- MQPUT, MQPUT1 and MQGET to or from a shared queue where the message payload has been offloaded to Db2

z/OS IMSBRIDGE

Stops the sending of messages from IMS bridge queues to OTMA. The IMS connection is not affected. When the tasks that transmit messages to IMS have been terminated, no further messages are sent to IMS until one of the following actions happens:

- OTMA or IMS is stopped and restarted
- IBM MQ is stopped and restarted
- A `RESUME QMGR` command is processed

Return messages from IMS OTMA to the queue manager are unaffected.

To monitor progress of the command, issue the following command and ensure that none of the queues are open:

```
DIS Q(*) CMDSCOPE(qmgr) STGCLASS(bridge_stgclass) IPPROCS
```

If any queue is open, use `DISPLAY QSTATUS` to verify that the MQ-IMS bridge does not have it open.

This parameter is valid only on z/OS.

z/OS LOG

Suspends logging and update activity for the queue manager until a subsequent **RESUME** request is issued. Any unwritten log buffers are externalized, a system checkpoint is taken (non-data sharing environment only), and the BSDS is updated with the high-written RBA before the update activity is suspended. A highlighted message (CSQJ372I) is issued and remains on the system console until update activity has been resumed. Valid on z/OS only. If **LOG** is specified, the command can be issued only from the z/OS system console.

This option is not permitted when a system quiesce is active by either the **ARCHIVE LOG** or **STOP QMGR** command.

Update activity remains suspended until a `RESUME QMGR LOG` or `STOP QMGR` command is issued.

This command must not be used during periods of high activity, or for long periods of time. Suspending update activity can cause timing-related events such as lock timeouts or IBM MQ diagnostic memory dumps when delays are detected.

z/OS **CMDSCOPE**

This parameter applies to z/OS only and specifies how the command runs when the queue manager is a member of a queue sharing group.

..

The command runs on the queue manager on which it was entered. This is the default value.

qmgr-name

The command runs on the queue manager you specify, providing the queue manager is active within the queue sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue sharing group environment and if the command server is enabled.

MODE

Specifies how the suspension of availability is to take effect:

QUIESCE

Other queue managers in the cluster are advised to avoid sending messages to the local queue manager if possible. It does not mean that the queue manager is disabled.

FORCE

All inbound cluster channels from other queue managers in the cluster are stopped forcibly. This occurs only if the queue manager has also been forcibly suspended from all other clusters to which the cluster receiver channel for this cluster belongs.

The **MODE** keyword is permitted only with **CLUSTER** or **CLUSNL**. It is not permitted with the **LOG** or **FACILITY** parameter.

Related reference

[“RESUME QMGR \(resume a cluster queue manager\)” on page 940](#)

Use the MQSC command **RESUME QMGR** to inform other queue managers in a cluster that the local queue manager is available again for processing and can be sent messages. It reverses the action of the **SUSPEND QMGR** command.

[SUSPEND QMGR, RESUME QMGR and clusters](#)

Programmable command formats (PCFs) reference

PCFs define command and reply messages that can be exchanged across a network between a program and any queue manager that supports PCFs. This simplifies queue manager administration and other network administration.

For an introduction to PCFs, see [Introduction to Programmable Command Formats](#).

For the full list of PCFs, see [“Definitions of the Programmable Command Formats” on page 1012](#).

PCF commands and responses have a consistent structure including of a header and any number of parameter structures of defined types. For information about these structures, see [“Structures for PCF commands and responses” on page 1544](#).

For an example PCF, see [“PCF example” on page 1571](#).

- [“Definitions of the Programmable Command Formats” on page 1012](#)
- [“Structures for PCF commands and responses” on page 1544](#)
- [“PCF example” on page 1571](#)

How the PCF definitions are shown

The definitions of the Programmable Command Formats (PCFs) including their commands, responses, parameters, constants, and error codes are shown in a consistent format.

For each PCF command or response, there is a description of what the command or response does, giving the command identifier in parentheses. See [Constants](#) for all values of the command identifier. Each command description starts with a table that identifies the platforms on which the command is valid. For additional, more detailed, usage notes for each command, see the corresponding command description in the [“Definitions of the Programmable Command Formats” on page 1012](#).

IBM MQ products, other than IBM MQ for z/OS, can use the IBM MQ Administration Interface (MQAI), which provides a simplified way for applications written in the C and Visual Basic programming language to build and send PCF commands. For information about the MQAI see the second section of this topic.

Commands

The *required parameters* and the *optional parameters* are listed.

[Multi](#) On [Multiplatforms](#), the parameters must occur in this order:

1. All required parameters, in the order stated, followed by
2. Optional parameters as required, in any order, unless noted in the PCF definition.

[z/OS](#) On z/OS, the parameters can be in any order.

Responses

The response data attribute is *always returned* whether it is requested or not. This parameter is required to identify, uniquely, the object when there is a possibility of multiple reply messages being returned.

The other attributes shown are *returned if requested* as optional parameters on the command. The response data attributes are not returned in a defined order.

Parameters and response data

Each parameter name is followed by its structure name in parentheses (details are given in [“Structures for PCF commands and responses” on page 1544](#)). The parameter identifier is given at the beginning of the description.

Constants

For the values of constants used by PCF commands and responses see [Constants](#).

Informational messages

On z/OS, a number of command responses return a structure, MQIACF_COMMAND_INFO, with values that provide information about the command.

MQIACF_COMMAND_INFO value	Meaning
MQCMDI_CMDScope_ACCEPTED	A command that specified <i>CommandScope</i> was entered. It has been passed to the one or more requested queue managers for processing
MQCMDI_CMDScope_GENERATED	A command that specified <i>CommandScope</i> was generated in response to the command originally entered
MQCMDI_CMDScope_COMPLETED	Processing for the command that specified <i>CommandScope</i> - either entered or generated by another command - has completed successfully on all requested queue managers
MQCMDI_QSG_DISP_COMPLETED	Processing for the command that refers to an object with the indicated disposition has completed successfully
MQCMDI_COMMAND_ACCEPTED	Initial processing for the command has completed successfully. The command requires further action by the channel initiator, for which a request has been queued. Messages reporting the success or otherwise of the action are be sent to the command issuer later
MQCMDI_CLUSTER_REQUEST_QUEUED	Initial processing for the command has completed successfully. The command requires further action by the cluster repository manager, for which a request has been queued
MQCMDI_CHANNEL_INIT_STARTED	A Start Channel Initiator command has been issued and the channel initiator address space has been started successfully
MQCMDI_RECOVER_STARTED	The queue manager has successfully started a task to process the Recover CF Structure command for the named structure
MQCMDI_BACKUP_STARTED	The queue manager has successfully started a task to process the Backup CF Structure command for the named structure
MQCMDI_RECOVER_COMPLETED	The named CF structure has been recovered successfully. The structure is available for use again
MQCMDI_SEC_TIMER_ZERO	The Change Security command was entered with the <i>SecurityInterval</i> attribute set to 0. This means that no user timeouts occur

Table 190. MQIACF_COMMAND_INFO values (continued)

MQIACF_COMMAND_INFO value	Meaning
MQCMDI_REFRESH_CONFIGURATION	A Change Queue Manager command has been issued that enables configuration events. Event messages need to be generated to ensure that the configuration information is complete and up to date
MQCMDI_IMS_BRIDGE_SUSPENDED	The MQ-IMS bridge facility is suspended.
MQCMDI_DB2_SUSPENDED	The connection to Db2 is suspended
MQCMDI_DB2_OBSOLETE_MSGS	Obsolete Db2 messages exist in the queue sharing group

Error codes

 In z/OS, PCF commands can return MQRC reason codes instead of MQRCCF codes

MQRCCF codes are used in AIX, Linux, and Windows. At the end of most command format definitions, there is a list of error codes that might be returned by that command.

Error codes applicable to all commands

In addition to those error codes listed under each command format, any command might return the following error codes in the response format header (descriptions of the MQRC_* error codes are given in the [Messages and reason codes](#)  and [IBM MQ for z/OS messages, completion, and reason codes](#) documentation):

Reason (MQLONG)

The value can be any of the following values:

MQRC_NONE

(0, X'000') No reason to report.

MQRC_MSG_TOO_BIG_FOR_Q

(2030, X'7EE') Message length greater than maximum for queue.

MQRC_CONNECTION_BROKEN

(2009, X'7D9') Connection to queue manager lost.

MQRC_NOT_AUTHORIZED

(2035, X'7F3') Not authorized for access.

MQRC_SELECTOR_ERROR

(2067, X'813') Attribute selector not valid.

MQRC_STORAGE_NOT_AVAILABLE

(2071, X'817') Insufficient storage available.

MQRC_UNKNOWN_OBJECT_NAME

(2085, X'825') Unknown object name.

MQRCCF_ATTR_VALUE_ERROR

Attribute value not valid.

MQRCCF_CFBF_FILTER_VAL_LEN_ERROR

Filter value length not valid.

MQRCCF_CFBF_LENGTH_ERROR

Structure length not valid.

MQRCCF_CFBF_OPERATOR_ERROR

Operator error.

MQRCCF_CFBF_PARM_ID_ERROR
Parameter identifier not valid.

MQRCCF_CFBS_DUPLICATE_PARM
Duplicate parameter.

MQRCCF_CFBS_LENGTH_ERROR
Structure length not valid.

MQRCCF_CFBS_PARM_ID_ERROR
Parameter identifier not valid.

MQRCCF_CFBS_STRING_LENGTH_ERROR
String length not valid.

MQRCCF_CFGR_LENGTH_ERROR
Structure length not valid.

MQRCCF_CFGR_PARM_COUNT_ERROR
Parameter count not valid.

MQRCCF_CFGR_PARM_ID_ERROR
Parameter identifier not valid.

MQRCCF_CFH_COMMAND_ERROR
Command identifier not valid.

MQRCCF_CFH_CONTROL_ERROR
Control option not valid.

MQRCCF_CFH_LENGTH_ERROR
Structure length not valid.

MQRCCF_CFH_MSG_SEQ_NUMBER_ERR
Message sequence number not valid.

MQRCCF_CFH_PARM_COUNT_ERROR
Parameter count not valid.

MQRCCF_CFH_TYPE_ERROR
Type not valid.

MQRCCF_CFH_VERSION_ERROR
Structure version number is not valid.

MQRCCF_CFIF_LENGTH_ERROR
Structure length not valid.

MQRCCF_CFIF_OPERATOR_ERROR
Operator error.

MQRCCF_CFIF_PARM_ID_ERROR
Parameter identifier not valid.

MQRCCF_CFIL_COUNT_ERROR
Count of parameter values not valid.

MQRCCF_CFIL_DUPLICATE_VALUE
Duplicate parameter.

MQRCCF_CFIL_LENGTH_ERROR
Structure length not valid.

MQRCCF_CFIL_PARM_ID_ERROR
Parameter identifier not valid.

MQRCCF_CFIN_DUPLICATE_PARM
Duplicate parameter.

MQRCCF_CFIN_LENGTH_ERROR
Structure length not valid.

MQRCCF_CFIN_PARM_ID_ERROR
Parameter identifier not valid.

MQRCCF_CFSF_FILTER_VAL_LEN_ERROR
Filter value length not valid.

MQRCCF_CFSF_LENGTH_ERROR
Structure length not valid.

MQRCCF_CFSF_OPERATOR_ERROR
Operator error.

MQRCCF_CFSF_PARM_ID_ERROR
Parameter identifier not valid.

MQRCCF_CFSL_COUNT_ERROR
Count of parameter values not valid.

MQRCCF_CFSL_DUPLICATE_PARM
Duplicate parameter.

MQRCCF_CFSL_LENGTH_ERROR
Structure length not valid.

MQRCCF_CFSL_PARM_ID_ERROR
Parameter identifier not valid.

MQRCCF_CFSL_STRING_LENGTH_ERROR
String length value not valid.

MQRCCF_CFSL_TOTAL_LENGTH_ERROR
Total string length error.

MQRCCF_CFST_CONFLICTING_PARM
Conflicting parameters.

MQRCCF_CFST_DUPLICATE_PARM
Duplicate parameter.

MQRCCF_CFST_LENGTH_ERROR
Structure length not valid.

MQRCCF_CFST_PARM_ID_ERROR
Parameter identifier not valid.

MQRCCF_CFST_STRING_LENGTH_ERROR
String length value not valid.

MQRCCF_COMMAND_FAILED
Command failed.

MQRCCF_ENCODING_ERROR
Encoding error.

MQRCCF_MD_FORMAT_ERROR
Format not valid.

MQRCCF_MSG_SEQ_NUMBER_ERROR
Message sequence number not valid.

MQRCCF_MSG_TRUNCATED
Message truncated.

MQRCCF_MSG_LENGTH_ERROR
Message length not valid.

MQRCCF_OBJECT_NAME_ERROR
Object name not valid.

MQRCCF_OBJECT_OPEN
Object is open.

MQRCCF_PARM_COUNT_TOO_BIG
Parameter count too large.

MQRCCF_PARM_COUNT_TOO_SMALL
Parameter count too small.

MQRCCF_PARM_SEQUENCE_ERROR

Parameter sequence not valid.

MQRCCF_PARM_SYNTAX_ERROR

Syntax error found in parameter.

MQRCCF_STRUCTURE_TYPE_ERROR

Structure type not valid.

MQRCCF_UNKNOWN_OBJECT_NAME

Unknown object name.

PCF commands and responses in groups

In the main navigation for this product documentation, the PCF commands and data responses are given in alphabetical order. This topic gives an alternative index, by grouping the PCF commands by functional area.

Authentication Information commands

- [“Change, Copy, and Create Authentication Information Object” on page 1026](#)
- [“MQCMD_DELETE_AUTH_INFO \(Delete Authentication Information Object\)” on page 1166](#)
- [“MQCMD_INQUIRE_AUTH_INFO \(Inquire Authentication Information Object\)” on page 1193](#)
- [“MQCMD_INQUIRE_AUTH_INFO_NAMES \(Inquire Authentication Information Object Names\)” on page 1199](#)

Authority Record commands

- [“MQCMD_DELETE_AUTH_REC \(Delete Authority Record\) on Multiplatforms” on page 1167](#)
- [“MQCMD_INQUIRE_AUTH_RECS \(Inquire Authority Records\) on Multiplatforms” on page 1202](#)
- [“MQCMD_INQUIRE_AUTH_SERVICE \(Inquire Authority Service\) on Multiplatforms” on page 1207](#)
- [“MQCMD_INQUIRE_ENTITY_AUTH \(Inquire Entity Authority\) on Multiplatforms” on page 1307](#)
- [“MQCMD_SET_AUTH_REC \(Set Authority Record\) on Multiplatforms” on page 1510](#)

CF commands

- [“MQCMD_BACKUP_CF_STRUC \(Backup CF Structure\) on z/OS” on page 1131](#)
- [“Change, Copy, and Create CF Structure on z/OS” on page 1035](#)
- [“MQCMD_DELETE_CF_STRUC \(Delete CF Structure\) on z/OS” on page 1169](#)
- [“MQCMD_INQUIRE_CF_STRUC \(Inquire CF Structure\) on z/OS” on page 1209](#)
- [“MQCMD_INQUIRE_CF_STRUC_NAMES \(Inquire CF Structure Names\) on z/OS” on page 1213](#)
- [“MQCMD_INQUIRE_CF_STRUC_STATUS \(Inquire CF Structure Status\) on z/OS” on page 1214](#)
- [“MQCMD_RECOVER_CF_STRUC \(Recover CF Structure\) on z/OS” on page 1487](#)

Channel commands

- [“Change, Copy, and Create Channel” on page 1040](#)
- [“MQCMD_DELETE_CHANNEL \(Delete Channel\)” on page 1169](#)
- [“MQCMD_INQUIRE_CHANNEL \(Inquire Channel\)” on page 1219](#)
-  [“MQCMD_INQUIRE_CHANNEL_INIT \(Inquire Channel Initiator\) on z/OS” on page 1240](#)
- [“MQCMD_INQUIRE_CHANNEL_NAMES \(Inquire Channel Names\)” on page 1242](#)
- [“MQCMD_INQUIRE_CHANNEL_STATUS \(Inquire Channel Status\)” on page 1245](#)

- [“MQCMD_PING_CHANNEL \(Ping Channel\)” on page 1483](#)
- [“MQCMD_RESET_CHANNEL \(Reset Channel\)” on page 1494](#)
- [“MQCMD_RESOLVE_CHANNEL \(Resolve Channel\)” on page 1503](#)
- [“MQCMD_START_CHANNEL \(Start Channel\)” on page 1525](#)
-  [“MQCMD_START_CHANNEL_INIT \(Start Channel Initiator\)” on page 1529](#)
- [“MQCMD_STOP_CHANNEL \(Stop Channel\)” on page 1533](#)
-  [“MQCMD_STOP_CHANNEL_INIT \(Stop Channel Initiator\) on z/OS” on page 1538](#)

Channel commands (MQTT)

- [“Change, Copy, and Create Channel \(MQTT\) on AIX, Linux, and Windows” on page 1076](#)
- [“MQCMD_DELETE_CHANNEL \(delete channel\) MQTT on AIX, Linux, and Windows” on page 1171](#)
- [“MQCMD_INQUIRE_CHANNEL \(Inquire Channel\) MQTT on AIX, Linux, and Windows” on page 1227](#)
- [“MQCMD_INQUIRE_CHANNEL_STATUS \(Inquire Channel Status\) MQTT on AIX, Linux, and Windows” on page 1258](#)
- [“MQCMD_PURGE_CHANNEL \(Purge Channel\) on AIX, Linux, and Windows” on page 1487](#)
- [“MQCMD_START_CHANNEL \(Start Channel\) MQTT on AIX, Linux, and Windows” on page 1528](#)
- [“MQCMD_STOP_CHANNEL \(Stop Channel\) MQTT on AIX, Linux, and Windows” on page 1537](#)

Channel Authentication commands

- [“MQCMD_INQUIRE_CHLAUTH_RECS \(Inquire Channel Authentication Records\)” on page 1275](#)
- [“MQCMD_SET_CHLAUTH_REC \(Set Channel Authentication Record\)” on page 1514](#)

Channel Listener commands

- [“Change, Copy, and Create Channel Listener on Multiplatforms” on page 1081](#)
- [“MQCMD_DELETE_LISTENER \(Delete Channel Listener\) on Multiplatforms” on page 1172](#)
- [“MQCMD_INQUIRE_LISTENER \(Inquire Channel Listener\) on Multiplatforms” on page 1314](#)
- [“MQCMD_INQUIRE_LISTENER_STATUS \(Inquire Channel Listener Status\) on Multiplatforms” on page 1318](#)
- [“MQCMD_START_CHANNEL_LISTENER \(Start Channel Listener\)” on page 1530](#)
- [“MQCMD_STOP_CHANNEL_LISTENER \(Stop Channel Listener\)” on page 1539](#)

Cluster commands

- [“MQCMD_INQUIRE_CLUSTER_Q_MGR \(Inquire Cluster Queue Manager\)” on page 1281](#)
- [“MQCMD_REFRESH_CLUSTER \(Refresh Cluster\)” on page 1488](#)
- [“MQCMD_RESET_CLUSTER \(Reset Cluster\)” on page 1496](#)
- [“MQCMD_RESUME_Q_MGR_CLUSTER \(Resume Queue Manager Cluster\)” on page 1505](#)
- [“MQCMD_SUSPEND_Q_MGR_CLUSTER \(Suspend Queue Manager Cluster\)” on page 1543](#)

Communication Information commands

- [“Change, Copy, and Create Communication Information Object on Multiplatforms” on page 1083](#)
- [“MQCMD_DELETE_COMM_INFO \(Delete Communication Information Object\) on Multiplatforms” on page 1171](#)
- [“MQCMD_INQUIRE_COMM_INFO \(Inquire Communication Information Object\) on Multiplatforms” on page 1292](#)

Connection commands

- [“MQCMD_INQUIRE_CONNECTION \(Inquire Connection\)” on page 1296](#)
- [“MQCMD_STOP_CONNECTION \(Stop Connection\) on Multiplatforms” on page 1540](#)

Escape command

- [“MQCMD_ESCAPE \(Escape\) on Multiplatforms” on page 1181](#)

Namelist commands

- [“Change, Copy, and Create Namelist” on page 1087](#)
- [“MQCMD_DELETE_NAMELIST \(Delete Namelist\)” on page 1172](#)
- [“MQCMD_INQUIRE_NAMELIST \(Inquire Namelist\)” on page 1327](#)
- [“MQCMD_INQUIRE_NAMELIST_NAMES \(Inquire Namelist Names\)” on page 1330](#)

Process commands

- [“Change, Copy, and Create Process” on page 1090](#)
- [“MQCMD_DELETE_PROCESS \(Delete Process\)” on page 1173](#)
- [“MQCMD_INQUIRE_PROCESS \(Inquire Process\)” on page 1332](#)
- [“MQCMD_INQUIRE_PROCESS_NAMES \(Inquire Process Names\)” on page 1335](#)

Publish/subscribe commands

- [“Change, Copy, and Create Subscription” on page 1118](#)
- [“Change, Copy, and Create Topic” on page 1122](#)
- [“MQCMD_CLEAR_TOPIC_STRING \(Clear Topic String\)” on page 1165](#)
- [“MQCMD_DELETE_SUBSCRIPTION \(Delete Subscription\)” on page 1179](#)
- [“MQCMD_DELETE_TOPIC \(Delete Topic\)” on page 1180](#)
- [“MQCMD_INQUIRE_PUBSUB_STATUS \(Inquire Publish/Subscribe Status\)” on page 1339](#)
- [“MQCMD_INQUIRE_SUBSCRIPTION \(Inquire Subscription\)” on page 1443](#)
- [“MQCMD_INQUIRE_SUB_STATUS \(Inquire Subscription Status\)” on page 1451](#)
- [“MQCMD_INQUIRE_TOPIC \(Inquire Topic\)” on page 1458](#)
- [“MQCMD_INQUIRE_TOPIC_NAMES \(Inquire Topic Names\)” on page 1468](#)
- [“MQCMD_INQUIRE_TOPIC_STATUS \(Inquire Topic Status\)” on page 1469](#)

Queue commands

- [“Change, Copy, and Create Queue” on page 1093](#)
- [“MQCMD_CLEAR_Q \(Clear Queue\)” on page 1164](#)
- [“MQCMD_DELETE_Q \(Delete Queue\)” on page 1175](#)
- [“MQCMD_INQUIRE_Q \(Inquire Queue\)” on page 1343](#)
- [“MQCMD_INQUIRE_Q_NAMES \(Inquire Queue Names\)” on page 1413](#)
- [“MQCMD_INQUIRE_Q_STATUS \(Inquire Queue Status\)” on page 1415](#)
-  [“MQCMD_MOVE_Q \(Move Queue\) on z/OS” on page 1482](#)
- [“MQCMD_RESET_Q_STATS \(Reset Queue Statistics\)” on page 1500](#)

Queue Manager commands

- [“MQCMD_CHANGE_Q_MGR \(Change Queue Manager\)” on page 1134](#)
- [“MQCMD_INQUIRE_Q_MGR \(Inquire Queue Manager\)” on page 1363](#)
- [“MQCMD_INQUIRE_Q_MGR_STATUS \(Inquire Queue Manager Status\) on Multiplatforms” on page 1402](#)
- [“MQCMD_PING_Q_MGR \(Ping Queue Manager\) on Multiplatforms” on page 1486](#)
- [“MQCMD_REFRESH_Q_MGR \(Refresh Queue Manager\)” on page 1489](#)
- [“MQCMD_RESET_Q_MGR \(Reset Queue Manager\)” on page 1497](#)
-  [“MQCMD_RESUME_Q_MGR \(Resume Queue Manager\) on z/OS” on page 1505](#)
-  [“MQCMD_SUSPEND_Q_MGR \(Suspend Queue Manager\) on z/OS” on page 1542](#)

Security commands

-  [“MQCMD_CHANGE_SECURITY \(Change Security\) on z/OS” on page 1163](#)
-  [“MQCMD_INQUIRE_SECURITY \(Inquire Security\) on z/OS” on page 1427](#)
- [“MQCMD_REFRESH_SECURITY \(Refresh Security\)” on page 1492](#)
-  [“MQCMD_REVERIFY_SECURITY \(Reverify Security\) on z/OS” on page 1506](#)

Service commands

- [“Change, Copy, and Create Service on Multiplatforms” on page 1113](#)
- [“MQCMD_DELETE_SERVICE \(Delete Service\) on Multiplatforms” on page 1178](#)
- [“MQCMD_INQUIRE_SERVICE \(Inquire Service\) on Multiplatforms” on page 1429](#)
- [“MQCMD_INQUIRE_SERVICE_STATUS \(Inquire Service Status\) on Multiplatforms” on page 1432](#)
- [“MQCMD_START_SERVICE \(Start Service\) on Multiplatforms” on page 1532](#)
- [“MQCMD_STOP_SERVICE \(Stop Service\) on Multiplatforms” on page 1541](#)

SMDS commands

-  [“MQCMD_CHANGE_SMDS \(Change SMDS\) on z/OS” on page 1163](#)
- [“MQCMD_INQUIRE_SMDS \(Inquire SMDS\) on z/OS” on page 1435](#)
- [“MQCMD_INQUIRE_SMDSCONN \(Inquire SMDS Connection\) on z/OS” on page 1436](#)
- [“MQCMD_RESET_SMDS \(Reset shared message data sets\) on z/OS” on page 1502](#)
- [“MQCMD_START_SMDSCONN \(Start SMDS Connection\) on z/OS” on page 1532](#)
- [“MQCMD_STOP_SMDSCONN \(stop shared message data sets connection\) on z/OS” on page 1541](#)

Storage class commands

-  [“Change, Copy, and Create Storage Class on z/OS” on page 1115](#)
- [“MQCMD_DELETE_STG_CLASS \(Delete Storage Class\) on z/OS” on page 1178](#)
- [“MQCMD_INQUIRE_STG_CLASS \(Inquire Storage Class\) on z/OS” on page 1438](#)
- [“MQCMD_INQUIRE_STG_CLASS_NAMES \(Inquire Storage Class Names\) on z/OS” on page 1441](#)

System commands

z/OS

- [“MQCMD_INQUIRE_ARCHIVE \(Inquire Archive\) on z/OS” on page 1189](#)
- [“MQCMD_SET_ARCHIVE \(Set Archive\) on z/OS” on page 1507](#)
- [“MQCMD_INQUIRE_QSG \(Inquire Group\) on z/OS” on page 1312](#)
- [“MQCMD_INQUIRE_LOG \(Inquire Log\) on z/OS” on page 1322](#)
- [“MQCMD_SET_LOG \(Set Log\) on z/OS” on page 1521](#)
- [“MQCMD_INQUIRE_SYSTEM \(Inquire System\) on z/OS” on page 1454](#)
- [“MQCMD_SET_SYSTEM \(Set System\) on z/OS” on page 1523](#)
- [“MQCMD_INQUIRE_USAGE \(Inquire Usage\) on z/OS” on page 1476](#)

Data responses to commands

- [“MQCMD_ESCAPE \(Escape\) Response on Multiplatforms” on page 1182](#)
- **z/OS** [“MQCMD_INQUIRE_ARCHIVE \(Inquire Archive\) Response on z/OS” on page 1190](#)
- [“MQCMD_INQUIRE_AUTH_INFO \(Inquire Authentication Information Object\) Response” on page 1196](#)
- [“MQCMD_INQUIRE_AUTH_INFO_NAMES \(Inquire Authentication Information Object Names\) Response” on page 1201](#)
- [“MQCMD_INQUIRE_AUTH_RECS \(Inquire Authority Records\) Response on Multiplatforms” on page 1205](#)
- [“MQCMD_INQUIRE_AUTH_SERVICE \(Inquire Authority Service\) Response on Multiplatforms” on page 1208](#)
- **z/OS** [“MQCMD_INQUIRE_CF_STRUC \(Inquire CF Structure\) Response on z/OS” on page 1210](#)
- **z/OS** [“MQCMD_INQUIRE_CF_STRUC_NAMES \(Inquire CF Structure Names\) Response on z/OS” on page 1214](#)
- **z/OS** [“MQCMD_INQUIRE_CF_STRUC_STATUS \(Inquire CF Structure Status\) Response on z/OS” on page 1215](#)
- [“MQCMD_INQUIRE_CHANNEL \(Inquire Channel\) Response” on page 1228](#)
- [“MQCMD_INQUIRE_CHLAUTH_RECS \(Inquire Channel Authentication Records\) Response” on page 1278](#)
- **z/OS** [“MQCMD_INQUIRE_CHANNEL_INIT \(Inquire Channel Initiator\) Response on z/OS” on page 1240](#)
- [“MQCMD_INQUIRE_LISTENER \(Inquire Channel Listener\) Response on Multiplatforms” on page 1316](#)
- [“MQCMD_INQUIRE_LISTENER_STATUS \(Inquire Channel Listener Status\) Response on Multiplatforms” on page 1320](#)
- [“MQCMD_INQUIRE_CHANNEL_NAMES \(Inquire Channel Names\) Response” on page 1244](#)
- [“MQCMD_INQUIRE_CHANNEL_STATUS \(Inquire Channel Status\) Response” on page 1260](#)
- [“MQCMD_INQUIRE_CHANNEL_STATUS \(Inquire Channel Status\) Response MQTT on AIX, Linux, and Windows” on page 1273](#)
- [“MQCMD_INQUIRE_CLUSTER_Q_MGR \(Inquire Cluster Queue Manager\) Response” on page 1285](#)
- [“MQCMD_INQUIRE_COMM_INFO \(Inquire Communication Information Object\) Response on Multiplatforms” on page 1294](#)
- [“MQCMD_INQUIRE_CONNECTION \(Inquire Connection\) Response” on page 1300](#)
- [“MQCMD_INQUIRE_ENTITY_AUTH \(Inquire Entity Authority\) Response on Multiplatforms” on page 1309](#)

-  [“MQCMD_INQUIRE_QSG \(Inquire Group\) Response on z/OS” on page 1312](#)
-  [“MQCMD_INQUIRE_LOG \(Inquire Log\) Response on z/OS” on page 1322](#)
- [“MQCMD_INQUIRE_NAMELIST \(Inquire Namelist\) Response” on page 1329](#)
- [“MQCMD_INQUIRE_NAMELIST_NAMES \(Inquire Namelist Names\) Response” on page 1331](#)
- [“MQCMD_INQUIRE_PROCESS \(Inquire Process\) Response” on page 1334](#)
- [“MQCMD_INQUIRE_PROCESS_NAMES \(Inquire Process Names\) Response” on page 1336](#)
- [“MQCMD_INQUIRE_PUBSUB_STATUS \(Inquire Publish/Subscribe Status\) Response” on page 1340](#)
- [“MQCMD_INQUIRE_Q \(Inquire Queue\) Response” on page 1352](#)
- [“MQCMD_INQUIRE_Q_MGR \(Inquire Queue Manager\) Response” on page 1374](#)
- [“MQCMD_INQUIRE_Q_MGR_STATUS \(Inquire Queue Manager Status\) Response on Multiplatforms” on page 1407](#)
- [“MQCMD_INQUIRE_Q_NAMES \(Inquire Queue Names\) Response” on page 1414](#)
- [“MQCMD_RESET_Q_STATS \(Reset Queue Statistics\) Response” on page 1501](#)
- [“MQCMD_INQUIRE_Q_STATUS \(Inquire Queue Status\) Response” on page 1420](#)
-  [“MQCMD_INQUIRE_SECURITY \(Inquire Security\) Response on z/OS” on page 1427](#)
- [“MQCMD_INQUIRE_SERVICE \(Inquire Service\) Response on Multiplatforms” on page 1430](#)
- [“MQCMD_INQUIRE_SERVICE_STATUS \(Inquire Service Status\) Response on Multiplatforms” on page 1433](#)
-  [“MQCMD_INQUIRE_STG_CLASS \(Inquire Storage Class\) Response on z/OS” on page 1440](#)
-  [“MQCMD_INQUIRE_STG_CLASS_NAMES \(Inquire Storage Class Names\) Response on z/OS” on page 1443](#)
-  [“MQCMD_INQUIRE_SMDS \(Inquire SMDS\) Response on z/OS” on page 1435](#)
-  [“MQCMD_INQUIRE_SMDSCONN \(Inquire SMDS Connection\) Response on z/OS” on page 1437](#)
- [“MQCMD_INQUIRE_SUBSCRIPTION \(Inquire Subscription\) Response” on page 1446](#)
- [“MQCMD_INQUIRE_SUB_STATUS \(Inquire Subscription Status\) Response” on page 1452](#)
-  [“MQCMD_INQUIRE_SYSTEM \(Inquire System\) Response on z/OS” on page 1454](#)
- [“MQCMD_INQUIRE_TOPIC \(Inquire Topic\) Response” on page 1461](#)
- [“MQCMD_INQUIRE_TOPIC_NAMES \(Inquire Topic Names\) Response” on page 1469](#)
- [“MQCMD_INQUIRE_TOPIC_STATUS \(Inquire Topic Status\) Response” on page 1471](#)
-  [“MQCMD_INQUIRE_USAGE \(Inquire Usage\) Response on z/OS” on page 1477](#)

Change, Copy, and Create Authentication Information Object

The Change authentication information PCF command changes attributes of an existing authentication information object. The Create and Copy authentication information commands create new authentication information objects - the Copy command uses attribute values of an existing object.

The Change authentication information (MQCMD_CHANGE_AUTH_INFO) command changes the specified attributes in an authentication information object. For any optional parameters that are omitted, the value does not change.

The Copy authentication information (MQCMD_COPY_AUTH_INFO) command creates new authentication information object using, for attributes not specified in the command, the attribute values of an existing authentication information object.

The Create authentication information (MQCMD_CREATE_AUTH_INFO) command creates an authentication information object. Any attributes that are not defined explicitly are set to the default values on the destination queue manager. A system default authentication information object exists and default values are taken from it.

Required parameters (Change authentication information)

AuthInfoName (MQCFST)

The authentication information object name (parameter identifier: MQCA_AUTH_INFO_NAME).

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

AuthInfoType (MQCFIN)

The type of authentication information object (parameter identifier: MQIA_AUTH_INFO_TYPE).

The value can be:

MQAIT_CRL_LDAP

This defines this authentication information object as specifying an LDAP server containing Certificate Revocation Lists.

MQAIT_OCSP

This value defines this authentication information object as specifying certificate revocation checking using OCSP.

AuthInfoType MQAIT_OCSP does not apply for use on IBM i or z/OS queue managers, but it can be specified on those platforms to be copied to the client channel definition table for client use.

MQAIT_IDPW_OS

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through the operating system.

MQAIT_IDPW_LDAP

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through an LDAP server.

Important: This option is not valid on z/OS.

See [Securing IBM MQ](#) for more information.

Required parameters (Copy authentication information)

FromAuthInfoName (MQCFST)

The name of the authentication information object definition to be copied from (parameter identifier: MQCACF_FROM_AUTH_INFO_NAME).

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR or MQQSGD_COPY to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToAuthInfoName* and the disposition of MQQSGD_GROUP is searched for to copy from.

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

ToAuthInfoName (MQCFST)

The name of the authentication information object to copy to (parameter identifier: MQCACF_TO_AUTH_INFO_NAME).

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

AuthInfoType (MQCFIN)

The type of authentication information object (parameter identifier: MQIA_AUTH_INFO_TYPE). The value must match the AuthInfoType of the authentication information object from which you are copying.

The value can be:

MQAIT_CRL_LDAP

This value defines this authentication information object as specifying Certificate Revocation Lists that are held on LDAP.

MQAIT_OCSP

This value defines this authentication information object as specifying certificate revocation checking using OCSP.

MQAIT_IDPW_OS

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through the operating system.

MQAIT_IDPW_LDAP

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through an LDAP server.

Important: This option is not valid on z/OS.

See [Securing IBM MQ](#) for more information.

Required parameters (Create authentication information)**AuthInfoName (MQCFST)**

Authentication information object name (parameter identifier: MQCA_AUTH_INFO_NAME).

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

AuthInfoType (MQCFIN)

The type of authentication information object (parameter identifier: MQIA_AUTH_INFO_TYPE).

The following values are accepted:

MQAIT_CRL_LDAP

This value defines this authentication information object as specifying an LDAP server containing Certificate Revocation Lists.

MQAIT_OCSP

This value defines this authentication information object as specifying certificate revocation checking using OCSP.

An authentication information object with AuthInfoType MQAIT_OCSP does not apply for use on IBM i or z/OS queue managers, but it can be specified on those platforms to be copied to the client channel definition table for client use.

MQAIT_IDPW_OS

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through the operating system.

MQAIT_IDPW_LDAP

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through an LDAP server.

Important: This option is not valid on z/OS.

See [Securing IBM MQ](#) for more information.

Optional parameters (Change, Copy, and Create Authentication Information Object)**AdoptContext (MQCFIN)**

Whether to use the presented credentials as the context for this application (parameter identifier MQIA_ADOPT_CONTEXT). This means that they are used for authorization checks, shown on administrative displays, and appear in messages.

MQADPCTX_YES

The user ID presented in the MQCSP structure, which has been successfully validated by password, is adopted as the context to use for this application. Therefore, this user ID will be the credentials checked for authorization to use IBM MQ resources.

If the user ID presented is an LDAP user ID, and authorization checks are done using operating system user IDs, the `ShortUser` associated with the user entry in LDAP will be adopted as the credentials for authorization checks to be done against.

MQADPCTX_NO

Authentication will be performed on the user ID and password presented in the MQCSP structure, but then the credentials will not be adopted for further use. Authorization will be performed using the user ID the application is running under.

This attribute is only valid for **AuthInfoType** of `MQAIT_IDPW_OS` and `MQAIT_IDPW_LDAP`.

The maximum length is `MQIA_ADOPT_CONTEXT_LENGTH`.

AuthInfoConnName (MQCFST)

The connection name of the authentication information object (parameter identifier: `MQCA_AUTH_INFO_CONN_NAME`).

This parameter is relevant only when `AuthInfoType` is set to `MQAIT_CRL_LDAP` or `MQAIT_IDPW_LDAP`, when it is required.

When used with an `AuthInfoType` of `MQAIT_IDPW_LDAP`, this can be a comma separated list of connection names.

 On Multiplatforms, the maximum length is `MQ_AUTH_INFO_CONN_NAME_LENGTH`.

 On z/OS, the maximum length is `MQ_LOCAL_ADDRESS_LENGTH`.

AuthInfoDesc (MQCFST)

The description of the authentication information object (parameter identifier: `MQCA_AUTH_INFO_DESC`).

The maximum length is `MQ_AUTH_INFO_DESC_LENGTH`.

AuthenticationMethod (MQCFIN)

Authentication methods for user passwords (parameter identifier: `MQIA_AUTHENTICATION_METHOD`). Possible values are:

MQAUTHENTICATE_OS

Use the traditional UNIX password verification method

This is the default value.

MQAUTHENTICATE_PAM

Use the Pluggable Authentication Method to authenticate the user passwords.

You can set the PAM value only on AIX and Linux platforms.

This attribute is valid only for an **AuthInfoType** of `MQAIT_IDPW_OS`, and is not valid on IBM MQ for z/OS.

AuthorizationMethod (MQCFIN)

Authorization methods for the queue manager (parameter identifier: `MQIA_LDAP_AUTHORMD`). Possible values are:

MQLDAP_AUTHORMD_OS

Use operating system groups to determine permissions associated with a user.

This is how IBM MQ has previously worked, and is the default value.

MQLDAP_AUTHORMD_SEARCHGRP

A group entry in the LDAP repository contains an attribute listing the Distinguished Name of all the users belonging to that group. Membership is indicated by the attribute defined in [FindGroup](#). This value is typically *member* or *uniqueMember*.

MQLDAP_AUTHORMD_SEARCHUSR

A user entry in the LDAP repository contains an attribute listing the Distinguished Name of all the groups to which the specified user belongs. The attribute to query is defined by the [FindGroup](#) value, typically *memberOf*.

MQLDAP_AUTHORMD_SRCHGRPSN

A group entry in the LDAP repository contains an attribute listing the short user name of all the users belonging to that group. The attribute in the user record that contains the short user name is specified by [ShortUser](#).

Membership is indicated by the attribute defined in [FindGroup](#). This value is typically *memberUid*.

Note: This authorization method should only be used if all user short names are distinct.

Many LDAP servers use an attribute of the group object to determine group membership and you should, therefore, set this value to *MQLDAP_AUTHORMD_SEARCHGRP*.

Microsoft Active Directory typically stores group memberships as a user attribute. The IBM Tivoli Directory Server supports both methods.

In general, retrieving memberships through a user attribute will be faster than searching for groups that list the user as a member.

BaseDNGroup (MQCFST)

In order to be able to find group names, this parameter must be set with the base DN to search for groups in the LDAP server (parameter identifier: *MQCA_LDAP_BASE_DN_GROUPS*).

The maximum length is *MQ_LDAP_BASE_DN_LENGTH*.

BaseDNUser (MQCFST)

In order to be able to find the short user name attribute (see [ShortUser](#)) this parameter must be set with the base DN to search for users within the LDAP server (parameter identifier: *MQCA_LDAP_BASE_DN_USERS*).

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_LDAP* and is mandatory.

The maximum length is *MQ_LDAP_BASE_DN_LENGTH*.

Checkclient (MQCFIN)

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_OS* or *MQAIT_IDPW_LDAP* (parameter identifier: *MQIA_CHECK_CLIENT_BINDING*). The possible values are:

MQCHK_NONE

Switches off checking.

MQCHK_OPTIONAL

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

MQCHK_REQUIRED

Requires that all applications provide a valid user ID and password.

MQCHK_REQUIRED_ADMIN

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the *OPTIONAL* setting.  (This setting is not allowed on z/OS systems.)

A privileged user is one that has full administrative authorities for IBM MQ. See [Privileged users](#) for more information.

Checklocal (MQCFIN)

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_OS* or *MQAIT_IDPW_LDAP* (parameter identifier: *MQIA_CHECK_LOCAL_BINDING*). The possible values are:

MQCHK_NONE

Switches off checking.

MQCHK_OPTIONAL

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

MQCHK_REQUIRED

Requires that all applications provide a valid user ID and password.

z/OS If your user ID has UPDATE access to the BATCH profile in the MQCONN class, you can treat **MQCHK_REQUIRED** as if it is **MQCHK_OPTIONAL**. That is, you do not have to supply a password, but if you do, the password must be the correct one.

MQCHK_REQUIRED_ADMIN

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the OPTIONAL setting. **z/OS** (This setting is not allowed on z/OS systems.)

A privileged user is one that has full administrative authorities for IBM MQ. See [Privileged users](#) for more information.

ClassGroup (MQCFST)

The LDAP object class used for group records in the LDAP repository (parameter identifier: MQCA_LDAP_GROUP_OBJECT_CLASS).

If the value is blank, **groupOfNames** is used.

Other commonly used values include *groupOfUniqueNames* or *group*.

The maximum length is MQ_LDAP_CLASS_LENGTH.

Classuser (MQCFST)

The LDAP object class used for user records in the LDAP repository (parameter identifier MQCA_LDAP_USER_OBJECT_CLASS).

If blank, the value defaults to *inetOrgPerson*, which is generally the value needed.

For Microsoft Active Directory, the value you require required is often *user*.

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_LDAP*.

z/OS CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

FailureDelay (MQCFIN)

When a user ID and password are provided for connection authentication, and the authentication fails due to the user ID or password being incorrect, this is the delay, in seconds, before the failure is returned to the application (parameter identifier: MQIA_AUTHENTICATION_FAIL_DELAY).

This can aid in avoiding busy loops from an application that simply retries, continuously, after receiving a failure.

The value must be in the range 0 - 60 seconds. The default value is 1.

This parameter is valid only for an **AuthInfoType** of *MQAIT_IDPW_OS* or *MQAIT_IDPW_LDAP*.

FindGroup (MQCFST)

Name of the attribute used within an LDAP entry to determine group membership (parameter identifier: *MQCA_LDAP_FIND_GROUP_FIELD*).

When AuthorizationMethod = *MQLDAP_AUTHORMD_SEARCHGRP*, this attribute is typically set to *member* or *uniqueMember*.

When AuthorizationMethod = *MQLDAP_AUTHORMD_SEARCHUSR*, this attribute is typically set to *memberOf*.

When AuthorizationMethod = *MQLDAP_AUTHORMD_SRCHGRPSN*, this attribute is typically set to *memberUid*.

When left blank, if:

- AuthorizationMethod = *MQLDAP_AUTHORMD_SEARCHGRP*, this attribute defaults to *memberOf*.
- AuthorizationMethod = *MQLDAP_AUTHORMD_SEARCHUSR*, this attribute defaults to *member*.
- AuthorizationMethod = *MQLDAP_AUTHORMD_SRCHGRPSN*, this attribute defaults to *memberUid*.

The maximum length is *MQ_LDAP_FIELD_LENGTH*.

GroupField (MQCFST)

LDAP attribute that represents a simple name for the group (parameter identifier: *MQCA_LDAP_GROUP_ATTR_FIELD*).

If the value is blank, commands like setmqaut must use a qualified name for the group. The value can either be a full DN, or a single attribute.

The maximum length is *MQ_LDAP_FIELD_LENGTH*.

GroupNesting (MQCFIN)

Whether groups are members of other groups (parameter identifier: *MQIA_LDAP_NESTGRP*). The values can be:

MQLDAP_NESTGRP_NO

Only the initially discovered groups are considered for authorization.

MQLDAP_NESTGRP_YES

The group list is searched recursively to enumerate all the groups to which a user belongs.

The group's Distinguished Name is used when searching the group list recursively, regardless of the authorization method selected in AuthorizationMethod.

LDAPPassword (MQCFST)

The LDAP password (parameter identifier: *MQCA_LDAP_PASSWORD*).

This parameter is relevant only when **AuthInfoType** is set to *MQAIT_CRL_LDAP* or *MQAIT_IDPW_LDAP*.

The maximum length is *MQ_LDAP_PASSWORD_LENGTH*.

LDAPUserName (MQCFST)

The LDAP user name (parameter identifier: *MQCA_LDAP_USER_NAME*).

This parameter is relevant only when **AuthInfoType** is set to *MQAIT_CRL_LDAP* or *MQAIT_IDPW_LDAP*.

 On Multiplatforms, the maximum length is *MQ_DISTINGUISHED_NAME_LENGTH*.

 On z/OS, the maximum length is *MQ_SHORT_DNAME_LENGTH*.

OCSPResponderURL (MQCFST)

The URL at which the OCSP responder can be contacted (parameter identifier: *MQCA_AUTH_INFO_OCSP_URL*).

This parameter is relevant only when **AuthInfoType** is set to *MQAIT_OCSP*, when it is required.

This field is case-sensitive. It must start with the string `http://` in lowercase. The rest of the URL might be case sensitive, depending on the OCSP server implementation.

The maximum length is `MQ_AUTH_INFO_OCSP_URL_LENGTH`.

z/OS QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: `MQIA_QSG_DISP`). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

<i>Table 191. QSGDisposition: Where objects are defined and how they behave</i>		
QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter <code>MQQSGD_COPY</code> . Any object residing in the shared repository, or any object defined using a command that had the parameter <code>MQQSGD_Q_MGR</code> , is not affected by this command.	The object is defined on the page set of the queue manager that executes the command. It uses the <code>MQQSGD_GROUP</code> object of the same name as the <i>ToAuthInfoName</i> object (for Copy) or the <i>AuthInfoName</i> object (for Create).
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter <code>MQQSGD_GROUP</code>. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they refresh local copies on page set zero:</p> <pre>DEFINE AUTHINFO(name) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with <code>QSGDISP(COPY)</code> fails.</p>	<p>The object definition resides in the shared repository. This definition is allowed only if the queue manager is in a queue sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they make or refresh local copies on page set zero:</p> <pre>DEFINE AUTHINFO(name) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with <code>QSGDISP(COPY)</code> fails.</p>
MQQSGD_PRIVATE	The object resides on the page set of the queue manager that executes the command, and was defined with <code>MQQSGD_Q_MGR</code> , or <code>MQQSGD_COPY</code> . Any object residing in the shared repository is unaffected.	Not permitted.

Table 191. QSGDisposition: Where objects are defined and how they behave (continued)

QSGDisposition	Change	Copy, Create
MQQSGD_Q_MGR	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.	The object is defined on the page set of the queue manager that executes the command. This value is the default value.

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If an Authentication Information object with the same name as AuthInfoName or ToAuthInfoName exists, it specifies whether it is to be replaced. The value can be any of the following values:

MQRP_YES

Replace existing definition

MQRP_NO

Do not replace existing definition

SecureComms (MQCFIN)

Whether connectivity to the LDAP server should be done securely using TLS (parameter identifier MQIA_LDAP_SECURE_COMM).

MQSECCOMM_YES

Connectivity to the LDAP server is made securely using TLS.

The certificate used is the default certificate for the queue manager, named in CERTLABL on the queue manager object, or if that is blank, the one described in [Digital certificate labels, understanding the requirements](#).

The certificate is located in the key repository specified in SSLKEYR on the queue manager object. A cipherspec will be negotiated that is supported by both IBM MQ and the LDAP server.

If the queue manager is configured to use SSLFIPS(YES) or SUITEB cipher specs, then this is taken account of in the connection to the LDAP server as well.

MQSECCOMM_ANON

Connectivity to the LDAP server is made securely using TLS just as for MQSECCOMM_YES with one difference.

No certificate is sent to the LDAP server; the connection will be made anonymously. To use this setting, ensure that the key repository specified in SSLKEYR, on the queue manager object, does not contain a certificate marked as the default.

MQSECCOMM_NO

Connectivity to the LDAP server does not use TLS.

This attribute is valid only for an **AuthInfoType** of MQAIT_IDPW_LDAP.

ShortUser (MQCFST)

A field in the user record to be used as a short user name in IBM MQ (parameter identifier MQCA_LDAP_SHORT_USER_FIELD).

This field must contain values of 12 characters or less. This short user name is used for the following purposes:

- If LDAP authentication is enabled, but LDAP authorization is not enabled, this is used as an operating system user ID for authorization checks. In this case, the attribute must represent an operating system user ID.

- If LDAP authentication and authorization are both enabled, this is used as the user ID carried with the message in order for the LDAP user name to be rediscovered when the user ID inside the message needs to be used.

For example, on another queue manager, or when writing report messages. In this case, the attribute does not need to represent an operating system user ID, but must be a unique string. An employee serial number is an example of a good attribute for this purpose.

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_LDAP* and is mandatory.

The maximum length is *MQ_LDAP_FIELD_LENGTH*.

UserField (MQCFST)

If the user ID provided by an application for authentication does not contain a qualifier for the field in the LDAP user record, that is, it does not contain an '=' sign, this attribute identifies the field in the LDAP user record that is used to interpret the provided user ID (parameter identifier *MQCA_LDAP_USER_ATTR_FIELD*).

This field can be blank. If this is the case, any unqualified user IDs use the ShortUser field to interpret the provided user ID.

The contents of this field will be concatenated with an '=' sign, together with the value provided by the application, to form the full user ID to be located in an LDAP user record. For example, the application provides a user of *fred* and this field has the value *cn*, then the LDAP repository will be searched for *cn=fred*.

The maximum length is *MQ_LDAP_FIELD_LENGTH*.

Change, Copy, and Create CF Structure on z/OS

The Change CF Structure PCF command changes existing CF application structures. The Copy and Create CF Structure commands create new CF application structures - the Copy command uses attribute values of an existing CF application structure.

Note: These commands are supported only on z/OS when the queue manager is a member of a queue sharing group.

The Change CF Structure (*MQCMD_CHANGE_CF_STRUC*) command changes the specified attributes in a CF application structure. For any optional parameters that are omitted, the value does not change.

The Copy CF Structure (*MQCMD_COPY_CF_STRUC*) command creates new CF application structure using, for attributes not specified in the command, the attribute values of an existing CF application structure.

The Create CF Structure (*MQCMD_CREATE_CF_STRUC*) command creates a CF application structure. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameters (Change and Create CF Structure)

CFStrucName (MQCFST)

The name of the CF application structure with backup and recovery parameters that you want to define (parameter identifier: *MQCA_CF_STRUC_NAME*).

The maximum length of the string is *MQ_CF_STRUC_NAME_LENGTH*.

Required parameters (Copy CF Structure)

FromCFStrucName (MQCFST)

The name of the CF application structure to be copied from (parameter identifier: *MQCACF_FROM_CF_STRUC_NAME*).

The maximum length of the string is *MQ_CF_STRUC_NAME_LENGTH*.

ToCFStrucName (MQCFST)

The name of the CF application structure to copy to (parameter identifier: *MQCACF_TO_CF_STRUC_NAME*).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters (Change, Copy, and Create CF Structure)

CFConlos (MQCFIN)

Specifies the action to be taken when a queue manager loses connectivity to the CF structure (parameter identifier: MQIA_CF_CFCONLOS).

The value can be any of the following values:

MQCFCONLOS_ASQMGR

The action taken is based on the setting of the CFCONLOS queue manager attribute. This value is the default for newly created CF structure objects with CFLEVEL(5).

MQCFCONLOS_TERMINATE

The queue manager terminates when connectivity to the structure is lost. This value is the default if the CF structure object is not at CFLEVEL(5), and for existing CF structure objects that are changed to CFLEVEL(5).

MQCFCONLOS_TOLERATE

The queue manager tolerates loss of connectivity to the structure without terminating.

This parameter is only valid from CFLEVEL(5).

CFLevel (MQCFIN)

The functional capability level for this CF application structure (parameter identifier: MQIA_CF_LEVEL).

Specifies the functional capability level for the CF application structure. The value can be any of the following values:

1

A CF structure that can be "auto-created" by a queue manager at command level 520.

2

A CF structure at command level 520 that can only be created or deleted by a queue manager at command level 530 or greater.

3

A CF structure at command level 530. This *CFLevel* is required if you want to use persistent messages on shared queues, or for message grouping, or both. This level is the default *CFLevel* for queue managers at command level 600.

You can only increase the value of *CFLevel* to 3 if all the queue managers in the queue sharing group are at command level 530 or greater - this restriction is to ensure that there are no latent command level 520 connections to queues referencing the CF structure.

You can only decrease the value of *CFLevel* from 3 if all the queues that reference the CF structure are both empty (have no messages or uncommitted activity) and closed.

4

This *CFLevel* supports all the *CFLevel* (3) functions. *CFLevel* (4) allows queues defined with CF structures at this level to have messages with a length greater than 63 KB.

Only a queue manager with a command level of 600 can connect to a CF structure at *CFLevel* (4).

You can only increase the value of *CFLevel* to 4 if all the queue managers in the queue sharing group are at command level 600 or greater.

You can only decrease the value of *CFLevel* from 4 if all the queues that reference the CF structure are both empty (have no messages or uncommitted activity) and closed.

5

This *CFLevel* supports all the *CFLevel* (4) functions. *CFLevel* (5) allows persistent, and nonpersistent messages to be selectively stored in Db2 or shared message data sets.

Structures are required to be at CFLEVEL(5) to support toleration of loss of connectivity.

 For more information, see [Where are shared queue messages held?](#).

CFStrucDesc (MQCFST)

The description of the CF structure (parameter identifier: MQCA_CF_STRUC_DESC).

The maximum length is MQ_CF_STRUC_DESC_LENGTH.

DSBlock (MQCFIN)

The logical block size for shared message data sets (parameter identifier: MQIACF_CF_SMDS_BLOCK_SIZE).

The unit in which shared message data set space is allocated to individual queues. The value can be any of the following values:

MQDSB_8K

The logical block size is set to 8 K.

MQDSB_16K

The logical block size is set to 16K.

MQDSB_32K

The logical block size is set to 32 K.

MQDSB_64K

The logical block size is set to 64 K.

MQDSB_128K

The logical block size is set to 128 K.

MQDSB_256K

The logical block size is set to 256 K.

MQDSB_512K

The logical block size is set to 512 K.

MQDSB_1024K

The logical block size is set to 1024 K.

MQDSB_1M

The logical block size is set to 1 M.

Value can not be set unless CFLEVEL(5) is defined.

The default value is 256 K unless CFLEVEL is not 5. In this case a value of 0 is used.

DSBufs (MQCFIN)

The shared message data set buffers group (parameter identifier: MQIA_CF_SMDS_BUFFERS).

Specifies the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

A value in the range 1 - 9999.

Value can not be set unless CFLEVEL(5) is defined.

DSEXPAND (MQCFIN)

The shared message data set expand option (parameter identifier: MQIACF_CF_SMDS_EXPAND).

Specifies whether or not the queue manager should expand a shared message data set when it is nearly full, and further blocks are required in the data set. The value can be any of the following values:

MQDSE_YES

The data set can be expanded.

MQDSE_NO

The data set cannot be expanded.

MQDSE_DEFAULT

Only returned on DISPLAY CFSTRUCT when not explicitly set

Value can not be set unless CFLEVEL(5) is defined.

DSGroup (MQCFST)

The shared message data set group name (parameter identifier: MQCACF_CF_SMDS_GENERIC_NAME).

Specifies a generic data set name to be used for the group of shared message data sets associated with this CF structure.

The string must contain exactly one asterisk (*), which will be replaced with the queue manager name of up to 4 characters.

The maximum length of this parameter is 44 characters.

Value can not be set unless CFLEVEL(5) is defined.

Offload (MQCFIN)

Specifies whether offloaded message data is to be stored in a group of shared message data sets or in Db2 (parameter identifier: MQIA_CF_OFFLOAD).

The value can be:

MQCFOFFLD_DB2

Large shared messages can be stored in Db2.

MQCFOFFLD_SMDS

Large shared messages can be stored in z/OS shared message data sets.

Value can not be set unless CFLEVEL(5) is defined.

For existing CF structure objects that are changed to CFLEVEL(5) the default is MQCFOFFLD_DB2.

For newly created CF structure objects with CFLEVEL(5) the default is MQCFOFFLD_SMDS.

For more information about the group of parameters (*OFFLDxSZ* and *OFFLDxTH*), see [Specifying offload options for shared message data sets](#)

OFFLD1SZ (MQCFST)

The offload size property 1 (parameter identifier: MQCACF_CF_OFFLOAD_SIZE1)

Specifies the first offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the size of the messages to be offloaded. The property is specified as a string with values in the range 0K - 64K.

The default value is 32K. This property is used with *OFFLD1TH*.

Value can not be set unless CFLEVEL(5) is defined.

The value 64K indicates that the rule is not being used.

The maximum length is 3.

OFFLD2SZ (MQCFST)

The offload size property 2 (parameter identifier: MQCACF_CF_OFFLOAD_SIZE2)

Specifies the second offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the size of the messages to be offloaded. The property is specified as a string with values in the range 0K - 64K.

The default value is 4K. This property is used with *OFFLD2TH*.

Value can not be set unless CFLEVEL(5) is defined.

The value 64K indicates that the rule is not being used.

The maximum length is 3.

OFFLD3SZ (MQCFST)

The offload size property 3 (parameter identifier: MQCACF_CF_OFFLOAD_SIZE3)

Specifies the third offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the size of the messages to be offloaded. The property is specified as a string with values in the range 0K - 64K.

The default value is 0K. This property is used with *OFFLD3TH*.

Value can not be set unless CFLEVEL(5) is defined.

The value 64K indicates that the rule is not being used.

The maximum length is 3.

OFFLD1TH (MQCFIN)

The offload threshold property 1 (parameter identifier: MQIA_CF_OFFLOAD_THRESHOLD1)

Specifies the first offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the coupling facility structure percentage full.

The default value is 70. This property is used with *OFFLD1SZ*.

Value can not be set unless CFLEVEL(5) is defined.

OFFLD2TH (MQCFIN)

The offload threshold property 2 (parameter identifier: MQIA_CF_OFFLOAD_THRESHOLD2)

Specifies the second offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the coupling facility structure percentage full.

The default value is 80. This property is used with *OFFLD2SZ*.

Value can not be set unless CFLEVEL(5) is defined.

OFFLD3TH (MQCFIN)

The offload threshold property 3 (parameter identifier: MQIA_CF_OFFLOAD_THRESHOLD3)

Specifies the third offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the coupling facility structure percentage full.

The default value is 90. This property is used with *OFFLD3SZ*.

Value can not be set unless CFLEVEL(5) is defined.

Recauto (MQCFIN)

Specifies the automatic recovery action to be taken when a queue manager detects that the structure is failed, or when a queue manager loses connectivity to the structure and no systems in the sysplex have connectivity to the coupling facility that the structure is allocated in (parameter identifier: MQIA_CF_RECAUTO).

