MQIACH\_MR\_INTERVAL).

Specifies the minimum time interval in milliseconds between retries of failing messages.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT\_RECEIVER, MQCHT\_REQUESTER, or MQCHT\_CLUSRCVR.

#### **MsgRetryUserData (MQCFST)**

Message retry exit user data (parameter identifier: MQCACH\_MR\_EXIT\_USER\_DATA).

Specifies user data that is passed to the message retry exit.

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

This parameter is valid only for *ChannelType* values of MQCHT\_RECEIVER, MQCHT\_REQUESTER, or MQCHT\_CLUSRCVR.

#### **MsgUserData (MQCFSL)**

Message exit user data (parameter identifier: MQCACH\_MSG\_EXIT\_USER\_DATA).

Specifies user data that is passed to the message exit.

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

For channels with a channel type (*ChannelType*) of MQCHT\_SVRCONN or MQCHT\_CLNTCONN, this parameter is accepted but ignored, since message exits are not invoked for such channels.

You can specify a list of exit user data strings by using an MQCFSL structure instead of an MQCFST structure.

- Each exit user data string is passed to the exit at the same ordinal position in the *MsgExit* list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit user data in the list (excluding trailing blanks in each string) must not exceed MQ\_TOTAL\_EXIT\_DATA\_LENGTH. An individual string must not exceed MQ\_EXIT\_DATA\_LENGTH.
- On z/OS, you can specify up to eight strings.

#### **NetworkPriority (MQCFIN)**

Network priority (parameter identifier: MQIACH\_NETWORK\_PRIORITY).

The priority for the network connection. If there are multiple paths available, distributed queuing selects the path with the highest priority.

The value must be in the range 0 (lowest) - 9 (highest).

This parameter applies only to channels with a *ChannelType* of MQCHT\_CLUSRCVR

#### **NonPersistentMsgSpeed (MQCFIN)**

Speed at which nonpersistent messages are to be sent (parameter identifier: MQIACH\_NPM\_SPEED).

This parameter is supported in the following environments: IBM i, UNIX, Linux, and Windows.

Specifying MQNPMS\_FAST means that nonpersistent messages on a channel need not wait for a syncpoint before being made available for retrieval. The advantage of this is that nonpersistent

messages become available for retrieval far more quickly. The disadvantage is that because they do not wait for a syncpoint, they might be lost if there is a transmission failure.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_RECEIVER, MQCHT\_REQUESTER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR. The value can be any of the following values:

**MQNPMS\_NORMAL**

Normal speed.

**MQNPMS\_FAST**

Fast speed.

**Password (MQCFST)**

Password (parameter identifier: MQCACH\_PASSWORD).

This parameter is used by the message channel agent when attempting to initiate a secure SNA session with a remote message channel agent. On IBM i, HP Integrity NonStop Server, and UNIX, it is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_REQUESTER, MQCHT\_CLNTCONN, or MQCHT\_CLUSSDR. On z/OS, it is valid only for a *ChannelType* value of MQCHT\_CLNTCONN.

The maximum length of the string is MQ\_PASSWORD\_LENGTH. However, only the first 10 characters are used.

**Port (MQCFIN)**

Port number (parameter identifier MQIACH\_PORT).

The port number used to connect an AMQP channel. The default port for AMQP 1.0 connections is 5672. If you are already using port 5672, you can specify a different port.

This attribute is applicable to AMQP channels.

**PropertyControl (MQCFIN)**

Property control attribute (parameter identifier MQIA\_PROPERTY\_CONTROL).

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor). The value can be any of the following values:

**MQPROP\_COMPATIBILITY**

If the message contains a property with a prefix of **mcd.**, **jms.**, **usr.** or **mqext.**, all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those properties contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

This value is the default value; it allows applications which expect JMS-related properties to be in an MQRFH2 header in the message data to continue to work unmodified.

**MQPROP\_NONE**

All properties of the message, except those properties in the message descriptor (or extension), are removed from the message before the message is sent to the remote queue manager.

**MQPROP\_ALL**

All properties of the message are included with the message when it is sent to the remote queue manager. The properties, except those properties in the message descriptor (or extension), are placed in one or more MQRFH2 headers in the message data.

This attribute is applicable to Sender, Server, Cluster Sender, and Cluster Receiver channels.

**PutAuthority (MQCFIN)**

Put authority (parameter identifier: MQIACH\_PUT\_AUTHORITY).

Specifies which user identifiers are used to establish authority to put messages to the destination queue (for message channels) or to execute an MQI call (for MQI channels).

This parameter is valid only for channels with a *ChannelType* value of MQCHT\_RECEIVER, MQCHT\_REQUESTER, MQCHT\_CLUSRCVR, or MQCHT\_SVRCONN.

The value can be any of the following values:

**MQPA\_DEFAULT**

Default user identifier is used.

**z/OS** On z/OS, MQPA\_DEFAULT might involve using both the user ID received from the network and that derived from MCAUSER.

**MQPA\_CONTEXT**

The user ID from the *UserIdentifier* field of the message descriptor is used.

**z/OS** On z/OS, MQPA\_CONTEXT might involve also using the user ID received from the network or that derived from MCAUSER, or both.

**MQPA\_ALTERNATE\_OR\_MCA**

The user ID from the *UserIdentifier* field of the message descriptor is used. Any user ID received from the network is not used. This value is supported only on z/OS.

**MQPA\_ONLY\_MCA**

The user ID derived from MCAUSER is used. Any user ID received from the network is not used. This value is supported only on z/OS.

**QMgrName (MQCFST)**

Queue manager name (parameter identifier: MQCA\_Q\_MGR\_NAME).

For channels with a *ChannelType* of MQCHT\_CLNTCONN, this name is the name of a queue manager to which a client application can request connection.

For channels of other types, this parameter is not valid. The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

**z/OS**

**QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

Table 307. QSGDisposition: Where objects are defined and how they behave		
QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToChannelName</i> object (for Copy) or <i>ChannelName</i> object (for Create).

Table 307. QSGDisposition: Where objects are defined and how they behave (continued)

QSGDisposition	Change	Copy, Create
<b>MQQSGD_GROUP</b>	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to attempt to refresh local copies on page set zero:</p> <pre>DEFINE CHANNEL(channel-name) CHLTYPE(type) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This definition is allowed only if the queue manager is in a queue sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to attempt to make or refresh local copies on page set zero:</p> <pre>DEFINE CHANNEL(channel-name) CHLTYPE(type) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
<b>MQQSGD_PRIVATE</b>	<p>The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.</p>	Not permitted.
<b>MQQSGD_Q_MGR</b>	<p>The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.</p>	<p>The object is defined on the page set of the queue manager that executes the command. This value is the default value.</p>

### ReceiveExit (MQCFSL)

Receive exit name (parameter identifier: MQCACH\_RCV\_EXIT\_NAME).

If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

You can specify a list of exit names by using an MQCFSL structure instead of an MQCFST structure.

- The exits are invoked in the order specified in the list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.

- The total length of all the exit names in the list (excluding trailing blanks in each name) must not exceed MQ\_TOTAL\_EXIT\_NAME\_LENGTH. An individual string must not exceed MQ\_EXIT\_NAME\_LENGTH.
- On z/OS, you can specify the names of up to eight exit programs.

### ReceiveUserData (MQCFSL)

Receive exit user data (parameter identifier: MQCACH\_RCV\_EXIT\_USER\_DATA).

Specifies user data that is passed to the receive exit.

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

You can specify a list of exit user data strings by using an MQCFSL structure instead of an MQCFST structure.

- Each exit user data string is passed to the exit at the same ordinal position in the *ReceiveExit* list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit user data in the list (excluding trailing blanks in each string) must not exceed MQ\_TOTAL\_EXIT\_DATA\_LENGTH. An individual string must not exceed MQ\_EXIT\_DATA\_LENGTH.
- On z/OS, you can specify up to eight strings.

### Replace (MQCFIN)

Replace channel definition (parameter identifier: MQIACF\_REPLACE).

The value can be any of the following values:

#### MQRP\_YES

Replace existing definition.

If *ChannelType* is MQCHT\_CLUSSDR, MQRP\_YES can be specified only if the channel was created manually.

#### MQRP\_NO

Do not replace existing definition.

### SecurityExit (MQCFST)

Security exit name (parameter identifier: MQCACH\_SEC\_EXIT\_NAME).

If a nonblank name is defined, the security exit is invoked at the following times:

- Immediately after establishing a channel.
 

Before any messages are transferred, the exit is enabled to instigate security flows to validate connection authorization.
- Upon receipt of a response to a security message flow.
 

Any security message flows received from the remote processor on the remote machine are passed to the exit.

The exit is given the entire application message and message descriptor for modification.

The format of the string depends on the platform, as follows:

- On IBM i and UNIX, it is of the form

```
libraryname(functionname)
```

**Note:** On IBM i systems, the following form is also supported for compatibility with older releases:

```
progrname libname
```

where *programe* occupies the first 10 characters, and *libname* the second 10 characters (both blank-padded to the right if necessary).

- On Windows, it is of the form

```
dllname(functionname)
```

where *dllname* is specified without the suffix .DLL.

- On z/OS, it is a load module name, maximum length 8 characters (128 characters are allowed for exit names for client-connection channels, subject to a maximum total length of 999).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

### **SecurityUserData (MQCFST)**

Security exit user data (parameter identifier: MQCACH\_SEC\_EXIT\_USER\_DATA).

Specifies user data that is passed to the security exit.

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

### **SendExit (MQCFSL)**

Send exit name (parameter identifier: MQCACH\_SEND\_EXIT\_NAME).

If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

You can specify a list of exit names by using an MQCFSL structure instead of an MQCFST structure.

- The exits are invoked in the order specified in the list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit names in the list (excluding trailing blanks in each name) must not exceed MQ\_TOTAL\_EXIT\_NAME\_LENGTH. An individual string must not exceed MQ\_EXIT\_NAME\_LENGTH.
- On z/OS, you can specify the names of up to eight exit programs.

### **SendUserData (MQCFSL)**

Send exit user data (parameter identifier: MQCACH\_SEND\_EXIT\_USER\_DATA).

Specifies user data that is passed to the send exit.

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

You can specify a list of exit user data strings by using an MQCFSL structure instead of an MQCFST structure.

- Each exit user data string is passed to the exit at the same ordinal position in the *SendExit* list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit user data in the list (excluding trailing blanks in each string) must not exceed MQ\_TOTAL\_EXIT\_DATA\_LENGTH. An individual string must not exceed MQ\_EXIT\_DATA\_LENGTH.

- On z/OS, you can specify up to eight strings.

### **SeqNumberWrap (MQCFIN)**

Sequence wrap number (parameter identifier: MQIACH\_SEQUENCE\_NUMBER\_WRAP).

Specifies the maximum message sequence number. When the maximum is reached, sequence numbers wrap to start again at 1.

The maximum message sequence number is not negotiable; the local and remote channels must wrap at the same number.

Specify a value in the range 100 - 999 999 999.

This parameter is not valid for channels with a *ChannelType* of MQCHT\_SVRCONN or MQCHT\_CLNTCONN.

### **SharingConversations (MQCFIN)**

Maximum number of sharing conversations (parameter identifier: MQIACH\_SHARING\_CONVERSATIONS).

Specifies the maximum number of conversations that can share a particular TCP/IP MQI channel instance (socket).

Specify a value in the range 0 - 999 999 999. The default value is 10 and the migrated value is 10.

This parameter is valid only for channels with a *ChannelType* of MQCHT\_CLNTCONN or MQCHT\_SVRCONN. It is ignored for channels with a *TransportType* other than MQXPT\_TCP.

The number of shared conversations does not contribute to the *MaxInstances* or *MaxInstancesPerClient* totals.

A value of:

**1**

Means that there is no sharing of conversations over a TCP/IP channel instance, but client heartbeating is available whether in an MQGET call or not, read ahead and client asynchronous consumption are available, and channel quiescing is more controllable.

**0**

Specifies no sharing of conversations over a TCP/IP channel instance. The channel instance runs in a mode before that of IBM WebSphere MQ 7.0, regarding:

- Administrator stop-quiesce
- Heartbeating
- Read ahead
- Client asynchronous consumption

### **ShortRetryCount (MQCFIN)**

Short retry count (parameter identifier: MQIACH\_SHORT\_RETRY).

The maximum number of attempts that are made by a sender or server channel to establish a connection to the remote machine, at intervals specified by *ShortRetryInterval* before the (normally longer) *LongRetryCount* and *LongRetryInterval* are used.

Retry attempts are made if the channel fails to connect initially (whether it is started automatically by the channel initiator or by an explicit command), and also if the connection fails after the channel has successfully connected. However, if the cause of the failure is such that retry is unlikely to be successful, retries are not attempted.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

### **ShortRetryInterval (MQCFIN)**

Short timer (parameter identifier: MQIACH\_SHORT\_TIMER).

Specifies the short retry wait interval for a sender or server channel that is started automatically by the channel initiator. It defines the interval in seconds between attempts to establish a connection to the remote machine.

The time is approximate. From IBM MQ 8.0, zero means that another connection attempt is made as soon as possible.

Specify a value in the range 0 - 999 999. Values exceeding this value are treated as 999 999.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

### **SPLProtection (MQCFIN)**

SPLProtection (parameter identifier: MQIACH\_SPL\_PROTECTION). This parameter applies to z/OS only, from IBM MQ 9.1.3 onwards.

Security policy protection parameter. Specifies what happens to messages across the channel when Advanced Message Security is active and an applicable policy exists.

This parameter is valid for channel types MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_RECEIVER, and MQCHT\_REQUESTER only.

Possible values are:

#### **MQSPL\_PASSTHRU**

Pass through, unchanged, any messages sent or received by the message channel agent for this channel.

This value is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_RECEIVER, or MQCHT\_REQUESTER, and is the default value.

#### **MQSPL\_REMOVE**

Remove any AMS protection from messages retrieved from the transmission queue by the message channel agent, and send the messages to the partner.

When the MCA gets a message from the transmission queue, if an AMS policy is defined for the transmission queue, it is applied to remove any AMS protection from the message prior to sending the message across the channel. If an AMS policy is not defined for the transmission queue, the message is sent as is.

This value is valid only for *ChannelType* values of MQCHT\_SENDER or MQCHT\_SERVER.

#### **MQSPL\_AS\_POLICY**

Based on the policy defined for the target queue, apply AMS protection to inbound messages prior to putting them on to the target queue.

When the message channel agent receives an inbound message, if an AMS policy is defined for the target queue, AMS protection is applied to the message prior to the message being put to the target queue. If an AMS policy is not defined for the target queue, the message is put to the target queue as is.

This value is valid only for *ChannelType* values of MQCHT\_RECEIVER or MQCHT\_REQUESTER.

### **SSLCipherSpec (MQCFST)**

CipherSpec (parameter identifier: MQCACH\_SSL\_CIPHER\_SPEC). Specifies the CipherSpec that is used on the channel. The length of the string is MQ\_SSL\_CIPHER\_SPEC\_LENGTH.

**Attention:**   On IBM MQ for z/OS, you can also specify the two digit hexadecimal code of a CipherSpec, whether or not it appears in the following table. On IBM i, you can also specify the two digit hexadecimal code of a CipherSpec, whether or not it appears in the following table. Also, on IBM i, installation of AC3 is a prerequisite for the use of TLS. You should not specify hexadecimal cipher values in SSLCipherSpec, because it is unclear from the value which cipher will be used, and the choice of which protocol to be used is indeterminate. Using hexadecimal cipher values can lead to CipherSpec mismatch errors.

If a specific named CipherSpec is being used, the **SSLCIPH** values at the two ends of a channel must specify the same named CipherSpec.

This parameter is valid on all channel types that use transport type **TRPTYPE(TCP)**. If the parameter is blank, no attempt is made to use TLS on the channel. If the TRPTYPE is not TCP, the data is ignored and no error message is issued.

The value for this parameter is also used to set the value of SecurityProtocol, which is an output field on the Inquire Channel Status (Response) command.

**Note:** When SSLCipherSpec is used with a telemetry channel, it means TLS Cipher Suite.

**ULW** **V 9.1.1** From IBM MQ 9.1.1, you can specify a value of ANY\_TLS12, which represents a subset of acceptable CipherSpecs that use the TLS 1.2 protocol; these CipherSpecs are listed in the following table. See [Migrating existing security configurations to use the ANY\\_TLS12 CipherSpec](#) for information on changing your existing security configurations to use the ANY\_TLS12 value.

**ULW** **V 9.1.4** From IBM MQ 9.1.4, on AIX, Linux, and Windows, IBM MQ provides an expanded set of alias CipherSpecs that includes ANY\_TLS12\_OR\_HIGHER, and ANY\_TLS13\_OR\_HIGHER. These alias CipherSpecs are listed in the following table.

 **Attention:** If your enterprise needs to guarantee that a certain CipherSpec is negotiated and used, you must not use an alias CipherSpec value such as ANY\_TLS12.

**V 9.1.4** For information on changing your existing security configurations to use the ANY\_TLS12\_OR\_HIGHER CipherSpec, see [Migrating existing security configurations to use the ANY\\_TLS12\\_OR\\_HIGHER CipherSpec](#).

*Table 308. CipherSpecs you can use with IBM MQ TLS support*

Table 308. CipherSpecs you can use with IBM MQ TLS support (continued)

Platform support "1" on page 1425	CipherSpec name	Hex code	MAC algorithm	Data integrity	Encryption algorithm (encryption bits)	FIPS "2" on page 1425	Suite B
-----------------------------------	-----------------	----------	---------------	----------------	--	-----------------------	---------

**Notes:**

- For a list of platforms covered by each platform icon, see [Release and platform icons in the product documentation](#).
- Specifies whether the CipherSpec is FIPS-certified on a FIPS-certified platform. See [Federal Information Processing Standards \(FIPS\)](#) for an explanation of FIPS.
-  The ANY\_TLS13\_OR\_HIGHER alias CipherSpec negotiates the highest level of security that the remote end will allow but will only connect using a TLS 1.3 or higher protocol.
-  To use TLS 1.3, or the ANY CipherSpec, on IBM MQ for z/OS, the operating system must be z/OS 2.4 or later.
-  To use TLS 1.3, or the ANY CipherSpec, on IBM i the underlying operating system version must support TLS 1.3. See [System TLS support for TLSv1.3](#) for more information.
-  The ANY\_TLS13 alias CipherSpec represents a subset of acceptable CipherSpecs that use the TLS 1.3 protocol, as listed in this table for each platform.
-  The ANY\_TLS12\_OR\_HIGHER alias CipherSpec negotiates the highest level of security that the remote end will allow but will only connect using a TLS 1.2 or higher protocol.
- The ANY\_TLS12 CipherSpec represents a subset of acceptable CipherSpecs that use the TLS 1.2 protocol, as listed in this table for each platform.
-  The ANY alias CipherSpec negotiates the highest level of security that the remote end will allow.
-  These CipherSpecs are not enabled on IBM i 7.4 systems that have System Value QSSLCSLCTL set to \*OPSSYS.
-  These CipherSpecs use an 8-octet Integrity Check Value (ICV) instead of a 16-octet ICV.
- This CipherSpec cannot be used to secure a connection from the IBM MQ Explorer to a queue manager unless the appropriate unrestricted policy files are applied to the JRE used by the Explorer.
-   Following a recommendation by GSKit, TLS 1.2 GCM CipherSpecs have a restriction which means that after 2<sup>24.5</sup> TLS records are sent, using the same session key, the connection is terminated with message [AMQ9288E](#). This GCM restriction is active, regardless of the FIPS mode being used.

To prevent this error from happening, avoid using TLS 1.2 GCM Ciphers, enable secret key reset, or start your IBM MQ queue manager or client with the environment variable GSK\_ENFORCE\_GCM\_RESTRICTION=GSK\_FALSE set. For GSKit libraries, you must set this environment variable on both sides of the connection, and apply it to both client to queue manager connections and queue manager to queue manager connections. Note that this setting affects unmanaged .NET clients, but not Java or managed .NET clients. For more information, see [AES-GCM cipher restriction](#).

This restriction does not apply to IBM MQ for z/OS.

For more information about CipherSpecs, see [Enabling CipherSpecs](#).

When you request a personal certificate, you specify a key size for the public and private key pair. The key size that is used during the SSL handshake can depend on the size stored in the certificate and on the CipherSpec:

-   On z/OS, UNIX, Linux, and Windows, when a CipherSpec name includes \_EXPORT, the maximum handshake key size is 512 bits. If either of the certificates exchanged during the SSL handshake has a key size greater than 512 bits, a temporary 512-bit key is generated for use during the handshake.
-  On UNIX, Linux, and Windows, when a CipherSpec name includes \_EXPORT1024, the handshake key size is 1024 bits.
- Otherwise the handshake key size is the size stored in the certificate.

### SSLClientAuth (MQCFIN)

Client authentication (parameter identifier: MQIACH\_SSL\_CLIENT\_AUTH).

The value can be any of the following values:

#### MQSCA\_REQUIRED

Client authentication required.

#### MQSCA\_OPTIONAL

Client authentication optional.

Defines whether IBM MQ requires a certificate from the TLS client.

The TLS client is the end of the message channel that initiates the connection. The TLS Server is the end of the message channel that receives the initiation flow.

The parameter is used only for channels with SSLCIPH specified. If SSLCIPH is blank, the data is ignored and no error message is issued.

### SSLPeerName (MQCFST)

Peer name (parameter identifier: MQCACH\_SSL\_PEER\_NAME).

**Note:** An alternative way of restricting connections into channels by matching against the TLS Subject Distinguished Name, is to use channel authentication records. With channel authentication records, different TLS Subject Distinguished Name patterns can be applied to the same channel. If both SSLPEER on the channel and a channel authentication record are used to apply to the same channel, the inbound certificate must match both patterns in order to connect. For more information, see [Channel authentication records](#).

 On [Multiplatforms](#), the length of the string is MQ\_SSL\_PEER\_NAME\_LENGTH.

 On z/OS, the length of the string is MQ\_SSL\_SHORT\_PEER\_NAME\_LENGTH.

Specifies the filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel. (A Distinguished Name is the identifier of the TLS certificate.) If the Distinguished Name in the certificate received from the peer does not match the SSLPEER filter, the channel does not start.

This parameter is optional; if it is not specified, the Distinguished Name of the peer is not checked when the channel is started. (The Distinguished Name from the certificate is still written into the SSLPEER definition held in memory, and passed to the security exit). If SSLCIPH is blank, the data is ignored and no error message is issued.

This parameter is valid for all channel types.

The SSLPEER value is specified in the standard form used to specify a Distinguished Name. For example:  
SSLPEER (' SERIALNUMBER=4C : D0 : 49 : D5 : 02 : 5F : 38 , CN="H1\_C\_FR1" , O=IBM , C=GB ' )

You can use a semi-colon as a separator instead of a comma.

The possible attribute types supported are as follows:

Table 309. Attribute types and descriptions

Attribute	Description
SERIALNUMBER	Certificate serial number
MAIL	Email address
E	Email address (Deprecated in preference to MAIL)
UID or USERID	User identifier
CN	Common Name
T	Title
OU	Organizational Unit name
DC	Domain component
O	Organization name
STREET	Street / First line of address
L	Locality name
ST (or SP or S)	State or Province name
PC	Postal code / zip code
C	Country
UNSTRUCTUREDNAME	Host name
UNSTRUCTUREDADDRESS	IP address
DNQ	Distinguished name qualifier

IBM MQ only accepts uppercase letters for the attribute types.

If any of the unsupported attribute types are specified in the SSLPEER string, an error is output either when the attribute is defined or at run time (depending on which platform you are running on), and the string is deemed not to have matched the Distinguished Name of the flowed certificate.

If the Distinguished Name of the flowed certificate contains multiple OU (organizational unit) attributes, and SSLPEER specifies these attributes to be compared, they must be defined in descending hierarchical order. For example, if the Distinguished Name of the flowed certificate contains the OUs OU=Large Unit,OU=Medium Unit,OU=Small Unit, specifying the following SSLPEER values work:

```
('OU=Large Unit,OU=Medium Unit') ('OU=*,OU=Medium Unit,OU=Small Unit') ('OU=*,OU=Medium Unit')
```

but specifying the following SSLPEER values fail:

```
('OU=Medium Unit,OU=Small Unit') ('OU=Large Unit,OU=Small Unit') ('OU=Medium Unit')
```

Any or all the attribute values can be generic, either an asterisk (\*) on its own, or a stem with initiating or trailing asterisks. This value allows the SSLPEER to match any Distinguished Name value, or any value starting with the stem for that attribute.

If an asterisk is specified at the beginning or end of any attribute value in the Distinguished Name on the certificate, you can specify \\* to check for an exact match in SSLPEER. For example, if you have an attribute of CN=Test\* in the Distinguished Name of the certificate, you can use the following command:

```
SSLPEER('CN=Test\*')
```

### TpName (MQCFST)

Transaction program name (parameter identifier: MQCACH\_TP\_NAME).

This name is the LU 6.2 transaction program name.

The maximum length of the string is MQ\_TP\_NAME\_LENGTH.

- On IBM i, HP Integrity NonStop Server, UNIX, and Windows platforms, this parameter can be set only to blanks. The actual name is taken instead from the CPI-C Communications Side Object or (on Windows ) from the CPI-C symbolic destination name properties.

This parameter is valid only for channels with a *TransportType* of MQXPT\_LU62. It is not valid for receiver channels.

### **TPRoot (MQCFST)**

Topic root for an AMQP channel. (parameter identifier: MQCACH\_TOPIC\_ROOT).

The default value for TPRoot is SYSTEM.BASE.TOPIC. With this value, the topic string an AMQP client uses to publish or subscribe has no prefix, and the client can exchange messages with other MQ pub/sub applications. To have AMQP clients publish and subscribe under a topic prefix, first create an MQ topic object with a topic string set to the prefix you want, then set TPRoot to the name of the MQ topic object you created.

This parameter is valid only for AMQP channels.

### **TransportType (MQCFIN)**

Transmission protocol type (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

No check is made that the correct transport type has been specified if the channel is initiated from the other end. The value can be any of the following values:

#### **MQXPT\_LU62**

LU 6.2.

#### **MQXPT\_TCP**

TCP.

#### **MQXPT\_NETBIOS**

NetBIOS.

This value is supported in Windows. It also applies to z/OS for defining client-connection channels that connect to servers on the platforms supporting NetBIOS.

#### **MQXPT\_SPX**

SPX.

This value is supported in Windows. It also applies to z/OS for defining client-connection channels that connect to servers on the platforms supporting SPX.

### **UseCltId (MQCFIN)**

Determines how authorization checks are done for AMQP channels. (parameter identifier: MQIACH\_USE\_CLIENT\_ID).

The value can be any of the following values:

#### **MQUCI\_NO**

The MCA user ID should be used for authorization checks.

#### **MQUCI\_YES**

The client ID should be used for authorization checks.

This parameter is valid only for AMQP channels.

### **UseDLQ (MQCFIN)**

Determines whether the dead-letter queue is used when messages cannot be delivered by channels. (parameter identifier: MQIA\_USE\_DEAD\_LETTER\_Q).

The value can be any of the following values:

**MQUSEDLQ\_NO**

Messages that cannot be delivered by a channel are treated as a failure. The channel either discards the message, or the channel ends, in accordance with the NonPersistentMsgSpeed setting.

**MQUSEDLQ\_YES**

When the DEADQ queue manager attribute provides the name of a dead-letter queue, then it is used, else the behavior is as for MQUSEDLQ\_NO.

**UserIdentifier (MQCFST)**

Task user identifier (parameter identifier: MQCACH\_USER\_ID).

This parameter is used by the message channel agent when attempting to initiate a secure SNA session with a remote message channel agent. On IBM i and UNIX, it is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_REQUESTER, MQCHT\_CLNTCONN, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR. On z/OS, it is valid only for a *ChannelType* value of MQCHT\_CLNTCONN.

The maximum length of the string is MQ\_USER\_ID\_LENGTH. However, only the first 10 characters are used.

**XmitQName (MQCFST)**

Transmission queue name (parameter identifier: MQCACH\_XMIT\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

A transmission queue name is required (either previously defined or specified here) if *ChannelType* is MQCHT\_SENDER or MQCHT\_SERVER. It is not valid for other channel types.

**Error codes (Change, Copy, and Create Channel)**

This command might return the following error codes in the response format header, in addition to those codes listed in [“Error codes applicable to all commands”](#) on page 1374.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_BATCH\_INT\_ERROR**

Batch interval not valid.

**MQRCCF\_BATCH\_INT\_WRONG\_TYPE**

Batch interval parameter not allowed for this channel type.

**MQRCCF\_BATCH\_SIZE\_ERROR**

Batch size not valid.

**MQRCCF\_CHANNEL\_NAME\_ERROR**

Channel name error.

**MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

**MQRCCF\_CHANNEL\_TYPE\_ERROR**

Channel type not valid.

**MQRCCF\_CLUSTER\_NAME\_CONFLICT**

Cluster name conflict.

**MQRCCF\_DISC\_INT\_ERROR**

Disconnection interval not valid.

**MQRCCF\_DISC\_INT\_WRONG\_TYPE**

Disconnection interval not allowed for this channel type.

**MQRCCF\_HB\_INTERVAL\_ERROR**

Heartbeat interval not valid.

**MQRCCF\_HB\_INTERVAL\_WRONG\_TYPE**

Heartbeat interval parameter not allowed for this channel type.

**MQRCCF\_KWD\_VALUE\_WRONG\_TYPE**

An attribute keyword and value combination are not valid for this channel type.

**MQRCCF\_LONG\_RETRY\_ERROR**

Long retry count not valid.

**MQRCCF\_LONG\_RETRY\_WRONG\_TYPE**

Long retry parameter not allowed for this channel type.

**MQRCCF\_LONG\_TIMER\_ERROR**

Long timer not valid.

**MQRCCF\_LONG\_TIMER\_WRONG\_TYPE**

Long timer parameter not allowed for this channel type.

**MQRCCF\_MAX\_INSTANCES\_ERROR**

Maximum instances value not valid.

**MQRCCF\_MAX\_INSTS\_PER\_CLNT\_ERR**

Maximum instances per client value not valid.

**MQRCCF\_MAX\_MSG\_LENGTH\_ERROR**

Maximum message length not valid.

**MQRCCF\_MCA\_NAME\_ERROR**

Message channel agent name error.

**MQRCCF\_MCA\_NAME\_WRONG\_TYPE**

Message channel agent name not allowed for this channel type.

**MQRCCF\_MCA\_TYPE\_ERROR**

Message channel agent type not valid.

**MQRCCF\_MISSING\_CONN\_NAME**

Connection name parameter required but missing.

**MQRCCF\_MR\_COUNT\_ERROR**

Message retry count not valid.

**MQRCCF\_MR\_COUNT\_WRONG\_TYPE**

Message-retry count parameter not allowed for this channel type.

**MQRCCF\_MR\_EXIT\_NAME\_ERROR**

Channel message-retry exit name error.

**MQRCCF\_MR\_EXIT\_NAME\_WRONG\_TYPE**

Message-retry exit parameter not allowed for this channel type.

**MQRCCF\_MR\_INTERVAL\_ERROR**

Message retry interval not valid.

**MQRCCF\_MR\_INTERVAL\_WRONG\_TYPE**

Message-retry interval parameter not allowed for this channel type.

**MQRCCF\_MSG\_EXIT\_NAME\_ERROR**

Channel message exit name error.

**MQRCCF\_NET\_PRIORITY\_ERROR**

Network priority value error.

**MQRCCF\_NET\_PRIORITY\_WRONG\_TYPE**

Network priority attribute not allowed for this channel type.

**MQRCCF\_NPM\_SPEED\_ERROR**

Nonpersistent message speed not valid.

**MQRCCF\_NPM\_SPEED\_WRONG\_TYPE**

Nonpersistent message speed parameter not allowed for this channel type.

**MQRCCF\_PARM\_SEQUENCE\_ERROR**

Parameter sequence not valid.

**MQRCCF\_PUT\_AUTH\_ERROR**

Put authority value not valid.

**MQRCCF\_PUT\_AUTH\_WRONG\_TYPE**

Put authority parameter not allowed for this channel type.

**MQRCCF\_RCV\_EXIT\_NAME\_ERROR**

Channel receive exit name error.

**MQRCCF\_SEC\_EXIT\_NAME\_ERROR**

Channel security exit name error.

**MQRCCF\_SEND\_EXIT\_NAME\_ERROR**

Channel send exit name error.

**MQRCCF\_SEQ\_NUMBER\_WRAP\_ERROR**

Sequence wrap number not valid.

**MQRCCF\_SHARING\_CONVS\_ERROR**

Value given for Sharing Conversations not valid.

**MQRCCF\_SHARING\_CONVS\_TYPE**

Sharing Conversations parameter not valid for this channel type.

**MQRCCF\_SHORT\_RETRY\_ERROR**

Short retry count not valid.

**MQRCCF\_SHORT\_RETRY\_WRONG\_TYPE**

Short retry parameter not allowed for this channel type.

**MQRCCF\_SHORT\_TIMER\_ERROR**

Short timer value not valid.

**MQRCCF\_SHORT\_TIMER\_WRONG\_TYPE**

Short timer parameter not allowed for this channel type.

**MQRCCF\_SSL\_CIPHER\_SPEC\_ERROR**

TLS CipherSpec not valid.

**MQRCCF\_SSL\_CLIENT\_AUTH\_ERROR**

TLS client authentication not valid.

**MQRCCF\_SSL\_PEER\_NAME\_ERROR**

TLS peer name not valid.

**MQRCCF\_WRONG\_CHANNEL\_TYPE**

Parameter not allowed for this channel type.

**MQRCCF\_XMIT\_PROTOCOL\_TYPE\_ERR**

Transmission protocol type not valid.

**MQRCCF\_XMIT\_Q\_NAME\_ERROR**

Transmission queue name error.

**MQRCCF\_XMIT\_Q\_NAME\_WRONG\_TYPE**

Transmission queue name not allowed for this channel type.

**Change, Copy, and Create Channel (MQTT)**

The Change Channel command changes existing Telemetry channel definitions. The Copy and Create Channel commands create new Telemetry channel definitions - the Copy command uses attribute values of an existing channel definition.

The Change Channel (MQCMD\_CHANGE\_CHANNEL) command changes the specified attributes in a channel definition. For any optional parameters that are omitted, the value does not change.

The Copy Channel (MQCMD\_COPY\_CHANNEL) command creates new channel definition using, for attributes not specified in the command, the attribute values of an existing channel definition.

The Create Channel (MQCMD\_CREATE\_CHANNEL) command creates an IBM MQ channel definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

If a system default channel exists for the type of channel being created, the default values are taken from there.

## Required parameters (Change, Create Channel)

### ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Specifies the name of the channel definition to be changed, or created

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

### ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

#### MQCHT\_MQTT

Telemetry.

### TrpType (MQCFIN)

Transmission protocol type of the channel (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

This parameter is required for a create command in telemetry.

No check is made that the correct transport type has been specified if the channel is initiated from the other end. The value is:

#### MQXPT\_TCP

TCP.

### Port (MQCFIN)

The port number to use if *TrpType* is set to MQXPT\_TCP. This parameter is required for a create command in telemetry, if *TrpType* is set to MQXPT\_TCP.

The value is in the range 1 - 65335.

## Required parameters (Copy Channel)

### ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

#### MQCHT\_MQTT

Telemetry.

## Optional parameters (Change, Copy, and Create Channel)

### Backlog (MQCFIN)

The number of concurrent connection requests that the telemetry channel supports at any one time (parameter identifier: MQIACH\_BACKLOG).

The value is in the range 0 - 999999999.

### JAASConfig (MQCFST)

The file path of the JAAS configuration (parameter identifier: MQCACH\_JAAS\_CONFIG).

The maximum length of this value is MQ\_JAAS\_CONFIG\_LENGTH.

Only one of JAASCONFIG, MCAUSER, and USECLIENTID can be specified for a telemetry channel; if none is specified, no authentication is performed. If JAASConfig is specified, the client flows a user name and password. In all other cases, the flowed user name is ignored.

### LocalAddress (MQCFST)

Local communications address for the channel (parameter identifier: MQCACH\_LOCAL\_ADDRESS).

The maximum length of the string is MQ\_LOCAL\_ADDRESS\_LENGTH.

The value that you specify depends on the transport type (*TrpType*) to be used:

### TCP/IP

The value is the optional IP address and optional port or port range to be used for outbound TCP/IP communications. The format for this information is as follows:

```
[ip-addr][(low-port[,high-port])]
```

where *ip-addr* is specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric form, and *low-port* and *high-port* are port numbers enclosed in parentheses. All are optional.

### All Others

The value is ignored; no error is diagnosed.

Use this parameter if you want a channel to use a particular IP address, port, or port range for outbound communications. This parameter is useful when a machine is connected to multiple networks with different IP addresses.

Examples of use

Value	Meaning
9.20.4.98	Channel binds to this address locally
9.20.4.98 (1000)	Channel binds to this address and port 1000 locally
9.20.4.98 (1000,2000)	Channel binds to this address and uses a port in the range 1000 - 2000 locally
(1000)	Channel binds to port 1000 locally
(1000,2000)	Channel binds to a port in the range 1000 - 2000 locally

### Note:

- Do not confuse this parameter with *ConnectionName*. The *LocalAddress* parameter specifies the characteristics of the local communications; the *ConnectionName* parameter specifies how to reach a remote queue manager.

### Protocol (MQCFIL)

Client protocols supported by the MQTT channel (parameter identifier: MQIACH\_PROTOCOL).

The value can be one or more of the following values:

#### MQPROTO\_MQTTV311

The channel accepts connections from clients using the protocol defined by the [MQTT 3.1.1](#) Oasis standard. The functionality provided by this protocol is almost identical to that provided by the pre-existing MQTTV3 protocol.

#### MQPROTO\_MQTTV3

The channel accepts connections from clients using the [MQTT V3.1 Protocol Specification](#) from [mqtt.org](#).

#### MQPROTO\_HTTP

The channel accepts HTTP requests for pages, or WebSockets connections to MQ Telemetry.

If you specify no client protocols, the channel accepts connections from clients using any of the supported protocols.

If you are using IBM MQ 8.0.0 Fix Pack 3 or later, and your configuration includes an MQTT channel that was last modified in an earlier version of the product, you must explicitly change the protocol setting to prompt the channel to use the MQTTV311 option. This is so even if the channel does not specify any client protocols, because the specific protocols to use with the channel are stored at

the time the channel is configured, and previous versions of the product have no awareness of the MQTTV311 option. To prompt a channel in this state to use the MQTTV311 option, explicitly add the option then save your changes. The channel definition is now aware of the option. If you subsequently change the settings again, and specify no client protocols, the MQTTV311 option is still included in the stored list of supported protocols.

### **SSLCipherSuite (MQCFST)**

CipherSuite (parameter identifier: MQCACH\_SSL\_CIPHER\_SUITE).

The length of the string is MQ\_SSL\_CIPHER\_SUITE\_LENGTH.

SSL CIPHER SUITE character channel parameter type.

### **SSLClientAuth (MQCFIN)**

Client authentication (parameter identifier: MQIACH\_SSL\_CLIENT\_AUTH).

The value can be any of the following values:

#### **MQSCA\_REQUIRED**

Client authentication required

#### **MQSCA\_OPTIONAL**

Client authentication is optional.

#### **MQSCA\_NEVER\_REQUIRED**

Client authentication is never required, and must not be provided.

Defines whether IBM MQ requires a certificate from the TLS client.

The TLS client is the end of the message channel that initiates the connection. The TLS Server is the end of the message channel that receives the initiation flow.

The parameter is used only for channels with SSLCIPH specified. If SSLCIPH is blank, the data is ignored and no error message is issued.

### **SSLKeyFile (MQCFST)**

The store for digital certificates and their associated private keys (parameter identifier: MQCA\_SSL\_KEY\_REPOSITORY).

If you do not specify a key file, TLS is not used.

The maximum length of this parameter is MQ\_SSL\_KEY\_REPOSITORY\_LENGTH.

### **SSLPassPhrase (MQCFST)**

The password for the key repository (parameter identifier: MQCACH\_SSL\_KEY\_PASSPHRASE).

If no pass phrase is entered, then unencrypted connections must be used.

The maximum length of this parameter is MQ\_SSL\_KEY\_PASSPHRASE\_LENGTH.

### **UseClientIdentifier (MQCFIN)**

Determines whether to use the client ID of a new connection as the user ID for that connection (parameter identifier: MQIACH\_USE\_CLIENT\_ID).

The value is either:

#### **MQUCI\_YES**

Yes.

#### **MQUCI\_NO**

No.

Only one of JAASCONFIG, MCAUSER, and USECLIENTID can be specified for a telemetry channel; if none is specified, no authentication is performed. If USECLIENTID is specified, the flowed user name of the client is ignored.

## **Error codes (Change, Copy, and Create Channel)**

This command might return the following error codes in the response format header, in addition to those codes listed in [“Error codes applicable to all commands” on page 1374](#).

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_BATCH\_INT\_ERROR**

Batch interval not valid.

**MQRCCF\_BATCH\_INT\_WRONG\_TYPE**

Batch interval parameter not allowed for this channel type.

**MQRCCF\_BATCH\_SIZE\_ERROR**

Batch size not valid.

**MQRCCF\_CHANNEL\_NAME\_ERROR**

Channel name error.

**MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

**MQRCCF\_CHANNEL\_TYPE\_ERROR**

Channel type not valid.

**MQRCCF\_CLUSTER\_NAME\_CONFLICT**

Cluster name conflict.

**MQRCCF\_DISC\_INT\_ERROR**

Disconnection interval not valid.

**MQRCCF\_DISC\_INT\_WRONG\_TYPE**

Disconnection interval not allowed for this channel type.

**MQRCCF\_HB\_INTERVAL\_ERROR**

Heartbeat interval not valid.

**MQRCCF\_HB\_INTERVAL\_WRONG\_TYPE**

Heartbeat interval parameter not allowed for this channel type.

**MQRCCF\_LONG\_RETRY\_ERROR**

Long retry count not valid.

**MQRCCF\_LONG\_RETRY\_WRONG\_TYPE**

Long retry parameter not allowed for this channel type.

**MQRCCF\_LONG\_TIMER\_ERROR**

Long timer not valid.

**MQRCCF\_LONG\_TIMER\_WRONG\_TYPE**

Long timer parameter not allowed for this channel type.

**MQRCCF\_MAX\_INSTANCES\_ERROR**

Maximum instances value not valid.

**MQRCCF\_MAX\_INSTS\_PER\_CLNT\_ERR**

Maximum instances per client value not valid.

**MQRCCF\_MAX\_MSG\_LENGTH\_ERROR**

Maximum message length not valid.

**MQRCCF\_MCA\_NAME\_ERROR**

Message channel agent name error.

**MQRCCF\_MCA\_NAME\_WRONG\_TYPE**

Message channel agent name not allowed for this channel type.

**MQRCCF\_MCA\_TYPE\_ERROR**

Message channel agent type not valid.

**MQRCCF\_MISSING\_CONN\_NAME**

Connection name parameter required but missing.

**MQRCCF\_MR\_COUNT\_ERROR**

Message retry count not valid.

**MQRCCF\_MR\_COUNT\_WRONG\_TYPE**  
Message-retry count parameter not allowed for this channel type.

**MQRCCF\_MR\_EXIT\_NAME\_ERROR**  
Channel message-retry exit name error.

**MQRCCF\_MR\_EXIT\_NAME\_WRONG\_TYPE**  
Message-retry exit parameter not allowed for this channel type.

**MQRCCF\_MR\_INTERVAL\_ERROR**  
Message retry interval not valid.

**MQRCCF\_MR\_INTERVAL\_WRONG\_TYPE**  
Message-retry interval parameter not allowed for this channel type.

**MQRCCF\_MSG\_EXIT\_NAME\_ERROR**  
Channel message exit name error.

**MQRCCF\_NET\_PRIORITY\_ERROR**  
Network priority value error.

**MQRCCF\_NET\_PRIORITY\_WRONG\_TYPE**  
Network priority attribute not allowed for this channel type.

**MQRCCF\_NPM\_SPEED\_ERROR**  
Nonpersistent message speed not valid.

**MQRCCF\_NPM\_SPEED\_WRONG\_TYPE**  
Nonpersistent message speed parameter not allowed for this channel type.

**MQRCCF\_PARM\_SEQUENCE\_ERROR**  
Parameter sequence not valid.

**MQRCCF\_PUT\_AUTH\_ERROR**  
Put authority value not valid.

**MQRCCF\_PUT\_AUTH\_WRONG\_TYPE**  
Put authority parameter not allowed for this channel type.

**MQRCCF\_RCV\_EXIT\_NAME\_ERROR**  
Channel receive exit name error.

**MQRCCF\_SEC\_EXIT\_NAME\_ERROR**  
Channel security exit name error.

**MQRCCF\_SEND\_EXIT\_NAME\_ERROR**  
Channel send exit name error.

**MQRCCF\_SEQ\_NUMBER\_WRAP\_ERROR**  
Sequence wrap number not valid.

**MQRCCF\_SHARING\_CONVS\_ERROR**  
Value given for Sharing Conversations not valid.

**MQRCCF\_SHARING\_CONVS\_TYPE**  
Sharing Conversations parameter not valid for this channel type.

**MQRCCF\_SHORT\_RETRY\_ERROR**  
Short retry count not valid.

**MQRCCF\_SHORT\_RETRY\_WRONG\_TYPE**  
Short retry parameter not allowed for this channel type.

**MQRCCF\_SHORT\_TIMER\_ERROR**  
Short timer value not valid.

**MQRCCF\_SHORT\_TIMER\_WRONG\_TYPE**  
Short timer parameter not allowed for this channel type.

**MQRCCF\_SSL\_CIPHER\_SPEC\_ERROR**  
TLS CipherSpec not valid.

**MQRCCF\_SSL\_CLIENT\_AUTH\_ERROR**  
TLS client authentication not valid.

**MQRCCF\_SSL\_PEER\_NAME\_ERROR**

TLS peer name not valid.

**MQRCCF\_WRONG\_CHANNEL\_TYPE**

Parameter not allowed for this channel type.

**MQRCCF\_XMIT\_PROTOCOL\_TYPE\_ERR**

Transmission protocol type not valid.

**MQRCCF\_XMIT\_Q\_NAME\_ERROR**

Transmission queue name error.

**MQRCCF\_XMIT\_Q\_NAME\_WRONG\_TYPE**

Transmission queue name not allowed for this channel type.

Multi

**Change, Copy, and Create Channel Listener on Multiplatforms**

The Change Channel Listener command changes existing channel listener definitions. The Copy and Create Channel Listener commands create new channel listener definitions - the Copy command uses attribute values of an existing channel listener definition.

The Change Channel Listener (MQCMD\_CHANGE\_LISTENER) command changes the specified attributes of an existing IBM MQ listener definition. For any optional parameters that are omitted, the value does not change.

The Copy Channel Listener (MQCMD\_COPY\_LISTENER) command creates an IBM MQ listener definition, using, for attributes not specified in the command, the attribute values of an existing listener definition.

The Create Channel Listener (MQCMD\_CREATE\_LISTENER) command creates an IBM MQ listener definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

**Required parameters (Change and Create Channel Listener)****ListenerName (MQCFST)**

The name of the listener definition to be changed or created (parameter identifier: MQCACH\_LISTENER\_NAME).

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

**TransportType (MQCFIN)**

Transmission protocol (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value can be:

**MQXPT\_TCP**

TCP.

**MQXPT\_LU62**

LU 6.2. This value is valid only on Windows.

**MQXPT\_NETBIOS**

NetBIOS. This value is valid only on Windows.

**MQXPT\_SPX**

SPX. This value is valid only on Windows.

**Required parameters (Copy Channel Listener)****FromListenerName (MQCFST)**

The name of the listener definition to be copied from (parameter identifier: MQCACF\_FROM\_LISTENER\_NAME).

This parameter specifies the name of the existing listener definition that contains values for the attributes not specified in this command.

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

**ToListenerName (MQCFST)**

To listener name (parameter identifier: MQCACF\_TO\_LISTENER\_NAME).

This parameter specifies the name of the new listener definition. If a listener definition with this name exists, *Replace* must be specified as MQRP\_YES.

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

**Optional parameters (Change, Copy, and Create Channel Listener)****Adapter (MQCFIN)**

Adapter number (parameter identifier: MQIACH\_ADAPTER).

The adapter number on which NetBIOS listens. This parameter is valid only on Windows.

**Backlog (MQCFIN)**

Backlog (parameter identifier: MQIACH\_BACKLOG).

The number of concurrent connection requests that the listener supports.

**Commands (MQCFIN)**

Adapter number (parameter identifier: MQIACH\_COMMAND\_COUNT).

The number of commands that the listener can use. This parameter is valid only on Windows.

**IPAddress (MQCFST)**

IP address (parameter identifier: MQCACH\_IP\_ADDRESS).

IP address for the listener specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric host name form. If you do not specify a value for this parameter, the listener listens on all configured IPv4 and IPv6 stacks.

The maximum length of the string is MQ\_LOCAL\_ADDRESS\_LENGTH

**ListenerDesc (MQCFST)**

Description of listener definition (parameter identifier: MQCACH\_LISTENER\_DESC).

This parameter is a plain-text comment that provides descriptive information about the listener definition. It must contain only displayable characters.

If characters are used that are not in the coded character set identifier (CCSID) for the queue manager on which the command is executing, they might be translated incorrectly.

The maximum length of the string is MQ\_LISTENER\_DESC\_LENGTH.

**LocalName (MQCFST)**

NetBIOS local name (parameter identifier: MQCACH\_LOCAL\_NAME).

The NetBIOS local name that the listener uses. This parameter is valid only on Windows.

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH

**NetbiosNames (MQCFIN)**

NetBIOS names (parameter identifier: MQIACH\_NAME\_COUNT).

The number of names that the listener supports. This parameter is valid only on Windows.

**Port (MQCFIN)**

Port number (parameter identifier: MQIACH\_PORT).

The port number for TCP/IP. This parameter is valid only if the value of *TransportType* is MQXPT\_TCP.

**Replace (MQCFIN)**

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If a namelist definition with the same name as *ToListenerName* exists, this definition specifies whether it is to be replaced. The value can be:

**MQRP\_YES**

Replace existing definition.

**MQRP\_NO**

Do not replace existing definition.

**Sessions (MQCFIN)**

NetBIOS sessions (parameter identifier: MQIACH\_SESSION\_COUNT).

The number of sessions that the listener can use. This parameter is valid only on Windows.

**Socket (MQCFIN)**

SPX socket number (parameter identifier: MQIACH\_SOCKET).

The SPX socket on which to listen. This parameter is valid only if the value of *TransportType* is MQXPT\_SPX.

**StartMode (MQCFIN)**

Service mode (parameter identifier: MQIACH\_LISTENER\_CONTROL).

Specifies how the listener is to be started and stopped. The value can be any of the following values:

**MQSVC\_CONTROL\_MANUAL**

The listener is not to be started automatically or stopped automatically. It is to be controlled by user command. This value is the default value.

**MQSVC\_CONTROL\_Q\_MGR**

The listener being defined is to be started and stopped at the same time as the queue manager is started and stopped.

**MQSVC\_CONTROL\_Q\_MGR\_START**

The listener is to be started at the same time as the queue manager is started, but is not requested to stop when the queue manager is stopped.

**TPName (MQCFST)**

Transaction program name (parameter identifier: MQCACH\_TP\_NAME).

The LU 6.2 transaction program name. This parameter is valid only on Windows.

The maximum length of the string is MQ\_TP\_NAME\_LENGTH

## **Change, Copy, and Create Communication Information Object on Multiplatforms**

The Change Communication Information Object command changes existing communication information object definitions. The Copy and Create Communication Information Object commands create new communication information object definitions - the Copy command uses attribute values of an existing communication information object definition.

The Change communication information (MQCMD\_CHANGE\_COMM\_INFO) command changes the specified attributes of an existing IBM MQ communication information object definition. For any optional parameters that are omitted, the value does not change.

The Copy communication information (MQCMD\_COPY\_COMM\_INFO) command creates an IBM MQ communication information object definition, using, for attributes not specified in the command, the attribute values of an existing communication information definition.

The Create communication information (MQCMD\_CREATE\_COMM\_INFO) command creates an IBM MQ communication information object definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

## Required parameter (Change communication information)

### ComminfoName (MQCFST)

The name of the communication information definition to be changed (parameter identifier: MQCA\_COMM\_INFO\_NAME).

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

## Required parameters (Copy communication information)

### FromComminfoName (MQCFST)

The name of the communication information object definition to be copied from (parameter identifier: MQCACF\_FROM\_COMM\_INFO\_NAME).

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

### ToComminfoName (MQCFST)

The name of the communication information definition to copy to (parameter identifier: MQCACF\_TO\_COMM\_INFO\_NAME).

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

## Required parameters (Create communication information)

### ComminfoName (MQCFST)

The name of the communication information definition to be created (parameter identifier: MQCA\_COMM\_INFO\_NAME).

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

## Optional parameters (Change, Copy, and Create communication information)

### Bridge (MQCFIN)

Controls whether publications from applications not using Multicast are bridged to applications using multicast (parameter identifier: MQIA\_MCAST\_BRIDGE).

Bridging does not apply to topics that are marked as **MCAST (ONLY)**. As these topics can only have multicast traffic, it is not applicable to bridge to the non-multicast publish/subscribe domain.

### MQMCB\_DISABLED

Publications from applications not using multicast are not bridged to applications that do use Multicast. This is the default for IBM i.

### MQMCB\_ENABLED

Publications from applications not using multicast are bridged to applications that do use Multicast. This is the default for platforms other than IBM i. This value is not valid on IBM i.

### CCSID (MQCFIN)

The coded character set identifier that messages are transmitted on (parameter identifier: MQIA\_CODED\_CHAR\_SET\_ID).

Specify a value in the range 1 to 65535.

The CCSID must specify a value that is defined for use on your platform, and use a character set that is appropriate to the platform. If you use this parameter to change the CCSID, applications that are running when the change is applied continue to use the original CCSID. Because of this, you must stop and restart all running applications before you continue.

This includes the command server and channel programs. To do this, stop and restart the queue manager after making the change. The default value is ASPUB which means that the coded character set is taken from the one that is supplied in the published message.

### CommEvent (MQCFIN)

Controls whether event messages are generated for multicast handles that are created using this COMMINFO object (parameter identifier: MQIA\_COMM\_EVENT).

Events are only generated if monitoring is also enabled using the **MonitorInterval** parameter.

**MQEVR\_DISABLED**

Publications from applications not using multicast are not bridged to applications that do use multicast. This is the default value.

**MQEVR\_ENABLED**

Publications from applications not using multicast are bridged to applications that do use multicast.

**MQEVR\_EXCEPTION**

Event messages are written if the message reliability is below the reliability threshold. The reliability threshold is set to 90 by default.

**Description (MQCFST)**

Plain-text comment that provides descriptive information about the communication information object (parameter identifier: MQCA\_COMM\_INFO\_DESC).

It must contain only displayable characters. The maximum length is 64 characters. In a DBCS installation, it can contain DBCS characters (subject to a maximum length of 64 bytes).

If characters are used that are not in the coded character set identifier (CCSID) for this queue manager, they might be translated incorrectly if the information is sent to another queue manager.

The maximum length is MQ\_COMM\_INFO\_DESC\_LENGTH.

**Encoding (MQCFIN)**

The encoding that the messages are transmitted in (parameter identifier: MQIACF\_ENCODING).

**MQENC\_AS\_PUBLISHED**

The encoding of the message is taken from the one that is supplied in the published message. This is the default value.

**MQENC\_NORMAL**

**MQENC\_REVERSED**

**MQENC\_S390**

**MQENC\_TNS**

**GrpAddress (MQCFST)**

The group IP address or DNS name (parameter identifier: MQCACH\_GROUP\_ADDRESS).

It is the administrator's responsibility to manage the group addresses. It is possible for all multicast clients to use the same group address for every topic; only the messages that match outstanding subscriptions on the client are delivered. Using the same group address can be inefficient because every client must examine and process every multicast packet in the network. It is more efficient to allocate different IP group addresses to different topics or sets of topics, but this requires careful management, especially if other non-MQ multicast applications are in use on the network. The default value is 239.0.0.0.

The maximum length is MQ\_GROUP\_ADDRESS\_LENGTH.

**MonitorInterval (MQCFIN)**

How frequently monitoring information is updated and event messages are generated (parameter identifier: MQIA\_MONITOR\_INTERVAL).

The value is specified as a number of seconds in the range 0 to 999 999. A value of 0 indicates that no monitoring is required.

If a non-zero value is specified, monitoring is enabled. Monitoring information is updated and event messages (if enabled using *CommEvent*, are generated about the status of the multicast handles created using this communication information object.

**MsgHistory (MQCFIN)**

This value is the amount of message history in kilobytes that is kept by the system to handle retransmissions in the case of NACKs (parameter identifier: MQIACH\_MSG\_HISTORY).

The value is in the range 0 to 999 999 999. A value of 0 gives the least level of reliability. The default value is 100.

### **MulticastHeartbeat (MQCFIN)**

The heartbeat interval is measured in milliseconds, and specifies the frequency at which the transmitter notifies any receivers that there is no further data available (parameter identifier: MQIACH\_MC\_HB\_INTERVAL).

The value is in the range 0 to 999 999. The default value is 2000 milliseconds.

### **MulticastPropControl (MQCFIN)**

The multicast properties control how many of the MQMD properties and user properties flow with the message (parameter identifier: MQIACH\_MULTICAST\_PROPERTIES).

#### **MQMCP\_ALL**

All user properties and all the fields of the MQMD are transported. This is the default value.

#### **MQMCP\_REPLY**

Only user properties, and MQMD fields that deal with replying to the messages, are transmitted. These properties are:

- MsgType
- MessageId
- CorrelId
- ReplyToQ
- ReplyToQmgr

#### **MQMCP\_USER**

Only the user properties are transmitted.

#### **MQMCP\_NONE**

No user properties or MQMD fields are transmitted.

#### **MQMCP\_COMPAT**

Properties are transmitted in a format compatible with previous MQ multicast clients.

### **NewSubHistory (MQCFIN)**

The new subscriber history controls whether a subscriber joining a publication stream receives as much data as is currently available, or receives only publications made from the time of the subscription (parameter identifier: MQIACH\_NEW\_SUBSCRIBER\_HISTORY).

#### **MQNSH\_NONE**

A value of NONE causes the transmitter to transmit only publication made from the time of the subscription. This is the default value.

#### **MQNSH\_ALL**

A value of ALL causes the transmitter to retransmit as much history of the topic as is known. In some circumstances, this can give a similar behavior to retained publications.

Using the value of MQNSH\_ALL might have a detrimental effect on performance if there is a large topic history because all the topic history is retransmitted.

### **PortNumber (MQCFIN)**

The port number to transmit on (parameter identifier: MQIACH\_PORT).

The default port number is 1414.

### **Type (MQCFIN)**

The type of the communications information object (parameter identifier: MQIA\_COMM\_INFO\_TYPE).

The only type supported is MQCIT\_MULTICAST.

## Change, Copy, and Create Namelist

The Change Namelist command changes existing namelist definitions. The Copy and Create Namelist commands create new namelist definitions - the Copy command uses attribute values of an existing namelist definition.

The Change Namelist (MQCMD\_CHANGE\_NAMELIST) command changes the specified attributes of an existing IBM MQ namelist definition. For any optional parameters that are omitted, the value does not change.

The Copy Namelist (MQCMD\_COPY\_NAMELIST) command creates an IBM MQ namelist definition, using, for attributes not specified in the command, the attribute values of an existing namelist definition.

The Create Namelist (MQCMD\_CREATE\_NAMELIST) command creates an IBM MQ namelist definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

### Required parameter (Change and Create Namelist)

#### NamelistName (MQCFST)

The name of the namelist definition to be changed (parameter identifier: MQCA\_NAMELIST\_NAME).

The maximum length of the string is MQ\_NAMELIST\_NAME\_LENGTH.

### Required parameters (Copy Namelist)

#### FromNamelistName (MQCFST)

The name of the namelist definition to be copied from (parameter identifier: MQCACF\_FROM\_NAMELIST\_NAME).

This parameter specifies the name of the existing namelist definition that contains values for the attributes not specified in this command.

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR or MQQSGD\_COPY to copy from. This parameter is ignored if a value of MQQSGD\_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToNamelistName* and the disposition MQQSGD\_GROUP is searched for to copy from.

The maximum length of the string is MQ\_NAMELIST\_NAME\_LENGTH.

#### ToNamelistName (MQCFST)

To namelist name (parameter identifier: MQCACF\_TO\_NAMELIST\_NAME).

This parameter specifies the name of the new namelist definition. If a namelist definition with this name exists, *Replace* must be specified as MQRP\_YES.

The maximum length of the string is MQ\_NAMELIST\_NAME\_LENGTH.

### Optional parameters (Change, Copy, and Create Namelist)

#### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **NamelistDesc (MQCFST)**

Description of namelist definition (parameter identifier: MQCA\_NAMELIST\_DESC).

This parameter is a plain-text comment that provides descriptive information about the namelist definition. It must contain only displayable characters.

If characters are used that are not in the coded character set identifier (CCSID) for the queue manager on which the command is executing, they might be translated incorrectly.

The maximum length of the string is MQ\_NAMELIST\_DESC\_LENGTH.

### **NamelistType (MQCFIN)**

Type of names in the namelist (parameter identifier: MQIA\_NAMELIST\_TYPE). This parameter applies to z/OS only.

Specifies the type of names in the namelist. The value can be any of the following values:

#### **MQNT\_NONE**

The names are of no particular type.

#### **MQNT\_Q**

A namelist that holds a list of queue names.

#### **MQNT\_CLUSTER**

A namelist that is associated with clustering, containing a list of the cluster names.

#### **MQNT\_AUTH\_INFO**

The namelist is associated with TLS, and contains a list of authentication information object names.

### **Names (MQCFSL)**

The names to be placed in the namelist (parameter identifier: MQCA\_NAMES).

The number of names in the list is given by the *Count* field in the MQCFSL structure. The length of each name is given by the *StringLength* field in that structure. The maximum length of a name is MQ\_OBJECT\_NAME\_LENGTH.

### **QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

<i>Table 311. QSGDisposition: Where objects are defined and how they behave</i>		
<b>QSGDisposition</b>	<b>Change</b>	<b>Copy, Create</b>
<b>MQQSGD_COPY</b>	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToNameListName</i> object (for Copy) or <i>NameListName</i> object (for Create).

Table 311. QSGDisposition: Where objects are defined and how they behave (continued)

QSGDisposition	Change	Copy, Create
<b>MQQSGD_GROUP</b>	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they refresh local copies on page set zero:</p> <pre>DEFINE NAMELIST(name) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This is allowed only if the queue manager is in a queue sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they make or refresh local copies on page set zero:</p> <pre>DEFINE NAMELIST(name) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
<b>MQQSGD_PRIVATE</b>	<p>The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.</p>	<p>Not permitted.</p>
<b>MQQSGD_Q_MGR</b>	<p>The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.</p>	<p>The object is defined on the page set of the queue manager that executes the command. This value is the default value.</p>

**Replace (MQCFIN)**

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If a namelist definition with the same name as *ToNameListName* exists, this definition specifies whether it is to be replaced. The value can be:

**MQRP\_YES**

Replace existing definition.

**MQRP\_NO**

Do not replace existing definition.

## Change, Copy, and Create Process

The Change Process command changes existing process definitions. The Copy and Create Process commands create new process definitions - the Copy command uses attribute values of an existing process definition.

The Change Process (MQCMD\_CHANGE\_PROCESS) command changes the specified attributes of an existing IBM MQ process definition. For any optional parameters that are omitted, the value does not change.

The Copy Process (MQCMD\_COPY\_PROCESS) command creates an IBM MQ process definition, using, for attributes not specified in the command, the attribute values of an existing process definition.

The Create Process (MQCMD\_CREATE\_PROCESS) command creates an IBM MQ process definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

### Required parameters (Change and Create Process)

#### ProcessName (MQCFST)

The name of the process definition to be changed or created (parameter identifier: MQCA\_PROCESS\_NAME).

The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

### Required parameters (Copy Process)

#### FromProcessName (MQCFST)

The name of the process definition to be copied from (parameter identifier: MQCACF\_FROM\_PROCESS\_NAME).

Specifies the name of the existing process definition that contains values for the attributes not specified in this command.

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR or MQQSGD\_COPY to copy from. This parameter is ignored if a value of MQQSGD\_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToProcessName* and the disposition MQQSGD\_GROUP is searched for to copy from.

The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

#### ToProcessName (MQCFST)

To process name (parameter identifier: MQCACF\_TO\_PROCESS\_NAME).

The name of the new process definition. If a process definition with this name exists, *Replace* must be specified as MQRP\_YES.

The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

### Optional parameters (Change, Copy, and Create Process)

#### ApplId (MQCFST)

Application identifier (parameter identifier: MQCA\_APPL\_ID).

*ApplId* is the name of the application to be started. The application must be on the platform for which the command is executing. The name might typically be a fully qualified file name of an executable object. Qualifying the file name is particularly important if you have multiple IBM MQ installations, to ensure the correct version of the application is run.

The maximum length of the string is MQ\_PROCESS\_APPL\_ID\_LENGTH.

#### ApplType (MQCFIN)

Application type (parameter identifier: MQIA\_APPL\_TYPE).

Valid application types are:

**MQAT\_OS400**

IBM i application.

**MQAT\_DOS**

DOS client application.

**MQAT\_WINDOWS**

Windows client application.

**MQAT\_AIX**

AIX application (same value as MQAT\_UNIX).

**MQAT\_CICS**

CICS transaction.

 **MQAT\_ZOS**

z/OS application.

**MQAT\_DEFAULT**

Default application type.

*integer*: System-defined application type in the range zero through 65 535 or a user-defined application type in the range 65 536 through 999 999 999 (not checked).

Only specify application types (other than user-defined types) that are supported on the platform at which the command is executed:

-  On IBM i: MQAT\_OS400, MQAT\_CICS, and MQAT\_DEFAULT are supported.
-  On UNIX: MQAT\_UNIX, MQAT\_OS2, MQAT\_DOS, MQAT\_WINDOWS, MQAT\_CICS, and MQAT\_DEFAULT are supported.
-  On Windows: MQAT\_WINDOWS\_NT, MQAT\_OS2, MQAT\_DOS, MQAT\_WINDOWS, MQAT\_CICS, and MQAT\_DEFAULT are supported.
-  On z/OS: MQAT\_DOS, MQAT\_IMS, MQAT\_MVS, MQAT\_UNIX, MQAT\_CICS, and MQAT\_DEFAULT are supported.

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. In a shared queue environment, you can provide a different queue manager name from the one you are using to enter the command. The command server must be enabled.
- An asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**EnvData (MQCFST)**

Environment data (parameter identifier: MQCA\_ENV\_DATA).

A character string that contains environment information pertaining to the application to be started.

The maximum length of the string is MQ\_PROCESS\_ENV\_DATA\_LENGTH.

### ProcessDesc (MQCFST)

Description of process definition (parameter identifier: MQCA\_PROCESS\_DESC).

A plain-text comment that provides descriptive information about the process definition. It must contain only displayable characters.

The maximum length of the string is MQ\_PROCESS\_DESC\_LENGTH.

Use characters from the coded character set identifier (CCSID) for this queue manager. Other characters might be translated incorrectly if the information is sent to another queue manager.

### QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
<b>MQQSGD_COPY</b>	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToProcessName</i> object (for Copy) or <i>ProcessName</i> object (for Create).
<b>MQQSGD_GROUP</b>	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameters QSGDISP(GROUP). On the page set of the queue manager that executes the command, only a local copy of the object is altered by this command. If the command is successful, the following command is generated.</p> <pre>DEFINE PROCESS(process-name) REPLACE QSGDISP(COPY)</pre> <p>The command is sent to all active queue managers in the queue sharing group to attempt to refresh local copies on page set zero. The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. GROUP is allowed only if the queue manager is in a queue sharing group. If the definition is successful, the following command is generated.</p> <pre>DEFINE PROCESS(process-name) REPLACE QSGDISP(COPY)</pre> <p>The command is sent to all active queue managers in the queue sharing group to attempt to make or refresh local copies on page set zero. The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
<b>MQQSGD_PRIVATE</b>	The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.	Not permitted.

Table 312. QSGDisposition: Where objects are defined and how they behave (continued)

QSGDisposition	Change	Copy, Create
<b>MQQSGD_Q_MGR</b>	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. MQQSGD_Q_MGR is the default value.	The object is defined on the page set of the queue manager that executes the command. MQQSGD_Q_MGR is the default value.

### Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If a process definition with the same name as *ToProcessName* exists, specify whether to replace it.

The value can be any of the following values:

#### MQRP\_YES

Replace existing definition.

#### MQRP\_NO

Do not replace existing definition.

### UserData (MQCFST)

User data (parameter identifier: MQCA\_USER\_DATA).

A character string that contains user information pertaining to the application (defined by *AppLId*) that is to be started.

For Microsoft Windows, the character string must not contain double quotation marks if the process definition is going to be passed to **runmqtrm**.

The maximum length of the string is MQ\_PROCESS\_USER\_DATA\_LENGTH.

## Change, Copy, and Create Queue

The Change Queue command changes existing queue definitions. The Copy and Create Queue commands create new queue definitions - the Copy command uses attribute values of an existing queue definition.

The Change Queue command MQCMD\_CHANGE\_Q changes the specified attributes of an existing IBM MQ queue. For any optional parameters that are omitted, the value does not change.

The Copy Queue command MQCMD\_COPY\_Q creates a queue definition of the same type. For attributes not specified in the command, it uses the attribute values of an existing queue definition.

The Create Queue command MQCMD\_CREATE\_Q creates a queue definition with the specified attributes. All attributes that are not specified are set to the default value for the type of queue that is created.

### Required parameters (Change and Create Queue)

#### QName (MQCFST)

Queue name (parameter identifier: MQCA\_Q\_NAME).

The name of the queue to be changed. The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### Required parameters (Copy Queue)

#### FromQName (MQCFST)

From queue name (parameter identifier: MQCACF\_FROM\_Q\_NAME).

Specifies the name of the existing queue definition.

**z/OS** On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR, MQQSGD\_COPY, or MQQSGD\_SHARED to copy from. This parameter is ignored if a value of MQQSGD\_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToQName* and the disposition MQQSGD\_GROUP is searched for to copy from.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### **ToQName (MQCFST)**

To queue name (parameter identifier: MQCACF\_TO\_Q\_NAME).

Specifies the name of the new queue definition.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

Queue names must be unique; if a queue definition exists with the name and type of the new queue, *Replace* must be specified as MQRP\_YES. If a queue definition exists with the same name as and a different type from the new queue, the command fails.

## **Required parameters (all commands)**

### **QType (MQCFIN)**

Queue type (parameter identifier: MQIA\_Q\_TYPE).

The value specified must match the type of the queue being changed.

The value can be any of the following values:

#### **MQQT\_ALIAS**

Alias queue definition.

#### **MQQT\_LOCAL**

Local queue.

#### **MQQT\_REMOTE**

Local definition of a remote queue.

#### **MQQT\_MODEL**

Model queue definition.

## **Optional parameters (Change, Copy, and Create Queue)**

### **BackoutRequeueName (MQCFST) - see MQSC BOQNAME**

Excessive backout requeue name (parameter identifier: MQCA\_BACKOUT\_REQ\_Q\_NAME).

Specifies the name of the queue to which a message is transferred if it is backed out more times than the value of *BackoutThreshold*. The queue does not have to be a local queue.

The backout queue does not need to exist at this time but it must exist when the *BackoutThreshold* value is exceeded.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### **BackoutThreshold (MQCFIN)**

Backout threshold (parameter identifier: MQIA\_BACKOUT\_THRESHOLD).

The number of times a message can be backed out before it is transferred to the backout queue specified by *BackoutRequeueName*.

If the value is later reduced, messages that are already on the queue that were backed out at least as many times as the new value remain on the queue. Those messages are transferred if they are backed out again.

Specify a value in the range 0 - 999,999,999.

### **BaseObjectName (MQCFST)**

Name of the object to which the alias resolves (parameter identifier: MQCA\_BASE\_OBJECT\_NAME).

This parameter is the name of a queue or topic that is defined to the local queue manager.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

### BaseQName (MQCFST)

Queue name to which the alias resolves (parameter identifier: MQCA\_BASE\_Q\_NAME).

This parameter is the name of a local or remote queue that is defined to the local queue manager.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### CFStructure (MQCFST)

Coupling facility structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME). This parameter applies to z/OS only.

Specifies the name of the coupling facility structure where you want to store messages when you use shared queues. The name:

- Cannot have more than 12 characters
- Must start with an uppercase letter (A - Z)
- Can include only the characters A - Z and 0 - 9

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

The name of the queue sharing group to which the queue manager is connected is prefixed to the name you supply. The name of the queue sharing group is always four characters, padded with @ symbols if necessary. For example, if you use a queue sharing group named NY03 and you supply the name PRODUCT7, the resultant coupling facility structure name is NY03PRODUCT7. Note the administrative structure for the queue sharing group (in this case NY03CSQ\_ADMIN) cannot be used for storing messages.

For local and model queues, the following rules apply. The rules apply if you use the Create Queue command with a value of MQRP\_YES in the **Replace** parameter. The rules also apply if you use the Change Queue command.

- On a local queue with a value of MQQSGD\_SHARED in the **QSGDisposition** parameter, *CFStructure* cannot change.  
If you need to change either the *CFStructure* or *QSGDisposition* value, you must delete and redefine the queue. To preserve any of the messages on the queue you must offload the messages before you delete the queue. Reload the messages after you redefine the queue, or move the messages to another queue.
- On a model queue with a value of MQQDT\_SHARED\_DYNAMIC in the **DefinitionType** parameter, *CFStructure* cannot be blank.
- On a local queue with a value other than MQQSGD\_SHARED in the **QSGDisposition** parameter, the value of *CFStructure* does not matter. The value *CFStructure* also does not matter for a model queue with a value other than MQQDT\_SHARED\_DYNAMIC in the **DefinitionType** parameter.

For local and model queues, when you use the Create Queue command with a value of MQRP\_NO in the **Replace** parameter, the coupling facility structure:

- On a local queue with a value of MQQSGD\_SHARED in the **QSGDisposition** parameter, or a model queue with a value of MQQDT\_SHARED\_DYNAMIC in the **DefinitionType** parameter, *CFStructure* cannot be blank.
- On a local queue with a value other than MQQSGD\_SHARED in the **QSGDisposition** parameter, the value of *CFStructure* does not matter. The value *CFStructure* also does not matter for a model queue with a value other than MQQDT\_SHARED\_DYNAMIC in the **DefinitionType** parameter.

**Note:** Before you can use the queue, the structure must be defined in the coupling facility Resource Management (CFRM) policy data set.

### ClusterChannelName (MQCFST)

This parameter is supported only on transmission queues.

`ClusterChannelName` is the generic name of the cluster-sender channels that use this queue as a transmission queue. The attribute specifies which cluster-sender channels send messages to a cluster-receiver channel from this cluster transmission queue. (Parameter identifier: `MQCA_CLUS_CHL_NAME`.)

You can also set the transmission queue attribute `ClusterChannelName` to a cluster-sender channel manually. Messages that are destined for the queue manager connected by the cluster-sender channel are stored in the transmission queue that identifies the cluster-sender channel. They are not stored in the default cluster transmission queue. If you set the `ClusterChannelName` attribute to blanks, the channel switches to the default cluster transmission queue when the channel restarts. The default queue is either `SYSTEM.CLUSTER.TRANSMIT.ChannelName` or `SYSTEM.CLUSTER.TRANSMIT.QUEUE`, depending on the value of the queue manager `DefClusterXmitQueueType` attribute.

By specifying asterisks, "\*", in **`ClusterChannelName`**, you can associate a transmission queue with a set of cluster-sender channels. The asterisks can be at the beginning, end, or any number of places in the middle of the channel name string. **`ClusterChannelName`** is limited to a length of 20 characters: `MQ_CHANNEL_NAME_LENGTH`.

The default queue manager configuration is for all cluster-sender channels to send messages from a single transmission queue, `SYSTEM.CLUSTER.TRANSMIT.QUEUE`. The default configuration can be changed by modified by changing the queue manager attribute, **`DefClusterXmitQueueType`**. The default value of the attribute is `SCTQ`. You can change the value to `CHANNEL`. If you set the **`DefClusterXmitQueueType`** attribute to `CHANNEL`, each cluster-sender channel defaults to using a specific cluster transmission queue, `SYSTEM.CLUSTER.TRANSMIT.ChannelName`.

#### **ClusterName (MQCFST)**

Cluster name (parameter identifier: `MQCA_CLUSTER_NAME`).

The name of the cluster to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are open.

Only one of the resultant values of **`ClusterName`** and **`ClusterNameList`** can be nonblank; you cannot specify a value for both.

The maximum length of the string is `MQ_CLUSTER_NAME_LENGTH`.

#### **ClusterNameList (MQCFST)**

Cluster namelist (parameter identifier: `MQCA_CLUSTER_NAMELIST`).

The name of the namelist, that specifies a list of clusters to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are open.

Only one of the resultant values of **`ClusterName`** and **`ClusterNameList`** can be nonblank; you cannot specify a value for both.

#### **CLWLQueuePriority (MQCFIN)**

Cluster workload queue priority (parameter identifier: `MQIA_CLWL_Q_PRIORITY`).

Specifies the priority of the queue in cluster workload management; see [Configuring a queue manager cluster](#). The value must be in the range 0 - 9, where 0 is the lowest priority and 9 is the highest.

#### **CLWLQueueRank (MQCFIN)**

Cluster workload queue rank (parameter identifier: `MQIA_CLWL_Q_RANK`).

Specifies the rank of the queue in cluster workload management. The value must be in the range 0 - 9, where 0 is the lowest priority and 9 is the highest.

#### **CLWLUseQ (MQCFIN)**

Cluster workload use remote queue (parameter identifier: `MQIA_CLWL_USEQ`).

Specifies whether remote and local queues are to be used in cluster workload distribution. The value can be any of the following values:

**MQCLWL\_USEQ\_AS\_Q\_MGR**

Use the value of the **CLWLUseQ** parameter on the definition of the queue manager.

**MQCLWL\_USEQ\_ANY**

Use remote and local queues.

**MQCLWL\_USEQ\_LOCAL**

Do not use remote queues.

 **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is run when the queue manager is a member of a queue sharing group. You can specify one of the following values:

- Blank, or omit the parameter altogether. The command is run on the queue manager on which it was entered.
- A queue manager name. The command is run on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment. The command server must be enabled.
- An asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**Custom (MQCFST)**

Custom attribute for new features (parameter identifier: MQCA\_CUSTOM).

This attribute contains the values of attributes, as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE). Single quotation marks must be escaped with another single quotation mark.

**CAPEXPY (integer)**

The maximum time, expressed in tenths of a second, until a message put using an object handle, opened using this object on the resolution path, remains in the system until it becomes eligible for expiry processing.

For more information on message expiry processing, see [Enforcing lower expiration times](#).

The value can be one of the following:

**integer**

The value must be in the range one through to 999 999 999.

**NOLIMIT**

There is no limit on the expiry time of messages put using this object. This is the default value.

Specifying a value for CAPEXPY that is not valid, does not cause the command to fail. Instead, the default value is used.

**DefaultPutResponse (MQCFIN)**

Default put response type definition (parameter identifier: MQIA\_DEF\_PUT\_RESPONSE\_TYPE).

The parameter specifies the type of response to be used for put operations to the queue when an application specifies MQPMO\_RESPONSE\_AS\_Q\_DEF. The value can be any of the following values:

**MQPRT\_SYNC\_RESPONSE**

The put operation is issued synchronously, returning a response.

**MQPRT\_ASYNC\_RESPONSE**

The put operation is issued asynchronously, returning a subset of MQMD fields.

**DefBind (MQCFIN)**

Bind definition (parameter identifier: MQIA\_DEF\_BIND).

The parameter specifies the binding to be used when MQ00\_BIND\_AS\_Q\_DEF is specified on the MQOPEN call. The value can be any of the following values:

**MQBND\_BIND\_ON\_OPEN**

The binding is fixed by the MQOPEN call.

**MQBND\_BIND\_NOT\_FIXED**

The binding is not fixed.

**MQBND\_BIND\_ON\_GROUP**

Allows an application to request that a group of messages are all allocated to the same destination instance.

Changes to this parameter do not affect instances of the queue that are open.

**DefinitionType (MQCFIN)**

Queue definition type (parameter identifier: MQIA\_DEFINITION\_TYPE).

The value can be any of the following values:

**MQQDT\_PERMANENT\_DYNAMIC**

Dynamically defined permanent queue.

**MQQDT\_SHARED\_DYNAMIC**

Dynamically defined shared queue. This option is available on z/OS only.

**MQQDT\_TEMPORARY\_DYNAMIC**

Dynamically defined temporary queue.

**DefInputOpenOption (MQCFIN)**

Default input open option (parameter identifier: MQIA\_DEF\_INPUT\_OPEN\_OPTION).

Specifies the default share option for applications opening this queue for input.

The value can be any of the following values:

**MQ00\_INPUT\_EXCLUSIVE**

Open queue to get messages with exclusive access.

**MQ00\_INPUT\_SHARED**

Open queue to get messages with shared access.

**DefPersistence (MQCFIN)**

Default persistence (parameter identifier: MQIA\_DEF\_PERSISTENCE).

Specifies the default for message-persistence on the queue. Message persistence determines whether messages are preserved across restarts of the queue manager.

The value can be any of the following values:

**MQPER\_PERSISTENT**

Message is persistent.

**MQPER\_NOT\_PERSISTENT**

Message is not persistent.

**DefPriority (MQCFIN)**

Default priority (parameter identifier: MQIA\_DEF\_PRIORITY).

Specifies the default priority of messages put on the queue. The value must be in the range zero through to the maximum priority value that is supported (9).

**DefReadAhead (MQCFIN)**

Default read ahead (parameter identifier: MQIA\_DEF\_READ\_AHEAD).

Specifies the default read ahead behavior for non-persistent messages delivered to the client.

The value can be any of the following values:

**MQREADA\_NO**

Non-persistent messages are not read ahead unless the client application is configured to request read ahead.

**MQREADA\_YES**

Non-persistent messages are sent ahead to the client before an application requests them. Non-persistent messages can be lost if the client ends abnormally or if the client does not consume all the messages it is sent.

**MQREADA\_DISABLED**

Read ahead of non-persistent messages is not enabled for this queue. Messages are not sent ahead to the client regardless of whether read ahead is requested by the client application.

**Multi****DistLists (MQCFIN)**

Distribution list support (parameter identifier: MQIA\_DIST\_LISTS).

Specifies whether distribution-list messages can be placed on the queue.

**Note:** This attribute is set by the sending message channel agent (MCA). The sending MCA removes messages from the queue each time it establishes a connection to a receiving MCA on a partner queue manager. The attribute is not normally set by administrators, although it can be set if the need arises.

This parameter is supported on [Multiplatforms](#).

The value can be any of the following values:

**MQDL\_SUPPORTED**

Distribution lists supported.

**MQDL\_NOT\_SUPPORTED**

Distribution lists not supported.

**Force (MQCFIN)**

Force changes (parameter identifier: MQIACF\_FORCE).

Specifies whether the command must be forced to complete when conditions are such that completing the command would affect an open queue. The conditions depend upon the type of the queue that is being changed:

**QALIAS**

*BaseQName* is specified with a queue name and an application has the alias queue open.

**QLOCAL**

Either of the following conditions indicates that a local queue would be affected:

- *Shareability* is specified as MQQA\_NOT\_SHAREABLE and more than one application has the local queue open for input.
- The *Usage* value is changed and one or more applications has the local queue open, or there are one or more messages on the queue. (The *Usage* value must not normally be changed while there are messages on the queue. The format of messages changes when they are put on a transmission queue.)

**QREMOTE**

Either of the following conditions indicates that a remote queue would be affected:

- If *XmitQName* is specified with a transmission-queue name, or blank, and an application has a remote queue open that would be affected by this change.
- If any of the following parameters are specified with a queue or queue manager name, and one or more applications has a queue open that resolved through this definition as a queue manager alias. The parameters are:
  1. *RemoteQName*
  2. *RemoteQMgrName*
  3. *XmitQName*

## **QMODEL**

This parameter is not valid for model queues.

**Note:** A value of MQFC\_YES is not required if this definition is in use as a reply-to queue definition only.

The value can be any of the following values:

### **MQFC\_YES**

Force the change.

### **MQFC\_NO**

Do not force the change.

## **HardenGetBackout (MQCFIN)**

Harden the backout count, or not (parameter identifier: MQIA\_HARDEN\_GET\_BACKOUT).

Specifies whether the count of the number of times that a message was backed out is hardened. When the count is hardened, the value of the **BackoutCount** field of the message descriptor is written to the log before the message is returned by an MQGET operation. Writing the value to the log ensures that the value is accurate across restarts of the queue manager.

**Note:** IBM MQ for IBM i always hardens the count, regardless of the setting of this attribute.

When the backout count is hardened, the performance of MQGET operations for persistent messages on this queue is impacted.

The value can be any of the following values:

### **MQQA\_BACKOUT\_HARDENED**

The message backout count for messages on this queue is hardened to ensure that the count is accurate.

### **MQQA\_BACKOUT\_NOT\_HARDENED**

The message backout count for messages on this queue is not hardened and might not be accurate over queue manager restarts.

## **V 9.1.0**

## **ImageRecoverQueue (MQCFST)**

Specifies whether a local or permanent dynamic queue object is recoverable from a media image, if linear logging is being used (parameter identifier: MQIA\_MEDIA\_IMAGE\_RECOVER\_Q).

This parameter is not valid on z/OS. Possible values are:

### **MQIMGRCOV\_YES**

These queue objects are recoverable.

### **MQIMGRCOV\_NO**

The “[rcdmqimg \(record media image\)](#)” on page 128 and “[rcrmqobj \(re-create object\)](#)” on page 134 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

### **MQIMGRCOV\_AS\_Q\_MGR**

If you specify MQIMGRCOV\_AS\_Q\_MGR , and the **ImageRecoverQueue** attribute for the queue manager specifies MQIMGRCOV\_YES , these queue objects are recoverable.

If you specify MQIMGRCOV\_AS\_Q\_MGR and the **ImageRecoverQueue** attribute for the queue manager specifies MQIMGRCOV\_NO, the “[rcdmqimg \(record media image\)](#)” on page 128 and “[rcrmqobj \(re-create object\)](#)” on page 134 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

MQIMGRCOV\_AS\_Q\_MGR is the default value.

## **IndexType (MQCFIN)**

Index type (parameter identifier: MQIA\_INDEX\_TYPE). This parameter applies to z/OS only.

Specifies the type of index maintained by the queue manager to expedite MQGET operations on the queue. For shared queues, the type of index determines what type of MQGET calls can be used. The value can be any of the following values:

**MQIT\_NONE**

No index.

**MQIT\_MSG\_ID**

The queue is indexed using message identifiers.

**MQIT\_CORREL\_ID**

The queue is indexed using correlation identifiers.

**MQIT\_MSG\_TOKEN**

**Important:** This index type should only be used for queues used with the IBM MQ Workflow for z/OS product.

The queue is indexed using message tokens.

**MQIT\_GROUP\_ID**

The queue is indexed using group identifiers.

Messages can be retrieved using a selection criterion only if an appropriate index type is maintained, as the following table shows:

<i>Table 313. Retrieval selection criteria and index types</i>		
Retrieval selection criterion	IndexType required	
	Shared queue	Other queue
None (sequential retrieval)	Any	Any
Message identifier	MQIT_MSG_ID or MQIT_NONE	Any
Correlation identifier	MQIT_CORREL_ID	Any
Message and correlation identifiers	MQIT_MSG_ID or MQIT_CORREL_ID	Any
Group identifier	MQIT_GROUP_ID	Any
Grouping	MQIT_GROUP_ID	MQIT_GROUP_ID
Message token	Not allowed	MQIT_MSG_TOKEN

**InhibitGet (MQCFIN)**

Get operations are allowed or inhibited (parameter identifier: MQIA\_INHIBIT\_GET).

The value can be:

**MQQA\_GET\_ALLOWED**

Get operations are allowed.

**MQQA\_GET\_INHIBITED**

Get operations are inhibited.

**InhibitPut (MQCFIN)**

Put operations are allowed or inhibited (parameter identifier: MQIA\_INHIBIT\_PUT).

Specifies whether messages can be put on the queue.

The value can be any of the following values:

**MQQA\_PUT\_ALLOWED**

Put operations are allowed.

**MQQA\_PUT\_INHIBITED**

Put operations are inhibited.

**InitiationQName (MQCFST)**

Initiation queue name (parameter identifier: MQCA\_INITIATION\_Q\_NAME).

The local queue for trigger messages relating to this queue. The initiation queue must be on the same queue manager.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### **MaxMsgLength (MQCFIN)**

Maximum message length (parameter identifier: MQIA\_MAX\_MSG\_LENGTH).

The maximum length for messages on the queue. Applications might use the value of this attribute to determine the size of buffer they need to retrieve messages from the queue. If you change this value it might cause an application to operate incorrectly.

Do not set a value that is greater than the *MaxMsgLength* attribute of a queue manager.

The lower limit for this parameter is 0. The upper limit depends on the environment:

- On AIX, Linux, Windows, IBM i, and z/OS, the maximum message length is 100 MB (104,857,600 bytes).
- On other UNIX systems, the maximum message length is 4 MB (4,194,304 bytes).

### **MaxQDepth (MQCFIN)**

Maximum queue depth (parameter identifier: MQIA\_MAX\_Q\_DEPTH).

The maximum number of messages allowed on the queue.

**Note:** Other factors might cause the queue to be treated as full. For example, it appears to be full if there is no storage available for a message.

Specify a value greater than or equal to 0, and less than or equal to 999,999,999.

### **Multi V 9.1.5 MaxQFileSize (MQCFIN)**

Maximum queue depth (parameter identifier: MQIA\_MAX\_Q\_FILE\_SIZE).

The maximum size, in megabytes, that a queue file can grow to.

It is possible for a queue file to exceed the maximum size, if it is configured to a value lower than the current queue file size. If that happens the queue file no longer accepts new messages, but allows existing messages to be consumed. When the queue file size has dropped below the configured value, new messages are allowed to be put to the queue.

When displayed in queue status, this attribute indicates the current maximum size the queue file can grow to.

**Note:** This figure can differ from the value of the attribute configured on the queue because internally the queue manager might need to use a larger block size to reach the chosen size. See [Modifying IBM MQ queue files](#) for more information on changing the size of queue files and block size and granularity.

When the granularity needs changing because this attribute has been increased, warning message AMQ7493W Granularity changed is written to the AMQERR logs. This gives you an indication that you need to plan for the queue to be emptied, in order for IBM MQ to adopt the new granularity.

Specify a value greater than or equal to 20, and less than or equal to 267,386,880.

### **MsgDeliverySequence (MQCFIN)**

Messages are delivered in priority order or sequence (parameter identifier: MQIA\_MSG\_DELIVERY\_SEQUENCE).

The value can be any of the following values:

#### **MQMDS\_PRIORITY**

Messages are returned in priority order.

#### **MQMDS\_FIFO**

Messages are returned in FIFO order (first in, first out).

### **NonPersistentMessageClass (MQCFIN)**

The level of reliability to be assigned to non-persistent messages that are put to the queue (parameter identifier: MQIA\_NPM\_CLASS).

The value can be:

**MQNPM\_CLASS\_NORMAL**

Non-persistent messages persist as long as the lifetime of the queue manager session. They are discarded in the event of a queue manager restart. This value is the default value.

**MQNPM\_CLASS\_HIGH**

The queue manager attempts to retain non-persistent messages for the lifetime of the queue. Non-persistent messages might still be lost in the event of a failure.

This parameter is valid only on local and model queues. It is not valid on z/OS.

**ProcessName (MQCFST)**

Name of process definition for the queue (parameter identifier: MQCA\_PROCESS\_NAME).

Specifies the local name of the IBM MQ process that identifies the application to be started when a trigger event occurs.

- If the queue is a transmission queue, the process definition contains the name of the channel to be started. This parameter is optional for transmission queues. If you do not specify it, the channel name is taken from the value specified for the **TriggerData** parameter.
- In other environments, the process name must be nonblank for a trigger event to occur, although it can be set after creating the queue.

The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

**PropertyControl (MQCFIN)**

Property control attribute (parameter identifier: MQIA\_PROPERTY\_CONTROL).

Specifies how message properties are handled when messages are retrieved from queues using the MQGET call with the MQGMO\_PROPERTIES\_AS\_Q\_DEF option. The value can be any of the following values:

**MQPROP\_COMPATIBILITY**

If the message contains a property with a prefix of **mcd.**, **jms.**, **usr.** or **mqext.**, all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those properties contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

This value is the default value. It allows applications which expect JMS-related properties to be in an MQRFH2 header in the message data to continue to work unmodified.

**MQPROP\_NONE**

All properties of the message are removed from the message before the message is sent to the remote queue manager. Properties in the message descriptor, or extension, are not removed.

**MQPROP\_ALL**

All properties of the message are included with the message when it is sent to the remote queue manager. The properties, except those properties in the message descriptor (or extension), are placed in one or more MQRFH2 headers in the message data.

**MQPROP\_FORCE\_MQRFH2**

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

A valid message handle supplied in the MsgHandle field of the MQGMO structure on the MQGET call is ignored. Properties of the message are not accessible using the message handle.

**MQPROP\_V6COMPAT**

Any application MQRFH2 header is received as it was sent. Any properties set using MQSETMP must be retrieved using MQINQMP. They are not added to the MQRFH2 created by the application. Properties that were set in the MQRFH2 header by the sending application cannot be retrieved using MQINQMP.

This parameter is applicable to Local, Alias, and Model queues.

### **QDepthHighEvent (MQCFIN)**

Controls whether Queue Depth High events are generated (parameter identifier: MQIA\_Q\_DEPTH\_HIGH\_EVENT).

A Queue Depth High event indicates that an application put a message on a queue. This event caused the number of messages on the queue to become greater than or equal to the queue depth high threshold. See the **QDepthHighLimit** parameter.

**Note:** The value of this attribute can change implicitly; see [“Definitions of the Programmable Command Formats” on page 1368](#).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

### **QDepthHighLimit (MQCFIN)**

High limit for queue depth (parameter identifier: MQIA\_Q\_DEPTH\_HIGH\_LIMIT).

The threshold against which the queue depth is compared to generate a Queue Depth High event.

This event indicates that an application put a message to a queue. This event caused the number of messages on the queue to become greater than or equal to the queue depth high threshold. See the **QDepthHighEvent** parameter.

The value is expressed as a percentage of the maximum queue depth, *MaxQDepth*. It must be greater than or equal to 0 and less than or equal to 100.

### **QDepthLowEvent (MQCFIN)**

Controls whether Queue Depth Low events are generated (parameter identifier: MQIA\_Q\_DEPTH\_LOW\_EVENT).

A Queue Depth Low event indicates that an application retrieved a message from a queue. This event caused the number of messages on the queue to become less than or equal to the queue depth low threshold. See the **QDepthLowLimit** parameter.

**Note:** The value of this attribute can change implicitly. See [“Definitions of the Programmable Command Formats” on page 1368](#).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

### **QDepthLowLimit (MQCFIN)**

Low limit for queue depth (parameter identifier: MQIA\_Q\_DEPTH\_LOW\_LIMIT).

The threshold against which the queue depth is compared to generate a Queue Depth Low event.

This event indicates that an application retrieved a message from a queue. This event caused the number of messages on the queue to become less than or equal to the queue depth low threshold. See the **QDepthLowEvent** parameter.

Specify the value as a percentage of the maximum queue depth (**MaxQDepth** attribute), in the range 0 through 100.

### **QDepthMaxEvent (MQCFIN)**

Controls whether Queue Full events are generated (parameter identifier: MQIA\_Q\_DEPTH\_MAX\_EVENT).

A Queue Full event indicates that an MQPUT call to a queue was rejected because the queue is full. That is, the queue depth reached its maximum value.

**Note:** The value of this attribute can change implicitly; see [“Definitions of the Programmable Command Formats” on page 1368.](#)

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**QDesc (MQCFST)**

Queue description (parameter identifier: MQCA\_Q\_DESC).

Text that briefly describes the object.

The maximum length of the string is MQ\_Q\_DESC\_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the message queue manager on which the command is executing. This choice ensures that the text is translated correctly if it is sent to another queue manager.

**QServiceInterval (MQCFIN)**

Target for queue service interval (parameter identifier: MQIA\_Q\_SERVICE\_INTERVAL).

The service interval used for comparison to generate Queue Service Interval High and Queue Service Interval OK events. See the *QServiceIntervalEvent* parameter.

Specify a value in the range 0 through 999 999 999 milliseconds.

**QServiceIntervalEvent (MQCFIN)**

Controls whether Service Interval High or Service Interval OK events are generated (parameter identifier: MQIA\_Q\_SERVICE\_INTERVAL\_EVENT).

A Queue Service Interval High event is generated when a check indicates that no messages were retrieved from, or put to, the queue for at least the time indicated by the **QServiceInterval** attribute.

A Queue Service Interval OK event is generated when a check indicates that a message was retrieved from the queue within the time indicated by the **QServiceInterval** attribute.

**Note:** The value of this attribute can change implicitly; see [“Definitions of the Programmable Command Formats” on page 1368.](#)

The value can be any of the following values:

**MQQSIE\_HIGH**

Queue Service Interval High events enabled.

- Queue Service Interval High events are enabled and
- Queue Service Interval OK events are disabled.

**MQQSIE\_OK**

Queue Service Interval OK events enabled.

- Queue Service Interval High events are disabled and
- Queue Service Interval OK events are enabled.

**MQQSIE\_NONE**

No queue service interval events enabled.

- Queue Service Interval High events are disabled and
- Queue Service Interval OK events are also disabled.

 **QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

<i>Table 314. QSGDisposition: Where objects are defined and how they behave</i>		
<b>QSGDisposition</b>	<b>Change</b>	<b>Copy, Create</b>
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToQName</i> object (for Copy) or the <i>QName</i> object (for Create). For local queues, messages are stored on the page sets of each queue manager and are available only through that queue manager.
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to attempt to refresh local copies on page set zero:</p> <pre>DEFINE QUEUE(q-name) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This value is allowed only in a shared queue manager environment.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers to attempt to make or refresh local copies on page set zero:</p> <pre>DEFINE QUEUE(q-name) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
MQQSGD_PRIVATE	The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.	Not permitted.
MQQSGD_Q_MGR	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.	The object is defined on the page set of the queue manager that executes the command. This value is the default value. For local queues, messages are stored on the page sets of each queue manager and are available only through that queue manager.

Table 314. *QSGDisposition: Where objects are defined and how they behave (continued)*

QSGDisposition	Change	Copy, Create
MQQSGD_SHARED	This value applies only to local queues. The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_SHARED. Any object residing on the page set of the queue manager that executes the command, or any object defined by a command using the parameter MQQSGD_GROUP, is not affected by this command.	This option applies only to local queues. The object is defined in the shared repository. Messages are stored in the coupling facility and are available to any queue manager in the queue sharing group. You can specify MQQSGD_SHARED only if: <ul style="list-style-type: none"> <li>• <i>CFStructure</i> is nonblank</li> <li>• <i>IndexType</i> is not MQIT_MSG_TOKEN</li> <li>• The queue is not one of the following: <ul style="list-style-type: none"> <li>– SYSTEM.CHANNEL.INITQ</li> <li>– SYSTEM.COMMAND.INPUT</li> </ul> </li> </ul>

### QueueAccounting (MQCFIN)

Controls the collection of accounting data (parameter identifier: MQIA\_ACCOUNTING\_Q).

The value can be:

#### MQMON\_Q\_MGR

The collection of accounting data for the queue is performed based upon the setting of the **QueueAccounting** parameter on the queue manager.

#### MQMON\_OFF

Accounting data collection is disabled for the queue.

#### MQMON\_ON

If the value of the queue manager's *QueueAccounting* parameter is not MQMON\_NONE, accounting data collection is enabled for the queue.

### QueueMonitoring (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA\_MONITORING\_Q).

Specifies whether online monitoring data is to be collected and, if so, the rate at which the data is collected. The value can be any of the following values:

#### MQMON\_OFF

Online monitoring data collection is turned off for this queue.

#### MQMON\_Q\_MGR

The value of the queue manager's **QueueMonitoring** parameter is inherited by the queue.

#### MQMON\_LOW

If the value of the queue manager **QueueMonitoring** parameter is not MQMON\_NONE, online monitoring data collection is turned on. The rate of data collection is low for this queue.

#### MQMON\_MEDIUM

If the value of the queue manager **QueueMonitoring** parameter is not MQMON\_NONE, online monitoring data collection is turned on. The rate of data collection is moderate for this queue.

#### MQMON\_HIGH

If the value of the queue manager **QueueMonitoring** parameter is not MQMON\_NONE, online monitoring data collection is turned on. The rate of data collection is high for this queue.

### QueueStatistics (MQCFIN)

Statistics data collection (parameter identifier: MQIA\_STATISTICS\_Q).

Specifies whether statistics data collection is enabled. The value can be any of the following values:

#### MQMON\_Q\_MGR

The value of the queue manager's **QueueStatistics** parameter is inherited by the queue.

**MQMON\_OFF**

Statistics data collection is disabled

**MQMON\_ON**

If the value of the queue manager's *QueueStatistics* parameter is not MQMON\_NONE, statistics data collection is enabled

This parameter is valid only on IBM i, UNIX, and Windows.

**RemoteQMGrName (MQCFST)**

Name of remote queue manager (parameter identifier: MQCA\_REMOTE\_Q\_MGR\_NAME).

If an application opens the local definition of a remote queue, *RemoteQMGrName* must not be blank or the name of the queue manager the application is connected to. If *XmitQName* is blank there must be a local queue called *RemoteQMGrName*. That queue is used as the transmission queue.

If this definition is used for a queue manager alias, *RemoteQMGrName* is the name of the queue manager. The queue manager name can be the name of the connected queue manager. If *XmitQName* is blank, when the queue is opened there must be a local queue called *RemoteQMGrName*. That queue is used as the transmission queue.

If this definition is used for a reply-to queue alias, *RemoteQMGrName* is the name of the queue manager that is to be the reply-to queue manager.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

**RemoteQName (MQCFST)**

Name of remote queue as known locally on the remote queue manager (parameter identifier: MQCA\_REMOTE\_Q\_NAME).

If this definition is used for a local definition of a remote queue, *RemoteQName* must not be blank when the open occurs.

If this definition is used for a queue manager alias definition, *RemoteQName* must be blank when the open occurs.

If this definition is used for a reply-to queue alias, this name is the name of the queue that is to be the reply-to queue.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**Replace (MQCFIN)**

Replace attributes (parameter identifier: MQIACF\_REPLACE). This parameter is not valid on a Change Queue command.

If the object exists, the effect is like issuing the Change Queue command. It is like a Change Queue command without the MQFC\_YES option on the **Force** parameter, and with all of the other attributes specified. In particular, note that any messages which are on the existing queue are retained.

The Change Queue command without MQFC\_YES on the **Force** parameter, and the Create Queue command with MQRP\_YES on the **Replace** parameter, are different. The difference is that the Change Queue command does not change unspecified attributes. Create Queue with MQRP\_YES sets all the attributes. If you use MQRP\_YES, unspecified attributes are taken from the default definition, and the attributes of the object being replaced, if one exists, are ignored.)

The command fails if both of the following statements are true:

- The command sets attributes that would require the use of MQFC\_YES on the **Force** parameter if you were using the Change Queue command.
- The object is open.

The Change Queue command with MQFC\_YES on the **Force** parameter succeeds in this situation.

If MQSCO\_CELL is specified on the **Scope** parameter on UNIX, and there is already a queue with the same name in the cell directory, the command fails. The command fails even if MQRP\_YES is specified.

The value can be any of the following values:

**MQRP\_YES**

Replace existing definition.

**MQRP\_NO**

Do not replace existing definition.

**RetentionInterval (MQCFIN)**

Retention interval (parameter identifier: MQIA\_RETENTION\_INTERVAL).

The number of hours for which the queue might be needed, based on the date and time when the queue was created.

This information is available to a housekeeping application or an operator and can be used to determine when a queue is no longer required. The queue manager does not delete queues nor does it prevent queues from being deleted if their retention interval is not expired. It is the responsibility of the user to take any required action.

Specify a value in the range 0 - 999,999,999.

**Scope (MQCFIN)**

Scope of the queue definition (parameter identifier: MQIA\_SCOPE).

Specifies whether the scope of the queue definition extends beyond the queue manager which owns the queue. It does so if the queue name is contained in a cell directory, so that it is known to all the queue managers within the cell.

If this attribute is changed from MQSCO\_CELL to MQSCO\_Q\_MGR, the entry for the queue is deleted from the cell directory.

Model and dynamic queues cannot be changed to have cell scope.

If it is changed from MQSCO\_Q\_MGR to MQSCO\_CELL, an entry for the queue is created in the cell directory. If there is already a queue with the same name in the cell directory, the command fails. The command also fails if no name service supporting a cell directory is configured.

The value can be:

**MQSCO\_Q\_MGR**

Queue manager scope.

**MQSCO\_CELL**

Cell scope.

This value is not supported on IBM i.

This parameter is not available on z/OS.

**Shareability (MQCFIN)**

The queue can be shared, or not (parameter identifier: MQIA\_SHAREABILITY).

Specifies whether multiple instances of applications can open this queue for input.

The value can be any of the following values:

**MQQA\_SHAREABLE**

Queue is shareable.

**MQQA\_NOT\_SHAREABLE**

Queue is not shareable.

**z/OS StorageClass (MQCFST)**

Storage class (parameter identifier: MQCA\_STORAGE\_CLASS). This parameter applies to z/OS only.

Specifies the name of the storage class.

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

**TargetType (MQCFIN)**

Target type (parameter identifier: MQIA\_BASE\_TYPE).

Specifies the type of object to which the alias resolves.

The value can be any of the following values:

**MQOT\_Q**

The object is a queue.

**MQOT\_TOPIC**

The object is a topic.

**TriggerControl (MQCFIN)**

Trigger control (parameter identifier: MQIA\_TRIGGER\_CONTROL).

Specifies whether trigger messages are written to the initiation queue.

The value can be:

**MQTC\_OFF**

Trigger messages not required.

**MQTC\_ON**

Trigger messages required.

**TriggerData (MQCFST)**

Trigger data (parameter identifier: MQCA\_TRIGGER\_DATA).

Specifies user data that the queue manager includes in the trigger message. This data is made available to the monitoring application that processes the initiation queue and to the application that is started by the monitor.

The maximum length of the string is MQ\_TRIGGER\_DATA\_LENGTH.

**TriggerDepth (MQCFIN)**

Trigger depth (parameter identifier: MQIA\_TRIGGER\_DEPTH).

Specifies (when *TriggerType* is MQTT\_DEPTH) the number of messages that initiates a trigger message to the initiation queue. The value must be in the range 1 through 999 999 999.

**TriggerMsgPriority (MQCFIN)**

Threshold message priority for triggers (parameter identifier: MQIA\_TRIGGER\_MSG\_PRIORITY).

Specifies the minimum priority that a message must have before it can cause, or be counted for, a trigger event. The value must be in the range of priority values that is supported (0 through 9).

**TriggerType (MQCFIN)**

Trigger type (parameter identifier: MQIA\_TRIGGER\_TYPE).

Specifies the condition that initiates a trigger event. When the condition is true, a trigger message is sent to the initiation queue.

The value can be any of the following values:

**MQTT\_NONE**

No trigger messages.

**MQTT EVERY**

Trigger message for every message.

**MQTT\_FIRST**

Trigger message when queue depth goes from 0 to 1.

**MQTT\_DEPTH**

Trigger message when depth threshold exceeded.

**Usage (MQCFIN)**

Usage (parameter identifier: MQIA\_USAGE).

Specifies whether the queue is for normal usage or for transmitting messages to a remote message queue manager.

The value can be any of the following values:

**MQUS\_NORMAL**

Normal usage.

**MQUS\_TRANSMISSION**

Transmission queue.

**XmitQName (MQCFST)**

Transmission queue name (parameter identifier: MQCA\_XMIT\_Q\_NAME).

Specifies the local name of the transmission queue to be used for messages destined for either a remote queue or for a queue manager alias definition.

If *XmitQName* is blank, a queue with the same name as *RemoteQMGrName* is used as the transmission queue.

This attribute is ignored if the definition is being used as a queue manager alias and *RemoteQMGrName* is the name of the connected queue manager.

It is also ignored if the definition is used as a reply-to queue alias definition.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**Error codes (Change, Copy, and Create Queue)**

This command might return the following errors in the response format header, in addition to the values shown on in [“Error codes applicable to all commands”](#) on page 1374.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_CELL\_DIR\_NOT\_AVAILABLE**

Cell directory is not available.

**MQRCCF\_CLUSTER\_NAME\_CONFLICT**

Cluster name conflict.

**MQRCCF\_CLUSTER\_Q\_USAGE\_ERROR**

Cluster usage conflict.

**MQRCCF\_DYNAMIC\_Q\_SCOPE\_ERROR**

Dynamic queue scope error.

**MQRCCF\_FORCE\_VALUE\_ERROR**

Force value not valid.

**MQRCCF\_Q\_ALREADY\_IN\_CELL**

Queue exists in cell.

**MQRCCF\_Q\_TYPE\_ERROR**

Queue type not valid.

**Change Queue Manager**

The Change Queue Manager (MQCMD\_CHANGE\_Q\_MGR) command changes the specified attributes of the queue manager.

For any optional parameters that are omitted, the value does not change.

**Required parameters:**

None

**Optional parameters (Change Queue Manager)****Multi AccountingConnOverride (MQCFIN)**

Specifies whether applications can override the settings of the *QueueAccounting* and *MQIAccounting* queue manager parameters (parameter identifier: MQIA\_ACCOUNTING\_CONN\_OVERRIDE).

The value can be any of the following values:

**MQMON\_DISABLED**

Applications cannot override the settings of the **QueueAccounting** and **MQIAccounting** parameters.

This value is the initial default value for the queue manager.

**MQMON\_ENABLED**

Applications can override the settings of the **QueueAccounting** and **MQIAccounting** parameters by using the options field of the MQCNO structure of the MQCONN API call.

This parameter is valid only on [Multiplatforms](#).

**Multi AccountingInterval (MQCFIN)**

The time interval, in seconds, at which intermediate accounting records are written (parameter identifier: MQIA\_ACCOUNTING\_INTERVAL).

Specify a value in the range 1 - 604,000.

This parameter is valid only on [Multiplatforms](#).

**ActivityRecording (MQCFIN)**

Specifies whether activity reports can be generated (parameter identifier: MQIA\_ACTIVITY\_RECORDING).

The value can be:

**MQRECORDING\_DISABLED**

Activity reports cannot be generated.

**MQRECORDING\_MSG**

Activity reports can be generated and sent to the reply queue specified by the originator in the message causing the report.

**MQRECORDING\_Q**

Activity reports can be generated and sent to SYSTEM.ADMIN.ACTIVITY.QUEUE.

**z/OS AdoptNewMCACheck (MQCFIN)**

The elements checked to determine whether an MCA must be adopted (restarted) when a new inbound channel is detected. It must be adopted (restarted) if it has the same name as a currently active MCA (parameter identifier: MQIA\_ADOPTNEWMCA\_CHECK).

The value can be:

**MQADOPT\_CHECK\_Q\_MGR\_NAME**

Check the queue manager name.

**MQADOPT\_CHECK\_NET\_ADDR**

Check the network address.

**MQADOPT\_CHECK\_ALL**

Check the queue manager name and network address. Perform this check to prevent your channels from being inadvertently shut down. This value is the initial default value of the queue manager.

**MQADOPT\_CHECK\_NONE**

Do not check any elements.

This parameter applies to z/OS only.

**z/OS AdoptNewMCAType (MQCFIN)**

Adoption of orphaned channel instances (parameter identifier: MQIA\_ADOPTNEWMCA\_TYPE).

Specify whether an orphaned MCA instance is to be adopted when a new inbound channel request is detected matching the **AdoptNewMCACheck** parameters.

The value can be:

**MQADOPT\_TYPE\_NO**

Do not adopt orphaned channel instances.

**MQADOPT\_TYPE\_ALL**

Adopt all channel types. This value is the initial default value of the queue manager.

This parameter applies to z/OS only.

**AuthorityEvent (MQCFIN)**

Controls whether authorization (Not Authorized) events are generated (parameter identifier: MQIA\_AUTHORITY\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled. This value is not permitted on z/OS.

**BridgeEvent (MQCFIN)**

Controls whether IMS bridge events are generated (parameter identifier: MQIA\_BRIDGE\_EVENT). This parameter applies to z/OS only.

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled. This value is the default value.

**MQEVR\_ENABLED**

Event reporting enabled.

**CertificateLabel (MQCFST)**

Specifies the certificate label for this queue manager to use. The label identifies which personal certificate in the key repository has been selected (parameter identifier: MQCA\_CERT\_LABEL).

The default and migrated queue manager values are:

-  On UNIX, Linux, and Windows: *ibmwebspheremqxxxx* where *xxxx* is the queue manager name folded to lowercase.
-  On IBM i:
  - If you specified SSLKEYR(\*SYSTEM), the value is blank.
  - Note that it is forbidden to use a nonblank queue manager CERTLABL with SSLKEYR(\*SYSTEM). Attempting to do so results in an MQRCCF\_Q\_MGR\_ATTR\_CONFLICT error.
  - Otherwise, *ibmwebspheremqxxxx* where *xxxx* is the queue manager name folded to lowercase.
-  On z/OS: *ibmWebSphereMQXXXX* where *XXXX* is the queue manager name.

See [z/OS systems](#) for more information.

**CertificateValPolicy (MQCFIN)**

Specifies which TLS certificate validation policy is used to validate digital certificates received from remote partner systems (parameter identifier: MQIA\_CERT\_VAL\_POLICY).

This attribute can be used to control how strictly the certificate chain validation conforms to industry security standards. For more information, see [Certificate validation policies in IBM MQ](#).

The value can be any of the following values:

**MQ\_CERT\_VAL\_POLICY\_ANY**

Apply each of the certificate validation policies supported by the secure sockets library and accept the certificate chain if any of the policies considers the certificate chain valid. This setting can be used for maximum backwards compatibility with older digital certificates which do not comply with the modern certificate standards.

### **MQ\_CERT\_VAL\_POLICY\_RFC5280**

Apply only the RFC 5280 compliant certificate validation policy. This setting provides stricter validation than the ANY setting, but rejects some older digital certificates.

This parameter is only valid on UNIX, Linux, and Windows and can be used only on a queue manager with a command level of 711, or higher.

Changes to **CertificateValPolicy** become effective either:

- When a new channel process is started.
- For channels that run as threads of the channel initiator, when the channel initiator is restarted.
- For channels that run as threads of the listener, when the listener is restarted.
- For channels that run as threads of a process pooling process, when the process pooling process is started or restarted and first runs a TLS channel. If the process pooling process has already run a TLS channel, and you want the change to become effective immediately, run the MQSC command **REFRESH SECURITY TYPE(SSL)**. The process pooling process is amqmpa on UNIX, Linux, and Windows.
- When a **REFRESH SECURITY TYPE(SSL)** command is issued.

**z/OS**

### **CFConlos (MQCFIN)**

Specifies the action to be taken when the queue manager loses connectivity to the administration structure, or any CF structure with CFConlos set to ASQMGR (parameter identifier: MQIA\_QMGR\_CFCONLOS).

The value can be:

#### **MQCFCONLOS\_TERMINATE**

The queue manager terminates when connectivity to CF structures is lost.

#### **MQCFCONLOS\_TOLERATE**

The queue manager tolerates loss of connectivity to CF structures without terminating.

This parameter applies to z/OS only.

### **ChannelAutoDef (MQCFIN)**

Controls whether receiver and server-connection channels can be auto-defined (parameter identifier: MQIA\_CHANNEL\_AUTO\_DEF).

Auto-definition for cluster-sender channels is always enabled.

This parameter is supported in the following environments: IBM i, UNIX, Linux, and Windows systems.

The value can be:

#### **MQCHAD\_DISABLED**

Channel auto-definition disabled.

#### **MQCHAD\_ENABLED**

Channel auto-definition enabled.

### **ChannelAutoDefEvent (MQCFIN)**

Controls whether channel auto-definition events are generated (parameter identifier: MQIA\_CHANNEL\_AUTO\_DEF\_EVENT), when a receiver, server-connection, or cluster-sender channel is auto-defined.

This parameter is supported in the following environments: IBM i, UNIX, Linux, and Windows systems.

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

### **ChannelAutoDefExit (MQCFIN)**

Channel auto-definition exit name (parameter identifier: MQCA\_CHANNEL\_AUTO\_DEF\_EXIT).

This exit is invoked when an inbound request for an undefined channel is received, if:

1. The channel is a cluster-sender, or
2. Channel auto-definition is enabled (see *ChannelAutoDef*).

This exit is also invoked when a cluster-receiver channel is started.

The format of the name is the same as for the *SecurityExit* parameter described in [“Change, Copy, and Create Channel” on page 1396](#).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

This parameter is supported in the following environments: z/OS, IBM i, UNIX, Linux, and Windows. On z/OS, it applies only to cluster-sender and cluster-receiver channels.

### **ChannelAuthenticationRecords (MQCFIN)**

Controls whether channel authentication records are used. Channel authentication records can still be set and displayed regardless of the value of this attribute. (parameter identifier: MQIA\_CHLAUTH\_RECORDS).

The value can be:

#### **MQCHLA\_DISABLED**

Channel authentication records are not checked.

#### **MQCHLA\_ENABLED**

Channel authentication records are checked.

### **ChannelEvent (MQCFIN)**

Controls whether channel events are generated (parameter identifier: MQIA\_CHANNEL\_EVENT).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

#### **MQEVR\_EXCEPTION**

Reporting of exception channel events enabled.

### **Multi ChannelInitiatorControl (MQCFIN)**

Specifies whether the channel initiator is to be started when the queue manager starts (parameter identifier: MQIA\_CHINIT\_CONTROL).

The value can be:

#### **MQSVC\_CONTROL\_MANUAL**

The channel initiator is not to be started automatically.

#### **MQSVC\_CONTROL\_Q\_MGR**

The channel initiator is to be started automatically when the queue manager starts.

This parameter is valid only on [Multiplatforms](#).

### **ChannelMonitoring (MQCFIN)**

Default setting for online monitoring for channels (parameter identifier: MQIA\_MONITORING\_CHANNEL).