The value can be:

MQRECAUTO_YES

The structure and associated shared message data sets which also need recovery are automatically recovered. This value is the default for newly created CF structure objects with CFLEVEL(5).

MQRECAUTO_NO

The structure is not automatically recovered. This value is the default if the CF structure object is not at CFLEVEL(5), and for existing CF structure objects that are changed to CFLEVEL(5).

This parameter is only valid from CFLEVEL(5).

Recovery (MQCFIN)

Specifies whether CF recovery is supported for the application structure (parameter identifier: MQIA_CF_RECOVER).

The value can be:

MQCFR_YES

Recovery is supported.

MQCFR_NO

Recovery is not supported.

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If a CF structure definition with the same name as *ToCFStructName* exists, this value specifies whether it is to be replaced. The value can be any of the following values:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

Change, Copy, and Create Channel

The Change Channel PCF command changes existing channel definitions. The Copy and Create Channel commands create new channel definitions - the Copy command uses attribute values of an existing channel definition.

The Change Channel (MQCMD_CHANGE_CHANNEL) command changes the specified attributes in a channel definition. For any optional parameters that are omitted, the value does not change.

The Copy Channel (MQCMD_COPY_CHANNEL) command creates new channel definition using, for attributes not specified in the command, the attribute values of an existing channel definition.

The Create Channel (MQCMD_CREATE_CHANNEL) command creates an IBM MQ channel definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager. If a system default channel exists for the type of channel being created, the default values are taken from there.

The following table shows the parameters that are applicable to each type of channel.

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	AMQP
<i>AMQPKeepAlive</i>									✓
<i>BatchHeartBeat</i>	✓	✓					✓	✓	
<i>BatchInterval</i>	✓	✓					✓	✓	
<i>BatchDataLimit</i>	✓	✓					✓	✓	
<i>BatchSize</i>	✓	✓	✓	✓			✓	✓	
<i>CertificateLabel</i>	✓	✓	✓	✓			✓	✓	✓
<i>ChannelDesc</i>	✓	✓	✓	✓	✓	✓	✓	✓	✓
<i>ChannelMonitoring</i>	✓	✓	✓	✓		✓	✓	✓	
<i>ChannelStatistics</i>	✓	✓	✓	✓			✓	✓	
<i>ChannelName</i> (see footnote 1)	✓	✓	✓	✓	✓	✓	✓	✓	✓

Table 192. Change, Copy, Create Channel parameters (continued)

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	AMQP
<u>ChannelType</u> (see footnote 3)	✓	✓	✓	✓	✓	✓	✓	✓	✓
<u>ClientChannelWeight</u>					✓				
<u>ClusterName</u>							✓	✓	
<u>ClusterNameList</u>							✓	✓	
<u>CLWLChannelPriority</u>							✓	✓	
<u>CLWLChannelRank</u>							✓	✓	
<u>CLWLChannelWeight</u>							✓	✓	
 <u>CommandScope</u>	✓	✓	✓	✓	✓	✓	✓	✓	
<u>ConnectionAffinity</u>					✓				
<u>ConnectionName</u>	✓	✓		✓	✓		✓	✓	
<u>DataConversion</u>	✓	✓		✓	✓		✓	✓	
<u>DefaultChannelDisposition</u>	✓	✓	✓	✓		✓	✓	✓	
<u>DefReconnect</u>					✓				
<u>DiscInterval</u>	✓	✓				✓	✓	✓	
<u>FromChannelName</u> (see footnote 2)	✓	✓	✓	✓	✓	✓	✓	✓	
<u>HeaderCompression</u>	✓	✓	✓	✓	✓	✓	✓	✓	
<u>HeartBeatInterval</u>	✓	✓	✓	✓	✓	✓	✓	✓	
<u>KeepAliveInterval</u>	✓	✓	✓	✓	✓	✓	✓	✓	
<u>LocalAddress</u>	✓	✓		✓	✓		✓	✓	✓
<u>LongRetryCount</u>	✓	✓					✓	✓	

Table 192. Change, Copy, Create Channel parameters (continued)

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	AMQP

Note:

1. Required parameter on Change and Create Channel commands.
2. Required parameter on Copy Channel command.
3. Required parameter on Change, Create, and Copy Channel commands.
4. PUTAUT is valid for a channel type of SVRCONN on z/OS only.
5. Required parameter on Create Channel command if TripType is TCP.
6. Required parameter on Create Channel command for a channel type of MQTT.

Required parameters (Change, Create Channel)

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Specifies the name of the channel definition to be changed, or created

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

This parameter is required on all types of channel; on a CLUSSDR it can be different from on the other channel types. If your convention for naming channels includes the name of the queue manager, you can make a CLUSSDR definition using the +QMNAME+ construction, and IBM MQ substitutes the correct repository queue manager name in place of +QMNAME+. This facility applies only to IBM i, AIX, Linux, and Windows only. See [Configuring a queue manager cluster](#) for more details.

Multi On CLUSRCVR channels when using automatic cluster setup, this parameter can use some additional inserts:

- +AUTOCL+ resolves to the automatic cluster name
- +QMNAME+ resolves to the local queue manager name.

When using these inserts, both the unexpanded string and the string with the replaced values must fit inside the maximum size of the field. If there are configured automatic cluster full repositories in the AutoCluster configuration, the channel name must also fit in the maximum channel name length when +QMNAME+ is replaced with each of the configured full repository names.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

MQCHT_SENDER

Sender.

MQCHT_SERVER

Server.

MQCHT_RECEIVER

Receiver.

MQCHT_REQUESTER

Requester.

MQCHT_SVRCONN

Server-connection (for use by clients).

MQCHT_CLNTCONN

Client connection.

MQCHT_CLUSRCVR

Cluster-receiver.

MQCHT_CLUSSDR

Cluster-sender.

MQCHT_AMQP

AMQP.

Required parameters (Copy Channel)**FromChannelName (MQCFST)**

From channel name (parameter identifier: MQCACF_FROM_CHANNEL_NAME).

The name of the existing channel definition that contains values for the attributes that are not specified in this command.

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR or MQQSGD_COPY to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToChannelName* and the disposition MQQSGD_GROUP is searched for to copy from.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

MQCHT_SENDER

Sender.

MQCHT_SERVER

Server.

MQCHT_RECEIVER

Receiver.

MQCHT_REQUESTER

Requester.

MQCHT_SVRCONN

Server-connection (for use by clients).

MQCHT_CLNTCONN

Client connection.

MQCHT_CLUSRCVR

Cluster-receiver.

MQCHT_CLUSSDR

Cluster-sender.

MQCHT_AMQP

AMQP.

ToChannelName (MQCFST)

To channel name (parameter identifier: MQCACF_TO_CHANNEL_NAME).

The name of the new channel definition.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Channel names must be unique; if a channel definition with this name exists, the value of *Replace* must be MQRP_YES. The channel type of the existing channel definition must be the same as the channel type of the new channel definition otherwise it cannot be replaced.

Optional parameters (Change, Copy, and Create Channel)

AMQPKeepAlive (MQCFIN)

The AMQP channel keep alive interval (parameter identifier: MQIACH_AMQP_KEEP_ALIVE).

The keep alive time for an AMQP channel in milliseconds. If the AMQP client has not sent any frames within the keep alive interval, then the connection is closed with a `amqp:resource-limit-exceeded` AMQP error condition.

This parameter is valid only for *ChannelType* values of MQCHT_AMQP.

BatchHeartbeat (MQCFIN)

The batch heartbeat interval (parameter identifier: MQIACH_BATCH_HB).

Batch heartbeating allows sender-type channels to determine whether the remote channel instance is still active, before going in-doubt. The value can be in the range 0 - 999999. A value of 0 indicates that batch heart-beating is not to be used. Batch heartbeat is measured in milliseconds.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

BatchInterval (MQCFIN)

Batch interval (parameter identifier: MQIACH_BATCH_INTERVAL). The approximate time in milliseconds that a channel keeps a batch open, if fewer than *BatchSize* messages or *BatchDataLimit* bytes have been transmitted in the current batch.

The batch is terminated when one of the following conditions is met:

- *BatchSize* messages have been sent.
- *BatchDataLimit* bytes have been sent.
- The transmission queue is empty and *BatchInterval* milliseconds have elapsed since the start of the batch.

BatchInterval must be in the range 0 - 999999999. A value of zero means that the batch is terminated as soon as the transmission queue becomes empty, or the *BatchSize* or *BatchDataLimit* is reached.

This parameter applies only to channels with a *ChannelType* of: MQCHT_SENDER, MQCHT_SERVER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

BatchDataLimit (MQCFIN)

Batch data limit (parameter identifier: MQIACH_BATCH_DATA_LIMIT).

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

The value must be in the range 0 - 999999. The default value is 5000.

The **BATCHLIM** parameter is supported on all platforms.

This parameter only applies to channels with a *ChannelType* of MQCHT_SENDER, MQCHT_SERVER, MQCHT_CLUSRCVR, or MQCHT_CLUSSDR.

BatchSize (MQCFIN)

Batch size (parameter identifier: MQIACH_BATCH_SIZE).

The maximum number of messages that must be sent through a channel before a checkpoint is taken.

The batch size which is used is the lowest of the following:

- The *BatchSize* of the sending channel
- The *BatchSize* of the receiving channel
- The maximum number of uncommitted messages at the sending queue manager
- The maximum number of uncommitted messages at the receiving queue manager

The maximum number of uncommitted messages is specified by the **MaxUncommittedMsgs** parameter of the Change Queue Manager command.

Specify a value in the range 1 - 9999.

This parameter is not valid for channels with a *ChannelType* of MQCHT_SVRCONN or MQCHT_CLNTCONN.

CertificateLabel (MQCFST)

Certificate label (parameter identifier: MQCA_CERT_LABEL).

Certificate label for this channel to use.

The label identifies which personal certificate in the key repository is sent to the remote peer. If this attribute is blank, the certificate is determined by the queue manager **CertificateLabel** parameter.

Note that inbound channels (including receiver, requester, cluster-receiver, unqualified server, and server-connection channels) only send the configured certificate if the IBM MQ version of the remote peer fully supports certificate label configuration, and the channel is using a TLS CipherSpec.

An unqualified server channel is one that does not have the **ConnectionName** field set.

In all other cases, the queue manager **CertificateLabel** parameter determines the certificate sent. In particular, the following only ever receive the certificate configured by the **CertificateLabel** parameter of the queue manager, regardless of the channel-specific label setting:

- All current Java and JMS clients.
- Versions of IBM MQ prior to IBM MQ 8.0.

ChannelDesc (MQCFST)

Channel description (parameter identifier: MQCACH_DESC).

The maximum length of the string is MQ_CHANNEL_DESC_LENGTH.

Use characters from the character set, identified by the coded character set identifier (CCSID) for the message queue manager on which the command is executing, to ensure that the text is translated correctly.

ChannelMonitoring (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA_MONITORING_CHANNEL).

Specifies whether online monitoring data is to be collected and, if so, the rate at which the data is collected. The value can be any of the following values:

MQMON_OFF

Online monitoring data collection is turned off for this channel.

MQMON_Q_MGR

The value of the queue manager's **ChannelMonitoring** parameter is inherited by the channel.

MQMON_LOW

If the value of the queue manager's *ChannelMonitoring* parameter is not MQMON_NONE, online monitoring data collection is turned on, with a low rate of data collection, for this channel.

MQMON_MEDIUM

If the value of the queue manager's *ChannelMonitoring* parameter is not MQMON_NONE, online monitoring data collection is turned on, with a moderate rate of data collection, for this channel.

MQMON_HIGH

If the value of the queue manager's *ChannelMonitoring* parameter is not MQMON_NONE, online monitoring data collection is turned on, with a high rate of data collection, for this channel.

ChannelStatistics (MQCFIN)

Statistics data collection (parameter identifier: MQIA_STATISTICS_CHANNEL).

Specifies whether statistics data is to be collected and, if so, the rate at which the data is collected. The value can be:

MQMON_OFF

Statistics data collection is turned off for this channel.

MQMON_Q_MGR

The value of the queue manager's **ChannelStatistics** parameter is inherited by the channel.

MQMON_LOW

If the value of the queue manager's *ChannelStatistics* parameter is not MQMON_NONE, online monitoring data collection is turned on, with a low rate of data collection, for this channel.

MQMON_MEDIUM

If the value of the queue manager's *ChannelStatistics* parameter is not MQMON_NONE, online monitoring data collection is turned on, with a moderate rate of data collection, for this channel.

MQMON_HIGH

If the value of the queue manager's *ChannelStatistics* parameter is not MQMON_NONE, online monitoring data collection is turned on, with a high rate of data collection, for this channel.

 On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

ClientChannelWeight (MQCFIN)

Client Channel Weight (parameter identifier: MQIACH_CLIENT_CHANNEL_WEIGHT).

The client channel weighting attribute is used so client channel definitions can be selected at random, with the larger weightings having a higher probability of selection, when more than one suitable definition is available.

Specify a value in the range 0 - 99. The default is 0.

This parameter is only valid for channels with a ChannelType of MQCHT_CLNTCONN

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

The name of the cluster to which the channel belongs.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT_CLUSSDR
- MQCHT_CLUSRCVR

Only one of the values of *ClusterName* and *ClusterNameList* can be nonblank; the other must be blank.

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

ClusterNameList (MQCFST)

Cluster namelist (parameter identifier: MQCA_CLUSTER_NAMELIST).

The name, of the namelist, that specifies a list of clusters to which the channel belongs.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT_CLUSSDR
- MQCHT_CLUSRCVR

Only one of the values of *ClusterName* and *ClusterNameList* can be nonblank; the other must be blank.

CLWLChannelPriority (MQCFIN)

Channel priority for the purposes of cluster workload distribution (parameter identifier: MQIACH_CLWL_CHANNEL_PRIORITY).

Specify a value in the range 0 - 9 where 0 is the lowest priority and 9 is the highest.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT_CLUSSDR
- MQCHT_CLUSRCVR

CLWLChannelRank (MQCFIN)

Channel rank for the purposes of cluster workload distribution (parameter identifier: MQIACH_CLWL_CHANNEL_RANK).

Specify a value in the range 0 - 9 where 0 is the lowest priority and 9 is the highest.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT_CLUSSDR
- MQCHT_CLUSRCVR

CLWLChannelWeight (MQCFIN)

Channel weighting for the purposes of cluster workload distribution (parameter identifier: MQIACH_CLWL_CHANNEL_WEIGHT).

Specify a weighting for the channel for use in workload management. Specify a value in the range 1 - 99 where 1 is the lowest priority and 99 is the highest.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT_CLUSSDR
- MQCHT_CLUSRCVR

z/OS CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

ConnectionAffinity (MQCFIN)

Channel Affinity (parameter identifier: MQIACH_CONNECTION_AFFINITY)

The channel affinity attribute specifies whether client applications that connect multiple times using the same queue manager name, use the same client channel. The value can be any of the following values:

MQCAFTY_PREFERRED

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any zero ClientChannelWeight definitions first

in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful nonzero ClientChannelWeight definitions are moved to the end of the list. Zero ClientChannelWeight definitions remain at the start of the list and are selected first for each connection. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created. Each client process with the same host name creates the same list.

This value is the default value.

MQCAFTY_NONE

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process independently select an applicable definition based on the weighting with any applicable zero ClientChannelWeight definitions selected first in alphabetical order. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created.

This parameter is only valid for channels with a ChannelType of MQCHT_CLNTCONN.

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

Multi On CLUSRCVR channels when using automatic cluster setup, this parameter can use some additional inserts:

- +AUTOCL+ resolves to the automatic cluster name
- +QMNAME+ resolves to the local queue manager name

In addition, any variable configured at queue manager create time, see the `crtmqm -iv` option, can be used surrounded by '+', for example +CONNAME+. When using these inserts, both the unexpanded inserts and the expanded values must fit inside the field maximum size.

Multi On [Multiplatforms](#), the maximum length of the string is 264.

z/OS On z/OS, the maximum length of the string is 48.

Specify *ConnectionName* as a comma-separated list of names of machines for the stated *TransportType*. Typically, only one machine name is required. You can provide multiple machine names to configure multiple connections with the same properties. The connections are tried in the order they are specified in the connection list until a connection is successfully established. If no connection is successful, the channel starts to try processing again. Connection lists are an alternative to queue manager groups to configure connections for reconnectable clients, and also to configure channel connections to multi-instance queue managers.

Specify the name of the machine as required for the stated *TransportType*:

- For MQXPT_LU62 on IBM i, AIX and Linux, specify the name of the CPI-C communications side object. On Windows specify the CPI-C symbolic destination name.

z/OS On z/OS, there are two forms in which to specify the value:

Logical unit name

The logical unit information for the queue manager, comprising the logical unit name, TP name, and optional mode name. This name can be specified in one of three forms:

<i>Table 193. Logical unit names and forms</i>	
Form	Example
luname	IGY12355
luname/TPname	IGY12345/APING
luname/TPname/modename	IGY12345/APINGD/#INTER

For the first form, the TP name and mode name must be specified for the *TpName* and *ModeName* parameters; otherwise these parameters must be blank.

Note: For client-connection channels, only the first form is allowed.

Symbolic name

The symbolic destination name for the logical unit information for the queue manager, as defined in the side information data set. The **TpName** and **ModeName** parameters must be blank.

Note: For cluster-receiver channels, the side information is on the other queue managers in the cluster. Alternatively, in this case it can be a name that a channel auto-definition exit can resolve into the appropriate logical unit information for the local queue manager.

The specified or implied LU name can be that of a VTAM generic resources group.

- For MQXPT_TCP, you can specify a connection name, or a connection list, containing the host name or the network address of the remote machine. Separate connection names in a connection list with commas.

z/OS On z/OS, the connection name can include the IP_name of a z/OS dynamic DNS group or a network dispatcher input port. Do not include this parameter for channels with a *ChannelType* value of MQCHT_CLUSSDR.

Multi On Multiplatforms, the TCP/IP connection name parameter of a cluster-receiver channel is optional. If you leave the connection name blank, IBM MQ generates a connection name for you, assuming the default port and using the current IP address of the system. You can override the default port number, but still use the current IP address of the system. For each connection name leave the IP name blank, and provide the port number in parentheses; for example:

```
(1415)
```

The generated **CONNAME** is always in the dotted decimal (IPv4) or hexadecimal (IPv6) form, rather than in the form of an alphanumeric DNS host name.

- For MQXPT_NETBIOS specify the NetBIOS station name.
- For MQXPT_SPX specify the 4 byte network address, the 6 byte node address, and the 2 byte socket number. These values must be entered in hexadecimal, with a period separating the network and node addresses. The socket number must be enclosed in brackets, for example:

```
0a0b0c0d.804abcde23a1(5e86)
```

If the socket number is omitted, the IBM MQ default value (5e86 hex) is assumed.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_REQUESTER, MQCHT_CLNTCONN, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

Note: If you are using clustering between IPv6 -only and IPv4 -only queue managers, do not specify an IPv6 network address as the *ConnectionName* for cluster-receiver channels. A queue manager that is capable only of IPv4 communication is unable to start a cluster sender channel definition that specifies the *ConnectionName* in IPv6 hexadecimal form. Consider, instead, using host names in a heterogeneous IP environment.

DataConversion (MQCFIN)

Whether sender must convert application data (parameter identifier: MQIACH_DATA_CONVERSION).

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

The value can be any of the following values:

MQCDC_NO_SENDER_CONVERSION

No conversion by sender.

MQCDC_SENDER_CONVERSION

Conversion by sender.

DefaultChannelDisposition (MQCFIN)

Intended disposition of the channel when activated or started (parameter identifier: MQIACH_DEF_CHANNEL_DISP).

This parameter applies to z/OS only.

The value can be any of the following values:

MQCHLD_PRIVATE

The intended use of the object is as a private channel.

This value is the default value.

MQCHLD_FIXSHARED

The intended use of the object is as a fixshared channel.

MQCHLD_SHARED

The intended use of the object is as a shared channel.

DefReconnect (MQCFIN)

Client channel default reconnection option (parameter identifier: MQIACH_DEF_RECONNECT).

The default automatic client reconnection option. You can configure an IBM MQ MQI client to automatically reconnect a client application. The IBM MQ MQI client tries to reconnect to a queue manager after a connection failure. It tries to reconnect without the application client issuing an MQCONN or MQCONNX MQI call.

MQRCN_NO

MQRCN_NO is the default value.

Unless overridden by **MQCONNX**, the client is not reconnected automatically.

MQRCN_YES

Unless overridden by **MQCONNX**, the client reconnects automatically.

MQRCN_Q_MGR

Unless overridden by **MQCONNX**, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO_RECONNECT_Q_MGR.

MQRCN_DISABLED

Reconnection is disabled, even if requested by the client program using the **MQCONNX** MQI call.

<i>Table 194. Automatic reconnection depends on the values set in the application and in the channel definition</i>				
DefReconnect	Reconnection options set in the application			
	MQCNO_RECONNE CT	MQCNO_RECONNE CT_Q_MGR	MQCNO_RECONNE CT_AS_DEF	MQCNO_RECONNE CT_DISABLED
MQRCN_NO	YES	QMGR	NO	NO
MQRCN_YES	YES	QMGR	YES	NO
MQRCN_Q_MGR	YES	QMGR	QMGR	NO
MQRCN_DISABLED	NO	NO	NO	NO

This parameter is valid only for a *ChannelType* value of MQCHT_CLNTCONN.

DiscInterval (MQCFIN)

Disconnection interval (parameter identifier: MQIACH_DISC_INTERVAL).

This interval defines the maximum number of seconds that the channel waits for messages to be put on a transmission queue before terminating the channel. A value of zero causes the message channel agent to wait indefinitely.

Specify a value in the range 0 - 999 999.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER MQCHT_SERVER, MQCHT_SVRCONN, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

For server-connection channels using the TCP protocol, this interval is the minimum time in seconds for which the server-connection channel instance remains active without any communication from its partner client. A value of zero disables this disconnect processing. The server-connection inactivity interval only applies between MQ API calls from a client, so no client is disconnected during an extended MQGET with wait call. This attribute is ignored for server-connection channels using protocols other than TCP.

HeaderCompression (MQCFIL)

Header data compression techniques supported by the channel (parameter identifier: MQIACH_HDR_COMPRESSION).

The list of header data compression techniques supported by the channel. For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The mutually supported compression techniques of the channel are passed to the message exit of the sending channel where the compression technique used can be altered on a per message basis. Compression alters the data passed to send and receive exits.

Specify one or more of:

MQCOMPRESS_NONE

No header data compression is performed. This value is the default value.

MQCOMPRESS_SYSTEM

Header data compression is performed.

HeartbeatInterval (MQCFIN)

Heartbeat interval (parameter identifier: MQIACH_HB_INTERVAL).

The interpretation of this parameter depends on the channel type, as follows:

- For a channel type of MQCHT_SENDER, MQCHT_SERVER, MQCHT_RECEIVER, MQCHT_REQUESTER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR, this interval is the time in seconds between heartbeat flows passed from the sending MCA when there are no messages on the transmission queue. This interval gives the receiving MCA the opportunity to quiesce the channel. To be useful, *HeartbeatInterval* must be less than *DiscInterval*. However, the only check is that the value is within the permitted range.

This type of heartbeat is supported on the following platforms: IBM i, z/OS, AIX, Linux, and Windows.

- For a channel type of MQCHT_CLNTCONN or MQCHT_SVRCONN, this interval is the time in seconds between heartbeat flows passed from the server MCA when that MCA has issued an MQGET call with the MQGMO_WAIT option on behalf of a client application. This interval allows the server MCA to handle situations where the client connection fails during an MQGET with MQGMO_WAIT.

This type of heartbeat is supported on all platforms.

The value must be in the range 0 - 999 999. A value of 0 means that no heartbeat exchange occurs. The value that is used is the larger of the values specified at the sending side and receiving side.

KeepAliveInterval (MQCFIN)

KeepAlive interval (parameter identifier: MQIACH_KEEP_ALIVE_INTERVAL).

Specifies the value passed to the communications stack for KeepAlive timing for the channel.

For this attribute to be effective, TCP/IP keepalive must be enabled. On z/OS, you enable TCP/IP keepalive by issuing the Change Queue Manager command with a value of MQTCPKEEP in the *TCPKeepAlive* parameter; if the *TCPKeepAlive* queue manager parameter has a value of MQTCPKEEP_NO, the value is ignored, and the KeepAlive facility is not used. On other platforms, TCP/IP keepalive is enabled when the KEEPALIVE=YES parameter is specified in the TCP stanza in the

distributed queuing configuration file, qm.ini, or through the IBM MQ Explorer. Keepalive must also be enabled within TCP/IP itself, using the TCP profile configuration data set.

Although this parameter is available on all platforms, its setting is implemented only on z/OS. On Multiplatforms, you can access and modify the parameter but it is only stored and forwarded; there is no functional implementation of the parameter. This parameter is useful in a clustered environment where a value set in a cluster-receiver channel definition on (for example) AIX flows to (and is implemented by) z/OS queue managers that are in, or join, the cluster.

Specify either:

integer

The KeepAlive interval to be used, in seconds, in the range 0 - 99 999. If you specify a value of 0, the value used is that specified by the INTERVAL statement in the TCP profile configuration data set.

MQKAI_AUTO

The KeepAlive interval is calculated based upon the negotiated heartbeat value as follows:

- If the negotiated *HeartbeatInterval* is greater than zero, KeepAlive interval is set to that value plus 60 seconds.
- If the negotiated *HeartbeatInterval* is zero, the value used is that specified by the INTERVAL statement in the TCP profile configuration data set.

Multi On Multiplatforms, if you need the functionality provided by the **KeepAliveInterval** parameter, use the **HeartBeatInterval** parameter.

LocalAddress (MQCFST)

Local communications address for the channel (parameter identifier: MQCACH_LOCAL_ADDRESS).

The maximum length of the string is MQ_LOCAL_ADDRESS_LENGTH.

The value that you specify depends on the transport type (*TransportType*) to be used:

TCP/IP

The value is the optional IP address and optional port or port range to be used for outbound TCP/IP communications. The format for this information is as follows:

```
LOCLADDR([ip-addr][(low-port[,high-port])][, [ip-addr][(low-port[,high-port])]])
```

where *ip-addr* is specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric form, and *low-port* and *high-port* are port numbers enclosed in parentheses. All are optional.

Specify `[, [ip-addr][(low-port[,high-port])]]` multiple times for each additional local address. Use multiple local addresses if you want to specify a specific subset of local network adapters. You can also use `[, [ip-addr][(low-port[,high-port])]]` to represent a particular local network address on different servers that are part of a multi-instance queue manager configuration.

All Others

The value is ignored; no error is diagnosed.

Use this parameter if you want a channel to use a particular IP address, port, or port range for outbound communications. This parameter is useful when a machine is connected to multiple networks with different IP addresses.

Examples of use

Table 195. Meanings of example IP addresses, ports, and port ranges	
Value	Meaning
9.20.4.98	Channel binds to this address locally
9.20.4.98 (1000)	Channel binds to this address and port 1000 locally

Table 195. Meanings of example IP addresses, ports, and port ranges (continued)	
Value	Meaning
9.20.4.98 (1000,2000)	Channel binds to this address and uses a port in the range 1000 - 2000 locally
(1000)	Channel binds to port 1000 locally
(1000,2000)	Channel binds to a port in the range 1000 - 2000 locally

This parameter is valid for the following channel types:

- MQCHT_SENDER
- MQCHT_SERVER
- MQCHT_REQUESTER
- MQCHT_CLNTCONN
- MQCHT_CLUSRCVR
- MQCHT_CLUSSDR

Note:

- Do not confuse this parameter with *ConnectionName*. The *LocalAddress* parameter specifies the characteristics of the local communications; the *ConnectionName* parameter specifies how to reach a remote queue manager.

LongRetryCount (MQCFIN)

Long retry count (parameter identifier: MQIACH_LONG_RETRY).

When a sender or server channel is attempting to connect to the remote machine, and the count specified by *ShortRetryCount* has been exhausted, this count specifies the maximum number of further attempts that are made to connect to the remote machine, at intervals specified by *LongRetryInterval*.

If this count is also exhausted without success, an error is logged to the operator, and the channel is stopped. The channel must later be restarted with a command (it is not started automatically by the channel initiator), and it then makes only one attempt to connect, as it is assumed that the problem has now been cleared by the administrator. The retry sequence is not carried out again until after the channel has successfully connected.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

LongRetryInterval (MQCFIN)

Long timer (parameter identifier: MQIACH_LONG_TIMER).

Specifies the long retry wait interval for a sender or server channel that is started automatically by the channel initiator. It defines the interval in seconds between attempts to establish a connection to the remote machine, after the count specified by *ShortRetryCount* has been exhausted.

The time is approximate; zero means that another connection attempt is made as soon as possible.

Specify a value in the range 0 - 999 999. Values exceeding this value are treated as 999 999.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

MaxInstances (MQCFIN)

Maximum number of simultaneous instances of a server-connection channel or an AMQP channel (parameter identifier: MQIACH_MAX_INSTANCES).

Specify a value in the range 0 - 999 999 999.

The default value is 999 999 999.

A value of zero indicates that no client connections are allowed on the channel.

If the value is reduced below the number of instances of the server-connection channel that are currently running, the running channels are not affected. This parameter applies even if the value is zero. However, if the value is reduced below the number of instances of the server-connection channel that are currently running, then new instances cannot be started until sufficient existing instances have ceased to run.

If an AMQP client attempts to connect to an AMQP channel, and the number of connected clients has reached `MaxInstances`, the channel closes the connection with a close frame. The close frame contains the following message: `amqp:resource-limit-exceeded`. If a client connects with an ID that is already connected (that is, it performs a client-takeover), and the client is permitted to take over the connection, the takeover will succeed regardless of whether the number of connected clients has reached `MaxInstances`.

This parameter is valid only for channels with a *ChannelType* value of `MQCHT_SVRCONN` or `MQCHT_AMQP`.

MaxInstancesPerClient (MQCFIN)

Maximum number of simultaneous instances of a server-connection channel that can be started from a single client (parameter identifier: `MQIACH_MAX_INSTS_PER_CLIENT`). In this context, connections that originate from the same remote network address are regarded as coming from the same client.

Specify a value in the range 0 - 999 999 999.

The default value is 999 999 999.

A value of zero indicates that no client connections are allowed on the channel.

If the value is reduced below the number of instances of the server-connection channel that are currently running from individual clients, the running channels are not affected. This parameter applies even if the value is zero. However, if the value is reduced below the number of instances of the server-connection channel that are currently running from individual clients, new instances from those clients cannot start until sufficient existing instances have ceased to run.

This parameter is valid only for channels with a *ChannelType* value of `MQCHT_SVRCONN`.

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: `MQIACH_MAX_MSG_LENGTH`).

Specifies the maximum message length that can be transmitted on the channel. This value is compared with the value for the remote channel and the actual maximum is the lower of the two values.

The value zero means the maximum message length for the queue manager.

The lower limit for this parameter is 0. The maximum message length is 100 MB (104 857 600 bytes).

MCAName (MQCFST)

Message channel agent name (parameter identifier: `MQCACH_MCA_NAME`).

Note: An alternative way of providing a user ID for a channel to run under is to use channel authentication records. With channel authentication records, different connections can use the same channel while using different credentials. If both `MCAUSER` on the channel is set and channel authentication records are used to apply to the same channel, the channel authentication records take precedence. The `MCAUSER` on the channel definition is only used if the channel authentication record uses `USERSRC(CHANNEL)`. For more details, see [Channel authentication records](#)

This parameter is reserved, and if specified can be set only to blanks.

The maximum length of the string is `MQ_MCA_NAME_LENGTH`.

This parameter is valid only for *ChannelType* values of `MQCHT_SENDER`, `MQCHT_SERVER`, `MQCHT_REQUESTER`, `MQCHT_CLUSSDR`, or `MQCHT_CLUSRCVR`.

MCAType (MQCFIN)

Message channel agent type (parameter identifier: MQIACH_MCA_TYPE).

Specifies the type of the message channel agent program.

Multi On Multiplatforms, this parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_REQUESTER, or MQCHT_CLUSSDR.

z/OS On z/OS, this parameter is valid only for a *ChannelType* value of MQCHT_CLURCVR.

The value can be any of the following values:

MQMCAT_PROCESS

Process.

MQMCAT_THREAD

Thread.

MCAUserIdentifier (MQCFST)

Message channel agent user identifier (parameter identifier: MQCACH_MCA_USER_ID).

If this parameter is nonblank, it is the user identifier which is to be used by the message channel agent for authorization to access IBM MQ resources, including (if *PutAuthority* is MQPA_DEFAULT) authorization to put the message to the destination queue for receiver or requester channels.

If it is blank, the message channel agent uses its default user identifier.

This user identifier can be overridden by one supplied by a channel security exit.

This parameter is not valid for channels with a *ChannelType* of MQCHT_SDR, MQCHT_SVR, MQCHT_CLNTCONN, MQCHT_CLUSSDR.

The maximum length of the MCA user identifier depends on the environment in which the MCA is running. MQ_MCA_USER_ID_LENGTH gives the maximum length for the environment for which your application is running. MQ_MAX_MCA_USER_ID_LENGTH gives the maximum for all supported environments.

On Windows, you can optionally qualify a user identifier with the domain name in the following format:

```
user@domain
```

MessageCompression (MQCFIL)

The list of message data compression techniques supported by the channel (parameter identifier: MQIACH_MSG_COMPRESSION). For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The mutually supported compression techniques of the channel are passed to the message exit of the sending channel where the compression technique used can be altered on a per message basis. Compression alters the data passed to send and receive exits.

Specify one or more of:

MQCOMPRESS_NONE

No message data compression is performed. This value is the default value.

MQCOMPRESS_RLE

Message data compression is performed using run-length encoding.

MQCOMPRESS_ZLIBFAST

Message data compression is performed using ZLIB encoding with speed prioritized.

MQCOMPRESS_ZLIBHIGH

Message data compression is performed using ZLIB encoding with compression prioritized.

Multi **V 9.4.0** **LZ4FAST**

Message data compression is performed using LZ4 encoding with speed prioritized.

Message data compression is performed using LZ4 encoding with compression prioritized.

MQCOMPRESS_ANY

Any compression technique supported by the queue manager can be used. This value is only valid for receiver, requester, and server-connection channels.

ModeName (MQCFST)

Mode name (parameter identifier: MQCACH_MODE_NAME).

This parameter is the LU 6.2 mode name.

The maximum length of the string is MQ_MODE_NAME_LENGTH.

- On IBM i, AIX, Linux, and Windows, this parameter can be set only to blanks. The actual name is taken instead from the CPI-C Communications Side Object or (on Windows) from the CPI-C symbolic destination name properties.

This parameter is valid only for channels with a *TransportType* of MQXPT_LU62. It is not valid for receiver or server-connection channels.

MsgExit (MQCFSL)

Message exit name (parameter identifier: MQCACH_MSG_EXIT_NAME).

If a nonblank name is defined, the exit is invoked immediately after a message has been retrieved from the transmission queue. The exit is given the entire application message and message descriptor for modification.

For channels with a channel type (*ChannelType*) of MQCHT_SVRCONN or MQCHT_CLNTCONN, this parameter is accepted but ignored, since message exits are not invoked for such channels.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

You can specify a list of exit names by using an MQCFSL structure instead of an MQCFST structure.

- The exits are invoked in the order specified in the list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit names in the list (excluding trailing blanks in each name) must not exceed MQ_TOTAL_EXIT_NAME_LENGTH. An individual string must not exceed MQ_EXIT_NAME_LENGTH.
- On z/OS, you can specify the names of up to eight exit programs.

MsgRetryCount (MQCFIN)

Message retry count (parameter identifier: MQIACH_MR_COUNT).

Specifies the number of times that a failing message must be retried.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT_RECEIVER, MQCHT_REQUESTER, or MQCHT_CLUSRCVR.

MsgRetryExit (MQCFST)

Message retry exit name (parameter identifier: MQCACH_MR_EXIT_NAME).

If a nonblank name is defined, the exit is invoked before performing a wait before retrying a failing message.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

This parameter is valid only for *ChannelType* values of MQCHT_RECEIVER, MQCHT_REQUESTER, or MQCHT_CLUSRCVR.

MsgRetryInterval (MQCFIN)

Message retry interval (parameter identifier: MQIACH_MR_INTERVAL).

Specifies the minimum time interval in milliseconds between retries of failing messages.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT_RECEIVER, MQCHT_REQUESTER, or MQCHT_CLUSRCVR.

MsgRetryUserData (MQCFST)

Message retry exit user data (parameter identifier: MQCACH_MR_EXIT_USER_DATA).

Specifies user data that is passed to the message retry exit.

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

This parameter is valid only for *ChannelType* values of MQCHT_RECEIVER, MQCHT_REQUESTER, or MQCHT_CLUSRCVR.

MsgUserData (MQCFSL)

Message exit user data (parameter identifier: MQCACH_MSG_EXIT_USER_DATA).

Specifies user data that is passed to the message exit.

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

For channels with a channel type (*ChannelType*) of MQCHT_SVRCONN or MQCHT_CLNTCONN, this parameter is accepted but ignored, since message exits are not invoked for such channels.

You can specify a list of exit user data strings by using an MQCFSL structure instead of an MQCFST structure.

- Each exit user data string is passed to the exit at the same ordinal position in the *MsgExit* list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit user data in the list (excluding trailing blanks in each string) must not exceed MQ_TOTAL_EXIT_DATA_LENGTH. An individual string must not exceed MQ_EXIT_DATA_LENGTH.
- On z/OS, you can specify up to eight strings.

NetworkPriority (MQCFIN)

Network priority (parameter identifier: MQIACH_NETWORK_PRIORITY).

The priority for the network connection. If there are multiple paths available, distributed queuing selects the path with the highest priority.

The value must be in the range 0 (lowest) - 9 (highest).

This parameter applies only to channels with a *ChannelType* of MQCHT_CLUSRCVR

NonPersistentMsgSpeed (MQCFIN)

Speed at which nonpersistent messages are to be sent (parameter identifier: MQIACH_NPM_SPEED).

This parameter is supported in the following environments: IBM i, AIX, Linux, and Windows.

Specifying MQNPMS_FAST means that nonpersistent messages on a channel need not wait for a syncpoint before being made available for retrieval. The advantage of this is that nonpersistent

messages become available for retrieval far more quickly. The disadvantage is that because they do not wait for a syncpoint, they might be lost if there is a transmission failure.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_RECEIVER, MQCHT_REQUESTER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR. The value can be any of the following values:

MQNPMS_NORMAL

Normal speed.

MQNPMS_FAST

Fast speed.

Password (MQCFST)

Password (parameter identifier: MQCACH_PASSWORD).

This parameter is used by the message channel agent when attempting to initiate a secure SNA session with a remote message channel agent. On IBM i, AIX and Linux, it is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_REQUESTER, MQCHT_CLNTCONN, or MQCHT_CLUSSDR. On z/OS, it is valid only for a *ChannelType* value of MQCHT_CLNTCONN.

The maximum length of the string is MQ_PASSWORD_LENGTH. However, only the first 10 characters are used.

Port (MQCFIN)

Port number (parameter identifier MQIACH_PORT).

The port number used to connect an AMQP channel. The default port for AMQP 1.0 connections is 5672. If you are already using port 5672, you can specify a different port.

This attribute is applicable to AMQP channels.

PropertyControl (MQCFIN)

Property control attribute (parameter identifier MQIA_PROPERTY_CONTROL).

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor). The value can be any of the following values:

MQPROP_COMPATIBILITY

If the message contains a property with a prefix of **mcd.**, **jms.**, **usr.** or **mqext.**, all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those properties contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

This value is the default value; it allows applications which expect JMS-related properties to be in an MQRFH2 header in the message data to continue to work unmodified.

MQPROP_NONE

All properties of the message, except those properties in the message descriptor (or extension), are removed from the message before the message is sent to the remote queue manager.

MQPROP_ALL

All properties of the message are included with the message when it is sent to the remote queue manager. The properties, except those properties in the message descriptor (or extension), are placed in one or more MQRFH2 headers in the message data.

This attribute is applicable to Sender, Server, Cluster Sender, and Cluster Receiver channels.

PutAuthority (MQCFIN)

Put authority (parameter identifier: MQIACH_PUT_AUTHORITY).

Specifies which user identifiers are used to establish authority to put messages to the destination queue (for message channels) or to execute an MQI call (for MQI channels).

This parameter is valid only for channels with a *ChannelType* value of MQCHT_RECEIVER, MQCHT_REQUESTER, MQCHT_CLUSRCVR, or MQCHT_SVRCONN.

The value can be any of the following values:

MQPA_DEFAULT

Default user identifier is used.

z/OS On z/OS, MQPA_DEFAULT might involve using both the user ID received from the network and that derived from MCAUSER.

MQPA_CONTEXT

The user ID from the *UserIdentifier* field of the message descriptor is used.

z/OS On z/OS, MQPA_CONTEXT might involve also using the user ID received from the network or that derived from MCAUSER, or both.

MQPA_ALTERNATE_OR_MCA

The user ID from the *UserIdentifier* field of the message descriptor is used. Any user ID received from the network is not used. This value is supported only on z/OS.

MQPA_ONLY_MCA

The user ID derived from MCAUSER is used. Any user ID received from the network is not used. This value is supported only on z/OS.

QMgrName (MQCFST)

Queue manager name (parameter identifier: MQCA_Q_MGR_NAME).

For channels with a *ChannelType* of MQCHT_CLNTCONN, this name is the name of a queue manager to which a client application can request connection.

For channels of other types, this parameter is not valid. The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

z/OS QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

Table 196. QSGDisposition: Where objects are defined and how they behave		
QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command. It uses the MQQSGD_GROUP object of the same name as the <i>ToChannelName</i> object (for Copy) or <i>ChannelName</i> object (for Create).

Table 196. QSGDisposition: Where objects are defined and how they behave (continued)

QSGDisposition	Change	Copy, Create
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to attempt to refresh local copies on page set zero:</p> <pre>DEFINE CHANNEL(channel-name) CHLTYPE(type) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This definition is allowed only if the queue manager is in a queue sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to attempt to make or refresh local copies on page set zero:</p> <pre>DEFINE CHANNEL(channel-name) CHLTYPE(type) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
MQQSGD_PRIVATE	<p>The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.</p>	Not permitted.
MQQSGD_Q_MGR	<p>The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.</p>	<p>The object is defined on the page set of the queue manager that executes the command. This value is the default value.</p>

ReceiveExit (MQCFSL)

Receive exit name (parameter identifier: MQCACH_RCV_EXIT_NAME).

If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

You can specify a list of exit names by using an MQCFSL structure instead of an MQCFST structure.

- The exits are invoked in the order specified in the list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.

- The total length of all the exit names in the list (excluding trailing blanks in each name) must not exceed MQ_TOTAL_EXIT_NAME_LENGTH. An individual string must not exceed MQ_EXIT_NAME_LENGTH.
- On z/OS, you can specify the names of up to eight exit programs.

ReceiveUserData (MQCFSL)

Receive exit user data (parameter identifier: MQCACH_RCV_EXIT_USER_DATA).

Specifies user data that is passed to the receive exit.

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

You can specify a list of exit user data strings by using an MQCFSL structure instead of an MQCFST structure.

- Each exit user data string is passed to the exit at the same ordinal position in the *ReceiveExit* list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit user data in the list (excluding trailing blanks in each string) must not exceed MQ_TOTAL_EXIT_DATA_LENGTH. An individual string must not exceed MQ_EXIT_DATA_LENGTH.
- On z/OS, you can specify up to eight strings.

Replace (MQCFIN)

Replace channel definition (parameter identifier: MQIACF_REPLACE).

The value can be any of the following values:

MQRP_YES

Replace existing definition.

If *ChannelType* is MQCHT_CLUSSDR, MQRP_YES can be specified only if the channel was created manually.

MQRP_NO

Do not replace existing definition.

SecurityExit (MQCFST)

Security exit name (parameter identifier: MQCACH_SEC_EXIT_NAME).

If a nonblank name is defined, the security exit is invoked at the following times:

- Immediately after establishing a channel.

Before any messages are transferred, the exit is enabled to instigate security flows to validate connection authorization.
- Upon receipt of a response to a security message flow.

Any security message flows received from the remote processor on the remote machine are passed to the exit.

The exit is given the entire application message and message descriptor for modification.

The format of the string depends on the platform, as follows:

- On IBM i, AIX and Linux, it is of the form

```
libraryname(functionname)
```

Note: On IBM i systems, the following form is also supported for compatibility with older releases:

```
progrname libname
```

where *programe* occupies the first 10 characters, and *libname* the second 10 characters (both blank-padded to the right if necessary).

- On Windows, it is of the form

```
dllname(functionname)
```

where *dllname* is specified without the suffix `.DLL`.

- On z/OS, it is a load module name, maximum length 8 characters (128 characters are allowed for exit names for client-connection channels, subject to a maximum total length of 999).

The maximum length of the exit name depends on the environment in which the exit is running. `MQ_EXIT_NAME_LENGTH` gives the maximum length for the environment in which your application is running. `MQ_MAX_EXIT_NAME_LENGTH` gives the maximum for all supported environments.

SecurityUserData (MQCFST)

Security exit user data (parameter identifier: `MQCACH_SEC_EXIT_USER_DATA`).

Specifies user data that is passed to the security exit.

The maximum length of the string is `MQ_EXIT_DATA_LENGTH`.

SendExit (MQCFSL)

Send exit name (parameter identifier: `MQCACH_SEND_EXIT_NAME`).

If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. `MQ_EXIT_NAME_LENGTH` gives the maximum length for the environment in which your application is running. `MQ_MAX_EXIT_NAME_LENGTH` gives the maximum for all supported environments.

You can specify a list of exit names by using an `MQCFSL` structure instead of an `MQCFST` structure.

- The exits are invoked in the order specified in the list.
- A list with only one name is equivalent to specifying a single name in an `MQCFST` structure.
- You cannot specify both a list (`MQCFSL`) and a single entry (`MQCFST`) structure for the same channel attribute.
- The total length of all the exit names in the list (excluding trailing blanks in each name) must not exceed `MQ_TOTAL_EXIT_NAME_LENGTH`. An individual string must not exceed `MQ_EXIT_NAME_LENGTH`.
- On z/OS, you can specify the names of up to eight exit programs.

SendUserData (MQCFSL)

Send exit user data (parameter identifier: `MQCACH_SEND_EXIT_USER_DATA`).

Specifies user data that is passed to the send exit.

The maximum length of the string is `MQ_EXIT_DATA_LENGTH`.

You can specify a list of exit user data strings by using an `MQCFSL` structure instead of an `MQCFST` structure.

- Each exit user data string is passed to the exit at the same ordinal position in the *SendExit* list.
- A list with only one name is equivalent to specifying a single name in an `MQCFST` structure.
- You cannot specify both a list (`MQCFSL`) and a single entry (`MQCFST`) structure for the same channel attribute.
- The total length of all the exit user data in the list (excluding trailing blanks in each string) must not exceed `MQ_TOTAL_EXIT_DATA_LENGTH`. An individual string must not exceed `MQ_EXIT_DATA_LENGTH`.

- On z/OS, you can specify up to eight strings.

SeqNumberWrap (MQCFIN)

Sequence wrap number (parameter identifier: MQIACH_SEQUENCE_NUMBER_WRAP).

Specifies the maximum message sequence number. When the maximum is reached, sequence numbers wrap to start again at 1.

The maximum message sequence number is not negotiable; the local and remote channels must wrap at the same number.

Specify a value in the range 100 - 999 999 999.

This parameter is not valid for channels with a *ChannelType* of MQCHT_SVRCONN or MQCHT_CLNTCONN.

SharingConversations (MQCFIN)

Maximum number of sharing conversations (parameter identifier: MQIACH_SHARING_CONVERSATIONS).

Specifies the maximum number of conversations that can share a particular TCP/IP MQI channel instance (socket).

Specify a value in the range 0 - 999 999 999. The default value is 10 and the migrated value is 10.

This parameter is valid only for channels with a *ChannelType* of MQCHT_CLNTCONN or MQCHT_SVRCONN. It is ignored for channels with a *TransportType* other than MQXPT_TCP.

The number of shared conversations does not contribute to the *MaxInstances* or *MaxInstancesPerClient* totals.

A value of:

1

Means that there is no sharing of conversations over a TCP/IP channel instance, but client heartbeating is available whether in an MQGET call or not, read ahead and client asynchronous consumption are available, and channel quiescing is more controllable.

0

Specifies no sharing of conversations over a TCP/IP channel instance. The channel instance runs in a mode before that of IBM WebSphere MQ 7.0, regarding:

- Administrator stop-quiesce
- Heartbeating
- Read ahead
- Client asynchronous consumption

ShortRetryCount (MQCFIN)

Short retry count (parameter identifier: MQIACH_SHORT_RETRY).

The maximum number of attempts that are made by a sender or server channel to establish a connection to the remote machine, at intervals specified by *ShortRetryInterval* before the (normally longer) *LongRetryCount* and *LongRetryInterval* are used.

Retry attempts are made if the channel fails to connect initially (whether it is started automatically by the channel initiator or by an explicit command), and also if the connection fails after the channel has successfully connected. However, if the cause of the failure is such that retry is unlikely to be successful, retries are not attempted.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

ShortRetryInterval (MQCFIN)

Short timer (parameter identifier: MQIACH_SHORT_TIMER).

Specifies the short retry wait interval for a sender or server channel that is started automatically by the channel initiator. It defines the interval in seconds between attempts to establish a connection to the remote machine.

The time is approximate. Zero means that another connection attempt is made as soon as possible.

Specify a value in the range 0 - 999 999. Values exceeding this value are treated as 999 999.

This parameter is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR.

SPLProtection (MQCFIN)

SPLProtection (parameter identifier: MQIACH_SPL_PROTECTION). This parameter applies to z/OS only, from IBM MQ 9.1.3 onwards.

Security policy protection parameter. Specifies what happens to messages across the channel when Advanced Message Security is active and an applicable policy exists.

This parameter is valid for channel types MQCHT_SENDER, MQCHT_SERVER, MQCHT_RECEIVER, and MQCHT_REQUESTER only.

Possible values are:

MQSPL_PASSTHRU

Pass through, unchanged, any messages sent or received by the message channel agent for this channel.

This value is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_RECEIVER, or MQCHT_REQUESTER, and is the default value.

MQSPL_REMOVE

Remove any AMS protection from messages retrieved from the transmission queue by the message channel agent, and send the messages to the partner.

When the MCA gets a message from the transmission queue, if an AMS policy is defined for the transmission queue, it is applied to remove any AMS protection from the message prior to sending the message across the channel. If an AMS policy is not defined for the transmission queue, the message is sent as is.

This value is valid only for *ChannelType* values of MQCHT_SENDER or MQCHT_SERVER.

MQSPL_AS_POLICY

Based on the policy defined for the target queue, apply AMS protection to inbound messages prior to putting them on to the target queue.

When the message channel agent receives an inbound message, if an AMS policy is defined for the target queue, AMS protection is applied to the message prior to the message being put to the target queue. If an AMS policy is not defined for the target queue, the message is put to the target queue as is.

This value is valid only for *ChannelType* values of MQCHT_RECEIVER or MQCHT_REQUESTER.

SSLCipherSpec (MQCFST)

CipherSpec (parameter identifier: MQCACH_SSL_CIPHER_SPEC). Specifies the CipherSpec that is used on the channel. The length of the string is MQ_SSL_CIPHER_SPEC_LENGTH.

Attention:   On IBM MQ for z/OS, you can also specify the four digit hexadecimal code of a CipherSpec, whether or not it appears in the following table. On IBM i, you can also specify the two digit hexadecimal code of a CipherSpec, whether or not it appears in the following table. Also, on IBM i, installation of AC3 is a prerequisite for the use of TLS. You should not specify hexadecimal cipher values in SSLCIPH, because it is unclear from the value which cipher will be used, and the choice of which protocol to be used is indeterminate. Using hexadecimal cipher values can lead to CipherSpec mismatch errors.

If a specific named CipherSpec is being used, the **SSLCIPH** values at the two ends of a channel must specify the same named CipherSpec.

This parameter is valid on all channel types that use transport type **TRPTYPE (TCP)**. If the parameter is blank, no attempt is made to use TLS on the channel. If the TRPTYPE is not TCP, the data is ignored and no error message is issued.

The value for this parameter is also used to set the value of SecurityProtocol, which is an output field on the [Inquire Channel Status \(Response\)](#) command.

Note: When SSLCipherSpec is used with a telemetry channel, it means TLS Cipher Suite.

ALW You can specify a value of ANY_TLS12, which represents a subset of acceptable CipherSpecs that use the TLS 1.2 protocol; these CipherSpecs are listed in the following table.

ALW On AIX, Linux, and Windows, IBM MQ provides an expanded set of alias CipherSpecs that includes ANY_TLS12_OR_HIGHER, and ANY_TLS13_OR_HIGHER. These alias CipherSpecs are listed in the following table.

 **Attention:** If your enterprise needs to guarantee that a certain CipherSpec is negotiated and used, you must not use an alias CipherSpec value such as ANY_TLS12.

For information on changing your existing security configurations to use the ANY_TLS12_OR_HIGHER CipherSpec, see [Migrating existing security configurations to use the ANY_TLS12_OR_HIGHER CipherSpec](#).

Table 197. CipherSpecs you can use with IBM MQ TLS support (continued)

Platform support "1" on page 1069	CipherSpec name	Hex code	Protocol used	MAC algorithm	Encryption algorithm (encryption bits)	FIPS "2" on page 1069	Suite B
-----------------------------------	-----------------	----------	---------------	---------------	--	-----------------------	---------

Notes:

1. For a list of platforms covered by each platform icon, see [Icons used in the product documentation](#).
2. Specifies whether the CipherSpec is FIPS-certified on a FIPS-certified platform. See [Federal Information Processing Standards \(FIPS\)](#) for an explanation of FIPS.
3.  The ANY_TLS13_OR_HIGHER alias CipherSpec negotiates the highest level of security that the remote end will allow but will only connect using a TLS 1.3 or higher protocol.
4.  To use TLS 1.3, or the ANY CipherSpec, on IBM i the underlying operating system version must support TLS 1.3. See [System TLS support for TLSv1.3](#) for more information.
5.  The ANY_TLS13 alias CipherSpec represents a subset of acceptable CipherSpecs that use the TLS 1.3 protocol, as listed in this table for each platform.
6.  The ANY_TLS12_OR_HIGHER alias CipherSpec negotiates the highest level of security that the remote end will allow but will only connect using a TLS 1.2 or higher protocol.
7. The ANY_TLS12 CipherSpec represents a subset of acceptable CipherSpecs that use the TLS 1.2 protocol, as listed in this table for each platform.
8.  The ANY alias CipherSpec negotiates the highest level of security that the remote end will allow.
9.  These CipherSpecs are not enabled on IBM i 7.4 systems that have System Value QSSLCSLCTL set to *OPSSYS.
10.  These CipherSpecs use an 8-octet Integrity Check Value (ICV) instead of a 16-octet ICV.
11. This CipherSpec cannot be used to secure a connection from the IBM MQ Explorer to a queue manager unless the appropriate unrestricted policy files are applied to the JRE used by the Explorer.
12.  Following a recommendation by GSKit, TLS 1.2 GCM CipherSpecs have a restriction which means that after 2^{24.5} TLS records are sent, using the same session key, the connection is terminated with message `AMQ9288E`. This GCM restriction is active, regardless of the FIPS mode being used.

To prevent this error from happening, avoid using TLS 1.2 GCM Ciphers, enable secret key reset, or start your IBM MQ queue manager or client with the environment variable `GSK_ENFORCE_GCM_RESTRICTION=GSK_FALSE` set. For GSKit libraries, you must set this environment variable on both sides of the connection, and apply it to both client to queue manager connections and queue manager to queue manager connections. Note that this setting affects unmanaged .NET clients, but not Java or managed .NET clients. For more information, see [AES-GCM cipher restriction](#).

 This restriction does not apply to IBM MQ for z/OS.

For more information about CipherSpecs, see [Enabling CipherSpecs](#).

When you request a personal certificate, you specify a key size for the public and private key pair. The key size that is used during the SSL handshake can depend on the size stored in the certificate and on the CipherSpec:

-   On z/OS, AIX, Linux, and Windows, when a CipherSpec name includes `_EXPORT`, the maximum handshake key size is 512 bits. If either of the certificates exchanged

during the SSL handshake has a key size greater than 512 bits, a temporary 512-bit key is generated for use during the handshake.

- **z/OS** For z/OS, System SSL state that if a TLS V1.3 connection is being negotiated:
 - The minimum key size for an RSA peer certificate is the larger of the following two values: 2048, or the value specified in the GSK_PEER_RSA_MIN_KEY_SIZE attribute.
 - The minimum key size for an ECC peer certificate is the larger of the following two values: 256, or the value specified in the GSK_PEER_ECC_MIN_KEY_SIZE attribute.
- **ALW** On AIX, Linux, and Windows, when a CipherSpec name includes _EXPORT1024, the handshake key size is 1024 bits.
- Otherwise the handshake key size is the size stored in the certificate.

SSLClientAuth (MQCFIN)

Client authentication (parameter identifier: MQIACH_SSL_CLIENT_AUTH).

The value can be any of the following values:

MQSCA_REQUIRED

Client authentication required.

MQSCA_OPTIONAL

Client authentication optional.

Defines whether IBM MQ requires a certificate from the TLS client.

The TLS client is the end of the message channel that initiates the connection. The TLS Server is the end of the message channel that receives the initiation flow.

The parameter is used only for channels with SSLCIPH specified. If SSLCIPH is blank, the data is ignored and no error message is issued.

SSLPeerName (MQCFST)

Peer name (parameter identifier: MQCACH_SSL_PEER_NAME).

Note: An alternative way of restricting connections into channels by matching against the TLS Subject Distinguished Name, is to use channel authentication records. With channel authentication records, different TLS Subject Distinguished Name patterns can be applied to the same channel. If both SSLPEER on the channel and a channel authentication record are used to apply to the same channel, the inbound certificate must match both patterns in order to connect. For more information, see [Channel authentication records](#).

Multi On [Multiplatforms](#), the length of the string is MQ_SSL_PEER_NAME_LENGTH.

z/OS On z/OS, the length of the string is MQ_SSL_SHORT_PEER_NAME_LENGTH.

Specifies the filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel. (A Distinguished Name is the identifier of the TLS certificate.) If the Distinguished Name in the certificate received from the peer does not match the SSLPEER filter, the channel does not start.

This parameter is optional; if it is not specified, the Distinguished Name of the peer is not checked when the channel is started. (The Distinguished Name from the certificate is still written into the SSLPEER definition held in memory, and passed to the security exit). If SSLCIPH is blank, the data is ignored and no error message is issued.

This parameter is valid for all channel types.

The SSLPEER value is specified in the standard form used to specify a Distinguished Name. For example:
SSLPEER('SERIALNUMBER=4C:D0:49:D5:02:5F:38,CN="H1_C_FR1",O=IBM,C=GB')

You can use a semi-colon as a separator instead of a comma.

The possible attribute types supported are as follows:

Table 198. Attribute types and descriptions

Attribute	Description
SERIALNUMBER	Certificate serial number
MAIL	Email address
 E	Email address (Deprecated in preference to MAIL)
UID or USERID	User identifier
CN	Common Name
T	Title
OU	Organizational Unit name
DC	Domain component
O	Organization name
STREET	Street / First line of address
L	Locality name
ST (or SP or S)	State or Province name
PC	Postal code / zip code
C	Country
UNSTRUCTUREDNAME	Host name
UNSTRUCTUREDADDRESS	IP address
DNQ	Distinguished name qualifier

IBM MQ only accepts uppercase letters for the attribute types.

If any of the unsupported attribute types are specified in the SSLPEER string, an error is output either when the attribute is defined or at run time (depending on which platform you are running on), and the string is deemed not to have matched the Distinguished Name of the flowed certificate.

If the Distinguished Name of the flowed certificate contains multiple OU (organizational unit) attributes, and SSLPEER specifies these attributes to be compared, they must be defined in descending hierarchical order. For example, if the Distinguished Name of the flowed certificate contains the OUs OU=Large Unit,OU=Medium Unit,OU=Small Unit, specifying the following SSLPEER values work:

```
('OU=Large Unit,OU=Medium Unit') ('OU=*,OU=Medium Unit,OU=Small Unit') ('OU=*,OU=Medium Unit')
```

but specifying the following SSLPEER values fail:

```
('OU=Medium Unit,OU=Small Unit') ('OU=Large Unit,OU=Small Unit') ('OU=Medium Unit')
```

Any or all the attribute values can be generic, either an asterisk (*) on its own, or a stem with initiating or trailing asterisks. This value allows the SSLPEER to match any Distinguished Name value, or any value starting with the stem for that attribute.

If an asterisk is specified at the beginning or end of any attribute value in the Distinguished Name on the certificate, you can specify * to check for an exact match in SSLPEER. For example, if you have an attribute of CN=Test* in the Distinguished Name of the certificate, you can use the following command:

```
SSLPEER('CN=Test\*')
```

Multi TemporaryModelQName (MQCFST)

The name of the model queue to be used while creating a temporary queue (parameter identifier MQCACH_TEMPORARY_MODEL_Q).

The maximum length of the string is MQ_Q_NAME_LENGTH.

Multi TemporaryQPrefix (MQCFST)

The temporary queue name prefix to add to the beginning of the model queue, when deriving a temporary queue name (parameter identifier MQCACH_TEMPORARY_Q_PREFIX).

The maximum length of the string is MQ_TEMPORARY_Q_PREFIX_LENGTH.

TpName (MQCFST)

Transaction program name (parameter identifier: MQCACH_TP_NAME).

This name is the LU 6.2 transaction program name.

The maximum length of the string is MQ_TP_NAME_LENGTH.

- On IBM i, AIX, Linux, and Windows platforms, this parameter can be set only to blanks. The actual name is taken instead from the CPI-C Communications Side Object or (on Windows) from the CPI-C symbolic destination name properties.

This parameter is valid only for channels with a *TransportType* of MQXPT_LU62. It is not valid for receiver channels.

TPRoot (MQCFST)

Topic root for an AMQP channel. (parameter identifier: MQCACH_TOPIC_ROOT).

The default value for TPRoot is SYSTEM.BASE.TOPIC. With this value, the topic string an AMQP client uses to publish or subscribe has no prefix, and the client can exchange messages with other MQ pub/sub applications. To have AMQP clients publish and subscribe under a topic prefix, first create an MQ topic object with a topic string set to the prefix you want, then set TPRoot to the name of the MQ topic object you created.

This parameter is valid only for AMQP channels.

TransportType (MQCFIN)

Transmission protocol type (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

No check is made that the correct transport type has been specified if the channel is initiated from the other end. The value can be any of the following values:

MQXPT_LU62

LU 6.2.

MQXPT_TCP

TCP.

MQXPT_NETBIOS

NetBIOS.

This value is supported in Windows. It also applies to z/OS for defining client-connection channels that connect to servers on the platforms supporting NetBIOS.

MQXPT_SPX

SPX.

This value is supported in Windows. It also applies to z/OS for defining client-connection channels that connect to servers on the platforms supporting SPX.

UseClId (MQCFIN)

Determines how authorization checks are done for AMQP channels. (parameter identifier: MQIACH_USE_CLIENT_ID).

The value can be any of the following values:

MQUCI_NO

The MCA user ID should be used for authorization checks.

MQUCI_YES

The client ID should be used for authorization checks.

This parameter is valid only for AMQP channels.

UseDLQ (MQCFIN)

Determines whether the dead-letter queue is used when messages cannot be delivered by channels. (parameter identifier: MQIA_USE_DEAD_LETTER_Q).

The value can be any of the following values:

MQUSEDLQ_NO

Messages that cannot be delivered by a channel are treated as a failure. The channel either discards the message, or the channel ends, in accordance with the NonPersistentMsgSpeed setting.

MQUSEDLQ_YES

When the DEADQ queue manager attribute provides the name of a dead-letter queue, then it is used, else the behavior is as for MQUSEDLQ_NO.

UserIdentifier (MQCFST)

Task user identifier (parameter identifier: MQCACH_USER_ID).

This parameter is used by the message channel agent when attempting to initiate a secure SNA session with a remote message channel agent. On IBM i, AIX and Linux, it is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_REQUESTER, MQCHT_CLNTCONN, MQCHT_CLUSSDR, or MQCHT_CLUSRCVR. On z/OS, it is valid only for a *ChannelType* value of MQCHT_CLNTCONN.

The maximum length of the string is MQ_USER_ID_LENGTH. However, only the first 10 characters are used.

XmitQName (MQCFST)

Transmission queue name (parameter identifier: MQCACH_XMIT_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

A transmission queue name is required (either previously defined or specified here) if *ChannelType* is MQCHT_SENDER or MQCHT_SERVER. It is not valid for other channel types.

Error codes (Change, Copy, and Create Channel)

This command might return the following error codes in the response format header, in addition to those codes listed in [“Error codes applicable to all commands”](#) on page 1018.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_BATCH_INT_ERROR

Batch interval not valid.

MQRCCF_BATCH_INT_WRONG_TYPE

Batch interval parameter not allowed for this channel type.

MQRCCF_BATCH_SIZE_ERROR

Batch size not valid.

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHANNEL_TYPE_ERROR

Channel type not valid.

MQRCCF_CLUSTER_NAME_CONFLICT
Cluster name conflict.

MQRCCF_DISC_INT_ERROR
Disconnection interval not valid.

MQRCCF_DISC_INT_WRONG_TYPE
Disconnection interval not allowed for this channel type.

MQRCCF_HB_INTERVAL_ERROR
Heartbeat interval not valid.

MQRCCF_HB_INTERVAL_WRONG_TYPE
Heartbeat interval parameter not allowed for this channel type.

MQRCCF_KWD_VALUE_WRONG_TYPE
An attribute keyword and value combination are not valid for this channel type.

MQRCCF_LONG_RETRY_ERROR
Long retry count not valid.

MQRCCF_LONG_RETRY_WRONG_TYPE
Long retry parameter not allowed for this channel type.

MQRCCF_LONG_TIMER_ERROR
Long timer not valid.

MQRCCF_LONG_TIMER_WRONG_TYPE
Long timer parameter not allowed for this channel type.

MQRCCF_MAX_INSTANCES_ERROR
Maximum instances value not valid.

MQRCCF_MAX_INSTS_PER_CLNT_ERR
Maximum instances per client value not valid.

MQRCCF_MAX_MSG_LENGTH_ERROR
Maximum message length not valid.

MQRCCF_MCA_NAME_ERROR
Message channel agent name error.

MQRCCF_MCA_NAME_WRONG_TYPE
Message channel agent name not allowed for this channel type.

MQRCCF_MCA_TYPE_ERROR
Message channel agent type not valid.

MQRCCF_MISSING_CONN_NAME
Connection name parameter required but missing.

MQRCCF_MR_COUNT_ERROR
Message retry count not valid.

MQRCCF_MR_COUNT_WRONG_TYPE
Message-retry count parameter not allowed for this channel type.

MQRCCF_MR_EXIT_NAME_ERROR
Channel message-retry exit name error.

MQRCCF_MR_EXIT_NAME_WRONG_TYPE
Message-retry exit parameter not allowed for this channel type.

MQRCCF_MR_INTERVAL_ERROR
Message retry interval not valid.

MQRCCF_MR_INTERVAL_WRONG_TYPE
Message-retry interval parameter not allowed for this channel type.

MQRCCF_MSG_EXIT_NAME_ERROR
Channel message exit name error.

MQRCCF_NET_PRIORITY_ERROR
Network priority value error.

MQRCCF_NET_PRIORITY_WRONG_TYPE
Network priority attribute not allowed for this channel type.

MQRCCF_NPM_SPEED_ERROR
Nonpersistent message speed not valid.

MQRCCF_NPM_SPEED_WRONG_TYPE
Nonpersistent message speed parameter not allowed for this channel type.

MQRCCF_PARM_SEQUENCE_ERROR
Parameter sequence not valid.

MQRCCF_PUT_AUTH_ERROR
Put authority value not valid.

MQRCCF_PUT_AUTH_WRONG_TYPE
Put authority parameter not allowed for this channel type.

MQRCCF_RCV_EXIT_NAME_ERROR
Channel receive exit name error.

MQRCCF_SEC_EXIT_NAME_ERROR
Channel security exit name error.

MQRCCF_SEND_EXIT_NAME_ERROR
Channel send exit name error.

MQRCCF_SEQ_NUMBER_WRAP_ERROR
Sequence wrap number not valid.

MQRCCF_SHARING_CONVS_ERROR
Value given for Sharing Conversations not valid.

MQRCCF_SHARING_CONVS_TYPE
Sharing Conversations parameter not valid for this channel type.

MQRCCF_SHORT_RETRY_ERROR
Short retry count not valid.

MQRCCF_SHORT_RETRY_WRONG_TYPE
Short retry parameter not allowed for this channel type.

MQRCCF_SHORT_TIMER_ERROR
Short timer value not valid.

MQRCCF_SHORT_TIMER_WRONG_TYPE
Short timer parameter not allowed for this channel type.

MQRCCF_SSL_CIPHER_SPEC_ERROR
TLS CipherSpec not valid.

MQRCCF_SSL_CLIENT_AUTH_ERROR
TLS client authentication not valid.

MQRCCF_SSL_PEER_NAME_ERROR
TLS peer name not valid.

MQRCCF_WRONG_CHANNEL_TYPE
Parameter not allowed for this channel type.

MQRCCF_XMIT_PROTOCOL_TYPE_ERR
Transmission protocol type not valid.

MQRCCF_XMIT_Q_NAME_ERROR
Transmission queue name error.

MQRCCF_XMIT_Q_NAME_WRONG_TYPE
Transmission queue name not allowed for this channel type.

Change, Copy, and Create Channel (MQTT) on AIX, Linux, and Windows

The Change Channel PCF command changes existing Telemetry channel definitions. The Copy and Create Channel commands create new Telemetry channel definitions - the Copy command uses attribute values of an existing channel definition.

The Change Channel (MQCMD_CHANGE_CHANNEL) command changes the specified attributes in a channel definition. For any optional parameters that are omitted, the value does not change.

The Copy Channel (MQCMD_COPY_CHANNEL) command creates new channel definition using, for attributes not specified in the command, the attribute values of an existing channel definition.

The Create Channel (MQCMD_CREATE_CHANNEL) command creates an IBM MQ channel definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager. If a system default channel exists for the type of channel being created, the default values are taken from there.

Required parameters (Change, Create Channel)

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Specifies the name of the channel definition to be changed, or created

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

MQCHT_MQTT

Telemetry.

TrpType (MQCFIN)

Transmission protocol type of the channel (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE). This parameter is required for a create command in telemetry.

No check is made that the correct transport type has been specified if the channel is initiated from the other end. The value is:

MQXPT_TCP

TCP.

Port (MQCFIN)

The port number to use if *TrpType* is set to MQXPT_TCP. This parameter is required for a create command in telemetry, if *TrpType* is set to MQXPT_TCP.

The value is in the range 1 - 65335.

Required parameters (Copy Channel)

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

MQCHT_MQTT

Telemetry.

Optional parameters (Change, Copy, and Create Channel)

Backlog (MQCFIN)

The number of concurrent connection requests that the telemetry channel supports at any one time (parameter identifier: MQIACH_BACKLOG).

The value is in the range 0 - 999999999.

JAASConfig (MQCFST)

The file path of the JAAS configuration (parameter identifier: MQCACH_JAAS_CONFIG).

The maximum length of this value is MQ_JAAS_CONFIG_LENGTH.

Only one of JAASCONFIG, MCAUSER, and USECLIENTID can be specified for a telemetry channel; if none is specified, no authentication is performed. If JAASConfig is specified, the client flows a user name and password. In all other cases, the flowed user name is ignored.

LocalAddress (MQCFST)

Local communications address for the channel (parameter identifier: MQCACH_LOCAL_ADDRESS).

The maximum length of the string is MQ_LOCAL_ADDRESS_LENGTH.

The value that you specify depends on the transport type (*TrpType*) to be used:

TCP/IP

The value is the optional IP address and optional port or port range to be used for outbound TCP/IP communications. The format for this information is as follows:

```
[ip-addr][(low-port[,high-port])]
```

where *ip-addr* is specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric form, and *low-port* and *high-port* are port numbers enclosed in parentheses. All are optional.

All Others

The value is ignored; no error is diagnosed.

Use this parameter if you want a channel to use a particular IP address, port, or port range for outbound communications. This parameter is useful when a machine is connected to multiple networks with different IP addresses.

Examples of use

Value	Meaning
9.20.4.98	Channel binds to this address locally
9.20.4.98 (1000)	Channel binds to this address and port 1000 locally
9.20.4.98 (1000,2000)	Channel binds to this address and uses a port in the range 1000 - 2000 locally
(1000)	Channel binds to port 1000 locally
(1000,2000)	Channel binds to a port in the range 1000 - 2000 locally

Note:

- Do not confuse this parameter with *ConnectionName*. The *LocalAddress* parameter specifies the characteristics of the local communications; the *ConnectionName* parameter specifies how to reach a remote queue manager.

Protocol (MQCFIL)

Client protocols supported by the MQTT channel (parameter identifier: MQIACH_PROTOCOL).

The value can be one or more of the following values:

MQPROTO_MQTTV311

The channel accepts connections from clients using the protocol defined by the [MQTT 3.1.1](#) Oasis standard. The functionality provided by this protocol is almost identical to that provided by the pre-existing MQTTV3 protocol.

MQPROTO_MQTTV3

The channel accepts connections from clients using the [MQTT V3.1 Protocol Specification](#) from [mqtt.org](#).

MQPROTO_HTTP

The channel accepts HTTP requests for pages, or WebSockets connections to MQ Telemetry.

If you specify no client protocols, the channel accepts connections from clients using any of the supported protocols.

If your configuration includes an MQTT channel that was last modified in an earlier version of the product, you must explicitly change the protocol setting to prompt the channel to use the MQTTV311 option. This is so even if the channel does not specify any client protocols, because the specific protocols to use with the channel are stored at the time the channel is configured, and previous versions of the product have no awareness of the MQTTV311 option. To prompt a channel in this state to use the MQTTV311 option, explicitly add the option then save your changes. The channel definition is now aware of the option. If you subsequently change the settings again, and specify no client protocols, the MQTTV311 option is still included in the stored list of supported protocols.

SSLCipherSuite (MQCFST)

CipherSuite (parameter identifier: MQCACH_SSL_CIPHER_SUITE).

The length of the string is MQ_SSL_CIPHER_SUITE_LENGTH.

SSL CIPHER SUITE character channel parameter type.

SSLClientAuth (MQCFIN)

Client authentication (parameter identifier: MQIACH_SSL_CLIENT_AUTH).

The value can be any of the following values:

MQSCA_REQUIRED

Client authentication required

MQSCA_OPTIONAL

Client authentication is optional.

MQSCA_NEVER_REQUIRED

Client authentication is never required, and must not be provided.

Defines whether IBM MQ requires a certificate from the TLS client.

The TLS client is the end of the message channel that initiates the connection. The TLS Server is the end of the message channel that receives the initiation flow.

The parameter is used only for channels with SSLCIPH specified. If SSLCIPH is blank, the data is ignored and no error message is issued.

SSLKeyFile (MQCFST)

The store for digital certificates and their associated private keys (parameter identifier: MQCA_SSL_KEY_REPOSITORY).

If you do not specify a key file, TLS is not used.

The maximum length of this parameter is MQ_SSL_KEY_REPOSITORY_LENGTH.

SSLPassPhrase (MQCFST)

The password for the key repository (parameter identifier: MQCACH_SSL_KEY_PASSPHRASE).

If no pass phrase is entered, then unencrypted connections must be used.

The maximum length of this parameter is MQ_SSL_KEY_PASSPHRASE_LENGTH.

If the MQXR service is configured for encryption of passphrases by specifying the **-sf** option in STARTARG for the service, then the pass phrase will be encrypted. For more information on encryption of passphrases see [Encryption of passphrases for MQTT TLS channels](#).

UseClientIdentifier (MQCFIN)

Determines whether to use the client ID of a new connection as the user ID for that connection (parameter identifier: MQIACH_USE_CLIENT_ID).

The value is either:

MQUCI_YES

Yes.

MQUCI_NO

No.

Only one of JAASCONFIG, MCAUSER, and USECLIENTID can be specified for a telemetry channel; if none is specified, no authentication is performed. If USECLIENTID is specified, the flowed user name of the client is ignored.

Error codes (Change, Copy, and Create Channel)

This command might return the following error codes in the response format header, in addition to those codes listed in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_BATCH_INT_ERROR

Batch interval not valid.

MQRCCF_BATCH_INT_WRONG_TYPE

Batch interval parameter not allowed for this channel type.

MQRCCF_BATCH_SIZE_ERROR

Batch size not valid.

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHANNEL_TYPE_ERROR

Channel type not valid.

MQRCCF_CLUSTER_NAME_CONFLICT

Cluster name conflict.

MQRCCF_DISC_INT_ERROR

Disconnection interval not valid.

MQRCCF_DISC_INT_WRONG_TYPE

Disconnection interval not allowed for this channel type.

MQRCCF_HB_INTERVAL_ERROR

Heartbeat interval not valid.

MQRCCF_HB_INTERVAL_WRONG_TYPE

Heartbeat interval parameter not allowed for this channel type.

MQRCCF_LONG_RETRY_ERROR

Long retry count not valid.

MQRCCF_LONG_RETRY_WRONG_TYPE

Long retry parameter not allowed for this channel type.

MQRCCF_LONG_TIMER_ERROR

Long timer not valid.

MQRCCF_LONG_TIMER_WRONG_TYPE
Long timer parameter not allowed for this channel type.

MQRCCF_MAX_INSTANCES_ERROR
Maximum instances value not valid.

MQRCCF_MAX_INSTS_PER_CLNT_ERR
Maximum instances per client value not valid.

MQRCCF_MAX_MSG_LENGTH_ERROR
Maximum message length not valid.

MQRCCF_MCA_NAME_ERROR
Message channel agent name error.

MQRCCF_MCA_NAME_WRONG_TYPE
Message channel agent name not allowed for this channel type.

MQRCCF_MCA_TYPE_ERROR
Message channel agent type not valid.

MQRCCF_MISSING_CONN_NAME
Connection name parameter required but missing.

MQRCCF_MR_COUNT_ERROR
Message retry count not valid.

MQRCCF_MR_COUNT_WRONG_TYPE
Message-retry count parameter not allowed for this channel type.

MQRCCF_MR_EXIT_NAME_ERROR
Channel message-retry exit name error.

MQRCCF_MR_EXIT_NAME_WRONG_TYPE
Message-retry exit parameter not allowed for this channel type.

MQRCCF_MR_INTERVAL_ERROR
Message retry interval not valid.

MQRCCF_MR_INTERVAL_WRONG_TYPE
Message-retry interval parameter not allowed for this channel type.

MQRCCF_MSG_EXIT_NAME_ERROR
Channel message exit name error.

MQRCCF_NET_PRIORITY_ERROR
Network priority value error.

MQRCCF_NET_PRIORITY_WRONG_TYPE
Network priority attribute not allowed for this channel type.

MQRCCF_NPM_SPEED_ERROR
Nonpersistent message speed not valid.

MQRCCF_NPM_SPEED_WRONG_TYPE
Nonpersistent message speed parameter not allowed for this channel type.

MQRCCF_PARM_SEQUENCE_ERROR
Parameter sequence not valid.

MQRCCF_PUT_AUTH_ERROR
Put authority value not valid.

MQRCCF_PUT_AUTH_WRONG_TYPE
Put authority parameter not allowed for this channel type.

MQRCCF_RCV_EXIT_NAME_ERROR
Channel receive exit name error.

MQRCCF_SEC_EXIT_NAME_ERROR
Channel security exit name error.

MQRCCF_SEND_EXIT_NAME_ERROR
Channel send exit name error.

MQRCCF_SEQ_NUMBER_WRAP_ERROR

Sequence wrap number not valid.

MQRCCF_SHARING_CONVS_ERROR

Value given for Sharing Conversations not valid.

MQRCCF_SHARING_CONVS_TYPE

Sharing Conversations parameter not valid for this channel type.

MQRCCF_SHORT_RETRY_ERROR

Short retry count not valid.

MQRCCF_SHORT_RETRY_WRONG_TYPE

Short retry parameter not allowed for this channel type.

MQRCCF_SHORT_TIMER_ERROR

Short timer value not valid.

MQRCCF_SHORT_TIMER_WRONG_TYPE

Short timer parameter not allowed for this channel type.

MQRCCF_SSL_CIPHER_SPEC_ERROR

TLS CipherSpec not valid.

MQRCCF_SSL_CLIENT_AUTH_ERROR

TLS client authentication not valid.

MQRCCF_SSL_PEER_NAME_ERROR

TLS peer name not valid.

MQRCCF_WRONG_CHANNEL_TYPE

Parameter not allowed for this channel type.

MQRCCF_XMIT_PROTOCOL_TYPE_ERR

Transmission protocol type not valid.

MQRCCF_XMIT_Q_NAME_ERROR

Transmission queue name error.

MQRCCF_XMIT_Q_NAME_WRONG_TYPE

Transmission queue name not allowed for this channel type.

Multi **Change, Copy, and Create Channel Listener on Multiplatforms**

The Change Channel Listener PCF command changes existing channel listener definitions. The Copy and Create Channel Listener commands create new channel listener definitions - the Copy command uses attribute values of an existing channel listener definition.

The Change Channel Listener (MQCMD_CHANGE_LISTENER) command changes the specified attributes of an existing IBM MQ listener definition. For any optional parameters that are omitted, the value does not change.

The Copy Channel Listener (MQCMD_COPY_LISTENER) command creates an IBM MQ listener definition, using, for attributes not specified in the command, the attribute values of an existing listener definition.

The Create Channel Listener (MQCMD_CREATE_LISTENER) command creates an IBM MQ listener definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameters (Change and Create Channel Listener)**ListenerName (MQCFST)**

The name of the listener definition to be changed or created (parameter identifier: MQCACH_LISTENER_NAME).

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

TransportType (MQCFIN)

Transmission protocol (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value can be:

MQXPT_TCP
TCP.

MQXPT_LU62
LU 6.2. This value is valid only on Windows.

MQXPT_NETBIOS
NetBIOS. This value is valid only on Windows.

MQXPT_SPX
SPX. This value is valid only on Windows.

Required parameters (Copy Channel Listener)

FromListenerName (MQCFST)

The name of the listener definition to be copied from (parameter identifier: MQCACF_FROM_LISTENER_NAME).

This parameter specifies the name of the existing listener definition that contains values for the attributes not specified in this command.

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

ToListenerName (MQCFST)

To listener name (parameter identifier: MQCACF_TO_LISTENER_NAME).

This parameter specifies the name of the new listener definition. If a listener definition with this name exists, *Replace* must be specified as MQRP_YES.

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

Optional parameters (Change, Copy, and Create Channel Listener)

Adapter (MQCFIN)

Adapter number (parameter identifier: MQIACH_ADAPTER).

The adapter number on which NetBIOS listens. This parameter is valid only on Windows.

Backlog (MQCFIN)

Backlog (parameter identifier: MQIACH_BACKLOG).

The number of concurrent connection requests that the listener supports.

Commands (MQCFIN)

Adapter number (parameter identifier: MQIACH_COMMAND_COUNT).

The number of commands that the listener can use. This parameter is valid only on Windows.

IPAddress (MQCFST)

IP address (parameter identifier: MQCACH_IP_ADDRESS).

IP address for the listener specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric host name form. If you do not specify a value for this parameter, the listener listens on all configured IPv4 and IPv6 stacks.

The maximum length of the string is MQ_LOCAL_ADDRESS_LENGTH

ListenerDesc (MQCFST)

Description of listener definition (parameter identifier: MQCACH_LISTENER_DESC).

This parameter is a plain-text comment that provides descriptive information about the listener definition. It must contain only displayable characters.

If characters are used that are not in the coded character set identifier (CCSID) for the queue manager on which the command is executing, they might be translated incorrectly.

The maximum length of the string is MQ_LISTENER_DESC_LENGTH.

LocalName (MQCFST)

NetBIOS local name (parameter identifier: MQCACH_LOCAL_NAME).

The NetBIOS local name that the listener uses. This parameter is valid only on Windows.

The maximum length of the string is MQ_CONN_NAME_LENGTH

NetbiosNames (MQCFIN)

NetBIOS names (parameter identifier: MQIACH_NAME_COUNT).

The number of names that the listener supports. This parameter is valid only on Windows.

Port (MQCFIN)

Port number (parameter identifier: MQIACH_PORT).

The port number for TCP/IP. This parameter is valid only if the value of *TransportType* is MQXPT_TCP.

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If a namelist definition with the same name as *ToListenerName* exists, this definition specifies whether it is to be replaced. The value can be:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

Sessions (MQCFIN)

NetBIOS sessions (parameter identifier: MQIACH_SESSION_COUNT).

The number of sessions that the listener can use. This parameter is valid only on Windows.

Socket (MQCFIN)

SPX socket number (parameter identifier: MQIACH_SOCKET).

The SPX socket on which to listen. This parameter is valid only if the value of *TransportType* is MQXPT_SPX.

StartMode (MQCFIN)

Service mode (parameter identifier: MQIACH_LISTENER_CONTROL).

Specifies how the listener is to be started and stopped. The value can be any of the following values:

MQSVC_CONTROL_MANUAL

The listener is not to be started automatically or stopped automatically. It is to be controlled by user command. This value is the default value.

MQSVC_CONTROL_Q_MGR

The listener being defined is to be started and stopped at the same time as the queue manager is started and stopped.

MQSVC_CONTROL_Q_MGR_START

The listener is to be started at the same time as the queue manager is started, but is not requested to stop when the queue manager is stopped.

TPName (MQCFST)

Transaction program name (parameter identifier: MQCACH_TP_NAME).

The LU 6.2 transaction program name. This parameter is valid only on Windows.

The maximum length of the string is MQ_TP_NAME_LENGTH

Multi *Change, Copy, and Create Communication Information Object on Multiplatforms*

The Change Communication Information Object PCF command changes existing communication information object definitions. The Copy and Create Communication Information Object commands create

new communication information object definitions - the Copy command uses attribute values of an existing communication information object definition.

The Change communication information (MQCMD_CHANGE_COMM_INFO) command changes the specified attributes of an existing IBM MQ communication information object definition. For any optional parameters that are omitted, the value does not change.

The Copy communication information (MQCMD_COPY_COMM_INFO) command creates an IBM MQ communication information object definition, using, for attributes not specified in the command, the attribute values of an existing communication information definition.

The Create communication information (MQCMD_CREATE_COMM_INFO) command creates an IBM MQ communication information object definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameter (Change communication information)

ComminfoName (MQCFST)

The name of the communication information definition to be changed (parameter identifier: MQCA_COMM_INFO_NAME).

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

Required parameters (Copy communication information)

FromComminfoName (MQCFST)

The name of the communication information object definition to be copied from (parameter identifier: MQCACF_FROM_COMM_INFO_NAME).

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

ToComminfoName (MQCFST)

The name of the communication information definition to copy to (parameter identifier: MQCACF_TO_COMM_INFO_NAME).

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

Required parameters (Create communication information)

ComminfoName (MQCFST)

The name of the communication information definition to be created (parameter identifier: MQCA_COMM_INFO_NAME).

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

Optional parameters (Change, Copy, and Create communication information)

Bridge (MQCFIN)

Controls whether publications from applications not using Multicast are bridged to applications using multicast (parameter identifier: MQIA_MCAST_BRIDGE).

Bridging does not apply to topics that are marked as **MCAST (ONLY)**. As these topics can only have multicast traffic, it is not applicable to bridge to the non-multicast publish/subscribe domain.

MQMCB_DISABLED

Publications from applications not using multicast are not bridged to applications that do use Multicast. This is the default for IBM i.

MQMCB_ENABLED

Publications from applications not using multicast are bridged to applications that do use Multicast. This is the default for platforms other than IBM i. This value is not valid on IBM i.

CCSID (MQCFIN)

The coded character set identifier that messages are transmitted on (parameter identifier: MQIA_CODED_CHAR_SET_ID).

Specify a value in the range 1 to 65535.

The CCSID must specify a value that is defined for use on your platform, and use a character set that is appropriate to the platform. If you use this parameter to change the CCSID, applications that are running when the change is applied continue to use the original CCSID. Because of this, you must stop and restart all running applications before you continue.

This includes the command server and channel programs. To do this, stop and restart the queue manager after making the change. The default value is ASPUB which means that the coded character set is taken from the one that is supplied in the published message.

CommEvent (MQCFIN)

Controls whether event messages are generated for multicast handles that are created using this COMMINFO object (parameter identifier: MQIA_COMM_EVENT).

Events are only generated if monitoring is also enabled using the **MonitorInterval** parameter.

MQEVR_DISABLED

Publications from applications not using multicast are not bridged to applications that do use multicast. This is the default value.

MQEVR_ENABLED

Publications from applications not using multicast are bridged to applications that do use multicast.

MQEVR_EXCEPTION

Event messages are written if the message reliability is below the reliability threshold. The reliability threshold is set to 90 by default.

Description (MQCFST)

Plain-text comment that provides descriptive information about the communication information object (parameter identifier: MQCA_COMM_INFO_DESC).

It must contain only displayable characters. The maximum length is 64 characters. In a DBCS installation, it can contain DBCS characters (subject to a maximum length of 64 bytes).

If characters are used that are not in the coded character set identifier (CCSID) for this queue manager, they might be translated incorrectly if the information is sent to another queue manager.

The maximum length is MQ_COMM_INFO_DESC_LENGTH.

Encoding (MQCFIN)

The encoding that the messages are transmitted in (parameter identifier: MQIACF_ENCODING).

MQENC_AS_PUBLISHED

The encoding of the message is taken from the one that is supplied in the published message. This is the default value.

MQENC_NORMAL**MQENC_REVERSED****MQENC_S390****MQENC_TNS****GrpAddress (MQCFST)**

The group IP address or DNS name (parameter identifier: MQCACH_GROUP_ADDRESS).

It is the administrator's responsibility to manage the group addresses. It is possible for all multicast clients to use the same group address for every topic; only the messages that match outstanding subscriptions on the client are delivered. Using the same group address can be inefficient because every client must examine and process every multicast packet in the network. It is more efficient to allocate different IP group addresses to different topics or sets of topics, but this requires careful

management, especially if other non-MQ multicast applications are in use on the network. The default value is 239.0.0.0.

The maximum length is MQ_GROUP_ADDRESS_LENGTH.

MonitorInterval (MQCFIN)

How frequently monitoring information is updated and event messages are generated (parameter identifier: MQIA_MONITOR_INTERVAL).

The value is specified as a number of seconds in the range 0 to 999 999. A value of 0 indicates that no monitoring is required.

If a non-zero value is specified, monitoring is enabled. Monitoring information is updated and event messages (if enabled using *CommEvent*, are generated about the status of the multicast handles created using this communication information object.

MsgHistory (MQCFIN)

This value is the amount of message history in kilobytes that is kept by the system to handle retransmissions in the case of NACKs (parameter identifier: MQIACH_MSG_HISTORY).

The value is in the range 0 to 999 999 999. A value of 0 gives the least level of reliability. The default value is 100.

MulticastHeartbeat (MQCFIN)

The heartbeat interval is measured in milliseconds, and specifies the frequency at which the transmitter notifies any receivers that there is no further data available (parameter identifier: MQIACH_MC_HB_INTERVAL).

The value is in the range 0 to 999 999. The default value is 2000 milliseconds.

MulticastPropControl (MQCFIN)

The multicast properties control how many of the MQMD properties and user properties flow with the message (parameter identifier: MQIACH_MULTICAST_PROPERTIES).

MQMCP_ALL

All user properties and all the fields of the MQMD are transported. This is the default value.

MQMCP_REPLY

Only user properties, and MQMD fields that deal with replying to the messages, are transmitted. These properties are:

- MsgType
- MessageId
- CorrelId
- ReplyToQ
- ReplyToQmgr

MQMCP_USER

Only the user properties are transmitted.

MQMCP_NONE

No user properties or MQMD fields are transmitted.

MQMCP_COMPAT

Properties are transmitted in a format compatible with previous MQ multicast clients.

NewSubHistory (MQCFIN)

The new subscriber history controls whether a subscriber joining a publication stream receives as much data as is currently available, or receives only publications made from the time of the subscription (parameter identifier: MQIACH_NEW_SUBSCRIBER_HISTORY).

MQNSH_NONE

A value of NONE causes the transmitter to transmit only publication made from the time of the subscription. This is the default value.

MQNSH_ALL

A value of ALL causes the transmitter to retransmit as much history of the topic as is known. In some circumstances, this can give a similar behavior to retained publications.

Using the value of MQNSH_ALL might have a detrimental effect on performance if there is a large topic history because all the topic history is retransmitted.

PortNumber (MQCFIN)

The port number to transmit on (parameter identifier: MQIACH_PORT).

The default port number is 1414.

Type (MQCFIN)

The type of the communications information object (parameter identifier: MQIA_COMM_INFO_TYPE).

The only type supported is MQCIT_MULTICAST.

Change, Copy, and Create Namelist

The Change Namelist PCF command changes existing namelist definitions. The Copy and Create Namelist commands create new namelist definitions - the Copy command uses attribute values of an existing namelist definition.

The Change Namelist (MQCMD_CHANGE_NAMELIST) command changes the specified attributes of an existing IBM MQ namelist definition. For any optional parameters that are omitted, the value does not change.

The Copy Namelist (MQCMD_COPY_NAMELIST) command creates an IBM MQ namelist definition, using, for attributes not specified in the command, the attribute values of an existing namelist definition.

The Create Namelist (MQCMD_CREATE_NAMELIST) command creates an IBM MQ namelist definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameter (Change and Create Namelist)

NamelistName (MQCFST)

The name of the namelist definition to be changed (parameter identifier: MQCA_NAMELIST_NAME).

The maximum length of the string is MQ_NAMELIST_NAME_LENGTH.

Required parameters (Copy Namelist)

FromNamelistName (MQCFST)

The name of the namelist definition to be copied from (parameter identifier: MQCACF_FROM_NAMELIST_NAME).

This parameter specifies the name of the existing namelist definition that contains values for the attributes not specified in this command.

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR or MQQSGD_COPY to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToNamelistName* and the disposition MQQSGD_GROUP is searched for to copy from.

The maximum length of the string is MQ_NAMELIST_NAME_LENGTH.

ToNamelistName (MQCFST)

To namelist name (parameter identifier: MQCACF_TO_NAMELIST_NAME).

This parameter specifies the name of the new namelist definition. If a namelist definition with this name exists, *Replace* must be specified as MQRP_YES.

The maximum length of the string is MQ_NAMELIST_NAME_LENGTH.

Optional parameters (Change, Copy, and Create Namelist)

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

NamelistDesc (MQCFST)

Description of namelist definition (parameter identifier: MQCA_NAMELIST_DESC).

This parameter is a plain-text comment that provides descriptive information about the namelist definition. It must contain only displayable characters.

If characters are used that are not in the coded character set identifier (CCSID) for the queue manager on which the command is executing, they might be translated incorrectly.

The maximum length of the string is MQ_NAMELIST_DESC_LENGTH.

NamelistType (MQCFIN)

Type of names in the namelist (parameter identifier: MQIA_NAMELIST_TYPE). This parameter applies to z/OS only.

Specifies the type of names in the namelist. The value can be any of the following values:

MQNT_NONE

The names are of no particular type.

MQNT_Q

A namelist that holds a list of queue names.

MQNT_CLUSTER

A namelist that is associated with clustering, containing a list of the cluster names.

MQNT_AUTH_INFO

The namelist is associated with TLS, and contains a list of authentication information object names.

Names (MQCFSL)

The names to be placed in the namelist (parameter identifier: MQCA_NAMES).

The number of names in the list is given by the *Count* field in the MQCFSL structure. The length of each name is given by the *StringLength* field in that structure. The maximum length of a name is MQ_OBJECT_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

Table 200. QSGDisposition: Where objects are defined and how they behave

QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command. It uses the MQQSGD_GROUP object of the same name as the <i>ToNameListName</i> object (for Copy) or <i>NameListName</i> object (for Create).
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they refresh local copies on page set zero:</p> <pre>DEFINE NAMELIST(name) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This is allowed only if the queue manager is in a queue sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they make or refresh local copies on page set zero:</p> <pre>DEFINE NAMELIST(name) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
MQQSGD_PRIVATE	The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.	Not permitted.
MQQSGD_Q_MGR	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.	The object is defined on the page set of the queue manager that executes the command. This value is the default value.

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If a namelist definition with the same name as *ToNameListName* exists, this definition specifies whether it is to be replaced. The value can be:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

Change, Copy, and Create Process

The Change Process PCF command changes existing process definitions. The Copy and Create Process commands create new process definitions - the Copy command uses attribute values of an existing process definition.

The Change Process (MQCMD_CHANGE_PROCESS) command changes the specified attributes of an existing IBM MQ process definition. For any optional parameters that are omitted, the value does not change.

The Copy Process (MQCMD_COPY_PROCESS) command creates an IBM MQ process definition, using, for attributes not specified in the command, the attribute values of an existing process definition.

The Create Process (MQCMD_CREATE_PROCESS) command creates an IBM MQ process definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameters (Change and Create Process)

ProcessName (MQCFST)

The name of the process definition to be changed or created (parameter identifier: MQCA_PROCESS_NAME).

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

Required parameters (Copy Process)

FromProcessName (MQCFST)

The name of the process definition to be copied from (parameter identifier: MQCACF_FROM_PROCESS_NAME).

Specifies the name of the existing process definition that contains values for the attributes not specified in this command.

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR or MQQSGD_COPY to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToProcessName* and the disposition MQQSGD_GROUP is searched for to copy from.

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

ToProcessName (MQCFST)

To process name (parameter identifier: MQCACF_TO_PROCESS_NAME).

The name of the new process definition. If a process definition with this name exists, *Replace* must be specified as MQRP_YES.

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

Optional parameters (Change, Copy, and Create Process)

ApplId (MQCFST)

Application identifier (parameter identifier: MQCA_APPL_ID).

ApplId is the name of the application to be started. The application must be on the platform for which the command is executing. The name might typically be a fully qualified file name of an executable object. Qualifying the file name is particularly important if you have multiple IBM MQ installations, to ensure the correct version of the application is run.

The maximum length of the string is MQ_PROCESS_APPL_ID_LENGTH.

ApplType (MQCFIN)

Application type (parameter identifier: MQIA_APPL_TYPE).

Valid application types are:

MQAT_OS400

IBM i application.

MQAT_DOS

DOS client application.

MQAT_WINDOWS

IBM MQ MQI client application.

MQAT_AIX

AIX application (same value as MQAT_UNIX).

MQAT_CICS

CICS transaction.

 **MQAT_ZOS**

z/OS application.

MQAT_DEFAULT

Default application type.

integer: System-defined application type in the range zero through 65 535 or a user-defined application type in the range 65 536 through 999 999 999 (not checked).

Only specify application types (other than user-defined types) that are supported on the platform at which the command is executed:

-  On IBM i: MQAT_OS400, MQAT_CICS, and MQAT_DEFAULT are supported.
-   On AIX and Linux: MQAT_UNIX, MQAT_OS2, MQAT_DOS, MQAT_WINDOWS, MQAT_CICS, and MQAT_DEFAULT are supported.
-  On Windows: MQAT_WINDOWS_NT, MQAT_OS2, MQAT_DOS, MQAT_WINDOWS, MQAT_CICS, and MQAT_DEFAULT are supported.
-  On z/OS: MQAT_DOS, MQAT_IMS, MQAT_MVS, MQAT_UNIX, MQAT_CICS, and MQAT_DEFAULT are supported.

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. In a shared queue environment, you can provide a different queue manager name from the one you are using to enter the command. The command server must be enabled.
- An asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

EnvData (MQCFST)

Environment data (parameter identifier: MQCA_ENV_DATA).

A character string that contains environment information pertaining to the application to be started.

The maximum length of the string is MQ_PROCESS_ENV_DATA_LENGTH.

ProcessDesc (MQCFST)

Description of process definition (parameter identifier: MQCA_PROCESS_DESC).

A plain-text comment that provides descriptive information about the process definition. It must contain only displayable characters.

The maximum length of the string is MQ_PROCESS_DESC_LENGTH.

Use characters from the coded character set identifier (CCSID) for this queue manager. Other characters might be translated incorrectly if the information is sent to another queue manager.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command. It uses the MQQSGD_GROUP object of the same name as the <i>ToProcessName</i> object (for Copy) or <i>ProcessName</i> object (for Create).
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameters QSGDISP(GROUP). On the page set of the queue manager that executes the command, only a local copy of the object is altered by this command. If the command is successful, the following command is generated.</p> <pre>DEFINE PROCESS(process-name) REPLACE QSGDISP(COPY)</pre> <p>The command is sent to all active queue managers in the queue sharing group to attempt to refresh local copies on page set zero. The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. GROUP is allowed only if the queue manager is in a queue sharing group. If the definition is successful, the following command is generated.</p> <pre>DEFINE PROCESS(process-name) REPLACE QSGDISP(COPY)</pre> <p>The command is sent to all active queue managers in the queue sharing group to attempt to make or refresh local copies on page set zero. The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
MQQSGD_PRIVATE	The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.	Not permitted.

Table 201. QSGDisposition: Where objects are defined and how they behave (continued)

QSGDisposition	Change	Copy, Create
MQQSGD_Q_MGR	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. MQQSGD_Q_MGR is the default value.	The object is defined on the page set of the queue manager that executes the command. MQQSGD_Q_MGR is the default value.

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If a process definition with the same name as *ToProcessName* exists, specify whether to replace it.

The value can be any of the following values:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

UserData (MQCFST)

User data (parameter identifier: MQCA_USER_DATA).

A character string that contains user information pertaining to the application (defined by *AppLId*) that is to be started.

For Microsoft Windows, the character string must not contain double quotation marks if the process definition is going to be passed to **runmqtrm**.

The maximum length of the string is MQ_PROCESS_USER_DATA_LENGTH.

Change, Copy, and Create Queue

The Change Queue PCF command changes existing queue definitions. The Copy and Create Queue commands create new queue definitions - the Copy command uses attribute values of an existing queue definition.

The Change Queue command MQCMD_CHANGE_Q changes the specified attributes of an existing IBM MQ queue. For any optional parameters that are omitted, the value does not change.

The Copy Queue command MQCMD_COPY_Q creates a queue definition of the same type. For attributes not specified in the command, it uses the attribute values of an existing queue definition.

The Create Queue command MQCMD_CREATE_Q creates a queue definition with the specified attributes. All attributes that are not specified are set to the default value for the type of queue that is created.

Required parameters (Change and Create Queue)

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

The name of the queue to be changed. The maximum length of the string is MQ_Q_NAME_LENGTH.

Required parameters (Copy Queue)

FromQName (MQCFST)

From queue name (parameter identifier: MQCACF_FROM_Q_NAME).

Specifies the name of the existing queue definition.

z/OS On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR, MQQSGD_COPY, or MQQSGD_SHARED to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDDisposition*. In this case, an object with the name specified by *ToQName* and the disposition MQQSGD_GROUP is searched for to copy from.

The maximum length of the string is MQ_Q_NAME_LENGTH.

ToQName (MQCFST)

To queue name (parameter identifier: MQCACF_TO_Q_NAME).

Specifies the name of the new queue definition.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Queue names must be unique; if a queue definition exists with the name and type of the new queue, *Replace* must be specified as MQRP_YES. If a queue definition exists with the same name as and a different type from the new queue, the command fails.

Required parameters (all commands)

QType (MQCFIN)

Queue type (parameter identifier: MQIA_Q_TYPE).

The value specified must match the type of the queue being changed.

The value can be any of the following values:

MQQT_ALIAS

Alias queue definition.

MQQT_LOCAL

Local queue.

MQQT_REMOTE

Local definition of a remote queue.

MQQT_MODEL

Model queue definition.

Optional parameters (Change, Copy, and Create Queue)

BackoutRequeueName (MQCFST) - see MQSC BOQNAME

Excessive backout requeue name (parameter identifier: MQCA_BACKOUT_REQ_Q_NAME).

Specifies the name of the queue to which a message is transferred if it is backed out more times than the value of *BackoutThreshold*. The queue does not have to be a local queue.

The backout queue does not need to exist at this time but it must exist when the *BackoutThreshold* value is exceeded.

The maximum length of the string is MQ_Q_NAME_LENGTH.

BackoutThreshold (MQCFIN)

Backout threshold (parameter identifier: MQIA_BACKOUT_THRESHOLD).

The number of times a message can be backed out before it is transferred to the backout queue specified by *BackoutRequeueName*.

If the value is later reduced, messages that are already on the queue that were backed out at least as many times as the new value remain on the queue. Those messages are transferred if they are backed out again.

Specify a value in the range 0 - 999,999,999.

BaseObjectName (MQCFST)

Name of the object to which the alias resolves (parameter identifier: MQCA_BASE_OBJECT_NAME).

This parameter is the name of a queue or topic that is defined to the local queue manager.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

BaseQName (MQCFST)

Queue name to which the alias resolves (parameter identifier: MQCA_BASE_Q_NAME).

This parameter is the name of a local or remote queue that is defined to the local queue manager.

The maximum length of the string is MQ_Q_NAME_LENGTH.

V 9.4.0

CapExpiry (MQCFIN)

Capped message expiry processing (parameter identifier MQIA_CAP_EXPIRY) which can be an integer value or can take the value of MQCEX_NOLIMIT.

Specifies a lifetime limit for messages put using the object, expressed in 10ths of a second. A value of -1, displayed as NOLIMIT, has no effect on processing.

For more information on message expiry processing, see [Enforcing lower expiration times](#)

CapExpiry provides, or limits, the value in the MQMD [Expiry](#) field of any message put.

An application provided MQMD **Expiry** that is less than any resolved CapExpiry value is passed. This value is not replaced by that resolved CapExpiry value.

This process allows an IBM MQ administrator to limit the life of messages put by an application that overlooked (or was unable to provide, in the case of MQTT) message expiration criteria.

However, this option does not allow an administrator to override application behavior where the required lifetime of messages was under-estimated.

If more than one object is used on the resolution path, for example, alias queue-> remote queue-> transmission queue, then the smallest of all their non-zero CapExpiry values is used as the upper limit for expiry.

The new capped value for expiry is used during the put processing as if it had been provided by the application in the MQMD structure.

The *capped* value is evaluated for each put being performed, and so is sensitive to the resolution of the put operation. For example, in a cluster, where the put operation is performed with BIND NOT FIXED, messages might pick up different expiry values depending on the CapExpiry value set for the transmission queue used by the channel.

z/OS

You cannot specify an integer value for the CAPEXPY attribute on a queue object with QSGDISP(SHARED|GROUP|COPY), which resides in a queue sharing group that contains queue managers running any version of IBM MQ for z/OS below 9.4.0. Attempting to do so, results in messages CSQM532I and CSQM533I to identify which queue managers do not support CAPEXPY, and no modification to the object.

z/OS

CFStructure (MQCFST)

Coupling facility structure name (parameter identifier: MQCA_CF_STRUC_NAME). This parameter applies to z/OS only.

Specifies the name of the coupling facility structure where you want to store messages when you use shared queues. The name:

- Cannot have more than 12 characters
- Must start with an uppercase letter (A - Z)
- Can include only the characters A - Z and 0 - 9

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

The name of the queue sharing group to which the queue manager is connected is prefixed to the name you supply. The name of the queue sharing group is always four characters, padded with @ symbols if necessary. For example, if you use a queue sharing group named NY03 and you supply the name PRODUCT7, the resultant coupling facility structure name is NY03PRODUCT7. Note the

administrative structure for the queue sharing group (in this case NY03CSQ_ADMIN) cannot be used for storing messages.

For local and model queues, the following rules apply. The rules apply if you use the Create Queue command with a value of MQRP_YES in the **Replace** parameter. The rules also apply if you use the Change Queue command.

- On a local queue with a value of MQQSGD_SHARED in the **QSGDisposition** parameter, *CFStructure* cannot change.

If you need to change either the *CFStructure* or *QSGDisposition* value, you must delete and redefine the queue. To preserve any of the messages on the queue you must offload the messages before you delete the queue. Reload the messages after you redefine the queue, or move the messages to another queue.

- On a model queue with a value of MQQDT_SHARED_DYNAMIC in the **DefinitionType** parameter, *CFStructure* cannot be blank.
- On a local queue with a value other than MQQSGD_SHARED in the **QSGDisposition** parameter, the value of *CFStructure* does not matter. The value *CFStructure* also does not matter for a model queue with a value other than MQQDT_SHARED_DYNAMIC in the **DefinitionType** parameter.

For local and model queues, when you use the Create Queue command with a value of MQRP_NO in the **Replace** parameter, the coupling facility structure:

- On a local queue with a value of MQQSGD_SHARED in the **QSGDisposition** parameter, or a model queue with a value of MQQDT_SHARED_DYNAMIC in the **DefinitionType** parameter, *CFStructure* cannot be blank.
- On a local queue with a value other than MQQSGD_SHARED in the **QSGDisposition** parameter, the value of *CFStructure* does not matter. The value *CFStructure* also does not matter for a model queue with a value other than MQQDT_SHARED_DYNAMIC in the **DefinitionType** parameter.

Note: Before you can use the queue, the structure must be defined in the coupling facility Resource Management (CFRM) policy data set.

ClusterChannelName (MQCFST)

This parameter is supported only on transmission queues.

`ClusterChannelName` is the generic name of the cluster-sender channels that use this queue as a transmission queue. The attribute specifies which cluster-sender channels send messages to a cluster-receiver channel from this cluster transmission queue. (Parameter identifier: MQCA_CLUS_CHL_NAME.)

You can also set the transmission queue attribute `ClusterChannelName` attribute to a cluster-sender channel manually. Messages that are destined for the queue manager connected by the cluster-sender channel are stored in the transmission queue that identifies the cluster-sender channel. They are not stored in the default cluster transmission queue. If you set the `ClusterChannelName` attribute to blanks, the channel switches to the default cluster transmission queue when the channel restarts. The default queue is either `SYSTEM.CLUSTER.TRANSMIT.ChannelName` or `SYSTEM.CLUSTER.TRANSMIT.QUEUE`, depending on the value of the queue manager `DefClusterXmitQueueType` attribute.

By specifying asterisks, "*", in **ClusterChannelName**, you can associate a transmission queue with a set of cluster-sender channels. The asterisks can be at the beginning, end, or any number of places in the middle of the channel name string. **ClusterChannelName** is limited to a length of 20 characters: MQ_CHANNEL_NAME_LENGTH.

The default queue manager configuration is for all cluster-sender channels to send messages from a single transmission queue, `SYSTEM.CLUSTER.TRANSMIT.QUEUE`. The default configuration can be changed by modified by changing the queue manager attribute, **DefClusterXmitQueueType**. The default value of the attribute is `SCTQ`. You can change the value to `CHANNEL`. If you set the **DefClusterXmitQueueType** attribute to `CHANNEL`, each cluster-sender channel defaults to using a specific cluster transmission queue, `SYSTEM.CLUSTER.TRANSMIT.ChannelName`.

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

The name of the cluster to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are open.

Only one of the resultant values of **ClusterName** and **ClusterNamelist** can be nonblank; you cannot specify a value for both.

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

ClusterNamelist (MQCFST)

Cluster namelist (parameter identifier: MQCA_CLUSTER_NAMELIST).

The name of the namelist, that specifies a list of clusters to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are open.

Only one of the resultant values of **ClusterName** and **ClusterNamelist** can be nonblank; you cannot specify a value for both.

CLWLQueuePriority (MQCFIN)

Cluster workload queue priority (parameter identifier: MQIA_CLWL_Q_PRIORITY).

Specifies the priority of the queue in cluster workload management; see [Configuring a queue manager cluster](#). The value must be in the range 0 - 9, where 0 is the lowest priority and 9 is the highest.

CLWLQueueRank (MQCFIN)

Cluster workload queue rank (parameter identifier: MQIA_CLWL_Q_RANK).

Specifies the rank of the queue in cluster workload management. The value must be in the range 0 - 9, where 0 is the lowest priority and 9 is the highest.

CLWLUseQ (MQCFIN)

Cluster workload use remote queue (parameter identifier: MQIA_CLWL_USEQ).

Specifies whether remote and local queues are to be used in cluster workload distribution. The value can be any of the following values:

MQCLWL_USEQ_AS_Q_MGR

Use the value of the **CLWLUseQ** parameter on the definition of the queue manager.

MQCLWL_USEQ_ANY

Use remote and local queues.

MQCLWL_USEQ_LOCAL

Do not use remote queues.

z/OS CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is run when the queue manager is a member of a queue sharing group. You can specify one of the following values:

- Blank, or omit the parameter altogether. The command is run on the queue manager on which it was entered.
- A queue manager name. The command is run on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment. The command server must be enabled.
- An asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Custom (MQCFST)

Custom attribute for new features (parameter identifier: MQCA_CUSTOM).

This attribute contains the values of attributes, as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE) . Single quotation marks must be escaped with another single quotation mark.

CAEXPRY (integer)

The maximum time, expressed in tenths of a second, until a message put using an object handle, opened using this object on the resolution path, remains in the system until it becomes eligible for expiry processing.

For more information on message expiry processing, see [Enforcing lower expiration times](#).

The value can be one of the following:

integer

The value must be in the range one through to 999 999 999.

NOLIMIT

There is no limit on the expiry time of messages put using this object. This is the default value.

Specifying a value for CAEXPRY that is not valid, does not cause the command to fail. Instead, the default value is used.

DefaultPutResponse (MQCFIN)

Default put response type definition (parameter identifier: MQIA_DEF_PUT_RESPONSE_TYPE).

The parameter specifies the type of response to be used for put operations to the queue when an application specifies MQPMO_RESPONSE_AS_Q_DEF. The value can be any of the following values:

MQPRT_SYNC_RESPONSE

The put operation is issued synchronously, returning a response.

MQPRT_ASYNC_RESPONSE

The put operation is issued asynchronously, returning a subset of MQMD fields.

DefBind (MQCFIN)

Bind definition (parameter identifier: MQIA_DEF_BIND).

The parameter specifies the binding to be used when MQOO_BIND_AS_Q_DEF is specified on the MQOPEN call. The value can be any of the following values:

MQBND_BIND_ON_OPEN

The binding is fixed by the MQOPEN call.

MQBND_BIND_NOT_FIXED

The binding is not fixed.

MQBND_BIND_ON_GROUP

Allows an application to request that a group of messages are all allocated to the same destination instance.

Changes to this parameter do not affect instances of the queue that are open.

DefinitionType (MQCFIN)

Queue definition type (parameter identifier: MQIA_DEFINITION_TYPE).

The value can be any of the following values:

MQQDT_PERMANENT_DYNAMIC

Dynamically defined permanent queue.

MQQDT_SHARED_DYNAMIC

Dynamically defined shared queue. This option is available on z/OS only.

MQQDT_TEMPORARY_DYNAMIC

Dynamically defined temporary queue.

DefInputOpenOption (MQCFIN)

Default input open option (parameter identifier: MQIA_DEF_INPUT_OPEN_OPTION).

Specifies the default share option for applications opening this queue for input.

The value can be any of the following values:

MQOO_INPUT_EXCLUSIVE

Open queue to get messages with exclusive access.

MQOO_INPUT_SHARED

Open queue to get messages with shared access.

DefPersistence (MQCFIN)

Default persistence (parameter identifier: MQIA_DEF_PERSISTENCE).

Specifies the default for message-persistence on the queue. Message persistence determines whether messages are preserved across restarts of the queue manager.

The value can be any of the following values:

MQPER_PERSISTENT

Message is persistent.

MQPER_NOT_PERSISTENT

Message is not persistent.

DefPriority (MQCFIN)

Default priority (parameter identifier: MQIA_DEF_PRIORITY).

Specifies the default priority of messages put on the queue. The value must be in the range zero through to the maximum priority value that is supported (9).

DefReadAhead (MQCFIN)

Default read ahead (parameter identifier: MQIA_DEF_READ_AHEAD).

Specifies the default read ahead behavior for non-persistent messages delivered to the client.

The value can be any of the following values:

MQREADA_NO

Non-persistent messages are not read ahead unless the client application is configured to request read ahead.

MQREADA_YES

Non-persistent messages are sent ahead to the client before an application requests them. Non-persistent messages can be lost if the client ends abnormally or if the client does not consume all the messages it is sent.

MQREADA_DISABLED

Read ahead of non-persistent messages is not enabled for this queue. Messages are not sent ahead to the client regardless of whether read ahead is requested by the client application.

Multi DistLists (MQCFIN)

Distribution list support (parameter identifier: MQIA_DIST_LISTS).

Specifies whether distribution-list messages can be placed on the queue.

Note: This attribute is set by the sending message channel agent (MCA). The sending MCA removes messages from the queue each time it establishes a connection to a receiving MCA on a partner queue manager. The attribute is not normally set by administrators, although it can be set if the need arises.

This parameter is supported on Multiplatforms.

The value can be any of the following values:

MQDL_SUPPORTED

Distribution lists supported.

MQDL_NOT_SUPPORTED

Distribution lists not supported.

Force (MQCFIN)

Force changes (parameter identifier: MQIACF_FORCE).

Specifies whether the command must be forced to complete when conditions are such that completing the command would affect an open queue. The conditions depend upon the type of the queue that is being changed:

QALIAS

BaseQName is specified with a queue name and an application has the alias queue open.

QLOCAL

Either of the following conditions indicates that a local queue would be affected:

- *Shareability* is specified as MQQA_NOT_SHAREABLE and more than one application has the local queue open for input.
- The *Usage* value is changed and one or more applications has the local queue open, or there are one or more messages on the queue. (The *Usage* value must not normally be changed while there are messages on the queue. The format of messages changes when they are put on a transmission queue.)

QREMOTE

Either of the following conditions indicates that a remote queue would be affected:

- If *XmitQName* is specified with a transmission-queue name, or blank, and an application has a remote queue open that would be affected by this change.
- If any of the following parameters are specified with a queue or queue manager name, and one or more applications has a queue open that resolved through this definition as a queue manager alias. The parameters are:

1. *RemoteQName*
2. *RemoteQMGrName*
3. *XmitQName*

QMODEL

This parameter is not valid for model queues.

Note: A value of MQFC_YES is not required if this definition is in use as a reply-to queue definition only.

The value can be any of the following values:

MQFC_YES

Force the change.

MQFC_NO

Do not force the change.

HardenGetBackout (MQCFIN)

Harden the backout count, or not (parameter identifier: MQIA_HARDEN_GET_BACKOUT).

Specifies whether the count of the number of times that a message was backed out is hardened. When the count is hardened, the value of the **BackoutCount** field of the message descriptor is written to the log before the message is returned by an MQGET operation. Writing the value to the log ensures that the value is accurate across restarts of the queue manger.

Note: IBM MQ for IBM i always hardens the count, regardless of the setting of this attribute.

When the backout count is hardened, the performance of MQGET operations for persistent messages on this queue is impacted.

The value can be any of the following values:

MQQA_BACKOUT_HARDENED

The message backout count for messages on this queue is hardened to ensure that the count is accurate.

MQQA_BACKOUT_NOT_HARDENED

The message backout count for messages on this queue is not hardened and might not be accurate over queue manager restarts.

ImageRecoverQueue (MQCFST)

Specifies whether a local or permanent dynamic queue object is recoverable from a media image, if linear logging is being used (parameter identifier: MQIA_MEDIA_IMAGE_RECOVER_Q).

This parameter is not valid on z/OS. Possible values are:

MQIMGRCOV_YES

These queue objects are recoverable.

MQIMGRCOV_NO

The “[rcdmqimg \(record media image\)](#)” on page 139 and “[rcrmqobj \(re-create object\)](#)” on page 142 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

MQIMGRCOV_AS_Q_MGR

If you specify MQIMGRCOV_AS_Q_MGR , and the **ImageRecoverQueue** attribute for the queue manager specifies MQIMGRCOV_YES , these queue objects are recoverable.

If you specify MQIMGRCOV_AS_Q_MGR and the **ImageRecoverQueue** attribute for the queue manager specifies MQIMGRCOV_NO, the “[rcdmqimg \(record media image\)](#)” on page 139 and “[rcrmqobj \(re-create object\)](#)” on page 142 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

MQIMGRCOV_AS_Q_MGR is the default value.

IndexType (MQCFIN)

Index type (parameter identifier: MQIA_INDEX_TYPE). This parameter applies to z/OS only.

Specifies the type of index maintained by the queue manager to expedite MQGET operations on the queue. For shared queues, the type of index determines what type of MQGET calls can be used. The value can be any of the following values:

MQIT_NONE

No index.

MQIT_MSG_ID

The queue is indexed using message identifiers.

MQIT_CORREL_ID

The queue is indexed using correlation identifiers.