The value can be:

#### **MQMON\_NONE**

Online monitoring data collection is turned off for channels regardless of the setting of their **ChannelMonitoring** parameter.

**MQMON\_OFF**

Online monitoring data collection is turned off for channels specifying a value of MQMON\_Q\_MGR in their **ChannelMonitoring** parameter. This value is the initial default value of the queue manager.

**MQMON\_LOW**

Online monitoring data collection is turned on, with a low ratio of data collection, for channels specifying a value of MQMON\_Q\_MGR in their **ChannelMonitoring** parameter.

**MQMON\_MEDIUM**

Online monitoring data collection is turned on, with a moderate ratio of data collection, for channels specifying a value of MQMON\_Q\_MGR in their **ChannelMonitoring** parameter.

**MQMON\_HIGH**

Online monitoring data collection is turned on, with a high ratio of data collection, for channels specifying a value of MQMON\_Q\_MGR in their **ChannelMonitoring** parameter.

**ChannelStatistics (MQCFIN)**

Controls whether statistics data is to be collected for channels (parameter identifier: MQIA\_STATISTICS\_CHANNEL).

The value can be:

**MQMON\_NONE**

Statistics data collection is turned off for channels regardless of the setting of their **ChannelStatistics** parameter. This value is the initial default value of the queue manager.

**MQMON\_OFF**

Statistics data collection is turned off for channels specifying a value of MQMON\_Q\_MGR in their *ChannelStatistics* parameter.

**MQMON\_LOW**

Statistics data collection is turned on, with a low ratio of data collection, for channels specifying a value of MQMON\_Q\_MGR in their **ChannelStatistics** parameter.

**MQMON\_MEDIUM**

Statistics data collection is turned on, with a moderate ratio of data collection, for channels specifying a value of MQMON\_Q\_MGR in their **ChannelStatistics** parameter.

**MQMON\_HIGH**

Statistics data collection is turned on, with a high ratio of data collection, for channels specifying a value of MQMON\_Q\_MGR in their **ChannelStatistics** parameter.

**z/OS** On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

**z/OS ChinitAdapters (MQCFIN)**

Number of adapter subtasks (parameter identifier: MQIA\_CHINIT\_ADAPTERS).

The number of adapter subtasks to use for processing IBM MQ calls. This parameter applies to z/OS only.

Specify a value in the range 1 - 9999. The initial default value of the queue manager is 8.

**z/OS ChinitDispatchers (MQCFIN)**

Number of dispatchers (parameter identifier: MQIA\_CHINIT\_DISPATCHERS).

The number of dispatchers to use for the channel initiator. This parameter applies to z/OS only.

Specify a value in the range 1 - 9999. The initial default value of the queue manager is 5.

**z/OS ChinitServiceParm (MQCFIN)**

Reserved for use by IBM (parameter identifier: MQCA\_CHINIT\_SERVICE\_PARM).

This parameter applies to z/OS only.

▶ z/OS

### **ChinitTraceAutoStart (MQCFIN)**

Specifies whether the channel initiator trace must start automatically (parameter identifier: MQIA\_CHINIT\_TRACE\_AUTO\_START).

The value can be:

#### **MQTRAXSTR\_YES**

Channel initiator trace is to start automatically.

#### **MQTRAXSTR\_NO**

Channel initiator trace is not to start automatically. This value is the initial default value of the queue manager.

This parameter applies to z/OS only.

▶ z/OS

### **ChinitTraceTableSize (MQCFIN)**

The size, in megabytes, of the trace data space of the channel initiator (parameter identifier: MQIA\_CHINIT\_TRACE\_TABLE\_SIZE).

Specify a value in the range 2 - 2048. The initial default value of the queue manager is 2.

This parameter applies to z/OS only.

### **ClusterSenderMonitoringDefault (MQCFIN)**

Default setting for online monitoring for automatically defined cluster-sender channels (parameter identifier: MQIA\_MONITORING\_AUTO\_CLUSSDR).

Specifies the value to be used for the *ChannelMonitoring* attribute of automatically defined cluster-sender channels. The value can be any of the following values:

#### **MQMON\_Q\_MGR**

Collection of online monitoring data is inherited from the setting of the queue manager's **ChannelMonitoring** parameter. This value is the initial default value of the queue manager.

#### **MQMON\_OFF**

Monitoring for the channel is disabled.

#### **MQMON\_LOW**

Unless *ChannelMonitoring* is MQMON\_NONE, this value specifies a low rate of data collection with a minimal effect on system performance. The data collected is not likely to be the most current.

#### **MQMON\_MEDIUM**

Unless *ChannelMonitoring* is MQMON\_NONE, this value specifies a moderate rate of data collection with limited effect on system performance.

#### **MQMON\_HIGH**

Unless *ChannelMonitoring* is MQMON\_NONE, this value specifies a high rate of data collection with a likely effect on system performance. The data collected is the most current available.

▶ z/OS

On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

### **ClusterSenderStatistics (MQCFIN)**

Controls whether statistics data is to be collected for auto-defined cluster-sender channels (parameter identifier: MQIA\_STATISTICS\_AUTO\_CLUSSDR).

The value can be:

#### **MQMON\_Q\_MGR**

Collection of statistics data is inherited from the setting of the queue manager's **ChannelStatistics** parameter. This value is the initial default value of the queue manager.

#### **MQMON\_OFF**

Statistics data collection for the channel is disabled.

**MQMON\_LOW**

Unless *ChannelStatistics* is MQMON\_NONE, this value specifies a low rate of data collection with a minimal effect on system performance.

**MQMON\_MEDIUM**

Unless *ChannelStatistics* is MQMON\_NONE, this value specifies a moderate rate of data collection.

**MQMON\_HIGH**

Unless *ChannelStatistics* is MQMON\_NONE, this value specifies a high rate of data collection.

 On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

**ClusterWorkLoadData (MQCFST)**

Cluster workload exit data (parameter identifier: MQCA\_CLUSTER\_WORKLOAD\_DATA).

This parameter is passed to the cluster workload exit when it is called.

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

**ClusterWorkLoadExit (MQCFST)**

Cluster workload exit name (parameter identifier: MQCA\_CLUSTER\_WORKLOAD\_EXIT).

If a nonblank name is defined this exit is invoked when a message is put to a cluster queue.

The format of the name is the same as for the *SecurityExit* parameter described in [“Change, Copy, and Create Channel” on page 1396](#).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

**ClusterWorkLoadLength (MQCFIN)**

Cluster workload length (parameter identifier: MQIA\_CLUSTER\_WORKLOAD\_LENGTH).

The maximum length of the message passed to the cluster workload exit.

The value of this attribute must be in the range 0 - 999,999 999.

**CLWLMRUChannels (MQCFIN)**

Cluster workload most recently used (MRU) channels (parameter identifier: MQIA\_CLWL\_MRU\_CHANNELS).

The maximum number of active most recently used outbound channels.

Specify a value in the range 1 - 999,999 999.

**CLWLUseQ (MQCFIN)**

Use of remote queue (parameter identifier: MQIA\_CLWL\_USEQ).

Specifies whether a cluster queue manager is to use remote puts to other queues defined in other queue managers within the cluster during workload management.

Specify either:

**MQCLWL\_USEQ\_ANY**

Use remote queues.

**MQCLWL\_USEQ\_LOCAL**

Do not use remote queues.

**CodedCharSetId (MQCFIN)**

Queue manager coded character set identifier (parameter identifier: MQIA\_CODED\_CHAR\_SET\_ID).

The coded character set identifier (CCSID) for the queue manager. The CCSID is the identifier used with all character string fields defined by the application programming interface (API). If the CCSID in a message descriptor is set to the value MQCCSI\_Q\_MGR, it applies to the character data written

into the body of a message. Data is written using MQPUT or MQPUT1. Character data is identified by the format specified for the message.

Specify a value in the range 1 - 65,535.

The CCSID must specify a value that is defined for use on the platform and use an appropriate character set. The character set must be:

- EBCDIC on IBM i
- ASCII or ASCII-related on other platforms

Stop and restart the queue manager after execution of this command so that all processes reflect the changed CCSID of the queue manager.

This parameter is not supported on z/OS.

### **CommandEvent (MQCFIN)**

Controls whether command events are generated (parameter identifier: MQIA\_COMMAND\_EVENT).

The value can be any of the following values:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

#### **MQEVR\_NO\_DISPLAY**

Event reporting enabled for all successful commands except Inquire commands.

### **z/OS**

#### **CommandScope (MQCFIN)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment. The command server must be enabled.
- An asterisk " \* ". The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **Multi**

#### **CommandServerControl (MQCFIN)**

Specifies whether the command server is to be started when the queue manager starts (parameter identifier: MQIA\_CMD\_SERVER\_CONTROL).

The value can be:

#### **MQSVC\_CONTROL\_MANUAL**

The command server is not to be started automatically.

#### **MQSVC\_CONTROL\_Q\_MGR**

The command server is to be started automatically when the queue manager starts.

This parameter is valid only on [Multiplatforms](#).

### **ConfigurationEvent (MQCFIN)**

Controls whether configuration events are generated (parameter identifier: MQIA\_CONFIGURATION\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**ConnAuth (MQCFST)**

The name of an authentication information object that is used to provide the location of user ID and password authentication (parameter identifier: MQCA\_CONN\_AUTH).

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH. Only authentication information objects with type IDPWOS or IDPWLDAP can be specified; other types result in an error message when the OAM (on UNIX, Linux, and Windows) or the security component (on z/OS) reads the configuration.

**Custom (MQCFST)**

Custom attribute for new features (parameter identifier: MQCA\_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes are introduced. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE). Single quotation marks must be escaped with another single quotation mark.

This description is updated when features using this attribute are introduced. Currently there are no possible values for *Custom*.

The maximum length of the string is MQ\_CUSTOM\_LENGTH.

**DeadLetterQName (MQCFIN)**

Dead letter (undelivered message) queue name (parameter identifier: MQCA\_DEAD\_LETTER\_Q\_NAME).

Specifies the name of the local queue that is to be used for undelivered messages. Messages are put on this queue if they cannot be routed to their correct destination. The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**DefClusterXmitQueueType (MQCFIN)**

The DefClusterXmitQueueType attribute controls which transmission queue is selected by default by cluster-sender channels to get messages from, to send the messages to cluster-receiver channels. (Parameter identifier: MQIA\_DEF\_CLUSTER\_XMIT\_Q\_TYPE.)

The values of **DefClusterXmitQueueType** are MQCLXQ\_SCTQ or MQCLXQ\_CHANNEL.

**MQCLXQ\_SCTQ**

All cluster-sender channels send messages from SYSTEM.CLUSTER.TRANSMIT.QUEUE. The correlID of messages placed on the transmission queue identifies which cluster-sender channel the message is destined for.

SCTQ is set when a queue manager is defined. This behavior is implicit in versions of IBM WebSphere MQ, earlier than IBM WebSphere MQ 7.5. In earlier versions, the queue manager attribute DefClusterXmitQueueType was not present.

**MQCLXQ\_CHANNEL**

Each cluster-sender channel sends messages from a different transmission queue. Each transmission queue is created as a permanent dynamic queue from the model queue SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE.

**DefXmitQName (MQCFST)**

Default transmission queue name (parameter identifier: MQCA\_DEF\_XMIT\_Q\_NAME).

This parameter is the name of the default transmission queue that is used for the transmission of messages to remote queue managers. It is selected if there is no other indication of which transmission queue to use.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### **DNSGroup (MQCFST)**

DNS group name (parameter identifier: MQCA\_DNS\_GROUP).

This parameter is no longer used. See [z/OS: WLM/DNS no longer supported](#). This parameter applies to z/OS only.

The maximum length of the string is MQ\_DNS\_GROUP\_NAME\_LENGTH.

### **z/OS DNSWLM (MQCFIN)**

WLM/DNS Control: (parameter identifier: MQIA\_DNS\_WLM).

This parameter is no longer used. See [z/OS: WLM/DNS no longer supported](#).

The value can be any of the following values:

#### **MQDNSWLM\_NO**

This is the only value supported by the queue manager.

This parameter applies to z/OS only.

### **z/OS ExpiryInterval (MQCFIN)**

Interval between scans for expired messages (parameter identifier: MQIA\_EXPIRY\_INTERVAL). This parameter applies to z/OS only.

Specifies the frequency with which the queue manager scans the queues looking for expired messages. Specify a time interval in seconds in the range 1 - 99,999,999, or the following special value:

#### **MQEXPI\_OFF**

No scans for expired messages.

The minimum scan interval used is 5 seconds, even if you specify a lower value.

### **EncryptionPolicySuiteB (MQCFIL)**

Specifies whether Suite B-compliant cryptography is used and what level of strength is employed (parameter identifier MQIA\_SUITE\_B\_STRENGTH).

The value can be one or more of:

#### **MQ\_SUITE\_B\_NONE**

Suite B-compliant cryptography is not used.

#### **MQ\_SUITE\_B\_128\_BIT**

Suite B 128-bit strength security is used.

#### **MQ\_SUITE\_B\_192\_BIT**

Suite B 192-bit strength security is used.

If invalid lists are specified, such as MQ\_SUITE\_B\_NONE with MQ\_SUITE\_B\_128\_BIT, the error MQRCCF\_SUITE\_B\_ERROR is issued.

### **Force (MQCFIN)**

Force changes (parameter identifier: MQIACF\_FORCE).

Specifies whether the command is forced to complete if both of the following are true:

- *DefXmitQName* is specified, and
- An application has a remote queue open, the resolution for which is affected by this change.

### **z/OS GroupUR (MQCFIN)**

Controls whether CICS and XA client applications can establish transactions with a GROUP unit of recovery disposition.

This attribute is only valid on z/OS and can be enabled only when the queue manager is a member of a queue sharing group.

The value can be:

## **MQGUR\_DISABLED**

CICS and XA client applications must connect using a queue manager name.

## **MQGUR\_ENABLED**

CICS and XA client applications can establish transactions with a group unit of recovery disposition by specifying a queue sharing group name when they connect.

**z/OS**

See [Unit of recovery disposition in a queue sharing group](#).

**z/OS**

## **IGQPutAuthority (MQCFIN)**

Command scope (parameter identifier: MQIA\_IGQ\_PUT\_AUTHORITY). This parameter is valid only on z/OS when the queue manager is a member of a queue sharing group.

Specifies the type of authority checking and, therefore, the user IDs to be used by the IGQ agent (IGQA). This parameter establishes the authority to put messages to a destination queue. The value can be any of the following values:

### **MQIGQPA\_DEFAULT**

Default user identifier is used.

The user identifier used for authorization is the value of the *UserIdentifier* field. The *UserIdentifier* field is in the separate MQMD that is associated with the message when the message is on the shared transmission queue. This value is the user identifier of the program that placed the message on the shared transmission queue. It is typically the same as the user identifier under which the remote queue manager is running.

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the user identifier of the local IGQ agent (*IGQUserId*) is checked.

### **MQIGQPA\_CONTEXT**

Context user identifier is used.

The user identifier used for authorization is the value of the *UserIdentifier* field. The *UserIdentifier* field is in the separate MQMD that is associated with the message when the message is on the shared transmission queue. This value is the user identifier of the program that placed the message on the shared transmission queue. It is typically the same as the user identifier under which the remote queue manager is running.

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the user identifier of the local IGQ agent (*IGQUserId*) is checked.. The value of the *UserIdentifier* field in the embedded MQMD is also checked. The latter user identifier is typically the user identifier of the application that originated the message.

### **MQIGQPA\_ONLY\_IGQ**

Only the IGQ user identifier is used.

The user identifier used for authorization is the user identifier of the local IGQ agent (*IGQUserId*).

If the RESLEVEL profile indicates that more than one user identifier is to be checked, this user identifier is used for all checks.

### **MQIGQPA\_ALTERNATE\_OR\_IGQ**

Alternate user identifier or IGQ-agent user identifier is used.

The user identifier used for authorization is the user identifier of the local IGQ agent (*IGQUserId*).

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the value of the *UserIdentifier* field in the embedded MQMD is also checked. The latter user identifier is typically the user identifier of the application that originated the message.

**z/OS**

## **IGQUserId (MQCFST)**

Intra-group queuing agent user identifier (parameter identifier: MQCA\_IGQ\_USER\_ID). This parameter is valid only on z/OS when the queue manager is a member of a queue sharing group.

Specifies the user identifier that is associated with the local intra-group queuing agent. This identifier is one of the user identifiers that might be checked for authorization when the IGQ agent puts messages on local queues. The actual user identifiers checked depend on the setting of the *IGQPutAuthority* attribute, and on external security options.

The maximum length is MQ\_USER\_ID\_LENGTH.

#### **V 9.1.0 ImageInterval (MQCFIN)**

The target frequency with which the queue manager automatically writes media images, in minutes since the previous media image for an object (parameter identifier: MQIA\_MEDIA\_IMAGE\_INTERVAL). This parameter is not valid on z/OS.

The value can be:

The time in minutes from 1 - 999 999 999, at which the queue manager automatically writes media images.

The default value is 60 minutes.

#### **MQMEDIMGINTVL\_OFF**

Automatic media images are not written on a time interval basis.

#### **V 9.1.0 ImageLogLength (MQCFIN)**

The target size of the recovery log, written before the queue manager automatically writes media images, in number of megabytes since the previous media image for an object. This limits the amount of log to be read when recovering an object (parameter identifier: MQIA\_MEDIA\_IMAGE\_LOG\_LENGTH). This parameter is not valid on z/OS.

The value can be:

The target size of the recovery log in megabytes from 1 - 999 999 999.

#### **MQMEDIMGLOGLN\_OFF**

Automatic media images are not written based on the size of log written.

MQMEDIMGLOGLN\_OFF is the default value.

#### **V 9.1.0 ImageRecoverObject (MQCFST)**

Specifies whether authentication information, channel, client connection, listener, namelist, process, alias queue, remote queue, and service objects are recoverable from a media image, if linear logging is being used (parameter identifier: MQIA\_MEDIA\_IMAGE\_RECOVER\_OBJ). This parameter is not valid on z/OS.

The value can be:

#### **MQIMGRCOV\_NO**

The “[rcdmqimg \(record media image\)](#)” on page 128 and “[rcrmqobj \(re-create object\)](#)” on page 134 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

#### **MQIMGRCOV\_YES**

These objects are recoverable.

MQIMGRCOV\_YES is the default value.

#### **V 9.1.0 ImageRecoverQueue (MQCFST)**

Specifies the default **ImageRecoverQueue** attribute for local and permanent dynamic queue objects, when used with this parameter (parameter identifier: MQIA\_MEDIA\_IMAGE\_RECOVER\_Q). This parameter is not valid on z/OS.

The value can be:

#### **MQIMGRCOV\_NO**

The **ImageRecoverQueue** attribute for local and permanent dynamic queue objects is set to MQIMGRCOV\_NO .

### **MQIMGRCOV\_YES**

The **ImageRecoverQueue** attribute for local and permanent dynamic queue objects is set to MQIMGRCOV\_YES .

MQIMGRCOV\_YES is the default value.

### **V 9.1.0 ImageSchedule (MQCFST)**

Whether the queue manager automatically writes media images (parameter identifier: MQIA\_MEDIA\_IMAGE\_SCHEDUING). This parameter is not valid on z/OS.

The value can be:

#### **MQMEDIMGSCHED\_AUTO**

The queue manager attempts to automatically write a media image for an object, before **ImageInterval** minutes have elapsed, or **ImageLogLength** megabytes of recovery log have been written, since the previous media image for the object was taken.

The previous media image might have been taken manually or automatically, depending on the settings of **ImageInterval** or **ImageLogLength**.

#### **MQMEDIMGSCHED\_MANUAL**

Automatic media images are not written.

MQMEDIMGSCHED\_MANUAL is the default value.

### **InhibitEvent (MQCFIN)**

Controls whether inhibit (Inhibit Get and Inhibit Put) events are generated (parameter identifier: MQIA\_INHIBIT\_EVENT).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

### **z/OS IntraGroupqueuing (MQCFIN)**

Command scope (parameter identifier: MQIA\_INTRA\_GROUP\_QUEUING). This parameter is valid only on z/OS when the queue manager is a member of a queue sharing group.

Specifies whether intra-group queuing is used. The value can be any of the following values:

#### **MQIGQ\_DISABLED**

Intra-group queuing disabled.

#### **MQIGQ\_ENABLED**

Intra-group queuing enabled.

### **IPAddressVersion (MQCFIN)**

IP address version selector (parameter identifier: MQIA\_IP\_ADDRESS\_VERSION).

Specifies which IP address version, either IPv4 or IPv6, is used. The value can be:

#### **MQIPADDR\_IPv4**

IPv4 is used.

#### **MQIPADDR\_IPv6**

IPv6 is used.

This parameter is only relevant for systems that run both IPv4 and IPv6. It affects only channels defined as having a *TransportType* of MQXPY\_TCP when one of the following conditions is true:

- The channel attribute *ConnectionName* is a host name that resolves to both an IPv4 and IPv6 address and its **LocalAddress** parameter is not specified.
- The channel attributes *ConnectionName* and *LocalAddress* are both host names that resolve to both IPv4 and IPv6 addresses.

**z/OS ListenerTimer (MQCFIN)**

Listener restart interval (parameter identifier: MQIA\_LISTENER\_TIMER).

The time interval, in seconds, between attempts by IBM MQ to restart the listener after an APPC or TCP/IP failure. This parameter applies to z/OS only.

Specify a value in the range 5 - 9,999. The initial default value of the queue manager is 60.

**LocalEvent (MQCFIN)**

Controls whether local error events are generated (parameter identifier: MQIA\_LOCAL\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**Multi LoggerEvent (MQCFIN)**

Controls whether recovery log events are generated (parameter identifier: MQIA\_LOGGER\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled. This value is valid only on queue managers that use linear logging.

This parameter is valid only on [Multiplatforms](#).

**z/OS LUGroupName (MQCFST)**

Generic LU name for the LU 6.2 listener (parameter identifier: MQCA\_LU\_GROUP\_NAME).

The generic LU name to be used by the LU 6.2 listener that handles inbound transmissions for the queue sharing group.

This parameter applies to z/OS only.

The maximum length of the string is MQ\_LU\_NAME\_LENGTH.

**z/OS LUName (MQCFST)**

LU name to use for outbound LU 6.2 transmissions (parameter identifier: MQCA\_LU\_NAME).

The name of the LU to use for outbound LU 6.2 transmissions. Set this parameter to be the same as the name of the LU to be used by the listener for inbound transmissions.

This parameter applies to z/OS only.

The maximum length of the string is MQ\_LU\_NAME\_LENGTH.

**z/OS LU62ARMSuffix (MQCFST)**

APPCPM suffix (parameter identifier: MQCA\_LU62\_ARM\_SUFFIX).

The suffix of the APPCPM member of SYS1.PARMLIB. This suffix nominates the LUADD for this channel initiator.

This parameter applies to z/OS only.

The maximum length of the string is MQ\_ARM\_SUFFIX\_LENGTH.

**z/OS LU62Channels (MQCFIN)**

Maximum number of LU 6.2 channels (parameter identifier: MQIA\_LU62\_CHANNELS).

The maximum number of channels that can be current, or clients that can be connected, that use the LU 6.2 transmission protocol.

This parameter applies to z/OS only.

Specify a value in the range 0 - 9999. The initial default value of the queue manager is 200.

#### **MaxActiveChannels (MQCFIN)**

Maximum number of active channels (parameter identifier: MQIA\_ACTIVE\_CHANNELS ).

The maximum number of channels that can be *active* at any time.

This parameter applies to z/OS only.

Sharing conversations do not contribute to the total for this parameter.

Specify a value in the range 1 - 9999. The initial default value of the queue manager is 200.

#### **MaxChannels (MQCFIN)**

Maximum number of current channels (parameter identifier: MQIA\_MAX\_CHANNELS).

The maximum number of channels that can be *current* (including server-connection channels with connected clients).

This parameter applies to z/OS only.

Sharing conversations do not contribute to the total for this parameter.

Specify a value in the range 1 - 9999.

#### **MaxHandles (MQCFIN)**

Maximum number of handles (parameter identifier: MQIA\_MAX\_HANDLES).

The maximum number of handles that any one connection can have open at the same time.

Specify a value in the range 0 - 999,999,999.

#### **MaxMsgLength (MQCFIN)**

Maximum message length (parameter identifier: MQIA\_MAX\_MSG\_LENGTH).

Specifies the maximum length of messages allowed on queues on the queue manager. No message that is larger than either the queue attribute *MaxMsgLength* or the queue manager attribute *MaxMsgLength* can be put on a queue.

If you reduce the maximum message length for the queue manager, you must also reduce the maximum message length of the SYSTEM.DEFAULT.LOCAL.QUEUE definition, and your other queues. Reduce the definitions on the queues to less than or equal to the limit of the queue manager. If you do not reduce the message lengths appropriately, and applications inquire only the value of the queue attribute *MaxMsgLength*, they might not work correctly.

The lower limit for this parameter is 32 KB (32,768 bytes). The upper limit is 100 MB (104,857,600 bytes).

This parameter is not valid on z/OS.

#### **MaxPropertiesLength (MQCFIN)**

Maximum property length (parameter identifier: MQIA\_MAX\_PROPERTIES\_LENGTH).

Specifies the maximum length of the properties, including both the property name in bytes and the size of the property value in bytes.

Specify a value in the range 0 - 100 MB (104,857,600 bytes), or the special value:

#### **MQPROP\_UNRESTRICTED\_LENGTH**

The size of the properties is restricted only by the upper limit.

#### **MaxUncommittedMsgs (MQCFIN)**

Maximum uncommitted messages (parameter identifier: MQIA\_MAX\_UNCOMMITTED\_MSGS).

Specifies the maximum number of uncommitted messages. The maximum number of uncommitted messages under any sync point is the sum of the following messages:

The number of messages that can be retrieved.

The number of messages that can be put.

The number of trigger messages generated within this unit of work.

The limit does not apply to messages that are retrieved or put outside sync point.

Specify a value in the range 1 - 10,000.

#### **Multi MQIAccounting (MQCFIN)**

Controls whether accounting information for MQI data is to be collected (parameter identifier: MQIA\_ACCOUNTING\_MQI).

The value can be:

##### **MQMON\_OFF**

MQI accounting data collection is disabled. This value is the initial default value of the queue manager.

##### **MQMON\_ON**

MQI accounting data collection is enabled.

This parameter is valid only on [Multiplatforms](#).

#### **Multi MQIStatistics (MQCFIN)**

Controls whether statistics monitoring data is to be collected for the queue manager (parameter identifier: MQIA\_STATISTICS\_MQI).

The value can be:

##### **MQMON\_OFF**

Data collection for MQI statistics is disabled. This value is the initial default value of the queue manager.

##### **MQMON\_ON**

Data collection for MQI statistics is enabled.

This parameter is valid only on [Multiplatforms](#).

#### **MsgMarkBrowseInterval (MQCFIN)**

Mark-browse interval (parameter identifier: MQIA\_MSG\_MARK\_BROWSE\_INTERVAL).

Specifies the time interval in milliseconds after which the queue manager can automatically unmark messages.

Specify a value up to the maximum of 999,999,999, or the special value MQMMBI\_UNLIMITED. The default value is 5000.

**Attention:** You should not reduce the value below the default of 5000.

MQMMBI\_UNLIMITED indicates that the queue manager does not automatically unmark messages.

#### **z/OS OutboundPortMax (MQCFIN)**

The maximum value in the range for the binding of outgoing channels (parameter identifier: MQIA\_OUTBOUND\_PORT\_MAX).

The maximum value in the range of port numbers to be used when binding outgoing channels. This parameter applies to z/OS only.

Specify a value in the range 0 - 65,535. The initial default value of the queue manager is zero.

Specify a corresponding value for *OutboundPortMin* and ensure that the value of *OutboundPortMax* is greater than or equal to the value of *OutboundPortMin* .

#### **z/OS OutboundPortMin (MQCFIN)**

The minimum value in the range for the binding of outgoing channels (parameter identifier: MQIA\_OUTBOUND\_PORT\_MIN).

The minimum value in the range of port numbers to be used when binding outgoing channels. This parameter applies to z/OS only.

Specify a value in the range 0 - 65,535. The initial default value of the queue manager is zero.

Specify a corresponding value for *OutboundPortMax* and ensure that the value of *OutboundPortMin* is less than or equal to the value of *OutboundPortMax* .

### **Parent (MQCFST)**

The name of the queue manager to which this queue manager is to connect hierarchically as its child (parameter identifier: MQCA\_PARENT).

A blank value indicates that this queue manager has no parent queue manager. If there is an existing parent queue manager it is disconnected. This value is the initial default value of the queue manager.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

#### **Note:**

- The use of IBM MQ hierarchical connections requires that the queue manager attribute PSMODE is set to MQPSM\_ENABLED.
- The value of *Parent* can be set to a blank value if PSMODE is set to MQPSM\_DISABLED.
- Before connecting to a queue manager hierarchically as its child, channels in both directions must exist between the parent queue manager and child queue manager.
- If a parent is defined, the **Change Queue Manager** command disconnects from the original parent and sends a connection flow to the new parent queue manager.
- Successful completion of the command does not mean that the action completed or that it is going to complete successfully. Use the **Inquire Pub/Sub Status** command to track the status of the requested parent relationship.

### **PerformanceEvent (MQCFIN)**

Controls whether performance-related events are generated (parameter identifier: MQIA\_PERFORMANCE\_EVENT).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

### **PubSubClus (MQCFIN)**

Controls whether the queue manager participates in publish/subscribe clustering (parameter identifier: MQIA\_PUBSUB\_CLUSTER).

The value can be:

#### **MQPSCLUS\_ENABLED**

The creating or receipt of clustered topic definitions and cluster subscriptions is permitted.

**Note:** The introduction of a clustered topic into a large IBM MQ cluster can cause a degradation in performance. This degradation occurs because all partial repositories are notified of all the other members of the cluster. Unexpected subscriptions might be created at all other nodes; for example; where `proxysub(FORCE)` is specified. Large numbers of channels might be started from a queue manager; for example, on resync after a queue manager failure.

#### **MQPSCLUS\_DISABLED**

The creating or receipt of clustered topic definitions and cluster subscriptions is inhibited. The creations or receipts are recorded as warnings in the queue manager error logs.

### **PubSubMaxMsgRetryCount (MQCFIN)**

The number of attempts to reprocess a message when processing a failed command message under sync point (parameter identifier: MQIA\_PUBSUB\_MAXMSG\_RETRY\_COUNT).

The value can be:

**0 to 999 999 999**

The initial value is 5.

**PubSubMode (MQCFIN)**

Specifies whether the publish/subscribe engine and the queued publish/subscribe interface are running. The publish/subscribe engine enables applications to publish or subscribe by using the application programming interface. The publish/subscribe interface monitors the queues used the queued publish/subscribe interface (parameter identifier: MQIA\_PUBSUB\_MODE).

The value can be:

**MQPSM\_COMPAT**

The publish/subscribe engine is running. It is therefore possible to publish or subscribe by using the application programming interface. The queued publish/subscribe interface is not running. Therefore any message that is put to the queues that are monitored by the queued publish/subscribe interface is not acted on. MQPSM\_COMPAT is used for compatibility with versions of IBM Integration Bus (formerly known as WebSphere Message Broker) prior to version 7 that use this queue manager.

**MQPSM\_DISABLED**

The publish/subscribe engine and the queued publish/subscribe interface are not running. It is therefore not possible to publish or subscribe using the application programming interface. Any publish/subscribe messages that are put to the queues that are monitored by the queued publish/subscribe interface are not acted on.

**MQPSM\_ENABLED**

The publish/subscribe engine and the queued publish/subscribe interface are running. It is therefore possible to publish or subscribe by using the application programming interface and the queues that are monitored by the queued publish/subscribe interface. This value is the initial default value of the queue manager.

**PubSubNPInputMsg (MQCFIN)**

Whether to discard (or keep) an undelivered input message (parameter identifier: MQIA\_PUBSUB\_NP\_MSG).

The value can be:

**MQUNDELIVERED\_DISCARD**

Non-persistent input messages are discarded if they cannot be processed.

**MQUNDELIVERED\_KEEP**

Non-persistent input messages are not discarded if they cannot be processed. In this situation, the queued publish/subscribe interface continues to try the process again at appropriate intervals and does not continue processing subsequent messages.

**PubSubNPResponse (MQCFIN)**

Controls the behavior of undelivered response messages (parameter identifier: MQIA\_PUBSUB\_NP\_RESP).

The value can be:

**MQUNDELIVERED\_NORMAL**

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If they cannot be placed on the dead letter queue they are discarded.

**MQUNDELIVERED\_SAFE**

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If the response cannot be sent and cannot be placed on the dead letter queue the queued publish/subscribe interface rolls back the current operation. The operation is tried again at appropriate intervals and does not continue processing subsequent messages.

**MQUNDELIVERED\_DISCARD**

Non-persistent responses that are not placed on the reply queue are discarded.

### **MQUNDELIVERED\_KEEP**

Non-persistent responses are not placed on the dead letter queue or discarded. Instead, the queued publish/subscribe interface backs out the current operation and then try it again at appropriate intervals.

### **PubSubSyncPoint (MQCFIN)**

Whether only persistent (or all) messages must be processed under sync point (parameter identifier: MQIA\_PUBSUB\_SYNC\_PT).

The value can be:

#### **MQSYNCPOINT\_IFPER**

This value makes the queued publish/subscribe interface receive non-persistent messages outside sync point. If the interface receives a publication outside sync point, the interface forwards the publication to subscribers known to it outside sync point.

#### **MQSYNCPOINT\_YES**

This value makes the queued publish/subscribe interface receive all messages under sync point.

### **QMgrDesc (MQCFST)**

Queue manager description (parameter identifier: MQCA\_Q\_MGR\_DESC).

This parameter is text that briefly describes the object.

The maximum length of the string is MQ\_Q\_MGR\_DESC\_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the queue manager on which the command is executing. Using this character set ensures that the text is translated correctly.

### **QSGCertificateLabel (MQCFST)**

Specifies the certificate label for the queue sharing group to use (parameter identifier: MQCA\_QSG\_CERT\_LABEL).

This parameter takes precedence over **CERTLABL** in the event that the queue manager is a member of a QSG.

### **QueueAccounting (MQCFIN)**

Controls the collection of accounting (thread-level and queue-level accounting) data for queues (parameter identifier: MQIA\_ACCOUNTING\_Q). Note, that changes to this value are only effective for connections to the queue manager that occur after the change to the attribute.

The value can be:

#### **MQMON\_NONE**

Accounting data collection for queues is disabled. This value must not be overridden by the value of the **QueueAccounting** parameter on the queue.

#### **MQMON\_OFF**

Accounting data collection is disabled for queues specifying a value of MQMON\_Q\_MGR in the **QueueAccounting** parameter.

#### **MQMON\_ON**

Accounting data collection is enabled for queues specifying a value of MQMON\_Q\_MGR in the **QueueAccounting** parameter.

### **QueueMonitoring (MQCFIN)**

Default setting for online monitoring for queues (parameter identifier: MQIA\_MONITORING\_Q).

If the **QueueMonitoring** queue attribute is set to MQMON\_Q\_MGR, this attribute specifies the value which is assumed by the channel. The value can be any of the following values:

#### **MQMON\_OFF**

Online monitoring data collection is turned off. This value is the initial default value of the queue manager.

**MQMON\_NONE**

Online monitoring data collection is turned off for queues regardless of the setting of their **QueueMonitoring** attribute.

**MQMON\_LOW**

Online monitoring data collection is turned on, with a low ratio of data collection.

**MQMON\_MEDIUM**

Online monitoring data collection is turned on, with a moderate ratio of data collection.

**MQMON\_HIGH**

Online monitoring data collection is turned on, with a high ratio of data collection.

**Multi****QueueStatistics (MQCFIN)**

Controls whether statistics data is to be collected for queues (parameter identifier: MQIA\_STATISTICS\_Q).

The value can be:

**MQMON\_NONE**

Statistics data collection is turned off for queues regardless of the setting of their **QueueStatistics** parameter. This value is the initial default value of the queue manager.

**MQMON\_OFF**

Statistics data collection is turned off for queues specifying a value of MQMON\_Q\_MGR in their **QueueStatistics** parameter.

**MQMON\_ON**

Statistics data collection is turned on for queues specifying a value of MQMON\_Q\_MGR in their **QueueStatistics** parameter.

This parameter is valid only on [Multiplatforms](#).

**z/OS****ReceiveTimeout (MQCFIN)**

How long a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA\_RECEIVE\_TIMEOUT).

The approximate length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state.

This parameter applies to z/OS only. It applies to message channels, and not to MQI channels. This number can be qualified as follows:

- This number is a multiplier to be applied to the negotiated *HeartBeatInterval* value to determine how long a channel is to wait. Set *ReceiveTimeoutType* to MQRCVTIME\_MULTIPLY. Specify a value of zero or in the range 2 - 99. If you specify zero, the channel waits indefinitely to receive data from its partner.
- This number is a value, in seconds, to be added to the negotiated *HeartBeatInterval* value to determine how long a channel is to wait. Set *ReceiveTimeoutType* to MQRCVTIME\_ADD. Specify a value in the range 1 - 999,999.
- This number is a value, in seconds, that the channel is to wait, set *ReceiveTimeoutType* to MQRCVTIME\_EQUAL. Specify a value in the range 0 - 999,999. If you specify 0, the channel waits indefinitely to receive data from its partner.

The initial default value of the queue manager is zero.

**z/OS****ReceiveTimeoutMin (MQCFIN)**

The minimum length of time that a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA\_RECEIVE\_TIMEOUT\_MIN).

The minimum length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state. This parameter applies to z/OS only.

Specify a value in the range 0 - 999,999.

**ReceiveTimeoutType (MQCFIN)**

The qualifier to apply to *ReceiveTimeout* (parameter identifier: MQIA\_RECEIVE\_TIMEOUT\_TYPE).

The qualifier to apply to *ReceiveTimeoutType* to calculate how long a TCP/IP channel waits to receive data, including heartbeats, from its partner. It waits to receive data before returning to the inactive state. This parameter applies to z/OS only.

The value can be any of the following values:

**MQRCVTIME\_MULTIPLY**

The *ReceiveTimeout* value is a multiplier to be applied to the negotiated value of *HeartbeatInterval* to determine how long a channel waits. This value is the initial default value of the queue manager.

**MQRCVTIME\_ADD**

*ReceiveTimeout* is a value, in seconds, to be added to the negotiated value of *HeartbeatInterval* to determine how long a channel waits.

**MQRCVTIME\_EQUAL**

*ReceiveTimeout* is a value, in seconds, representing how long a channel waits.

**RemoteEvent (MQCFIN)**

Controls whether remote error events are generated (parameter identifier: MQIA\_REMOTE\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**RepositoryName (MQCFST)**

Cluster name (parameter identifier: MQCA\_REPOSITORY\_NAME).

The name of a cluster for which this queue manager provides a repository manager service.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

No more than one of the resultant values of *RepositoryName* can be nonblank.

**RepositoryNameList (MQCFST)**

Repository namelist (parameter identifier: MQCA\_REPOSITORY\_NAMELIST).

The name, of a namelist of clusters, for which this queue manager provides a repository manager service.

This queue manager does not have a full repository, but can be a client of other repository services that are defined in the cluster, if

- Both *RepositoryName* and *RepositoryNameList* are blank, or
- *RepositoryName* is blank and the namelist specified by *RepositoryNameList* is empty.

No more than one of the resultant values of *RepositoryNameList* can be nonblank.

**RevDns (MQCFIN)**

Whether reverse lookup of the host name from a Domain Name Server is carried out. (parameter identifier: MQIA\_REVERSE\_DNS\_LOOKUP).

This attribute has an effect only on channels using a transport type (TRPTYPE) of TCP.

The value can be:

**MQRDNS\_DISABLED**

DNS host names are not reverse looked-up for the IP addresses of inbound channels. With this setting any CHLAUTH rules using host names are not matched.

## **MQRDNS\_ENABLED**

DNS host names are reverse looked-up for the IP addresses of inbound channels when this information is required. This setting is required for matching against CHLAUTH rules that contain host names, and for writing out error messages.

**z/OS**

### **SecurityCase (MQCFIN)**

Security case supported (parameter identifier: MQIA\_SECURITY\_CASE).

Specifies whether the queue manager supports security profile names in mixed case, or in uppercase only. The value is activated when a Refresh Security command is run with *SecurityType* (MQSECTYPE\_CLASSES) specified. This parameter is valid only on z/OS.

The value can be:

### **MQSCYC\_UPPER**

Security profile names must be in uppercase.

### **MQSCYC\_MIXED**

Security profile names can be in uppercase or in mixed case.

**z/OS**

### **SharedQMgrName (MQCFIN)**

Shared-queue queue manager name (parameter identifier: MQIA\_SHARED\_Q\_Q\_MGR\_NAME).

A queue manager makes an MQOPEN call for a shared queue. The queue manager that is specified in the **ObjectQmgrName** parameter of the MQOPEN call is in the same queue sharing group as the processing queue manager. The SQQMNAME attribute specifies whether the **ObjectQmgrName** is used or whether the processing queue manager opens the shared queue directly. This parameter is valid only on z/OS.

The value can be any of the following values:

### **MQSQQM\_USE**

*ObjectQmgrName* is used and the appropriate transmission queue is opened.

### **MQSQQM\_IGNORE**

The processing queue manager opens the shared queue directly. This value can reduce the traffic in your queue manager network.

## **SSLCRLNameList (MQCFST)**

The TLS namelist (parameter identifier: MQCA\_SSL\_CRL\_NAMELIST).

The length of the string is MQ\_NAMELIST\_NAME\_LENGTH.

Indicates the name of a namelist of authentication information objects which are used to provide certificate revocation locations to allow enhanced TLS certificate checking.

If *SSLCRLNameList* is blank, certificate revocation checking is not invoked.

Changes to *SSLCRLNameList*, or to the names in a previously specified namelist, or to previously referenced authentication information objects become effective:

- **Multi** On Multiplatforms, when a new channel process is started.
- **Multi** For channels that run as threads of the channel initiator on Multiplatforms, when the channel initiator is restarted.
- **Multi** For channels that run as threads of the listener on Multiplatforms, when the listener is restarted.
- **z/OS** On z/OS, when the channel initiator is restarted.
- When a **REFRESH SECURITY TYPE(SSL)** command is issued.
- **IBM i** On IBM i queue managers, this parameter is ignored. However, it is used to determine which authentication information objects are written to the AMQCLCHL . TAB file.

Only authentication information objects with types of CRLLDAP or OCSP are allowed in the namelist referred to by *SSLCRLNamelist* (MQCFST). Any other type results in an error message when the list is processed and is subsequently ignored.

### **SSLCryptoHardware (MQCFST)**

The TLS cryptographic hardware (parameter identifier: MQCA\_SSL\_CRYPTO\_HARDWARE).

The length of the string is MQ\_SSL\_CRYPTO\_HARDWARE\_LENGTH.

Sets the name of the parameter string required to configure the cryptographic hardware present on the system.

This parameter is valid only on UNIX, Linux, and Windows.

All supported cryptographic hardware supports the PKCS #11 interface. Specify a string of the following format:

```
GSK_PKCS11=PKCS_#11_driver_path_and_file_name;PKCS_#11_token_label;PKCS_#11_token_password;symmetric_cipher_setting;
```

The PKCS #11 driver path is an absolute path to the shared library providing support for the PKCS #11 card. The PKCS #11 driver file name is the name of the shared library. An example of the value required for the PKCS #11 driver path and file name is `/usr/lib/pkcs11/PKCS11_API.so`

To access symmetric cipher operations through GSKit, specify the symmetric cipher setting parameter. The value of this parameter is either:

#### **SYMMETRIC\_CIPHER\_OFF**

Do not access symmetric cipher operations.

#### **SYMMETRIC\_CIPHER\_ON**

Access symmetric cipher operations.

If the symmetric cipher setting is not specified, this value has the same effect as specifying SYMMETRIC\_CIPHER\_OFF.

The maximum length of the string is 256 characters. The default value is blank.

If you specify a string in the wrong format, you get an error.

When the *SSLCryptoHardware* (MQCFST) value is changed, the cryptographic hardware parameters specified become the ones used for new TLS connection environments. The new information becomes effective:

- When a new channel process is started.
- For channels that run as threads of the channel initiator, when the channel initiator is restarted.
- For channels that run as threads of the listener, when the listener is restarted.
- When a Refresh Security command is issued to refresh the contents of the TLS key repository.

### **SSLEvent (MQCFIN)**

Controls whether TLS events are generated (parameter identifier: MQIA\_SSL\_EVENT).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

### **SSLFipsRequired (MQCFIN)**

SSLFIPS specifies whether only FIPS-certified algorithms are to be used if cryptography is carried out in IBM MQ, rather than in cryptographic hardware (parameter identifier: MQIA\_SSL\_FIPS\_REQUIRED).

If cryptographic hardware is configured, the cryptographic modules used are those modules provided by the hardware product. These modules might, or might not, be FIPS-certified to a particular level

depending on the hardware product in use. This parameter applies to z/OS, UNIX, Linux, and Windows platforms only.

The value can be any of the following values:

#### **MQSSL\_FIPS\_NO**

IBM MQ provides an implementation of TLS cryptography which supplies some FIPS-certified modules on some platforms. If you set *SSLFIPSRequired* to **MQSSL\_FIPS\_NO**, any CipherSpec supported on a particular platform can be used. This value is the initial default value of the queue manager.

If the queue manager runs without using cryptographic hardware, refer to the CipherSpecs listed in [Specifying CipherSpecs employing FIPS 140-2 certified cryptography](#):

#### **MQSSL\_FIPS\_YES**

Specifies that only FIPS-certified algorithms are to be used in the CipherSpecs allowed on all TLS connections from and to this queue manager.

For a listing of appropriate FIPS 140-2 certified CipherSpecs; see [Specifying CipherSpecs](#).

Changes to SSLFIPS become effective either:

- On UNIX, Linux, and Windows, when a new channel process is started.
- For channels that run as threads of the channel initiator on UNIX, Linux, and Windows, when the channel initiator is restarted.
- For channels that run as threads of the listener on UNIX, Linux, and Windows, when the listener is restarted.
- For channels that run as threads of a process pooling process, when the process pooling process is started or restarted and first runs a TLS channel. If the process pooling process has already run a TLS channel, and you want the change to become effective immediately, run the MQSC command **REFRESH SECURITY TYPE(SSL)**. The process pooling process is **amqzmpa** on UNIX, Linux, and Windows.
- On z/OS, when the channel initiator is restarted.
- When a **REFRESH SECURITY TYPE(SSL)** command is issued, except on z/OS.

#### **SSLKeyRepository (MQCFST)**

The TLS key repository (parameter identifier: MQCA\_SSL\_KEY\_REPOSITORY).

The length of the string is MQ\_SSL\_KEY\_REPOSITORY\_LENGTH.

Indicates the name of the Secure Sockets Layer key repository.

The format of the name depends on the environment:

- On z/OS, it is the name of a key ring.
- On IBM i, it is of the form *pathname/keyfile*, where *keyfile* is specified without the suffix ( .kdb ), and identifies a GSKit key database file. The default value is /QIBM/UserData/ICSS/Cert/Server/Default.

If you specify \*SYSTEM, IBM MQ uses the system certificate store as the key repository for the queue manager. As a result, the queue manager is registered as a server application in Digital Certificate Manager (DCM). You can assign any server/client certificate in the system store to this application.

If you change the SSLKEYR parameter to a value other than \*SYSTEM, IBM MQ unregisters the queue manager as an application with DCM.

- On UNIX, it is of the form *pathname/keyfile* and on Windows *pathname\keyfile*, where *keyfile* is specified without the suffix ( .kdb ), and identifies a GSKit key database file. The default value for UNIX is /var/mqm/qmgrs/QMGR/ssl/key, and on Windows it is C:\Program Files\IBM\MQ\qmgrs\QMGR\ssl\key, where QMGR is replaced by the queue manager name (on UNIX, Linux, and Windows).

**Multi** On Multiplatforms, the syntax of this parameter is validated to ensure that it contains a valid, absolute, directory path.

If SSLKEYR is blank, or is a value that does not correspond to a key ring or key database file, channels using TLS fail to start.

Changes to SSLKeyRepository become effective as follows:

- **Multi** On Multiplatforms:
  - when a new channel process is started
  - for channels that run as threads of the channel initiator, when the channel initiator is restarted.
  - for channels that run as threads of the listener, when the listener is restarted.
- **z/OS** On z/OS, when the channel initiator is restarted.

### **SSLKeyResetCount (MQCFIN)**

SSL key reset count (parameter identifier: MQIA\_SSL\_RESET\_COUNT).

Specifies when TLS channel MCAs that initiate communication reset the secret key used for encryption on the channel. The value of this parameter represents the total number of unencrypted bytes that are sent and received on the channel before the secret key is renegotiated. This number of bytes includes control information sent by the MCA.

The secret key is renegotiated when (whichever occurs first):

- The total number of unencrypted bytes sent and received by the initiating channel MCA exceeds the specified value, or,
- If channel heartbeats are enabled, before data is sent or received following a channel heartbeat.

Specify a value in the range 0 - 999,999,999. A value of zero, the initial default value of the queue manager, signifies that secret keys are never renegotiated. If you specify a TLS secret key reset count between 1 byte through 32 KB, TLS channels use a secret key reset count of 32Kb. This count is to avoid the performance effect of excessive key resets which would occur for small TLS secret key reset values.

### **SSLTasks (MQCFIN)**

Number of server subtasks to use for processing TLS calls (parameter identifier: MQIA\_SSL\_TASKS). This parameter applies to z/OS only.

The number of server subtasks to use for processing TLS calls. To use TLS channels, you must have at least two of these tasks running.

Specify a value in the range 0 - 9999. However, to avoid problems with storage allocation, do not set this parameter to a value greater than 50.

### **StartStopEvent (MQCFIN)**

Controls whether start and stop events are generated (parameter identifier: MQIA\_START\_STOP\_EVENT).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

### **Multi StatisticsInterval (MQCFIN)**

The time interval, in seconds, at which statistics monitoring data is written to the monitoring queue (parameter identifier: MQIA\_STATISTICS\_INTERVAL).

Specify a value in the range 1 - 604,000.

This parameter is valid only on Multiplatforms.

▶ **z/OS TCPChannels (MQCFIN)**

The maximum number of channels that can be current, or clients that can be connected, that use the TCP/IP transmission protocol (parameter identifier: MQIA\_TCP\_CHANNELS).

Specify a value in the range 0 - 9999. The initial default value of the queue manager is 200.

Sharing conversations do not contribute to the total for this parameter.

This parameter applies to z/OS only.

▶ **z/OS TCPKeepAlive (MQCFIN)**

Specifies whether the TCP KEEPALIVE facility is to be used to check whether the other end of a connection is still available (parameter identifier: MQIA\_TCP\_KEEP\_ALIVE).

The value can be:

**MQTCPKEEP\_YES**

The TCP KEEPALIVE facility is to be used as specified in the TCP profile configuration data set. The interval is specified in the *KeepAliveInterval* channel attribute.

**MQTCPKEEP\_NO**

The TCP KEEPALIVE facility is not to be used. This value is the initial default value of the queue manager.

This parameter applies only to z/OS.

▶ **z/OS TCPName (MQCFST)**

The name of the TCP/IP system that you are using (parameter identifier: MQIA\_TCP\_NAME).

The maximum length of the string is MQ\_TCP\_NAME\_LENGTH.

This parameter applies only to z/OS.

▶ **z/OS TCPStackType (MQCFIN)**

Specifies whether the channel initiator can use only the TCP/IP address space specified in *TCPName* , or can optionally bind to any selected TCP/IP address (parameter identifier: MQIA\_TCP\_STACK\_TYPE).

The value can be:

**MQTCPSTACK\_SINGLE**

The channel initiator uses the TCP/IP address space that is specified in *TCPName* . This value is the initial default value of the queue manager.

**MQTCPSTACK\_MULTIPLE**

The channel initiator can use any TCP/IP address space available to it. It defaults to the one specified in *TCPName* if no other is specified for a channel or listener.

This parameter applies only to z/OS.

**TraceRouteRecording (MQCFIN)**

Specifies whether trace-route information can be recorded and a reply message generated (parameter identifier: MQIA\_TRACE\_ROUTE\_RECORDING).

The value can be:

**MQRECORDING\_DISABLED**

Trace-route information cannot be recorded.

**MQRECORDING\_MSG**

Trace-route information can be recorded and replies sent to the destination specified by the originator of the message causing the trace-route record.

**MQRECORDING\_Q**

Trace-route information can be recorded and replies sent to SYSTEM.ADMIN.TRACE.ROUTE.QUEUE.

If participation in route tracing is enabled using this queue manager attribute, the value of the attribute is only important if a reply is generated. Route tracing is enabled by not setting *TraceRouteRecording* to MQRECORDING\_DISABLED. The reply must go either to SYSTEM.ADMIN.TRACE.ROUTE.QUEUE, or to the destination specified by the message itself. Provided the attribute is not disabled then messages not yet at the final destination might have information added to them. For more information about trace-route records, see [Controlling trace-route messaging](#).

### **TreeLifeTime (MQCFIN)**

The lifetime, in seconds, of non-administrative topics (parameter identifier: MQIA\_TREE\_LIFE\_TIME).

Non-administrative topics are those topics created when an application publishes to, or subscribes as, a topic string that does not exist as an administrative node. When this non-administrative node no longer has any active subscriptions, this parameter determines how long the queue manager waits before removing that node. Only non-administrative topics that are in use by a durable subscription remain after the queue manager is recycled.

Specify a value in the range 0 - 604,000. A value of 0 means that non-administrative topics are not removed by the queue manager. The initial default value of the queue manager is 1800.

### **TriggerInterval (MQCFIN)**

Trigger interval (parameter identifier: MQIA\_TRIGGER\_INTERVAL).

Specifies the trigger time interval, expressed in milliseconds, for use only with queues where *TriggerType* has a value of MQTT\_FIRST.

In this case, trigger messages are normally generated only when a suitable message arrives on the queue, and the queue was previously empty. Under certain circumstances, however, an additional trigger message can be generated with MQTT\_FIRST triggering, even if the queue was not empty. These additional trigger messages are not generated more often than every *TriggerInterval* milliseconds.

Specify a value in the range 0 - 999,999,999.

## **Error codes (Change Queue Manager)**

This command might return the following errors in the response format header, in addition to the values shown on page [“Error codes applicable to all commands” on page 1374](#).

### **Reason (MQLONG)**

The value can be any of the following values:

#### **MQRCCF\_CERT\_LABEL\_NOT\_ALLOWED**

Certificate label error.

#### **MQRCCF\_CHAD\_ERROR**

Channel automatic definition error.

#### **MQRCCF\_CHAD\_EVENT\_ERROR**

Channel automatic definition event error.

#### **MQRCCF\_CHAD\_EVENT\_WRONG\_TYPE**

Channel automatic definition event parameter not allowed for this channel type.

#### **MQRCCF\_CHAD\_EXIT\_ERROR**

Channel automatic definition exit name error.

#### **MQRCCF\_CHAD\_EXIT\_WRONG\_TYPE**

Channel automatic definition exit parameter not allowed for this channel type.

#### **MQRCCF\_CHAD\_WRONG\_TYPE**

Channel automatic definition parameter not allowed for this channel type.

#### **MQRCCF\_FORCE\_VALUE\_ERROR**

Force value not valid.

**MQRCCF\_PATH\_NOT\_VALID**

Path not valid.

**MQRCCF\_PWD\_LENGTH\_ERROR**

Password length error.

**MQRCCF\_PSCLUS\_DISABLED\_TOPDEF**

Administrator or application attempted to define a cluster topic when **PubSubClub** is set to MQPSCLUS\_DISABLED.

**MQRCCF\_PSCLUS\_TOPIC\_EXSITS**

Administrator tried to set **PubSubClub** to MQPSCLUS\_DISABLED when a cluster topic definition exists.

**IBM i MQRCCF\_Q\_MGR\_ATTR\_CONFLICT**

Queue manager attribute error. A possible cause is that you attempted to specify SSLKEYR(\*SYSTEM) with a nonblank queue manager CERTLABL.

**MQRCCF\_Q\_MGR\_CCSID\_ERROR**

Coded character set value not valid.

**MQRCCF\_REPOS\_NAME\_CONFLICT**

Repository names not valid.

**MQRCCF\_UNKNOWN\_Q\_MGR**

Queue manager not known.

**MQRCCF\_WRONG\_CHANNEL\_TYPE**

Channel type error.

**Related concepts**

**Related reference**

[Federal Information Processing Standards \(FIPS\) for UNIX, Linux and Windows](#)

**z/OS Change Security on z/OS**

The Change Security command changes specified attributes of an existing security definition.

The Change Security (MQCMD\_CHANGE\_SECURITY) command defines system-wide security options.

**Required parameters**

*None*

**Optional parameters****CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **SecurityInterval (MQCFIN)**

Timeout check interval (parameter identifier: MQIACF\_SECURITY\_INTERVAL).

Specifies the interval between checks for user IDs and associated resources to determine whether the *SecurityTimeout* has occurred. The value specifies a number of minutes in the range zero through 10080 (one week). If *SecurityInterval* is specified as zero, no user timeouts occur. If *SecurityInterval* is specified as nonzero, the user ID times out at a time between *SecurityTimeout* and *SecurityTimeout* plus *SecurityInterval*.

### **SecurityTimeout (MQCFIN)**

Security information timeout (parameter identifier: MQIACF\_SECURITY\_TIMEOUT).

Specifies how long security information about an unused user ID and associated resources is retained by IBM MQ. The value specifies a number of minutes in the range zero through 10080 (one week). If *SecurityTimeout* is specified as zero, and *SecurityInterval* is nonzero, all such information is discarded by the queue manager every *SecurityInterval* number of minutes.

## **Change SMDS on z/OS**

The Change SMDS (MQCMD\_CHANGE\_SMDS) command changes the attributes of shared message data set.

The Change SMDS (MQCMD\_CHANGE\_SMDS) command changes the current shared message data set options for the specified queue manager and CF structure.

### **SMDS (MQCFST)**

Specifies the queue manager for which the shared message data set properties are to be changed, or an asterisk to change the properties for all shared message data sets associated with the specified CFSTRUCT.

### **CFStrucName (MQCFST)**

The name of the CF application structure with SMDS parameters that you want to change (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

## **Optional parameters**

### **DSBufs (MQCFIN)**

The shared message data set buffers group (parameter identifier: MQIA\_CF\_SMDS\_BUFFERS).

Specifies the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

A value in the range 1 - 9999 or MQDSB\_DEFAULT.

When DEFAULT is used any previous value is overridden and the DSBUFS value from the CFSTRUCT definition is used. The size of each buffer is equal to the logical block size.

Value can not be set unless CFLEVEL(5) is defined.

### **DSEXPAND (MQCFIN)**

The shared message data set expand option (parameter identifier: MQIACF\_CF\_SMDS\_EXPAND).

Specifies whether or not the queue manager should expand a shared message data set when it is nearly full, and further blocks are required in the data set. The value can be any of the following values:

#### **MQDSE\_YES**

The data set can be expanded.

#### **MQDSE\_NO**

The data set cannot be expanded.

## **MQDSE\_DEFAULT**

Only returned on DISPLAY CFSTRUCT when not explicitly set

Value can not be set unless CFLEVEL(5) is defined.

Multi

## **Change, Copy, and Create Service on Multiplatforms**

The Change Service command changes existing service definitions. The Copy and Create service commands create new service definitions - the Copy command uses attribute values of an existing service definition.

The Change Service (MQCMD\_CHANGE\_SERVICE) command changes the specified attributes of an existing IBM MQ service definition. For any optional parameters that are omitted, the value does not change.

The Copy Service (MQCMD\_COPY\_SERVICE) command creates an IBM MQ service definition, using, for attributes not specified in the command, the attribute values of an existing service definition.

The Create Service (MQCMD\_CREATE\_SERVICE) command creates an IBM MQ service definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

### **Required parameter (Change and Create Service)**

#### **ServiceName (MQCFST)**

The name of the service definition to be changed or created (parameter identifier: MQCA\_SERVICE\_NAME).

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

### **Required parameters (Copy Service)**

#### **FromServiceName (MQCFST)**

The name of the service definition to be copied from (parameter identifier: MQCACF\_FROM\_SERVICE\_NAME).

This parameter specifies the name of the existing service definition that contains values for the attributes not specified in this command.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

#### **ToServiceName (MQCFST)**

To service name (parameter identifier: MQCACF\_TO\_SERVICE\_NAME).

This parameter specifies the name of the new service definition. If a service definition with this name exists, *Replace* must be specified as MQRP\_YES.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

### **Optional parameters (Change, Copy, and Create Service)**

#### **Replace (MQCFIN)**

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If a namelist definition with the same name as *ToServiceName* exists, this specifies parameter whether it is to be replaced. The value can be:

#### **MQRP\_YES**

Replace existing definition.

#### **MQRP\_NO**

Do not replace existing definition.

#### **ServiceDesc (MQCFST)**

Description of service definition (parameter identifier: MQCA\_SERVICE\_DESC).

This parameter is a plain-text comment that provides descriptive information about the service definition. It must contain only displayable characters.

If characters are used that are not in the coded character set identifier (CCSID) for the queue manager on which the command is executing, they might be translated incorrectly.

The maximum length of the string is MQ\_SERVICE\_DESC\_LENGTH.

### **ServiceType (MQCFIN)**

The mode in which the service is to run (parameter identifier: MQIA\_SERVICE\_TYPE).

Specify either:

#### **MQSVC\_TYPE\_SERVER**

Only one instance of the service can be executed at a time, with the status of the service made available by the Inquire Service Status command.

#### **MQSVC\_TYPE\_COMMAND**

Multiple instances of the service can be started.

### **StartArguments (MQCFST)**

Arguments to be passed to the program on startup (parameter identifier: MQCA\_SERVICE\_START\_ARGS).

Specify each argument within the string as you would on a command line, with a space to separate each argument to the program.

The maximum length of the string is MQ\_SERVICE\_ARGS\_LENGTH.

### **StartCommand (MQCFST)**

Service program name (parameter identifier: MQCA\_SERVICE\_START\_COMMAND).

Specifies the name of the program which is to run. You must specify a fully qualified path name to the executable program.

The maximum length of the string is MQ\_SERVICE\_COMMAND\_LENGTH.

### **StartMode (MQCFIN)**

Service mode (parameter identifier: MQIA\_SERVICE\_CONTROL).

Specifies how the service is to be started and stopped. The value can be any of the following values:

#### **MQSVC\_CONTROL\_MANUAL**

The service is not to be started automatically or stopped automatically. It is to be controlled by user command. This value is the default value.

#### **MQSVC\_CONTROL\_Q\_MGR**

The service being defined is to be started and stopped at the same time as the queue manager is started and stopped.

#### **MQSVC\_CONTROL\_Q\_MGR\_START**

The service is to be started at the same time as the queue manager is started, but is not requested to stop when the queue manager is stopped.

### **StderrDestination (MQCFST)**

Specifies the path to a file to which the standard error (stderr) of the service program must be redirected (parameter identifier: MQCA\_STDERR\_DESTINATION).

If the file does not exist when the service program is started, the file is created.

The maximum length of the string is MQ\_SERVICE\_PATH\_LENGTH.

### **StdoutDestination (MQCFST)**

Specifies the path to a file to which the standard output (stdout) of the service program must be redirected (parameter identifier: MQCA\_STDOUT\_DESTINATION).

If the file does not exist when the service program is started, the file is created.

The maximum length of the string is MQ\_SERVICE\_PATH\_LENGTH.

### **StopArguments (MQCFST)**

Specifies the arguments to be passed to the stop program when instructed to stop the service (parameter identifier: MQCA\_SERVICE\_STOP\_ARGS).

Specify each argument within the string as you would on a command line, with a space to separate each argument to the program.

The maximum length of the string is MQ\_SERVICE\_ARGS\_LENGTH.

### **StopCommand (MQCFST)**

Service program stop command (parameter identifier: MQCA\_SERVICE\_STOP\_COMMAND).

This parameter is the name of the program that is to run when the service is requested to stop. You must specify a fully qualified path name to the executable program.

The maximum length of the string is MQ\_SERVICE\_COMMAND\_LENGTH.

## **Change, Copy, and Create Storage Class on z/OS**

The Change Storage Class command changes existing storage class definitions. The Copy and Create Storage Class commands create new storage class definitions - the Copy command uses attribute values of an existing storage class definition.

The Change Storage Class (MQCMD\_CHANGE\_STG\_CLASS) command changes the characteristics of a storage class. For any optional parameters that are omitted, the value does not change.

The Copy Storage Class (MQCMD\_COPY\_STG\_CLASS) command creates a storage class to page set mapping using, for attributes not specified in the command, the attribute values of an existing storage class.

The Create Storage Class (MQCMD\_CREATE\_STG\_CLASS) command creates a storage class to page set mapping. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

### **Required parameter (Change and Create Storage Class)**

#### **StorageClassName (MQCFST)**

The name of the storage class to be changed or created (parameter identifier: MQCA\_STORAGE\_CLASS).

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

### **Required parameters (Copy Storage Class)**

#### **FromStorageClassName (MQCFST)**

The name of the storage class to be copied from (parameter identifier: MQCACF\_FROM\_STORAGE\_CLASS).

On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR or MQQSGD\_COPY to copy from. This parameter is ignored if a value of MQQSGD\_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToStorageClassName* and the disposition MQQSGD\_GROUP is searched for to copy from.

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

#### **ToStorageClassName (MQCFST)**

The name of the storage class to copy to (parameter identifier: MQCACF\_TO\_STORAGE\_CLASS).

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

### **Optional parameters (Change, Copy, and Create Storage Class)**

#### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**PageSetId (MQCFIN)**

Page set identifier that the storage class is to be associated with (parameter identifier: MQIA\_PAGESET\_ID).

Specify a string of two numeric characters in the range 00 through 99.

If you do not specify this parameter, the default is taken from the default storage class SYSTEMST.

No check is made that the page set has been defined; an error is raised only if you try to put a message to a queue that specifies this storage class (MQRC\_PAGESET\_ERROR).

**PassTicketApplication (MQCFST)**

Pass ticket application (parameter identifier: MQCA\_PASS\_TICKET\_APPL).

The application name that is passed to RACF when authenticating the passticket specified in the MQIIH header.

The maximum length is MQ\_PASS\_TICKET\_APPL\_LENGTH.

**QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

<i>Table 315. QSGDisposition: Where objects are defined and how they behave</i>		
<b>QSGDisposition</b>	<b>Change</b>	<b>Copy, Create</b>
<b>MQQSGD_COPY</b>	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToStorageClassName</i> object (for Copy) or the <i>StorageClassName</i> object (for Create).

Table 315. QSGDisposition: Where objects are defined and how they behave (continued)

QSGDisposition	Change	Copy, Create
<b>MQQSGD_GROUP</b>	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to attempt to refresh local copies on page set zero:</p> <pre>DEFINE STGCLASS(storage-class) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This parameter is allowed only if the queue manager is in a queue sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to attempt to make or refresh local copies on page set zero:</p> <pre>DEFINE STGCLASS(storage-class) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
<b>MQQSGD_PRIVATE</b>	<p>The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.</p>	Not permitted.
<b>MQQSGD_Q_MGR</b>	<p>The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.</p>	<p>The object is defined on the page set of the queue manager that executes the command. This value is the default value.</p>

**Replace (MQCFIN)**

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If a storage class definition with the same name as *ToStorageClassName* exists, this parameter specifies whether it is to be replaced. The value can be:

**MQRP\_YES**

Replace existing definition.

**MQRP\_NO**

Do not replace existing definition.

**StorageClassDesc (MQCFST)**

The description of the storage class (parameter identifier: MQCA\_STORAGE\_CLASS\_DESC).

The maximum length is MQ\_STORAGE\_CLASS\_DESC\_LENGTH.

**XCFGroupName (MQCFST)**

XCF group name (parameter identifier: MQCA\_XCF\_GROUP\_NAME).

If you are using the IMS bridge, this parameter is the name of the XCF group to which the IMS system belongs.

The maximum length is MQ\_XCF\_GROUP\_NAME\_LENGTH.

### **XCFMemberName (MQCFST)**

XCF member name (parameter identifier: MQCA\_XCF\_MEMBER\_NAME).

If you are using the IMS bridge, this parameter is the XCF member name of the IMS system within the XCF group specified in *XCFGroupName*.

The maximum length is MQ\_XCF\_MEMBER\_NAME\_LENGTH.

## **Change, Copy, and Create Subscription**

The Change Subscription command changes existing subscription definitions. The Copy and Create Subscription commands create new subscription definitions - the Copy command uses attribute values of an existing subscription definition.

The Change Subscription (MQCMD\_CHANGE\_SUBSCRIPTION) command changes the specified attributes of an existing IBM MQ subscription. For any optional parameters that are omitted, the value does not change.

The Copy Subscription (MQCMD\_COPY\_SUBSCRIPTION) command creates an IBM MQ subscription, using, for attributes not specified in the command, the attribute values of an existing subscription.

The Create Subscription (MQCMD\_CREATE\_SUBSCRIPTION) command creates an IBM MQ administrative subscription so that existing applications can participate in publish/subscribe application.

## **Required parameters (Change Subscription)**

### **SubName (MQCFST)**

The name of the subscription definition to be changed (parameter identifier: MQCACF\_SUB\_NAME).

The maximum length of the string is MQ\_SUB\_NAME\_LENGTH.

or

### **SubId (MQCFBS)**

The unique identifier of the subscription definition to be changed (parameter identifier: MQBACF\_SUB\_ID).

The maximum length of the string is MQ\_CORREL\_ID\_LENGTH.

## **Required parameters (Copy Subscription)**

### **ToSubscriptionName (MQCFBS)**

The name of the subscription to copy to (parameter identifier: MQCACF\_TO\_SUB\_NAME).

The maximum length of the string is MQ\_SUB\_NAME\_LENGTH.

You require at least one of *FromSubscriptionName* or *SubId*.

### **FromSubscriptionName (MQCFST)**

The name of the subscription definition to be copied from (parameter identifier: MQCACF\_FROM\_SUB\_NAME).

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR or MQQSGD\_COPY to copy from. This parameter is ignored if a value of MQQSGD\_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToSubscriptionName* and the disposition MQQSGD\_GROUP is used.

The maximum length of the string is MQ\_SUB\_NAME\_LENGTH.

**SubId (MQCFBS)**

The unique identifier of the subscription definition to be changed (parameter identifier: MQBACF\_SUB\_ID).

The maximum length of the string is MQ\_CORREL\_ID\_LENGTH.

**Required parameters (Create Subscription)**

You must provide the *SubName*.

**SubName (MQCFST)**

The name of the subscription definition to be changed (parameter identifier: MQCACF\_SUB\_NAME).

The maximum length of the string is MQ\_SUB\_NAME\_LENGTH.

You require at least one of *TopicObject* or *TopicString*.

**TopicObject (MQCFST)**

The name of a previously defined topic object from which is obtained the topic name for the subscription (parameter identifier: MQCA\_TOPIC\_NAME). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

**TopicString (MQCFST)**

The resolved topic string (parameter identifier: MQCA\_TOPIC\_STRING).

The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

**Optional parameters (Change, Copy, and Create Subscription)****CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**Destination (MQCFST)**

Destination (parameter identifier: MQCACF\_DESTINATION).

Specifies the name of the alias, local, remote, or cluster queue to which messages for this subscription are put.

This parameter is mandatory if *DestinationClass* is set to MQDC\_PROVIDED, but is not applicable if *DestinationClass* is set to MQDC\_MANAGED.

**DestinationClass (MQCFIN)**

Destination class (parameter identifier: MQIACF\_DESTINATION\_CLASS).

Specifies whether the destination is managed.

Specify either:

**MQDC\_MANAGED**

The destination is managed.

**MQDC\_PROVIDED**

The destination queue is as specified in the *Destination* field.

Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

**DestinationCorrelId (MQCFBS)**

Destination correlation identifier (parameter identifier: MQBACF\_DESTINATION\_CORREL\_ID).

Provides a correlation identifier that is placed in the *CorrelId* field of the message descriptor for all the messages sent to this subscription.

The maximum length is MQ\_CORREL\_ID\_LENGTH.

**DestinationQueueManager (MQCFST)**

Destination queue manager (parameter identifier: MQCACF\_DESTINATION\_Q\_MGR).

Specifies the name of the destination queue manager, either local or remote, to which messages for the subscription are forwarded.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

**Expiry (MQCFIN)**

The time, in tenths of a second, at which a subscription expires after its creation date and time (parameter identifier: MQIACF\_EXPIRY).

The default value of MQEI\_UNLIMITED means that the subscription never expires.

After a subscription has expired it becomes eligible to be discarded by the queue manager and receives no further publications.

**PublishedAccountingToken (MQCFBS)**

Value of the accounting token used in the *AccountingToken* field of the message descriptor (parameter identifier: MQBACF\_ACCOUNTING\_TOKEN).

The maximum length of the string is MQ\_ACCOUNTING\_TOKEN\_LENGTH.

**PublishedApplicationIdentifier (MQCFST)**

Value of the application identity data used in the *ApplIdentityData* field of the message descriptor (parameter identifier: MQCACF\_APPL\_IDENTITY\_DATA).

The maximum length of the string is MQ\_APPL\_IDENTITY\_DATA\_LENGTH.

**PublishPriority (MQCFIN)**

The priority of the message sent to this subscription (parameter identifier: MQIACF\_PUB\_PRIORITY).

The value can be:

**MQPRI\_PRIORITY\_AS\_PUBLISHED**

Priority of messages sent to this subscription is taken from the priority supplied to the published message. This value is the supplied default value.

**MQPRI\_PRIORITY\_AS\_QDEF**

Priority of messages sent to this subscription is determined by the default priority of the queue defined as a destination.

**0-9**

An integer value providing an explicit priority for messages sent to this subscription.

**PublishSubscribeProperties (MQCFIN)**

Specifies how publish/subscribe related message properties are added to messages sent to this subscription (parameter identifier: MQIACF\_PUBSUB\_PROPERTIES).

The value can be:

**MQPSPROP\_COMPAT**

If the original publication is a PCF message, then the publish/subscribe properties are added as PCF attributes. Otherwise, publish/subscribe properties are added within an MQRFH version 1 header. This method is compatible with applications coded for use with previous versions of IBM MQ.

**MQPSPROP\_NONE**

Do not add publish/subscribe properties to the messages. This value is the supplied default value.

**MQPSPROP\_RFH2**

Publish/subscribe properties are added within an MQRFH version 2 header. This method is compatible with applications coded for use with IBM Integration Bus, formerly known as WebSphere Message Broker.

**Selector (MQCFST)**

Specifies the selector applied to messages published to the topic (parameter identifier: MQCACF\_SUB\_SELECTOR). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

Only those messages that satisfy the selection criteria are put to the destination specified by this subscription.

The maximum length of the string is MQ\_SELECTOR\_LENGTH.

**SubscriptionLevel (MQCFIN)**

The level within the subscription interception hierarchy at which this subscription is made (parameter identifier: MQIACF\_SUB\_LEVEL). To ensure that an intercepting application receives messages before any other subscribers, make sure that it has the highest subscription level of all subscribers. Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The value can be:

**0 - 9**

An integer in the range 0-9. The default value is 1. Subscribers with a subscription level of 9 intercept publications before they reach subscribers with lower subscription levels.

**SubscriptionScope (MQCFIN)**

Determines whether this subscription is passed to other queue managers in the network (parameter identifier: MQIACF\_SUBSCRIPTION\_SCOPE). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The value can be:

**MQTSCOPE\_ALL**

The subscription is forwarded to all queue managers directly connected through a publish/subscribe collective or hierarchy. This value is the supplied default value.

**MQTSCOPE\_QMGR**

The subscription only forwards messages published on the topic within this queue manager.

**SubscriptionUser (MQCFST)**

The userid that 'owns' this subscription. This parameter is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription. (parameter identifier: MQCACF\_SUB\_USER\_ID).

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

**TopicString (MQCFST)**

The resolved topic string (parameter identifier: MQCA\_TOPIC\_STRING). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

**Userdata (MQCFST)**

User data (parameter identifier: MQCACF\_SUB\_USER\_DATA).

Specifies the user data associated with the subscription

The maximum length of the string is MQ\_USER\_DATA\_LENGTH.

#### **VariableUser (MQCFST)**

Specifies whether a user other than the one who created the subscription, that is, the user shown in *SubscriptionUser* can take over the ownership of the subscription (parameter identifier: MQIACF\_VARIABLE\_USER\_ID).

The value can be:

##### **MQVU\_ANY\_USER**

Any user can take over the ownership. This value is the supplied default value.

##### **MQVU\_FIXED\_USER**

No other user can take over the ownership.

#### **WildcardSchema (MQCFIN)**

Specifies the schema to be used when interpreting any wildcard characters contained in the *TopicString* (parameter identifier: MQIACF\_WILDCARD\_SCHEMA). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The value can be:

##### **MQWS\_CHAR**

Wildcard characters represent portions of strings for compatibility with IBM MQ V6.0 broker.

##### **MQWS\_TOPIC**

Wildcard characters represent portions of the topic hierarchy for compatibility with IBM Integration Bus. This value is the supplied default value.

## **Change, Copy, and Create Topic**

The Change Topic command changes existing topic definitions. The Copy and Create Topic commands create new topic definitions - the Copy command uses attribute values of an existing topic definition.

The Change Topic (MQCMD\_CHANGE\_TOPIC) command changes the specified attributes of an existing IBM MQ administrative topic definition. For any optional parameters that are omitted, the value does not change.

The Copy Topic (MQCMD\_COPY\_TOPIC) command creates an IBM MQ administrative topic definition by using, for attributes not specified in the command, the attribute values of an existing topic definition.

The Create Topic (MQCMD\_CREATE\_TOPIC) command creates an IBM MQ administrative topic definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

### **Required parameter (Change Topic)**

#### **TopicName (MQCFST)**

The name of the administrative topic definition to be changed (parameter identifier: MQCA\_TOPIC\_NAME).

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

### **Required parameters (Copy Topic)**

#### **FromTopicName (MQCFST)**

The name of the administrative topic object definition to be copied from (parameter identifier: MQCACF\_FROM\_TOPIC\_NAME).

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR or MQQSGD\_COPY to copy from. This parameter is ignored if a value

of MQQSGD\_COPY is specified for *QSGDisposition* . In this case, an object with the name specified by *ToTopicName* and the disposition MQQSGD\_GROUP is searched for to copy from.

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

#### **TopicString (MQCFST)**

The topic string (parameter identifier: MQCA\_TOPIC\_STRING). This string uses the forward slash (/) character as a delimiter for elements within the topic tree.

The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

#### **ToTopicName (MQCFST)**

The name of the administrative topic definition to copy to (parameter identifier: MQCACF\_TO\_TOPIC\_NAME).

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

### **Required parameters (Create Topic)**

#### **TopicName (MQCFST)**

The name of the administrative topic definition to be created (parameter identifier: MQCA\_TOPIC\_NAME).

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

#### **TopicString (MQCFST)**

The topic string (parameter identifier: MQCA\_TOPIC\_STRING).

This parameter is required and cannot contain the empty string. The "/" character within this string has a special meaning. It delimits the elements in the topic tree. A topic string can start with the "/" character but is not required to. A string starting with the "/" character is not the same as a string that does not start with the "/" character. A topic string cannot end with the "/" character.

The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

### **Optional parameters (Change, Copy, and Create Topic)**

#### **ClusterName (MQCFST)**

The name of the cluster to which this topic belongs. (parameter identifier: MQCA\_CLUSTER\_NAME). The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH. Setting this parameter to a cluster that this queue manager is a member of makes all queue managers in the cluster aware of this topic. Any publication to this topic or a topic string below it put to any queue manager in the cluster is propagated to subscriptions on any other queue manager in the cluster. For more details, see [Distributed publish/subscribe networks](#).

The value can be any of the following values:

##### **Blank**

If no topic object above this topic in the topic tree has set this parameter to a cluster name, then this topic does not belong to a cluster. Publications and subscriptions for this topic are not propagated to publish/subscribe cluster-connected queue managers. If a topic node higher in the topic tree has a cluster name set, publications and subscriptions to this topic are also propagated throughout the cluster.

This value is the default value for this parameter if no value is specified.

##### **String**

The topic belongs to this cluster. It is not recommended that this is set to a different cluster from a topic object above this topic object in the topic tree. Other queue managers in the cluster will honor this object's definition unless a local definition of the same name exists on those queue managers.

Additionally, if PublicationScope or SubscriptionScope are set to MQSCOPE\_ALL, this value is the cluster to be used for the propagation of publications and subscriptions, for this topic, to publish/subscribe cluster-connected queue managers.

### **ClusterPubRoute (MQCFIN)**

The routing behavior of publications between queue managers in a cluster (parameter identifier: MQIA\_CLUSTER\_PUB\_ROUTE).

The value can be any of the following values:

#### **MQCLROUTE\_DIRECT**

When you configure a direct routed clustered topic on a queue manager, all queue managers in the cluster become aware of all other queue managers in the cluster. When performing publish and subscribe operations, each queue manager can connect direct to any other queue manager in the cluster.

#### **MQCLROUTE\_TOPIC\_HOST**

When you use topic host routing, all queue managers in the cluster become aware of the cluster queue managers that host the routed topic definition (that is, the queue managers on which you have defined the topic object). When performing publish and subscribe operations, queue managers in the cluster connect only to these topic host queue managers, and not directly to each other. The topic host queue managers are responsible for routing publications from queue managers on which publications are published to queue managers with matching subscriptions.

After a topic object has been clustered (through setting the **CLUSTER** property) you cannot change the value of the **CLROUTE** property. The object must be un-clustered (**CLUSTER** set to ' ') before you can change the value. Un-clustering a topic converts the topic definition to a local topic, which results in a period during which publications are not delivered to subscriptions on remote queue managers; this should be considered when performing this change. See [The effect of defining a non-cluster topic with the same name as a cluster topic from another queue manager](#). If you try to change the value of the **CLROUTE** property while it is clustered, the system generates an MQRCCF\_CLROUTE\_NOT\_ALTERABLE exception.

See also [Routing for publish/subscribe clusters: Notes on behavior](#) and [Designing publish/subscribe clusters](#).

### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **CommunicationInformation (MQCFST)**

The Multicast communication information object (parameter identifier: MQCA\_COMM\_INFO\_NAME).

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

### **Custom (MQCFST)**

Custom attribute for new features (parameter identifier: MQCA\_CUSTOM).

This attribute contains the values of attributes, as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE). Single quotation marks must be escaped with another single quotation mark.

**CAPEXPY ( *integer* )**

The maximum time, expressed in tenths of a second, until a message published to a topic which inherits properties from this object, remains in the system until it becomes eligible for expiry processing.

For more information on message expiry processing, see [Enforcing lower expiration times](#).

The value can be one of the following:

***integer***

The value must be in the range one through to 999 999 999.

**NOLIMIT**

There is no limit on the expiry time of messages put using this object.

**ASPARENT**

The maximum message expiry time is based on the setting of the closest parent administrative topic object in the topic tree. This is the default value.

Specifying a value for CAPEXPY that is not valid, does not cause the command to fail. Instead,, the default value is used.

**DefPersistence (MQCFIN)**

Default persistence (parameter identifier: MQIA\_TOPIC\_DEF\_PERSISTENCE).

Specifies the default for message-persistence of messages published to the topic. Message persistence determines whether messages are preserved across restarts of the queue manager.

The value can be any of the following values:

**MQPER\_PERSISTENCE\_AS\_PARENT**

The default persistence is based on the setting of the closest parent administrative topic object in the topic tree.

**MQPER\_PERSISTENT**

Message is persistent.

**MQPER\_NOT\_PERSISTENT**

Message is not persistent.

**DefPriority (MQCFIN)**

Default priority (parameter identifier: MQIA\_DEF\_PRIORITY).

Specifies the default priority of messages published to the topic.

Specify either:

***integer***

The default priority to be used, in the range zero through to the maximum priority value that is supported (9).

**MQPRI\_PRIORITY\_AS\_PARENT**

The default priority is based on the setting of the closest parent administrative topic object in the topic tree.

**DefPutResponse (MQCFIN)**

Default put response (parameter identifier: MQIA\_DEF\_PUT\_RESPONSE\_TYPE).

The value can be:

**MQPRT\_ASYNC\_RESPONSE**

The put operation is issued asynchronously, returning a subset of MQMD fields.

**MQPRT\_RESPONSE\_AS\_PARENT**

The default put response is based on the setting of the closest parent administrative topic object in the topic tree.

**MQPRT\_SYNC\_RESPONSE**

The put operation is issued synchronously, returning a response.

**DurableModelQName (MQCFST)**

Name of the model queue to be used for durable subscriptions (parameter identifier: MQCA\_MODEL\_DURABLE\_Q).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**DurableSubscriptions (MQCFIN)**

Whether applications are permitted to make durable subscriptions (parameter identifier: MQIA\_DURABLE\_SUB).

The value can be:

**MQSUB\_DURABLE\_AS\_PARENT**

Whether durable subscriptions are permitted is based on the setting of the closest parent administrative topic object in the topic tree.

**MQSUB\_DURABLE\_ALLOWED**

Durable subscriptions are permitted.

**MQSUB\_DURABLE\_INHIBITED**

Durable subscriptions are not permitted.

**InhibitPublications (MQCFIN)**

Whether publications are allowed for this topic (parameter identifier: MQIA\_INHIBIT\_PUB).

The value can be:

**MQTA\_PUB\_AS\_PARENT**

Whether messages can be published to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

**MQTA\_PUB\_INHIBITED**

Publications are inhibited for this topic.

**MQTA\_PUB\_ALLOWED**

Publications are allowed for this topic.

**InhibitSubscriptions (MQCFIN)**

Whether subscriptions are allowed for this topic (parameter identifier: MQIA\_INHIBIT\_SUB).

The value can be:

**MQTA\_SUB\_AS\_PARENT**

Whether applications can subscribe to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

**MQTA\_SUB\_INHIBITED**

Subscriptions are inhibited for this topic.

**MQTA\_SUB\_ALLOWED**

Subscriptions are allowed for this topic.

**Multicast (MQCFIN)**

Whether multicast is allowable in the topic tree (parameter identifier: MQIA\_MULTICAST).

The value can be:

**MQMC\_AS\_PARENT**

Whether multicast is allowed on this topic is based on the setting of the closest parent administrative topic object in the topic tree.

**MQMC\_ENABLED**

Multicast is allowed on this topic.

**MQMC\_DISABLED**

Multicast is not allowed on this topic.

**MQMC\_ONLY**

Only subscriptions and publications made using multicast are allowed on this topic.

**NonDurableModelQName (MQCFST)**

Name of the model queue to be used for non-durable subscriptions (parameter identifier: MQCA\_MODEL\_NON\_DURABLE\_Q).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**NonPersistentMsgDelivery (MQCFIN)**

The delivery mechanism for non-persistent messages published to this topic (parameter identifier: MQIA\_NPM\_DELIVERY).

The value can be:

**MQDLV\_AS\_PARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**MQDLV\_ALL**

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

**MQDLV\_ALL\_DUR**

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a non-persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

**MQDLV\_ALL\_AVAIL**

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

**PersistentMsgDelivery (MQCFIN)**

The delivery mechanism for persistent messages published to this topic (parameter identifier: MQIA\_PM\_DELIVERY).

The value can be:

**MQDLV\_AS\_PARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**MQDLV\_ALL**

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

**MQDLV\_ALL\_DUR**

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

**MQDLV\_ALL\_AVAIL**

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

**ProxySubscriptions (MQCFIN)**

Whether a proxy subscription is to be sent for this topic to directly connected queue managers, even if no local subscriptions exist (parameter identifier: MQIA\_PROXY\_SUB).

The value can be:

**MQTA\_PROXY\_SUB\_FORCE**

A proxy subscription is sent to connected queue managers even if no local subscriptions exist.

**Note:** The proxy subscription is sent when this value is set on Create or Change of the topic.

**MQTA\_PROXY\_SUB\_FIRSTUSE**

For each unique topic string at or below this topic object, a proxy subscription is asynchronously sent to all neighboring queue managers in the following scenarios:

- When a local subscription is created.
- When a proxy subscription is received that must be propagated to further directly connected queue managers.

This value is the default value for this parameter if no value is specified.

**PublicationScope (MQCFIN)**

Whether this queue manager propagates publications for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA\_PUB\_SCOPE).

The value can be:

**MQSCOPE\_AS\_PARENT**

Whether this queue manager propagates publications, for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

This value is the default value for this parameter if no value is specified.

**MQSCOPE\_QMGR**

Publications for this topic are not propagated to other queue managers.

**MQSCOPE\_ALL**

Publications for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

**Note:** This behavior can be over-ridden on a publication-by-publication basis, by using MQPMO\_SCOPE\_QMGR on the Put Message Options.

**z/OS QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

<i>Table 316. QSGDisposition: Where objects are defined and how they behave</i>		
<b>QSGDisposition</b>	<b>Change</b>	<b>Copy, Create</b>
<b>MQQSGD_COPY</b>	The object definition resides on the page set of the queue manager that executes the command. The object was defined by using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined by using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command by using the MQQSGD_GROUP object of the same name as the <i>ToTopicName</i> object (for Copy) or <i>TopicName</i> object (for Create).

Table 316. QSGDisposition: Where objects are defined and how they behave (continued)

QSGDisposition	Change	Copy, Create
<b>MQQSGD_GROUP</b>	<p>The object definition resides in the shared repository. The object was defined by using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they refresh local copies on page set zero:</p> <pre>DEFINE TOPIC(name) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This definition is allowed only if the queue manager is in a queue sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they make or refresh local copies on page set zero:</p> <pre>DEFINE TOPIC(name) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
<b>MQQSGD_PRIVATE</b>	<p>The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.</p>	<p>Not permitted.</p>
<b>MQQSGD_Q_MGR</b>	<p>The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.</p>	<p>The object is defined on the page set of the queue manager that executes the command. This value is the default value.</p>

**Replace (MQCFIN)**

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If a topic definition with the same name as *ToTopicName* exists, this parameter specifies whether it is to be replaced. The value can be as follows:

**MQRP\_YES**

Replace existing definition.

**MQRP\_NO**

Do not replace existing definition.

**SubscriptionScope (MQCFIN)**

Whether this queue manager propagates subscriptions for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA\_SUB\_SCOPE).

The value can be:

**MQSCOPE\_AS\_PARENT**

Whether this queue manager propagates subscriptions, for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe-cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

This value is the default value for this parameter if no value is specified.

**MQSCOPE\_QMGR**

Subscriptions for this topic are not propagated to other queue managers.

**MQSCOPE\_ALL**

Subscriptions for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

**Note:** This behavior can be over-ridden on a subscription-by-subscription basis, by using MQSO\_SCOPE\_QMGR on the Subscription Descriptor or SUBSCOPE(QMGR) on DEFINE SUB.

**TopicDesc (MQCFST)**

Topic description (parameter identifier: MQCA\_TOPIC\_DESC).

Text that briefly describes the object

The maximum length is MQ\_TOPIC\_DESC\_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the message queue manager on which the command is executing to ensure that the text is translated correctly if it is sent to another queue manager.

**TopicType (MQCFIN)**

Topic type (parameter identifier: MQIA\_TOPIC\_TYPE).

The value specified must match the type of the topic being changed. The value can be:

**MQTOPT\_LOCAL**

Local topic object

**UseDLQ (MQCFIN)**

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA\_USE\_DEAD\_LETTER\_Q).

The value can be any of the following values:

**MQUSEDLQ\_AS\_PARENT**

Determines whether to use the dead-letter queue using the setting of the closest administrative topic object in the topic tree. This value is the default supplied with IBM MQ, but your installation might have changed it.

**MQUSEDLQ\_NO**

Publication messages that cannot be delivered to their correct subscriber queue are treated as a failure to put the message. The MQPUT of an application to a topic fails in accordance with the settings of MQIA\_NPM\_DELIVERY and MQIA\_PM\_DELIVERY.

**MQUSEDLQ\_YES**

If the DEADQ queue manager attribute provides the name of a dead-letter queue then it is used, otherwise the behavior is as for MQUSEDLQ\_NO.

**WildcardOperation (MQCFIN)**

Behavior of subscriptions including wildcards made to this topic (parameter identifier: MQIA\_WILDCARD\_OPERATION).

The value can be:

**MQTA\_PASSTHRU**

A less specific wildcard subscription is a subscription made by using wildcard topic names that are less specific than the topic string at this topic object. MQTA\_PASSTHRU lets less specific wildcard subscriptions receive publications made to this topic and to topic strings more specific than this topic. This value is the default supplied with IBM MQ.

## **MQTA\_BLOCK**

A less specific wildcard subscription is a subscription made by using wildcard topic names that are less specific than the topic string at this topic object. MQTA\_BLOCK stops less specific wildcard subscriptions receiving publications made to this topic or to topic strings more specific than this topic.

This value of this attribute is used when subscriptions are defined. If you alter this attribute, the set of topics covered by existing subscriptions is not affected by the modification. This value applies also, if the topology is changed when topic objects are created or deleted; the set of topics matching subscriptions created following the modification of the **WildcardOperation** attribute is created by using the modified topology. If you want to force the matching set of topics to be re-evaluated for existing subscriptions, you must restart the queue manager.

## **Clear Queue**

The Clear Queue (MQCMD\_CLEAR\_Q) command deletes all the messages from a local queue.

The command fails if the queue contains uncommitted messages.

## **Required parameters**

### **QName (MQCFST)**

Queue name (parameter identifier: MQCA\_Q\_NAME).

The name of the local queue to be cleared. The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**Note:** The target queue must be type local.

## **Optional parameters**

### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

### **MQQSGD\_PRIVATE**

Clear the private queue named in *QName* . The queue is private if it was created using a command with the attributes MQQSGD\_PRIVATE or MQQSGD\_Q\_MGR. This value is the default value.

## **MQQSGD\_SHARED**

Clear the shared queue named in *QName* . The queue is shared if it was created using a command with the attribute MQQSGD\_SHARED. This value applies only to local queues.

## **Error codes**

This command might return the following error codes in the response format header, in addition to the values shown on page “[Error codes applicable to all commands](#)” on page 1374.

### **Reason (MQLONG)**

The value can be any of the following values:

#### **MQRC\_Q\_NOT\_EMPTY**

(2055, X'807') Queue contains one or more messages or uncommitted put or get requests.

This reason occurs only if there are uncommitted updates.

#### **MQRCCF\_Q\_WRONG\_TYPE**

Action not valid for the queue of specified type.

## **Clear Topic String**

The Clear Topic String (MQCMD\_CLEAR\_TOPIC\_STRING) command clears the retained message which is stored for the specified topic.

## **Required parameters**

### **TopicString (MQCFST)**

Topic String (parameter identifier: MQCA\_TOPIC\_STRING).

The topic string to be cleared The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

### **ClearType (MQCFIN)**

Clear type (parameter identifier: MQIACF\_CLEAR\_TYPE).

Specifies the type of clear command being issued. The value must be:

MQCLRT\_RETAINED Remove the retained publication from the specified topic string.

## **Optional parameters**

### **Scope (MQCFIN)**

Scope of clearance (parameter identifier: MQIACF\_CLEAR\_SCOPE).

Whether the topic string is to be cleared locally or globally. The value can be:

#### **MQCLRS\_LOCAL**

The retained message is removed from the specified topic string at the local queue manager only.

### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue

manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## Delete Authentication Information Object

The Delete authentication information (MQCMD\_DELETE\_AUTH\_INFO) command deletes the specified authentication information object.

### Required parameters

#### AuthInfoName (MQCFST)

Authentication information object name (parameter identifier: MQCA\_AUTH\_INFO\_NAME).

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

### Optional parameters

#### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

#### MQQSGD\_COPY

The object definition resides on the page set of the queue manager which executes this command. The object was defined by a command using the parameter MQQSGD\_COPY. Any object in the shared repository, or any object defined by a command using the parameter MQQSGD\_Q\_MGR, is not affected by this command.

#### MQQSGD\_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD\_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE AUTHINFO(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

### **MQQSGD\_Q\_MGR**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_Q\_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD\_Q\_MGR is the default value.

**Multi**

## **Delete Authority Record on Multiplatforms**

The Delete Authority Record (MQCMD\_DELETE\_AUTH\_REC) command deletes an authority record. The authorizations associated with the profile no longer apply to IBM MQ objects with names that match the profile name specified.

### **Required parameters**

#### **ObjectType (MQCFIN)**

The type of object for which to delete authorizations (parameter identifier: MQIACF\_OBJECT\_TYPE).

The value can be any of the following values:

#### **MQOT\_AUTH\_INFO**

Authentication information.

#### **MQOT\_CHANNEL**

Channel object.

#### **MQOT\_CLNTCONN\_CHANNEL**

Client-connection channel object.

#### **MQOT\_COMM\_INFO**

Communication information object

#### **MQOT\_LISTENER**

Listener object.

#### **MQOT\_NAMELIST**

Namelist.

#### **MQOT\_PROCESS**

Process.

#### **MQOT\_Q**

Queue, or queues, that match the object name parameter.

#### **MQOT\_Q\_MGR**

Queue manager.

#### **MQOT\_REMOTE\_Q\_MGR\_NAME**

Remote queue manager.

#### **MQOT\_SERVICE**

Service object.

#### **MQOT\_TOPIC**

Topic object.

#### **ProfileName (MQCFST)**

Name of the profile to be deleted (parameter identifier: MQCACF\_AUTH\_PROFILE\_NAME).

If you have defined a generic profile then you can specify it here, using wildcard characters to specify a named generic profile to be removed. If you specify an explicit profile name, the object must exist.

The maximum length of the string is MQ\_AUTH\_PROFILE\_NAME\_LENGTH.

## Optional parameters

### GroupNames (MQCFSL)

Group names (parameter identifier: MQCACF\_GROUP\_ENTITY\_NAMES).

The names of groups having a profile deleted. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ\_ENTITY\_NAME\_LENGTH.

### PrincipalNames (MQCFSL)

Principal names (parameter identifier: MQCACF\_PRINCIPAL\_ENTITY\_NAMES).

The names of principals having a profile deleted. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ\_ENTITY\_NAME\_LENGTH.

## Error codes (Delete Authority Record)

This command might return the following error codes in the response format header, in addition to the values shown on page [“Error codes applicable to all commands”](#) on page 1374.

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRC\_OBJECT\_TYPE\_ERROR**

Invalid object type.

#### **MQRC\_UNKNOWN\_ENTITY**

Userid not authorized, or unknown.

#### **MQRCCF\_ENTITY\_NAME\_MISSING**

Entity name missing.

#### **MQRCCF\_OBJECT\_TYPE\_MISSING**

Object type missing.

#### **MQRCCF\_PROFILE\_NAME\_ERROR**

Invalid profile name.

## Delete CF Structure on z/OS

The Delete CF Structure (MQCMD\_DELETE\_CF\_STRUC) command deletes an existing CF application structure definition.

**Note:** This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

## Required parameters

### CFStrucName (MQCFST)

CF structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The CF application structure definition to be deleted. The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

## Delete Channel

The Delete Channel (MQCMD\_DELETE\_CHANNEL) command deletes the specified channel definition.

### Required parameters

#### ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel definition to be deleted. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

### Optional parameters

None of the following attributes are applicable to MQTT channels unless specifically mentioned in the parameter description.

#### ChannelType (MQCFIN)

The type of channel (parameter identifier: MQIACH\_CHANNEL\_TYPE). This parameter is currently only used with MQTT Telemetry channels, and is required when deleting a Telemetry channel. The only value that can currently be given to the parameter is **MQCHT\_MQTT**.

#### ChannelTable (MQCFIN)

Channel table (parameter identifier: MQIACH\_CHANNEL\_TABLE).

Specifies the ownership of the channel definition table that contains the specified channel definition.

The value can be any of the following values:

##### **MQHTAB\_Q\_MGR**

Queue manager table.

MQHTAB\_Q\_MGR is the default. This table contains channel definitions for channels of all types except MQCHT\_CLNTCONN.

##### **MQHTAB\_CLNTCONN**

Client-connection table.

This table only contains channel definitions for channels of type MQCHT\_CLNTCONN.

This parameter is not applicable to MQ Telemetry.

#### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### **QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_COPY**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_COPY. Any object residing in the shared repository, or any object defined by a command using the parameter MQQSGD\_Q\_MGR, is not affected by this command.

#### **MQQSGD\_GROUP**

The object definition resides in the shared repository. The object was defined by a command using the parameters MQQSGD\_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE CHANNEL(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

#### **MQQSGD\_Q\_MGR**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_Q\_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD\_Q\_MGR is the default value.

This command might return the following error codes in the response format header, in addition to the values shown on page [“Error codes applicable to all commands” on page 1374](#).

### **Error codes**

#### **Reason (MQLONG)**

The value can be any of the following values:

##### **MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

##### **MQRCCF\_CHANNEL\_TABLE\_ERROR**

Channel table value not valid.

### **Windows Linux AIX Delete Channel (MQTT)**

The Delete Telemetry Channel (MQCMD\_DELETE\_CHANNEL) command deletes the specified channel definition.

### **Required parameters**

#### **ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel definition to be deleted. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

#### **ChannelType (MQCFIN)**

The type of channel (parameter identifier: MQIACH\_CHANNEL\_TYPE). Required when deleting a Telemetry channel. The only value that can currently be given to the parameter is **MQCHT\_MQTT**.

## Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

## **Delete Channel Listener on Multiplatforms**

The Delete Channel Listener (MQCMD\_DELETE\_LISTENER) command deletes an existing channel listener definition.

## Required parameters

### ListenerName (MQCFST)

Listener name (parameter identifier: MQCACH\_LISTENER\_NAME).

This parameter is the name of the listener definition to be deleted. The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

## **Delete Communication Information Object on Multiplatforms**

The Delete Communication Information Object (MQCMD\_DELETE\_COMM\_INFO) command deletes the specified communication information object.

## Required parameter

### CommInfoName (MQCFST)

The name of the communication information definition to be deleted (parameter identifier: MQCA\_COMM\_INFO\_NAME).

## Delete Namelist

The Delete Namelist (MQCMD\_DELETE\_NAMELIST) command deletes an existing namelist definition.

## Required parameters

### NamelistName (MQCFST)

Namelist name (parameter identifier: MQCA\_NAMELIST\_NAME).

This parameter is the name of the namelist definition to be deleted. The maximum length of the string is MQ\_NAMELIST\_NAME\_LENGTH.

## Optional parameters

### z/OS

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_COPY**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD\_Q\_MGR, is not affected by this command.

#### **MQQSGD\_GROUP**

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD\_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE NAMELIST(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

#### **MQQSGD\_Q\_MGR**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_Q\_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD\_Q\_MGR is the default value.

## **Multi Delete Policy on Multiplatforms**

The Delete Policy (MQCMD\_DELETE\_PROT\_POLICY) command deletes a security policy.

### **Required parameters**

#### **Policy-name (MQCFST)**

The name of the security policy to be deleted (parameter identifier: MQCA\_POLICY\_NAME).

The name of the policy, or policies, to delete are the same as the name of the queue, or queues, that the policies control.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

### **Error codes (Delete Security Policy)**

This command might return the following error codes in the response format header, in addition to the values shown on page [“Error codes applicable to all commands”](#) on page 1374.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRC\_OBJECT\_TYPE\_ERROR**

Invalid object type.

**MQRCCF\_POLICY\_NAME\_ERROR**

Invalid policy name.

**Delete Process**

The Delete Process (MQCMD\_DELETE\_PROCESS) command deletes an existing process definition.

**Required parameters****ProcessName (MQCFST)**

Process name (parameter identifier: MQCA\_PROCESS\_NAME).

The process definition to be deleted. The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

**Optional parameters****CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

**MQQSGD\_COPY**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD\_Q\_MGR, is not affected by this command.

**MQQSGD\_GROUP**

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD\_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE PROCESS(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

### **MQQSGD\_Q\_MGR**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_Q\_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD\_Q\_MGR is the default value.

## **Delete Queue**

The Delete Queue (MQCMD\_DELETE\_Q) command deletes a queue.

### **Required parameters**

#### **QName (MQCFST)**

Queue name (parameter identifier: MQCA\_Q\_NAME).

The name of the queue to be deleted.

If the **Scope** attribute of the queue is MQSCO\_CELL, the entry for the queue is deleted from the cell directory.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### **Optional parameters**

#### **Authrec (MQCFIN)**

Authrec (parameter identifier: MQIACF\_REMOVE\_AUTHREC).

Specifies whether the associated authority record is also deleted.

This parameter does not apply to z/OS.

The value can be any of the following values:

#### **MQRAR\_YES**

The authority record associated with the object is deleted. This is the default.

#### **MQRAR\_NO**

The authority record associated with the object is not deleted.

#### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### Purge (MQCFIN)

Purge queue (parameter identifier: MQIACF\_PURGE).

If there are messages on the queue MQPO\_YES must be specified, otherwise the command fails. If this parameter is not present the queue is not purged.

Valid only for queue of type local.

The value can be any of the following values:

#### MQPO\_YES

Purge the queue.

#### MQPO\_NO

Do not purge the queue.

## z/OS

### QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

#### MQQSGD\_COPY

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD\_Q\_MGR, is not affected by this command.