MQIT_MSG_TOKEN

Important: This index type should only be used for queues used with the IBM MQ Workflow for z/OS product.

The queue is indexed using message tokens.

MQIT_GROUP_ID

The queue is indexed using group identifiers.

Messages can be retrieved using a selection criterion only if an appropriate index type is maintained, as the following table shows:

Retrieval selection criterion	IndexType required	
	Shared queue	Other queue
None (sequential retrieval)	Any	Any

Table 202. Retrieval selection criteria and index types (continued)

Retrieval selection criterion	IndexType required	
Message identifier	MQIT_MSG_ID or MQIT_NONE	Any
Correlation identifier	MQIT_CORREL_ID	Any
Message and correlation identifiers	MQIT_MSG_ID or MQIT_CORREL_ID	Any
Group identifier	MQIT_GROUP_ID	Any
Grouping	MQIT_GROUP_ID	MQIT_GROUP_ID
Message token	Not allowed	MQIT_MSG_TOKEN

InhibitGet (MQCFIN)

Get operations are allowed or inhibited (parameter identifier: MQIA_INHIBIT_GET).

The value can be:

MQQA_GET_ALLOWED

Get operations are allowed.

MQQA_GET_INHIBITED

Get operations are inhibited.

InhibitPut (MQCFIN)

Put operations are allowed or inhibited (parameter identifier: MQIA_INHIBIT_PUT).

Specifies whether messages can be put on the queue.

The value can be any of the following values:

MQQA_PUT_ALLOWED

Put operations are allowed.

MQQA_PUT_INHIBITED

Put operations are inhibited.

InitiationQName (MQCFST)

Initiation queue name (parameter identifier: MQCA_INITIATION_Q_NAME).

The local queue for trigger messages relating to this queue. The initiation queue must be on the same queue manager.

The maximum length of the string is MQ_Q_NAME_LENGTH.

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: MQIA_MAX_MSG_LENGTH).

The maximum length for messages on the queue. Applications might use the value of this attribute to determine the size of buffer they need to retrieve messages from the queue. If you change this value it might cause an application to operate incorrectly.

Do not set a value that is greater than the *MaxMsgLength* attribute of a queue manager.

The lower limit for this parameter is 0. The upper limit depends on the environment:

- On AIX, Linux, Windows, IBM i, and z/OS, the maximum message length is 100 MB (104,857,600 bytes).
- On other UNIX systems, the maximum message length is 4 MB (4,194,304 bytes).

MaxQDepth (MQCFIN)

Maximum queue depth (parameter identifier: MQIA_MAX_Q_DEPTH).

The maximum number of messages allowed on the queue.

Note: Other factors might cause the queue to be treated as full. For example, it appears to be full if there is no storage available for a message.

Specify a value greater than or equal to 0, and less than or equal to 999,999,999.

Multi **MaxQFileSize (MQCFIN)**

Maximum queue depth (parameter identifier: MQIA_MAX_Q_FILE_SIZE).

The maximum size, in megabytes, that a queue file can grow to.

It is possible for a queue file to exceed the maximum size, if it is configured to a value lower than the current queue file size. If that happens the queue file no longer accepts new messages, but allows existing messages to be consumed. When the queue file size has dropped below the configured value, new messages are allowed to be put to the queue.

When displayed in queue status, this attribute indicates the current maximum size the queue file can grow to.

Note: This figure can differ from the value of the attribute configured on the queue because internally the queue manager might need to use a larger block size to reach the chosen size. See [Modifying IBM MQ queue files](#) for more information on changing the size of queue files and block size and granularity.

When the granularity needs changing because this attribute has been increased, warning message AMQ7493W Granularity changed is written to the AMQERR logs. This gives you an indication that you need to plan for the queue to be emptied, in order for IBM MQ to adopt the new granularity.

Specify a value greater than or equal to 20, and less than or equal to 267,386,880.

MsgDeliverySequence (MQCFIN)

Messages are delivered in priority order or sequence (parameter identifier: MQIA_MSG_DELIVERY_SEQUENCE).

The value can be any of the following values:

MQMDS_PRIORITY

Messages are returned in priority order.

MQMDS_FIFO

Messages are returned in FIFO order (first in, first out).

NonPersistentMessageClass (MQCFIN)

The level of reliability to be assigned to non-persistent messages that are put to the queue (parameter identifier: MQIA_NPM_CLASS).

The value can be:

MQNPM_CLASS_NORMAL

Non-persistent messages persist as long as the lifetime of the queue manager session. They are discarded in the event of a queue manager restart. This value is the default value.

MQNPM_CLASS_HIGH

The queue manager attempts to retain non-persistent messages for the lifetime of the queue. Non-persistent messages might still be lost in the event of a failure.

This parameter is valid only on local and model queues. It is not valid on z/OS.

ProcessName (MQCFST)

Name of process definition for the queue (parameter identifier: MQCA_PROCESS_NAME).

Specifies the local name of the IBM MQ process that identifies the application to be started when a trigger event occurs.

- If the queue is a transmission queue, the process definition contains the name of the channel to be started. This parameter is optional for transmission queues. If you do not specify it, the channel name is taken from the value specified for the **TriggerData** parameter.
- In other environments, the process name must be nonblank for a trigger event to occur, although it can be set after creating the queue.

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

PropertyControl (MQCFIN)

Property control attribute (parameter identifier: MQIA_PROPERTY_CONTROL).

Specifies how message properties are handled when messages are retrieved from queues using the MQGET call with the MQGMO_PROPERTIES_AS_Q_DEF option. The value can be any of the following values:

MQPROP_COMPATIBILITY

If the message contains a property with a prefix of **mcd.**, **jms.**, **usr.** or **mqext.**, all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those properties contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

This value is the default value. It allows applications which expect JMS-related properties to be in an MQRFH2 header in the message data to continue to work unmodified.

MQPROP_NONE

All properties of the message are removed from the message before the message is sent to the remote queue manager. Properties in the message descriptor, or extension, are not removed.

MQPROP_ALL

All properties of the message are included with the message when it is sent to the remote queue manager. The properties, except those properties in the message descriptor (or extension), are placed in one or more MQRFH2 headers in the message data.

MQPROP_FORCE_MQRFH2

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

A valid message handle supplied in the MsgHandle field of the MQGMO structure on the MQGET call is ignored. Properties of the message are not accessible using the message handle.

MQPROP_V6COMPAT

Any application MQRFH2 header is received as it was sent. Any properties set using MQSETMP must be retrieved using MQINQMP. They are not added to the MQRFH2 created by the application. Properties that were set in the MQRFH2 header by the sending application cannot be retrieved using MQINQMP.

This parameter is applicable to Local, Alias, and Model queues.

QDepthHighEvent (MQCFIN)

Controls whether Queue Depth High events are generated (parameter identifier: MQIA_Q_DEPTH_HIGH_EVENT).

A Queue Depth High event indicates that an application put a message on a queue. This event caused the number of messages on the queue to become greater than or equal to the queue depth high threshold. See the **QDepthHighLimit** parameter.

Note: The value of this attribute can change implicitly; see [“Definitions of the Programmable Command Formats” on page 1012](#).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

QDepthHighLimit (MQCFIN)

High limit for queue depth (parameter identifier: MQIA_Q_DEPTH_HIGH_LIMIT).

The threshold against which the queue depth is compared to generate a Queue Depth High event.

This event indicates that an application put a message to a queue. This event caused the number of messages on the queue to become greater than or equal to the queue depth high threshold. See the **QDepthHighEvent** parameter.

The value is expressed as a percentage of the maximum queue depth, *MaxQDepth*. It must be greater than or equal to 0 and less than or equal to 100.

QDepthLowEvent (MQCFIN)

Controls whether Queue Depth Low events are generated (parameter identifier: MQIA_Q_DEPTH_LOW_EVENT).

A Queue Depth Low event indicates that an application retrieved a message from a queue. This event caused the number of messages on the queue to become less than or equal to the queue depth low threshold. See the **QDepthLowLimit** parameter.

Note: The value of this attribute can change implicitly. See [“Definitions of the Programmable Command Formats” on page 1012](#).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

QDepthLowLimit (MQCFIN)

Low limit for queue depth (parameter identifier: MQIA_Q_DEPTH_LOW_LIMIT).

The threshold against which the queue depth is compared to generate a Queue Depth Low event.

This event indicates that an application retrieved a message from a queue. This event caused the number of messages on the queue to become less than or equal to the queue depth low threshold. See the **QDepthLowEvent** parameter.

Specify the value as a percentage of the maximum queue depth (**MaxQDepth** attribute), in the range 0 through 100.

QDepthMaxEvent (MQCFIN)

Controls whether Queue Full events are generated (parameter identifier: MQIA_Q_DEPTH_MAX_EVENT).

A Queue Full event indicates that an MQPUT call to a queue was rejected because the queue is full. That is, the queue depth reached its maximum value.

Note: The value of this attribute can change implicitly; see [“Definitions of the Programmable Command Formats” on page 1012](#).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

QDesc (MQCFST)

Queue description (parameter identifier: MQCA_Q_DESC).

Text that briefly describes the object.

The maximum length of the string is MQ_Q_DESC_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the message queue manager on which the command is executing. This choice ensures that the text is translated correctly if it is sent to another queue manager.

QServiceInterval (MQCFIN)

Target for queue service interval (parameter identifier: MQIA_Q_SERVICE_INTERVAL).

The service interval used for comparison to generate Queue Service Interval High and Queue Service Interval OK events. See the *QServiceIntervalEvent* parameter.

Specify a value in the range 0 through 999 999 999 milliseconds.

QServiceIntervalEvent (MQCFIN)

Controls whether Service Interval High or Service Interval OK events are generated (parameter identifier: MQIA_Q_SERVICE_INTERVAL_EVENT).

A Queue Service Interval High event is generated when a check indicates that no messages were retrieved from, or put to, the queue for at least the time indicated by the **QServiceInterval** attribute.

A Queue Service Interval OK event is generated when a check indicates that a message was retrieved from the queue within the time indicated by the **QServiceInterval** attribute.

Note: The value of this attribute can change implicitly; see [“Definitions of the Programmable Command Formats”](#) on page 1012.

The value can be any of the following values:

MQQSIE_HIGH

Queue Service Interval High events enabled.

- Queue Service Interval High events are enabled and
- Queue Service Interval OK events are disabled.

MQQSIE_OK

Queue Service Interval OK events enabled.

- Queue Service Interval High events are disabled and
- Queue Service Interval OK events are enabled.

MQQSIE_NONE

No queue service interval events enabled.

- Queue Service Interval High events are disabled and
- Queue Service Interval OK events are also disabled.

z/OS QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

<i>Table 203. QSGDisposition: Where objects are defined and how they behave</i>		
QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command. It uses the MQQSGD_GROUP object of the same name as the <i>ToQName</i> object (for Copy) or the <i>QName</i> object (for Create). For local queues, messages are stored on the page sets of each queue manager and are available only through that queue manager.

Table 203. QSGDisposition: Where objects are defined and how they behave (continued)

QSGDisposition	Change	Copy, Create
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to attempt to refresh local copies on page set zero:</p> <pre>DEFINE QUEUE(q-name) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This value is allowed only in a shared queue manager environment.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers to attempt to make or refresh local copies on page set zero:</p> <pre>DEFINE QUEUE(q-name) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
MQQSGD_PRIVATE	<p>The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.</p>	<p>Not permitted.</p>
MQQSGD_Q_MGR	<p>The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.</p>	<p>The object is defined on the page set of the queue manager that executes the command. This value is the default value. For local queues, messages are stored on the page sets of each queue manager and are available only through that queue manager.</p>
MQQSGD_SHARED	<p>This value applies only to local queues. The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_SHARED. Any object residing on the page set of the queue manager that executes the command, or any object defined by a command using the parameter MQQSGD_GROUP, is not affected by this command.</p>	<p>This option applies only to local queues. The object is defined in the shared repository. Messages are stored in the coupling facility and are available to any queue manager in the queue sharing group. You can specify MQQSGD_SHARED only if:</p> <ul style="list-style-type: none"> • <i>CFStructure</i> is nonblank • <i>IndexType</i> is not MQIT_MSG_TOKEN • The queue is not one of the following: <ul style="list-style-type: none"> – SYSTEM.CHANNEL.INITQ – SYSTEM.COMMAND.INPUT

QueueAccounting (MQCFIN)

Controls the collection of accounting data (parameter identifier: MQIA_ACCOUNTING_Q).

The value can be:

MQMON_Q_MGR

The collection of accounting data for the queue is performed based upon the setting of the **QueueAccounting** parameter on the queue manager.

MQMON_OFF

Accounting data collection is disabled for the queue.

MQMON_ON

If the value of the queue manager's *QueueAccounting* parameter is not MQMON_NONE, accounting data collection is enabled for the queue.

QueueMonitoring (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA_MONITORING_Q).

Specifies whether online monitoring data is to be collected and, if so, the rate at which the data is collected. The value can be any of the following values:

MQMON_OFF

Online monitoring data collection is turned off for this queue.

 This is the default value on z/OS.

MQMON_Q_MGR

The value of the queue manager's **QueueMonitoring** parameter is inherited by the queue.

MQMON_LOW

The rate of data collection is low for this queue.

 If the value of the queue manager **QueueMonitoring** parameter is not MQMON_NONE, online monitoring data collection is turned on.

MQMON_MEDIUM

The rate of data collection is moderate for this queue.

 If the value of the queue manager **QueueMonitoring** parameter is not MQMON_NONE, online monitoring data collection is turned on.

MQMON_HIGH

The rate of data collection is high for this queue.

 If the value of the queue manager **QueueMonitoring** parameter is not MQMON_NONE, online monitoring data collection is turned on.

QueueStatistics (MQCFIN)

Statistics data collection (parameter identifier: MQIA_STATISTICS_Q).

Specifies whether statistics data collection is enabled. The value can be any of the following values:

MQMON_Q_MGR

The value of the queue manager's **QueueStatistics** parameter is inherited by the queue.

MQMON_OFF

Statistics data collection is disabled

MQMON_ON

 If the value of the queue manager's *QueueStatistics* parameter is not MQMON_NONE, statistics data collection is enabled

 On z/OS systems, you must enable class 5 statistics using the START TRACE command.

RemoteQMGrName (MQCFST)

Name of remote queue manager (parameter identifier: MQCA_REMOTE_Q_MGR_NAME).

If an application opens the local definition of a remote queue, *RemoteQMGrName* must not be blank or the name of the queue manager the application is connected to. If *XmitQName* is blank there must be a local queue called *RemoteQMGrName*. That queue is used as the transmission queue.

If this definition is used for a queue manager alias, *RemoteQMgrName* is the name of the queue manager. The queue manager name can be the name of the connected queue manager. If *XmitQName* is blank, when the queue is opened there must be a local queue called *RemoteQMgrName*. That queue is used as the transmission queue.

If this definition is used for a reply-to queue alias, *RemoteQMgrName* is the name of the queue manager that is to be the reply-to queue manager.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

RemoteQName (MQCFST)

Name of remote queue as known locally on the remote queue manager (parameter identifier: MQCA_REMOTE_Q_NAME).

If this definition is used for a local definition of a remote queue, *RemoteQName* must not be blank when the open occurs.

If this definition is used for a queue manager alias definition, *RemoteQName* must be blank when the open occurs.

If this definition is used for a reply-to queue alias, this name is the name of the queue that is to be the reply-to queue.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE). This parameter is not valid on a Change Queue command.

If the object exists, the effect is like issuing the Change Queue command. It is like a Change Queue command without the MQFC_YES option on the **Force** parameter, and with all of the other attributes specified. In particular, note that any messages which are on the existing queue are retained.

The Change Queue command without MQFC_YES on the **Force** parameter, and the Create Queue command with MQRP_YES on the **Replace** parameter, are different. The difference is that the Change Queue command does not change unspecified attributes. Create Queue with MQRP_YES sets all the attributes. If you use MQRP_YES, unspecified attributes are taken from the default definition, and the attributes of the object being replaced, if one exists, are ignored.)

The command fails if both of the following statements are true:

- The command sets attributes that would require the use of MQFC_YES on the **Force** parameter if you were using the Change Queue command.
- The object is open.

The Change Queue command with MQFC_YES on the **Force** parameter succeeds in this situation.

If MQSCO_CELL is specified on the **Scope** parameter on AIX and Linux, and there is already a queue with the same name in the cell directory, the command fails. The command fails even if MQRP_YES is specified.

The value can be any of the following values:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

RetentionInterval (MQCFIN)

Retention interval (parameter identifier: MQIA_RETENTION_INTERVAL).

The number of hours for which the queue might be needed, based on the date and time when the queue was created.

This information is available to a housekeeping application or an operator and can be used to determine when a queue is no longer required. The queue manager does not delete queues nor does

it prevent queues from being deleted if their retention interval is not expired. It is the responsibility of the user to take any required action.

Specify a value in the range 0 - 999,999,999.

Scope (MQCFIN)

Scope of the queue definition (parameter identifier: MQIA_SCOPE).

Specifies whether the scope of the queue definition extends beyond the queue manager which owns the queue. It does so if the queue name is contained in a cell directory, so that it is known to all the queue managers within the cell.

If this attribute is changed from MQSCO_CELL to MQSCO_Q_MGR, the entry for the queue is deleted from the cell directory.

Model and dynamic queues cannot be changed to have cell scope.

If it is changed from MQSCO_Q_MGR to MQSCO_CELL, an entry for the queue is created in the cell directory. If there is already a queue with the same name in the cell directory, the command fails. The command also fails if no name service supporting a cell directory is configured.

The value can be:

MQSCO_Q_MGR

Queue manager scope.

MQSCO_CELL

Cell scope.

This value is not supported on IBM i.

This parameter is not available on z/OS.

Shareability (MQCFIN)

The queue can be shared, or not (parameter identifier: MQIA_SHAREABILITY).

Specifies whether multiple instances of applications can open this queue for input.

The value can be any of the following values:

MQQA_SHAREABLE

Queue is shareable.

MQQA_NOT_SHAREABLE

Queue is not shareable.

z/OS StorageClass (MQCFST)

Storage class (parameter identifier: MQCA_STORAGE_CLASS). This parameter applies to z/OS only.

Specifies the name of the storage class.

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

Multi StreamQ (MQCFST)

Name of the streaming queue (parameter identifier: MQCA_STREAM_QUEUE_NAME)

Note: If the user setting the **Streamq** attribute does not have change authority on the chosen stream queue, the command fails with error message AMQ8135E Not Authorized, or the equivalent message CSQ9016E on z/OS.

In addition, if the stream queue does not exist, error message AMQ8135E is returned instead of AMQ8147E IBM MQ object not found or message CSQM125I on z/OS.

Multi StreamQService (MQCFIN)

Quality of service used when delivering messages to **Streamq** (parameter identifier: MQIA_STREAM_QUEUE_QOS)

The value can be:

MQST_BEST_EFFORT

If the original message can be delivered, but the streamed message cannot, the original message is still delivered to its queue.

This is the default value.

MQST_MUST_DUP

The queue manager ensures that both the original message and the streamed message are successfully delivered to their queues.

If, for some reason, the streamed message cannot be delivered to its queue, the original message is not delivered to its queue either.

TargetType (MQCFIN)

Target type (parameter identifier: MQIA_BASE_TYPE).

Specifies the type of object to which the alias resolves.

The value can be any of the following values:

MQOT_Q

The object is a queue.

MQOT_TOPIC

The object is a topic.

TriggerControl (MQCFIN)

Trigger control (parameter identifier: MQIA_TRIGGER_CONTROL).

Specifies whether trigger messages are written to the initiation queue.

The value can be:

MQTC_OFF

Trigger messages not required.

MQTC_ON

Trigger messages required.

TriggerData (MQCFST)

Trigger data (parameter identifier: MQCA_TRIGGER_DATA).

Specifies user data that the queue manager includes in the trigger message. This data is made available to the monitoring application that processes the initiation queue and to the application that is started by the monitor.

The maximum length of the string is MQ_TRIGGER_DATA_LENGTH.

TriggerDepth (MQCFIN)

Trigger depth (parameter identifier: MQIA_TRIGGER_DEPTH).

Specifies (when *TriggerType* is MQTT_DEPTH) the number of messages that initiates a trigger message to the initiation queue. The value must be in the range 1 through 999 999 999.

TriggerMsgPriority (MQCFIN)

Threshold message priority for triggers (parameter identifier: MQIA_TRIGGER_MSG_PRIORITY).

Specifies the minimum priority that a message must have before it can cause, or be counted for, a trigger event. The value must be in the range of priority values that is supported (0 through 9).

TriggerType (MQCFIN)

Trigger type (parameter identifier: MQIA_TRIGGER_TYPE).

Specifies the condition that initiates a trigger event. When the condition is true, a trigger message is sent to the initiation queue.

The value can be any of the following values:

MQTT_NONE

No trigger messages.

MQTT_EVERY

Trigger message for every message.

MQTT_FIRST

Trigger message when queue depth goes from 0 to 1.

MQTT_DEPTH

Trigger message when depth threshold exceeded.

Usage (MQCFIN)

Usage (parameter identifier: MQIA_USAGE).

Specifies whether the queue is for normal usage or for transmitting messages to a remote message queue manager.

The value can be any of the following values:

MQUS_NORMAL

Normal usage.

MQUS_TRANSMISSION

Transmission queue.

XmitQName (MQCFST)

Transmission queue name (parameter identifier: MQCA_XMIT_Q_NAME).

Specifies the local name of the transmission queue to be used for messages destined for either a remote queue or for a queue manager alias definition.

If *XmitQName* is blank, a queue with the same name as *RemoteQMgrName* is used as the transmission queue.

This attribute is ignored if the definition is being used as a queue manager alias and *RemoteQMgrName* is the name of the connected queue manager.

It is also ignored if the definition is used as a reply-to queue alias definition.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Error codes (Change, Copy, and Create Queue)

This command might return the following errors in the response format header, in addition to the values shown on in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CELL_DIR_NOT_AVAILABLE

Cell directory is not available.

MQRCCF_CLUSTER_NAME_CONFLICT

Cluster name conflict.

MQRCCF_CLUSTER_Q_USAGE_ERROR

Cluster usage conflict.

MQRCCF_DYNAMIC_Q_SCOPE_ERROR

Dynamic queue scope error.

MQRCCF_FORCE_VALUE_ERROR

Force value not valid.

MQRCCF_Q_ALREADY_IN_CELL

Queue exists in cell.

MQRCCF_Q_TYPE_ERROR

Queue type not valid.

► **Multi** **MQRCCF_STREAMQ_CONFLICT**

This queue has one or more attributes which are incompatible with having the STREAMQ attribute set on it.

► **Multi** **MQRCCF_STREAMQ_DEST_CONFLICT**

The STREAMQ attribute refers to a queue that has one or more attributes which are incompatible with being a streaming queue.

► **Multi** **MQRCCF_STREAMQ_DEST_NOT_SUPP**

The STREAMQ attribute refers to a queue that cannot be used as a streaming queue.

► **Multi** **MQRCCF_STREAMQ_NOT_SUPPORTED**

This queue cannot have the STREAMQ attribute set on it.

► **Multi** ***Change, Copy, and Create Service on Multiplatforms***

The Change Service PCF command changes existing service definitions. The Copy and Create service commands create new service definitions - the Copy command uses attribute values of an existing service definition.

The Change Service (MQCMD_CHANGE_SERVICE) command changes the specified attributes of an existing IBM MQ service definition. For any optional parameters that are omitted, the value does not change.

The Copy Service (MQCMD_COPY_SERVICE) command creates an IBM MQ service definition, using, for attributes not specified in the command, the attribute values of an existing service definition.

The Create Service (MQCMD_CREATE_SERVICE) command creates an IBM MQ service definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameter (Change and Create Service)

ServiceName (MQCFST)

The name of the service definition to be changed or created (parameter identifier: MQCA_SERVICE_NAME).

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Required parameters (Copy Service)

FromServiceName (MQCFST)

The name of the service definition to be copied from (parameter identifier: MQCACF_FROM_SERVICE_NAME).

This parameter specifies the name of the existing service definition that contains values for the attributes not specified in this command.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

ToServiceName (MQCFST)

To service name (parameter identifier: MQCACF_TO_SERVICE_NAME).

This parameter specifies the name of the new service definition. If a service definition with this name exists, *Replace* must be specified as MQRP_YES.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Optional parameters (Change, Copy, and Create Service)

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If a namelist definition with the same name as *ToServiceName* exists, this specifies parameter whether it is to be replaced. The value can be:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

ServiceDesc (MQCFST)

Description of service definition (parameter identifier: MQCA_SERVICE_DESC).

This parameter is a plain-text comment that provides descriptive information about the service definition. It must contain only displayable characters.

If characters are used that are not in the coded character set identifier (CCSID) for the queue manager on which the command is executing, they might be translated incorrectly.

The maximum length of the string is MQ_SERVICE_DESC_LENGTH.

ServiceType (MQCFIN)

The mode in which the service is to run (parameter identifier: MQIA_SERVICE_TYPE).

Specify either:

MQSVC_TYPE_SERVER

Only one instance of the service can be executed at a time, with the status of the service made available by the Inquire Service Status command.

MQSVC_TYPE_COMMAND

Multiple instances of the service can be started.

StartArguments (MQCFST)

Arguments to be passed to the program on startup (parameter identifier: MQCA_SERVICE_START_ARGS).

Specify each argument within the string as you would on a command line, with a space to separate each argument to the program.

The maximum length of the string is MQ_SERVICE_ARGS_LENGTH.

StartCommand (MQCFST)

Service program name (parameter identifier: MQCA_SERVICE_START_COMMAND).

Specifies the name of the program which is to run. You must specify a fully qualified path name to the executable program.

The maximum length of the string is MQ_SERVICE_COMMAND_LENGTH.

StartMode (MQCFIN)

Service mode (parameter identifier: MQIA_SERVICE_CONTROL).

Specifies how the service is to be started and stopped. The value can be any of the following values:

MQSVC_CONTROL_MANUAL

The service is not to be started automatically or stopped automatically. It is to be controlled by user command. This value is the default value.

MQSVC_CONTROL_Q_MGR

The service being defined is to be started and stopped at the same time as the queue manager is started and stopped.

MQSVC_CONTROL_Q_MGR_START

The service is to be started at the same time as the queue manager is started, but is not requested to stop when the queue manager is stopped.

StderrDestination (MQCFST)

Specifies the path to a file to which the standard error (stderr) of the service program must be redirected (parameter identifier: MQCA_STDERR_DESTINATION).

If the file does not exist when the service program is started, the file is created.

The maximum length of the string is MQ_SERVICE_PATH_LENGTH.

StdoutDestination (MQCFST)

Specifies the path to a file to which the standard output (stdout) of the service program must be redirected (parameter identifier: MQCA_STDOUT_DESTINATION).

If the file does not exist when the service program is started, the file is created.

The maximum length of the string is MQ_SERVICE_PATH_LENGTH.

StopArguments (MQCFST)

Specifies the arguments to be passed to the stop program when instructed to stop the service (parameter identifier: MQCA_SERVICE_STOP_ARGS).

Specify each argument within the string as you would on a command line, with a space to separate each argument to the program.

The maximum length of the string is MQ_SERVICE_ARGS_LENGTH.

StopCommand (MQCFST)

Service program stop command (parameter identifier: MQCA_SERVICE_STOP_COMMAND).

This parameter is the name of the program that is to run when the service is requested to stop. You must specify a fully qualified path name to the executable program.

The maximum length of the string is MQ_SERVICE_COMMAND_LENGTH.

 **Change, Copy, and Create Storage Class on z/OS**

The Change Storage Class PCF command changes existing storage class definitions. The Copy and Create Storage Class commands create new storage class definitions - the Copy command uses attribute values of an existing storage class definition.

The Change Storage Class (MQCMD_CHANGE_STG_CLASS) command changes the characteristics of a storage class. For any optional parameters that are omitted, the value does not change.

The Copy Storage Class (MQCMD_COPY_STG_CLASS) command creates a storage class to page set mapping using, for attributes not specified in the command, the attribute values of an existing storage class.

The Create Storage Class (MQCMD_CREATE_STG_CLASS) command creates a storage class to page set mapping. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameter (Change and Create Storage Class)**StorageClassName (MQCFST)**

The name of the storage class to be changed or created (parameter identifier: MQCA_STORAGE_CLASS).

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

Required parameters (Copy Storage Class)**FromStorageClassName (MQCFST)**

The name of the storage class to be copied from (parameter identifier: MQCACF_FROM_STORAGE_CLASS).

On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR or MQQSGD_COPY to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToStorageClassName* and the disposition MQQSGD_GROUP is searched for to copy from.

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

ToStorageClassName (MQCFST)

The name of the storage class to copy to (parameter identifier: MQCACF_TO_STORAGE_CLASS).

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

Optional parameters (Change, Copy, and Create Storage Class)

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

PageSetId (MQCFIN)

Page set identifier that the storage class is to be associated with (parameter identifier: MQIA_PAGESET_ID).

Specify a string of two numeric characters in the range 00 through 99.

If you do not specify this parameter, the default is taken from the default storage class SYSTEMST.

No check is made that the page set has been defined; an error is raised only if you try to put a message to a queue that specifies this storage class (MQRC_PAGESET_ERROR).

PassTicketApplication (MQCFST)

Pass ticket application (parameter identifier: MQCA_PASS_TICKET_APPL).

The application name that is passed to RACF when authenticating the passticket specified in the MQIIH header.

The maximum length is MQ_PASS_TICKET_APPL_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

<i>Table 204. QSGDisposition: Where objects are defined and how they behave</i>		
QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command. It uses the MQQSGD_GROUP object of the same name as the <i>ToStorageClassName</i> object (for Copy) or the <i>StorageClassName</i> object (for Create).

Table 204. QSGDisposition: Where objects are defined and how they behave (continued)

QSGDisposition	Change	Copy, Create
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to attempt to refresh local copies on page set zero:</p> <pre>DEFINE STGCLASS(storage-class) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This parameter is allowed only if the queue manager is in a queue sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to attempt to make or refresh local copies on page set zero:</p> <pre>DEFINE STGCLASS(storage-class) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
MQQSGD_PRIVATE	<p>The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.</p>	Not permitted.
MQQSGD_Q_MGR	<p>The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.</p>	<p>The object is defined on the page set of the queue manager that executes the command. This value is the default value.</p>

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If a storage class definition with the same name as *ToStorageClassName* exists, this parameter specifies whether it is to be replaced. The value can be:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

StorageClassDesc (MQCFST)

The description of the storage class (parameter identifier: MQCA_STORAGE_CLASS_DESC).

The maximum length is MQ_STORAGE_CLASS_DESC_LENGTH.

XCFGroupName (MQCFST)

XCF group name (parameter identifier: MQCA_XCF_GROUP_NAME).

If you are using the IMS bridge, this parameter is the name of the XCF group to which the IMS system belongs.

The maximum length is MQ_XCF_GROUP_NAME_LENGTH.

XCFMemberName (MQCFST)

XCF member name (parameter identifier: MQCA_XCF_MEMBER_NAME).

If you are using the IMS bridge, this parameter is the XCF member name of the IMS system within the XCF group specified in *XCFGroupName*.

The maximum length is MQ_XCF_MEMBER_NAME_LENGTH.

Change, Copy, and Create Subscription

The Change Subscription PCF command changes existing subscription definitions. The Copy and Create Subscription commands create new subscription definitions - the Copy command uses attribute values of an existing subscription definition.

The Change Subscription (MQCMD_CHANGE_SUBSCRIPTION) command changes the specified attributes of an existing IBM MQ subscription. For any optional parameters that are omitted, the value does not change.

The Copy Subscription (MQCMD_COPY_SUBSCRIPTION) command creates an IBM MQ subscription, using, for attributes not specified in the command, the attribute values of an existing subscription.

The Create Subscription (MQCMD_CREATE_SUBSCRIPTION) command creates an IBM MQ administrative subscription so that existing applications can participate in publish/subscribe application.

Required parameters (Change Subscription)

SubName (MQCFST)

The name of the subscription definition to be changed (parameter identifier: MQCACF_SUB_NAME).

The maximum length of the string is MQ_SUB_NAME_LENGTH.

or

SubId (MQCFBS)

The unique identifier of the subscription definition to be changed (parameter identifier: MQBACF_SUB_ID).

The maximum length of the string is MQ_CORREL_ID_LENGTH.

Required parameters (Copy Subscription)

ToSubscriptionName (MQCFBS)

The name of the subscription to copy to (parameter identifier: MQCACF_TO_SUB_NAME).

The maximum length of the string is MQ_SUB_NAME_LENGTH.

You require at least one of *FromSubscriptionName* or *SubId*.

FromSubscriptionName (MQCFST)

The name of the subscription definition to be copied from (parameter identifier: MQCACF_FROM_SUB_NAME).

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR or MQQSGD_COPY to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToSubscriptionName* and the disposition MQQSGD_GROUP is used.

The maximum length of the string is MQ_SUB_NAME_LENGTH.

SubId (MQCFBS)

The unique identifier of the subscription definition to be changed (parameter identifier: MQBACF_SUB_ID).

The maximum length of the string is MQ_CORREL_ID_LENGTH.

Required parameters (Create Subscription)

You must provide the *SubName*.

SubName (MQCFST)

The name of the subscription definition to be changed (parameter identifier: MQCACF_SUB_NAME).

The maximum length of the string is MQ_SUB_NAME_LENGTH.

You require at least one of *TopicObject* or *TopicString*.

TopicObject (MQCFST)

The name of a previously defined topic object from which is obtained the topic name for the subscription (parameter identifier: MQCA_TOPIC_NAME). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

TopicString (MQCFST)

The resolved topic string (parameter identifier: MQCA_TOPIC_STRING).

The maximum length of the string is MQ_TOPIC_STR_LENGTH.

Optional parameters (Change, Copy, and Create Subscription)

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Destination (MQCFST)

Destination (parameter identifier: MQCACF_DESTINATION).

Specifies the name of the alias, local, remote, or cluster queue to which messages for this subscription are put.

This parameter is mandatory if *DestinationClass* is set to MQDC_PROVIDED, but is not applicable if *DestinationClass* is set to MQDC_MANAGED.

DestinationClass (MQCFIN)

Destination class (parameter identifier: MQIACF_DESTINATION_CLASS).

Specifies whether the destination is managed.

Specify either:

MQDC_MANAGED

The destination is managed.

MQDC_PROVIDED

The destination queue is as specified in the *Destination* field.

Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

DestinationCorrelId (MQCFBS)

Destination correlation identifier (parameter identifier: MQBACF_DESTINATION_CORREL_ID).

Provides a correlation identifier that is placed in the *CorrelId* field of the message descriptor for all the messages sent to this subscription.

The maximum length is MQ_CORREL_ID_LENGTH.

DestinationQueueManager (MQCFST)

Destination queue manager (parameter identifier: MQCACF_DESTINATION_Q_MGR).

Specifies the name of the destination queue manager, either local or remote, to which messages for the subscription are forwarded.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

Expiry (MQCFIN)

The time, in tenths of a second, at which a subscription expires after its creation date and time (parameter identifier: MQIACF_EXPIRY).

The default value of MQEI_UNLIMITED means that the subscription never expires.

After a subscription has expired it becomes eligible to be discarded by the queue manager and receives no further publications.

PublishedAccountingToken (MQCFBS)

Value of the accounting token used in the *AccountingToken* field of the message descriptor (parameter identifier: MQBACF_ACCOUNTING_TOKEN).

The maximum length of the string is MQ_ACCOUNTING_TOKEN_LENGTH.

PublishedApplicationIdentifier (MQCFST)

Value of the application identity data used in the *AppIdentityData* field of the message descriptor (parameter identifier: MQCACF_APPL_IDENTITY_DATA).

The maximum length of the string is MQ_APPL_IDENTITY_DATA_LENGTH.

PublishPriority (MQCFIN)

The priority of the message sent to this subscription (parameter identifier: MQIACF_PUB_PRIORITY).

The value can be:

MQPRI_PRIORITY_AS_PUBLISHED

Priority of messages sent to this subscription is taken from the priority supplied to the published message. This value is the supplied default value.

MQPRI_PRIORITY_AS_QDEF

Priority of messages sent to this subscription is determined by the default priority of the queue defined as a destination.

0-9

An integer value providing an explicit priority for messages sent to this subscription.

PublishSubscribeProperties (MQCFIN)

Specifies how publish/subscribe related message properties are added to messages sent to this subscription (parameter identifier: MQIACF_PUBSUB_PROPERTIES).

The value can be:

MQPSPROP_COMPAT

If the original publication is a PCF message, then the publish/subscribe properties are added as PCF attributes. Otherwise, publish/subscribe properties are added within an MQRFH version 1

header. This method is compatible with applications coded for use with previous versions of IBM MQ.

MQPSPROP_NONE

Do not add publish/subscribe properties to the messages. This value is the supplied default value.

MQPSPROP_RFH2

Publish/subscribe properties are added within an MQRFH version 2 header. This method is compatible with applications coded for use with IBM Integration Bus, formerly known as WebSphere Message Broker.

Selector (MQCFST)

Specifies the selector applied to messages published to the topic (parameter identifier: MQCACF_SUB_SELECTOR). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

Only those messages that satisfy the selection criteria are put to the destination specified by this subscription.

The maximum length of the string is MQ_SELECTOR_LENGTH.

SubscriptionLevel (MQCFIN)

The level within the subscription interception hierarchy at which this subscription is made (parameter identifier: MQIACF_SUB_LEVEL). To ensure that an intercepting application receives messages before any other subscribers, make sure that it has the highest subscription level of all subscribers. Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The value can be:

0 - 9

An integer in the range 0-9. The default value is 1. Subscribers with a subscription level of 9 intercept publications before they reach subscribers with lower subscription levels.

SubscriptionScope (MQCFIN)

Determines whether this subscription is passed to other queue managers in the network (parameter identifier: MQIACF_SUBSCRIPTION_SCOPE). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The value can be:

MQTSCOPE_ALL

The subscription is forwarded to all queue managers directly connected through a publish/subscribe collective or hierarchy. This value is the supplied default value.

MQTSCOPE_QMGR

The subscription only forwards messages published on the topic within this queue manager.

SubscriptionUser (MQCFST)

The userid that 'owns' this subscription. This parameter is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription. (parameter identifier: MQCACF_SUB_USER_ID).

The maximum length of the string is MQ_USER_ID_LENGTH.

TopicString (MQCFST)

The resolved topic string (parameter identifier: MQCA_TOPIC_STRING). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The maximum length of the string is MQ_TOPIC_STR_LENGTH.

Userdata (MQCFST)

User data (parameter identifier: MQCACF_SUB_USER_DATA).

Specifies the user data associated with the subscription

The maximum length of the string is MQ_USER_DATA_LENGTH.

VariableUser (MQCFST)

Specifies whether a user other than the one who created the subscription, that is, the user shown in *SubscriptionUser* can take over the ownership of the subscription (parameter identifier: MQIACF_VARIABLE_USER_ID).

The value can be:

MQVU_ANY_USER

Any user can take over the ownership. This value is the supplied default value.

MQVU_FIXED_USER

No other user can take over the ownership.

WildcardSchema (MQCFIN)

Specifies the schema to be used when interpreting any wildcard characters contained in the *TopicString* (parameter identifier: MQIACF_WILDCARD_SCHEMA). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The value can be:

MQWS_CHAR

Wildcard characters represent portions of strings for compatibility with IBM MQ V6.0 broker.

MQWS_TOPIC

Wildcard characters represent portions of the topic hierarchy for compatibility with IBM Integration Bus. This value is the supplied default value.

Change, Copy, and Create Topic

The Change Topic PCF command changes existing topic definitions. The Copy and Create Topic commands create new topic definitions - the Copy command uses attribute values of an existing topic definition.

The Change Topic (MQCMD_CHANGE_TOPIC) command changes the specified attributes of an existing IBM MQ administrative topic definition. For any optional parameters that are omitted, the value does not change.

The Copy Topic (MQCMD_COPY_TOPIC) command creates an IBM MQ administrative topic definition by using, for attributes not specified in the command, the attribute values of an existing topic definition.

The Create Topic (MQCMD_CREATE_TOPIC) command creates an IBM MQ administrative topic definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

Required parameter (Change Topic)

TopicName (MQCFST)

The name of the administrative topic definition to be changed (parameter identifier: MQCA_TOPIC_NAME).

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

Required parameters (Copy Topic)

FromTopicName (MQCFST)

The name of the administrative topic object definition to be copied from (parameter identifier: MQCACF_FROM_TOPIC_NAME).

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD_Q_MGR or MQQSGD_COPY to copy from. This parameter is ignored if a value of MQQSGD_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToTopicName* and the disposition MQQSGD_GROUP is searched for to copy from.

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

TopicString (MQCFST)

The topic string (parameter identifier: MQCA_TOPIC_STRING). This string uses the forward slash (/) character as a delimiter for elements within the topic tree.

The maximum length of the string is MQ_TOPIC_STR_LENGTH.

ToTopicName (MQCFST)

The name of the administrative topic definition to copy to (parameter identifier: MQCACF_TO_TOPIC_NAME).

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

Required parameters (Create Topic)

TopicName (MQCFST)

The name of the administrative topic definition to be created (parameter identifier: MQCA_TOPIC_NAME).

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

TopicString (MQCFST)

The topic string (parameter identifier: MQCA_TOPIC_STRING).

This parameter is required and cannot contain the empty string. The "/" character within this string has a special meaning. It delimits the elements in the topic tree. A topic string can start with the "/" character but is not required to. A string starting with the "/" character is not the same as a string that does not start with the "/" character. A topic string cannot end with the "/" character.

The maximum length of the string is MQ_TOPIC_STR_LENGTH.

Optional parameters (Change, Copy, and Create Topic)

V 9.4.0 CapExpiry (MQCFIN)

Capped expiry processing (parameter identifier MQIA_CAP_EXPIRY) which can be an integer value or take values of MQCEX_NOLIMIT or MQCEX_AS_PARENT.

Specifies a lifetime limit for messages put using the object, expressed in 10ths of a second. A value of -1, displayed as NOLIMIT, has no effect on processing.

Note that in addition to the CapExpiry attribute itself, you can use an attribute of the **CUSTOM** parameter, which is a string. Therefore passing a string PCF parameter MQCA_CUSTOM, has a string value of CAEXPRY (integer).

CapExpiry provides, or limits, the value in the MQMD Expiry field of any message put.

An application provided MQMD **Expiry** that is less than any resolved CapExpiry value is passed. This value is not replaced by that resolved CapExpiry value.

This process allows an IBM MQ administrator to limit the life of messages put by an application that overlooked (or was unable to provide, in the case of MQTT) message expiration criteria.

However, this option does not allow an administrator to override application behavior where the required lifetime of messages was under-estimated.

If you specify **CAEXPRY ASPARENT**, the value is established by moving up the tree towards the root, until the point of first resolution to a non *ASPARENT* value. Additionally you can use the **CUSTOM CAEXPRY** option. See [Making CAEXPRY a first-class MQSC attribute in MQ 9.3.1](#) for more information.

As for queues, the smallest **CAEXPRY** found during a put operation, is used. Further limiting can be set for specific subscribers, based on **CAEXPRY** resolution applied on the path to resolve the destination for a subscription.

The new capped value for expiry is used during the put processing as if it had been provided by the application in the MQMD structure.

The *capped* value is evaluated for each put being performed, and so is sensitive to the resolution of the put operation. For example, in a cluster, where the put operation is performed with BIND NOT FIXED, messages might pick up different expiry values depending on the CapExpiry value set for the transmission queue used by the channel.

z/OS You cannot specify an integer value for the CAPEXPY attribute on a topic object with QSGDISP(GROUP|COPY), which resides in a queue sharing group that contains queue managers running any version of IBM MQ for z/OS below 9.4.0. Attempting to do so, results in messages CSQM532I and CSQM533I to identify which queue managers do not support CAPEXPY, and no modification to the object.

ClusterName (MQCFST)

The name of the cluster to which this topic belongs. (parameter identifier: MQCA_CLUSTER_NAME). The maximum length of the string is MQ_CLUSTER_NAME_LENGTH. Setting this parameter to a cluster that this queue manager is a member of makes all queue managers in the cluster aware of this topic. Any publication to this topic or a topic string below it put to any queue manager in the cluster is propagated to subscriptions on any other queue manager in the cluster. For more details, see [Distributed publish/subscribe networks](#).

The value can be any of the following values:

Blank

If no topic object above this topic in the topic tree has set this parameter to a cluster name, then this topic does not belong to a cluster. Publications and subscriptions for this topic are not propagated to publish/subscribe cluster-connected queue managers. If a topic node higher in the topic tree has a cluster name set, publications and subscriptions to this topic are also propagated throughout the cluster.

This value is the default value for this parameter if no value is specified.

String

The topic belongs to this cluster. It is not recommended that this is set to a different cluster from a topic object above this topic object in the topic tree. Other queue managers in the cluster will honor this object's definition unless a local definition of the same name exists on those queue managers.

Additionally, if PublicationScope or SubscriptionScope are set to MQSCOPE_ALL, this value is the cluster to be used for the propagation of publications and subscriptions, for this topic, to publish/subscribe cluster-connected queue managers.

ClusterPubRoute (MQCFIN)

The routing behavior of publications between queue managers in a cluster (parameter identifier: MQIA_CLUSTER_PUB_ROUTE).

The value can be any of the following values:

MQCLROUTE_DIRECT

When you configure a direct routed clustered topic on a queue manager, all queue managers in the cluster become aware of all other queue managers in the cluster. When performing publish and subscribe operations, each queue manager can connect direct to any other queue manager in the cluster.

MQCLROUTE_TOPIC_HOST

When you use topic host routing, all queue managers in the cluster become aware of the cluster queue managers that host the routed topic definition (that is, the queue managers on which you have defined the topic object). When performing publish and subscribe operations, queue managers in the cluster connect only to these topic host queue managers, and not directly to each other. The topic host queue managers are responsible for routing publications from queue managers on which publications are published to queue managers with matching subscriptions.

After a topic object has been clustered (through setting the **CLUSTER** property) you cannot change the value of the **CLROUTE** property. The object must be un-clustered (**CLUSTER** set to ' ') before you can change the value. Un-clustering a topic converts the topic definition to a local topic, which results in a period during which publications are not delivered to subscriptions on remote queue managers; this

should be considered when performing this change. See [The effect of defining a non-cluster topic with the same name as a cluster topic from another queue manager](#). If you try to change the value of the **CLROUTE** property while it is clustered, the system generates an `MQRCCF_CLROUTE_NOT_ALTERABLE` exception.

See also [Routing for publish/subscribe clusters: Notes on behavior](#) and [Designing publish/subscribe clusters](#).

CommandScope (MQCFST)

Command scope (parameter identifier: `MQCACF_COMMAND_SCOPE`). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is `MQ_QSG_NAME_LENGTH`.

CommunicationInformation (MQCFST)

The Multicast communication information object (parameter identifier: `MQCA_COMM_INFO_NAME`).

The maximum length of the string is `MQ_COMM_INFO_NAME_LENGTH`.

Custom (MQCFST)

Custom attribute for new features (parameter identifier: `MQCA_CUSTOM`).

This attribute contains the values of attributes, as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form `NAME (VALUE)`. Single quotation marks must be escaped with another single quotation mark.

CAPEXPY (integer)

The maximum time, expressed in tenths of a second, until a message published to a topic which inherits properties from this object, remains in the system until it becomes eligible for expiry processing.

For more information on message expiry processing, see [Enforcing lower expiration times](#).

The value can be one of the following:

integer

The value must be in the range one through to 999 999 999.

NOLIMIT

There is no limit on the expiry time of messages put using this object.

ASPARENT

The maximum message expiry time is based on the setting of the closest parent administrative topic object in the topic tree. This is the default value.

Specifying a value for `CAPEXPY` that is not valid, does not cause the command to fail. Instead,, the default value is used.

DefPersistence (MQCFIN)

Default persistence (parameter identifier: `MQIA_TOPIC_DEF_PERSISTENCE`).

Specifies the default for message-persistence of messages published to the topic. Message persistence determines whether messages are preserved across restarts of the queue manager.

The value can be any of the following values:

MQPER_PERSISTENCE_AS_PARENT

The default persistence is based on the setting of the closest parent administrative topic object in the topic tree.

MQPER_PERSISTENT

Message is persistent.

MQPER_NOT_PERSISTENT

Message is not persistent.

DefPriority (MQCFIN)

Default priority (parameter identifier: MQIA_DEF_PRIORITY).

Specifies the default priority of messages published to the topic.

Specify either:

integer

The default priority to be used, in the range zero through to the maximum priority value that is supported (9).

MQPRI_PRIORITY_AS_PARENT

The default priority is based on the setting of the closest parent administrative topic object in the topic tree.

DefPutResponse (MQCFIN)

Default put response (parameter identifier: MQIA_DEF_PUT_RESPONSE_TYPE).

The value can be:

MQPRT_ASYNC_RESPONSE

The put operation is issued asynchronously, returning a subset of MQMD fields.

MQPRT_RESPONSE_AS_PARENT

The default put response is based on the setting of the closest parent administrative topic object in the topic tree.

MQPRT_SYNC_RESPONSE

The put operation is issued synchronously, returning a response.

DurableModelQName (MQCFST)

Name of the model queue to be used for durable subscriptions (parameter identifier: MQCA_MODEL_DURABLE_Q).

The maximum length of the string is MQ_Q_NAME_LENGTH.

DurableSubscriptions (MQCFIN)

Whether applications are permitted to make durable subscriptions (parameter identifier: MQIA_DURABLE_SUB).

The value can be:

MQSUB_DURABLE_AS_PARENT

Whether durable subscriptions are permitted is based on the setting of the closest parent administrative topic object in the topic tree.

MQSUB_DURABLE_ALLOWED

Durable subscriptions are permitted.

MQSUB_DURABLE_INHIBITED

Durable subscriptions are not permitted.

InhibitPublications (MQCFIN)

Whether publications are allowed for this topic (parameter identifier: MQIA_INHIBIT_PUB).

The value can be:

MQTA_PUB_AS_PARENT

Whether messages can be published to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

MQTA_PUB_INHIBITED

Publications are inhibited for this topic.

MQTA_PUB_ALLOWED

Publications are allowed for this topic.

InhibitSubscriptions (MQCFIN)

Whether subscriptions are allowed for this topic (parameter identifier: MQIA_INHIBIT_SUB).

The value can be:

MQTA_SUB_AS_PARENT

Whether applications can subscribe to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

MQTA_SUB_INHIBITED

Subscriptions are inhibited for this topic.

MQTA_SUB_ALLOWED

Subscriptions are allowed for this topic.

Multicast (MQCFIN)

Whether multicast is allowable in the topic tree (parameter identifier: MQIA_MULTICAST).

The value can be:

MQMC_AS_PARENT

Whether multicast is allowed on this topic is based on the setting of the closest parent administrative topic object in the topic tree.

MQMC_ENABLED

Multicast is allowed on this topic.

MQMC_DISABLED

Multicast is not allowed on this topic.

MQMC_ONLY

Only subscriptions and publications made using multicast are allowed on this topic.

NonDurableModelQName (MQCFST)

Name of the model queue to be used for non-durable subscriptions (parameter identifier: MQCA_MODEL_NON_DURABLE_Q).

The maximum length of the string is MQ_Q_NAME_LENGTH.

NonPersistentMsgDelivery (MQCFIN)

The delivery mechanism for non-persistent messages published to this topic (parameter identifier: MQIA_NPM_DELIVERY).

The value can be:

MQDLV_AS_PARENT

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQDLV_ALL

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_DUR

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a non-persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_AVAIL

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

PersistentMsgDelivery (MQCFIN)

The delivery mechanism for persistent messages published to this topic (parameter identifier: MQIA_PM_DELIVERY).

The value can be:

MQDLV_AS_PARENT

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQDLV_ALL

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_DUR

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_AVAIL

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

ProxySubscriptions (MQCFIN)

Whether a proxy subscription is to be sent for this topic to directly connected queue managers, even if no local subscriptions exist (parameter identifier: MQIA_PROXY_SUB).

The value can be:

MQTA_PROXY_SUB_FORCE

A proxy subscription is sent to connected queue managers even if no local subscriptions exist.

Note: The proxy subscription is sent when this value is set on Create or Change of the topic.

MQTA_PROXY_SUB_FIRSTUSE

For each unique topic string at or below this topic object, a proxy subscription is asynchronously sent to all neighboring queue managers in the following scenarios:

- When a local subscription is created.
- When a proxy subscription is received that must be propagated to further directly connected queue managers.

This value is the default value for this parameter if no value is specified.

PublicationScope (MQCFIN)

Whether this queue manager propagates publications for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA_PUB_SCOPE).

The value can be:

MQSCOPE_AS_PARENT

Whether this queue manager propagates publications, for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

This value is the default value for this parameter if no value is specified.

MQSCOPE_QMGR

Publications for this topic are not propagated to other queue managers.

MQSCOPE_ALL

Publications for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

Note: This behavior can be over-riden on a publication-by-publication basis, by using MQPMO_SCOPE_QMGR on the Put Message Options.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined by using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined by using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command. It uses the MQQSGD_GROUP object of the same name as the <i>ToTopicName</i> object (for Copy) or <i>TopicName</i> object (for Create).
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined by using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they refresh local copies on page set zero:</p> <pre>DEFINE TOPIC(name) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This definition is allowed only if the queue manager is in a queue sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group so that they make or refresh local copies on page set zero:</p> <pre>DEFINE TOPIC(name) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
MQQSGD_PRIVATE	The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.	Not permitted.

Table 205. QSGDisposition: Where objects are defined and how they behave (continued)

QSGDisposition	Change	Copy, Create
MQQSGD_Q_MGR	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.	The object is defined on the page set of the queue manager that executes the command. This value is the default value.

Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF_REPLACE).

If a topic definition with the same name as *ToTopicName* exists, this parameter specifies whether it is to be replaced. The value can be as follows:

MQRP_YES

Replace existing definition.

MQRP_NO

Do not replace existing definition.

SubscriptionScope (MQCFIN)

Whether this queue manager propagates subscriptions for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA_SUB_SCOPE).

The value can be:

MQSCOPE_AS_PARENT

Whether this queue manager propagates subscriptions, for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe-cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

This value is the default value for this parameter if no value is specified.

MQSCOPE_QMGR

Subscriptions for this topic are not propagated to other queue managers.

MQSCOPE_ALL

Subscriptions for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

Note: This behavior can be over-ridden on a subscription-by-subscription basis, by using MQSO_SCOPE_QMGR on the Subscription Descriptor or SUBSCOPE(QMGR) on DEFINE SUB.

TopicDesc (MQCFST)

Topic description (parameter identifier: MQCA_TOPIC_DESC).

Text that briefly describes the object

The maximum length is MQ_TOPIC_DESC_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the message queue manager on which the command is executing to ensure that the text is translated correctly if it is sent to another queue manager.

TopicType (MQCFIN)

Topic type (parameter identifier: MQIA_TOPIC_TYPE).

The value specified must match the type of the topic being changed. The value can be:

MQTOPT_LOCAL

Local topic object

UseDLQ (MQCFIN)

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA_USE_DEAD_LETTER_Q).

The value can be any of the following values:

MQUSEDLQ_AS_PARENT

Determines whether to use the dead-letter queue using the setting of the closest administrative topic object in the topic tree. This value is the default supplied with IBM MQ, but your installation might have changed it.

MQUSEDLQ_NO

Publication messages that cannot be delivered to their correct subscriber queue are treated as a failure to put the message. The MQPUT of an application to a topic fails in accordance with the settings of MQIA_NPM_DELIVERY and MQIA_PM_DELIVERY.

MQUSEDLQ_YES

If the DEADQ queue manager attribute provides the name of a dead-letter queue then it is used, otherwise the behavior is as for MQUSEDLQ_NO.

WildcardOperation (MQCFIN)

Behavior of subscriptions including wildcards made to this topic (parameter identifier: MQIA_WILDCARD_OPERATION).

The value can be:

MQTA_PASSTHRU

A less specific wildcard subscription is a subscription made by using wildcard topic names that are less specific than the topic string at this topic object. MQTA_PASSTHRU lets less specific wildcard subscriptions receive publications made to this topic and to topic strings more specific than this topic. This value is the default supplied with IBM MQ.

MQTA_BLOCK

A less specific wildcard subscription is a subscription made by using wildcard topic names that are less specific than the topic string at this topic object. MQTA_BLOCK stops less specific wildcard subscriptions receiving publications made to this topic or to topic strings more specific than this topic.

This value of this attribute is used when subscriptions are defined. If you alter this attribute, the set of topics covered by existing subscriptions is not affected by the modification. This value applies also, if the topology is changed when topic objects are created or deleted; the set of topics matching subscriptions created following the modification of the **WildcardOperation** attribute is created by using the modified topology. If you want to force the matching set of topics to be re-evaluated for existing subscriptions, you must restart the queue manager.

MQCMD_BACKUP_CF_STRUC (Backup CF Structure) on z/OS

The Backup CF Structure (MQCMD_BACKUP_CF_STRUC) PCF command initiates a CF application structure backup.

Note: This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

Required parameters

CFStrucName (MQCFST)

The name of the CF application structure to be backed up (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

ExcludeInterval (MQCFIN)

Exclude interval (parameter identifier: MQIACF_EXCLUDE_INTERVAL).

Specifies a value in seconds that defines the length of time immediately before the current time where the backup starts. The backup excludes backing-up the last *n* seconds activity. For example, if 30 seconds is specified, the backup does not include the last 30 seconds worth of activity for this application-structure.

The value must be in the range 30 through 600. The default value is 30.

Multi MQCMD_CHANGE_PROT_POLICY (set protection policy) AMS on Multiplatforms

The set protection policy (MQCMD_CHANGE_PROT_POLICY) PCF command uses Advanced Message Security (AMS) to set the protection policy.

Important: You must have an AMS license installed to issue this command. If you attempt to issue the **Set Policy** command without an AMS license installed, you receive message AMQ7155 - License file not found or not valid.

Syntax diagram

See the syntax diagram in the MQSC [“SET POLICY \(set security policy\) on Multiplatforms”](#) on page 967 command for combinations of parameters and values that are allowed.

Required parameters

PolicyName (MQCFST)

Specifies the name of the policy. The policy name must match the name of the queue which is to be protected (parameter identifier: MQCA_POLICY_NAME).

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Optional parameters

SignAlg (MQCFIN)

Specifies the digital signature algorithm (parameter identifier: MQIA_SIGNATURE_ALGORITHM). The following values are valid:

MQMLP_SIGN_ALG_NONE

No digital signature algorithm specified. This is the default value.

MQMLP_SIGN_ALG_MD5

Deprecated MD5 digital signature algorithm specified.

MQMLP_SIGN_ALG_SHA1

Deprecated SHA1 digital signature algorithm specified.

MQMLP_SIGN_ALG_SHA256

SHA256 digital signature algorithm specified.

MQMLP_SIGN_ALG_SHA384

SHA384 digital signature algorithm specified.

MQMLP_SIGN_ALG_SHA512

SHA512 digital signature algorithm specified.

EncAlg (MQCFIN)

Specifies the encryption algorithm (parameter identifier: MQIA_ENCRYPTION_ALGORITHM). The following values are valid:

MQMLP_ENCRYPTION_ALG_NONE

No encryption algorithm specified. This is the default value.

MQMLP_ENCRYPTION_ALG_RC2

 RC2 encryption algorithm specified.

MQMLP_ENCRYPTION_ALG_DES

DES encryption algorithm specified.

MQMLP_ENCRYPTION_ALG_3DES

3DES encryption algorithm specified.

MQMLP_ENCRYPTION_ALG_AES128

AES128 encryption algorithm specified.

MQMLP_ENCRYPTION_ALG_AES256

AES256 encryption algorithm specified.

Signer (MQCFST)

Specifies the distinguished name of an authorized signer. This parameter can be specified multiple times (parameter identifier: MQCA_SIGNER_DN).

Recipient (MQCFST)

Specifies the distinguished name of the intended recipient. This parameter can be specified multiple times (parameter identifier: MQCA_RECIPIENT_DN).

Enforce and Tolerate (MQCFST)

Indicates whether the security policy should be enforced or whether unprotected messages are tolerated (parameter identifier: MQIA_TOLERATE_UNPROTECTED). The following values are valid:

MQMLP_TOLERATE_NO

Specifies that all message must be protected when retrieved from the queue. Any unprotected message encountered is moved to the SYSTEM.PROTECTION.ERROR.QUEUE. This is the default value.

MQMLP_TOLERATE_YES

Specifies that the messages that are not protected when retrieved from the queue can ignore the policy.