#### MQQSGD\_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD\_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the deletion is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE queue(q-name) QSGDISP(COPY)
```

or, for a local queue only:

```
DELETE QLOCAL(q-name) NOPURGE QSGDISP(COPY)
```

The deletion of the group object takes effect even if the generated command with QSGDISP(COPY) fails.

**Note:** You always get the NOPURGE option even if you specify MQPO\_YES for *Purge*. To delete messages on local copies of the queues, you must explicitly issue, for each copy, the Delete Queue command with a *QSGDisposition* value of MQQSGD\_COPY and a *Purge* value of MQPO\_YES.

#### MQQSGD\_Q\_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_Q\_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD\_Q\_MGR is the default value.

#### MQQSGD\_SHARED

Valid only for queue of type local.

The object resides in the shared repository. The object was defined by a command using the parameter MQQSGD\_SHARED. Any object residing on the page set of the queue manager

that executes the command, or any object defined by a command using the parameter MQQSGD\_GROUP, is not affected by this command.

### **QType (MQCFIN)**

Queue type (parameter identifier: MQIA\_Q\_TYPE).

If this parameter is present, the queue must be of the specified type.

The value can be:

#### **MQQT\_ALIAS**

Alias queue definition.

#### **MQQT\_LOCAL**

Local queue.

#### **MQQT\_REMOTE**

Local definition of a remote queue.

#### **MQQT\_MODEL**

Model queue definition.

## **Error codes (Delete Queue)**

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### **Reason (MQLONG)**

The value can be any of the following values:

#### **MQRC\_Q\_NOT\_EMPTY**

(2055, X'807') Queue contains one or more messages or uncommitted put or get requests.

## **Multi Delete Service on Multiplatforms**

The Delete Service (MQCMD\_DELETE\_SERVICE) command deletes an existing service definition.

## **Required parameters**

### **ServiceName (MQCFST)**

Service name (parameter identifier: MQCA\_SERVICE\_NAME).

This parameter is the name of the service definition to be deleted.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

## **z/OS Delete Storage Class on z/OS**

The Delete Storage Class (MQCMD\_DELETE\_STG\_CLASS) command deletes an existing storage class definition.

## **Required parameters**

### **StorageClassName (MQCFST)**

Storage class name (parameter identifier: MQCA\_STORAGE\_CLASS).

The storage class definition to be deleted. The maximum length of the string is

MQ\_STORAGE\_CLASS\_LENGTH.

## **Optional parameters**

### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_COPY**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD\_Q\_MGR, is not affected by this command.

#### **MQQSGD\_GROUP**

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD\_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE STGCLASS(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

#### **MQQSGD\_Q\_MGR**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_Q\_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD\_Q\_MGR is the default value.

## **Delete Subscription**

The Delete Subscription (MQCMD\_DELETE\_SUBSCRIPTION) command deletes a subscription.

### **Required parameters**

#### **SubName (MQCFST)**

Subscription name (parameter identifier: MQCACF\_SUB\_NAME).

Specifies the unique subscription name. The subscription name, if provided, must be fully specified; a wildcard is not acceptable.

The subscription name must refer to a durable subscription.

If *SubName* is not provided, *SubId* must be specified to identify the subscription to be deleted.

The maximum length of the string is MQ\_SUB\_NAME\_LENGTH.

**SubId (MQCFBS)**

Subscription identifier (parameter identifier: MQBACF\_SUB\_ID).

Specifies the unique internal subscription identifier.

You must supply a value for *SubId* if you have not supplied a value for *SubName*.

The maximum length of the string is MQ\_CORREL\_ID\_LENGTH.

**Optional parameters****CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter on which to filter.

**Delete Topic**

The Delete Topic (MQCMD\_DELETE\_TOPIC) command deletes the specified administrative topic object.

**Required parameters****TopicName (MQCFST)**

The name of the administrative topic definition to be deleted (parameter identifier: MQCA\_TOPIC\_NAME).

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

**Optional parameters****Authrec (MQCFIN)**

Authrec (parameter identifier: MQIACF\_REMOVE\_AUTHREC).

Specifies whether the associated authority record is also deleted.

This parameter does not apply to z/OS.

The value can be any of the following values:

**MQRAR\_YES**

The authority record associated with the object is deleted. This is the default.

**MQRAR\_NO**

The authority record associated with the object is not deleted.

**z/OS CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## z/OS

### QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

#### MQQSGD\_COPY

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD\_Q\_MGR, is not affected by this command.

#### MQQSGD\_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD\_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the deletion is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to make, or delete, local copies on page set zero:

```
DELETE TOPIC(name) QSGDISP(COPY)
```

The deletion of the group object takes effect even if the generated command with QSGDISP(COPY) fails.

#### MQQSGD\_Q\_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_Q\_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD\_Q\_MGR is the default value.

## Multiplatforms

The Escape (MQCMD\_ESCAPE) command conveys any IBM MQ command (MQSC) to a remote queue manager.

Use the Escape command when the queue manager (or application) sending the command does not support the particular IBM MQ command, and so does not recognize it and cannot construct the required PCF command.

The Escape command can also be used to send a command for which no Programmable Command Format has been defined.

The only type of command that can be carried is one that is identified as an MQSC, that is recognized at the receiving queue manager.

## Required parameters

### EscapeType (MQCFIN)

Escape type (parameter identifier: MQIACF\_ESCAPE\_TYPE).

The only value supported is:

#### **MQET\_MQSC**

IBM MQ command.

### EscapeText (MQCFST)

Escape text (parameter identifier: MQCACF\_ESCAPE\_TEXT).

A string to hold a command. The length of the string is limited only by the size of the message.

## Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_ESCAPE\_TYPE\_ERROR**

Escape type not valid.

## **Escape (Response) on Multiplatforms**

The response to the Escape (MQCMD\_ESCAPE) command consists of the response header followed by two parameter structures, one containing the escape type, and the other containing the text response. More than one such message might be issued, depending upon the command contained in the Escape request.

The *Command* field in the response header MQCFH contains the MQCMD\_\* command identifier of the text command contained in the **EscapeText** parameter in the original Escape command. For example, if *EscapeText* in the original Escape command specified PING QMGR, *Command* in the response has the value MQCMD\_PING\_Q\_MGR.

If it is possible to determine the outcome of the command, the *CompCode* in the response header identifies whether the command was successful. The success or otherwise can therefore be determined without the recipient of the response having to parse the text of the response.

If it is not possible to determine the outcome of the command, *CompCode* in the response header has the value MQCC\_UNKNOWN, and *Reason* is MQRC\_NONE.

## Parameters

### EscapeType (MQCFIN)

Escape type (parameter identifier: MQIACF\_ESCAPE\_TYPE).

The only value supported is:

#### **MQET\_MQSC**

IBM MQ command.

### EscapeText (MQCFST)

Escape text (parameter identifier: MQCACF\_ESCAPE\_TEXT).

A string holding the response to the original command.

The Inquire Application Status (MQCMD\_INQUIRE\_APPL\_STATUS) command inquires about the applications and application instances connected to a queue manager or uniform cluster.

You must specify the application name for which you want to receive status information.

## Required parameters

### ApplicationName (MQCFST)

Application name set using the APPPLTAG parameter (parameter identifier: MQCACF\_APPL\_NAME).

Generic application names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all applications having names that start with the selected character string. An asterisk on its own matches all possible names.

The application name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ\_APPL\_NAME\_LENGTH.

## Optional parameters

### ApplicationInfoAttrs (MQCFIL)

Application information attributes (parameter identifier: MQIACF\_APPL\_INFO\_ATTRS)

If not provided, defaults to MQIACF\_ALL

Alternatively, you can specify any of the parameter values listed in the [Inquire Application Status \(Response\)](#) command, which are valid for the requested status type.

### ApplicationStatusInfoType (MQCFIN)

The type of status to return (parameter identifier: MQIACF\_APPL\_INFO\_TYPE).

The value can be:

- MQIACF\_APPL\_INFO\_APPL
- MQIACF\_APPL\_INFO\_QMGR
- MQIACF\_APPL\_INFO\_LOCAL

The default value, if this parameter is not specified, is MQIACF\_APPL\_INFO\_APPL.

### IntegerFilterCommand (MQCFIF)

Integer filter command descriptor that you use to restrict the output from the command. The parameter identifier must be an integer type, and must be one of the values allowed for the **ApplicationStatusInfoType** selected, except MQIACF\_ALL.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

### StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter except MQCA\_APPL\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition.

Ensure that the parameter is valid for the type selected in **ApplicationStatusInfoType**.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

**Note:** Although the ConnectionTag (MQBACF\_CONN\_TAG) field in [Inquire Application Status \(Response\)](#) is defined as a binary field, the contents should be UTF8.

Because of this, use a *StringFilter* for this field, not a *ByteStringFilter*, and you can use all valid *StringFilter* operators.

The response to the Inquire Application Status (**MQCMD\_INQUIRE\_APPL\_STATUS**) command consists of the response header followed by the *ApplicationName* structure and the requested combination of attribute parameter structures (where applicable) for the requested *ApplicationStatusInfoType*.

**Always returned:**

*ApplicationName*

**Returned if *ApplicationStatusInfoType* is MQIACF\_APPL\_INFO\_APPL:**

*Balanced, ClusterName, InstanceCount, MovableInstanceCount* **V 9.1.4**,  
*MqiacfApplInfoAppl*

**Returned if *ApplicationStatusInfoType* is MQIACF\_APPL\_INFO\_QMGR:**

*BalanceState, InstanceCount, LastMessageDate, LastMessageTime,*  
*MovableInstanceCount, QueueManagerActive, QueueManagerID,*  
*QueueManagerName* **V 9.1.4**, *MqiacfApplInfoQmgr*

**Returned if *ApplicationStatusInfoType* is MQIACF\_APPL\_INFO\_LOCAL:**

*Connections, ConnectionTag, ImmovableCount, ImmovableDate, ImmovableReason,*  
*ImmovableTime, Movable* **V 9.1.4**, *MqiacfApplInfoLocal*

**Response data (MQIACF\_APPL\_INFO\_APPL)**

**Balanced (MQCFIN)**

The overall state of this application relative to whether it is balanced in a uniform cluster or not (parameter identifier: MQIACF\_BALANCED).

The value can be any of the following values:

**MQBALANCED\_NO**

This application is not considered balanced in the uniform cluster.

**MQBALANCED\_YES**

This application is considered balanced in the uniform cluster.

**MQBALANCED\_NOT\_APPLICABLE**

This application is not shared across a uniform cluster.

**MQBALANCED\_UNKNOWN**

This is a temporary state, representing an application that has not yet undergone a scan to calculate whether it is balanced or not, on at least one queue manager, across the uniform cluster.

**ClusterName (MQCFST)**

The name of the uniform cluster in which details of this application are being distributed (parameter identifier: MQCA\_CLUSTER\_NAME).

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH.

The value can be any of the following values:

**Blank**

If this application is not being distributed around a uniform cluster. This might be because the application has never connected in a way which is compatible with being moved (not reconnectable, for example) or it might be that the queue manager is not a member of a uniform cluster.

**String**

The name of the uniform cluster.

**InstanceCount (MQCFIN)**

The summary count of application instances for this application. This includes the local queue managers count of instances, plus those from any queue manager in a uniform cluster that has distributed details about this application (parameter identifier: MQIACF\_APPL\_COUNT).

### **MovableInstanceCount (MQCFIN)**

The summary count of the movable application instances for this application. This includes the local queue managers count of movable instances, plus those from any queue manager in a uniform cluster that has distributed details about this application (parameter identifier: MQIACF\_MOVABLE\_APPL\_COUNT).

V 9.1.4

### **MqiacfApplInfoAppl**

Signifies that the response type is an application.

## **Response data (MQIACF\_APPL\_INFO\_QMGR)**

### **BalanceState (MQCFIN)**

The current state of this application for the queue manager being reported against, relative to whether it is considered balanced across a uniform cluster or not. This information is only updated periodically at the time when a scan causes the rebalancing to occur and might not be based on the current values for *InstanceCount* and *MovableInstanceCount* (parameter identifier: MQIACF\_BALSTATE).

The value can be any of the following values:

#### **MQBALSTATE\_LOW**

This application is not balanced in the uniform cluster and has a deficit of application instances. A queue manager in this state usually requests applications to be rebalanced to it, so as to balance out the cluster.

#### **MQBALSTATE\_OK**

This application is balanced in the uniform cluster.

#### **MQBALSTATE\_HIGH**

This application is not balanced in the uniform cluster and has a surplus of application instances. A queue manager in this state usually honors requests to rebalance some of the applications connected to it, over to a queue manager in the LOW state.

#### **MQBALSTATE\_NOT\_APPLICABLE**

This queue manager is not in a uniform cluster and, therefore, balancing cannot occur.

#### **MQBALSTATE\_UNKNOWN**

This is a temporary state representing an application that is new to the uniform cluster, and which has not yet undergone a scan to calculate whether it is balanced or not.

### **InstanceCount (MQCFIN)**

The count of application instances for this application, on the queue manager being reported (parameter identifier: MQIACF\_APPL\_COUNT).

### **LastMessageDate (MQCFST)**

Local date on which the queue manager being reported against, has distributed information on its application instances. For the local queue manager, this is just the current date. (parameter identifier: MQCACF\_LAST\_MSG\_DATE).

The length of the string is MQ\_DATE\_LENGTH

### **LastMessageTime (MQCFST)**

Local time on which the queue manager being reported against, has distributed information on its application instances. For the local queue manager, this is just the current time. (parameter identifier: MQCACF\_LAST\_MSG\_TIME).

The length of the string is MQ\_TIME\_LENGTH

### **MovableInstanceCount (MQCFIN)**

The summary count of the movable application instances for this application on the queue manager being reported for (parameter identifier: MQIA\_MOVABLE\_APPL\_COUNT).

### **QueueManagerActive(MQCFIN)**

Indicates whether the queue manager being reported for is currently considered active. Application instances on an inactive queue manager are not included in the numbers used to calculate application instance balancing. (parameter identifier: MQIACF\_REMOTE\_QMGR\_ACTIVE).

The value can be any of the following values:

**MQACTIVE\_NO**

This queue manager is not considered active, because it has not distributed its application balancing information to the local queue manager recently.

**MQACTIVE\_YES**

This queue manager is considered active, and is actively distributing its application balancing information.

**QueueManagerID (MQCFST)**

The internally generated unique queue manager identifier of the queue manager being reported for (parameter identifier: MQCA\_Q\_MGR\_IDENTIFIER).

The length of the string is MQ\_Q\_MGR\_IDENTIFIER\_LENGTH.

**QueueManagerName (MQCFST)**

The queue manager name of the queue manager being reported for (parameter identifier: MQCA\_Q\_MGR\_NAME).

The length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

V 9.1.4

**MqiacfApplInfoQmgr**

Signifies that the response type is a queue manager.

**Response data (MQIACF\_APPL\_INFO\_LOCAL)**

**Connections(MQCFIN)**

The number of queue manager connections this application instance currently has open. (parameter identifier: MQIACF\_CONNECTION\_COUNT).

**ConnectionTag (MQCFBS)**

The connection tag associated with this application instance. When generated by the queue manager, this is a UTF8 string. (parameter identifier: MQBACF\_CONN\_TAG).

The maximum length of this field is MQ\_CONN\_TAG\_LENGTH

**ImmovableCount (MQCFIN)**

The count of times this application instance has been requested to move to another queue manager and has not yet disconnected. Any value higher than one is an indication that the application is failing to rebalance when requested to. (parameter identifier: MQIACF\_APPL\_IMMOVABLE\_COUNT).

**ImmovableDate (MQCFST)**

Date on which this local instance is considered eligible for being moved around a uniform cluster. This field is blank unless there is a temporary condition which prevents an application instance being moved to another queue manager in a uniform cluster. (parameter identifier: MQCACF\_APPL\_IMMOVABLE\_DATE).

The length of the string is MQ\_DATE\_LENGTH

**ImmovableReason (MQCFIN)**

The reason why this application is currently considered to be immovable and, therefore, will not be rebalanced around the cluster. Some reasons are temporary, and have an associated *ImmovableDate* and *ImmovableTime*, or *ImmovableTime* reason. Other reasons persist for the lifetime of this application instance. (parameter identifier: MQIACF\_APPL\_IMMOVABLE\_REASON).

The value can be any of the following values:

**MQIMMREASON\_NONE**

This application instance is currently considered movable.

**MQIMMREASON\_NOT\_CLIENT**

This application instance cannot be moved as it is not a client connection.

**MQIMMREASON\_NOT\_RECONNECTABLE**

This application instance cannot be moved as it is not a reconnectable client connection.

**MQIMMREASON\_MOVING**

This application instance cannot be moved as it has recently been requested to move, and has not yet disconnected.

**MQIMMREASON\_APPLNAME\_CHANGED**

This application instance cannot be moved as it is sharing a socket with a connection from an application instance which has a different application name.

**ImmovableTime (MQCFST)**

Time on which this local instance is considered eligible for being moved around a uniform cluster. This field is blank unless there is a temporary condition which prevents an application instance being moved to another queue manager in a uniform cluster. (parameter identifier: MQCACF\_APPL\_IMMOVABLE\_TIME).

The length of the string is MQ\_TIME\_LENGTH

**Movable (MQCFIN)**

Indicates whether this application instance is considered eligible for moving around the uniform cluster. At a minimum, a movable application must be a client connection which has connected as reconnectable. (parameter identifier: MQIACF\_APPL\_MOVABLE).

The value can be any of the following values:

**MQACTIVE\_YES**

This application instance is considered movable.

**MQACTIVE\_NO**

This application instance is not considered movable.

**V 9.1.4**

**MqiacfApplInfoLocal**

Signifies that the response type is local.

**Related tasks**

[Monitoring application balancing](#)

**Related reference**

[“DISPLAY APSTATUS” on page 597](#)

Use the MQSC command DISPLAY APSTATUS to display the status of one or more applications and application instances connected to a queue manager or a uniform cluster.

**z/OS**

**Inquire Archive on z/OS**

The Inquire Archive (MQCMD\_INQUIRE\_ARCHIVE) command returns archive system parameters and information.

**Optional parameters****CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## **Inquire Archive (Response) on z/OS**

The response to the Inquire Archive (MQCMD\_INQUIRE\_ARCHIVE) command consists of the response header followed by the *ParameterType* structure and the combination of attribute parameter structures determined by the value of *ParameterType*.

### **Always returned:**

*ParameterType* Specifies the type of archive information being returned. The value can be any of the following values:

#### **MQSYSP\_TYPE\_INITIAL**

The initial settings of the archive parameters.

#### **MQSYSP\_TYPE\_SET**

The settings of the archive parameters if they have been altered since their initial setting.

#### **MQSYSP\_TYPE\_ARCHIVE\_TAPE**

Parameters relating to the tape unit (if in use). There is one such message per tape unit in use for archive logging.

### **Returned if *ParameterType* is MQSYSP\_TYPE\_INITIAL (one message is returned):**

*AllocPrimary, AllocSecondary, AllocUnits, ArchivePrefix1, ArchivePrefix2, ArchiveRetention, ArchiveUnit1, ArchiveUnit2, ArchiveWTOR, BlockSize, Catalog, Compact, Protect, QuiesceInterval, RoutingCode, TimeStampFormat*

### **Returned if *ParameterType* is MQSYSP\_TYPE\_SET and any value is set (one message is returned):**

*AllocPrimary, AllocSecondary, AllocUnits, ArchivePrefix1, ArchivePrefix2, ArchiveRetention, ArchiveUnit1, ArchiveUnit2, ArchiveWTOR, BlockSize, Catalog, Compact, Protect, QuiesceInterval, RoutingCode, TimeStampFormat*

### **Returned if *ParameterType* is MQSYSP\_TYPE\_ARCHIVE\_TAPE (one message is returned for each tape unit in use for archive logging):**

*DataSetName, LogCorrelId, UnitAddress, UnitStatus, UnitVolser*

## **Response data - archive parameter information**

### **AllocPrimary (MQCFIN)**

Primary space allocation for DASD data sets (parameter identifier: MQIACF\_SYSP\_ALLOC\_PRIMARY).

Specifies the primary space allocation for DASD data sets in the units specified in the **AllocUnits** parameter.

### **AllocSecondary (MQCFIN)**

Secondary space allocation for DASD data sets (parameter identifier:

MQIACF\_SYSP\_ALLOC\_SECONDARY).

Specifies the secondary space allocation for DASD data sets in the units specified in the **AllocUnits** parameter.

### **AllocUnits (MQCFIN)**

Allocation unit (parameter identifier: MQIACF\_SYSP\_ALLOC\_UNIT).

Specifies the unit in which primary and secondary space allocations are made. The value can be any of the following values:

#### **MQSYSP\_ALLOC\_BLK**

Blocks.

#### **MQSYSP\_ALLOC\_TRK**

Tracks.

#### **MQSYSP\_ALLOC\_CYL**

Cylinders.

**ArchivePrefix1 (MQCFST)**

Prefix for the first archive log data set name (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_PFX1).

The maximum length of the string is MQ\_ARCHIVE\_PFX\_LENGTH.

**ArchivePrefix2 (MQCFST)**

Prefix for the second archive log data set name (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_PFX2).

The maximum length of the string is MQ\_ARCHIVE\_PFX\_LENGTH.

**ArchiveRetention (MQCFIN)**

Archive retention period (parameter identifier: MQIACF\_SYSP\_ARCHIVE\_RETAIN).

Specifies the retention period, in days, to be used when the archive log data set is created.

**ArchiveUnit1 (MQCFST)**

Specifies the device type or unit name of the device that is used to store the first copy of the archive log data set (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_UNIT1).

The maximum length of the string is MQ\_ARCHIVE\_UNIT\_LENGTH.

**ArchiveUnit2 (MQCFST)**

Specifies the device type or unit name of the device that is used to store the second copy of the archive log data set (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_UNIT2).

The maximum length of the string is MQ\_ARCHIVE\_UNIT\_LENGTH.

**ArchiveWTOR (MQCFIN)**

Specifies whether a message is to be sent to the operator and a reply is received before attempting to mount an archive log data set (parameter identifier: MQIACF\_SYSP\_ARCHIVE\_WTOR).

The value can be:

**MQSYSP\_YES**

A message is to be sent and a reply received before an attempt to mount an archive log data set.

**MQSYSP\_NO**

A message is not to be sent and a reply received before an attempt to mount an archive log data set.

**BlockSize (MQCFIN)**

Block size of the archive log data set (parameter identifier: MQIACF\_SYSP\_BLOCK\_SIZE).

**Catalog (MQCFIN)**

Specifies whether archive log data sets are cataloged in the primary integrated catalog facility (parameter identifier: MQIACF\_SYSP\_CATALOG).

The value can be:

**MQSYSP\_YES**

Archive log data sets are cataloged.

**MQSYSP\_NO**

Archive log data sets are not cataloged.

**Compact (MQCFIN)**

Specifies whether data written to archive logs is to be compacted (parameter identifier: MQIACF\_SYSP\_COMPACT).

The value can be any of the following values:

**MQSYSP\_YES**

Data is to be compacted.

**MQSYSP\_NO**

Data is not to be compacted.

**Protect (MQCFIN)**

Protection by external security manager (ESM) (parameter identifier: MQIACF\_SYSP\_PROTECT).

Specifies whether archive log data sets are protected by ESM profiles when the data sets are created.

The value can be any of the following values:

**MQSYSP\_YES**

Data set profiles are created when logs are offloaded.

**MQSYSP\_NO**

Profiles are not created.

**QuiesceInterval (MQCFIN)**

Maximum time allowed for the quiesce (parameter identifier: MQIACF\_SYSP\_QUIESCE\_INTERVAL).

Specifies the maximum time, in seconds, allowed for the quiesce.

**RoutingCode (MQCFIL)**

z/OS routing code list (parameter identifier: MQIACF\_SYSP\_ROUTING\_CODE).

Specifies the list of z/OS routing codes for messages about the archive log data sets to the operator. There can be 1 - 14 entries in the list.

**TimeStampFormat (MQCFIN)**

Time stamp included (parameter identifier: MQIACF\_SYSP\_TIMESTAMP).

Specifies whether the archive log data set name has a time stamp in it.

The value can be:

**MQSYSP\_YES**

Names include a time stamp.

**MQSYSP\_NO**

Names do not include a time stamp.

**MQSYSP\_EXTENDED**

Names include a time stamp.

**Response data - tape unit status information**

**DataSetName (MQCFST)**

Data set name (parameter identifier: MQCACF\_DATA\_SET\_NAME).

Specifies the data set name on the tape volume that is being processed, or was last processed.

The maximum length of the string is MQ\_DATA\_SET\_NAME\_LENGTH.

**LogCorrelId (MQCFST)**

Correlation identifier (parameter identifier: MQCACF\_SYSP\_LOG\_CORREL\_ID).

Specifies the correlation ID associated with the user of the tape being processed. This parameter is blank if there is no current user.

The maximum length of the string is MQ\_LOG\_CORREL\_ID\_LENGTH.

**UnitAddress (MQCFIN)**

Tape unit address: MQIACF\_SYSP\_UNIT\_ADDRESS).

Specifies the physical address of the tape unit allocated to read the archive log.

**UnitStatus (MQCFIN)**

Status if the tape unit: MQIACF\_SYSP\_UNIT\_STATUS).

The value can be:

**MQSYSP\_STATUS\_BUSY**

The tape unit is busy, actively processing an archive log data set.

**MQSYSP\_STATUS\_PREMOUNT**

The tape unit is active and allocated for premounting.

**MQSYSP\_STATUS\_AVAILABLE**

The tape unit is available, inactive, and waiting for work.

**MQSYSP\_STATUS\_UNKNOWN**

The tape unit status is unknown.

**UnitVolser (MQCFST)**

The volume serial number of the tape that is mounted (parameter identifier: MQCACF\_SYSP\_UNIT\_VOLSER).

The maximum length of the string is MQ\_VOLSER\_LENGTH.

**Inquire Authentication Information Object**

The Inquire authentication information object (**MQCMD\_INQUIRE\_AUTH\_INFO**) command inquires about the attributes of authentication information objects.

**Required parameters****AuthInfoName (MQCFST)**

Authentication information object name (parameter identifier: MQCA\_AUTH\_INFO\_NAME).

Specifies the name of the authentication information object about which information is to be returned.

Generic authentication information object names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all authentication information objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

**Optional parameters****AuthInfoAttrs (MQCFIL)**

Authentication information object attributes (parameter identifier: MQIACF\_AUTH\_INFO\_ATTRS).

The attribute list can specify the following value - the default value if the parameter is not specified):

**MQIACF\_ALL**

All attributes.

or a combination of the following:

**MQIA\_ADOPT\_CONTEXT**

Adopt the presented credentials as the context for the application.

**MQCA\_ALTERATION\_DATE**

Date on which the definition was last altered.

**MQCA\_ALTERATION\_TIME**

Time at which the definition was last altered.

**MQCA\_AUTH\_INFO\_DESC**

Description of the authentication information object.

**MQCA\_AUTH\_INFO\_NAME**

Name of the authentication information object.

**MQIA\_AUTH\_INFO\_TYPE**

Type of authentication information object.

**MQCA\_AUTH\_INFO\_CONN\_NAME**

Connection name of the authentication information object.

This attribute is relevant only when **AuthInfoType** is set to MQAIT\_CRL\_LDAP or MQAIT\_IDPW\_LDAP.

**MQIA\_AUTHENTICATION\_FAIL\_DELAY**

Delay in seconds before an authentication failure is returned to an application.

**MQIA\_AUTHENTICATION\_METHOD**

Authentication method for user passwords.

**MQIA\_CHECK\_CLIENT\_BINDING**

Authentication requirements for client applications.

**MQIA\_CHECK\_LOCAL\_BINDING**

Authentication requirements for locally bound applications.

**MQIA\_LDAP\_AUTHORMD**

Authorization method for the queue manager.

**MQCA\_LDAP\_BASE\_DN\_GROUPS**

The base Distinguished Name for groups in the LDAP server.

**MQCA\_LDAP\_BASE\_DN\_USERS**

The base Distinguished Name for users in the LDAP server.

**MQCA\_LDAP\_FIND\_GROUP\_FIELD**

Name of the attribute used within an LDAP entry to determine group membership.

**MQCA\_LDAP\_GROUP\_ATTR\_FIELD**

LDAP attribute that represents a simple name for the group.

**MQCA\_LDAP\_GROUP\_OBJECT\_CLASS**

The LDAP object class used for group records in the LDAP repository.

**MQIA\_LDAP\_NESTGRP**

Whether LDAP groups are checked for membership of other groups.

**MQCA\_LDAP\_PASSWORD**

LDAP password in the authentication information object.

This attribute is relevant only when **AuthInfoType** is set to MQAIT\_CRL\_LDAP or MQAIT\_IDPW\_LDAP.

**MQIA\_LDAP\_SECURE\_COMM**

Whether connectivity to the LDAP server should be done securely using TLS.

**MQCA\_LDAP\_SHORT\_USER\_FIELD**

The field in the LDAP user record to be used as a short user name in IBM MQ.

**MQCA\_LDAP\_USER\_ATTR\_FIELD**

The field in the LDAP user record to be used to interpret the user ID provided by an application, if the user ID does not contain a qualifier.

**MQCA\_LDAP\_USER\_NAME**

LDAP user name in the authentication information object.

This attribute is relevant only when **AuthInfoType** is set to MQAIT\_CRL\_LDAP or MQAIT\_IDPW\_LDAP.

**MQCA\_LDAP\_USER\_OBJECT\_CLASS**

The LDAP object class used for user records in the LDAP repository.

**MQCA\_AUTH\_INFO\_OCSP\_URL**

The URL of the OCSP responder used to check for certificate revocation.

**AuthInfoType (MQCFIN)**

Type of authentication information object. The following values are accepted:

**MQAIT\_CRL\_LDAP**

Authentication information objects specifying Certificate Revocation Lists held on LDAP servers.

**MQAIT\_OCSP**

Authentication information objects specifying certificate revocation checking using OCSP.

### **MQAIT\_IDPW\_OS**

Authentication information objects specifying certificate revocation checking using user ID and password checking through the operating system.

### **MQAIT\_IDPW\_LDAP**

Authentication information objects specifying certificate revocation checking using user ID and password checking through an LDAP server.

### **MQAIT\_ALL**

Authentication information objects of any type.

## **z/OS CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use **CommandScope** as a parameter to filter on.

## **IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in **AuthInfoAttrs**, except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

## **z/OS QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

### **MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. This value is the default value if the parameter is not specified.

### **MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. This value is permitted only in a shared queue environment.

### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

### **MQQSGD\_PRIVATE**

The object is defined as either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

You cannot use **QSGDisposition** as a parameter to filter on.

### **StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in **AuthInfoAttrs**, except MQCA\_AUTH\_INFO\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. For information about using this filter condition, see [“MQCFSF - PCF string filter parameter” on page 1903](#).

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

## **Inquire Authentication Information Object (Response)**

The response of the Inquire authentication information (MQCMD\_INQUIRE\_AUTH\_INFO) command consists of the response header followed by the *AuthInfoName* structure (and on z/OS only, the *QSGDisposition* structure), and the requested combination of attribute parameter structures (where applicable).

### **Always returned:**

*AuthInfoName* , *QSGDisposition*

### **Returned if requested:**

*AdoptContext* , *AlterationDate* , *AlterationTime* , *AuthInfoConnName* ,  
*BaseDNGroup* , *BaseDNUser* , *AuthInfoType* , *CheckClient* , *CheckLocal* , *ClassUser* ,  
*FailureDelay* , *LDAPPassword* , *LDAPUserName* , *OCSPResponderURL* , *SecureComms* ,  
*ShortUser* , *UserField*

## **Response data**

### **AdoptContext**

Whether to use the presented credentials as the context for this application.

### **AlterationDate (MQCFST)**

Alteration date of the authentication information object, in the form yyyy-mm-dd (parameter identifier: MQCA\_ALTERATION\_DATE).

### **AlterationTime (MQCFST)**

Alteration time of the authentication information object, in the form hh.mm.ss (parameter identifier: MQCA\_ALTERATION\_TIME).

### **AuthInfoConnName (MQCFST)**

The connection name of the authentication information object (parameter identifier: MQCA\_AUTH\_INFO\_CONN\_NAME).

The maximum length of the string is MQ\_AUTH\_INFO\_CONN\_NAME\_LENGTH. On z/OS, it is MQ\_LOCAL\_ADDRESS\_LENGTH.

This parameter is relevant only when *AuthInfoType* is set to *MQAIT\_CRL\_LDAP* or *MQAIT\_IDPW\_LDAP*.

### **AuthInfoDesc (MQCFST)**

The description of the authentication information object (parameter identifier: MQCA\_AUTH\_INFO\_DESC).

The maximum length is MQ\_AUTH\_INFO\_DESC\_LENGTH.

#### **AuthInfoName (MQCFST)**

Authentication information object name (parameter identifier: MQCA\_AUTH\_INFO\_NAME).

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

#### **AuthInfoType (MQCFIN)**

The type of authentication information object (parameter identifier: MQIA\_AUTH\_INFO\_TYPE).

The value can be:

##### **MQAIT\_CRL\_LDAP**

This authentication information object specifies Certificate Revocation Lists that are held on LDAP servers.

##### **MQAIT\_OCSP**

This authentication information object specifies certificate revocation checking using OCSP.

##### **MQAIT\_IDPW\_OS**

This authentication information object specifies certificate revocation checking using user ID and password checking through the operating system.

##### **MQAIT\_IDPW\_LDAP**

This authentication information object specifies certificate revocation checking using user ID and password checking through an LDAP server.

See [Securing IBM MQ](#) for more information.

#### **AuthenticationMethod (MQCFIN)**

Authentication methods for user passwords (parameter identifier: MQIA\_AUTHENTICATION\_METHOD). Possible values are:

##### **MQAUTHENTICATE\_OS**

Use the traditional UNIX password verification method.

##### **MQAUTHENTICATE\_PAM**

Use the Pluggable Authentication Method to authenticate the user passwords.

You can set the PAM value only on UNIX and Linux.

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_OS*, and is not valid on IBM MQ for z/OS.

#### **AuthorizationMethod (MQCFIN)**

Authorization methods for the queue manager (parameter identifier MQIA\_LDAP\_AUTHORMD). Possible values are:

##### **MQLDAP\_AUTHORMD\_OS**

Use operating system groups to determine permissions associated with a user.

##### **MQLDAP\_AUTHORMD\_SEARCHGRP**

A group entry in the LDAP repository contains an attribute listing the Distinguished Name of all the users belonging to that group.

##### **MQLDAP\_AUTHORMD\_SEARCHUSER**

A user entry in the LDAP repository contains an attribute listing the Distinguished Name of all the groups to which the specified user belongs.

##### **V 9.1.0 MQLDAP\_AUTHORMD\_SRCHGRPSN**

A group entry in the LDAP repository contains an attribute listing the short user name of all the users belonging to that group.

#### **BaseDNGroup (MQCFST)**

In order to be able to find group names, this parameter must be set with the base DN to search for groups in the LDAP server (parameter identifier MQCA\_LDAP\_BASE\_DN\_GROUPS).

The maximum length of the string is MQ\_LDAP\_BASE\_DN\_LENGTH.

**BaseDNUser (MQCFST)**

In order to be able to find the short user name attribute (see [ShortUser](#)) this parameter must be set with the base DN to search for users within the LDAP server.

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* and is mandatory (parameter identifier *MQ\_LDAP\_BASE\_DN\_USERS*).

The maximum length is *MQ\_LDAP\_BASE\_DN\_LENGTH*.

**Checklocal or Checkclient (MQCFIN)**

These attributes are valid only for an **AuthInfoType** of *MQAIT\_IDPW\_OS* or *MQAIT\_IDPW\_LDAP* (parameter identifier *MQIA\_CHECK\_LOCAL\_BINDING* or *MQIA\_CHECK\_CLIENT\_BINDING*). The possible values are:

**MQCHK\_NONE**

Switches off checking.

**MQCHK\_OPTIONAL**

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

**MQCHK\_REQUIRED**

Requires that all applications provide a valid user ID and password.

**MQCHK\_REQUIRED\_ADMIN**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the *OPTIONAL* setting. See also the following note.  (This setting is not allowed on z/OS systems.)

**ClassGroup (MQCFST)**

The LDAP object class used for group records in the LDAP repository (parameter identifier *MQCA\_LDAP\_GROUP\_OBJECT\_CLASS*).

**Classuser (MQCFST)**

The LDAP object class used for user records in the LDAP repository (parameter identifier *MQCA\_LDAP\_USER\_OBJECT\_CLASS*).

The maximum length is *MQ\_LDAP\_CLASS\_LENGTH*.

**FailureDelay (MQCFIN)**

The failure delay (parameter identifier *MQIA\_AUTHENTICATION\_FAIL\_DELAY*) when an authentication fails due to the user ID or password being incorrect, in seconds, before the failure is returned to the application.

**FindGroup (MQCFST)**

Name of the attribute used within an LDAP entry to determine group membership (parameter identifier *MQCA\_LDAP\_FIND\_GROUP\_FIELD*).

The maximum length of the string is *MQ\_LDAP\_FIELD\_LENGTH*.

**GroupField (MQCFST)**

LDAP attribute that represents a simple name for the group (parameter identifier *MQCA\_LDAP\_GROUP\_ATTR\_FIELD*).

The maximum length of the string is *MQ\_LDAP\_FIELD\_LENGTH*.

**GroupNesting (MQCFIN)**

Whether groups are members of other groups (parameter identifier *MQIA\_LDAP\_NESTGRP*). The values can be:

**MQLDAP\_NESTGRP\_NO**

Only the initially discovered groups are considered for authorization.

**MQLDAP\_NESTGRP\_YES**

The group list is searched recursively to enumerate all the groups to which a user belongs.

**LDAPPassword (MQCFST)**

The LDAP password (parameter identifier: MQCA\_LDAP\_PASSWORD).

The maximum length is MQ\_LDAP\_PASSWORD\_LENGTH.

This parameter is relevant only when AuthInfoType is set to *MQAIT\_CRL\_LDAP* or *MQAIT\_IDPW\_LDAP*.

**LDAPUserName (MQCFST)**

The LDAP user name (parameter identifier: MQCA\_LDAP\_USER\_NAME).

The Distinguished Name of the user who is binding to the directory.

The maximum length is MQ\_DISTINGUISHED\_NAME\_LENGTH. On z/OS, it is MQ\_SHORT\_DNAME\_LENGTH.

This parameter is relevant only when AuthInfoType is set to *MQAIT\_CRL\_LDAP* or *MQAIT\_IDPW\_LDAP*.

**OCSPResponderURL (MQCFST)**

The URL of the OCSP responder used to check for certificate revocation.

**z/OS MQSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**SecureComms (MQCFIN)**

Whether connectivity to the LDAP server should be done securely using TLS (parameter identifier MQIA\_LDAP\_SECURE\_COMM).

The maximum length is MQ\_LDAP\_SECURE\_COMM\_LENGTH.

**ShortUser (MQCFST)**

A field in the user record to be used as a short user name in IBM MQ (parameter identifier MQCA\_LDAP\_SHORT\_USER\_FIELD)..

The maximum length is MQ\_LDAP\_FIELD\_LENGTH.

**UserField (MQCFST)**

Identifies the field in the LDAP user record that is used to interpret the provided user ID, only if the user ID does not contain a qualifier (parameter identifier MQCA\_LDAP\_USER\_ATTR\_FIELD).

The maximum length is MQ\_LDAP\_FIELD\_LENGTH.

**Inquire Authentication Information Object Names**

The Inquire authentication information names (MQCMD\_INQUIRE\_AUTH\_INFO\_NAMES) command asks for a list of authentication information names that match the generic authentication information name specified.

**Required parameters****AuthInfoName (MQCFST)**

Authentication information object name (parameter identifier: MQCA\_AUTH\_INFO\_NAME).

Specifies the name of the authentication information object about which information is to be returned.

Generic authentication information object names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all authentication information objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

## Optional parameters

### AuthInfoType (MQCFIN)

Type of authentication information object. The following values are accepted:

#### MQAIT\_CRL\_LDAP

Authentication information objects specifying Certificate Revocation Lists held on LDAP servers.

#### MQAIT\_OCSP

Authentication information objects specifying certificate revocation checking using OCSP.

#### MQAIT\_ALL

Authentication information objects of any type. MQAIT\_ALL is the default value

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### 

### QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

#### MQQSGD\_LIVE

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

#### MQQSGD\_ALL

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

#### MQQSGD\_COPY

The object is defined as MQQSGD\_COPY.

### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

### **MQQSGD\_PRIVATE**

The object is defined as either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

## **Inquire Authentication Information Object Names (Response)**

The response to the inquire authentication information names (MQCMD\_INQUIRE\_AUTH\_INFO\_NAMES) command consists of the response header followed by a parameter structure giving zero or more names that match the specified authentication information name.

**z/OS** Additionally, on z/OS only, parameter structures, *QSGDispositions* and *AuthInfoTypes* (with the same number of entries as the *AuthInfoNames* structure), are returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *AuthInfoNames* structure.

### **Always returned:**

*AuthInfoNames*, **z/OS**, *QSGDispositions*, **z/OS**, *AuthInfoTypes*

### **Returned if requested:**

None

## **Response data**

### **AuthInfoNames (MQCFSL)**

List of authentication information object names (parameter identifier: MQCACF\_AUTH\_INFO\_NAMES).

**z/OS**

### **QSGDispositions (MQCFIL)**

List of queue sharing group dispositions (parameter identifier: MQIACF\_QSG\_DISPS).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**z/OS**

### **AuthInfoTypes (MQCFIL)**

List of authentication information object types (parameter identifier: MQIACH\_AUTH\_INFO\_TYPES).

Specifies the type of the object. This parameter is valid on z/OS only. The value can be any of the following values:

#### **MQAIT\_CRL\_LDAP**

This defines this authentication information object as specifying an LDAP server containing Certificate Revocation Lists.

## **MQAIT\_OCSP**

This value defines this authentication information object as specifying certificate revocation checking using OCSP.

## **MQAIT\_IDPW\_OS**

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through the operating system.

**Multi**

## **Inquire Authority Records on Multiplatforms**

The Inquire Authority Records (MQCMD\_INQUIRE\_AUTH\_RECS) command retrieves authority records associated with a profile name.

### **Required parameters**

#### **Options (MQCFIN)**

Options to control the set of authority records that is returned (parameter identifier: MQIACF\_AUTH\_OPTIONS).

This parameter is required and you must include one of the following two values:

#### **MQAUTHOPT\_NAME\_ALL\_MATCHING**

Return all profiles the names of which match the specified *ProfileName*. This means that a *ProfileName* of ABCD results in the profiles ABCD, ABC\*, and AB\* being returned (if ABC\* and AB\* have been defined as profiles).

#### **MQAUTHOPT\_NAME\_EXPLICIT**

Return only those profiles the names of which exactly match the *ProfileName*. No matching generic profiles are returned unless the *ProfileName* is, itself, a generic profile. You cannot specify this value and MQAUTHOPT\_ENTITY\_SET.

and one of the following two values:

#### **MQAUTHOPT\_ENTITY\_EXPLICIT**

Return all profiles the entity fields of which match the specified *EntityName*. No profiles are returned for any group in which *EntityName* is a member; only the profile defined for the specified *EntityName*.

#### **MQAUTHOPT\_ENTITY\_SET**

Return the profile the entity field of which matches the specified *EntityName* and the profiles pertaining to any groups in which *EntityName* is a member that contribute to the cumulative authority for the specified entity. You cannot specify this value and MQAUTHOPT\_NAME\_EXPLICIT.

You can also optionally specify:

#### **MQAUTHOPT\_NAME\_AS\_WILDCARD**

Interpret *ProfileName* as a filter on the profile name of the authority records. If you do not specify this attribute and *ProfileName* contains wildcard characters, it is interpreted as a generic profile and only those authority records where the generic profile names match the value of *ProfileName* are returned.

You cannot specify MQAUTHOPT\_NAME\_AS\_WILDCARD if you also specify MQAUTHOPT\_ENTITY\_SET.

#### **ProfileName (MQCFST)**

Profile name (parameter identifier: MQCACF\_AUTH\_PROFILE\_NAME).

This parameter is the name of the profile for which to retrieve authorizations. Generic profile names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all profiles having names that start with the selected character string. An asterisk on its own matches all possible names.

If you have defined a generic profile, you can return information about it by not setting MQAUTHOPT\_NAME\_AS\_WILDCARD in *Options*.

If you set *Options* to MQAUTHOPT\_NAME\_AS\_WILDCARD, the only valid value for *ProfileName* is a single asterisk (\*). This means that all authority records that satisfy the values specified in the other parameters are returned.

Do not specify *ProfileName* if the value of *ObjectType* is MQOT\_Q\_MGR.

The profile name is always returned regardless of the attributes requested.

The maximum length of the string is MQ\_AUTH\_PROFILE\_NAME\_LENGTH.

### **ObjectType (MQCFIN)**

The type of object referred to by the profile (parameter identifier: MQIACF\_OBJECT\_TYPE).

The value can be any of the following values:

#### **MQOT\_ALL**

All object types. MQOT\_ALL is the default if you do not specify a value for *ObjectType*.

#### **MQOT\_AUTH\_INFO**

Authentication information.

#### **MQOT\_CHANNEL**

Channel object.

#### **MQOT\_CLNTCONN\_CHANNEL**

Client-connection channel object.

#### **MQOT\_COMM\_INFO**

Communication information object

#### **MQOT\_LISTENER**

Listener object.

#### **MQOT\_NAMELIST**

Namelist.

#### **MQOT\_PROCESS**

Process.

#### **MQOT\_Q**

Queue, or queues, that match the object name parameter.

#### **MQOT\_Q\_MGR**

Queue manager.

#### **MQOT\_REMOTE\_Q\_MGR\_NAME**

Remote queue manager.

#### **MQOT\_SERVICE**

Service object.

#### **MQOT\_TOPIC**

Topic object.

## **Optional parameters**

### **EntityName (MQCFST)**

Entity name (parameter identifier: MQCACF\_ENTITY\_NAME).

Depending on the value of *EntityType*, this parameter is either:

- A principal name. This name is the name of a user for whom to retrieve authorizations to the specified object. On IBM MQ for Windows, the name of the principal can optionally include a domain name, specified in this format: `user@domain`.
- A group name. This name is the name of the user group on which to make the inquiry. You can specify one name only and this name must be the name of an existing user group.

**Windows** For IBM MQ for Windows only, the group name can optionally include a domain name, specified in the following formats:

```
GroupName@domain  
domain\GroupName
```

The maximum length of the string is MQ\_ENTITY\_NAME\_LENGTH.

### EntityType (MQCFIN)

Entity type (parameter identifier: MQIACF\_ENTITY\_TYPE).

The value can be:

#### **MQZAET\_GROUP**

The value of the **EntityName** parameter refers to a group name.

#### **MQZAET\_PRINCIPAL**

The value of the **EntityName** parameter refers to a principal name.

### ProfileAttrs (MQCFIL)

Profile attributes (parameter identifier: MQIACF\_AUTH\_PROFILE\_ATTRS).

The attribute list might specify the following value on its own - the default value if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQCACF\_ENTITY\_NAME**

Entity name.

#### **MQIACF\_AUTHORIZATION\_LIST**

Authorization list.

#### **MQIACF\_ENTITY\_TYPE**

Entity type.

**Note:** If an entity is specified by using the parameters MQCACF\_ENTITY\_NAME and MQIACF\_ENTITY\_TYPE, then all the required parameters must be passed in first.

### ServiceComponent (MQCFST)

Service component (parameter identifier: MQCACF\_SERVICE\_COMPONENT).

If installable authorization services are supported, this parameter specifies the name of the authorization service from which to retrieve authorization.

If you omit this parameter, the authorization inquiry is made to the first installable component for the service.

The maximum length of the string is MQ\_SERVICE\_COMPONENT\_LENGTH.

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRC\_OBJECT\_TYPE\_ERROR**

Invalid object type.

#### **MQRC\_UNKNOWN\_ENTITY**

User ID not authorized, or unknown.

**MQRCCF\_CFST\_CONFLICTING\_PARM**

Conflicting parameters.

**MQRCCF\_PROFILE\_NAME\_ERROR**

Invalid profile name.

**MQRCCF\_ENTITY\_NAME\_MISSING**

Entity name missing.

**MQRCCF\_OBJECT\_TYPE\_MISSING**

Object type missing.

**MQRCCF\_PROFILE\_NAME\_MISSING**

Profile name missing.

**Multi**

## **Inquire Authority Records (Response) on Multiplatforms**

The response to the Inquire Authority Records (MQCMD\_INQUIRE\_AUTH\_RECS) command consists of the response header followed by the *QMgrName*, *Options*, *ProfileName*, and *ObjectType* structures and the requested combination of attribute parameter structures.

One PCF message is returned for each authority record that is found the profile name of which matches the options specified in the Inquire Authority Records request.

**Always returned:**

*ObjectType*, *Options*, *ProfileName*, *QMgrName*

**Returned if requested:**

*AuthorizationList*, *EntityName*, *EntityType*

### **Response data**

**AuthorizationList (MQCFIL)**

Authorization list (parameter identifier: MQIACF\_AUTHORIZATION\_LIST).

This list can contain zero or more authorization values. Each returned authorization value means that any user ID in the specified group or principal has the authority to perform the operation defined by that value. The value can be any of the following values:

**MQAUTH\_NONE**

The entity has authority set to 'none'.

**MQAUTH\_ALT\_USER\_AUTHORITY**

Specify an alternate user ID on an MQI call.

**MQAUTH\_BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

**MQAUTH\_CHANGE**

Change the attributes of the specified object, using the appropriate command set.

**MQAUTH\_CLEAR**

Clear a queue.

**MQAUTH\_CONNECT**

Connect the application to the specified queue manager by issuing an MQCONN call.

**MQAUTH\_CREATE**

Create objects of the specified type using the appropriate command set.

**MQAUTH\_DELETE**

Delete the specified object using the appropriate command set.

**MQAUTH\_DISPLAY**

Display the attributes of the specified object using the appropriate command set.

**MQAUTH\_INPUT**

Retrieve a message from a queue by issuing an MQGET call.

**MQAUTH\_INQUIRE**

Make an inquiry on a specific queue by issuing an MQINQ call.

**MQAUTH\_OUTPUT**

Put a message on a specific queue by issuing an MQPUT call.

**MQAUTH\_PASS\_ALL\_CONTEXT**

Pass all context.

**MQAUTH\_PASS\_IDENTITY\_CONTEXT**

Pass the identity context.

**MQAUTH\_SET**

Set attributes on a queue from the MQI by issuing an MQSET call.

**MQAUTH\_SET\_ALL\_CONTEXT**

Set all context on a queue.

**MQAUTH\_SET\_IDENTITY\_CONTEXT**

Set the identity context on a queue.

**MQAUTH\_CONTROL**

For listeners and services, start and stop the specified channel, listener, or service.

For channels, start, stop, and ping the specified channel.

For topics, define, alter, or delete subscriptions.

**MQAUTH\_CONTROL\_EXTENDED**

Reset or resolve the specified channel.

**MQAUTH\_PUBLISH**

Publish to the specified topic.

**MQAUTH\_SUBSCRIBE**

Subscribe to the specified topic.

**MQAUTH\_RESUME**

Resume a subscription to the specified topic.

**MQAUTH\_SYSTEM**

Use queue manager for internal system operations.

**MQAUTH\_ALL**

Use all operations applicable to the object.

**MQAUTH\_ALL\_ADMIN**

Use all operations applicable to the object.

**MQAUTH\_ALL\_MQI**

Use all MQI calls applicable to the object.

Use the *Count* field in the MQCFIL structure to determine how many values are returned.

**EntityName (MQCFST)**

Entity name (parameter identifier: MQCACF\_ENTITY\_NAME).

This parameter can either be a principal name or a group name.

The maximum length of the string is MQ\_ENTITY\_NAME\_LENGTH.

**EntityType (MQCFIN)**

Entity type (parameter identifier: MQIACF\_ENTITY\_TYPE).

The value can be:

**MQZAET\_GROUP**

The value of the **EntityName** parameter refers to a group name.

**MQZAET\_PRINCIPAL**

The value of the **EntityName** parameter refers to a principal name.

**MQZAET\_UNKNOWN**

On Windows, an authority record still exists from a previous queue manager which did not originally contain entity type information.

**ObjectType (MQCFIN)**

Object type (parameter identifier: MQIACF\_OBJECT\_TYPE).

The value can be:

**MQOT\_AUTH\_INFO**

Authentication information.

**MQOT\_CHANNEL**

Channel object.

**MQOT\_CLNTCONN\_CHANNEL**

Client-connection channel object.

**MQOT\_COMM\_INFO**

Communication information object

**MQOT\_LISTENER**

Listener object.

**MQOT\_NAMELIST**

Namelist.

**MQOT\_PROCESS**

Process.

**MQOT\_Q**

Queue, or queues, that match the object name parameter.

**MQOT\_Q\_MGR**

Queue manager.

**MQOT\_REMOTE\_Q\_MGR\_NAME**

Remote queue manager.

**MQOT\_SERVICE**

Service object.

**MQOT\_TOPIC**

Topic object.

**Options (MQCFIN)**

Options used to indicate the level of information that is returned (parameter identifier: MQIACF\_AUTH\_OPTIONS).

**ProfileName (MQCFST)**

Profile name (parameter identifier: MQCACF\_AUTH\_PROFILE\_NAME).

The maximum length of the string is MQ\_AUTH\_PROFILE\_NAME\_LENGTH.

**QMgrName (MQCFST)**

Name of the queue manager on which the Inquire command is issued (parameter identifier: MQCA\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

## **Inquire Authority Service on Multiplatforms**

The Inquire Authority Service (MQCMD\_INQUIRE\_AUTH\_SERVICE) command retrieves information about the level of function supported by installed authority managers.

**Required parameters****AuthServiceAttrs (MQCFIL)**

Authority service attributes (parameter identifier: MQIACF\_AUTH\_SERVICE\_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

**MQIACF\_ALL**

All attributes.

or a combination of the following:

**MQIACF\_INTERFACE\_VERSION**

Current interface version of the authority service.

**MQIACF\_USER\_ID\_SUPPORT**

Whether the authority service supports user IDs.

## Optional parameters

### ServiceComponent (MQCFST)

Name of authorization service (parameter identifier: MQCACF\_SERVICE\_COMPONENT).

The name of the authorization service which is to handle the Inquire Authority Service command.

If this parameter is omitted, or specified as a blank or null string, the inquire function is called in each installed authorization service in reverse order to the order in which the services have been installed, until all authorization services have been called or until one returns a value of MQZCI\_STOP in the Continuation field.

The maximum length of the string is MQ\_SERVICE\_COMPONENT\_LENGTH.

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

**MQRC\_SELECTOR\_ERROR**

Attribute selector not valid.

**MQRC\_UNKNOWN\_COMPONENT\_NAME**

Unknown service component name.

## Inquire Authority Service (Response) on Multiplatforms

The response to the Inquire Authority Service (MQCMD\_INQUIRE\_AUTH\_SERVICE) command consists of the response header followed by the *ServiceComponent* structure and the requested combination of attribute parameter structures.

### Always returned:

*ServiceComponent*

### Returned if requested:

*InterfaceVersion, UserIDSupport*

## Response data

### InterfaceVersion (MQCFIN)

Interface version (parameter identifier: MQIACF\_INTERFACE\_VERSION).

This parameter is the current interface version of the OAM.

### ServiceComponent (MQCFSL)

Name of authorization service (parameter identifier: MQCACF\_SERVICE\_COMPONENT).

If you included a specific value for *ServiceComponent* on the Inquire Authority Service command, this field contains the name of the authorization service that handled the command. If you did not include a specific value for *ServiceComponent* on the Inquire Authority Service command, the list contains the names of all the installed authorization services.

If there is no OAM or if the OAM requested in the ServiceComponent does not exist this field is blank.

The maximum length of each element in the list is MQ\_SERVICE\_COMPONENT\_LENGTH.

### **UserIDSupport (MQCFIN)**

User ID support (parameter identifier: MQIACF\_USER\_ID\_SUPPORT).

The value can be:

#### **MQIDSUPP\_YES**

The authority service supports user IDs.

#### **MQIDSUPP\_NO**

The authority service does not support user IDs.

## **Inquire CF Structure on z/OS**

The Inquire CF Structure (MQCMD\_INQUIRE\_CF\_STRUC) command returns information about the attributes of one or more CF application structures.

**Note:** This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

### **Required parameters**

#### **CFStrucName (MQCFST)**

CF Structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

Specifies the name of the CF application structure about which information is to be returned.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all CF application structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ\_CF\_STRUC\_NAME\_LENGTH.

### **Optional parameters**

#### **CFStrucAttrs (MQCFIL)**

CF application structure attributes (parameter identifier: MQIACF\_CF\_STRUC\_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQCA\_ALTERATION\_DATE**

The date on which the definition was last altered.

#### **MQCA\_ALTERATION\_TIME**

The time at which the definition was last altered.

#### **MQIA\_CF\_CFCNLOS**

The action to be taken when the queue manager loses connectivity to the CF application structure.

#### **MQIA\_CF\_LEVEL**

Functional capability level for the CF application structure.

#### **MQIA\_CF\_OFFLOAD**

The shared message data set OFFLOAD property for the CF application structure.

**MQIA\_CF\_RECOVER**

Whether CF recovery for the application structure is supported.

**MQIA\_CF\_RECAUTO**

Whether automatic recovery action is taken when a structure is failed or when a queue manager loses connectivity to the structure and no systems in the SysPlex have connectivity to the Coupling Facility the structure is located in.

**MQIACF\_CF\_SMDS\_BLOCK\_SIZE**

The shared message data set DSGROUP property for the CF application structure.

**MQIA\_CF\_SMDS\_BUFFERS**

The shared message data set DSGROUP property for the CF application structure.

**MQIACF\_CF\_SMDS\_EXPAND**

The shared message data set DSEXPAND property for the CF application structure.

**MQCACF\_CF\_SMDS\_GENERIC\_NAME**

The shared message data set DSBUFFS property for the CF application structure.

**MQCA\_CF\_STRUC\_DESC**

Description of CF application structure.

**MQCA\_CF\_STRUC\_NAME**

Name of CF application structure.

**IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *CFStrucAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *CFStrucAttrs* except MQCA\_CF\_STRUC\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1903](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

## **Inquire CF Structure (Response) on z/OS**

The response to the Inquire CF Structure (MQCMD\_INQUIRE\_CF\_STRUC) command consists of the response header followed by the *CFStrucName* structure and the requested combination of attribute parameter structures.

If a generic CF application structure name was specified, one such message is generated for each CF application structure found.

**Always returned:**

*CFStrucName*

**Returned if requested:**

*AlterationDate, AlterationTime, CFConlos, CFLevel, CFStrucDesc, DSBLOCK, DSBUFFS, DSEXPAND, DSGROUP, OFFLD1SZ, OFFLD12SZ, OFFLD3SZ, OFFLD1TH, OFFLD2TH, OFFLD3TH, Offload, RCVDATE, RCVTIME, Recauto, Recovery*

**Response data****AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date on which the definition was last altered, in the form yyyy-mm-dd.

The maximum length of the string is MQ\_DATE\_LENGTH.

#### **AlterationTime (MQCFST)**

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time at which the definition was last altered, in the form hh.mm.ss.

The maximum length of the string is MQ\_TIME\_LENGTH.

#### **CFConlos (MQCFIN)**

The CFConlos property (parameter identifier: MQIA\_CF\_CFCONLOS).

Specifies the action to be taken when a queue manager loses connectivity to the CF structure. The value can be any of the following values:

##### **MQCFCONLOS\_TERMINATE**

The queue manager will terminate when connectivity to the structure is lost.

##### **MQCFCONLOS\_TOLERATE**

The queue manager will tolerate loss of connectivity to the structure without terminating.

##### **MQCFCONLOS\_ASQMGR**

The action taken is based on the setting of the CFCONLOS queue manager attribute

This parameter is only valid from CFLEVEL(5).

#### **CFLevel (MQCFIN)**

The functional capability level for this CF application structure (parameter identifier: MQIA\_CF\_LEVEL).

Specifies the functional capability level for the CF application structure. The value can be any of the following values:

**1**

A CF structure that can be "auto-created" by a queue manager at command level 520.

**2**

A CF structure at command level 520 that can only be created or deleted by a queue manager at command level 530 or greater. This level is the default *CFLevel* for queue managers at command level 530 or greater.

**3**

A CF structure at command level 530. This *CFLevel* is required if you want to use persistent messages on shared queues, or for message grouping, or both.

**4**

A CF structure at command level 600. This *CFLevel* can be used for persistent messages or for messages longer than 64 512 bytes.

**5**

A CF structure at command level 710. This *CFLevel* supports shared message data sets (SMDS) and Db2 for offloading messages.

Structures are required to be at CFLEVEL(5) to support toleration of loss of connectivity.

#### **CFStrucDesc (MQCFST)**

The description of the CF structure (parameter identifier: MQCA\_CF\_STRUC\_DESC).

The maximum length is MQ\_CF\_STRUC\_DESC\_LENGTH.

#### **CFStrucName (MQCFST)**

CF Structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length is MQ\_CF\_STRUC\_NAME\_LENGTH.

#### **DSBLOCK (MQCFIN)**

The CF DSBLOCK property (parameter identifier: MQIACF\_CF\_SMDS\_BLOCK\_SIZE).

The returned value is one of the following constants: MQDSB\_8K, MQDSB\_16K, MQDSB\_32K, MQDSB\_64K, MQDSB\_128K, MQDSB\_256K, MQDSB\_512K, MQDSB\_1024K, MQDSB\_1M.

**DSBUFS (MQCFIN)**

The CF DSBUFS property (parameter identifier: MQIA\_CF\_SMDS\_BUFFERS).

The returned value is in the range 0 - 9999.

The value is the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

**DSEXPAND (MQCFIN)**

The CF DSEXPAND property (parameter identifier: MQIACF\_CF\_SMDS\_EXPAND).

**MQDSE\_YES**

The data set can be expanded.

**MQDSE\_NO**

The data set cannot be expanded.

**MQDSE\_DEFAULT**

Only returned on Inquire CF Struct when not explicitly set

**DSGROUP (MQCFST)**

The CF DSGROUP property (parameter identifier: MQCACF\_CF\_SMDS\_GENERIC\_NAME).

The returned value is a string containing a generic data set name used for the group of shared message data sets associated with this CF structure.

**OFFLD1SZ (MQCFST)**

The CF OFFLD1SZ property (parameter identifier: MQCACF\_CF\_OFFLOAD\_SIZE1).

The returned value is a string in the range 0K - 64K.

Returned if the MQIACF\_ALL or MQIA\_CF\_OFFLOAD parameters are specified.

The maximum length is 3.

**OFFLD2SZ (MQCFST)**

The CF OFFLD2SZ property (parameter identifier: MQCACF\_CF\_OFFLOAD\_SIZE2).

The returned value is a string in the range 0K - 64K.

Returned if the MQIACF\_ALL or MQIA\_CF\_OFFLOAD parameters are specified.

The maximum length is 3.

**OFFLD3SZ (MQCFST)**

The CF OFFLD3SZ property (parameter identifier: MQCACF\_CF\_OFFLOAD\_SIZE3).

The returned value is a string in the range 0K - 64K.

Returned if the MQIACF\_ALL or MQIA\_CF\_OFFLOAD parameters are specified.

The maximum length is 3.

**OFFLD1TH (MQCFIN)**

The CF OFFLD1TH property (parameter identifier: MQIA\_CF\_OFFLOAD\_THRESHOLD1).

The returned value is in the range 0 - 100.

Returned if the MQIACF\_ALL or MQIA\_CF\_OFFLOAD parameters are specified.

**OFFLD2TH (MQCFIN)**

The CF OFFLD2TH property (parameter identifier: MQIA\_CF\_OFFLOAD\_THRESHOLD2).

The returned value is in the range 0 - 100.

Returned if the MQIACF\_ALL or MQIA\_CF\_OFFLOAD parameters are specified.

**OFFLD3TH (MQCFIN)**

The CF OFFLD3TH property (parameter identifier: MQIA\_CF\_OFFLOAD\_THRESHOLD3).

The returned value is in the range 0 - 100.

Returned if the MQIACF\_ALL or MQIA\_CF\_OFFLOAD parameters are specified.

#### **Offload (MQCFIN)**

The CF OFFLOAD property (parameter identifier: MQIA\_CF\_OFFLOAD).

The returned values can be:

##### **MQCFOFFLD\_DB2**

Large shared messages can be stored in Db2.

##### **MQCFOFFLD\_SMDS**

Large shared messages can be stored in z/OS shared message data sets.

##### **MQCFOFFLD\_NONE**

Used when the property *Offload* has not been explicitly set.

#### **RCVDATE (MQCFST)**

The recovery start date (parameter identifier: MQCACF\_RECOVERY\_DATE).

If recovery is currently enabled for the data set, this indicates the date when it was activated, in the form yyyy-mm-dd. If recovery is not enabled, this is displayed as RCVDATE().

#### **RCVTIME (MQCFST)**

The recovery start time (parameter identifier: MQCACF\_RECOVERY\_TIME).

If recovery is currently enabled for the data set, this indicates the time when it was activated, in the form hh.mm.ss. If recovery is not enabled, this is displayed as RCVTIME().

#### **Recauto (MQCFIN)**

Recauto (parameter identifier: MQIA\_CF\_RECAUTO).

Indicates whether automatic recovery action is taken when a queue manager detects that the structure is failed, or when a queue manager loses connectivity to the structure and no systems in the SysPlex have connectivity to the Coupling Facility that the structure is allocated in. The value can be:

##### **MQRECAUTO\_YES**

The structure and associated shared message data sets which also need recovery will be automatically recovered.

##### **MQRECAUTO\_NO**

The structure will not be automatically recovered.

#### **Recovery (MQCFIN)**

Recovery (parameter identifier: MQIA\_CF\_RECOVER).

Specifies whether CF recovery is supported for the application structure. The value can be:

##### **MQCFR\_YES**

Recovery is supported.

##### **MQCFR\_NO**

Recovery is not supported.

## **Inquire CF Structure Names on z/OS**

The Inquire CF Structure Names (MQCMD\_INQUIRE\_CF\_STRUC\_NAMES) command inquires for a list of CF application structure names that match the generic CF structure name specified.

**Note:** This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

### **Required parameters**

#### **CFStrucName (MQCFST)**

CF Structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

Specifies the name of the CF application structure about which information is to be returned.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all CF application structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ\_CF\_STRUC\_NAME\_LENGTH.

## **Inquire CF Structure Names (Response) on z/OS**

The response to the Inquire CF Structure Names (MQCMD\_INQUIRE\_CF\_STRUC\_NAMES) command consists of the response header followed by a single parameter structure giving zero or more names that match the specified CF application structure name.

### **Always returned:**

*CFStrucNames*

### **Returned if requested:**

None

## **Response data**

### **CFStrucNames (MQCFSL)**

List of CF application structure names (parameter identifier: MQCACF\_CF\_STRUC\_NAMES).

## **Inquire CF Structure Status on z/OS**

The Inquire CF Structure Status (MQCMD\_INQUIRE\_CF\_STRUC\_STATUS) command inquires about the status of a CF application structure.

**Note:** This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

## **Required parameters**

### **CFStrucName (MQCFST)**

CF Structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

Specifies the name of the CF application structure for which status information is to be returned.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all CF application structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ\_CF\_STRUC\_NAME\_LENGTH.

## **Optional parameters**

### **CFStatusType (MQCFIN)**

Status information type (parameter identifier: MQIACF\_CF\_STATUS\_TYPE).

Specifies the type of status information you want to be returned. You can specify one of the following:

#### **MQIACF\_CF\_STATUS\_SUMMARY**

Summary status information for the CF application structure. MQIACF\_CF\_STATUS\_SUMMARY is the default.

#### **MQIACF\_CF\_STATUS\_CONNECT**

Connection status information for each CF application structure for each active queue manager.

#### **MQIACF\_CF\_STATUS\_BACKUP**

Backup status information for each CF application structure.

#### **MQIACF\_CF\_STATUS\_SMDS**

Shared message data set information for each CF application structure.

### **IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter in the response data except MQIACF\_CF\_STATUS\_TYPE. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

### **StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter in the response data except MQCA\_CF\_STRUC\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1903](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

## **Inquire CF Structure Status (Response) on z/OS**

The response to the Inquire CF Structure Status (MQCMD\_INQUIRE\_CF\_STRUC\_STATUS) command consists of the response header followed by the *CFStrucName* and *CFStatusType* structures and a set of attribute parameter structures determined by the value of *CFStatusType* in the Inquire command.

### **Always returned:**

*CFStrucName*, *CFStatusType*.

*CFStatusType* specifies the type of status information being returned. The value can be any of the following values:

#### **MQIACF\_CF\_STATUS\_SUMMARY**

Summary status information for the CF application structure. This is the default.

#### **MQIACF\_CF\_STATUS\_CONNECT**

Connection status information for each CF application structure for each active queue manager.

#### **MQIACF\_CF\_STATUS\_BACKUP**

Backup status information for each CF application structure.

#### **MQIACF\_CF\_STATUS\_SMDS**

Shared message data set information for each CF application structure.

### **Returned if *CFStatusType* is MQIACF\_CF\_STATUS\_SUMMARY:**

*CFStrucStatus*, *CFStrucType*, *EntriesMax*, *EntriesUsed*, *FailDate*, *FailTime*, *OffLdUse*, *SizeMax*, *SizeUsed*

### **Returned if *CFStatusType* is MQIACF\_CF\_STATUS\_CONNECT:**

*CFStrucStatus*, *FailDate*, *FailTime*, *QMgrName*, *SysName*

### **Returned if *CFStatusType* is MQIACF\_CF\_STATUS\_BACKUP:**

*BackupDate*, *BackupEndRBA*, *BackupSize*, *BackupStartRBA*, *BackupTime*, *CFStrucStatus*, *FailDate*, *FailTime*, *LogQMgrNames*, *QmgrName*

### **Returned if *CFStatusType* is MQIACF\_CF\_STATUS\_SMDS:**

*Access*, *FailDate*, *FailTime*, *RcvDate*, *RcvTime*, *CFStrucStatus*

## **Response data**

### **Access (MQCFIN)**

Availability of the shared message data set (parameter identifier: MQIACF\_CF\_STRUC\_ACCESS).

#### **MQCFACCESS\_ENABLED**

The shared message data set is either available for use, or is to be enabled after previously being disabled, or access to the shared message data set is to be retried following an error.

#### **MQCFACCESS\_SUSPENDED**

The shared message data set is unavailable because of an error.

**MQCFACCESS\_DISABLED**

The shared message data set is either disabled, or is to be set as disabled.

**BackupDate (MQCFST)**

The date, in the form yyyy-mm-dd, on which the last successful backup was taken for this CF application structure (parameter identifier: MQCACF\_BACKUP\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

**BackupEndRBA (MQCFST)**

The backup data set end RBA for the end of the last successful backup taken for this CF application structure (parameter identifier: MQCACF\_CF\_STRUC\_BACKUP\_END).

The maximum length of the string is MQ\_RBA\_LENGTH.

**BackupSize (MQCFIN)**

The size, in megabytes, of the last successful backup taken for this CF application structure (parameter identifier: MQIACF\_CF\_STRUC\_BACKUP\_SIZE).

**BackupStartRBA (MQCFST)**

The backup data set start RBA for the start of the last successful backup taken for this CF application structure (parameter identifier: MQCACF\_CF\_STRUC\_BACKUP\_START).

The maximum length of the string is MQ\_RBA\_LENGTH.

**BackupTime (MQCFST)**

The end time, in the form hh.mm.ss, of the last successful backup taken for this CF application structure (parameter identifier: MQCACF\_BACKUP\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

**CFStatusType (MQCFIN)**

Status information type (parameter identifier: MQIACF\_CF\_STATUS\_TYPE).

Specifies the type of status information being returned. The value can be any of the following values:

**MQIACF\_CF\_STATUS\_SUMMARY**

Summary status information for the CF application structure. MQIACF\_CF\_STATUS\_SUMMARY is the default.

**MQIACF\_CF\_STATUS\_CONNECT**

Connection status information for each CF application structure for each active queue manager.

**MQIACF\_CF\_STATUS\_BACKUP**

Back up status information for each CF application structure.

**MQIACF\_CF\_STATUS\_SMDS**

Shared message data set information for each CF application structure.

**CFStrucName (MQCFST)**

CF Structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length is MQ\_CF\_STRUC\_NAME\_LENGTH.

**CFStrucStatus (MQCFIN)**

CF Structure status (parameter identifier: MQIACF\_CF\_STRUC\_STATUS).

The status of the CF application structure.

If *CFStatusType* is MQIACF\_CF\_STATUS\_SUMMARY, the value can be:

**MQCFSTATUS\_ACTIVE**

The structure is active.

**MQCFSTATUS\_FAILED**

The structure has failed.

**MQCFSTATUS\_NOT\_FOUND**

The structure is not allocated in the CF, but has been defined to Db2.

**MQCFSTATUS\_IN\_BACKUP**

The structure is in the process of being backed up.

**MQCFSTATUS\_IN\_RECOVER**

The structure is in the process of being recovered.

**MQCFSTATUS\_UNKNOWN**

The status of the CF structure is unknown because, for example, Db2 might be unavailable.

If *CFStatusType* is MQIACF\_CF\_STATUS\_CONNECT, the value can be:

**MQCFSTATUS\_ACTIVE**

The structure is connected to this queue manager.

**MQCFSTATUS\_FAILED**

The queue manager connection to this structure has failed.

**MQCFSTATUS\_NONE**

The structure has never been connected to this queue manager.

If *CFStatusType* is MQIACF\_CF\_STATUS\_BACKUP, the value can be:

**MQCFSTATUS\_ACTIVE**

The structure is active.

**MQCFSTATUS\_FAILED**

The structure has failed.

**MQCFSTATUS\_NONE**

The structure has never been backed up.

**MQCFSTATUS\_IN\_BACKUP**

The structure is in the process of being backed up.

**MQCFSTATUS\_IN\_RECOVER**

The structure is in the process of being recovered.

If *CFStatusType* is MQIACF\_CF\_STATUS\_SMDS, the value can be:

**MQCFSTATUS\_ACTIVE**

The shared message data set is available for normal use

**MQCFSTATUS\_FAILED**

The shared message data set is in an unusable state and probably requires recovery.

**MQCFSTATUS\_IN\_RECOVER**

The shared message data set is in the process of being recovered (by way of a RECOVER CFSTRUCT command).

**MQCFSTATUS\_NOT\_FOUND**

The data set has never been used, or the attempt to open it for the first time failed.

**MQCFSTATUS\_RECOVERED**

The data set has been recovered or otherwise repaired, and is ready for use again, but requires some restart processing the next time it is opened. This restart processing ensures that obsolete references to any deleted messages have been removed from the coupling facility structure before the data set is made available again. The restart processing also rebuilds the data set space map.

**MQCFSTATUS\_EMPTY**

The data set contains no messages. The data set is put into this state if it is closed normally by the owning queue manager at a time when it does not contain any messages. It can also be put into EMPTY state when the previous data set contents are to be discarded because the application structure has been emptied (using **RECOVER CFSTRUCT** with TYPE PURGE or, for a nonrecoverable structure only, by deleting the previous instance of the structure). The next time the data set is opened by its owning queue manager, the space map is reset to empty, and the status is changed to ACTIVE. As the previous data set contents are no longer required, a data set in this state can be replaced with a newly allocated data set, for example to change the space allocation or move it to another volume.

**MQCFSTATUS\_NEW**

The data set is being opened and initialized for the first time, ready to be made active.

**CFStrucType (MQCFIN)**

CF Structure type (parameter identifier: MQIACF\_CF\_STRUC\_TYPE).

The value can be:

**MQCFTYPE\_ADMIN**

MQCFTYPE\_ADMIN is the CF administration structure.

**MQCFTYPE\_APPL**

MQCFTYPE\_APPL is a CF application structure.

**EntriesMax (MQCFIN)**

Number of CF list entries defined for this CF application structure (parameter identifier: MQIACF\_CF\_STRUC\_ENTRIES\_MAX).

**EntriesUsed (MQCFIN)**

Number of CF list entries defined for this CF application structure that are in use (parameter identifier: MQIACF\_CF\_STRUC\_ENTRIES\_USED).

**FailDate (MQCFST)**

The date, in the form yyyy-mm-dd, on which this CF application structure failed (parameter identifier: MQCACF\_FAIL\_DATE).

If *CFStatusType* is MQIACF\_CF\_STATUS\_CONNECT, it is the date on which the queue manager lost connectivity to this application structure. For the other values of *CFStatusType*, it is the date on which this CF application structure failed. This parameter is only applicable when *CFStrucStatus* is MQCFSTATUS\_FAILED or MQCFSTATUS\_IN\_RECOVER.

The maximum length of the string is MQ\_DATE\_LENGTH.

**FailTime (MQCFST)**

The time, in the form hh.mm.ss, that this CF application structure failed (parameter identifier: MQCACF\_FAIL\_TIME).

If *CFStatusType* is MQIACF\_CF\_STATUS\_CONNECT, it is the time that the queue manager lost connectivity to this application structure. For the other values of *CFStatusType*, it is the time that this CF application structure failed. This parameter is only applicable when *CFStrucStatus* is MQCFSTATUS\_FAILED or MQCFSTATUS\_IN\_RECOVER.

The maximum length of the string is MQ\_TIME\_LENGTH.

**LogQMgrNames (MQCFSL)**

A list of queue managers, the logs of which are required to perform a recovery (parameter identifier: MQCACF\_CF\_STRUC\_LOG\_Q\_MGRS).

The maximum length of each name is MQ\_Q\_MGR\_NAME\_LENGTH.

**OffLdUse (MQCFIN)**

Offload usage (parameter identifier: MQIA\_CF\_OFFLDUSE).

Indicates whether any offloaded large message data might currently exist in shared message data sets, Db2, or both. The value can be any of the following values:

**MQCFOFFLD\_DB2**

Large shared messages are stored in Db2.

**MQCFOFFLD\_SMLS**

Large shared messages are stored in z/OS shared message data sets.

**MQCFOFFLD\_NONE**

Use on DISPLAY CFSTRUCT when the property has not been explicitly set.

**MQCFOFFLD\_BOTH**

There might be large shared messages stored in both Db2, and shared message data sets.

Value cannot be set unless CFLEVEL(5) is defined.

**QMgrName (MQCFST)**

Queue manager name (parameter identifier: MQCA\_Q\_MGR\_NAME).

This parameter is the name of the queue manager. If *CFStatusType* is MQIACF\_CF\_STATUS\_BACKUP, it is the name of the queue manager that took the last successful backup.

The maximum length is MQ\_Q\_MGR\_NAME\_LENGTH.

**RcvDate (MQCFST)**

The recovery start date (parameter identifier: MQCACF\_RECOVERY\_DATE).

If recovery is currently enabled for the data set, this indicates the date when it was activated, in the form yyyy-mm-dd.

**RcvTime (MQCFST)**

The recovery start time (parameter identifier: MQCACF\_RECOVERY\_TIME).

If recovery is currently enabled for the data set, this indicates the time when it was activated, in the form hh.mm.ss.

**SizeMax (MQCFIN)**

Size of the CF application structure (parameter identifier: MQIACF\_CF\_STRUC\_SIZE\_MAX).

This parameter is the size, in kilobytes, of the CF application structure.

**SizeUsed (MQCFIN)**

Percentage of the CF application structure that is in use (parameter identifier: MQIACF\_CF\_STRUC\_SIZE\_USED).

This parameter is the percentage of the size of the CF application structure that is in use.

**SysName (MQCFST)**

Queue manager name (parameter identifier: MQCACF\_SYSTEM\_NAME).

This parameter is the name of the z/OS image of the queue manager that last connected to the CF application structure.

The maximum length is MQ\_SYSTEM\_NAME\_LENGTH.

**SizeMax (MQCFIN)**

Size of the CF application structure (parameter identifier: MQIACF\_CF\_STRUC\_SIZE\_MAX).

This parameter is the size, in kilobytes, of the CF application structure.

**Inquire Channel**

The Inquire Channel (MQCMD\_INQUIRE\_CHANNEL) command inquires about the attributes of IBM MQ channel definitions.

**Required parameters****ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all channels having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

## Optional parameters

### ChannelAttrs (MQCFIL)

Channel attributes (parameter identifier: MQIACF\_CHANNEL\_ATTRS).

The attribute list can specify the following value on its own. This is also the default value used if the parameter is not specified:

#### MQIACF\_ALL

All attributes.

Alternatively, the attribute list can specify a combination of the parameters in the following table:

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	AMQP
<b>MQCA_ALTERATION_DATE</b> Date on which the definition was last altered	✓	✓	✓	✓	✓	✓	✓	✓	✓
<b>MQCA_ALTERATION_TIME</b> Time at which the definition was last altered	✓	✓	✓	✓	✓	✓	✓	✓	✓
<b>MQCA_CERT_LABEL</b> Certificate label	✓	✓	✓	✓	✓	✓	✓	✓	✓
<b>MQCA_CLUSTER_NAME</b> Name of local queue manager							✓	✓	
<b>MQCA_CLUSTER_NAMELIST</b> Name of local queue manager							✓	✓	
<b>MQCA_Q_MGR_NAME</b> Name of local queue manager					✓				
<b>MQCACH_CHANNEL_NAME</b> Channel name. You cannot use this attribute as a filter keyword.	✓	✓	✓	✓	✓	✓	✓	✓	✓
<b>MQCACH_CONNECTION_NAME</b> Connection name	✓	✓		✓	✓		✓	✓	

Table 317. Optional parameters for ChannelAttrs (continued)

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	AMQP
<b>MQCACH_DESC</b> Description	✓	✓	✓	✓	✓	✓	✓	✓	✓
<b>MQCACH_LOCAL_ADDRESS</b> Local communications address for the channel	✓	✓		✓	✓		✓	✓	✓
<b>MQCACH_MCA_NAME</b> Message channel agent name	✓	✓		✓			✓		
<b>MQCACH_MCA_USER_ID</b> MCA user identifier	✓	✓	✓	✓		✓	✓	✓	✓
<b>MQCACH_MODE_NAME</b> Mode name	✓	✓		✓	✓		✓	✓	
<b>MQCACH_MR_EXIT_NAME</b> Message-retry exit name			✓	✓				✓	
<b>MQCACH_MR_EXIT_USER_DATA</b> Message-retry exit name			✓	✓				✓	
<b>MQCACH_MSG_EXIT_NAME</b> Message exit name	✓	✓	✓	✓			✓	✓	
<b>MQCACH_MSG_EXIT_USER_DATA</b> Message exit user data	✓	✓	✓	✓			✓	✓	
<b>MQCACH_PASSWORD</b> Password	✓	✓		✓	✓		✓		
<b>MQCACH_RCV_EXIT_NAME</b> Receive exit name	✓	✓	✓	✓	✓	✓	✓	✓	
<b>MQCACH_RCV_EXIT_USER_DATA</b> Receive exit user data	✓	✓	✓	✓	✓	✓	✓	✓	

Table 317. Optional parameters for ChannelAttrs (continued)

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	AMQP
<b>MQCACH_SEC_EXIT_NAME</b> Security exit name	✓	✓	✓	✓	✓	✓	✓	✓	
<b>MQCACH_SEC_EXIT_USER_DATA</b> Security exit user data	✓	✓	✓	✓	✓	✓	✓	✓	
<b>MQCACH_SEND_EXIT_NAME</b> Send exit name	✓	✓	✓	✓	✓	✓	✓	✓	
<b>MQCACH_SEND_EXIT_USER_DATA</b> Send exit user data	✓	✓	✓	✓	✓	✓	✓	✓	
<b>MQCACH_SSL_CIPHER_SPEC</b> TLS cipher spec	✓	✓	✓	✓	✓	✓	✓	✓	✓
<b>MQCACH_SSL_PEER_NAME</b> TLS peer name	✓	✓	✓	✓	✓	✓	✓	✓	✓
<b>MQCACH_TP_NAME</b> Transaction program name	✓	✓		✓	✓	✓	✓	✓	
<b>MQCACH_TP_ROOT</b> Topic root for AMQP channel									✓
<b>MQCACH_USER_ID</b> User identifier	✓	✓		✓	✓		✓		
<b>MQCACH_XMIT_Q_NAME</b> Transmission queue name	✓	✓							
<b>MQIA_MONITORING_CHANNEL</b> Online monitoring data collection	✓	✓	✓	✓		✓	✓	✓	

Table 317. Optional parameters for ChannelAttrs (continued)

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	AMQP
<b>MQIA_PROPERTY_CONTROL</b> Property control attribute	✓	✓					✓	✓	
<b>MQIA_STATISTICS_CHANNEL</b> Online statistics collection	✓	✓	✓	✓			✓	✓	
<b>MQIA_USE_DEAD_LETTER_Q</b> Determines whether the dead-letter queue is used when messages cannot be delivered by channels.	✓	✓	✓	✓			✓	✓	
<b>MQIACH_AMQP_KEEP_ALIVE</b> AMQP channel keep alive interval									✓
<b>MQIACH_BATCH_HB</b> Value to use for batch heartbeating	✓	✓					✓	✓	
<b>MQIACH_BATCH_INTERVAL</b> Batch wait interval (seconds)	✓	✓					✓	✓	
<b>MQIACH_BATCH_DATA_LIMIT</b> Batch data limit (kilobytes)	✓	✓					✓	✓	
<b>MQIACH_BATCH_SIZE</b> Batch size	✓	✓	✓	✓			✓	✓	
<b>MQIACH_CHANNEL_TYPE</b> Channel type	✓	✓	✓	✓	✓	✓	✓	✓	✓
<b>MQIACH_CLIENT_CHANNEL_WEIGHT</b> Client Channel Weight					✓				

Table 317. Optional parameters for ChannelAttrs (continued)

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	AMQP
<b>MQIACH_CLWL_CHANNEL_PRIORITY</b> Cluster workload channel priority							✓	✓	
<b>MQIACH_CLWL_CHANNEL_RANK</b> Cluster workload channel rank							✓	✓	
<b>MQIACH_CLWL_CHANNEL_WEIGHT</b> Cluster workload channel weight							✓	✓	
<b>MQIACH_CONNECTION_AFFINITY</b> Connection Affinity					✓				
<b>MQIACH_DATA_CONVERSION</b> Whether sender must convert application data	✓	✓					✓	✓	
<b>MQIACH_DEF_RECONNECT</b> Default reconnection option					✓				
<b>MQIACH_DISC_INTERVAL</b> Disconnection interval	✓	✓				✓	✓	✓	
<b>MQIACH_HB_INTERVAL</b> Heartbeat interval (seconds)	✓	✓	✓	✓	✓	✓	✓	✓	
<b>MQIACH_HDR_COMPRESSION</b> List of header data compression techniques supported by the channel	✓	✓	✓	✓	✓	✓	✓	✓	
<b>MQIACH_KEEP_ALIVE_INTERVAL</b> KeepAlive interval	✓	✓	✓	✓	✓	✓	✓	✓	

Table 317. Optional parameters for ChannelAttrs (continued)

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	AMQP
<b>MQIACH_LONG_RETRY</b> Long retry count	✓	✓					✓	✓	
<b>MQIACH_LONG_TIMER</b> Long timer	✓	✓					✓	✓	
<b>MQIACH_MAX_INSTANCES</b> Maximum number of simultaneous instances of a server-connection channel that can be started.						✓			✓
<b>MQIACH_MAX_INSTS_PER_CLIENT</b> Maximum number of simultaneous instances of a server-connection channel that can be started from a single client.						✓			
<b>MQIACH_MAX_MSG_LENGTH</b> Maximum message length	✓	✓	✓	✓	✓	✓	✓	✓	✓
<b>MQIACH_MCA_TYPE</b> MCA type	✓	✓		✓			✓	✓	
<b>MQIACH_MR_COUNT</b> Message retry count			✓	✓				✓	
<b>MQIACH_MSG_COMPRESSION</b> List of message data compression techniques supported by the channel	✓	✓	✓	✓	✓	✓	✓	✓	
<b>MQIACH_MR_INTERVAL</b> Message retry interval (milliseconds)			✓	✓				✓	
<b>MQIACH_NPM_SPEED</b> Speed of nonpersistent messages	✓	✓	✓	✓			✓	✓	

Table 317. Optional parameters for ChannelAttrs (continued)

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	AMQP
<b>MQIACH_PORT</b> AMQP port number									✓
<b>MQIACH_PUT_AUTHORITY</b> Put authority			✓	✓		✓		✓	
<b>MQIACH_RESET_REQUESTED</b> Sequence number of outstanding request when a RESET CHANNEL command is used	✓	✓	✓	✓			✓	✓	
<b>MQIACH_SEQUENCE_NUMBER_WRAP</b> Sequence number wrap	✓	✓	✓	✓			✓	✓	
<b>MQIACH_SHARING_CONVERSATIONS</b> Value of Sharing Conversations						✓			
<b>MQIACH_SHORT_RETRY</b> Short retry count	✓	✓					✓	✓	
<b>MQIACH_SHORT_TIMER</b> Short timer	✓	✓					✓	✓	
 <b>MQIACH_SPL_PROTECTION</b> Security policy protection	✓	✓	✓	✓					
<b>MQIACH_SSL_CLIENT_AUTH</b> TLS client authentication	✓	✓	✓	✓		✓		✓	✓

Table 317. Optional parameters for ChannelAttrs (continued)

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	AMQP
<b>MQIACH_USE_CLIENT_ID</b> Specify that the client ID is used for authorization checks for an AMQP channel									✓
<b>MQIACH_XMIT_PROTOCOL_TYPE</b> Transport (transmission protocol) type	✓	✓	✓	✓	✓	✓	✓	✓	

**Note:**

1. Only one of the following parameters can be specified:

- MQCACH\_JAAS\_CONFIG
- MQCACH\_MCA\_USER\_ID
- MQIACH\_USE\_CLIENT\_ID

If none of these parameters is specified, no authentication is performed. If MQCACH\_JAAS\_CONFIG is specified, the client flows a user name and password, in all other cases the flowed user name is ignored.

**ChannelType (MQCFIN)**

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

If this parameter is present, eligible channels are limited to the specified type. Any attribute selector specified in the *ChannelAttrs* list which is only valid for channels of a different type or types is ignored; no error is raised.

If this parameter is not present (or if MQCHT\_ALL is specified), channels of all types other than MQCHT\_MQTT are eligible. Each attribute specified must be a valid channel attribute selector (that is, it must be one from the following list), but it might not be applicable to all (or any) of the channels returned. Channel attribute selectors that are valid but not applicable to the channel are ignored, no error messages occur, and no attribute is returned.

The value can be:

**MQCHT\_SENDER**

Sender.

**MQCHT\_SERVER**

Server.

**MQCHT\_RECEIVER**

Receiver.

**MQCHT\_REQUESTER**

Requester.

**MQCHT\_SVRCONN**

Server-connection (for use by clients).

**MQCHT\_CLNTCONN**

Client connection.

**MQCHT\_CLUSRCVR**

Cluster-receiver.

**MQCHT\_CLUSSDR**

Cluster-sender.

**MQCHT\_AMQP**

AMQP channel.

**MQCHT\_MQTT**

Telemetry channel.

**MQCHT\_ALL**

All types other than MQCHT\_MQTT.

The default value if this parameter is not specified is MQCHT\_ALL.

**Note:** If this parameter is present, it must occur immediately after the **ChannelName** parameter on platforms other than z/OS otherwise resulting in a MQRCCF\_MSG\_LENGTH\_ERROR error message.

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

**IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ChannelAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you specify an integer filter for channel type, you cannot also specify the **ChannelType** parameter.

If you specify an integer filter, you cannot also specify a string filter using the

**StringFilterCommand** parameter.

**QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

**MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

### **MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

### **MQQSGD\_PRIVATE**

The object is defined as either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

### **StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ChannelAttrs* except MQCACH\_CHANNEL\_NAME and MQCACH\_MCA\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1903](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the

**IntegerFilterCommand** parameter.

## **Error codes**

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### **Reason (MQLONG)**

The value can be any of the following values:

#### **MQRCCF\_CHANNEL\_NAME\_ERROR**

Channel name error.

#### **MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

#### **MQRCCF\_CHANNEL\_TYPE\_ERROR**

Channel type not valid.

Windows

Linux

AIX

## **Inquire Channel (MQTT)**

The Inquire Channel (MQCMD\_INQUIRE\_CHANNEL) command inquires about the attributes of IBM MQ channel definitions.

## **Required parameters**

### **ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all channels having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

### **ChannelType (MQCFIN)**

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

If this parameter is present, eligible channels are limited to the specified type. Any attribute selector specified in the *ChannelAttrs* list which is only valid for channels of a different type or types is ignored; no error is raised.

If this parameter is not present (or if MQCHT\_ALL is specified), channels of all types are eligible. Each attribute specified must be a valid channel attribute selector (that is, it must be one from the following list), but it might not be applicable to all (or any) of the channels returned. Channel attribute selectors that are valid but not applicable to the channel are ignored, no error messages occur, and no attribute is returned.

The value must be:

#### **MQCHT\_MQTT**

Telemetry channel.

### **Optional parameters**

#### **ChannelAttrs (MQCFIL)**

Channel attributes (parameter identifier: MQIACF\_CHANNEL\_ATTRS).

The attribute list can specify the following value on its own - default value used if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following parameters:

#### **MQCA\_SSL\_KEY\_REPOSITORY**

TLS Key Repository

#### **MQCACH\_CHANNEL\_NAME**

Channel name. You cannot use this attribute as a filter keyword.

#### **MQCACH\_JAAS\_CONFIG**

The file path of the JAAS configuration

#### **MQCACH\_LOCAL\_ADDRESS**

Local communications address for the channel

#### **MQCACH\_MCA\_USER\_ID**

MCA user identifier.

#### **MQCACH\_SSL\_CIPHER\_SPEC**

TLS cipher spec.

#### **MQCACH\_SSL\_KEY\_PASSPHRASE**

TLS key passphrase.

#### **MQIACH\_BACKLOG**

The number of concurrent connection requests that the channel supports.

#### **MQIACH\_CHANNEL\_TYPE**

Channel type

#### **MQIACH\_PORT**

Port number to use when *TransportType* is set to TCP.

#### **MQIACH\_PROTOCOL**

The communication protocol supported by the channel.

## **MQIACH\_SSL\_CLIENT\_AUTH**

TLS client authentication.

## **MQIACH\_USE\_CLIENT\_ID**

Specify whether to use the *clientID* of a new connection as the *userID* for that connection

## **MQIACH\_XMIT\_PROTOCOL\_TYPE**

Transport (transmission protocol) type

### **Note:**

1. Only one of the following parameters can be specified:

- MQCACH\_JAAS\_CONFIG
- MQCACH\_MCA\_USER\_ID
- MQIACH\_USE\_CLIENT\_ID

If none of these parameters are specified, no authentication is performed. If MQCACH\_JAAS\_CONFIG is specified, the client flows a user name and password, in all other cases the flowed user name is ignored.

## **Error codes**

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### **Reason (MQLONG)**

The value can be any of the following values:

#### **MQRCCF\_CHANNEL\_NAME\_ERROR**

Channel name error.

#### **MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

#### **MQRCCF\_CHANNEL\_TYPE\_ERROR**

Channel type not valid.

## **Inquire Channel (Response)**

The response to the Inquire Channel (MQCMD\_INQUIRE\_CHANNEL) command consists of the response header followed by the *ChannelName* and *ChannelType* structures (and on z/OS only, the *DefaultChannelDisposition*, and *QSGDisposition* structure), and the requested combination of attribute parameter structures (where applicable).

If a generic channel name was specified, one such message is generated for each channel found.

### **Always returned:**

*ChannelName* , *ChannelType* ,  *DefaultChannelDisposition* ,  *QSGDisposition*

### **Returned if requested:**

*AlterationDate*, *AlterationTime*, *BatchDataLimit*, *BatchHeartbeat*, *BatchInterval*, *BatchSize*, *CertificateLabel*, *ChannelDesc*, *ChannelMonitoring*, *ChannelStatistics*, *ClientChannelWeight*, *ClientIdentifier*, *ClusterName*, *ClusterNameList*, *CLWLChannelPriority*, *CLWLChannelRank*, *CLWLChannelWeight*, *ConnectionAffinity*, *ConnectionName*, *DataConversion*, *DefReconnect*, *DiscInterval*, *HeaderCompression*, *HeartbeatInterval*, *InDoubtInbound*, *InDoubtOutbound*, *KeepAliveInterval*, *LastMsgTime*, *LocalAddress*, *LongRetryCount*, *LongRetryInterval*, *MaxMsgLength*, *MCAName*, *MCAType*, *MCAUserIdentifier*, *MessageCompression*, *ModeName*, *MsgExit*, *MsgRetryCount*, *MsgRetryExit*, *MsgRetryInterval*, *MsgRetryUserData*, *MsgsReceived*, *MsgsSent*, *MsgUserData*, *NetworkPriority*, *NonPersistentMsgSpeed*, *Password*, *PendingOutbound*, *PropertyControl*, *PutAuthority*, *QMGrName*, *ReceiveExit*, *ReceiveUserData*, *ResetSeq*, *SecurityExit*, *SecurityUserData*, *SendExit*, *SendUserData*, *SeqNumberWrap*, *SharingConversations*, *ShortRetryCount*,

*ShortRetryInterval*,   *SPLProtection, SSLCipherSpec, SSLCipherSuite, SSLClientAuth, SSLPeerName, TpName, TransportType, UseDLQ, UserIdentifier, XmitQName*

## Response data

### AlterationDate (MQCFST)

Alteration date, in the form yyyy-mm-dd (parameter identifier: MQCA\_ALTERATION\_DATE).

The date when the information was last altered.

### AlterationTime (MQCFST)

Alteration time, in the form hh.mm.ss (parameter identifier: MQCA\_ALTERATION\_TIME).

The time when the information was last altered.

### BatchDataLimit (MQCFIN)

Batch data limit (parameter identifier: MQIACH\_BATCH\_DATA\_LIMIT).

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

This parameter only applies to channels with a *ChannelType* of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_CLUSRCVR, or MQCHT\_CLUSSDR.

### BatchHeartbeat (MQCFIN)

The value being used for the batch heartbeating (parameter identifier: MQIACH\_BATCH\_HB).

The value can be 0 - 999999. A value of 0 indicates that heartbeating is not in use.

### BatchInterval (MQCFIN)

Batch interval (parameter identifier: MQIACH\_BATCH\_INTERVAL).

### BatchSize (MQCFIN)

Batch size (parameter identifier: MQIACH\_BATCH\_SIZE).

### CertificateLabel (MQCFST)

Certificate label (parameter identifier: MQCA\_CERT\_LABEL).

Specifies the certificate label in use.

The maximum length is MQ\_CERT\_LABEL\_LENGTH.

### ChannelDesc (MQCFST)

Channel description (parameter identifier: MQCACH\_DESC).

The maximum length of the string is MQ\_CHANNEL\_DESC\_LENGTH.

### ChannelMonitoring (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA\_MONITORING\_CHANNEL).

The value can be any of the following values:

#### MQMON\_OFF

Online monitoring data collection is turned off for this channel.

#### MQMON\_Q\_MGR

The value of the queue manager's **ChannelMonitoring** parameter is inherited by the channel.

#### MQMON\_LOW

Online monitoring data collection is turned on, with a low rate of data collection, for this channel unless the queue manager's **ChannelMonitoring** parameter is MQMON\_NONE.

#### MQMON\_MEDIUM

Online monitoring data collection is turned on, with a moderate rate of data collection, for this channel unless the queue manager's *ChannelMonitoring* parameter is MQMON\_NONE.

**MQMON\_HIGH**

Online monitoring data collection is turned on, with a high rate of data collection, for this channel unless the queue manager's **ChannelMonitoring** parameter is MQMON\_NONE.

**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

**ChannelStatistics (MQCFIN)**

Statistics data collection (parameter identifier: MQIA\_STATISTICS\_CHANNEL).

The value can be any of the following values:

**MQMON\_OFF**

Statistics data collection is turned off for this channel.

**MQMON\_Q\_MGR**

The value of the queue manager's **ChannelStatistics** parameter is inherited by the channel.

**MQMON\_LOW**

Statistics data collection is turned on, with a low rate of data collection, for this channel unless the queue manager's **ChannelStatistics** parameter is MQMON\_NONE.

**MQMON\_MEDIUM**

Statistics data collection is turned on, with a moderate rate of data collection, for this channel unless the queue manager's **ChannelStatistics** parameter is MQMON\_NONE.

**MQMON\_HIGH**

Statistics data collection is turned on, with a high rate of data collection, for this channel unless the queue manager's **ChannelStatistics** parameter is MQMON\_NONE.

 On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

**ChannelType (MQCFIN)**

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

The value can be any of the following values:

**MQCHT\_SENDER**

Sender.

**MQCHT\_SERVER**

Server.

**MQCHT\_RECEIVER**

Receiver.

**MQCHT\_REQUESTER**

Requester.

**MQCHT\_SVRCONN**

Server-connection (for use by clients).

**MQCHT\_CLNTCONN**

Client connection.

**MQCHT\_CLUSRCVR**

Cluster-receiver.

**MQCHT\_CLUSSDR**

Cluster-sender.

**MQCHT\_MQTT**

Telemetry channel.

**ClientChannelWeight (MQCFIN)**

Client Channel Weight (parameter identifier: MQIACH\_CLIENT\_CHANNEL\_WEIGHT).

The client channel weighting attribute is used so client channel definitions can be selected at random, with the larger weightings having a higher probability of selection, when more than one suitable definition is available.

The value can be 0 - 99. The default is 0.

This parameter is only valid for channels with a ChannelType of MQCHT\_CLNTCONN

**ClientIdentifier (MQCFST)**

the clientId of the client (parameter identifier: MQCACH\_CLIENT\_ID).

**ClusterName (MQCFST)**

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

**ClusterNamelist (MQCFST)**

Cluster namelist (parameter identifier: MQCA\_CLUSTER\_NAMELIST).

**CLWLChannelPriority (MQCFIN)**

Channel priority (parameter identifier: MQIACH\_CLWL\_CHANNEL\_PRIORITY).

**CLWLChannelRank (MQCFIN)**

Channel rank (parameter identifier: MQIACH\_CLWL\_CHANNEL\_RANK).

**CLWLChannelWeight (MQCFIN)**

Channel weighting (parameter identifier: MQIACH\_CLWL\_CHANNEL\_WEIGHT).

**ConnectionAffinity (MQCFIN)**

Channel Affinity (parameter identifier: MQIACH\_CONNECTION\_AFFINITY)

The channel affinity attribute specifies whether client applications that connect multiple times using the same queue manager name, use the same client channel. The value can be any of the following values:

**MQCAFTY\_PREFERRED**

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any zero ClientChannelWeight definitions first in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful nonzero ClientChannelWeight definitions are moved to the end of the list. Zero ClientChannelWeight definitions remain at the start of the list and are selected first for each connection. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created. Each client process with the same host name creates the same list.

MQCAFTY\_PREFERRED is the default, and has the value of 1.

**MQCAFTY\_NONE**

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process independently select an applicable definition based on the weighting with any applicable zero ClientChannelWeight definitions selected first in alphabetical order. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created.

This parameter is only valid for channels with a ChannelType of MQCHT\_CLNTCONN.

**ConnectionName (MQCFST)**

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH. On z/OS, it is MQ\_LOCAL\_ADDRESS\_LENGTH.

The *ConnectionName* is a comma-separated list.

**DataConversion (MQCFIN)**

Whether sender must convert application data (parameter identifier: MQIACH\_DATA\_CONVERSION).

The value can be:

**MQCDC\_NO\_SENDER\_CONVERSION**

No conversion by sender.

## **MQCDC\_SENDER\_CONVERSION**

Conversion by sender.

z/OS

## **DefaultChannelDisposition (MQCFIN)**

Default channel disposition (parameter identifier: MQIACH\_DEF\_CHANNEL\_DISP).

This parameter applies to z/OS only.

Specifies the intended disposition of the channel when active. The value can be any of the following values:

### **MQCHLD\_PRIVATE**

The intended use of the object is as a private channel.

### **MQCHLD\_FIXSHARED**

The intended use of the object is as a shared channel linked to a specific queue manager.

### **MQCHLD\_SHARED**

The intended use of the object is as a shared channel.

## **DiscInterval (MQCFIN)**

Disconnection interval (parameter identifier: MQIACH\_DISC\_INTERVAL).

## **DefReconnect (MQCFIN)**

Client channel default reconnection option (parameter identifier: MQIACH\_DEF\_RECONNECT).

The returned values can be:

### **MQRCN\_NO**

MQRCN\_NO is the default value.

Unless overridden by **MQCONN**, the client is not reconnected automatically.

### **MQRCN\_YES**

Unless overridden by **MQCONN**, the client reconnects automatically.

### **MQRCN\_Q\_MGR**

Unless overridden by **MQCONN**, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO\_RECONNECT\_Q\_MGR.

### **MQRCN\_DISABLED**

Reconnection is disabled, even if requested by the client program using the **MQCONN** MQI call.

## **HeaderCompression (MQCFIL)**

Header data compression techniques supported by the channel (parameter identifier: MQIACH\_HDR\_COMPRESSION). For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference.

The value can be one, or more, of

### **MQCOMPRESS\_NONE**

No header data compression is performed.

### **MQCOMPRESS\_SYSTEM**

Header data compression is performed.

## **HeartbeatInterval (MQCFIN)**

Heartbeat interval (parameter identifier: MQIACH\_HB\_INTERVAL).

## **InDoubtInbound (MQCFIN)**

Number of inbound messages to the client that are in doubt (Parameter identifier: MQIACH\_IN\_DOUBT\_IN).

## **InDoubtOutbound (MQCFIN)**

Number of outbound messages from the client that are in doubt (Parameter identifier: MQIACH\_IN\_DOUBT\_OUT).

## **KeepAliveInterval (MQCFIN)**

KeepAlive interval (parameter identifier: MQIACH\_KEEP\_ALIVE\_INTERVAL).

**LastMsgTime (MQCFST)**

The time that the last message was sent or received (parameter identifier: MQCACH\_LAST\_MSG\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

**LocalAddress (MQCFST)**

Local communications address for the channel (parameter identifier: MQCACH\_LOCAL\_ADDRESS).

The maximum length of the string is MQ\_LOCAL\_ADDRESS\_LENGTH.

**LongRetryCount (MQCFIN)**

Long retry count (parameter identifier: MQIACH\_LONG\_RETRY).

**LongRetryInterval (MQCFIN)**

Long timer (parameter identifier: MQIACH\_LONG\_TIMER).

**MaxInstances (MQCFIN)**

Maximum number of simultaneous instances of a server-connection channel (parameter identifier: MQIACH\_MAX\_INSTANCES).

This parameter is returned only for server-connection channels in response to an Inquire Channel call with ChannelAttrs including MQIACF\_ALL or MQIACH\_MAX\_INSTANCES.

**MaxInstancesPerClient (MQCFIN)**

Maximum number of simultaneous instances of a server-connection channel that can be started from a single client (parameter identifier: MQIACH\_MAX\_INSTS\_PER\_CLIENT).

This parameter is returned only for server-connection channels in response to an Inquire Channel call with ChannelAttrs including MQIACF\_ALL or MQIACH\_MAX\_INSTS\_PER\_CLIENT.

**MaxMsgLength (MQCFIN)**

Maximum message length (parameter identifier: MQIACH\_MAX\_MSG\_LENGTH).

**MCAName (MQCFST)**

Message channel agent name (parameter identifier: MQCACH\_MCA\_NAME).

The maximum length of the string is MQ\_MCA\_NAME\_LENGTH.

**MCAType (MQCFIN)**

Message channel agent type (parameter identifier: MQIACH\_MCA\_TYPE).

The value can be any of the following values:

**MQMCAT\_PROCESS**

Process.

**MQMCAT\_THREAD**

Thread (Windows only).

**MCAUserIdentifier (MQCFST)**

Message channel agent user identifier (parameter identifier: MQCACH\_MCA\_USER\_ID).

**Note:** An alternative way of providing a user ID for a channel to run under is to use channel authentication records. With channel authentication records, different connections can use the same channel while using different credentials. If both MCAUSER on the channel is set and channel authentication records are used to apply to the same channel, the channel authentication records take precedence. The MCAUSER on the channel definition is only used if the channel authentication record uses USERSRC(CHANNEL). For more details, see [Channel authentication records](#)

The maximum length of the MCA user identifier depends on the environment in which the MCA is running. MQ\_MCA\_USER\_ID\_LENGTH gives the maximum length for the environment for which your application is running. MQ\_MAX\_MCA\_USER\_ID\_LENGTH gives the maximum for all supported environments.

On Windows, the user identifier might be qualified with the domain name in the following format:

user@domain

### **MessageCompression (MQCFIL)**

Message data compression techniques supported by the channel (parameter identifier: MQIACH\_MSG\_COMPRESSION). For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference.

The value can be one, or more, of:

#### **MQCOMPRESS\_NONE**

No message data compression is performed.

#### **MQCOMPRESS\_RLE**

Message data compression is performed using run-length encoding.

#### **MQCOMPRESS\_ZLIBFAST**

Message data compression is performed using ZLIB encoding with speed prioritized.

#### **MQCOMPRESS\_ZLIBHIGH**

Message data compression is performed using ZLIB encoding with compression prioritized.

#### **MQCOMPRESS\_ANY**

Any compression technique supported by the queue manager can be used. MQCOMPRESS\_ANY is only valid for receiver, requester, and server-connection channels.

### **ModeName (MQCFST)**

Mode name (parameter identifier: MQCACH\_MODE\_NAME).

The maximum length of the string is MQ\_MODE\_NAME\_LENGTH.

### **MsgExit (MQCFST)**

Message exit name (parameter identifier: MQCACH\_MSG\_EXIT\_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

 On Multiplatforms, if more than one message exit has been defined for the channel, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

 On z/OS, an MQCFSL structure is always used.

### **MsgsReceived (MQCFIN64)**

The number of messages received by the client since it last connected (parameter identifier: MQIACH\_MSGS\_RECEIVED / MQIACH\_MSGS\_RCVD).

### **MsgRetryCount (MQCFIN)**

Message retry count (parameter identifier: MQIACH\_MR\_COUNT).

### **MsgRetryExit (MQCFST)**

Message retry exit name (parameter identifier: MQCACH\_MR\_EXIT\_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

### **MsgRetryInterval (MQCFIN)**

Message retry interval (parameter identifier: MQIACH\_MR\_INTERVAL).

### **MsgRetryUserData (MQCFST)**

Message retry exit user data (parameter identifier: MQCACH\_MR\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

### **MsgsSent (MQCFIN64)**

The number of messages sent by the client since it last connected (parameter identifier: MQIACH\_MSGS\_SENT).

### **MsgUserData (MQCFST)**

Message exit user data (parameter identifier: MQCACH\_MSG\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

**Multi** On Multiplatforms, if more than one message exit has been defined for the channel, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

**z/OS** On z/OS, an MQCFSL structure is always used.

**NetworkPriority (MQCFIN)**

Network priority (parameter identifier: MQIACH\_NETWORK\_PRIORITY).

**NonPersistentMsgSpeed (MQCFIN)**

Speed at which non-persistent messages are to be sent (parameter identifier: MQIACH\_NPM\_SPEED).

The value can be:

**MQNPMS\_NORMAL**

Normal speed.

**MQNPMS\_FAST**

Fast speed.

**Password (MQCFST)**

Password (parameter identifier: MQCACH\_PASSWORD).

If a nonblank password is defined, it is returned as asterisks. Otherwise, it is returned as blanks.

The maximum length of the string is MQ\_PASSWORD\_LENGTH. However, only the first 10 characters are used.

**PropertyControl (MQCFIN)**

Property control attribute (parameter identifier MQIA\_PROPERTY\_CONTROL).

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor). The value can be any of the following values:

**MQPROP\_COMPATIBILITY**

<i>Table 318. Range of results, depending on which message properties are set, when PropertyControl value is MQPROP_COMPATIBILITY</i>	
<b>Message properties</b>	<b>Result</b>
The message contains a property with a prefix of <b>mcd.</b> , <b>jms.</b> , <b>usr.</b> or <b>mqext.</b>	All optional message properties (where the <b>Support</b> value is MQPD_SUPPORT_OPTIONAL), except those properties in the message descriptor or extension, are placed in one or more MQRFH2 headers in the message data before the message it sent to the remote queue manager.
The message does not contain a property with a prefix of <b>mcd.</b> , <b>jms.</b> , <b>usr.</b> or <b>mqext.</b>	All message properties, except those properties in the message descriptor or extension, are removed from the message before the message is sent to the remote queue manager.
The message contains a property where the <b>Support</b> field of the property descriptor is not set to MQPD_SUPPORT_OPTIONAL	The message is rejected with reason MQRC_UNSUPPORTED_PROPERTY and treated in accordance with its report options.
The message contains one or more properties where the <b>Support</b> field of the property descriptor is set to MQPD_SUPPORT_OPTIONAL but other fields of the property descriptor are set to non-default values	The properties with non-default values are removed from the message before the message is sent to the remote queue manager.

Table 318. Range of results, depending on which message properties are set, when PropertyControl value is MQPROP\_COMPATIBILITY (continued)

Message properties	Result
The MQRFH2 folder that would contain the message property needs to be assigned with the <i>content='properties'</i> attribute	The properties are removed to prevent MQRFH2 headers with unsupported syntax flowing to a V6 or prior queue manager.

#### **MQPROP\_NONE**

All properties of the message, except those properties in the message descriptor or extension, are removed from the message before the message is sent to the remote queue manager.

If the message contains a property where the **Support** field of the property descriptor is not set to MQPD\_SUPPORT\_OPTIONAL then the message is rejected with reason MQRC\_UNSUPPORTED\_PROPERTY and treated in accordance with its report options.

#### **MQPROP\_ALL**

All properties of the message are included with the message when it is sent to the remote queue manager. The properties, except those properties in the message descriptor (or extension), are placed in one or more MQRFH2 headers in the message data.

This attribute is applicable to Sender, Server, Cluster Sender, and Cluster Receiver channels.

#### **PutAuthority (MQCFIN)**

Put authority (parameter identifier: MQIACH\_PUT\_AUTHORITY).

The value can be any of the following values:

##### **MQPA\_DEFAULT**

Default user identifier is used.

##### **MQPA\_CONTEXT**

Context user identifier is used.

#### **QMgrName (MQCFST)**

Queue manager name (parameter identifier: MQCA\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

#### **z/OS QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid only on z/OS. The value can be any of the following values:

##### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

##### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

##### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

#### **ReceiveExit (MQCFST)**

Receive exit name (parameter identifier: MQCACH\_RCV\_EXIT\_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

**Multi** On Multiplatforms, if more than one receive exit has been defined for the channel, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

**z/OS** On z/OS, an MQCFSL structure is always used.

### ReceiveUserData (MQCFST)

Receive exit user data (parameter identifier: MQCACH\_RCV\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

**Multi** On Multiplatforms, if more than one receive exit user data string has been defined for the channel, the list of strings is returned in an MQCFSL structure instead of an MQCFST structure.

**z/OS** On z/OS, an MQCFSL structure is always used.

### ResetSeq (MQCFIN)

Pending reset sequence number (parameter identifier: MQIACH\_RESET\_REQUESTED).

This is the sequence number from an outstanding request and it indicates a user Reset Channel command request is outstanding.

A value of zero indicates that there is no outstanding Reset Channel. The value can be in the range 1 - 999999999.

Possible return values include MQCHRR\_RESET\_NOT\_REQUESTED.

This parameter is not applicable on z/OS.

### SecurityExit (MQCFST)

Security exit name (parameter identifier: MQCACH\_SEC\_EXIT\_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

### SecurityUserData (MQCFST)

Security exit user data (parameter identifier: MQCACH\_SEC\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

### SendExit (MQCFST)

Send exit name (parameter identifier: MQCACH\_SEND\_EXIT\_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

**Multi** On Multiplatforms, if more than one send exit has been defined for the channel, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

**z/OS** On z/OS, an MQCFSL structure is always used.

### SendUserData (MQCFST)

Send exit user data (parameter identifier: MQCACH\_SEND\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

**Multi** On Multiplatforms, if more than one send exit user data string has been defined for the channel, the list of strings is returned in an MQCFSL structure instead of an MQCFST structure.

**z/OS** On z/OS, an MQCFSL structure is always used.

### SeqNumberWrap (MQCFIN)

Sequence wrap number (parameter identifier: MQIACH\_SEQUENCE\_NUMBER\_WRAP).

### SharingConversations (MQCFIN)

Number of sharing conversations (parameter identifier: MQIACH\_SHARING\_CONVERSATIONS).

This parameter is returned only for TCP/IP client-connection and server-connection channels.

**ShortRetryCount (MQCFIN)**

Short retry count (parameter identifier: MQIACH\_SHORT\_RETRY).

**ShortRetryInterval (MQCFIN)**

Short timer (parameter identifier: MQIACH\_SHORT\_TIMER).

 **SPLProtection (MQCFIN)**

SPLProtection (parameter identifier: MQIACH\_SPL\_PROTECTION). This parameter applies to z/OS only, from IBM MQ 9.1.3 onwards.

Security policy protection parameter. Specifies what happens to messages across the channel when Advanced Message Security is active and an applicable policy exists.

This parameter is valid for channel types MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_RECEIVER, and MQCHT\_REQUESTER only.

Possible values are:

**MQSPL\_PASSTHRU**

Pass through, unchanged, any messages sent or received by the message channel agent for this channel.

This value is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_RECEIVER, or MQCHT\_REQUESTER, and is the default value.

**MQSPL\_REMOVE**

Remove any AMS protection from messages retrieved from the transmission queue by the message channel agent, and send the messages to the partner.

When the MCA gets a message from the transmission queue, if an AMS policy is defined for the transmission queue, it is applied to remove any AMS protection from the message prior to sending the message across the channel. If an AMS policy is not defined for the transmission queue, the message is sent as is.

This value is valid only for *ChannelType* values of MQCHT\_SENDER or MQCHT\_SERVER.

**MQSPL\_AS\_POLICY**

Based on the policy defined for the target queue, apply AMS protection to inbound messages prior to putting them on to the target queue.

When the message channel agent receives an inbound message, if an AMS policy is defined for the target queue, AMS protection is applied to the message prior to the message being put to the target queue. If an AMS policy is not defined for the target queue, the message is put to the target queue as is.

This value is valid only for *ChannelType* values of MQCHT\_RECEIVER or MQCHT\_REQUESTER.

**SSLCipherSpec (MQCFST)**

CipherSpec (parameter identifier: MQCACH\_SSL\_CIPHER\_SPEC).

The length of the string is MQ\_SSL\_CIPHER\_SPEC\_LENGTH.

**SSLCipherSuite (MQCFST)**

CipherSuite (parameter identifier: MQCACH\_SSL\_CIPHER\_SUITE).

The length of the string is MQ\_SSL\_CIPHER\_SUITE\_LENGTH.

**SSLClientAuth (MQCFIN)**

Client authentication (parameter identifier: MQIACH\_SSL\_CLIENT\_AUTH).

The value can be

**MQSCA\_REQUIRED**

Client authentication required

**MQSCA\_OPTIONAL**

Client authentication is optional.

The following value is also valid for Channels of type MQCHT\_MQTT:

**MQSCA\_NEVER\_REQUIRED**

Client authentication is never required, and must not be provided.

Defines whether IBM MQ requires a certificate from the TLS client.

**SSLPeerName (MQCFST)**

Peer name (parameter identifier: MQCACH\_SSL\_PEER\_NAME).

**Note:** An alternative way of restricting connections into channels by matching against the TLS Subject Distinguished Name, is to use channel authentication records. With channel authentication records, different TLS Subject Distinguished Name patterns can be applied to the same channel. If both SSLPEER on the channel and a channel authentication record are used to apply to the same channel, the inbound certificate must match both patterns in order to connect. For more information, see [Channel authentication records](#).

The length of the string is MQ\_SSL\_PEER\_NAME\_LENGTH. On z/OS, it is MQ\_SSL\_SHORT\_PEER\_NAME\_LENGTH.

Specifies the filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel. (A Distinguished Name is the identifier of the TLS certificate.) If the Distinguished Name in the certificate received from the peer does not match the SSLPEER filter, the channel does not start.

**TpName (MQCFST)**

Transaction program name (parameter identifier: MQCACH\_TP\_NAME).

The maximum length of the string is MQ\_TP\_NAME\_LENGTH.

**TransportType (MQCFIN)**

Transmission protocol type (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value might be:

**MQXPT\_LU62**

LU 6.2.

**MQXPT\_TCP**

TCP.

**MQXPT\_NETBIOS**

NetBIOS.

**MQXPT\_SPX**

SPX.

**MQXPT\_DECNET**

DECnet.

**UseDLQ (MQCFIN)**

Whether the dead-letter queue (or undelivered message queue) should be used when messages cannot be delivered by channels (parameter identifier: MQIA\_USE\_DEAD\_LETTER\_Q).

The value might be:

**MQUSEDLQ\_NO**

Messages that cannot be delivered by a channel will be treated as a failure and either the channel will discard them, or the channel will end, in accordance with the setting of NPMSPEED.

**MQUSEDLQ\_YES**

If the queue manager DEADQ attribute provides the name of a dead-letter queue then it will be used, otherwise the behavior will be as for MQUSEDLQ\_NO.

**UserIdentifier (MQCFST)**

Task user identifier (parameter identifier: MQCACH\_USER\_ID).

The maximum length of the string is MQ\_USER\_ID\_LENGTH. However, only the first 10 characters are used.

**XmitQName (MQCFST)**

Transmission queue name (parameter identifier: MQCACH\_XMIT\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**Inquire Channel Authentication Records**

The Inquire Channel Authentication Records (MQCMD\_INQUIRE\_CHLAUTH\_RECS) command retrieves the allowed partner details and mappings to MCAUSER for a channel or set of channels.

**Required parameters****generic-channel-name (MQCFST)**

The name of the channel or set of channels on which you are inquiring (parameter identifier: MQCACH\_CHANNEL\_NAME).

You can use the asterisk (\*) as a wildcard to specify a set of channels, unless you set Match to MQMATCH\_RUNCHECK. If you set Type to BLOCKADDR, you must set the generic channel name to a single asterisk, which matches all channel names.

**Optional parameters****Address (MQCFST)**

The IP address to be mapped (parameter identifier: MQCACH\_CONNECTION\_NAME).

This parameter is valid only when **Match** is MQMATCH\_RUNCHECK and must not be generic.

**ByteStringFilterCommand (MQCFBF)**

Byte string filter command descriptor. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFBF - PCF byte string filter parameter” on page 1891](#) for information about using this filter condition.

If you specify a byte string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter, or a string filter using the **StringFilterCommand** parameter.

**ChannelAuthAttrs (MQCFIL)**

Authority record attributes (parameter identifier: MQIACF\_CHLAUTH\_ATTRS).

You can specify the following value in the attribute list on its own. This is the default value if the parameter is not specified.

**MQIACF\_ALL**

All attributes.

If MQIACF\_ALL is not specified, specify a combination of the following values:

**MQCA\_ALTERATION\_DATE**

Alteration Date.

**MQCA\_ALTERATION\_TIME**

Alteration Time.

**MQCA\_CHLAUTH\_DESC**

Description.

**MQCA\_CUSTOM**

Custom.

**MQCACH\_CONNECTION\_NAME**

IP address filter.

**MQCACH\_MCA\_USER\_ID**

MCA User ID mapped on the record.

**MQIACH\_USER\_SOURCE**

The source of the user ID for this record.

## **MQIACH\_WARNING**

Warning mode.

## **CheckClient (MQCFIN)**

The user ID and password requirements for the client connection to be successful. The following values are valid:

### **MQCHK\_REQUIRED\_ADMIN**

A valid user ID and password are required for the connection to be allowed if you are using a privileged user ID.

Any connections using a non-privileged user ID are not required to provide a user ID and password.

The user ID and password are checked against the user repository details provided in an authentication information object, and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

A privileged user is one that has full administrative authorities for IBM MQ. See [Privileged users](#) for more information.

This option is not valid on z/OS platforms.

### **MQCHK\_REQUIRED**

A valid user ID and password are required for the connection to be allowed.

The user ID and password are checked against the user repository details provided in an authentication information object and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

### **MQCHK\_AS\_Q\_MGR**

In order for the connection to be allowed, it must meet the connection authentication requirements defined on the queue manager.

If the CONNAUTH field provides an authentication information object, and the value of CHCKCLNT is REQUIRED, the connection fails unless a valid user ID and password are supplied.

If the CONNAUTH field does not provide an authentication information object, or the value of CHCKCLNT is not REQUIRED, the user ID and password are not required.

**Attention:** If you select MQCHK\_REQUIRED or MQCHK\_REQUIRED\_ADMIN on [Multiplatforms](#) and you have not set the **Connauth** field on the queue manager, or if the value of **CheckClient** is None, the connection fails. On Multiplatforms, you receive message AMQ9793. On z/OS, you receive message CSQX793E.

## **ClntUser (MQCFST)**

The client asserted user ID to be mapped to a new user ID, allowed through unchanged, or blocked (parameter identifier: MQCACH\_CLIENT\_USER\_ID).

This can be the user ID flowed from the client indicating the user ID the client side process is running under, or the user ID presented by the client on an MQCONN call using MQCSP.

This parameter is valid only with TYPE(USERMAP) and when **Match** is MQMATCH\_RUNCHECK.

## **z/OS CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following values:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.

- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which the command was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

### **IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter”](#) on page 1896 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or a string filter using the **StringFilterCommand** parameter.

### **Match (MQCFIN)**

Indicates the type of matching to be applied (parameter identifier MQIACH\_MATCH). You can specify any one of the following values:

#### **MQMATCH\_RUNCHECK**

A specific match is made against the supplied channel name and optionally supplied **Address**, **SSLPeer**, **QMName**, and **ClntUser** attributes to find the channel authentication record that will be matched by the channel at runtime if it connects into this queue manager. If the record discovered has **Warn** set to MQWARN\_YES, a second record might also be displayed to show the actual record the channel will use at runtime. The channel name supplied in this case cannot be generic. This option must be combined with **Type** MQCAUT\_ALL.

#### **MQMATCH\_EXACT**

Return only those records which exactly match the channel profile name supplied. If there are no asterisks in the channel profile name, this option returns the same output as MQMATCH\_GENERIC.

#### **MQMATCH\_GENERIC**

Any asterisks in the channel profile name are treated as wildcards. If there are no asterisks in the channel profile name, this returns the same output as MQMATCH\_EXACT. For example, a profile of ABC\* could result in records for ABC, ABC\*, and ABCD being returned.

#### **MQMATCH\_ALL**

Return all possible records that match the channel profile name supplied. If the channel name is generic in this case, all records that match the channel name are returned even if more specific matches exist. For example, a profile of SYSTEM\*.SVRCONN could result in records for SYSTEM.\*, SYSTEM.DEF.\*, SYSTEM.DEF.SVRCONN, and SYSTEM.ADMIN.SVRCONN being returned.

### **QMName (MQCFST)**

The name of the remote partner queue manager to be matched (parameter identifier: MQCA\_REMOTE\_Q\_MGR\_NAME).

This parameter is valid only when **Match** is MQMATCH\_RUNCHECK. The value cannot be generic.

### **SSLCertIssuer (MQCFST)**

This parameter is additional to the **SSLPeer** parameter.

**SSLCertIssuer** restricts matches to being within certificates issued by a particular Certificate Authority.

### **SSLPeer (MQCFST)**

The Distinguished Name of the certificate to be matched (parameter identifier: MQCACH\_SSL\_PEER\_NAME).

This parameter is valid only when **Match** is MQMATCH\_RUNCHECK.

The **SSLPeer** value is specified in the standard form used to specify a Distinguished Name and cannot be a generic value.

The maximum length of the parameter is MQ\_SSL\_PEER\_NAME\_LENGTH.

### **StringFilterCommand (MQCFSF)**

String filter command descriptor. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1903 for information about using this filter condition.

If you specify a string filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or an integer filter using the **IntegerFilterCommand** parameter.

### **Type (MQCFIN)**

The type of channel authentication record for which to set allowed partner details or mappings to MCAUSER (parameter identifier: MQIACF\_CHLAUTH\_TYPE). The following values are valid:

#### **MQCAUT\_BLOCKUSER**

This channel authentication record prevents a specified user or users from connecting.

#### **MQCAUT\_BLOCKADDR**

This channel authentication record prevents connections from a specified IP address or addresses.

#### **MQCAUT\_SSLPEERMAP**

This channel authentication record maps TLS Distinguished Names (DNs) to MCAUSER values.

#### **MQCAUT\_ADDRESSMAP**

This channel authentication record maps IP addresses to MCAUSER values.

#### **MQCAUT\_USERMAP**

This channel authentication record maps asserted user IDs to MCAUSER values.

#### **MQCAUT\_QMGRMAP**

This channel authentication record maps remote queue manager names to MCAUSER values.

#### **MQCAUT\_ALL**

Inquire on all types of record. This is the default value.

### **Related concepts**

[Channel authentication records](#)

## **Inquire Channel Authentication Records (Response)**

The response to the Inquire Channel Authentication Records (MQCMD\_INQUIRE\_CHLAUTH\_RECS) command consists of the response header followed by the requested combination of attribute parameter structures.

#### **Always returned:**

*ChlAuth, Type, Warn (yes)*

#### **Always returned if type is MQCAUT\_BLOCKUSER:**

*UserList*

#### **Always returned if type is MQCAUT\_BLOCKADDR:**

*AddrList*

#### **Always returned if type is MQCAUT\_SSLPEERMAP:**

*Address (unless blanks), MCAUser (unless blanks), SSLCertIssuer, SSLPeer, UserSrc*

#### **Always returned if type is MQCAUT\_ADDRESSMAP:**

*Address (unless blanks), MCAUser (unless blanks), UserSrc*

#### **Always returned if type is MQCAUT\_USERMAP:**

*Address (unless blanks), ClnUser, MCAUser (unless blanks), UserSrc*

#### **Always returned if type is MQCAUT\_QMGRMAP:**

*Address (unless blanks), MCAUser (unless blanks), QMName, UserSrc*

**Returned if requested:**

*Address, AlterationDate, AlterationTime, Custom, Description, MCAUser, SSLPeer, UserSrc, Warn*

**Response data****AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

**AlterationTime (MQCFST)**

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time when the information was last altered, in the form hh.mm.ss.

**Address (MQCFST)**

The filter used to compare with the IP address, or host name, of the partner queue manager or client at the other end of the channel (parameter identifier: MQCACH\_CONNECTION\_NAME).

**AddrList (MQCFSL)**

A list of up to 100 IP address patterns which are banned from accessing this queue manager on any channel (parameter identifier: MQCACH\_CONNECTION\_NAME\_LIST).

**Chlauth (MQCFST)**

The name of the channel, or pattern that matches a set of channels, to which the channel authentication record applies (parameter identifier: MQCACH\_CHANNEL\_NAME).

**CheckClient (MQCFIN)**

The user ID and password requirements for the client connection to be successful (parameter identifier: MQIA\_CHECK\_CLIENT\_BINDING).

**ClntUser (MQCFST)**

The client asserted user ID to be mapped to a new user ID, allowed through unchanged, or blocked (parameter identifier: MQCACH\_CLIENT\_USER\_ID).

**Description (MQCFST)**

Descriptive information about the channel authentication record (parameter identifier: MQCA\_CHLAUTH\_DESC).

**MCAUser (MQCFST)**

The user identifier to be used when the inbound connection matches the TLS DN, IP address, client asserted user ID or remote queue manager name supplied (parameter identifier: MQCACH\_MCA\_USER\_ID).

**QMName (MQCFST)**

The name of the remote partner queue manager to be mapped to a user ID, allowed through unchanged, or blocked (parameter identifier: MQCA\_REMOTE\_Q\_MGR\_NAME).

**SSLCertIssuer (MQCFST)**

This parameter is additional to the **SSLPeer** parameter.

**SSLCertIssuer** restricts matches to being within certificates issued by a particular Certificate Authority (parameter identifier: MQCA\_SSL\_CERT\_ISSUER\_NAME).

**SSLPeer (MQCFST)**

The filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel (parameter identifier: MQCACH\_SSL\_PEER\_NAME).

**Type (MQCFIN)**

The type of channel authentication record for which to set allowed partner details or mappings to MCAUSER (parameter identifier: MQIACF\_CHLAUTH\_TYPE). The following values can be returned:

**MQCAUT\_BLOCKUSER**

This channel authentication record prevents a specified user or users from connecting.

**MQCAUT\_BLOCKADDR**

This channel authentication record prevents connections from a specified IP address or addresses.

**MQCAUT\_SSLPEERMAP**

This channel authentication record maps TLS Distinguished Names (DNs) to MCAUSER values.

**MQCAUT\_ADDRESSMAP**

This channel authentication record maps IP addresses to MCAUSER values.

**MQCAUT\_USERMAP**

This channel authentication record maps asserted user IDs to MCAUSER values.

**MQCAUT\_QMGRMAP**

This channel authentication record maps remote queue manager names to MCAUSER values.

**UserList (MQCFSL)**

A list of up to 100 user IDs which are banned from use of this channel or set of channels (parameter identifier: MQCACH\_MCA\_USER\_ID\_LIST). Use the special value \*MQADMIN to mean privileged or administrative users. The definition of this value depends on the operating system, as follows:

- On Windows, all members of the mqm group, the Administrators group and SYSTEM.
- On UNIX and Linux, all members of the mqm group.
- On IBM i, the profiles (users) qmqm and qmqmadm and all members of the qmqmadm group, and any user defined with the \*ALLOBJ special setting.
- On z/OS, the user ID that the channel initiator, queue manager and advanced message security address spaces are running under.

**UserSrc (MQCFIN)**

The source of the user ID to be used for MCAUSER at run time (parameter identifier: MQIACH\_USER\_SOURCE).

The following values can be returned:

**MQUSRC\_MAP**

Inbound connections that match this mapping use the user ID specified in the **MCAUser** attribute.

**MQUSRC\_NOACCESS**

Inbound connections that match this mapping have no access to the queue manager and the channel ends immediately.

**MQUSRC\_CHANNEL**

Inbound connections that match this mapping use the flowed user ID or any user defined on the channel object in the MCAUSER field.

**Warn (MQCFIN)**

Indicates whether this record operates in warning mode (parameter identifier: MQIACH\_WARNING).

**MQWARN\_NO**

This record does not operate in warning mode. Any inbound connection that matches this record is blocked. This is the default value.

**MQWARN\_YES**

This record operates in warning mode. Any inbound connection that matches this record and would therefore be blocked is allowed access. An error message is written and, if events are configured, an event message is created showing the details of what would have been blocked. The connection is allowed to continue.

## **Inquire Channel Initiator on z/OS**

The Inquire Channel Initiator (MQCMD\_INQUIRE\_CHANNEL\_INIT) command returns information about the channel initiator.

### **Optional parameters**

#### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## **Inquire Channel Initiator (Response) on z/OS**

The response to the Inquire Channel Initiator (MQCMD\_INQUIRE\_CHANNEL\_INIT) command consists of one response with a series of attribute parameter structures showing the status of the channel initiator (shown by the *ChannelInitiatorStatus* parameter), and one response for each listener (shown by the **ListenerStatus** parameter).

#### **Always returned (one message with channel initiator information):**

*ActiveChannels, ActiveChannelsMax, ActiveChannelsPaused, ActiveChannelsRetrying, ActiveChannelsStarted, ActiveChannelsStopped, AdaptersMax, AdaptersStarted, ChannelInitiatorStatus, CurrentChannels, CurrentChannelsLU62, CurrentChannelsMax, CurrentChannelsTCP, DispatchersMax, DispatchersStarted, SSLTasksStarted, TCPName*

#### **Always returned (one message for each listener):**

*InboundDisposition, ListenerStatus, TransportType*

#### **Returned if applicable for the listener:**

*IPAddress, LUName, Port*

### **Response data - channel initiator information**

#### **ActiveChannels (MQCFIN)**

The number of active channel connections (parameter identifier: MQIACH\_ACTIVE\_CHL).

#### **ActiveChannelsMax (MQCFIN)**

The requested number of active channel connections (parameter identifier: MQIACH\_ACTIVE\_CHL\_MAX).

#### **ActiveChannelsPaused (MQCFIN)**

The number of active channel connections that have paused, waiting to become active, because the limit for active channels has been reached (parameter identifier: MQIACH\_ACTIVE\_CHL\_PAUSED).

#### **ActiveChannelsRetrying (MQCFIN)**

The number of active channel connections that are attempting to reconnect following a temporary error (parameter identifier: MQIACH\_ACTIVE\_CHL\_RETRY).

**ActiveChannelsStarted (MQCFIN)**

The number of active channel connections that have started (parameter identifier: MQIACH\_ACTIVE\_CHL\_STARTED).

**ActiveChannelsStopped (MQCFIN)**

The number of active channel connections that have stopped, requiring manual intervention (parameter identifier: MQIACH\_ACTIVE\_CHL\_STOPPED).

**AdaptersMax (MQCFIN)**

The requested number of adapter subtasks (parameter identifier: MQIACH\_ADAPS\_MAX).

**AdaptersStarted (MQCFIN)**

The number of active adapter subtasks (parameter identifier: MQIACH\_ADAPS\_STARTED).

**ChannelInitiatorStatus (MQCFIN)**

Status of the channel initiator (parameter identifier: MQIACF\_CHINIT\_STATUS).

The value can be:

**MQSVC\_STATUS\_STOPPED**

The channel initiator is not running.

**MQSVC\_STATUS\_RUNNING**

The channel initiator is fully initialized and is running.

**CurrentChannels (MQCFIN)**

The number of current channel connections (parameter identifier: MQIACH\_CURRENT\_CHL).

**CurrentChannelsLU62 (MQCFIN)**

The number of current LU 6.2 channel connections (parameter identifier: MQIACH\_CURRENT\_CHL\_LU62).

**CurrentChannelsMax (MQCFIN)**

The requested number of channel connections (parameter identifier: MQIACH\_CURRENT\_CHL\_MAX).

**CurrentChannelsTCP (MQCFIN)**

The number of current TCP/IP channel connections (parameter identifier: MQIACH\_CURRENT\_CHL\_TCP).

**DispatchersMax (MQCFIN)**

The requested number of dispatchers (parameter identifier: MQIACH\_DISPS\_MAX).

**DispatchersStarted (MQCFIN)**

The number of active dispatchers (parameter identifier: MQIACH\_DISPS\_STARTED).

**SSLTasksMax (MQCFIN)**

The requested number of TLS server subtasks (parameter identifier: MQIACH\_SSLTASKS\_MAX).

**SSLTasksStarted (MQCFIN)**

The number of active TLS server subtasks (parameter identifier: MQIACH\_SSLTASKS\_STARTED).

**TCPName (MQCFST)**

TCP system name (parameter identifier: MQCACH\_TCP\_NAME).

The maximum length is MQ\_TCP\_NAME\_LENGTH.

**Response data - listener information****InboundDisposition (MQCFIN)**

Inbound transmission disposition (parameter identifier: MQIACH\_INBOUND\_DISP).

Specifies the disposition of the inbound transmissions that the listener handles. The value can be any of the following values:

**MQINBD\_Q\_MGR**

Handling for transmissions directed to the queue manager. MQINBD\_Q\_MGR is the default.

**MQINBD\_GROUP**

Handling for transmissions directed to the queue sharing group. MQINBD\_GROUP is permitted only if there is a shared queue manager environment.

**IPAddress (MQCFST)**

IP address on which the listener listens (parameter identifier: MQCACH\_IP\_ADDRESS).

**ListenerStatus (MQCFIN)**

Listener status (parameter identifier: MQIACH\_LISTENER\_STATUS).

The value can be:

**MQSVC\_STATUS\_RUNNING**

The listener has started.

**MQSVC\_STATUS\_STOPPED**

The listener has stopped.

**MQSVC\_STATUS\_RETRYING**

The listener is trying again.

**LUName (MQCFST)**

LU name on which the listener listens (parameter identifier: MQCACH\_LU\_NAME).

The maximum length is MQ\_LU\_NAME\_LENGTH.

**Port (MQCFIN)**

Port number on which the listener listens (parameter identifier: MQIACH\_PORT\_NUMBER).

**TransportType (MQCFIN)**

Transmission protocol type that the listener is using (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value can be:

**MQXPT\_LU62**

LU62.

**MQXPT\_TCP**

TCP.

## **Inquire Channel Listener on Multiplatforms**

The Inquire Channel Listener (MQCMD\_INQUIRE\_LISTENER) command inquires about the attributes of existing IBM MQ listeners.

**Required parameters****ListenerName (MQCFST)**

Listener name (parameter identifier: MQCACH\_LISTENER\_NAME).

This parameter is the name of the listener with attributes that are required. Generic listener names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all listeners having names that start with the selected character string. An asterisk on its own matches all possible names.

The listener name is always returned regardless of the attributes requested.

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

**Optional parameters****IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ListenerAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the

command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

### **ListenerAttrs (MQCFIL)**

Listener attributes (parameter identifier: MQIACF\_LISTENER\_ATTRS).

The attribute list might specify the following value on its own- default value if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQCA\_ALTERATION\_DATE**

Date on which the definition was last altered.

#### **MQCA\_ALTERATION\_TIME**

Time at which the definition was last altered.

#### **MQCACH\_IP\_ADDRESS**

IP address for the listener.

#### **MQCACH\_LISTENER\_DESC**

Description of listener definition.

#### **MQCACH\_LISTENER\_NAME**

Name of listener definition.

#### **MQCACH\_LOCAL\_NAME**

NetBIOS local name that the listener uses. MQCACH\_LOCAL\_NAME is valid only on Windows.

#### **MQCACH\_TP\_NAME**

The LU 6.2 transaction program name. MQCACH\_TP\_NAME is valid only on Windows.

#### **MQIACH\_ADAPTER**

Adapter number on which NetBIOS listens. MQIACH\_ADAPTER is valid only on Windows.

#### **MQIACH\_BACKLOG**

Number of concurrent connection requests that the listener supports.

#### **MQIACH\_COMMAND\_COUNT**

Number of commands that the listener can use. MQIACH\_COMMAND\_COUNT is valid only on Windows.

#### **MQIACH\_LISTENER\_CONTROL**

Specifies when the queue manager starts and stops the listener.

#### **MQIACH\_NAME\_COUNT**

Number of names that the listener can use. MQIACH\_NAME\_COUNT is valid only on Windows.

#### **MQIACH\_PORT**

Port number.

#### **MQIACH\_SESSION\_COUNT**

Number of sessions that the listener can use. MQIACH\_SESSION\_COUNT is valid only on Windows.

#### **MQIACH\_SOCKET**

SPX socket on which to listen. MQIACH\_SOCKET is valid only on Windows.

### **StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ListenerAttrs* except MQCACH\_LISTENER\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1903](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

### TransportType (MQCFIN)

Transport protocol type (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

If you specify this parameter, information is returned relating only to those listeners defined with the specified transport protocol type. If you specify an attribute in the *ListenerAttrs* list which is valid only for listeners of a different transport protocol type, it is ignored and no error is raised. If you specify this parameter, it must occur immediately after the **ListenerName** parameter.

If you do not specify this parameter, or if you specify it with a value of MQXPT\_ALL, information about all listeners is returned. Valid attributes in the *ListenerAttrs* list which are not applicable to the listener are ignored, and no error messages are issued. The value can be any of the following values:

#### MQXPT\_ALL

All transport types.

#### MQXPT\_LU62

SNA LU 6.2. MQXPT\_LU62 is valid only on Windows.

#### MQXPT\_NETBIOS

NetBIOS. MQXPT\_NETBIOS is valid only on Windows.

#### MQXPT\_SPX

SPX. MQXPT\_SPX is valid only on Windows.

#### MQXPT\_TCP

Transmission Control Protocol/Internet Protocol (TCP/IP).

## Inquire Channel Listener (Response) on Multiplatforms

The response to the Inquire Channel Listener (MQCMD\_INQUIRE\_LISTENER) command consists of the response header followed by the *ListenerName* structure and the requested combination of attribute parameter structures.

If a generic listener name was specified, one such message is generated for each listener found.

### Always returned:

*ListenerName*

### Returned if requested:

*Adapter, AlterationDate, AlterationTime, Backlog, Commands, IPAddress, ListenerDesc, LocalName, NetbiosNames, Port, Sessions, Socket, StartMode, TPname, TransportType*

## Response data

### AlterationDate (MQCFST)

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date, in the form yyyy-mm-dd, on which the information was last altered.

### AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time, in the form hh.mm.ss, at which the information was last altered.

### Adapter (MQCFIN)

Adapter number (parameter identifier: MQIACH\_ADAPTER).

The adapter number on which NetBIOS listens. This parameter is valid only on Windows.

### Backlog (MQCFIN)

Backlog (parameter identifier: MQIACH\_BACKLOG).

The number of concurrent connection requests that the listener supports.

**Commands (MQCFIN)**

Adapter number (parameter identifier: MQIACH\_COMMAND\_COUNT).

The number of commands that the listener can use. This parameter is valid only on Windows.

**IPAddress (MQCFST)**

IP address (parameter identifier: MQCACH\_IP\_ADDRESS).

IP address for the listener specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric host name form.

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH

**ListenerDesc (MQCFST)**

Description of listener definition (parameter identifier: MQCACH\_LISTENER\_DESC).

The maximum length of the string is MQ\_LISTENER\_DESC\_LENGTH.

**ListenerName (MQCFST)**

Name of listener definition (parameter identifier: MQCACH\_LISTENER\_NAME).

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

**LocalName (MQCFST)**

NetBIOS local name (parameter identifier: MQCACH\_LOCAL\_NAME).

The NetBIOS local name that the listener uses. This parameter is valid only on Windows.

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH

**NetbiosNames (MQCFIN)**

NetBIOS names (parameter identifier: MQIACH\_NAME\_COUNT).

The number of names that the listener supports. This parameter is valid only on Windows.

**Port (MQCFIN)**

Port number (parameter identifier: MQIACH\_PORT).

The port number for TCP/IP. This parameter is valid only if the value of *TransportType* is MQXPT\_TCP.

**Sessions (MQCFIN)**

NetBIOS sessions (parameter identifier: MQIACH\_SESSION\_COUNT).

The number of sessions that the listener can use. This parameter is valid only on Windows.

**Socket (MQCFIN)**

SPX socket number (parameter identifier: MQIACH\_SOCKET).

The SPX socket on which to listen. This parameter is valid only if the value of *TransportType* is MQXPT\_SPX.

**StartMode (MQCFIN)**

Service mode (parameter identifier: MQIACH\_LISTENER\_CONTROL).

Specifies how the listener is to be started and stopped. The value can be any of the following values:

**MQSVC\_CONTROL\_MANUAL**

The listener is not to be started automatically or stopped automatically. It is to be controlled by user command. MQSVC\_CONTROL\_MANUAL is the default value.

**MQSVC\_CONTROL\_Q\_MGR**

The listener being defined is to be started and stopped at the same time as the queue manager is started and stopped.

**MQSVC\_CONTROL\_Q\_MGR\_START**

The listener is to be started at the same time as the queue manager is started, but is not request to stop when the queue manager is stopped.

**TPName (MQCFST)**

Transaction program name (parameter identifier: MQCACH\_TP\_NAME).

The LU 6.2 transaction program name. This parameter is valid only on Windows.

The maximum length of the string is MQ\_TP\_NAME\_LENGTH

**TransportType (MQCFIN)**

Transmission protocol (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value can be:

**MQXPT\_TCP**

TCP.

**MQXPT\_LU62**

LU 6.2. MQXPT\_LU62 is valid only on Windows.

**MQXPT\_NETBIOS**

NetBIOS. MQXPT\_NETBIOS is valid only on Windows.

**MQXPT\_SPX**

SPX. MQXPT\_SPX is valid only on Windows.

## **Inquire Channel Listener Status on Multiplatforms**

The Inquire Channel Listener Status (MQCMD\_INQUIRE\_LISTENER\_STATUS) command inquires about the status of one or more IBM MQ listener instances.

You must specify the name of a listener for which you want to receive status information. You can specify a listener by using either a specific listener name or a generic listener name. By using a generic listener name, you can display either:

- Status information for all listener definitions, by using a single asterisk (\*), or
- Status information for one or more listeners that match the specified name.

**Required parameters****ListenerName (MQCFST)**

Listener name (parameter identifier: MQCACH\_LISTENER\_NAME).

Generic listener names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all listeners having names that start with the selected character string. An asterisk on its own matches all possible names.

The listener name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

**Optional parameters****IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ListenerStatusAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

**ListenerStatusAttrs (MQCFIL)**

Listener status attributes (parameter identifier: MQIACF\_LISTENER\_STATUS\_ATTRS).

The attribute list can specify the following value on its own - default value used if the parameter is not specified:

**MQIACF\_ALL**

All attributes.

or a combination of the following:

**MQCACH\_IP\_ADDRESS**

IP address of the listener.

**MQCACH\_LISTENER\_DESC**

Description of listener definition.

**MQCACH\_LISTENER\_NAME**

Name of listener definition.

**MQCACH\_LISTENER\_START\_DATE**

The date on which the listener was started.

**MQCACH\_LISTENER\_START\_TIME**

The time at which the listener was started.

**MQCACH\_LOCAL\_NAME**

NetBIOS local name that the listener uses. MQCACH\_LOCAL\_NAME is valid only on Windows.

**MQCACH\_TP\_NAME**

LU6.2 transaction program name. MQCACH\_TP\_NAME is valid only on Windows.

**MQIACF\_PROCESS\_ID**

Operating system process identifier associated with the listener.

**MQIACH\_ADAPTER**

Adapter number on which NetBIOS listens. MQIACH\_ADAPTER is valid only on Windows.

**MQIACH\_BACKLOG**

Number of concurrent connection requests that the listener supports.

**MQIACH\_COMMAND\_COUNT**

Number of commands that the listener can use. MQIACH\_COMMAND\_COUNT is valid only on Windows.

**MQIACH\_LISTENER\_CONTROL**

How the listener is to be started and stopped.

**MQIACH\_LISTENER\_STATUS**

Status of the listener.

**MQIACH\_NAME\_COUNT**

Number of names that the listener can use. MQIACH\_NAME\_COUNT is valid only on Windows.

**MQIACH\_PORT**

Port number for TCP/IP.

**MQIACH\_SESSION\_COUNT**

Number of sessions that the listener can use. MQIACH\_SESSION\_COUNT is valid only on Windows.

**MQIACH\_SOCKET**

SPX socket. MQIACH\_SOCKET is valid only on Windows.

**MQIACH\_XMIT\_PROTOCOL\_TYPE**

Transport type.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ListenerStatusAttrs* except MQCACH\_LISTENER\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter”](#) on page 1903 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

## Error code

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_LSTR\_STATUS\_NOT\_FOUND**

Listener status not found.

## **Inquire Channel Listener Status (Response) on Multiplatforms**

The response to the Inquire Channel Listener Status (MQCMD\_INQUIRE\_LISTENER\_STATUS) command consists of the response header followed by the *ListenerName* structure and the requested combination of attribute parameter structures.

If a generic listener name was specified, one such message is generated for each listener found.

### Always returned:

*ListenerName*

### Returned if requested:

*Adapter, Backlog, ChannelCount, Commands, IPAddress, ListenerDesc, LocalName, NetbiosNames, Port, ProcessId, Sessions, Socket, StartDate, StartMode, StartTime, Status, TPname, TransportType*

## Response data

### Adapter (MQCFIN)

Adapter number (parameter identifier: MQIACH\_ADAPTER).

The adapter number on which NetBIOS listens.

### Backlog (MQCFIN)

Backlog (parameter identifier: MQIACH\_BACKLOG).

The number of concurrent connection requests that the listener supports.

### Commands (MQCFIN)

Adapter number (parameter identifier: MQIACH\_COMMAND\_COUNT).

The number of commands that the listener can use.

### IPAddress (MQCFST)

IP address (parameter identifier: MQCACH\_IP\_ADDRESS).

IP address for the listener specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric host name form.

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH

### ListenerDesc (MQCFST)

Description of listener definition (parameter identifier: MQCACH\_LISTENER\_DESC).

The maximum length of the string is MQ\_LISTENER\_DESC\_LENGTH.

### ListenerName (MQCFST)

Name of listener definition (parameter identifier: MQCACH\_LISTENER\_NAME).

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

### LocalName (MQCFST)

NetBIOS local name (parameter identifier: MQCACH\_LOCAL\_NAME).

The NetBIOS local name that the listener uses.

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH

**NetbiosNames (MQCFIN)**

NetBIOS names (parameter identifier: MQIACH\_NAME\_COUNT).

The number of names that the listener supports.

**Port (MQCFIN)**

Port number (parameter identifier: MQIACH\_PORT).

The port number for TCP/IP.

**ProcessId (MQCFIN)**

Process identifier (parameter identifier: MQIACF\_PROCESS\_ID).

The operating system process identifier associated with the listener.

**Sessions (MQCFIN)**

NetBIOS sessions (parameter identifier: MQIACH\_SESSION\_COUNT).

The number of sessions that the listener can use.

**Socket (MQCFIN)**

SPX socket number (parameter identifier: MQIACH\_SOCKET).

The SPX socket on which the listener is to listen.

**StartDate (MQCFST)**

Start date (parameter identifier: MQCACH\_LISTENER\_START\_DATE).

The date, in the form yyyy-mm-dd, on which the listener was started.

The maximum length of the string is MQ\_DATE\_LENGTH

**StartMode (MQCFIN)**

Service mode (parameter identifier: MQIACH\_LISTENER\_CONTROL).

Specifies how the listener is to be started and stopped. The value can be any of the following values:

**MQSVC\_CONTROL\_MANUAL**

The listener is not to be started automatically or stopped automatically. It is to be controlled by user command. MQSVC\_CONTROL\_MANUAL is the default value.

**MQSVC\_CONTROL\_Q\_MGR**

The listener being defined is to be started and stopped at the same time as the queue manager is started and stopped.

**MQSVC\_CONTROL\_Q\_MGR\_START**

The listener is to be started at the same time as the queue manager is started, but is not request to stop when the queue manager is stopped.

**StartTime (MQCFST)**

Start date (parameter identifier: MQCACH\_LISTENER\_START\_TIME).

The time, in the form hh.mm.ss, at which the listener was started.

The maximum length of the string is MQ\_TIME\_LENGTH

**Status (MQCFIN)**

Listener status (parameter identifier: MQIACH\_LISTENER\_STATUS).

The status of the listener. The value can be any of the following values:

**MQSVC\_STATUS\_STARTING**

The listener is in the process of initializing.

**MQSVC\_STATUS\_RUNNING**

The listener is running.

**MQSVC\_STATUS\_STOPPING**

The listener is stopping.

**TPName (MQCFST)**

Transaction program name (parameter identifier: MQCACH\_TP\_NAME).

The LU 6.2 transaction program name.

The maximum length of the string is MQ\_TP\_NAME\_LENGTH

**TransportType (MQCFIN)**

Transmission protocol (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value can be:

**MQXPT\_TCP**

TCP.

**MQXPT\_LU62**

LU 6.2. MQXPT\_LU62 is valid only on Windows.

**MQXPT\_NETBIOS**

NetBIOS. MQXPT\_NETBIOS is valid only on Windows.

**MQXPT\_SPX**

SPX. MQXPT\_SPX is valid only on Windows.

**Inquire Channel Names**

The Inquire Channel Names (MQCMD\_INQUIRE\_CHANNEL\_NAMES) command inquires a list of IBM MQ channel names that match the generic channel name, and the optional channel type specified.

**Required parameters****ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

**Optional parameters****ChannelType (MQCFIN)**

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

If present, this parameter limits the channel names returned to channels of the specified type.

The value can be any of the following values:

**MQCHT\_SENDER**

Sender.

**MQCHT\_SERVER**

Server.

**MQCHT\_RECEIVER**

Receiver.

**MQCHT\_REQUESTER**

Requester.

**MQCHT\_SVRCONN**

Server-connection (for use by clients).

**MQCHT\_CLNTCONN**

Client connection.

**MQCHT\_CLUSRCVR**

Cluster-receiver.

**MQCHT\_CLUSSDR**

Cluster-sender.

**MQCHT\_ALL**

All types.

The default value if this parameter is not specified is MQCHT\_ALL, which means that channels of all types except MQCHT\_CLNTCONN are eligible.

**z/OS**

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**z/OS**

**QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

**MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

**MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

## **MQQSGD\_PRIVATE**

The object is defined with either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

## **Error code**

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### **Reason (MQLONG)**

The value can be any of the following values:

#### **MQRCCF\_CHANNEL\_NAME\_ERROR**

Channel name error.

#### **MQRCCF\_CHANNEL\_TYPE\_ERROR**

Channel type not valid.

## **Inquire Channel Names (Response)**

The response to the Inquire Channel Names (MQCMD\_INQUIRE\_CHANNEL\_NAMES) command consists of one response for each client connection channel (except for SYSTEM.DEF.CLNTCONN), and a final message with all the remaining channels.

### **Always returned:**

*ChannelNames, ChannelTypes*

### **Returned if requested:**

None

On z/OS only, one additional parameter structure (with the same number of entries as the *ChannelNames* structure), is returned. Each entry in the structure, *QSGDispositions*, indicates the disposition of the object with the corresponding entry in the *ChannelNames* structure.

## **Response data**

### **ChannelNames (MQCFSL)**

List of channel names (parameter identifier: MQCACH\_CHANNEL\_NAMES).

### **ChannelTypes (MQCFIL)**

List of channel types (parameter identifier: MQIACH\_CHANNEL\_TYPES). Possible values for fields in this structure are those values permitted for the **ChannelType** parameter, except MQCHT\_ALL.

### **QSGDispositions (MQCFIL)**

List of queue sharing group dispositions (parameter identifier: MQIACF\_QSG\_DISPS). This parameter is valid only on z/OS. The value can be:

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

## Inquire Channel Status

The Inquire Channel Status (MQCMD\_INQUIRE\_CHANNEL\_STATUS) command inquires about the status of one or more channel instances.

You must specify the name of the channel for which you want to inquire status information. This name can be a specific channel name or a generic channel name. By using a generic channel name, you can inquire either:

- Status information for all channels, or
- Status information for one or more channels that match the specified name.

You must also specify whether you want:

- The status data (of current channels only), or
- The saved status data of all channels, or
- On z/OS only, the short status data of the channel.

Status for all channels that meet the selection criteria is returned, whether the channels were defined manually or automatically.

## Selection

The way to make a selection, is to use one of the following four options:

- **XmitQname** (MQCACH\_XMIT\_Q\_NAME)
- **ConnectionName** (MQCACH\_CONNECTION\_NAME)
-  **ChannelDisposition** (MQIACH\_CHANNEL\_DISP)
- **ChannelInstanceType** (MQIACH\_CHANNEL\_INSTANCE\_TYPE)

 This command includes a check on the current depth of the transmission queue for the channel, if the channel is a CLUSSDR channel. To issue this command, you must be authorized to inquire the queue depth, and to do this requires *+inq* authority on the transmission queue. Note that another name for this authority is MQZAO\_INQUIRE.

 Without this authority this command runs without error, but a value of zero is output for the **MsgsAvailable** parameter of the “[Inquire Channel Status \(Response\)](#)” on page 1624 command. If you have the correct authority, the command provides the correct value for **MsgsAvailable**.

There are three classes of data available for channel status. These classes are **saved**, **current**, and **short**. The status fields available for saved data are a subset of the fields available for current data and are called **common** status fields. Although the common data *fields* are the same, the data *values* might be different for saved and current status. The rest of the fields available for current data are called **current-only** status fields.

- **Saved** data consists of the common status fields. This data is reset at the following times:
  - For all channels:
    - When the channel enters or leaves STOPPED or RETRY state
  - For a sending channel:
    - Before requesting confirmation that a batch of messages has been received
    - When confirmation has been received
  - For a receiving channel:
    - Just before confirming that a batch of messages has been received
  - For a server connection channel:
    - No data is saved

Therefore, a channel which has never been current does not have any saved status.

- **Current** data consists of the common status fields and current-only status fields. The data fields are continually updated as messages are sent or received.
- **Short** data consists of the queue manager name that owns the channel instance. This class of data is available only on z/OS.

This method of operation has the following consequences:

- An inactive channel might not have any saved status if it has never been current or has not yet reached a point where saved status is reset.
- The "common" data fields might have different values for saved and current status.
- A current channel always has current status and might have saved status.

Channels can be current or inactive:

#### **Current channels**

These are channels that have been started, or on which a client has connected, and that have not finished or disconnected normally. They might not yet have reached the point of transferring messages, or data, or even of establishing contact with the partner. Current channels have **current** status and can also have **saved** or **short** status.

The term **Active** is used to describe the set of current channels which are not stopped.

#### **Inactive channels**

These are channels that have either not been started or on which a client has not connected, or that have finished or disconnected normally. (If a channel is stopped, it is not yet considered to have finished normally and is, therefore, still current.) Inactive channels have either **saved** status or no status at all.

There can be more than one instance of a receiver, requester, cluster-sender, cluster-receiver, or server-connection channel current at the same time (the requester is acting as a receiver). This situation occurs if several senders, at different queue managers, each initiate a session with this receiver, using the same channel name. For channels of other types, there can only be one instance current at any time.

For all channel types, however, there can be more than one set of saved status information available for a particular channel name. At most one of these sets relates to a current instance of the channel, the rest relate to previously current instances. Multiple instances arise if different transmission queue names or connection names have been used with the same channel. This situation can happen in the following cases:

- At a sender or server:
  - If the same channel has been connected to by different requesters (servers only),
  - If the transmission queue name has been changed in the definition, or
  - If the connection name has been changed in the definition.
- At a receiver or requester:
  - If the same channel has been connected to by different senders or servers, or
  - If the connection name has been changed in the definition (for requester channels initiating connection).

The number of sets returned for a particular channel can be limited by using the **XmitQName**, **ConnectionName** and **ChannelInstanceType** parameters.

### **Required parameters**

#### **ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The channel name is always returned, regardless of the instance attributes requested.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

## Optional parameters

### ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH\_CHANNEL\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels for which information is to be returned. The value can be any of the following values:

#### **MQCHLD\_ALL**

Returns requested status information for private channels.

In a shared queue environment where the command is being executed on the queue manager where it was issued, or if *ChannelInstanceType* has a value of MQOT\_CURRENT\_CHANNEL, this option also displays the requested status information for shared channels.

#### **MQCHLD\_PRIVATE**

Returns requested status information for private channels.

#### **MQCHLD\_SHARED**

Returns requested status information for shared channels.

The status information that is returned for various combinations of *ChannelDisposition*, *CommandScope*, and status type, is summarized in [Table 319 on page 1611](#), [Table 320 on page 1611](#), and [Table 321 on page 1612](#).

<b>ChannelDisposition</b>	<b>CommandScope blank or local queue manager</b>	<b>CommandScope (qmgr-name)</b>	<b>CommandScope (*)</b>
MQCHLD_PRIVATE	Common and current-only status for current private channels on the local queue manager	Common and current-only status for current private channels on the named queue manager	Common and current-only status for current private channels on all queue managers
MQCHLD_SHARED	Common and current-only status for current shared channels on the local queue manager	Common and current-only status for current shared channels on the named queue manager	Common and current-only status for current shared channels on all queue managers
MQCHLD_ALL	Common and current-only status for current private and shared channels on the local queue manager	Common and current-only status for current private and shared channels on the named queue manager	Common and current-only status for current private and shared channels on all active queue managers

<b>ChannelDisposition</b>	<b>CommandScope blank or local queue manager</b>	<b>CommandScope (qmgr-name)</b>	<b>CommandScope (*)</b>
MQCHLD_PRIVATE	<i>ChannelStatus</i> and short status for current private channels on the local queue manager	<i>ChannelStatus</i> and short status for current private channels on the named queue manager	<i>ChannelStatus</i> and short status for current private channels on all active queue managers

<b>ChannelDisposition</b>	<b>CommandScope blank or local queue manager</b>	<b>CommandScope (qmgr-name)</b>	<b>CommandScope (*)</b>
MQCHLD_SHARED	ChannelStatus and short status for current shared channels on all active queue managers in the queue sharing group	Not permitted	Not permitted
MQCHLD_ALL	ChannelStatus and short status for current private channels on the local queue manager and current shared channels in the queue sharing group( "1" on page 1612 )	ChannelStatus and short status for current private channels on the named queue manager	ChannelStatus and short status for current private, and shared, channels on all active queue managers in the queue sharing group( "1" on page 1612 )

**Note:**

1. In this case you get two separate sets of responses to the command on the queue manager where it was entered; one for MQCHLD\_PRIVATE and one for MQCHLD\_SHARED.

<b>ChannelDisposition</b>	<b>CommandScope blank or local queue manager</b>	<b>CommandScope (qmgr-name)</b>	<b>CommandScope (*)</b>
MQCHLD_PRIVATE	Common status for saved private channels on the local queue manager	Common status for saved private channels on the named queue manager	Common status for saved private channels on all active queue managers
MQCHLD_SHARED	Common status for saved shared channels on all active queue managers in the queue sharing group	Not permitted	Not permitted
MQCHLD_ALL	Common status for saved private channels on the local queue manager and saved shared channels in the queue sharing group	Common status for saved private channels on the named queue manager	Common status for saved private, and shared, channels on all active queue managers in the queue sharing group

You cannot use this parameter as a filter keyword.

**ChannelInstanceAttrs (MQCFIL)**

Channel instance attributes (parameter identifier: MQIACH\_CHANNEL\_INSTANCE\_ATTRS).

The **ChannelInstanceAttrs** parameter names the list of attributes to be returned. This parameter does not provide any way to select, based upon the value of the items in that list of attributes.

If status information is requested which is not relevant for the particular channel type, it is not an error. Similarly, it is not an error to request status information that is applicable only to active channels for saved channel instances. In both of these cases, no structure is returned in the response for the information concerned.

For a saved channel instance, the MQCACH\_CURRENT\_LUWID, MQIACH\_CURRENT\_MSGS, and MQIACH\_CURRENT\_SEQ\_NUMBER attributes have meaningful information only if the channel instance is in doubt. However, the attribute values are still returned when requested, even if the channel instance is not in-doubt.

The attribute list might specify the following value on its own:

**MQIACF\_ALL**

All attributes.

MQIACF\_ALL is the default value used if the parameter is not specified or it can specify a combination of the following:

- Relevant for common status:

The following information applies to all sets of channel status, whether the set is current.

**MQCACH\_CHANNEL\_NAME**

Channel name.

**MQCACH\_CONNECTION\_NAME**

Connection name.

**MQCACH\_CURRENT\_LUWID**

Logical unit of work identifier for current batch.

**MQCACH\_LAST\_LUWID**

Logical unit of work identifier for last committed batch.

**MQCACH\_XMIT\_Q\_NAME**

Transmission queue name.

**MQIACH\_CHANNEL\_INSTANCE\_TYPE**

Channel instance type.

**MQIACH\_CHANNEL\_TYPE**

Channel type.

**MQIACH\_CURRENT\_MSGS**

Number of messages sent or received in current batch.

**MQIACH\_CURRENT\_SEQ\_NUMBER**

Sequence number of last message sent or received.

**MQIACH\_INDOUBT\_STATUS**

Whether the channel is currently in-doubt.

**MQIACH\_LAST\_SEQ\_NUMBER**

Sequence number of last message in last committed batch.

MQCACH\_CURRENT\_LUWID, MQCACH\_LAST\_LUWID, MQIACH\_CURRENT\_MSGS, MQIACH\_CURRENT\_SEQ\_NUMBER, MQIACH\_INDOUBT\_STATUS and MQIACH\_LAST\_SEQ\_NUMBER do not apply to server-connection channels, and no values are returned. If specified on the command, they are ignored.

- Relevant for current-only status:

The following information applies only to current channel instances. The information applies to all channel types, except where stated.

**MQCA\_Q\_MGR\_NAME**

Name of the queue manager that owns the channel instance. This parameter is valid only on z/OS.

**MQCA\_REMOTE\_Q\_MGR\_NAME**

Queue manager name, or queue sharing group name of the remote system. The remote queue manager name is always returned regardless of the instance attributes requested.

**MQCACH\_CHANNEL\_START\_DATE**

Date channel was started.

**MQCACH\_CHANNEL\_START\_TIME**

Time channel was started.

**MQCACH\_LAST\_MSG\_DATE**

Date last message was sent, or MQI call was handled.

**MQCACH\_LAST\_MSG\_TIME**

Time last message was sent, or MQI call was handled.

**MQCACH\_LOCAL\_ADDRESS**

Local communications address for the channel.

**MQCACH\_MCA\_JOB\_NAME**

Name of MCA job.

This parameter is not valid on z/OS.

You cannot use MQCACH\_MCA\_JOB\_NAME as a parameter to filter on.

**MQCACH\_MCA\_USER\_ID**

The user ID used by the MCA.

**MQCACH\_REMOTE\_APPL\_TAG**

Remote partner application name. MQCACH\_REMOTE\_APPL\_TAG is the name of the client application at the remote end of the channel. This parameter applies only to server-connection channels.

**MQCACH\_REMOTE\_PRODUCT**

Remote partner product identifier. This is the product identifier of the IBM MQ code running at the remote end of the channel.

**MQCACH\_REMOTE\_VERSION**

Remote partner version. This is the version of the IBM MQ code running at the remote end of the channel.

**MQCACH\_SSL\_CIPHER\_SPEC**

CipherSpec in use on the connection.

**MQCACH\_SSL\_SHORT\_PEER\_NAME**

TLS short peer name.

**MQCACH\_SSL\_CERT\_ISSUER\_NAME**

The full Distinguished Name of the issuer of the remote certificate.

**z/OS MQCACH\_SSL\_CERT\_USER\_ID**

User ID associated with the remote certificate; valid on z/OS only.

**MQCACH\_TOPIC\_ROOT**

Topic root for AMQP channel.

**MQIA\_MONITORING\_CHANNEL**

The level of monitoring data collection.

**z/OS MQIA\_STATISTICS\_CHANNEL**

The level of statistics data collection; valid on z/OS only.

**MQIACF\_MONITORING**

All channel status monitoring attributes. These attributes are:

**MQIA\_MONITORING\_CHANNEL**

The level of monitoring data collection.

**MQIACH\_BATCH\_SIZE\_INDICATOR**

Batch size.

**MQIACH\_COMPRESSION\_RATE**

The compression rate achieved displayed to the nearest percentage.

**MQIACH\_COMPRESSION\_TIME**

The amount of time per message, displayed in microseconds, spent during compression or decompression.

**MQIACH\_EXIT\_TIME\_INDICATOR**

Exit time.

**MQIACH\_NETWORK\_TIME\_INDICATOR**

Network time.

**MQIACH\_XMITQ\_MSGS\_AVAILABLE**

Number of messages available to the channel on the transmission queue.

**MQIACH\_XMITQ\_TIME\_INDICATOR**

Time on transmission queue.

You cannot use MQIACF\_MONITORING as a parameter to filter on.

**MQIACH\_BATCH\_SIZE\_INDICATOR**

Batch size.

You cannot use MQIACH\_BATCH\_SIZE\_INDICATOR as a parameter to filter on.

**MQIACH\_BATCHES**

Number of completed batches.

**MQIACH\_BUFFERS\_RCVD**

Number of buffers received.

**MQIACH\_BUFFERS\_SENT**

Number of buffers sent.

**MQIACH\_BYTES\_RCVD**

Number of bytes received.

**MQIACH\_BYTES\_SENT**

Number of bytes sent.

**MQIACH\_CHANNEL\_SUBSTATE**

The channel substate.

**MQIACH\_COMPRESSION\_RATE**

The compression rate achieved displayed to the nearest percentage.

You cannot use MQIACH\_COMPRESSION\_RATE as a parameter to filter on.

**MQIACH\_COMPRESSION\_TIME**

The amount of time per message, displayed in microseconds, spent during compression or decompression.

You cannot use MQIACH\_COMPRESSION\_TIME as a parameter to filter on.

**MQIACH\_CURRENT\_SHARING\_CONVS**

Requests information about the current number of conversations on this channel instance.

This attribute applies only to TCP/IP server-connection channels.

**MQIACH\_EXIT\_TIME\_INDICATOR**

Exit time.

You cannot use MQIACH\_EXIT\_TIME\_INDICATOR as a parameter to filter on.

**MQIACH\_HDR\_COMPRESSION**

Technique used to compress the header data sent by the channel.

**MQIACH\_KEEP\_ALIVE\_INTERVAL**

The KeepAlive interval in use for this session. This parameter is significant only for z/OS.

**MQIACH\_LONG\_RETRIES\_LEFT**

Number of long retry attempts remaining.

**MQIACH\_MAX\_MSG\_LENGTH**

Maximum message length. MQIACH\_MAX\_MSG\_LENGTH is valid only on z/OS.

**MQIACH\_MAX\_SHARING\_CONVS**

Requests information about the maximum number of conversations on this channel instance.

This attribute applies only to TCP/IP server-connection channels.

**MQIACH\_MCA\_STATUS**

MCA status.

You cannot use MQIACH\_MCA\_STATUS as a parameter to filter on.

**MQIACH\_MSG\_COMPRESSION**

Technique used to compress the message data sent by the channel.

**MQIACH\_MSGS**

Number of messages sent or received, or number of MQI calls handled.

**MQIACH\_NETWORK\_TIME\_INDICATOR**

Network time.

You cannot use MQIACH\_NETWORK\_TIME\_INDICATOR as a parameter on which to filter.

**MQIACH\_SECURITY\_PROTOCOL**

Security protocol currently in use.

This parameter does not apply to client-connection channels.

  From IBM MQ 9.1.1, this parameter is supported on z/OS.

**MQIACH\_SHORT\_RETRIES\_LEFT**

Number of short retry attempts remaining.

**MQIACH\_SSL\_KEY\_RESETS**

Number of successful TLS key resets.

**MQIACH\_SSL\_RESET\_DATE**

Date of previous successful TLS secret key reset.

**MQIACH\_SSL\_RESET\_TIME**

Time of previous successful TLS secret key reset.

**MQIACH\_STOP\_REQUESTED**

Whether user stop request has been received.

**MQIACH\_XMITQ\_MSGS\_AVAILABLE**

Number of messages available to the channel on the transmission queue.

**MQIACH\_XMITQ\_TIME\_INDICATOR**

Time on transmission queue.

You cannot use MQIACH\_XMITQ\_TIME\_INDICATOR as a parameter to filter on.

The following value is supported on all platforms:

**MQIACH\_BATCH\_SIZE**

Batch size.

The following value is supported on all platforms:

**MQIACH\_HB\_INTERVAL**

Heartbeat interval (seconds).

**MQIACH\_NPM\_SPEED**

Speed of nonpersistent messages.

The following attributes do not apply to server-connection channels, and no values are returned. If specified on the command they are ignored:

- MQIACH\_BATCH\_SIZE\_INDICATOR
- MQIACH\_BATCH\_SIZE
- MQIACH\_BATCHES
- MQIACH\_LONG\_RETRIES\_LEFT
- MQIACH\_NETWORK\_TIME
- MQIACH\_NPM\_SPEED
- MQCA\_REMOTE\_Q\_MGR\_NAME
- MQIACH\_SHORT\_RETRIES\_LEFT
- MQIACH\_XMITQ\_MSGS\_AVAILABLE

– MQIACH\_XMITQ\_TIME\_INDICATOR

The following attributes apply only to server-connection channels. If specified on the command for other types of channel the attribute is ignored and no value is returned:

– MQIACH\_CURRENT\_SHARING\_CONVS  
– MQIACH\_MAX\_SHARING\_CONVS

- **z/OS** Relevant for short status:

The following parameter applies to current channels on z/OS:

#### **MQCACH\_Q\_MGR\_NAME**

Name of the queue manager that owns the channel instance.

### **ChannelInstanceType (MQCFIN)**

Channel instance type (parameter identifier: MQIACH\_CHANNEL\_INSTANCE\_TYPE).

It is always returned regardless of the channel instance attributes requested.

The value can be:

#### **MQOT\_CURRENT\_CHANNEL**

The channel status.

MQOT\_CURRENT\_CHANNEL is the default, and indicates that only current status information for active channels is to be returned.

Both common status information and active-only status information can be requested for current channels.

#### **MQOT\_SAVED\_CHANNEL**

Saved channel status.

Specify MQOT\_SAVED\_CHANNEL to cause saved status information for both active and inactive channels to be returned.

Only common status information can be returned. Active-only status information is not returned for active channels if this keyword is specified.

#### **z/OS MQOT\_SHORT\_CHANNEL**

Short channel status (valid on z/OS only).

Specify MQOT\_SHORT\_CHANNEL to cause short status information for current channels to be returned.

Other common status and current-only status information are not returned for current channels if this keyword is specified.

You cannot use MQIACH\_CHANNEL\_INSTANCE\_TYPE as a parameter to filter on.

#### **z/OS**

### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

### **ConnectionName (MQCFST)**

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

If this parameter is present, eligible channel instances are limited to those using this connection name. If it is not specified, eligible channel instances are not limited in this way.

The connection name is always returned, regardless of the instance attributes requested.

The value returned for *ConnectionName* might not be the same as in the channel definition, and might differ between the current channel status and the saved channel status. (Using *ConnectionName* for limiting the number of sets of status is therefore not recommended.)

For example, when using TCP, if *ConnectionName* in the channel definition:

- Is blank or is in *host name* format, the channel status value has the resolved IP address.
- Includes the port number, the current channel status value includes the port number (except on z/OS), but the saved channel status value does not.

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH.

### **IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ChannelInstanceAttrs* except MQIACF\_ALL and others as noted. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

### **StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ChannelInstanceAttrs* except MQCACH\_CHANNEL\_NAME and others as noted. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1903](#) for information about using this filter condition.

If you specify a string filter for **ConnectionName** or **XmitQName**, you cannot also specify the **ConnectionName** or **XmitQName** parameter.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

### **XmitQName (MQCFST)**

Transmission queue name (parameter identifier: MQCACH\_XMIT\_Q\_NAME).

If this parameter is present, eligible channel instances are limited to those using this transmission queue. If it is not specified, eligible channel instances are not limited in this way.

The transmission queue name is always returned, regardless of the instance attributes requested.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

## **Error code**

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### **Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_CHANNEL\_NAME\_ERROR**

Channel name error.

**MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

**MQRCCF\_CHL\_INST\_TYPE\_ERROR**

Channel instance type not valid.

**MQRCCF\_CHL\_STATUS\_NOT\_FOUND**

Channel status not found.

**MQRCCF\_NONE\_FOUND**

Channel status not found.

**MQRCCF\_XMIT\_Q\_NAME\_ERROR**

Transmission queue name error.

## **Inquire Channel Status (AMQP)**

The Inquire Channel Status (MQCMD\_INQUIRE\_CHANNEL\_STATUS) (AMQP) command inquires about the status of one or more AMQP channel instances.

You must specify the name of the channel for which you want to inquire status information. This name can be a specific channel name or a generic channel name. By using a generic channel name, you can inquire either:

- Status information for all channels, or
- Status information for one or more channels that match the specified name.

If the **ClientIdentifier** parameter is not specified, the output of the **Inquire Channel Status** command is a summary of statuses of all clients connected to the channel. One PCF response message is returned per channel.

If the **ClientIdentifier** parameter is specified, separate PCF response messages are returned for each client connection. The **ClientIdentifier** parameter may be a wildcard, in which the status for all clients that match the **ClientIdentifier** string is returned.

### Required parameters

#### ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects which have names that start with the selected character string. An asterisk on its own matches all possible names.

The channel name is always returned, regardless of the instance attributes requested.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

#### ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

The value must be:

**MQCHT\_AMQP**

AMQP

### Optional parameters

#### ChannelInstanceAttrs (MQCFIL)

Channel instance attributes (parameter identifier: MQIACH\_CHANNEL\_INSTANCE\_ATTRS).

The **ChannelInstanceAttrs** parameter names the list of attributes to be returned. This parameter does not provide any way to select, based upon the value of the items in that list of attributes.

The attribute list might specify the following value on its own:

**MQIACF\_ALL**

All attributes.

MQIACF\_ALL is the default value used if the parameter is not specified or it can specify a combination of the following:

- Relevant for summary status, applicable when you do not specify a **ClientIdentifier** parameter.

The following information applies:

**MQCACH\_CHANNEL\_NAME**

Channel name

**MQIACH\_CHANNEL\_TYPE**

Channel type

**MQIACF\_CONNECTION\_COUNT**

Number of connections described in the summary

**MQIACH\_CHANNEL\_STATUS**

Current status of the client

- Relevant for client details mode, applicable when you do specify a **ClientIdentifier** parameter.

The following information applies:

**MQCACH\_CHANNEL\_NAME**

Channel name

**MQIACH\_CHANNEL\_STATUS**

Current status of the client

**MQIACH\_CHANNEL\_TYPE**

Channel type

**MQCACH\_CONNECTION\_NAME**

Name of the remote connection (IP address)

**MQIACH\_AMQP\_KEEP\_ALIVE**

Keep alive interval of the client

**MQCACH\_MCA\_USER\_ID**

Message channel agent user Id

**MQIACH\_MSGS\_SENT**

Number of messages sent by the client since it last connected

**MQIACH\_MSGS\_RECEIVED or MQIACH\_MSGS\_RCVD**

Number of messages received by the client since it last connected

**MQCACH\_LAST\_MSG\_DATE**

Date last message was received or sent

**MQCACH\_LAST\_MSG\_TIME**

Time last message was received or sent

**MQCACH\_CHANNEL\_START\_DATE**

Date channel started

**MQCACH\_CHANNEL\_START\_TIME**

Time channel started

**ClientIdentifier (MQCFST)**

The ClientId of the client (parameter identifier: MQCACH\_CLIENT\_ID).

The maximum length of the string is MQ\_CLIENT\_ID\_LENGTH.

**Summary mode**

If you do not specify a **ClientIdentifier** parameter, the following fields are returned:

**MQCACH\_CHANNEL\_NAME**

The channel name.

**MQIACH\_CHANNEL\_TYPE**

The channel type of AMQP.

**MQIACF\_CONNECTION\_COUNT**

The number of connections described in the summary.

**MQIACH\_CHANNEL\_STATUS**

The current status of the client.

**Client details mode**

If you specify a **ClientIdentifier** parameter, the following fields are returned:

**MQIACH\_CHANNEL\_STATUS**

The current status of the client.

**MQCACH\_CONNECTION\_NAME**

The name of the remote connection, that is, the IP address.

**MQIACH\_AMQP\_KEEP\_ALIVE**

The keep alive interval of the client.

**MQCACH\_MCA\_USER\_ID**

Message channel agent user Id.

**MQIACH\_MSGS\_SENT**

Number of messages sent by the client since it last connected.

**MQIACH\_MSGS\_RECEIVED or MQIACH\_MSGS\_RCVD**

Number of messages received by the client since it last connected.

**MQCACH\_LAST\_MSG\_DATE**

Date last message was received or sent.

**MQCACH\_LAST\_MSG\_TIME**

Time last message was received or sent.

**MQCACH\_CHANNEL\_START\_DATE**

Date channel started.

**MQCACH\_CHANNEL\_START\_TIME**

Time channel was started.

**MQIACH\_PROTOCOL**

AMQP protocol supported by this channel.

**Error code**

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_CHANNEL\_NAME\_ERROR**

Channel name error.

**MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

**MQRCCF\_CHL\_INST\_TYPE\_ERROR**

Channel instance type not valid.

**MQRCCF\_CHL\_STATUS\_NOT\_FOUND**

Channel status not found.

**MQRCCF\_XMIT\_Q\_NAME\_ERROR**

Transmission queue name error.

The Inquire Channel Status (MQCMD\_INQUIRE\_CHANNEL\_STATUS) (MQTT) command inquires about the status of one or more Telemetry channel instances.

You must specify the name of the channel for which you want to inquire status information. This name can be a specific channel name or a generic channel name. By using a generic channel name, you can inquire either:

- Status information for all channels, or
- Status information for one or more channels that match the specified name.

**Note:** The **Inquire Channel Status** command for MQ Telemetry has the potential to return a far larger number of responses than if the command was run for an IBM MQ channel. For this reason, the MQ Telemetry server does not return more responses than fit on the reply-to queue. The number of responses is limited to the value of `MAXDEPTH` parameter of the `SYSTEM.MQSC.REPLY.QUEUE` queue. When an MQ Telemetry command is truncated by the MQ Telemetry server, the `AMQ8492` message is displayed specifying how many responses are returned based on the size of `MAXDEPTH`.

If the **ClientIdentifier** parameter is not specified, the output of the **Inquire Channel Status** command is a summary of statuses of all clients connected to the channel. One PCF response message is returned per channel.

If the **ClientIdentifier** parameter is specified, separate PCF response messages are returned for each client connection. The **ClientIdentifier** parameter may be a wildcard, in which the status for all clients that match the **ClientIdentifier** string is returned (within the limits of **MaxResponses** and **ResponseRestartPoint** if they are set).

## Required parameters

### ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects which have names that start with the selected character string. An asterisk on its own matches all possible names.

This parameter is allowed for only when the **ResponseType** parameter is set to MQRESP\_TOTAL.

The channel name is always returned, regardless of the instance attributes requested.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

### ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

The value must be:

**MQCHT\_MQTT**

Telemetry.

## Optional parameters

### ClientIdentifier (MQCFST)

The ClientId of the client (parameter identifier: MQCACH\_CLIENT\_ID).

### MaxResponses (MQCFIN)

The maximum number of clients to return status for (parameter identifier: MQIA\_MAX\_RESPONSES).

This parameter is only allowed when the **ClientIdentifier** parameter is specified.

### ResponseRestartPoint (MQCFIN)

The first client to return status for (parameter identifier: MQIA\_RESPONSE\_RESTART\_POINT). The combination of this parameter with **MaxResponses** enables the range of clients to be specified.

This parameter is only allowed when the **ClientIdentifier** parameter is specified.

## Client details mode

### STATUS

The current status of the client (parameter identifier: MQIACH\_CHANNEL\_STATUS).

### CONNNAME

The name of the remote connection (ip address) (parameter identifier: MQCACH\_CONNECTION\_NAME).

### KAIN

The keep alive interval of the client (parameter identifier: MQIACH\_KEEP\_ALIVE\_INTERVAL).

### MCANAME

Message channel agent name (parameter identifier: MQCACH\_MCA\_USER\_ID).

### MSGSNT

Number of messages sent by the client since it last connected (parameter identifier: MQIACH\_MSGS\_SENT).

### MSGRCVD

Number of messages received by the client since it last connected (parameter identifier: MQIACH\_MSGS\_RECEIVED / MQIACH\_MSGS\_RCVD).

### INDOUBTIN

Number of in doubt, inbound messages to the client (parameter identifier: MQIACH\_IN\_DOUBT\_IN).

### INDOUBTOUT

Number of in doubt, outbound messages to the client (parameter identifier: MQIACH\_IN\_DOUBT\_OUT).

### PENDING

Number of outbound pending messages (parameter identifier: MQIACH\_PENDING\_OUT).

### LMSGDATE

Date last message was received or sent (parameter identifier: MQCACH\_LAST\_MSG\_DATE).

### LMSGTIME

Time last message was received or sent (parameter identifier: MQCACH\_LAST\_MSG\_TIME).

### CHLSDATE

Date channel started (parameter identifier: MQCACH\_CHANNEL\_START\_DATE).

### CHLSTIME

Time channel was started (parameter identifier: MQCACH\_CHANNEL\_START\_TIME).

## Error code

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands”](#) on page 1374.

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_CHANNEL\_NAME\_ERROR**

Channel name error.

#### **MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

#### **MQRCCF\_CHL\_INST\_TYPE\_ERROR**

Channel instance type not valid.

#### **MQRCCF\_CHL\_STATUS\_NOT\_FOUND**

Channel status not found.

#### **MQRCCF\_XMIT\_Q\_NAME\_ERROR**

Transmission queue name error.

## Inquire Channel Status (Response)

The response to the Inquire Channel Status (MQCMD\_INQUIRE\_CHANNEL\_STATUS) command consists of the response header followed by several structures.

These structures are

- The *ChannelName* structure
-  The *ChannelDisposition* structure (on z/OS only),
- The *ChannelInstanceType* structure
- The *ChannelStatus* structure (except on z/OS channels whose **ChannelInstanceType** parameter has a value of MQOT\_SAVED\_CHANNEL).
- The **ChannelType** structure
- The **ConnectionName** structure
- The **RemoteApplTag** structure
- The **RemoteQMgrName** structure
- The **StopRequested** structure
- The **XmitQName** structure

which are then followed by the requested combination of status attribute parameter structures. One such message is generated for each channel instance found that matches the criteria specified on the command.

 On z/OS, if the value for *BytesSent* or *BytesReceived* exceeds 999999999, it is wrapped.

### Always returned:

 *ChannelDisposition* , *ChannelInstanceType* , *ChannelName* , *ChannelStatus* , *ChannelType* , *ConnectionName* , *RemoteApplTag* , *RemoteQMgrName* , *StopRequested* , *SubState* , *XmitQName*

### Returned if requested:

*Batches* , *BatchSize* , *BatchSizeIndicator* , *BuffersReceived* , *BuffersSent* , *BytesReceived* , *BytesSent* , *ChannelMonitoring* , *ChannelStartDate* , *ChannelStartTime* , *CompressionRate* , *CompressionTime* , *CurrentLUWID* , *CurrentMsgs* , *CurrentSequenceNumber* , *CurrentSharingConversations* , *ExitTime* , *HeaderCompression* , *HeartbeatInterval* , *InDoubtStatus* , *KeepAliveInterval* , *LastLUWID* , *LastMsgDate* , *LastMsgTime* , *LastSequenceNumber* , *LocalAddress* , *LongRetriesLeft* , *MaxMsgLength* , *MaxSharingConversations* , *MCAJobName* , *MCAStatus* , *MCAUserIdentifier* , *MessageCompression* , *Msgs* , *MsgsAvailable* , *NetTime* , *NonPersistentMsgSpeed* , *QMgrName* , *RemoteVersion* , *RemoteProduct* , *SecurityProtocol* , *ShortRetriesLeft* , *SSLCertRemoteIssuerName* , *SSLCertUserId* , *SSLKeyResetDate* , *SSLKeyResets* , *SSLKeyResetTime* , *SSLShortPeerName* , *XQTime*

## Response data

### Batches (MQCFIN)

Number of completed batches (parameter identifier: MQIACH\_BATCHES).

### BatchSize (MQCFIN)

Negotiated batch size (parameter identifier: MQIACH\_BATCH\_SIZE).

### BatchSizeIndicator (MQCFIL)

Indicator of the number of messages in a batch (parameter identifier: MQIACH\_BATCH\_SIZE\_INDICATOR). Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned.

**BuffersReceived (MQCFIN)**

Number of buffers received (parameter identifier: MQIACH\_BUFFERS\_RCVD).

**BuffersSent (MQCFIN)**

Number of buffers sent (parameter identifier: MQIACH\_BUFFERS\_SENT).

**BytesReceived (MQCFIN)**

Number of bytes received (parameter identifier: MQIACH\_BYTES\_RCVD).

 If the value for BytesSent or BytesReceived exceeds 4294967295, it is returned as 4294967295.

**BytesSent (MQCFIN)**

Number of bytes sent (parameter identifier: MQIACH\_BYTES\_SENT).

 If the value for BytesSent or BytesReceived exceeds 4294967295, it is returned as 4294967295.

 **z/OS**

**ChannelDisposition (MQCFIN)**

Channel disposition (parameter identifier: MQIACH\_CHANNEL\_DISP). This parameter is valid only on z/OS.

The value can be any of the following values:

**MQCHLD\_PRIVATE**

Status information for a private channel.

**MQCHLD\_SHARED**

Status information for a shared channel.

**MQCHLD\_FIXSHARED**

Status information for a shared channel, tied to a specific queue manager.

**ChannelInstanceType (MQCFIN)**

Channel instance type (parameter identifier: MQIACH\_CHANNEL\_INSTANCE\_TYPE).

The value can be any of the following values:

**MQOT\_CURRENT\_CHANNEL**

Current channel status.

**MQOT\_SAVED\_CHANNEL**

Saved channel status.

 **MQOT\_SHORT\_CHANNEL**

Short channel status, only on z/OS.

**ChannelMonitoring (MQCFIN)**

Current level of monitoring data collection for the channel (parameter identifier: MQIA\_MONITORING\_CHANNEL).

The value can be any of the following values:

**MQMON\_OFF**

Monitoring for the channel is disabled.

**MQMON\_LOW**

Low rate of data collection.

**MQMON\_MEDIUM**

Medium rate of data collection.

**MQMON\_HIGH**

High rate of data collection.

**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

**ChannelStartDate (MQCFST)**

Date channel started, in the form yyyy-mm-dd (parameter identifier: MQCACH\_CHANNEL\_START\_DATE).

The maximum length of the string is MQ\_CHANNEL\_DATE\_LENGTH.

**ChannelStartTime (MQCFST)**

Time channel started, in the form hh.mm.ss (parameter identifier: MQCACH\_CHANNEL\_START\_TIME).

The maximum length of the string is MQ\_CHANNEL\_TIME\_LENGTH.

 **ChannelStatistics (MQCFIN)**

Specifies whether statistics data is to be collected for channels (parameter identifier: MQIA\_STATISTICS\_CHANNEL).

The value can be:

**MQMON\_OFF**

Statistics data collection is turned off.

**MQMON\_LOW**

Statistics data collection is turned on, with a low ratio of data collection.

**MQMON\_MEDIUM**

Statistics data collection is turned on, with a moderate ratio of data collection.

**MQMON\_HIGH**

Statistics data collection is turned on, with a high ratio of data collection.

On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

This parameter is valid only on z/OS.

**ChannelStatus (MQCFIN)**

Channel status (parameter identifier: MQIACH\_CHANNEL\_STATUS).

Channel status has the following values defined:

**MQCHS\_BINDING**

Channel is negotiating with the partner.

**MQCHS\_STARTING**

Channel is waiting to become active.

**MQCHS\_RUNNING**

Channel is transferring or waiting for messages.

**MQCHS\_PAUSED**

Channel is paused.

**MQCHS\_STOPPING**

Channel is in process of stopping.

**MQCHS\_RETRYING**

Channel is reattempting to establish connection.

**MQCHS\_STOPPED**

Channel is stopped.

**MQCHS\_REQUESTING**

Requester channel is requesting connection.

**MQCHS\_SWITCHING**

Channel is switching transmission queues.

**MQCHS\_INITIALIZING**

Channel is initializing.

**ChannelType (MQCFIN)**

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

The value can be any of the following values:

**MQCHT\_SENDER**

Sender.

**MQCHT\_SERVER**

Server.

**MQCHT\_RECEIVER**

Receiver.

**MQCHT\_REQUESTER**

Requester.

**MQCHT\_SVRCONN**

Server-connection (for use by clients).

**MQCHT\_CLNTCONN**

Client connection.

**MQCHT\_CLUSRCVR**

Cluster-receiver.

**MQCHT\_CLUSSDR**

Cluster-sender.

**CompressionRate (MQCFIL)**

The compression rate achieved displayed to the nearest percentage (parameter identifier: MQIACH\_COMPRESSION\_RATE). Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned.

**CompressionTime (MQCFIL)**

The amount of time per message, displayed in microseconds, spent during compression or decompression (parameter identifier: MQIACH\_COMPRESSION\_TIME). Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned.

**ConnectionName (MQCFST)**

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

 On Multiplatforms, the maximum length of the string is 264.

 On z/OS, the maximum length of the string is 48.

**CurrentLUWID (MQCFST)**

Logical unit of work identifier for in-doubt batch (parameter identifier: MQCACH\_CURRENT\_LUWID).

The logical unit of work identifier associated with the current batch, for a sending or a receiving channel.

For a sending channel, when the channel is in-doubt it is the LUWID of the in-doubt batch.

It is updated with the LUWID of the next batch when it is known.

The maximum length is MQ\_LUWID\_LENGTH.

### **CurrentMsgs (MQCFIN)**

Number of messages in-doubt (parameter identifier: MQIACH\_CURRENT\_MSGS).

For a sending channel, this parameter is the number of messages that have been sent in the current batch. It is incremented as each message is sent, and when the channel becomes in-doubt it is the number of messages that are in-doubt.

For a receiving channel, it is the number of messages that have been received in the current batch. It is incremented as each message is received.

The value is reset to zero, for both sending and receiving channels, when the batch is committed.

### **CurrentSequenceNumber (MQCFIN)**

Sequence number of last message in in-doubt batch (parameter identifier: MQIACH\_CURRENT\_SEQ\_NUMBER).

For a sending channel, this parameter is the message sequence number of the last message sent. It is updated as each message is sent, and when the channel becomes in-doubt it is the message sequence number of the last message in the in-doubt batch.

For a receiving channel, it is the message sequence number of the last message that was received. It is updated as each message is received.

### **CurrentSharingConversations (MQCFIN)**

Number of conversations currently active on this channel instance (parameter identifier: MQIACH\_CURRENT\_SHARING\_CONVS).

This parameter is returned only for TCP/IP server-connection channels.

A value of zero indicates that the channel instance is running in a mode before IBM WebSphere MQ 7.0, regarding:

- Administrator stop-quiet
- Heartbeating
- Read ahead
- Client asynchronous consumption

### **ExitTime (MQCFIL)**

Indicator of the time taken executing user exits per message (parameter identifier: MQIACH\_EXIT\_TIME\_INDICATOR). Amount of time, in microseconds, spent processing user exits per message. Where more than one exit is executed per message, the value is the sum of all the user exit times for a single message. Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned.

### **HeaderCompression (MQCFIL)**

Whether the header data sent by the channel is compressed (parameter identifier: MQIACH\_HDR\_COMPRESSION). Two values are returned:

- The default header data compression value negotiated for this channel.
- The header data compression value used for the last message sent. The header data compression value can be altered in a sending channels message exit. If no message has been sent, the second value is MQCOMPRESS\_NOT\_AVAILABLE.

The values can be:

#### **MQCOMPRESS\_NONE**

No header data compression is performed. MQCOMPRESS\_NONE is the default value.

#### **MQCOMPRESS\_SYSTEM**

Header data compression is performed.

**MQCOMPRESS\_NOT\_AVAILABLE**

No message has been sent by the channel.

**HeartbeatInterval (MQCFIN)**

Heartbeat interval (parameter identifier: MQIACH\_HB\_INTERVAL).

**InDoubtStatus (MQCFIN)**

Whether the channel is currently in doubt (parameter identifier: MQIACH\_INDOUBT\_STATUS).

A sending channel is only in doubt while the sending Message Channel Agent is waiting for an acknowledgment that a batch of messages, which it has sent, has been successfully received. It is not in doubt at all other times, including the period during which messages are being sent, but before an acknowledgment has been requested.

A receiving channel is never in doubt.

The value can be any of the following values:

**MQCHIDS\_NOT\_INDOUBT**

Channel is not in-doubt.

**MQCHIDS\_INDOUBT**

Channel is in-doubt.

**KeepAliveInterval (MQCFIN)**

KeepAlive interval (parameter identifier: MQIACH\_KEEP\_ALIVE\_INTERVAL). This parameter is valid only on z/OS.

**LastLUWID (MQCFST)**

Logical unit of work identifier for last committed batch (parameter identifier: MQCACH\_LAST\_LUWID).

The maximum length is MQ\_LUWID\_LENGTH.

**LastMsgDate (MQCFST)**

Date last message was sent, or MQI call was handled, in the form yyyy-mm-dd (parameter identifier: MQCACH\_LAST\_MSG\_DATE).

The maximum length of the string is MQ\_CHANNEL\_DATE\_LENGTH.

**LastMsgTime (MQCFST)**

Time last message was sent, or MQI call was handled, in the form hh.mm.ss (parameter identifier: MQCACH\_LAST\_MSG\_TIME).

The maximum length of the string is MQ\_CHANNEL\_TIME\_LENGTH.

**LastSequenceNumber (MQCFIN)**

Sequence number of last message in last committed batch (parameter identifier: MQIACH\_LAST\_SEQ\_NUMBER).

**LocalAddress (MQCFST)**

Local communications address for the channel (parameter identifier: MQCACH\_LOCAL\_ADDRESS).

The maximum length of the string is MQ\_LOCAL\_ADDRESS\_LENGTH.

**LongRetriesLeft (MQCFIN)**

Number of long retry attempts remaining (parameter identifier: MQIACH\_LONG\_RETRIES\_LEFT).

**MaxMsgLength (MQCFIN)**

Maximum message length (parameter identifier: MQIACH\_MAX\_MSG\_LENGTH). This parameter is valid only on z/OS.

**MaxSharingConversations (MQCFIN)**

Maximum number of conversations permitted on this channel instance. (parameter identifier: MQIACH\_MAX\_SHARING\_CONVS)

This parameter is returned only for TCP/IP server-connection channels.

A value of zero indicates that the channel instance is running in a mode before IBM WebSphere MQ 7.0, regarding:

- Administrator stop-quiesce
- Heartbeating
- Read ahead
- Client asynchronous consumption

#### **MCAJobName (MQCFST)**

Name of MCA job (parameter identifier: MQCACH\_MCA\_JOB\_NAME).

The maximum length of the string is MQ\_MCA\_JOB\_NAME\_LENGTH.

#### **MCAStatus (MQCFIN)**

MCA status (parameter identifier: MQIACH\_MCA\_STATUS).

The value can be any of the following values:

##### **MQMCAS\_STOPPED**

Message channel agent stopped.

##### **MQMCAS\_RUNNING**

Message channel agent running.

#### **MCAUserIdentifier (MQCFST)**

The user ID used by the MCA (parameter identifier: MQCACH\_MCA\_USER\_ID).

This parameter applies only to server-connection, receiver, requester, and cluster-receiver channels.

The maximum length of the string is MQ\_MCA\_USER\_ID\_LENGTH.

#### **MessageCompression (MQCFIL)**

Whether the message data sent by the channel is compressed (parameter identifier: MQIACH\_MSG\_COMPRESSION). Two values are returned:

- The default message data compression value negotiated for this channel.
- The message data compression value used for the last message sent. The message data compression value can be altered in a sending channels message exit. If no message has been sent, the second value is MQCOMPRESS\_NOT\_AVAILABLE.

The values can be:

##### **MQCOMPRESS\_NONE**

No message data compression is performed. MQCOMPRESS\_NONE is the default value.

##### **MQCOMPRESS\_RLE**

Message data compression is performed using run-length encoding.

##### **MQCOMPRESS\_ZLIBFAST**

Message data compression is performed using ZLIB encoding with speed prioritized.

##### **MQCOMPRESS\_ZLIBHIGH**

Message data compression is performed using ZLIB encoding with compression prioritized.

##### **MQCOMPRESS\_NOT\_AVAILABLE**

No message has been sent by the channel.

#### **Msgs (MQCFIN)**

Number of messages sent or received, or number of MQI calls handled (parameter identifier: MQIACH\_MSGS).

#### **MsgsAvailable (MQCFIN)**

Number of messages available (parameter identifier: MQIACH\_XMITQ\_MSGS\_AVAILABLE). Number of messages queued on the transmission queue available to the channel for MQGETs.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned.

This parameter applies to cluster sender channels only.

**NetTime (MQCFIL)**

Indicator of the time of a network operation (parameter identifier: MQIACH\_NETWORK\_TIME\_INDICATOR). Amount of time, in microseconds, to send a request to the remote end of the channel and receive a response. This time only measures the network time for such an operation. Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned.

**NonPersistentMsgSpeed (MQCFIN)**

Speed at which nonpersistent messages are to be sent (parameter identifier: MQIACH\_NPM\_SPEED).

The value can be any of the following values:

**MQNPMS\_NORMAL**

Normal speed.

**MQNPMS\_FAST**

Fast speed.

**QMgrName (MQCFST)**

Name of the queue manager that owns the channel instance (parameter identifier: MQCA\_Q\_MGR\_NAME). This parameter is valid only on z/OS.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

**RemoteApplTag (MQCFST)**

The remote partner application name. This parameter is the name of the client application at the remote end of the channel. This parameter applies only to server-connection channels (parameter identifier: MQCACH\_REMOTE\_APPL\_TAG).

**RemoteProduct (MQCFST)**

The remote partner product identifier. This parameter is the product identifier of the IBM MQ code running at the remote end of the channel (parameter identifier: MQCACH\_REMOTE\_PRODUCT).

The possible values are shown in the following table:

Product Identifier	Description
MQMM	Queue Manager (non z/OS Platform)
MQMV	Queue Manager on z/OS
MQCC	IBM MQ C client
MQNM	IBM MQ .NET fully managed client
MQJB	IBM MQ Classes for JAVA
MQJM	IBM MQ Classes for JMS (normal mode)
MQJN	IBM MQ Classes for JMS (migration mode)
MQJU	Common Java interface to the MQI
MQXC	XMS client C/C++ (normal mode)
MQXD	XMS client C/C++ (migration mode)
MQXN	XMS client .NET (normal mode)
MQXM	XMS client .NET (migration mode)
MQXU	IBM MQ .NET XMS client (unmanaged/XA)

Table 322. Product Identifier values (continued)

Product Identifier	Description
MQNU	IBM MQ .NET unmanaged client

### RemoteVersion (MQCFST)

The remote partner version. This parameter is the version of the IBM MQ code running at the remote end of the channel (parameter identifier: MQCACH\_REMOTE\_VERSION).

The remote version is displayed as **VVRRMMFF**, where

#### VV

Version

#### RR

Release

#### MM

Maintenance level

#### FF

Fix level

### RemoteQMgrName (MQCFST)

Name of the remote queue manager, or queue sharing group (parameter identifier: MQCA\_REMOTE\_Q\_MGR\_NAME).

### ShortRetriesLeft (MQCFIN)

Number of short retry attempts remaining (parameter identifier: MQIACH\_SHORT\_RETRIES\_LEFT).

### SecurityProtocol (MQCFIN)

Defines the security protocol currently in use (parameter identifier: MQIACH\_SECURITY\_PROTOCOL).

Does not apply to client-connection channels.

Set automatically, based on the value you set for [SSLCipherSpecification](#).

Possible values are:

#### MQSECPROT\_NONE

No security protocol

#### MQSECPROT\_SSLV30

SSL 3.0

This protocol is deprecated. See [Deprecated CipherSpecs](#)

#### MQSECPROT\_TLSV10

TLS 1.0

#### MQSECPROT\_TLSV12

TLS 1.2

#### MQSECPROT\_TLSV13

TLS 1.3

  From IBM MQ 9.1.1, this parameter is supported on z/OS.

### SSLCertRemoteIssuerName (MQCFST)

The full Distinguished Name of the issuer of the remote certificate. The issuer is the certificate authority that issued the certificate (parameter identifier: MQCACH\_SSL\_CERT\_ISSUER\_NAME).

The maximum length of the string is MQ\_SHORT\_DNAME\_LENGTH.

### SSLCertUserId (MQCFST)

The local user ID associated with the remote certificate (parameter identifier: MQCACH\_SSL\_CERT\_USER\_ID).

This parameter is valid only on z/OS.

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

#### **SSLCipherSpecification (MQCFST)**

The CipherSpec that is being used by the connection (parameter identifier: MQCACH\_SSL\_CIPHER\_SPEC).

The maximum length of the string is MQ\_SSL\_CIPHER\_SPEC\_LENGTH.

For more information, see [the SSLCipherSpec property in Change, Copy, and Create Channel](#).

The value for this parameter is also used to set the value of [SecurityProtocol](#)

#### **SSLKeyResetDate (MQCFST)**

Date of the previous successful TLS secret key reset, in the form yyyy-mm-dd (parameter identifier: MQCACH\_SSL\_KEY\_RESET\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

#### **SSLKeyResets (MQCFIN)**

TLS secret key resets (parameter identifier: MQIACH\_SSL\_KEY\_RESETS).

The number of successful TLS secret key resets that have occurred for this channel instance since the channel started. If TLS secret key negotiation is enabled, the count is incremented whenever a secret key reset is performed.

#### **SSLKeyResetTime (MQCFST)**

Time of the previous successful TLS secret key reset, in the form hh.mm.ss (parameter identifier: MQCACH\_SSL\_KEY\_RESET\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

#### **SSLShortPeerName (MQCFST)**

Distinguished Name of the peer queue manager or client at the other end of the channel (parameter identifier: MQCACH\_SSL\_SHORT\_PEER\_NAME).

The maximum length is MQ\_SHORT\_DNAME\_LENGTH, so longer Distinguished Names are truncated.

#### **StopRequested (MQCFIN)**

Whether user stop request is outstanding (parameter identifier: MQIACH\_STOP\_REQUESTED).

The value can be any of the following values:

##### **MQCHSR\_STOP\_NOT\_REQUESTED**

User stop request has not been received.

##### **MQCHSR\_STOP\_REQUESTED**

User stop request has been received.

#### **SubState (MQCFIN)**

Current action being performed by the channel (parameter identifier: MQIACH\_CHANNEL\_SUBSTATE).

The value can be any of the following values:

##### **MQCHSSTATE\_CHADEXIT**

Running channel auto-definition exit.

##### **MQCHSSTATE\_COMPRESSING**

Compressing or decompressing data.

##### **MQCHSSTATE\_END\_OF\_BATCH**

End of batch processing.

##### **MQCHSSTATE\_HANDSHAKING**

TLS handshaking.

##### **MQCHSSTATE\_HEARTBEATING**

Heartbeating with partner.

##### **MQCHSSTATE\_IN\_MQGET**

Performing MQGET.

**MQCHSSTATE\_IN\_MQI\_CALL**

Executing an IBM MQ API call, other than an MQPUT or MQGET.

**MQCHSSTATE\_IN\_MQPUT**

Performing MQPUT.

**MQCHSSTATE\_MREXIT**

Running retry exit.

**MQCHSSTATE\_MSGEXIT**

Running message exit.

**MQCHSSTATE\_NAME\_SERVER**

Name server request.

**MQCHSSTATE\_NET\_CONNECTING**

Network connect.

**MQCHSSTATE\_OTHER**

Undefined state.

**MQCHSSTATE\_RCVEXIT**

Running receive exit.

**MQCHSSTATE\_RECEIVING**

Network receive.

**MQCHSSTATE\_RESYNCHING**

Resynching with partner.

**MQCHSSTATE\_SCYEXIT**

Running security exit.

**MQCHSSTATE\_SENDEXIT**

Running send exit.

**MQCHSSTATE\_SENDING**

Network send.

**MQCHSSTATE\_SERIALIZING**

Serialized on queue manager access.

**XmitQName (MQCFST)**

Transmission queue name (parameter identifier: MQCACH\_XMIT\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**XQTime (MQCFIL)**

This parameter applies to only sender, server, and cluster-sender channels.

Transmission queue time indicator (parameter identifier: MQIACH\_XMITQ\_TIME\_INDICATOR). The time, in microseconds, that messages remained on the transmission queue before being retrieved. The time is measured from when the message is put onto the transmission queue until it is retrieved to be sent on the channel and, therefore, includes any interval caused by a delay in the putting application.

Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned.

**Related reference**

[“DISPLAY CHSTATUS” on page 649](#)

Use the MQSC command DISPLAY CHSTATUS to display the status of one or more channels.

## **Inquire Channel Status (Response) (AMQP)**

The response to the Inquire Channel Status (MQCMD\_INQUIRE\_CHANNEL\_STATUS) command consists of the response header followed by the *ChannelName* structure and the requested combination of attribute parameter structures.

One PCF response message is generated for each channel instance found that matches the criteria that are specified on the command.

If the **ClientIdentifier** parameter is not specified, the output of the Inquire Channel Status command is a summary of statuses of all clients that are connected to the channel. One PCF response message is returned per channel.

### **Always returned:**

*ChannelName, ChannelStatus, ChannelType,*

If the **ClientIdentifier** parameter is specified, separate PCF response messages are returned for each client connection. The **ClientIdentifier** parameter might be a wildcard, in which the status for all clients that match the **ClientIdentifier** string is returned.

### **Always returned:**

*ChannelName, ChannelStatus, ChannelType, ClientIdentifier*

### **Returned if requested:**

*ChannelStartDate, ChannelStartTime, ClientUser, ConnectionName, Connections, KeepAliveInterval, LastMsgDate, LastMsgTime, MCAUser, MsgsReceived, MsgsSent, Protocol*

## **Response data**

### **ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

### **ChannelStartDate (MQCFST)**

Date on which the channel started, in the form yyyy-mm-dd (parameter identifier: MQCACH\_CHANNEL\_START\_DATE).

The maximum length of the string is MQ\_CHANNEL\_DATE\_LENGTH.

### **ChannelStartTime (MQCFST)**

Time at which the channel started, in the form hh.mm.ss (parameter identifier: MQCACH\_CHANNEL\_START\_TIME).

The maximum length of the string is MQ\_CHANNEL\_TIME\_LENGTH.

### **ChannelStatus (MQCFIN)**

Channel status (parameter identifier: MQIACH\_CHANNEL\_STATUS).

The value can be:

#### **MQCHS\_DISCONNECTED**

Channel is disconnected.

#### **MQCHS\_RUNNING**

Channel is transferring or waiting for messages.

### **ChannelType (MQCFIN)**

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

The value must be:

#### **MQCHT\_AMQP**

AMQP

**ClientUser (MQCFST)**

Client Id of the client (parameter identifier: MQCACH\_CLIENT\_USER\_ID).

The maximum length of the string is MQ\_CLIENT\_USER\_ID\_LENGTH.

**ConnectionName (MQCFST)**

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH.

**Connections (MQCFIN)**

Current number of AMQP connections connected to this channel (parameter identifier: MQIACF\_NAME\_LENGTH).

**KeepAliveInterval (MQCFIN)**

Keep alive interval (parameter identifier: MQIACH\_KEEP\_ALIVE\_INTERVAL).

The interval in milliseconds after which the client is disconnected because of inactivity.

**LastMsgDate (MQCFST)**

Date on which the last message was sent, or the MQI call was handled, in the form yyyy-mm-dd (parameter identifier: MQCACH\_LAST\_MSG\_DATE).

The maximum length of the string is MQ\_CHANNEL\_DATE\_LENGTH.

**LastMsgTime (MQCFST)**

Time at which the last message was sent, or the MQI call was handled, in the form hh.mm.ss (parameter identifier: MQCACH\_LAST\_MSG\_TIME).

The maximum length of the string is MQ\_CHANNEL\_TIME\_LENGTH.

**MCAUser (MQCFST)**

Message channel agent user identifier (parameter identifier: MQCACH\_MCA\_USER\_ID).

The maximum length of the MCA user identifier is MQ\_MCA\_USER\_ID\_LENGTH.

**MsgsReceived (MQCFIN64)**

Number of messages received by the client since it last connected (parameter identifier: MQIACH\_MSGS\_RECEIVED or MQIACH\_MSGS\_RCVD).

**MsgsSent (MQCFIN64)**

Number of messages sent by the client since it last connected (parameter identifier: MQIACH\_MSGS\_SENT).

**Protocol (MQCFST)**

AMQP protocol supported by this channel (parameter identifier: MQIACH\_PROTOCOL).

The value will be:

**MQPROTO\_AMQP**

AMQP

**Inquire Channel Status (Response) (MQTT)**

The response to the Inquire Channel Status (MQCMD\_INQUIRE\_CHANNEL\_STATUS) command consists of the response header followed by the *ChannelName* structure and the requested combination of attribute parameter structures.

One PCF response message is generated for each channel instance found that matches the criteria that are specified on the command.

If the **ClientIdentifier** parameter is not specified, the output of the Inquire Channel Status command is a summary of statuses of all clients that are connected to the channel. One PCF response message is returned per channel.

**Always returned:**

*ChannelName, ChannelStatus, ChannelType, Connections,*

If the **ClientIdentifier** parameter is specified, separate PCF response messages are returned for each client connection. The **ClientIdentifier** parameter might be a wildcard, in which the status for all clients that match the **ClientIdentifier** string is returned (within the limits of **MaxResponses** and **ResponseRestartPoint** if they are set).

**Always returned:**

*ChannelName, ChannelStatus, ChannelType, ClientId*

**Returned if requested:**

*ChannelStartDate, ChannelStatusTime, ClientUser, InDoubtInput, InDoubtOutput, KeepAliveInterval, LastMessageSentDate, LastMessageSentTime, MCAUser, MessagesReceived, MessagesSent, PendingOutbound, Protocol*

## Response data

### ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

### ChannelStartDate (MQCFST)

Date on which the channel started, in the form yyyy-mm-dd (parameter identifier: MQCACH\_CHANNEL\_START\_DATE).

The maximum length of the string is MQ\_CHANNEL\_DATE\_LENGTH.

### ChannelStartTime (MQCFST)

Time at which the channel started, in the form hh.mm.ss (parameter identifier: MQCACH\_CHANNEL\_START\_TIME).

The maximum length of the string is MQ\_CHANNEL\_TIME\_LENGTH.

### ChannelStatus (MQCFIN)

Channel status (parameter identifier: MQIACH\_CHANNEL\_STATUS).

The value can be:

#### **MQCHS\_DISCONNECTED**

Channel is disconnected.

#### **MQCHS\_RUNNING**

Channel is transferring or waiting for messages.

### ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

The value must be:

#### **MQCHT\_MQTT**

Telemetry.

### ClientUser (MQCFST)

ClientID of the client (parameter identifier: MQCACH\_CLIENT\_USER\_ID).

The maximum length of the string is MQ\_CLIENT\_USER\_ID\_LENGTH.

### ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH.

### Connections (MQCFIN)

Current number of MQTT connections connected to this channel (parameter identifier: MQIACH\_NAME\_LENGTH).

### InDoubtInput (MQCFIN)

The number of inbound messages to the client that are in doubt (parameter identifier: MQIACH\_IN\_DOUBT\_IN).

**InDoubtOutput (MQCFIN)**

The number of outbound messages from the client that are in doubt (parameter identifier: MQIACH\_IN\_DOUBT\_OUT).

**KeepAliveInterval (MQCFIN)**

KeepAlive interval (parameter identifier: MQIACH\_KEEP\_ALIVE\_INTERVAL).

The interval in milliseconds after which the client is disconnected because of inactivity. If the MQXR service does not receive any communication from the client within the keep alive interval, it disconnects from the client. This interval is calculated based on the MQTT keep alive time sent by the client when it connects. The maximum size is MQ\_MQTT\_MAX\_KEEP\_ALIVE.

**LastMsgDate (MQCFST)**

Date on which the last message was sent, or the MQI call was handled, in the form yyyy-mm-dd (parameter identifier: MQCACH\_LAST\_MSG\_DATE).

The maximum length of the string is MQ\_CHANNEL\_DATE\_LENGTH.

**LastMsgTime (MQCFST)**

Time at which the last message was sent, or the MQI call was handled, in the form hh.mm.ss (parameter identifier: MQCACH\_LAST\_MSG\_TIME).

The maximum length of the string is MQ\_CHANNEL\_TIME\_LENGTH.

**MCAUser (MQCFST)**

Message channel agent user identifier (parameter identifier: MQCACH\_MCA\_USER\_ID).

The maximum length of the MCA user identifier is MQ\_MCA\_USER\_ID\_LENGTH.

**MsgsReceived (MQCFIN64)**

Number of messages received by the client since it last connected (parameter identifier: MQIACH\_MSGS\_RECEIVED / MQIACH\_MSGS\_RCVD).

**MsgsSent (MQCFIN64)**

Number of messages sent by the client since it last connected (parameter identifier: MQIACH\_MSGS\_SENT).

**PendingOutbound (MQCFIN)**

The number of outbound messages pending (parameter identifier: MQIACH\_PENDING\_OUT).

**Protocol (MQCFST)**

MQTT protocol supported by this channel (parameter identifier: MQIACH\_PROTOCOL).

Specify one or more of the following options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

MQTTv311 (constant: MQPROTO\_MQTTV311)

MQTTv3 (constant: MQPROTO\_MQTTV3)

HTTP (constant: MQPROTO\_HTTP)

**Inquire Cluster Queue Manager**

The Inquire Cluster Queue Manager (MQCMD\_INQUIRE\_CLUSTER\_Q\_MGR) command inquires about the attributes of IBM MQ queue managers in a cluster.

**Required parameters****ClusterQMgrName (MQCFST)**

Queue manager name (parameter identifier: MQCA\_CLUSTER\_Q\_MGR\_NAME).

Generic queue manager names are supported. A generic name is a character string followed by an asterisk "\*", for example ABC\*. It selects all queue managers having names that start with the selected character string. An asterisk on its own matches all possible names.

The queue manager name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

## Optional parameters

### Channel (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Specifies that eligible cluster queue managers are limited to those having the specified channel name.

Generic channel names are supported. A generic name is a character string followed by an asterisk "\*", for example ABC\*. It selects all queue managers having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

If you do not specify a value for this parameter, channel information about *all* queue managers in the cluster is returned.

### ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

Specifies that eligible cluster queue managers are limited to those having the specified cluster name.

Generic cluster names are supported. A generic name is a character string followed by an asterisk "\*", for example ABC\*. It selects all queue managers having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH.

If you do not specify a value for this parameter, cluster information about *all* queue managers inquired is returned.

### ClusterQMGrAttrs (MQCFIL)

Attributes (parameter identifier: MQIACF\_CLUSTER\_Q\_MGR\_ATTRS).

Some parameters are relevant only for cluster channels of a particular type or types. Attributes that are not relevant for a particular type of channel cause no output, and do not cause an error. To check which attributes apply to which channel types; see [Channel attributes and channel types](#).

The attribute list might specify the following value on its own. If the parameter is not specified, a default value is used.

#### **MQIACF\_ALL**

All attributes.

Alternative, supply a combination of the following values:

#### **MQCA\_ALTERATION\_DATE**

The date on which the information was last altered.

#### **MQCA\_ALTERATION\_TIME**

The time at which the information was last altered.

#### **MQCA\_CLUSTER\_DATE**

The date on which the information became available to the local queue manager.

#### **MQCA\_CLUSTER\_NAME**

The name of the cluster to which the channel belongs.

#### **MQCA\_CLUSTER\_Q\_MGR\_NAME**

The name of the cluster to which the channel belongs.

#### **MQCA\_CLUSTER\_TIME**

The time at which the information became available to the local queue manager.

#### **MQCA\_Q\_MGR\_IDENTIFIER**

The unique identifier of the queue manager.

**MQCA\_VERSION**

The version of the IBM MQ installation that the cluster queue manager is associated with.

**MQCA\_XMIT\_Q\_NAME**

The cluster transmission queue used by the queue manager.

**MQCACH\_CONNECTION\_NAME**

Connection name.

**MQCACH\_DESCRIPTION**

Description.

**MQCACH\_LOCAL\_ADDRESS**

Local communications address for the channel.

**MQCACH\_MCA\_NAME**

Message channel agent name.

You cannot use MQCACH\_MCA\_NAME as a parameter to filter on.

**MQCACH\_MCA\_USER\_ID**

MCA user identifier.

**MQCACH\_MODE\_NAME**

Mode name.

**MQCACH\_MR\_EXIT\_NAME**

Message-retry exit name.

**MQCACH\_MR\_EXIT\_USER\_DATA**

Message-retry exit user data.

**MQCACH\_MSG\_EXIT\_NAME**

Message exit name.

**MQCACH\_MSG\_EXIT\_USER\_DATA**

Message exit user data.

**MQCACH\_PASSWORD**

Password.

This parameter is not valid on z/OS.

**MQCACH\_RCV\_EXIT\_NAME**

Receive exit name.

**MQCACH\_RCV\_EXIT\_USER\_DATA**

Receive exit user data.

**MQCACH\_SEC\_EXIT\_NAME**

Security exit name.

**MQCACH\_SEC\_EXIT\_USER\_DATA**

Security exit user data.

**MQCACH\_SEND\_EXIT\_NAME**

Send exit name.

**MQCACH\_SEND\_EXIT\_USER\_DATA**

Send exit user data.

**MQCACH\_SSL\_CIPHER\_SPEC**

TLS cipher spec.

**MQCACH\_SSL\_CLIENT\_AUTH**

TLS client authentication.

**MQCACH\_SSL\_PEER\_NAME**

TLS peer name.

**MQCACH\_TP\_NAME**

Transaction program name.

**MQCACH\_USER\_ID**

User identifier.

This parameter is not valid on z/OS.

**MQIA\_MONITORING\_CHANNEL**

Online monitoring data collection.

**MQIA\_USE\_DEAD\_LETTER\_Q**

Determines whether the dead-letter queue is used when messages cannot be delivered by channels.

**MQIACF\_Q\_MGR\_DEFINITION\_TYPE**

How the cluster queue manager was defined.

**MQIACF\_Q\_MGR\_TYPE**

The function of the queue manager in the cluster.

**MQIACF\_SUSPEND**

Specifies whether the queue manager is suspended from the cluster.

**MQIACH\_BATCH\_HB**

The value being used for the batch heartbeat.

**MQIACH\_BATCH\_INTERVAL**

Batch wait interval (seconds).

**MQIACH\_BATCH\_DATA\_LIMIT**

Batch data limit (kilobytes).

**MQIACH\_BATCH\_SIZE**

Batch size.

**MQIACH\_CHANNEL\_STATUS**

Channel status.

**MQIACH\_CLWL\_CHANNEL\_PRIORITY**

Cluster workload channel priority.

**MQIACH\_CLWL\_CHANNEL\_RANK**

Cluster workload channel rank.

**MQIACH\_CLWL\_CHANNEL\_WEIGHT**

Cluster workload channel weight.

**MQIACH\_DATA\_CONVERSION**

Specifies whether sender must convert application data.

**MQIACH\_DISC\_INTERVAL**

Disconnection interval.

**MQIACH\_HB\_INTERVAL**

Heartbeat interval (seconds).

**MQIACH\_HDR\_COMPRESSION**

The list of header data compression techniques supported by the channel.

**MQIACH\_KEEP\_ALIVE\_INTERVAL**

KeepAlive interval (valid on z/OS only).

**MQIACH\_LONG\_RETRY**

Count of long duration attempts.

**MQIACH\_LONG\_TIMER**

Long duration timer.

**MQIACH\_MAX\_MSG\_LENGTH**

Maximum message length.

**MQIACH\_MCA\_TYPE**

MCA type.

**MQIACH\_MR\_COUNT**

Count of send message attempts.

**MQIACH\_MR\_INTERVAL**

Interval between attempting to resend a message in milliseconds.

**MQIACH\_MSG\_COMPRESSION**

List of message data compression techniques supported by the channel.

**MQIACH\_NETWORK\_PRIORITY**

Network priority.

**MQIACH\_NPM\_SPEED**

Speed of nonpersistent messages.

**MQIACH\_PUT\_AUTHORITY**

Put authority.

**MQIACH\_SEQUENCE\_NUMBER\_WRAP**

Sequence number wrap.

**MQIACH\_SHORT\_RETRY**

Count of short duration attempts.

**MQIACH\_SHORT\_TIMER**

Short duration timer.

**MQIACH\_XMIT\_PROTOCOL\_TYPE**

Transmission protocol type.

z/OS

z/OS

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment. The command server must be enabled.
- An asterisk " \* ". The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

**IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ClusterQMGrAttrs* except MQIACF\_ALL and others as noted. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter”](#) on page 1896 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ClusterQMGrAttrs* except MQCA\_CLUSTER\_Q\_MGR\_NAME and others as noted. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter”](#) on page 1903 for information about using this filter condition.

If you specify a string filter for *Channel* or *ClusterName*, you cannot also specify the *Channel* or *ClusterName* parameter.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

## Inquire Cluster Queue Manager (Response)

The response to the Inquire Cluster Queue Manager (MQCMD\_INQUIRE\_CLUSTER\_Q\_MGR) command consists of three parts. The response header is followed by the *QMGrName* structure and the requested combination of attribute parameter structures.

### Always returned:

*ChannelName, ClusterName, QMGrName,*

### Returned if requested:

*AlterationDate, AlterationTime, BatchHeartbeat, BatchInterval, BatchSize, ChannelDesc, ChannelMonitoring, ChannelStatus, ClusterDate, ClusterInfo, ClusterTime, CLWLChannelPriority, CLWLChannelRank, CLWLChannelWeight, ConnectionName, DataConversion, DiscInterval, HeaderCompression, HeartbeatInterval, z/OS KeepAliveInterval, LocalAddress, LongRetryCount, LongRetryInterval, MaxMsgLength, MCAName, MCAType, MCAUserIdentifier, MessageCompression, ModeName, MsgExit, MsgRetryCount, MsgRetryExit, MsgRetryInterval, MsgRetryUserData, MsgUserData, NetworkPriority, NonPersistentMsgSpeed, Password, PutAuthority, QMGrDefinitionType, QMGrIdentifier, QMGrType, ReceiveExit, ReceiveUserData, SecurityExit, SecurityUserData, SendExit, SendUserData, SeqNumberWrap, ShortRetryCount, ShortRetryInterval, SSLCipherSpec, SSLClientAuth, SSLPeerName, Suspend, TpName, TransmissionQName, TransportType, UseDLQ, UserIdentifier, Version*

## Response data

### AlterationDate (MQCFST)

Alteration date, in the form yyyy-mm-dd (parameter identifier: MQCA\_ALTERATION\_DATE).

The date at which the information was last altered.

### AlterationTime (MQCFST)

Alteration time, in the form hh.mm.ss (parameter identifier: MQCA\_ALTERATION\_TIME).

The time at which the information was last altered.

### BatchHeartbeat (MQCFIN)

The value being used for the batch heartbeat (parameter identifier: MQIACH\_BATCH\_HB).

The value can be 0 - 999,999. A value of 0 indicates that the batch heartbeat is not being used.

### BatchInterval (MQCFIN)

Batch interval (parameter identifier: MQIACH\_BATCH\_INTERVAL).

### BatchSize (MQCFIN)

Batch size (parameter identifier: MQIACH\_BATCH\_SIZE).

### ChannelDesc (MQCFST)

Channel description (parameter identifier: MQCACH\_DESC).

The maximum length of the string is MQ\_CHANNEL\_DESC\_LENGTH.

### ChannelMonitoring (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA\_MONITORING\_CHANNEL).

The value can be:

**MQMON\_OFF**

Online monitoring data collection is turned off for this channel.

**MQMON\_Q\_MGR**

The value of the queue manager's **ChannelMonitoring** parameter is inherited by the channel. MQMON\_Q\_MGR is the default value.

**MQMON\_LOW**

Online monitoring data collection is turned on, with a low rate of data collection, for this channel unless the queue manager's **ChannelMonitoring** parameter is MQMON\_NONE.

**MQMON\_MEDIUM**

Online monitoring data collection is turned on, with a moderate rate of data collection, for this channel unless the queue manager's **ChannelMonitoring** parameter is MQMON\_NONE.

**MQMON\_HIGH**

Online monitoring data collection is turned on, with a high rate of data collection, for this channel unless the queue manager's **ChannelMonitoring** parameter is MQMON\_NONE.

**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

**ChannelStatus (MQCFIN)**

Channel status (parameter identifier: MQIACH\_CHANNEL\_STATUS).

The value can be:

**MQCHS\_BINDING**

Channel is negotiating with the partner.

**MQCHS\_INACTIVE**

Channel is not active.

**MQCHS\_STARTING**

Channel is waiting to become active.

**MQCHS\_RUNNING**

Channel is transferring or waiting for messages.

**MQCHS\_PAUSED**

Channel is paused.

**MQCHS\_STOPPING**

Channel is in process of stopping.

**MQCHS\_RETRYING**

Channel is reattempting to establish connection.

**MQCHS\_STOPPED**

Channel is stopped.

**MQCHS\_REQUESTING**

Requester channel is requesting connection.

**MQCHS\_INITIALIZING**

Channel is initializing.

This parameter is returned if the channel is a cluster-sender channel ( CLUSSDR ) only.

**ClusterDate (MQCFST)**

Cluster date, in the form yyyy-mm-dd (parameter identifier: MQCA\_CLUSTER\_DATE).

The date at which the information became available to the local queue manager.

**ClusterInfo (MQCFIN)**

Cluster information (parameter identifier: MQIACF\_CLUSTER\_INFO).

The cluster information available to the local queue manager.

**ClusterName (MQCFST)**

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

**ClusterTime (MQCFST)**

Cluster time, in the form hh . mm . ss (parameter identifier: MQCA\_CLUSTER\_TIME).

The time at which the information became available to the local queue manager.

**CLWLChannelPriority (MQCFIN)**

Channel priority (parameter identifier: MQIACH\_CLWL\_CHANNEL\_PRIORITY).

**CLWLChannelRank (MQCFIN)**

Channel rank (parameter identifier: MQIACH\_CLWL\_CHANNEL\_RANK).

**CLWLChannelWeight (MQCFIN)**

Channel weighting (parameter identifier: MQIACH\_CLWL\_CHANNEL\_WEIGHT).

**ConnectionName (MQCFST)**

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH. On z/OS, it is MQ\_LOCAL\_ADDRESS\_LENGTH.

**DataConversion (MQCFIN)**

Specifies whether sender must convert application data (parameter identifier: MQIACH\_DATA\_CONVERSION).

The value can be:

**MQCDC\_NO\_SENDER\_CONVERSION**

No conversion by sender.

**MQCDC\_SENDER\_CONVERSION**

Conversion by sender.

**DiscInterval (MQCFIN)**

Disconnection interval (parameter identifier: MQIACH\_DISC\_INTERVAL).

**HeaderCompression (MQCFIL)**

Header data compression techniques supported by the channel (parameter identifier: MQIACH\_HDR\_COMPRESSION). The values specified are in order of preference.

The value can be one, or more, of

**MQCOMPRESS\_NONE**

No header data compression is performed.

**MQCOMPRESS\_SYSTEM**

Header data compression is performed.

**HeartbeatInterval (MQCFIN)**

Heartbeat interval (parameter identifier: MQIACH\_HB\_INTERVAL).

**KeepAliveInterval (MQCFIN)**

KeepAlive interval (parameter identifier: MQIACH\_KEEP\_ALIVE\_INTERVAL). This parameter applies to z/OS only.

**LocalAddress (MQCFST)**

Local communications address for the channel (parameter identifier: MQCACH\_LOCAL\_ADDRESS).

The maximum length of the string is MQ\_LOCAL\_ADDRESS\_LENGTH.

**LongRetryCount (MQCFIN)**

Long retry count (parameter identifier: MQIACH\_LONG\_RETRY).

**LongRetryInterval (MQCFIN)**

Long timer (parameter identifier: MQIACH\_LONG\_TIMER).

**MaxMsgLength (MQCFIN)**

Maximum message length (parameter identifier: MQIACH\_MAX\_MSG\_LENGTH).

**MCAName (MQCFST)**

Message channel agent name (parameter identifier: MQCACH\_MCA\_NAME).

The maximum length of the string is MQ\_MCA\_NAME\_LENGTH.

**MCAType (MQCFIN)**

Message channel agent type (parameter identifier: MQIACH\_MCA\_TYPE).

The value can be:

**MQMCAT\_PROCESS**

Process.

**MQMCAT\_THREAD**

Thread (Windows only).

**MCAUserIdentifier (MQCFST)**

Message channel agent user identifier (parameter identifier: MQCACH\_MCA\_USER\_ID).

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

**MessageCompression (MQCFIL)**

Message data compression techniques supported by the channel (parameter identifier: MQIACH\_MSG\_COMPRESSION). The values specified are in order of preference.

The value can be one, or more, of:

**MQCOMPRESS\_NONE**

No message data compression is performed.

**MQCOMPRESS\_RLE**

Message data compression is performed using run-length encoding.

**MQCOMPRESS\_ZLIBFAST**

Message data compression is performed using ZLIB encoding with speed prioritized.

**MQCOMPRESS\_ZLIBHIGH**

Message data compression is performed using ZLIB encoding with compression prioritized.

**ModeName (MQCFST)**

Mode name (parameter identifier: MQCACH\_MODE\_NAME).

The maximum length of the string is MQ\_MODE\_NAME\_LENGTH.

**MsgExit (MQCFST)**

Message exit name (parameter identifier: MQCACH\_MSG\_EXIT\_NAME).

The maximum length of the string is MQ\_EXIT\_NAME\_LENGTH.

 On Multiplatforms, more than one message exit can be defined for a channel. If more than one message exit is defined, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

 On z/OS, an MQCFSL structure is always used.

**MsgRetryCount (MQCFIN)**

Message retry count (parameter identifier: MQIACH\_MR\_COUNT).

**MsgRetryExit (MQCFST)**

Message retry exit name (parameter identifier: MQCACH\_MR\_EXIT\_NAME).

The maximum length of the string is MQ\_EXIT\_NAME\_LENGTH.

**MsgRetryInterval (MQCFIN)**

Message retry interval (parameter identifier: MQIACH\_MR\_INTERVAL).

**MsgRetryUserData (MQCFST)**

Message retry exit user data (parameter identifier: MQCACH\_MR\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

**MsgUserData (MQCFST)**

Message exit user data (parameter identifier: MQCACH\_MSG\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

**Multi** On Multiplatforms, more than one message exit user data string can be defined for a channel. If more than one string is defined, the list of strings is returned in an MQCFSL structure instead of an MQCFST structure.

**z/OS** On z/OS, an MQCFSL structure is always used.

**NetworkPriority (MQCFIN)**

Network priority (parameter identifier: MQIACH\_NETWORK\_PRIORITY).

**NonPersistentMsgSpeed (MQCFIN)**

Speed at which non-persistent messages are to be sent (parameter identifier: MQIACH\_NPM\_SPEED).

The value can be:

**MQNPMS\_NORMAL**

Normal speed.

**MQNPMS\_FAST**

Fast speed.

**Password (MQCFST)**

Password (parameter identifier: MQCACH\_PASSWORD). This parameter is not available on z/OS.

If a nonblank password is defined, it is returned as asterisks. Otherwise, it is returned as blanks.

The maximum length of the string is MQ\_PASSWORD\_LENGTH. However, only the first 10 characters are used.

**PutAuthority (MQCFIN)**

Put authority (parameter identifier: MQIACH\_PUT\_AUTHORITY).

The value can be:

**MQPA\_DEFAULT**

Default user identifier is used.

**MQPA\_CONTEXT**

Context user identifier is used.

**MQPA\_ALTERNATE\_OR\_MCA**

The user identifier from the *UserIdentifier* field of the message descriptor is used. Any user ID received from the network is not used. This value is valid only on z/OS.

**MQPA\_ONLY\_MCA**

The default user identifier is used. Any user ID received from the network is not used. This value is valid only on z/OS.

**QMgrDefinitionType (MQCFIN)**

Queue manager definition type (parameter identifier: MQIACF\_Q\_MGR\_DEFINITION\_TYPE).

The value can be:

**MQQMDT\_EXPLICIT\_CLUSTER\_SENDER**

A cluster-sender channel from an explicit definition.

**MQQMDT\_AUTO\_CLUSTER\_SENDER**

A cluster-sender channel by auto-definition.

**MQQMDT\_CLUSTER\_RECEIVER**

A cluster-receiver channel.

### **MQQMDT\_AUTO\_EXP\_CLUSTER\_SENDER**

A cluster-sender channel, both from an explicit definition and by auto-definition.

### **QMgrIdentifier (MQCFST)**

Queue manager identifier (parameter identifier: MQCA\_Q\_MGR\_IDENTIFIER).

The unique identifier of the queue manager.

### **QMgrName (MQCFST)**

Queue manager name (parameter identifier: MQCA\_CLUSTER\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

### **QMgrType (MQCFIN)**

Queue manager type (parameter identifier: MQIACF\_Q\_MGR\_TYPE).

The value can be:

#### **MQQMT\_NORMAL**

A normal queue manager.

#### **MQQMT\_REPOSITORY**

A repository queue manager.

### **ReceiveExit (MQCFST)**

Receive exit name (parameter identifier: MQCACH\_RCV\_EXIT\_NAME).

The maximum length of the string is MQ\_EXIT\_NAME\_LENGTH.

**Multi** On Multiplatforms, more than one receive exit can be defined for a channel. If more than one receive exit is defined, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

**z/OS** On z/OS, an MQCFSL structure is always used.

### **ReceiveUserData (MQCFST)**

Receive exit user data (parameter identifier: MQCACH\_RCV\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

**Multi** On Multiplatforms, more than one receive exit user data string can be defined for a channel. If more than one string is defined, the list of strings is returned in an MQCFSL structure instead of an MQCFST structure.

**z/OS** On z/OS, an MQCFSL structure is always used.

### **SecurityExit (MQCFST)**

Security exit name (parameter identifier: MQCACH\_SEC\_EXIT\_NAME).

The maximum length of the string is MQ\_EXIT\_NAME\_LENGTH.

### **SecurityUserData (MQCFST)**

Security exit user data (parameter identifier: MQCACH\_SEC\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

### **SendExit (MQCFST)**

Send exit name (parameter identifier: MQCACH\_SEND\_EXIT\_NAME).

The maximum length of the string is MQ\_EXIT\_NAME\_LENGTH.

**Multi** On Multiplatforms, more than one send exit can be defined for a channel. If more than one send exit is defined, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

**z/OS** On z/OS, an MQCFSL structure is always used.

**SendUserData (MQCFST)**

Send exit user data (parameter identifier: MQCACH\_SEND\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

**Multi** On Multiplatforms, more than one send exit user data string can be defined for a channel. If more than one string is defined, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

**z/OS** On z/OS, an MQCFSL structure is always used.

**SeqNumberWrap (MQCFIN)**

Sequence wrap number (parameter identifier: MQIACH\_SEQUENCE\_NUMBER\_WRAP).

**ShortRetryCount (MQCFIN)**

Short retry count (parameter identifier: MQIACH\_SHORT\_RETRY).

**ShortRetryInterval (MQCFIN)**

Short timer (parameter identifier: MQIACH\_SHORT\_TIMER).

**SSLCipherSpec (MQCFST)**

CipherSpec (parameter identifier: MQCACH\_SSL\_CIPHER\_SPEC).

The length of the string is MQ\_SSL\_CIPHER\_SPEC\_LENGTH.

**SSLClientAuth (MQCFIN)**

Client authentication (parameter identifier: MQIACH\_SSL\_CLIENT\_AUTH).

The value can be:

**MQSCA\_REQUIRED**

Client authentication required

**MQSCA\_OPTIONAL**

Client authentication is optional.

Defines whether IBM MQ requires a certificate from the TLS client.

**SSLPeerName (MQCFST)**

Peer name (parameter identifier: MQCACH\_SSL\_PEER\_NAME).

The length of the string is MQ\_SSL\_PEER\_NAME\_LENGTH. On z/OS, it is MQ\_SHORT\_PEER\_NAME\_LENGTH.

Specifies the filter to use to compare with the distinguished name of the certificate from the peer queue manager or client at the other end of the channel. (A distinguished name is the identifier of the TLS certificate.) If the distinguished name in the certificate received from the peer does not match the SSLPEER filter, the channel does not start.

**Suspend (MQCFIN)**

Specifies whether the queue manager is suspended (parameter identifier: MQIACF\_SUSPEND).

The value can be:

**MQSUS\_NO**

The queue manager is not suspended from the cluster.

**MQSUS\_YES**

The queue manager is suspended from the cluster.

**TpName (MQCFST)**

Transaction program name (parameter identifier: MQCACH\_TP\_NAME).

The maximum length of the string is MQ\_TP\_NAME\_LENGTH.

**TranmissionQName (MQCFST)**

Transmission queue name (parameter identifier: MQCA\_XMIT\_Q\_NAME). The cluster transmission queue used by the queue manager.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### **TransportType (MQCFIN)**

Transmission protocol type (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value can be:

#### **MQXPT\_LU62**

LU 6.2.

#### **MQXPT\_TCP**

TCP.

#### **MQXPT\_NETBIOS**

NetBIOS.

#### **MQXPT\_SPX**

SPX.

#### **MQXPT\_DECNET**

DECnet.

### **UseDLQ (MQCFIN)**

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA\_USE\_DEAD\_LETTER\_Q).

### **UserIdentifier (MQCFST)**

Task user identifier (parameter identifier: MQCACH\_USER\_ID). This parameter is not available on z/OS.

The maximum length of the string is MQ\_USER\_ID\_LENGTH. However, only the first 10 characters are used.

### **Version (MQCFST)**

The version of the IBM MQ installation that the cluster queue manager is associated with. (parameter identifier: MQCA\_VERSION). The version has the format VVRRMMFF:

VV: Version

RR: Release

MM: Maintenance level

FF: Fix level

## **Multi Inquire Communication Information Object on Multiplatforms**

The Inquire Communication Information Object (MQCMD\_INQUIRE\_COMM\_INFO) command inquires about the attributes of existing IBM MQ communication information objects.

### **Required parameters:**

*CommInfoName*

### **Optional parameters:**

*CommInfoAttrs*, **IntegerFilterCommand**, **StringFilterCommand**

### **Required parameters**

#### **CommInfoName (MQCFST)**

The name of the communication information definition about which information is to be returned (parameter identifier: MQCA\_COMM\_INFO\_NAME).

The communication information name is always returned regardless of the attributes requested.

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

## Optional parameters

### ComminfoAttrs (MQCFIL)

Comminfo attributes (parameter identifier: MQIACF\_COMM\_INFO\_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQIA\_CODED\_CHAR\_SET\_ID**

CCSID for transmitted messages.

#### **MQIA\_COMM\_EVENT**

Comminfo event control.

#### **MQIA\_MCAST\_BRIDGE**

Multicast bridging.

#### **MQIA\_MONITOR\_INTERVAL**

Frequency of update for monitoring information.

#### **MQIACF\_ENCODING**

Encoding for transmitted messages.

#### **MQIACH\_MC\_HB\_INTERVAL**

Multicast heartbeat interval.

#### **MQIACH\_MSG\_HISTORY**

Amount of message history being kept.

#### **MQIACH\_MULTICAST\_PROPERTIES**

Multicast properties control.

#### **MQIACH\_NEW\_SUBSCRIBER\_HISTORY**

New subscriber history.

#### **MQIACH\_PORT**

Port Number.

#### **MQCA\_ALTERATION\_DATE**

The date on which the information was last altered.

#### **MQCA\_ALTERATION\_TIME**

The time at which the information was last altered.

#### **MQCA\_COMM\_INFO\_DESC**

Comminfo description.

#### **MQCA\_COMM\_INFO\_TYPE**

Comminfo type

#### **MQCACH\_GROUP\_ADDRESS**

Group Address.

### IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ComminfoAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you specify an integer filter for *ComminfoType* (MQIA\_COMM\_INFO\_TYPE), you cannot also specify the **ComminfoType** parameter.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

### **StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *CommInfoAttrs* except MQCA\_COMM\_INFO\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1903 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

## **Multi Inquire Communication Information Object (Response) on Multiplatforms**

The response to the Inquire Communication Information Object (MQCMD\_INQUIRE\_COMM\_INFO) command consists of the response header followed by the *CommInfoName* structure, and the requested combination of attribute parameter structures (where applicable).

If a generic communication information name was specified, one such message is generated for each object found.

### **Always returned:**

*CommInfoName*

### **Returned if requested:**

*AlterationDate, AlterationTime, Bridge, CCSID, CommEvent, Description, Encoding, GrpAddress, MonitorInterval, MulticastHeartbeat, MulticastPropControl, MsgHistory, NewSubHistory, PortNumber, Type*

## **Response data**

### **AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

### **AlterationTime (MQCFST)**

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time when the information was last altered, in the form hh.mm.ss.

### **Bridge (MQCFIN)**

Multicast Bridging (parameter identifier: MQIA\_MCAST\_BRIDGE).

Controls whether publications from applications not using Multicast are bridged to applications using multicast.

### **CCSID (MQCFIN)**

CCSID that messages are transmitted in (parameter identifier: MQIA\_CODED\_CHAR\_SET\_ID).

The coded character set identifier that messages are transmitted in.

### **CommEvent (MQCFIN)**

Event Control (parameter identifier: MQIA\_COMM\_EVENT).

Controls whether event messages are generated for multicast handles that are created using this COMMINFO object. The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

#### **MQEVR\_EXCEPTION**

Reporting of events for message reliability below the reliability threshold enabled.

**ComminfoName (MQCFST)**

The name of the communication information definition (parameter identifier: MQCA\_COMM\_INFO\_NAME).

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

**Description (MQCFST)**

Description of the communication information definition (parameter identifier: MQCA\_COMM\_INFO\_DESC).

The maximum length of the string is MQ\_COMM\_INFO\_DESC\_LENGTH.

**Encoding (MQCFIN)**

Encoding that messages are transmitted in (parameter identifier: MQIACF\_ENCODING).

The encoding that messages are transmitted in. The value can be any of the following values:

**MQENC\_AS\_PUBLISHED**

Encoding taken from published message.

**MQENC\_NORMAL****MQENC\_REVERSED****MQENC\_S390****MQENC\_TNS****GrpAddress (MQCFST)**

The group IP address or DNS name (parameter identifier: MQCACH\_GROUP\_ADDRESS).

The maximum length of the string is MQ\_GROUP\_ADDRESS\_LENGTH.

**MonitorInterval (MQCFIN)**

Frequency of monitoring (parameter identifier: MQIA\_MONITOR\_INTERVAL).

How frequently, in seconds, monitoring information is updated and event messages are generated.

**MulticastHeartbeat (MQCFIN)**

Heartbeat Interval for multicast (parameter identifier: MQIACH\_MC\_HB\_INTERVAL).

The heartbeat interval, in milliseconds, for multicast transmitters.

**MulticastPropControl (MQCFIN)**

Multicast property control (parameter identifier: MQIACH\_MULTICAST\_PROPERTIES).

Control which MQMD properties and user properties flow with the message. The value can be any of the following values:

**MQMCP\_ALL**

All MQMD and user properties.

**MQMAP\_REPLY**

Properties related to replying to messages.

**MQMAP\_USER**

Only user properties.

**MQMAP\_NONE**

No MQMD or user properties.

**MQMAP\_COMPAT**

Properties are transmitted in a format compatible with previous Multicast clients.

**MsgHistory (MQCFIN)**

Message History (parameter identifier: MQIACH\_MSG\_HISTORY).

The amount of message history, in kilobytes, that is kept by the system to handle retransmissions in the case of NACKS.

**NewSubHistory (MQCFIN)**

New Subscriber History (parameter identifier: MQIACH\_NEW\_SUBSCRIBER\_HISTORY).

Controls how much historical data a new subscriber receives. The value can be any of the following values:

**MQNSH\_NONE**

Only publications from the time of the subscription are sent.

**MQNSH\_ALL**

As much history as is known is retransmitted.

**PortNumber (MQCFIN)**

Port Number (parameter identifier: MQIACH\_PORT).

The port number to transmit on.

**Type (MQCFIN)**

The type of the communications information definition (parameter identifier: MQIA\_COMM\_INFO\_TYPE).

The value can be:

**MQCIT\_MULTICAST**

Multicast.

## Inquire Connection

The Inquire connection (MQCMD\_INQUIRE\_CONNECTION) command inquires about the applications which are connected to the queue manager, the status of any transactions that those applications are running, and the objects which the application has open.

## Required parameters

**ConnectionId (MQCFBS)**

Connection identifier (parameter identifier: MQBACF\_CONNECTION\_ID).

This parameter is the unique connection identifier associated with an application that is connected to the queue manager. Specify either this parameter **or** *GenericConnectionId*.

All connections are assigned a unique identifier by the queue manager regardless of how the connection is established.

If you need to specify a generic connection identifier, use the **GenericConnectionId** parameter instead.

The length of the string is MQ\_CONNECTION\_ID\_LENGTH.

**GenericConnectionId (MQCFBS)**

Generic specification of a connection identifier (parameter identifier: MQBACF\_GENERIC\_CONNECTION\_ID).

Specify either this parameter **or** *ConnectionId*.

If you specify a byte string of zero length, or one which contains only null bytes, information about all connection identifiers is returned. This value is the only value permitted for *GenericConnectionId*.

The length of the string is MQ\_CONNECTION\_ID\_LENGTH.

## Optional parameters

**ByteStringFilterCommand (MQCFBF)**

Byte string filter command descriptor. The parameter identifier must be MQBACF\_EXTERNAL\_UOW\_ID, MQBACF\_ORIGIN\_UOW\_ID, or MQBACF\_Q\_MGR\_UOW\_ID. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFBF - PCF byte string filter parameter” on page 1891 for information about using this filter condition.

If you specify a byte string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter, or a string filter using the **StringFilterCommand** parameter.

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_Q\_MGR\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

**ConnectionAttrs (MQCFIL)**

Connection attributes (parameter identifier: MQIACF\_CONNECTION\_ATTRS).

The attribute list can specify the following value on its own - default value if the parameter is not specified:

**MQIACF\_ALL**

All attributes of the selected *ConnInfoType*.

or, if you select a value of MQIACF\_CONN\_INFO\_CONN for *ConnInfoType*, a combination of the following:

**MQBACF\_CONNECTION\_ID**

Connection identifier.

Multi

V 9.1.3

**MQBACF\_CONN\_TAG**

Connection tag.

**MQBACF\_EXTERNAL\_UOW\_ID**

External unit of recovery identifier associated with the connection.

**MQBACF\_ORIGIN\_UOW\_ID**

Unit of recovery identifier assigned by the originator (valid on z/OS only).

**MQBACF\_Q\_MGR\_UOW\_ID**

Unit of recovery identifier assigned by the queue manager.

**MQCACF\_APPL\_TAG**

Name of an application that is connected to the queue manager.

**MQCACF\_ASID**

The 4-character address-space identifier of the application identified in MQCACF\_APPL\_TAG (valid on z/OS only).

**MQCACF\_ORIGIN\_NAME**

Originator of the unit of recovery (valid on z/OS only).

**MQCACF\_PSB\_NAME**

The 8-character name of the program specification block (PSB) associated with the running IMS transaction (valid on z/OS only).

**MQCACF\_PST\_ID**

The 4-character IMS program specification table (PST) region identifier for the connected IMS region (valid on z/OS only).

**MQCACF\_TASK\_NUMBER**

A 7-digit CICS task number (valid on z/OS only).

**MQCACF\_TRANSACTION\_ID**

A 4-character CICS transaction identifier (valid on z/OS only).

**MQCACF\_UOW\_LOG\_EXTENT\_NAME**

Name of the first extent required to recover the transaction. MQCACF\_UOW\_LOG\_EXTENT\_NAME is not valid on z/OS.

**MQCACF\_UOW\_LOG\_START\_DATE**

Date on which the transaction associated with the current connection first wrote to the log.

**MQCACF\_UOW\_LOG\_START\_TIME**

Time at which the transaction associated with the current connection first wrote to the log.

**MQCACF\_UOW\_START\_DATE**

Date on which the transaction associated with the current connection was started.

**MQCACF\_UOW\_START\_TIME**

Time at which the transaction associated with the current connection was started.

**MQCACF\_USER\_IDENTIFIER**

User identifier of the application that is connected to the queue manager.

**MQCACH\_CHANNEL\_NAME**

Name of the channel associated with the connected application.

**MQCACH\_CONNECTION\_NAME**

Connection name of the channel associated with the application.

**MQIA\_APPL\_TYPE**

Type of the application that is connected to the queue manager.

**MQIACF\_CONNECT\_OPTIONS**

Connect options currently in force for this application connection.

You cannot use the value MQCNO\_STANDARD\_BINDING as a filter value.

**MQIACF\_PROCESS\_ID**

Process identifier of the application that is currently connected to the queue manager.

This parameter is not valid on z/OS.

**MQIACF\_THREAD\_ID**

Thread identifier of the application that is currently connected to the queue manager.

This parameter is not valid on z/OS.

**MQIACF\_UOW\_STATE**

State of the unit of work.

**MQIACF\_UOW\_TYPE**

Type of external unit of recovery identifier as understood by the queue manager.

or, if you select a value of MQIACF\_CONN\_INFO\_HANDLE for *ConnInfoType*, a combination of the following:

**MQCACF\_OBJECT\_NAME**

Name of each object that the connection has open.

**MQCACH\_CONNECTION\_NAME**

Connection name of the channel associated with the application.

**MQIA\_QSG\_DISP**

Disposition of the object (valid on z/OS only).

You cannot use MQIA\_QSG\_DISP as a parameter to filter on.

**MQIA\_READ\_AHEAD**

The read ahead connection status.

**MQIA\_UR\_DISP**

The unit of recovery disposition associated with the connection (valid on z/OS only).

**MQIACF\_HANDLE\_STATE**

Whether an API call is in progress.

**MQIACF\_OBJECT\_TYPE**

Type of each object that the connection has open.

**MQIACF\_OPEN\_OPTIONS**

Options used by the connection to open each object.

or, if you select a value of MQIACF\_CONN\_INFO\_ALL for *ConnInfoType*, any of the previous values.

**ConnInfoType (MQCFIN)**

Type of connection information to be returned (parameter identifier: MQIACF\_CONN\_INFO\_TYPE).

The value can be any of the following values:

**MQIACF\_CONN\_INFO\_CONN**

Connection information. On z/OS, MQIACF\_CONN\_INFO\_CONN includes threads which might be logically or actually disassociated from a connection, together with those threads that are in-doubt and for which external intervention is needed to resolve them. MQIACF\_CONN\_INFO\_CONN is the default value used if the parameter is not specified.

**MQIACF\_CONN\_INFO\_HANDLE**

Information pertaining only to those objects opened by the specified connection.

**MQIACF\_CONN\_INFO\_ALL**

Connection information and information about those objects that the connection has open.

You cannot use *ConnInfoType* as a parameter to filter on.

**IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ConnectionAttrs* except as noted and MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. You cannot use the value MQCNO\_STANDARD\_BINDING on the MQIACF\_CONNECT\_OPTIONS parameter with either the MQCFOP\_CONTAINS or MQCFOP\_EXCLUDES operator. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you filter on MQIACF\_CONNECT\_OPTIONS or MQIACF\_OPEN\_OPTIONS, in each case the filter value must have only 1 bit set.

If you specify an integer filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or a string filter using the **StringFilterCommand** parameter.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ConnectionAttrs*. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1903](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or an integer filter using the **IntegerFilterCommand** parameter.

**URDisposition (MQCFIN)**

The unit of recovery disposition associated with the connection (parameter identifier: MQI\_UR\_DISP). This parameter is valid only on z/OS.

The value can be any of the following values:

**MQQSGD\_ALL**

Specifies that all connections must be returned.

**MQQSGD\_GROUP**

Specifies that only connections with a GROUP unit of recovery disposition must be returned.

**MQQSGD\_Q\_MGR**

Specifies that only connections with a QMGR unit of recovery disposition must be returned.

**Error code**

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands”](#) on page 1374.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_CONNECTION\_ID\_ERROR**

Connection identifier not valid.

**Inquire Connection (Response)**

The response to the Inquire Connection (MQCMD\_INQUIRE\_CONNECTION) command consists of the response header followed by the *ConnectionId* structure and a set of attribute parameter structures determined by the value of *ConnInfoType* in the Inquire command.

If the value of *ConnInfoType* was MQIACF\_CONN\_INFO\_ALL, there is one message for each connection found with MQIACF\_CONN\_INFO\_CONN, and *n* more messages per connection with MQIACF\_CONN\_INFO\_HANDLE (where *n* is the number of objects that the connection has open).

**Always returned:**

*ConnectionId*, *ConnInfoType*

**Always returned if ConnInfoType is MQIACF\_CONN\_INFO\_HANDLE:**

*ObjectName* , *ObjectType* ,  *QSGDisposition*

**Returned if requested and ConnInfoType is MQIACF\_CONN\_INFO\_CONN:**

*ApplDesc* , *ApplTag* , *ApplType* ,  *ASID* , *AsynchronousState* ,  
*ChannelName* , *ClientIdentifier* , *ConnectionName* , *ConnectionOptions* ,  
  *ConnectionTag* ,  *OriginName* ,   
*OriginUOWId* ,  *ProcessId* , *PSBName* ,  *PSTId* , *QMgrUOWId* ,  
*StartUOWLogExtent* , *TaskNumber* , *ThreadId* ,  *TransactionId* ,  
*UOWIdentifier* , *UOWLogStartDate* , *UOWLogStartTime* , *UOWStartDate* , *UOWStartTime* ,  
*UOWState* , *UOWType* ,  *URDisposition* , *UserId*

**Returned if requested and ConnInfoType is MQIACF\_CONN\_INFO\_HANDLE:**

*AsynchronousState*, *Destination*, *DestinationQueueManager*, *HandleState*,  
*OpenOptions*, *ReadAhead*, *SubscriptionID*, *SubscriptionName*, *TopicString*

**Response data****ApplDesc (MQCFST)**

Application description (parameter identifier: MQCACF\_APPL\_DESC).

The maximum length is MQ\_APPL\_DESC\_LENGTH.

**ApplTag (MQCFST)**

Application tag (parameter identifier: MQCACF\_APPL\_TAG).

The maximum length is MQ\_APPL\_TAG\_LENGTH.

**ApplType (MQCFIN)**

Application type (parameter identifier: MQIA\_APPL\_TYPE).

The value can be any of the following values:

**MQAT\_QMGR**

Queue manager process.

**MQAT\_CHANNEL\_INITIATOR**

Channel initiator.

**MQAT\_USER**

User application.

**MQAT\_BATCH**

Application using a batch connection (only on z/OS).

**MQAT\_RRS\_BATCH**

RRS-coordinated application using a batch connection (only on z/OS).

**MQAT\_CICS**

CICS transaction (only on z/OS).

**MQAT\_IMS**

IMS transaction (only on z/OS).

**MQAT\_SYSTEM\_EXTENSION**

Application performing an extension of function that is provided by the queue manager.

**ASID (MQCFST)**

Address space identifier (parameter identifier: MQCACF\_ASID).

The four character address-space identifier of the application identified by *AppLTag*. It distinguishes duplicate values of *AppLTag*.

This parameter is valid only on z/OS.

The length of the string is MQ\_ASID\_LENGTH.

**AsynchronousState (MQCFIN)**

The state of asynchronous consumption on this handle (parameter identifier: MQIACF\_ASYNC\_STATE).

The value can be:

**MQAS\_NONE**

If *ConnInfoType* is MQIACF\_CONN\_INFO\_CONN, an MQCTL call has not been issued against the handle. Asynchronous message consumption cannot currently proceed on this connection. If *ConnInfoType* is MQIACF\_CONN\_INFO\_HANDLE, an MQCB call has not been issued against this handle, so no asynchronous message consumption is configured on this handle.

**MQAS\_SUSPENDED**

The asynchronous consumption callback has been suspended so that asynchronous message consumption cannot currently proceed on this handle. This situation can be either because an MQCB or MQCTL call with *Operation* MQOP\_SUSPEND has been issued against this object handle by the application, or because it has been suspended by the system. If it has been suspended by the system, as part of the process of suspending asynchronous message consumption the callback function is called with the reason code that describes the problem resulting in suspension. This reason code is reported in the *Reason* field in the MQCBC structure passed to the callback. In order for asynchronous message consumption to proceed, the application must issue an MQCB or MQCTL call with *Operation* MQOP\_RESUME. This reason code can be returned if *ConnInfoType* is MQIACF\_CONN\_INFO\_CONN or MQIACF\_CONN\_INFO\_HANDLE.

**MQAS\_SUSPENDED\_TEMPORARY**

The asynchronous consumption callback has been temporarily suspended by the system so that asynchronous message consumption cannot currently proceed on this object handle. As part of the process of suspending asynchronous message consumption, the callback function is called with the reason code that describes the problem resulting in suspension. MQAS\_SUSPENDED\_TEMPORARY is reported in the *Reason* field in the MQCBC structure passed to the callback. The callback function is called again when

asynchronous message consumption is resumed by the system when the temporary condition has been resolved. MQAS\_SUSPENDED\_TEMPORARY is returned only if ConnInfoType is MQIACF\_CONN\_INFO\_HANDLE.

#### **MQAS\_STARTED**

An MQCTL call with *Operation* MQOP\_START has been issued against the connection handle so that asynchronous message consumption can proceed on this connection. MQAS\_STARTED is returned only if *ConnInfoType* is MQIACF\_CONN\_INFO\_CONN.

#### **MQAS\_START\_WAIT**

An MQCTL call with *Operation* MQOP\_START\_WAIT has been issued against the connection handle so that asynchronous message consumption can proceed on this connection. MQAS\_START\_WAIT is returned only if *ConnInfoType* is MQIACF\_CONN\_INFO\_CONN.

#### **MQAS\_STOPPED**

An MQCTL call with *Operation* MQOP\_STOP has been issued against the connection handle so that asynchronous message consumption cannot currently proceed on this connection. MQAS\_STOPPED is returned only if *ConnInfoType* is MQIACF\_CONN\_INFO\_CONN.

#### **MQAS\_ACTIVE**

An MQCB call has set up a function to call back to process messages asynchronously and the connection handle has been started so that asynchronous message consumption can proceed. MQAS\_ACTIVE is returned only if *ConnInfoType* is MQIACF\_CONN\_INFO\_HANDLE.

#### **MQAS\_INACTIVE**

An MQCB call has set up a function to call back to process messages asynchronously but the connection handle has not yet been started, or has been stopped or suspended, so that asynchronous message consumption cannot currently proceed. MQAS\_INACTIVE is returned only if *ConnInfoType* is MQIACF\_CONN\_INFO\_HANDLE.

#### **ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

#### **ClientId (MQCFST)**

Client identifier (parameter identifier: MQCACH\_CLIENT\_ID). The client identifier of the client that is using the connection. If there is no client identifier associated with the connection, this attribute is blank.

The maximum length of the string is MQ\_CLIENT\_ID\_LENGTH.

#### **ConnectionId (MQCFBS)**

Connection identifier (parameter identifier: MQBACF\_CONNECTION\_ID).

The length of the string is MQ\_CONNECTION\_ID\_LENGTH.

#### **ConnectionName (MQCFST)**

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH.

#### **ConnectionOptions (MQCFIL)**

Connect options currently in force for the connection (parameter identifier: MQIACF\_CONNECT\_OPTIONS).

#### **Multi**

#### **V 9.1.3 ConnectionTag (MQCFBS)**

Connection tag (parameter identifier: MQBACF\_CONN\_TAG).

Identifies related connections, which collectively represent a single instance of an application. The length of the string is MQ\_CONN\_TAG\_LENGTH.

#### **ConnInfoType (MQCFIN)**

Type of information returned (parameter identifier: MQIACF\_CONN\_INFO\_TYPE).

The value can be any of the following values:

**MQIACF\_CONN\_INFO\_CONN**

Generic information for the specified connection.

**MQIACF\_CONN\_INFO\_HANDLE**

Information pertinent only to those objects opened by the specified connection.

**Destination (MQCFST)**

The destination queue for messages published to this subscription (parameter identifier MQCACF\_DESTINATION).

This parameter is relevant only for handles of subscriptions to topics.

**DestinationQueueManager (MQCFST)**

The destination queue manager for messages published to this subscription (parameter identifier MQCACF\_DESTINATION\_Q\_MGR).

This parameter is relevant only for handles of subscriptions to topics. If *Destination* is a queue hosted on the local queue manager, this parameter contains the local queue manager name. If *Destination* is a queue hosted on a remote queue manager, this parameter contains the name of the remote queue manager.

**HandleState (MQCFIN)**

State of the handle (parameter identifier: MQIACF\_HANDLE\_STATE).

The value can be any of the following values:

**MQHSTATE\_ACTIVE**

An API call from this connection is currently in progress for this object. If the object is a queue, this condition can arise when an MQGET WAIT call is in progress.

If there is an MQGET SIGNAL outstanding, then this situation does not mean, by itself, that the handle is active.

**MQHSTATE\_INACTIVE**

No API call from this connection is currently in progress for this object. If the object is a queue, this condition can arise when no MQGET WAIT call is in progress.

**ObjectName (MQCFST)**

Object name (parameter identifier: MQCACF\_OBJECT\_NAME).

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

**ObjectType (MQCFIN)**

Object type (parameter identifier: MQIACF\_OBJECT\_TYPE).

If this parameter is a handle of a subscription to a topic, the SUBID parameter identifies the subscription and can be used with the Inquire Subscription command to find all the details about the subscription.

The value can be any of the following values:

**MQOT\_Q**

Queue.

**MQOT\_NAMELIST**

Namelist.

**MQOT\_PROCESS**

Process.

**MQOT\_Q\_MGR**

Queue manager.

**MQOT\_CHANNEL**

Channel.

**MQOT\_AUTH\_INFO**

Authentication information object.

## **MQOT\_TOPIC**

Topic.

### **OpenOptions (MQCFIN)**

Open options currently in force for the object for connection (parameter identifier: MQIACF\_OPEN\_OPTIONS).

This parameter is not relevant for a subscription. Use the SUBID field of the DISPLAY SUB command to find all the details about the subscription.

**z/OS**

### **OriginName (MQCFST)**

Origin name (parameter identifier: MQCACF\_ORIGIN\_NAME).

Identifies the originator of the unit of recovery, except where *AppType* is MQAT\_RRS\_BATCH when it is omitted.

This parameter is valid only on z/OS.

The length of the string is MQ\_ORIGIN\_NAME\_LENGTH.

**z/OS**

### **OriginUOWId (MQCFBS)**

Origin UOW identifier (parameter identifier: MQBACF\_ORIGIN\_UOW\_ID).

The unit of recovery identifier assigned by the originator. It is an 8-byte value.

This parameter is valid only on z/OS.

The length of the string is MQ\_UOW\_ID\_LENGTH.

**z/OS**

### **ProcessId (MQCFIN)**

Process identifier (parameter identifier: MQIACF\_PROCESS\_ID).

### **PSBName (MQCFST)**

Program specification block name (parameter identifier: MQCACF\_PSB\_NAME).

The 8-character name of the program specification block (PSB) associated with the running IMS transaction.

This parameter is valid only on z/OS.

The length of the string is MQ\_PSB\_NAME\_LENGTH.

**z/OS**

### **PSTId (MQCFST)**

Program specification table identifier (parameter identifier: MQCACF\_PST\_ID).

The 4-character IMS program specification table (PST) region identifier for the connected IMS region.

This parameter is valid only on z/OS.

The length of the string is MQ\_PST\_ID\_LENGTH.

### **QMGrUOWId (MQCFBS)**

Unit of recovery identifier assigned by the queue manager (parameter identifier: MQBACF\_Q\_MGR\_UOW\_ID).

**z/OS**

On z/OS platforms, this parameter is returned as an 8-byte RBA.

**Multi**

On Multiplatforms, this parameter is an 8-byte transaction identifier.

The maximum length of the string is MQ\_UOW\_ID\_LENGTH.

**QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid only on z/OS. The value can be any of the following values:

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED.

**ReadAhead (MQCFIN)**

The read ahead connection status (parameter identifier: MQIA\_READ\_AHEAD).

The value can be any of the following values:

**MQREADA\_NO**

Read ahead for browsing messages, or of non-persistent messages is not enabled for the object that the connection has open.

**MQREADA\_YES**

Read ahead for browsing messages, or of non-persistent messages is enabled for the object that the connection has open and is being used efficiently.

**MQREADA\_BACKLOG**

Read ahead for browsing messages, or of non-persistent messages is enabled for this object. Read ahead is not being used efficiently because the client has been sent many messages which are not being consumed.

**MQREADA\_INHIBITED**

Read ahead was requested by the application but has been inhibited because of incompatible options specified on the first MQGET call.

**StartUOWLogExtent (MQCFST)**

Name of the first extent needed to recover the transaction (parameter identifier: MQCACF\_UOW\_LOG\_EXTENT\_NAME).

The 8-character name of the program specification block (PSB) associated with the running IMS transaction.

This parameter is not valid on z/OS.

The maximum length of the string is MQ\_LOG\_EXTENT\_NAME\_LENGTH.

**SubscriptionID (MQCFBS)**

The internal, all time unique identifier of the subscription (parameter identifier MQBACF\_SUB\_ID).

This parameter is relevant only for handles of subscriptions to topics.

Not all subscriptions can be seen using Inquire Connection; only those subscriptions that have current handles open to the subscriptions can be seen. Use the Inquire Subscription command to see all subscriptions.

**SubscriptionName (MQCFST)**

The unique subscription name of the application associated with the handle (parameter identifier MQCACF\_SUB\_NAME).

This parameter is relevant only for handles of subscriptions to topics. Not all subscriptions have a subscription name.

**ThreadId (MQCFIN)**

Thread identifier (parameter identifier: MQIACF\_THREAD\_ID).

**TopicString (MQCFST)**

Resolved topic string (parameter identifier: MQCA\_TOPIC\_STRING).

This parameter is relevant for handles with an ObjectType of MQOT\_TOPIC. For any other object type, this parameter is blank.

**TransactionId (MQCFST)**

Transaction identifier (parameter identifier: MQCACF\_TRANSACTION\_ID).

The 4-character CICS transaction identifier.

This parameter is valid only on z/OS.

The maximum length of the string is MQ\_TRANSACTION\_ID\_LENGTH.

**UOWIdentifier (MQCFBS)**

External unit of recovery identifier associated with the connection (parameter identifier: MQBACF\_EXTERNAL UOW\_ID).

This parameter is the recovery identifier for the unit of recovery. The value of *UOWType* determines its format.

The maximum length of the byte string is MQ\_UOW\_ID\_LENGTH.

**UOWLogStartDate (MQCFST)**

Logged unit of work start date, in the form yyyy-mm-dd (parameter identifier: MQCACF\_UOW\_LOG\_START\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

**UOWLogStartTime (MQCFST)**

Logged unit of work start time, in the form hh.mm.ss (parameter identifier: MQCACF\_UOW\_LOG\_START\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

**UOWStartDate (MQCFST)**

Unit of work creation date (parameter identifier: MQCACF\_UOW\_START\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

**UOWStartTime (MQCFST)**

Unit of work creation time (parameter identifier: MQCACF\_UOW\_START\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

**UOWState (MQCFIN)**

State of the unit of work (parameter identifier: MQIACF\_UOW\_STATE).

The value can be any of the following values:

**MQUOWST\_NONE**

There is no unit of work.

**MQUOWST\_ACTIVE**

The unit of work is active.

**MQUOWST\_PREPARED**

The unit of work is in the process of being committed.

**MQUOWST\_UNRESOLVED**

The unit of work is in the second phase of a two-phase commit operation. IBM MQ holds resources on behalf of the unit of work and external intervention is required to resolve it. It might be as simple as starting the recovery coordinator (such as CICS, IMS, or RRS) or it might involve a more complex operation such as using the RESOLVE INDOUBT command. This value can occur only on z/OS.

### UOWType (MQCFIN)

Type of external unit of recovery identifier as perceived by the queue manager (parameter identifier: MQIACF\_UOW\_TYPE).

The value can be any of the following values:

**MQUOWT\_Q\_MGR**

**MQUOWT\_CICS**

**MQUOWT\_RRS**

**MQUOWT\_IMS**

**MQUOWT\_XA**

### z/OS

### URDisposition (MQCFIN)

The unit of recovery disposition associated with the connection.

This parameter is valid only on z/OS.

The value can be:

**MQQSGD\_GROUP**

This connection has a GROUP unit of recovery disposition.

**MQQSGD\_Q\_MGR**

This connection has a QMGR unit of recovery disposition.

### UserId (MQCFST)

User identifier (parameter identifier: MQCACF\_USER\_IDENTIFIER).

The maximum length of the string is MQ\_MAX\_USER\_ID\_LENGTH.

## Multi Inquire Entity Authority on Multiplatforms

The Inquire Entity Authority (MQCMD\_INQUIRE\_ENTITY\_AUTH) command inquires about authorizations of an entity to a specified object.

### Required parameters

#### EntityName (MQCFST)

Entity name (parameter identifier: MQCACF\_ENTITY\_NAME).

Depending on the value of *EntityType*, this parameter is either:

- A principal name. This name is the name of a user for whom to retrieve authorizations to the specified object. On IBM MQ for Windows, the name of the principal can optionally include a domain name, specified in this format: `user@domain`.
- A group name. This name is the name of the user group on which to make the inquiry. You can specify one name only and this name must be the name of an existing user group.

**Windows** For IBM MQ for Windows only, the group name can optionally include a domain name, specified in the following formats:

```
GroupName@domain  
domain\GroupName
```

The maximum length of the string is MQ\_ENTITY\_NAME\_LENGTH.

#### EntityType (MQCFIN)

Entity type (parameter identifier: MQIACF\_ENTITY\_TYPE).

The value can be:

**MQZAET\_GROUP**

The value of the **EntityName** parameter refers to a group name.

**MQZAET\_PRINCIPAL**

The value of the **EntityName** parameter refers to a principal name.

**ObjectType (MQCFIN)**

The type of object referred to by the profile (parameter identifier: MQIACF\_OBJECT\_TYPE).

The value can be any of the following values:

**MQOT\_AUTH\_INFO**

Authentication information.

**MQOT\_CHANNEL**

Channel object.

**MQOT\_CLNTCONN\_CHANNEL**

Client-connection channel object.

**MQOT\_COMM\_INFO**

Communication information object

**MQOT\_LISTENER**

Listener object.

**MQOT\_NAMELIST**

Namelist.

**MQOT\_PROCESS**

Process.

**MQOT\_Q**

Queue, or queues, that match the object name parameter.

**MQOT\_Q\_MGR**

Queue manager.

**MQOT\_REMOTE\_Q\_MGR\_NAME**

Remote queue manager.

**MQOT\_SERVICE**

Service object.

**MQOT\_TOPIC**

Topic object.

**Options (MQCFIN)**

Options to control the set of authority records that is returned (parameter identifier: MQIACF\_AUTH\_OPTIONS).

This parameter is required and you must set it to the value MQAUTHOPT\_CUMULATIVE. It returns a set of authorities representing the cumulative authority that an entity has to a specified object.

If a user ID is a member of more than one group, this command displays the combined authorizations of all groups.

**Optional parameters****ObjectName (MQCFST)**

Object name (parameter identifier: MQCACF\_OBJECT\_NAME).

The name of the queue manager, queue, process definition, or generic profile on which to make the inquiry.

You must include a parameter if the *ObjectType* is not MQOT\_Q\_MGR. If you do not include this parameter, it is assumed that you are making an inquiry on the queue manager.

You cannot specify a generic object name although you can specify the name of a generic profile.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

### **ProfileAttrs (MQCFIL)**

Profile attributes (parameter identifier: MQIACF\_AUTH\_PROFILE\_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQCACF\_ENTITY\_NAME**

Entity name.

#### **MQIACF\_AUTHORIZATION\_LIST**

Authorization list.

#### **MQIACF\_ENTITY\_TYPE**

Entity type.

#### **MQIACF\_OBJECT\_TYPE**

Object type.

### **ServiceComponent (MQCFST)**

Service component (parameter identifier: MQCACF\_SERVICE\_COMPONENT).

If installable authorization services are supported, this parameter specifies the name of the authorization service to which the authorizations apply.

If you omit this parameter, the authorization inquiry is made to the first installable component for the service.

The maximum length of the string is MQ\_SERVICE\_COMPONENT\_LENGTH.

### **Error codes**

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

#### **Reason (MQLONG)**

The value can be any of the following values:

##### **MQRC\_UNKNOWN\_ENTITY**

User ID not authorized, or unknown.

##### **MQRCCF\_OBJECT\_TYPE\_MISSING**

Object type missing.

## **Multi Inquire Entity Authority (Response) on Multiplatforms**

Each response to the Inquire Entity Authority (MQCMD\_INQUIRE\_AUTH\_RECS) command consists of the response header followed by the *QMgrName*, *Options*, and *ObjectName* structures and the requested combination of attribute parameter structures.

#### **Always returned:**

*ObjectName*, *Options*, *QMgrName*

#### **Returned if requested:**

*AuthorizationList*, *EntityName*, *EntityType*, *ObjectType*

### **Response data**

#### **AuthorizationList (MQCFIL)**

Authorization list (parameter identifier: MQIACF\_AUTHORIZATION\_LIST).

This list can contain zero or more authorization values. Each returned authorization value means that any user ID in the specified group or principal has the authority to perform the operation defined by that value. The value can be any of the following values:

**MQAUTH\_NONE**

The entity has authority set to 'none'.

**MQAUTH\_ALT\_USER\_AUTHORITY**

Specify an alternate user ID on an MQI call.

**MQAUTH\_BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

**MQAUTH\_CHANGE**

Change the attributes of the specified object, using the appropriate command set.

**MQAUTH\_CLEAR**

Clear a queue.

**MQAUTH\_CONNECT**

Connect the application to the specified queue manager by issuing an MQCONN call.

**MQAUTH\_CREATE**

Create objects of the specified type using the appropriate command set.

**MQAUTH\_DELETE**

Delete the specified object using the appropriate command set.

**MQAUTH\_DISPLAY**

Display the attributes of the specified object using the appropriate command set.

**MQAUTH\_INPUT**

Retrieve a message from a queue by issuing an MQGET call.

**MQAUTH\_INQUIRE**

Make an inquiry on a specific queue by issuing an MQINQ call.

**MQAUTH\_OUTPUT**

Put a message on a specific queue by issuing an MQPUT call.

**MQAUTH\_PASS\_ALL\_CONTEXT**

Pass all context.

**MQAUTH\_PASS\_IDENTITY\_CONTEXT**

Pass the identity context.

**MQAUTH\_SET**

Set attributes on a queue from the MQI by issuing an MQSET call.

**MQAUTH\_SET\_ALL\_CONTEXT**

Set all context on a queue.

**MQAUTH\_SET\_IDENTITY\_CONTEXT**

Set the identity context on a queue.

**MQAUTH\_CONTROL**

For listeners and services, start and stop the specified channel, listener, or service.

For channels, start, stop, and ping the specified channel.

For topics, define, alter, or delete subscriptions.

**MQAUTH\_CONTROL\_EXTENDED**

Reset or resolve the specified channel.

**MQAUTH\_PUBLISH**

Publish to the specified topic.

**MQAUTH\_SUBSCRIBE**

Subscribe to the specified topic.

**MQAUTH\_RESUME**

Resume a subscription to the specified topic.

**MQAUTH\_SYSTEM**

Use queue manager for internal system operations.

**MQAUTH\_ALL**

Use all operations applicable to the object.

**MQAUTH\_ALL\_ADMIN**

Use all administration operations applicable to the object.

**MQAUTH\_ALL\_MQI**

Use all MQI calls applicable to the object.

Use the *Count* field in the MQCFIL structure to determine how many values are returned.

**EntityName (MQCFST)**

Entity name (parameter identifier: MQCACF\_ENTITY\_NAME).

This parameter can either be a principal name or a group name.

The maximum length of the string is MQ\_ENTITY\_NAME\_LENGTH.

**EntityType (MQCFIN)**

Entity type (parameter identifier: MQIACF\_ENTITY\_TYPE).

The value can be:

**MQZAET\_GROUP**

The value of the **EntityName** parameter refers to a group name.

**MQZAET\_PRINCIPAL**

The value of the **EntityName** parameter refers to a principal name.

**MQZAET\_UNKNOWN**

On Windows, an authority record still exists from a previous queue manager which did not originally contain entity type information.

**ObjectName (MQCFST)**

Object name (parameter identifier: MQCACF\_OBJECT\_NAME).

The name of the queue manager, queue, process definition, or generic profile on which the inquiry is made.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

**ObjectType (MQCFIN)**

Object type (parameter identifier: MQIACF\_OBJECT\_TYPE).

The value can be:

**MQOT\_AUTH\_INFO**

Authentication information.

**MQOT\_CHANNEL**

Channel object.

**MQOT\_CLNTCONN\_CHANNEL**

Client-connection channel object.

**MQOT\_COMM\_INFO**

Communication information object

**MQOT\_LISTENER**

Listener object.

**MQOT\_NAMELIST**

Namelist.

**MQOT\_PROCESS**

Process.

**MQOT\_Q**

Queue, or queues, that match the object name parameter.

**MQOT\_Q\_MGR**

Queue manager.

**MQOT\_REMOTE\_Q\_MGR\_NAME**

Remote queue manager.

**MQOT\_SERVICE**

Service object.

**QMgrName (MQCFST)**

Name of the queue manager on which the Inquire command is issued (parameter identifier: MQCA\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

## **Inquire Group on z/OS**

The Inquire Group (MQCMD\_INQUIRE\_QSG) command inquires about the queue sharing group to which the queue manager is connected.

**Note:** This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

**Optional parameters****ObsoleteDB2Msgs (MQCFIN)**

Whether to look for obsolete Db2 messages (parameter identifier: MQIACF\_OBSOLETE\_MSGS).

The value can be any of the following values:

**MQOM\_NO**

Obsolete messages in Db2 are not looked for. MQOM\_NO is the default value used if the parameter is not specified.

**MQOM\_YES**

Obsolete messages in Db2 are looked for and messages containing information about any found are returned.

## **Inquire Group (Response) on z/OS**

The response to the Inquire Group (MQCMD\_INQUIRE\_QSG) command consists of the response header followed by the *QMgrName* structure and a number of other parameter structures. One such message is generated for each queue manager in the queue sharing group.

If there are any obsolete Db2 messages, and that information is requested, one message, identified by a value of MQCMDI\_DB2\_OBSOLETE\_MSGS in the **CommandInformation** parameter, is returned for each such message.

**Always returned for the queue manager:**

*CommandLevel, DB2ConnectStatus, DB2Name, QmgrCPF, QMgrName, QmgrNumber, QMgrStatus, QSGName*

**Always returned for obsolete Db2 messages:**

*CommandInformation, CFMsgIdentifier*

**Response data relating to the queue manager****CommandLevel (MQCFIN)**

Command level supported by the queue manager (parameter identifier: MQIA\_COMMAND\_LEVEL). The value can be any of the following values:

**MQCMDL\_LEVEL\_800**

Level 800 of system control commands.

**MQCMDL\_LEVEL\_802**

Level 802 of system control commands.

**MQCMDL\_LEVEL\_900**

Level 900 of system control commands.

**MQCMDL\_LEVEL\_901**

Level 901 of system control commands.

**MQCMDL\_LEVEL\_902**

Level 902 of system control commands.

**MQCMDL\_LEVEL\_903**

Level 903 of system control commands.

**MQCMDL\_LEVEL\_904**

Level 904 of system control commands.

**MQCMDL\_LEVEL\_905**

Level 905 of system control commands.

**MQCMDL\_LEVEL\_910**

Level 910 of system control commands.

**MQCMDL\_LEVEL\_911**

Level 911 of system control commands.

**MQCMDL\_LEVEL\_912**

Level 912 of system control commands.

**MQCMDL\_LEVEL\_913**

Level 913 of system control commands.

**MQCMDL\_LEVEL\_914**

Level 914 of system control commands.

**MQCMDL\_LEVEL\_915**

Level 915 of system control commands.

**DB2ConnectStatus (MQCFIN)**

The current status of the connection to Db2 (parameter identifier: MQIACF\_DB2\_CONN\_STATUS).

The current status of the queue manager. The value can be any of the following values:

**MQQSGS\_ACTIVE**

The queue manager is running and is connected to Db2.

**MQQSGS\_INACTIVE**

The queue manager is not running and is not connected to Db2.

**MQQSGS\_FAILED**

The queue manager is running but not connected because Db2 has terminated abnormally.

**MQQSGS\_PENDING**

The queue manager is running but not connected because Db2 has terminated normally.

**MQQSGS\_UNKNOWN**

The status cannot be determined.

**DB2Name (MQCFST)**

The name of the Db2 subsystem or group to which the queue manager is to connect (parameter identifier: MQCACF\_DB2\_NAME).

The maximum length is MQ\_DB2\_NAME\_LENGTH.

**QMGrCPF (MQCFST)**

The command prefix of the queue manager (parameter identifier: MQCACF\_Q\_MGR\_CPF).

The maximum length is MQ\_Q\_MGR\_CPF\_LENGTH.

**QMGrName (MQCFST)**

Name of the queue manager (parameter identifier: MQCA\_Q\_MGR\_NAME).

The maximum length is MQ\_Q\_MGR\_NAME\_LENGTH.

#### **QmgrNumber (MQCFIN)**

The number, generated internally, of the queue manager in the group.(parameter identifier: MQIACF\_Q\_MGR\_NUMBER).

#### **QMgrStatus (MQCFIN)**

Recovery (parameter identifier: MQIACF\_Q\_MGR\_STATUS).

The current status of the queue manager. The value can be any of the following values:

##### **MQQSGS\_ACTIVE**

The queue manager is running.

##### **MQQSGS\_INACTIVE**

The queue manager is not running, having terminated normally.

##### **MQQSGS\_FAILED**

The queue manager is not running, having terminated abnormally.

##### **MQQSGS\_CREATED**

The queue manager has been defined to the group, but has not yet been started.

##### **MQQSGS\_UNKNOWN**

The status cannot be determined.

#### **QSGName (MQCFST)**

The name of the queue sharing group (parameter identifier: MQCA\_QSG\_NAME).

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **Response data relating to obsolete Db2 messages**

#### **CFMsgIdentifier (MQCFBS)**

CF list entry identifier (parameter identifier: MQBACF\_CF\_LEID).

The maximum length is MQ\_CF\_LEID\_LENGTH.

#### **CommandInformation (MQCFIN)**

Command information (parameter identifier: MQIACF\_COMMAND\_INFO). This indicates whether queue managers in the group contain obsolete messages. The value is MQCMDI\_DB2\_OBSOLETE\_MSGS.

## **Inquire Log on z/OS**

The Inquire Log (MQCMD\_INQUIRE\_LOG) command returns log system parameters and information.

### **Optional parameters**

#### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## MQCMD\_INQUIRE\_LOG (Inquire Log) Response on z/OS

The response to the Inquire Log (MQCMD\_INQUIRE\_LOG) PCF command consists of the response header followed by the *ParameterType* structure and the combination of attribute parameter structures determined by the value of *ParameterType*.

### Always returned:

*ParameterType*. Specifies the type of archive information being returned. The value can be any of the following values:

#### **MQSYSP\_TYPE\_INITIAL**

The initial settings of the log parameters.

#### **MQSYSP\_TYPE\_SET**

The settings of the log parameters if they have been altered since their initial setting.

#### **MQSYSP\_TYPE\_LOG\_COPY**

Information relating to the active log copy.

#### **MQSYSP\_TYPE\_LOG\_STATUS**

Information relating to the status of the logs.

### Returned if *ParameterType* is MQSYSP\_TYPE\_INITIAL (one message is returned):

*DeallocateInterval* , *DualArchive* , *DualActive* , *DualBSDS* , *InputBufferSize* , *LogArchive* , *LogCompression* , *MaxArchiveLog* , *MaxConcurrentOffloads* , *MaxReadTapeUnits* , *OutputBufferCount* , *OutputBufferSize* , *ZHyperWrite*

### Returned if *ParameterType* is MQSYSP\_TYPE\_SET and any value is set (one message is returned):

*DeallocateInterval* , *DualArchive* , *DualActive* , *DualBSDS* , *InputBufferSize* , *LogArchive* , *MaxArchiveLog* , *MaxConcurrentOffloads* , *MaxReadTapeUnits* , *OutputBufferCount* , *OutputBufferSize* ,  *ZHyperWrite*

### Returned if *ParameterType* is MQSYSP\_TYPE\_LOG\_COPY (one message is returned for each log copy):

*DataSetName* , *LogCopyNumber* , *LogUsed* , *ZHyperWrite* ,  *Encrypted*

### Returned if *ParameterType* is MQSYSP\_TYPE\_LOG\_STATUS (one message is returned):

*FullLogs* , *LogCompression* , *LogRBA* , *LogSuspend* , *OffloadStatus* , *QMgrStartDate* , *QMgrStartRBA* , *QMgrStartTime* , *TotalLogs*

## Response data - log parameter information

### **DeallocateInterval (MQCFIN)**

Deallocation interval (parameter identifier: MQIACF\_SYSP\_DEALLOC\_INTERVAL).

Specifies the length of time, in minutes, that an allocated archive read tape unit is allowed to remain unused before it is deallocated. The value can be in the range zero through 1440. If it is zero, the tape unit is deallocated immediately. If it is 1440, the tape unit is never deallocated.

### **DualActive (MQCFIN)**

Specifies whether dual logging is being used (parameter identifier: MQIACF\_SYSP\_DUAL\_ACTIVE).

The value can be any of the following values:

#### **MQSYSP\_YES**

Dual logging is being used.

#### **MQSYSP\_NO**

Dual logging is not being used.

### **DualArchive (MQCFIN)**

Specifies whether dual archive logging is being used (parameter identifier: MQIACF\_SYSP\_DUAL\_ARCHIVE).

The value can be any of the following values:

**MQSYSP\_YES**

Dual archive logging is being used.

**MQSYSP\_NO**

Dual archive logging is not being used.

**DualBSDS (MQCFIN)**

Specifies whether dual BSDS is being used (parameter identifier: MQIACF\_SYSP\_DUAL\_BSDS).

The value can be any of the following values:

**MQSYSP\_YES**

Dual BSDS is being used.

**MQSYSP\_NO**

Dual BSDS is not being used.

**InputBufferSize (MQCFIN)**

Specifies the size of input buffer storage for active and archive log data sets (parameter identifier: MQIACF\_SYSP\_IN\_BUFFER\_SIZE).

**LogArchive (MQCFIN)**

Specifies whether archiving is on or off (parameter identifier: MQIACF\_SYSP\_ARCHIVE).

The value can be any of the following values:

**MQSYSP\_YES**

Archiving is on.

**MQSYSP\_NO**

Archiving is off.

**LogCompression (MQCFIN)**

Specifies which log compression parameter is used (parameter identifier: MQIACF\_LOG\_COMPRESSION).

The value can be any of the following values:

**MQCOMPRESS\_NONE**

No log compression is performed.

**MQCOMPRESS\_RLE**

Run-length encoding compression is performed.

**MQCOMPRESS\_ANY**

Enable the queue manager to select the compression algorithm that gives the greatest degree of log record compression. Using this option currently results in RLE compression.

**MaxArchiveLog (MQCFIN)**

Specifies the maximum number of archive log volumes that can be recorded in the BSDS (parameter identifier: MQIACF\_SYSP\_MAX\_ARCHIVE).

**MaxConcurrentOffloads (MQCFIN)**

Specifies the maximum number of concurrent log offload tasks (parameter identifier: MQIACF\_SYSP\_MAX\_CONC\_OFFLOADS).

**MaxReadTapeUnits (MQCFIN)**

The maximum number of dedicated tape units that can be set to read archive log tape volumes (parameter identifier: MQIACF\_SYSP\_MAX\_READ\_TAPES).

**OutputBufferCount (MQCFIN)**

Specifies the number of output buffers to be filled before they are written to the active log data sets (parameter identifier: MQIACF\_SYSP\_OUT\_BUFFER\_COUNT).

**OutputBufferSize (MQCFIN)**

Specifies the size of output buffer storage for active and archive log data sets (parameter identifier: MQIACF\_SYSP\_OUT\_BUFFER\_SIZE).

## ZHyperWrite (MQCFIN)

**V 9.1.2** For *MQSYSP\_TYPE\_INITIAL* and *MQSYSP\_TYPE\_SET*, shows whether writes to the active logs are made with zHyperWrite being enabled, if the logs are on zHyperWrite capable volumes (parameter identifier: *MQIACF\_SYSP\_ZHYPERWRITE*).

The value can be one of the following values:

### **MQSYSP\_YES**

Writes are made using zHyperWrite, for active log datasets that are on zHyperWrite capable volumes.

### **MQSYSP\_NO**

Writes are not made using zHyperWrite.

**V 9.1.2** For *MQSYSP\_TYPE\_LOG\_COPY*, shows whether the log copy is on a zHyperWrite capable volume (parameter identifier: *MQIACF\_SYSP\_ZHYPERWRITE*).

The value can be one of the following values:

### **MQSYSP\_YES**

The log data set is on a zHyperWrite capable volume.

### **MQSYSP\_NO**

The log data set is not on a zHyperWrite capable volume.

## Response data - to log status information

### **DataSetName (MQCFST)**

The data set name of the active log data set (parameter identifier: *MQCACF\_DATA\_SET\_NAME*).

If the copy is not currently active, this parameter is returned as blank.

The maximum length of the string is *MQ\_DATA\_DATA\_SET\_NAME\_LENGTH*.

**V 9.1.4**

### **Encrypted (MQCFIN)**

For *MQSYSP\_TYPE\_LOG\_COPY*, shows whether the log copy is an encrypted data set (parameter identifier: *MQIACF\_DS\_ENCRYPTED*)

The value can be one of the following values:

### **MQSYSP\_YES**

The log data set is encrypted.

### **MQSYSP\_NO**

The log data set is not encrypted.

### **FullLogs (MQCFIN)**

The total number of full active log data sets that have not yet been archived (parameter identifier: *MQIACF\_SYSP\_FULL\_LOGS*).

### **LogCompression (MQCFIN)**

Specifies the current log compression option (parameter identifier: *MQIACF\_LOG\_COMPRESSION*).

The value can be any of the following values:

### **MQCOMPRESS\_NONE**

Log compression is not enabled.

### **MQCOMPRESS\_RLE**

Run-length encoding log compression is enabled.

### **MQCOMPRESS\_ANY**

Any compression algorithm supported by the queue manager is enabled.

### **LogCopyNumber (MQCFIN)**

Copy number (parameter identifier: *MQIACF\_SYSP\_LOG\_COPY*).

**LogRBA (MQCFST)**

The RBA of the most recently written log record (parameter identifier: MQCACF\_SYSP\_LOG\_RBA).

The maximum length of the string is MQ\_RBA\_LENGTH.

**LogSuspend (MQCFIN)**

Specifies whether logging is suspended (parameter identifier: MQIACF\_SYSP\_LOG\_SUSPEND).

The value can be any of the following values:

**MQSYSP\_YES**

Logging is suspended.

**MQSYSP\_NO**

Logging is not suspended.

**LogUsed (MQCFIN)**

The percentage of the active log data set that has been used (parameter identifier: MQIACF\_SYSP\_LOG\_USED).

**OffloadStatus (MQCFIN)**

Specifies the status of the offload task (parameter identifier: MQIACF\_SYSP\_OFFLOAD\_STATUS).

The value can be any of the following values:

**MQSYSP\_STATUS\_ALLOCATING\_ARCHIVE**

The offload task is busy, allocating the archive data set. MQSYSP\_STATUS\_ALLOCATING\_ARCHIVE could indicate that a tape mount request is pending.

**MQSYSP\_STATUS\_COPYING\_BSDS**

The offload task is busy, copying the BSDS data set.

**MQSYSP\_STATUS\_COPYING\_LOG**

The offload task is busy, copying the active log data set.

**MQSYSP\_STATUS\_BUSY**

The offload task is busy with other processing.

**MQSYSP\_STATUS\_AVAILABLE**

The offload task is waiting for work.

**QMgrStartDate (MQCFST)**

The date on which the queue manager was started, in the form yyyy-mm-dd (parameter identifier: MQCACF\_SYSP\_Q\_MGR\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

**QMgrStartRBA (MQCFST)**

The RBA from which logging began when the queue manager was started (parameter identifier: MQCACF\_SYSP\_Q\_MGR\_RBA).

The maximum length of the string is MQ\_RBA\_LENGTH.

**QMgrStartTime (MQCFST)**

The time that the queue manager was started, in the form hh.mm.ss (parameter identifier: MQCACF\_SYSP\_Q\_MGR\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

**TotalLogs (MQCFIN)**

The total number of active log data sets (parameter identifier: MQIACF\_SYSP\_TOTAL\_LOGS).

**Inquire Namelist**

The Inquire Namelist (MQCMD\_INQUIRE\_NAMELIST) command inquires about the attributes of existing IBM MQ namelists.

**Required parameters:**

*NamelistName*

## Optional parameters:

 *CommandScope* , *IntegerFilterCommand* , *NamelistAttrs* ,   
*QSGDisposition* , *StringFilterCommand*

## Required parameters

### NamelistName (MQCFST)

Namelist name (parameter identifier: MQCA\_NAMELIST\_NAME).

This parameter is the name of the namelist with attributes that are required. Generic namelist names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all namelists having names that start with the selected character string. An asterisk on its own matches all possible names.

The namelist name is always returned regardless of the attributes requested.

The maximum length of the string is MQ\_NAMELIST\_NAME\_LENGTH.

## Optional parameters

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

### IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *NamelistAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you specify an integer filter for *NamelistType* (MQIA\_NAMELIST\_TYPE), you cannot also specify the **NamelistType** parameter.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

### NamelistAttrs (MQCFIL)

Namelist attributes (parameter identifier: MQIACF\_NAMELIST\_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

#### MQIACF\_ALL

All attributes.

or a combination of the following:

**MQCA\_NAMELIST\_NAME**

Name of namelist object.

**MQCA\_NAMELIST\_DESC**

Namelist description.

**MQCA\_NAMES**

Names in the namelist.

**MQCA\_ALTERATION\_DATE**

The date on which the information was last altered.

**MQCA\_ALTERATION\_TIME**

The time at which the information was last altered.

**MQIA\_NAME\_COUNT**

Number of names in the namelist.

**MQIA\_NAMELIST\_TYPE**

Namelist type (valid only on z/OS )

**NamelistType (MQCFIN)**

Namelist attributes (parameter identifier: MQIA\_NAMELIST\_TYPE). This parameter applies to z/OS only.

Specifies the type of names in the namelist. The value can be any of the following values:

**MQNT\_NONE**

The names are of no particular type.

**MQNT\_Q**

A namelist that holds a list of queue names.

**MQNT\_CLUSTER**

A namelist that is associated with clustering, containing a list of the cluster names.

**MQNT\_AUTH\_INFO**

The namelist is associated with TLS, and contains a list of authentication information object names.

**QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

**MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

**MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

## MQQSGD\_Q\_MGR

The object is defined as MQQSGD\_Q\_MGR.

## MQQSGD\_PRIVATE

The object is defined as either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

## StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *NameListAttrs* except MQCA\_NAMELIST\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1903 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

## Inquire Namelist (Response)

The response to the Inquire Namelist (MQCMD\_INQUIRE\_NAMELIST) command consists of the response header followed by the *NameListName* structure and the requested combination of attribute parameter structures.

If a generic namelist name was specified, one such message is generated for each namelist found.

### Always returned:

*NameListName* ,  *QSGDisposition*

### Returned if requested:

*AlterationDate* , *AlterationTime* , *NameCount* , *NameListDesc* ,  *NameListType* , *Names*

## Response data

### AlterationDate (MQCFST)

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

### AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time when the information was last altered, in the form hh.mm.ss.

### NameCount (MQCFIN)

Number of names in the namelist (parameter identifier: MQIA\_NAME\_COUNT).

The number of names contained in the namelist.

### NameListDesc (MQCFST)

Description of namelist definition (parameter identifier: MQCA\_NAMELIST\_DESC).

The maximum length of the string is MQ\_NAMELIST\_DESC\_LENGTH.

### NameListName (MQCFST)

The name of the namelist definition (parameter identifier: MQCA\_NAMELIST\_NAME).

The maximum length of the string is MQ\_NAMELIST\_NAME\_LENGTH.

### NameListType (MQCFIN)

Type of names in the namelist (parameter identifier: MQIA\_NAMELIST\_TYPE). This parameter applies to z/OS only.

Specifies the type of names in the namelist. The value can be any of the following values:

**MQNT\_NONE**

The names are of no particular type.

**MQNT\_Q**

A namelist that holds a list of queue names.

**MQNT\_CLUSTER**

A namelist that is associated with clustering, containing a list of the cluster names.

**MQNT\_AUTH\_INFO**

The namelist is associated with TLS, and contains a list of authentication information object names.

**Names (MQCFSL)**

A list of the names contained in the namelist (parameter identifier: MQCA\_NAMES).

The number of names in the list is given by the *Count* field in the MQCFSL structure. The length of each name is given by the *StringLength* field in that structure. The maximum length of a name is MQ\_OBJECT\_NAME\_LENGTH.

**QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter applies only to z/OS. The value can be any of the following values:

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**Inquire Namelist Names**

The Inquire Namelist Names (MQCMD\_INQUIRE\_NAMELIST\_NAMES) command inquires for a list of namelist names that match the generic namelist name specified.

**Required parameters****NamelistName (MQCFST)**

Name of namelist (parameter identifier: MQCA\_NAMELIST\_NAME).

Generic namelist names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

**Optional parameters****CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.

- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

#### **MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being processed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

#### **MQQSGD\_PRIVATE**

The object is defined with either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

## **Inquire Namelist Names (Response)**

The response to the Inquire Namelist Names (MQCMD\_INQUIRE\_NAMELIST\_NAMES) command consists of the response header followed by a single parameter structure giving zero or more names that match the specified namelist name.

### **z/OS**

Additionally, on z/OS only, the *QSGDispositions* structure (with the same number of entries as the *NamelistNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *NamelistNames* structure.

#### **Always returned:**

*NamelistNames* , **z/OS** *QSGDispositions*

#### **Returned if requested:**

None

## Response data

### NamelistNames (MQCFSL)

List of namelist names (parameter identifier: MQCACF\_NAMELIST\_NAMES).

### QSGDispositions (MQCFIL)

List of queue sharing group dispositions (parameter identifier: MQIACF\_QSG\_DISPS). This parameter is valid only on z/OS. Possible values for fields in this structure are:

#### MQQSGD\_COPY

The object is defined as MQQSGD\_COPY.

#### MQQSGD\_GROUP

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

#### MQQSGD\_Q\_MGR

The object is defined as MQQSGD\_Q\_MGR.

## Multi Inquire Policy on Multiplatforms

The Inquire Policy (MQCMD\_INQUIRE\_PROT\_POLICY) command inquires about the policy, or policies, set on a queue.

## Required parameters

### policy-name (MQCFST)

Policy name (parameter identifier: MQCA\_POLICY\_NAME).

This parameter is the name of the policy with attributes that are required. Generic policy names are not supported, however, an asterisk on its own can be used to return all policy objects.

The name of the policy, or policies (or part of the policy name or names) to inquire is the same as the name of the queue, or queues, that the policies control. The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

The policy name is always returned regardless of the attributes requested.

## Optional parameters

### PolicyAttrs (MQCFIL)

Policy attributes (parameter identifier: MQIACF\_POLICY\_ATTRS).

The attribute list might specify the following value on its own- default value if the parameter is not specified:

#### MQIACF\_ALL

All attributes.

or a combination of the following:

#### MQCA\_POLICY\_NAME

Name of the policy.

#### MQIA\_SIGNATURE\_ALGORITHM

The digital signature algorithm.

#### MQIA\_ENCRYPTION\_ALGORITHM

The encryption algorithm.

#### MQCA\_SIGNER\_DN

The distinguished name of an authorized signer, or signers.

#### MQCA\_RECIPIENT\_DN

The distinguished name of an intended recipient, or recipients.

**MQIA\_TOLERATE\_UNPROTECTED**

Whether the policy is enforced or unprotected messages tolerated.

**MQIA\_KEY\_REUSE\_COUNT**

The number of times that an encryption key can be re-used.

**MQIACF\_ACTION**

The action taken on the command with regards to signer and recipient parameters.

**Expected behavior for inquiring a policy**

When inquiring a policy name, a policy object is always returned even if one does not exist. When a policy object does not exist, the policy object returned is a default policy object that specifies plain text protection, that is, no signing or encryption of message data.

To view policy objects that exist, the policy name should be set to '\*'. This returns all policy objects that exist.

**Related information**

[Managing security policies in AMS](#)

**Inquire Policy (Response) on Multiplatforms**

The response to the Inquire Policy (MQCMD\_INQUIRE\_PROT\_POLICY) command consists of the response header followed by the *PolicyName* structure and the requested combination of attribute parameter structures.

If a generic security policy name was specified, one such message is generated for each policy found.

**Always returned:**

*PolicyName*

The name of the policy, or policies (or part of the policy name or names) to inquire are the same as the name of the queue, or queues, that the policies control.

**Returned if requested:**

*Action* , *EncAlg* , *Enforce* and *Tolerate* , *KeyReuse* , *Recipient* , *SignAlg* , *Signer*

**Response data****Action (MQCFIL)**

Action (parameter identifier: MQIACF\_ACTION).

The action taken on the command with regards to signer and recipient parameters.

**EncAlg (MQCFIL)**

Encryption algorithm (parameter identifier: MQIA\_ENCRYPTION\_ALGORITHM).

The encryption algorithm specified.

**Enforce and Tolerate (MQCFST)**

Indicates whether the security policy should be enforced or whether unprotected messages are tolerated (parameter identifier: MQIA\_TOLERATE\_UNPROTECTED).

**KeyReuse (MQCFIN)**

Specifies the number of times that an encryption key can be re-used (parameter identifier MQIA\_KEY\_REUSE\_COUNT)

**Recipient (MQCFIL)**

Specifies the distinguished name of the intended recipient (parameter identifier: MQCA\_RECIPIENT\_DN)

This parameter can be specified multiple times.

The maximum length of the string is MQ\_DISTINGUISHED\_NAME\_LENGTH.

**SignAlg (MQCFIL)**

Specifies the digital signature algorithm (parameter identifier: MQIA\_SIGNATURE\_ALGORITHM).

**Signer (MQCFST)**

Specifies the distinguished name of an authorized signer (parameter identifier: MQCA\_SIGNER\_DN)

This parameter can be specified multiple times.

The maximum length of the string is MQ\_DISTINGUISHED\_NAME\_LENGTH.

**Inquire Process**

The Inquire Process (MQCMD\_INQUIRE\_PROCESS) command inquires about the attributes of existing IBM MQ processes.

**Required parameters****ProcessName (MQCFST)**

Process name (parameter identifier: MQCA\_PROCESS\_NAME).

Generic process names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all processes having names that start with the selected character string. An asterisk on its own matches all possible names.

The process name is always returned regardless of the attributes requested.

The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

**Optional parameters****CommandScope (MQCFST)**

Command scope (parameter identifier: MQACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

**IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ProcessAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

**ProcessAttrs (MQCFIL)**

Process attributes (parameter identifier: MQIACF\_PROCESS\_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

**MQIACF\_ALL**

All attributes.

or a combination of the following:

**MQCA\_ALTERATION\_DATE**

The date at which the information was last altered.

**MQCA\_ALTERATION\_TIME**

The time at which the information was last altered.

**MQCA\_APPL\_ID**

Application identifier.

**MQCA\_ENV\_DATA**

Environment data.

**MQCA\_PROCESS\_DESC**

Description of process definition.

**MQCA\_PROCESS\_NAME**

Name of process definition.

**MQCA\_USER\_DATA**

User data.

**MQIA\_APPL\_TYPE**

Application type.

**QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

**MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

**MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_PRIVATE**

The object is defined as either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

### **StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ProcessAttrs* except MQCA\_PROCESS\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter”](#) on page 1903 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

### **Inquire Process (Response)**

The response to the Inquire Process (MQCMD\_INQUIRE\_PROCESS) command consists of the response header followed by the *ProcessName* structure and the requested combination of attribute parameter structures.

If a generic process name was specified, one such message is generated for each process found.

#### **Always returned:**

*ProcessName* ,  *QSGDisposition*

#### **Returned if requested:**

*AlterationDate, AlterationTime, ApplId, ApplType, EnvData, ProcessDesc, UserData*

### **Response data**

#### **AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

#### **AlterationTime (MQCFST)**

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time when the information was last altered, in the form hh.mm.ss.

#### **ApplId (MQCFST)**

Application identifier (parameter identifier: MQCA\_APPL\_ID).

The maximum length of the string is MQ\_PROCESS\_APPL\_ID\_LENGTH.

#### **ApplType (MQCFIN)**

Application type (parameter identifier: MQIA\_APPL\_TYPE).

The value can be:

##### **MQAT\_AIX**

AIX application (same value as MQAT\_UNIX)

##### **MQAT\_CICS**

CICS transaction

##### **MQAT\_DOS**

DOS client application

##### **MQAT\_MVS**

z/OS application

##### **MQAT\_OS400**

IBM i application

##### **MQAT\_QMGR**

Queue manager

##### **MQAT\_UNIX**

UNIX application

##### **MQAT\_WINDOWS**

16-bit Windows application

## **MQAT\_WINDOWS\_NT**

32-bit Windows application

### ***integer***

System-defined application type in the range zero through 65 535 or a user-defined application type in the range 65 536 through 999 999 999

## **EnvData (MQCFST)**

Environment data (parameter identifier: MQCA\_ENV\_DATA).

The maximum length of the string is MQ\_PROCESS\_ENV\_DATA\_LENGTH.

## **ProcessDesc (MQCFST)**

Description of process definition (parameter identifier: MQCA\_PROCESS\_DESC).

The maximum length of the string is MQ\_PROCESS\_DESC\_LENGTH.

## **ProcessName (MQCFST)**

The name of the process definition (parameter identifier: MQCA\_PROCESS\_NAME).

The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

## **QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

## **UserData (MQCFST)**

User data (parameter identifier: MQCA\_USER\_DATA).

The maximum length of the string is MQ\_PROCESS\_USER\_DATA\_LENGTH.

## **Inquire Process Names**

The Inquire Process Names (MQCMD\_INQUIRE\_PROCESS\_NAMES) command inquires for a list of process names that match the generic process name specified.

## **Required parameters**

### **ProcessName (MQCFST)**

Name of process-definition for queue (parameter identifier: MQCA\_PROCESS\_NAME).

Generic process names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

## **Optional parameters**

### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

#### **MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

#### **MQQSGD\_PRIVATE**

The object is defined with either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

## **Inquire Process Names (Response)**

The response to the Inquire Process Names (MQCMD\_INQUIRE\_PROCESS\_NAMES) command consists of the response header followed by a single parameter structure giving zero or more names that match the specified process name.

Additionally, on z/OS only, a parameter structure, *QSGDispositions* (with the same number of entries as the *ProcessNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *ProcessNames* structure.

This response is not supported on Windows.

### **Always returned:**

*ProcessNames, QSGDispositions*

**Returned if requested:**

None

**Response data****ProcessNames (MQCFSL)**

List of process names (parameter identifier: MQCACF\_PROCESS\_NAMES).

**QSGDispositions (MQCFIL)**

List of queue sharing group dispositions (parameter identifier: MQIACF\_QSG\_DISPS). This parameter applies only to z/OS. Possible values for fields in this structure are:

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**Inquire Pub/Sub Status**

The Inquire Pub/Sub Status (MQCMD\_INQUIRE\_PUBSUB\_STATUS) command inquires about the status of publish/subscribe connections.

**Optional parameters** **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

**blank (or omit the parameter altogether)**

The command is executed on the queue manager on which it was entered.

**a queue manager name**

The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

**an asterisk (\*)**

The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use CommandScope as a parameter to filter on.

**PubSubStatusAttrs (MQCFIL)**

Publish/subscribe status attributes (parameter identifier: MQIACF\_PUBSUB\_STATUS\_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

**MQIACF\_ALL**

All attributes.

or a combination of the following:

**MQIA\_SUB\_COUNT**

The total number of subscriptions against the local tree.

**MQIA\_TOPIC\_NODE\_COUNT**

The total number of topic nodes in the local tree.

**MQIACF\_PUBSUB\_STATUS**

Hierarchy status.

**MQIACF\_PS\_STATUS\_TYPE**

Hierarchy type.

**Type (MQCFIN)**

Type (parameter identifier: MQIACF\_PS\_STATUS\_TYPE).

The type can specify one of the following:

**MQPSST\_ALL**

Return status of both parent and child connections. MQPSST\_ALL is the default value if the parameter is not specified.

**MQPSST\_LOCAL**

Return local status information.

**MQPSST\_PARENT**

Return status of the parent connection.

**MQPSST\_CHILD**

Return status of the child connections.

**Inquire Pub/Sub Status (Response)**

The response to the Inquire publish/subscribe Status (MQCMD\_INQUIRE\_PUBSUB\_STATUS) command consists of the response header followed by the attribute structures.

A group of parameters is returned containing the following attributes: *Type*, *QueueManagerName*, *Status*, *SubCount*, and *TopicNodeCount*.

**Always returned:**

*QueueManagerName*, *Status*, *Type*, *SubCount*, and *TopicNodeCount*.

**Returned if requested:**

*None*

**Response data****QueueManagerName (MQCFST)**

Either the name of the local queue manager when TYPE is LOCAL, or the name of the hierarchically connected queue manager (parameter identifier: MQCA\_Q\_MGR\_NAME).

**Type (MQCFIN)**

Type of status that is being returned (parameter identifier: MQIACF\_PS\_STATUS\_TYPE).

The value can be:

**MQPSST\_CHILD**

Publish/subscribe status for a child hierarchical connection.

**MQPSST\_LOCAL**

Publish/subscribe status for the local queue manager.

**MQPSST\_PARENT**

Publish/subscribe status for the parent hierarchical connection.

**Status (MQCFIN)**

The status of the publish/subscribe engine or the hierarchical connection (parameter identifier: MQIACF\_PUBSUB\_STATUS).

When TYPE is LOCAL the following values can be returned:

**MQPS\_STATUS\_ACTIVE**

The publish/subscribe engine and the queued publish/subscribe interface are running. It is therefore possible to publish or subscribe using the application programming interface and the queues that are monitored by the queued publish/subscribe interface appropriately.

**MQPS\_STATUS\_COMPAT**

The publish/subscribe engine is running. It is therefore possible to publish or subscribe using the application programming interface. The queued publish/subscribe interface is not running. Therefore, any message that is put to the queues monitored by the queued publish/subscribe interface is not acted upon by IBM MQ.

**MQPS\_STATUS\_ERROR**

The publish/subscribe engine has failed. Check your error logs to determine the reason for the failure.

**MQPS\_STATUS\_INACTIVE**

The publish/subscribe engine and the queued publish/subscribe interface are not running. It is therefore not possible to publish or subscribe using the application programming interface. Any publish/subscribe messages that are put to the queues that are monitored by the queued publish/subscribe interface is not acted upon by IBM MQ.

If inactive and you want to start the publish/subscribe engine, on the Change Queue Manager command set PubSubMode to **MQPSM\_ENABLED**.

**MQPS\_STATUS\_STARTING**

The publish/subscribe engine is initializing and is not yet operational.

**MQPS\_STATUS\_STOPPING**

The publish/subscribe engine is stopping.

When TYPE is PARENT, the following values can be returned:

**MQPS\_STATUS\_ACTIVE**

The connection with the parent queue manager is active.

**MQPS\_STATUS\_ERROR**

This queue manager is unable to initialize a connection with the parent queue manager because of a configuration error.

A message is produced in the queue manager logs to indicate the specific error. If you receive error message AMQ5821 or on z/OS systems CSQT821E, possible causes include:

- Transmit queue is full
- Transmit queue put disabled

If you receive error message AMQ5814 or on z/OS systems CSQT814E, take the following actions:

- Check that the parent queue manager is correctly specified.
- Ensure that broker is able to resolve the queue manager name of the parent broker.

To resolve the queue manager name, at least one of the following resources must be configured:

- A transmission queue with the same name as the parent queue manager name.
- A queue manager alias definition with the same name as the parent queue manager name.
- A cluster with the parent queue manager a member of the same cluster as this queue manager.
- A cluster queue manager alias definition with the same name as the parent queue manager name.
- A default transmission queue.

After you have set up the configuration correctly, modify the parent queue manager name to blank. Then set with the parent queue manager name.

**MQPS\_STATUS\_REFUSED**

The connection has been refused by the parent queue manager.

This situation might be caused by the parent queue manager already having another child queue manager of the same name as this queue manager.

Alternatively, the parent queue manager has used the RESET QMGR TYPE(PUBSUB) CHILD command to remove this queue manager as one of its children.

#### **MQPS\_STATUS\_STARTING**

The queue manager is attempting to request that another queue manager is its parent.

If the parent status remains in starting status without progressing to active status, take the following actions:

- Check that the sender channel to parent queue manager is running
- Check that the receiver channel from parent queue manager is running

#### **MQPS\_STATUS\_STOPPING**

The queue manager is disconnecting from its parent.

If the parent status remains in stopping status, take the following actions:

- Check that the sender channel to parent queue manager is running
- Check that the receiver channel from parent queue manager is running

When TYPE is CHILD, the following values can be returned:

#### **MQPS\_STATUS\_ACTIVE**

The connection with the parent queue manager is active.

#### **MQPS\_STATUS\_ERROR**

This queue manager is unable to initialize a connection with the parent queue manager because of a configuration error.

A message is produced in the queue manager logs to indicate the specific error. If you receive error message AMQ5821 or on z/OS systems CSQT821E, possible causes include:

- Transmit queue is full
- Transmit queue put disabled

If you receive error message AMQ5814 or on z/OS systems CSQT814E, take the following actions:

- Check that the child queue manager is correctly specified.
- Ensure that broker is able to resolve the queue manager name of the child broker.

To resolve the queue manager name, at least one of the following resources must be configured:

- A transmission queue with the same name as the child queue manager name.
- A queue manager alias definition with the same name as the child queue manager name.
- A cluster with the child queue manager a member of the same cluster as this queue manager.
- A cluster queue manager alias definition with the same name as the child queue manager name.
- A default transmission queue.

After you have set up the configuration correctly, modify the child queue manager name to blank. Then set with the child queue manager name.

#### **MQPS\_STATUS\_STARTING**

The queue manager is attempting to request that another queue manager is its parent.

If the child status remains in starting status without progressing to active status, take the following actions:

- Check that the sender channel to child queue manager is running
- Check that the receiver channel from child queue manager is running

#### **MQPS\_STATUS\_STOPPING**

The queue manager is disconnecting from its parent.

If the child status remains in stopping status, take the following actions:

- Check that the sender channel to child queue manager is running
- Check that the receiver channel from child queue manager is running

### **SubCount (MQCFIN)**

When *Type* is MQPSST\_LOCAL, the total number of subscriptions against the local tree is returned. When *Type* is MQPSST\_CHILD or MQPSST\_PARENT, queue manager relations are not inquired and the value MQPSCT\_NONE is returned. (parameter identifier: MQIA\_SUB\_COUNT).

### **TopicNodeCount (MQCFIN)**

When *Type* is MQPSST\_LOCAL, the total number of topic nodes in the local tree is returned. When *Type* is MQPSST\_CHILD or MQPSST\_PARENT, queue manager relations are not inquired and the value MQPSCT\_NONE is returned. (parameter identifier: MQIA\_TOPIC\_NODE\_COUNT).

## **Inquire Queue**

Use the Inquire Queue command MQCMD\_INQUIRE\_Q to query the attributes of IBM MQ queues.

## **Required parameters**

### **QName (MQCFST)**

Queue name (parameter identifier: MQCA\_Q\_NAME).

Generic queue names are supported. A generic name is a character string followed by an asterisk \* ; for example ABC\*. It selects all queues having names that start with the selected character string. An asterisk on its own matches all possible names.

The queue name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

## **Optional parameters**

### **CFStructure (MQCFST)**

CF structure (parameter identifier: MQCA\_CF\_STRUC\_NAME). Specifies the name of the CF structure. This parameter is valid only on z/OS.

This parameter specifies that eligible queues are limited to those having the specified *CFStructure* value. If this parameter is not specified, then all queues are eligible.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk \* ; for example ABC\*. It selects all CF structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

### **ClusterInfo (MQCFIN)**

Cluster information (parameter identifier: MQIACF\_CLUSTER\_INFO).

This parameter requests that cluster information about these queues and other queues in the repository that match the selection criteria is displayed. The cluster information is displayed in addition to information about attributes of queues defined on this queue manager.

In this case, there might be multiple queues with the same name displayed. The cluster information is shown with a queue type of MQQT\_CLUSTER.

You can set this parameter to any integer value, the value used does not affect the response to the command.

The cluster information is obtained locally from the queue manager.

### **ClusterName (MQCFST)**

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

This parameter specifies that eligible queues are limited to those having the specified *ClusterName* value. If this parameter is not specified, then all queues are eligible.

Generic cluster names are supported. A generic name is a character string followed by an asterisk \* ; for example ABC\*. It selects all clusters having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH.

### **ClusterNameList (MQCFST)**

Cluster namelist (parameter identifier: MQCA\_CLUSTER\_NAMELIST).

This parameter specifies that eligible queues are limited to those having the specified *ClusterNameList* value. If this parameter is not specified, then all queues are eligible.

Generic cluster namelists are supported. A generic name is a character string followed by an asterisk \* ; for example ABC\*. It selects all cluster namelists having names that start with the selected character string. An asterisk on its own matches all possible names.

### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment. The command server must be enabled.
- An asterisk " \* ". The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

### **IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *QAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you specify an integer filter for *Qtype* or *PageSetID*, you cannot also specify the *Qtype* or *PageSetID* parameter.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

### **PageSetID (MQCFIN)**

Page set identifier (parameter identifier: MQIA\_PAGESET\_ID). This parameter applies to z/OS only.

This parameter specifies that eligible queues are limited to those having the specified *PageSetID* value. If this parameter is not specified, then all queues are eligible.

### **QAttrs (MQCFIL)**

Queue attributes (parameter identifier: MQIACF\_Q\_ATTRS).

The attribute list might specify the following value on its own. If the parameter is not specified, this value is the default:

**MQIACF\_ALL**

All attributes.

You can also specify a combination of the parameters in the following table:

<i>Table 323. Inquire Queue command, queue attributes</i>					
	<b>Local queue</b>	<b>Model queue</b>	<b>Alias queue</b>	<b>Remote queue</b>	<b>Cluster queue</b>
MQCA_ALTERATION_DATE The date on which the information was last altered	✓	✓	✓	✓	✓
MQCA_ALTERATION_TIME The time at which the information was last altered	✓	✓	✓	✓	✓
MQCA_BACKOUT_REQ_Q_NAME Excessive backout requeue name	✓	✓			
MQCA_BASE_NAME Name of queue that alias resolves to			✓		
MQCA_CF_STRUC_NAME Coupling facility structure name. This attribute is valid on z/OS only	✓	✓			
MQCA_CLUS_CHL_NAME The generic name of the cluster-sender channels that use this queue as a transmission queue.	✓	✓			
MQCA_CLUSTER_DATE Date when the definition became available to the local queue manager					✓
MQCA_CLUSTER_NAME Cluster name	✓		✓	✓	✓
MQCA_CLUSTER_NAMELIST Cluster namelist	✓		✓	✓	
MQCA_CLUSTER_Q_MGR_NAME Queue manager name that hosts the queue					✓
MQCA_CLUSTER_TIME Time when the definition became available to the local queue manager					✓

Table 323. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQCA_CREATION_DATE Queue creation date	✓	✓			
MQCA_CREATION_TIME Queue creation time	✓	✓			
MQCA_CUSTOM The custom attribute for new features	✓	✓	✓	✓	✓
MQCA_INITIATION_Q_NAME Initiation queue name	✓	✓			
MQCA_PROCESS_NAME Name of process definition	✓	✓			
MQCA_Q_DESC Queue description	✓	✓	✓	✓	✓
MQCA_Q_MGR_IDENTIFIER Internally generated queue manager name					✓
MQCA_Q_NAME Queue name	✓	✓	✓	✓	✓
MQCA_REMOTE_Q_MGR_NAME Name of remote queue manager				✓	
MQCA_REMOTE_Q_NAME Name of remote queue as known locally on the remote queue manager				✓	
 MQCA_STORAGE_CLASS Storage class. MQCA_STORAGE_CLASS is valid on z/OS only	✓	✓			
MQCA_TPIPE_NAME The <b>TPIPE</b> name used for communication with OTMA using the IBM MQ IMS bridge	✓				
MQCA_TRIGGER_DATA Trigger data	✓	✓			
MQCA_XMIT_Q_NAME Transmission queue name				✓	

Table 323. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQIA_ACCOUNTING_Q Accounting data collection	✓	✓			
MQIA_BACKOUT_THRESHOLD Backout threshold	✓	✓			
MQIA_BASE_TYPE Type of object	✓	✓	✓	✓	✓
MQIA_CLUSTER_Q_TYPE Cluster queue type					✓
MQIA_CLWL_Q_PRIORITY Cluster workload queue priority	✓		✓	✓	✓
MQIA_CLWL_Q_RANK Cluster workload queue rank	✓		✓	✓	✓
MQIA_CLWL_USEQ Cluster workload use remote setting	✓				
MQIA_CURRENT_Q_DEPTH Number of messages on queue	✓				
MQIA_DEF_BIND Default binding	✓		✓	✓	✓
MQIA_DEF_INPUT_OPEN_OPTION Default open-for-input option	✓	✓			
MQIA_DEF_PERSISTENCE Default message persistence	✓	✓	✓	✓	✓
MQIA_DEF_PRIORITY Default message priority	✓	✓	✓	✓	✓
MQIA_DEF_PUT_RESPONSE_TYPE Default put response type	✓	✓	✓	✓	✓
MQIA_DEF_READ_AHEAD Default put response type	✓	✓	✓	✓	✓
MQIA_DEFINITION_TYPE Queue definition type	✓	✓			

Table 323. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQIA_DIST_LISTS Distribution list support. MQIA_DIST_LISTS is not valid on z/OS	✓	✓			
MQIA_HARDEN_GET_BACKOUT Whether to harden backout count	✓	✓			
MQIA_INDEX_TYPE Index type. This attribute is valid on z/OS only.	✓	✓			
MQIA_INHIBIT_GET Whether get operations are allowed	✓	✓	✓		
MQIA_INHIBIT_PUT Whether put operations are allowed	✓	✓	✓	✓	✓
MQIA_MAX_MSG_LENGTH Maximum message length	✓	✓			
MQIA_MAX_Q_DEPTH Maximum number of messages allowed on queue	✓	✓			
<b>V9.1.0</b> MQIA_MEDIA_IMAGE_RECOVER_Q Whether a queue object is recoverable from a media image, if linear logging is being used.	✓	✓			
MQIA_MONITORING_Q Online monitoring data collection	✓	✓			
MQIA_MSG_DELIVERY_SEQUENCE Whether message priority is relevant	✓	✓			
MQIA_NPM_CLASS Level of reliability assigned to non-persistent messages that are put to the queue	✓	✓			
MQIA_OPEN_INPUT_COUNT Number of MQOPEN calls that have the queue open for input	✓				
MQIA_OPEN_OUTPUT_COUNT Number of MQOPEN calls that have the queue open for output	✓				

Table 323. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
 MQIA_PAGESET_ID Page set identifier	✓				
MQIA_PROPERTY_CONTROL Property control attribute	✓	✓	✓		
MQIA_Q_DEPTH_HIGH_EVENT Control attribute for queue depth high events. You cannot use MQIA_Q_DEPTH_HIGH_EVENT as a filter attribute.	✓	✓			
MQIA_Q_DEPTH_HIGH_LIMIT High limit for queue depth	✓	✓			
MQIA_Q_DEPTH_LOW_EVENT Control attribute for queue depth low events. You cannot use MQIA_Q_DEPTH_LOW_EVENT as a filter attribute.	✓	✓			
MQIA_Q_DEPTH_LOW_LIMIT Low limit for queue depth	✓	✓			
MQIA_Q_DEPTH_MAX_EVENT Control attribute for queue depth max events	✓	✓			
MQIA_Q_SERVICE_INTERVAL Limit for queue service interval	✓	✓			
MQIA_Q_SERVICE_INTERVAL_ EVENT Control attribute for queue service interval events	✓	✓			
MQIA_Q_TYPE Queue type	✓	✓	✓	✓	✓
MQIA_RETENTION_INTERVAL Queue retention interval	✓	✓			
MQIA_SCOPE Queue definition scope. MQIA_SCOPE is not valid on z/OS or IBM i	✓		✓	✓	

Table 323. Inquire Queue command, queue attributes (continued)					
	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQIA_SHAREABILITY Whether queue can be shared	✓	✓			
MQIA_STATISTICS_Q Statistics data collection. MQIA_STATISTICS_Q is valid only on Multiplatforms.	✓	✓			
MQIA_TRIGGER_CONTROL Trigger control	✓	✓			
MQIA_TRIGGER_DEPTH Trigger depth	✓	✓			
MQIA_TRIGGER_MSG_PRIORITY Threshold message priority for triggers	✓	✓			
MQIA_TRIGGER_MTYPE Trigger type	✓	✓			
MQIA_USAGE Usage	✓	✓			

### **QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP ). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned. The meaning of "the disposition of an object" is where the object is defined and how it behaves. The value can be any of the following values:

#### **MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. In a shared queue manager environment, if the command is run on the queue manager where it was issued, MQQSGD\_LIVE also returns information for objects defined with MQQSGD\_SHARED. MQQSGD\_LIVE is the default value if the parameter is not specified.

#### **MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

In a shared queue manager environment, if the command is run on the queue manager where it was issued, MQQSGD\_ALL also displays information for objects defined with MQQSGD\_GROUP or MQQSGD\_SHARED.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names, with different dispositions.

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_PRIVATE**

The object is defined with either MQQSGD\_Q\_MGR or MQQSGD\_COPY.

**MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED. MQQSGD\_SHARED is permitted only in a shared queue environment.

You cannot use *QSGDisposition* as a parameter to filter on.

**QType (MQCFIN)**

Queue type (parameter identifier: MQIA\_Q\_TYPE).

If this parameter is present, eligible queues are limited to the specified type. Any attribute selector specified in the *QAttrs* list which is valid only for queues of a different type or types is ignored; no error is raised.

If this parameter is not present, or if MQQT\_ALL is specified, queues of all types are eligible. Each attribute specified must be a valid queue attribute selector. The attribute can apply to some of the queues returned. It does not have to apply to all the queues. Queue attribute selectors that are valid but not applicable to the queue are ignored, no error messages occur and no attribute is returned. The following lists contains the value of all valid queue attribute selectors:

**MQQT\_ALL**

All queue types.

**MQQT\_LOCAL**

Local queue.

**MQQT\_ALIAS**

Alias queue definition.

**MQQT\_REMOTE**

Local definition of a remote queue.

**MQQT\_CLUSTER**

Cluster queue.

**MQQT\_MODEL**

Model queue definition.

**Note:**  On Multiplatforms, if this parameter is present, it must occur immediately after the *QName* parameter.

** StorageClass (MQCFST)**

Storage class (parameter identifier: MQCA\_STORAGE\_CLASS). Specifies the name of the storage class. This parameter is valid only on z/OS.

This parameter specifies that eligible queues are limited to those having the specified *StorageClass* value. If this parameter is not specified, then all queues are eligible.

Generic names are supported. A generic name is a character string followed by an asterisk \* ; for example ABC\*. It selects all storage classes having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *QAttrs* except MQCA\_Q\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1903 for information about using this filter condition.

If you specify a string filter for *ClusterName*, *ClusterNameList*, *StorageClass*, or *CFStructure*, you cannot also specify that as a parameter.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

## Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_Q\_TYPE\_ERROR**

Queue type not valid.

## Inquire Queue (Response)

The response to the Inquire Queue command MQCMD\_INQUIRE\_Q consists of the response header followed by the *QName* structure. On z/OS only, response includes the *QSGDisposition* structure, and the requested combination of attribute parameter structures.

If a generic queue name was specified, or cluster queues requested, by setting either MQQT\_CLUSTER or MQIACF\_CLUSTER\_INFO, one message is generated for each queue found.

### Always returned:

*QName*, *QSGDisposition*, *QType*

### Returned if requested:

*AlterationDate*, *AlterationTime*, *BackoutRequeueName*, *BackoutThreshold*, *BaseQName*, *CFStructure*, *ClusterChannelName*, *ClusterDate*, *ClusterName*, *ClusterNameList*, *ClusterQType*, *ClusterTime*, *CLWLQueuePriority*, *CLWLQueueRank*, *CLWLUseQ*, *CreationDate*, *CreationTime*, *CurrentQDepth*, *Custom*, *DefaultPutResponse*, *DefBind*, *DefinitionType*, *DefInputOpenOption*, *DefPersistence*, *DefPriority*, *DefReadAhead*, *DistLists*, *HardenGetBackout*, **V9.1.0** *Imgrcovq*, *IndexType*, *InhibitGet*, *InhibitPut*, *InitiationQName*, *MaxMsgLength*, *MaxQDepth*, *MsgDeliverySequence*, *NonPersistentMessageClass*, *OpenInputCount*, *OpenOutputCount*, *PageSetID*, *ProcessName*, *PropertyControl*, *QDepthHighEvent*, *QDepthHighLimit*, *QDepthLowEvent*, *QDepthLowLimit*, *QDepthMaxEvent*, *QDesc*, *QMgrIdentifier*, *QMgrName*, *QServiceInterval*, *QServiceIntervalEvent*, *QueueAccounting*, *QueueMonitoring*, *QueueStatistics*, *RemoteQMgrName*, *RemoteQName*, *RetentionInterval*, *Scope*, *Shareability*, *StorageClass*, *TpipeNames*, *TriggerControl*, *TriggerData*, *TriggerDepth*, *TriggerMsgPriority*, *TriggerType*, *Usage*, *XmitQName*

## Response data

### **AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

### **AlterationTime (MQCFST)**

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time when the information was last altered, in the form hh.mm.ss.

### **BackoutRequeueName (MQCFST)**

Excessive backout requeue name (parameter identifier: MQCA\_BACKOUT\_REQ\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### **BackoutThreshold (MQCFIN)**

Backout threshold (parameter identifier: MQIA\_BACKOUT\_THRESHOLD).

**BaseQName (MQCFST)**

Queue name to which the alias resolves (parameter identifier: MQCA\_BASE\_Q\_NAME).

The name of a queue that is defined to the local queue manager.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**CFStructure (MQCFST)**

Coupling facility structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME). This parameter applies to z/OS only.

Specifies the name of the coupling facility structure where you want to store messages when you use shared queues.

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

**ClusterChannelName (MQCFST)**

Cluster-sender channel name (parameter identifier: MQCA\_CLUS\_CHL\_NAME).

ClusterChannelName is the generic name of the cluster-sender channels that use this queue as a transmission queue.

The maximum length of the channel name is: MQ\_CHANNEL\_NAME\_LENGTH.

**ClusterDate (MQCFST)**

Cluster date (parameter identifier: MQCA\_CLUSTER\_DATE).

The date on which the information became available to the local queue manager, in the form yyyy-mm-dd.

**ClusterName (MQCFST)**

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

**ClusterNamelist (MQCFST)**

Cluster namelist (parameter identifier: MQCA\_CLUSTER\_NAMELIST).

**ClusterQType (MQCFIN)**

Cluster queue type (parameter identifier: MQIA\_CLUSTER\_Q\_TYPE).

The value can be:

**MQCQT\_LOCAL\_Q**

The cluster queue represents a local queue.

**MQCQT\_ALIAS\_Q**

The cluster queue represents an alias queue.

**MQCQT\_REMOTE\_Q**

The cluster queue represents a remote queue.

**MQCQT\_Q\_MGR\_ALIAS**

The cluster queue represents a queue manager alias.

**ClusterTime (MQCFST)**

Cluster time (parameter identifier: MQCA\_CLUSTER\_TIME).

The time at which the information became available to the local queue manager, in the form hh.mm.ss.

**CLWLQueuePriority (MQCFIN)**

Cluster workload queue priority (parameter identifier: MQIA\_CLWL\_Q\_PRIORITY).

Priority of the queue in cluster workload management. The value is in the range zero through 9, where zero is the lowest priority and 9 is the highest.

**CLWLQueueRank (MQCFIN)**

Cluster workload queue rank (parameter identifier: MQIA\_CLWL\_Q\_RANK).

Rank of the queue in cluster workload management. The value is in the range zero through 9, where zero is the lowest rank and 9 is the highest.

**CLWLUseQ (MQCFIN)**

Cluster workload queue rank (parameter identifier: MQIA\_CLWL\_USEQ).

The value can be:

**MQCLWL\_USEQ\_AS\_Q\_MGR**

Use the value of the **CLWLUseQ** parameter on the queue manager's definition.

**MQCLWL\_USEQ\_ANY**

Use remote and local queues.

**MQCLWL\_USEQ\_LOCAL**

Do not use remote queues.

**CreationDate (MQCFST)**

Queue creation date, in the form yyyy-mm-dd (parameter identifier: MQCA\_CREATION\_DATE).

The maximum length of the string is MQ\_CREATION\_DATE\_LENGTH.

**CreationTime (MQCFST)**

Creation time, in the form hh.mm.ss (parameter identifier: MQCA\_CREATION\_TIME).

The maximum length of the string is MQ\_CREATION\_TIME\_LENGTH.

**CurrentQDepth (MQCFIN)**

Current queue depth (parameter identifier: MQIA\_CURRENT\_Q\_DEPTH).

**Custom (MQCFST)**

Custom attribute for new features (parameter identifier: MQCA\_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes are named. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE).

This description is updated when features using this attribute are introduced.

**DefaultPutResponse (MQCFIN)**

Default put response type definition (parameter identifier: MQIA\_DEF\_PUT\_RESPONSE\_TYPE).

The parameter specifies the type of response to be used for put operations to the queue when an application specifies MQPMO\_RESPONSE\_AS\_Q\_DEF. The value can be any of the following values:

**MQPRT\_SYNC\_RESPONSE**

The put operation is issued synchronously, returning a response.

**MQPRT\_ASYNC\_RESPONSE**

The put operation is issued asynchronously, returning a subset of MQMD fields.

**DefBind (MQCFIN)**

Default binding (parameter identifier: MQIA\_DEF\_BIND).

The value can be:

**MQBND\_BIND\_ON\_OPEN**

Binding fixed by MQOPEN call.

**MQBND\_BIND\_NOT\_FIXED**

Binding not fixed.

**MQBND\_BIND\_ON\_GROUP**

Allows an application to request that a group of messages are all allocated to the same destination instance.

**DefinitionType (MQCFIN)**

Queue definition type (parameter identifier: MQIA\_DEFINITION\_TYPE).

The value can be:

**MQQDT\_PREDEFINED**

Predefined permanent queue.

**MQQDT\_PERMANENT\_DYNAMIC**

Dynamically defined permanent queue.

**MQQDT\_SHARED\_DYNAMIC**

Dynamically defined shared queue. This option is available on z/OS only.

**MQQDT\_TEMPORARY\_DYNAMIC**

Dynamically defined temporary queue.

**DefInputOpenOption (MQCFIN)**

Default input open option for defining whether queues can be shared (parameter identifier: MQIA\_DEF\_INPUT\_OPEN\_OPTION).

The value can be:

**MQOO\_INPUT\_EXCLUSIVE**

Open queue to get messages with exclusive access.

**MQOO\_INPUT\_SHARED**

Open queue to get messages with shared access.

**DefPersistence (MQCFIN)**

Default persistence (parameter identifier: MQIA\_DEF\_PERSISTENCE).

The value can be:

**MQPER\_PERSISTENT**

Message is persistent.

**MQPER\_NOT\_PERSISTENT**

Message is not persistent.

**DefPriority (MQCFIN)**

Default priority (parameter identifier: MQIA\_DEF\_PRIORITY).

**DefReadAhead (MQCFIN)**

Default read ahead (parameter identifier: MQIA\_DEF\_READ\_AHEAD).

Specifies the default read ahead behavior for non-persistent messages delivered to the client.

The value can be any of the following values:

**MQREADA\_NO**

Non-persistent messages are not sent ahead to the client before an application requests them. A maximum of one non-persistent message can be lost if the client ends abnormally.

**MQREADA\_YES**

Non-persistent messages are sent ahead to the client before an application requests them. Non-persistent messages can be lost if the client ends abnormally or if the client does not consume all the messages it is sent.

**MQREADA\_DISABLED**

Read ahead of non-persistent messages is not enabled for this queue. Messages are not sent ahead to the client regardless of whether read ahead is requested by the client application.

**Multi****DistLists (MQCFIN)**

Distribution list support (parameter identifier: MQIA\_DIST\_LISTS).

The value can be:

**MQDL\_SUPPORTED**

Distribution lists supported.

**MQDL\_NOT\_SUPPORTED**

Distribution lists not supported.

This parameter is supported only on [Multiplatforms](#).

**HardenGetBackout (MQCFIN)**

Harden backout, or not: (parameter identifier: MQIA\_HARDEN\_GET\_BACKOUT).

The value can be:

**MQQA\_BACKOUT\_HARDENED**

Backout count remembered.

**MQQA\_BACKOUT\_NOT\_HARDENED**

Backout count may not be remembered.

**V 9.1.0 ImageRecoverQueue (MQCFST)**

Specifies whether a local or permanent dynamic queue object is recoverable from a media image, if linear logging is being used (parameter identifier: MQIA\_MEDIA\_IMAGE\_RECOVER\_Q).

This parameter is not valid on z/OS. Possible values are:

**MQIMGRCOV\_YES**

These queue objects are recoverable.

**MQIMGRCOV\_NO**

Automatic media images, if enabled, are not written for these objects.

**MQIMGRCOV\_AS\_Q\_MGR**

If the **ImageRecoverQueue** attribute for the queue manager specifies MQIMGRCOV\_YES, these queue objects are recoverable.

If the **ImageRecoverQueue** attribute for the queue manager specifies MQIMGRCOV\_NO, the “[rcdmqimg \(record media image\)](#)” on page 128 and “[rcrmqobj \(re-create object\)](#)” on page 134 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

**IndexType (MQCFIN)**

Index type (parameter identifier: MQIA\_INDEX\_TYPE). This parameter applies to z/OS only.

Specifies the type of index maintained by the queue manager to expedite MQGET operations on the queue. The value can be any of the following values:

**MQIT\_NONE**

No index.

**MQIT\_MSG\_ID**

The queue is indexed using message identifiers.

**MQIT\_CORREL\_ID**

The queue is indexed using correlation identifiers.

**MQIT\_MSG\_TOKEN**

The queue is indexed using message tokens.

**MQIT\_GROUP\_ID**

The queue is indexed using group identifiers.

**InhibitGet (MQCFIN)**

Get operations are allowed or inhibited: (parameter identifier: MQIA\_INHIBIT\_GET).

The value can be:

**MQQA\_GET\_ALLOWED**

Get operations are allowed.

**MQQA\_GET\_INHIBITED**

Get operations are inhibited.

**InhibitPut (MQCFIN)**

Putt operations are allowed or inhibited: (parameter identifier: MQIA\_INHIBIT\_PUT).

The value can be:

**MQQA\_PUT\_ALLOWED**

Put operations are allowed.

**MQQA\_PUT\_INHIBITED**

Put operations are inhibited.

**InitiationQName (MQCFST)**

Initiation queue name (parameter identifier: MQCA\_INITIATION\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**MaxMsgLength (MQCFIN)**

Maximum message length (parameter identifier: MQIA\_MAX\_MSG\_LENGTH).

**MaxQDepth (MQCFIN)**

Maximum queue depth (parameter identifier: MQIA\_MAX\_Q\_DEPTH).

**MsgDeliverySequence (MQCFIN)**

Messages ordered by priority or sequence: (parameter identifier: MQIA\_MSG\_DELIVERY\_SEQUENCE).

The value can be:

**MQMDS\_PRIORITY**

Messages are returned in priority order.

**MQMDS\_FIFO**

Messages are returned in FIFO order (first in, first out).

**NonPersistentMessageClass (MQCFIN)**

The level of reliability assigned to non-persistent messages that are put to the queue (parameter identifier: MQIA\_NPM\_CLASS).

Specifies the circumstances under which non-persistent messages put to the queue may be lost. The value can be any of the following values:

**MQNPM\_CLASS\_NORMAL**

Non-persistent messages are limited to the lifetime of the queue manager session. They are discarded in the event of a queue manager restart. MQNPM\_CLASS\_NORMAL is the default value.

**MQNPM\_CLASS\_HIGH**

The queue manager attempts to retain non-persistent messages for the lifetime of the queue. Non-persistent messages may still be lost in the event of a failure.

**OpenInputCount (MQCFIN)**

Number of MQOPEN calls that have the queue open for input (parameter identifier: MQIA\_OPEN\_INPUT\_COUNT).

**OpenOutputCount (MQCFIN)**

Number of MQOPEN calls that have the queue open for output (parameter identifier: MQIA\_OPEN\_OUTPUT\_COUNT).

**PageSetID (MQCFIN)**

Page set identifier (parameter identifier: MQIA\_PAGESET\_ID).

Specifies the identifier of the page set on which the queue resides.

This parameter applies to z/OS only when the queue is actively associated with a page set.

**ProcessName (MQCFST)**

Name of process definition for queue (parameter identifier: MQCA\_PROCESS\_NAME).

The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

**PropertyControl (MQCFIN)**

Property control attribute (parameter identifier MQIA\_PROPERTY\_CONTROL).

Specifies how message properties are handled for messages that are retrieved from queues using the MQGET call with the MQGMO\_PROPERTIES\_AS\_Q\_DEF option. The value can be any of the following values:

**MQPROP\_COMPATIBILITY**

If the message contains a property with a prefix of **mcd.**, **jms.**, **usr.** or **mqext.**, all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the

message, except properties contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

MQPROP\_COMPATIBILITY is the default value. It allows applications which expect JMS-related properties to be in an MQRFH2 header in the message data to continue to work unmodified.

#### **MQPROP\_NONE**

All properties of the message are removed from the message before the message is sent to the remote queue manager. Properties in the message descriptor (or extension) are not removed.

#### **MQPROP\_ALL**

All properties of the message are included with the message when it is sent to the remote queue manager. The properties are placed in one or more MQRFH2 headers in the message data. Properties in the message descriptor (or extension) are not placed in MQRFH2 headers.

#### **MQPROP\_FORCE\_MQRFH2**

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

A valid message handle supplied in the `MsgHandle` field of the MQGMO structure on the MQGET call is ignored. Properties of the message are not accessible via the message handle.

This parameter is applicable to local, alias, and model queues.

#### **QDepthHighEvent (MQCFIN)**

Controls whether Queue Depth High events are generated (parameter identifier: MQIA\_Q\_DEPTH\_HIGH\_EVENT).

The value can be:

##### **MQEVR\_DISABLED**

Event reporting disabled.

##### **MQEVR\_ENABLED**

Event reporting enabled.

#### **QDepthHighLimit (MQCFIN)**

High limit for queue depth (parameter identifier: MQIA\_Q\_DEPTH\_HIGH\_LIMIT).

The threshold against which the queue depth is compared to generate a Queue Depth High event.

#### **QDepthLowEvent (MQCFIN)**

Controls whether Queue Depth Low events are generated (parameter identifier: MQIA\_Q\_DEPTH\_LOW\_EVENT).

The value can be:

##### **MQEVR\_DISABLED**

Event reporting disabled.

##### **MQEVR\_ENABLED**

Event reporting enabled.

#### **QDepthLowLimit (MQCFIN)**

Low limit for queue depth (parameter identifier: MQIA\_Q\_DEPTH\_LOW\_LIMIT).

The threshold against which the queue depth is compared to generate a Queue Depth Low event.

#### **QDepthMaxEvent (MQCFIN)**

Controls whether Queue Full events are generated (parameter identifier: MQIA\_Q\_DEPTH\_MAX\_EVENT).

The value can be:

##### **MQEVR\_DISABLED**

Event reporting disabled.

##### **MQEVR\_ENABLED**

Event reporting enabled.

**QDesc (MQCFST)**

Queue description (parameter identifier: MQCA\_Q\_DESC).

The maximum length of the string is MQ\_Q\_DESC\_LENGTH.

**QMgrIdentifier (MQCFST)**

Queue manager identifier (parameter identifier: MQCA\_Q\_MGR\_IDENTIFIER).

The unique identifier of the queue manager.

**QMgrName (MQCFST)**

Name of local queue manager (parameter identifier: MQCA\_CLUSTER\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

**QName (MQCFST)**

Queue name (parameter identifier: MQCA\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**QServiceInterval (MQCFIN)**

Target for queue service interval (parameter identifier: MQIA\_Q\_SERVICE\_INTERVAL).

The service interval used for comparison to generate Queue Service Interval High and Queue Service Interval OK events.

**QServiceIntervalEvent (MQCFIN)**

Controls whether Service Interval High or Service Interval OK events are generated (parameter identifier: MQIA\_Q\_SERVICE\_INTERVAL\_EVENT).

The value can be:

**MQQSIE\_HIGH**

Queue Service Interval High events enabled.

**MQQSIE\_OK**

Queue Service Interval OK events enabled.

**MQQSIE\_NONE**

No queue service interval events enabled.

**QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). *QSGDisposition* is valid only on z/OS. The value can be any of the following values:

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED.

**QType (MQCFIN)**

Queue type (parameter identifier: MQIA\_Q\_TYPE).

The value can be:

**MQQT\_ALIAS**

Alias queue definition.

**MQQT\_CLUSTER**

Cluster queue definition.

**MQQT\_LOCAL**

Local queue.

**MQQT\_REMOTE**

Local definition of a remote queue.

**MQQT\_MODEL**

Model queue definition.

**QueueAccounting (MQCFIN)**

Controls the collection of accounting (thread-level and queue-level accounting) data (parameter identifier: MQIA\_ACCOUNTING\_Q).

The value can be:

**MQMON\_Q\_MGR**

The collection of accounting data for the queue is performed based upon the setting of the **QueueAccounting** parameter on the queue manager.

**MQMON\_OFF**

Do not collect accounting data for the queue.

**MQMON\_ON**

Collect accounting data for the queue.

**QueueMonitoring (MQCFIN)**

Online monitoring data collection (parameter identifier: MQIA\_MONITORING\_Q).

The value can be:

**MQMON\_OFF**

Online monitoring data collection is turned off for this queue.

**MQMON\_Q\_MGR**

The value of the queue manager's **QueueMonitoring** parameter is inherited by the queue.

**MQMON\_LOW**

Online monitoring data collection is turned on, with a low rate of data collection, for this queue unless *QueueMonitoring* for the queue manager is MQMON\_NONE.

**MQMON\_MEDIUM**

Online monitoring data collection is turned on, with a moderate rate of data collection, for this queue unless *QueueMonitoring* for the queue manager is MQMON\_NONE.

**MQMON\_HIGH**

Online monitoring data collection is turned on, with a high rate of data collection, for this queue unless *QueueMonitoring* for the queue manager is MQMON\_NONE.

**Multi QueueStatistics (MQCFIN)**

Controls the collection of statistics data (parameter identifier: MQIA\_STATISTICS\_Q).

The value can be:

**MQMON\_Q\_MGR**

The collection of statistics data for the queue is performed based upon the setting of the **QueueStatistics** parameter on the queue manager.

**MQMON\_OFF**

Do not collect statistics data for the queue.

**MQMON\_ON**

Collect statistics data for the queue unless *QueueStatistics* for the queue manager is MQMON\_NONE.

This parameter is supported only on Multiplatforms.

**RemoteQMgrName (MQCFST)**

Name of remote queue manager (parameter identifier: MQCA\_REMOTE\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

**RemoteQName (MQCFST)**

Name of remote queue as known locally on the remote queue manager (parameter identifier: MQCA\_REMOTE\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**RetentionInterval (MQCFIN)**

Retention interval (parameter identifier: MQIA\_RETENTION\_INTERVAL).

**Scope (MQCFIN)**

Scope of the queue definition (parameter identifier: MQIA\_SCOPE).

The value can be:

**MQSCO\_Q\_MGR**

Queue manager scope.

**MQSCO\_CELL**

Cell scope.

This parameter is not valid on IBM i or z/OS.

**Shareability (MQCFIN)**

The queue can be shared, or not: (parameter identifier: MQIA\_SHAREABILITY).

The value can be:

**MQQA\_SHAREABLE**

Queue is shareable.

**MQQA\_NOT\_SHAREABLE**

Queue is not shareable.

**StorageClass (MQCFST)**

Storage class (parameter identifier: MQCA\_STORAGE\_CLASS). This parameter applies to z/OS only.

Specifies the name of the storage class.

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

**TpipeNames (MQCFSL)**

TPIPE names (parameter identifier: MQCA\_TPIPE\_NAME). This parameter applies to local queues on z/OS only.

Specifies the TPIPE names used for communication with OTMA via the IBM MQ IMS bridge, if the bridge is active.

The maximum length of the string is MQ\_TPIPE\_NAME\_LENGTH.

**TriggerControl (MQCFIN)**

Trigger control (parameter identifier: MQIA\_TRIGGER\_CONTROL).

The value can be:

**MQTC\_OFF**

Trigger messages not required.

**MQTC\_ON**

Trigger messages required.

**TriggerData (MQCFST)**

Trigger data (parameter identifier: MQCA\_TRIGGER\_DATA).

The maximum length of the string is MQ\_TRIGGER\_DATA\_LENGTH.

**TriggerDepth (MQCFIN)**

Trigger depth (parameter identifier: MQIA\_TRIGGER\_DEPTH).

**TriggerMsgPriority (MQCFIN)**

Threshold message priority for triggers (parameter identifier: MQIA\_TRIGGER\_MSG\_PRIORITY).

### TriggerType (MQCFIN)

Trigger type (parameter identifier: MQIA\_TRIGGER\_TYPE).

The value can be:

#### MQTT\_NONE

No trigger messages.

#### MQTT\_FIRST

Trigger message when queue depth goes from 0 to 1.

#### MQTT EVERY

Trigger message for every message.

#### MQTT\_DEPTH

Trigger message when depth threshold exceeded.

### Usage (MQCFIN)

Usage (parameter identifier: MQIA\_USAGE).

The value can be:

#### MQUS\_NORMAL

Normal usage.

#### MQUS\_TRANSMISSION

Transmission queue.

### XmitQName (MQCFST)

Transmission queue name (parameter identifier: MQCA\_XMIT\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

## Inquire Queue Manager

The Inquire Queue Manager ( **MQCMD\_INQUIRE\_Q\_MGR** ) command inquires about the attributes of a queue manager.

## Optional parameters

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment. The command server must be enabled.
- An asterisk " \* ". The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

### QMGrAttrs (MQCFIL)

Queue manager attributes (parameter identifier: **MQIACF\_Q\_MGR\_ATTRS**).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

**MQIACF\_ALL**

All attributes.

Or a combination of the following values:

**MQCA\_ALTERATION\_DATE**

Date at which the definition was last altered.

**MQCA\_ALTERATION\_TIME**

Time at which the definition was last altered.

**MQCA\_CERT\_LABEL**

Queue manager certificate label.

**MQCA\_CHANNEL\_AUTO\_DEF\_EXIT**

Automatic channel definition exit name. **MQCA\_CHANNEL\_AUTO\_DEF\_EXIT** is not valid on z/OS.

**MQCA\_CLUSTER\_WORKLOAD\_DATA**

Data passed to the cluster workload exit.

**MQCA\_CLUSTER\_WORKLOAD\_EXIT**

Name of the cluster workload exit.

**MQCA\_COMMAND\_INPUT\_Q\_NAME**

System command input queue name.

**MQCA\_CONN\_AUTH**

Name of the authentication information object that is used to provide the location of user ID and password authentication.

**MQCA\_CREATION\_DATE**

Queue manager creation date.

**MQCA\_CREATION\_TIME**

Queue manager creation time.

**MQCA\_CUSTOM**

The custom attribute for new features.

**MQCA\_DEAD\_LETTER\_Q\_NAME**

Name of dead-letter queue.

**MQCA\_DEF\_XMIT\_Q\_NAME**

Default transmission queue name.

**z/OS MQCA\_DNS\_GROUP**

The name of the group that the TCP listener handling inbound transmissions for the queue sharing group must join when using Workload Manager for Dynamic Domain Name Services support (DDNS). **MQCA\_DNS\_GROUP** is valid on z/OS only.

**z/OS MQCA\_IGQ\_USER\_ID**

Intra-group queuing user identifier. This parameter is valid on z/OS only.

**z/OS MQCA\_LU\_GROUP\_NAME**

Generic LU name for the LU 6.2 listener. **MQCA\_LU\_GROUP\_NAME** is valid on z/OS only.

**z/OS MQCA\_LU\_NAME**

LU name to use for outbound LU 6.2 transmissions. **MQCA\_LU\_NAME** is valid on z/OS only.

**z/OS MQCA\_LU62\_ARM\_SUFFIX**

APPCPM suffix. **MQCA\_LU62\_ARM\_SUFFIX** is valid on z/OS only.

**MQCA\_PARENT**

The name of the hierarchically connected queue manager that is nominated as the parent of this queue manager.

**MQCA\_Q\_MGR\_DESC**

Queue manager description.

**MQCA\_Q\_MGR\_IDENTIFIER**

Internally generated unique queue manager name.

**MQCA\_Q\_MGR\_NAME**

Name of local queue manager.

**z/OS** **MQCA\_QSG\_CERT\_LABEL**

Queue sharing group certificate label. This parameter attribute is valid on z/OS only.

**z/OS** **MQCA\_QSG\_NAME**

Queue sharing group name. This parameter attribute is valid on z/OS only.

**MQCA\_REPOSITORY\_NAME**

Cluster name for the queue manager repository.

**MQCA\_REPOSITORY\_NAMELIST**

Name of the list of clusters for which the queue manager is providing a repository manager service.

**MQCA\_SSL\_CRL\_NAMELIST**

TLS certificate revocation location namelist.

**ULW** **MQCA\_SSL\_CRYPTO\_HARDWARE**

Parameters to configure the TLS cryptographic hardware. This parameter is supported only on UNIX, Linux, and Windows.

**MQCA\_SSL\_KEY\_REPOSITORY**

Location and name of the TLS key repository.

**z/OS** **MQCA\_TCP\_NAME**

Name of the TCP/IP system that you are using. **MQCA\_TCP\_NAME** is valid on z/OS only.

**MQCA\_VERSION**

The version of the IBM MQ installation, the queue manager is associated with. The version has the format *VVRRMMFF*:

*VV*: Version

*RR*: Release

*MM*: Maintenance level

*FF*: Fix level

**ULW** **MQIA\_ACCOUNTING\_CONN\_OVERRIDE**

Specifies whether the settings of the **MQIAccounting** and **QueueAccounting** queue manager parameters can be overridden. **MQIA\_ACCOUNTING\_CONN\_OVERRIDE** is valid only on UNIX, Linux, and Windows.

**ULW** **MQIA\_ACCOUNTING\_INTERVAL**

Intermediate accounting data collection interval. **MQIA\_ACCOUNTING\_INTERVAL** is valid only on UNIX, Linux, and Windows.

**ULW** **MQIA\_ACCOUNTING\_MQI**

Specifies whether accounting information is to be collected for MQI data.

**MQIA\_ACCOUNTING\_MQI** is valid only on UNIX, Linux, and Windows.

**MQIA\_ACCOUNTING\_Q**

Accounting data collection for queues.

**z/OS** **MQIA\_ACTIVE\_CHANNELS**

Maximum number of channels that can be active at any time. **MQIA\_ACTIVE\_CHANNELS** is valid on z/OS only.

**MQIA\_ACTIVITY\_CONN\_OVERRIDE**

Specifies whether the value of application activity trace can be overridden.

## **MQIA\_ACTIVITY\_RECORDING**

Specifies whether activity reports can be generated.

## **MQIA\_ACTIVITY\_TRACE**

Specifies whether application activity trace reports can be generated.

### **z/OS MQIA\_ADOPTNEWMCA\_CHECK**

Elements checked to determine whether an MCA must be adopted when a new inbound channel is detected with the same name as an MCA that is already active. **MQIA\_ADOPTNEWMCA\_CHECK** is valid on z/OS only.

### **z/OS MQIA\_ADOPTNEWMCA\_TYPE**

Specifies whether an orphaned instance of an MCA must be restarted automatically when a new inbound channel request matching the **AdoptNewMCACheck** parameter is detected.

**MQIA\_ADOPTNEWMCA\_TYPE** is valid on z/OS only.

### **MQ Adv. V 9.1.0 MQIA\_ADVANCED\_CAPABILITY**

Specifies whether IBM MQ Advanced extended capabilities are available for a queue manager.

### **ULW MQIA\_AMQP\_CAPABILITY**

Specifies whether AMQP capabilities are available for a queue manager.

## **MQIA\_AUTHORITY\_EVENT**

Control attribute for authority events.

### **z/OS MQIA\_BRIDGE\_EVENT**

Control attribute for IMS bridge events. **MQIA\_BRIDGE\_EVENT** is valid only on z/OS.

### **ULW MQIA\_CERT\_VAL\_POLICY**

Specifies which TLS certificate validation policy is used to validate digital certificates received from remote partner systems. This attribute controls how strictly the certificate chain validation conforms to industry security standards. **MQIA\_CERT\_VAL\_POLICY** is valid only on UNIX, Linux, and Windows. For more information, see [Certificate validation policies in IBM MQ](#).

### **z/OS MQIA\_CHANNEL\_AUTO\_DEF**

Control attribute for automatic channel definition. **MQIA\_CHANNEL\_AUTO\_DEF** is not valid on z/OS.

### **z/OS MQIA\_CHANNEL\_AUTO\_DEF\_EVENT**

Control attribute for automatic channel definition events. **MQIA\_CHANNEL\_AUTO\_DEF\_EVENT** is not valid on z/OS.

## **MQIA\_CHANNEL\_EVENT**

Control attribute for channel events.

### **z/OS MQIA\_CHINIT\_ADAPTERS**

Number of adapter subtasks to use for processing IBM MQ calls. **MQIA\_CHINIT\_ADAPTERS** is valid on z/OS only.

## **MQIA\_CHINIT\_CONTROL**

Start channel initiator automatically when queue manager starts.

### **z/OS MQIA\_CHINIT\_DISPATCHERS**

Number of dispatchers to use for the channel initiator. **MQIA\_CHINIT\_DISPATCHERS** is valid on z/OS only.

### **z/OS MQIA\_CHINIT\_SERVICE\_PARM**

Reserved for use by IBM. **MQIA\_CHINIT\_SERVICE\_PARM** is valid only on z/OS.

### **z/OS MQIA\_CHINIT\_TRACE\_AUTO\_START**

Specifies whether the channel initiator trace must start automatically.

**MQIA\_CHINIT\_TRACE\_AUTO\_START** is valid on z/OS only.

▶ **z/OS**

**MQIA\_CHINIT\_TRACE\_TABLE\_SIZE**

Size, in megabytes, of the trace data space of the channel initiator. **MQIA\_CHINIT\_TRACE\_TABLE\_SIZE** is valid on z/OS only.

**MQIA\_CHLAUTH\_RECORDS**

Control attribute for checking of channel authentication records.

**MQIA\_CLUSTER\_WORKLOAD\_LENGTH**

Maximum length of the message passed to the cluster workload exit.

**MQIA\_CLWL\_MRU\_CHANNELS**

Cluster workload most recently used channels.

**MQIA\_CLWL\_USEQ**

Cluster workload remote queue use.

**MQIA\_CMD\_SERVER\_CONTROL**

Start command server automatically when queue manager starts.

**MQIA\_CODED\_CHAR\_SET\_ID**

Coded character set identifier.

**MQIA\_COMMAND\_EVENT**

Control attribute for command events.

**MQIA\_COMMAND\_LEVEL**

Command level supported by queue manager.

**MQIA\_CONFIGURATION\_EVENT**

Control attribute for configuration events.

**MQIA\_CPI\_LEVEL**

Reserved for use by IBM.

**MQIA\_DEF\_CLUSTER\_XMIT\_Q\_TYPE**

Default transmission queue type to be used for cluster-sender channels.

▶ **Multi**

**MQIA\_DIST\_LISTS**

Distribution list support. This parameter is not valid on z/OS.

▶ **z/OS**

**MQIA\_DNS\_WLM**

Specifies whether the TCP listener that handles inbound transmissions for the queue sharing group must register with Workload Manager (WLM) for DDNS. **MQIA\_DNS\_WLM** is valid on z/OS only.

▶ **z/OS**

**MQIA\_EXPIRY\_INTERVAL**

Expiry interval. This parameter is valid on z/OS only.

▶ **z/OS**

**MQIA\_GROUP\_UR**

Control attribute for whether transactional applications can connect with a GROUP unit of recovery disposition. This parameter is valid only on z/OS.

▶ **z/OS**

**MQIA\_IGQ\_PUT\_AUTHORITY**

Intra-group queuing put authority. This parameter is valid on z/OS only.

**MQIA\_INHIBIT\_EVENT**

Control attribute for inhibit events.

▶ **z/OS**

**MQIA\_INTRA\_GROUP\_queuing**

Intra-group queuing support. This parameter is valid on z/OS only.

**MQIA\_IP\_ADDRESS\_VERSION**

IP address version selector.

▶ **z/OS**

**MQIA\_LISTENER\_TIMER**

Listener restart interval. **MQIA\_LISTENER\_TIMER** is valid on z/OS only.

**MQIA\_LOCAL\_EVENT**

Control attribute for local events.

**MQIA\_LOGGER\_EVENT**

Control attribute for recovery log events.

▶ **z/OS** **MQIA\_LU62\_CHANNELS**

Maximum number of LU 6.2 channels. **MQIA\_LU62\_CHANNELS** is valid on z/OS only.

**MQIA\_MSG\_MARK\_BROWSE\_INTERVAL**

Interval for which messages that were browsed, remain marked.

▶ **z/OS** **MQIA\_MAX\_CHANNELS**

Maximum number of channels that can be current. **MQIA\_MAX\_CHANNELS** is valid on z/OS only.

**MQIA\_MAX\_HANDLES**

Maximum number of handles.

**MQIA\_MAX\_MSG\_LENGTH**

Maximum message length.

**MQIA\_MAX\_PRIORITY**

Maximum priority.

**MQIA\_MAX\_PROPERTIES\_LENGTH**

Maximum properties length.

**MQIA\_MAX\_UNCOMMITTED\_MSGS**

Maximum number of uncommitted messages within a unit of work.

▶ **V 9.1.0** ▶ **ULW** **MQIA\_MEDIA\_IMAGE\_INTERVAL**

The target frequency with which the queue manager automatically writes media images.

▶ **V 9.1.0** ▶ **ULW** **MQIA\_MEDIA\_IMAGE\_LOG\_LENGTH**

The target size of the recovery log.

▶ **V 9.1.0** ▶ **ULW** **MQIA\_MEDIA\_IMAGE\_RECOVER\_OBJ**

Specifies the recoverable objects from a media image, if linear logging is being used.

▶ **V 9.1.0** ▶ **ULW** **MQIA\_MEDIA\_IMAGE\_RECOVER\_Q**

Specifies whether local and permanent dynamic queues defined with **ImageRecoverQueue** set to **MQIMGRCOV\_AS\_Q\_MGR** are recoverable from a media image.

▶ **V 9.1.0** ▶ **ULW** **MQIA\_MEDIA\_IMAGE\_SCHEDULING**

Whether the queue manager automatically writes media images.

**MQIA\_MONITORING\_AUTO\_CLUSSDR**

Default value of the **ChannelMonitoring** attribute of automatically defined cluster-sender channels.

**MQIA\_MONITORING\_CHANNEL**

Specifies whether channel monitoring is enabled.

**MQIA\_MONITORING\_Q**

Specifies whether queue monitoring is enabled.

▶ **z/OS** **MQIA\_OUTBOUND\_PORT\_MAX**

Maximum value in the range for the binding of outgoing channels. **MQIA\_OUTBOUND\_PORT\_MAX** is valid on z/OS only.

▶ **z/OS** **MQIA\_OUTBOUND\_PORT\_MIN**

Minimum value in the range for the binding of outgoing channels. **MQIA\_OUTBOUND\_PORT\_MIN** is valid on z/OS only.

**MQIA\_PERFORMANCE\_EVENT**

Control attribute for performance events.

## **MQIA\_PLATFORM**

Platform on which the queue manager resides.

### **z/OS MQIA\_PROT\_POLICY\_CAPABILITY**

Specifies whether Advanced Message Security is installed for the version of IBM MQ that the queue manager is running.

## **MQIA\_PUBSUB\_CLUSTER**

Controls whether this queue manager participates in the publish/subscribe clustering.

## **MQIA\_PUBSUB\_MAXMSG\_RETRY\_COUNT**

The number of retries when processing (under sync point) a failed command message

## **MQIA\_PUBSUB\_MODE**

Inquires if the publish/subscribe engine and the queued publish/subscribe interface are running, which allow applications to publish/subscribe by using the application programming interface and the queues that are being monitored by the queued publish/subscribe interface.

## **MQIA\_PUBSUB\_NP\_MSG**

Specifies whether to discard (or keep) an undelivered input message.

## **MQIA\_PUBSUB\_NP\_RESP**

The behavior of undelivered response messages.

## **MQIA\_PUBSUB\_SYNC\_PT**

Specifies whether only persistent (or all) messages must be processed under sync point.

### **z/OS MQIA\_QMGR\_CFCONLOS**

Specifies action to be taken when the queue manager loses connectivity to the administration structure, or any CF structure with CFCONLOS set to **ASQMGR**. **MQIA\_QMGR\_CFCONLOS** is valid on z/OS only.

### **z/OS MQIA\_RECEIVE\_TIMEOUT**

How long a TCP/IP channel waits to receive data from its partner. **MQIA\_RECEIVE\_TIMEOUT** is valid on z/OS only.

### **z/OS MQIA\_RECEIVE\_TIMEOUT\_MIN**

Minimum length of time that a TCP/IP channel waits to receive data from its partner . **MQIA\_RECEIVE\_TIMEOUT\_MIN** is valid on z/OS only.

### **z/OS MQIA\_RECEIVE\_TIMEOUT\_TYPE**

Qualifier to apply to the **ReceiveTimeout** parameter. **MQIA\_RECEIVE\_TIMEOUT\_TYPE** is valid on z/OS only.

## **MQIA\_REMOTE\_EVENT**

Control attribute for remote events.

### **z/OS MQIA\_SECURITY\_CASE**

Specifies whether the queue manager supports security profile names either in mixed case, or in uppercase only. **MQIA\_SECURITY\_CASE** is valid only on z/OS.

### **z/OS MQIA\_SHARED\_Q\_Q\_MGR\_NAME**

When a queue manager makes an MQOPEN call for a shared queue and the queue manager that is specified in the **ObjectQmgrName** parameter of the MQOPEN call is in the same queue sharing group as the processing queue manager, the **SQQMNAME** attribute specifies whether the **ObjectQmgrName** is used or whether the processing queue manager opens the shared queue directly. **MQIA\_SHARED\_Q\_Q\_MGR\_NAME** is valid only on z/OS.

## **MQIA\_SSL\_EVENT**

Control attribute for TLS events.

## **MQIA\_SSL\_FIPS\_REQUIRED**

Specifies whether only FIPS-certified algorithms are to be used if cryptography is executed in IBM MQ rather than in the cryptographic hardware itself.

**MQIA\_SSL\_RESET\_COUNT**

TLS key reset count.

**z/OS** **MQIA\_SSL\_TASKS**

TLS tasks. This parameter is valid on z/OS only.

**MQIA\_START\_STOP\_EVENT**

Control attribute for start stop events.

**MQIA\_STATISTICS\_AUTO\_CLUSSDR**

Specifies whether statistics data is to be collected for auto-defined cluster-sender channels and, if so, the rate of data collection.

**MQIA\_STATISTICS\_CHANNEL**

Specifies whether statistics monitoring data is to be collected for channels and, if so, the rate of data collection.

**ULW** **MQIA\_STATISTICS\_INTERVAL**

Statistics data collection interval. **MQIA\_STATISTICS\_INTERVAL** is valid only on UNIX, Linux, and Windows.

**ULW** **MQIA\_STATISTICS\_MQI**

Specifies whether statistics monitoring data is to be collected for the queue manager. **MQIA\_STATISTICS\_MQI** is valid only on UNIX, Linux, and Windows.

**ULW** **MQIA\_STATISTICS\_Q**

Specifies whether statistics monitoring data is to be collected for queues. **MQIA\_STATISTICS\_Q** is valid only on UNIX, Linux, and Windows.

**MQIA\_SUITE\_B\_STRENGTH**

Specifies whether Suite B-compliant cryptography is used and the level of strength employed. For more information about Suite B configuration and its effect on TLS channels, see [NSA Suite B Cryptography in IBM MQ](#).

**MQIA\_SYNCPOINT**

Sync point availability.

**MQIA\_TCP\_CHANNELS**

Maximum number of channels that can be current, or clients that can be connected, that use the TCP/IP transmission protocol This is valid only on z/OS.

**z/OS** **MQIA\_TCP\_KEEP\_ALIVE**

Specifies whether the TCP KEEPALIVE facility is to be used to check whether the other end of a connection is still available. **MQIA\_TCP\_KEEP\_ALIVE** is valid only on z/OS.

**z/OS** **MQIA\_TCP\_STACK\_TYPE**

Specifies whether the channel initiator can use only the TCP/IP address space specified in the **TCPName** parameter, or can optionally bind to any selected TCP/IP address. **MQIA\_TCP\_STACK\_TYPE** is valid only on z/OS.

**MQIA\_TRACE\_ROUTE\_RECORDING**

Specifies whether trace-route information can be recorded and reply messages generated.

**MQIA\_TREE\_LIFE\_TIME**

The lifetime of non-administrative topics.

**MQIA\_TRIGGER\_INTERVAL**

Trigger interval.

**MQIA\_XR\_CAPABILITY**

Specifies whether telemetry commands are supported.

**MQIACF\_Q\_MGR\_CLUSTER**

All clustering attributes. These attributes are:

- **MQCA\_CLUSTER\_WORKLOAD\_DATA**

- MQCA\_CLUSTER\_WORKLOAD\_EXIT
- MQCA\_CHANNEL\_AUTO\_DEF\_EXIT
- MQCA\_REPOSITORY\_NAME
- MQCA\_REPOSITORY\_NAMELIST
- MQIA\_CLUSTER\_WORKLOAD\_LENGTH
- MQIA\_CLWL\_MRU\_CHANNELS
- MQIA\_CLWL\_USEQ
- MQIA\_MONITORING\_AUTO\_CLUSSDR
- MQCA\_Q\_MGR\_IDENTIFIER

#### **MQIACF\_Q\_MGR\_DQM**

All distributed queuing attributes. These attributes are:

- MQCA\_CERT\_LABEL
- MQCA\_CHANNEL\_AUTO\_DEF\_EXIT
- MQCA\_DEAD\_LETTER\_Q\_NAME
- MQCA\_DEF\_XMIT\_Q\_NAME
- MQCA\_DNS\_GROUP
- MQCA\_IGQ\_USER\_ID
- MQCA\_LU\_GROUP\_NAME
- MQCA\_LU\_NAME
- MQCA\_LU62\_ARM\_SUFFIX
- MQCA\_Q\_MGR\_IDENTIFIER
- MQCA\_QSG\_CERT\_LABEL
- MQCA\_SSL\_CRL\_NAMELIST
- MQCA\_SSL\_CRYPTOHARDWARE
- MQCA\_SSL\_KEY\_REPOSITORY
- MQCA\_TCP\_NAME
- MQIA\_ACTIVE\_CHANNELS
- MQIA\_ADOPTNEWMCA\_CHECK
- MQIA\_ADOPTNEWMCA\_TYPE
- MQIA\_CERT\_VAL\_POLICY
- MQIA\_CHANNEL\_AUTO\_DEF
- MQIA\_CHANNEL\_AUTO\_DEF\_EVENT
- MQIA\_CHANNEL\_EVENT
- MQIA\_CHINIT\_ADAPTERS
- MQIA\_CHINIT\_CONTROL
- MQIA\_CHINIT\_DISPATCHERS
- MQIA\_CHINIT\_SERVICE\_PARM
- MQIA\_CHINIT\_TRACE\_AUTO\_START
- MQIA\_CHINIT\_TRACE\_TABLE\_SIZE
- MQIA\_CHLAUTH\_RECORDS
- MQIA\_INTRA\_GROUP\_queuing
- MQIA\_IGQ\_PUT\_AUTHORITY
- MQIA\_IP\_ADDRESS\_VERSION

- MQIA\_LISTENER\_TIMER
- MQIA\_LU62\_CHANNELS
- MQIA\_MAX\_CHANNELS
- MQIA\_MONITORING\_CHANNEL
- MQIA\_OUTBOUND\_PORT\_MAX
- MQIA\_OUTBOUND\_PORT\_MIN
- MQIA\_RECEIVE\_TIMEOUT
- MQIA\_RECEIVE\_TIMEOUT\_MIN
- MQIA\_RECEIVE\_TIMEOUT\_TYPE
- MQIA\_SSL\_EVENT
- MQIA\_SSL\_FIPS\_REQUIRED
- MQIA\_SSL\_RESET\_COUNT
- MQIA\_SSL\_TASKS
- MQIA\_STATISTICS\_AUTO\_CLUSSDR
- MQIA\_TCP\_CHANNELS
- MQIA\_TCP\_KEEP\_ALIVE
- MQIA\_TCP\_STACK\_TYPE

#### **MQIACF\_Q\_MGR\_EVENT**

All event control attributes. These attributes are:

- MQIA\_AUTHORITY\_EVENT
- MQIA\_BRIDGE\_EVENT
- MQIA\_CHANNEL\_EVENT
- MQIA\_COMMAND\_EVENT
- MQIA\_CONFIGURATION\_EVENT
- MQIA\_INHIBIT\_EVENT
- MQIA\_LOCAL\_EVENT
- MQIA\_LOGGER\_EVENT
- MQIA\_PERFORMANCE\_EVENT
- MQIA\_REMOTE\_EVENT
- MQIA\_SSL\_EVENT
- MQIA\_START\_STOP\_EVENT

#### **MQIACF\_Q\_MGR\_PUBSUB**

All queue manager publish/subscribe attributes. These attributes are:

- MQCA\_PARENT
- MQIA\_PUBSUB\_MAXMSG\_RETRY\_COUNT
- MQIA\_PUBSUB\_MODE
- MQIA\_PUBSUB\_NP\_MSG
- MQIA\_PUBSUB\_NP\_RESP
- MQIA\_PUBSUB\_SYNC\_PT
- MQIA\_TREE\_LIFE\_TIME

#### **MQIACF\_Q\_MGR\_SYSTEM**

All queue manager system attributes. These attributes are:

- MQCA\_ALTERATION\_DATE

- MQCA\_ALTERATION\_TIME
- MQCA\_COMMAND\_INPUT\_Q\_NAME
- MQCA\_CONN\_AUTH
- MQCA\_CREATION\_DATE
- MQCA\_CREATION\_TIME
- MQCA\_CUSTOM
- MQCA\_DEAD\_LETTER\_Q\_NAME
- MQCA\_Q\_MGR\_DESC
- MQCA\_Q\_MGR\_NAME
- MQCA\_QSG\_NAME
- MQCA\_VERSION
- MQIA\_ACCOUNTING\_CONN\_OVERRIDE
- MQIA\_ACCOUNTING\_INTERVAL
- MQIA\_ACCOUNTING\_MQI
- MQIA\_ACCOUNTING\_Q
- MQIA\_ACTIVITY\_CONN\_OVERRIDE
- MQIA\_ACTIVITY\_RECORDING
- MQIA\_ACTIVITY\_TRACE
- MQIA\_ADVANCED\_CAPABILITY
- MQIA\_CMD\_SERVER\_CONTROL
- MQIA\_CODED\_CHAR\_SET\_ID
- MQIA\_COMMAND\_LEVEL
- MQIA\_CPI\_LEVEL
- MQIA\_DIST\_LISTS
- MQIA\_EXPIRY\_INTERVAL
- MQIA\_GROUP\_UR
- MQIA\_MAX\_HANDLES
- MQIA\_MAX\_MSG\_LENGTH
- MQIA\_MAX\_PRIORITY
- MQIA\_MAX\_PROPERTIES\_LENGTH
- MQIA\_MAX\_UNCOMMITTED\_MSGS
- MQIA\_MEDIA\_IMAGE\_INTERVAL
- MQIA\_MEDIA\_IMAGE\_LOG\_LENGTH
- MQIA\_MEDIA\_IMAGE\_RECOVER\_OBJ
- MQIA\_MEDIA\_IMAGE\_RECOVER\_Q
- MQIA\_MEDIA\_IMAGE\_SCHEDULING
- MQIA\_MONITORING\_Q
- MQIA\_MSG\_MARK\_BROWSE\_INTERVAL
- MQIA\_PROT\_POLICY\_CAPABILITY
- MQIA\_QMGR\_CFCONLOS
- MQIA\_SECURITY\_CASE
- MQIA\_PLATFORM
- MQIA\_SHARED\_Q\_Q\_MGR\_NAME

- MQIA\_STATISTICS\_INTERVAL
- MQIA\_STATISTICS\_MQI
- MQIA\_STATISTICS\_Q
- MQIA\_SYNCPOINT
- MQIA\_TRACE\_ROUTE\_RECORDING
- MQIA\_TRIGGER\_INTERVAL
- MQIA\_XR\_CAPABILITY

## Inquire Queue Manager (Response)

The response to the Inquire Queue Manager (MQCMD\_INQUIRE\_Q\_MGR) command consists of the response header followed by the *QMgrName* structure and the requested combination of attribute parameter structures.

### Always returned:

*QMgrName*

### Returned if requested:

*AccountingConnOverride* , *AccountingInterval* , *ActivityConnOverride* , *ActivityRecording* , *ActivityTrace* , *AdoptNewMCACheck* , *AdoptNewMCAType* , *AdvancedCapability* , *AlterationDate* , *AlterationTime* , *AMQPCapability* , *AuthorityEvent* ,  *BridgeEvent* , *CertificateLabel* , *CertificateValPolicy* ,  *CFConlos* , *ChannelAutoDef* , *ChannelAutoDefEvent* , *ChannelAutoDefExit* , *ChannelAuthenticationRecords* , *ChannelEvent* , *ChannelInitiatorControl* , *ChannelMonitoring* , *ChannelStatistics* ,  *ChinitAdapters* ,  *ChinitDispatchers* ,  *ChinitServiceParm* ,  *ChinitTraceAutoStart* ,  *ChinitTraceTableSize* , *ClusterSenderMonitoringDefault* , *ClusterSenderStatistics* , *ClusterWorkloadData* , *ClusterWorkloadExit* , *ClusterWorkloadLength* , *CLWLMRUChannels* , *CLWLUseQ* , *CodedCharSetId* , *CommandEvent* , *CommandInputQName* , *CommandLevel* , *CommandServerControl* , *ConfigurationEvent* , *ConnAuth* , *CreationDate* , *CreationTime* , *Custom* , *DeadLetterQName* , *DefClusterXmitQueueType* , *DefXmitQName* , *DistLists* , *DNSGroup* ,  *DNSWLM* , *EncryptionPolicySuiteB* , *ExpiryInterval* , *GroupUR* ,  *IGQPutAuthority* ,  *IGQUserId* ,  *ImageInterval* ,  *ImagelogLength* ,  *ImageRecoverObject* ,  *ImageRecoverQueue* ,  *ImageSchedule* , *InhibitEvent* , *IntraGroupQueueing* , *IPAddressVersion* , *ListenerTimer* , *LocalEvent* , *LoggerEvent* ,  *LUGroupName* ,  *LUName* ,  *LU62ARMSuffix* ,  *LU62Channels* ,  *MaxChannels* ,  *MaxActiveChannels* , *MaxHandles* , *MaxMsgLength* , *MaxPriority* , *MaxPropertiesLength* , *MaxUncommittedMsgs* , *MQIAccounting* , *MQIStatistics* ,  *OutboundPortMax* ,  *OutboundPortMin* , *Parent* , *PerformanceEvent* , *Platform* , *PubSubClus* , *PubSubMaxMsgRetryCount* , *PubSubMode* , *QmgrDesc* , *QmgrIdentifier* ,  *QSGCertificateLabel* ,  *QSGName* , *QueueAccounting* , *QueueMonitoring* , *QueueStatistics* , *ReceiveTimeout* , *ReceiveTimeoutMin* , *ReceiveTimeoutType* , *RemoteEvent* , *RepositoryName* , *RepositoryNameList* , *RevDns* ,  *SecurityCase* , *SharedQQmgrName* , *Splcap* , *SSLCRLNameList* , *SSLCryptoHardware* , *SSLEvent* , *SSLFIPSRequired* , *SSLKeyRepository* , *SSLKeyResetCount* , *SSLTasks* , *StartStopEvent* ,

*StatisticsInterval* , *SyncPoint* , *TCPChannels* , *TCPKeepAlive* , *TCPName* ,  
*TCPStackType* , *TraceRouteRecording* , *TreeLifeTime* , *TriggerInterval* , *Version*

## Response data

### AccountingConnOverride (MQCFIN)

Specifies whether applications can override the settings of the *QueueAccounting* and *MQIAccounting* queue manager parameters (parameter identifier: MQIA\_ACCOUNTING\_CONN\_OVERRIDE).

The value can be any of the following values:

#### **MQMON\_DISABLED**

Applications cannot override the settings of the **QueueAccounting** and **MQIAccounting** parameters.

#### **MQMON\_ENABLED**

Applications can override the settings of the **QueueAccounting** and **MQIAccounting** parameters by using the options field of the MQCNO structure of the MQCONN API call.

This parameter applies only to UNIX, Linux, and Windows.

### AccountingInterval (MQCFIN)

The time interval, in seconds, at which intermediate accounting records are written (parameter identifier: MQIA\_ACCOUNTING\_INTERVAL).

It is a value in the range 1 through 604 000.

This parameter applies only to UNIX, Linux, and Windows.

### ActivityConnOverride (MQCFIN)

Specifies whether applications can override the setting of the ACTVTRC value in the queue manager attribute (parameter identifier: MQIA\_ACTIVITY\_CONN\_OVERRIDE).

The value can be any of the following values:

#### **MQMON\_DISABLED**

Applications cannot override the setting of the ACTVTRC queue manager attribute using the Options field in the MQCNO structure on the MQCONN call. This is the default value.

#### **MQMON\_ENABLED**

Applications can override the ACTVTRC queue manager attribute using the Options field in the MQCNO structure.

Changes to this value are only effective for connections to the queue manager after the change to the attribute.

This parameter applies only to IBM i, UNIX, and Windows.

### ActivityRecording (MQCFIN)

Whether activity reports can be generated (parameter identifier: MQIA\_ACTIVITY\_RECORDING).

The value can be:

#### **MQRECORDING\_DISABLED**

Activity reports cannot be generated.

#### **MQRECORDING\_MSG**

Activity reports can be generated and sent to the destination specified by the originator of the message causing the report.

#### **MQRECORDING\_Q**

Activity reports can be generated and sent to SYSTEM.ADMIN.ACTIVITY.QUEUE.

### ActivityTrace (MQCFIN)

Whether activity reports can be generated (parameter identifier: MQIA\_ACTIVITY\_TRACE).

The value can be:

## **MQMON\_OFF**

Do not collect IBM MQ MQI application activity trace. This is the default value.

If you set the queue manager attribute ACTVCON0 to ENABLED, this value might be overridden for individual connections using the Options field in the MQCNO structure.

## **MQMON\_ON**

Collect IBM MQ MQI application activity trace.

Changes to this value are only effective for connections to the queue manager after the change to the attribute.

This parameter applies only to IBM i, UNIX, and Windows.

## **z/OS AdoptNewMCACheck (MQCFIN)**

The elements checked to determine whether an MCA must be adopted (restarted) when a new inbound channel is detected. It is adopted if it has the same name as a currently active MCA (parameter identifier: MQIA\_ADOPTNEWMCA\_CHECK).

The value can be:

### **MQADOPT\_CHECK\_Q\_MGR\_NAME**

Check the queue manager name.

### **MQADOPT\_CHECK\_NET\_ADDR**

Check the network address.

### **MQADOPT\_CHECK\_ALL**

Check the queue manager name and network address.

### **MQADOPT\_CHECK\_NONE**

Do not check any elements.

This parameter is valid only on z/OS.

## **z/OS AdoptNewMCAType (MQCFIL)**

Adoption of orphaned channel instances (parameter identifier: MQIA\_ADOPTNEWMCA\_TYPE).

The value can be:

### **MQADOPT\_TYPE\_NO**

Do not adopt orphaned channel instances.

### **MQADOPT\_TYPE\_ALL**

Adopt all channel types.

This parameter is valid only on z/OS.

## **MQ Adv. AdvancedCapability (MQCFIN)**

Whether IBM MQ Advanced extended capabilities are available for a queue manager (parameter identifier: MQIA\_ADVANCED\_CAPABILITY).

**z/OS V 9.1.0** On z/OS, the queue manager sets the value to be MQCAP\_SUPPORTED, only if the value of **QMGRPROD** is ADVANCEDVUE. For any other value of **QMGRPROD**, or if **QMGRPROD** is not set, the queue manager sets the value to MQCAP\_NOTSUPPORTED. See [“START QMGR on z/OS” on page 911](#) for more information.

**Multi V 9.1.0** On other platforms, from IBM MQ 9.1, the queue manager sets the value to be MQCAP\_SUPPORTED, only if you have installed Managed File Transfer, XR, or Advanced Message Security. If you have not installed Managed File Transfer, XR, or Advanced Message Security, **AdvancedCapability** is set to MQCAP\_NOTSUPPORTED. See [IBM MQ components and features](#) for more information.

## **AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date, in the form yyyy-mm-dd, on which the information was last altered.

### **AlterationTime (MQCFST)**

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time, in the form hh.mm.ss, at which the information was last altered.

**ULW**

### **AMQPCapability (MQCFIN)**

Whether AMQP capabilities are available on a queue manager (parameter identifier: MQIA\_AMQP\_CAPABILITY).

The value can be one of the following values:

#### **MQCAP\_SUPPORTED**

AMQP capability has been installed.

#### **MQCAP\_NOT\_SUPPORTED**

AMQP capability has not been installed.

### **AuthorityEvent (MQCFIN)**

Controls whether authorization (Not Authorized) events are generated (parameter identifier: MQIA\_AUTHORITY\_EVENT).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

**z/OS**

### **BridgeEvent (MQCFIN)**

Controls whether IMS bridge events are generated (parameter identifier: MQIA\_BRIDGE\_EVENT).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

This parameter is valid only on z/OS.

### **CertificateLabel (MQCFST)**

Certificate label in the key repository for this queue manager to use (parameter identifier: MQCA\_CERT\_LABEL).

The maximum length of the string is MQ\_CERT\_LABEL\_LENGTH.

**ULW**

### **CertificateValPolicy (MQCFIN)**

Specifies which TLS certificate validation policy is used to validate digital certificates received from remote partner systems (parameter identifier: MQIA\_CERT\_VAL\_POLICY).

This attribute can be used to control how strictly the certificate chain validation conforms to industry security standards. This parameter is valid only on UNIX, Linux, and Windows. For more information, see [Certificate validation policies in IBM MQ](#).

The value can be any of the following values:

#### **MQ\_CERT\_VAL\_POLICY\_ANY**

Apply each of the certificate validation policies supported by the secure sockets library and accept the certificate chain if any of the policies considers the certificate chain valid. This setting can be used for maximum backwards compatibility with older digital certificates which do not comply with the modern certificate standards.

#### **MQ\_CERT\_VAL\_POLICY\_RFC5280**

Apply only the RFC 5280 compliant certificate validation policy. This setting provides stricter validation than the ANY setting, but rejects some older digital certificates.

**CFConlos (MQCFIN)**

Specifies the action to be taken when the queue manager loses connectivity to the administration structure, or any CF structures with CFCONLOS set to ASQMGR (parameter identifier: MQIA\_QMGR\_CFCONLOS).

The value can be:

**MQCFCONLOS\_TERMINATE**

The queue manager terminates when connectivity to CF structures is lost.

**MQCFCONLOS\_TOLERATE**

The queue manager tolerates loss of connectivity to CF structures without terminating.

This parameter is valid only on z/OS.

**ChannelAutoDef (MQCFIN)**

Controls whether receiver and server-connection channels can be auto-defined (parameter identifier: MQIA\_CHANNEL\_AUTO\_DEF).

The value can be:

**MQCHAD\_DISABLED**

Channel auto-definition disabled.

**MQCHAD\_ENABLED**

Channel auto-definition enabled.

**ChannelAutoDefEvent (MQCFIN)**

Controls whether channel auto-definition events are generated (parameter identifier: MQIA\_CHANNEL\_AUTO\_DEF\_EVENT), when a receiver, server-connection, or cluster-sender channel is auto-defined.

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**ChannelAutoDefExit (MQCFST)**

Channel auto-definition exit name (parameter identifier: MQCA\_CHANNEL\_AUTO\_DEF\_EXIT).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

**ChannelAuthenticationRecords (MQCFIN)**

Controls whether channel authentication records are checked (parameter identifier: MQIA\_CHLAUTH\_RECORDS).

The value can be:

**MQCHLA\_DISABLED**

Channel authentication records are not checked.

**MQCHLA\_ENABLED**

Channel authentication records are checked.

**ChannelEvent (MQCFIN)**

Controls whether channel events are generated (parameter identifier: MQIA\_CHANNEL\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**MQEVR\_EXCEPTION**

Reporting of exception channel events enabled.

**ChannelInitiatorControl (MQCFIN)**

Start the channel initiator during queue manager start (parameter identifier: MQIA\_CHINIT\_CONTROL). This parameter is not available on z/OS.

The value can be:

**MQSVC\_CONTROL\_MANUAL**

The channel initiator is not to be started automatically when the queue manager starts.

**MQSVC\_CONTROL\_Q\_MGR**

The channel initiator is to be started automatically when the queue manager starts.

**ChannelMonitoring (MQCFIN)**

Default setting for online monitoring for channels (parameter identifier: MQIA\_MONITORING\_CHANNEL).

If the *ChannelMonitoring* channel attribute is set to MQMON\_Q\_MGR , this attribute specifies the value which is assumed by the channel. The value can be any of the following values:

**MQMON\_OFF**

Online monitoring data collection is turned off.

**MQMON\_NONE**

Online monitoring data collection is turned off for channels regardless of the setting of their **ChannelMonitoring** attribute.

**MQMON\_LOW**

Online monitoring data collection is turned on, with a low ratio of data collection.

**MQMON\_MEDIUM**

Online monitoring data collection is turned on, with a moderate ratio of data collection.

**MQMON\_HIGH**

Online monitoring data collection is turned on, with a high ratio of data collection.

**z/OS ChannelStatistics (MQCFIN)**

Specifies whether statistics data is to be collected for channels (parameter identifier: MQIA\_STATISTICS\_CHANNEL).

The value can be:

**MQMON\_OFF**

Statistics data collection is turned off.

**MQMON\_LOW**

Statistics data collection is turned on, with a low ratio of data collection.

**MQMON\_MEDIUM**

Statistics data collection is turned on, with a moderate ratio of data collection.

**MQMON\_HIGH**

Statistics data collection is turned on, with a high ratio of data collection.

On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

This parameter is valid only on z/OS.

**z/OS ChinitAdapters (MQCFIN)**

Number of adapter subtasks (parameter identifier: MQIA\_CHINIT\_ADAPTERS).

The number of adapter subtasks to use for processing IBM MQ calls. This parameter is valid only on z/OS.

▶ **z/OS ChinitDispatchers (MQCFIN)**

Number of dispatchers (parameter identifier: MQIA\_CHINIT\_DISPATCHERS).

The number of dispatchers to use for the channel initiator. This parameter is valid only on z/OS.

▶ **z/OS ChinitServiceParm (MQCFST)**

Reserved for use by IBM (parameter identifier: MQCA\_CHINIT\_SERVICE\_PARM).

▶ **z/OS ChinitTraceAutoStart (MQCFIN)**

Specifies whether the channel initiator trace must start automatically (parameter identifier: MQIA\_CHINIT\_TRACE\_AUTO\_START).

The value can be:

**MQTRAXSTR\_YES**

Channel initiator trace is to start automatically.

**MQTRAXSTR\_NO**

Channel initiator trace is not to start automatically.

This parameter is valid only on z/OS.

▶ **z/OS ChinitTraceTableSize (MQCFIN)**

The size, in megabytes, of the trace data space of the channel initiator (parameter identifier: MQIA\_CHINIT\_TRACE\_TABLE\_SIZE).

This parameter is valid only on z/OS.

**ClusterSenderMonitoringDefault (MQCFIN)**

Setting for online monitoring for automatically defined cluster-sender channels (parameter identifier: MQIA\_MONITORING\_AUTO\_CLUSSDR).

The value can be:

**MQMON\_Q\_MGR**

Collection of online monitoring data is inherited from the setting of the queue manager's **ChannelMonitoring** parameter.

**MQMON\_OFF**

Monitoring for the channel is disabled.

**MQMON\_LOW**

Specifies a low rate of data collection with a minimal effect on system performance unless **ChannelMonitoring** for the queue manager is MQMON\_NONE. The data collected is not likely to be the most current.

**MQMON\_MEDIUM**

Specifies a moderate rate of data collection with limited effect on system performance unless **ChannelMonitoring** for the queue manager is MQMON\_NONE.

**MQMON\_HIGH**

Specifies a high rate of data collection with a likely effect on system performance unless **ChannelMonitoring** for the queue manager is MQMON\_NONE. The data collected is the most current available.

▶ **z/OS** On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

**ClusterSenderStatistics (MQCFIN)**

Specifies whether statistics data is to be collected for auto-defined cluster-sender channels (parameter identifier: MQIA\_STATISTICS\_AUTO\_CLUSSDR).

The value can be:

**MQMON\_Q\_MGR**

Collection of statistics data is inherited from the setting of the queue manager's **ChannelStatistics** parameter.

**MQMON\_OFF**

Statistics data collection for the channel is disabled.

**MQMON\_LOW**

Specifies a low rate of data collection with a minimal effect on system performance.

**MQMON\_MEDIUM**

Specifies a moderate rate of data collection.

**MQMON\_HIGH**

Specifies a high rate of data collection.

 On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

**ClusterWorkLoadData (MQCFST)**

Data passed to the cluster workload exit (parameter identifier: MQCA\_CLUSTER\_WORKLOAD\_DATA).

**ClusterWorkLoadExit (MQCFST)**

Name of the cluster workload exit (parameter identifier: MQCA\_CLUSTER\_WORKLOAD\_EXIT).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

**ClusterWorkLoadLength (MQCFIN)**

Cluster workload length (parameter identifier: MQIA\_CLUSTER\_WORKLOAD\_LENGTH).

The maximum length of the message passed to the cluster workload exit.

**CLWLMRUChannels (MQCFIN)**

Cluster workload most recently used (MRU) channels (parameter identifier: MQIA\_CLWL\_MRU\_CHANNELS).

The maximum number of active most recently used outbound channels.

**CLWLUseQ (MQCFIN)**

Use of remote queue (parameter identifier: MQIA\_CLWL\_USEQ).

Specifies whether a cluster queue manager is to use remote puts to other queues defined in other queue managers within the cluster during workload management.

The value can be any of the following values:

**MQCLWL\_USEQ\_ANY**

Use remote queues.

**MQCLWL\_USEQ\_LOCAL**

Do not use remote queues.

**CodedCharSetId (MQCFIN)**

Coded character set identifier (parameter identifier: MQIA\_CODED\_CHAR\_SET\_ID).

**CommandEvent (MQCFIN)**

Controls whether command events are generated (parameter identifier: MQIA\_COMMAND\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**MQEVR\_NODISPLAY**

Event reporting enabled for all successful commands except Inquire commands.

**CommandInputQName (MQCFST)**

Command input queue name (parameter identifier: MQCA\_COMMAND\_INPUT\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**CommandLevel (MQCFIN)**

Command level supported by queue manager (parameter identifier: MQIA\_COMMAND\_LEVEL).

The value can be:

**MQCMDL\_LEVEL\_710**

Level 710 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX 7.1
- IBM WebSphere MQ for HP-UX 7.1
- IBM WebSphere MQ for IBM i 7.1
- IBM WebSphere MQ for Linux 7.1
- IBM WebSphere MQ for Solaris 7.1
- IBM WebSphere MQ for Windows 7.1
- IBM WebSphere MQ for z/OS 7.1

**MQCMDL\_LEVEL\_750**

Level 750 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX 7.5
- IBM WebSphere MQ for HP-UX 7.5
- IBM WebSphere MQ for IBM i 7.5
- IBM WebSphere MQ for Linux 7.5
- IBM MQ for Solaris 7.5
- IBM WebSphere MQ for Windows 7.5

**MQCMDL\_LEVEL\_800**

Level 800 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 8.0
- IBM MQ for HP-UX 8.0
- IBM MQ for IBM i 8.0
- IBM MQ for Linux 8.0
- IBM MQ for Solaris 8.0
- IBM MQ for Windows 8.0
- IBM MQ for z/OS 8.0

**MQCMDL\_LEVEL\_801**

Level 801 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 8.0.0 Fix Pack 2
- IBM MQ for HP-UX 8.0.0 Fix Pack 2

- IBM MQ for IBM i 8.0.0 Fix Pack 2
- IBM MQ for Linux 8.0.0 Fix Pack 2
- IBM MQ for Solaris 8.0.0 Fix Pack 2

**MQCMDL\_LEVEL\_802**

Level 802 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 8.0.0 Fix Pack 3
- IBM MQ for HP-UX 8.0.0 Fix Pack 3
- IBM MQ for IBM i 8.0.0 Fix Pack 3
- IBM MQ for Linux 8.0.0 Fix Pack 3
- IBM MQ for Solaris 8.0.0 Fix Pack 3
- IBM MQ for Windows 8.0.0 Fix Pack 3

**MQCMDL\_LEVEL\_900**

Level 900 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.0
- IBM MQ for HP-UX 9.0
- IBM MQ for IBM i 9.0
- IBM MQ for Linux 9.0
- IBM MQ for Solaris 9.0
- IBM MQ for Windows 9.0
- IBM MQ for z/OS 9.0

**MQCMDL\_LEVEL\_901**

Level 901 of system control commands.

This value is returned by the following versions:

- IBM MQ for Linux 9.0.1
- IBM MQ for Windows 9.0.1
- IBM MQ for z/OS 9.0.1

**MQCMDL\_LEVEL\_902**

Level 902 of system control commands.

This value is returned by the following versions:

- IBM MQ for Linux 9.0.2
- IBM MQ for Windows 9.0.2
- IBM MQ for z/OS 9.0.2

**MQCMDL\_LEVEL\_903**

Level 903 of system control commands.

This value is returned by the following versions:

- IBM MQ for Linux 9.0.3
- IBM MQ for Windows 9.0.3
- IBM MQ for z/OS 9.0.3

**MQCMDL\_LEVEL\_904**

Level 904 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.0.4
- IBM MQ for Linux 9.0.4
- IBM MQ for Windows 9.0.4
- IBM MQ for z/OS 9.0.4

#### **MQCMDL\_LEVEL\_905**

Level 905 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.0.5
- IBM MQ for Linux 9.0.5
- IBM MQ for Windows 9.0.5
- IBM MQ for z/OS 9.0.5

#### **MQCMDL\_LEVEL\_910**

Level 910 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.1.0
- IBM MQ for IBM i 9.1.0
- IBM MQ for Linux 9.1.0
- IBM MQ for Solaris 9.1.0
- IBM MQ for Windows 9.1.0
- IBM MQ for z/OS 9.1.0

#### **MQCMDL\_LEVEL\_911**

Level 911 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.1.1
- IBM MQ for Linux 9.1.1
- IBM MQ for Windows 9.1.1
- IBM MQ for z/OS 9.1.1

#### **MQCMDL\_LEVEL\_912**

Level 912 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.1.2
- IBM MQ for Linux 9.1.2
- IBM MQ for Windows 9.1.2
- IBM MQ for z/OS 9.1.2

#### **MQCMDL\_LEVEL\_913**

Level 913 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.1.3
- IBM MQ for Linux 9.1.3
- IBM MQ for Windows 9.1.3
- IBM MQ for z/OS 9.1.3

#### **MQCMDL\_LEVEL\_914**

Level 914 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.1.4
- IBM MQ for Linux 9.1.4
- IBM MQ for Windows 9.1.4
- IBM MQ for z/OS 9.1.4

#### **MQCMDL\_LEVEL\_915**

Level 915 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.1.5
- IBM MQ for Linux 9.1.5
- IBM MQ for Windows 9.1.5
- IBM MQ for z/OS 9.1.5

The set of system control commands that corresponds to a particular value of the **CommandLevel** attribute varies. It varies according to the value of the **Platform** attribute; both must be used to decide which system control commands are supported.

**Note:**  Support for the HP-UX operating system for all IBM MQ components, including server and clients, is removed from IBM MQ 9.1.0.

#### **CommandServerControl (MQCFIN)**

Start the command server during queue manager start (parameter identifier: MQIA\_CMD\_SERVER\_CONTROL). This parameter is not available on z/OS.

The value can be:

##### **MQSVC\_CONTROL\_MANUAL**

The command server is not to be started automatically when the queue manager starts.

##### **MQSVC\_CONTROL\_Q\_MGR**

The command server is to be started automatically when the queue manager starts.

#### **ConfigurationEvent (MQCFIN)**

Controls whether configuration events are generated (parameter identifier: MQIA\_CONFIGURATION\_EVENT).

The value can be:

##### **MQEVR\_DISABLED**

Event reporting disabled.

##### **MQEVR\_ENABLED**

Event reporting enabled.

#### **ConnAuth (MQCFST)**

Name of the authentication information object that is used to provide the location of user ID and password authentication (parameter identifier: MQCA\_CONN\_AUTH).

#### **CreationDate (MQCFST)**

Creation date, in the form yyyy-mm-dd (parameter identifier: MQCA\_CREATION\_DATE).

The maximum length of the string is MQ\_CREATION\_DATE\_LENGTH.

#### **CreationTime (MQCFST)**

Creation time, in the form hh.mm.ss (parameter identifier: MQCA\_CREATION\_TIME).

The maximum length of the string is MQ\_CREATION\_TIME\_LENGTH.

### **Custom (MQCFST)**

Custom attribute for new features (parameter identifier: MQCA\_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes are introduced. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE).

This description is updated when features using this attribute are introduced.

### **DeadLetterQName (MQCFST)**

Dead letter (undelivered message) queue name (parameter identifier: MQCA\_DEAD\_LETTER\_Q\_NAME).

Specifies the name of the local queue that is to be used for undelivered messages. Messages are put on this queue if they cannot be routed to their correct destination.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### **DefClusterXmitQueueType (MQCFIN)**

The DefClusterXmitQueueType attribute controls which transmission queue is selected by default by cluster-sender channels to get messages from, to send the messages to cluster-receiver channels. (Parameter identifier: MQIA\_DEF\_CLUSTER\_XMIT\_Q\_TYPE.)

The values of **DefClusterXmitQueueType** are MQCLXQ\_SCTQ or MQCLXQ\_CHANNEL.

#### **MQCLXQ\_SCTQ**

All cluster-sender channels send messages from SYSTEM.CLUSTER.TRANSMIT.QUEUE. The correlID of messages placed on the transmission queue identifies which cluster-sender channel the message is destined for.

SCTQ is set when a queue manager is defined. This behavior is implicit in versions of IBM WebSphere MQ, earlier than IBM WebSphere MQ 7.5. In earlier versions, the queue manager attribute DefClusterXmitQueueType was not present.

#### **MQCLXQ\_CHANNEL**

Each cluster-sender channel sends messages from a different transmission queue. Each transmission queue is created as a permanent dynamic queue from the model queue SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE.

### **DefXmitQName (MQCFST)**

Default transmission queue name (parameter identifier: MQCA\_DEF\_XMIT\_Q\_NAME).

The default transmission queue is used for the transmission of messages to remote queue managers. It is used if there is no other indication of which transmission queue to use.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### **DistLists (MQCFIN)**

Distribution list support (parameter identifier: MQIA\_DIST\_LISTS).

The value can be:

#### **MQDL\_SUPPORTED**

Distribution lists supported.

#### **MQDL\_NOT\_SUPPORTED**

Distribution lists not supported.

### **z/OS DNSGroup (MQCFST)**

DNS group name (parameter identifier: MQCA\_DNS\_GROUP).

This parameter is no longer used. See [z/OS: WLM/DNS no longer supported](#).

This parameter is valid only on z/OS.

### **z/OS DNSWLM (MQCFIN)**

WLM/DNS Control: (parameter identifier: MQIA\_DNS\_WLM).

This parameter is no longer used. See [z/OS: WLM/DNS no longer supported](#).

The value can be any of the following values:

**MQDNSWLM\_NO**

MQDNSWLM\_NO is the only value supported by the queue manager.

This parameter is valid only on z/OS.

**EncryptionPolicySuiteB (MQCFIL)**

Specifies whether Suite B-compliant cryptography is used and what level of strength is employed (parameter identifier: MQIA\_SUITE\_B\_STRENGTH). For more information about Suite B configuration and its effect on TLS channels, see [NSA Suite B Cryptography in IBM MQ](#).

The value can be one, or more, of:

**MQ\_SUITE\_B\_NONE**

Suite B-compliant cryptography is not used.

**MQ\_SUITE\_B\_128\_BIT**

Suite B 128-bit strength security is used.

**MQ\_SUITE\_B\_192\_BIT**

Suite B 192-bit strength security is used.

**MQ\_SUITE\_B\_128\_BIT, MQ\_SUITE\_B\_192\_BIT**

Suite B 128-bit and Suite B 192-bit strength security is used.

**z/OS ExpiryInterval (MQCFIN)**

Interval between scans for expired messages (parameter identifier: MQIA\_EXPIRY\_INTERVAL).

Specifies the frequency with which the queue manager scans the queues looking for expired messages. This parameter is a time interval in seconds in the range 1 through 99 999 999, or the following special value:

**MQEXPI\_OFF**

No scans for expired messages.

This parameter is valid only on z/OS.

**z/OS GroupUR (MQCFIN)**

Identifies whether XA client applications can establish transactions with a GROUP unit of recovery disposition.

The value can be:

**MQGUR\_DISABLED**

XA client applications must connect using a queue manager name.

**MQGUR\_ENABLED**

XA client applications can establish transactions with a group unit of recovery disposition by specifying a queue sharing group name when they connect.

This parameter is valid only on z/OS.

**z/OS IGQPutAuthority (MQCFIN)**

Type of authority checking used by the intra-group queuing agent (parameter identifier: MQIA\_IGQ\_PUT\_AUTHORITY).

The attribute indicates the type of authority checking that is performed by the local intra-group queuing agent (IGQ agent). The checking is performed when the IGQ agent removes a message from the shared transmission queue and places the message on a local queue. The value can be any of the following values:

**MQIGQPA\_DEFAULT**

Default user identifier is used.

**MQIGQPA\_CONTEXT**

Context user identifier is used.

**MQIGQPA\_ONLY\_IGQ**

Only the IGQ user identifier is used.

**MQIGQPA\_ALTERNATE\_OR\_IGQ**

Alternate user identifier or IGQ-agent user identifier is used.

This parameter is valid only on z/OS.

▶ **z/OS** **IGQUserId (MQCFST)**

User identifier used by the intra-group queuing agent (parameter identifier: MQCA\_IGQ\_USER\_ID).

The maximum length of the string is MQ\_USER\_ID\_LENGTH. This parameter is valid only on z/OS.

▶ **V 9.1.0** **ImageInterval (MQCFIN)**

The target frequency with which the queue manager automatically writes media images (parameter identifier: MQIA\_MEDIA\_IMAGE\_INTERVAL). This parameter is not valid on z/OS.

The value can be:

The time interval, at which the queue manager automatically writes media images.

**MQMEDIMGINTVL\_OFF**

Automatic media images are not written on a time interval basis.

▶ **V 9.1.0** **ImageLogLength (MQCFIN)**

The target size of the recovery log (parameter identifier: MQIA\_MEDIA\_IMAGE\_LOG\_LENGTH). This parameter is not valid on z/OS.

The value can be:

The size of the recovery log.

**MQMEDIMGLOGLN\_OFF**

Automatic media images are not written.

▶ **V 9.1.0** **ImageRecoverObject (MQCFST)**

Specifies the recoverable objects from a media image, if linear logging is being used (parameter identifier: MQIA\_MEDIA\_IMAGE\_RECOVER\_OBJ). This parameter is not valid on z/OS.

The value can be:

**MQIMGRCOV\_NO**

Automatic media images, if enabled, are not written for these objects.

**MQIMGRCOV\_YES**

These objects are recoverable.

▶ **V 9.1.0** **ImageRecoverQueue (MQCFST)**

Displays the default **ImageRecoverQueue** attribute for local and permanent dynamic queue objects, when used with this parameter (parameter identifier: MQIA\_MEDIA\_IMAGE\_RECOVER\_Q). This parameter is not valid on z/OS.

The value can be:

**MQIMGRCOV\_NO**

The **ImageRecoverQueue** attribute for local and permanent dynamic queue objects is set to MQIMGRCOV\_NO .

**MQIMGRCOV\_YES**

The **ImageRecoverQueue** attribute for local and permanent dynamic queue objects is set to MQIMGRCOV\_YES .

### **V 9.1.0 ImageSchedule (MQCFST)**

Whether the queue manager automatically writes media images (parameter identifier: MQIA\_MEDIA\_IMAGE\_SCHEDULING). This parameter is not valid on z/OS.

The value can be:

#### **MQMEDIMGSCHED\_AUTO**

The queue manager automatically writes a media image for an object.

#### **MQMEDIMGSCHED\_MANUAL**

Automatic media images are not written.

### **InhibitEvent (MQCFIN)**

Controls whether inhibit (Inhibit Get and Inhibit Put) events are generated (parameter identifier: MQIA\_INHIBIT\_EVENT).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

### **z/OS IntraGroupQueuing (MQCFIN)**

Specifies whether intra-group queuing is used (parameter identifier: MQIA\_INTRA\_GROUP\_QUEUING).

The value can be:

#### **MQIGQ\_DISABLED**

Intra-group queuing is disabled. All messages destined for other queue managers in the queue sharing group are transmitted using conventional channels.

#### **MQIGQ\_ENABLED**

Intra-group queuing is enabled.

This parameter is valid only on z/OS.

### **IPAddressVersion (MQCFIN)**

IP address version selector (parameter identifier: MQIA\_IP\_ADDRESS\_VERSION).

Specifies which IP address version, either IPv4 or IPv6, is used. The value can be:

#### **MQIPADDR\_IPv4**

IPv4 is used.

#### **MQIPADDR\_IPv6**

IPv6 is used.

### **ListenerTimer (MQCFIN)**

Listener restart interval (parameter identifier: MQIA\_LISTENER\_TIMER).

The time interval, in seconds, between attempts by IBM MQ to restart the listener after an APPC or TCP/IP failure.

### **z/OS LocalEvent (MQCFIN)**

Controls whether local error events are generated (parameter identifier: MQIA\_LOCAL\_EVENT).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

This parameter is valid only on z/OS.

**LoggerEvent (MQCFIN)**

Controls whether recovery log events are generated (parameter identifier: MQIA\_LOGGER\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

This parameter applies only to UNIX, Linux, and Windows.

**z/OS LUGroupName (MQCFST)**

Generic LU name for the LU 6.2 listener (parameter identifier: MQCA\_LU\_GROUP\_NAME).

The generic LU name to be used by the LU 6.2 listener that handles inbound transmissions for the queue sharing group. This parameter is valid only on z/OS.

**z/OS LUName (MQCFST)**

LU name to use for outbound LU 6.2 transmissions (parameter identifier: MQCA\_LU\_NAME).

The name of the LU to use for outbound LU 6.2 transmissions. This parameter is valid only on z/OS.

**z/OS LU62ARMSuffix (MQCFST)**

APPCPM suffix (parameter identifier: MQCA\_LU62\_ARM\_SUFFIX).

The suffix of the APPCPM member of SYS1.PARMLIB. This suffix nominates the LUADD for this channel initiator. This parameter is valid only on z/OS.

**z/OS LU62Channels (MQCFIN)**

Maximum number of LU 6.2 channels (parameter identifier: MQIA\_LU62\_CHANNELS).

The maximum number of channels that can be current, or clients that can be connected, that use the LU 6.2 transmission protocol. This parameter is valid only on z/OS.

**z/OS MaxActiveChannels (MQCFIN)**

Maximum number of channels (parameter identifier: MQIA\_ACTIVE\_CHANNELS).

The maximum number of channels that can be active at any time. This parameter is valid only on z/OS.

**z/OS MaxChannels (MQCFIN)**

Maximum number of current channels (parameter identifier: MQIA\_MAX\_CHANNELS).

The maximum number of channels that can be current (including server-connection channels with connected clients). This parameter is valid only on z/OS.

**MaxHandles (MQCFIN)**

Maximum number of handles (parameter identifier: MQIA\_MAX\_HANDLES).

Specifies the maximum number of handles that any one connection can have open at the same time.

**MaxMsgLength (MQCFIN)**

Maximum message length (parameter identifier: MQIA\_MAX\_MSG\_LENGTH).

**MaxPriority (MQCFIN)**

Maximum priority (parameter identifier: MQIA\_MAX\_PRIORITY).

**MaxPropertiesLength (MQCFIN)**

Maximum properties length (parameter identifier: MQIA\_MAX\_PROPERTIES\_LENGTH).

**MaxUncommittedMsgs (MQCFIN)**

Maximum number of uncommitted messages within a unit of work (parameter identifier: MQIA\_MAX\_UNCOMMITTED\_MSGS).

This number is the sum of the following number of messages under any one sync point. :

- The number of messages that can be retrieved, plus

- The number of messages that can be put on a queue, plus
- Any trigger messages generated within this unit of work

The limit does not apply to messages that are retrieved or put outside sync point.

### **MQIAccounting (MQCFIN)**

Specifies whether accounting information for MQI data is to be collected (parameter identifier: MQIA\_ACCOUNTING\_MQI).

The value can be:

#### **MQMON\_OFF**

MQI accounting data collection is disabled.

#### **MQMON\_ON**

MQI accounting data collection is enabled.

This parameter applies only to UNIX, Linux, and Windows.

### **MQIStatistics (MQCFIN)**

Specifies whether statistics monitoring data is to be collected for the queue manager (parameter identifier: MQIA\_STATISTICS\_MQI).

The value can be:

#### **MQMON\_OFF**

Data collection for MQI statistics is disabled. MQMON\_OFF is the initial default value of the queue manager.

#### **MQMON\_ON**

Data collection for MQI statistics is enabled.

This parameter applies only to UNIX, Linux, and Windows.

### **MsgMarkBrowseInterval (MQCFIN)**

Mark-browse interval (parameter identifier: MQIA\_MSG\_MARK\_BROWSE\_INTERVAL).

The time interval in milliseconds after which the queue manager can automatically unmark messages.

**Attention:** This value should not be below the default of 5000.

### **z/OS OutboundPortMax (MQCFIN)**

The maximum value in the range for the binding of outgoing channels (parameter identifier: MQIA\_OUTBOUND\_PORT\_MAX).

The maximum value in the range of port numbers to be used when binding outgoing channels. This parameter is valid only on z/OS.

### **z/OS OutboundPortMin (MQCFIN)**

The minimum value in the range for the binding of outgoing channels (parameter identifier: MQIA\_OUTBOUND\_PORT\_MIN).

The minimum value in the range of port numbers to be used when binding outgoing channels. This parameter is valid only on z/OS.

### **Parent (MQCFST)**

The name of the hierarchically connected queue manager nominated as the parent of this queue manager (parameter identifier: MQCA\_PARENT).

### **PerformanceEvent (MQCFIN)**

Controls whether performance-related events are generated (parameter identifier: MQIA\_PERFORMANCE\_EVENT).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**Platform (MQCFIN)**

Platform on which the queue manager resides (parameter identifier: MQIA\_PLATFORM).

The value can be:

**MQPL\_AIX**

AIX (same value as MQPL\_UNIX).

**MQPL\_APPLIANCE**

IBM MQ Appliance

**MQPL\_NSK**

HP Integrity NonStop Server.

**MQPL\_OS400**

IBM i.

**MQPL\_UNIX**

UNIX.

**MQPL\_WINDOWS\_NT**

Windows.

**MQPL\_ZOS**

z/OS

**PubSubClus (MQCFIN)**

Controls whether the queue manager participates in publish/subscribe clustering (parameter identifier: MQIA\_PUBSUB\_CLUSTER).

The value can be:

**MQPSCLUS\_ENABLED**

The creating or receipt of clustered topic definitions and cluster subscriptions is permitted.

**Note:** The introduction of a clustered topic into a large IBM MQ cluster can cause a degradation in performance. This degradation occurs because all partial repositories are notified of all the other members of the cluster. Unexpected subscriptions might be created at all other nodes; for example, where `proxysub(FORCE)` is specified. Large numbers of channels might be started from a queue manager; for example, on resync after a queue manager failure.

**MQPSCLUS\_DISABLED**

The creating or receipt of clustered topic definitions and cluster subscriptions is inhibited. The creations or receipts are recorded as warnings in the queue manager error logs.

**PubSubMaxMsgRetryCount (MQCFIN)**

The number of attempts to reprocess a failed command message under sync point (parameter identifier: MQIA\_PUBSUB\_MAXMSG\_RETRY\_COUNT).

**PubSubMode (MQCFIN)**

Specifies whether the publish/subscribe engine and the queued publish/subscribe interface are running. The publish/subscribe engine enables applications to publish or subscribe by using the application programming interface. The publish/subscribe interface monitors the queues used the queued publish/subscribe interface (parameter identifier: MQIA\_PUBSUB\_MODE).

The values can be as follows:

**MQPSM\_COMPAT**

The publish/subscribe engine is running. It is therefore possible to publish or subscribe by using the application programming interface. The queued publish/subscribe interface is not running. Therefore any message that is put to the queues that are monitored by the queued publish/subscribe interface is not acted on. MQPSM\_COMPAT is used for compatibility with versions of IBM Integration Bus, (formerly known as WebSphere Message Broker) prior to version 7 that use this queue manager.

**MQPSM\_DISABLED**

The publish/subscribe engine and the queued publish/subscribe interface are not running. It is therefore not possible to publish or subscribe by using the application programming interface. Any publish/subscribe messages that are put to the queues that are monitored by the queued publish/subscribe interface are not acted on.

**MQPSM\_ENABLED**

The publish/subscribe engine and the queued publish/subscribe interface are running. It is therefore possible to publish or subscribe by using the application programming interface and the queues that are being monitored by the queued publish/subscribe interface. MQPSM\_ENABLED is the initial default value of the queue manager.

**PubSubNPInputMsg (MQCFIN)**

Specifies whether to discard or keep an undelivered input message (parameter identifier: MQIA\_PUBSUB\_NP\_MSG).

The values can be as follows:

**MQUNDELIVERED\_DISCARD**

Non-persistent input messages can be discarded if they cannot be processed. MQUNDELIVERED\_DISCARD is the default value.

**MQUNDELIVERED\_KEEP**

Non-persistent input messages are not discarded if they cannot be processed. The queued publish/subscribe interface continues to try the process again at appropriate intervals. It does not continue processing subsequent messages.

**PubSubNPResponse (MQCFIN)**

Controls the behavior of undelivered response messages (parameter identifier: MQIA\_PUBSUB\_NP\_RESP).

The values can be as follows:

**MQUNDELIVERED\_NORMAL**

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If they cannot be placed on the dead letter queue, they are discarded.

**MQUNDELIVERED\_SAFE**

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If the response cannot be sent and cannot be placed on the dead letter queue the queued publish/subscribe interface rolls back the current operation. The operation is tried again at appropriate intervals and does not continue processing subsequent messages.

**MQUNDELIVERED\_DISCARD**

Non-persistent responses that cannot be placed on the reply queue are discarded. MQUNDELIVERED\_DISCARD is the default value for new queue managers.

**MQUNDELIVERED\_KEEP**

Non-persistent responses are not placed on the dead letter queue or discarded. Instead, the queued publish/subscribe interface backs out the current operation and then tries it again at appropriate intervals.

**PubSubSyncPoint (MQCFIN)**

Specifies whether only persistent messages or all messages are processed under sync point (parameter identifier: MQIA\_PUBSUB\_SYNC\_PT).

The values can be as follows:

**MQSYNCPOINT\_IFPER**

This makes the queued publish/subscribe interface receive non-persistent messages outside sync point. If the daemon receives a publication outside sync point, the daemon forwards the publication to subscribers known to it outside sync point. MQSYNCPOINT\_IFPER is the default value.

### **MQSYNCPOINT\_YES**

MQSYNCPOINT\_YES makes the queued publish/subscribe interface receive all messages under sync point.

### **QMGrDesc (MQCFST)**

Queue manager description (parameter identifier: MQCA\_Q\_MGR\_DESC).

This parameter is text that briefly describes the object.

The maximum length of the string is MQ\_Q\_MGR\_DESC\_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the queue manager on which the command is executing. Using this character set ensures that the text is translated correctly.

### **QMGrIdentifier (MQCFST)**

Queue manager identifier (parameter identifier: MQCA\_Q\_MGR\_IDENTIFIER).

The unique identifier of the queue manager.

### **QMGrName (MQCFST)**

Name of local queue manager (parameter identifier: MQCA\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

### **z/OS QSGCertificateLabel (MQCFST)**

Certificate label in the key repository for this queue sharing group to use (parameter identifier: MQCA\_QSG\_CERT\_LABEL).

The maximum length of the string is MQ\_QSG\_CERT\_LABEL\_LENGTH. This parameter is valid only on z/OS.

### **z/OS QSGName (MQCFST)**

Queue sharing group name (parameter identifier: MQCA\_QSG\_NAME).

The maximum length of the string is MQ\_QSG\_NAME\_LENGTH. This parameter is valid only on z/OS.

### **QueueAccounting (MQCFIN)**

Collection of accounting (thread-level and queue-level accounting) data for queues (parameter identifier: MQIA\_ACCOUNTING\_Q).

The value can be:

#### **MQMON\_NONE**

Accounting data collection for queues is disabled.

#### **MQMON\_OFF**

Accounting data collection is disabled for queues specifying a value of MQMON\_Q\_MGR in the **QueueAccounting** parameter.

#### **MQMON\_ON**

Accounting data collection is enabled for queues specifying a value of MQMON\_Q\_MGR in the **QueueAccounting** parameter.

### **QueueMonitoring (MQCFIN)**

Default setting for online monitoring for queues (parameter identifier: MQIA\_MONITORING\_Q).

If the **QueueMonitoring** queue attribute is set to MQMON\_Q\_MGR, this attribute specifies the value which is assumed by the channel. The value can be any of the following values:

#### **MQMON\_OFF**

Online monitoring data collection is turned off.

#### **MQMON\_NONE**

Online monitoring data collection is turned off for queues regardless of the setting of their **QueueMonitoring** attribute.

**MQMON\_LOW**

Online monitoring data collection is turned on, with a low ratio of data collection.

**MQMON\_MEDIUM**

Online monitoring data collection is turned on, with a moderate ratio of data collection.

**MQMON\_HIGH**

Online monitoring data collection is turned on, with a high ratio of data collection.

**Multi** **QueueStatistics (MQCFIN)**

Specifies whether statistics data is to be collected for queues (parameter identifier: MQIA\_STATISTICS\_Q).

The value can be:

**MQMON\_NONE**

Statistics data collection is turned off for queues regardless of the setting of their **QueueStatistics** parameter.

**MQMON\_OFF**

Statistics data collection is turned off for queues specifying a value of MQMON\_Q\_MGR in their **QueueStatistics** parameter.

**MQMON\_ON**

Statistics data collection is turned on for queues specifying a value of MQMON\_Q\_MGR in their **QueueStatistics** parameter.

This parameter is valid only on [Multiplatforms](#).

**z/OS** **ReceiveTimeout (MQCFIN)**

How long a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA\_RECEIVE\_TIMEOUT).

The length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state.

This parameter is valid only on z/OS.

**z/OS** **ReceiveTimeoutMin (MQCFIN)**

The minimum length of time that a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA\_RECEIVE\_TIMEOUT\_MIN).

The minimum length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state. This parameter is valid only on z/OS.

**z/OS** **ReceiveTimeoutType (MQCFIN)**

The qualifier to apply to *ReceiveTimeout* (parameter identifier: MQIA\_RECEIVE\_TIMEOUT\_TYPE).

The qualifier to apply to *ReceiveTimeoutType* to calculate how long a TCP/IP channel waits to receive data from its partner. The wait includes heartbeats. If the wait interval expires the channel returns to the inactive state. This parameter is valid only on z/OS.

The value can be:

**MQRCVTIME\_MULTIPLY**

The *ReceiveTimeout* value is a multiplier to be applied to the negotiated value of *HeartbeatInterval* to determine how long a channel waits.

**MQRCVTIME\_ADD**

*ReceiveTimeout* is a value, in seconds, to be added to the negotiated value of *HeartbeatInterval* to determine how long a channel waits.

**MQRCVTIME\_EQUAL**

*ReceiveTimeout* is a value, in seconds, representing how long a channel waits.

**RemoteEvent (MQCFIN)**

Controls whether remote error events are generated (parameter identifier: MQIA\_REMOTE\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**RepositoryName (MQCFST)**

Repository name (parameter identifier: MQCA\_REPOSITORY\_NAME).

The name of a cluster for which this queue manager is to provide a repository service.

**RepositoryNameList (MQCFST)**

Repository name list (parameter identifier: MQCA\_REPOSITORY\_NAMELIST).

The name of a list of clusters for which this queue manager is to provide a repository service.

**RevDns (MQCFIN)**

Whether reverse lookup of the host name from a Domain Name Server is carried out. (parameter identifier: MQIA\_REVERSE\_DNS\_LOOKUP).

This attribute has an effect only on channels using a transport type (TRPTYPE) of TCP.

The value can be:

**MQRDNS\_DISABLED**

DNS host names are not reverse looked-up for the IP addresses of inbound channels. With this setting any CHLAUTH rules using host names are not matched.

**MQRDNS\_ENABLED**

DNS host names are reverse looked-up for the IP addresses of inbound channels when this information is required. This setting is required for matching against CHLAUTH rules that contain host names, and for writing out error messages.

**z/OS SecurityCase (MQCFIN)**

Security case supported (parameter identifier: MQIA\_SECURITY\_CASE).

Specifies whether the queue manager supports security profile names in mixed case, or in uppercase only. The value is activated when a Refresh Security command is run with *SecurityType* (MQSECTYPE\_CLASSES) specified.

The value can be:

**MQSCYC\_UPPER**

Security profile names must be in uppercase.

**MQSCYC\_MIXED**

Security profile names can be in uppercase or in mixed case.

This parameter is valid only on z/OS.

**z/OS SharedQMgrName (MQCFIN)**

Shared-queue queue manager name (parameter identifier: MQIA\_SHARED\_Q\_Q\_MGR\_NAME).

A queue manager makes an MQOPEN call for a shared queue. The queue manager that is specified in the **ObjectQMgrName** parameter of the MQOPEN call is in the same queue sharing group as the processing queue manager. The SQQMNAME attribute specifies whether the *ObjectQMgrName* is used or whether the processing queue manager opens the shared queue directly.

The value can be any of the following values:

**MQSQQM\_USE**

*ObjectQMgrName* is used and the appropriate transmission queue is opened.

**MQSQQM\_IGNORE**

The processing queue manager opens the shared queue directly.

This parameter is valid only on z/OS.

### **Splcap (MQCFIN)**

Specifies whether the Advanced Message Security component is installed for the version of IBM MQ that the queue manager is running under (parameter identifier: MQIA\_PROT\_POLICY\_CAPABILITY).

The value can be one of the following values:

#### **MQCAP\_SUPPORTED**

If the AMS component is installed for the version of IBM MQ that the queue manager is running under.

#### **MQCAP\_NOT\_SUPPORTED**

If the AMS component is not installed.

### **SSLCRLNamelist (MQCFST)**

The TLS certificate revocation location namelist (parameter identifier: MQCA\_SSL\_CRL\_NAMELIST).

The length of the string is MQ\_NAMELIST\_NAME\_LENGTH.

Indicates the name of a namelist of authentication information objects to be used for certificate revocation checking by the queue manager.

Only authentication information objects with types of CRLLDAP or OCSP are allowed in the namelist referred to by *SSLCRLNamelist* (MQCFST). Any other type results in an error message when the list is processed and is subsequently ignored.

### **Multi SSLCryptoHardware (MQCFST)**

Parameters to configure the TLS cryptographic hardware (parameter identifier: MQCA\_SSL\_CRYPTO\_HARDWARE).

The length of the string is MQ\_SSL\_CRYPTO\_HARDWARE\_LENGTH.

Sets the name of the parameter string required to configure the cryptographic hardware present on the system.

This parameter is valid only on [Multiplatforms](#).

### **SSLEvent (MQCFIN)**

Controls whether TLS events are generated (parameter identifier: MQIA\_SSL\_EVENT).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

### **SSLFipsRequired (MQCFIN)**

Controls whether only FIPS-certified algorithms are to be used if cryptography is executed in IBM MQ itself (parameter identifier: MQIA\_SSL\_FIPS\_REQUIRED). This parameter is valid only on z/OS, UNIX, Linux, and Windows.

The value can be:

#### **MQSSL\_FIPS\_NO**

Any supported CipherSpec can be used.

#### **MQSSL\_FIPS\_YES**

Only FIPS-certified cryptographic algorithms are to be used if cryptography is executed in IBM MQ rather than cryptographic hardware.

### **SSLKeyRepository (MQCFST)**

Location and name of the TLS key repository (parameter identifier: MQCA\_SSL\_KEY\_REPOSITORY).

The length of the string is MQ\_SSL\_KEY\_REPOSITORY\_LENGTH.

Indicates the name of the Secure Sockets Layer key repository.

The format of the name depends on the environment.

### **SSLKeyResetCount (MQCFIN)**

TLS key reset count (parameter identifier: MQIA\_SSL\_RESET\_COUNT).

The number of unencrypted bytes that initiating TLS channel MCAs send or receive before renegotiating the secret key.

### **z/OS SSLTasks (MQCFIN)**

Number of server subtasks used for processing TLS calls (parameter identifier: MQIA\_SSL\_TASKS).

The number of server subtasks used for processing TLS calls. This parameter is valid only on z/OS.

### **StartStopEvent (MQCFIN)**

Controls whether start and stop events are generated (parameter identifier: MQIA\_START\_STOP\_EVENT).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

### **Multi StatisticsInterval (MQCFIN)**

The time interval, in seconds, at which statistics monitoring data is written to the monitoring queue (parameter identifier: MQIA\_STATISTICS\_INTERVAL).

This parameter is valid only on [Multiplatforms](#).

### **SyncPoint (MQCFIN)**

Sync point availability (parameter identifier: MQIA\_SYNCPOINT).

The value can be:

#### **MQSP\_AVAILABLE**

Units of work and sync pointing available.

#### **MQSP\_NOT\_AVAILABLE**

Units of work and sync pointing not available.

### **z/OS TCPChannels (MQCFIN)**

The maximum number of channels that can be current, or clients that can be connected, that use the TCP/IP transmission protocol (parameter identifier: MQIA\_TCP\_CHANNELS).

This parameter is valid only on z/OS.

### **z/OS TCPKeepAlive (MQCFIN)**

Specifies whether the TCP KEEPALIVE facility is to be used to check whether the other end of the connection is still available (parameter identifier: MQIA\_TCP\_KEEP\_ALIVE).

The value can be:

#### **MQTCPKEEP\_YES**

The TCP KEEPALIVE facility is to be used as specified in the TCP profile configuration data set. The interval is specified in the *KeepAliveInterval* channel attribute.

#### **MQTCPKEEP\_NO**

The TCP KEEPALIVE facility is not to be used.

This parameter is valid only on z/OS.

### **z/OS TCPName (MQCFST)**

The name of the TCP/IP system that you are using (parameter identifier: MQIA\_TCP\_NAME).

This parameter is valid only on z/OS.

### **TCPStackType (MQCFIN)**

Specifies whether the channel initiator can use only the TCP/IP address space specified in *TCPName*, or can optionally bind to any selected TCP/IP address (parameter identifier: MQIA\_TCP\_STACK\_TYPE).

The value can be:

#### **MQTCPSTACK\_SINGLE**

The channel initiator can use only the TCP/IP address space specified in *TCPName*.

#### **MQTCPSTACK\_MULTIPLE**

The channel initiator can use any TCP/IP address space available to it.

This parameter is valid only on z/OS.

### **TraceRouteRecording (MQCFIN)**

Specifies whether trace-route information can be recorded and a reply message generated (parameter identifier: MQIA\_TRACE\_ROUTE\_RECORDING).

The value can be:

#### **MQRECORDING\_DISABLED**

Trace-route information cannot be recorded.

#### **MQRECORDING\_MSG**

Trace-route information can be recorded and sent to the destination specified by the originator of the message causing the trace route record.

#### **MQRECORDING\_Q**

Trace-route information can be recorded and sent to SYSTEM.ADMIN.TRACE.ROUTE.QUEUE.

### **TreeLifeTime (MQCFIN)**

The lifetime in seconds of non-administrative topics (parameter identifier: MQIA\_TREE\_LIFE\_TIME).

Non-administrative topics are those topics created when an application publishes to, or subscribes on, a topic string that does not exist as an administrative node. When this non-administrative node no longer has any active subscriptions, this parameter determines how long the queue manager waits before removing that node. Only non-administrative topics that are in use by a durable subscription remain after the queue manager it recycled.

The value can be in the range 0 - 604,000. A value of 0 means that non-administrative topics are not removed by the queue manager. The initial default value of the queue manager is 1800.

### **TriggerInterval (MQCFIN)**

Trigger interval (parameter identifier: MQIA\_TRIGGER\_INTERVAL).

Specifies the trigger time interval, expressed in milliseconds, for use only with queues where *TriggerType* has a value of MQTT\_FIRST.

### **Version (MQCFST)**

The version of the IBM MQ code (parameter identifier: MQCA\_VERSION).

The version of the IBM MQ code is shown as VVRRMMFF:

VV: Version

RR: Release

MM: Maintenance level

FF: Fix level

### **XrCapability (MQCFIN)**

Specifies whether the MQ Telemetry capability and commands are supported by the queue manager where *XrCapability* has a value of MQCAP\_SUPPORTED or MQCAP\_NOT\_SUPPORTED (parameter identifier: MQIA\_XR\_CAPABILITY).

This parameter applies only to  IBM i, UNIX, and Windows.

## **Multi** MQCMD\_INQUIRE\_Q\_MGR\_STATUS (Inquire Queue Manager Status) on Multiplatforms

The Inquire Queue Manager Status (MQCMD\_INQUIRE\_Q\_MGR\_STATUS) PCF command inquires about the status of the local queue manager.

## Optional parameters

### QMStatusAttrs (MQCFIL)

Queue manager status attributes (parameter identifier: MQIACF\_Q\_MGR\_STATUS\_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQCA\_Q\_MGR\_NAME**

Name of the local queue manager.

#### **MQCA\_INSTALLATION\_DESC**

Description of the installation associated with the queue manager.

#### **MQCA\_INSTALLATION\_NAME**

Name of the installation associated with the queue manager.

#### **MQCA\_INSTALLATION\_PATH**

Path of the installation associated with the queue manager.

#### **MQCACF\_ARCHIVE\_LOG\_EXTENT\_NAME**

Name of the oldest log extent for which the queue manager is waiting for archive notification.

The maximum length of the string is MQ\_LOG\_EXTENT\_NAME\_LENGTH.

If the queue manager is not using archive log management, this attribute is blank. This parameter is not valid on IBM i.

#### **MQCACF\_CURRENT\_LOG\_EXTENT\_NAME**

Name of the log extent currently being written to by the logger.

MQCACF\_CURRENT\_LOG\_EXTENT\_NAME is available only on queue managers using linear logging. On other queue managers, MQCACF\_CURRENT\_LOG\_EXTENT\_NAME is blank.

#### **MQCACF\_LOG\_PATH**

Location of the recovery log extents.

#### **MQCACF\_MEDIA\_LOG\_EXTENT\_NAME**

Name of the earliest log extent required to perform media recovery.

MQCACF\_MEDIA\_LOG\_EXTENT\_NAME is available only on queue managers using linear logging. On other queue managers, MQCACF\_MEDIA\_LOG\_EXTENT\_NAME is blank.

#### **MQCACF\_RESTART\_LOG\_EXTENT\_NAME**

Name of the earliest log extent required to perform restart recovery.

MQCACF\_RESTART\_LOG\_EXTENT\_NAME is available only on queue managers using linear logging. On other queue managers, MQCACF\_RESTART\_LOG\_EXTENT\_NAME is blank.

#### **MQCACF\_Q\_MGR\_START\_DATE**

The date on which the queue manager was started (in the form yyyy-mm-dd). The length of this attribute is given by MQ\_DATE\_LENGTH.

**MQCACF\_Q\_MGR\_START\_TIME**

The time at which the queue manager was started (in the form hh.mm.ss). The length of this attribute is given by MQ\_TIME\_LENGTH.

**MQIACF\_ARCHIVE\_LOG\_SIZE**

Current size of the amount of space occupied, in megabytes, by log extents no longer required for restart or media recovery but waiting to be archived.

This attribute is not valid on IBM i.

**MQIACF\_CHINIT\_STATUS**

Current status of the channel initiator.

**MQIACF\_CMD\_SERVER\_STATUS**

Current status of the command server.

**MQIACF\_CONNECTION\_COUNT**

Current number of connections to the queue manager.

**MQIACF\_LDAP\_CONNECTION\_STATUS**

Current status of the connection to the LDAP server.

**MQIACF\_LOG\_IN\_USE**

Current size of the percentage of the primary log space in use for restart recovery at this point in time.

This attribute is not valid on IBM i.

**MQIACF\_LOG\_UTILIZATION**

Current percentage estimate of how well the queue manager workload is contained within the primary log space.

This attribute is not valid on IBM i.

**MQIACF\_MEDIA\_LOG\_SIZE**

Current size of the log data required for media recovery in megabytes.

This attribute is not valid on IBM i.

**MQIACF\_PERMIT\_STANDBY**

Whether a standby instance is permitted.

**MQIACF\_Q\_MGR\_STATUS**

Current status of the queue manager.

**MQIACF\_Q\_MGR\_STATUS\_LOG**

Current status of all the log attributes. The attributes can be any of the following:

- MQCACF\_ARCHIVE\_LOG\_EXTENT\_NAME
- MQIACF\_ARCHIVE\_LOG\_SIZE
- MQCACF\_CURRENT\_LOG\_EXTENT\_NAME
- MQIACF\_LOG\_IN\_USE
- MQIACF\_LOG\_UTILIZATION
- MQCACF\_MEDIA\_LOG\_EXTENT\_NAME
- MQIACF\_MEDIA\_LOG\_SIZE
- MQCACF\_RESTART\_LOG\_EXTENT\_NAME
- MQIACF\_RESTART\_LOG\_SIZE
- MQIACF\_REUSABLE\_LOG\_SIZE

**MQIACF\_RESTART\_LOG\_SIZE**

Size of the log data required for restart recovery in megabytes.

This attribute is not valid on IBM i.

## **MQIACF\_REUSABLE\_LOG\_SIZE**

The amount of space occupied, in megabytes, by log extents available to be reused.

This attribute is not valid on IBM i.

Multi

## **MQCMD\_INQUIRE\_Q\_MGR\_STATUS (Inquire Queue Manager Status)**

### **Response on Multiplatforms**

The response to the Inquire Queue Manager Status (MQCMD\_INQUIRE\_Q\_MGR\_STATUS) PCF command consists of the response header followed by the *QMgrName* and *QMgrStatus* structures and the requested combination of attribute parameter structures.

#### **Always returned:**

*QMgrName*, *QMgrStatus*

#### **Returned if requested:**

*ArchiveLog*, *ArchiveLogSize*, *ChannelInitiatorStatus*, *CommandServerStatus*, *ConnectionCount*, *CurrentLog*, *InstallationDesc*, *InstallationName*, *InstallationPath*, *LDAPConnectionStatus*, *LogInUse*, *LogPath*, *LogUtilization*, *MediaRecoveryLog*, *MediaRecoveryLogSize*, *PermitStandby*, *RestartRecoveryLogSize*, *ReusableLogSize*, *StartDate*, *StartTime*

### **Response data**

#### **ArchiveLog (MQCFST)**

Name of the oldest log extent for which the queue manager is waiting for archive notification or blank if they have all been archived (parameter identifier MQCACF\_ARCHIVE\_LOG\_EXTENT\_NAME).

#### **ArchiveLogSize (MQCFIN)**

Current size of the amount of space occupied, in megabytes, by log extents no longer required for restart or media recovery but waiting to be archived (parameter identifier MQIACF\_ARCHIVE\_LOG\_SIZE).

#### **ChannelInitiatorStatus (MQCFIN)**

Status of the channel initiator reading SYSTEM.CHANNEL.INITQ (parameter identifier: MQIACF\_CHINIT\_STATUS).

The value can be:

##### **MQSVC\_STATUS\_STOPPED**

The channel initiator is not running.

##### **MQSVC\_STATUS\_STARTING**

The channel initiator is in the process of initializing.

##### **MQSVC\_STATUS\_RUNNING**

The channel initiator is fully initialized and is running.

##### **MQSVC\_STATUS\_STOPPING**

The channel initiator is stopping.

#### **CommandServerStatus (MQCFIN)**

Status of the command server (parameter identifier: MQIACF\_CMD\_SERVER\_STATUS).

The value can be:

##### **MQSVC\_STATUS\_STARTING**

The command server is in the process of initializing.

##### **MQSVC\_STATUS\_RUNNING**

The command server is fully initialized and is running.

##### **MQSVC\_STATUS\_STOPPING**

The command server is stopping.

#### **ConnectionCount (MQCFIN)**

Connection count (parameter identifier: MQIACF\_CONNECTION\_COUNT).

The current number of connections to the queue manager.

**CurrentLog (MQCFST)**

Log extent name (parameter identifier: MQCACF\_CURRENT\_LOG\_EXTENT\_NAME).

The name of the log extent that was being written to at the time of the Inquire command. If the queue manager is using circular logging, this parameter is blank.

The maximum length of the string is MQ\_LOG\_EXTENT\_NAME\_LENGTH.

**InstallationDesc (MQCFST)**

Installation Description (parameter identifier: MQCA\_INSTALLATION\_DESC)

The installation description for this queue manager.

**InstallationName (MQCFST)**

Installation Name (parameter identifier: MQCA\_INSTALLATION\_NAME)

The installation name for this queue manager.

**InstallationPath (MQCFST)**

Installation Path (parameter identifier: MQCA\_INSTALLATION\_PATH)

The installation path for this queue manager.

**LDAPConnectionStatus (MQCFIN)**

Current status of the queue manager's connection to the LDAP server (parameter identifier: MQIACF\_LDAP\_CONNECTION\_STATUS).

The value can be:

**MQLDAPC\_CONNECTED**

The queue manager currently has a connection to the LDAP server.

**MQLDAPC\_ERROR**

The queue manager attempted to make a connection to the LDAP server and failed.

**MQLDAPC\_INACTIVE**

The queue manager is not configured to use an LDAP server or has not yet made a connection to the LDAP server.

**LogInUse (MQCFIN)**

Current size of the percentage of the primary log space in use for restart recovery at this point in time (parameter identifier MQIACF\_LOG\_IN\_USE).

**LogPath (MQCFST)**

Location of the recovery log extents (parameter identifier: MQCACF\_LOG\_PATH).

This parameter identifies the directory where log files are created by the queue manager.

The maximum length of the string is MQ\_LOG\_PATH\_LENGTH.

**LogUtilization (MQCFIN)**

Current percentage estimate of how well the queue manager workload is contained within the primary log space (parameter identifier MQIACF\_LOG\_UTILIZATION).

**MediaRecoveryLog (MQCFST)**

Name of the oldest log extent required by the queue manager to perform media recovery (parameter identifier: MQCACF\_MEDIA\_LOG\_EXTENT\_NAME). This parameter is available only on queue managers using linear logging. If the queue manager is using circular logging, this parameter is blank.

The maximum length of the string is MQ\_LOG\_EXTENT\_NAME\_LENGTH.

**MediaRecoveryLogSize (MQCFIN)**

Current size of the log data required for media recovery in megabytes (parameter identifier MQIACF\_MEDIA\_LOG\_SIZE).

**PermitStandby (MQCFIN)**

Whether a standby instance is permitted (parameter identifier: MQIACF\_PERMIT\_STANDBY).

The value can be:

**MQSTDBY\_NOT\_PERMITTED**

Standby instances are not permitted.

**MQSTDBY\_PERMITTED**

Standby instances are permitted.

**QMgrName (MQCFST)**

Name of the local queue manager (parameter identifier: MQCA\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

**QMgrStatus (MQCFIN)**

Current execution status of the queue manager (parameter identifier: MQIACF\_Q\_MGR\_STATUS).

The value can be:

**MQQMSTA\_STARTING**

The queue manager is initializing.

**MQQMSTA\_RUNNING**

The queue manager is fully initialized and is running.

**MQQMSTA QUIESCING**

The queue manager is quiescing.

**RestartRecoveryLog (MQCFST)**

Name of the oldest log extent required by the queue manager to perform restart recovery (parameter identifier: MQCACF\_RESTART\_LOG\_EXTENT\_NAME).

This parameter is available only on queue managers using linear logging. If the queue manager is using circular logging, this parameter is blank.

The maximum length of the string is MQ\_LOG\_EXTENT\_NAME\_LENGTH.

**RestartRecoveryLogSize (MQCFIN)**

Size of the log data required for restart recovery in megabytes (parameter identifier: MQIACF\_RESTART\_LOG\_SIZE).

**ReusableLogSize (MQCFIN)**

The amount of space occupied, in megabytes, by log extents available to be reused (parameter identifier: MQIACF\_REUSABLE\_LOG\_SIZE).

**StartDate (MQCFST)**

Date when this queue manager was started (in the form yyyy-mm-dd) (parameter identifier: MQCACF\_Q\_MGR\_START\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

**StartTime (MQCFST)**

Time when this queue manager was started (in the form hh:mm:ss) (parameter identifier: MQCACF\_Q\_MGR\_START\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

## Inquire Queue Names

The Inquire Queue Names (MQCMD\_INQUIRE\_Q\_NAMES) command inquires a list of queue names that match the generic queue name, and the optional queue type specified.

### Required parameters

#### QName (MQCFST)

Queue name (parameter identifier: MQCA\_Q\_NAME).

Generic queue names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_Q\_LENGTH.

### Optional parameters

#### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

When a value other than blank is specified, the maximum response size is limited to 32KB from each queue manager. If the response from a queue manager would be larger than this, an error response with reason code [MQRCCF\\_COMMAND\\_LENGTH\\_ERROR \(3230\)](#) is returned by that queue manager.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

##### MQQSGD\_LIVE

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

##### MQQSGD\_ALL

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_PRIVATE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

**MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED. MQQSGD\_SHARED is permitted only in a shared queue environment.

**QType (MQCFIN)**

Queue type (parameter identifier: MQIA\_Q\_TYPE).

If present, this parameter limits the queue names returned to queues of the specified type. If this parameter is not present, queues of all types are eligible. The value can be any of the following values:

**MQQT\_ALL**

All queue types.

**MQQT\_LOCAL**

Local queue.

**MQQT\_ALIAS**

Alias queue definition.

**MQQT\_REMOTE**

Local definition of a remote queue.

**MQQT\_MODEL**

Model queue definition.

The default value if this parameter is not specified is MQQT\_ALL.

**Inquire Queue Names (Response)**

The response to the Inquire Queue Names (MQCMD\_INQUIRE\_Q\_NAMES) command consists of the response header followed by a single parameter structure giving zero or more names that match the specified queue name. The response header is followed by the *QTypes* structure, with the same number of entries as the *QNames* structure. Each entry gives the type of the queue with the corresponding entry in the *QNames* structure.

Additionally, on z/OS only, the **QSGDispositions** parameter structure (with the same number of entries as the *QNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *QNames* structure.

**Always returned:**

*QNames* ,  *QSGDispositions* , *QTypes*

**Returned if requested:**

None

**Response data****QNames (MQCFSL)**

List of queue names (parameter identifier: MQCACF\_Q\_NAMES).

### **QSGDispositions (MQCFIL)**

List of queue sharing group dispositions (parameter identifier: MQIACF\_QSG\_DISPS). This parameter is valid on z/OS only. Possible values for fields in this structure are:

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

#### **MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED.

### **QTypes (MQCFIL)**

List of queue types (parameter identifier: MQIACF\_Q\_TYPES). Possible values for fields in this structure are:

#### **MQQT\_ALIAS**

Alias queue definition.

#### **MQQT\_LOCAL**

Local queue.

#### **MQQT\_REMOTE**

Local definition of a remote queue.

#### **MQQT\_MODEL**

Model queue definition.

## **Inquire Queue Status**

The Inquire Queue Status (MQCMD\_INQUIRE\_Q\_STATUS) command inquires about the status of a local IBM MQ queue. You must specify the name of a local queue for which you want to receive status information.

### **Required parameters**

#### **QName (MQCFST)**

Queue name (parameter identifier: MQCA\_Q\_NAME).

Generic queue names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all queues having names that start with the selected character string. An asterisk on its own matches all possible names.

The queue name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### **Optional parameters (Inquire Queue Status)**

#### **ByteStringFilterCommand (MQCFBF)**

Byte string filter command descriptor. The parameter identifier must be MQBACF\_EXTERNAL\_UOW\_ID or MQBACF\_Q\_MGR\_UOW\_ID. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFBF - PCF byte string filter parameter” on page 1891](#) for information about using this filter condition.

If you specify a byte string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter, or a string filter using the **StringFilterCommand** parameter.

### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is initiated when the queue manager is a member of a queue sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is initiated on the queue manager on which it was entered.
- Queue manager name. The command is initiated on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be initiated.
- An asterisk (\*). The command is initiated on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

### **IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *QStatusAttrs* except MQIACF\_ALL, MQIACF\_MONITORING, and MQIACF\_Q\_TIME\_INDICATOR. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1896 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or a string filter using the **StringFilterCommand** parameter.

### **OpenType (MQCFIN)**

Queue status open type (parameter identifier: MQIACF\_OPEN\_TYPE).

It is always returned, regardless of the queue instance attributes requested.

The value can be:

#### **MQQSOT\_ALL**

Selects status for queues that are open with any type of access.

#### **MQQSOT\_INPUT**

Selects status for queues that are open for input.

#### **MQQSOT\_OUTPUT**

Selects status for queues that are open for output.

The default value if this parameter is not specified is MQQSOT\_ALL.

Filtering is not supported for this parameter.

### **QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid only on z/OS. The value can be any of the following values:

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

#### **MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED.

You cannot use *QSGDisposition* as a parameter to filter on.

### **QStatusAttrs (MQCFIL)**

Queue status attributes (parameter identifier: MQIACF\_Q\_STATUS\_ATTRS).

The attribute list can specify the following value on its own - default value used if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

Where *StatusType* is MQIACF\_Q\_STATUS:

#### **MQCA\_Q\_NAME**

Queue name.

#### **MQCACF\_LAST\_GET\_DATE**

Date of the last message successfully destructively read from the queue.

#### **MQCACF\_LAST\_GET\_TIME**

Time of the last message successfully destructively read from the queue.

#### **MQCACF\_LAST\_PUT\_DATE**

Date of the last message successfully put to the queue.

#### **MQCACF\_LAST\_PUT\_TIME**

Time of the last message successfully put to the queue.

#### **MQCACF\_MEDIA\_LOG\_EXTENT\_NAME**

Identity of the oldest log extent required to perform media recovery of the queue.

On IBM i, this parameter identifies the name of the oldest journal receiver require to perform media recovery of the queue.

#### **MQIACF\_CUR\_MAX\_FILE\_SIZE**

Current maximum queue file size

#### **MQIACF\_CUR\_Q\_FILE\_SIZE)**

Current queue file size

#### **MQIA\_CURRENT\_Q\_DEPTH**

The current number of messages on the queue.

#### **MQIA\_MONITORING\_Q**

Current level of monitoring data collection.

#### **MQIA\_OPEN\_INPUT\_COUNT**

The number of handles that are currently open for input for the queue.

MQIA\_OPEN\_INPUT\_COUNT does not include handles that are open for browse.

#### **MQIA\_OPEN\_OUTPUT\_COUNT**

The number of handles that are currently open for output for the queue.

#### **MQIACF\_HANDLE\_STATE**

Whether an API call is in progress.

#### **MQIACF\_MONITORING**

All the queue status monitoring attributes. These attributes are:

- MQCACF\_LAST\_GET\_DATE
- MQCACF\_LAST\_GET\_TIME
- MQCACF\_LAST\_PUT\_DATE
- MQCACF\_LAST\_PUT\_TIME
- MQIA\_MONITORING\_Q
- MQIACF\_OLDEST\_MSG\_AGE
- MQIACF\_Q\_TIME\_INDICATOR

Filtering is not supported for this parameter.

**MQIACF\_OLDEST\_MSG\_AGE**

Age of oldest message on the queue.

**MQIACF\_Q\_TIME\_INDICATOR**

Indicator of the time that messages remain on the queue.

**MQIACF\_UNCOMMITTED\_MSGS**

The number of uncommitted messages on the queue.

Where *StatusType* is MQIACF\_Q\_HANDLE:

**MQBACF\_EXTERNAL\_UOW\_ID**

Unit of recovery identifier assigned by the queue manager.

**MQBACF\_Q\_MGR\_UOW\_ID**

External unit of recovery identifier associated with the connection.

**MQCA\_Q\_NAME**

Queue name.

**MQCACF\_APPL\_TAG**

This parameter is a string containing the tag of the application connected to the queue manager.

**MQCACF\_ASID**

Address-space identifier of the application identified by *ApplTag*. This parameter is valid on z/OS only.

**MQCACF\_PSB\_NAME**

Name of the program specification block (PSB) associated with the running IMS transaction. This parameter is valid on z/OS only.

**MQCACF\_PSTID**

Identifier of the IMS program specification table (PST) for the connected IMS region. This parameter is valid on z/OS only.

**MQCACF\_TASK\_NUMBER**

CICS task number. This parameter is valid on z/OS only.

**MQCACF\_TRANSACTION\_ID**

CICS transaction identifier. This parameter is valid on z/OS only.

**MQCACF\_USER\_IDENTIFIER**

The user name of the application that has opened the specified queue.

**MQCACH\_CHANNEL\_NAME**

The name of the channel that has the queue open, if any.

**MQCACH\_CONNECTION\_NAME**

The connection name of the channel that has the queue open, if any.

**MQIA\_APPL\_TYPE**

The type of application that has the queue open.

**MQIACF\_OPEN\_BROWSE**

Open browse.

Filtering is not supported for this parameter.

**MQIACF\_OPEN\_INPUT\_TYPE**

Open input type.

Filtering is not supported for this parameter.

**MQIACF\_OPEN\_INQUIRE**

Open inquire.

Filtering is not supported for this parameter.

**MQIACF\_OPEN\_OPTIONS**

The options used to open the queue.

If this parameter is requested, the following parameter structures are also returned:

- *OpenBrowse*
- *OpenInputType*
- *OpenInquire*
- *OpenOutput*
- *OpenSet*

Filtering is not supported for this parameter.

**MQIACF\_OPEN\_OUTPUT**

Open output.

Filtering is not supported for this parameter.

**MQIACF\_OPEN\_SET**

Open set.

Filtering is not supported for this parameter.

**MQIACF\_PROCESS\_ID**

The process identifier of the application that has opened the specified queue.

**MQIACF\_ASYNC\_STATE**

**MQIACF\_THREAD\_ID**

The thread identifier of the application that has opened the specified queue.

**MQIACF\_UOW\_TYPE**

Type of external unit of recovery identifier as seen by the queue manager.

**StatusType (MQCFIN)**

Queue status type (parameter identifier: MQIACF\_Q\_STATUS\_TYPE).

Specifies the type of status information required.

The value can be any of the following values:

**MQIACF\_Q\_STATUS**

Selects status information relating to queues.

**MQIACF\_Q\_HANDLE**

Selects status information relating to the handles that are accessing the queues.

The default value, if this parameter is not specified, is MQIACF\_Q\_STATUS.

You cannot use *StatusType* as a parameter to filter on.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *QStatusAttrs* except MQCA\_Q\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1903](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify a byte string filter using the

**ByteStringFilterCommand** parameter or an integer filter using the **IntegerFilterCommand** parameter.

**Error codes**

This command might return the following error code in the response format header [“Error codes applicable to all commands” on page 1374](#) along with any additional pertinent values.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_Q\_TYPE\_ERROR**

Queue type not valid.

## Inquire Queue Status (Response)

The response to the Inquire Queue Status (MQCMD\_INQUIRE\_Q\_STATUS) command consists of the response header followed by the *QName* structure and a set of attribute parameter structures determined by the value of *StatusType* in the Inquire command.

### Always returned:

*QName*, *ApplTag*, *ApplType*,  *QSGDisposition*, *StatusType*,  
 *UserIdentifier*

Possible values of *StatusType* are:

### MQIACF\_Q\_STATUS

Returns status information relating to queues.

### MQIACF\_Q\_HANDLE

Returns status information relating to the handles that are accessing the queues.

### Returned if requested and *StatusType* is MQIACF\_Q\_STATUS:

  *CurrentMaxQFileSize*,    
*CurrentQFileSize*, *CurrentQDepth*, *LastGetDate*, *LastGetTime*, *LastPutDate*,  
*LastPutTime*,  *MediaRecoveryLogExtent*, *OldestMsgAge*, *OnQTime*,  
*OpenInputCount*, *OpenOutputCount*, *QueueMonitoring*, *UncommittedMsgs*

### Returned if requested and *StatusType* is MQIACF\_Q\_HANDLE:

*ApplDesc*, *ApplTag*, *ApplType*,  *ASId*, *AsynchronousState*,  
*ChannelName*, *ConnectionName*,  *ExternalUOWId*, *HandleState*,  
*OpenOptions*,  *ProcessId*,  *PSBName*,  *PSTId*,  
*QMgrUOWId*,  *TaskNumber*,  *ThreadId*,   
*TransactionId*, *UOWIdentifier*, *UOWType*, *UserIdentifier*

## Response data if *StatusType* is MQIACF\_Q\_STATUS

### **CurrentMaxQFileSize (MQCFIN)**

Current maximum queue file size (parameter identifier MQIACF\_CUR\_MAX\_FILE\_SIZE)

The current maximum size the queue file can grow to, rounded up to the nearest megabyte, given the current block size in use on a queue

### **CurrentQFileSize (MQCFIN)**

Current queue file size (parameter identifier MQIACF\_CUR\_Q\_FILE\_SIZE)

The current size of the queue file in megabytes, rounded up to the nearest megabyte.

### **CurrentQDepth (MQCFIN)**

Current queue depth (parameter identifier: MQIA\_CURRENT\_Q\_DEPTH).

### **LastGetDate (MQCFST)**

Date on which the last message was destructively read from the queue (parameter identifier: MQCACF\_LAST\_GET\_DATE).

The date, in the form yyyy-mm-dd, on which the last message was successfully read from the queue. The date is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ\_DATE\_LENGTH.

### **LastGetTime (MQCFST)**

Time at which the last message was destructively read from the queue (parameter identifier: MQCACF\_LAST\_GET\_TIME).

The time, in the form hh.mm.ss, at which the last message was successfully read from the queue. The time is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ\_TIME\_LENGTH.

#### **LastPutDate (MQCFST)**

Date on which the last message was successfully put to the queue (parameter identifier: MQCACF\_LAST\_PUT\_DATE).

The date, in the form yyyy-mm-dd, on which the last message was successfully put to the queue. The date is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ\_DATE\_LENGTH.

#### **LastPutTime (MQCFST)**

Time at which the last message was successfully put to the queue (parameter identifier: MQCACF\_LAST\_PUT\_TIME).

The time, in the form hh.mm.ss, at which the last message was successfully put to the queue. The time is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ\_TIME\_LENGTH.

#### **Multi MediaRecoveryLogExtent (MQCFST)**

Name of the oldest log extent required to perform media recovery of the queue (parameter identifier: MQCACF\_MEDIA\_LOG\_EXTENT\_NAME).

On IBM i, this parameter identifies the name of the oldest journal receiver required to perform media recovery of the queue.

The name returned is of the form Snnnnnnn.LOG and is not a fully qualified path name. The use of this parameter provides the ability for the name to be easily correlated with the messages issued, following an **rcdmqimg** command to identify those queues causing the media recovery LSN not to move forwards.

This parameter is valid only on [Multiplatforms](#).

The maximum length of the string is MQ\_LOG\_EXTENT\_NAME\_LENGTH.

#### **OldestMsgAge (MQCFIN)**

Age of the oldest message (parameter identifier: MQIACF\_OLDEST\_MSG\_AGE). Age, in seconds, of the oldest message on the queue.

If the value is unavailable, MQMON\_NOT\_AVAILABLE is returned. If the queue is empty, 0 is returned. If the value exceeds 999 999 999, it is returned as 999 999 999.

#### **OnQTime (MQCFIL)**

Indicator of the time that messages remain on the queue (parameter identifier: MQIACF\_Q\_TIME\_INDICATOR). Amount of time, in microseconds, that a message spent on the queue. Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned. If the value exceeds 999 999 999, it is returned as 999 999 999.

#### **OpenInputCount (MQCFIN)**

Open input count (parameter identifier: MQIA\_OPEN\_INPUT\_COUNT).

#### **OpenOutputCount (MQCFIN)**

Open output count (parameter identifier: MQIA\_OPEN\_OUTPUT\_COUNT).

#### **QName (MQCFST)**

Queue name (parameter identifier: MQCA\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

#### **z/OS QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Returns the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED.

**QueueMonitoring (MQCFIN)**

Current level of monitoring data collection for the queue (parameter identifier: MQIA\_MONITORING\_Q). The value can be any of the following values:

**MQMON\_OFF**

Monitoring for the queue is disabled.

**MQMON\_LOW**

Low rate of data collection.

**MQMON\_MEDIUM**

Medium rate of data collection.

**MQMON\_HIGH**

High rate of data collection.

**StatusType (MQCFST)**

Queue status type (parameter identifier: MQIACF\_Q\_STATUS\_TYPE).

Specifies the type of status information.

**UncommittedMsgs (MQCFIN)**

The number of uncommitted changes (puts and gets) pending for the queue (parameter identifier: MQIACF\_UNCOMMITTED\_MSGS). The value can be any of the following values:

**MQQSUM\_YES**

On z/OS, there are one or more uncommitted changes pending.

**MQQSUM\_NO**

There are no uncommitted changes pending.

**n**

 On Multiplatforms, an integer value indicating how many uncommitted changes are pending.

**Response data if StatusType is MQIACF\_Q\_HANDLE**

**ApplDesc (MQCFST)**

Application description (parameter identifier: MQCACF\_APPL\_DESC).

The maximum length is MQ\_APPL\_DESC\_LENGTH.

**ApplTag (MQCFST)**

Open application tag (parameter identifier: MQCACF\_APPL\_TAG).

The maximum length of the string is MQ\_APPL\_TAG\_LENGTH.

**ApplType (MQCFIN)**

Open application type (parameter identifier: MQIA\_APPL\_TYPE).

The value can be any of the following values:

**MQAT\_QMGR**

A queue manager process.

**MQAT\_CHANNEL\_INITIATOR**

The channel initiator.

**MQAT\_USER**

A user application.

**MQAT\_BATCH**

Application using a batch connection. MQAT\_BATCH applies only to z/OS.

**MQAT\_RRS\_BATCH**

RRS-coordinated application using a batch connection. MQAT\_RRS\_BATCH applies only to z/OS.

**MQAT\_CICS**

A CICS transaction. MQAT\_CICS applies only to z/OS.

**MQAT\_IMS**

An IMS transaction. MQAT\_IMS applies only to z/OS.

**MQAT\_SYSTEM\_EXTENSION**

Application performing an extension of function that is provided by the queue manager.

 **ASId (MQCFST)**

Address-space identifier (parameter identifier: MQCACF\_ASID).

The 4-character address-space identifier of the application identified by *AppLTag* . It distinguishes duplicate values of *AppLTag* . This parameter applies only to z/OS.

The length of the string is MQ\_ASID\_LENGTH.

**AsynchronousState (MQCFIN)**

The state of the asynchronous consumer on this queue (parameter identifier: MQIACF\_ASYNC\_STATE).

The value can be any of the following values:

**MQAS\_ACTIVE**

An MQCB call has set up a function to call back to process messages asynchronously and the connection handle has been started so that asynchronous message consumption can proceed.

**MQAS\_INACTIVE**

An MQCB call has set up a function to call back to process messages asynchronously but the connection handle has not yet been started, or has been stopped or suspended, so that asynchronous message consumption cannot currently proceed.

**MQAS\_SUSPENDED**

The asynchronous consumption callback has been suspended so that asynchronous message consumption cannot currently proceed on this handle. This situation can be either because an MQCB or MQCTL call with *Operation* MQOP\_SUSPEND has been issued against this object handle by the application, or because it has been suspended by the system. If it has been suspended by the system, as part of the process of suspending asynchronous message consumption the callback function is called with the reason code that describes the problem resulting in suspension. This situation is reported in the *Reason* field in the MQCBC structure passed to the callback. In order for asynchronous message consumption to proceed, the application must issue an MQCB or MQCTL call with *Operation* MQOP\_RESUME.

**MQAS\_SUSPENDED\_TEMPORARY**

The asynchronous consumption callback has been temporarily suspended by the system so that asynchronous message consumption cannot currently proceed on this object handle. As part of the process of suspending asynchronous message consumption the callback function is called with the reason code that describes the problem resulting in suspension. This situation is reported in the *Reason* field in the MQCBC structure passed to the callback. The callback function is called again when asynchronous message consumption is resumed by the system after the temporary condition has been resolved.

**MQAS\_NONE**

An MQCB call has not been issued against this handle, so no asynchronous message consumption is configured on this handle.

**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

**ConnectionName (MQCFST)**

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH.

 **ExternalUOWId (MQCFBS)**

RRS unit-of-recovery identifier (parameter identifier: MQBACF\_EXTERNAL\_UOW\_ID).

The RRS unit-of-recovery identifier associated with the handle. This parameter is valid only on z/OS only.

The length of the string is MQ\_EXTERNAL\_UOW\_ID\_LENGTH.

**HandleState (MQCFIN)**

State of the handle (parameter identifier: MQIACF\_HANDLE\_STATE).

The value can be any of the following values:

**MQHSTATE\_ACTIVE**

An API call from a connection is currently in progress for this object. For a queue, this condition can arise when an MQGET WAIT call is in progress.

If there is an MQGET SIGNAL outstanding, it does not mean, by itself, that the handle is active.

**MQHSTATE\_INACTIVE**

No API call from a connection is currently in progress for this object. For a queue, this condition can arise when no MQGET WAIT call is in progress.

**OpenBrowse (MQCFIN)**

Open browse (parameter identifier: MQIACF\_OPEN\_BROWSE).

The value can be any of the following values:

**MQQSO\_YES**

The queue is open for browsing.

**MQQSO\_NO**

The queue is not open for browsing.

**OpenInputType (MQCFIN)**

Open input type (parameter identifier: MQIACF\_OPEN\_INPUT\_TYPE).

The value can be any of the following values:

**MQQSO\_NO**

The queue is not open for inputting.

**MQQSO\_SHARED**

The queue is open for shared input.

**MQQSO\_EXCLUSIVE**

The queue is open for exclusive input.

**OpenInquire (MQCFIN)**

Open inquire (parameter identifier: MQIACF\_OPEN\_INQUIRE).

The value can be any of the following values:

**MQQSO\_YES**

The queue is open for inquiring.

**MQQSO\_NO**

The queue is not open for inquiring.

**OpenOptions (MQCFIN)**

Open options currently in force for the queue (parameter identifier: MQIACF\_OPEN\_OPTIONS).

**OpenOutput (MQCFIN)**

Open output (parameter identifier: MQIACF\_OPEN\_OUTPUT).

The value can be any of the following values:

**MQQSO\_YES**

The queue is open for output.

**MQQSO\_NO**

The queue is not open for output.

**OpenSet (MQCFIN)**

Open set (parameter identifier: MQIACF\_OPEN\_SET).

The value can be any of the following values:

**MQQSO\_YES**

The queue is open for setting.

**MQQSO\_NO**

The queue is not open for setting.

**Multi ProcessId (MQCFIN)**

Open application process ID (parameter identifier: MQIACF\_PROCESS\_ID).

**z/OS PSBName (MQCFST)**

Program specification block (PSB) name (parameter identifier: MQCACF\_PSB\_NAME).

The 8-character name of the PSB associated with the running IMS transaction. This parameter is valid on z/OS only.

The length of the string is MQ\_PSB\_NAME\_LENGTH.

**z/OS PSTId (MQCFST)**

Program specification table (PST) identifier (parameter identifier: MQCACF\_PST\_ID).

The 4-character identifier of the PST region identifier for the connected IMS region. This parameter is valid on z/OS only.

The length of the string is MQ\_PST\_ID\_LENGTH.

**QMgrUOWId (MQCFBS)**

The unit of recovery assigned by the queue manager (parameter identifier: MQBACF\_Q\_MGR\_UOW\_ID).

On z/OS, this parameter is an 8-byte log RBA, displayed as 16 hexadecimal characters. On platforms other than z/OS, this parameter is an 8-byte transaction identifier, displayed as 16 hexadecimal characters.

The maximum length of the string is MQ\_UOW\_ID\_LENGTH.

**QName (MQCFST)**

Queue name (parameter identifier: MQCA\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**z/OS QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Returns the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED.

**StatusType (MQCFST)**

Queue status type (parameter identifier: MQIACF\_Q\_STATUS\_TYPE).

Specifies the type of status information.

**z/OS TaskNumber (MQCFST)**

CICS task number (parameter identifier: MQCACF\_TASK\_NUMBER).

A 7-digit CICS task number. This parameter is valid on z/OS only.

The length of the string is MQ\_TASK\_NUMBER\_LENGTH.

**Multi ThreadId (MQCFIN)**

The thread ID of the open application (parameter identifier: MQIACF\_THREAD\_ID).

A value of zero indicates that the handle was opened by a shared connection. A handle created by a shared connection is logically open to all threads.

**z/OS TransactionId (MQCFST)**

CICS transaction identifier (parameter identifier: MQCACF\_TRANSACTION\_ID).

A 4-character CICS transaction identifier. This parameter is valid on z/OS only.

The length of the string is MQ\_TRANSACTION\_ID\_LENGTH.

**UOWIdentifier (MQCFBS)**

The external unit of recovery associated with the connection (parameter identifier: MQBACF\_EXTERNAL\_UOW\_ID).

This parameter is the recovery identifier for the unit of recovery. Its format is determined by the value of *UOWType*.

The maximum length of the string is MQ\_UOW\_ID\_LENGTH.

**UOWType (MQCFIN)**

Type of external unit of recovery identifier as perceived by the queue manager (parameter identifier: MQIACF\_UOW\_TYPE).

The value can be any of the following values:

**MQUOWT\_Q\_MGR****MQUOWT\_CICS**

**z/OS** Valid only on z/OS.

**MQUOWT\_RRS**

**z/OS** Valid only on z/OS.

**MQUOWT\_IMS**

**z/OS** Valid only on z/OS.

**MQUOWT\_XA**

*UOWType* identifies the *UOWIdentifier* type and not the type of the transaction coordinator. When the value of *UOWType* is MQUOWT\_Q\_MGR, the associated identifier is in *QMGrUOWId* (and not *UOWIdentifier*).

**UserIdentifier (MQCFST)**

Open application user name (parameter identifier: MQCACF\_USER\_IDENTIFIER).

The maximum length of the string is MQ\_MAX\_USER\_ID\_LENGTH.

## **Inquire Security on z/OS**

The Inquire Security (MQCMD\_INQUIRE\_SECURITY) command returns information about the current settings for the security parameters.

### **Optional parameters**

#### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### **SecurityAttrs (MQCFIL)**

Security parameter attributes (parameter identifier: MQIACF\_SECURITY\_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

##### **MQIACF\_ALL**

All attributes.

or a combination of the following:

##### **MQIACF\_SECURITY\_SWITCH**

Current setting of the switch profiles. If the subsystem security switch is off, no other switch profile settings are returned.

##### **MQIACF\_SECURITY\_TIMEOUT**

Timeout value.

##### **MQIACF\_SECURITY\_INTERVAL**

Time interval between checks.

## **Inquire Security (Response) on z/OS**

The response to the Inquire Security (MQCMD\_INQUIRE\_SECURITY) command consists of the response header followed by the requested combination of attribute parameter structures.

One message is returned if either **SecurityTimeout** or **SecurityInterval** is specified on the command. If **SecuritySwitch** is specified, one message per security switch found is returned. This message includes the **SecuritySwitch**, **SecuritySwitchSetting**, and **SecuritySwitchProfile** parameter structures.

#### **Returned if requested:**

**SecurityInterval**, **SecuritySwitch**, **SecuritySwitchProfile**, **SecuritySwitchSetting**, **SecurityTimeout**

### **Response data**

#### **SecurityInterval (MQCFIN)**

Time interval between checks (parameter identifier: MQIACF\_SECURITY\_INTERVAL).

The interval, in minutes, between checks for user IDs and their associated resources to determine whether **SecurityTimeout** has expired.

### **SecuritySwitch (MQCFIN)**

Security switch profile (parameter identifier: MQIA\_CF\_LEVEL). The value can be any of the following values:

#### **MQSECSW\_SUBSYSTEM**

Subsystem security switch.

#### **MQSECSW\_Q\_MGR**

Queue manager security switch.

#### **MQSECSW\_QSG**

Queue sharing group security switch.

#### **MQSECSW\_CONNECTION**

Connection security switch.

#### **MQSECSW\_COMMAND**

Command security switch.

#### **MQSECSW\_CONTEXT**

Context security switch.

#### **MQSECSW\_ALTERNATE\_USER**

Alternate user security switch.

#### **MQSECSW\_PROCESS**

Process security switch.

#### **MQSECSW\_NAMELIST**

Namelist security switch.

#### **MQSECSW\_TOPIC**

Topic security switch.

#### **MQSECSW\_Q**

Queue security switch.

#### **MQSECSW\_COMMAND\_RESOURCES**

Command resource security switch.

### **SecuritySwitchProfile (MQCFST)**

Security switch profile (parameter identifier: MQCACF\_SECURITY\_PROFILE).

The maximum length of the string is MQ\_SECURITY\_PROFILE\_LENGTH.

### **SecuritySwitchSetting (MQCFIN)**

Setting of the security switch (parameter identifier: MQIACF\_SECURITY\_SETTING).

The value can be:

#### **MQSECSW\_ON\_FOUND**

Switch ON, profile found.

#### **MQSECSW\_OFF\_FOUND**

Switch OFF, profile found.

#### **MQSECSW\_ON\_NOT\_FOUND**

Switch ON, profile not found.

#### **MQSECSW\_OFF\_NOT\_FOUND**

Switch OFF, profile not found.

#### **MQSECSW\_OFF\_ERROR**

Switch OFF, profile error.

#### **MQSECSW\_ON\_OVERRIDDEN**

Switch ON, profile overridden.

### **SecurityTimeout (MQCFIN)**

Timeout value (parameter identifier: MQIACF\_SECURITY\_TIMEOUT).

How long, in minutes, security information about an unused user ID and associated resources is retained.

Multi

## **Inquire Service on Multiplatforms**

The Inquire Service (MQCMD\_INQUIRE\_SERVICE) command inquires about the attributes of existing IBM MQ services.

### **Required parameters**

#### **ServiceName (MQCFST)**

Service name (parameter identifier: MQCA\_SERVICE\_NAME).

This parameter is the name of the service whose attributes are required. Generic service names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all services having names that start with the selected character string. An asterisk on its own matches all possible names.

The service name is always returned regardless of the attributes requested.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

### **Optional parameters**

#### **IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ServiceAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

#### **ServiceAttrs (MQCFIL)**

Service attributes (parameter identifier: MQIACF\_SERVICE\_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

##### **MQIACF\_ALL**

All attributes.

or a combination of the following:

##### **MQCA\_ALTERATION\_DATE**

Date on which the definition was last altered.

##### **MQCA\_ALTERATION\_TIME**

Time at which the definition was last altered.

##### **MQCA\_SERVICE\_DESC**

Description of service definition.

##### **MQCA\_SERVICE\_NAME**

Name of service definition.

##### **MQCA\_SERVICE\_START\_ARGS**

Arguments to be passed to the service program.

##### **MQCA\_SERVICE\_START\_COMMAND**

Name of program to run to start the service.

##### **MQCA\_SERVICE\_STOP\_ARGS**

Arguments to be passed to the stop program to stop the service.

**MQCA\_STDERR\_DESTINATION**

Destination of standard error for the process.

**MQCA\_STDOUT\_DESTINATION**

Destination of standard output for the process.

**MQCA\_SERVICE\_START\_ARGS**

Arguments to be passed to the service program.

**MQIA\_SERVICE\_CONTROL**

When the queue manager must start the service.

**MQIA\_SERVICE\_TYPE**

Mode in which the service is to run.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ServiceAttrs* except MQCA\_SERVICE\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter”](#) on page 1903 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Multi

**Inquire Service (Response) on Multiplatforms**

The response to the Inquire Service (MQCMD\_INQUIRE\_SERVICE) command consists of the response header followed by the *ServiceName* structure and the requested combination of attribute parameter structures.

If a generic service name was specified, one such message is generated for each service found.

**Always returned:**

*ServiceName*

**Returned if requested:**

*AlterationDate, AlterationTime, Arguments, ServiceDesc, ServiceType, StartArguments, StartCommand, StartMode, StderrDestination, StdoutDestination, StopArguments, StopCommand*

**Response data****AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date on which the information was last altered in the form yyyy-mm-dd.

**AlterationTime (MQCFST)**

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time at which the information was last altered in the form hh.mm.ss.

**ServiceDesc (MQCFST)**

Description of service definition (parameter identifier: MQCA\_SERVICE\_DESC).

The maximum length of the string is MQ\_SERVICE\_DESC\_LENGTH.

**ServiceName (MQCFST)**

Name of service definition (parameter identifier: MQCA\_SERVICE\_NAME).

The maximum length of the string is MQ\_SERVICE\_NAME\_LENGTH.

**ServiceType (MQCFIN)**

The mode in which the service is to run (parameter identifier: MQIA\_SERVICE\_TYPE).

The value can be:

**MQSVC\_TYPE\_SERVER**

Only one instance of the service can be executed at a time, with the status of the service made available by the Inquire Service Status command.

**MQSVC\_TYPE\_COMMAND**

Multiple instances of the service can be started.

**StartArguments (MQCFST)**

The arguments to be passed to the user program at queue manager startup (parameter identifier: MQCA\_SERVICE\_START\_ARGS).

The maximum length of the string is MQ\_SERVICE\_ARGS\_LENGTH.

**StartCommand (MQCFST)**

Service program name (parameter identifier: MQCA\_SERVICE\_START\_COMMAND).

The name of the program which is to run.

The maximum length of the string is MQ\_SERVICE\_COMMAND\_LENGTH.

**StartMode (MQCFIN)**

Service mode (parameter identifier: MQIA\_SERVICE\_CONTROL).

Specifies how the service is to be started and stopped. The value can be any of the following values:

**MQSVC\_CONTROL\_MANUAL**

The service is not to be started automatically or stopped automatically. It is to be controlled by user command.

**MQSVC\_CONTROL\_Q\_MGR**

The service is to be started and stopped at the same time as the queue manager is started and stopped.

**MQSVC\_CONTROL\_Q\_MGR\_START**

The service is to be started at the same time as the queue manager is started, but is not requested to stop when the queue manager is stopped.

**StderrDestination (MQCFST)**

The path to a file to which the standard error (stderr) of the service program is to be redirected (parameter identifier: MQCA\_STDERR\_DESTINATION).

The maximum length of the string is MQ\_SERVICE\_PATH\_LENGTH.

**StdoutDestination (MQCFST)**

The path to a file to which the standard output (stdout) of the service program is to be redirected (parameter identifier: MQCA\_STDOUT\_DESTINATION).

The maximum length of the string is MQ\_SERVICE\_PATH\_LENGTH.

**StopArguments (MQCFST)**

The arguments to be passed to the stop program when instructed to stop the service (parameter identifier: MQCA\_SERVICE\_STOP\_ARGS).

The maximum length of the string is MQ\_SERVICE\_ARGS\_LENGTH.

**StopCommand (MQCFST)**

Service program stop command (parameter identifier: MQCA\_SERVICE\_STOP\_COMMAND).

This parameter is the name of the program that is to run when the service is requested to stop.

The maximum length of the string is MQ\_SERVICE\_COMMAND\_LENGTH.

## Inquire Service Status on Multiplatforms

The Inquire Service Status (MQCMD\_INQUIRE\_SERVICE\_STATUS) command inquires about the status of one or more IBM MQ service instances.

### Required parameters

#### ServiceName (MQCFST)

Service name (parameter identifier: MQCA\_SERVICE\_NAME).

Generic service names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all services having names that start with the selected character string. An asterisk on its own matches all possible names.

The service name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

### Optional parameters (Inquire Service Status)

#### IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ServiceStatusAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

#### ServiceStatusAttrs (MQCFIL)

Service status attributes (parameter identifier: MQIACF\_SERVICE\_STATUS\_ATTRS).

The attribute list can specify the following value on its own - is the default value used if the parameter is not specified:

##### **MQIACF\_ALL**

All attributes.

or a combination of the following:

##### **MQCA\_SERVICE\_DESC**

Description of service definition.

##### **MQCA\_SERVICE\_NAME**

Name of service definition.

##### **MQCA\_SERVICE\_START\_ARGS**

The arguments to pass to the service program.

##### **MQCA\_SERVICE\_START\_COMMAND**

The name of the program to run to start the service.

##### **MQCA\_SERVICE\_STOP\_ARGS**

The arguments to pass to the stop command to stop the service.

##### **MQCA\_SERVICE\_STOP\_COMMAND**

The name of the program to run to stop the service.

##### **MQCA\_STDERR\_DESTINATION**

Destination of standard error for the process.

##### **MQCA\_STDOUT\_DESTINATION**

Destination of standard output for the process.

##### **MQCACF\_SERVICE\_START\_DATE**

The date on which the service was started.

**MQCACF\_SERVICE\_START\_TIME**

The time at which the service was started.

**MQIA\_SERVICE\_CONTROL**

How the service is to be started and stopped.

**MQIA\_SERVICE\_TYPE**

The mode in which the service is to run.

**MQIACF\_PROCESS\_ID**

The process identifier of the operating system task under which this service is executing.

**MQIACF\_SERVICE\_STATUS**

Status of the service.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ServiceStatusAttrs* except MQCA\_SERVICE\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1903](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

**Error codes**

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_SERV\_STATUS\_NOT\_FOUND**

Service status not found.

**Multi**

**Inquire Service Status (Response) on Multiplatforms**

The response to the Inquire Service Status (MQCMD\_INQUIRE\_SERVICE\_STATUS) command consists of the response header followed by the *ServiceName* structure and the requested combination of attribute parameter structures.

If a generic service name was specified, one such message is generated for each service found.

**Always returned:**

*ServiceName*

**Returned if requested:**

*ProcessId, ServiceDesc, StartArguments, StartCommand, StartDate, StartMode, StartTime, Status, StderrDestination, StdoutDestination, StopArguments, StopCommand*

**Response data****ProcessId (MQCFIN)**

Process identifier (parameter identifier: MQIACF\_PROCESS\_ID).

The operating system process identifier associated with the service.

**ServiceDesc (MQCFST)**

Description of service definition (parameter identifier: MQCACH\_SERVICE\_DESC).

The maximum length of the string is MQ\_SERVICE\_DESC\_LENGTH.

**ServiceName (MQCFST)**

Name of the service definition (parameter identifier: MQCA\_SERVICE\_NAME).

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

**StartArguments (MQCFST)**

Arguments to be passed to the program on startup (parameter identifier: MQCA\_SERVICE\_START\_ARGS).

The maximum length of the string is MQ\_SERVICE\_ARGS\_LENGTH.

**StartCommand (MQCFST)**

Service program name (parameter identifier: MQCA\_SERVICE\_START\_COMMAND).

Specifies the name of the program which is to run.

The maximum length of the string is MQ\_SERVICE\_COMMAND\_LENGTH.

**StartDate (MQCFST)**

Start date (parameter identifier: MQIACF\_SERVICE\_START\_DATE).

The date, in the form yyyy-mm-dd, on which the service was started.

The maximum length of the string is MQ\_DATE\_LENGTH

**StartMode (MQCFIN)**

Service mode (parameter identifier: MQIA\_SERVICE\_CONTROL).

How the service is to be started and stopped. The value can be:

**MQSVC\_CONTROL\_MANUAL**

The service is not to be started automatically or stopped automatically. It is to be controlled by user command.

**MQSVC\_CONTROL\_Q\_MGR**

The service is to be started and stopped at the same time as the queue manager is started and stopped.

**MQSVC\_CONTROL\_Q\_MGR\_START**

The service is to be started at the same time as the queue manager is started, but is not request to stop when the queue manager is stopped.

**StartTime (MQCFST)**

Start date (parameter identifier: MQIACF\_SERVICE\_START\_TIME).

The time, in the form hh.mm.ss, at which the service was started.

The maximum length of the string is MQ\_TIME\_LENGTH

**Status (MQCFIN)**

Service status (parameter identifier: MQIACF\_SERVICE\_STATUS).

The status of the service. The value can be any of the following values:

**MQSVC\_STATUS\_STARTING**

The service is in the process of initializing.

**MQSVC\_STATUS\_RUNNING**

The service is running.

**MQSVC\_STATUS\_STOPPING**

The service is stopping.

**StderrDestination (MQCFST)**

Specifies the path to a file to which the standard error (stderr) of the service program is to be redirected (parameter identifier: MQCA\_STDERR\_DESTINATION).

The maximum length of the string is MQ\_SERVICE\_PATH\_LENGTH.

**StdoutDestination (MQCFST)**

Specifies the path to a file to which the standard output (stdout) of the service program is to be redirected (parameter identifier: MQCA\_STDOUT\_DESTINATION).

The maximum length of the string is MQ\_SERVICE\_PATH\_LENGTH.

### **StopArguments (MQCFST)**

Specifies the arguments to be passed to the stop program when instructed to stop the service (parameter identifier: MQCA\_SERVICE\_STOP\_ARGS).

The maximum length of the string is MQ\_SERVICE\_ARGS\_LENGTH.

### **StopCommand (MQCFST)**

Service program stop command (parameter identifier: MQCA\_SERVICE\_STOP\_COMMAND).

This parameter is the name of the program that is to run when the service is requested to stop.

The maximum length of the string is MQ\_SERVICE\_COMMAND\_LENGTH.

## **Inquire SMDS on z/OS**

The Inquire SMDS (MQCMD\_INQUIRE\_SMDS) command inquires about the attributes of shared message data sets for a CF application structure.

### **Required parameters**

#### **SMDS (qmgr\_name)**

Specifies the queue manager for which the shared message data set properties are to be displayed, or an asterisk to display the properties for all shared message data sets associated with the specified CFSTRUCT (parameter identifier: MQCACF\_CF\_SMDS).

#### **CFStrucName (MQCFST)**

The name of the CF application structure with SMDS properties that you want to inquire on (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

### **Optional parameters**

#### **CFSMDSAttrs (MQCFIL)**

CF application structure SMDS attributes (parameter identifier: MQIACF\_SMDS\_ATTRS).

The default value used if this parameter is not specified is:

#### **MQIACF\_ALL**

All attributes.

The attribute list might specify MQIACF\_ALL on its own, or may specify a combination of the following:

#### **MQIA\_CF\_SMDS\_BUFFERS**

The shared message data set DSBUFS property.

#### **MQIACF\_CF\_SMDS\_EXPAND**

The shared message data set DSEXPAND property.

## **Inquire SMDS (Response) on z/OS**

The response to the Inquire SMDS (MQCMD\_INQUIRE\_SMDS) command returns the attribute parameters of the shared message data set connection.

### **Response data**

#### **SMDS (MQCFST)**

The queue manager name for which the shared message data set properties are displayed (parameter identifier: MQCACF\_CF\_SMDS).

#### **CFStrucName (MQCFST)**

CF Structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length is MQ\_CF\_STRUC\_NAME\_LENGTH.

**DSBUFS (MQCFIN)**

The CF DSBUFS property (parameter identifier: MQIA\_CF\_SMDS\_BUFFERS).

The returned value is in the range 0 - 9999.

The value is the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

**DSEXPAND (MQCFIN)**

The CF DSEXPAND property (parameter identifier: MQIACF\_CF\_SMDS\_EXPAND).

**MQDSE\_YES**

The data set can be expanded.

**MQDSE\_NO**

The data set cannot be expanded.

**MQDSE\_DEFAULT**

Only returned on Inquire CF Struct when not explicitly set

## Inquire SMDS Connection on z/OS

The response to the Inquire SMDS Connection (MQCMD\_INQUIRE\_SMDSCONN) command returns status and availability information about the connection between the queue manager and the shared message data sets for the specified *CFStrucName*.

**Required parameters****SMDSCONN (MQCFST)**

Specify the queue manager which owns the SMDS for which the connection information is to be returned, or an asterisk to return the connection information for all shared message data sets associated with the specified *CFStrucName* (parameter identifier: MQCACF\_CF\_SMDSCONN).

**CFStrucName (MQCFST)**

The name of the CF application structure with SMDS connections properties that you want to inquire on (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## MQCMD\_INQUIRE\_SMDSCONN (Inquire SMDS Connection)

### Response on z/OS

The response to the Inquire SMDS Connection (MQCMD\_INQUIRE\_SMDSCONN) PCF command returns status and availability information about the connection between the queue manager and the shared message data sets for the specified *CFStrucName*.

### Response data

#### **SMDSCONN (MQCFST)**

The queue manager which owns the SMDS for which the connection information is returned (parameter identifier: MQCACF\_CF\_SMDSCONN).

#### **CFStrucName (MQCFST)**

The name of the CF application structure with SMDS connections properties that you want to inquire on (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

#### **Avail (MQCFIN)**

The availability of this data set connection as seen by this queue manager (parameter identifier MQIACF\_SMDS\_AVAIL).

This is one of the following values:

##### **MQS\_AVAIL\_NORMAL**

The connection can be used and no error has been detected.

##### **MQS\_AVAIL\_ERROR**

The connection is unavailable because of an error.

The queue manager may try to enable access again automatically if the error may no longer be present, for example when recovery completes or the status is manually set to RECOVERED. Otherwise, it can be enabled again using the START SMDSCONN command in order to retry the action which originally failed.

##### **MQS\_AVAIL\_STOPPED**

The connection cannot be used because it has been explicitly stopped using the STOP SMDSCONN command. It can only be made available again by using a START SMDSCONN command to enable it.

#### **ExpandST (MQCFIN)**

The data set automatic expansion status (parameter identifier MQIACF\_SMDS\_EXPANDST).

This is one of the following values:

##### **MQS\_EXPANDST\_NORMAL**

No problem has been noted which would affect automatic expansion.

##### **MQS\_EXPANDST\_FAILED**

A recent expansion attempt failed, causing the DSEXPAND option to be set to NO for this specific data set. This status is cleared when ALTER SMDS is used to set the DSEXPAND option back to YES or DEFAULT.

##### **MQS\_EXPANDST\_MAXIMUM**

The maximum number of extents has been reached, so future expansion is not possible (except by taking the data set out of service and copying it to larger extents).

#### **OpenMode (MQCFIN)**

Indicates the mode in which the shared message data set is currently open by this queue manager (parameter identifier MQIACF\_SMDS\_OPENMODE).

This is one of the following values:

##### **MQS\_OPENMODE\_NONE**

The shared message data set is not open.

**MQS\_OPENMODE\_READONLY**

The shared message data set is owned by another queue manager, and is open for read-only access.

**MQS\_OPENMODE\_UPDATE**

The shared message data set is owned by this queue manager, and is open for update access.

**MQS\_OPENMODE\_RECOVERY**

The shared message data set is open for recovery processing

**Status (MQCFIN)**

Indicates the shared message data set connection status as seen by this queue manager parameter identifier MQIACF\_SMDS\_STATUS).

This is one of the following values:

**MQS\_STATUS\_CLOSED**

This data set is not currently open.

**MQS\_STATUS\_CLOSING**

This queue manager is currently in the process of closing this data set, including quiescing normal I/O activity and storing the saved space map if necessary.

**MQS\_STATUS\_OPENING**

This queue manager is currently in the process of opening and validating this data set (including space map restart processing when necessary).

**MQS\_STATUS\_OPEN**

This queue manager has successfully opened this data set and it is available for normal use.

**MQS\_STATUS\_NOTENABLED**

The SMDS definition is not in the ACCESS(ENABLED) state so the data set is not currently available for normal use. This status is only set when the SMDSCONN status does not already indicate some other form of failure.

**MQS\_STATUS\_ALLOCFAIL**

This queue manager was unable to locate or allocate this data set.

**MQS\_STATUS\_OPENFAIL**

This queue manager was able to allocate the data set but was unable to open it, so it has now been deallocated.

**MQS\_STATUS\_STGFAIL**

The data set could not be used because the queue manager was unable to allocate associated storage areas for control blocks, or for space map or header record processing.

**MQS\_STATUS\_DATAFAIL**

The data set was successfully opened but the data was found to be invalid or inconsistent, or a permanent I/O error occurred, so it has now been closed and deallocated.

This might result in the shared message data set itself being marked as STATUS(FAILED).

## **Inquire Storage Class on z/OS**

The Inquire Storage Class (MQCMD\_INQUIRE\_STG\_CLASS) command returns information about storage classes.

**Required parameters****StorageClassName (MQCFST)**

Storage class name (parameter identifier: MQCA\_STORAGE\_CLASS).

Generic storage class names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all storage classes having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

## Optional parameters

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

### IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *StgClassAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you specify an integer filter for *PageSetId*, you cannot also specify the **PageSetId** parameter.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

### PageSetId (MQCFIN)

Page set identifier that the storage class is associated with (parameter identifier: MQIA\_PAGESET\_ID).

If you omit this parameter, storage classes with any page set identifiers qualify.

### QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). The value can be:

#### **MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

#### **MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

### **MQQSGD\_PRIVATE**

The object is defined with either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

### **StgClassAttrs (MQCFIL)**

Storage class parameter attributes (parameter identifier: MQIACF\_STORAGE\_CLASS\_ATTRS).

The attribute list might specify the following value on its own - is the default value used if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQCA\_STORAGE\_CLASS**

Storage class name.

#### **MQCA\_STORAGE\_CLASS\_DESC**

Description of the storage class.

#### **MQIA\_PAGESET\_ID**

The page set identifier to which the storage class maps.

#### **MQCA\_XCF\_GROUP\_NAME**

The name of the XCF group of which IBM MQ is a member.

#### **MQIA\_XCF\_MEMBER\_NAME**

The XCF member name of the IMS system within the XCF group specified in MQCA\_XCF\_GROUP\_NAME.

#### **MQCA\_ALTERATION\_DATE**

The date on which the definition was last altered.

#### **MQCA\_ALTERATION\_TIME**

The time at which the definition was last altered.

### **StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *StgClassAttrs* except MQCA\_STORAGE\_CLASS. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1903 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

## **Inquire Storage Class (Response) on z/OS**

The response to the Inquire Storage Class (MQCMD\_INQUIRE\_STG\_CLASS) command consists of the response header followed by the *StgClassName* structure, the *PageSetId* structure and the *QSGDisposition* structure which are followed by the requested combination of attribute parameter structures.

### **Always returned:**

*PageSetId*, *QSGDisposition*, *StgClassName*

### **Returned if requested:**

*AlterationDate*, *AlterationTime*, *PassTicketApplication*, *StorageClassDesc*, *XCFGroupName*, *XCFMemberName*,

## **Response data**

### **AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

This parameter is the date, in the form yyyy-mm-dd, on which the definition was last altered.

The maximum length of the string is MQ\_DATE\_LENGTH.

**AlterationTime (MQCFST)**

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

This parameter is the time, in the form hh.mm.ss, at which the definition was last altered.

The maximum length of the string is MQ\_TIME\_LENGTH.

**PageSetId (MQCFIN)**

Page set identifier (parameter identifier: MQIA\_PAGESET\_ID).

The page set identifier to which the storage class maps.

**PassTicketApplication (MQCFST)**

PassTicket application (parameter identifier: MQCA\_PASS\_TICKET\_APPL).

The application name that is passed to RACF when authenticating the PassTicket specified in the MQIIH header.

The maximum length is MQ\_PASS\_TICKET\_APPL\_LENGTH.

**QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). The value can be any of the following values:

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**StorageClassDesc (MQCFST)**

Description of the storage class (parameter identifier: MQCA\_STORAGE\_CLASS\_DESC).

The maximum length is MQ\_STORAGE\_CLASS\_DESC\_LENGTH.

**StgClassName (MQCFST)**

Name of the storage class (parameter identifier: MQCA\_STORAGE\_CLASS).

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

**XCFGroupName (MQCFST)**

Name of the XCF group of which IBM MQ is a member (parameter identifier: MQCA\_XCF\_GROUP\_NAME).

The maximum length is MQ\_XCF\_GROUP\_NAME\_LENGTH.

**XCFMemberName (MQCFST)**

Name of the XCF group of which IBM MQ is a member (parameter identifier: MQCA\_XCF\_MEMBER\_NAME).

The maximum length is MQ\_XCF\_MEMBER\_NAME\_LENGTH.

 **Inquire Storage Class Names on z/OS**

The Inquire Storage Class Names (MQCMD\_INQUIRE\_STG\_CLASS\_NAMES) command inquires a list of storage class names that match the generic storage class name specified.

## Required parameters

### StorageClassName (MQCFST)

Storage class name (parameter identifier: MQCA\_STORAGE\_CLASS).

Generic storage class names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all storage classes having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

## Optional parameters

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

#### **MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

#### **MQQSGD\_PRIVATE**

The object is defined with either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

## **Inquire Storage Class Names (Response) on z/OS**

The response to the Inquire Storage Class Names (MQCMD\_INQUIRE\_STG\_CLASS\_NAMES) command consists of the response header followed by a parameter structure giving zero or more names that match the specified namelist name.

In addition to this, the *QSGDispositions* structure (with the same number of entries as the *StorageClassNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *StorageClassNames* structure.

### **Always returned:**

*StorageClassNames, QSGDispositions*

### **Returned if requested:**

None

## **Response data**

### **StorageClassNames (MQCFSL)**

List of storage class names (parameter identifier: MQCACF\_STORAGE\_CLASS\_NAMES).

### **QSGDispositions (MQCFIL)**

List of queue sharing group dispositions (parameter identifier: MQIACF\_QSG\_DISPS). Possible values for fields in this structure are those permitted for the *QSGDisposition* parameter (MQQSGD\_\*). Possible values for fields in this structure are:

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

## **Inquire Subscription**

The Inquire Subscription (MQCMD\_INQUIRE\_SUBSCRIPTION) command inquires about the attributes of a subscription.

## **Required parameters**

### **SubName (MQCFST)**

The unique identifier of the application for a subscription (parameter identifier: MQCACF\_SUB\_NAME).

If *SubName* is not provided, *SubId* must be specified to identify the subscription to be inquired.

The maximum length of the string is MQ\_SUB\_NAME\_LENGTH.

### **SubId (MQCFBS)**

Subscription identifier (parameter identifier: MQBACF\_SUB\_ID).

Specifies the unique internal subscription identifier. If the queue manager is generating the *CorrelId* for a subscription, then the *SubId* is used as the *DestinationCorrelId*.

You must supply a value for *SubId* if you have not supplied a value for *SubName*.

The maximum length of the string is MQ\_CORREL\_ID\_LENGTH.

## **Optional parameters**

### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

### **Durable (MQCFIN)**

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF\_DURABLE\_SUBSCRIPTION).

#### **MQSUB\_DURABLE\_YES**

Information about durable subscriptions only is displayed.

#### **MQSUB\_DURABLE\_NO**

Information about nondurable subscriptions only is displayed.

#### **MQSUB\_DURABLE\_ALL**

Information about all subscriptions is displayed.

### **SubscriptionAttrs (MQCFIL)**

Subscription attributes (parameter identifier: MQIACF\_SUB\_ATTRS).

Use one of the following parameters to select the attributes you want to display:

- ALL to display all attributes.
- SUMMARY to display a subset of the attributes (see MQIACF\_SUMMARY for a list).
- Any of the following parameters individually or in combination.

#### **MQIACF\_ALL**

All attributes.

#### **MQIACF\_SUMMARY**

Use this parameter to display:

- MQBACF\_DESTINATION\_CORREL\_ID
- MQBACF\_SUB\_ID
- MQCACF\_DESTINATION
- MQCACF\_DESTINATION\_Q\_MGR
- MQCACF\_SUB\_NAME
- MQCA\_TOPIC\_STRING
- MQIACF\_SUB\_TYPE

#### **MQBACF\_ACCOUNTING\_TOKEN**

The accounting token passed by the subscriber for propagation into messages sent to this subscription in the AccountingToken field of the MQMD.

#### **MQBACF\_DESTINATION\_CORREL\_ID**

The CorrelId used for messages sent to this subscription.

#### **MQBACF\_SUB\_ID**

The internal unique key identifying a subscription.

#### **MQCA\_ALTERATION\_DATE**

The date of the most recent MQSUB with MQSO\_ALTER or ALTER SUB command.

**MQCA\_ALTERATION\_TIME**

The time of the most recent MQSUB with MQSO\_ALTER or ALTER SUB command.

**MQCA\_CREATION\_DATE**

The date of the first MQSUB command that caused this subscription to be created.

**MQCA\_CREATION\_TIME**

The time of the first MQSUB that caused this subscription to be created.

**MQCA\_TOPIC\_STRING**

The resolved topic string the subscription is for.

**MQCACF\_APPL\_IDENTITY\_DATA**

The identity data passed by the subscriber for propagation into messages sent to this subscription in the ApplIdentity field of the MQMD.

**MQCACF\_DESTINATION**

The destination for messages published to this subscription.

**MQCACF\_DESTINATION\_Q\_MGR**

The destination queue manager for messages published to this subscription.

**MQCACF\_SUB\_NAME**

The unique identifier of an application for a subscription.

**MQCACF\_SUB\_SELECTOR**

The SQL 92 selector string to be applied to messages published on the named topic to select whether they are eligible for this subscription.

**MQCACF\_SUB\_USER\_DATA**

The user data associated with the subscription.

**MQCACF\_SUB\_USER\_ID**

The userid that owns the subscription. MQCACF\_SUB\_USER\_ID is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription.

**MQCA\_TOPIC\_NAME**

The name of the topic object that identifies a position in the topic hierarchy to which the topic string is concatenated.

**MQIACF\_DESTINATION\_CLASS**

Indicated whether this subscription is a managed subscription.

**MQIACF\_DURABLE\_SUBSCRIPTION**

Whether the subscription is durable, persisting over queue manager restart.

**MQIACF\_EXPIRY**

The time to live from creation date and time.

**MQIACF\_PUB\_PRIORITY**

The priority of the messages sent to this subscription.

**MQIACF\_PUBSUB\_PROPERTIES**

The manner in which publish/subscribe related message properties are added to messages sent to this subscription.

**MQIACF\_REQUEST\_ONLY**

Indicates whether the subscriber polls for updates by using MQSUBRQ API, or whether all publications are delivered to this subscription.

**MQIACF\_SUB\_TYPE**

The type of subscription - how it was created.

**MQIACF\_SUBSCRIPTION\_SCOPE**

Whether the subscription forwards messages to all other queue managers directly connected by using a Publish/Subscribe collective or hierarchy, or the subscription forwards messages on this topic within this queue manager only.

**MQIACF\_SUB\_LEVEL**

The level within the subscription interception hierarchy at which this subscription is made.

**MQIACF\_VARIABLE\_USER\_ID**

Users other than the creator of this subscription that can connect to it (subject to topic and destination authority checks).

**MQIACF\_WILDCARD\_SCHEMA**

The schema to be used when interpreting wildcard characters in the topic string.

**MQIA\_DISPLAY\_TYPE**

Controls the output returned in the **TOPICSTR** and **TOPICOBJ** attributes.

**SubscriptionType (MQCFIN)**

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF\_SUB\_TYPE).

**MQSUBTYPE\_ADMIN**

Subscriptions which have been created by an admin interface or modified by an admin interface are selected.

**MQSUBTYPE\_ALL**

All subscription types are displayed.

**MQSUBTYPE\_API**

Subscriptions created by applications by way of the IBM MQ API are displayed.

**MQSUBTYPE\_PROXY**

System created subscriptions relating to inter-queue manager subscriptions are displayed.

**MQSUBTYPE\_USER**

USER subscriptions (with SUBTYPE of either ADMIN or API) are displayed. MQSUBTYPE\_USER is the default value.

**DisplayType (MQCFIN)**

Controls the output returned in the **MQCA\_TOPIC\_STRING** and **MQCA\_TOPIC\_NAME** attributes (parameter identifier: MQIA\_DISPLAY\_TYPE).

**MQDOPT\_RESOLVED**

Returns the resolved (full) topic string in the **MQCA\_TOPIC\_STRING** attribute. The value of the **MQCA\_TOPIC\_NAME** attribute is also returned.

**MQDOPT\_DEFINED**

Returns the values of the **MQCA\_TOPIC\_NAME** and **MQCA\_TOPIC\_STRING** attributes provided when the subscription was created. The **MQCA\_TOPIC\_STRING** attribute will contain the application part of the topic string only. You can use the values returned with **MQCA\_TOPIC\_NAME** and **MQCA\_TOPIC\_STRING** to fully re-create the subscription by using **MQDOPT\_DEFINED**.

**Inquire Subscription (Response)**

The response to the Inquire Subscription (MQCMD\_INQUIRE\_SUBSCRIPTION) command consists of the response header followed by the *SubId* and *SubName* structures, and the requested combination of attribute parameter structures (where applicable).

**Always returned**

*SubID, SubName*

**Returned if requested**

*AlterationDate, AlterationTime, CreationDate, CreationTime, Destination, DestinationClass, DestinationCorrelId, DestinationQueueManager, Expiry, PublishedAccountingToken, PublishedApplicationIdentityData, PublishPriority, PublishSubscribeProperties, Requestonly, Selector, SelectorType, SubscriptionLevel, SubscriptionScope, SubscriptionType, SubscriptionUser, TopicObject, TopicString, Userdata, VariableUser, WildcardSchema*

## Response Data

### AlterationDate (MQCFST)

The date of the most recent **MQSUB** or **Change Subscription** command that modified the properties of the subscription (parameter identifier: MQCA\_ALTERATION\_DATE).

### AlterationTime (MQCFST)

The time of the most recent **MQSUB** or **Change Subscription** command that modified the properties of the subscription (parameter identifier: MQCA\_ALTERATION\_TIME).

### CreationDate (MQCFST)

The creation date of the subscription, in the form yyyy-mm-dd (parameter identifier: MQCA\_CREATION\_DATE).

### CreationTime (MQCFST)

The creation time of the subscription, in the form hh.mm.ss (parameter identifier: MQCA\_CREATION\_TIME).

### Destination (MQCFST)

Destination (parameter identifier: MQCACF\_DESTINATION).

Specifies the name of the alias, local, remote, or cluster queue to which messages for this subscription are put.

### DestinationClass (MQCFIN)

Destination class (parameter identifier: MQIACF\_DESTINATION\_CLASS).

Whether the destination is managed.

The value can be any of the following values:

#### **MQDC\_MANAGED**

The destination is managed.

#### **MQDC\_PROVIDED**

The destination queue is as specified in the *Destination* field.

### DestinationCorrelId (MQCFBS)

Destination correlation identifier (parameter identifier: MQBACF\_DESTINATION\_CORREL\_ID).

A correlation identifier that is placed in the *CorrelId* field of the message descriptor for all the messages sent to this subscription.

The maximum length is MQ\_CORREL\_ID\_LENGTH.

### DestinationQueueManager (MQCFST)

Destination queue manager (parameter identifier: MQCACF\_DESTINATION\_Q\_MGR).

Specifies the name of the destination queue manager, either local or remote, to which messages for the subscription are forwarded.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

### DisplayType (MQCFIN)

The type of output requested for **MQCA\_TOPIC\_STRING** and **MQCA\_TOPIC\_NAME** is returned (parameter identifier: MQIA\_DISPLAY\_TYPE).

#### **MQDOPT\_RESOLVED**

Returns the resolved (full) topic string in the **MQCA\_TOPIC\_STRING** attribute. The value of the **MQCA\_TOPIC\_NAME** attribute is also returned.

#### **MQDOPT\_DEFINED**

The application portion of the topic string is returned in the **MQCA\_TOPIC\_STRING** attribute. **MQCA\_TOPIC\_NAME** contains the name of the **TOPIC** Object used when defining the subscription.

**Durable (MQCFIN)**

Whether this subscription is a durable subscription (parameter identifier: MQIACF\_DURABLE\_SUBSCRIPTION).

The value can be any of the following values:

**MQSUB\_DURABLE\_YES**

The subscription persists, even if the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. The queue manager reinstates the subscription during restart.

**MQSUB\_DURABLE\_NO**

The subscription is non-durable. The queue manager removes the subscription when the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. If the subscription has a destination class (DESTCLAS) of MANAGED, the queue manager removes any messages not yet consumed when it closes the subscription.

**Expiry (MQCFIN)**

The time, in tenths of a second, at which a subscription expires after its creation date and time (parameter identifier: MQIACF\_EXPIRY).

A value of unlimited means that the subscription never expires.

After a subscription has expired it becomes eligible to be discarded by the queue manager and receives no further publications.

**PublishedAccountingToken (MQCFBS)**

Value of the accounting token used in the *AccountingToken* field of the message descriptor (parameter identifier: MQBACF\_ACCOUNTING\_TOKEN).

The maximum length of the string is MQ\_ACCOUNTING\_TOKEN\_LENGTH.

**PublishedApplicationIdentityData (MQCFST)**

Value of the application identity data used in the *AppIdentityData* field of the message descriptor (parameter identifier: MQCACF\_APPL\_IDENTITY\_DATA).

The maximum length of the string is MQ\_APPL\_IDENTITY\_DATA\_LENGTH.

**PublishPriority (MQCFIN)**

The priority of messages sent to this subscription (parameter identifier: MQIACF\_PUB\_PRIORITY).

The value can be any of the following values:

**MQPRI\_PRIORITY\_AS\_PUBLISHED**

The priority of messages sent to this subscription is taken from that priority supplied to the published message. MQPRI\_PRIORITY\_AS\_PUBLISHED is the supplied default value.

**MQPRI\_PRIORITY\_AS\_QDEF**

The priority of messages sent to this subscription is determined by the default priority of the queue defined as a destination.

**0-9**

An integer value providing an explicit priority for messages sent to this subscription.

**PublishSubscribeProperties (MQCFIN)**

Specifies how publish/subscribe related message properties are added to messages sent to this subscription (parameter identifier: MQIACF\_PUBSUB\_PROPERTIES).

The value can be any of the following values:

**MQPSPROP\_NONE**

Publish/subscribe properties are not added to the messages. MQPSPROP\_NONE is the supplied default value.

**MQPSPROP\_MSGPROP**

Publish/subscribe properties are added as PCF attributes.

**MQPSPROP\_COMPAT**

If the original publication is a PCF message, then the publish/subscribe properties are added as PCF attributes. Otherwise, publish/subscribe properties are added within an MQRFH version 1 header. This method is compatible with applications coded for use with previous versions of IBM MQ.

**MQPSPROP\_RFH2**

Publish/subscribe properties are added within an MQRFH version 2 header. This method is compatible with applications coded for use with IBM Integration Bus brokers.

**Requestonly (MQCFIN)**

Indicates whether the subscriber polls for updates using the MQSUBRQ API call, or whether all publications are delivered to this subscription (parameter identifier: MQIACF\_REQUEST\_ONLY).

The value can be:

**MQRU\_PUBLISH\_ALL**

All publications on the topic are delivered to this subscription.

**MQRU\_PUBLISH\_ON\_REQUEST**

Publications are only delivered to this subscription in response to an MQSUBRQ API call.

**Selector (MQCFST)**

Specifies the selector applied to messages published to the topic (parameter identifier: MQCACF\_SUB\_SELECTOR).

Only those messages that satisfy the selection criteria are put to the destination specified by this subscription.

**SelectorType (MQCFIN)**

The type of selector string that has been specified (parameter identifier: MQIACF\_SELECTOR\_TYPE).

The value can be any of the following values:

**MQSELTYPE\_NONE**

No selector has been specified.