Toleration is optional and exists to facilitate staged implementation, where:

- Policies have been applied to queues, but those queues might already contain unprotected messages, or
- Queues might still receive messages from remote systems that do not yet have the policy set.

KeyReuse (MQCFIN)

Specifies the number of times that an encryption key can be re-used, in the range 1-9,999,999, or the special values *MQKEY_REUSE_DISABLED* or *MQKEY_REUSE_UNLIMITED* (parameter identifier: MQIA_KEY_REUSE_COUNT). The following values are valid:

MQKEY_REUSE_DISABLED

Prevents a symmetric key from being reused. This is the default value.

MQKEY_REUSE_UNLIMITED

Allows a symmetric key to be reused any number of times.

Attention: Key reuse is valid only for CONFIDENTIALITY policies, that is, **SignAlg** set to *MQESE_SIGN_ALG_NONE* and **EncAlg** set to an algorithm value. For all other policy types, you must omit the parameter, or set the **Keyreuse** value to *MQKEY_REUSE_DISABLED*.

Action (MQCFIN)

Specifies the action for the parameters supplied, as they apply to any existing policy (parameter identifier: MQIACF_ACTION). The following values are valid:

MQACT_REPLACE

Has the effect of replacing any existing policy with the parameters supplied. This is the default value.

MQACT_ADD

Has the effect that signers and recipients parameters have an additive effect. That is, if a signer or recipient is specified, and does not already exist in a preexisting policy, the signer or recipient value is added to the existing policy definition.

MQACT_REMOVE

Has the opposite effect of *MQACT_ADD*. That is, if any of the signer or recipient values specified exist in a preexisting policy, those values are removed from the policy definition.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown at [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_POLICY_TYPE_ERROR

Policy type not valid.

MQCMD_CHANGE_Q_MGR (Change Queue Manager)

The Change Queue Manager (MQCMD_CHANGE_Q_MGR) PCF command changes the specified attributes of the queue manager.

For any optional parameters that are omitted, the value does not change.

Required parameters:

None

Optional parameters (Change Queue Manager)

Multi

AccountingConnOverride (MQCFIN)

Specifies whether applications can override the settings of the *QueueAccounting* and *MQIAccounting* queue manager parameters (parameter identifier: MQIA_ACCOUNTING_CONN_OVERRIDE).

The value can be any of the following values:

MQMON_DISABLED

Applications cannot override the settings of the **QueueAccounting** and **MQIAccounting** parameters.

This value is the initial default value for the queue manager.

MQMON_ENABLED

Applications can override the settings of the **QueueAccounting** and **MQIAccounting** parameters by using the options field of the MQCNO structure of the MQCONN API call.

This parameter is valid only on [Multiplatforms](#).

Multi **AccountingInterval (MQCFIN)**

The time interval, in seconds, at which intermediate accounting records are written (parameter identifier: MQIA_ACCOUNTING_INTERVAL).

Specify a value in the range 1 - 604,000.

This parameter is valid only on [Multiplatforms](#).

ActivityRecording (MQCFIN)

Specifies whether activity reports can be generated (parameter identifier: MQIA_ACTIVITY_RECORDING).

The value can be:

MQRECORDING_DISABLED

Activity reports cannot be generated.

MQRECORDING_MSG

Activity reports can be generated and sent to the reply queue specified by the originator in the message causing the report.

MQRECORDING_Q

Activity reports can be generated and sent to SYSTEM.ADMIN.ACTIVITY.QUEUE.

z/OS **AdoptNewMCACheck (MQCFIN)**

The elements checked to determine whether an MCA must be adopted (restarted) when a new inbound channel is detected. It must be adopted (restarted) if it that has the same name as a currently active MCA (parameter identifier: MQIA_ADOPTNEWMCA_CHECK).

The value can be:

MQADOPT_CHECK_Q_MGR_NAME

Check the queue manager name.

MQADOPT_CHECK_NET_ADDR

Check the network address.

MQADOPT_CHECK_ALL

Check the queue manager name and network address. Perform this check to prevent your channels from being inadvertently shut down. This value is the initial default value of the queue manager.

MQADOPT_CHECK_NONE

Do not check any elements.

This parameter applies to z/OS only.

z/OS **AdoptNewMCAType (MQCFIN)**

Adoption of orphaned channel instances (parameter identifier: MQIA_ADOPTNEWMCA_TYPE).

Specify whether an orphaned MCA instance is to be adopted when a new inbound channel request is detected matching the **AdoptNewMCACheck** parameters.

The value can be:

MQADOPT_TYPE_NO

Do not adopt orphaned channel instances.

MQADOPT_TYPE_ALL

Adopt all channel types. This value is the initial default value of the queue manager.

This parameter applies to z/OS only.

AuthorityEvent (MQCFIN)

Controls whether authorization (Not Authorized) events are generated (parameter identifier: MQIA_AUTHORITY_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled. This value is not permitted on z/OS.

BridgeEvent (MQCFIN)

Controls whether IMS bridge events are generated (parameter identifier: MQIA_BRIDGE_EVENT). This parameter applies to z/OS only.

The value can be:

MQEVR_DISABLED

Event reporting disabled. This value is the default value.

MQEVR_ENABLED

Event reporting enabled.

CertificateLabel (MQCFST)

Specifies the certificate label for this queue manager to use. The label identifies which personal certificate in the key repository has been selected (parameter identifier: MQCA_CERT_LABEL).

The default and migrated queue manager values are:

-  On AIX, Linux, and Windows: *ibmwebspheremqxxxx* where *xxxx* is the queue manager name folded to lowercase.
-  On IBM i:
 - If you specified SSLKEYR(*SYSTEM), the value is blank.
 - Note that it is forbidden to use a nonblank queue manager CERTLABL with SSLKEYR(*SYSTEM). Attempting to do so results in an MQRCCF_Q_MGR_ATTR_CONFLICT error.
 - Otherwise, *ibmwebspheremqxxxx* where *xxxx* is the queue manager name folded to lowercase.
-  On z/OS: *ibmWebSphereMQXXXX* where *XXXX* is the queue manager name.

See [z/OS systems](#) for more information.

CertificateValPolicy (MQCFIN)

Specifies which TLS certificate validation policy is used to validate digital certificates received from remote partner systems (parameter identifier: MQIA_CERT_VAL_POLICY).

This attribute can be used to control how strictly the certificate chain validation conforms to industry security standards. For more information, see [Certificate validation policies in IBM MQ](#).

The value can be any of the following values:

MQ_CERT_VAL_POLICY_ANY

Apply each of the certificate validation policies supported by the secure sockets library and accept the certificate chain if any of the policies considers the certificate chain valid. This setting can be used for maximum backwards compatibility with older digital certificates which do not comply with the modern certificate standards.

MQ_CERT_VAL_POLICY_RFC5280

Apply only the RFC 5280 compliant certificate validation policy. This setting provides stricter validation than the ANY setting, but rejects some older digital certificates.

This parameter is only valid on AIX, Linux, and Windows and can be used only on a queue manager with a command level of 711, or higher.

Changes to **CertificateValPolicy** become effective either:

- When a new channel process is started.
- For channels that run as threads of the channel initiator, when the channel initiator is restarted.
- For channels that run as threads of the listener, when the listener is restarted.

- For channels that run as threads of a process pooling process, when the process pooling process is started or restarted and first runs a TLS channel. If the process pooling process has already run a TLS channel, and you want the change to become effective immediately, run the MQSC command **REFRESH SECURITY TYPE(SSL)**. The process pooling process is amqmpa on AIX, Linux, and Windows.
- When a **REFRESH SECURITY TYPE(SSL)** command is issued.

z/OS CFConlos (MQCFIN)

Specifies the action to be taken when the queue manager loses connectivity to the administration structure, or any CF structure with CFConlos set to ASQMGR (parameter identifier: MQIA_QMGR_CFCONLOS).

The value can be:

MQCFCONLOS_TERMINATE

The queue manager terminates when connectivity to CF structures is lost.

MQCFCONLOS_TOLERATE

The queue manager tolerates loss of connectivity to CF structures without terminating.

This parameter applies to z/OS only.

ChannelAutoDef (MQCFIN)

Controls whether receiver and server-connection channels can be auto-defined (parameter identifier: MQIA_CHANNEL_AUTO_DEF).

Auto-definition for cluster-sender channels is always enabled.

This parameter is supported in the following environments: IBM i, AIX, Linux, and Windows systems.

The value can be:

MQCHAD_DISABLED

Channel auto-definition disabled.

MQCHAD_ENABLED

Channel auto-definition enabled.

ChannelAutoDefEvent (MQCFIN)

Controls whether channel auto-definition events are generated (parameter identifier: MQIA_CHANNEL_AUTO_DEF_EVENT), when a receiver, server-connection, or cluster-sender channel is auto-defined.

This parameter is supported in the following environments: IBM i, AIX, Linux, and Windows systems.

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

ChannelAutoDefExit (MQCFIN)

Channel auto-definition exit name (parameter identifier: MQCA_CHANNEL_AUTO_DEF_EXIT).

This exit is invoked when an inbound request for an undefined channel is received, if:

1. The channel is a cluster-sender, or
2. Channel auto-definition is enabled (see *ChannelAutoDef*).

This exit is also invoked when a cluster-receiver channel is started.

The format of the name is the same as for the *SecurityExit* parameter described in [“Change, Copy, and Create Channel”](#) on page 1040.

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

This parameter is supported in the following environments: z/OS, IBM i, AIX, Linux, and Windows. On z/OS, it applies only to cluster-sender and cluster-receiver channels.

ChannelAuthenticationRecords (MQCFIN)

Controls whether channel authentication records are used. Channel authentication records can still be set and displayed regardless of the value of this attribute. (parameter identifier: MQIA_CHLAUTH_RECORDS).

The value can be:

MQCHLA_DISABLED

Channel authentication records are not checked.

MQCHLA_ENABLED

Channel authentication records are checked.

ChannelEvent (MQCFIN)

Controls whether channel events are generated (parameter identifier: MQIA_CHANNEL_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

MQEVR_EXCEPTION

Reporting of exception channel events enabled.

Multi ChannelInitiatorControl (MQCFIN)

Specifies whether the channel initiator is to be started when the queue manager starts (parameter identifier: MQIA_CHINIT_CONTROL).

The value can be:

MQSVC_CONTROL_MANUAL

The channel initiator is not to be started automatically.

MQSVC_CONTROL_Q_MGR

The channel initiator is to be started automatically when the queue manager starts.

This parameter is valid only on [Multiplatforms](#).

ChannelMonitoring (MQCFIN)

Default setting for online monitoring for channels (parameter identifier: MQIA_MONITORING_CHANNEL).

The value can be:

MQMON_NONE

Online monitoring data collection is turned off for channels regardless of the setting of their **ChannelMonitoring** parameter.

MQMON_OFF

Online monitoring data collection is turned off for channels specifying a value of MQMON_Q_MGR in their **ChannelMonitoring** parameter. This value is the initial default value of the queue manager.

MQMON_LOW

Online monitoring data collection is turned on, with a low ratio of data collection, for channels specifying a value of MQMON_Q_MGR in their **ChannelMonitoring** parameter.

MQMON_MEDIUM

Online monitoring data collection is turned on, with a moderate ratio of data collection, for channels specifying a value of MQMON_Q_MGR in their **ChannelMonitoring** parameter.

MQMON_HIGH

Online monitoring data collection is turned on, with a high ratio of data collection, for channels specifying a value of MQMON_Q_MGR in their **ChannelMonitoring** parameter.

ChannelStatistics (MQCFIN)

Controls whether statistics data is to be collected for channels (parameter identifier: MQIA_STATISTICS_CHANNEL).

The value can be:

MQMON_NONE

Statistics data collection is turned off for channels regardless of the setting of their **ChannelStatistics** parameter. This value is the initial default value of the queue manager.

MQMON_OFF

Statistics data collection is turned off for channels specifying a value of MQMON_Q_MGR in their *ChannelStatistics* parameter.

MQMON_LOW

Statistics data collection is turned on, with a low ratio of data collection, for channels specifying a value of MQMON_Q_MGR in their **ChannelStatistics** parameter.

MQMON_MEDIUM

Statistics data collection is turned on, with a moderate ratio of data collection, for channels specifying a value of MQMON_Q_MGR in their **ChannelStatistics** parameter.

MQMON_HIGH

Statistics data collection is turned on, with a high ratio of data collection, for channels specifying a value of MQMON_Q_MGR in their **ChannelStatistics** parameter.

z/OS On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

z/OS ChinitAdapters (MQCFIN)

Number of adapter subtasks (parameter identifier: MQIA_CHINIT_ADAPTERS).

The number of adapter subtasks to use for processing IBM MQ calls. This parameter applies to z/OS only.

Specify a value in the range 1 - 9999. The initial default value of the queue manager is 8.

z/OS ChinitDispatchers (MQCFIN)

Number of dispatchers (parameter identifier: MQIA_CHINIT_DISPATCHERS).

The number of dispatchers to use for the channel initiator. This parameter applies to z/OS only.

Specify a value in the range 1 - 9999. The initial default value of the queue manager is 5.

z/OS ChinitServiceParm (MQCFIN)

Reserved for use by IBM (parameter identifier: MQCA_CHINIT_SERVICE_PARM).

This parameter applies to z/OS only.

z/OS ChinitTraceAutoStart (MQCFIN)

Specifies whether the channel initiator trace must start automatically (parameter identifier: MQIA_CHINIT_TRACE_AUTO_START).

The value can be:

MQTRAXSTR_YES

Channel initiator trace is to start automatically.

MQTRAXSTR_NO

Channel initiator trace is not to start automatically. This value is the initial default value of the queue manager.

This parameter applies to z/OS only.

z/OS ChinitTraceTableSize (MQCFIN)

The size, in megabytes, of the trace data space of the channel initiator (parameter identifier: MQIA_CHINIT_TRACE_TABLE_SIZE).

Specify a value in the range 2 - 2048. The initial default value of the queue manager is 2.

This parameter applies to z/OS only.

ClusterSenderMonitoringDefault (MQCFIN)

Default setting for online monitoring for automatically defined cluster-sender channels (parameter identifier: MQIA_MONITORING_AUTO_CLUSSDR).

Specifies the value to be used for the *ChannelMonitoring* attribute of automatically defined cluster-sender channels. The value can be any of the following values:

MQMON_Q_MGR

Collection of online monitoring data is inherited from the setting of the queue manager's **ChannelMonitoring** parameter. This value is the initial default value of the queue manager.

MQMON_OFF

Monitoring for the channel is disabled.

MQMON_LOW

Unless *ChannelMonitoring* is MQMON_NONE, this value specifies a low rate of data collection with a minimal effect on system performance. The data collected is not likely to be the most current.

MQMON_MEDIUM

Unless *ChannelMonitoring* is MQMON_NONE, this value specifies a moderate rate of data collection with limited effect on system performance.

MQMON_HIGH

Unless *ChannelMonitoring* is MQMON_NONE, this value specifies a high rate of data collection with a likely effect on system performance. The data collected is the most current available.

z/OS On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

ClusterSenderStatistics (MQCFIN)

Controls whether statistics data is to be collected for auto-defined cluster-sender channels (parameter identifier: MQIA_STATISTICS_AUTO_CLUSSDR).

The value can be:

MQMON_Q_MGR

Collection of statistics data is inherited from the setting of the queue manager's **ChannelStatistics** parameter. This value is the initial default value of the queue manager.

MQMON_OFF

Statistics data collection for the channel is disabled.

MQMON_LOW

Unless *ChannelStatistics* is MQMON_NONE, this value specifies a low rate of data collection with a minimal effect on system performance.

MQMON_MEDIUM

Unless *ChannelStatistics* is MQMON_NONE, this value specifies a moderate rate of data collection.

MQMON_HIGH

Unless *ChannelStatistics* is MQMON_NONE, this value specifies a high rate of data collection.

On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

ClusterWorkLoadData (MQCFST)

Cluster workload exit data (parameter identifier: MQCA_CLUSTER_WORKLOAD_DATA).

This parameter is passed to the cluster workload exit when it is called.

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

ClusterWorkLoadExit (MQCFST)

Cluster workload exit name (parameter identifier: MQCA_CLUSTER_WORKLOAD_EXIT).

If a nonblank name is defined this exit is invoked when a message is put to a cluster queue.

The format of the name is the same as for the *SecurityExit* parameter described in [“Change, Copy, and Create Channel”](#) on page 1040.

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

ClusterWorkLoadLength (MQCFIN)

Cluster workload length (parameter identifier: MQIA_CLUSTER_WORKLOAD_LENGTH).

The maximum length of the message passed to the cluster workload exit.

The value of this attribute must be in the range 0 - 999,999 999.

CLWLMRUChannels (MQCFIN)

Cluster workload most recently used (MRU) channels (parameter identifier: MQIA_CLWL_MRU_CHANNELS).

The maximum number of active most recently used outbound channels.

Specify a value in the range 1 - 999,999 999.

CLWLUseQ (MQCFIN)

Use of remote queue (parameter identifier: MQIA_CLWL_USEQ).

Specifies whether a cluster queue manager is to use remote puts to other queues defined in other queue managers within the cluster during workload management.

Specify either:

MQCLWL_USEQ_ANY

Use remote queues.

MQCLWL_USEQ_LOCAL

Do not use remote queues.

CodedCharSetId (MQCFIN)

Queue manager coded character set identifier (parameter identifier: MQIA_CODED_CHAR_SET_ID).

The coded character set identifier (CCSID) for the queue manager. The CCSID is the identifier used with all character string fields defined by the application programming interface (API). If the CCSID in a message descriptor is set to the value MQCCSI_Q_MGR, it applies to the character data written into the body of a message. Data is written using MQPUT or MQPUT1. Character data is identified by the format specified for the message.

Specify a value in the range 1 - 65,535.

The CCSID must specify a value that is defined for use on the platform and use an appropriate character set. The character set must be:

- EBCDIC on IBM i
- ASCII or ASCII-related on other platforms

Stop and restart the queue manager after execution of this command so that all processes reflect the changed CCSID of the queue manager.

This parameter is not supported on z/OS.

CommandEvent (MQCFIN)

Controls whether command events are generated (parameter identifier: MQIA_COMMAND_EVENT).

The value can be any of the following values:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

MQEVR_NO_DISPLAY

Event reporting enabled for all successful commands except Inquire commands.

z/OS CommandScope (MQCFIN)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment. The command server must be enabled.
- An asterisk " * ". The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Multi CommandServerControl (MQCFIN)

Specifies whether the command server is to be started when the queue manager starts (parameter identifier: MQIA_CMD_SERVER_CONTROL).

The value can be:

MQSVC_CONTROL_MANUAL

The command server is not to be started automatically.

MQSVC_CONTROL_Q_MGR

The command server is to be started automatically when the queue manager starts.

This parameter is valid only on [Multiplatforms](#).

ConfigurationEvent (MQCFIN)

Controls whether configuration events are generated (parameter identifier: MQIA_CONFIGURATION_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

ConnAuth (MQCFST)

The name of an authentication information object that is used to provide the location of user ID and password authentication (parameter identifier: MQCA_CONN_AUTH).

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH. Only authentication information objects with type IDPWOS or IDPWLDAP can be specified; other types result in an error message when the OAM (on AIX, Linux, and Windows) or the security component (on z/OS) reads the configuration.

Custom (MQCFST)

Custom attribute for new features (parameter identifier: MQCA_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes are introduced. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE). Single quotation marks must be escaped with another single quotation mark.

This description is updated when features using this attribute are introduced. Currently there are no possible values for *Custom*.

The maximum length of the string is MQ_CUSTOM_LENGTH.

DeadLetterQName (MQCFIN)

Dead letter (undelivered message) queue name (parameter identifier: MQCA_DEAD_LETTER_Q_NAME).

Specifies the name of the local queue that is to be used for undelivered messages. Messages are put on this queue if they cannot be routed to their correct destination. The maximum length of the string is MQ_Q_NAME_LENGTH.

DefClusterXmitQueueType (MQCFIN)

The DefClusterXmitQueueType attribute controls which transmission queue is selected by default by cluster-sender channels to get messages from, to send the messages to cluster-receiver channels. (Parameter identifier: MQIA_DEF_CLUSTER_XMIT_Q_TYPE.)

The values of **DefClusterXmitQueueType** are MQCLXQ_SCTQ or MQCLXQ_CHANNEL.

MQCLXQ_SCTQ

All cluster-sender channels send messages from SYSTEM.CLUSTER.TRANSMIT.QUEUE. The correlID of messages placed on the transmission queue identifies which cluster-sender channel the message is destined for.

SCTQ is set when a queue manager is defined.

MQCLXQ_CHANNEL

Each cluster-sender channel sends messages from a different transmission queue. Each transmission queue is created as a permanent dynamic queue from the model queue SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE.

DefXmitQName (MQCFST)

Default transmission queue name (parameter identifier: MQCA_DEF_XMIT_Q_NAME).

This parameter is the name of the default transmission queue that is used for the transmission of messages to remote queue managers. It is selected if there is no other indication of which transmission queue to use.

The maximum length of the string is MQ_Q_NAME_LENGTH.

DNSGroup (MQCFST)

DNS group name (parameter identifier: MQCA_DNS_GROUP).

This parameter is no longer used. See [z/OS: WLM/DNS no longer supported](#). This parameter applies to z/OS only.

The maximum length of the string is MQ_DNS_GROUP_NAME_LENGTH.

z/OS DNSWLM (MQCFIN)

WLM/DNS Control: (parameter identifier: MQIA_DNS_WLM).

This parameter is no longer used. See [z/OS: WLM/DNS no longer supported](#).

The value can be any of the following values:

MQDNSWLM_NO

This is the only value supported by the queue manager.

This parameter applies to z/OS only.

z/OS ExpiryInterval (MQCFIN)

Interval between scans for expired messages (parameter identifier: MQIA_EXPIRY_INTERVAL). This parameter applies to z/OS only.

Specifies the frequency with which the queue manager scans the queues looking for expired messages. Specify a time interval in seconds in the range 1 - 99,999,999, or the following special value:

MQEXPI_OFF

No scans for expired messages.

The minimum scan interval used is 5 seconds, even if you specify a lower value.

EncryptionPolicySuiteB (MQCFIL)

Specifies whether Suite B-compliant cryptography is used and what level of strength is employed (parameter identifier MQIA_SUITE_B_STRENGTH).

The value can be one or more of:

MQ_SUITE_B_NONE

Suite B-compliant cryptography is not used.

MQ_SUITE_B_128_BIT

Suite B 128-bit strength security is used.

MQ_SUITE_B_192_BIT

Suite B 192-bit strength security is used.

If invalid lists are specified, such as MQ_SUITE_B_NONE with MQ_SUITE_B_128_BIT, the error MQRCCF_SUITE_B_ERROR is issued.

Force (MQCFIN)

Force changes (parameter identifier: MQIACF_FORCE).

Specifies whether the command is forced to complete if both of the following are true:

- *DefXmitQName* is specified, and
- An application has a remote queue open, the resolution for which is affected by this change.

z/OS GroupUR (MQCFIN)

Controls whether CICS and XA client applications can establish transactions with a GROUP unit of recovery disposition.

This attribute is only valid on z/OS and can be enabled only when the queue manager is a member of a queue sharing group.

The value can be:

MQGUR_DISABLED

CICS and XA client applications must connect using a queue manager name.

MQGUR_ENABLED

CICS and XA client applications can establish transactions with a group unit of recovery disposition by specifying a queue sharing group name when they connect.

z/OS See [Unit of recovery disposition in a queue sharing group](#).

z/OS IGQPutAuthority (MQCFIN)

Command scope (parameter identifier: MQIA_IGQ_PUT_AUTHORITY). This parameter is valid only on z/OS when the queue manager is a member of a queue sharing group.

Specifies the type of authority checking and, therefore, the user IDs to be used by the IGQ agent (IGQA). This parameter establishes the authority to put messages to a destination queue. The value can be any of the following values:

MQIGQPA_DEFAULT

Default user identifier is used.

The user identifier used for authorization is the value of the *UserIdentifier* field. The *UserIdentifier* field is in the separate MQMD that is associated with the message when the message is on the shared transmission queue. This value is the user identifier of the program that placed the message on the shared transmission queue. It is typically the same as the user identifier under which the remote queue manager is running.

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the user identifier of the local IGQ agent (*IGQUserId*) is checked.

MQIGQPA_CONTEXT

Context user identifier is used.

The user identifier used for authorization is the value of the *UserIdentifier* field. The *UserIdentifier* field is in the separate MQMD that is associated with the message when the message is on the shared transmission queue. This value is the user identifier of the program that placed the message on the shared transmission queue. It is typically the same as the user identifier under which the remote queue manager is running.

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the user identifier of the local IGQ agent (*IGQUserId*) is checked.. The value of the *UserIdentifier* field in the embedded MQMD is also checked. The latter user identifier is typically the user identifier of the application that originated the message.

MQIGQPA_ONLY_IGQ

Only the IGQ user identifier is used.

The user identifier used for authorization is the user identifier of the local IGQ agent (*IGQUserId*).

If the RESLEVEL profile indicates that more than one user identifier is to be checked, this user identifier is used for all checks.

MQIGQPA_ALTERNATE_OR_IGQ

Alternate user identifier or IGQ-agent user identifier is used.

The user identifier used for authorization is the user identifier of the local IGQ agent (*IGQUserId*).

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the value of the *UserIdentifier* field in the embedded MQMD is also checked. The latter user identifier is typically the user identifier of the application that originated the message.

z/OS IGQUserId (MQCFST)

Intra-group queuing agent user identifier (parameter identifier: MQCA_IGQ_USER_ID). This parameter is valid only on z/OS when the queue manager is a member of a queue sharing group.

Specifies the user identifier that is associated with the local intra-group queuing agent. This identifier is one of the user identifiers that might be checked for authorization when the IGQ agent puts messages on local queues. The actual user identifiers checked depend on the setting of the *IGQPutAuthority* attribute, and on external security options.

The maximum length is MQ_USER_ID_LENGTH.

ImageInterval (MQCFIN)

The target frequency with which the queue manager automatically writes media images, in minutes since the previous media image for an object (parameter identifier: MQIA_MEDIA_IMAGE_INTERVAL). This parameter is not valid on z/OS.

The value can be:

The time in minutes from 1 - 999 999 999, at which the queue manager automatically writes media images.

The default value is 60 minutes.

MQMEDIMGINTVL_OFF

Automatic media images are not written on a time interval basis.

ImageLogLength (MQCFIN)

The target size of the recovery log, written before the queue manager automatically writes media images, in number of megabytes since the previous media image for an object.

This limits the amount of log to be read when recovering an object (parameter identifier: MQIA_MEDIA_IMAGE_LOG_LENGTH). This parameter is not valid on z/OS.

The value can be:

The target size of the recovery log in megabytes from 1 - 999 999 999.

MQMEDIMGLOGLN_OFF

Automatic media images are not written based on the size of log written.

MQMEDIMGLOGLN_OFF is the default value.

ImageRecoverObject (MQCFST)

Specifies whether authentication information, channel, client connection, listener, namelist, process, alias queue, remote queue, and service objects are recoverable from a media image, if linear logging is being used (parameter identifier: MQIA_MEDIA_IMAGE_RECOVER_OBJ). This parameter is not valid on z/OS.

The value can be:

MQIMGRCOV_NO

The “rcdmqimg (record media image)” on page 139 and “rcrmqobj (re-create object)” on page 142 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

MQIMGRCOV_YES

These objects are recoverable.

MQIMGRCOV_YES is the default value.

ImageRecoverQueue (MQCFST)

Specifies the default **ImageRecoverQueue** attribute for local and permanent dynamic queue objects, when used with this parameter (parameter identifier: MQIA_MEDIA_IMAGE_RECOVER_Q). This parameter is not valid on z/OS.

The value can be:

MQIMGRCOV_NO

The **ImageRecoverQueue** attribute for local and permanent dynamic queue objects is set to MQIMGRCOV_NO .

MQIMGRCOV_YES

The **ImageRecoverQueue** attribute for local and permanent dynamic queue objects is set to MQIMGRCOV_YES .

MQIMGRCOV_YES is the default value.

ImageSchedule (MQCFST)

Whether the queue manager automatically writes media images (parameter identifier: MQIA_MEDIA_IMAGE_SCHEDULING). This parameter is not valid on z/OS.

The value can be:

MQMEDIMGSCHEM_AUTO

The queue manager attempts to automatically write a media image for an object, before **ImageInterval** minutes have elapsed, or **ImageLogLength** megabytes of recovery log have been written, since the previous media image for the object was taken.

The previous media image might have been taken manually or automatically, depending on the settings of **ImageInterval** or **ImageLogLength**.

MQMEDIMGSCHED_MANUAL

Automatic media images are not written.

MQMEDIMGSCHED_MANUAL is the default value.

InhibitEvent (MQCFIN)

Controls whether inhibit (Inhibit Get and Inhibit Put) events are generated (parameter identifier: MQIA_INHIBIT_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

Multi

InitialKey (MQCFST)

The initial key for the password protection system (parameter identifier: MQCA_INITIAL_KEY).

The length of the string is MQ_INITIAL_KEY_LENGTH.

IBM MQ encrypts the value of some queue manager attributes using the IBM MQ Password Protection system. An initial key is used by the encryption algorithm to encrypt and decrypt these attributes. You should use this attribute to set a unique initial key for the queue manager, prior to setting values of the attributes that are encrypted.

If an initial key is not set using this attribute, a default initial key is used. If this attribute is changed, the values of the attributes that are encrypted are invalidated and must be reset before they can be used.

The value of the **SSLKeyRepositoryPassword** attribute is encrypted using the initial key.

Warning: If you change this attribute, the values of the attributes that are encrypted are invalidated and you must reset them before they can be used.

z/OS

IntraGroupQueuing (MQCFIN)

Command scope (parameter identifier: MQIA_INTRA_GROUP_QUEUING). This parameter is valid only on z/OS when the queue manager is a member of a queue sharing group.

Specifies whether intra-group queuing is used. The value can be any of the following values:

MQIGQ_DISABLED

Intra-group queuing disabled.

MQIGQ_ENABLED

Intra-group queuing enabled.

IPAddressVersion (MQCFIN)

IP address version selector (parameter identifier: MQIA_IP_ADDRESS_VERSION).

Specifies which IP address version, either IPv4 or IPv6, is used. The value can be:

MQIPADDR_IPV4

IPv4 is used.

MQIPADDR_IPV6

IPv6 is used.

This parameter is only relevant for systems that run both IPv4 and IPv6. It affects only channels defined as having a *TransportType* of MQXPY_TCP when one of the following conditions is true:

- The channel attribute *ConnectionName* is a host name that resolves to both an IPv4 and IPv6 address and its **LocalAddress** parameter is not specified.

- The channel attributes *ConnectionName* and *LocalAddress* are both host names that resolve to both IPv4 and IPv6 addresses.

z/OS ListenerTimer (MQCFIN)

Listener restart interval (parameter identifier: MQIA_LISTENER_TIMER).

The time interval, in seconds, between attempts by IBM MQ to restart the listener after an APPC or TCP/IP failure. This parameter applies to z/OS only.

Specify a value in the range 5 - 9,999. The initial default value of the queue manager is 60.

LocalEvent (MQCFIN)

Controls whether local error events are generated (parameter identifier: MQIA_LOCAL_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

Multi LoggerEvent (MQCFIN)

Controls whether recovery log events are generated (parameter identifier: MQIA_LOGGER_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled. This value is not valid on queue managers that are using circular logs.

This parameter is valid only on [Multiplatforms](#).

z/OS LUGroupName (MQCFST)

Generic LU name for the LU 6.2 listener (parameter identifier: MQCA_LU_GROUP_NAME).

The generic LU name to be used by the LU 6.2 listener that handles inbound transmissions for the queue sharing group.

This parameter applies to z/OS only.

The maximum length of the string is MQ_LU_NAME_LENGTH.

z/OS LUName (MQCFST)

LU name to use for outbound LU 6.2 transmissions (parameter identifier: MQCA_LU_NAME).

The name of the LU to use for outbound LU 6.2 transmissions. Set this parameter to be the same as the name of the LU to be used by the listener for inbound transmissions.

This parameter applies to z/OS only.

The maximum length of the string is MQ_LU_NAME_LENGTH.

z/OS LU62ARMSuffix (MQCFST)

APPCPM suffix (parameter identifier: MQCA_LU62_ARM_SUFFIX).

The suffix of the APPCPM member of SYS1.PARMLIB. This suffix nominates the LUADD for this channel initiator.

This parameter applies to z/OS only.

The maximum length of the string is MQ_ARM_SUFFIX_LENGTH.

z/OS LU62Channels (MQCFIN)

Maximum number of LU 6.2 channels (parameter identifier: MQIA_LU62_CHANNELS).

The maximum number of channels that can be current, or clients that can be connected, that use the LU 6.2 transmission protocol.

This parameter applies to z/OS only.

Specify a value in the range 0 - 9999. The initial default value of the queue manager is 200.

z/OS MaxActiveChannels (MQCFIN)

Maximum number of active channels (parameter identifier: MQIA_ACTIVE_CHANNELS).

The maximum number of channels that can be *active* at any time.

This parameter applies to z/OS only.

Sharing conversations do not contribute to the total for this parameter.

Specify a value in the range 1 - 9999. The initial default value of the queue manager is 200.

z/OS MaxChannels (MQCFIN)

Maximum number of current channels (parameter identifier: MQIA_MAX_CHANNELS).

The maximum number of channels that can be *current* (including server-connection channels with connected clients).

This parameter applies to z/OS only.

Sharing conversations do not contribute to the total for this parameter.

Specify a value in the range 1 - 9999.

MaxHandles (MQCFIN)

Maximum number of handles (parameter identifier: MQIA_MAX_HANDLES).

The maximum number of handles that any one connection can have open at the same time.

Specify a value in the range 0 - 999,999,999.

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: MQIA_MAX_MSG_LENGTH).

Specifies the maximum length of messages allowed on queues on the queue manager. No message that is larger than either the queue attribute *MaxMsgLength* or the queue manager attribute *MaxMsgLength* can be put on a queue.

If you reduce the maximum message length for the queue manager, you must also reduce the maximum message length of the SYSTEM.DEFAULT.LOCAL.QUEUE definition, and your other queues. Reduce the definitions on the queues to less than or equal to the limit of the queue manager. If you do not reduce the message lengths appropriately, and applications inquire only the value of the queue attribute *MaxMsgLength*, they might not work correctly.

The lower limit for this parameter is 32 KB (32,768 bytes). The upper limit is 100 MB (104,857,600 bytes).

This parameter is not valid on z/OS.

MaxPropertiesLength (MQCFIN)

Maximum property length (parameter identifier: MQIA_MAX_PROPERTIES_LENGTH).

Specifies the maximum length of the properties, including both the property name in bytes and the size of the property value in bytes.

Specify a value in the range 0 - 100 MB (104,857,600 bytes), or the special value:

MQPROP_UNRESTRICTED_LENGTH

The size of the properties is restricted only by the upper limit.

MaxUncommittedMsgs (MQCFIN)

Maximum uncommitted messages (parameter identifier: MQIA_MAX_UNCOMMITTED_MSGS).

Specifies the maximum number of uncommitted messages. The maximum number of uncommitted messages under any sync point is the sum of the following messages:

The number of messages that can be retrieved.

The number of messages that can be put.

The number of trigger messages generated within this unit of work.

The limit does not apply to messages that are retrieved or put outside sync point.

Specify a value in the range 1 - 10,000.

Multi MQIAccounting (MQCFIN)

Controls whether accounting information for MQI data is to be collected (parameter identifier: MQIA_ACCOUNTING_MQI).

The value can be:

MQMON_OFF

MQI accounting data collection is disabled. This value is the initial default value of the queue manager.

MQMON_ON

MQI accounting data collection is enabled.

This parameter is valid only on [Multiplatforms](#).

Multi MQIStatistics (MQCFIN)

Controls whether statistics monitoring data is to be collected for the queue manager (parameter identifier: MQIA_STATISTICS_MQI).

The value can be:

MQMON_OFF

Data collection for MQI statistics is disabled. This value is the initial default value of the queue manager.

MQMON_ON

Data collection for MQI statistics is enabled.

This parameter is valid only on [Multiplatforms](#).

MsgMarkBrowseInterval (MQCFIN)

Mark-browse interval (parameter identifier: MQIA_MSG_MARK_BROWSE_INTERVAL).

Specifies the time interval in milliseconds after which the queue manager can automatically unmark messages.

Specify a value up to the maximum of 999,999,999, or the special value MQMMBI_UNLIMITED. The default value is 5000.

Attention: You should not reduce the value below the default of 5000.

MQMMBI_UNLIMITED indicates that the queue manager does not automatically unmark messages.

z/OS OutboundPortMax (MQCFIN)

The maximum value in the range for the binding of outgoing channels (parameter identifier: MQIA_OUTBOUND_PORT_MAX).

The maximum value in the range of port numbers to be used when binding outgoing channels. This parameter applies to z/OS only.

Specify a value in the range 0 - 65,535. The initial default value of the queue manager is zero.

Specify a corresponding value for *OutboundPortMin* and ensure that the value of *OutboundPortMax* is greater than or equal to the value of *OutboundPortMin*.

OutboundPortMin (MQCFIN)

The minimum value in the range for the binding of outgoing channels (parameter identifier: MQIA_OUTBOUND_PORT_MIN).

The minimum value in the range of port numbers to be used when binding outgoing channels. This parameter applies to z/OS only.

Specify a value in the range 0 - 65,535. The initial default value of the queue manager is zero.

Specify a corresponding value for *OutboundPortMax* and ensure that the value of *OutboundPortMin* is less than or equal to the value of *OutboundPortMax*.

Parent (MQCFST)

The name of the queue manager to which this queue manager is to connect hierarchically as its child (parameter identifier: MQCA_PARENT).

A blank value indicates that this queue manager has no parent queue manager. If there is an existing parent queue manager it is disconnected. This value is the initial default value of the queue manager.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

Note:

- The use of IBM MQ hierarchical connections requires that the queue manager attribute PSMODE is set to MQPSM_ENABLED.
- The value of *Parent* can be set to a blank value if PSMODE is set to MQPSM_DISABLED.
- Before connecting to a queue manager hierarchically as its child, channels in both directions must exist between the parent queue manager and child queue manager.
- If a parent is defined, the **Change Queue Manager** command disconnects from the original parent and sends a connection flow to the new parent queue manager.
- Successful completion of the command does not mean that the action completed or that it is going to complete successfully. Use the **Inquire Pub/Sub Status** command to track the status of the requested parent relationship.

PerformanceEvent (MQCFIN)

Controls whether performance-related events are generated (parameter identifier: MQIA_PERFORMANCE_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

PubSubClus (MQCFIN)

Controls whether the queue manager participates in publish/subscribe clustering (parameter identifier: MQIA_PUBSUB_CLUSTER).

The value can be:

MQPSCLUS_ENABLED

The creating or receipt of clustered topic definitions and cluster subscriptions is permitted.

Note: The introduction of a clustered topic into a large IBM MQ cluster can cause a degradation in performance. This degradation occurs because all partial repositories are notified of all the other members of the cluster. Unexpected subscriptions might be created at all other nodes; for example, where `proxysub(FORCE)` is specified. Large numbers of channels might be started from a queue manager; for example, on resync after a queue manager failure.

MQPSCLUS_DISABLED

The creating or receipt of clustered topic definitions and cluster subscriptions is inhibited. The creations or receipts are recorded as warnings in the queue manager error logs.

PubSubMaxMsgRetryCount (MQCFIN)

The number of attempts to reprocess a message when processing a failed command message under sync point (parameter identifier: MQIA_PUBSUB_MAXMSG_RETRY_COUNT).

The value can be:

0 to 999 999 999

The initial value is 5.

PubSubMode (MQCFIN)

Specifies whether the publish/subscribe engine and the queued publish/subscribe interface are running. The publish/subscribe engine enables applications to publish or subscribe by using the application programming interface. The publish/subscribe interface monitors the queues used the queued publish/subscribe interface (parameter identifier: MQIA_PUBSUB_MODE).

The value can be:

MQPSM_COMPAT

The publish/subscribe engine is running. It is therefore possible to publish or subscribe by using the application programming interface. The queued publish/subscribe interface is not running. Therefore any message that is put to the queues that are monitored by the queued publish/subscribe interface is not acted on. MQPSM_COMPAT is used for compatibility with versions of IBM Integration Bus (formerly known as WebSphere Message Broker) prior to version 7 that use this queue manager.

MQPSM_DISABLED

The publish/subscribe engine and the queued publish/subscribe interface are not running. It is therefore not possible to publish or subscribe using the application programming interface. Any publish/subscribe messages that are put to the queues that are monitored by the queued publish/subscribe interface are not acted on.

MQPSM_ENABLED

The publish/subscribe engine and the queued publish/subscribe interface are running. It is therefore possible to publish or subscribe by using the application programming interface and the queues that are monitored by the queued publish/subscribe interface. This value is the initial default value of the queue manager.

PubSubNPInputMsg (MQCFIN)

Whether to discard (or keep) an undelivered input message (parameter identifier: MQIA_PUBSUB_NP_MSG).

The value can be:

MQUNDELIVERED_DISCARD

Non-persistent input messages are discarded if they cannot be processed.

MQUNDELIVERED_KEEP

Non-persistent input messages are not discarded if they cannot be processed. In this situation, the queued publish/subscribe interface continues to try the process again at appropriate intervals and does not continue processing subsequent messages.

PubSubNPResponse (MQCFIN)

Controls the behavior of undelivered response messages (parameter identifier: MQIA_PUBSUB_NP_RESP).

The value can be:

MQUNDELIVERED_NORMAL

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If they cannot be placed on the dead letter queue they are discarded.

MQUNDELIVERED_SAFE

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If the response cannot be sent and cannot be placed on the dead letter queue the queued publish/subscribe interface rolls back the current operation. The operation is tried again at appropriate intervals and does not continue processing subsequent messages.

MQUNDELIVERED_DISCARD

Non-persistent responses that are not placed on the reply queue are discarded.

MQUNDELIVERED_KEEP

Non-persistent responses are not placed on the dead letter queue or discarded. Instead, the queued publish/subscribe interface backs out the current operation and then try it again at appropriate intervals.

PubSubSyncPoint (MQCFIN)

Whether only persistent (or all) messages must be processed under sync point (parameter identifier: MQIA_PUBSUB_SYNC_PT).

The value can be:

MQSYNCPOINT_IFPER

This value makes the queued publish/subscribe interface receive non-persistent messages outside sync point. If the interface receives a publication outside sync point, the interface forwards the publication to subscribers known to it outside sync point.

MQSYNCPOINT_YES

This value makes the queued publish/subscribe interface receive all messages under sync point.

QMGrDesc (MQCFST)

Queue manager description (parameter identifier: MQCA_Q_MGR_DESC).

This parameter is text that briefly describes the object.

The maximum length of the string is MQ_Q_MGR_DESC_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the queue manager on which the command is executing. Using this character set ensures that the text is translated correctly.

▶ **z/OS** **QSGCertificateLabel (MQCFST)**

Specifies the certificate label for the queue sharing group to use (parameter identifier: MQCA_QSG_CERT_LABEL).

This parameter takes precedence over **CERTLABL** in the event that the queue manager is a member of a QSG.

QueueAccounting (MQCFIN)

Controls the collection of accounting (thread-level and queue-level accounting) data for queues (parameter identifier: MQIA_ACCOUNTING_Q). Note, that changes to this value are only effective for connections to the queue manager that occur after the change to the attribute.

The value can be:

MQMON_NONE

Accounting data collection for queues is disabled. This value must not be overridden by the value of the **QueueAccounting** parameter on the queue.

MQMON_OFF

Accounting data collection is disabled for queues specifying a value of MQMON_Q_MGR in the **QueueAccounting** parameter.

MQMON_ON

Accounting data collection is enabled for queues specifying a value of MQMON_Q_MGR in the **QueueAccounting** parameter.

QueueMonitoring (MQCFIN)

Default setting for online monitoring for queues (parameter identifier: MQIA_MONITORING_Q).

If the **QueueMonitoring** queue attribute is set to MQMON_Q_MGR, this attribute specifies the value which is assumed by the channel. The value can be any of the following values:

MQMON_OFF

Online monitoring data collection is turned off. This value is the initial default value of the queue manager.

MQMON_NONE

Online monitoring data collection is turned off for queues regardless of the setting of their **QueueMonitoring** attribute.

MQMON_LOW

Online monitoring data collection is turned on, with a low ratio of data collection.

MQMON_MEDIUM

Online monitoring data collection is turned on, with a moderate ratio of data collection.

MQMON_HIGH

Online monitoring data collection is turned on, with a high ratio of data collection.

QueueStatistics (MQCFIN)

Controls whether statistics data is to be collected for queues (parameter identifier: MQIA_STATISTICS_Q).

The value can be:

Multi **MQMON_NONE**

Statistics data collection is turned off for queues regardless of the setting of their **QueueStatistics** parameter. This value is the initial default value of the queue manager.

z/OS This value is not applicable to z/OS

MQMON_OFF

Statistics data collection is turned off for queues specifying a value of MQMON_Q_MGR in their **QueueStatistics** parameter.

z/OS This is the default value on z/OS.

MQMON_ON

Statistics data collection is turned on for queues specifying a value of MQMON_Q_MGR in their **QueueStatistics** parameter.

z/OS On z/OS systems, you must enable class 5 statistics using the START TRACE command.

z/OS **ReceiveTimeout (MQCFIN)**

How long a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA_RECEIVE_TIMEOUT).

The approximate length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state.

This parameter applies to z/OS only. It applies to message channels, and not to MQI channels. This number can be qualified as follows:

- This number is a multiplier to be applied to the negotiated *HeartBeatInterval* value to determine how long a channel is to wait. Set *ReceiveTimeoutType* to MQRCVTIME_MULTIPLY. Specify a value of zero or in the range 2 - 99. If you specify zero, the channel waits indefinitely to receive data from its partner.
- This number is a value, in seconds, to be added to the negotiated *HeartBeatInterval* value to determine how long a channel is to wait. Set *ReceiveTimeoutType* to MQRCVTIME_ADD. Specify a value in the range 1 - 999,999.
- This number is a value, in seconds, that the channel is to wait, set *ReceiveTimeoutType* to MQRCVTIME_EQUAL. Specify a value in the range 0 - 999,999. If you specify 0, the channel waits indefinitely to receive data from its partner.

The initial default value of the queue manager is zero.

z/OS ReceiveTimeoutMin (MQCFIN)

The minimum length of time that a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA_RECEIVE_TIMEOUT_MIN).

The minimum length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state. This parameter applies to z/OS only.

Specify a value in the range 0 - 999,999.

z/OS ReceiveTimeoutType (MQCFIN)

The qualifier to apply to *ReceiveTimeout* (parameter identifier: MQIA_RECEIVE_TIMEOUT_TYPE).

The qualifier to apply to *ReceiveTimeoutType* to calculate how long a TCP/IP channel waits to receive data, including heartbeats, from its partner. It waits to receive data before returning to the inactive state. This parameter applies to z/OS only.

The value can be any of the following values:

MQRCVTIME_MULTIPLY

The *ReceiveTimeout* value is a multiplier to be applied to the negotiated value of *HeartbeatInterval* to determine how long a channel waits. This value is the initial default value of the queue manager.

MQRCVTIME_ADD

ReceiveTimeout is a value, in seconds, to be added to the negotiated value of *HeartbeatInterval* to determine how long a channel waits.

MQRCVTIME_EQUAL

ReceiveTimeout is a value, in seconds, representing how long a channel waits.

RemoteEvent (MQCFIN)

Controls whether remote error events are generated (parameter identifier: MQIA_REMOTE_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

RepositoryName (MQCFST)

Cluster name (parameter identifier: MQCA_REPOSITORY_NAME).

The name of a cluster for which this queue manager provides a repository manager service.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

No more than one of the resultant values of *RepositoryName* can be nonblank.

RepositoryNameList (MQCFST)

Repository namelist (parameter identifier: MQCA_REPOSITORY_NAMELIST).

The name, of a namelist of clusters, for which this queue manager provides a repository manager service.

This queue manager does not have a full repository, but can be a client of other repository services that are defined in the cluster, if

- Both *RepositoryName* and *RepositoryNameList* are blank, or
- *RepositoryName* is blank and the namelist specified by *RepositoryNameList* is empty.

No more than one of the resultant values of *RepositoryNameList* can be nonblank.

RevDns (MQCFIN)

Whether reverse lookup of the host name from a Domain Name Server is carried out. (parameter identifier: MQIA_REVERSE_DNS_LOOKUP).

This attribute has an effect only on channels using a transport type (TRPTYPE) of TCP.

The value can be:

MQRDNS_DISABLED

DNS host names are not reverse looked-up for the IP addresses of inbound channels. With this setting any CHLAUTH rules using host names are not matched.

MQRDNS_ENABLED

DNS host names are reverse looked-up for the IP addresses of inbound channels when this information is required. This setting is required for matching against CHLAUTH rules that contain host names, and for writing out error messages.

SecurityCase (MQCFIN)

Security case supported (parameter identifier: MQIA_SECURITY_CASE).

Specifies whether the queue manager supports security profile names in mixed case, or in uppercase only. The value is activated when a Refresh Security command is run with *SecurityType* (MQSECTYPE_CLASSES) specified. This parameter is valid only on z/OS.

The value can be:

MQSCYC_UPPER

Security profile names must be in uppercase.

MQSCYC_MIXED

Security profile names can be in uppercase or in mixed case.

SharedQMgrName (MQCFIN)

Shared-queue queue manager name (parameter identifier: MQIA_SHARED_Q_Q_MGR_NAME).

A queue manager makes an MQOPEN call for a shared queue. The queue manager that is specified in the **ObjectQMgrName** parameter of the MQOPEN call is in the same queue sharing group as the processing queue manager. The SQQMNAME attribute specifies whether the **ObjectQMgrName** is used or whether the processing queue manager opens the shared queue directly. This parameter is valid only on z/OS.

The value can be any of the following values:

MQSQQM_USE

ObjectQMgrName is used and the appropriate transmission queue is opened.

MQSQQM_IGNORE

The processing queue manager opens the shared queue directly. This value can reduce the traffic in your queue manager network.

SSLCRLNamelist (MQCFST)

The TLS namelist (parameter identifier: MQCA_SSL_CRL_NAMELIST).

The length of the string is MQ_NAMELIST_NAME_LENGTH.

Indicates the name of a namelist of authentication information objects which are used to provide certificate revocation locations to allow enhanced TLS certificate checking.

If *SSLCRLNamelist* is blank, certificate revocation checking is not invoked.

Changes to *SSLCRLNamelist*, or to the names in a previously specified namelist, or to previously referenced authentication information objects become effective:

-  On Multiplatforms, when a new channel process is started.
-  For channels that run as threads of the channel initiator on Multiplatforms, when the channel initiator is restarted.
-  For channels that run as threads of the listener on Multiplatforms, when the listener is restarted.

- **z/OS** On z/OS, when the channel initiator is restarted.
- When a **REFRESH SECURITY TYPE(SSL)** command is issued.
- **IBM i** On IBM i queue managers, this parameter is ignored. However, it is used to determine which authentication information objects are written to the AMQCLCHL . TAB file.

Only authentication information objects with types of CRLLDAP or OCSP are allowed in the namelist referred to by *SSLCRLNamelist* (MQCFST). Any other type results in an error message when the list is processed and is subsequently ignored.

SSLCryptoHardware (MQCFST)

The TLS cryptographic hardware (parameter identifier: MQCA_SSL_CRYPTO_HARDWARE).

The length of the string is MQ_SSL_CRYPTO_HARDWARE_LENGTH.

Sets the name of the parameter string required to configure the cryptographic hardware present on the system.

This parameter is valid only on AIX, Linux, and Windows.

All supported cryptographic hardware supports the PKCS #11 interface. Specify a string of the following format:

```
GSK_PKCS11=PKCS_#11_driver_path_and_file_name;PKCS_#11_token_label;PKCS_#11_token_password;symmetric_cipher_setting;
```

The PKCS #11 driver path is an absolute path to the shared library providing support for the PKCS #11 card. The PKCS #11 driver file name is the name of the shared library. An example of the value required for the PKCS #11 driver path and file name is `/usr/lib/pkcs11/PKCS11_API.so`

To access symmetric cipher operations through IBM Global Security Kit (GSKit), specify the symmetric cipher setting parameter. The value of this parameter is either:

SYMMETRIC_CIPHER_OFF

Do not access symmetric cipher operations.

SYMMETRIC_CIPHER_ON

Access symmetric cipher operations.

If the symmetric cipher setting is not specified, this value has the same effect as specifying SYMMETRIC_CIPHER_OFF.

The maximum length of the string is 256 characters. The default value is blank.

If you specify a string in the wrong format, you get an error.

When the *SSLCryptoHardware* (MQCFST) value is changed, the cryptographic hardware parameters specified become the ones used for new TLS connection environments. The new information becomes effective:

- When a new channel process is started.
- For channels that run as threads of the channel initiator, when the channel initiator is restarted.
- For channels that run as threads of the listener, when the listener is restarted.
- When a Refresh Security command is issued to refresh the contents of the TLS key repository.

SSLEvent (MQCFIN)

Controls whether TLS events are generated (parameter identifier: MQIA_SSL_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

SSLFipsRequired (MQCFIN)

SSLFIPS specifies whether only FIPS-certified algorithms are to be used if cryptography is carried out in IBM MQ, rather than in cryptographic hardware (parameter identifier: MQIA_SSL_FIPS_REQUIRED).

If cryptographic hardware is configured, the cryptographic modules used are those modules provided by the hardware product. These modules might, or might not, be FIPS-certified to a particular level depending on the hardware product in use. This parameter applies to z/OS, AIX, Linux, and Windows platforms only.

The value can be any of the following values:

MQSSL_FIPS_NO

IBM MQ provides an implementation of TLS cryptography which supplies some FIPS-certified modules on some platforms. If you set *SSLFIPSRequired* to MQSSL_FIPS_NO, any CipherSpec supported on a particular platform can be used. This value is the initial default value of the queue manager.

If the queue manager runs without using cryptographic hardware, refer to the CipherSpecs listed in [Specifying CipherSpecs](#) employing FIPS 140-2 certified cryptography:

MQSSL_FIPS_YES

Specifies that only FIPS-certified algorithms are to be used in the CipherSpecs allowed on all TLS connections from and to this queue manager.

For a listing of appropriate FIPS 140-2 certified CipherSpecs; see [Specifying CipherSpecs](#).

Changes to SSLFIPS become effective either:

- On AIX, Linux, and Windows, when a new channel process is started.
- For channels that run as threads of the channel initiator on AIX, Linux, and Windows, when the channel initiator is restarted.
- For channels that run as threads of the listener on AIX, Linux, and Windows, when the listener is restarted.
- For channels that run as threads of a process pooling process, when the process pooling process is started or restarted and first runs a TLS channel. If the process pooling process has already run a TLS channel, and you want the change to become effective immediately, run the MQSC command **REFRESH SECURITY TYPE(SSL)**. The process pooling process is **amqzmpa** on AIX, Linux, and Windows.
- On z/OS, when the channel initiator is restarted.
- When a **REFRESH SECURITY TYPE(SSL)** command is issued, except on z/OS.

SSLKeyRepository (MQCFST)

The TLS key repository (parameter identifier: MQCA_SSL_KEY_REPOSITORY).

The length of the string is MQ_SSL_KEY_REPOSITORY_LENGTH.

Indicates the name of the Secure Sockets Layer key repository.

The format of the name depends on the environment:

- On z/OS, it is the name of a key ring.
- On IBM i, it is of the form *pathname/keyfile.kdb*, where *keyfile* identifies a GSKit CMS key database file. If the file suffix is not specified, it is assumed to be .kdb.

The default value is /QIBM/UserData/ICSS/Cert/Server/Default.

If you specify *SYSTEM, IBM MQ uses the system certificate store as the key repository for the queue manager. As a result, the queue manager is registered as a server application in Digital Certificate Manager (DCM). You can assign any server/client certificate in the system store to this application.

If you change the SSLKeyRepository parameter to a value other than *SYSTEM, IBM MQ unregisters the queue manager as an application with DCM.

- On AIX and Linux, it is of the form *pathname/keyfile* and on Windows *pathname\keyfile*, where *keyfile* identifies a GSKit CMS or PKCS#12 key database file. If the file suffix is not specified, it is assumed to be *.kdb*.

The default value for AIX and Linux is `/var/mqm/qmgrs/QMGR/ssl/key`, and on Windows it is `C:\Program Files\IBM\MQ\qmgrs\QMGR\ssl\key`, where QMGR is replaced by the queue manager name.

If TLS AMQP channels are used, the suffix of the key repository file must be one of the following:

- *.kdb*, for a CMS key repository
- *.p12* or *.pkcs12*, for a PKCS #12 key repository.

Multi On Multiplatforms, the syntax of this parameter is validated to ensure that it contains a valid, absolute, directory path.

If `SSLKeyRepository` is blank, or is a value that does not correspond to a key ring or key database file, channels using TLS fail to start.

Changes to `SSLKeyRepository` become effective as follows:

- **Multi** On Multiplatforms:
 - when a new channel process is started
 - for channels that run as threads of the channel initiator, when the channel initiator is restarted.
 - for channels that run as threads of the listener, when the listener is restarted.
- **z/OS** On z/OS, when the channel initiator is restarted.

ALW `SSLKeyRepositoryPassword (MQCFST)`

The password to access the TLS key repository (parameter identifier: `MQCA_SSL_KEY_REPO_PASSWORD`).

The length of the string is `MQ_SSL_KEY_REPO_PWD_LEN`.

If you specify a value for this attribute, it is used as the password to access the Secure Sockets Layer key repository. If this attribute is blank, the stash file that is associated with the key repository is used.

Attention: If the stash file is not present or cannot be read, the key repository cannot be accessed and channels using TLS fail to start.

You should set **InitialKey** to a unique value for the queue manager before this attribute is set. The default value is blank.

SSLKeyResetCount (MQCFIN)

SSL key reset count (parameter identifier: `MQIA_SSL_RESET_COUNT`).

Specifies when TLS channel MCAs that initiate communication reset the secret key used for encryption on the channel. The value of this parameter represents the total number of unencrypted bytes that are sent and received on the channel before the secret key is renegotiated. This number of bytes includes control information sent by the MCA.

The secret key is renegotiated when (whichever occurs first):

- The total number of unencrypted bytes sent and received by the initiating channel MCA exceeds the specified value, or,
- If channel heartbeats are enabled, before data is sent or received following a channel heartbeat.

Specify a value in the range 0 - 999,999,999. A value of zero, the initial default value of the queue manager, signifies that secret keys are never renegotiated. If you specify a TLS secret key reset count between 1 byte through 32 KB, TLS channels use a secret key reset count of 32Kb. This count is to avoid the performance effect of excessive key resets which would occur for small TLS secret key reset values.

SSLTasks (MQCFIN)

Number of server subtasks to use for processing TLS calls (parameter identifier: MQIA_SSL_TASKS). This parameter applies to z/OS only.

The number of server subtasks to use for processing TLS calls. To use TLS channels, you must have at least two of these tasks running.

Specify a value in the range 0 - 9999. However, to avoid problems with storage allocation, do not set this parameter to a value greater than 50.

StartStopEvent (MQCFIN)

Controls whether start and stop events are generated (parameter identifier: MQIA_START_STOP_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

Multi StatisticsInterval (MQCFIN)

The time interval, in seconds, at which statistics monitoring data is written to the monitoring queue (parameter identifier: MQIA_STATISTICS_INTERVAL).

Specify a value in the range 1 - 604,000.

This parameter is valid only on [Multiplatforms](#).

z/OS TCPChannels (MQCFIN)

The maximum number of channels that can be current, or clients that can be connected, that use the TCP/IP transmission protocol (parameter identifier: MQIA_TCP_CHANNELS).

Specify a value in the range 0 - 9999. The initial default value of the queue manager is 200.

Sharing conversations do not contribute to the total for this parameter.

This parameter applies to z/OS only.

z/OS TCPKeepAlive (MQCFIN)

Specifies whether the TCP KEEPALIVE facility is to be used to check whether the other end of a connection is still available (parameter identifier: MQIA_TCP_KEEP_ALIVE).

The value can be:

MQTCPKEEP_YES

The TCP KEEPALIVE facility is to be used as specified in the TCP profile configuration data set. The interval is specified in the *KeepAliveInterval* channel attribute.

MQTCPKEEP_NO

The TCP KEEPALIVE facility is not to be used. This value is the initial default value of the queue manager.

This parameter applies only to z/OS.

z/OS TCPName (MQCFST)

The name of the TCP/IP system that you are using (parameter identifier: MQIA_TCP_NAME).

The maximum length of the string is MQ_TCP_NAME_LENGTH.

This parameter applies only to z/OS.

z/OS TCPStackType (MQCFIN)

Specifies whether the channel initiator can use only the TCP/IP address space specified in *TCPName*, or can optionally bind to any selected TCP/IP address (parameter identifier: MQIA_TCP_STACK_TYPE).

The value can be:

MQTCPSTACK_SINGLE

The channel initiator uses the TCP/IP address space that is specified in *TCPName*. This value is the initial default value of the queue manager.

MQTCPSTACK_MULTIPLE

The channel initiator can use any TCP/IP address space available to it. It defaults to the one specified in *TCPName* if no other is specified for a channel or listener.

This parameter applies only to z/OS.

TraceRouteRecording (MQCFIN)

Specifies whether trace-route information can be recorded and a reply message generated (parameter identifier: MQIA_TRACE_ROUTE_RECORDING).

The value can be:

MQRECORDING_DISABLED

Trace-route information cannot be recorded.

MQRECORDING_MSG

Trace-route information can be recorded and replies sent to the destination specified by the originator of the message causing the trace-route record.

MQRECORDING_Q

Trace-route information can be recorded and replies sent to SYSTEM.ADMIN.TRACE.ROUTE.QUEUE.

If participation in route tracing is enabled using this queue manager attribute, the value of the attribute is only important if a reply is generated. Route tracing is enabled by not setting *TraceRouteRecording* to MQRECORDING_DISABLED. The reply must go either to SYSTEM.ADMIN.TRACE.ROUTE.QUEUE, or to the destination specified by the message itself. Provided the attribute is not disabled then messages not yet at the final destination might have information added to them. For more information about trace-route records, see [Controlling trace-route messaging](#).

TreeLifeTime (MQCFIN)

The lifetime, in seconds, of non-administrative topics (parameter identifier: MQIA_TREE_LIFE_TIME).

Non-administrative topics are those topics created when an application publishes to, or subscribes as, a topic string that does not exist as an administrative node. When this non-administrative node no longer has any active subscriptions, this parameter determines how long the queue manager waits before removing that node. Only non-administrative topics that are in use by a durable subscription remain after the queue manager is recycled.

Specify a value in the range 0 - 604,000. A value of 0 means that non-administrative topics are not removed by the queue manager. The initial default value of the queue manager is 1800.

TriggerInterval (MQCFIN)

Trigger interval (parameter identifier: MQIA_TRIGGER_INTERVAL).

Specifies the trigger time interval, expressed in milliseconds, for use only with queues where *TriggerType* has a value of MQTT_FIRST.

In this case, trigger messages are normally generated only when a suitable message arrives on the queue, and the queue was previously empty. Under certain circumstances, however, an additional trigger message can be generated with MQTT_FIRST triggering, even if the queue was not empty. These additional trigger messages are not generated more often than every *TriggerInterval* milliseconds.

Specify a value in the range 0 - 999,999,999.

Error codes (Change Queue Manager)

This command might return the following errors in the response format header, in addition to the values shown on page [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CERT_LABEL_NOT_ALLOWED

Certificate label error.

MQRCCF_CHAD_ERROR

Channel automatic definition error.

MQRCCF_CHAD_EVENT_ERROR

Channel automatic definition event error.

MQRCCF_CHAD_EVENT_WRONG_TYPE

Channel automatic definition event parameter not allowed for this channel type.

MQRCCF_CHAD_EXIT_ERROR

Channel automatic definition exit name error.

MQRCCF_CHAD_EXIT_WRONG_TYPE

Channel automatic definition exit parameter not allowed for this channel type.

MQRCCF_CHAD_WRONG_TYPE

Channel automatic definition parameter not allowed for this channel type.

MQRCCF_FORCE_VALUE_ERROR

Force value not valid.

MQRCCF_PATH_NOT_VALID

Path not valid.

MQRCCF_PWD_LENGTH_ERROR

Password length error.

MQRCCF_PSCLUS_DISABLED_TOPDEF

Administrator or application attempted to define a cluster topic when **PubSubClub** is set to MQPSCLUS_DISABLED.

MQRCCF_PSCLUS_TOPIC_EXSITS

Administrator tried to set **PubSubClub** to MQPSCLUS_DISABLED when a cluster topic definition exists.

MQRCCF_Q_MGR_ATTR_CONFLICT

Queue manager attribute error. A possible cause is that you attempted to specify SSLKEYR(*SYSTEM) with a nonblank queue manager CERTLABL.

MQRCCF_Q_MGR_CCSID_ERROR

Coded character set value not valid.

MQRCCF_REPOS_NAME_CONFLICT

Repository names not valid.

MQRCCF_UNKNOWN_Q_MGR

Queue manager not known.

MQRCCF_WRONG_CHANNEL_TYPE

Channel type error.

MQCMD_CHANGE_SECURITY (Change Security) on z/OS

The Change Security (MQCMD_CHANGE_SECURITY) PCF command changes specified attributes of an existing security definition.

Required parameters

None

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

SecurityInterval (MQCFIN)

Timeout check interval (parameter identifier: MQIACF_SECURITY_INTERVAL).

Specifies the interval between checks for user IDs and associated resources to determine whether the *SecurityTimeout* has occurred. The value specifies a number of minutes in the range zero through 10080 (one week). If *SecurityInterval* is specified as zero, no user timeouts occur. If *SecurityInterval* is specified as nonzero, the user ID times out at a time between *SecurityTimeout* and *SecurityTimeout* plus *SecurityInterval*.

SecurityTimeout (MQCFIN)

Security information timeout (parameter identifier: MQIACF_SECURITY_TIMEOUT).

Specifies how long security information about an unused user ID and associated resources is retained by IBM MQ. The value specifies a number of minutes in the range zero through 10080 (one week). If *SecurityTimeout* is specified as zero, and *SecurityInterval* is nonzero, all such information is discarded by the queue manager every *SecurityInterval* number of minutes.

MQCMD_CHANGE_SMDS (Change SMDS) on z/OS

The Change SMDS (MQCMD_CHANGE_SMDS) PCF command changes the current shared message data set options for the specified queue manager and CF structure.

SMDS (MQCFST)

Specifies the queue manager for which the shared message data set properties are to be changed, or an asterisk to change the properties for all shared message data sets associated with the specified CFSTRUCT.

CFStrucName (MQCFST)

The name of the CF application structure with SMDS parameters that you want to change (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters

DSBufs (MQCFIN)

The shared message data set buffers group (parameter identifier: MQIA_CF_SMDS_BUFFERS).

Specifies the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

A value in the range 1 - 9999 or MQDSB_DEFAULT.

When DEFAULT is used any previous value is overridden and the DSBUFS value from the CFSTRUCT definition is used. The size of each buffer is equal to the logical block size.

Value can not be set unless CFLEVEL(5) is defined.

DSEXPA ND (MQCFIN)

The shared message data set expand option (parameter identifier: MQIACF_CF_SMDS_EXPAND).

Specifies whether or not the queue manager should expand a shared message data set when it is nearly full, and further blocks are required in the data set. The value can be any of the following values:

MQDSE_YES

The data set can be expanded.

MQDSE_NO

The data set cannot be expanded.

MQDSE_DEFAULT

Only returned on DISPLAY CFSTRUCT when not explicitly set

Value can not be set unless CFLEVEL(5) is defined.

MQCMD_CLEAR_Q (Clear Queue)

The Clear Queue (MQCMD_CLEAR_Q) PCF command deletes all the messages from a local queue.

The command fails if the queue contains uncommitted messages.

Required parameters

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

The name of the local queue to be cleared. The maximum length of the string is MQ_Q_NAME_LENGTH.

Note: The target queue must be type local.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_PRIVATE

Clear the private queue named in *QName*. The queue is private if it was created using a command with the attributes MQQSGD_PRIVATE or MQQSGD_Q_MGR. This value is the default value.

MQQSGD_SHARED

Clear the shared queue named in *QName*. The queue is shared if it was created using a command with the attribute MQQSGD_SHARED. This value applies only to local queues.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown on page [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRC_Q_NOT_EMPTY

(2055, X'807') Queue contains one or more messages or uncommitted put or get requests.

This reason occurs only if there are uncommitted updates.

MQRCCF_Q_WRONG_TYPE

Action not valid for the queue of specified type.

MQCMD_CLEAR_TOPIC_STRING (Clear Topic String)

The Clear Topic String (MQCMD_CLEAR_TOPIC_STRING) PCF command clears the retained message which is stored for the specified topic.

Required parameters

TopicString (MQCFST)

Topic String (parameter identifier: MQCA_TOPIC_STRING).

The topic string to be cleared The maximum length of the string is MQ_TOPIC_STR_LENGTH.

ClearType (MQCFIN)

Clear type (parameter identifier: MQIACF_CLEAR_TYPE).

Specifies the type of clear command being issued. The value must be:

MQCLRT_RETAINED Remove the retained publication from the specified topic string.

Optional parameters

Scope (MQCFIN)

Scope of clearance (parameter identifier: MQIACF_CLEAR_SCOPE).

Whether the topic string is to be cleared locally or globally. The value can be:

MQCLRS_LOCAL

The retained message is removed from the specified topic string at the local queue manager only.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

MQCMD_DELETE_AUTH_INFO (Delete Authentication Information Object)

The Delete authentication information (MQCMD_DELETE_AUTH_INFO) PCF command deletes the specified authentication information object.

Required parameters

AuthInfoName (MQCFST)

Authentication information object name (parameter identifier: MQCA_AUTH_INFO_NAME).

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

Optional parameters for z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object definition resides on the page set of the queue manager which executes this command. The object was defined by a command using the parameter MQQSGD_COPY. Any object in the

shared repository, or any object defined by a command using the parameter MQQSGD_Q_MGR, is not affected by this command.

MQQSGD_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE AUTHINFO(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

MQQSGD_Q_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD_Q_MGR is the default value.

Optional parameters for AIX, Linux, and Windows

ALW

IgnoreState (MQCFST)

Specifies whether the command fails if the object does not exist (parameter identifier MQIACF_IGNORE_STATE). The value can be any of the following values:

MQIS_YES

The command succeeds regardless of whether the object exists.

MQIS_NO

The command fails if the object does not exist. This is the default value.

Multi

MQCMD_DELETE_AUTH_REC (Delete Authority Record) on Multiplatforms

The Delete Authority Record (MQCMD_DELETE_AUTH_REC) PCF command deletes an authority record. The authorizations associated with the profile no longer apply to IBM MQ objects with names that match the profile name specified.

Required parameters

ObjectType (MQCFIN)

The type of object for which to delete authorizations (parameter identifier: MQIACF_OBJECT_TYPE).

The value can be any of the following values:

MQOT_AUTH_INFO

Authentication information.

MQOT_CHANNEL

Channel object.

MQOT_CLNTCONN_CHANNEL

Client-connection channel object.

MQOT_COMM_INFO

Communication information object

MQOT_LISTENER

Listener object.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process.

MQOT_Q

Queue, or queues, that match the object name parameter.

MQOT_Q_MGR

Queue manager.

MQOT_REMOTE_Q_MGR_NAME

Remote queue manager.

MQOT_SERVICE

Service object.

MQOT_TOPIC

Topic object.

ProfileName (MQCFST)

Name of the profile to be deleted (parameter identifier: MQCACF_AUTH_PROFILE_NAME).

If you have defined a generic profile then you can specify it here, using wildcard characters to specify a named generic profile to be removed. If you specify an explicit profile name, the object must exist.

The maximum length of the string is MQ_AUTH_PROFILE_NAME_LENGTH.

Optional parameters**GroupNames (MQCFSL)**

Group names (parameter identifier: MQCACF_GROUP_ENTITY_NAMES).

The names of groups having a profile deleted. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ_ENTITY_NAME_LENGTH.

PrincipalNames (MQCFSL)

Principal names (parameter identifier: MQCACF_PRINCIPAL_ENTITY_NAMES).

The names of principals having a profile deleted. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ_ENTITY_NAME_LENGTH.

ALW IgnoreState (MQCFST)

Specifies whether the command fails if the object does not exist (parameter identifier MQIACF_IGNORE_STATE). The value can be any of the following values:

MQIS_YES

The command succeeds regardless of whether the authority record exists.

This is the default value for objects of type QUEUE, QMGR, RQMNAME, and TOPIC.

MQIS_NO

The command fails if the authority record does not exist.

This value is not valid for objects of type QUEUE, QMGR, RQMNAME, and TOPIC. This is the default value for all other object types.

Error codes (Delete Authority Record)

This command might return the following error codes in the response format header, in addition to the values shown on page [“Error codes applicable to all commands”](#) on page 1018.

Reason (MQLONG)

The value can be any of the following values:

MQRC_OBJECT_TYPE_ERROR

Invalid object type.

MQRC_UNKNOWN_ENTITY

Userid not authorized, or unknown.

MQRCCF_ENTITY_NAME_MISSING

Entity name missing.

MQRCCF_OBJECT_TYPE_MISSING

Object type missing.

MQRCCF_PROFILE_NAME_ERROR

Invalid profile name.

MQCMD_DELETE_CF_STRUC (Delete CF Structure) on z/OS

The Delete CF Structure (MQCMD_DELETE_CF_STRUC) PCF command deletes an existing CF application structure definition.

Note: This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

Required parameters**CFStrucName (MQCFST)**

CF structure name (parameter identifier: MQCA_CF_STRUC_NAME).

The CF application structure definition to be deleted. The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

MQCMD_DELETE_CHANNEL (Delete Channel)

The Delete Channel (MQCMD_DELETE_CHANNEL) PCF command deletes the specified channel definition.

Required parameters**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel definition to be deleted. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Optional parameters

None of the following attributes are applicable to MQTT channels unless specifically mentioned in the parameter description.

ChannelType (MQCFIN)

The type of channel (parameter identifier: MQIACH_CHANNEL_TYPE). This parameter is currently only used with MQTT Telemetry channels, and is required when deleting a Telemetry channel. The only value that can currently be given to the parameter is **MQCHT_MQTT**.

ChannelTable (MQCFIN)

Channel table (parameter identifier: MQIACH_CHANNEL_TABLE).

Specifies the ownership of the channel definition table that contains the specified channel definition.

The value can be any of the following values:

MQCHTAB_Q_MGR

Queue manager table.

MQCHTAB_Q_MGR is the default. This table contains channel definitions for channels of all types except MQCHT_CLNTCONN.

MQCHTAB_CLNTCONN

Client-connection table.

This table only contains channel definitions for channels of type MQCHT_CLNTCONN.

This parameter is not applicable to MQ Telemetry.

z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

z/OS

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined by a command using the parameter MQQSGD_Q_MGR, is not affected by this command.

MQQSGD_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameters MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE CHANNEL(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

MQQSGD_Q_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD_Q_MGR is the default value.

ALW

IgnoreState (MQCFST)

Specifies whether the command fails if the channel does not exist (parameter identifier: MQIACF_IGNORE_STATE). The value can be any of the following values:

MQIS_YES

The command succeeds regardless of whether the channel exists.

MQIS_NO

The command fails if the channel does not exist. This is the default value.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in topic [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHANNEL_TABLE_ERROR

Channel table value not valid.

MQCMD_DELETE_CHANNEL (delete channel) MQTT on AIX, Linux, and Windows

The Delete Telemetry Channel (MQCMD_DELETE_CHANNEL) PCF command deletes the specified channel definition.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel definition to be deleted. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelType (MQCFIN)

The type of channel (parameter identifier: MQIACH_CHANNEL_TYPE). Required when deleting a Telemetry channel. The only value that can currently be given to the parameter is **MQCHT_MQTT**.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQCMD_DELETE_COMM_INFO (Delete Communication Information Object) on Multiplatforms

The Delete Communication Information Object (MQCMD_DELETE_COMM_INFO) PCF command deletes the specified communication information object.

Required parameter

CommInfoName (MQCFST)

The name of the communication information definition to be deleted (parameter identifier: MQCA_COMM_INFO_NAME).

Optional parameters

IgnoreState (MQCFST)

Specifies whether the command fails if the object does not exist (parameter identifier: MQIACF_IGNORE_STATE). The value can be any of the following values:

MQIS_YES

The command succeeds regardless of whether the object exists.

MQIS_NO

The command fails if the object does not exist. This is the default value.

Multi**MQCMD_DELETE_LISTENER (Delete Channel Listener) on Multiplatforms**

The Delete Channel Listener (MQCMD_DELETE_LISTENER) PCF command deletes an existing channel listener definition.

Required parameters**ListenerName (MQCFST)**

Listener name (parameter identifier: MQCACH_LISTENER_NAME).

This parameter is the name of the listener definition to be deleted. The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

ALW**IgnoreState (MQCFST)**

Specifies whether the command fails if the listener does not exist (parameter identifier MQIACF_IGNORE_STATE). The value can be any of the following values:

MQIS_YES

The command succeeds regardless of whether the listener exists.

MQIS_NO

The command fails if the listener does not exist. This is the default value.

MQCMD_DELETE_NAMELIST (Delete Namelist)

The Delete Namelist (MQCMD_DELETE_NAMELIST) PCF command deletes an existing namelist definition.

Required parameters**NamelistName (MQCFST)**

Namelist name (parameter identifier: MQCA_NAMELIST_NAME).

This parameter is the name of the namelist definition to be deleted. The maximum length of the string is MQ_NAMELIST_NAME_LENGTH.

Optional parameters for z/OS**z/OS****CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.

MQQSGD_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE NAMELIST(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

MQQSGD_Q_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD_Q_MGR is the default value.

Optional parameters for AIX, Linux, and Windows

 ALW

IgnoreState (MQCFST)

Specifies whether the command fails if the namelist does not exist (parameter identifier MQIACF_IGNORE_STATE). The value can be any of the following values:

MQIS_YES

The command succeeds regardless of whether the namelist exists.

MQIS_NO

The command fails if the namelist does not exist. This is the default value.

MQCMD_DELETE_PROCESS (Delete Process)

The Delete Process (MQCMD_DELETE_PROCESS) PCF command deletes an existing process definition.

Required parameters

ProcessName (MQCFST)

Process name (parameter identifier: MQCA_PROCESS_NAME).

The process definition to be deleted. The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

Optional parameters for z/OS

 z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.

MQQSGD_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE PROCESS(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

MQQSGD_Q_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD_Q_MGR is the default value.

Optional parameters for AIX, Linux, and Windows

IgnoreState (MQCFST)

Specifies whether the command fails if the process definition does not exist (parameter identifier MQIACF_IGNORE_STATE). The value can be any of the following values:

MQIS_YES

The command succeeds regardless of whether the process definition exists.

MQIS_NO

The command fails if the process definition does not exist. This is the default value.

Multi

MQCMD_DELETE_PROT_POLICY (delete security policy) on Multiplatforms

The Delete Policy (MQCMD_DELETE_PROT_POLICY) PCF command deletes a security policy.

Required parameters

Policy-name (MQCFST)

The name of the security policy to be deleted (parameter identifier: MQCA_POLICY_NAME).

The name of the policy, or policies, to delete are the same as the name of the queue, or queues, that the policies control.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Optional parameters

ALW

IgnoreState (MQCFST)

Specifies whether the command fails if the policy does not exist (parameter identifier MQIACF_IGNORE_STATE). The value can be any of the following values:

MQIS_YES

The command succeeds regardless of whether the policy exists.

MQIS_NO

The command fails if the policy does not exist. This is the default value.

Error codes (Delete Security Policy)

This command might return the following error codes in the response format header, in addition to the values shown on page [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRC_OBJECT_TYPE_ERROR

Invalid object type.

MQRCCF_POLICY_NAME_ERROR

Invalid policy name.

MQCMD_DELETE_Q (Delete Queue)

The Delete Queue (MQCMD_DELETE_Q) PCF command deletes a queue.

Required parameters

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

The name of the queue to be deleted.

If the **Scope** attribute of the queue is MQSCO_CELL, the entry for the queue is deleted from the cell directory.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Optional parameters

Authrec (MQCFIN)

Authrec (parameter identifier: MQIACF_REMOVE_AUTHREC).

Specifies whether the associated authority record is also deleted.

This parameter does not apply to z/OS.

The value can be any of the following values:

MQRAR_YES

The authority record associated with the object is deleted. This is the default.

MQRAR_NO

The authority record associated with the object is not deleted.

 z/OS**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Purge (MQCFIN)

Purge queue (parameter identifier: MQIACF_PURGE).

If there are messages on the queue MQPO_YES must be specified, otherwise the command fails. If this parameter is not present the queue is not purged.

Valid only for queue of type local.

The value can be any of the following values:

MQPO_YES

Purge the queue.

MQPO_NO

Do not purge the queue.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.

MQQSGD_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the deletion is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE queue(q-name) QSGDISP(COPY)
```

or, for a local queue only:

```
DELETE QLOCAL(q-name) NOPURGE QSGDISP(COPY)
```

The deletion of the group object takes effect even if the generated command with QSGDISP(COPY) fails.

Note: You always get the NOPURGE option even if you specify MQPO_YES for *Purge*. To delete messages on local copies of the queues, you must explicitly issue, for each copy, the Delete Queue command with a *QSGDisposition* value of MQQSGD_COPY and a *Purge* value of MQPO_YES.

MQQSGD_Q_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD_Q_MGR is the default value.

MQQSGD_SHARED

Valid only for queue of type local.

The object resides in the shared repository. The object was defined by a command using the parameter MQQSGD_SHARED. Any object residing on the page set of the queue manager that executes the command, or any object defined by a command using the parameter MQQSGD_GROUP, is not affected by this command.

QType (MQCFIN)

Queue type (parameter identifier: MQIA_Q_TYPE).

If this parameter is present, the queue must be of the specified type.

The value can be:

MQQT_ALIAS

Alias queue definition.

MQQT_LOCAL

Local queue.

MQQT_REMOTE

Local definition of a remote queue.

MQQT_MODEL

Model queue definition.

ALW IgnoreState (MQCFST)

Specifies whether the command fails if the queue does not exist (parameter identifier MQIACF_IGNORE_STATE). The value can be any of the following values:

MQIS_YES

The command succeeds regardless of whether the queue exists.

MQIS_NO

The command fails if the queue does not exist. This is the default value.

Error codes (Delete Queue)

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRC_Q_NOT_EMPTY

(2055, X'807') Queue contains one or more messages or uncommitted put or get requests.

Multi

MQCMD_DELETE_SERVICE (Delete Service) on Multiplatforms

The Delete Service (MQCMD_DELETE_SERVICE) PCF command deletes an existing service definition.

Required parameters

ServiceName (MQCFST)

Service name (parameter identifier: MQCA_SERVICE_NAME).

This parameter is the name of the service definition to be deleted.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Optional parameters

ALW

IgnoreState (MQCFST)

Specifies whether the command fails if the service does not exist (parameter identifier MQIACF_IGNORE_STATE). The value can be any of the following values:

MQIS_YES

The command succeeds regardless of whether the service exists.

MQIS_NO

The command fails if the service does not exist. This is the default value.

z/OS

MQCMD_DELETE_STG_CLASS (Delete Storage Class) on z/OS

The Delete Storage Class (MQCMD_DELETE_STG_CLASS) PCF command deletes an existing storage class definition.

Required parameters

StorageClassName (MQCFST)

Storage class name (parameter identifier: MQCA_STORAGE_CLASS).

The storage class definition to be deleted. The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.

MQQSGD_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to delete local copies on page set zero:

```
DELETE STGCLASS(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

MQQSGD_Q_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD_Q_MGR is the default value.

MQCMD_DELETE_SUBSCRIPTION (Delete Subscription)

The Delete Subscription (MQCMD_DELETE_SUBSCRIPTION) PCF command deletes a subscription.

Required parameters

SubName (MQCFST)

Subscription name (parameter identifier: MQCACF_SUB_NAME).

Specifies the unique subscription name. The subscription name, if provided, must be fully specified; a wildcard is not acceptable.

The subscription name must refer to a durable subscription.

If *SubName* is not provided, *SubId* must be specified to identify the subscription to be deleted.

The maximum length of the string is MQ_SUB_NAME_LENGTH.

SubId (MQCFBS)

Subscription identifier (parameter identifier: MQBACF_SUB_ID).

Specifies the unique internal subscription identifier.

You must supply a value for *SubId* if you have not supplied a value for *SubName*.

The maximum length of the string is MQ_CORREL_ID_LENGTH.

Optional parameters for z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.

- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter on which to filter.

Optional parameters for AIX, Linux, and Windows

IgnoreState (MQCFST)

Specifies whether the command fails if the subscription does not exist (parameter identifier MQIACF_IGNORE_STATE). The value can be any of the following values:

MQIS_YES

The command succeeds regardless of whether the subscription exists.

MQIS_NO

The command fails if the subscription does not exist. This is the default value.

MQCMD_DELETE_TOPIC (Delete Topic)

The Delete Topic (MQCMD_DELETE_TOPIC) PCF command deletes the specified administrative topic object.

Required parameters

TopicName (MQCFST)

The name of the administrative topic definition to be deleted (parameter identifier: MQCA_TOPIC_NAME).

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

Optional parameters for z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.

MQQSGD_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the deletion is successful, the following MQSC command is generated and sent to all active queue managers in the queue sharing group to make, or delete, local copies on page set zero:

```
DELETE TOPIC(name) QSGDISP(COPY)
```

The deletion of the group object takes effect even if the generated command with QSGDISP(COPY) fails.

MQQSGD_Q_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD_Q_MGR is the default value.

Optional parameters for Multiplatforms

Multi

Authrec (MQCFIN)

Authrec (parameter identifier: MQIACF_REMOVE_AUTHREC).

Specifies whether the associated authority record is also deleted.

This parameter does not apply to z/OS.

The value can be any of the following values:

MQRAR_YES

The authority record associated with the object is deleted. This is the default.

MQRAR_NO

The authority record associated with the object is not deleted.

IgnoreState (MQCFST)

Specifies whether the command fails if the topic does not exist (parameter identifier MQIACF_IGNORE_STATE). The value can be any of the following values:

MQIS_YES

The command succeeds regardless of whether the topic exists.

MQIS_NO

The command fails if the topic does not exist. This is the default value.

Multi

MQCMD_ESCAPE (Escape) on Multiplatforms

The Escape (MQCMD_ESCAPE) PCF command conveys any IBM MQ command (MQSC) to a remote queue manager.

Use the Escape command when the queue manager (or application) sending the command does not support the particular IBM MQ command, and so does not recognize it and cannot construct the required PCF command.

The Escape command can also be used to send a command for which no Programmable Command Format has been defined.

The only type of command that can be carried is one that is identified as an MQSC, that is recognized at the receiving queue manager.

Required parameters

EscapeType (MQCFIN)

Escape type (parameter identifier: MQIACF_ESCAPE_TYPE).

The only value supported is:

MQET_MQSC

IBM MQ command.

EscapeText (MQCFST)

Escape text (parameter identifier: MQCACF_ESCAPE_TEXT).

A string to hold a command. The length of the string is limited only by the size of the message.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_ESCAPE_TYPE_ERROR

Escape type not valid.

MQCMD_ESCAPE (Escape) Response on Multiplatforms

The response to the Escape (MQCMD_ESCAPE) PCF command consists of the response header followed by two parameter structures, one containing the escape type, and the other containing the text response. More than one such message might be issued, depending upon the command contained in the Escape request.

The *Command* field in the response header MQCFH contains the MQCMD_* command identifier of the text command contained in the **EscapeText** parameter in the original Escape command. For example, if *EscapeText* in the original Escape command specified PING QMGR, *Command* in the response has the value MQCMD_PING_Q_MGR.

If it is possible to determine the outcome of the command, the *CompCode* in the response header identifies whether the command was successful. The success or otherwise can therefore be determined without the recipient of the response having to parse the text of the response.

If it is not possible to determine the outcome of the command, *CompCode* in the response header has the value MQCC_UNKNOWN, and *Reason* is MQRC_NONE.

Parameters

EscapeType (MQCFIN)

Escape type (parameter identifier: MQIACF_ESCAPE_TYPE).

The only value supported is:

MQET_MQSC

IBM MQ command.

EscapeText (MQCFST)

Escape text (parameter identifier: MQCACF_ESCAPE_TEXT).

A string holding the response to the original command.

MQCMD_INQUIRE_APPL_STATUS (inquire application status) on Multiplatforms

The Inquire Application Status (MQCMD_INQUIRE_APPL_STATUS) PCF command inquires about the applications and application instances connected to a queue manager or uniform cluster.

You must specify the application name for which you want to receive status information.

Required parameters

ApplicationName (MQCFST)

Application name set using the APPPLTAG parameter (parameter identifier: MQCACF_APPL_NAME).

Generic application names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all applications having names that start with the selected character string. An asterisk on its own matches all possible names.

The application name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ_APPL_NAME_LENGTH.

Optional parameters

ApplicationInfoAttrs (MQCFIL)

Application information attributes (parameter identifier: MQIACF_APPL_INFO_ATTRS)

If not provided, defaults to MQIACF_ALL

Alternatively, you can specify any of the parameter values listed in the [Inquire Application Status \(Response\)command](#), which are valid for the requested status type.

ApplicationStatusInfoType (MQCFIN)

The type of status to return (parameter identifier: MQIACF_APPL_INFO_TYPE).

The value can be:

- MQIACF_APPL_INFO_APPL

The command displays status information relating to each unique application name. This represents a summary of the details from the local queue manager and any queue manager in the same uniform cluster.

- MQIACF_APPL_INFO_QMGR

The command displays status information relating to applications at a queue manager level, including the local queue manager and any queue manager in the same uniform cluster.

- MQIACF_APPL_INFO_LOCAL

The command displays status information for applications, for each application instance connected to the local queue manager.

The default value, if this parameter is not specified, is MQIACF_APPL_INFO_APPL.

ApplicationType (MQCFIL)

Application type (parameter identifier: MQIACF_BALANCING_TYPE)

The application type (MQBNO_BALTYPE_SIMPLE, MQBNO_BALTYPE_REQREP, or MQBNO_BALTYPE_RAMANAGED) in effect for this application instance.

Note that different instances of the same application can provide different balancing options without causing any error.

BalancingOptions (MQCFIL)

Application balancing options (parameter identifier: MQIACF_BALANCING_OPTIONS)

The balancing options (MQBNO_OPTIONS_NONE or MQBNO_OPTIONS_IGNORE_TRANS) in effect for this application instance.

Connections(MQCFIN)

The number of queue manager connections this application instance currently has open. (parameter identifier: MQIACF_CONNECTION_COUNT).

ConnectionTag (MQCFBS)

The connection tag associated with this application instance. When generated by the queue manager, this is a UTF8 string. (parameter identifier: MQBACF_CONN_TAG).

The maximum length of this field is MQ_CONN_TAG_LENGTH

ImmovableCount (MQCFIN)

The count of times this application instance has been requested to move to another queue manager and has not yet disconnected. Any value higher than one is an indication that the application is failing to rebalance when requested to. (parameter identifier: MQIACF_APPL_IMMOVABLE_COUNT).

ImmovableDate (MQCFST)

Date on which this local instance is considered eligible for being moved around a uniform cluster. This field is blank unless there is a temporary condition which prevents an application instance being moved to another queue manager in a uniform cluster. (parameter identifier: MQCACF_APPL_IMMOVABLE_DATE).

The length of the string is MQ_DATE_LENGTH

ImmovableReason (MQCFIN)

The reason why this application is currently considered to be immovable and, therefore, will not be rebalanced around the cluster. Some reasons are temporary, and have an associated *ImmovableDate* and *ImmovableTime*, or *ImmovableTime* reason. Other reasons persist for the lifetime of this application instance. (parameter identifier: MQIACF_APPL_IMMOVABLE_REASON).

The value can be any of the following values:

MQIMMREASON_NONE

This application instance is currently considered movable.

MQIMMREASON_NOT_CLIENT

This application instance cannot be moved as it is not a client connection.

MQIMMREASON_NOT_RECONNECTABLE

This application instance cannot be moved as it is not a reconnectable client connection.

MQIMMREASON_MOVING

This application instance cannot be moved as it has recently been requested to move, and has not yet disconnected.

MQIMMREASON_APPLNAME_CHANGED

This application instance cannot be moved as it is sharing a socket with a connection from an application instance which has a different application name.

MQIMMREASON_IN_TRANSACTION

The application instance has successfully performed at least one MQI operation within syncpoint, and the timeout specified to forcibly rebalance an instance has not been reached.

MQIMMREASON_TDQ_OPEN_INPUT

The application instance has at least one dynamic queue open for input, and the timeout specified to forcibly rebalance an instance has not been reached.

MQIMMREASON_AWAITS_REPLY

The application instance has successfully performed at least one MQI operation within syncpoint, and the timeout specified to forcibly rebalance an instance has not been reached.

ImmovableTime (MQCFST)

Time on which this local instance is considered eligible for being moved around a uniform cluster. This field is blank unless there is a temporary condition which prevents an application instance being moved to another queue manager in a uniform cluster. (parameter identifier: MQCACF_APPL_IMMOVABLE_TIME).

The length of the string is MQ_TIME_LENGTH

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor that you use to restrict the output from the command. The parameter identifier must be an integer type, and must be one of the values allowed for the **ApplicationStatusInfoType** selected, except MQIACF_ALL.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

Movable (MQCFIN)

Indicates whether this application instance is considered eligible for moving around the uniform cluster. At a minimum, a movable application must be a client connection which has connected as reconnectable. (parameter identifier: MQIACF_APPL_MOVABLE).

The value can be any of the following values:

MQACTIVE_YES

This application instance is considered movable.

MQACTIVE_NO

This application instance is not considered movable.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter except MQCA_APPL_NAME. Use this parameter to restrict the output from the command by specifying a filter condition.

Ensure that the parameter is valid for the type selected in **ApplicationStatusInfoType**.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Note: Although the ConnectionTag (MQBACF_CONN_TAG) field in Inquire Application Status (Response) is defined as a binary field, the contents should be UTF8.

Because of this, use a *StringFilter* for this field, not a *ByteStringFilter*, and you can use all valid *StringFilter* operators.

Timeout (MQCFIN)

Application timeout (parameter identifier: MQIACF_BALANCING_TIMEOUT)

The time out value of NEVER, IMMEDIATE, or the time in seconds up to a maximum of 999999999 seconds.

Multi MQCMD_INQUIRE_APPL_STATUS (inquire application status) Response on Multiplatforms

The response to the Inquire Application Status (**MQCMD_INQUIRE_APPL_STATUS**) PCF command consists of the response header followed by the *ApplicationName* structure and the requested combination of attribute parameter structures (where applicable) for the requested *ApplicationStatusInfoType*.

Always returned:

ApplicationName

Returned if *ApplicationStatusInfoType* is MQIACF_APPL_INFO_APPL:

Balanced, ClusterName, InstanceCount, MovableInstanceCount, MqiacfApplInfoAppl

Returned if *ApplicationStatusInfoType* is MQIACF_APPL_INFO_QMGR:

BalanceState, InstanceCount, LastMessageDate, LastMessageTime, MovableInstanceCount, QueueManagerActive, QueueManagerID, QueueManagerName, MqiacfApplInfoQmgr

Returned if *ApplicationStatusInfoType* is MQIACF_APPL_INFO_LOCAL:

ApplicationType, BalancingOptions, Connections, ConnectionTag, ImmovableCount, ImmovableDate, ImmovableReason, ImmovableTime, Movable, MqiacfApplInfoLocal, Timeout

Response data (MQIACF_APPL_INFO_APPL)

Balanced (MQCFIN)

The overall state of this application relative to whether it is balanced in a uniform cluster or not (parameter identifier: MQIACF_BALANCED).

The value can be any of the following values:

MQBALANCED_NO

This application is not considered balanced in the uniform cluster.

MQBALANCED_YES

This application is considered balanced in the uniform cluster.

MQBALANCED_NOT_APPLICABLE

This application is not shared across a uniform cluster.

MQBALANCED_UNKNOWN

This is a temporary state, representing an application that has not yet undergone a scan to calculate whether it is balanced or not, on at least one queue manager, across the uniform cluster.

ClusterName (MQCFST)

The name of the uniform cluster in which details of this application are being distributed (parameter identifier: MQCA_CLUSTER_NAME).

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

The value can be any of the following values:

Blank

If this application is not being distributed around a uniform cluster. This might be because the application has never connected in a way which is compatible with being moved (not reconnectable, for example) or it might be that the queue manager is not a member of a uniform cluster.

String

The name of the uniform cluster.

InstanceCount (MQCFIN)

The summary count of application instances for this application. This includes the local queue managers count of instances, plus those from any queue manager in a uniform cluster that has distributed details about this application (parameter identifier: MQIACF_APPL_COUNT).

MovableInstanceCount (MQCFIN)

The summary count of the movable application instances for this application. This includes the local queue managers count of movable instances, plus those from any queue manager in a uniform cluster that has distributed details about this application (parameter identifier: MQIACF_MOVABLE_APPL_COUNT).

MqiacfApplInfoAppl

Signifies that the response type is an application.

Response data (MQIACF_APPL_INFO_QMGR)

BalanceState (MQCFIN)

The current state of this application for the queue manager being reported against, relative to whether it is considered balanced across a uniform cluster or not. This information is only updated periodically at the time when a scan causes the rebalancing to occur and might not be based on the current values for *InstanceCount* and *MovableInstanceCount* (parameter identifier: MQIACF_BALSTATE).

The value can be any of the following values:

MQBALSTATE_LOW

This application is not balanced in the uniform cluster and has a deficit of application instances. A queue manager in this state usually requests applications to be rebalanced to it, so as to balance out the cluster.

MQBALSTATE_OK

This application is balanced in the uniform cluster.

MQBALSTATE_HIGH

This application is not balanced in the uniform cluster and has a surplus of application instances. A queue manager in this state usually honors requests to rebalance some of the applications connected to it, over to a queue manager in the LOW state.

MQBALSTATE_NOT_APPLICABLE

This queue manager is not in a uniform cluster and, therefore, balancing cannot occur.

MQBALSTATE_UNKNOWN

This is a temporary state representing an application that is new to the uniform cluster, and which has not yet undergone a scan to calculate whether it is balanced or not.

InstanceCount (MQCFIN)

The count of application instances for this application, on the queue manager being reported (parameter identifier: MQIACF_APPL_COUNT).

LastMessageDate (MQCFST)

Local date on which the queue manager being reported against, has distributed information on its application instances. For the local queue manager, this is just the current date. (parameter identifier: MQCACF_LAST_MSG_DATE).

The length of the string is MQ_DATE_LENGTH

LastMessageTime (MQCFST)

Local time on which the queue manager being reported against, has distributed information on its application instances. For the local queue manager, this is just the current time. (parameter identifier: MQCACF_LAST_MSG_TIME).

The length of the string is MQ_TIME_LENGTH

MovableInstanceCount (MQCFIN)

The summary count of the movable application instances for this application on the queue manager being reported for (parameter identifier: MQIA_MOVABLE_APPL_COUNT).

QueueManagerActive(MQCFIN)

Indicates whether the queue manager being reported for is currently considered active. Application instances on an inactive queue manager are not included in the numbers used to calculate application instance balancing. (parameter identifier: MQIACF_REMOTE_QMGR_ACTIVE).

The value can be any of the following values:

MQACTIVE_NO

This queue manager is not considered active, because it has not distributed its application balancing information to the local queue manager recently.

MQACTIVE_YES

This queue manager is considered active, and is actively distributing its application balancing information.

QueueManagerID (MQCFST)

The internally generated unique queue manager identifier of the queue manager being reported for (parameter identifier: MQCA_Q_MGR_IDENTIFIER).

The length of the string is MQ_Q_MGR_IDENTIFIER_LENGTH.

QueueManagerName (MQCFST)

The queue manager name of the queue manager being reported for (parameter identifier: MQCA_Q_MGR_NAME).

The length of the string is MQ_Q_MGR_NAME_LENGTH.

MqiacfApplInfoQmgr

Signifies that the response type is a queue manager.

Response data (MQIACF_APPL_INFO_LOCAL)

ApplicationType (MQCFIL)

Application type (parameter identifier: MQIACF_BALANCING_TYPE)

The application type (MQBNO_BALTYPE_SIMPLE, MQBNO_BALTYPE_REQREP, or MQBNO_BALTYPE_RAMANAGED) in effect for this application instance.

BalancingOptions (MQCFIL)

Application balancing options (parameter identifier: MQIACF_BALANCING_OPTIONS)

The balancing options (MQBNO_OPTIONS_NONE or MQBNO_OPTIONS_IGNORE_TRANS) in effect for this application instance.

Connections(MQCFIN)

The number of queue manager connections this application instance currently has open. (parameter identifier: MQIACF_CONNECTION_COUNT).

ConnectionTag (MQCFBS)

The connection tag associated with this application instance. When generated by the queue manager, this is a UTF8 string. (parameter identifier: MQBACF_CONN_TAG).

The maximum length of this field is MQ_CONN_TAG_LENGTH

ImmovableCount (MQCFIN)

The count of times this application instance has been requested to move to another queue manager and has not yet disconnected. Any value higher than one is an indication that the application is failing to rebalance when requested to. (parameter identifier: MQIACF_APPL_IMMOVABLE_COUNT).

ImmovableDate (MQCFST)

Date on which this local instance is considered eligible for being moved around a uniform cluster. This field is blank unless there is a temporary condition which prevents an application instance being moved to another queue manager in a uniform cluster. (parameter identifier: MQCACF_APPL_IMMOVABLE_DATE).

The length of the string is MQ_DATE_LENGTH

ImmovableReason (MQCFIN)

The reason why this application is currently considered to be immovable and, therefore, will not be rebalanced around the cluster. Some reasons are temporary, and have an associated *ImmovableDate* and *ImmovableTime*, or *ImmovableTime* reason. Other reasons persist for the lifetime of this application instance. (parameter identifier: MQIACF_APPL_IMMOVABLE_REASON).

The value can be any of the following values:

MQIMMREASON_NONE

This application instance is currently considered movable.

MQIMMREASON_NOT_CLIENT

This application instance cannot be moved as it is not a client connection.

MQIMMREASON_NOT_RECONNECTABLE

This application instance cannot be moved as it is not a reconnectable client connection.

MQIMMREASON_MOVING

This application instance cannot be moved as it has recently been requested to move, and has not yet disconnected.

MQIMMREASON_APPLNAME_CHANGED

This application instance cannot be moved as it is sharing a socket with a connection from an application instance which has a different application name.

MQIMMREASON_IN_TRANSACTION

The application instance has successfully performed at least one MQI operation within syncpoint, and the timeout specified to forcibly rebalance an instance has not been reached.

MQIMMREASON_TDQ_OPEN_INPUT

The application instance has at least one dynamic queue open for input, and the timeout specified to forcibly rebalance an instance has not been reached.

MQIMMREASON_AWAITS_REPLY

The application instance has successfully performed at least one MQI operation within syncpoint, and the timeout specified to forcibly rebalance an instance has not been reached.

ImmovableTime (MQCFST)

Time on which this local instance is considered eligible for being moved around a uniform cluster. This field is blank unless there is a temporary condition which prevents an application instance being moved to another queue manager in a uniform cluster. (parameter identifier: MQCACF_APPL_IMMOVABLE_TIME).

The length of the string is MQ_TIME_LENGTH

Movable (MQCFIN)

Indicates whether this application instance is considered eligible for moving around the uniform cluster. At a minimum, a movable application must be a client connection which has connected as reconnectable. (parameter identifier: MQIACF_APPL_MOVABLE).

The value can be any of the following values:

MQACTIVE_YES

This application instance is considered movable.

MQACTIVE_NO

This application instance is not considered movable.

MqiacfApplInfoLocal

Signifies that the response type is local.

Timeout (MQCFIN)

Application timeout (parameter identifier: MQIACF_BALANCING_TIMEOUT)

The time out value of NEVER, IMMEDIATE, or the time in seconds up to a maximum of 999999999 seconds.

Related tasks

[Monitoring application balancing](#)

Related reference

[“DISPLAY APSTATUS \(display application status\) on Multiplatforms” on page 659](#)

Use the MQSC command **DISPLAY APSTATUS** to display the status of one or more applications and application instances connected to a queue manager or a uniform cluster.

MQCMD_INQUIRE_ARCHIVE (Inquire Archive) on z/OS

The Inquire Archive (MQCMD_INQUIRE_ARCHIVE) PCF command returns archive system parameters and information.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

MQCMD_INQUIRE_ARCHIVE (Inquire Archive) Response on z/OS

The response to the Inquire Archive (MQCMD_INQUIRE_ARCHIVE) PCF command consists of the response header followed by the *ParameterType* structure and the combination of attribute parameter structures determined by the value of *ParameterType*.

Always returned:

ParameterType Specifies the type of archive information being returned. The value can be any of the following values:

MQSYSP_TYPE_INITIAL

The initial settings of the archive parameters.

MQSYSP_TYPE_SET

The settings of the archive parameters if they have been altered since their initial setting.

MQSYSP_TYPE_ARCHIVE_TAPE

Parameters relating to the tape unit (if in use). There is one such message per tape unit in use for archive logging.

Returned if *ParameterType* is MQSYSP_TYPE_INITIAL (one message is returned):

AllocPrimary, AllocSecondary, AllocUnits, ArchivePrefix1, ArchivePrefix2, ArchiveRetention, ArchiveUnit1, ArchiveUnit2, ArchiveWTOR, BlockSize, Catalog, Compact, Protect, QuiesceInterval, RoutingCode, TimeStampFormat

Returned if *ParameterType* is MQSYSP_TYPE_SET and any value is set (one message is returned):

AllocPrimary, AllocSecondary, AllocUnits, ArchivePrefix1, ArchivePrefix2, ArchiveRetention, ArchiveUnit1, ArchiveUnit2, ArchiveWTOR, BlockSize, Catalog, Compact, Protect, QuiesceInterval, RoutingCode, TimeStampFormat

Returned if *ParameterType* is MQSYSP_TYPE_ARCHIVE_TAPE (one message is returned for each tape unit in use for archive logging):

DataSetName, LogCorrelId, UnitAddress, UnitStatus, UnitVolser

Response data - archive parameter information

AllocPrimary (MQCFIN)

Primary space allocation for DASD data sets (parameter identifier: MQIACF_SYSP_ALLOC_PRIMARY).

Specifies the primary space allocation for DASD data sets in the units specified in the **AllocUnits** parameter.

AllocSecondary (MQCFIN)

Secondary space allocation for DASD data sets (parameter identifier: MQIACF_SYSP_ALLOC_SECONDARY).

Specifies the secondary space allocation for DASD data sets in the units specified in the **AllocUnits** parameter.

AllocUnits (MQCFIN)

Allocation unit (parameter identifier: MQIACF_SYSP_ALLOC_UNIT).

Specifies the unit in which primary and secondary space allocations are made. The value can be any of the following values:

MQSYSP_ALLOC_BLK

Blocks.

MQSYSP_ALLOC_TRK

Tracks.

MQSYSP_ALLOC_CYL

Cylinders.

ArchivePrefix1 (MQCFST)

Prefix for the first archive log data set name (parameter identifier: MQCACF_SYSP_ARCHIVE_PFX1).

The maximum length of the string is MQ_ARCHIVE_PFX_LENGTH.

ArchivePrefix2 (MQCFST)

Prefix for the second archive log data set name (parameter identifier: MQCACF_SYSP_ARCHIVE_PFX2).

The maximum length of the string is MQ_ARCHIVE_PFX_LENGTH.

ArchiveRetention (MQCFIN)

Archive retention period (parameter identifier: MQIACF_SYSP_ARCHIVE_RETAIN).

Specifies the retention period, in days, to be used when the archive log data set is created.

ArchiveUnit1 (MQCFST)

Specifies the device type or unit name of the device that is used to store the first copy of the archive log data set (parameter identifier: MQCACF_SYSP_ARCHIVE_UNIT1).

The maximum length of the string is MQ_ARCHIVE_UNIT_LENGTH.

ArchiveUnit2 (MQCFST)

Specifies the device type or unit name of the device that is used to store the second copy of the archive log data set (parameter identifier: MQCACF_SYSP_ARCHIVE_UNIT2).

The maximum length of the string is MQ_ARCHIVE_UNIT_LENGTH.

ArchiveWTOR (MQCFIN)

Specifies whether a message is to be sent to the operator and a reply is received before attempting to mount an archive log data set (parameter identifier: MQIACF_SYSP_ARCHIVE_WTOR).

The value can be:

MQSYSP_YES

A message is to be sent and a reply received before an attempt to mount an archive log data set.

MQSYSP_NO

A message is not to be sent and a reply received before an attempt to mount an archive log data set.

BlockSize (MQCFIN)

Block size of the archive log data set (parameter identifier: MQIACF_SYSP_BLOCK_SIZE).

Catalog (MQCFIN)

Specifies whether archive log data sets are cataloged in the primary integrated catalog facility (parameter identifier: MQIACF_SYSP_CATALOG).

The value can be:

MQSYSP_YES

Archive log data sets are cataloged.

MQSYSP_NO

Archive log data sets are not cataloged.

Compact (MQCFIN)

Specifies whether data written to archive logs is to be compacted (parameter identifier: MQIACF_SYSP_COMPACT).

The value can be any of the following values:

MQSYSP_YES

Data is to be compacted.

MQSYSP_NO

Data is not to be compacted.

Protect (MQCFIN)

Protection by external security manager (ESM) (parameter identifier: MQIACF_SYSP_PROTECT).

Specifies whether archive log data sets are protected by ESM profiles when the data sets are created.

The value can be any of the following values:

MQSYSP_YES

Data set profiles are created when logs are offloaded.

MQSYSP_NO

Profiles are not created.

QuiesceInterval (MQCFIN)

Maximum time allowed for the quiesce (parameter identifier: MQIACF_SYSP_QUIESCE_INTERVAL).

Specifies the maximum time, in seconds, allowed for the quiesce.

RoutingCode (MQCFIL)

z/OS routing code list (parameter identifier: MQIACF_SYSP_ROUTING_CODE).

Specifies the list of z/OS routing codes for messages about the archive log data sets to the operator. There can be 1 - 14 entries in the list.

TimeStampFormat (MQCFIN)

Time stamp included (parameter identifier: MQIACF_SYSP_TIMESTAMP).

Specifies whether the archive log data set name has a time stamp in it.

The value can be:

MQSYSP_YES

Names include a time stamp.

MQSYSP_NO

Names do not include a time stamp.

MQSYSP_EXTENDED

Names include a time stamp.

Response data - tape unit status information**DataSetName (MQCFST)**

Data set name (parameter identifier: MQCACF_DATA_SET_NAME).

Specifies the data set name on the tape volume that is being processed, or was last processed.

The maximum length of the string is MQ_DATA_SET_NAME_LENGTH.

LogCorrelId (MQCFST)

Correlation identifier (parameter identifier: MQCACF_SYSP_LOG_CORREL_ID).

Specifies the correlation ID associated with the user of the tape being processed. This parameter is blank if there is no current user.

The maximum length of the string is MQ_LOG_CORREL_ID_LENGTH.

UnitAddress (MQCFIN)

Tape unit address: MQIACF_SYSP_UNIT_ADDRESS).

Specifies the physical address of the tape unit allocated to read the archive log.

UnitStatus (MQCFIN)

Status if the tape unit: MQIACF_SYSP_UNIT_STATUS).

The value can be:

MQSYSP_STATUS_BUSY

The tape unit is busy, actively processing an archive log data set.

MQSYSP_STATUS_PREMOUNT

The tape unit is active and allocated for premounting.

MQSYSP_STATUS_AVAILABLE

The tape unit is available, inactive, and waiting for work.

MQSYSP_STATUS_UNKNOWN

The tape unit status is unknown.

UnitVolser (MQCFST)

The volume serial number of the tape that is mounted (parameter identifier: MQCACF_SYSP_UNIT_VOLSER).

The maximum length of the string is MQ_VOLSER_LENGTH.

MQCMD_INQUIRE_AUTH_INFO (Inquire Authentication Information Object)

The Inquire authentication information object (MQCMD_INQUIRE_AUTH_INFO) PCF command inquires about the attributes of authentication information objects.

Required parameters

AuthInfoName (MQCFST)

Authentication information object name (parameter identifier: MQCA_AUTH_INFO_NAME).

Specifies the name of the authentication information object about which information is to be returned.

Generic authentication information object names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all authentication information objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

Optional parameters

AuthInfoAttrs (MQCFIL)

Authentication information object attributes (parameter identifier: MQIACF_AUTH_INFO_ATTRS).

The attribute list can specify the following value - the default value if the parameter is not specified):

MQIACF_ALL

All attributes.

or a combination of the following:

MQIA_ADOPT_CONTEXT

Adopt the presented credentials as the context for the application.

MQCA_ALTERATION_DATE

Date on which the definition was last altered.

MQCA_ALTERATION_TIME

Time at which the definition was last altered.

MQCA_AUTH_INFO_DESC

Description of the authentication information object.

MQCA_AUTH_INFO_NAME

Name of the authentication information object.

MQIA_AUTH_INFO_TYPE

Type of authentication information object.

MQCA_AUTH_INFO_CONN_NAME

Connection name of the authentication information object.

This attribute is relevant only when **AuthInfoType** is set to MQAIT_CRL_LDAP or MQAIT_IDPW_LDAP.

MQIA_AUTHENTICATION_FAIL_DELAY

Delay in seconds before an authentication failure is returned to an application.

MQIA_AUTHENTICATION_METHOD

Authentication method for user passwords.

MQIA_CHECK_CLIENT_BINDING

Authentication requirements for client applications.

MQIA_CHECK_LOCAL_BINDING

Authentication requirements for locally bound applications.

MQIA_LDAP_AUTHORMD

Authorization method for the queue manager.

MQCA_LDAP_BASE_DN_GROUPS

The base Distinguished Name for groups in the LDAP server.

MQCA_LDAP_BASE_DN_USERS

The base Distinguished Name for users in the LDAP server.

MQCA_LDAP_FIND_GROUP_FIELD

Name of the attribute used within an LDAP entry to determine group membership.

MQCA_LDAP_GROUP_ATTR_FIELD

LDAP attribute that represents a simple name for the group.

MQCA_LDAP_GROUP_OBJECT_CLASS

The LDAP object class used for group records in the LDAP repository.

MQIA_LDAP_NESTGRP

Whether LDAP groups are checked for membership of other groups.

MQCA_LDAP_PASSWORD

LDAP password in the authentication information object.

This attribute is relevant only when **AuthInfoType** is set to MQAIT_CRL_LDAP or MQAIT_IDPW_LDAP.

MQIA_LDAP_SECURE_COMM

Whether connectivity to the LDAP server should be done securely using TLS.

MQCA_LDAP_SHORT_USER_FIELD

The field in the LDAP user record to be used as a short user name in IBM MQ.

MQCA_LDAP_USER_ATTR_FIELD

The field in the LDAP user record to be used to interpret the user ID provided by an application, if the user ID does not contain a qualifier.

MQCA_LDAP_USER_NAME

LDAP user name in the authentication information object.

This attribute is relevant only when **AuthInfoType** is set to MQAIT_CRL_LDAP or MQAIT_IDPW_LDAP.

MQCA_LDAP_USER_OBJECT_CLASS

The LDAP object class used for user records in the LDAP repository.

MQCA_AUTH_INFO_OCSP_URL

The URL of the OCSP responder used to check for certificate revocation.

AuthInfoType (MQCFIN)

Type of authentication information object. The following values are accepted:

MQAIT_CRL_LDAP

Authentication information objects specifying Certificate Revocation Lists held on LDAP servers.

MQAIT_OCSP

Authentication information objects specifying certificate revocation checking using OCSP.

MQAIT_IDPW_OS

Authentication information objects specifying certificate revocation checking using user ID and password checking through the operating system.

MQAIT_IDPW_LDAP

Authentication information objects specifying certificate revocation checking using user ID and password checking through an LDAP server.

MQAIT_ALL

Authentication information objects of any type.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use **CommandScope** as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in **AuthInfoAttrs**, except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. This value is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. This value is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

You cannot use **QSGDisposition** as a parameter to filter on.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in **AuthInfoAttrs**, except MQCA_AUTH_INFO_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. For information about using this filter condition, see [“MQCFSF - PCF string filter parameter” on page 1560](#).

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

MQCMD_INQUIRE_AUTH_INFO (Inquire Authentication Information Object) Response

The response of the Inquire authentication information (MQCMD_INQUIRE_AUTH_INFO) PCF command consists of the response header followed by the *AuthInfoName* structure (and on z/OS only, the *QSGDisposition* structure), and the requested combination of attribute parameter structures (where applicable).

Always returned:

AuthInfoName , *QSGDisposition*

Returned if requested:

AdoptContext, *AlterationDate*, *AlterationTime*, *AuthInfoConnName*, *BaseDNGroup*, *BaseDNUser*, *AuthInfoType*, *CheckClient*, *CheckLocal*, *ClassUser*, *FailureDelay*, *LDAPPassword*, *LDAPUserName*, *OCSPResponderURL*, *SecureComms*, *ShortUser*, *UserField*

Response data

AdoptContext

Whether to use the presented credentials as the context for this application.

AlterationDate (MQCFST)

Alteration date of the authentication information object, in the form yyyy-mm-dd (parameter identifier: MQCA_ALTERATION_DATE).

AlterationTime (MQCFST)

Alteration time of the authentication information object, in the form hh.mm.ss (parameter identifier: MQCA_ALTERATION_TIME).

AuthInfoConnName (MQCFST)

The connection name of the authentication information object (parameter identifier: MQCA_AUTH_INFO_CONN_NAME).

The maximum length of the string is MQ_AUTH_INFO_CONN_NAME_LENGTH. On z/OS, it is MQ_LOCAL_ADDRESS_LENGTH.

This parameter is relevant only when *AuthInfoType* is set to *MQAIT_CRL_LDAP* or *MQAIT_IDPW_LDAP*.

AuthInfoDesc (MQCFST)

The description of the authentication information object (parameter identifier: MQCA_AUTH_INFO_DESC).

The maximum length is MQ_AUTH_INFO_DESC_LENGTH.

AuthInfoName (MQCFST)

Authentication information object name (parameter identifier: MQCA_AUTH_INFO_NAME).

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

AuthInfoType (MQCFIN)

The type of authentication information object (parameter identifier: MQIA_AUTH_INFO_TYPE).

The value can be:

MQAIT_CRL_LDAP

This authentication information object specifies Certificate Revocation Lists that are held on LDAP servers.

MQAIT_OCSP

This authentication information object specifies certificate revocation checking using OCSP.

MQAIT_IDPW_OS

This authentication information object specifies certificate revocation checking using user ID and password checking through the operating system.

MQAIT_IDPW_LDAP

This authentication information object specifies certificate revocation checking using user ID and password checking through an LDAP server.

See [Securing IBM MQ](#) for more information.

AuthenticationMethod (MQCFIN)

Authentication methods for user passwords (parameter identifier: MQIA_AUTHENTICATION_METHOD). Possible values are:

MQAUTHENTICATE_OS

Use the traditional UNIX password verification method.

MQAUTHENTICATE_PAM

Use the Pluggable Authentication Method to authenticate the user passwords.

You can set the PAM value only on AIX and Linux.

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_OS*, and is not valid on IBM MQ for z/OS.

AuthorizationMethod (MQCFIN)

Authorization methods for the queue manager (parameter identifier MQIA_LDAP_AUTHORMD). Possible values are:

MQLDAP_AUTHORMD_OS

Use operating system groups to determine permissions associated with a user.

MQLDAP_AUTHORMD_SEARCHGRP

A group entry in the LDAP repository contains an attribute listing the Distinguished Name of all the users belonging to that group.

MQLDAP_AUTHORMD_SEARCHUSER

A user entry in the LDAP repository contains an attribute listing the Distinguished Name of all the groups to which the specified user belongs.

MQLDAP_AUTHORMD_SRCHGRPSN

A group entry in the LDAP repository contains an attribute listing the short user name of all the users belonging to that group.

BaseDNGroup (MQCFST)

In order to be able to find group names, this parameter must be set with the base DN to search for groups in the LDAP server (parameter identifier MQCA_LDAP_BASE_DN_GROUPS).

The maximum length of the string is MQ_LDAP_BASE_DN_LENGTH.

BaseDNUser (MQCFST)

In order to be able to find the short user name attribute (see [ShortUser](#)) this parameter must be set with the base DN to search for users within the LDAP server.

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_LDAP* and is mandatory (parameter identifier MQ_LDAP_BASE_DN_USERS).

The maximum length is MQ_LDAP_BASE_DN_LENGTH.