**MQSELTYPE\_STANDARD**

The selector references only the properties of the message, not its content, using the standard IBM MQ selector syntax. Selectors of this type are to be handled internally by the queue manager.

**MQSELTYPE\_EXTENDED**

The selector uses extended selector syntax, typically referencing the content of the message. Selectors of this type cannot be handled internally by the queue manager; extended selectors can be handled only by another program, such as IBM Integration Bus.

**SubID (MQCFBS)**

The internal, unique key identifying a subscription (parameter identifier: MQBACF\_SUB\_ID).

**SubscriptionLevel (MQCFIN)**

The level within the subscription interception hierarchy at which this subscription is made (parameter identifier: MQIACF\_SUB\_LEVEL).

The value can be:

**0 - 9**

An integer in the range 0-9. The default value is 1. Subscribers with a subscription level of 9 will intercept publications before they reach subscribers with lower subscription levels.

**SubscriptionScope (MQCFIN)**

Determines whether this subscription is passed to other queue managers in the network (parameter identifier: MQIACF\_SUBSCRIPTION\_SCOPE).

The value can be:

**MQTSCOPE\_ALL**

The subscription is forwarded to all queue managers directly connected through a publish/subscribe collective or hierarchy. MQTSCOPE\_ALL is the supplied default value.

**MQTSCOPE\_QMGR**

The subscription only forwards messages published on the topic within this queue manager.

**SubscriptionType (MQCFIN)**

Indicates how the subscription was created (parameter identifier: MQIACF\_SUB\_TYPE).

**MQSUBTYPE\_PROXY**

An internally created subscription used for routing publications through a queue manager.

**MQSUBTYPE\_ADMIN**

Created using **DEF SUB** MQSC or PCF command. This **SUBTYPE** also indicates that a subscription has been modified using an administrative command.

**MQSUBTYPE\_API**

Created using an **MQSUB** API request.

**SubscriptionUser (MQCFST)**

The userid that 'owns' this subscription. This parameter is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription. (parameter identifier: MQCACF\_SUB\_USER\_ID).

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

**TopicObject (MQCFST)**

The name of a previously defined topic object from which is obtained the topic name for the subscription (parameter identifier: MQCA\_TOPIC\_NAME).

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

**TopicString (MQCFST)**

The resolved topic string (parameter identifier: MQCA\_TOPIC\_STRING).

The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

**Userdata (MQCFST)**

User data (parameter identifier: MQCACF\_SUB\_USER\_DATA).

Specifies the user data associated with the subscription

The maximum length of the string is MQ\_USER\_DATA\_LENGTH.

**VariableUser (MQCFIN)**

Specifies whether a user other than the one who created the subscription, that is, the user shown in *SubscriptionUser* can take over the ownership of the subscription (parameter identifier: MQIACF\_VARIABLE\_USER\_ID).

The value can be any of the following values:

**MQVU\_ANY\_USER**

Any user can take over the ownership. MQVU\_ANY\_USER is the supplied default value.

**MQVU\_FIXED\_USER**

No other user can take over the ownership.

**WildcardSchema (MQCFIN)**

Specifies the schema to be used when interpreting any wildcard characters contained in the *TopicString* (parameter identifier: MQIACF\_WILDCARD\_SCHEMA).

The value can be any of the following values:

**MQWS\_CHAR**

Wildcard characters represent portions of strings; it is for compatibility with IBM MQ V6.0 broker.

## MQWS\_TOPIC

Wildcard characters represent portions of the topic hierarchy; this is for compatibility with IBM Integration Bus brokers. MQWS\_TOPIC is the supplied default value.

## Inquire Subscription Status

The Inquire Subscription Status (MQCMD\_INQUIRE\_SUB\_STATUS) command inquires about the status of a subscription.

### Required parameters

#### SubName (MQCFST)

The unique identifier of an application for a subscription (parameter identifier: MQCACF\_SUB\_NAME).

If *SubName* is not provided, *SubId* must be specified to identify the subscription to be inquired.

The maximum length of the string is MQ\_SUB\_NAME\_LENGTH.

#### SubId (MQCFBS)

Subscription identifier (parameter identifier: MQBACF\_SUB\_ID).

Specifies the unique internal subscription identifier. If the queue manager is generating the CorrelId for a subscription, then the *SubId* is used as the *DestinationCorrelId*.

You must supply a value for *SubId* if you have not supplied a value for *SubName*.

The maximum length of the string is MQ\_CORREL\_ID\_LENGTH.

### Optional parameters

#### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter on which to filter.

#### Durable (MQCFIN)

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF\_DURABLE\_SUBSCRIPTION).

##### MQSUB\_DURABLE\_YES

Information about durable subscriptions only is displayed. MQSUB\_DURABLE\_YES is the default.

##### MQSUB\_DURABLE\_NO

Information about non-durable subscriptions only is displayed.

#### SubscriptionType (MQCFIN)

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF\_SUB\_TYPE).

**MQSUBTYPE\_ADMIN**

Subscriptions which have been created by an admin interface or modified by an admin interface are selected.

**MQSUBTYPE\_ALL**

All subscription types are displayed.

**MQSUBTYPE\_API**

Subscriptions created by applications through an IBM MQ API call are displayed.

**MQSUBTYPE\_PROXY**

System created subscriptions relating to inter-queue manager subscriptions are displayed.

**MQSUBTYPE\_USER**

USER subscriptions (with SUBTYPE of either ADMIN or API) are displayed. MQSUBTYPE\_USER is the default value.

**StatusAttrs (MQCFIL)**

Subscription status attributes (parameter identifier: MQIACF\_SUB\_STATUS\_ATTRS).

To select the attributes you want to display you can specify;

- ALL to display all attributes.
- any of the following parameters individually or in combination.

**MQIACF\_ALL**

All attributes.

**MQBACF\_CONNECTION\_ID**

The currently active *ConnectionID* that has opened the subscription.

**MQIACF\_DURABLE\_SUBSCRIPTION**

Whether the subscription is durable, persisting over queue manager restart.

**MQCACF\_LAST\_MSG\_DATE**

The date that a message was last sent to the destination specified by the subscription.

**MQCACF\_LAST\_MSG\_TIME**

The time when a message was last sent to the destination specified by the subscription.

**MQIACF\_MESSAGE\_COUNT**

The number of messages put to the destination specified by the subscription.

**MQCA\_RESUME\_DATE**

The date of the most recent MQSUB command that connected to the subscription.

**MQCA\_RESUME\_TIME**

The time of the most recent MQSUB command that connected to the subscription.

**MQIACF\_SUB\_TYPE**

The type of subscription - how it was created.

**MQCACF\_SUB\_USER\_ID**

The userid owns the subscription.

**MQCA\_TOPIC\_STRING**

Returns the fully resolved topic string of the subscription.

**Inquire Subscription Status (Response)**

The response to the Inquire Subscription Status (MQCMD\_INQUIRE\_SUB\_STATUS) command consists of the response header followed by the *SubId* and *SubName* structures, and the requested combination of attribute parameter structures (where applicable).

**Always returned**

*SubID* , *SubName*

**Returned if requested**

*ActiveConnection* , *Durable* , *LastPublishDate* , *LastPublishTime* ,  
*MCastRelIndicator* , *NumberMsgs* , *ResumeDate* , *ResumeTime* , *SubType* , *TopicString*

## Response Data

### **ActiveConnection (MQCFBS)**

The *ConnId* of the *HConn* that currently has this subscription open (parameter identifier: MQBACF\_CONNECTION\_ID).

### **Durable (MQCFIN)**

A durable subscription is not deleted when the creating application closes its subscription handle (parameter identifier: MQIACF\_DURABLE\_SUBSCRIPTION).

#### **MQSUB\_DURABLE\_NO**

The subscription is removed when the application that created it is closed or disconnected from the queue manager.

#### **MQSUB\_DURABLE\_YES**

The subscription persists even when the creating application is no longer running or has been disconnected. The subscription is reinstated when the queue manager restarts.

### **LastMessageDate (MQCFST)**

The date that a message was last sent to the destination specified by the subscription (parameter identifier: MQCACF\_LAST\_MSG\_DATE).

### **LastMessageTime (MQCFST)**

The time when a message was last sent to the destination specified by the subscription (parameter identifier: MQCACF\_LAST\_MSG\_TIME).

### **MCastRelIndicator (MQCFIN)**

The multicast reliability indicator (parameter identifier: MQIACF\_MCAST\_REL\_INDICATOR).

### **NumberMsgs (MQCFIN)**

The number of messages put to the destination specified by this subscription (parameter identifier: MQIACF\_MESSAGE\_COUNT).

### **ResumeDate (MQCFST)**

The date of the most recent **MQSUB** API call that connected to the subscription (parameter identifier: MQCA\_RESUME\_DATE).

### **ResumeTime (MQCFST)**

The time of the most recent **MQSUB** API call that connected to the subscription (parameter identifier: MQCA\_RESUME\_TIME).

### **SubscriptionUser (MQCFST)**

The userid that 'owns' this subscription. This parameter is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription. (parameter identifier: MQCACF\_SUB\_USER\_ID).

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

### **SubID (MQCFBS)**

The internal, unique key identifying a subscription (parameter identifier: MQBACF\_SUB\_ID).

### **SubName (MQCFST)**

The unique identifier of a subscription (parameter identifier: MQCACF\_SUB\_NAME).

### **SubType (MQCFIN)**

Indicates how the subscription was created (parameter identifier: MQIACF\_SUB\_TYPE).

#### **MQSUBTYPE\_PROXY**

An internally created subscription used for routing publications through a queue manager.

#### **MQSUBTYPE\_ADMIN**

Created using the **DEF SUB MQSC** or **Create Subscription PCF** command. This Subtype also indicates that a subscription has been modified using an administrative command.

#### **MQSUBTYPE\_API**

Created using an **MQSUB** API call.

## TopicString (MQCFST)

The resolved topic string (parameter identifier: MQCA\_TOPIC\_STRING). The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

## z/OS Inquire System on z/OS

The Inquire System (MQCMD\_INQUIRE\_SYSTEM) command returns general system parameters and information.

### Optional parameters

#### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## z/OS MQCMD\_INQUIRE\_SYSTEM (Inquire System) Response on z/OS

The response to the Inquire System (MQCMD\_INQUIRE\_SYSTEM) PCF command consists of the response header followed by the *ParameterType* structure and the combination of attribute parameter structures determined by the value of the parameter type.

### Always returned:

*ParameterType*

Possible values of *ParameterType* are:

#### MQSYSP\_TYPE\_INITIAL

The initial settings of the system parameters.

#### MQSYSP\_TYPE\_SET

The settings of the system parameters if they have been altered since their initial setting.

### Returned if *ParameterType* is MQSYSP\_TYPE\_INITIAL or MQSYSP\_TYPE\_SET (and a value is set):

*CheckpointCount, ClusterCacheType, CodedCharSetId, CommandUserId, DB2BlobTasks, DB2Name, DB2Tasks, DSGName, Exclmsg, ExitInterval, ExitTasks, MULCCapture, OTMADruExit, OTMAGroup, OTMAInterval, OTMAMember, OTMSTpipePrefix, QIndexDefer, QSGName, RESLEVELAudit, RoutingCode, Service, SMFAccounting, SMFStatistics, SMFInterval, Splcap, TraceClass, TraceSize, WLMInterval, WLMIntervalUnits*

### Response data

#### CheckpointCount (MQCFIN)

The number of log records written by IBM MQ between the start of one checkpoint and the next (parameter identifier: MQIACF\_SYSP\_CHKPOINT\_COUNT).

#### ClusterCacheType (MQCFIN)

The type of the cluster cache (parameter identifier: MQIACF\_SYSP\_CLUSTER\_CACHE).

The value can be any of the following values:

**MQCLCT\_STATIC**

Static cluster cache.

**MQCLCT\_DYNAMIC**

Dynamic cluster cache.

**CodedCharSetId (MQCFIN)**

Archive retention period (parameter identifier: MQIA\_CODED\_CHAR\_SET\_ID).

The coded character set identifier for the queue manager.

**CommandUserId (MQCFST)**

Command user ID (parameter identifier: MQCACF\_SYSP\_CMD\_USER\_ID).

Specifies the default user ID for command security checks.

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

**DB2BlobTasks (MQCFIN)**

The number of Db2 server tasks to be used for BLOBs (parameter identifier: MQIACF\_SYSP\_DB2\_BLOB\_TASKS).

**DB2Name (MQCFST)**

The name of the Db2 subsystem or group attachment to which the queue manager is to connect (parameter identifier: MQCACF\_DB2\_NAME).

The maximum length of the string is MQ\_DB2\_NAME\_LENGTH.

**DB2Tasks (MQCFIN)**

The number of Db2 server tasks to use (parameter identifier: MQIACF\_SYSP\_DB2\_TASKS).

**DSGName (MQCFST)**

The name of the Db2 data-sharing group to which the queue manager is to connect (parameter identifier: MQCACF\_DSG\_NAME).

The maximum length of the string is MQ\_DSG\_NAME\_LENGTH.

**Exclmsg (MQCFSL)**

A list of message identifiers to be excluded from being written to any log (parameter identifier: MQCACF\_EXCL\_OPERATOR\_MESSAGES).

The maximum length of each message identifier is MQ\_OPERATOR\_MESSAGE\_LENGTH.

The list can contain a maximum of 16 message identifiers.

**ExitInterval (MQCFIN)**

The time, in seconds, for which queue manager exits can execute during each invocation (parameter identifier: MQIACF\_SYSP\_EXIT\_INTERVAL).

**ExitTasks (MQCFIN)**

Specifies how many started server tasks to use to run queue manager exits (parameter identifier: MQIACF\_SYSP\_EXIT\_TASKS).

**MaximumAcePool (MQCFIN)**

The maximum ACE storage pool size in 1 KB blocks (parameter identifier: MQIACF\_SYSP\_MAX\_ACE\_POOL).

**MULCCapture (MQCFIN)**

The Measured Usage Pricing property is used to control the algorithm for gathering data used by Measured Usage License Charging (MULC) (parameter identifier: MQIACF\_MULC\_CAPTURE).

The returned values can be MQMULC\_STANDARD or MQMULC\_REFINED.

**OTMADruExit (MQCFST)**

The name of the OTMA destination resolution user exit to be run by IMS (parameter identifier: MQCACF\_SYSP\_OTMA\_DRU\_EXIT).

The maximum length of the string is MQ\_EXIT\_NAME\_LENGTH.

**OTMAGroup (MQCFST)**

The name of the XCF group to which this instance of IBM MQ belongs (parameter identifier: MQCACF\_SYSP\_OTMA\_GROUP).

The maximum length of the string is MQ\_XCF\_GROUP\_NAME\_LENGTH.

**OTMAInterval (MQCFIN)**

The length of time, in seconds, that a user ID from IBM MQ is considered previously verified by IMS (parameter identifier: MQIACF\_SYSP\_OTMA\_INTERVAL).

**OTMAMember (MQCFST)**

The name of the XCF member to which this instance of IBM MQ belongs (parameter identifier: MQCACF\_SYSP\_OTMA\_MEMBER).

The maximum length of the string is MQ\_XCF\_MEMBER\_NAME\_LENGTH.

**OTMSTpipePrefix (MQCFST)**

The prefix to be used for Tpipe names (parameter identifier: MQCACF\_SYSP\_OTMA\_TPIPE\_PFX).

The maximum length of the string is MQ\_TPIPE\_PFX\_LENGTH.

**QIndexDefer (MQCFIN)**

Specifies whether queue manager restart completes before all indexes are built deferring building to later, or waits until all indexes are built (parameter identifier: MQIACF\_SYSP\_Q\_INDEX\_DEFER).

The value can be any of the following values:

**MQSYSP\_YES**

Queue manager restart completes before all indexes are built.

**MQSYSP\_NO**

Queue manager restart waits until all indexes are built.

**QSGName (MQCFST)**

The name of the queue sharing group to which the queue manager belongs (parameter identifier: MQCA\_QSG\_NAME).

The maximum length of the string is MQ\_QSG\_NAME\_LENGTH.

**RESLEVELAudit (MQCFIN)**

Specifies whether RACF audit records are written for RESLEVEL security checks performed during connection processing (parameter identifier: MQIACF\_SYSP\_RESLEVEL\_AUDIT).

The value can be any of the following values:

**MQSYSP\_YES**

RACF audit records are written.

**MQSYSP\_NO**

RACF audit records are not written.

**RoutingCode (MQCFIL)**

z/OS routing code list (parameter identifier: MQIACF\_SYSP\_ROUTING\_CODE).

Specifies the list of z/OS routing codes for messages that are not sent in direct response to an MQSC command. There can be in the range 1 through 16 entries in the list.

**Service (MQCFST)**

Service parameter setting (parameter identifier: MQCACF\_SYSP\_SERVICE).

The maximum length of the string is MQ\_SERVICE\_NAME\_LENGTH.

**SMFAccounting (MQCFIN)**

Specifies whether IBM MQ sends accounting data to SMF automatically when the queue manager starts (parameter identifier: MQIACF\_SYSP\_SMF\_ACCOUNTING).

The value can be any of the following values:

**MQSYSP\_YES**

Accounting data is sent automatically.

**MQSYSP\_NO**

Accounting data is not sent automatically.

**SMFInterval (MQCFIN)**

The default time, in minutes, between each gathering of statistics (parameter identifier: MQIACF\_SYSP\_SMF\_INTERVAL).

**SMFStatistics (MQCFIN)**

Specifies whether IBM MQ sends statistics data to SMF automatically when the queue manager starts (parameter identifier: MQIACF\_SYSP\_SMF\_STATS).

The value can be any of the following values:

**MQSYSP\_YES**

Statistics data is sent automatically.

**MQSYSP\_NO**

Statistics data is not sent automatically.

**Splcap (MQCFIN)**

If the AMS component is installed for the version of IBM MQ that the queue manager is running under, the attribute has a value YES (MQCAP\_SUPPORTED). If the AMS component is not installed, the value is NO (MQCAP\_NOT\_SUPPORTED) (parameter identifier MQIA\_PROT\_POLICY\_CAPABILITY).

The value can be one of the following values:

**MQCAP\_SUPPORTED**

If the AMS component is installed for the version of IBM MQ that the queue manager is running under.

**MQCAP\_NOT\_SUPPORTED**

If the AMS component is not installed.

**TraceClass (MQCFIL)**

Classes for which tracing is started automatically (parameter identifier: MQIACF\_SYSP\_TRACE\_CLASS). There can be in the range 1 through 4 entries in the list.

**TraceSize (MQCFIN)**

The size of the trace table, in 4 KB blocks, to be used by the global trace facility (parameter identifier: MQIACF\_SYSP\_TRACE\_SIZE).

**WLMInterval (MQCFIN)**

The time between scans of the queue index for WLM-managed queues (parameter identifier: MQIACF\_SYSP\_WLM\_INTERVAL).

**WLMIntervalUnits (MQCFIN)**

Whether the value of *WLMInterval* is given in seconds or minutes (parameter identifier: MQIACF\_SYSP\_WLM\_INT\_UNITS). The value can be any of the following values:

**MQTIME\_UNITS\_SEC**

The value of *WLMInterval* is given in seconds.

**MQTIME\_UNITS\_MINS**

The value of *WLMInterval* is given in minutes.

**Inquire Topic**

The Inquire Topic (MQCMD\_INQUIRE\_TOPIC) command inquires about the attributes of existing IBM MQ administrative topic objects

**Required parameters****TopicName (MQCFST)**

Administrative topic object name (parameter identifier: MQCA\_TOPIC\_NAME).

Specifies the name of the administrative topic object about which information is to be returned. Generic topic object names are supported. A generic name is a character string followed by an asterisk (\*). For example, ABC\* selects all administrative topic objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

## Optional parameters

### ClusterInfo (MQCFIN)

Cluster information (parameter identifier: MQIACF\_CLUSTER\_INFO).

This parameter requests that, in addition to information about attributes of topics defined on this queue manager, cluster information about these topics and other topics in the repository that match the selection criteria is returned.

In this case, there might be multiple topics with the same name returned.

You can set this parameter to any integer value: the value used does not affect the response to the command.

The cluster information is obtained locally from the queue manager.

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

### IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *TopicAttrs* except MQIACF\_ALL.

Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1896](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the

**StringFilterCommand** parameter.

### QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

**MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

**MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_PRIVATE**

The object is defined as either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *TopicAttrs* except MQCA\_TOPIC\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1903](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

**TopicAttrs (MQCFIL)**

Topic object attributes (parameter identifier: MQIACF\_TOPIC\_ATTRS).

The attribute list can specify the following value on its own - default value if the parameter is not specified:

**MQIACF\_ALL**

All attributes.

or a combination of the following:

**MQCA\_ALTERATION\_DATE**

The date on which the information was last altered.

**MQCA\_ALTERATION\_TIME**

The time at which the information was last altered.

**MQCA\_CLUSTER\_NAME**

The cluster that is to be used for the propagation of publications and subscription to publish/subscribe cluster-connected queue managers for this topic.

**MQCA\_CLUSTER\_DATE**

The date on which this information became available to the local queue manager.

**MQCA\_CLUSTER\_TIME**

The time at which this information became available to the local queue manager.

**MQCA\_CLUSTER\_Q\_MGR\_NAME**

Queue manager that hosts the topic.

**MQCA\_CUSTOM**

The custom attribute for new features.

**MQCA\_MODEL\_DURABLE\_Q**

Name of the model queue for durable managed subscriptions.

**MQCA\_MODEL\_NON\_DURABLE\_Q**

Name of the model queue for non-durable managed subscriptions.

**MQCA\_TOPIC\_DESC**

Description of the topic object.

**MQCA\_TOPIC\_NAME**

Name of the topic object.

**MQCA\_TOPIC\_STRING**

The topic string for the topic object.

**MQIA\_CLUSTER\_OBJECT\_STATE**

The current state of the clustered topic definition.

**MQIA\_CLUSTER\_PUB\_ROUTE**

The routing behavior of publications between queue managers in a cluster.

**MQIA\_DEF\_PRIORITY**

Default message priority.

**MQIA\_DEF\_PUT\_RESPONSE\_TYPE**

Default put response.

**MQIA\_DURABLE\_SUB**

Whether durable subscriptions are permitted.

**MQIA\_INHIBIT\_PUB**

Whether publications are allowed.

**MQIA\_INHIBIT\_SUB**

Whether subscriptions are allowed.

**MQIA\_NPM\_DELIVERY**

The delivery mechanism for non-persistent messages.

**MQIA\_PM\_DELIVERY**

The delivery mechanism for persistent messages.

**MQIA\_PROXY\_SUB**

Whether a proxy subscription is to be sent for this topic, even if no local subscriptions exist.

**MQIA\_PUB\_SCOPE**

Whether this queue manager propagates publications to queue managers as part of a hierarchy or a publish/subscribe cluster.

**MQIA\_SUB\_SCOPE**

Whether this queue manager propagates subscriptions to queue managers as part of a hierarchy or a publish/subscribe cluster.

**MQIA\_TOPIC\_DEF\_PERSISTENCE**

Default message persistence.

**MQIA\_USE\_DEAD\_LETTER\_Q**

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue.

**TopicType (MQCFIN)**

Cluster information (parameter identifier: MQIA\_TOPIC\_TYPE).

If this parameter is present, eligible queues are limited to the specified type. Any attribute selector that is specified in the TopicAttrs list and that is valid only for topics of different type is ignored; no error is raised.

If this parameter is not present (or if MQIACF\_ALL is specified), queues of all types are eligible. Each attribute specified must be a valid topic attribute selector (that is, it must be in the following list), but

it need not be applicable to all or any of the topics returned. Topic attribute selectors that are valid but not applicable to the queue are ignored; no error messages occur and no attribute is returned.

The value can be any of the following values:

**MQTOPT\_ALL**

All topic types are displayed. MQTOPT\_ALL includes cluster topics, if ClusterInfo is also specified. MQTOPT\_ALL is the default value.

**MQTOPT\_CLUSTER**

Topics that are defined in publish/subscribe clusters are returned.

**MQTOPT\_LOCAL**

Locally defined topics are displayed.

## Inquire Topic (Response)

The response to the Inquire Topic (MQCMD\_INQUIRE\_TOPIC) command consists of the response header followed by the *TopicName* structure (and on z/OS only, the *QSG Disposition* structure), and the requested combination of attribute parameter structures (where applicable).

**Always returned:**

*TopicName* , *TopicType* ,  *QSGDisposition*

**Returned if requested:**

*AlterationDate* , *AlterationTime* , *ClusterName* , *ClusterObjectState* , *ClusterPubRoute* , *CommInfo* , *Custom* , *DefPersistence* , *DefPriority* , *DefPutResponse* , *DurableModelQName* , *DurableSubscriptions* , *InhibitPublications* , *InhibitSubscriptions* , *Multicast* , *NonDurableModelQName* , *NonPersistentMsgDelivery* , *PersistentMsgDelivery* , *ProxySubscriptions* , *PublicationScope* , *QMgrName* , *SubscriptionScope* , *TopicDesc* , *TopicString* , *UseDLQ* , *WildcardOperation*

## Response data

**AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

**AlterationTime (MQCFST)**

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time when the information was last altered, in the form hh.mm.ss.

**ClusterName (MQCFST)**

The name of the cluster to which this topic belongs. (parameter identifier: MQCA\_CLUSTER\_NAME).

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH. Setting this parameter to a cluster that this queue manager is a member of makes all queue managers in the cluster aware of this topic. Any publication to this topic or a topic string below it put to any queue manager in the cluster is propagated to subscriptions on any other queue manager in the cluster. For more details, see [Distributed publish/subscribe networks](#).

The value can be any of the following values:

**Blank**

If no topic object above this topic in the topic tree has set this parameter to a cluster name, then this topic does not belong to a cluster. Publications and subscriptions for this topic are not propagated to publish/subscribe cluster-connected queue managers. If a topic node higher in the topic tree has a cluster name set, publications and subscriptions to this topic are also propagated throughout the cluster.

This value is the default value for this parameter if no value is specified.

**String**

The topic belongs to this cluster. It is not recommended that this is set to a different cluster from a topic object above this topic object in the topic tree. Other queue managers in the cluster will honor this object's definition unless a local definition of the same name exists on those queue managers.

Additionally, if **PublicationScope** or **SubscriptionScope** are set to MQSCOPE\_ALL, this value is the cluster to be used for the propagation of publications and subscriptions, for this topic, to publish/subscribe cluster-connected queue managers.

**ClusterObjectState (MQCFIN)**

The current state of the clustered topic definition (parameter identifier: MQIA\_CLUSTER\_OBJECT\_STATE).

The value can be any of the following values:

**MQCLST\_ACTIVE**

The cluster topic is correctly configured and being adhered to by this queue manager.

**MQCLST\_PENDING**

Only seen by a hosting queue manager, this state is reported when the topic has been created but the full repository has not yet propagated it to the cluster. This might be because the host queue manager is not connected to a full repository, or because the full repository has deemed the topic to be invalid.

**MQCLST\_INVALID**

This clustered topic definition conflicts with an earlier definition in the cluster and is therefore not currently active.

**MQCLST\_ERROR**

An error has occurred with respect to this topic object.

This parameter is typically used to aid diagnosis when multiple definitions of the same clustered topic are defined on different queue managers, and the definitions are not identical. See [Routing for publish/subscribe clusters: Notes on behavior](#).

**ClusterPubRoute (MQCFIN)**

The routing behavior of publications between queue managers in a cluster (parameter identifier: MQIA\_CLUSTER\_PUB\_ROUTE).

The value can be any of the following values:

**MQCLROUTE\_DIRECT**

When you configure a direct routed clustered topic on a queue manager, all queue managers in the cluster become aware of all other queue managers in the cluster. When performing publish and subscribe operations, each queue manager can connect direct to any other queue manager in the cluster.

**MQCLROUTE\_TOPIC\_HOST**

When you use topic host routing, all queue managers in the cluster become aware of the cluster queue managers that host the routed topic definition (that is, the queue managers on which you have defined the topic object). When performing publish and subscribe operations, queue managers in the cluster connect only to these topic host queue managers, and not directly to each other. The topic host queue managers are responsible for routing publications from queue managers on which publications are published to queue managers with matching subscriptions.

**CommInfo (MQCFST)**

The name of the communication information object (parameter identifier: MQCA\_COMM\_INFO\_NAME).

Shows the resolved value of the name of the communication information object to be used for this topic node.

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

**Custom (MQCFST)**

Custom attribute for new features (parameter identifier: MQCA\_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes have been introduced. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE).

This description will be updated when features using this attribute are introduced.

#### **DefPersistence (MQCFIN)**

Default persistence (parameter identifier: MQIA\_TOPIC\_DEF\_PERSISTENCE).

The value can be:

##### **MQPER\_PERSISTENCE\_AS\_PARENT**

The default persistence is based on the setting of the closest parent administrative topic object in the topic tree.

##### **MQPER\_PERSISTENT**

Message is persistent.

##### **MQPER\_NOT\_PERSISTENT**

Message is not persistent.

#### **DefPriority (MQCFIN)**

Default priority (parameter identifier: MQIA\_DEF\_PRIORITY).

#### **DefPutResponse (MQCFIN)**

Default put response (parameter identifier: MQIA\_DEF\_PUT\_RESPONSE\_TYPE).

The value can be:

##### **MQPRT\_ASYNC\_RESPONSE**

The put operation is issued asynchronously, returning a subset of MQMD fields.

##### **MQPRT\_RESPONSE\_AS\_PARENT**

The default put response is based on the setting of the closest parent administrative topic object in the topic tree.

##### **MQPRT\_SYNC\_RESPONSE**

The put operation is issued synchronously, returning a response.

#### **DurableModelQName (MQCFST)**

Name of the model queue to be used for durable managed subscriptions (parameter identifier: MQCA\_MODEL\_DURABLE\_Q).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

#### **DurableSubscriptions (MQCFIN)**

Whether applications are permitted to make durable subscriptions (parameter identifier: MQIA\_DURABLE\_SUB).

The value can be:

##### **MQSUB\_DURABLE\_AS\_PARENT**

Whether durable subscriptions are permitted is based on the setting of the closest parent administrative topic object in the topic tree.

##### **MQSUB\_DURABLE\_ALLOWED**

Durable subscriptions are permitted.

##### **MQSUB\_DURABLE\_INHIBITED**

Durable subscriptions are not permitted.

#### **InhibitPublications (MQCFIN)**

Whether publications are allowed for this topic (parameter identifier: MQIA\_INHIBIT\_PUB).

The value can be:

##### **MQTA\_PUB\_AS\_PARENT**

Whether messages can be published to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

**MQTA\_PUB\_INHIBITED**

Publications are inhibited for this topic.

**MQTA\_PUB\_ALLOWED**

Publications are allowed for this topic.

**InhibitSubscriptions (MQCFIN)**

Whether subscriptions are allowed for this topic (parameter identifier: MQIA\_INHIBIT\_SUB).

The value can be:

**MQTA\_SUB\_AS\_PARENT**

Whether applications can subscribe to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

**MQTA\_SUB\_INHIBITED**

Subscriptions are inhibited for this topic.

**MQTA\_SUB\_ALLOWED**

Subscriptions are allowed for this topic.

**Multicast (MQCFIN)**

Whether multicast is used for this topic (parameter identifier: MQIA\_MULTICAST).

Returned value:

**MQMC\_ENABLED**

Multicast can be used.

**MQMC\_DISABLED**

Multicast is not used.

**MQMC\_ONLY**

Only Multicast publish/subscribe can be used on this topic.

**NonDurableModelQName (MQCFST)**

Name of the model queue to be used for non-durable managed subscriptions (parameter identifier: MQCA\_MODEL\_NON\_DURABLE\_Q).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**NonPersistentMsgDelivery (MQCFIN)**

The delivery mechanism for non-persistent messages published to this topic (parameter identifier: MQIA\_NPM\_DELIVERY).

The value can be:

**MQDLV\_AS\_PARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**MQDLV\_ALL**

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

**MQDLV\_ALL\_DUR**

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a non-persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

**MQDLV\_ALL\_AVAIL**

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

**PersistentMsgDelivery (MQCFIN)**

The delivery mechanism for persistent messages published to this topic (parameter identifier: MQIA\_PM\_DELIVERY).

The value can be:

**MQDLV\_AS\_PARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**MQDLV\_ALL**

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

**MQDLV\_ALL\_DUR**

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

**MQDLV\_ALL\_AVAIL**

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

**ProxySubscriptions (MQCFIN)**

Whether a proxy subscription is to be sent for this topic, even if no local subscriptions exist, to directly connected queue managers (parameter identifier: MQIA\_PROXY\_SUB).

The value can be:

**MQTA\_PROXY\_SUB\_FORCE**

A proxy subscription is sent to connected queue managers even if no local subscriptions exist.

**MQTA\_PROXY\_SUB\_FIRSTUSE**

A proxy subscription is sent for this topic only when a local subscription exists.

**PublicationScope (MQCFIN)**

Whether this queue manager propagates publications to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA\_PUB\_SCOPE).

The value can be:

**MQSCOPE\_ALL**

Publications for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

**MQSCOPE\_AS\_PARENT**

Whether this queue manager propagates publications to queue managers as part of a hierarchy or as part of a publish/subscribe cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQSCOPE\_AS\_PARENT is the default value for this parameter if no value is specified.

**MQSCOPE\_QMGR**

Publications for this topic are not propagated to other queue managers.

**Note:** You can override this behavior on a publication-by-publication basis, using MQPMO\_SCOPE\_QMGR on the Put Message Options.

**QMgrName (MQCFST)**

Name of local queue manager (parameter identifier: MQCA\_CLUSTER\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH

**SubscriptionScope (MQCFIN)**

Whether this queue manager propagates subscriptions to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA\_SUB\_SCOPE).

The value can be:

**MQSCOPE\_ALL**

Subscriptions for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

**MQSCOPE\_AS\_PARENT**

Whether this queue manager propagates subscriptions to queue managers as part of a hierarchy or as part of a publish/subscribe cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQSCOPE\_AS\_PARENT is the default value for this parameter if no value is specified.

**MQSCOPE\_QMGR**

Subscriptions for this topic are not propagated to other queue managers.

**Note:** You can override this behavior on a subscription-by-subscription basis, using MQSO\_SCOPE\_QMGR on the Subscription Descriptor or SUBSCOPE(QMGR) on DEFINE SUB.

**TopicDesc (MQCFST)**

Topic description (parameter identifier: MQCA\_TOPIC\_DESC).

The maximum length is MQ\_TOPIC\_DESC\_LENGTH.

**TopicName (MQCFST)**

Topic object name (parameter identifier: MQCA\_TOPIC\_NAME).

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

**TopicString (MQCFST)**

The topic string (parameter identifier: MQCA\_TOPIC\_STRING).

The '/' character within this string has special meaning. It delimits the elements in the topic tree. A topic string can start with the '/' character but is not required to. A string starting with the '/' character is not the same as the string which starts without the '/' character. A topic string cannot end with the '/' character.

The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

**TopicType (MQCFIN)**

Whether this object is a local or cluster topic (parameter identifier: MQIA\_TOPIC\_TYPE).

The value can be:

**MQTOPT\_LOCAL**

This object is a local topic.

**MQTOPT\_CLUSTER**

This object is a cluster topic.

**UseDLQ (MQCFIN)**

Whether the dead-letter queue (or undelivered message queue) should be used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA\_USE\_DEAD\_LETTER\_Q).

The value might be:

**MQUSEDLQ\_NO**

Publication messages that cannot be delivered to their correct subscriber queue are treated as a failure to put the message and the application's MQPUT to a topic will fail in accordance with the settings of NPMMSGDLV and PMSGDLV.

**MQUSEDLQ\_YES**

If the queue manager DEADQ attribute provides the name of a dead-letter queue then it will be used, otherwise the behaviour will be as for MQUSEDLQ\_NO.

### **MQUSEDLQ\_AS\_PARENT**

Whether to use the dead-letter queue is based on the setting of the closest administrative topic object in the topic tree.

### **WildcardOperation (MQCFIN)**

Behavior of subscriptions including wildcards made to this topic (parameter identifier: MQIA\_WILDCARD\_OPERATION).

The value can be:

### **MQTA\_PASSTHRU**

Subscriptions made using wildcard topic names that are less specific than the topic string at this topic object receive publications made to this topic and to topic strings more specific than this topic. MQTA\_PASSTHRU is the default supplied with IBM MQ.

### **MQTA\_BLOCK**

Subscriptions made using wildcard topic names that are less specific than the topic string at this topic object do not receive publications made to this topic or to topic strings more specific than this topic.

## **Inquire Topic Names**

The Inquire Topic Names (MQCMD\_INQUIRE\_TOPIC\_NAMES) command inquires a list of administrative topic names that match the generic topic name specified.

## **Required parameters**

### **TopicName (MQCFST)**

Administrative topic object name (parameter identifier: MQCA\_TOPIC\_NAME).

Specifies the name of the administrative topic object that information is to be returned for.

Generic topic object names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

## **Optional parameters**

### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

#### **MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

#### **MQQSGD\_PRIVATE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

## **Inquire Topic Names (Response)**

The response to the Inquire Topic Names (MQCMD\_INQUIRE\_TOPIC\_NAMES) command consists of the response header followed by a parameter structure giving zero or more names that match the specified administrative topic name.

Additionally, on z/OS only, the **QSGDispositions** parameter structure (with the same number of entries as the *TopicNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *TopicNames* structure.

#### **Always returned:**

*TopicNames* ,  *QSGDispositions*

#### **Returned if requested:**

None

## **Response data**

#### **TopicNames (MQCFSL)**

List of topic object names (parameter identifier: MQCACF\_TOPIC\_NAMES).

#### **QSGDispositions (MQCFIL)**

List of queue sharing group dispositions (parameter identifier: MQIACF\_QSG\_DISPS). This parameter is valid on z/OS only. The value can be:

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

## MQQSGD\_Q\_MGR

The object is defined as MQQSGD\_Q\_MGR.

## Inquire Topic Status

The Inquire Topic Status (MQCMD\_INQUIRE\_TOPIC\_STATUS) command inquires the status of a particular topic, or of a topic and its child topics. The Inquire Topic Status command has a required parameter. The Inquire Topic Status command has optional parameters.

## Required parameters

### TopicString (MQCFST)

The topic string (parameter identifier: MQCA\_TOPIC\_STRING).

The name of the topic string to display. IBM MQ uses the topic wildcard characters ('#' and '+') and does not treat a trailing asterisk as a wildcard. For more information about using wildcard characters, refer to the related topic.

The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

## Optional parameters

### CommandScope (MQCFST)

Command scope (parameter identifier: MQACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command runs on the queue manager on which you enter it.
- A queue manager name. The command runs on the queue manager that you specify, if it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which you entered the command, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (\*). The command runs on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use CommandScope as a filter parameter.

### IntegerFilterCommand (MQCFIF)

Integer filter command descriptor that you use to restrict the output from the command. The parameter identifier must be an integer type and must be one of the values allowed for *MQIACF\_TOPIC\_SUB\_STATUS*, *MQIACF\_TOPIC\_PUB\_STATUS* or *MQIACF\_TOPIC\_STATUS*, except *MQIACF\_ALL*.

If you specify an integer filter, you cannot also specify a string filter with the **StringFilterCommand** parameter.

### StatusType (MQCFIN)

The type of status to return (parameter identifier: MQIACF\_TOPIC\_STATUS\_TYPE).

The value can be:

**MQIACF\_TOPIC\_STATUS**  
**MQIACF\_TOPIC\_SUB**  
**MQIACF\_TOPIC\_PUB**

This command ignores any attribute selectors specified in the *TopicStatusAttrs* list that are not valid for the selected *StatusType* and the command raises no error.

The default value if this parameter is not specified is **MQIACF\_TOPIC\_STATUS**.

### **StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed for *MQIACF\_TOPIC\_SUB\_STATUS*, *MQIACF\_TOPIC\_PUB\_STATUS* or *MQIACF\_TOPIC\_STATUS*, except *MQIACF\_ALL*, or the identifier *MQCA\_TOPIC\_STRING\_FILTER* to filter on the topic string.

Use the parameter identifier to restrict the output from the command by specifying a filter condition. Ensure that the parameter is valid for the type selected in *StatusType*. If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

### **TopicStatusAttrs (MQCFIL)**

Topic status attributes (parameter identifier: *MQIACF\_TOPIC\_STATUS\_ATTRS*)

The default value used if the parameter is not specified is:

*MQIACF\_ALL*

You can specify any of the parameter values listed in [“Inquire Topic Status \(Response\)” on page 1811](#). It is not an error to request status information that is not relevant for a particular status type, but the response contains no information for the value concerned.

## **Inquire Topic Status (Response)**

The response of the Inquire topic (*MQCMD\_INQUIRE\_TOPIC\_STATUS*) command consists of the response header, followed by the *TopicString* structure, and the requested combination of attribute parameter structures (where applicable). The Inquire Topic Status command returns the values requested when the *StatusType* is *MQIACF\_TOPIC\_STATUS*. The Inquire Topic Status command returns the values requested when the *StatusType* is *MQIACF\_TOPIC\_STATUS\_SUB*. The Inquire Topic Status command returns the values requested when the *StatusType* is *MQIACF\_TOPIC\_STATUS\_PUB*.

### **Always returned:**

*TopicString*

### **Returned if requested and StatusType is MQIACF\_TOPIC\_STATUS:**

*Cluster, ClusterPubRoute, CommInfo, DefPriority, DefaultPutResponse, DefPersistence, DurableSubscriptions, InhibitPublications, InhibitSubscriptions, AdminTopicName, Multicast, DurableModelQName, NonDurableModelQName, PersistentMessageDelivery, NonPersistentMessageDelivery, RetainedPublication, PublishCount, SubscriptionScope, SubscriptionCount, PublicationScope, UseDLQ*

**Note:** The Inquire Topic Status command returns only resolved values for the topic, and no *AS\_PARENT* values.

### **Returned if requested and StatusType is MQIACF\_TOPIC\_SUB:**

*SubscriptionId, SubscriptionUserId, Durable, SubscriptionType, ResumeDate, ResumeTime, LastMessageDate, LastMessageTime, NumberOfMessages, ActiveConnection*

### **Returned if requested and StatusType is MQIACF\_TOPIC\_PUB:**

*LastPublishDate, LastPublishTime, NumberOfPublishes, ActiveConnection*

## **Response data (TOPIC\_STATUS)**

### **ClusterName (MQCFST)**

The name of the cluster to which this topic belongs. (parameter identifier: **MQCA\_CLUSTER\_NAME**).

The maximum length of the string is *MQ\_CLUSTER\_NAME\_LENGTH*. Setting this parameter to a cluster that this queue manager is a member of makes all queue managers in the cluster aware of this topic. Any publication to this topic or a topic string below it put to any queue manager in the cluster is propagated to subscriptions on any other queue manager in the cluster. For more details, see [Distributed publish/subscribe networks](#).

The value can be any of the following values:

**Blank**

If no topic object above this topic in the topic tree has set this parameter to a cluster name, then this topic does not belong to a cluster. Publications and subscriptions for this topic are not propagated to publish/subscribe cluster-connected queue managers. If a topic node higher in the topic tree has a cluster name set, publications and subscriptions to this topic are also propagated throughout the cluster.

This value is the default value for this parameter if no value is specified.

**String**

The topic belongs to this cluster. It is not recommended that this is set to a different cluster from a topic object above this topic object in the topic tree. Other queue managers in the cluster will honor this object's definition unless a local definition of the same name exists on those queue managers.

Additionally, if **PublicationScope** or **SubscriptionScope** are set to MQSCOPE\_ALL, this value is the cluster to be used for the propagation of publications and subscriptions, for this topic, to publish/subscribe cluster-connected queue managers.

**ClusterPubRoute (MQCFIN)**

The routing behavior to use for this topic in the cluster (parameter identifier: MQIA\_CLUSTER\_PUB\_ROUTE).

The values can be as follows:

**MQCLROUTE\_DIRECT**

A publication on this topic string, originating from this queue manager, is sent direct to any queue manager in the cluster with a matching subscription.

**MQCLROUTE\_TOPIC\_HOST**

A publication on this topic string, originating from this queue manager, is sent to one of the queue managers in the cluster that hosts a definition of the corresponding clustered topic object, and from there to any queue manager in the cluster with a matching subscription.

**MQCLROUTE\_NONE**

This topic node is not clustered.

**CommInfo (MQCFST)**

The name of the communication information object (parameter identifier: MQCA\_COMM\_INFO\_NAME).

Shows the resolved value of the name of the communication information object to be used for this topic node.

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

**DefPersistence (MQCFIN)**

Default persistence (parameter identifier: MQIA\_TOPIC\_DEF\_PERSISTENCE).

Returned value:

**MQPER\_PERSISTENT**

Message is persistent.

**MQPER\_NOT\_PERSISTENT**

Message is not persistent.

**DefaultPutResponse (MQCFIN)**

Default put response (parameter identifier: MQIA\_DEF\_PUT\_RESPONSE\_TYPE).

Returned value:

**MQPRT\_SYNC\_RESPONSE**

The put operation is issued synchronously, returning a response.

**MQPRT\_ASYNC\_RESPONSE**

The put operation is issued asynchronously, returning a subset of MQMD fields.

**DefPriority (MQCFIN)**

Default priority (parameter identifier: MQIA\_DEF\_PRIORITY).

Shows the resolved default priority of messages published to the topic.

**DurableSubscriptions (MQCFIN)**

Whether applications are permitted to make durable subscriptions (parameter identifier: MQIA\_DURABLE\_SUB).

Returned value:

**MQSUB\_DURABLE\_ALLOWED**

Durable subscriptions are permitted.

**MQSUB\_DURABLE\_INHIBITED**

Durable subscriptions are not permitted.

**InhibitPublications (MQCFIN)**

Whether publications are allowed for this topic (parameter identifier: MQIA\_INHIBIT\_PUB).

Returned value:

**MQTA\_PUB\_INHIBITED**

Publications are inhibited for this topic.

**MQTA\_PUB\_ALLOWED**

Publications are allowed for this topic.

**InhibitSubscriptions (MQCFIN)**

Whether subscriptions are allowed for this topic (parameter identifier: MQIA\_INHIBIT\_SUB).

Returned value:

**MQTA\_SUB\_INHIBITED**

Subscriptions are inhibited for this topic.

**MQTA\_SUB\_ALLOWED**

Subscriptions are allowed for this topic.

**AdminTopicName (MQCFST)**

Topic object name (parameter identifier: MQCA\_ADMIN\_TOPIC\_NAME).

If the topic is an admin-node, the command displays the associated topic object name containing the node configuration. If the field is not an admin-node the command displays a blank.

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

**Multicast (MQCFIN)**

Whether multicast is used for this topic (parameter identifier: MQIA\_MULTICAST).

Returned value:

**MQMC\_ENABLED**

Multicast can be used.

**MQMC\_DISABLED**

Multicast is not used.

**MQMC\_ONLY**

Only Multicast publish/subscribe can be used on this topic.

**DurableModelQName (MQCFST)**

The name of the model queue used for managed durable subscriptions (parameter identifier: MQCA\_MODEL\_DURABLE\_Q).

Shows the resolved value of the name of the model queue to be used for durable subscriptions that request the queue manager to manage the destination of publications.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**NonDurableModelQName (MQCFST)**

The name of the model queue for managed non-durable subscriptions (parameter identifier: MQCA\_MODEL\_NON\_DURABLE\_Q).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**PersistentMessageDelivery (MQCFIN)**

Delivery mechanism for persistent messages published to this topic (parameter identifier: MQIA\_PM\_DELIVERY).

Returned value:

**MQDLV\_ALL**

Persistent messages must be delivered to all subscribers, irrespective of durability, for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

**MQDLV\_ALL\_DUR**

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

**MQDLV\_ALL\_AVAIL**

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

**NonPersistentMessageDelivery (MQCFIN)**

Delivery mechanism for non-persistent messages published to this topic (parameter identifier: MQIA\_NPM\_DELIVERY).

Returned value:

**MQDLV\_ALL**

Non-persistent messages must be delivered to all subscribers, irrespective of durability, for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

**MQDLV\_ALL\_DUR**

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a non-persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

**MQDLV\_ALL\_AVAIL**

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

**RetainedPublication (MQCFIN)**

Whether there is a retained publication for this topic (parameter identifier: MQIACF\_RETAINED\_PUBLICATION).

Returned value:

**MQQSO\_YES**

There is a retained publication for this topic.

**MQQSO\_NO**

There is no retained publication for this topic.

**PublishCount (MQCFIN)**

Publish count (parameter identifier: MQIA\_PUB\_COUNT).

The number of applications currently publishing to the topic.

**SubscriptionCount (MQCFIN)**

Subscription count (parameter identifier: MQIA\_SUB\_COUNT).

The number of subscribers for this topic string, including durable subscribers who are not currently connected.

**SubscriptionScope (MQCFIN)**

Determines whether this queue manager propagates subscriptions for this topic to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA\_SUB\_SCOPE).

Returned value:

**MQSCOPE\_QMGR**

The queue manager does not propagate subscriptions for this topic to other queue managers.

**MQSCOPE\_ALL**

The queue manager propagates subscriptions for this topic to hierarchically connected queue managers and to publish/subscribe cluster connected queues.

**PublicationScope (MQCFIN)**

Determines whether this queue manager propagates publications for this topic to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA\_PUB\_SCOPE).

Returned value:

**MQSCOPE\_QMGR**

The queue manager does not propagate publications for this topic to other queue managers.

**MQSCOPE\_ALL**

The queue manager propagates publications for this topic to hierarchically connected queue managers and to publish/subscribe cluster connected queues.

**UseDLQ (MQCFIN)**

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA\_USE\_DEAD\_LETTER\_Q).

The value can be any of the following values:

**MQUSEDLQ\_NO**

Publication messages that cannot be delivered to their correct subscriber queue are treated as a failure to put the message. The MQPUT of an application to a topic fails in accordance with the settings of MQIA\_NPM\_DELIVERY and MQIA\_PM\_DELIVERY.

**MQUSEDLQ\_YES**

If the DEADQ queue manager attribute provides the name of a dead-letter queue then it is used, otherwise the behavior is as for MQUSEDLQ\_NO.

**Response data (TOPIC\_STATUS\_SUB)****SubscriptionId (MQCFBS)**

Subscription identifier (parameter identifier: MQBACF\_SUB\_ID).

The queue manager assigns *SubscriptionId* as an all time unique identifier for this subscription.

The maximum length of the string is MQ\_CORREL\_ID\_LENGTH.

**SubscriptionUserId (MQCFST)**

The user ID that owns this subscription (parameter identifier: MQCACF\_SUB\_USER\_ID).

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

**Durable (MQCFIN)**

Whether this subscription is a durable subscription (parameter identifier: MQIACF\_DURABLE\_SUBSCRIPTION).

**MQSUB\_DURABLE\_YES**

The subscription persists, even if the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. The queue manager reinstates the subscription during restart.

**MQSUB\_DURABLE\_NO**

The subscription is non-durable. The queue manager removes the subscription when the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. If the subscription has a destination class (DESTCLAS) of MANAGED, the queue manager removes any messages not yet consumed when it closes the subscription.

**SubscriptionType (MQCFIN)**

The type of subscription (parameter identifier: MQIACF\_SUB\_TYPE).

The value can be:

MQSUBTYPE\_ADMIN

MQSUBTYPE\_API

MQSUBTYPE\_PROXY

**ResumeDate (MQCFST)**

Date of the most recent MQSUB call that connected to this subscription (parameter identifier: MQCA\_RESUME\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

**ResumeTime (MQCFST)**

Time of the most recent MQSUB call that connected to this subscription (parameter identifier: MQCA\_RESUME\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

**LastMessageDate (MQCFST)**

Date on which an MQPUT call last sent a message to this subscription. The queue manager updates the date field after the MQPUT call successfully puts a message to the destination specified by this subscription (parameter identifier: MQCACF\_LAST\_MSG\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

**Note:** An MQSUBRQ call updates this value.

**LastMessageTime (MQCFST)**

Time at which an MQPUT call last sent a message to this subscription. The queue manager updates the time field after the MQPUT call successfully puts a message to the destination specified by this subscription (parameter identifier: MQCACF\_LAST\_MSG\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

**Note:** An MQSUBRQ call updates this value.

**NumberOfMessages (MQCFIN)**

Number of messages put to the destination specified by this subscription (parameter identifier: MQIACF\_MESSAGE\_COUNT).

**Note:** An MQSUBRQ call updates this value.

**ActiveConnection (MQCFBS)**

The currently active *ConnectionId* (CONNID) that opened this subscription (parameter identifier: MQBACF\_CONNECTION\_ID).

The maximum length of the string is MQ\_CONNECTION\_ID\_LENGTH.

**Response data (TOPIC\_STATUS\_PUB)****LastPublicationDate (MQCFST)**

Date on which this publisher last sent a message (parameter identifier: MQCACF\_LAST\_PUB\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

**LastPublicationTime (MQCFST)**

Time at which this publisher last sent a message (parameter identifier: MQCACF\_LAST\_PUB\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

**NumberOfPublishes (MQCFIN)**

Number of publishes made by this publisher (parameter identifier: MQIACF\_PUBLISH\_COUNT).

**ActiveConnection (MQCFBS)**

The currently active *ConnectionId* (CONNID) associated with the handle that has this topic open for publish (parameter identifier: MQBACF\_CONNECTION\_ID).

The maximum length of the string is MQ\_CONNECTION\_ID\_LENGTH.

 **Inquire Usage on z/OS**

The Inquire Usage (MQCMD\_INQUIRE\_USAGE) command inquires about the current state of a page set, or information about the log data sets.

**Optional parameters****CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**PageSetId (MQCFIN)**

Page set identifier (parameter identifier: MQIA\_PAGESET\_ID). If you omit this parameter, all page set identifiers are returned.

**UsageType (MQCFIN)**

The type of information to be returned (parameter identifier: MQIACF\_USAGE\_TYPE).

The value can be any of the following values:

**MQIACF\_USAGE\_PAGESET**

Return page set (MQIACF\_USAGE\_PAGESET) and buffer pool information (MQIACF\_USAGE\_BUFFER\_POOL).

**MQIACF\_USAGE\_DATA\_SET**

Return data set information for log data sets (MQIACF\_USAGE\_DATA\_SET).

**MQIACF\_ALL**

Return page set, buffer pool, and data set information (MQIACF\_USAGE\_PAGESET), (MQIACF\_USAGE\_BUFFER\_POOL), and (MQIACF\_USAGE\_DATA\_SET).

**MQIACF\_USAGE\_SMDS**

Return shared message data set usage (MQIACF\_USAGE\_SMDS) and buffer pool information (MQIACF\_USAGE\_BUFFER\_POOL).

This includes the allocated, and used space for each data set, and information about the number of buffers currently active, the number with valid contents, and the number of free buffers.

## **Inquire Usage (Response) on z/OS**

The response to the Inquire Usage (MQCMD\_INQUIRE\_USAGE) command consists of the response header followed by one or more *UsageType* structure and a set of attribute parameter structures determined by the value of *UsageType* in the Inquire command.

### **Always returned:**

*UsageType*

Possible values of *ParameterType* are:

#### **MQIACF\_USAGE\_PAGESET**

Page set information.

#### **MQIACF\_USAGE\_BUFFER\_POOL**

Buffer pool information.

#### **MQIACF\_USAGE\_DATA\_SET**

Data set information for log data sets.

#### **MQIACF\_USAGE\_SMDS**

Return shared message data set usage and buffer pool information.

This includes the allocated, and used space for each data set, and information about the number of buffers currently active, the number with valid contents, and the number of free buffers.

### **Returned if *UsageType* is MQIACF\_USAGE\_PAGESET:**

*BufferPoolId*,  *Encrypted*, *ExpandCount*, *ExpandType*, *LogRBA*, *NonPersistentDataPages*, *PageSetId*, *PageSetStatus*, *PersistentDataPages*, *TotalPages*, *UnusedPages*

### **Returned if *UsageType* is MQIACF\_USAGE\_BUFFER\_POOL:**

*BufferPoolId*, *FreeBuffers*, *FreeBuffersPercentage*, *TotalBuffers*, *BufferPoolLocation*, *PageClass*

### **Returned if *UsageType* is MQIACF\_USAGE\_DATA\_SET:**

*DataSetName*, *DataSetType*, *LogRBA*, *LogLRSN*

### **Returned if *UsageType* is MQIACF\_USAGE\_SMDS:**

*DataSetName*, *DataSetType*,  *Encrypted*

## **Response data if *UsageType* is MQIACF\_USAGE\_PAGESET**

### **BufferPoolId (MQCFIN)**

Buffer pool identifier (parameter identifier: MQIACF\_BUFFER\_POOL\_ID).

This parameter identifies the buffer pool being used by the page set.

### **Encrypted (MQCFIN)**

Shows whether the page set is encrypted (parameter identifier: MQIACF\_DS\_ENCRYPTED)

The value can be one of the following values:

#### **MQSYSP\_YES**

The page set is encrypted.

#### **MQSYSP\_NO**

The page set is not encrypted.

### **ExpandCount (MQCFIN)**

The number of times the page set has been dynamically expanded since restart (parameter identifier: MQIACF\_USAGE\_EXPAND\_COUNT).

### **ExpandType (MQCFIN)**

How the queue manager expands a page set when it becomes nearly full, and further pages are required within it (parameter identifier: MQIACF\_USAGE\_EXPAND\_TYPE).

The value can be:

**MQUSAGE\_EXPAND\_NONE**

No further page set expansion is to take place.

**MQUSAGE\_EXPAND\_USER**

The secondary extent size that was specified when the page set was defined is used. If no secondary extent size was specified, or it was specified as zero, then no dynamic page set expansion can take place.

At restart, if a previously used page set has been replaced with a data set that is smaller, it is expanded until it reaches the size of the previously used data set. Only one extent is required to reach this size.

**MQUSAGE\_EXPAND\_SYSTEM**

A secondary extent size that is approximately 10 per cent of the current size of the page set is used. MQUSAGE\_EXPAND\_SYSTEM can be rounded up to the nearest cylinder of DASD.

**NonPersistentDataPages (MQCFIN)**

The number of pages holding nonpersistent data (parameter identifier: MQIACF\_USAGE\_NONPERSIST\_PAGES).

These pages are being used to store nonpersistent message data.

**PageSetId (MQCFIN)**

Page set identifier (parameter identifier: MQIA\_PAGESET\_ID).

The string consists of two numeric characters, in the range 00 through 99.

**PageSetStatus (MQCFIN)**

Current status of the page set (parameter identifier: MQIACF\_PAGESET\_STATUS).

The value can be any of the following values:

**MQUSAGE\_PS\_AVAILABLE**

The page set is available.

**MQUSAGE\_PS\_DEFINED**

The page set has been defined but has never been used.

**MQUSAGE\_PS\_OFFLINE**

The page set is currently not accessible by the queue manager, for example because the page set has not been defined to the queue manager.

**MQUSAGE\_PS\_NOT\_DEFINED**

The command was issued for a specific page set that is not defined to the queue manager.

**MQUSAGE\_PS\_SUSPENDED**

The page set has been suspended.

**PersistentDataPages (MQCFIN)**

The number of pages holding persistent data (parameter identifier: MQIACF\_USAGE\_PERSIST\_PAGES).

These pages are being used to store object definitions and persistent message data.

**TotalPages (MQCFIN)**

The total number of 4 KB pages in the page set (parameter identifier: MQIACF\_USAGE\_TOTAL\_PAGES).

**UnusedPages (MQCFIN)**

The number of pages that are not used (that is, available page sets) (parameter identifier: MQIACF\_USAGE\_UNUSED\_PAGES).

**LogRBA (MQCFST)**

Log RBA (parameter identifier: MQCACF\_USAGE\_LOG\_RBA).

The maximum length is MQ\_RBA\_LENGTH.

This response is returned only if PageSetStatus is set to MQUSAGE\_PS\_NOT\_DEFINED or MQUSAGE\_SUSPENDED. However, the response is not always returned if PageSetStatus is set to MQUSAGE\_PS\_NOT\_DEFINED.

A value of 'FFFFFFFFFFFFFFFF' indicates that the page set has never been online.

## **Response data if UsageType is MQIACF\_USAGE\_BUFFER\_POOL**

### **BufferPoolId (MQCFIN)**

Buffer pool identifier (parameter identifier: MQIACF\_BUFFER\_POOL\_ID).

This parameter identifies the buffer pool being used by the page set.

### **FreeBuffers (MQCFIN)**

Number of free buffers (parameter identifier: MQIACF\_USAGE\_FREE\_BUFF).

### **FreeBuffersPercentage (MQCFIN)**

Number of free buffers as a percentage of all buffers in the buffer pool (parameter identifier: MQIACF\_USAGE\_FREE\_BUFF\_PERC).

### **TotalBuffers (MQCFIN)**

The number of buffers defined for specified buffer pool (parameter identifier: MQIACF\_USAGE\_TOTAL\_BUFFERS).

### **BufferPoolLocation (MQCFIN)**

The location of the buffers in this buffer pool relative to the bar. This is one of the following values:

#### **MQBPLOCATION\_ABOVE**

All buffer pool buffers are above the bar.

#### **MQBPLOCATION\_BELOW**

All buffer pool buffers are below the bar.

#### **MQBPLOCATION\_SWITCHING\_ABOVE**

Buffer pool buffers are being moved above the bar.

#### **MQBPLOCATION\_SWITCHING\_BELOW**

Buffer pool buffers are being moved below the bar.

### **PageClass (MQCFIN)**

The type of virtual storage pages used for backing the buffers in the buffer pool. This is one of the following values:

#### **MQPAGECLAS\_4KB**

Pageable 4 KB pages are used.

#### **MQPAGECLAS\_FIXED4KB**

Fixed 4 KB pages are used.

## **Response data if UsageType is MQIACF\_USAGE\_DATA\_SET**

### **DataSetName (MQCFST)**

Data set name (parameter identifier: MQCACF\_DATA\_SET\_NAME).

The maximum length is MQ\_DATA\_SET\_NAME\_LENGTH.

### **DataSetType (MQCFIN)**

The type of data set, and circumstance (parameter identifier: MQIACF\_USAGE\_DATA\_SET\_TYPE).

The value can be:

#### **MQUSAGE\_DS\_OLDEST\_ACTIVE\_UOW**

The log data set containing the start RBA of the oldest active unit of work for the queue manager

#### **MQUSAGE\_DS\_OLDEST\_PS\_RECOVERY**

The log data set containing the oldest restart RBA of any page set for the queue manager.

### **MQUSAGE\_\_DS\_OLDEST\_CF\_RECOVERY**

The log data set containing the LRSN which matches the time of the oldest current backup of any CF structure in the queue sharing group.

### **LogRBA (MQCFST)**

Log RBA (parameter identifier: MQCACF\_USAGE\_LOG\_RBA).

The maximum length is MQ\_RBA\_LENGTH.

### **LogLRSN (MQCFST)**

Log LRSN (parameter identifier: MQIACF\_USAGE\_LOG\_LRSN).

The length of the string is MQ\_LRSN\_LENGTH.

## **Response data if UsageType is MQIACF\_USAGE\_SMDS**

### **V 9.1.4 Encrypted (MQCFIN)**

Shows whether the SMDS is encrypted (parameter identifier: MQIACF\_DS\_ENCRYPTED)

The value can be one of the following values:

#### **MQSYSP\_YES**

The SMDS is encrypted.

#### **MQSYSP\_NO**

The SMDS is not encrypted.

### **SMDSStatus (MQCFIN)**

SMDS status (parameter identifier: MQIACF\_SMDS\_STATUS).

#### **MQUSAGE\_SMDS\_NO\_DATA**

There is no SMDS data available. Nothing further is returned.

#### **MQUSAGE\_SMDS\_AVAILABLE**

For each CF structure two sets of PCF data are returned:

#### **A**

##### **CFStrucNames (MQCFSL)**

List of CF application structure names (parameter identifier: MQCACF\_CF\_STRUC\_NAME).

##### **MQIACF\_USAGE\_OFFLOAD\_MSGS (MQCFIN)**

Description required (parameter identifier: MQIACF\_USAGE\_OFFLOAD\_MSGS).

##### **MQIACF\_USAGE\_TOTAL\_BLOCKS (MQCFIN)**

Description required (parameter identifier: MQIACF\_USAGE\_TOTAL\_BLOCKS).

##### **MQIACF\_USAGE\_DATA\_BLOCKS (MQCFIN)**

Description required (parameter identifier: MQIACF\_USAGE\_DATA\_BLOCKS).

##### **MQIACF\_USAGE\_USED\_BLOCKS (MQCFIN)**

Description required (parameter identifier: MQIACF\_USAGE\_USED\_BLOCKS).

##### **MQIACF\_USAGE\_USED\_RATE (MQCFIN)**

Description required (parameter identifier: MQIACF\_USAGE\_USED\_RATE).

##### **MQIACF\_SMDS\_STATUS (MQCFIN)**

Description required (parameter identifier: MQIACF\_SMDS\_STATUS). The value is MQUSAGE\_SMDS\_AVAILABLE.

##### **MQIACF\_USAGE\_TYPE (MQCFIN)**

Description required (parameter identifier: MQIACF\_USAGE\_TYPE).

#### **B**

##### **CFStrucNames (MQCFSL)**

List of CF application structure names (parameter identifier: MQCACF\_CF\_STRUC\_NAME).

##### **MQIACF\_USAGE\_BLOCK\_SIZE (MQCFIN)**

Description required (parameter identifier: MQIACF\_USAGE\_BLOCK\_SIZE).

**MQIACF\_USAGE\_TOTAL\_BUFFERS (MQCFIN)**

Description required (parameter identifier: MQIACF\_USAGE\_TOTAL\_BUFFERS).

**MQIACF\_USAGE\_INUSE\_BUFFERS (MQCFIN)**

Description required (parameter identifier: MQIACF\_USAGE\_INUSE\_BUFFERS).

**MQIACF\_USAGE\_SAVED\_BUFFERS (MQCFIN)**

Description required (parameter identifier: MQIACF\_USAGE\_SAVED\_BUFFERS).

**MQIACF\_USAGE\_EMPTY\_BUFFERS (MQCFIN)**

Description required (parameter identifier: MQIACF\_USAGE\_EMPTY\_BUFFERS).

**MQIACF\_USAGE\_READS\_SAVED (MQCFIN)**

Description required (parameter identifier: MQIACF\_USAGE\_READS\_SAVED).

**MQIACF\_USAGE\_LOWEST\_FREE (MQCFIN)**

Description required (parameter identifier: MQIACF\_USAGE\_LOWEST\_FREE).

**MQIACF\_USAGE\_WAIT\_RATE (MQCFIN)**

Description required (parameter identifier: MQIACF\_USAGE\_WAIT\_RATE).

**MQIACF\_SMDS\_STATUS (MQCFIN)**

Description required (parameter identifier: MQIACF\_SMDS\_STATUS). The value is MQUSAGE\_SMDS\_AVAILABLE.

**MQIACF\_USAGE\_TYPE (MQCFIN)**

Description required (parameter identifier: MQIACF\_USAGE\_TYPE).

**z/OS Move Queue on z/OS**

The Move Queue (MQCMD\_MOVE\_Q) command moves all the messages from one local queue to another.

**Required parameters****FromQName (MQCFST)**

From queue name (parameter identifier: MQCACF\_FROM\_Q\_NAME).

The name of the local queue from which messages are moved. The name must be defined to the local queue manager.

The command fails if the queue contains uncommitted messages.

If an application has this queue open, or has open a queue that eventually resolves to this queue, the command fails. For example, the command fails if this queue is a transmission queue, and any queue that is, or resolves to, a remote queue that references this transmission queue, is open.

An application can open this queue while the command is in progress but the application waits until the command has completed.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**Optional parameters (Move Queue)****CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **MoveType (MQCFIN)**

Move type (parameter identifier: MQIA\_QSG\_DISP).

Specifies how the messages are moved. The value can be any of the following values:

#### **MQIACF\_MOVE\_TYPE\_MOVE**

Move the messages from the source queue to the empty target queue.

The command fails if the target queue already contains one or more messages. The messages are deleted from the source queue. MQIACF\_MOVE\_TYPE\_MOVE is the default value.

#### **MQIACF\_MOVE\_TYPE\_ADD**

Move the messages from the source queue and add them to any messages already on the target queue.

The messages are deleted from the source queue.

### **QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_PRIVATE**

The object is defined as either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE is the default value.

#### **MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED. MQQSGD\_SHARED is valid only in a shared queue environment.

### **ToQName (MQCFST)**

To queue name (parameter identifier: MQCACF\_TO\_Q\_NAME).

The name of the local queue to which messages are moved. The name must be defined to the local queue manager.

The name of the target queue can be the same as the name of the source queue only if the queue exists as both a shared and a private queue. In this case, the command moves messages to the queue that has the opposite disposition (shared or private) from that disposition specified for the source queue on the **QSGDisposition** parameter.

If an application has this queue open, or has open a queue that eventually resolves to this queue, the command fails. The command also fails if this queue is a transmission queue, and any queue that is, or resolves to, a remote queue that references this transmission queue, is open.

No application can open this queue while the command is in progress.

If you specify a value of MQIACF\_MOVE\_TYPE\_MOVE on the **MoveType** parameter, the command fails if the target queue already contains one or more messages.

The **DefinitionType**, **HardenGetBackout**, **Usage** parameters of the target queue must be the same as those parameters of the source queue.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

## **Ping Channel**

The Ping Channel (MQCMD\_PING\_CHANNEL) command tests a channel by sending data as a special message to the remote message queue manager and checking that the data is returned. The data is generated by the local queue manager.

This command can only be used for channels with a *ChannelType* value of MQCHT\_SENDER, MQCHT\_SERVER, or MQCHT\_CLUSSDR.

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

The command is not valid if the channel is running; however it is valid if the channel is stopped or in retry mode.

## Required parameters

### ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel to be tested. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

## Optional parameters

### DataCount (MQCFIN)

Data count (parameter identifier: MQIACH\_DATA\_COUNT).

Specifies the length of the data.

Specify a value in the range 16 through 32 768. The default value is 64 bytes.

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH\_CHANNEL\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be tested.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

#### MQCHLD\_PRIVATE

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD\_SHARED.

## MQCHLD\_SHARED

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD\_SHARED.

## MQCHLD\_FIXSHARED

Tests shared channels, tied to a specific queue manager.

The combination of the **ChannelDisposition** and **CommandScope** parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.
- On the most suitable queue manager in the group, determined automatically by the queue manager itself.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in [Table 324 on page 1825](#)

<b>ChannelDisposition</b>	<b>CommandScope blank or local-qmgr</b>	<b>CommandScope qmgr-name</b>	<b>CommandScope (*)</b>
MQCHLD_PRIVATE	Ping private channel on the local queue manager	Ping private channel on the named queue manager	Ping private channel on all active queue managers
MQCHLD_SHARED	<p>Ping a shared channel on the most suitable queue manager in the group</p> <p>MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted	Not permitted
MQCHLD_FIXSHARED	Ping a shared channel on the local queue manager	Ping a shared channel on the named queue manager	Not permitted

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

**MQRCCF\_ALLOCATE\_FAILED**

Allocation failed.

**MQRCCF\_BIND\_FAILED**

Bind failed.

**MQRCCF\_CCSID\_ERROR**

Coded character-set identifier error.

**MQRCCF\_CHANNEL\_CLOSED**

Channel closed.

**MQRCCF\_CHANNEL\_IN\_USE**

Channel in use.

**MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

**MQRCCF\_CHANNEL\_TYPE\_ERROR**

Channel type not valid.

**MQRCCF\_CONFIGURATION\_ERROR**

Configuration error.

**MQRCCF\_CONNECTION\_CLOSED**

Connection closed.

**MQRCCF\_CONNECTION\_REFUSED**

Connection refused.

**MQRCCF\_DATA\_TOO\_LARGE**

Data too large.

**MQRCCF\_ENTRY\_ERROR**

Connection name not valid.

**MQRCCF\_HOST\_NOT\_AVAILABLE**

Remote system not available.

**MQRCCF\_NO\_COMMS\_MANAGER**

Communications manager not available.

**MQRCCF\_PING\_DATA\_COMPARE\_ERROR**

Ping Channel command failed.

**MQRCCF\_PING\_DATA\_COUNT\_ERROR**

Data count not valid.

**MQRCCF\_PING\_ERROR**

Ping error.

**MQRCCF\_RECEIVE\_FAILED**

Receive failed.

**MQRCCF\_RECEIVED\_DATA\_ERROR**

Received data error.

**MQRCCF\_REMOTE\_QM\_TERMINATING**

Remote queue manager terminating.

**MQRCCF\_REMOTE\_QM\_UNAVAILABLE**

Remote queue manager not available.

**MQRCCF\_SEND\_FAILED**

Send failed.

**MQRCCF\_STRUCTURE\_TYPE\_ERROR**

Structure type not valid.

**MQRCCF\_TERMINATED\_BY\_SEC\_EXIT**

Channel terminated by security exit.

**MQRCCF\_UNKNOWN\_REMOTE\_CHANNEL**

Remote channel not known.

**MQRCCF\_USER\_EXIT\_NOT\_AVAILABLE**

User exit not available.

## Multi Ping Queue Manager on Multiplatforms

The Ping Queue Manager (MQCMD\_PING\_Q\_MGR) command tests whether the queue manager and its command server is responsive to commands. If the queue manager is responding a positive reply is returned.

**Required parameters:**

None

**Optional parameters:**

None

## Windows Linux AIX Purge Channel

The Purge Channel (MQCMD\_PURGE\_CHANNEL) command stops and purges an IBM MQ telemetry or AMQP channel.

This command can only be issued to channel of type MQTT or AMQP.

Purging a telemetry or AMQP channel disconnects all the MQTT or AMQP clients connect to it, cleans up the state of the MQTT or AMQP clients, and stops the telemetry or AMQP channel. Cleaning the state of a client deletes all the pending publications and removes all the subscriptions from the client.

**Required parameters****ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel to be stopped and purged. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

**Optional parameters****ChannelType (MQCFIN)**

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

This parameter is required to purge an MQTT channel. It can not be specified for other types of channels. If specified, this parameter must follow immediately after the **ChannelName** parameter, and the value must be MQCHT\_MQTT.

**ClientIdentifier (MQCFST)**

Client identifier (parameter identifier: MQCACH\_CLIENT\_ID).

The client identifier is a 23 byte string that identifies an MQ Telemetry Transport or AMQP client. When the Purge Channel command specifies a *ClientIdentifier*, only the connection for the specified client identifier is purged. If the *ClientIdentifier* is not specified, all the connections on the channel are purged.

The maximum length of the string is MQ\_CLIENT\_ID\_LENGTH.

## Recover CF Structure on z/OS

The Recover CF Structure (MQCMD\_RECOVER\_CF\_STRUC) command initiates recovery of CF application structures.

**Note:** This command is valid only on z/OS when the queue manager is a member of a queue sharing group.

### Required parameters

#### CFStrucName (MQCFST)

CF application structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

### Optional parameters

#### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ\_Q\_MGR\_NAME\_LENGTH.

#### Purge (MQCFIN)

Recover to empty CF structure (parameter identifier: MQIACF\_PURGE).

Specifies whether the CF application structure is emptied. The value can be any of the following values:

##### MQPO\_YES

Recover to empty CF structure. Any messages in the CF structure are lost.

##### MQPO\_NO

Performs a true recovery of the CF structure. MQPO\_NO is the default value.

### Refresh Cluster

The Refresh Cluster (MQCMD\_REFRESH\_CLUSTER) command discards all locally held cluster information, including any auto-defined channels that are not in doubt, and forces the repository to be rebuilt.

**Note:** For large clusters, use of the **REFRESH CLUSTER** command can be disruptive to the cluster while it is in progress, and again at 27 day intervals thereafter when the cluster objects automatically send status updates to all interested queue managers. See [Refreshing in a large cluster can affect performance and availability of the cluster](#).

### Required parameters

#### ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

The name of the cluster to be refreshed.

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH.

This parameter is the name of the cluster to be refreshed. If an asterisk (\*) is specified for the name, the queue manager is refreshed in all the clusters to which it belongs.

If an asterisk (\*) is specified with *RefreshRepository* set to MQCFO\_REFRESH\_REPOSITORY\_YES, the queue manager restarts its search for repository queue managers, using information in the local cluster-sender channel definitions.

## Optional parameters

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### RefreshRepository (MQCFIN)

Whether repository information is refreshed (parameter identifier: MQIACF\_REFRESH\_REPOSITORY).

This parameter indicates whether the information about repository queue managers is refreshed.

The value can be:

#### **MQCFO\_REFRESH\_REPOSITORY\_YES**

Refresh repository information.

This value cannot be specified if the queue manager is itself a repository queue manager.

MQCFO\_REFRESH\_REPOSITORY\_YES specifies that in addition to MQCFO\_REFRESH\_REPOSITORY\_NO behavior, objects representing full repository cluster queue managers are also refreshed. Do not use this option if the queue manager is itself a full repository.

If it is a full repository, you must first alter it so that it is not a full repository for the cluster in question.

The full repository location is recovered from the manually defined cluster-sender channel definitions. After the refresh with MQCFO\_REFRESH\_REPOSITORY\_YES has been issued the queue manager can be altered so that it is once again a full repository.

#### **MQCFO\_REFRESH\_REPOSITORY**

Do not refresh repository information. MQCFO\_REFRESH\_REPOSITORY is the default.

If you select MQCFO\_REFRESH\_REPOSITORY\_YES, check that all cluster-sender channels in the relevant cluster are inactive or stopped before you issue the Refresh Cluster command. If there are cluster-sender channels running at the time when the Refresh is processed, and they are used exclusively by the cluster or clusters being refreshed and MQCFO\_REFRESH\_REPOSITORY\_YES is used, the channels are stopped, by using the Stop Channel command with a value of MQMODE\_FORCE in the **Mode** parameter if necessary.

This scenario ensures that the Refresh can remove the channel state and that the channel will run with the refreshed version after the Refresh has completed. If the state of a channel cannot be deleted, for example because it is in doubt, or because it is also running as part of another cluster, its state is not new after the refresh and it does not automatically restart if it was stopped.

### Related information

[Clustering: Using REFRESH CLUSTER best practices](#)

## Refresh Queue Manager

Use the Refresh Queue Manager (MQCMD\_REFRESH\_Q\_MGR) command to perform special operations on queue managers.

### Required parameters

#### RefreshType (MQCFIN)

Type of information to be refreshed (parameter identifier: MQIACF\_REFRESH\_TYPE).

Use this parameter to specify the type of information to be refreshed. The value can be any of the following values:

#### **MQRT\_CONFIGURATION**

MQRT\_CONFIGURATION causes the queue manager to generate configuration event messages for every object definition that matches the selection criteria specified by the **ObjectType**, **ObjectName**, and **RefreshInterval** parameters.

A Refresh Queue Manager command with a **RefreshType** value of MQRT\_CONFIGURATION is generated automatically when the value of the queue manager's **ConfigurationEvent** parameter changes from MQEVR\_DISABLED to MQEVR\_ENABLED.

Use this command with a **RefreshType** of MQRT\_CONFIGURATION to recover from problems such as errors on the event queue. In such cases, use appropriate selection criteria, to avoid excessive processing time and event message generation.

#### **MQRT\_EXPIRY**

This requests that the queue manager performs a scan to discard expired messages for every queue that matches the selection criteria specified by the **ObjectName** parameter.

**Note:**  Valid only on z/OS.

#### **MQRT\_EARLY**

Requests that the subsystem function routines (generally known as early code) for the queue manager replace themselves with the corresponding routines in the linkpack area (LPA).

You need to use this command only after you install new subsystem function routines (provided as corrective maintenance or with a new version or release of IBM MQ). This command instructs the queue manager to use the new routines.

 See [Task 3: Update the z/OS link list and LPA](#) for more information about IBM MQ early code routines.

#### **MQRT\_PROXYSUB**

Requests that the queue manager resynchronizes the proxy subscriptions that are held with, and on behalf of, queue managers that are connected in a hierarchy or publish/subscribe cluster.

You should only resynchronize the proxy subscriptions in exceptional circumstances. See [Resynchronization of proxy subscriptions](#).

### Optional parameters (Refresh Queue Manager)

#### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.

- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **ObjectName (MQCFST)**

Name of object to be included in the processing of this command (parameter identifier: MQCACF\_OBJECT\_NAME).

Use this parameter to specify the name of the object to be included in the processing of this command.

Generic names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ\_OBJECT\_NAME\_LENGTH.

### **ObjectType (MQCFIN)**

Object type for which configuration data is to be refreshed (parameter identifier: MQIACF\_OBJECT\_TYPE).

Use this parameter to specify the object type for which configuration data is to be refreshed. This parameter is valid only if the value of *RefreshType* is MQRT\_CONFIGURATION. The default value, in that case, is MQOT\_ALL. The value can be one of:

#### **MQOT\_AUTH\_INFO**

Authentication information object.

#### **MQOT\_CF\_STRUC**

CF structure.

#### **MQOT\_CHANNEL**

Channel.

#### **MQOT\_CHLAUTH**

Channel authentication

#### **MQOT\_LISTENER**

Listener.

#### **MQOT\_NAMELIST**

Namelist.

#### **MQOT\_PROCESS**

Process definition.

#### **MQOT\_Q**

Queue.

#### **MQOT\_LOCAL\_Q**

Local queue.

#### **MQOT\_MODEL\_Q**

Model queue.

#### **MQOT\_ALIAS\_Q**

Alias queue.

#### **MQOT\_REMOTE\_Q**

Remote queue.

#### **MQOT\_Q\_MGR**

Queue manager.

**MQOT\_CFSTRUC**

CF structure.

**MQOT\_SERVICE**

Service.

**Note:**  Not valid on z/OS.**MQOT\_STORAGE\_CLASS**

Storage class.

**MQOT\_TOPIC**

Topic name.

**RefreshInterval (MQCFIN)**

Refresh interval (parameter identifier: MQIACF\_REFRESH\_INTERVAL).

Use this parameter to specify a value, in minutes, defining a period immediately before the current time. This requests that only objects that have been created or altered within that period (as defined by their *AlterationDate* and **AlterationTime** attributes) are included.

Specify a value in the range zero through 999 999. A value of zero means there is no time limit (0 is the default).

This parameter is valid only if the value of *RefreshType* is MQRT\_CONFIGURATION.

**Usage Notes for Refresh Queue Manager**

1. Issue this command with *RefreshType* (MQRT\_CONFIGURATION) after setting the MQRT\_CONFIGURATION queue manager attribute to ENABLED, to bring the queue manager configuration up to date. To ensure that complete configuration information is generated, include all objects; if you have many objects, it might be preferable to use several commands, each with a different selection of objects, but such that all are included.
2. You can also use the command with *RefreshType* (MQRT\_CONFIGURATION) to recover from problems such as errors on the event queue. In such cases, use appropriate selection criteria, to avoid excessive processing time and event messages generation.
3. Issue the command with *RefreshType* (MQRT\_EXPIRY) at any time when you believe that a queue could contain numbers of expired messages.
4. If *RefreshType* (MQRT\_EARLY) is specified, no other keywords are allowed and the command can be issued only from the z/OS console and only if the queue manager is not active.
5. You are unlikely to use **Refresh Queue Manager RefreshType (MQRT\_PROXYSUB)** other than in exceptional circumstances. See [Resynchronization of proxy subscriptions](#).
6. If a **Refresh Queue Manager Object Type (MQRT\_PROXYSUB)** command is issued on z/OS when the CHINIT is not running, the command is queued up and will be processed when the CHINIT starts.
7. Running the command Refresh Queue Manager RefreshType (MQRT\_CONFIGURATION) Object Type (MQOT\_ALL) includes authority records.

You cannot specify the **Refresh Interval** and **Object Name** parameters if you explicitly specify Authority Record events. If you specify **Object Type (MQOT\_ALL)** the **Refresh Interval** and **Object Name** parameters are ignored.

**Refresh Security**

The Refresh Security (MQCMD\_REFRESH\_SECURITY) command refreshes the list of authorizations held internally by the authorization service component.

**Optional parameters**

### CommandScope (MQCFST)

Command scope (parameter identifier: MQACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### SecurityItem (MQCFIN)

Resource class for which the security refresh is to be performed (parameter identifier: MQIACF\_SECURITY\_ITEM). This parameter applies to z/OS only.

Use this parameter to specify the resource class for which the security refresh is to be performed. The value can be any of the following values:

#### MQSECITEM\_ALL

A full refresh of the type specified is performed. MQSECITEM\_ALL is the default value.

#### MQSECITEM\_MQADMIN

Specifies that administration type resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### MQSECITEM\_MQNLIST

Specifies that namelist resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### MQSECITEM\_MQPROC

Specifies that process resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### MQSECITEM\_MQQUEUE

Specifies that queue resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### MQSECITEM\_MXADMIN

Specifies that administration type resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### MQSECITEM\_MXNLIST

Specifies that namelist resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### MQSECITEM\_MXPROC

Specifies that process resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### MQSECITEM\_MXQUEUE

Specifies that queue resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### MQSECITEM\_MXTOPIC

Specifies that topic resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

## SecurityType (MQCFIN)

Security type (parameter identifier: MQIACF\_SECURITY\_TYPE).

Use this parameter to specify the type of security refresh to be performed. The value can be any of the following values:

### MQSECTYPE\_AUTHSERV

The list of authorizations held internally by the authorization services component is refreshed. MQSECTYPE\_AUTHSERV is not valid on z/OS.

MQSECTYPE\_AUTHSERV is the default on platforms other than z/OS.

### MQSECTYPE\_CLASSES

Permits you to select specific resource classes for which to perform the security refresh.

 MQSECTYPE\_CLASSES is valid only on z/OS where it is the default.

### MQSECTYPE\_CONNAUTH

Refreshes the cached view of the configuration for connection authentication.

 On [Multiplatforms](#) this is also a synonym for MQSECTYPE\_AUTHSERV.

### MQSECTYPE\_SSL

MQSECTYPE\_SSL refreshes the locations of the LDAP servers to be used for Certified Revocation Lists and the key repository. It also refreshes any cryptographic hardware parameters specified through IBM MQ and the cached view of the Secure Sockets Layer key repository. It also allows updates to become effective on successful completion of the command.

MQSECTYPE\_SSL updates all TLS channels currently running, as follows:

- Sender, server, and cluster-sender channels using TLS are allowed to complete the current batch. In general, they then run the TLS handshake again with the refreshed view of the TLS key repository. However, you must manually restart a requester-server channel on which the server definition has no CONNAME parameter.
- AMQP channels using TLS are restarted, with any currently connected clients being forcibly disconnected. The client receives an `amqp:connection:forced` AMQP error message.
- All other channel types using TLS are stopped with a `STOP CHANNEL MODE(FORCE) STATUS(INACTIVE)` command. If the partner end of the stopped message channel has retry values defined, the channel tries again and the new TLS handshake uses the refreshed view of the contents of the TLS key repository, the location of the LDAP server to be used for Certification Revocation Lists, and the location of the key repository. If there is a server-connection channel, the client application loses its connection to the queue manager and must reconnect in order to continue.

## Reset CF Structure on z/OS

The Reset coupling facility (CF) Structure (MQCMD\_RESET\_CF\_STRUC) command modifies the status of a specific application structure.

## Required parameters

### CFStructName (MQCFST)

The name of the coupling facility application structure that you want to reset (parameter identifier: MQCA\_CF\_STRUC\_NAME). The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

### Action (MQCFIN)

The action to perform to reset the named application structure (parameter identifier: MQIACF\_ACTION).

### MQACT\_FAIL

A structure failure is simulated and the status of the application structure is set to FAILED.

**Note:** Failing a structure deletes all nonpersistent messages stored in the structure, and makes the structure unavailable until recovery is complete. Structure recovery can take a long time to complete. Therefore, this action should be used only in a situation where you can resolve a problem with the structure by forcing the structure to be reallocated and recovered.

## Reset Channel

The Reset Channel (MQCMD\_RESET\_CHANNEL) command resets the message sequence number for an IBM MQ channel with, optionally, a specified sequence number to be used the next time that the channel is started.

This command can be issued to a channel of any type (except MQCHT\_SVRCONN and MQCHT\_CLNTCONN). However, if it is issued to a sender (MQCHT\_SENDER), server (MQCHT\_SERVER), or cluster-sender (MQCHT\_CLUSSDR) channel, the value at both ends (issuing end and receiver or requester end), is reset when the channel is next initiated or resynchronized. The value at both ends is reset to be equal.

If the command is issued to a receiver (MQCHT\_RECEIVER), requester (MQCHT\_REQUESTER), or cluster-receiver (MQCHT\_CLUSRCVR) channel, the value at the other end is not reset as well; this step must be done separately if necessary.

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

## Required parameters

### ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel to be reset. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

## Optional parameters

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH\_CHANNEL\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be reset.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

**MQCHLD\_PRIVATE**

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD\_SHARED.

**MQCHLD\_SHARED**

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD\_SHARED.

The combination of the **ChannelDisposition** and **CommandScope** parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in [Table 325 on page 1836](#)

<i>Table 325. ChannelDisposition and CommandScope for RESET CHANNEL</i>		
<b>ChannelDisposition</b>	<b>CommandScope blank or local-qmgr</b>	<b>CommandScope qmgr-name</b>
MQCHLD_PRIVATE	Reset private channel on the local queue manager	Reset private channel on the named queue manager
MQCHLD_SHARED	<p>Reset a shared channel on all active queue managers.</p> <p>MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted

**MsgSeqNumber (MQCFIN)**

Message sequence number (parameter identifier: MQIACH\_MSG\_SEQUENCE\_NUMBER).

Specifies the new message sequence number.

The value must be in the range 1 through 999 999 999. The default value is one.

## Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

## Reset Cluster

The Reset Cluster (MQCMD\_RESET\_CLUSTER) command forces a queue manager to leave a cluster.

## Required parameters

### ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

The name of the cluster to be reset.

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH.

### QMgrIdentifier (MQCFST)

Queue manager identifier (parameter identifier: MQCA\_Q\_MGR\_IDENTIFIER).

This parameter is the unique identifier of the queue manager to be forcibly removed from the cluster. Only one of `QMgrIdentifier` and `QMgrName` can be specified. Use `QMgrIdentifier` in preference to `QMgrName`, because `QMgrName` might not be unique.

### QMgrName (MQCFST)

Queue manager name (parameter identifier: MQCA\_Q\_MGR\_NAME).

This parameter is the name of the queue manager to be forcibly removed from the cluster. Only one of `QMgrIdentifier` and `QMgrName` can be specified. Use `QMgrIdentifier` in preference to `QMgrName`, because `QMgrName` might not be unique.

### Action (MQCFIN)

Action (parameter identifier: MQIACF\_ACTION).

Specifies the action to take place. This parameter can be requested only by a repository queue manager.

The value can be any of the following values:

#### **MQACT\_FORCE\_REMOVE**

Requests that a queue manager is forcibly removed from a cluster.

## Optional parameters

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **RemoveQueues (MQCFIN)**

Whether cluster queues are removed from the cluster (parameter identifier: MQIACF\_REMOVE\_QUEUES).

This parameter indicates whether the cluster queues that belong to the queue manager being removed from the cluster are to be removed from the cluster. This parameter can be specified even if the queue manager identified by the **QMgrName** parameter is not currently in the cluster.

The value can be any of the following values:

#### **MQCFO\_REMOVE\_QUEUES\_YES**

Remove queues belonging to the queue manager being removed from the cluster.

#### **MQCFO\_REMOVE\_QUEUES\_NO**

Do not remove queues belonging to the queue manager being removed.  
MQCFO\_REMOVE\_QUEUES\_NO is the default.

### **Error codes**

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

#### **Reason (MQLONG)**

The value can be any of the following values:

#### **MQRCCF\_ACTION\_VALUE\_ERROR**

Value not valid.

### **Reset Queue Manager**

Use the Reset Queue Manager (MQCMD\_RESET\_Q\_MGR) command as part of your backup and recovery procedures.  The **Archive** option enables you to notify the queue manager that all log extents, up to the specified one, have been archived. If the log management type is not **ArchivedLog** the command fails. The **ReduceLog** option enables you to request that the queue manager reduces the number of log extents, provided they are no longer required.

You can use this command to request that the queue manager starts writing to a new log extent, making the previous log extent available for archiving.

Use the Reset Queue Manager (MQCMD\_RESET\_Q\_MGR) command to forcibly remove a publish/subscribe hierarchical connection for which this queue manager is nominated as either the parent or the child in a hierarchical connection. Valid on all supported platforms.

### **Archive option**

This option requires change authority on the queue manager object.

The command fails if the log extent is not recognized, or is being written.

If, for some reason, the programmatic way that your enterprise notifies your log extents are archived is not working, and the disk is filling up with log extents, your administrator can use this command.

You need to determine yourself, the name to pass in from your archiving process, as to what has already been archived.

This option is not valid on IBM i.

### **ReduceLog option**

This option requires change authority on the queue manager object.

You should not need this command in normal circumstances. In general, when using automatic management of log files, you should leave it up to the queue manager to reduce the number of log extents as necessary.

For circular logging, this can remove inactive secondary log extents. The increase in secondary log extents is usually noticed by an increase in disk usage, often due to some specific issue in the past.

**Note:** For circular logging the command might not be able reduce the log extents by the required number immediately. In that case, the command returns, and the reduction takes place asynchronously at some later point.

For linear logging this can remove log extents that are not required for recovery (and have been archived) as noticed by a high value for `ReusableLogSize` on the Inquire Queue Manager Status command.

You should run this command only after some specific event that has caused the number of log extents to be extraordinarily large.

The command blocks until the chosen number of extents have been deleted. Note that the command does not return the number of extents that have been removed, but a queue manager error log message is written, indicating what has taken place.

This option is not valid on IBM i.

## Required parameters

### Action (MQCFIN)

Action (parameter identifier: MQIACF\_ACTION).

Specifies the action to take place.

The value can be any of the following values, but you can specify one only:

#### **MQACT\_ADVANCE\_LOG**

Requests that the queue manager starts writing to a new log extent, making the previous log extent available for archiving. This command is accepted only if the queue manager is configured to use linear logging.

#### **MQACT\_COLLECT\_STATISTICS**

Requests that the queue manager ends the current statistics collection period, and writes the statistics collected.

#### **MQACT\_PUBSUB**

Requests a publish/subscribe reset. This value requires that one of the optional parameters, `ChildName` or `ParentName`, is specified.

#### **V 9.1.0 MQACT\_ARCHIVE\_LOG (11)**

Requests that log extents are archived.

The command fails if the log extent is not recognized, or is the current log.

If, for some reason, the programmatic way that your enterprise notifies your log extents are archived is not working, and the disk is filling up with log extents, your administrator can use this command.

#### **V 9.1.0 MQACT\_REDUCE\_LOG (10)**

You should not need this command in normal circumstances. In general, when using automatic management of log files, you should leave it up to the queue manager to reduce the number of log extents as necessary.

For circular logging, you can use this option to remove inactive secondary log extents. A growth in secondary log extents is usually noticed by an increase in disk usage, often due to some specific issue in the past.

You should run this command only after some specific event that has caused the number of log extents to be extraordinarily large.

The command blocks until the chosen number of extents have been deleted. Note that the command does not return the number of extents that have been removed, but a queue manager error log message is written, indicating what has taken place.

## Optional parameters

### **V 9.1.0** ArchivedLog (MQCFST)

Specifies the name of the log extent to be archived (parameter identifier: MQCACF\_ARCHIVE\_LOG\_EXTENT\_NAME).

The maximum length of the string is MQ\_LOG\_EXTENT\_NAME\_LENGTH.

### ChildName (MQCFST)

The name of the child queue manager for which the hierarchical connection is to be forcibly canceled (parameter identifier: MQCA\_CHILD).

This attribute is valid only when the Action parameter has the value MQACT\_PUBSUB.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

### ParentName (MQCFST)

The name of the parent queue manager for which the hierarchical connection is to be forcibly canceled (parameter identifier: MQCA\_PARENT).

This attribute is valid only when the Action parameter has the value MQACT\_PUBSUB.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

### **V 9.1.0** LogReduction (MQCFIN)

Specifies that the type of log reduction (parameter identifier: MQIACF\_LOG\_REDUCTION).

The value can be one of:

#### **MLR\_AUTO**

-1. The default value. Reduce the log extents by an amount chosen by the queue manager.

#### **MLR\_ONE**

1. Reduce the log extents by one extent, if possible.

#### **MLR\_MAX**

-2. Reduce the log extents by the maximum number possible.

## Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

#### **V 9.1.0** MQRCCF\_CURRENT\_LOG\_EXTENT

The specified log extent is the current log extent, and cannot have been validly archived yet.

#### **V 9.1.0** MQRCCF\_LOG\_EXTENT\_NOT\_FOUND

The specified log extent was not found or is not valid.

#### **V 9.1.0** MQRCCF\_LOG\_NOT\_REDUCED

No log events could be removed.

#### **MQRC\_RESOURCE\_PROBLEM**

Insufficient system resources available.

## Reset Queue Statistics

The Reset Queue Statistics (MQCMD\_RESET\_Q\_STATS) command reports the performance data for a queue and then resets the performance data. Performance data is maintained for each local queue (including transmission queues).

Performance data is reset at the following times:

- When a Reset Queue Statistics command is issued
- When the queue manager is restarted
- When a performance event is generated for a queue

## Required parameters

### QName (MQCFST)

Queue name (parameter identifier: MQCA\_Q\_NAME).

The name of the local queue to be tested and reset.

Generic queue names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

## Optional parameters

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

#### MQRCCF\_Q\_WRONG\_TYPE

Action not valid for the queue of specified type.

#### MQRCCF\_EVENTS\_DISABLED

The queue manager performance events are disabled (PERFMEV). On z/OS, it is necessary to enable queue manager performance events to use this command. For more details, see the PerformanceEvent property in the [“Change Queue Manager” on page 1467](#) command.

## Reset Queue Statistics (Response)

The response to the Reset Queue Statistics (MQCMD\_RESET\_Q\_STATS) command consists of the response header followed by the *QName* structure and the attribute parameter structures shown in the following sections.

If a generic queue name was specified, one such message is generated for each queue found.

### Always returned:

*HighQDepth* , *MsgDeqCount* , *MsgEnqCount* , *QName* ,  *QSGDisposition* ,  
*TimeSinceReset*

### Response data

#### HighQDepth (MQCFIN)

Maximum number of messages on a queue (parameter identifier: MQIA\_HIGH\_Q\_DEPTH).

This count is the peak value of the *CurrentQDepth* local queue attribute since the last reset. The *CurrentQDepth* is incremented during an MQPUT call, and during backout of an MQGET call, and is decremented during a (nonbrowse) MQGET call, and during backout of an MQPUT call.

#### MsgDeqCount (MQCFIN)

Number of messages dequeued (parameter identifier: MQIA\_MSG\_DEQ\_COUNT).

This count includes messages that have been successfully retrieved (with a nonbrowse MQGET) from the queue, even though the MQGET has not yet been committed. The count is not decremented if the MQGET is later backed out.

 On z/OS, if the value exceeds 999 999 999, it is returned as 999 999 999

#### MsgEnqCount (MQCFIN)

Number of messages enqueued (parameter identifier: MQIA\_MSG\_ENQ\_COUNT).

This count includes messages that have been put to the queue, but have not yet been committed. The count is not decremented if the put is later backed out.

 On z/OS, if the value exceeds 999 999 999, it is returned as 999 999 999

#### QName (MQCFST)

Queue name (parameter identifier: MQCA\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

#### QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

##### MQQSGD\_COPY

The object is defined as MQQSGD\_COPY.

##### MQQSGD\_SHARED

The object is defined as MQQSGD\_SHARED.

##### MQQSGD\_Q\_MGR

The object is defined as MQQSGD\_Q\_MGR.

#### TimeSinceReset (MQCFIN)

Time since statistics reset in seconds (parameter identifier: MQIA\_TIME\_SINCE\_RESET).

## **Reset SMDS on z/OS**

The Reset SMDS (MQCMD\_RESET\_SMDS) command modifies the availability or status information relating to one or more shared message data sets associated with a specific application structure

### **Required parameters**

#### **SMDS (MQCFST)**

Specifies the queue manager for which the shared message data set availability or status information is to be modified or an asterisk to modify the information for all data sets associated with the specified CFSTRUCT. (parameter identifier: MQCACF\_CF\_SMDS).

The maximum length of the string is 4 characters.

#### **CFStrucName (MQCFST)**

The name of the CF application structure with SMDS connections properties that you want to reset (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

### **Optional parameters**

#### **Access (MQCFIN)**

Availability of the share message data set (parameter identifier: MQIACF\_CF\_STRUC\_ACCESS).

#### **MQCFACCESS\_ENABLED**

The shared message data set is available for use.

#### **MQCFACCESS\_DISABLED**

The shared message data set is disabled.

#### **Status (MQCFIN)**

Status information indicates the state of a resource (parameter identifier: MQIACF\_CF\_STRUC\_STATUS).

#### **MQCFSTATUS\_FAILED**

The shared message data set is in an unusable state.

#### **MQCFSTATUS\_RECOVERED**

The data set is set to recovered, and is ready for use again, but requires some restart processing the next time it is opened. This restart processing ensures that obsolete references to any deleted messages have been removed from the coupling facility structure before the data set is made available again. The restart processing also rebuilds the data set space map.

### **Resolve Channel**

The Resolve Channel (MQCMD\_RESOLVE\_CHANNEL) command requests a channel to commit or back out in-doubt messages. This command is used when the other end of a link fails during the confirmation stage, and for some reason it is not possible to reestablish the connection. In this situation the sending end remains in an in-doubt state, whether the messages were received. Any outstanding units of work must be resolved using Resolve Channel with either backout or commit.

Care must be exercised in the use of this command. If the resolution specified is not the same as the resolution at the receiving end, messages can be lost or duplicated.

This command can only be used for channels with a *ChannelType* value of MQCHT\_SENDER, MQCHT\_SERVER, or MQCHT\_CLUSSDR.

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

## Required parameters

### ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel to be resolved. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

### InDoubt (MQCFIN)

Indoubt resolution (parameter identifier: MQIACH\_IN\_DOUBT).

Specifies whether to commit or back out the in-doubt messages.

The value can be:

#### **MQIDO\_COMMIT**

Commit.

#### **MQIDO\_BACKOUT**

Backout.

## Optional parameters

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH\_CHANNEL\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be resolved.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

#### **MQCHLD\_PRIVATE**

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD\_SHARED.

#### **MQCHLD\_SHARED**

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD\_SHARED.

The combination of the **ChannelDisposition** and **CommandScope** parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in [Table 326 on page 1845](#)

<i>Table 326. ChannelDisposition and CommandScope for RESOLVE CHANNEL</i>		
<b>ChannelDisposition</b>	<b>CommandScope blank or local-qmgr</b>	<b>CommandScope qmgr-name</b>
MQCHLD_PRIVATE	Resolve private channel on the local queue manager	Resolve private channel on the named queue manager
MQCHLD_SHARED	Resolve a shared channel on all active queue managers.  MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.  The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.	Not permitted

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

#### **MQRCCF\_INDOUBT\_VALUE\_ERROR**

In-doubt value not valid.

## Resume Queue Manager on z/OS

The Resume Queue Manager (MQCMD\_RESUME\_Q\_MGR) command renders the queue manager available again for the processing of IMS or Db2 messages. It reverses the action of the Suspend Queue Manager (MQCMD\_SUSPEND\_Q\_MGR) command.

## Required parameters

### Facility (MQCFIN)

Facility (parameter identifier: MQIACF\_Q\_MGR\_FACILITY).

The type of facility for which activity is to be resumed. The value can be:

#### **MQQMFACT\_DB2**

Resumes normal activity with Db2.

## **MQQMFACTIMSBRIDGE**

Resumes normal IMS bridge activity.

### **Optional parameters**

#### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **Resume Queue Manager Cluster**

The Resume Queue Manager Cluster (MQCMD\_RESUME\_Q\_MGR\_CLUSTER) command informs other queue managers in a cluster that the local queue manager is again available for processing, and can be sent messages. It reverses the action of the Suspend Queue Manager Cluster (MQCMD\_SUSPEND\_Q\_MGR\_CLUSTER) command.

### **Required parameters**

#### **ClusterName (MQCFST)**

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

The name of the cluster for which availability is to be resumed.

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH.

#### **ClusterNamelist (MQCFST)**

Cluster Namelist (parameter identifier: MQCA\_CLUSTER\_NAMELIST).

The name of the namelist specifying a list of clusters for which availability is to be resumed.

### **Optional parameters**

#### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_CLUSTER\_NAME\_CONFLICT**

Cluster name conflict.

## **Reverify Security on z/OS**

The Reverify Security (MQCMD\_REVERIFY\_SECURITY) to set a reverification flag for all specified users. The user is reverified the next time that security is checked for that user.

## Required parameters

### Userid (MQCFST)

User ID (parameter identifier: MQCACF\_USER\_IDENTIFIER).

Use this parameter to specify one or more user IDs. Each user ID specified is signed off and signed back on again the next time that a request requiring a security check is issued on behalf of that user.

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

## Optional parameters

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## **Set Archive on z/OS**

Use the Set Archive (MQCMD\_SET\_ARCHIVE) to dynamically change certain archive system parameter values initially set by your system parameter module at queue manager startup.

## Required parameters

### ParameterType (MQCFIN)

Parameter type (parameter identifier: MQIACF\_SYSP\_TYPE).

Specifies how the parameters are to be reset:

#### **MQSYSP\_TYPE\_INITIAL**

The initial settings of the archive system parameters. MQSYSP\_TYPE\_INITIAL resets all the archive system parameters to the values set at queue manager startup.

**MQSYSP\_TYPE\_SET**

MQSYSP\_TYPE\_SET indicates that you intend to change one, or more, of the archive system parameter settings.

**Optional parameters****AllocPrimary (MQCFIN)**

Primary space allocation for DASD data sets (parameter identifier: MQIACF\_SYSP\_ALLOC\_PRIMARY).

Specifies the primary space allocation for DASD data sets in the units specified in the **AllocUnits** parameter.

Specify a value greater than zero. This value must be sufficient for a copy of either the log data set or its corresponding BSDS, whichever is the larger.

**AllocSecondary (MQCFIN)**

Secondary space allocation for DASD data sets (parameter identifier: MQIACF\_SYSP\_ALLOC\_SECONDARY).

Specifies the secondary space allocation for DASD data sets in the units specified in the **AllocUnits** parameter.

Specify a value greater than zero.

**AllocUnits (MQCFIN)**

Allocation unit (parameter identifier: MQIACF\_SYSP\_ALLOC\_UNIT).

Specifies the unit in which primary and secondary space allocations are made. The value can be any of the following values:

**MQSYSP\_ALLOC\_BLK**

Blocks.

**MQSYSP\_ALLOC\_TRK**

Tracks.

**MQSYSP\_ALLOC\_CYL**

Cylinders.

**ArchivePrefix1 (MQCFST)**

Specifies the prefix for the first archive log data set name (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_PFX1).

The maximum length of the string is MQ\_ARCHIVE\_PFX\_LENGTH.

**ArchivePrefix2 (MQCFST)**

Specifies the prefix for the second archive log data set name (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_PFX2).

The maximum length of the string is MQ\_ARCHIVE\_PFX\_LENGTH.

**ArchiveRetention (MQCFIN)**

Archive retention period (parameter identifier: MQIACF\_SYSP\_ARCHIVE\_RETAIN).

Specifies the retention period, in days, to be used when the archive log data set is created. Specify a value in the range zero through 9999.

For more information, see [Discarding archive log data sets](#).

**ArchiveUnit1 (MQCFST)**

Specifies the device type or unit name of the device that is used to store the first copy of the archive log data set (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_UNIT1).

Specify a device type or unit name of 1-8 characters.

If you archive to DASD, you can specify a generic device type with a limited volume range.

The maximum length of the string is MQ\_ARCHIVE\_UNIT\_LENGTH.

**ArchiveUnit2 (MQCFST)**

Specifies the device type or unit name of the device that is used to store the second copy of the archive log data set (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_UNIT2).

Specify a device type or unit name of 1-8 characters.

If this parameter is blank, the value set for the **ArchiveUnit1** parameter is used.

The maximum length of the string is MQ\_ARCHIVE\_UNIT\_LENGTH.

**ArchiveWTOR (MQCFIN)**

Specifies whether a message is to be sent to the operator and a reply is received before attempting to mount an archive log data set (parameter identifier: MQIACF\_SYSP\_ARCHIVE\_WTOR).

Other IBM MQ users might be forced to wait until the data set is mounted, but they are not affected while IBM MQ is waiting for the reply to the message.

The value can be any of the following values:

**MQSYSP\_YES**

A message is to be sent and a reply received before an attempt to mount an archive log data set.

**MQSYSP\_NO**

A message is not to be sent and a reply received before an attempt to mount an archive log data set.

**BlockSize (MQCFIN)**

Block size of the archive log data set (parameter identifier: MQIACF\_SYSP\_BLOCK\_SIZE).

The block size you specify must be compatible with the device type you specify in the **ArchiveUnit1** and **ArchiveUnit2** parameters.

Specify a value in the range 4 097 through 28 672. The value you specify is rounded up to a multiple of 4 096.

This parameter is ignored for data sets that are managed by the storage management system (SMS).

**Catalog (MQCFIN)**

Specifies whether archive log data sets are cataloged in the primary integrated catalog facility (parameter identifier: MQIACF\_SYSP\_CATALOG).

The value can be:

**MQSYSP\_YES**

Archive log data sets are cataloged.

**MQSYSP\_NO**

Archive log data sets are not cataloged.

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **Compact (MQCFIN)**

Specifies whether data written to archive logs is to be compacted (parameter identifier: MQIACF\_SYSP\_COMPACT).

This parameter applies to a 3480 or 3490 device that has the improved data recording capability (IDRC) feature. When this feature is turned on, hardware in the tape control unit writes data at a much higher density than normal, allowing for more data on each volume. Specify MQSYSP\_NO if you do not use a 3480 device with the IDRC feature or a 3490 base model, except for the 3490E. Specify MQSYSP\_YES if you want the data to be compacted.

The value can be:

#### **MQSYSP\_YES**

Data is to be compacted.

#### **MQSYSP\_NO**

Data is not to be compacted.

### **Protect (MQCFIN)**

Protection by external security manager (ESM) (parameter identifier: MQIACF\_SYSP\_PROTECT).

Specifies whether archive log data sets are protected by ESM profiles when the data sets are created.

If you specify MQSYSP\_YES, ensure that:

- ESM protection is active for IBM MQ.
- The user ID associated with the IBM MQ address space has authority to create these profiles.
- The TAPEVOL class is active if you are archiving to tape.

otherwise, offload processing fails.

The value can be any of the following values:

#### **MQSYSP\_YES**

Data set profiles are created when logs are offloaded.

#### **MQSYSP\_NO**

Profiles are not created.

### **QuiesceInterval (MQCFIN)**

Maximum time allowed for the quiesce (parameter identifier: MQIACF\_SYSP\_QUIESCE\_INTERVAL).

Specifies the maximum time, in seconds, allowed for the quiesce.

Specify a value in the range 1 through 999.

### **RoutingCode (MQCFIL)**

z/OS routing code list (parameter identifier: MQIACF\_SYSP\_ROUTING\_CODE).

Specifies the list of z/OS routing codes for messages about the archive log data sets to the operator.

Specify up to 14 routing codes, each with a value in the range zero through 16. You must specify at least one code.

### **TimeStampFormat (MQCFIN)**

Time stamp included (parameter identifier: MQIACF\_SYSP\_TIMESTAMP).

Specifies whether the archive log data set name has a time stamp in it.

The value can be:

#### **MQSYSP\_YES**

Names include a time stamp. The archive log data sets are named:

```
arcpxi.cydd.T hhmsst.A nnnnnn
```

where *c* is 'D' for the years up to and including 1999 or 'E' for the year 2000 and later, and *arcpfxi* is the data set name prefix specified by *ArchivePrefix1* or *ArchivePrefix2*. *arcpfxi* can have up to 19 characters.

#### **MQSYSP\_NO**

Names do not include a time stamp. The archive log data sets are named:

```
arcpfxi.A nnnnnnn
```

Where *arcpfxi* is the data set name prefix specified by *ArchivePrefix1* or *ArchivePrefix2*. *arcpfxi* can have up to 35 characters.

#### **MQSYSP\_EXTENDED**

Names include a time stamp. The archive log data sets are named:

```
arcpfxi.D yyyyddd.T hhmsst.A nnnnnnn
```

Where *arcpfxi* is the data set name prefix specified by *ArchivePrefix1* or *ArchivePrefix2*. *arcpfxi* can have up to 17 characters.

### **Multi**

## **Set Authority Record on Multiplatforms**

The Set Authority Record (MQCMD\_SET\_AUTH\_REC) command sets the authorizations of a profile, object, or class of objects. Authorizations can be granted to, or revoked from, any number of principals or groups.

### **Required parameters**

#### **ProfileName (MQCFST)**

Profile name (parameter identifier: MQCACF\_AUTH\_PROFILE\_NAME).

The authorizations apply to all IBM MQ objects with names that match the profile name specified. You can define a generic profile. If you specify an explicit profile name, the object must exist.

The maximum length of the string is MQ\_AUTH\_PROFILE\_NAME\_LENGTH.

#### **ObjectType (MQCFIN)**

The type of object for which to set authorizations (parameter identifier: MQIACF\_OBJECT\_TYPE).

The value can be any of the following values:

#### **MQOT\_AUTH\_INFO**

Authentication information.

#### **MQOT\_CHANNEL**

Channel object.

#### **MQOT\_CLNTCONN\_CHANNEL**

Client-connection channel object.

#### **MQOT\_COMM\_INFO**

Communication information object

#### **MQOT\_LISTENER**

Listener object.

#### **MQOT\_NAMELIST**

Namelist.

#### **MQOT\_PROCESS**

Process.

#### **MQOT\_Q**

Queue, or queues, that match the object name parameter.

#### **MQOT\_Q\_MGR**

Queue manager.

**MQOT\_REMOTE\_Q\_MGR\_NAME**

Remote queue manager.

**MQOT\_SERVICE**

Service object.

**MQOT\_TOPIC**

Topic object.

**Note:** The required parameters must be in the order **ProfileName** followed by **ObjectType**.

**Optional parameters****AuthorityAdd (MQCFIL)**

Authority values to set (parameter identifier: MQIACF\_AUTH\_ADD\_AUTHS).

This parameter is a list of authority values to set for the named profile. The values can be:

**MQAUTH\_NONE**

The entity has authority set to 'none'.

**MQAUTH\_ALT\_USER\_AUTHORITY**

Specify an alternate user ID on an MQI call.

**MQAUTH\_BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

**MQAUTH\_CHANGE**

Change the attributes of the specified object, using the appropriate command set.

**MQAUTH\_CLEAR**

Clear a queue.

**MQAUTH\_CONNECT**

Connect the application to the specified queue manager by issuing an MQCONN call.

**MQAUTH\_CREATE**

Create objects of the specified type using the appropriate command set.

**MQAUTH\_DELETE**

Delete the specified object using the appropriate command set.

**MQAUTH\_DISPLAY**

Display the attributes of the specified object using the appropriate command set.

**MQAUTH\_INPUT**

Retrieve a message from a queue by issuing an MQGET call.

**MQAUTH\_INQUIRE**

Make an inquiry on a specific queue by issuing an MQINQ call.

**MQAUTH\_OUTPUT**

Put a message on a specific queue by issuing an MQPUT call.

**MQAUTH\_PASS\_ALL\_CONTEXT**

Pass all context.

**MQAUTH\_PASS\_IDENTITY\_CONTEXT**

Pass the identity context.

**MQAUTH\_SET**

Set attributes on a queue from the MQI by issuing an MQSET call.

**MQAUTH\_SET\_ALL\_CONTEXT**

Set all context on a queue.

**MQAUTH\_SET\_IDENTITY\_CONTEXT**

Set the identity context on a queue.

**MQAUTH\_CONTROL**

For listeners and services, start and stop the specified channel, listener, or service.

For channels, start, stop, and ping the specified channel.

For topics, define, alter, or delete subscriptions.

**MQAUTH\_CONTROL\_EXTENDED**

Reset or resolve the specified channel.

**MQAUTH\_PUBLISH**

Publish to the specified topic.

**MQAUTH\_SUBSCRIBE**

Subscribe to the specified topic.

**MQAUTH\_RESUME**

Resume a subscription to the specified topic.

**MQAUTH\_SYSTEM**

Use queue manager for internal system operations.

**MQAUTH\_ALL**

Use all operations applicable to the object.

**MQAUTH\_ALL\_ADMIN**

Use all administration operations applicable to the object.

**MQAUTH\_ALL\_MQI**

Use all MQI calls applicable to the object.

The contents of the *AuthorityAdd* and *AuthorityRemove* lists must be mutually exclusive. You must specify a value for either *AuthorityAdd* or *AuthorityRemove*. An error occurs if you do not specify either.

**AuthorityRemove (MQCFIL)**

Authority values to remove (parameter identifier: MQIACF\_AUTH\_REMOVE\_AUTHS).

This parameter is a list of authority values to remove from the named profile. The values can be:

**MQAUTH\_NONE**

The entity has authority set to 'none'.

**MQAUTH\_ALT\_USER\_AUTHORITY**

Specify an alternate user ID on an MQI call.

**MQAUTH\_BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

**MQAUTH\_CHANGE**

Change the attributes of the specified object, using the appropriate command set.

**MQAUTH\_CLEAR**

Clear a queue.

**MQAUTH\_CONNECT**

Connect the application to the specified queue manager by issuing an MQCONN call.

**MQAUTH\_CREATE**

Create objects of the specified type using the appropriate command set.

**MQAUTH\_DELETE**

Delete the specified object using the appropriate command set.

**MQAUTH\_DISPLAY**

Display the attributes of the specified object using the appropriate command set.

**MQAUTH\_INPUT**

Retrieve a message from a queue by issuing an MQGET call.

**MQAUTH\_INQUIRE**

Make an inquiry on a specific queue by issuing an MQINQ call.

**MQAUTH\_OUTPUT**

Put a message on a specific queue by issuing an MQPUT call.

**MQAUTH\_PASS\_ALL\_CONTEXT**

Pass all context.

**MQAUTH\_PASS\_IDENTITY\_CONTEXT**

Pass the identity context.

**MQAUTH\_SET**

Set attributes on a queue from the MQI by issuing an MQSET call.

**MQAUTH\_SET\_ALL\_CONTEXT**

Set all context on a queue.

**MQAUTH\_SET\_IDENTITY\_CONTEXT**

Set the identity context on a queue.

**MQAUTH\_CONTROL**

For listeners and services, start and stop the specified channel, listener, or service.

For channels, start, stop, and ping the specified channel.

For topics, define, alter, or delete subscriptions.

**MQAUTH\_CONTROL\_EXTENDED**

Reset or resolve the specified channel.

**MQAUTH\_PUBLISH**

Publish to the specified topic.

**MQAUTH\_SUBSCRIBE**

Subscribe to the specified topic.

**MQAUTH\_RESUME**

Resume a subscription to the specified topic.

**MQAUTH\_SYSTEM**

Use queue manager for internal system operations.

**MQAUTH\_ALL**

Use all operations applicable to the object.

**MQAUTH\_ALL\_ADMIN**

Use all administration operations applicable to the object.

**MQAUTH\_ALL\_MQI**

Use all MQI calls applicable to the object.

The contents of the *AuthorityAdd* and *AuthorityRemove* lists must be mutually exclusive. You must specify a value for either *AuthorityAdd* or *AuthorityRemove*. An error occurs if you do not specify either.

**GroupNames (MQCFSL)**

Group names (parameter identifier: MQCACF\_GROUP\_ENTITY\_NAMES).

The names of groups having their authorizations set. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ\_ENTITY\_NAME\_LENGTH.

**PrincipalNames (MQCFSL)**

Principal names (parameter identifier: MQCACF\_PRINCIPAL\_ENTITY\_NAMES).

The names of principals having their authorizations set. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ\_ENTITY\_NAME\_LENGTH.

**ServiceComponent (MQCFST)**

Service component (parameter identifier: MQCACF\_SERVICE\_COMPONENT).

If installable authorization services are supported, this parameter specifies the name of the authorization service to which the authorizations apply.

If you omit this parameter, the authorization inquiry is made to the first installable component for the service.

The maximum length of the string is MQ\_SERVICE\_COMPONENT\_LENGTH.

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRC\_UNKNOWN\_ENTITY**

Userid not authorized, or unknown.

#### **MQRCCF\_AUTH\_VALUE\_ERROR**

Invalid authorization.

#### **MQRCCF\_AUTH\_VALUE\_MISSING**

Authorization missing.

#### **MQRCCF\_ENTITY\_NAME\_MISSING**

Entity name missing.

#### **MQRCCF\_OBJECT\_TYPE\_MISSING**

Object type missing.

#### **MQRCCF\_PROFILE\_NAME\_ERROR**

Invalid profile name.

## Set Channel Authentication Record

The Set Channel Authentication Record (MQCMD\_SET\_CHLAUTH\_REC) command sets the allowed partner details and mappings to MCAUSER for a channel or set of channels.

## Syntax diagram

See the syntax diagram in the MQSC [“SET CHLAUTH” on page 885](#) command for combinations of parameters and values that are allowed.

## Required parameters

The required parameters are valid for the **Action** values of:

- MQACT\_ADD or MQACT\_REPLACE
- MQACT\_REMOVE
- MQACT\_REMOVEALL

### ProfileName (MQCFST)

The name of the channel or set of channels for which you are setting channel authentication configuration (parameter identifier: MQCACH\_CHANNEL\_NAME). You can use one or more asterisks (\*), in any position, as wildcards to specify a set of channels. If you set Type to MQCAUT\_BLOCKADDR, you must set the generic channel name to a single asterisk, which matches all channel names.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

### Type (MQCFIN)

The **Type** parameter must follow the **ProfileName** parameter.

The type of channel authentication record for which to set allowed partner details or mappings to MCAUSER (parameter identifier: MQIACF\_CHLAUTH\_TYPE). The following values are valid:

**MQCAUT\_BLOCKUSER**

This channel authentication record prevents a specified user or users from connecting. The MQCAUT\_BLOCKUSER parameter must be accompanied by a **UserList**.

**MQCAUT\_BLOCKADDR**

This channel authentication record prevents connections from a specified IP address or addresses. The MQCAUT\_BLOCKADDR parameter must be accompanied by an **AddrList**.

**MQCAUT\_SSLPEERMAP**

This channel authentication record maps TLS Distinguished Names (DNs) to MCAUSER values. The MQCAUT\_SSLPEERMAP parameter must be accompanied by an **SSLPeer**.

**MQCAUT\_ADDRESSMAP**

This channel authentication record maps IP addresses to MCAUSER values. The MQCAUT\_ADDRESSMAP parameter must be accompanied by an **Address**.

**MQCAUT\_USERMAP**

This channel authentication record maps asserted user IDs to MCAUSER values. The MQCAUT\_USERMAP parameter must be accompanied by a **ClntUser**.

**MQCAUT\_QMGRMAP**

This channel authentication record maps remote queue manager names to MCAUSER values. The MQCAUT\_QMGRMAP parameter must be accompanied by a **QMName**.

**Optional parameters**

The following table shows which parameters are valid for each value of **Action**:

Parameter	MQACT_ADD or MQACT_REPLACE	MQACT_REMOVE	MQACT_REMOVEALL
z/OS	✓	✓	✓
z/OS	✓	✓	✓
CommandScope			
Action	✓	✓	✓
Address	✓	✓	
Addrlist	✓	✓	
CheckClient	✓	✓	
ClntUser	✓	✓	
MCAUser	✓		
QMName	✓	✓	
SSLCertIssuer	✓	✓	
SSLPeer	✓	✓	
UserList	✓	✓	
UserSrc	✓		
Warn	✓		
Description	✓		

### Action (MQCFIN)

The action to perform on the channel authentication record (parameter identifier: MQIACF\_ACTION). The following values are valid:

#### MQACT\_ADD

Add the specified configuration to a channel authentication record. This is the default value.

For types MQCAUT\_SSLPEERMAP, MQCAUT\_ADDRESSMAP, MQCAUT\_USERMAP and MQCAUT\_QMGRMAP, if the specified configuration exists, the command fails.

For types MQCAUT\_BLOCKUSER and MQCAUT\_BLOCKADDR, the configuration is added to the list.

#### MQACT\_REPLACE

Replace the current configuration of a channel authentication record.

For types MQCAUT\_SSLPEERMAP, MQCAUT\_ADDRESSMAP, MQCAUT\_USERMAP and MQCAUT\_QMGRMAP, if the specified configuration exists, it is replaced with the new configuration. If it does not exist it is added.

For types MQCAUT\_BLOCKUSER and MQCAUT\_BLOCKADDR, the configuration specified replaces the current list, even if the current list is empty. If you replace the current list with an empty list, this acts like MQACT\_REMOVEALL.

#### MQACT\_REMOVE

Remove the specified configuration from the channel authentication records. If the configuration does not exist the command fails. If you remove the last entry from a list, this acts like MQACT\_REMOVEALL.

#### MQACT\_REMOVEALL

Remove all members of the list and thus the whole record (for MQCAUT\_BLOCKADDR and MQCAUT\_BLOCKUSER) or all previously defined mappings (for MQCAUT\_ADDRESSMAP, MQCAUT\_SSLPEERMAP, MQCAUT\_QMGRMAP and MQCAUT\_USERMAP) from the channel authentication records. This option cannot be combined with specific values supplied in **AddrList**, **UserList**, **Address**, **SSLPeer**, **QMName** or **CIntUser**. If the specified type has no current configuration the command still succeeds.

### Address (MQCFST)

The filter to be used to compare with the IP address, or host name, of the partner queue manager or client at the other end of the channel (parameter identifier: MQCACH\_CONNECTION\_NAME).

This parameter is mandatory when **Type** is MQCAUT\_ADDRESSMAP and is also valid when **Type** is MQCAUT\_SSLPEERMAP, MQCAUT\_USERMAP, or MQCAUT\_QMGRMAP and **Action** is MQACT\_ADD, MQACT\_REPLACE, or MQACT\_REMOVE. You can define more than one channel authentication object with the same main identity, for example the same TLS peer name, with different addresses. See [“Generic IP addresses for channel authentication records” on page 892](#) for more information about filtering IP addresses.

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH.

### AddrList (MQCFSL)

A list of up to 100 generic IP addresses which are banned from accessing this queue manager on any channel (parameter identifier: MQCACH\_CONNECTION\_NAME\_LIST).

This parameter is only valid when **Type** is MQCAUT\_BLOCKADDR.

The maximum length of each address is MQ\_CONN\_NAME\_LENGTH.

### CheckClient (MQCFIN)

The user ID and password requirements for the client connection to be successful. The following values are valid:

#### MQCHK\_REQUIRED\_ADMIN

A valid user ID and password are required for the connection to be allowed if you are using a privileged user ID. The password cannot contain single quotation marks ( ' ).

Any connections using a non-privileged user ID are not required to provide a user ID and password.

The user ID and password are checked against the user repository details provided in an authentication information object, and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

A privileged user is one that has full administrative authorities for IBM MQ. See [Privileged users](#) for more information.

This option is not valid on z/OS platforms.

### **MQCHK\_REQUIRED**

A valid user ID and password are required for the connection to be allowed. The password cannot contain single quotation marks ( ' ).

The user ID and password are checked against the user repository details provided in an authentication information object and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

### **MQCHK\_AS\_Q\_MGR**

In order for the connection to be allowed, it must meet the connection authentication requirements defined on the queue manager.

If the CONNAUTH field provides an authentication information object, and the value of CHCKCLNT is REQUIRED, the connection fails unless a valid user ID and password are supplied.

If the CONNAUTH field does not provide an authentication information object, or the value of CHCKCLNT is not REQUIRED, the user ID and password are not required.

### **ClntUser (MQCFST)**

The client asserted user ID to be mapped to a new user ID, allowed through unchanged, or blocked (parameter identifier: MQCACH\_CLIENT\_USER\_ID).

This can be the user ID flowed from the client indicating the user ID the client side process is running under, or the user ID presented by the client on an MQCONN call using MQCSP.

This parameter is valid only with TYPE(USERMAP) and when **Match** is MQMATCH\_RUNCHECK.

The maximum length of the string is MQ\_CLIENT\_USER\_ID\_LENGTH.

### **z/OS CommandScope (MQCFST)**

Command scope (parameter identifier: MQACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is run when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is run on the queue manager on which it was entered.
- a queue manager name. The command is run on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which the command was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is run on the local queue manager and is also passed to every active queue manager in the queue sharing group.

### **Custom (MQCFST)**

Reserved for future use.

### Description (MQCFST)

Provides descriptive information about the channel authentication record, which is displayed when you issue the Inquire Channel Authentication Records command (parameter identifier: MQCA\_CHLAUTH\_DESC).

This parameter must contain only displayable characters. In a DBCS installation, it can contain DBCS characters. The maximum length of the string is MQ\_CHLAUTH\_DESC\_LENGTH.

**Note:** Use characters from the coded character set identifier (CCSID) for this queue manager. Other characters might be translated incorrectly if the information is sent to another queue manager.

### MCAUser (MQCFST)

The user identifier to be used when the inbound connection matches the TLS DN, IP address, client asserted user ID or remote queue manager name supplied (parameter identifier: MQCACH\_MCA\_USER\_ID).

This parameter is mandatory when **UserSrc** is MQUSRC\_MAP and is valid when **Type** is MQCAUT\_SSLPEERMAP, MQCAUT\_ADDRESSMAP, MQCAUT\_USERMAP, or MQCAUT\_QMGRMAP.

This parameter is valid only when **Action** is MQACT\_ADD or MQACT\_REPLACE.

The maximum length of the string is MQ\_MCA\_USER\_ID\_LENGTH.

### QMName (MQCFST)

The name of the remote partner queue manager, or pattern that matches a set of queue manager names, to be mapped to a user ID or blocked (parameter identifier: MQCA\_REMOTE\_Q\_MGR\_NAME).

This parameter is valid only when **Type** is MQCAUT\_QMGRMAP.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

### SSLCertIssuer (MQCFST)

This parameter is additional to the **SSLPeer** parameter.

**SSLCertIssuer** restricts matches to being within certificates issued by a particular Certificate Authority.

### SSLPeer (MQCFST)

The filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel (parameter identifier: MQCACH\_SSL\_PEER\_NAME).

The **SSLPeer** value is specified in the standard form used to specify a Distinguished Name. See [Distinguished Names](#) and [IBM MQ rules for SSLPEER values](#).

The maximum length of the string is MQ\_SSL\_PEER\_NAME\_LENGTH .

### UserList (MQCFSL)

A list of up to 100 user IDs which are banned from using this channel or set of channels (parameter identifier: MQCACH\_MCA\_USER\_ID\_LIST).

The following special value can be used:

#### \*MQADMIN

The exact meaning of this value is determined at runtime. If you are using the OAM supplied with IBM MQ, the meaning depends on platform, as follows:

- On Windows, all members of the mqm group, the Administrators group and SYSTEM
- On UNIX and Linux, all members of the mqm group
- On IBM i, the profiles (users) qmqm and qmqmadm and all members of the qmqmadm group, and any user defined with the \*ALLOBJ special setting
-  On z/OS, the user ID that the CHINIT and the user ID that the MSTR address spaces are running under

This parameter is only valid when **TYPE** is MQCAUT\_BLOCKUSER.

The maximum length of each user ID is MQ\_MCA\_USER\_ID\_LENGTH .

**UserSrc (MQCFIN)**

The source of the user ID to be used for MCAUSER at run time (parameter identifier: MQIACH\_USER\_SOURCE).

The following values are valid:

**MQUSRC\_MAP**

Inbound connections that match this mapping use the user ID specified in the **MCAUser** attribute. This is the default value.

**MQUSRC\_NOACCESS**

Inbound connections that match this mapping have no access to the queue manager and the channel ends immediately.

**MQUSRC\_CHANNEL**

Inbound connections that match this mapping use the flowed user ID or any user defined on the channel object in the MCAUSER field.

Note that *Warn* and MQUSRC\_CHANNEL, or MQUSRC\_MAP are incompatible. This is because channel access is never blocked in these cases, so there is never a reason to generate a warning.

**Warn (MQCFIN)**

Indicates whether this record operates in warning mode (parameter identifier: MQIACH\_WARNING).

**MQWARN\_NO**

This record does not operate in warning mode. Any inbound connection that matches this record is blocked. This is the default value.

**MQWARN\_YES**

This record operates in warning mode. Any inbound connection that matches this record and would therefore be blocked is allowed access. An error message is written and, if events are configured, an event message is created showing the details of what would have been blocked. The connection is allowed to continue. An attempt is made to find another record that is set to WARN(NO) to set the credentials for the inbound channel.

**Error codes**

This command might return the following error codes in the response format header, in addition to the values shown at [“Error codes applicable to all commands” on page 1374](#).

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_CHLAUTH\_TYPE\_ERROR**

Channel authentication record type not valid.

**MQRCCF\_CHLAUTH\_ACTION\_ERROR**

Channel authentication record action not valid.

**MQRCCF\_CHLAUTH\_USERSRC\_ERROR**

Channel authentication record user source not valid.

**MQRCCF\_WRONG\_CHLAUTH\_TYPE**

Parameter not allowed for this channel authentication record type.

**MQRCCF\_CHLAUTH\_ALREADY\_EXISTS**

Channel authentication record already exists

**Related concepts**

[Channel authentication records](#)

The Set Log (MQCMD\_SET\_LOG) command on Multiplatforms enables you to notify the queue manager that archiving of a log is complete. If the log management type is not **Archive** the command fails. This command requires change authority on the queue manager object. This command is not valid on IBM i.

**Required parameters:**

*ParameterType*

**Optional parameters:**

*Archive*

**Required parameters**

**ParameterType (MQCFIN)**

Specifies the type of the log (parameter identifier: MQIACF\_SYSP\_TYPE).

The value must be MQSYSP\_TYPE\_SET

**Optional parameters**

**Archive (MQCFST)**

Specifies the log extent that is being marked as archived (parameter identifier: MQCACF\_ARCHIVE\_LOG\_EXTENT\_NAME).

The command fails if the log extent is not recognized, or is the current log. The command does not fail if the extent has already been marked as having been archived.

A message is written to the error log if the queue manager is notified about an extent more than once.

**Error codes**

This command might return the following error codes in the response format header, in addition to the values shown at [“Error codes applicable to all commands” on page 1374](#).

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_LOG\_EXTENT\_NOT\_FOUND**

The specified log extent was not found or is not valid.

**MQRCCF\_CURRENT\_LOG\_EXTENT**

The specified log extent is the current log extent, and cannot have been validly archived yet.

**MQRCCF\_LOG\_TYPE\_ERROR**

The command has been run on a log that is not an archive log.

**MQRCCF\_LOG\_EXTENT\_ERROR**

The specified log extent is corrupt.

Use the Set Log (MQCMD\_SET\_LOG) command to dynamically change certain log system parameter values initially set by your system parameter module at queue manager startup.

**Required parameters:**

*ParameterType*

**Optional parameters (if the value of *ParameterType* is MQSYSP\_TYPE\_SET:**

*CommandScope* , *DeallocateInterval* , *LogCompression* , *MaxArchiveLog* ,  
*MaxConcurrentOffloads* , *MaxReadTapeUnits* , *OutputBufferCount*

**Optional parameters if *ParameterType* type is MQSYSP\_TYPE\_INITIAL:**

*CommandScope*

## Required parameters

### ParameterType (MQCFIN)

Parameter type (parameter identifier: MQIACF\_SYSP\_TYPE).

Specifies how the parameters are to be set:

#### MQSYSP\_TYPE\_INITIAL

The initial settings of the log system parameters. This MQSYSP\_TYPE\_INITIAL resets all the log system parameters to the values at queue manager startup.

#### MQSYSP\_TYPE\_SET

This MQSYSP\_TYPE\_SET indicates that you intend to change one, or more, of the archive log system parameter settings.

## Optional parameters

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### DeallocateInterval (MQCFIN)

Deallocation interval (parameter identifier: MQIACF\_SYSP\_DEALLOC\_INTERVAL).

Specifies the length of time, in minutes, that an allocated archive read tape unit is allowed to remain unused before it is deallocated. This parameter, together with the **MaxReadTapeUnits** parameter, allows IBM MQ to optimize archive log reading from tape devices. You are recommended to specify the maximum values, within system constraints, for both parameters, in order to achieve the optimum performance for reading archive tapes.

Specify a value in the range zero and 1440. Zero means that a tape unit is deallocated immediately. If you specify a value of 1440, the tape unit is never deallocated.

### LogCompression (MQCFIN)

Log compression parameter (parameter identifier: MQIACF\_LOG\_COMPRESSION).

Specifies the log compression algorithm to enable.

The possible values are:

#### MQCOMPRESS\_NONE

Log compression is disabled.

#### MQCOMPRESS\_RLE

Enable run-length encoding log compression.

#### MQCOMPRESS\_ANY

Enable the queue manager to select the compression algorithm that gives the greatest degree of log record compression.

 For more details see [The log files](#).

### **MaxArchiveLog (MQCFIN)**

Specifies the maximum number of archive log volumes that can be recorded in the BSDS (parameter identifier: MQIACF\_SYSP\_MAX\_ARCHIVE).

When this value is exceeded, recording recommences at the start of the BSDS.

Specify a value in the range 10 through 100.

### **MaxConcurrentOffloads (MQCFIN)**

Specifies the maximum number of concurrent log offload tasks (parameter identifier: MQIACF\_SYSP\_MAX\_CONC\_OFFLOADS).

Specify a decimal number between 1 and 31. If no value is specified the default of 31 applies.

Configure a number lower than the default if your archive logs are allocated on a tape device, and there are constraints on the number of such devices that can be concurrently allocated to the queue manager.

### **MaxReadTapeUnits (MQCFIN)**

Specifies the maximum number of dedicated tape units that can be allocated to read archive log tape volumes (parameter identifier: MQIACF\_SYSP\_MAX\_READ\_TAPES).

This parameter, together with the *DeallocateInterval* parameter, allows IBM MQ to optimize archive log reading from tape devices.

Specify a value in the range 1 through 99.

If you specify a value that is greater than the current specification, the maximum number of tape units allowable for reading archive logs increases. If you specify a value that is less than the current specification, tape units that are not being used are immediately deallocated to adjust to the new value. Active, or premounted, tapes remain allocated.

### **OutputBufferCount (MQCFIN)**

Specifies the number of 4 KB output buffers to be filled before they are written to the active log data sets (parameter identifier: MQIACF\_SYSP\_OUT\_BUFFER\_COUNT).

Specify the number of buffers in the range 1 through 256.

The larger the number of buffers and the less often the write takes place improves the performance of IBM MQ. The buffers might be written before this number is reached if significant events, such as a commit point, occur.

## **Multi Set Policy**

The Set Policy (MQCMD\_CHANGE\_PROT\_POLICY) command sets the protection policy.

**Important:** You must have an Advanced Message Security (AMS) license installed to issue this command. If you attempt to issue the **Set Policy** command without an AMS license installed, you receive message AMQ7155 - License file not found or not valid.

### **Syntax diagram**

See the syntax diagram in the MQSC [“SET POLICY” on page 897](#) command for combinations of parameters and values that are allowed.

### **Required parameters**

#### **PolicyName (MQCFST)**

Specifies the name of the policy. The policy name must match the name of the queue which is to be protected (parameter identifier: MQCA\_POLICY\_NAME).

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

## Optional parameters

### SignAlg (MQCFIN)

Specifies the digital signature algorithm (parameter identifier: MQIA\_SIGNATURE\_ALGORITHM). The following values are valid:

#### **MQMLP\_SIGN\_ALG\_NONE**

No digital signature algorithm specified. This is the default value.

#### **MQMLP\_SIGN\_ALG\_MD5**

MD5 digital signature algorithm specified.

#### **MQMLP\_SIGN\_ALG\_SHA1**

SHA1 digital signature algorithm specified.

#### **MQMLP\_SIGN\_ALG\_SHA256**

SHA256 digital signature algorithm specified.

#### **MQMLP\_SIGN\_ALG\_SHA384**

SHA384 digital signature algorithm specified.

#### **MQMLP\_SIGN\_ALG\_SHA512**

SHA512 digital signature algorithm specified.

### EncAlg (MQCFIN)

Specifies the encryption algorithm (parameter identifier: MQIA\_ENCRYPTION\_ALGORITHM). The following values are valid:

#### **MQMLP\_ENCRYPTION\_ALG\_NONE**

No encryption algorithm specified. This is the default value.

#### **MQMLP\_ENCRYPTION\_ALG\_RC2**

RC2 encryption algorithm specified.

#### **MQMLP\_ENCRYPTION\_ALG\_DES**

DES encryption algorithm specified.

#### **MQMLP\_ENCRYPTION\_ALG\_3DES**

3DES encryption algorithm specified.

#### **MQMLP\_ENCRYPTION\_ALG\_AES128**

AES128 encryption algorithm specified.

#### **MQMLP\_ENCRYPTION\_ALG\_AES256**

AES256 encryption algorithm specified.

### Signer (MQCFST)

Specifies the distinguished name of an authorized signer. This parameter can be specified multiple times (parameter identifier: MQCA\_SIGNER\_DN).

### Recipient (MQCFST)

Specifies the distinguished name of the intended recipient. This parameter can be specified multiple times (parameter identifier: MQCA\_RECIPIENT\_DN).

### Enforce and Tolerate (MQCFST)

Indicates whether the security policy should be enforced or whether unprotected messages are tolerated (parameter identifier: MQIA\_TOLERATE\_UNPROTECTED). The following values are valid:

#### **MQMLP\_TOLERATE\_NO**

Specifies that all message must be protected when retrieved from the queue. Any unprotected message encountered is moved to the SYSTEM.PROTECTION.ERROR.QUEUE. This is the default value.

#### **MQMLP\_TOLERATE\_YES**

Specifies that the messages that are not protected when retrieved from the queue can ignore the policy.

Toleration is optional and exists to facilitate staged implementation, where:

- Policies have been applied to queues, but those queues might already contain unprotected messages, or
- Queues might still receive messages from remote systems that do not yet have the policy set.

### KeyReuse (MQCFIN)

Specifies the number of times that an encryption key can be re-used, in the range 1-9,999,999, or the special values *MQKEY\_REUSE\_DISABLED* or *MQKEY\_REUSE\_UNLIMITED* (parameter identifier: *MQIA\_KEY\_REUSE\_COUNT*). The following values are valid:

#### **MQKEY\_REUSE\_DISABLED**

Prevents a symmetric key from being reused. This is the default value.

#### **MQKEY\_REUSE\_UNLIMITED**

Allows a symmetric key to be reused any number of times.

**Attention:** Key reuse is valid only for CONFIDENTIALITY policies, that is, **SignAlg** set to *MQESE\_SIGN\_ALG\_NONE* and **EncAlg** set to an algorithm value. For all other policy types, you must omit the parameter, or set the **Keyreuse** value to *MQKEY\_REUSE\_DISABLED*.

### Action (MQCFIN)

Specifies the action for the parameters supplied, as they apply to any existing policy (parameter identifier: *MQIACF\_ACTION*). The following values are valid:

#### **MQACT\_REPLACE**

Has the effect of replacing any existing policy with the parameters supplied. This is the default value.

#### **MQACT\_ADD**

Has the effect that signers and recipients parameters have an additive effect. That is, if a signer or recipient is specified, and does not already exist in a preexisting policy, the signer or recipient value is added to the existing policy definition.

#### **MQACT\_REMOVE**

Has the opposite effect of *MQACT\_ADD*. That is, if any of the signer or recipient values specified exist in a preexisting policy, those values are removed from the policy definition.

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown at [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_POLICY\_TYPE\_ERROR**

Policy type not valid.

## Set System on z/OS

Use the Set System (*MQCMD\_SET\_SYSTEM*) command to dynamically change certain general system parameter values initially set from your system parameter module at queue manager startup.

### Required parameters:

*ParameterType*

### Optional parameters (if the value of *ParameterType* is *MQSYSP\_TYPE\_SET*):

*CheckpointCount, CommandScope, Exclmsg, MaxConnects, MaxConnectsBackground, MaxConnectsForeground, Service, SMFInterval, TraceSize*

### Optional parameters if *ParameterType* type is *MQSYSP\_INITIAL*:

*CommandScope*

## Required parameters

### ParameterType (MQCFIN)

Parameter type (parameter identifier: MQIACF\_SYSP\_TYPE).

Specifies how the parameters are to be set:

#### MQSYSP\_TYPE\_INITIAL

The initial settings of the system parameters. MQSYSP\_TYPE\_INITIAL resets the parameters to the values specified in the system parameters at queue manager startup.

#### MQSYSP\_TYPE\_SET

MQSYSP\_TYPE\_SET indicates that you intend to change one, or more, of the system parameter settings.

## Optional parameters

### CheckpointCount (MQCFIN)

The number of log records written by IBM MQ between the start of one checkpoint and the next (parameter identifier: MQIACF\_SYSP\_CHKPOINT\_COUNT).

IBM MQ starts a new checkpoint after the number of records that you specify has been written.

Specify a value in the range 200 through 16 000 000.

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### Exclmsg (MQCFSL)

A list of message identifiers to be excluded from being written to any log (parameter identifier: MQCACF\_EXCL\_OPERATOR\_MESSAGES).

Specify a list of error message identifiers to be excluded from being written to any log. For example, to exclude message CSQX500I, add X500 to this list. Messages in this list are not sent to the z/OS console and hardcopy log. As a result using the EXCLMSG parameter to exclude messages is more efficient from a CPU perspective than using z/OS mechanisms such as the message processing facility list and should be used instead where possible.

The maximum length of each message identifier is MQ\_OPERATOR\_MESSAGE\_LENGTH.

The list can contain a maximum of 16 message identifiers.

### Service (MQCFST)

Service parameter setting (parameter identifier: MQCACF\_SYSP\_SERVICE).

This parameter is reserved for use by IBM.

### SMFInterval (MQCFIN)

The default time, in minutes, between each gathering of statistics (parameter identifier: MQIACF\_SYSP\_SMF\_INTERVAL).

Specify a value in the range zero through 1440.

If you specify a value of zero, statistics data and accounting data are both collected at the SMF data collection broadcast.

### **TraceSize (MQCFIN)**

The size of the trace table, in 4 KB blocks, to be used by the global trace facility (parameter identifier: MQIACF\_SYSP\_TRACE\_SIZE).

Specify a value in the range zero through 999.

## **Start Channel**

The Start Channel (MQCMD\_START\_CHANNEL) command starts an IBM MQ channel. This command can be issued to a channel of any type (except MQCHT\_CLNTCONN). If, however, it is issued to a channel with a *ChannelType* value of MQCHT\_RECEIVER, MQCHT\_SVRCONN, or MQCHT\_CLUSRCVR, the only action is to enable the channel, not start it.

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

None of the following attributes are applicable to MQTT channels unless specifically mentioned in the parameter description.

## **Required parameters**

### **ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel to be started. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

This parameter is required for all channel types including MQTT channels.

## **Optional parameters**

### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **ChannelDisposition (MQCFIN)**

Channel disposition (parameter identifier: MQIACH\_CHANNEL\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be started.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be:

**MQCHLD\_PRIVATE**

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD\_SHARED.

**MQCHLD\_SHARED**

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD\_SHARED.

**MQCHLD\_FIXSHARED**

Shared channels tied to a specific queue manager.

The combination of the **ChannelDisposition** and **CommandScope** parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.
- On every active queue manager in the group.
- On the most suitable queue manager in the group, determined automatically by the queue manager itself.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in [Table 328 on page 1868](#)

<i>Table 328. ChannelDisposition and CommandScope for START CHANNEL</i>			
<b>ChannelDisposition</b>	<b>CommandScope blank or local-qmgr</b>	<b>CommandScope qmgr-name</b>	<b>CommandScope (*)</b>
MQCHLD_PRIVATE	Start as a private channel on the local queue manager	Start as a private channel on the named queue manager	Start as a private channel on all active queue managers

Table 328. ChannelDisposition and CommandScope for START CHANNEL (continued)

<b>ChannelDisposition</b>	<b>CommandScope blank or local-qmgr</b>	<b>CommandScope qmgr-name</b>	<b>CommandScope (*)</b>
MQCHLD_SHARED	<p>For channels of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, start as a shared channel on the most suitable queue manager in the group.</p> <p>For a shared channel of <i>ChannelType</i> MQCHT_RECEIVER and MQCHT_SVRCONN, start the channel on all active queue managers.</p> <p>For a shared channel of <i>ChannelType</i> MQCHT_CLUSSDR and MQCHT_CLUSRCVR, this option is not permitted.</p> <p>MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted	Not permitted
MQCHLD_FIXSHARED	For a shared channel of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, with a nonblank <i>ConnectionName</i> , start as a shared channel on the local queue manager.	For a shared channel of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, with a nonblank <i>ConnectionName</i> , start as a shared channel on the named queue manager.	Not permitted

### Optional parameters

 V 9.1.1 Multi

#### MQIACF\_IGNORE\_STATE

Specifies whether the command fails if the channel is already running. The possible values are:

**MQIS\_NO**

The command fails if the channel is already running. This is the default value.

**MQIS\_YES**

The command succeeds regardless of the current state of the channel.

**Error codes**

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_CHANNEL\_INDOUBT**

Channel in-doubt.

**MQRCCF\_CHANNEL\_IN\_USE**

Channel in use.

**MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

**MQRCCF\_CHANNEL\_TYPE\_ERROR**

Channel type not valid.

**MQRCCF\_MQCONN\_FAILED**

MQCONN call failed.

**MQRCCF\_MQINQ\_FAILED**

MQINQ call failed.

**MQRCCF\_MQOPEN\_FAILED**

MQOPEN call failed.

**MQRCCF\_NOT\_XMIT\_Q**

Queue is not a transmission queue.

The Start Channel (MQCMD\_START\_CHANNEL) command starts an IBM MQ channel. This command can be issued to a channel of type MQCHT\_MQTT.

**Required parameters****ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel to be started. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

This parameter is required for all channel types including MQTT channels.

**ChannelType (MQCFIN)**

The type of channel (parameter identifier: MQIACH\_CHANNEL\_TYPE). This parameter is currently only used with MQTT Telemetry channels, and is required when starting a Telemetry channel. The only value that can currently be given to the parameter is MQCHT\_MQTT.

**Error codes**

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_PARM\_SYNTAX\_ERROR**

The parameter specified contained a syntax error.

**MQRCCF\_PARM\_MISSING**

Parameters are missing.

**MQRCCF\_CHANNEL\_NOT\_FOUND**

The channel specified does not exist.

**MQRCCF\_CHANNEL\_IN\_USE**

The command did not specify a parameter or parameter value that was required.

**MQRCCF\_NO\_STORAGE**

Insufficient storage is available.

**MQRCCF\_COMMAND\_FAILED**

The command has failed.

**MQRCCF\_PORT\_IN\_USE**

The port is in use.

**MQRCCF\_BIND\_FAILED**

The bind to a remote system during session negotiation has failed.

**MQRCCF\_SOCKET\_ERROR**

Socket error has occurred.

**MQRCCF\_HOST\_NOT\_AVAILABLE**

An attempt to allocate a conversation to a remote system was unsuccessful. The error might be transitory, and the allocate might succeed later. This reason can occur if the listening program at the remote system is not running.

## Start Channel Initiator

The Start Channel Initiator (MQCMD\_START\_CHANNEL\_INIT) command starts an IBM MQ channel initiator.

### Required parameters

**InitiationQName (MQCFST)**

Initiation queue name (parameter identifier: MQCA\_INITIATION\_Q\_NAME).

The name of the initiation queue for the channel initiation process. That is, the initiation queue that is specified in the definition of the transmission queue.

This parameter is not valid on z/OS.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### Optional parameters

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### EnvironmentInfo (MQCFST)

Environment information (parameter identifier: MQCACF\_ENV\_INFO).

The parameters and values to be substituted in the JCL procedure (xxxxCHIN, where xxxx is the queue manager name) that is used to start the channel initiator address space. This parameter applies to z/OS only.

The maximum length of the string is MQ\_ENV\_INFO\_LENGTH.

### Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_MQCONN\_FAILED**

MQCONN call failed.

#### **MQRCCF\_MQGET\_FAILED**

MQGET call failed.

#### **MQRCCF\_MQOPEN\_FAILED**

MQOPEN call failed.

### Start Channel Listener

The Start Channel Listener (MQCMD\_START\_CHANNEL\_LISTENER) command starts an IBM MQ listener. On z/OS, this command is valid for any transmission protocol; on other platforms, it is valid only for TCP transmission protocols.

### Optional parameters

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ\_Q\_MGR\_NAME\_LENGTH.

### InboundDisposition (MQCFIN)

Inbound transmission disposition (parameter identifier: MQIACH\_INBOUND\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the inbound transmissions that are to be handled. The value can be any of the following values:

#### **MQINBD\_Q\_MGR**

Listen for transmissions directed to the queue manager. MQINBD\_Q\_MGR is the default.

## **MQINBD\_GROUP**

Listen for transmissions directed to the queue sharing group. MQINBD\_GROUP is permitted only if there is a shared queue manager environment.

z/OS

## **IPAddress (MQCFST)**

IP address (parameter identifier: MQCACH\_IP\_ADDRESS). This parameter applies to z/OS only.

The IP address for TCP/IP specified in IPv4 dotted decimal, IPv6 hexadecimal, or alphanumeric form. This parameter is valid only for channels that have a *TransportType* of MQXPT\_TCP.

The maximum length of the string is MQ\_IP\_ADDRESS\_LENGTH.

## **ListenerName (MQCFST)**

Listener name (parameter identifier: MQCACH\_LISTENER\_NAME). This parameter does not apply to z/OS.

The name of the listener definition to be started. On those platforms on which this parameter is valid, if this parameter is not specified, the default listener SYSTEM.DEFAULT.LISTENER is assumed. If this parameter is specified, no other parameters can be specified.

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

z/OS

## **LUName (MQCFST)**

LU name (parameter identifier: MQCACH\_LU\_NAME). This parameter applies to z/OS only.

The symbolic destination name for the logical unit (LU) as specified in the APPC side information data set. The LU must be the same LU that is specified in the channel initiator parameters to be used for outbound transmissions. This parameter is valid only for channels with a *TransportType* of MQXPT\_LU62.

The maximum length of the string is MQ\_LU\_NAME\_LENGTH.

z/OS

## **Port (MQCFIN)**

Port number for TCP (parameter identifier: MQIACH\_PORT\_NUMBER). This parameter applies to z/OS only.

The port number for TCP. This parameter is valid only for channels with a *TransportType* of MQXPT\_TCP.

z/OS

## **TransportType (MQCFIN)**

Transmission protocol type (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value can be:

### **MQXPT\_LU62**

LU 6.2.

### **MQXPT\_TCP**

TCP.

### **MQXPT\_NETBIOS**

NetBIOS.

### **MQXPT\_SPX**

SPX.

V 9.1.1

Multi

## **MQIACF\_IGNORE\_STATE**

Specifies whether the command fails if the listener is already running. The possible values are:

**MQIS\_NO**

The command fails if the listener is already running. This is the default value.

**MQIS\_YES**

The command succeeds regardless of the current state of the listener.

**Error codes**

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_COMMS\_LIBRARY\_ERROR**

Communications protocol library error.

**MQRCCF\_LISTENER\_NOT\_STARTED**

Listener not started.

**MQRCCF\_LISTENER\_RUNNING**

Listener already running.

**MQRCCF\_NETBIOS\_NAME\_ERROR**

NetBIOS listener name error.

**Start Service on Multiplatforms**

The Start Service (MQCMD\_START\_SERVICE) command starts an existing IBM MQ service definition.

**Required parameters****ServiceName (MQCFST)**

Service name (parameter identifier: MQCA\_SERVICE\_NAME).

This parameter is the name of the service definition to be started. The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

**Optional parameters**

**MQIACF\_IGNORE\_STATE**

Specifies whether the command fails if the service is already running. The possible values are:

**MQIS\_NO**

The command fails if the service is already running. This is the default value.

**MQIS\_YES**

The command succeeds regardless of the current state of the service.

**Error codes**

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_NO\_START\_CMD**

The **StartCommand** parameter of the service is blank.

**MQRCCF\_SERVICE\_RUNNING**

Service is already running.

## Start SMDS Connection on z/OS

Use the Start SMDS Connection (MQCMD\_INQUIRE\_SMDSCONN) command after connections have been put into the AVAIL(STOPPED) state by a previous STOP SMDSCONN command. It can also be used to signal to the queue manager to retry a connection which is in the AVAIL(ERROR) state after a previous error.

### Required parameters

#### SMDSConn (MQCFST)

Specifies the queue manager name relating to the connection between the shared message data set and the queue manager (parameter identifier: MQCACF\_CF\_SMDSCONN).

An asterisk value can be used to denote all shared message data sets associated with a specific CFSTRUCT name.

The maximum length of the string is 4 characters.

#### CFStrucName (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to start (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

#### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### Stop Channel

The Stop Channel (MQCMD\_STOP\_CHANNEL) command stops an IBM MQ channel.

This command can be issued to a channel of any type (except MQCHT\_CLNTCONN).

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

None of the following attributes are applicable to MQTT channels unless specifically mentioned in the parameter description.

### Required parameters

#### ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel to be stopped. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

This parameter is required for all channel types..

## Optional parameters

### **z/OS ChannelDisposition (MQCFIN)**

Channel disposition (parameter identifier: MQIACH\_CHANNEL\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be stopped.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

#### **MQCHLD\_PRIVATE**

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD\_SHARED.

#### **MQCHLD\_SHARED**

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD\_SHARED.

The combination of the **ChannelDisposition** and **CommandScope** parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.
- On every active queue manager in the group.
- On the most suitable queue manager in the group, determined automatically by the queue manager itself.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in [Table 329 on page 1876](#)

<b>ChannelDisposition</b>	<b>CommandScope blank or local-qmgr</b>	<b>CommandScope qmgr-name</b>	<b>CommandScope (*)</b>
MQCHLD_PRIVATE	Stop as a private channel on the local queue manager	Stop as a private channel on the named queue manager	Stop as a private channel on all active queue managers

Table 329. ChannelDisposition and CommandScope for STOP CHANNEL (continued)

<b>ChannelDisposition</b>	<b>CommandScope blank or local-qmgr</b>	<b>CommandScope qmgr-name</b>	<b>CommandScope (*)</b>
MQCHLD_SHARED	<p>For channels of <i>ChannelType</i> MQCHT_RECEIVER or MQCHT_SVRCONN, stop as shared channel on all active queue managers.</p> <p>For channels of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, stop as a shared channel on the queue manager where it is running. If the channel is in an inactive state (not running), or if it is in RETRY state because the channel initiator on which it was running has stopped, a STOP request for the channel is issued on the local queue manager.</p> <p>MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted	Not permitted

**ChannelStatus (MQCFIN)**

The new state of the channel after the command is executed (parameter identifier: MQIACH\_CHANNEL\_STATUS).

The value can be any of the following values:

**MQCHS\_INACTIVE**

Channel is inactive.

**MQCHS\_STOPPED**

Channel is stopped. MQCHS\_STOPPED is the default if nothing is specified.

 **CommandScope (MQCFST)**

Command scope (parameter identifier: MQACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### ConnectionName (MQCFST)

Connection name of channel to be stopped (parameter identifier: MQCACH\_CONNECTION\_NAME).

This parameter is the connection name of the channel to be stopped. If this parameter is omitted, all channels with the specified channel name and remote queue manager name are stopped.

On Multiplatforms, the maximum length of the string is MQ\_CONN\_NAME\_LENGTH. On z/OS, the maximum length of the string is MQ\_LOCAL\_ADDRESS\_LENGTH.

If this parameter is specified, ChannelStatus must be MQCHS\_INACTIVE.

### Mode (MQCFIN)

How the channel must be stopped (parameter identifier: MQIACF\_MODE).

The value can be:

#### MQMODE\_QUIESCE

Quiesce the channel. MQMODE\_QUIESCE is the default.

If you issue a `Stop Channel channelname Mode(MQMODE_QUIESCE)` command on a server-connection channel with the sharing conversations feature enabled, the IBM MQ client infrastructure becomes aware of the stop request in a timely manner; this time is dependent upon the speed of the network. The client application becomes aware of the stop request as a result of issuing a subsequent call to IBM MQ.

#### MQMODE\_FORCE

Stop the channel immediately; the thread or process of the channel is not terminated. Stops transmission of any current batch.

For server-connection channels, breaks the current connection, returning MQRC\_CONNECTION\_BROKEN.

For other types of channels, this situation is likely to result in in-doubt situations.

**z/OS** On z/OS, this option interrupts any message reallocation in progress, which can leave BIND\_NOT\_FIXED messages partially reallocated or out of order.

#### MQMODE\_TERMINATE

**Multi** On Multiplatforms, stop the channel immediately; the thread or process of the channel is terminated.

**z/OS** On z/OS, MQMODE\_TERMINATE is synonymous with FORCE.

**z/OS** On z/OS, this option interrupts any message reallocation in progress, which can leave BIND\_NOT\_FIXED messages partially reallocated or out of order.

**Note:** This parameter was previously called *Quiesce* (MQIACF\_QUIESCE), with values MQQO\_YES and MQQO\_NO. The old names can still be used.

### QMgrName (MQCFST)

Name of remote queue manager (parameter identifier: MQCA\_Q\_MGR\_NAME).

This parameter is the name of the remote queue manager to which the channel is connected. If this parameter is omitted, all channels with the specified channel name and connection name are stopped. The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

If this parameter is specified, ChannelStatus must be MQCHS\_INACTIVE.

#### V 9.1.1 Multi MQIACF\_IGNORE\_STATE

Specifies whether the command fails if the channel is already stopped. The possible values are:

##### **MQIS\_NO**

The command fails if the channel is already stopped. This is the default value.

##### **MQIS\_YES**

The command succeeds regardless of the current state of the channel.

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_CHANNEL\_DISABLED**

Channel disabled.

#### **MQRCCF\_CHANNEL\_NOT\_ACTIVE**

Channel not active.

#### **MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

#### **MQRCCF\_MODE\_VALUE\_ERROR**

Mode value not valid.

#### **MQRCCF\_MQCONN\_FAILED**

MQCONN call failed.

#### **MQRCCF\_MQOPEN\_FAILED**

MQOPEN call failed.

#### **MQRCCF\_MQSET\_FAILED**

MQSET call failed.

## Windows Linux AIX Stop Channel (MQTT)

The Stop Channel (MQCMD\_STOP\_CHANNEL) command stops an MQ Telemetry channel.

## Required parameters

### ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

This parameter is required.

The name of the channel to be stopped. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

### ChannelType (MQCFIN)

The type of channel (parameter identifier: MQIACH\_CHANNEL\_TYPE). This parameter is currently only used with MQTT Telemetry channels, and is required when stopping a Telemetry channel. The only value that can currently be given to the parameter is **MQCHT\_MQTT**.

## Optional parameters

### ClientIdentifier (MQCFST)

Client identifier. The client identifier is a 23-byte string that identifies an MQ Telemetry Transport client. When the Stop Channel command specifies a *ClientIdentifier*, only the connection for the specified client identifier is stopped. If the CLIENTID is not specified, all the connections on the channel are stopped.

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_CHANNEL\_DISABLED**

Channel disabled.

#### **MQRCCF\_CHANNEL\_NOT\_ACTIVE**

Channel not active.

#### **MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

#### **MQRCCF\_MODE\_VALUE\_ERROR**

Mode value not valid.

#### **MQRCCF\_MQCONN\_FAILED**

MQCONN call failed.

#### **MQRCCF\_MQOPEN\_FAILED**

MQOPEN call failed.

#### **MQRCCF\_MQSET\_FAILED**

MQSET call failed.

## Stop Channel Initiator on z/OS

The Stop Channel Initiator (MQCMD\_STOP\_CHANNEL\_INIT) command stops an IBM MQ channel initiator.

## Optional parameters

### CommandScope (MQCFST)

Command scope (parameter identifier: MQACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### SharedChannelRestart (MQCFIN)

Shared channel restart (parameter identifier: MQIACH\_SHARED\_CHL\_RESTART).

Specifies whether the channel initiator attempts to restart any active sending channels, started with the **ChannelDisposition** parameter set to MQCHLD\_SHARED, that it owns on another queue manager. The value can be:

**MQCHSH\_RESTART\_YES**

Shared sending channels are to be restarted. MQCHSH\_RESTART\_YES is the default.

**MQCHSH\_RESTART\_NO**

Shared sending channels are not to be restarted, so become inactive.

Active channels started with the **ChannelDisposition** parameter set to MQCHLD\_FIXSHARED are not restarted, and always become inactive.

## Stop Channel Listener

The Stop Channel Listener (MQCMD\_STOP\_CHANNEL\_LISTENER) command stops an IBM MQ listener.

### Required parameters

**ListenerName (MQCFST)**

Listener name (parameter identifier: MQCACH\_LISTENER\_NAME). This parameter does not apply to z/OS.

The name of the listener definition to be stopped. If this parameter is specified, no other parameters can be specified.

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

### Optional parameters

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

This parameter is valid only on z/OS.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**InboundDisposition (MQCFIN)**

Inbound transmission disposition (parameter identifier: MQIACH\_INBOUND\_DISP).

Specifies the disposition of the inbound transmissions that the listener handles. The value can be any of the following values:

**MQINBD\_Q\_MGR**

Handling for transmissions directed to the queue manager. MQINBD\_Q\_MGR is the default.

**MQINBD\_GROUP**

Handling for transmissions directed to the queue sharing group. MQINBD\_GROUP is permitted only if there is a shared queue manager environment.

This parameter is valid only on z/OS.

**IPAddress (MQCFST)**

IP address (parameter identifier: MQCACH\_IP\_ADDRESS).

The IP address for TCP/IP specified in dotted decimal or alphanumeric form. This parameter is valid on z/OS only where channels have a *TransportType* of MQXPT\_TCP.

The maximum length of the string is MQ\_IP\_ADDRESS\_LENGTH.

#### **Port (MQCFIN)**

Port number for TCP (parameter identifier: MQIACH\_PORT\_NUMBER).

The port number for TCP. This parameter is valid only on z/OS where channels have a *TransportType* of MQXPT\_TCP.

#### **TransportType (MQCFIN)**

Transmission protocol type (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value can be:

##### **MQXPT\_LU62**

LU 6.2.

##### **MQXPT\_TCP**

TCP.

This parameter is valid only on z/OS.

### **Optional parameters**

#### **MQIACF\_IGNORE\_STATE**

Specifies whether the command fails if the listener is already stopped. The possible values are:

##### **MQIS\_NO**

The command fails if the listener is already stopped. This is the default value.

##### **MQIS\_YES**

The command succeeds regardless of the current state of the listener.

### **Error codes**

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

#### **Reason (MQLONG)**

The value can be any of the following values:

##### **MQRCCF\_LISTENER\_STOPPED**

Listener not running.

### **Stop Connection on Multiplatforms**

The Stop Connection (MQCMD\_STOP\_CONNECTION) command attempts to break a connection between an application and the queue manager. There might be circumstances in which the queue manager cannot implement this command.

### **Required parameters**

#### **ConnectionId (MQCFBS)**

Connection identifier (parameter identifier: MQBACF\_CONNECTION\_ID).

This parameter is the unique connection identifier associated with an application that is connected to the queue manager.

The length of the byte string is MQ\_CONNECTION\_ID\_LENGTH.

## Stop Service on Multiplatforms

The Stop Service (MQCMD\_STOP\_SERVICE) command stops an existing IBM MQ service definition that is running.

### Required parameters

#### ServiceName (MQCFST)

Service name (parameter identifier: MQCA\_SERVICE\_NAME).

This parameter is the name of the service definition to be stopped. The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

### Optional parameters

V 9.1.1

#### MQIACF\_IGNORE\_STATE

Specifies whether the command fails if the service is already stopped. The possible values are:

##### MQIS\_NO

The command fails if the service is already stopped. This is the default value.

##### MQIS\_YES

The command succeeds regardless of the current state of the service.

### Error codes

This command might return the following error codes in the response format header, in addition to the values shown on page [“Error codes applicable to all commands” on page 1374](#).

#### Reason (MQLONG)

The value can be any of the following values:

##### MQRCCF\_NO\_STOP\_CMD

The **StopCommand** parameter of the service is blank.

##### MQRCCF\_SERVICE\_STOPPED

Service is not running.

## Stop SMDS Connection on z/OS

Use the Stop SMDS Connection (MQCMD\_STOP\_SMDSCONN) command to terminate the connection from this queue manager to one or more specified shared message data sets (causing them to be closed and deallocated) and to mark the connection as STOPPED.

### Required parameters

#### SMDSConn (MQCFST)

Specifies the queue manager name relating to the connection between the shared message data set and the queue manager (parameter identifier: MQCACF\_CF\_SMDSCONN).

An asterisk value can be used to denote all shared message data sets associated with a specific CFSTRUCT name.

The maximum length of the string is 4 characters.

#### CFStrucName (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to stop (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## **Suspend Queue Manager on z/OS**

The Suspend Queue Manager (MQCMD\_SUSPEND\_Q\_MGR) command renders the local queue manager unavailable for the processing of IMS or Db2 messages. Its action can be reversed by the Resume Queue Manager command (MQCMD\_RESUME\_Q\_MGR) command.

### **Required parameters**

#### **Facility (MQCFIN)**

Facility (parameter identifier: MQIACF\_Q\_MGR\_FACILITY).

The type of facility for which activity is to be suspended. The value can be:

#### **MQQMFACT\_DB2**

The existing connection to Db2 is terminated.

Any in-flight or subsequent MQGET or MQPUT requests are suspended and applications wait until the Db2 connection is re-established by the Resume Queue Manager command, or if the queue manager is stopped.

#### **MQQMFACT\_IMS\_BRIDGE**

Resumes normal IMS bridge activity.

Stops the sending of messages from IMS bridge queues to OTMA. No further messages are sent to IMS until one of these events occurs:

- OTMA is stopped and restarted
- IMS or IBM MQ is stopped or restarted
- A Resume Queue Manager command is processed

Messages returning from IMS OTMA to the queue manager are unaffected.

### **Optional parameters**

#### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue

manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## Suspend Queue Manager Cluster

The Suspend Queue Manager Cluster (MQCMD\_SUSPEND\_Q\_MGR\_CLUSTER) command informs other queue managers in a cluster that the local queue manager is not available for processing, and cannot be sent messages. Its action can be reversed by the Resume Queue Manager Cluster (MQCMD\_RESUME\_Q\_MGR\_CLUSTER) command.

### Required parameters

#### ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

The name of the cluster for which availability is to be suspended.

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH.

#### ClusterNamelist (MQCFST)

Cluster Namelist (parameter identifier: MQCA\_CLUSTER\_NAMELIST).

The name of the namelist specifying a list of clusters for which availability is to be suspended.

### Optional parameters

#### CommandScope (MQCFST)

Command scope (parameter identifier: MQACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### Mode (MQCFIN)

How the local queue manager is suspended from the cluster (parameter identifier: MQIACF\_MODE).

The value can be:

##### MQMODE QUIESCE

Other queue managers in the cluster are told not to send further messages to the local queue manager.

##### MQMODE FORCE

All inbound and outbound channels to other queue managers in the cluster are stopped forcibly.

**Note:** This parameter was previously called *Quiesce* (MQIACF QUIESCE), with values MQQO\_YES and MQQO\_NO. The old names can still be used.

### Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1374](#).

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_CLUSTER\_NAME\_CONFLICT**

Cluster name conflict.

**MQRCCF\_MODE\_VALUE\_ERROR**

Mode value not valid.

## Structures for commands and responses

PCF commands and responses have a consistent structure including of a header and any number of parameter structures of defined types.

Commands and responses have the form:

- PCF header (MQCFH) structure (described in topic [“MQCFH - PCF header” on page 1887](#)), followed by
- Zero or more parameter structures. Each of these is one of the following:
  - PCF byte string filter parameter (MQCFBF, see topic [“MQCFBF - PCF byte string filter parameter” on page 1891](#))
  - PCF byte string parameter (MQCFBS, see topic [“MQCFBS - PCF byte string parameter” on page 1893](#))
  - PCF integer filter parameter (MQCFIF, see topic [“MQCFIF - PCF integer filter parameter” on page 1896](#))
  - PCF integer list parameter (MQCFIL, see topic [“MQCFIL - PCF integer list parameter” on page 1899](#))
  - PCF integer parameter (MQCFIN, see topic [“MQCFIN - PCF integer parameter” on page 1901](#))
  - PCF string filter parameter (MQCFSF, see topic [“MQCFSF - PCF string filter parameter” on page 1903](#))
  - PCF string list parameter (MQCFSL, see topic [“MQCFSL - PCF string list parameter” on page 1907](#))
  - PCF string parameter (MQCFST, see topic [“MQCFST - PCF string parameter” on page 1910](#))

## How the structures are shown

The structures are described in a language-independent form.

The declarations are shown in the following programming languages:

- C
- COBOL
- PL/I
- S/390 assembler
- Visual Basic

## Data types

For each field of the structure, the data type is given in brackets after the field name. These data types are the elementary data types described in [Data types used in the MQI](#).

## Initial values and default structures

See [IBM MQ COPY, header, include, and module files](#) for details of the supplied header files that contain the structures, constants, initial values, and default structures.

## Usage notes

The format of the strings in the PCF message determines the settings of the character set fields in the message descriptor to enable conversion of strings within the message.

If all of the strings in a PCF message have the same coded character-set identifier, the *CodedCharSetId* field in the message descriptor MQMD should be set to that identifier when the message is put, and the *CodedCharSetId* fields in the MQCFST, MQCFSL, and MQCFSF structures within the message should be set to MQCCSI\_DEFAULT.

If the format of the PCF message is MQFMT\_ADMIN, MQFMT\_EVENT, or MQFMT\_PCF and some of the strings in the message have different character-set identifiers, the *CodedCharSetId* field in MQMD should be set to MQCCSI\_EMBEDDED when the message is put, and the *CodedCharSetId* fields in the MQCFST, MQCFSL, and MQCFSF structures within the message should all be set to the identifiers that apply.

This enables conversions of the strings within the message, to the *CodedCharSetId* value in the MQMD specified on the MQGET call, if the MQGMO\_CONVERT option is also specified.

For more information about the MQEPH structure, see [MQEPH - Embedded PCF header](#).

**Note:** If you request conversion of the internal strings in the message, the conversion will occur only if the value of the *CodedCharSetId* field in the MQMD of the message is different from the *CodedCharSetId* field of the MQMD specified on the MQGET call.

Do not specify MQCCSI\_EMBEDDED in MQMD when the message is put, with MQCCSI\_DEFAULT in the MQCFST, MQCFSL, or MQCFSF structures within the message, as this will prevent conversion of the message.

## MQCFH - PCF header

The MQCFH structure describes the information that is present at the start of the message data of a command message, or a response to a command message. In either case, the message descriptor *Format* field is MQFMT\_ADMIN.

The PCF structures are also used for event messages. In this case the message descriptor *Format* field is MQFMT\_EVENT.

The PCF structures can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT\_PCF (see [Message descriptor for a PCF command](#)). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *StructLength* and *ParameterCount* fields to the values appropriate to the data.

## Fields for MQCFH

### Type (MQLONG)

Structure type.

This field indicates the content of the message. The following values are valid for commands:

#### **MQCFT\_COMMAND**

Message is a command.

#### **MQCFT\_COMMAND\_XR**

Message is a command to which standard or extended responses might be sent.

This value is required on z/OS.

#### **MQCFT\_RESPONSE**

Message is a response to a command.

#### **MQCFT\_XR\_MSG**

Message is an extended response to a command. It contains informational or error details.

**MQCFT\_XR\_ITEM**

Message is an extended response to an Inquire command. It contains item data.

**MQCFT\_XR\_SUMMARY**

Message is an extended response to a command. It contains summary information.

**MQCFT\_USER**

User-defined PCF message.

**StrucLength (MQLONG)**

Structure length.

This field is the length in bytes of the MQCFH structure. The value must be:

**MQCFH\_STRUC\_LENGTH**

Length of command format header structure.

**Version (MQLONG)**

Structure version number.

For z/OS, the value must be:

**MQCFH\_VERSION\_3**

Version number for command format header structure.

The following constant specifies the version number of the current version:

**MQCFH\_CURRENT\_VERSION**

Current version of command format header structure.

**Command (MQLONG)**

Command identifier.

For a command message, this field identifies the function to be performed. For a response message, it identifies the command to which this field is the reply. See the description of each command for the value of this field.

**MsgSeqNumber (MQLONG)**

Message sequence number.

This field is the sequence number of the message within a set of related messages. For a command, this field must have the value one (because a command is always contained within a single message). For a response, the field has the value one for the first (or only) response to a command, and increases by one for each successive response to that command.

The last (or only) message in a set has the MQCFC\_LAST flag set in the *Control* field.

**Control (MQLONG)**

Control options.

The following values are valid:

**MQCFC\_LAST**

Last message in the set.

For a command, this value must always be set.

**MQCFC\_NOT\_LAST**

Not the last message in the set.

**CompCode (MQLONG)**

Completion code.

This field is meaningful only for a response; its value is not significant for a command. The following values are possible:

**MQCC\_OK**

Command completed successfully.

**MQCC\_WARNING**

Command completed with warning.

**MQCC\_FAILED**

Command failed.

**MQCC\_UNKNOWN**

Whether command succeeded is not known.

**Reason (MQLONG)**

Reason code qualifying completion code.

This field is meaningful only for a response; its value is not significant for a command.

The possible reason codes that can be returned in response to a command are listed in, [“Definitions of the Programmable Command Formats”](#) on page 1368 and in the description of each command.

**ParameterCount (MQLONG)**

Count of parameter structures.

This field is the number of parameter structures (MQCFBF, MQCFBS, MQCFIF, MQCFIL, MQCFIN, MQCFSL, MQCFSF, and MQCFST) that follow the MQCFH structure. The value of this field is zero or greater.

**C language declaration**

```
typedef struct tagMQCFH {
    MQLONG  Type;           /* Structure type */
    MQLONG  StrucLength;    /* Structure length */

## MQCFBF - PCF byte string filter parameter

The MQCFBF structure describes a byte string filter parameter. The format name in the message descriptor is MQFMT\_ADMIN.

The MQCFBF structure is used in Inquire commands to provide a filter description. This filter description is used to filter the results of the Inquire command and return to the user only those objects that satisfy the filter description.

When an MQCFBF structure is present, the Version field in the MQCFH structure at the start of the PCF must be MQCFH\_VERSION\_3 or higher.

On z/OS, a single filter parameter only is allowed. If multiple MQCFIF, MQCFSF and MQCFBF, or MQCFBF, parameters are specified, the PCF command fails with error MQRCCF\_TOO\_MANY\_FILTERS (MQRCCF 3248).

### Fields for MQCFBF

#### Type (MQLONG)

Structure type.

This indicates that the structure is a MQCFBF structure describing a byte string filter parameter. The value must be:

#### **MQCFT\_BYTE\_STRING\_FILTER**

Structure defining a byte string filter.

#### StrucLength (MQLONG)

Structure length.

This is the length, in bytes, of the MQCFBF structure, including the string at the end of the structure (the *FilterValue* field). The length must be a multiple of 4, and must be sufficient to contain the string. Bytes between the end of the string and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *FilterValue* field:

#### **MQCFBF\_STRUC\_LENGTH\_FIXED**

Length of fixed part of command format filter string-parameter structure.

#### Parameter (MQLONG)

Parameter identifier.

This identifies the parameter that is to be filtered on. The value of this identifier depends on the parameter to be filtered on.

The parameter is one of the following:

- MQBACF\_EXTERNAL\_UOW\_ID
- MQBACF\_Q\_MGR\_UOW\_ID
- MQBACF\_ORIGIN\_UOW\_ID (on z/OS only)

#### Operator (MQLONG)

Operator identifier.

This identifies the operator that is being used to evaluate whether the parameter satisfies the filter-value.

Possible values are:

#### **MQCFOP\_GREATER**

Greater than

**MQCFOP\_LESS**

Less than

**MQCFOP\_EQUAL**

Equal to

**MQCFOP\_NOT\_EQUAL**

Not equal to

**MQCFOP\_NOT\_LESS**

Greater than or equal to

**MQCFOP\_NOT\_GREATER**

Less than or equal to

**FilterValueLength (MQLONG)**

Length of filter-value string.

This is the length, in bytes, of the data in the *FilterValue* field. This must be zero or greater, and does not need to be a multiple of 4.

**FilterValue (MQBYTE x FilterValueLength)**

Filter value.

This specifies the filter-value that must be satisfied. Use this parameter where the response type of the filtered parameter is a byte string.

**Note:** If the specified byte string is shorter than the standard length of the parameter in MQFMT\_ADMIN command messages, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.

**C language declaration**

```
typedef struct tagMQCFBF {
    MQLONG  Type;                /* Structure type */
    MQLONG  StrucLength;         /* Structure length */
    MQLONG  Parameter;          /* Parameter identifier */
    MQLONG  Operator;           /* Operator identifier */
    MQLONG  FilterValueLength;  /* Filter value length */
    MQBYTE  FilterValue[1];     /* Filter value -- first byte */
} MQCFBF;
```

## MQCFBS - PCF byte string parameter

The MQCFBS structure describes a byte-string parameter in a PCF message. The format name in the message descriptor is MQFMT\_ADMIN.

When an MQCFBS structure is present, the *Version* field in the MQCFH structure at the start of the PCF must be MQCFH\_VERSION\_2 or greater.

In a user PCF message, the *Parameter* field has no significance, and can be used by the application for its own purposes.

The structure ends with a variable-length byte string; see the *String* field in the following section for further details.

## Fields for MQCFBS

### Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFBS structure describing byte string parameter. The value must be:

## **MQCFT\_BYTE\_STRING**

Structure defining a byte string.

### **StrucLength (MQLONG)**

Structure length.

This is the length in bytes of the MQCFBS structure, including the variable-length string at the end of the structure (the *String* field). The length must be a multiple of four, and must be sufficient to contain the string; any bytes between the end of the string and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *String* field:

### **MQCFBS\_STRUC\_LENGTH\_FIXED**

Length of fixed part of MQCFBS structure.

### **Parameter (MQLONG)**

Parameter identifier.

This identifies the parameter with a value that is contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see “MQCFH - PCF header” on page 1887 for details. In user PCF messages (MQCFT\_USER), this field has no significance.

The parameter is from the MQBACF\_\* group of parameters.

### **StringLength (MQLONG)**

Length of string.

This is the length in bytes of the data in the *string* field; it must be zero or greater. This length does not need to be a multiple of four.

### **String (MQBYTE x StringLength)**

String value.

This is the value of the parameter identified by the *parameter* field. The string is a byte string, and so is not subject to character-set conversion when sent between different systems.

**Note:** A null character in the string is treated as normal data, and does not act as a delimiter for the string

For MQFMT\_ADMIN messages, if the specified string is shorter than the standard length of the *parameter*, the omitted characters are assumed to be nulls. If the specified string is longer than the standard length, it is an error.

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For other programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, you must include MQCFBS in a larger structure, and declare additional fields following MQCFBS, to represent the *String* field as required.

## **C language declaration**

```
typedef struct tagMQCFBS {
    MQLONG   Type;           /* Structure type */
    MQLONG   StrucLength;    /* Structure length */
    MQLONG   Parameter;      /* Parameter identifier */
    MQLONG   StringLength;   /* Length of string */
    MQBYTE   String[1];     /* String value - first byte */

} MQCFBS;
```

## MQCFIF - PCF integer filter parameter

The MQCFIF structure describes an integer filter parameter. The format name in the message descriptor is MQFMT\_ADMIN.

The MQCFIF structure is used in Inquire commands to provide a filter condition. This filter condition is used to filter the results of the Inquire command and return to the user only those objects that satisfy the filter condition.

When an MQCFIF structure is present, the Version field in the MQCFH structure at the start of the PCF must be MQCFH\_VERSION\_3 or higher.

On z/OS, a single filter parameter only is allowed. If multiple MQCFIF, MQCFSF and MQCFBF, or MQCFBF, parameters are specified, the PCF command fails with error MQRCCF\_TOO\_MANY\_FILTERS (MQRCCF 3248).

### Fields for MQCFIF

#### Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFIF structure describing an integer filter parameter. The value must be:

#### **MQCFT\_INTEGER\_FILTER**

Structure defining an integer filter.

#### StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFIF structure. The value must be:

#### **MQCFIF\_STRUC\_LENGTH**

Length of command format integer-parameter structure.

#### Parameter (MQLONG)

Parameter identifier.

This identifies the parameter that is to be filtered on. The value of this identifier depends on the parameter to be filtered on. Any of the parameters which can be used in the Inquire command can be used in this field.

The parameter is from the following groups of parameters:

- MQIA\_\*
- MQIACF\_\*
- MQIAMO\_\*
- MQIACH\_\*

#### Operator (MQLONG)

Operator identifier.

This identifies the operator that is being used to evaluate whether the parameter satisfies the filter-value.

Possible values are:

#### **MQCFOP\_GREATER**

Greater than

#### **MQCFOP\_LESS**

Less than

**MQCFOP\_EQUAL**

Equal to

**MQCFOP\_NOT\_EQUAL**

Not equal to

**MQCFOP\_NOT\_LESS**

Greater than or equal to

**MQCFOP\_NOT\_GREATER**

Less than or equal to

**MQCFOP\_CONTAINS**

Contains a specified value. Use MQCFOP\_CONTAINS when filtering on lists of values or integers.

**MQCFOP\_EXCLUDES**

Does not contain a specified value. Use MQCFOP\_EXCLUDES when filtering on lists of values or integers.

See the *FilterValue* description for details telling you which operators can be used in which circumstances.

**FilterValue (MQLONG)**

Filter value identifier.

This specifies the filter-value that must be satisfied.

Depending on the parameter, the value and the permitted operators can be:

- An explicit integer value, if the parameter takes a single integer value.

You can only use the following operators:

- MQCFOP\_GREATER
- MQCFOP\_LESS
- MQCFOP\_EQUAL
- MQCFOP\_NOT\_EQUAL
- MQCFOP\_NOT\_GREATER
- MQCFOP\_NOT\_LESS

- An MQ constant, if the parameter takes a single value from a possible set of values (for example, the value MQCHT\_SENDER on the **ChannelType** parameter). You can only use MQCFOP\_EQUAL or MQCFOP\_NOT\_EQUAL.
- An explicit value or an MQ constant, as the case might be, if the parameter takes a list of values. You can use either MQCFOP\_CONTAINS or MQCFOP\_EXCLUDES. For example, if the value 6 is specified with the operator MQCFOP\_CONTAINS, all items where one of the parameter values is 6 are listed.

For example, if you need to filter on queues that are enabled for put operations in your Inquire Queue command, the parameter would be MQIA\_INHIBIT\_PUT and the filter-value would be MQQA\_PUT\_ALLOWED.

The filter value must be a valid value for the parameter being tested.

**C language declaration**

```
typedef struct tagMQCFIF {
    MQLONG  Type;           /* Structure type */
    MQLONG  StructLength; /* Structure length */
    MQLONG  Parameter;     /* Parameter identifier */
    MQLONG  Operator;      /* Operator identifier */
    MQLONG  FilterValue;   /* Filter value */
} MQCFIF;
```

## MQCFIL - PCF integer list parameter

The MQCFIL structure describes an integer-list parameter in a message that is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT\_ADMIN.

The MQCFIL structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT\_PCF (see [Message descriptor for a PCF command](#)). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *StrucLength*, *Count*, and *Values* fields to the values appropriate to the data.

The structure ends with a variable-length array of integers; see the *Values* field in the following section for further details.

### Fields for MQCFIL

#### Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFIL structure describing an integer-list parameter. The value must be:

#### MQCFT\_INTEGER\_LIST

Structure defining an integer list.

#### StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFIL structure, including the array of integers at the end of the structure (the *Values* field). The length must be a multiple of four, and must be sufficient to contain the array; any bytes between the end of the array and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *Values* field:

#### MQCFIL\_STRUC\_LENGTH\_FIXED

Length of fixed part of command format integer-list parameter structure.

#### Parameter (MQLONG)

Parameter identifier.

This identifies the parameter with values that are contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see [“MQCFH - PCF header” on page 1887](#) for details.

The parameter is from the following groups of parameters:

- MQIA\_\*
- MQIACF\_\*
- MQIAMO\_\*
- MQIACH\_\*

#### Count (MQLONG)

Count of parameter values.

This is the number of elements in the *Values* array; it must be zero or greater.

#### Values (MQLONG x Count)

Parameter values.

This is an array of values for the parameter identified by the *Parameter* field. For example, for MQIACF\_Q\_ATTRS, this field is a list of attribute selectors (MQCA\_\* and MQIA\_\* values).

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For the COBOL, PL/I, RPG, and System/390 assembler programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, you must include MQCFIL in a larger structure, and declare additional fields following MQCFIL, to represent the *Values* field as required.

## C language declaration

```
typedef struct tagMQCFIL {
    MQLONG  Type;           /* Structure type */
    MQLONG  StrucLength;    /* Structure length */

## MQCFIN - PCF integer parameter

The MQCFIN structure describes an integer parameter in a message that is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT\_ADMIN.

The MQCFIN structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT\_PCF (see Message descriptor for a PCF command). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *Value* field to the value appropriate to the data.

### Fields for MQCFIN

#### Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFIN structure describing an integer parameter. The value must be:

#### MQCFT\_INTEGER

Structure defining an integer.

#### StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFIN structure. The value must be:

#### MQCFIN\_STRUC\_LENGTH

Length of command format integer-parameter structure.

#### Parameter (MQLONG)

Parameter identifier.

This identifies the parameter with a value that is contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see [“MQCFH - PCF header” on page 1887](#) for details.

The parameter is from the following groups of parameters:

- MQIA\_\*
- MQIACF\_\*
- MQIAMO\_\*
- MQIACH\_\*

#### Value (MQLONG)

Parameter value.

This is the value of the parameter identified by the *Parameter* field.

## C language declaration

```
typedef struct tagMQCFIN {
```

```

MQLONG Type;          /* Structure type */
MQLONG StructLength; /* Structure length */
MQLONG Parameter;    /* Parameter identifier */

## MQCF SF - PCF string filter parameter

The MQCF SF structure describes a string filter parameter. The format name in the message descriptor is MQFMT\_ADMIN.

The MQCF SF structure is used in Inquire commands to provide a filter condition. This filter condition is used to filter the results of the Inquire command and return to the user only those objects that satisfy the filter condition.

On z/OS, a single filter parameter only is allowed. If multiple MQCFIF, MQCF SF and MQCFBF, or MQCFBF, parameters are specified, the PCF command fails with error MQRCCF\_TOO\_MANY\_FILTERS (MQRCCF 3248).

The results of filtering character strings on EBCDIC-based systems might be different from those results achieved on ASCII-based systems. This difference is because comparison of character strings is based on the collating sequence of the internal built-in values representing the characters.

When an MQCF SF structure is present, the Version field in the MQCFH structure at the start of the PCF must be MQCFH\_VERSION\_3 or higher.

### Fields for MQCF SF

#### Type (MQLONG)

Structure type.

This indicates that the structure is an MQCF SF structure describing a string filter parameter. The value must be:

#### **MQCF T\_STRING\_FILTER**

Structure defining a string filter.

#### StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCF SF structure. The value must be:

#### **MQCF SF\_STRUC\_LENGTH**

MQCF SF\_STRUC\_LENGTH is the length, in bytes, of the MQCF SF structure, including the string at the end of the structure (the *FilterValue* field). The length must be a multiple of 4, and must be sufficient to contain the string. Bytes between the end of the string and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *FilterValue* field:

#### **MQCF SF\_STRUC\_LENGTH\_FIXED**

Length of fixed part of command format filter string-parameter structure.

#### Parameter (MQLONG)

Parameter identifier.

This identifies the parameter that is to be filtered on. The value of this identifier depends on the parameter to be filtered on. Any of the parameters which can be used in the Inquire command can be used in this field.

The parameter is from the following groups of parameters:

- MQCA\_\*
- MQCACF\_\*
- MQCAMO\_\*
- MQCACH\_\*

### Operator (MQLONG)

Operator identifier.

This identifies the operator that is being used to evaluate whether the parameter satisfies the filter-value.

Possible values are:

#### **MQCFOP\_GREATER**

Greater than

#### **MQCFOP\_LESS**

Less than

#### **MQCFOP\_EQUAL**

Equal to

#### **MQCFOP\_NOT\_EQUAL**

Not equal to

#### **MQCFOP\_NOT\_LESS**

Greater than or equal to

#### **MQCFOP\_NOT\_GREATER**

Less than or equal to

#### **MQCFOP\_LIKE**

Matches a generic string

#### **MQCFOP\_NOT\_LIKE**

Does not match a generic string

#### **MQCFOP\_CONTAINS**

Contains a specified string. Use MQCFOP\_CONTAINS when filtering on lists of strings.

#### **MQCFOP\_EXCLUDES**

Does not contain a specified string. Use MQCFOP\_EXCLUDES when filtering on lists of strings.

#### **MQCFOP\_CONTAINS\_GEN**

Contains an item which matches a generic string. Use MQCFOP\_CONTAINS\_GEN when filtering on lists of strings.

#### **MQCFOP\_EXCLUDES\_GEN**

Does not contain any item which matches a generic string. Use MQCFOP\_EXCLUDES\_GEN when filtering on lists of strings.

See the *FilterValue* description for details telling you which operators can be used in which circumstances.

### CodedCharSetId (MQLONG)

Coded character set identifier.

This specifies the coded character set identifier of the data in the *FilterValue* field. The following special value can be used:

#### **MQCCSI\_DEFAULT**

Default character set identifier.

The string data is in the character set defined by the *CodedCharSetId* field in the MQ header structure that *precedes* the MQCFH structure, or by the *CodedCharSetId* field in the MQMD if the MQCFH structure is at the start of the message.

### FilterValueLength (MQLONG)

Length of filter-value string.

This is the length, in bytes, of the data in the *FilterValue* field. This parameter must be zero or greater, and does not need to be a multiple of 4.

**Note:**  On z/OS there is a 256 character limit for the filter-value of the MQSC **WHERE** clause. This limit is not in place for other platforms.

## FilterValue (MQCHAR x FilterValueLength)

Filter value.

This specifies the filter-value that must be satisfied. Depending on the parameter, the value and the permitted operators can be:

- An explicit string value.

You can only use the following operators:

- MQCFOP\_GREATER
- MQCFOP\_LESS
- MQCFOP\_EQUAL
- MQCFOP\_NOT\_EQUAL
- MQCFOP\_NOT\_GREATER
- MQCFOP\_NOT\_LESS

- A generic string value. This field is a character string with an asterisk at the end, for example ABC\*. The operator must be either MQCFOP\_LIKE or MQCFOP\_NOT\_LIKE. The characters must be valid for the attribute you are testing. If the operator is MQCFOP\_LIKE, all items where the attribute value begins with the string (ABC in the example) are listed. If the operator is MQCFOP\_NOT\_LIKE, all items where the attribute value does not begin with the string are listed.

- If the parameter takes a list of string values, the operator can be:

- MQCFOP\_CONTAINS
- MQCFOP\_EXCLUDES
- MQCFOP\_CONTAINS\_GEN
- MQCFOP\_EXCLUDES\_GEN

An item in a list of values. The value can be explicit or generic. If it is explicit, use MQCFOP\_CONTAINS or MQCFOP\_EXCLUDES as the operator. For example, if the value DEF is specified with the operator MQCFOP\_CONTAINS, all items where one of the attribute values is DEF are listed. If it is generic, use MQCFOP\_CONTAINS\_GEN or MQCFOP\_EXCLUDES\_GEN as the operator. If ABC\* is specified with the operator MQCFOP\_CONTAINS\_GEN, all items where one of the attribute values begins with ABC are listed.

### Note:

1. If the specified string is shorter than the standard length of the parameter in MQFMT\_ADMIN command messages, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.
2. When the queue manager reads an MQCFSF structure in an MQFMT\_ADMIN message from the command input queue, the queue manager processes the string as though it had been specified on an MQI call. This processing means that within the string, the first null and the characters following it (up to the end of the string) are treated as blanks.
3. On z/OS there is a 256 character limit for the filter-value of the MQSC **WHERE** clause. This limit is not in place for other platforms.

The filter value must be a valid value for the parameter being tested.

## C language declaration

## MQCFSL - PCF string list parameter

The MQCFSL structure describes a string-list parameter in a message which is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT\_ADMIN.

The MQCFSL structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT\_PCF (see Message descriptor for a PCF command). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *StrucLength*, *Count*, *StringLength*, and *Strings* fields to the values appropriate to the data.

The structure ends with a variable-length array of character strings; see the *Strings* field section for further details.

See “Usage notes” on page 1887 for further information about how to use the structure.

## Fields for MQCFSL

### Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFSL structure describing a string-list parameter. The value must be:

#### **MQCFT\_STRING\_LIST**

Structure defining a string list.

### StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFSL structure, including the data at the end of the structure (the *Strings* field). The length must be a multiple of four, and must be sufficient to contain all the strings; any bytes between the end of the strings and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *Strings* field:

#### **MQCFSL\_STRUC\_LENGTH\_FIXED**

Length of fixed part of command format string-list parameter structure.

### Parameter (MQLONG)

Parameter identifier.

This identifies the parameter with values that are contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see “MQCFH - PCF header” on page 1887 for details.

The parameter is from the following groups of parameters:

- MQCA\_\*
- MQCACF\_\*
- MQCAMO\_\*
- MQCACH\_\*

### **CodedCharSetId (MQLONG)**

Coded character set identifier.

This specifies the coded character set identifier of the data in the *Strings* field. The following special value can be used:

#### **MQCCSI\_DEFAULT**

Default character set identifier.

The string data is in the character set defined by the *CodedCharSetId* field in the MQ header structure that *precedes* the MQCFH structure, or by the *CodedCharSetId* field in the MQMD if the MQCFH structure is at the start of the message.

### **Count (MQLONG)**

Count of parameter values.

This is the number of strings present in the *Strings* field; it must be zero or greater.

### **StringLength (MQLONG)**

Length of one string.

This is the length in bytes of one parameter value, that is the length of one string in the *Strings* field; all the strings are this length. The length must be zero or greater, and need not be a multiple of four.

### **Strings (MQCHAR x StringLength x Count)**

String values.

This is a set of string values for the parameter identified by the *Parameter* field. The number of strings is given by the *Count* field, and the length of each string is given by the *StringLength* field. The strings are concatenated together, with no bytes skipped between adjacent strings. The total length of the strings is the length of one string multiplied by the number of strings present (that is, *StringLength* x *Count*).

- In MQFMT\_ADMIN command messages, if the specified string is shorter than the standard length of the parameter, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.
- In MQFMT\_ADMIN response messages, string parameters might be returned padded with blanks to the standard length of the parameter.
- In MQFMT\_EVENT messages, trailing blanks might be omitted from string parameters (that is, the string might be shorter than the standard length of the parameter).

In all cases, *StringLength* gives the length of the string present in the message.

The strings can contain any characters that are in the character set defined by *CodedCharSetId*, and that are valid for the parameter identified by *Parameter*.

**Note:** When the queue manager reads an MQCFSL structure in an MQFMT\_ADMIN message from the command input queue, the queue manager processes each string in the list as though it had been specified on an MQI call. This processing means that within each string, the first null, and the characters following it (up to the end of the string) are treated as blanks.

In responses and all other cases, a null character in a string is treated as normal data, and does not act as a delimiter for the string. This treatment means that when a receiving application reads a MQFMT\_PCF, MQFMT\_EVENT, or MQFMT\_ADMIN message, the receiving application receives all the data specified by the sending application.

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For the COBOL, PL/I, RPG, and System/390 assembler programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, you must include MQCFSL in a larger structure, and declare additional fields following MQCFSL, to represent the *Strings* field as required.

### C language declaration

```

## MQCFST - PCF string parameter

The MQCFST structure describes a string parameter in a message that is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT\_ADMIN.

The MQCFST structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT\_PCF (see [Message descriptor for a PCF command](#)). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *StrucLength*, *StringLength*, and *String* fields to the values appropriate to the data.

The structure ends with a variable-length character string; see the *String* field section for further details.

See [“Usage notes” on page 1887](#) for further information about how to use the structure.

## Fields for MQCFST

### Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFST structure describing a string parameter. The value must be:

#### **MQCFST\_STRING**

Structure defining a string.

### StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFST structure, including the string at the end of the structure (the *String* field). The length must be a multiple of four, and must be sufficient to contain the string; any bytes between the end of the string and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *String* field:

## **MQCFST\_STRUC\_LENGTH\_FIXED**

Length of fixed part of command format string-parameter structure.

### **Parameter (MQLONG)**

Parameter identifier.

This identifies the parameter with a value that is contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see [“MQCFH - PCF header” on page 1887](#) for details.

The parameter is from the following groups of parameters:

- MQCA\_\*
- MQCACF\_\*
- MQCAMO\_\*
- MQCACH\_\*

### **CodedCharSetId (MQLONG)**

Coded character set identifier.

This specifies the coded character set identifier of the data in the *String* field. The following special value can be used:

#### **MQCCSI\_DEFAULT**

Default character set identifier.

The string data is in the character set defined by the *CodedCharSetId* field in the MQ header structure that *precedes* the MQCFH structure, or by the *CodedCharSetId* field in the MQMD if the MQCFH structure is at the start of the message.

### **StringLength (MQLONG)**

Length of string.

This is the length in bytes of the data in the *String* field; it must be zero or greater. This length does not need to be a multiple of four.

### **String (MQCHAR x StringLength)**

String value.

This is the value of the parameter identified by the *Parameter* field:

- In MQFMT\_ADMIN command messages, if the specified string is shorter than the standard length of the parameter, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.
- In MQFMT\_ADMIN response messages, string parameters might be returned padded with blanks to the standard length of the parameter.
- In MQFMT\_EVENT messages, trailing blanks might be omitted from string parameters (that is, the string can be shorter than the standard length of the parameter).

The value of *StringLength* depends on whether, when the specified string is shorter than the standard length, padding blanks have been added to the string. If so, the value of *StringLength* is the sum of the actual length of the string plus the padded blanks.

The string can contain any characters that are in the character set defined by *CodedCharSetId*, and that are valid for the parameter identified by *Parameter*.

**Note:** When the queue manager reads an MQCFST structure in an MQFMT\_ADMIN message from the command input queue, the queue manager processes the string as though it had been specified on an MQI call. This processing means that within the string, the first null and the characters following it (up to the end of the string) are treated as blanks.

In responses and all other cases, a null character in the string is treated as normal data, and does not act as a delimiter for the string. This treatment means that when a receiving application reads a

MQFMT\_PCF, MQFMT\_EVENT, or MQFMT\_ADMIN message, the receiving application receives all the data specified by the sending application.

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For the COBOL, PL/I, and System/390 assembler programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, the user must include MQCFST in a larger structure, and declare an additional field or additional fields following MQCFST, to represent the *String* field as required.

## C language declaration

```
typedef struct tagMQCFST {
    MQLONG  Type;           /* Structure type */
    MQLONG  StructLength;  /* Structure length */
    MQLONG  Parameter;     /* Parameter identifier */
    MQLONG  CodedCharSetId; /* Coded character set identifier */
    MQLONG  StringLength;  /* Length of string */
    MQCHAR  String[1];    /* String value - first
                          character */
} MQCFST;
```

## COBOL language declaration

```
**      MQCFST structure
**      10 MQCFST.
**      Structure type
**      15 MQCFST-TYPE          PIC S9(9) BINARY.
**      Structure length
**      15 MQCFST-STRULENGTH   PIC S9(9) BINARY.
**      Parameter identifier
**      15 MQCFST-PARAMETER    PIC S9(9) BINARY.
**      Coded character set identifier
**      15 MQCFST-CODEDCHARSETID PIC S9(9) BINARY.
**      Length of string
**      15 MQCFST-STRINGLENGTH PIC S9(9) BINARY.
```

## PL/I language declaration ( z/OS only)

```
dcl
  1 MQCFST based,
  3 Type          fixed bin(31), /* Structure type */
  3 StructLength  fixed bin(31), /* Structure length */
  3 Parameter     fixed bin(31), /* Parameter identifier */
  3 CodedCharSetId fixed bin(31), /* Coded character set identifier */
  3 StringLength  fixed bin(31); /* Length of string */
```

## System/390 assembler-language declaration ( z/OS only)

MQCFST	DSECT		
MQCFST_TYPE	DS	F	Structure type
MQCFST_STRULENGTH	DS	F	Structure length
MQCFST_PARAMETER	DS	F	Parameter identifier
MQCFST_CODEDCHARSETID	DS	F	Coded character set identifier

```

## PCF example

The compiled program, written in C language, in the example uses IBM MQ for Windows. It inquires of the default queue manager about a subset of the attributes for all local queues defined to it. It then produces an output file, SAVEQMGR.TST, in the directory from which it was run for use with RUNMQSC.

### Inquire local queue attributes

This following section provides an example of how Programmable Command Formats can be used in a program for administration of IBM MQ queues.

The program is given as an example of using PCFs and has been limited to a simple case. This program is of most use as an example if you are considering the use of PCFs to manage your IBM MQ environment.

### Program listing

```
/*=====*/
/*
/* This is a program to inquire of the default queue manager about the
/* local queues defined to it.
/*
/* The program takes this information and appends it to a file
/* SAVEQMGR.TST which is of a format suitable for RUNMQSC. It could,
/* therefore, be used to re-create or clone a queue manager.
/*
/* It is offered as an example of using Programmable Command Formats (PCFs)
/* as a method for administering a queue manager.
/*
/*=====*/

/* Include standard libraries */