Checklocal or Checkclient (MQCFIN)

These attributes are valid only for an **AuthInfoType** of *MQAIT_IDPW_OS* or *MQAIT_IDPW_LDAP* (parameter identifier MQIA_CHECK_LOCAL_BINDING or MQIA_CHECK_CLIENT_BINDING). The possible values are:

MQCHK_NONE

Switches off checking.

MQCHK_OPTIONAL

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

MQCHK_REQUIRED

Requires that all applications provide a valid user ID and password.

MQCHK_REQUIRED_ADMIN

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the OPTIONAL setting. See also the following note.  (This setting is not allowed on z/OS systems.)

ClassGroup (MQCFST)

The LDAP object class used for group records in the LDAP repository (parameter identifier MQCA_LDAP_GROUP_OBJECT_CLASS).

Classuser (MQCFST)

The LDAP object class used for user records in the LDAP repository (parameter identifier MQCA_LDAP_USER_OBJECT_CLASS).

The maximum length is MQ_LDAP_CLASS_LENGTH.

FailureDelay (MQCFIN)

The failure delay (parameter identifier MQIA_AUTHENTICATION_FAIL_DELAY) when an authentication fails due to the user ID or password being incorrect, in seconds, before the failure is returned to the application.

FindGroup (MQCFST)

Name of the attribute used within an LDAP entry to determine group membership (parameter identifier MQCA_LDAP_FIND_GROUP_FIELD).

The maximum length of the string is MQ_LDAP_FIELD_LENGTH.

GroupField (MQCFST)

LDAP attribute that represents a simple name for the group (parameter identifier MQCA_LDAP_GROUP_ATTR_FIELD).

The maximum length of the string is MQ_LDAP_FIELD_LENGTH.

GroupNesting (MQCFIN)

Whether groups are members of other groups (parameter identifier MQIA_LDAP_NESTGRP). The values can be:

MQLDAP_NESTGRP_NO

Only the initially discovered groups are considered for authorization.

MQLDAP_NESTGRP_YES

The group list is searched recursively to enumerate all the groups to which a user belongs.

LDAPPassword (MQCFST)

The LDAP password (parameter identifier: MQCA_LDAP_PASSWORD).

The maximum length is MQ_LDAP_PASSWORD_LENGTH.

This parameter is relevant only when AuthInfoType is set to *MQAIT_CRL_LDAP* or *MQAIT_IDPW_LDAP*.

LDAPUserName (MQCFST)

The LDAP user name (parameter identifier: MQCA_LDAP_USER_NAME).

The Distinguished Name of the user who is binding to the directory.

The maximum length is MQ_DISTINGUISHED_NAME_LENGTH. On z/OS, it is MQ_SHORT_DNAME_LENGTH.

This parameter is relevant only when AuthInfoType is set to *MQAIT_CRL_LDAP* or *MQAIT_IDPW_LDAP*.

OCSPResponderURL (MQCFST)

The URL of the OCSP responder used to check for certificate revocation.

QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

SecureComms (MQCFIN)

Whether connectivity to the LDAP server should be done securely using TLS (parameter identifier MQIA_LDAP_SECURE_COMM).

The maximum length is MQ_LDAP_SECURE_COMM_LENGTH.

ShortUser (MQCFST)

A field in the user record to be used as a short user name in IBM MQ (parameter identifier MQCA_LDAP_SHORT_USER_FIELD).

This field must contain values of 12 characters or less. This short user name is used for the following purposes:

- If LDAP authentication is enabled, but LDAP authorization is not enabled, this is used as an operating system user ID for authorization checks. In this case, the attribute must represent an operating system user ID.
- If LDAP authentication and authorization are both enabled, this is used as the user ID carried with the message in order for the LDAP user name to be rediscovered when the user ID inside the message needs to be used.

For example, on another queue manager, or when writing report messages. In this case, the attribute does not need to represent an operating system user ID, but must be a unique string. An employee serial number is an example of a good attribute for this purpose.

This attribute is valid only for an **AuthInfoType** of *MQAIT_IDPW_LDAP* and is mandatory.

The maximum length is MQ_LDAP_FIELD_LENGTH.

UserField (MQCFST)

Identifies the field in the LDAP user record that is used to interpret the provided user ID, only if the user ID does not contain a qualifier (parameter identifier MQCA_LDAP_USER_ATTR_FIELD).

The maximum length is MQ_LDAP_FIELD_LENGTH.

MQCMD_INQUIRE_AUTH_INFO_NAMES (Inquire Authentication Information Object Names)

The Inquire authentication information names (MQCMD_INQUIRE_AUTH_INFO_NAMES) PCF command asks for a list of authentication information names that match the generic authentication information name specified.

Required parameters**AuthInfoName (MQCFST)**

Authentication information object name (parameter identifier: MQCA_AUTH_INFO_NAME).

Specifies the name of the authentication information object about which information is to be returned.

Generic authentication information object names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all authentication information objects

having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_AUTH_INFO_NAME_LENGTH.

Optional parameters

AuthInfoType (MQCFIN)

Type of authentication information object. The following values are accepted:

MQAIT_CRL_LDAP

Authentication information objects specifying Certificate Revocation Lists held on LDAP servers.

MQAIT_OCSP

Authentication information objects specifying certificate revocation checking using OCSP.

MQAIT_ALL

Authentication information objects of any type. MQAIT_ALL is the default value

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

MQCMD_INQUIRE_AUTH_INFO_NAMES (Inquire Authentication Information Object Names) Response

The response to the inquire authentication information names (MQCMD_INQUIRE_AUTH_INFO_NAMES) PCF command consists of the response header followed by a parameter structure giving zero or more names that match the specified authentication information name.

z/OS Additionally, on z/OS only, parameter structures, *QSGDispositions* and *AuthInfoTypes* (with the same number of entries as the *AuthInfoNames* structure), are returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *AuthInfoNames* structure.

Always returned:

AuthInfoNames, **z/OS**, *QSGDispositions*, **z/OS**, *AuthInfoTypes*

Returned if requested:

None

Response data

AuthInfoNames (MQCFSL)

List of authentication information object names (parameter identifier: MQCACF_AUTH_INFO_NAMES).

z/OS

QSGDispositions (MQCFIL)

List of queue sharing group dispositions (parameter identifier: MQIACF_QSG_DISPS).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

AuthInfoTypes (MQCFIL)

List of authentication information object types (parameter identifier: MQIACH_AUTH_INFO_TYPES).

Specifies the type of the object. This parameter is valid on z/OS only. The value can be any of the following values:

MQAIT_CRL_LDAP

This defines this authentication information object as specifying an LDAP server containing Certificate Revocation Lists.

MQAIT_OCSP

This value defines this authentication information object as specifying certificate revocation checking using OCSP.

MQAIT_IDPW_OS

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through the operating system.

Multiplatforms

The Inquire Authority Records (MQCMD_INQUIRE_AUTH_RECS) PCF command retrieves authority records associated with a profile name.

Required parameters**Options (MQCFIN)**

Options to control the set of authority records that is returned (parameter identifier: MQIACF_AUTH_OPTIONS).

This parameter is required and you must include one of the following two values:

MQAUTHOPT_NAME_ALL_MATCHING

Return all profiles the names of which match the specified *ProfileName*. This means that a *ProfileName* of ABCD results in the profiles ABCD, ABC*, and AB* being returned (if ABC* and AB* have been defined as profiles).

MQAUTHOPT_NAME_EXPLICIT

Return only those profiles the names of which exactly match the *ProfileName*. No matching generic profiles are returned unless the *ProfileName* is, itself, a generic profile. You cannot specify this value and MQAUTHOPT_ENTITY_SET.

and one of the following two values:

MQAUTHOPT_ENTITY_EXPLICIT

Return all profiles the entity fields of which match the specified *EntityName*. No profiles are returned for any group in which *EntityName* is a member; only the profile defined for the specified *EntityName*.

MQAUTHOPT_ENTITY_SET

Return the profile the entity field of which matches the specified *EntityName* and the profiles pertaining to any groups in which *EntityName* is a member that contribute to the cumulative authority for the specified entity. You cannot specify this value and MQAUTHOPT_NAME_EXPLICIT.

You can also optionally specify:

MQAUTHOPT_NAME_AS_WILDCARD

Interpret *ProfileName* as a filter on the profile name of the authority records. If you do not specify this attribute and *ProfileName* contains wildcard characters, it is interpreted as a generic profile and only those authority records where the generic profile names match the value of *ProfileName* are returned.

You cannot specify MQAUTHOPT_NAME_AS_WILDCARD if you also specify MQAUTHOPT_ENTITY_SET.

ProfileName (MQCFST)

Profile name (parameter identifier: MQCACF_AUTH_PROFILE_NAME).

This parameter is the name of the profile for which to retrieve authorizations. Generic profile names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all profiles having names that start with the selected character string. An asterisk on its own matches all possible names.

If you have defined a generic profile, you can return information about it by not setting MQAUTHOPT_NAME_AS_WILDCARD in *Options*.

If you set *Options* to MQAUTHOPT_NAME_AS_WILDCARD, the only valid value for *ProfileName* is a single asterisk (*). This means that all authority records that satisfy the values specified in the other parameters are returned.

Do not specify *ProfileName* if the value of *ObjectType* is MQOT_Q_MGR.

The profile name is always returned regardless of the attributes requested.

The maximum length of the string is MQ_AUTH_PROFILE_NAME_LENGTH.

ObjectType (MQCFIN)

The type of object referred to by the profile (parameter identifier: MQIACF_OBJECT_TYPE).

The value can be any of the following values:

MQOT_ALL

All object types. MQOT_ALL is the default if you do not specify a value for *ObjectType*.

MQOT_AUTH_INFO

Authentication information.

MQOT_CHANNEL

Channel object.

MQOT_CLNTCONN_CHANNEL

Client-connection channel object.

MQOT_COMM_INFO

Communication information object

MQOT_LISTENER

Listener object.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process.

MQOT_Q

Queue, or queues, that match the object name parameter.

MQOT_Q_MGR

Queue manager.

MQOT_REMOTE_Q_MGR_NAME

Remote queue manager.

MQOT_SERVICE

Service object.

MQOT_TOPIC

Topic object.

Optional parameters

EntityName (MQCFST)

Entity name (parameter identifier: MQCACF_ENTITY_NAME).

Depending on the value of *EntityType*, this parameter is either:

- A principal name. This name is the name of a user for whom to retrieve authorizations to the specified object. On IBM MQ for Windows, the name of the principal can optionally include a domain name, specified in this format: `user@domain`.
- A group name. This name is the name of the user group on which to make the inquiry. You can specify one name only and this name must be the name of an existing user group.

 For IBM MQ for Windows only, the group name can optionally include a domain name, specified in the following formats:

```
GroupName@domain  
domain\GroupName
```

The maximum length of the string is MQ_ENTITY_NAME_LENGTH.

EntityType (MQCFIN)

Entity type (parameter identifier: MQIACF_ENTITY_TYPE).

The value can be:

MQZAET_GROUP

The value of the **EntityName** parameter refers to a group name.

MQZAET_PRINCIPAL

The value of the **EntityName** parameter refers to a principal name.

ProfileAttrs (MQCFIL)

Profile attributes (parameter identifier: MQIACF_AUTH_PROFILE_ATTRS).

The attribute list might specify the following value on its own - the default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCACF_ENTITY_NAME

Entity name.

MQIACF_AUTHORIZATION_LIST

Authorization list.

MQIACF_ENTITY_TYPE

Entity type.

Note: If an entity is specified by using the parameters MQCACF_ENTITY_NAME and MQIACF_ENTITY_TYPE, then all the required parameters must be passed in first.

ServiceComponent (MQCFST)

Service component (parameter identifier: MQCACF_SERVICE_COMPONENT).

If installable authorization services are supported, this parameter specifies the name of the authorization service from which to retrieve authorization.

If you omit this parameter, the authorization inquiry is made to the first installable component for the service.

The maximum length of the string is MQ_SERVICE_COMPONENT_LENGTH.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRC_OBJECT_TYPE_ERROR

Invalid object type.

MQRC_UNKNOWN_ENTITY

User ID not authorized, or unknown.

MQRCCF_CFST_CONFLICTING_PARM

Conflicting parameters.

MQRCCF_PROFILE_NAME_ERROR

Invalid profile name.

MQRCCF_ENTITY_NAME_MISSING

Entity name missing.

MQRCCF_OBJECT_TYPE_MISSING

Object type missing.

MQRCCF_PROFILE_NAME_MISSING

Profile name missing.

Multi **MQCMD_INQUIRE_AUTH_RECS (Inquire Authority Records) Response on Multiplatforms**

The response to the Inquire Authority Records (MQCMD_INQUIRE_AUTH_RECS) PCF command consists of the response header followed by the *QMgrName*, *Options*, *ProfileName*, and *ObjectType* structures and the requested combination of attribute parameter structures.

One PCF message is returned for each authority record that is found the profile name of which matches the options specified in the Inquire Authority Records request.

Always returned:

ObjectType, *Options*, *ProfileName*, *QMgrName*

Returned if requested:

AuthorizationList, *EntityName*, *EntityType*

Response data**AuthorizationList (MQCFIL)**

Authorization list (parameter identifier: MQIACF_AUTHORIZATION_LIST).

This list can contain zero or more authorization values. Each returned authorization value means that any user ID in the specified group or principal has the authority to perform the operation defined by that value. The value can be any of the following values:

MQAUTH_NONE

The entity has authority set to 'none'.

MQAUTH_ALT_USER_AUTHORITY

Specify an alternate user ID on an MQI call.

MQAUTH_BROWSE

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

MQAUTH_CHANGE

Change the attributes of the specified object, using the appropriate command set.

MQAUTH_CLEAR

Clear a queue.

MQAUTH_CONNECT

Connect the application to the specified queue manager by issuing an MQCONN call.

MQAUTH_CREATE

Create objects of the specified type using the appropriate command set.

MQAUTH_DELETE

Delete the specified object using the appropriate command set.

MQAUTH_DISPLAY

Display the attributes of the specified object using the appropriate command set.

MQAUTH_INPUT

Retrieve a message from a queue by issuing an MQGET call.

MQAUTH_INQUIRE

Make an inquiry on a specific queue by issuing an MQINQ call.

MQAUTH_OUTPUT

Put a message on a specific queue by issuing an MQPUT call.

MQAUTH_PASS_ALL_CONTEXT

Pass all context.

MQAUTH_PASS_IDENTITY_CONTEXT

Pass the identity context.

MQAUTH_SET

Set attributes on a queue from the MQI by issuing an MQSET call.

MQAUTH_SET_ALL_CONTEXT

Set all context on a queue.

MQAUTH_SET_IDENTITY_CONTEXT

Set the identity context on a queue.

MQAUTH_CONTROL

For listeners and services, start and stop the specified channel, listener, or service.

For channels, start, stop, and ping the specified channel.

For topics, define, alter, or delete subscriptions.

MQAUTH_CONTROL_EXTENDED

Reset or resolve the specified channel.

MQAUTH_PUBLISH

Publish to the specified topic.

MQAUTH_SUBSCRIBE

Subscribe to the specified topic.

MQAUTH_RESUME

Resume a subscription to the specified topic.

MQAUTH_SYSTEM

Use queue manager for internal system operations.

MQAUTH_ALL

Use all operations applicable to the object.

MQAUTH_ALL_ADMIN

Use all operations applicable to the object.

MQAUTH_ALL_MQI

Use all MQI calls applicable to the object.

Use the *Count* field in the MQCFIL structure to determine how many values are returned.

EntityName (MQCFST)

Entity name (parameter identifier: MQCACF_ENTITY_NAME).

This parameter can either be a principal name or a group name.

The maximum length of the string is MQ_ENTITY_NAME_LENGTH.

EntityType (MQCFIN)

Entity type (parameter identifier: MQIACF_ENTITY_TYPE).

The value can be:

MQZAET_GROUP

The value of the **EntityName** parameter refers to a group name.

MQZAET_PRINCIPAL

The value of the **EntityName** parameter refers to a principal name.

MQZAET_UNKNOWN

On Windows, an authority record still exists from a previous queue manager which did not originally contain entity type information.

ObjectType (MQCFIN)

Object type (parameter identifier: MQIACF_OBJECT_TYPE).

The value can be:

MQOT_AUTH_INFO

Authentication information.

MQOT_CHANNEL

Channel object.

MQOT_CLNTCONN_CHANNEL

Client-connection channel object.

MQOT_COMM_INFO

Communication information object

MQOT_LISTENER

Listener object.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process.

MQOT_Q

Queue, or queues, that match the object name parameter.

MQOT_Q_MGR

Queue manager.

MQOT_REMOTE_Q_MGR_NAME

Remote queue manager.

MQOT_SERVICE

Service object.

MQOT_TOPIC

Topic object.

Options (MQCFIN)

Options used to indicate the level of information that is returned (parameter identifier: MQIACF_AUTH_OPTIONS).

ProfileName (MQCFST)

Profile name (parameter identifier: MQCACF_AUTH_PROFILE_NAME).

The maximum length of the string is MQ_AUTH_PROFILE_NAME_LENGTH.

QMgrName (MQCFST)

Name of the queue manager on which the Inquire command is issued (parameter identifier: MQCA_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

Multi *MQCMD_INQUIRE_AUTH_SERVICE (Inquire Authority Service) on Multiplatforms*

The Inquire Authority Service (MQCMD_INQUIRE_AUTH_SERVICE) PCF command retrieves information about the level of function supported by installed authority managers.

Required parameters**AuthServiceAttrs (MQCFIL)**

Authority service attributes (parameter identifier: MQIACF_AUTH_SERVICE_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQIACF_INTERFACE_VERSION

Current interface version of the authority service.

MQIACF_USER_ID_SUPPORT

Whether the authority service supports user IDs.

Optional parameters

ServiceComponent (MQCFST)

Name of authorization service (parameter identifier: MQCACF_SERVICE_COMPONENT).

The name of the authorization service which is to handle the Inquire Authority Service command.

If this parameter is omitted, or specified as a blank or null string, the inquire function is called in each installed authorization service in reverse order to the order in which the services have been installed, until all authorization services have been called or until one returns a value of MQZCI_STOP in the Continuation field.

The maximum length of the string is MQ_SERVICE_COMPONENT_LENGTH.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands”](#) on page 1018.

Reason (MQLONG)

The value can be any of the following values:

MQRC_SELECTOR_ERROR

Attribute selector not valid.

MQRC_UNKNOWN_COMPONENT_NAME

Unknown service component name.

Multi MQCMD_INQUIRE_AUTH_SERVICE (Inquire Authority Service) Response on Multiplatforms

The response to the Inquire Authority Service (MQCMD_INQUIRE_AUTH_SERVICE) PCF command consists of the response header followed by the *ServiceComponent* structure and the requested combination of attribute parameter structures.

Always returned:

ServiceComponent

Returned if requested:

InterfaceVersion, UserIDSupport

Response data

InterfaceVersion (MQCFIN)

Interface version (parameter identifier: MQIACF_INTERFACE_VERSION).

This parameter is the current interface version of the OAM.

ServiceComponent (MQCFSL)

Name of authorization service (parameter identifier: MQCACF_SERVICE_COMPONENT).

If you included a specific value for *ServiceComponent* on the Inquire Authority Service command, this field contains the name of the authorization service that handled the command. If you did not include a specific value for *ServiceComponent* on the Inquire Authority Service command, the list contains the names of all the installed authorization services.

If there is no OAM or if the OAM requested in the ServiceComponent does not exist this field is blank.

The maximum length of each element in the list is MQ_SERVICE_COMPONENT_LENGTH.

UserIDSsupport (MQCFIN)

User ID support (parameter identifier: MQIACF_USER_ID_SUPPORT).

The value can be:

MQUIDSUPP_YES

The authority service supports user IDs.

MQUIDSUPP_NO

The authority service does not support user IDs.

 **MQCMD_INQUIRE_CF_STRUC (Inquire CF Structure) on z/OS**

The Inquire CF Structure (MQCMD_INQUIRE_CF_STRUC) PCF command returns information about the attributes of one or more CF application structures.

Note: This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

Required parameters

CFStrucName (MQCFST)

CF Structure name (parameter identifier: MQCA_CF_STRUC_NAME).

Specifies the name of the CF application structure about which information is to be returned.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all CF application structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters

CFStrucAttrs (MQCFIL)

CF application structure attributes (parameter identifier: MQIACF_CF_STRUC_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_ALTERATION_DATE

The date on which the definition was last altered.

MQCA_ALTERATION_TIME

The time at which the definition was last altered.

MQIA_CF_CFCONLOS

The action to be taken when the queue manager loses connectivity to the CF application structure.

MQIA_CF_LEVEL

Functional capability level for the CF application structure.

MQIA_CF_OFFLOAD

The shared message data set OFFLOAD property for the CF application structure.

MQIA_CF_RECOVER

Whether CF recovery for the application structure is supported.

MQIA_CF_RECAUTO

Whether automatic recovery action is taken when a structure is failed or when a queue manager loses connectivity to the structure and no systems in the SysPlex have connectivity to the Coupling Facility the structure is located in.

MQIACF_CF_SMDS_BLOCK_SIZE

The shared message data set DSGROUP property for the CF application structure.

MQIA_CF_SMDS_BUFFERS

The shared message data set DSGROUP property for the CF application structure.

MQIACF_CF_SMDS_EXPAND

The shared message data set DSEXPAND property for the CF application structure.

MQCACF_CF_SMDS_GENERIC_NAME

The shared message data set DSBUFFS property for the CF application structure.

MQCA_CF_STRUC_DESC

Description of CF application structure.

MQCA_CF_STRUC_NAME

Name of CF application structure.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *CFStrucAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *CFStrucAttrs* except MQCA_CF_STRUC_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1560](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

MQCMD_INQUIRE_CF_STRUC (Inquire CF Structure) Response on z/OS

The response to the Inquire CF Structure (MQCMD_INQUIRE_CF_STRUC) PCF command consists of the response header followed by the *CFStrucName* structure and the requested combination of attribute parameter structures.

If a generic CF application structure name was specified, one such message is generated for each CF application structure found.

Always returned:

CFStrucName

Returned if requested:

AlterationDate, AlterationTime, CFConlos, CFLevel, CFStrucDesc, DSBLOCK, DSBUFFS, DSEXPAND, DSGROUP, OFFLD1SZ, OFFLD12SZ, OFFLD3SZ, OFFLD1TH, OFFLD2TH, OFFLD3TH, Offload, RCVDATE, RCVTIME, Recauto, Recovery

Response data**AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date on which the definition was last altered, in the form yyyy-mm-dd.

The maximum length of the string is MQ_DATE_LENGTH.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time at which the definition was last altered, in the form hh.mm.ss.

The maximum length of the string is MQ_TIME_LENGTH.

CFConlos (MQCFIN)

The CFConlos property (parameter identifier: MQIA_CF_CFCONLOS).

Specifies the action to be taken when a queue manager loses connectivity to the CF structure. The value can be any of the following values:

MQCFCONLOS_TERMINATE

The queue manager will terminate when connectivity to the structure is lost.

MQCFCONLOS_TOLERATE

The queue manager will tolerate loss of connectivity to the structure without terminating.

MQCFCONLOS_ASQMGR

The action taken is based on the setting of the CFCONLOS queue manager attribute

This parameter is only valid from CFLEVEL(5).

CFLevel (MQCFIN)

The functional capability level for this CF application structure (parameter identifier: MQIA_CF_LEVEL).

Specifies the functional capability level for the CF application structure. The value can be any of the following values:

1

A CF structure that can be "auto-created" by a queue manager at command level 520.

2

A CF structure at command level 520 that can only be created or deleted by a queue manager at command level 530 or greater. This level is the default *CFLevel* for queue managers at command level 530 or greater.

3

A CF structure at command level 530. This *CFLevel* is required if you want to use persistent messages on shared queues, or for message grouping, or both.

4

A CF structure at command level 600. This *CFLevel* can be used for persistent messages or for messages longer than 64 512 bytes.

5

A CF structure at command level 710. This *CFLevel* supports shared message data sets (SMDS) and Db2 for offloading messages.

Structures are required to be at CFLEVEL(5) to support toleration of loss of connectivity.

CFStrucDesc (MQCFST)

The description of the CF structure (parameter identifier: MQCA_CF_STRUC_DESC).

The maximum length is MQ_CF_STRUC_DESC_LENGTH.

CFStrucName (MQCFST)

CF Structure name (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length is MQ_CF_STRUC_NAME_LENGTH.

DSBLOCK (MQCFIN)

The CF DSBLOCK property (parameter identifier: MQIACF_CF_SMDS_BLOCK_SIZE).

The returned value is one of the following constants: MQDSB_8K, MQDSB_16K, MQDSB_32K, MQDSB_64K, MQDSB_128K, MQDSB_256K, MQDSB_512K, MQDSB_1024K, MQDSB_1M.

DSBUFS (MQCFIN)

The CF DSBUFS property (parameter identifier: MQIA_CF_SMDS_BUFFERS).

The returned value is in the range 0 - 9999.

The value is the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

DSEXPAND (MQCFIN)

The CF DSEXPAND property (parameter identifier: MQIACF_CF_SMDS_EXPAND).

MQDSE_YES

The data set can be expanded.

MQDSE_NO

The data set cannot be expanded.

MQDSE_DEFAULT

Only returned on Inquire CF Struct when not explicitly set

DSGROUP (MQCFST)

The CF DSGROUP property (parameter identifier: MQCACF_CF_SMDS_GENERIC_NAME).

The returned value is a string containing a generic data set name used for the group of shared message data sets associated with this CF structure.

OFFLD1SZ (MQCFST)

The CF OFFLD1SZ property (parameter identifier: MQCACF_CF_OFFLOAD_SIZE1).

The returned value is a string in the range 0K - 64K.

Returned if the MQIACF_ALL or MQIA_CF_OFFLOAD parameters are specified.

The maximum length is 3.

OFFLD2SZ (MQCFST)

The CF OFFLD2SZ property (parameter identifier: MQCACF_CF_OFFLOAD_SIZE2).

The returned value is a string in the range 0K - 64K.

Returned if the MQIACF_ALL or MQIA_CF_OFFLOAD parameters are specified.

The maximum length is 3.

OFFLD3SZ (MQCFST)

The CF OFFLD3SZ property (parameter identifier: MQCACF_CF_OFFLOAD_SIZE3).

The returned value is a string in the range 0K - 64K.

Returned if the MQIACF_ALL or MQIA_CF_OFFLOAD parameters are specified.

The maximum length is 3.

OFFLD1TH (MQCFIN)

The CF OFFLD1TH property (parameter identifier: MQIA_CF_OFFLOAD_THRESHOLD1).

The returned value is in the range 0 - 100.

Returned if the MQIACF_ALL or MQIA_CF_OFFLOAD parameters are specified.

OFFLD2TH (MQCFIN)

The CF OFFLD2TH property (parameter identifier: MQIA_CF_OFFLOAD_THRESHOLD2).

The returned value is in the range 0 - 100.

Returned if the MQIACF_ALL or MQIA_CF_OFFLOAD parameters are specified.

OFFLD3TH (MQCFIN)

The CF OFFLD3TH property (parameter identifier: MQIA_CF_OFFLOAD_THRESHOLD3).

The returned value is in the range 0 - 100.

Returned if the MQIACF_ALL or MQIA_CF_OFFLOAD parameters are specified.

Offload (MQCFIN)

The CF OFFLOAD property (parameter identifier: MQIA_CF_OFFLOAD).

The returned values can be:

MQCFOFFLD_DB2

Large shared messages can be stored in Db2.

MQCFOFFLD_SMDS

Large shared messages can be stored in z/OS shared message data sets.

MQCFOFFLD_NONE

Used when the property *Offload* has not been explicitly set.

RCVDATE (MQCFST)

The recovery start date (parameter identifier: MQCACF_RECOVERY_DATE).

If recovery is currently enabled for the data set, this indicates the date when it was activated, in the form yyyy-mm-dd. If recovery is not enabled, this is displayed as RCVDATE().

RCVTIME (MQCFST)

The recovery start time (parameter identifier: MQCACF_RECOVERY_TIME).

If recovery is currently enabled for the data set, this indicates the time when it was activated, in the form hh.mm.ss. If recovery is not enabled, this is displayed as RCVTIME().

Recauto (MQCFIN)

Recauto (parameter identifier: MQIA_CF_RECAUTO).

Indicates whether automatic recovery action is taken when a queue manager detects that the structure is failed, or when a queue manager loses connectivity to the structure and no systems in the SysPlex have connectivity to the Coupling Facility that the structure is allocated in. The value can be:

MQRECAUTO_YES

The structure and associated shared message data sets which also need recovery will be automatically recovered.

MQRECAUTO_NO

The structure will not be automatically recovered.

Recovery (MQCFIN)

Recovery (parameter identifier: MQIA_CF_RECOVER).

Specifies whether CF recovery is supported for the application structure. The value can be:

MQCFR_YES

Recovery is supported.

MQCFR_NO

Recovery is not supported.

MQCMD_INQUIRE_CF_STRUC_NAMES (Inquire CF Structure Names) on z/OS

The Inquire CF Structure Names (MQCMD_INQUIRE_CF_STRUC_NAMES) PCF command inquires for a list of CF application structure names that match the generic CF structure name specified.

Note: This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

Required parameters**CFStrucName (MQCFST)**

CF Structure name (parameter identifier: MQCA_CF_STRUC_NAME).

Specifies the name of the CF application structure about which information is to be returned.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all CF application structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ_CF_STRUC_NAME_LENGTH.

MQCMD_INQUIRE_CF_STRUC_NAMES (Inquire CF Structure Names)

Response on z/OS

The response to the Inquire CF Structure Names (MQCMD_INQUIRE_CF_STRUC_NAMES) PCF command consists of the response header followed by a single parameter structure giving zero or more names that match the specified CF application structure name.

Always returned:

CFStrucNames

Returned if requested:

None

Response data

CFStrucNames (MQCFSL)

List of CF application structure names (parameter identifier: MQCACF_CF_STRUC_NAMES).

MQCMD_INQUIRE_CF_STRUC_STATUS (Inquire CF Structure Status) on z/OS

The Inquire CF Structure Status (MQCMD_INQUIRE_CF_STRUC_STATUS) PCF command inquires about the status of a CF application structure.

Note: This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

Required parameters

CFStrucName (MQCFST)

CF Structure name (parameter identifier: MQCA_CF_STRUC_NAME).

Specifies the name of the CF application structure for which status information is to be returned.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all CF application structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters

CFStatusType (MQCFIN)

Status information type (parameter identifier: MQIACF_CF_STATUS_TYPE).

Specifies the type of status information you want to be returned. You can specify one of the following:

MQIACF_CF_STATUS_SUMMARY

Summary status information for the CF application structure. MQIACF_CF_STATUS_SUMMARY is the default.

MQIACF_CF_STATUS_CONNECT

Connection status information for each CF application structure for each active queue manager.

MQIACF_CF_STATUS_BACKUP

Backup status information for each CF application structure.

MQIACF_CF_STATUS_SMDS

Shared message data set information for each CF application structure.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter in the response data except MQIACF_CF_STATUS_TYPE. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter in the response data except MQCA_CF_STRUC_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1560 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

z/OS MQCMD_INQUIRE_CF_STRUC_STATUS (Inquire CF Structure Status)

Response on z/OS

The response to the Inquire CF Structure Status (MQCMD_INQUIRE_CF_STRUC_STATUS) PCF command consists of the response header followed by the *CFStrucName* and *CFStatusType* structures and a set of attribute parameter structures determined by the value of *CFStatusType* in the Inquire command.

Always returned:

CFStrucName, *CFStatusType*.

CFStatusType specifies the type of status information being returned. The value can be any of the following values:

MQIACF_CF_STATUS_SUMMARY

Summary status information for the CF application structure. This is the default.

MQIACF_CF_STATUS_CONNECT

Connection status information for each CF application structure for each active queue manager.

MQIACF_CF_STATUS_BACKUP

Backup status information for each CF application structure.

MQIACF_CF_STATUS_SMDS

Shared message data set information for each CF application structure.

Returned if *CFStatusType* is MQIACF_CF_STATUS_SUMMARY:

CFStrucStatus, *CFStrucType*, *EntriesMax*, *EntriesUsed*, *FailDate*, *FailTime*, *OffLdUse*, *SizeMax*, *SizeUsed*

Returned if *CFStatusType* is MQIACF_CF_STATUS_CONNECT:

CFStrucStatus, *FailDate*, *FailTime*, *QMgrName*, *SysName*

Returned if *CFStatusType* is MQIACF_CF_STATUS_BACKUP:

BackupDate, *BackupEndRBA*, *BackupSize*, *BackupStartRBA*, *BackupTime*, *CFStrucStatus*, *FailDate*, *FailTime*, *LogQMgrNames*, *QmgrName*

Returned if *CFStatusType* is MQIACF_CF_STATUS_SMDS:

Access, *FailDate*, *FailTime*, *RcvDate*, *RcvTime*, *CFStrucStatus*

Response data

Access (MQCFIN)

Availability of the shared message data set (parameter identifier: MQIACF_CF_STRUC_ACCESS).

MQCFACCESS_ENABLED

The shared message data set is either available for use, or is to be enabled after previously being disabled, or access to the shared message data set is to be retried following an error.

MQCFACCESS_SUSPENDED

The shared message data set is unavailable because of an error.

MQCFACCESS_DISABLED

The shared message data set is either disabled, or is to be set as disabled.

BackupDate (MQCFST)

The date, in the form yyyy-mm-dd, on which the last successful backup was taken for this CF application structure (parameter identifier: MQCACF_BACKUP_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

BackupEndRBA (MQCFST)

The backup data set end RBA for the end of the last successful backup taken for this CF application structure (parameter identifier: MQCACF_CF_STRUC_BACKUP_END).

The maximum length of the string is MQ_RBA_LENGTH.

BackupSize (MQCFIN)

The size, in megabytes, of the last successful backup taken for this CF application structure (parameter identifier: MQIACF_CF_STRUC_BACKUP_SIZE).

BackupStartRBA (MQCFST)

The backup data set start RBA for the start of the last successful backup taken for this CF application structure (parameter identifier: MQCACF_CF_STRUC_BACKUP_START).

The maximum length of the string is MQ_RBA_LENGTH.

BackupTime (MQCFST)

The end time, in the form hh.mm.ss, of the last successful backup taken for this CF application structure (parameter identifier: MQCACF_BACKUP_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

CFStatusType (MQCFIN)

Status information type (parameter identifier: MQIACF_CF_STATUS_TYPE).

Specifies the type of status information being returned. The value can be any of the following values:

MQIACF_CF_STATUS_SUMMARY

Summary status information for the CF application structure. MQIACF_CF_STATUS_SUMMARY is the default.

MQIACF_CF_STATUS_CONNECT

Connection status information for each CF application structure for each active queue manager.

MQIACF_CF_STATUS_BACKUP

Back up status information for each CF application structure.

MQIACF_CF_STATUS_SMDS

Shared message data set information for each CF application structure.

CFStrucName (MQCFST)

CF Structure name (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length is MQ_CF_STRUC_NAME_LENGTH.

CFStrucStatus (MQCFIN)

CF Structure status (parameter identifier: MQIACF_CF_STRUC_STATUS).

The status of the CF application structure.

If *CFStatusType* is MQIACF_CF_STATUS_SUMMARY, the value can be:

MQCFSTATUS_ACTIVE

The structure is active.

MQCFSTATUS_FAILED

The structure has failed.

MQCFSTATUS_NOT_FOUND

The structure is not allocated in the CF, but has been defined to Db2.

MQCFSTATUS_IN_BACKUP

The structure is in the process of being backed up.

MQCFSTATUS_IN_RECOVER

The structure is in the process of being recovered.

MQCFSTATUS_UNKNOWN

The status of the CF structure is unknown because, for example, Db2 might be unavailable.

If *CFStatusType* is MQIACF_CF_STATUS_CONNECT, the value can be:

MQCFSTATUS_ACTIVE

The structure is connected to this queue manager.

MQCFSTATUS_FAILED

The queue manager connection to this structure has failed.

MQCFSTATUS_NONE

The structure has never been connected to this queue manager.

If *CFStatusType* is MQIACF_CF_STATUS_BACKUP, the value can be:

MQCFSTATUS_ACTIVE

The structure is active.

MQCFSTATUS_FAILED

The structure has failed.

MQCFSTATUS_NONE

The structure has never been backed up.

MQCFSTATUS_IN_BACKUP

The structure is in the process of being backed up.

MQCFSTATUS_IN_RECOVER

The structure is in the process of being recovered.

If *CFStatusType* is MQIACF_CF_STATUS_SMDS, the value can be:

MQCFSTATUS_ACTIVE

The shared message data set is available for normal use

MQCFSTATUS_FAILED

The shared message data set is in an unusable state and probably requires recovery.

MQCFSTATUS_IN_RECOVER

The shared message data set is in the process of being recovered (by way of a RECOVER CFSTRUCT command).

MQCFSTATUS_NOT_FOUND

The data set has never been used, or the attempt to open it for the first time failed.

MQCFSTATUS_RECOVERED

The data set has been recovered or otherwise repaired, and is ready for use again, but requires some restart processing the next time it is opened. This restart processing ensures that obsolete references to any deleted messages have been removed from the coupling facility structure before the data set is made available again. The restart processing also rebuilds the data set space map.

MQCFSTATUS_EMPTY

The data set contains no messages. The data set is put into this state if it is closed normally by the owning queue manager at a time when it does not contain any messages. It can also be put into EMPTY state when the previous data set contents are to be discarded because the application structure has been emptied (using **RECOVER CFSTRUCT** with TYPE PURGE or, for a nonrecoverable structure only, by deleting the previous instance of the structure). The next time the data set is opened by its owning queue manager, the space map is reset to empty, and the status is changed to ACTIVE. As the previous data set contents are no longer required, a data set in this state can be replaced with a newly allocated data set, for example to change the space allocation or move it to another volume.

MQCFSTATUS_NEW

The data set is being opened and initialized for the first time, ready to be made active.

CFStrucType (MQCFIN)

CF Structure type (parameter identifier: MQIACF_CF_STRUC_TYPE).

The value can be:

MQCFTYPE_ADMIN

MQCFTYPE_ADMIN is the CF administration structure.

MQCFTYPE_APPL

MQCFTYPE_APPL is a CF application structure.

EntriesMax (MQCFIN)

Number of CF list entries defined for this CF application structure (parameter identifier: MQIACF_CF_STRUC_ENTRIES_MAX).

EntriesUsed (MQCFIN)

Number of CF list entries defined for this CF application structure that are in use (parameter identifier: MQIACF_CF_STRUC_ENTRIES_USED).

FailDate (MQCFST)

The date, in the form yyyy-mm-dd, on which this CF application structure failed (parameter identifier: MQCACF_FAIL_DATE).

If *CFStatusType* is MQIACF_CF_STATUS_CONNECT, it is the date on which the queue manager lost connectivity to this application structure. For the other values of *CFStatusType*, it is the date on which this CF application structure failed. This parameter is only applicable when *CFStrucStatus* is MQCFSTATUS_FAILED or MQCFSTATUS_IN_RECOVER.

The maximum length of the string is MQ_DATE_LENGTH.

FailTime (MQCFST)

The time, in the form hh.mm.ss, that this CF application structure failed (parameter identifier: MQCACF_FAIL_TIME).

If *CFStatusType* is MQIACF_CF_STATUS_CONNECT, it is the time that the queue manager lost connectivity to this application structure. For the other values of *CFStatusType*, it is the time that this CF application structure failed. This parameter is only applicable when *CFStrucStatus* is MQCFSTATUS_FAILED or MQCFSTATUS_IN_RECOVER.

The maximum length of the string is MQ_TIME_LENGTH.

LogQMgrNames (MQCFSL)

A list of queue managers, the logs of which are required to perform a recovery (parameter identifier: MQCACF_CF_STRUC_LOG_Q_MGRS).

The maximum length of each name is MQ_Q_MGR_NAME_LENGTH.

OffLdUse (MQCFIN)

Offload usage (parameter identifier: MQIA_CF_OFFLDUSE).

Indicates whether any offloaded large message data might currently exist in shared message data sets, Db2, or both. The value can be any of the following values:

MQCFOFFLD_DB2

Large shared messages are stored in Db2.

MQCFOFFLD_SMDS

Large shared messages are stored in z/OS shared message data sets.

MQCFOFFLD_NONE

Use on DISPLAY CFSTRUCT when the property has not been explicitly set.

MQCFOFFLD_BOTH

There might be large shared messages stored in both Db2, and shared message data sets.

Value cannot be set unless CFLEVEL(5) is defined.

QMgrName (MQCFST)

Queue manager name (parameter identifier: MQCA_Q_MGR_NAME).

This parameter is the name of the queue manager. If *CFStatusType* is MQIACF_CF_STATUS_BACKUP, it is the name of the queue manager that took the last successful backup.

The maximum length is MQ_Q_MGR_NAME_LENGTH.

RcvDate (MQCFST)

The recovery start date (parameter identifier: MQCACF_RECOVERY_DATE).

If recovery is currently enabled for the data set, this indicates the date when it was activated, in the form yyyy-mm-dd.

RcvTime (MQCFST)

The recovery start time (parameter identifier: MQCACF_RECOVERY_TIME).

If recovery is currently enabled for the data set, this indicates the time when it was activated, in the form hh.mm.ss.

SizeMax (MQCFIN)

Size of the CF application structure (parameter identifier: MQIACF_CF_STRUC_SIZE_MAX).

This parameter is the size, in kilobytes, of the CF application structure.

SizeUsed (MQCFIN)

Percentage of the CF application structure that is in use (parameter identifier: MQIACF_CF_STRUC_SIZE_USED).

This parameter is the percentage of the size of the CF application structure that is in use.

SysName (MQCFST)

Queue manager name (parameter identifier: MQCACF_SYSTEM_NAME).

This parameter is the name of the z/OS image of the queue manager that last connected to the CF application structure.

The maximum length is MQ_SYSTEM_NAME_LENGTH.

SizeMax (MQCFIN)

Size of the CF application structure (parameter identifier: MQIACF_CF_STRUC_SIZE_MAX).

This parameter is the size, in kilobytes, of the CF application structure.

MQCMD_INQUIRE_CHANNEL (Inquire Channel)

The Inquire Channel (MQCMD_INQUIRE_CHANNEL) PCF command inquires about the attributes of IBM MQ channel definitions.

Required parameters**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all channels having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Optional parameters**ChannelAttrs (MQCFIL)**

Channel attributes (parameter identifier: MQIACF_CHANNEL_ATTRS).

The attribute list can specify the following value on its own. This is also the default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

Alternatively, the attribute list can specify a combination of the parameters in the following table:

Parameter	SDR	SVR	RCV	REQ	CLI CONN	SVR CONN	CLUS SDR	CLUS RCV	AMQP
MQCA_ALTERATION_DATE Date on which the definition was last altered	✓	✓	✓	✓	✓	✓	✓	✓	✓
MQCA_ALTERATION_TIME Time at which the definition was last altered	✓	✓	✓	✓	✓	✓	✓	✓	✓
MQCA_CERT_LABEL Certificate label	✓	✓	✓	✓	✓	✓	✓	✓	✓
MQCA_CLUSTER_NAME Name of local queue manager							✓	✓	
MQCA_CLUSTER_NAMELIST Name of local queue manager							✓	✓	
MQCA_Q_MGR_NAME Name of local queue manager					✓				
MQCACH_CHANNEL_NAME Channel name. You cannot use this attribute as a filter keyword.	✓	✓	✓	✓	✓	✓	✓	✓	✓
MQCACH_CONNECTION_NAME Connection name	✓	✓		✓	✓		✓	✓	
MQCACH_DESC Description	✓	✓	✓	✓	✓	✓	✓	✓	✓
MQCACH_LOCAL_ADDRESS Local communications address for the channel	✓	✓		✓	✓		✓	✓	✓
Parameter	SDR	SVR	RCV	REQ	CLI CONN	SVR CONN	CLUS SDR	CLUS RCV	AMQP
MQCACH_MCA_NAME Message channel agent name	✓	✓		✓			✓		
MQCACH_MCA_USER_ID MCA user identifier	✓	✓	✓	✓		✓	✓	✓	✓
MQCACH_MODE_NAME Mode name	✓	✓		✓	✓		✓	✓

MQIACH_SHARING_CONVERSATIONS Value of Sharing Conversations						✓			
MQIACH_SHORT_RETRY Short retry count	✓	✓					✓	✓	
MQIACH_SHORT_TIMER Short timer	✓	✓					✓	✓	
 MQIACH_SPL_PROTECTION Security policy protection	✓	✓	✓	✓					
MQIACH_SSL_CLIENT_AUTH TLS client authentication	✓	✓	✓	✓		✓		✓	✓

Table 206. Optional parameters for ChannelAttrs (continued)

Parameter	SDR	SVR	RCV	REQ	CLI CONN	SVR CONN	CLUS SDR	CLUS RCV	AMQP
MQIACH_USE_CLIENT_ID Specify that the client ID is used for authorization checks for an AMQP channel									✓
MQIACH_XMIT_PROTOCOL_TYPE Transport (transmission protocol) type	✓	✓	✓	✓	✓	✓	✓	✓	
Parameter	SDR	SVR	RCV	REQ	CLI CONN	SVR CONN	CLUS SDR	CLUS RCV	AMQP

Key:

- SDR - Sender
- SVR - Server
- RCV - Receiver
- REQ - Requester
- CLI CONN - Client Connection
- SVR CONN - Server Connection
- CLUS SDR - Cluster Sender
- CLUS RCV - Cluster receiver
- AMQP - AMQP

Note:

1. Only one of the following parameters can be specified:
 - MQCACH_JAAS_CONFIG
 - MQCACH_MCA_USER_ID
 - MQIACH_USE_CLIENT_ID

If none of these parameters is specified, no authentication is performed. If MQCACH_JAAS_CONFIG is specified, the client flows a user name and password, in all other cases the flowed user name is ignored.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

If this parameter is present, eligible channels are limited to the specified type. Any attribute selector specified in the *ChannelAttrs* list which is only valid for channels of a different type or types is ignored; no error is raised.

If this parameter is not present (or if MQCHT_ALL is specified), channels of all types other than MQCHT_MQTT are eligible. Each attribute specified must be a valid channel attribute selector (that is, it must be one from the following list), but it might not be applicable to all (or any) of the channels returned. Channel attribute selectors that are valid but not applicable to the channel are ignored, no error messages occur, and no attribute is returned.

The value can be:

MQCHT_SENDER

Sender.

MQCHT_SERVER

Server.

MQCHT_RECEIVER

Receiver.

MQCHT_REQUESTER

Requester.

MQCHT_SVRCONN

Server-connection (for use by clients).

MQCHT_CLNTCONN

Client connection.

MQCHT_CLUSRCVR

Cluster-receiver.

MQCHT_CLUSSDR

Cluster-sender.

MQCHT_AMQP

AMQP channel.

MQCHT_MQTT

Telemetry channel.

MQCHT_ALL

All types other than MQCHT_MQTT.

The default value if this parameter is not specified is MQCHT_ALL.

Note:  On Multplatforms, if this parameter is present it must occur immediately after the **ChannelName** parameter. Otherwise an MQRCCF_MSG_LENGTH_ERROR error message is generated.

 z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ChannelAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter”](#) on page 1553 for information about using this filter condition.

If you specify an integer filter for channel type, you cannot also specify the **ChannelType** parameter.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ChannelAttrs* except MQCACH_CHANNEL_NAME and MQCACH_MCA_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter”](#) on page 1560 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands”](#) on page 1018.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHANNEL_TYPE_ERROR

Channel type not valid.

MQTT on AIX, Linux, and Windows

The Inquire Channel (MQCMD_INQUIRE_CHANNEL) PCF command inquires about the attributes of IBM MQ channel definitions.

Required parameters**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all channels having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

If this parameter is present, eligible channels are limited to the specified type. Any attribute selector specified in the *ChannelAttrs* list which is only valid for channels of a different type or types is ignored; no error is raised.

If this parameter is not present (or if MQCHT_ALL is specified), channels of all types are eligible. Each attribute specified must be a valid channel attribute selector (that is, it must be one from the following list), but it might not be applicable to all (or any) of the channels returned. Channel attribute selectors that are valid but not applicable to the channel are ignored, no error messages occur, and no attribute is returned.

The value must be:

MQCHT_MQTT

Telemetry channel.

Optional parameters**ChannelAttrs (MQCFIL)**

Channel attributes (parameter identifier: MQIACF_CHANNEL_ATTRS).

The attribute list can specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following parameters:

MQCA_SSL_KEY_REPOSITORY

TLS Key Repository

MQCACH_CHANNEL_NAME

Channel name. You cannot use this attribute as a filter keyword.

MQCACH_JAAS_CONFIG

The file path of the JAAS configuration

MQCACH_LOCAL_ADDRESS

Local communications address for the channel

MQCACH_MCA_USER_ID

MCA user identifier.

MQCACH_SSL_CIPHER_SPEC

TLS cipher spec.

MQCACH_SSL_KEY_PASSPHRASE

TLS key passphrase.

MQIACH_BACKLOG

The number of concurrent connection requests that the channel supports.

MQIACH_CHANNEL_TYPE

Channel type

MQIACH_PORT

Port number to use when *TransportType* is set to TCP.

MQIACH_PROTOCOL

The communication protocol supported by the channel.

MQIACH_SSL_CLIENT_AUTH

TLS client authentication.

MQIACH_USE_CLIENT_ID

Specify whether to use the *clientID* of a new connection as the *userID* for that connection

MQIACH_XMIT_PROTOCOL_TYPE

Transport (transmission protocol) type

Note:

1. Only one of the following parameters can be specified:

- MQCACH_JAAS_CONFIG
- MQCACH_MCA_USER_ID
- MQIACH_USE_CLIENT_ID

If none of these parameters are specified, no authentication is performed. If MQCACH_JAAS_CONFIG is specified, the client flows a user name and password, in all other cases the flowed user name is ignored.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHANNEL_TYPE_ERROR

Channel type not valid.

MQCMD_INQUIRE_CHANNEL (Inquire Channel) Response

The response to the Inquire Channel (MQCMD_INQUIRE_CHANNEL) PCF command consists of the response header followed by the *ChannelName* and *ChannelType* structures (and on z/OS only, the *DefaultChannelDisposition*, and *QSGDisposition* structure), and the requested combination of attribute parameter structures (where applicable).

If a generic channel name was specified, one such message is generated for each channel found.

Always returned:

ChannelName, *ChannelType*,  *DefaultChannelDisposition*,  *QSGDisposition*

Returned if requested:

AlterationDate, *AlterationTime*, *BatchDataLimit*, *BatchHeartbeat*, *BatchInterval*, *BatchSize*, *CertificateLabel*, *ChannelDesc*, *ChannelMonitoring*, *ChannelStatistics*, *ClientChannelWeight*, *ClientIdentifier*, *ClusterName*, *ClusterNameList*, *CLWLChannelPriority*, *CLWLChannelRank*, *CLWLChannelWeight*, *ConnectionAffinity*, *ConnectionName*, *DataConversion*, *DefReconnect*, *DiscInterval*, *HeaderCompression*,

HeartbeatInterval, InDoubtInbound, InDoubtOutbound, KeepAliveInterval, LastMsgTime, LocalAddress, LongRetryCount, LongRetryInterval, MaxMsgLength, MCAName, MCAType, MCAUserIdentifier, MessageCompression, ModeName, MsgExit, MsgRetryCount, MsgRetryExit, MsgRetryInterval, MsgRetryUserData, MsgsReceived, MsgsSent, MsgUserData, NetworkPriority, NonPersistentMsgSpeed, Password, PendingOutbound, PropertyControl, PutAuthority, QMgrName, ReceiveExit, ReceiveUserData, ResetSeq, SecurityExit, SecurityUserData, SendExit, SendUserData, SeqNumberWrap, SharingConversations, ShortRetryCount, ShortRetryInterval, z/OS SPLProtection, SSLCipherSpec, SSLCipherSuite, SSLClientAuth, SSLPeerName, TpName, TransportType, UseDLQ, UserIdentifier, XmitQName

Response data

AlterationDate (MQCFST)

Alteration date, in the form yyyy-mm-dd (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered.

AlterationTime (MQCFST)

Alteration time, in the form hh.mm.ss (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered.

BatchDataLimit (MQCFIN)

Batch data limit (parameter identifier: MQIACH_BATCH_DATA_LIMIT).

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

This parameter only applies to channels with a *ChannelType* of MQCHT_SENDER, MQCHT_SERVER, MQCHT_CLUSRCVR, or MQCHT_CLUSSDR.

BatchHeartbeat (MQCFIN)

The value being used for the batch heartbeating (parameter identifier: MQIACH_BATCH_HB).

The value can be 0 - 999999. A value of 0 indicates that heartbeating is not in use.

BatchInterval (MQCFIN)

Batch interval (parameter identifier: MQIACH_BATCH_INTERVAL).

BatchSize (MQCFIN)

Batch size (parameter identifier: MQIACH_BATCH_SIZE).

CertificateLabel (MQCFST)

Certificate label (parameter identifier: MQCA_CERT_LABEL).

Specifies the certificate label in use.

The maximum length is MQ_CERT_LABEL_LENGTH.

ChannelDesc (MQCFST)

Channel description (parameter identifier: MQCACH_DESC).

The maximum length of the string is MQ_CHANNEL_DESC_LENGTH.

ChannelMonitoring (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA_MONITORING_CHANNEL).

The value can be any of the following values:

MQMON_OFF

Online monitoring data collection is turned off for this channel.

MQMON_Q_MGR

The value of the queue manager's **ChannelMonitoring** parameter is inherited by the channel.

MQMON_LOW

Online monitoring data collection is turned on, with a low rate of data collection, for this channel unless the queue manager's **ChannelMonitoring** parameter is MQMON_NONE.

MQMON_MEDIUM

Online monitoring data collection is turned on, with a moderate rate of data collection, for this channel unless the queue manager's *ChannelMonitoring* parameter is MQMON_NONE.

MQMON_HIGH

Online monitoring data collection is turned on, with a high rate of data collection, for this channel unless the queue manager's **ChannelMonitoring** parameter is MQMON_NONE.

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelStatistics (MQCFIN)

Statistics data collection (parameter identifier: MQIA_STATISTICS_CHANNEL).

The value can be any of the following values:

MQMON_OFF

Statistics data collection is turned off for this channel.

MQMON_Q_MGR

The value of the queue manager's **ChannelStatistics** parameter is inherited by the channel.

MQMON_LOW

Statistics data collection is turned on, with a low rate of data collection, for this channel unless the queue manager's **ChannelStatistics** parameter is MQMON_NONE.

MQMON_MEDIUM

Statistics data collection is turned on, with a moderate rate of data collection, for this channel unless the queue manager's **ChannelStatistics** parameter is MQMON_NONE.

MQMON_HIGH

Statistics data collection is turned on, with a high rate of data collection, for this channel unless the queue manager's **ChannelStatistics** parameter is MQMON_NONE.

 On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

The value can be any of the following values:

MQCHT_SENDER

Sender.

MQCHT_SERVER

Server.

MQCHT_RECEIVER

Receiver.

MQCHT_REQUESTER

Requester.

MQCHT_SVRCONN

Server-connection (for use by clients).

MQCHT_CLNTCONN

Client connection.

MQCHT_CLUSRCVR

Cluster-receiver.

MQCHT_CLUSSDR

Cluster-sender.

MQCHT_MQTT

Telemetry channel.

ClientChannelWeight (MQCFIN)

Client Channel Weight (parameter identifier: MQIACH_CLIENT_CHANNEL_WEIGHT).

The client channel weighting attribute is used so client channel definitions can be selected at random, with the larger weightings having a higher probability of selection, when more than one suitable definition is available.

The value can be 0 - 99. The default is 0.

This parameter is only valid for channels with a ChannelType of MQCHT_CLNTCONN

ClientIdentifier (MQCFST)

the clientId of the client (parameter identifier: MQCACH_CLIENT_ID).

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

ClusterNameList (MQCFST)

Cluster namelist (parameter identifier: MQCA_CLUSTER_NAMELIST).

CLWLChannelPriority (MQCFIN)

Channel priority (parameter identifier: MQIACH_CLWL_CHANNEL_PRIORITY).

CLWLChannelRank (MQCFIN)

Channel rank (parameter identifier: MQIACH_CLWL_CHANNEL_RANK).

CLWLChannelWeight (MQCFIN)

Channel weighting (parameter identifier: MQIACH_CLWL_CHANNEL_WEIGHT).

ConnectionAffinity (MQCFIN)

Channel Affinity (parameter identifier: MQIACH_CONNECTION_AFFINITY)

The channel affinity attribute specifies whether client applications that connect multiple times using the same queue manager name, use the same client channel. The value can be any of the following values:

MQCAFTY_PREFERRED

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any zero ClientChannelWeight definitions first in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful nonzero ClientChannelWeight definitions are moved to the end of the list. Zero ClientChannelWeight definitions remain at the start of the list and are selected first for each connection. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created. Each client process with the same host name creates the same list.

MQCAFTY_PREFERRED is the default, and has the value of 1.

MQCAFTY_NONE

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process independently select an applicable definition based on the weighting with any applicable zero ClientChannelWeight definitions selected first in alphabetical order. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created.

This parameter is only valid for channels with a ChannelType of MQCHT_CLNTCONN.

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

The maximum length of the string is MQ_CONN_NAME_LENGTH. On z/OS, it is MQ_LOCAL_ADDRESS_LENGTH.

The *ConnectionName* is a comma-separated list.

DataConversion (MQCFIN)

Whether sender must convert application data (parameter identifier: MQIACH_DATA_CONVERSION).

The value can be:

MQCDC_NO_SENDER_CONVERSION

No conversion by sender.

MQCDC_SENDER_CONVERSION

Conversion by sender.

z/OS DefaultChannelDisposition (MQCFIN)

Default channel disposition (parameter identifier: MQIACH_DEF_CHANNEL_DISP).

This parameter applies to z/OS only.

Specifies the intended disposition of the channel when active. The value can be any of the following values:

MQCHLD_PRIVATE

The intended use of the object is as a private channel.

MQCHLD_FIXSHARED

The intended use of the object is as a shared channel linked to a specific queue manager.

MQCHLD_SHARED

The intended use of the object is as a shared channel.

DiscInterval (MQCFIN)

Disconnection interval (parameter identifier: MQIACH_DISC_INTERVAL).

DefReconnect (MQCFIN)

Client channel default reconnection option (parameter identifier: MQIACH_DEF_RECONNECT).

The returned values can be:

MQRcn_NO

MQRcn_NO is the default value.

Unless overridden by **MQRcn_YES**, the client is not reconnected automatically.

MQRcn_YES

Unless overridden by **MQRcn_NO**, the client reconnects automatically.

MQRcn_Q_MGR

Unless overridden by **MQRcn_NO**, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO_RECONNECT_Q_MGR.

MQRcn_DISABLED

Reconnection is disabled, even if requested by the client program using the **MQRcn_YES** MQI call.

HeaderCompression (MQCFIL)

Header data compression techniques supported by the channel (parameter identifier: MQIACH_HDR_COMPRESSION). For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference.

The value can be one, or more, of

MQCOMPRESS_NONE

No header data compression is performed.

MQCOMPRESS_SYSTEM

Header data compression is performed.

HeartbeatInterval (MQCFIN)

Heartbeat interval (parameter identifier: MQIACH_HB_INTERVAL).

InDoubtInbound (MQCFIN)

Number of inbound messages to the client that are in doubt (Parameter identifier: MQIACH_IN_DOUBT_IN).

InDoubtOutbound (MQCFIN)

Number of outbound messages from the client that are in doubt (Parameter identifier: MQIACH_IN_DOUBT_OUT).

KeepAliveInterval (MQCFIN)

KeepAlive interval (parameter identifier: MQIACH_KEEP_ALIVE_INTERVAL).

LastMsgTime (MQCFST)

The time that the last message was sent or received (parameter identifier: MQCACH_LAST_MSG_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

LocalAddress (MQCFST)

Local communications address for the channel (parameter identifier: MQCACH_LOCAL_ADDRESS).

The maximum length of the string is MQ_LOCAL_ADDRESS_LENGTH.

LongRetryCount (MQCFIN)

Long retry count (parameter identifier: MQIACH_LONG_RETRY).

LongRetryInterval (MQCFIN)

Long timer (parameter identifier: MQIACH_LONG_TIMER).

MaxInstances (MQCFIN)

Maximum number of simultaneous instances of a server-connection channel (parameter identifier: MQIACH_MAX_INSTANCES).

This parameter is returned only for server-connection channels in response to an Inquire Channel call with ChannelAttrs including MQIACF_ALL or MQIACH_MAX_INSTANCES.

MaxInstancesPerClient (MQCFIN)

Maximum number of simultaneous instances of a server-connection channel that can be started from a single client (parameter identifier: MQIACH_MAX_INSTS_PER_CLIENT).

This parameter is returned only for server-connection channels in response to an Inquire Channel call with ChannelAttrs including MQIACF_ALL or MQIACH_MAX_INSTS_PER_CLIENT.

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: MQIACH_MAX_MSG_LENGTH).

MCAName (MQCFST)

Message channel agent name (parameter identifier: MQCACH_MCA_NAME).

The maximum length of the string is MQ_MCA_NAME_LENGTH.

MCAType (MQCFIN)

Message channel agent type (parameter identifier: MQIACH_MCA_TYPE).

The value can be any of the following values:

MQMCAT_PROCESS

Process.

MQMCAT_THREAD

Thread (Windows only).

MCAUserIdentifier (MQCFST)

Message channel agent user identifier (parameter identifier: MQCACH_MCA_USER_ID).

Note: An alternative way of providing a user ID for a channel to run under is to use channel authentication records. With channel authentication records, different connections can use the same channel while using different credentials. If both MCAUSER on the channel is set and channel authentication records are used to apply to the same channel, the channel authentication records

take precedence. The MCAUSER on the channel definition is only used if the channel authentication record uses USERSRC(CHANNEL). For more details, see [Channel authentication records](#)

The maximum length of the MCA user identifier depends on the environment in which the MCA is running. MQ_MCA_USER_ID_LENGTH gives the maximum length for the environment for which your application is running. MQ_MAX_MCA_USER_ID_LENGTH gives the maximum for all supported environments.

On Windows, the user identifier might be qualified with the domain name in the following format:

user@domain

MessageCompression (MQCFIL)

Message data compression techniques supported by the channel (parameter identifier: MQIACH_MSG_COMPRESSION). For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference.

The value can be one, or more, of:

MQCOMPRESS_NONE

No message data compression is performed.

MQCOMPRESS_RLE

Message data compression is performed using run-length encoding.

MQCOMPRESS_ZLIBFAST

Message data compression is performed using ZLIB encoding with speed prioritized.

MQCOMPRESS_ZLIBHIGH

Message data compression is performed using ZLIB encoding with compression prioritized.

MQCOMPRESS_ANY

Any compression technique supported by the queue manager can be used. MQCOMPRESS_ANY is only valid for receiver, requester, and server-connection channels.

ModeName (MQCFST)

Mode name (parameter identifier: MQCACH_MODE_NAME).

The maximum length of the string is MQ_MODE_NAME_LENGTH.

MsgExit (MQCFST)

Message exit name (parameter identifier: MQCACH_MSG_EXIT_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

 On [Multiplatforms](#), if more than one message exit has been defined for the channel, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

 On z/OS, an MQCFSL structure is always used.

MsgsReceived (MQCFIN64)

The number of messages received by the client since it last connected (parameter identifier: MQIACH_MSGS_RECEIVED / MQIACH_MSGS_RCVD).

MsgRetryCount (MQCFIN)

Message retry count (parameter identifier: MQIACH_MR_COUNT).

MsgRetryExit (MQCFST)

Message retry exit name (parameter identifier: MQCACH_MR_EXIT_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

MsgRetryInterval (MQCFIN)

Message retry interval (parameter identifier: MQIACH_MR_INTERVAL).

MsgRetryUserData (MQCFST)

Message retry exit user data (parameter identifier: MQCACH_MR_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

MsgsSent (MQCFIN64)

The number of messages sent by the client since it last connected (parameter identifier: MQIACH_MSGS_SENT).

MsgUserData (MQCFST)

Message exit user data (parameter identifier: MQCACH_MSG_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

Multi On Multiplatforms, if more than one message exit has been defined for the channel, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

NetworkPriority (MQCFIN)

Network priority (parameter identifier: MQIACH_NETWORK_PRIORITY).

NonPersistentMsgSpeed (MQCFIN)

Speed at which non-persistent messages are to be sent (parameter identifier: MQIACH_NPM_SPEED).

The value can be:

MQNPMS_NORMAL

Normal speed.

MQNPMS_FAST

Fast speed.

Password (MQCFST)

Password (parameter identifier: MQCACH_PASSWORD).

If a nonblank password is defined, it is returned as asterisks. Otherwise, it is returned as blanks.

The maximum length of the string is MQ_PASSWORD_LENGTH. However, only the first 10 characters are used.

PropertyControl (MQCFIN)

Property control attribute (parameter identifier MQIA_PROPERTY_CONTROL).

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor). The value can be any of the following values:

MQPROP_COMPATIBILITY

<i>Table 207. Range of results, depending on which message properties are set, when PropertyControl value is MQPROP_COMPATIBILITY</i>	
Message properties	Result
The message contains a property with a prefix of mcd. , jms. , usr. or mqext.	All optional message properties (where the Support value is MQPD_SUPPORT_OPTIONAL), except those properties in the message descriptor or extension, are placed in one or more MQRFH2 headers in the message data before the message is sent to the remote queue manager.
The message does not contain a property with a prefix of mcd. , jms. , usr. or mqext.	All message properties, except those properties in the message descriptor or extension, are removed from the message before the message is sent to the remote queue manager.

Table 207. Range of results, depending on which message properties are set, when PropertyControl value is MQPROP_COMPATIBILITY (continued)

Message properties	Result
The message contains a property where the Support field of the property descriptor is not set to MQPD_SUPPORT_OPTIONAL	The message is rejected with reason MQRC_UNSUPPORTED_PROPERTY and treated in accordance with its report options.
The message contains one or more properties where the Support field of the property descriptor is set to MQPD_SUPPORT_OPTIONAL but other fields of the property descriptor are set to non-default values	The properties with non-default values are removed from the message before the message is sent to the remote queue manager.
The MQRFH2 folder that would contain the message property needs to be assigned with the <i>content='properties'</i> attribute	The properties are removed to prevent MQRFH2 headers with unsupported syntax flowing to a V6 or prior queue manager.

MQPROP_NONE

All properties of the message, except those properties in the message descriptor or extension, are removed from the message before the message is sent to the remote queue manager.

If the message contains a property where the **Support** field of the property descriptor is not set to MQPD_SUPPORT_OPTIONAL then the message is rejected with reason MQRC_UNSUPPORTED_PROPERTY and treated in accordance with its report options.

MQPROP_ALL

All properties of the message are included with the message when it is sent to the remote queue manager. The properties, except those properties in the message descriptor (or extension), are placed in one or more MQRFH2 headers in the message data.

This attribute is applicable to Sender, Server, Cluster Sender, and Cluster Receiver channels.

PutAuthority (MQCFIN)

Put authority (parameter identifier: MQIACH_PUT_AUTHORITY).

The value can be any of the following values:

MQPA_DEFAULT

Default user identifier is used.

MQPA_CONTEXT

Context user identifier is used.

QMgrName (MQCFST)

Queue manager name (parameter identifier: MQCA_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

z/OS QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid only on z/OS. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

ReceiveExit (MQCFST)

Receive exit name (parameter identifier: MQCACH_RCV_EXIT_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

Multi On Multiplatforms, if more than one receive exit has been defined for the channel, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

ReceiveUserData (MQCFST)

Receive exit user data (parameter identifier: MQCACH_RCV_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

Multi On Multiplatforms, if more than one receive exit user data string has been defined for the channel, the list of strings is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

ResetSeq (MQCFIN)

Pending reset sequence number (parameter identifier: MQIACH_RESET_REQUESTED).

This is the sequence number from an outstanding request and it indicates a user Reset Channel command request is outstanding.

A value of zero indicates that there is no outstanding Reset Channel. The value can be in the range 1 - 999999999.

Possible return values include MQCHRR_RESET_NOT_REQUESTED.

This parameter is not applicable on z/OS.

SecurityExit (MQCFST)

Security exit name (parameter identifier: MQCACH_SEC_EXIT_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

SecurityUserData (MQCFST)

Security exit user data (parameter identifier: MQCACH_SEC_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

SendExit (MQCFST)

Send exit name (parameter identifier: MQCACH_SEND_EXIT_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

Multi On Multiplatforms, if more than one send exit has been defined for the channel, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

SendUserData (MQCFST)

Send exit user data (parameter identifier: MQCACH_SEND_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

Multi On Multiplatforms, if more than one send exit user data string has been defined for the channel, the list of strings is returned in an MQCFSL structure instead of an MQCFST structure.

▶ z/OS

On z/OS, an MQCFSL structure is always used.

SeqNumberWrap (MQCFIN)

Sequence wrap number (parameter identifier: MQIACH_SEQUENCE_NUMBER_WRAP).

SharingConversations (MQCFIN)

Number of sharing conversations (parameter identifier: MQIACH_SHARING_CONVERSATIONS).

This parameter is returned only for TCP/IP client-connection and server-connection channels.

ShortRetryCount (MQCFIN)

Short retry count (parameter identifier: MQIACH_SHORT_RETRY).

ShortRetryInterval (MQCFIN)

Short timer (parameter identifier: MQIACH_SHORT_TIMER).

▶ z/OS

SPLProtection (MQCFIN)

SPLProtection (parameter identifier: MQIACH_SPL_PROTECTION). This parameter applies to z/OS only, from IBM MQ 9.1.3 onwards.

Security policy protection parameter. Specifies what happens to messages across the channel when Advanced Message Security is active and an applicable policy exists.

This parameter is valid for channel types MQCHT_SENDER, MQCHT_SERVER, MQCHT_RECEIVER, and MQCHT_REQUESTER only.

Possible values are:

MQSPL_PASSTHRU

Pass through, unchanged, any messages sent or received by the message channel agent for this channel.

This value is valid only for *ChannelType* values of MQCHT_SENDER, MQCHT_SERVER, MQCHT_RECEIVER, or MQCHT_REQUESTER, and is the default value.

MQSPL_REMOVE

Remove any AMS protection from messages retrieved from the transmission queue by the message channel agent, and send the messages to the partner.

When the MCA gets a message from the transmission queue, if an AMS policy is defined for the transmission queue, it is applied to remove any AMS protection from the message prior to sending the message across the channel. If an AMS policy is not defined for the transmission queue, the message is sent as is.

This value is valid only for *ChannelType* values of MQCHT_SENDER or MQCHT_SERVER.

MQSPL_AS_POLICY

Based on the policy defined for the target queue, apply AMS protection to inbound messages prior to putting them on to the target queue.

When the message channel agent receives an inbound message, if an AMS policy is defined for the target queue, AMS protection is applied to the message prior to the message being put to the target queue. If an AMS policy is not defined for the target queue, the message is put to the target queue as is.

This value is valid only for *ChannelType* values of MQCHT_RECEIVER or MQCHT_REQUESTER.

SSLCipherSpec (MQCFST)

CipherSpec (parameter identifier: MQCACH_SSL_CIPHER_SPEC).

The length of the string is MQ_SSL_CIPHER_SPEC_LENGTH.

SSLCipherSuite (MQCFST)

CipherSuite (parameter identifier: MQCACH_SSL_CIPHER_SUITE).

The length of the string is MQ_SSL_CIPHER_SUITE_LENGTH.

SSLClientAuth (MQCFIN)

Client authentication (parameter identifier: MQIACH_SSL_CLIENT_AUTH).

The value can be

MQSCA_REQUIRED

Client authentication required

MQSCA_OPTIONAL

Client authentication is optional.

The following value is also valid for Channels of type MQCHT_MQTT:

MQSCA_NEVER_REQUIRED

Client authentication is never required, and must not be provided.

Defines whether IBM MQ requires a certificate from the TLS client.

SSLPeerName (MQCFST)

Peer name (parameter identifier: MQCACH_SSL_PEER_NAME).

Note: An alternative way of restricting connections into channels by matching against the TLS Subject Distinguished Name, is to use channel authentication records. With channel authentication records, different TLS Subject Distinguished Name patterns can be applied to the same channel. If both SSLPEER on the channel and a channel authentication record are used to apply to the same channel, the inbound certificate must match both patterns in order to connect. For more information, see [Channel authentication records](#).

The length of the string is MQ_SSL_PEER_NAME_LENGTH. On z/OS, it is MQ_SSL_SHORT_PEER_NAME_LENGTH.

Specifies the filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel. (A Distinguished Name is the identifier of the TLS certificate.) If the Distinguished Name in the certificate received from the peer does not match the SSLPEER filter, the channel does not start.

TpName (MQCFST)

Transaction program name (parameter identifier: MQCACH_TP_NAME).

The maximum length of the string is MQ_TP_NAME_LENGTH.

TransportType (MQCFIN)

Transmission protocol type (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value might be:

MQXPT_LU62

LU 6.2.

MQXPT_TCP

TCP.

MQXPT_NETBIOS

NetBIOS.

MQXPT_SPX

SPX.

MQXPT_DECNET

DECnet.

UseDLQ (MQCFIN)

Whether the dead-letter queue (or undelivered message queue) should be used when messages cannot be delivered by channels (parameter identifier: MQIA_USE_DEAD_LETTER_Q).

The value might be:

MQUSEDLQ_NO

Messages that cannot be delivered by a channel will be treated as a failure and either the channel will discard them, or the channel will end, in accordance with the setting of NPMSPEED.

MQUSEDLQ_YES

If the queue manager DEADQ attribute provides the name of a dead-letter queue then it will be used, otherwise the behavior will be as for MQUSEDLQ_NO.

UserIdentifier (MQCFST)

Task user identifier (parameter identifier: MQCACH_USER_ID).

The maximum length of the string is MQ_USER_ID_LENGTH. However, only the first 10 characters are used.

XmitQName (MQCFST)

Transmission queue name (parameter identifier: MQCACH_XMIT_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

z/OS MQCMD_INQUIRE_CHANNEL_INIT (Inquire Channel Initiator) on z/OS

The Inquire Channel Initiator (MQCMD_INQUIRE_CHANNEL_INIT) PCF command returns information about the channel initiator.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

z/OS MQCMD_INQUIRE_CHANNEL_INIT (Inquire Channel Initiator) Response on z/OS

The response to the Inquire Channel Initiator (MQCMD_INQUIRE_CHANNEL_INIT) PCF command consists of one response with a series of attribute parameter structures showing the status of the channel initiator (shown by the *ChannelInitiatorStatus* parameter), and one response for each listener (shown by the **ListenerStatus** parameter).

Always returned (one message with channel initiator information):

ActiveChannels, ActiveChannelsMax, ActiveChannelsPaused, ActiveChannelsRetrying, ActiveChannelsStarted, ActiveChannelsStopped, AdaptersMax, AdaptersStarted, ChannelInitiatorStatus, CurrentChannels, CurrentChannelsLU62, CurrentChannelsMax, CurrentChannelsTCP, DispatchersMax, DispatchersStarted, SSLTasksStarted, TCPName

Always returned (one message for each listener):

InboundDisposition, ListenerStatus, TransportType

Returned if applicable for the listener:

IPAddress, LUName, Port

Response data - channel initiator information

ActiveChannels (MQCFIN)

The number of active channel connections (parameter identifier: MQIACH_ACTIVE_CHL).

ActiveChannelsMax (MQCFIN)

The requested number of active channel connections (parameter identifier: MQIACH_ACTIVE_CHL_MAX).

ActiveChannelsPaused (MQCFIN)

The number of active channel connections that have paused, waiting to become active, because the limit for active channels has been reached (parameter identifier: MQIACH_ACTIVE_CHL_PAUSED).

ActiveChannelsRetrying (MQCFIN)

The number of active channel connections that are attempting to reconnect following a temporary error (parameter identifier: MQIACH_ACTIVE_CHL_RETRY).

ActiveChannelsStarted (MQCFIN)

The number of active channel connections that have started (parameter identifier: MQIACH_ACTIVE_CHL_STARTED).

ActiveChannelsStopped (MQCFIN)

The number of active channel connections that have stopped, requiring manual intervention (parameter identifier: MQIACH_ACTIVE_CHL_STOPPED).

AdaptersMax (MQCFIN)

The requested number of adapter subtasks (parameter identifier: MQIACH_ADAPS_MAX).

AdaptersStarted (MQCFIN)

The number of active adapter subtasks (parameter identifier: MQIACH_ADAPS_STARTED).

ChannelInitiatorStatus (MQCFIN)

Status of the channel initiator (parameter identifier: MQIACH_CHINIT_STATUS).

The value can be:

MQSVC_STATUS_STOPPED

The channel initiator is not running.

MQSVC_STATUS_RUNNING

The channel initiator is fully initialized and is running.

CurrentChannels (MQCFIN)

The number of current channel connections (parameter identifier: MQIACH_CURRENT_CHL).

CurrentChannelsLU62 (MQCFIN)

The number of current LU 6.2 channel connections (parameter identifier: MQIACH_CURRENT_CHL_LU62).

CurrentChannelsMax (MQCFIN)

The requested number of channel connections (parameter identifier: MQIACH_CURRENT_CHL_MAX).

CurrentChannelsTCP (MQCFIN)

The number of current TCP/IP channel connections (parameter identifier: MQIACH_CURRENT_CHL_TCP).

DispatchersMax (MQCFIN)

The requested number of dispatchers (parameter identifier: MQIACH_DISPS_MAX).

DispatchersStarted (MQCFIN)

The number of active dispatchers (parameter identifier: MQIACH_DISPS_STARTED).

SSLTasksMax (MQCFIN)

The requested number of TLS server subtasks (parameter identifier: MQIACH_SSLTASKS_MAX).

SSLTasksStarted (MQCFIN)

The number of active TLS server subtasks (parameter identifier: MQIACH_SSLTASKS_STARTED).

TCPName (MQCFST)

TCP system name (parameter identifier: MQCACH_TCP_NAME).

The maximum length is MQ_TCP_NAME_LENGTH.

Response data - listener information

InboundDisposition (MQCFIN)

Inbound transmission disposition (parameter identifier: MQIACH_INBOUND_DISP).

Specifies the disposition of the inbound transmissions that the listener handles. The value can be any of the following values:

MQINBD_Q_MGR

Handling for transmissions directed to the queue manager. MQINBD_Q_MGR is the default.

MQINBD_GROUP

Handling for transmissions directed to the queue sharing group. MQINBD_GROUP is permitted only if there is a shared queue manager environment.

IPAddress (MQCFST)

IP address on which the listener listens (parameter identifier: MQCACH_IP_ADDRESS).

ListenerStatus (MQCFIN)

Listener status (parameter identifier: MQIACH_LISTENER_STATUS).

The value can be:

MQSVC_STATUS_RUNNING

The listener has started.

MQSVC_STATUS_STOPPED

The listener has stopped.

MQSVC_STATUS_RETRYING

The listener is trying again.

LUName (MQCFST)

LU name on which the listener listens (parameter identifier: MQCACH_LU_NAME).

The maximum length is MQ_LU_NAME_LENGTH.

Port (MQCFIN)

Port number on which the listener listens (parameter identifier: MQIACH_PORT_NUMBER).

TransportType (MQCFIN)

Transmission protocol type that the listener is using (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value can be:

MQXPT_LU62

LU62.

MQXPT_TCP

TCP.

MQCMD_INQUIRE_CHANNEL_NAMES (Inquire Channel Names)

The Inquire Channel Names (MQCMD_INQUIRE_CHANNEL_NAMES) PCF command inquires a list of IBM MQ channel names that match the generic channel name, and the optional channel type specified.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Optional parameters

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

If present, this parameter limits the channel names returned to channels of the specified type.

The value can be any of the following values:

MQCHT_SENDER

Sender.

MQCHT_SERVER

Server.

MQCHT_RECEIVER

Receiver.

MQCHT_REQUESTER

Requester.

MQCHT_SVRCONN

Server-connection (for use by clients).

MQCHT_CLNTCONN

Client connection.

MQCHT_CLUSRCVR

Cluster-receiver.

MQCHT_CLUSSDR

Cluster-sender.

MQCHT_ALL

All types.

The default value if this parameter is not specified is MQCHT_ALL, which means that channels of all types except MQCHT_CLNTCONN are eligible.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined with either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

Error code

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_TYPE_ERROR

Channel type not valid.

MQCMD_INQUIRE_CHANNEL_NAMES (Inquire Channel Names) Response

The response to the Inquire Channel Names (MQCMD_INQUIRE_CHANNEL_NAMES) PCF command consists of one response for each client connection channel (except for SYSTEM.DEF.CLNTCONN), and a final message with all the remaining channels.

Always returned:

ChannelNames, ChannelTypes

Returned if requested:

None

 On z/OS only, one additional parameter structure (with the same number of entries as the *ChannelNames* structure), is returned. Each entry in the structure, *QSGDispositions*, indicates the disposition of the object with the corresponding entry in the *ChannelNames* structure.

Response data**ChannelNames (MQCFSL)**

List of channel names (parameter identifier: MQCACH_CHANNEL_NAMES).

ChannelTypes (MQCFIL)

List of channel types (parameter identifier: MQIACH_CHANNEL_TYPES). Possible values for fields in this structure are those values permitted for the **ChannelType** parameter, except MQCHT_ALL.

QSGDispositions (MQCFIL)

List of queue sharing group dispositions (parameter identifier: MQIACF_QSG_DISPS). This parameter is valid only on z/OS. The value can be:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQCMD_INQUIRE_CHANNEL_STATUS (Inquire Channel Status)

The Inquire Channel Status (MQCMD_INQUIRE_CHANNEL_STATUS) PCF command inquires about the status of one or more channel instances.

You must specify the name of the channel for which you want to inquire status information. This name can be a specific channel name or a generic channel name. By using a generic channel name, you can inquire either:

- Status information for all channels, or
- Status information for one or more channels that match the specified name.

You must also specify whether you want:

- The status data (of current channels only), or
- The saved status data of all channels, or
- On z/OS only, the short status data of the channel.

Status for all channels that meet the selection criteria is returned, whether the channels were defined manually or automatically.

Selection

The way to make a selection, is to use one of the following options:

- **XmitQname** (MQCACH_XMIT_Q_NAME)
- **ConnectionName** (MQCACH_CONNECTION_NAME)
- **z/OS ChannelType** (MQIACH_CHANNEL_TYPE)
- **ChannelInstanceType** (MQIACH_CHANNEL_INSTANCE_TYPE)
- **ChannelSummaryAttrs** (MQIACH_CHANNEL_SUMMARY_ATTRS)
- **ClientID** (MQCACH_CLIENT_ID)

Multi

This command includes a check on the current depth of the transmission queue for the channel, if the channel is a CLUSSDR channel. To issue this command, you must be authorized to inquire the queue depth, and to do this requires *+inq* authority on the transmission queue. Note that another name for this authority is MQZAO_INQUIRE.

Multi

Without this authority this command runs without error, but a value of zero is output for the **MsgsAvailable** parameter of the “MQCMD_INQUIRE_CHANNEL_STATUS (Inquire Channel Status) Response” on page 1260 command. If you have the correct authority, the command provides the correct value for **MsgsAvailable**.

There are three classes of data available for channel status. These classes are **saved**, **current**, and **short**. The status fields available for saved data are a subset of the fields available for current data and are called **common** status fields. Although the common data *fields* are the same, the data *values* might

be different for saved and current status. The rest of the fields available for current data are called **current-only** status fields.

- **Saved** data consists of the common status fields. This data is reset at the following times:
 - For all channels:
 - When the channel enters or leaves STOPPED or RETRY state
 - For a sending channel:
 - Before requesting confirmation that a batch of messages has been received
 - When confirmation has been received
 - For a receiving channel:
 - Just before confirming that a batch of messages has been received
 - For a server connection channel:
 - No data is saved

Therefore, a channel which has never been current does not have any saved status.

- **Current** data consists of the common status fields and current-only status fields. The data fields are continually updated as messages are sent or received.
- **Short** data consists of the queue manager name that owns the channel instance. This class of data is available only on z/OS.

This method of operation has the following consequences:

- An inactive channel might not have any saved status if it has never been current or has not yet reached a point where saved status is reset.
- The "common" data fields might have different values for saved and current status.
- A current channel always has current status and might have saved status.

Channels can be current or inactive:

Current channels

These are channels that have been started, or on which a client has connected, and that have not finished or disconnected normally. They might not yet have reached the point of transferring messages, or data, or even of establishing contact with the partner. Current channels have **current** status and can also have **saved** or **short** status.

The term **Active** is used to describe the set of current channels which are not stopped.

Inactive channels

These are channels that have either not been started or on which a client has not connected, or that have finished or disconnected normally. (If a channel is stopped, it is not yet considered to have finished normally and is, therefore, still current.) Inactive channels have either **saved** status or no status at all.

There can be more than one instance of a receiver, requester, cluster-sender, cluster-receiver, or server-connection channel current at the same time (the requester is acting as a receiver). This situation occurs if several senders, at different queue managers, each initiate a session with this receiver, using the same channel name. For channels of other types, there can only be one instance current at any time.

For all channel types, however, there can be more than one set of saved status information available for a particular channel name. At most one of these sets relates to a current instance of the channel, the rest relate to previously current instances. Multiple instances arise if different transmission queue names or connection names have been used with the same channel. This situation can happen in the following cases:

- At a sender or server:
 - If the same channel has been connected to by different requesters (servers only),
 - If the transmission queue name has been changed in the definition, or

- If the connection name has been changed in the definition.
- At a receiver or requester:
 - If the same channel has been connected to by different senders or servers, or
 - If the connection name has been changed in the definition (for requester channels initiating connection).

The number of sets returned for a particular channel can be limited by using the **XmitQName**, **ConnectionName** and **ChannelInstanceType** parameters.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The channel name is always returned, regardless of the instance attributes requested.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Optional parameters

ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH_CHANNEL_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels for which information is to be returned. The value can be any of the following values:

MQCHLD_ALL

Returns requested status information for private channels.

In a shared queue environment where the command is being executed on the queue manager where it was issued, or if *ChannelInstanceType* has a value of MQOT_CURRENT_CHANNEL, this option also displays the requested status information for shared channels.

MQCHLD_PRIVATE

Returns requested status information for private channels.

MQCHLD_SHARED

Returns requested status information for shared channels.

The status information that is returned for various combinations of *ChannelDisposition*, *CommandScope*, and status type, is summarized in [Table 208 on page 1247](#), [Table 209 on page 1248](#), and [Table 210 on page 1248](#).

<i>Table 208. ChannelDisposition and CommandScope for Inquire Channel Status, Current</i>			
ChannelDisposition	CommandScope blank or local queue manager	CommandScope (qmgr-name)	CommandScope (*)
MQCHLD_PRIVATE	Common and current-only status for current private channels on the local queue manager	Common and current-only status for current private channels on the named queue manager	Common and current-only status for current private channels on all queue managers
MQCHLD_SHARED	Common and current-only status for current shared channels on the local queue manager	Common and current-only status for current shared channels on the named queue manager	Common and current-only status for current shared channels on all queue managers

<i>Table 208. ChannelDisposition and CommandScope for Inquire Channel Status, Current (continued)</i>			
ChannelDisposition	CommandScope blank or local queue manager	CommandScope (qmgr-name)	CommandScope (*)
MQCHLD_ALL	Common and current-only status for current private and shared channels on the local queue manager	Common and current-only status for current private and shared channels on the named queue manager	Common and current-only status for current private and shared channels on all active queue managers

<i>Table 209. ChannelDisposition and CommandScope for Inquire Channel Status, Short</i>			
ChannelDisposition	CommandScope blank or local queue manager	CommandScope (qmgr-name)	CommandScope (*)
MQCHLD_PRIVATE	<i>ChannelStatus</i> and short status for current private channels on the local queue manager	<i>ChannelStatus</i> and short status for current private channels on the named queue manager	<i>ChannelStatus</i> and short status for current private channels on all active queue managers
MQCHLD_SHARED	<i>ChannelStatus</i> and short status for current shared channels on all active queue managers in the queue sharing group	Not permitted	Not permitted
MQCHLD_ALL	<i>ChannelStatus</i> and short status for current private channels on the local queue manager and current shared channels in the queue sharing group(<u>"1"</u> on page 1248)	<i>ChannelStatus</i> and short status for current private channels on the named queue manager	<i>ChannelStatus</i> and short status for current private, and shared, channels on all active queue managers in the queue sharing group(<u>"1"</u> on page 1248)

Note:

1. In this case you get two separate sets of responses to the command on the queue manager where it was entered; one for MQCHLD_PRIVATE and one for MQCHLD_SHARED.

<i>Table 210. ChannelDisposition and CommandScope for Inquire Channel Status, Saved</i>			
ChannelDisposition	CommandScope blank or local queue manager	CommandScope (qmgr-name)	CommandScope (*)
MQCHLD_PRIVATE	Common status for saved private channels on the local queue manager	Common status for saved private channels on the named queue manager	Common status for saved private channels on all active queue managers
MQCHLD_SHARED	Common status for saved shared channels on all active queue managers in the queue sharing group	Not permitted	Not permitted
MQCHLD_ALL	Common status for saved private channels on the local queue manager and saved shared channels in the queue sharing group	Common status for saved private channels on the named queue manager	Common status for saved private, and shared, channels on all active queue managers in the queue sharing group

You cannot use this parameter as a filter keyword.

ChannelInstanceAttrs (MQCFIL)

Channel instance attributes (parameter identifier: MQIACH_CHANNEL_INSTANCE_ATTRS).

The **ChannelInstanceAttrs** parameter names the list of attributes to be returned. This parameter does not provide any way to select, based upon the value of the items in that list of attributes.

If status information is requested which is not relevant for the particular channel type, it is not an error. Similarly, it is not an error to request status information that is applicable only to active channels for saved channel instances. In both of these cases, no structure is returned in the response for the information concerned.

For a saved channel instance, the MQCACH_CURRENT_LUWID, MQIACH_CURRENT_MSGS, and MQIACH_CURRENT_SEQ_NUMBER attributes have meaningful information only if the channel instance is in doubt. However, the attribute values are still returned when requested, even if the channel instance is not in-doubt.

The attribute list might specify the following value on its own:

MQIACF_ALL

All attributes.

MQIACF_ALL is the default value used if the parameter is not specified or it can specify a combination of the following:

- Relevant for common status:

The following information applies to all sets of channel status, whether the set is current.

MQCACH_CHANNEL_NAME

Channel name.

MQCACH_CONNECTION_NAME

Connection name.

MQCACH_CURRENT_LUWID

Logical unit of work identifier for current batch.

MQCACH_LAST_LUWID

Logical unit of work identifier for last committed batch.

MQCACH_XMIT_Q_NAME

Transmission queue name.

MQIACH_CHANNEL_INSTANCE_TYPE

Channel instance type.

MQIACH_CHANNEL_TYPE

Channel type.

MQIACH_CURRENT_MSGS

Number of messages sent or received in current batch.

MQIACH_CURRENT_SEQ_NUMBER

Sequence number of last message sent or received.

MQIACH_INDOUBT_STATUS

Whether the channel is currently in-doubt.

MQIACH_LAST_SEQ_NUMBER

Sequence number of last message in last committed batch.

MQCACH_CURRENT_LUWID, MQCACH_LAST_LUWID, MQIACH_CURRENT_MSGS, MQIACH_CURRENT_SEQ_NUMBER, MQIACH_INDOUBT_STATUS and MQIACH_LAST_SEQ_NUMBER do not apply to server-connection channels, and no values are returned. If specified on the command, they are ignored.

- Relevant for current-only status:

The following information applies only to current channel instances. The information applies to all channel types, except where stated.

MQCA_Q_MGR_NAME

Name of the queue manager that owns the channel instance. This parameter is valid only on z/OS.

MQCA_REMOTE_Q_MGR_NAME

Queue manager name, or queue sharing group name of the remote system. The remote queue manager name is always returned regardless of the instance attributes requested.

MQCACH_CHANNEL_START_DATE

Date channel was started.

MQCACH_CHANNEL_START_TIME

Time channel was started.

MQCACH_LAST_MSG_DATE

Date last message was sent, or MQI call was handled.

MQCACH_LAST_MSG_TIME

Time last message was sent, or MQI call was handled.

MQCACH_LOCAL_ADDRESS

Local communications address for the channel.

MQCACH_MCA_JOB_NAME

Name of MCA job.

This parameter is not valid on z/OS.

You cannot use MQCACH_MCA_JOB_NAME as a parameter to filter on.

MQCACH_MCA_USER_ID

The user ID used by the MCA.

MQCACH_REMOTE_APPL_TAG

Remote partner application name. MQCACH_REMOTE_APPL_TAG is the name of the client application at the remote end of the channel. This parameter applies only to server-connection channels.

MQCACH_REMOTE_PRODUCT

Remote partner product identifier. This is the product identifier of the IBM MQ code running at the remote end of the channel.

MQCACH_REMOTE_VERSION

Remote partner version. This is the version of the IBM MQ code running at the remote end of the channel.

MQCACH_SSL_CIPHER_SPEC

CipherSpec in use on the connection.

MQCACH_SSL_SHORT_PEER_NAME

TLS short peer name.

MQCACH_SSL_CERT_ISSUER_NAME

The full Distinguished Name of the issuer of the remote certificate.

z/OS **MQCACH_SSL_CERT_USER_ID**

User ID associated with the remote certificate; valid on z/OS only.

MQCACH_TOPIC_ROOT

Topic root for AMQP channel.

MQIA_MONITORING_CHANNEL

The level of monitoring data collection.

z/OS **MQIA_STATISTICS_CHANNEL**

The level of statistics data collection; valid on z/OS only.

MQIACF_MONITORING

All channel status monitoring attributes. These attributes are:

MQIA_MONITORING_CHANNEL

The level of monitoring data collection.

MQIACH_BATCH_SIZE_INDICATOR

Batch size.

MQIACH_COMPRESSION_RATE

The compression rate achieved displayed to the nearest percentage.

MQIACH_COMPRESSION_TIME

The amount of time per message, displayed in microseconds, spent during compression or decompression.

MQIACH_EXIT_TIME_INDICATOR

Exit time.

MQIACH_NETWORK_TIME_INDICATOR

Network time.

MQIACH_XMITQ_MSGS_AVAILABLE

Number of messages available to the channel on the transmission queue.

MQIACH_XMITQ_TIME_INDICATOR

Time on transmission queue.

You cannot use MQIACF_MONITORING as a parameter to filter on.

MQIACH_BATCH_SIZE_INDICATOR

Batch size.

You cannot use MQIACH_BATCH_SIZE_INDICATOR as a parameter to filter on.

MQIACH_BATCHES

Number of completed batches.

MQIACH_BUFFERS_RCVD

Number of buffers received.

MQIACH_BUFFERS_SENT

Number of buffers sent.

MQIACH_BYTES_RCVD

Number of bytes received.

MQIACH_BYTES_SENT

Number of bytes sent.

MQIACH_CHANNEL_SUBSTATE

The channel substate.

MQIACH_COMPRESSION_RATE

The compression rate achieved displayed to the nearest percentage.

You cannot use MQIACH_COMPRESSION_RATE as a parameter to filter on.

MQIACH_COMPRESSION_TIME

The amount of time per message, displayed in microseconds, spent during compression or decompression.

You cannot use MQIACH_COMPRESSION_TIME as a parameter to filter on.

MQIACH_CURRENT_SHARING_CONVS

Requests information about the current number of conversations on this channel instance.

This attribute applies only to TCP/IP server-connection channels.

MQIACH_EXIT_TIME_INDICATOR

Exit time.

You cannot use MQIACH_EXIT_TIME_INDICATOR as a parameter to filter on.

MQIACH_HDR_COMPRESSION

Technique used to compress the header data sent by the channel.

MQIACH_KEEP_ALIVE_INTERVAL

The KeepAlive interval in use for this session. This parameter is significant only for z/OS.

MQIACH_LONG_RETRIES_LEFT

Number of long retry attempts remaining.

MQIACH_MAX_MSG_LENGTH

Maximum message length. MQIACH_MAX_MSG_LENGTH is valid only on z/OS.

MQIACH_MAX_SHARING_CONVS

Requests information about the maximum number of conversations on this channel instance.

This attribute applies only to TCP/IP server-connection channels.

MQIACH_MCA_STATUS

MCA status.

You cannot use MQIACH_MCA_STATUS as a parameter to filter on.

MQIACH_MSG_COMPRESSION

Technique used to compress the message data sent by the channel.

MQIACH_MSGS

Number of messages sent or received, or number of MQI calls handled.

MQIACH_NETWORK_TIME_INDICATOR

Network time.

You cannot use MQIACH_NETWORK_TIME_INDICATOR as a parameter on which to filter.

MQIACH_SECURITY_PROTOCOL

Security protocol currently in use.

This parameter does not apply to client-connection channels.

 From IBM MQ 9.1.1, this parameter is supported on z/OS.

MQIACH_SHORT_RETRIES_LEFT

Number of short retry attempts remaining.

MQIACH_SSL_KEY_RESETS

Number of successful TLS key resets.

MQIACH_SSL_RESET_DATE

Date of previous successful TLS secret key reset.

MQIACH_SSL_RESET_TIME

Time of previous successful TLS secret key reset.

MQIACH_STOP_REQUESTED

Whether user stop request has been received.

MQIACH_XMITQ_MSGS_AVAILABLE

Number of messages available to the channel on the transmission queue.

MQIACH_XMITQ_TIME_INDICATOR

Time on transmission queue.

You cannot use MQIACH_XMITQ_TIME_INDICATOR as a parameter to filter on.

The following value is supported on all platforms:

MQIACH_BATCH_SIZE

Batch size.

The following value is supported on all platforms:

MQIACH_HB_INTERVAL

Heartbeat interval (seconds).

MQIACH_NPM_SPEED

Speed of nonpersistent messages.

The following attributes do not apply to server-connection channels, and no values are returned. If specified on the command they are ignored:

- MQIACH_BATCH_SIZE_INDICATOR
- MQIACH_BATCH_SIZE
- MQIACH_BATCHES
- MQIACH_LONG_RETRIES_LEFT
- MQIACH_NETWORK_TIME
- MQIACH_NPM_SPEED
- MQCA_REMOTE_Q_MGR_NAME
- MQIACH_SHORT_RETRIES_LEFT
- MQIACH_XMITQ_MSGS_AVAILABLE
- MQIACH_XMITQ_TIME_INDICATOR

The following attributes apply only to server-connection channels. If specified on the command for other types of channel the attribute is ignored and no value is returned:

- MQIACH_CURRENT_SHARING_CONVS
- MQIACH_MAX_SHARING_CONVS

-  Relevant for short status:

The following parameter applies to current channels on z/OS:

MQCACH_Q_MGR_NAME

Name of the queue manager that owns the channel instance.

ChannelInstanceType (MQCFIN)

Channel instance type (parameter identifier: MQIACH_CHANNEL_INSTANCE_TYPE).

It is always returned regardless of the channel instance attributes requested.

The value can be:

MQOT_CURRENT_CHANNEL

The channel status.

MQOT_CURRENT_CHANNEL is the default, and indicates that only current status information for active channels is to be returned.

Both common status information and active-only status information can be requested for current channels.

MQOT_SAVED_CHANNEL

Saved channel status.

Specify MQOT_SAVED_CHANNEL to cause saved status information for both active and inactive channels to be returned.

Only common status information can be returned. Active-only status information is not returned for active channels if this keyword is specified.

• **MQOT_SHORT_CHANNEL**

Short channel status (valid on z/OS only).

Specify MQOT_SHORT_CHANNEL to cause short status information for current channels to be returned.

Other common status and current-only status information are not returned for current channels if this keyword is specified.

You cannot use MQIACH_CHANNEL_INSTANCE_TYPE as a parameter to filter on.

z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

If this parameter is present, eligible channel instances are limited to those using this connection name. If it is not specified, eligible channel instances are not limited in this way.

The connection name is always returned, regardless of the instance attributes requested.

The value returned for *ConnectionName* might not be the same as in the channel definition, and might differ between the current channel status and the saved channel status. (Using *ConnectionName* for limiting the number of sets of status is therefore not recommended.)

For example, when using TCP, if *ConnectionName* in the channel definition:

- Is blank or is in *host name* format, the channel status value has the resolved IP address.
- Includes the port number, the current channel status value includes the port number (except on z/OS), but the saved channel status value does not.

The maximum length of the string is MQ_CONN_NAME_LENGTH.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ChannelInstanceAttrs* except MQIACF_ALL and others as noted. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ChannelInstanceAttrs* except MQCACH_CHANNEL_NAME and others as noted. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1560](#) for information about using this filter condition.

If you specify a string filter for **ConnectionName** or **XmitQName**, you cannot also specify the **ConnectionName** or **XmitQName** parameter.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

XmitQName (MQCFST)

Transmission queue name (parameter identifier: MQCACH_XMIT_Q_NAME).

If this parameter is present, eligible channel instances are limited to those using this transmission queue. If it is not specified, eligible channel instances are not limited in this way.

The transmission queue name is always returned, regardless of the instance attributes requested.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Error code

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHL_INST_TYPE_ERROR

Channel instance type not valid.

MQRCCF_CHL_STATUS_NOT_FOUND

Channel status not found.

MQRCCF_NONE_FOUND

Channel status not found.

MQRCCF_XMIT_Q_NAME_ERROR

Transmission queue name error.

MQCMD_INQUIRE_CHANNEL_STATUS (inquire channel status) AMQP on AIX, Linux, and Windows

The Inquire Channel Status (MQCMD_INQUIRE_CHANNEL_STATUS) (AMQP) PCF command inquires about the status of one or more AMQP channel instances.

You must specify the name of the channel for which you want to inquire status information. This name can be a specific channel name or a generic channel name. By using a generic channel name, you can inquire either:

- Status information for all channels, or
- Status information for one or more channels that match the specified name.

If the **ClientIdentifier** parameter is not specified, the output of the **Inquire Channel Status** command is a summary of statuses of all clients connected to the channel. One PCF response message is returned per channel.

If the **ClientIdentifier** parameter is specified, separate PCF response messages are returned for each client connection. The **ClientIdentifier** parameter can be a wildcard, in which the status for all clients that match the **ClientIdentifier** string is returned.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects which have names that start with the selected character string. An asterisk on its own matches all possible names.

The channel name is always returned, regardless of the instance attributes requested.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

The value must be:

MQCHT_AMQP
AMQP

Optional parameters

ChannelInstanceAttrs (MQCFIL)

Channel instance attributes (parameter identifier: MQIACH_CHANNEL_INSTANCE_ATTRS).

The **ChannelInstanceAttrs** parameter names the list of attributes to be returned. This parameter does not provide any way to select, based upon the value of the items in that list of attributes.

The attribute list might specify the following value on its own:

MQIACF_ALL

All attributes.

MQIACF_ALL is the default value used if the parameter is not specified or it can specify a combination of the following:

- Relevant for summary status, applicable when you do not specify a **ClientIdentifier** parameter.

The following information applies:

MQCACH_CHANNEL_NAME

Channel name

MQIACH_CHANNEL_TYPE

Channel type

MQIACF_CONNECTION_COUNT

Number of connections described in the summary

MQIACH_CHANNEL_STATUS

Current status of the client

- Relevant for client details mode, applicable when you do specify a **ClientIdentifier** parameter.

The following information applies:

MQCACH_CHANNEL_NAME

Channel name

MQIACH_CHANNEL_STATUS

Current status of the client

MQIACH_CHANNEL_TYPE

Channel type

MQCACH_CONNECTION_NAME

Name of the remote connection (IP address)

MQIACH_AMQP_KEEP_ALIVE

Keep alive interval of the client

MQCACH_MCA_USER_ID

Message channel agent user Id

MQIACH_MSGS_SENT

Number of messages sent by the client since it last connected

MQIACH_MSGS_RECEIVED or **MQIACH_MSGS_RCVD**

Number of messages received by the client since it last connected

MQCACH_LAST_MSG_DATE

Date last message was received or sent

MQCACH_LAST_MSG_TIME

Time last message was received or sent

MQCACH_CHANNEL_START_DATE

Date channel started

MQCACH_CHANNEL_START_TIME

Time channel started

ClientIdentifier (MQCFST)

The Client Id of the client (parameter identifier: MQCACH_CLIENT_ID).

The maximum length of the string is MQ_CLIENT_ID_LENGTH.

Summary mode

If you do not specify a **ClientIdentifier** parameter, the following fields are returned:

MQCACH_CHANNEL_NAME

The channel name.

MQIACH_CHANNEL_TYPE

The channel type of AMQP.

MQIACF_CONNECTION_COUNT

The number of connections described in the summary.

MQIACH_CHANNEL_STATUS

The current status of the client.

Client details mode

If you specify a **ClientIdentifier** parameter, the following fields are returned:

MQIACH_CHANNEL_STATUS

The current status of the client.

MQCACH_CONNECTION_NAME

The name of the remote connection, that is, the IP address.

MQIACH_AMQP_KEEP_ALIVE

The keep alive interval of the client.

MQCACH_MCA_USER_ID

Message channel agent user Id.

MQIACH_MSGS_SENT

Number of messages sent by the client since it last connected.

MQIACH_MSGS_RECEIVED or MQIACH_MSGS_RCVD

Number of messages received by the client since it last connected.

MQCACH_LAST_MSG_DATE

Date last message was received or sent.

MQCACH_LAST_MSG_TIME

Time last message was received or sent.

MQCACH_CHANNEL_START_DATE

Date channel started.

MQCACH_CHANNEL_START_TIME

Time channel was started.

MQIACH_PROTOCOL

AMQP protocol supported by this channel.

Error code

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands”](#) on page 1018.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHL_INST_TYPE_ERROR

Channel instance type not valid.

MQRCCF_CHL_STATUS_NOT_FOUND

Channel status not found.

MQRCCF_XMIT_Q_NAME_ERROR

Transmission queue name error.

MQCMD_INQUIRE_CHANNEL_STATUS (Inquire Channel Status) MQTT on AIX, Linux, and Windows

The Inquire Channel Status (MQCMD_INQUIRE_CHANNEL_STATUS) (MQTT) PCF command inquires about the status of one or more Telemetry channel instances.

You must specify the name of the channel for which you want to inquire status information. This name can be a specific channel name or a generic channel name. By using a generic channel name, you can inquire either:

- Status information for all channels, or
- Status information for one or more channels that match the specified name.

Note: The **Inquire Channel Status** command for MQ Telemetry has the potential to return a far larger number of responses than if the command was run for an IBM MQ channel. For this reason, the MQ Telemetry server does not return more responses than fit on the reply-to queue. The number of responses is limited to the value of `MAXDEPTH` parameter of the `SYSTEM.MQSC.REPLY.QUEUE` queue. When an MQ Telemetry command is truncated by the MQ Telemetry server, the `AMQ8492` message is displayed specifying how many responses are returned based on the size of `MAXDEPTH`.

If the **ClientIdentifier** parameter is not specified, the output of the **Inquire Channel Status** command is a summary of statuses of all clients connected to the channel. One PCF response message is returned per channel.

If the **ClientIdentifier** parameter is specified, separate PCF response messages are returned for each client connection. The **ClientIdentifier** parameter may be a wildcard, in which the status for all clients that match the **ClientIdentifier** string is returned (within the limits of **MaxResponses** and **ResponseRestartPoint** if they are set).

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (*), for example `ABC*`, and it selects all objects which have names that start with the selected character string. An asterisk on its own matches all possible names.

This parameter is allowed for only when the **ResponseType** parameter is set to `MQRESP_TOTAL`.

The channel name is always returned, regardless of the instance attributes requested.

The maximum length of the string is `MQ_CHANNEL_NAME_LENGTH`.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

The value must be:

MQCHT_MQTT

Telemetry.

Optional parameters**ClientIdentifier (MQCFST)**

The ClientId of the client (parameter identifier: MQCACH_CLIENT_ID).

MaxResponses (MQCFIN)

The maximum number of clients to return status for (parameter identifier: MQIA_MAX_RESPONSES).

This parameter is only allowed when the **ClientIdentifier** parameter is specified.

ResponseRestartPoint (MQCFIN)

The first client to return status for (parameter identifier: MQIA_RESPONSE_RESTART_POINT). The combination of this parameter with **MaxResponses** enables the range of clients to be specified.

This parameter is only allowed when the **ClientIdentifier** parameter is specified.

Client details mode**STATUS**

The current status of the client (parameter identifier: MQIACH_CHANNEL_STATUS).

CONNAME

The name of the remote connection (ip address) (parameter identifier: MQCACH_CONNECTION_NAME).

KAINTE

The keep alive interval of the client (parameter identifier: MQIACH_KEEP_ALIVE_INTERVAL).

MCANAME

Message channel agent name (parameter identifier: MQCACH_MCA_USER_ID).

MSGSENT

Number of messages sent by the client since it last connected (parameter identifier: MQIACH_MSGS_SENT).

MSGRCVD

Number of messages received by the client since it last connected (parameter identifier: MQIACH_MSGS_RECEIVED / MQIACH_MSGS_RCVD).

INDOUBTIN

Number of in doubt, inbound messages to the client (parameter identifier: MQIACH_IN_DOUBT_IN).

INDOUBTOUT

Number of in doubt, outbound messages to the client (parameter identifier: MQIACH_IN_DOUBT_OUT).

PENDING

Number of outbound pending messages (parameter identifier: MQIACH_PENDING_OUT).

LMSGDATE

Date last message was received or sent (parameter identifier: MQCACH_LAST_MSG_DATE).

LMSGTIME

Time last message was received or sent (parameter identifier: MQCACH_LAST_MSG_TIME).

CHLSDATE

Date channel started (parameter identifier: MQCACH_CHANNEL_START_DATE).

CHLSTIME

Time channel was started (parameter identifier: MQCACH_CHANNEL_START_TIME).

Error code

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NAME_ERROR

Channel name error.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHL_INST_TYPE_ERROR

Channel instance type not valid.

MQRCCF_CHL_STATUS_NOT_FOUND

Channel status not found.

MQRCCF_XMIT_Q_NAME_ERROR

Transmission queue name error.

MQCMD_INQUIRE_CHANNEL_STATUS (Inquire Channel Status) Response

The response to the Inquire Channel Status (MQCMD_INQUIRE_CHANNEL_STATUS) PCF command consists of the response header followed by several structures.

These structures are

- The *ChannelName* structure
-  The *ChannelDisposition* structure (on z/OS only),
- The *ChannelInstanceType* structure
- The *ChannelStatus* structure (except on z/OS channels whose **ChannelInstanceType** parameter has a value of MQOT_SAVED_CHANNEL).
- The **ChannelType** structure
- The **ConnectionName** structure
- The **RemoteAppTag** structure
- The **RemoteQMGrName** structure
- The **StopRequested** structure
- The **XmitQName** structure

which are then followed by the requested combination of status attribute parameter structures. One such message is generated for each channel instance found that matches the criteria specified on the command.

On all platforms, from IBM MQ 9.3.0, if the value for *BuffersSent* or *BytesReceived* exceeds 999999999, it is wrapped.

Always returned:

 *ChannelDisposition*, *ChannelInstanceType*, *ChannelName*, *ChannelStatus*, *ChannelType*, *ConnectionName*, *RemoteAppTag*, *RemoteQMGrName*, *StopRequested*, *SubState*, *XmitQName*

Returned if requested:

Batches, *BatchSize*, *BatchSizeIndicator*, *BuffersReceived*, *BuffersSent*, *BytesReceived*, *BytesSent*, *ChannelMonitoring*, *ChannelStartDate*, *ChannelStartTime*, *CompressionRate*, *CompressionTime*, *CurrentLUWID*, *CurrentMsgs*, *CurrentSequenceNumber*, *CurrentSharingConversations*, *ExitTime*, *HeaderCompression*, *HeartbeatInterval*, *InDoubtStatus*, *KeepAliveInterval*, *LastLUWID*, *LastMsgDate*, *LastMsgTime*, *LastSequenceNumber*, *LocalAddress*, *LongRetriesLeft*, *MaxMsgLength*, *MaxSharingConversations*, *MCAJobName*, *MCAStatus*, *MCAUserIdentifier*,

MessageCompression, Msgs, MsgsAvailable, NetTime, NonPersistentMsgSpeed, QMgrName, RemoteVersion, RemoteProduct, SecurityProtocol, ShortRetriesLeft, SSLCertRemoteIssuerName, SSLCertUserId, SSLKeyResetDate, SSLKeyResets, SSLKeyResetTime, SSLShortPeerName, XQTime

Response data

Batches (MQCFIN)

Number of completed batches (parameter identifier: MQIACH_BATCHES).

BatchSize (MQCFIN)

Negotiated batch size (parameter identifier: MQIACH_BATCH_SIZE).

BatchSizeIndicator (MQCFIL)

Indicator of the number of messages in a batch (parameter identifier: MQIACH_BATCH_SIZE_INDICATOR). Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned.

BuffersReceived (MQCFIN)

Number of buffers received (parameter identifier: MQIACH_BUFFERS_RCVD).

BuffersSent (MQCFIN)

Number of buffers sent (parameter identifier: MQIACH_BUFFERS_SENT).

BytesReceived (MQCFIN)

Number of bytes received (parameter identifier: MQIACH_BYTES_RCVD).

If the value for BytesSent or BytesReceived exceeds 999999999, it wraps to zero.

BytesSent (MQCFIN)

Number of bytes sent (parameter identifier: MQIACH_BYTES_SENT).

If the value for BytesSent or BytesReceived exceeds 999999999, it wraps to zero.

ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH_CHANNEL_DISP). This parameter is valid only on z/OS.

The value can be any of the following values:

MQCHLD_PRIVATE

Status information for a private channel.

MQCHLD_SHARED

Status information for a shared channel.

MQCHLD_FIXSHARED

Status information for a shared channel, tied to a specific queue manager.

ChannelInstanceType (MQCFIN)

Channel instance type (parameter identifier: MQIACH_CHANNEL_INSTANCE_TYPE).

The value can be any of the following values:

MQOT_CURRENT_CHANNEL

Current channel status.

MQOT_SAVED_CHANNEL

Saved channel status.

MQOT_SHORT_CHANNEL

Short channel status, only on z/OS.

ChannelMonitoring (MQCFIN)

Current level of monitoring data collection for the channel (parameter identifier: MQIA_MONITORING_CHANNEL).

The value can be any of the following values:

MQMON_OFF

Monitoring for the channel is disabled.

MQMON_LOW

Low rate of data collection.

MQMON_MEDIUM

Medium rate of data collection.

MQMON_HIGH

High rate of data collection.

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelStartDate (MQCFST)

Date channel started, in the form yyyy-mm-dd (parameter identifier: MQCACH_CHANNEL_START_DATE).

The maximum length of the string is MQ_CHANNEL_DATE_LENGTH.

ChannelStartTime (MQCFST)

Time channel started, in the form hh.mm.ss (parameter identifier: MQCACH_CHANNEL_START_TIME).

The maximum length of the string is MQ_CHANNEL_TIME_LENGTH.

 **ChannelStatistics (MQCFIN)**

Specifies whether statistics data is to be collected for channels (parameter identifier: MQIA_STATISTICS_CHANNEL).

The value can be:

MQMON_OFF

Statistics data collection is turned off.

MQMON_LOW

Statistics data collection is turned on, with a low ratio of data collection.

MQMON_MEDIUM

Statistics data collection is turned on, with a moderate ratio of data collection.

MQMON_HIGH

Statistics data collection is turned on, with a high ratio of data collection.

On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

This parameter is valid only on z/OS.

ChannelStatus (MQCFIN)

Channel status (parameter identifier: MQIACH_CHANNEL_STATUS).

Channel status has the following values defined:

MQCHS_BINDING

Channel is negotiating with the partner.

MQCHS_STARTING

Channel is waiting to become active.

MQCHS_RUNNING

Channel is transferring or waiting for messages.

MQCHS_PAUSED

Channel is paused.

MQCHS_STOPPING

Channel is in process of stopping.

MQCHS_RETRYING

Channel is reattempting to establish connection.

MQCHS_STOPPED

Channel is stopped.

MQCHS_REQUESTING

Requester channel is requesting connection.

MQCHS_SWITCHING

Channel is switching transmission queues.

MQCHS_INITIALIZING

Channel is initializing.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

The value can be any of the following values:

MQCHT_SENDER

Sender.

MQCHT_SERVER

Server.

MQCHT_RECEIVER

Receiver.

MQCHT_REQUESTER

Requester.

MQCHT_SVRCONN

Server-connection (for use by clients).

MQCHT_CLNTCONN

Client connection.

MQCHT_CLUSRCVR

Cluster-receiver.

MQCHT_CLUSSDR

Cluster-sender.

CompressionRate (MQCFIL)

The compression rate achieved displayed to the nearest percentage (parameter identifier: MQIACH_COMPRESSION_RATE). Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned.

CompressionTime (MQCFIL)

The amount of time per message, displayed in microseconds, spent during compression or decompression (parameter identifier: MQIACH_COMPRESSION_TIME). Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned.

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

Multi On Multiplatforms, the maximum length of the string is 264.

z/OS On z/OS, the maximum length of the string is 48.

CurrentLUWID (MQCFST)

Logical unit of work identifier for in-doubt batch (parameter identifier: MQCACH_CURRENT_LUWID).

The logical unit of work identifier associated with the current batch, for a sending or a receiving channel.

For a sending channel, when the channel is in-doubt it is the LUWID of the in-doubt batch.

It is updated with the LUWID of the next batch when it is known.

The maximum length is MQ_LUWID_LENGTH.

CurrentMsgs (MQCFIN)

Number of messages in-doubt (parameter identifier: MQIACH_CURRENT_MSGS).

For a sending channel, this parameter is the number of messages that have been sent in the current batch. It is incremented as each message is sent, and when the channel becomes in-doubt it is the number of messages that are in-doubt.

For a receiving channel, it is the number of messages that have been received in the current batch. It is incremented as each message is received.

The value is reset to zero, for both sending and receiving channels, when the batch is committed.

CurrentSequenceNumber (MQCFIN)

Sequence number of last message in in-doubt batch (parameter identifier: MQIACH_CURRENT_SEQ_NUMBER).

For a sending channel, this parameter is the message sequence number of the last message sent. It is updated as each message is sent, and when the channel becomes in-doubt it is the message sequence number of the last message in the in-doubt batch.

For a receiving channel, it is the message sequence number of the last message that was received. It is updated as each message is received.

CurrentSharingConversations (MQCFIN)

Number of conversations currently active on this channel instance (parameter identifier: MQIACH_CURRENT_SHARING_CONVS).

This parameter is returned only for TCP/IP server-connection channels.

A value of zero indicates that the channel instance is running in a mode before IBM WebSphere MQ 7.0, regarding:

- Administrator stop-quietce
- Heartbeating
- Read ahead
- Client asynchronous consumption

ExitTime (MQCFIL)

Indicator of the time taken executing user exits per message (parameter identifier: MQIACH_EXIT_TIME_INDICATOR). Amount of time, in microseconds, spent processing user exits per message. Where more than one exit is executed per message, the value is the sum of all the user exit times for a single message. Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned.

HeaderCompression (MQCFIL)

Whether the header data sent by the channel is compressed (parameter identifier: MQIACH_HDR_COMPRESSION). Two values are returned:

- The default header data compression value negotiated for this channel.
- The header data compression value used for the last message sent. The header data compression value can be altered in a sending channels message exit. If no message has been sent, the second value is MQCOMPRESS_NOT_AVAILABLE.

The values can be:

MQCOMPRESS_NONE

No header data compression is performed. MQCOMPRESS_NONE is the default value.

MQCOMPRESS_SYSTEM

Header data compression is performed.

MQCOMPRESS_NOT_AVAILABLE

No message has been sent by the channel.

HeartbeatInterval (MQCFIN)

Heartbeat interval (parameter identifier: MQIACH_HB_INTERVAL).

InDoubtStatus (MQCFIN)

Whether the channel is currently in doubt (parameter identifier: MQIACH_INDOUBT_STATUS).

A sending channel is only in doubt while the sending Message Channel Agent is waiting for an acknowledgment that a batch of messages, which it has sent, has been successfully received. It is not in doubt at all other times, including the period during which messages are being sent, but before an acknowledgment has been requested.

A receiving channel is never in doubt.

The value can be any of the following values:

MQCHIDS_NOT_INDOUBT

Channel is not in-doubt.

MQCHIDS_INDOUBT

Channel is in-doubt.

KeepAliveInterval (MQCFIN)

KeepAlive interval (parameter identifier: MQIACH_KEEP_ALIVE_INTERVAL). This parameter is valid only on z/OS.

LastLUWID (MQCFST)

Logical unit of work identifier for last committed batch (parameter identifier: MQCACH_LAST_LUWID).

The maximum length is MQ_LUWID_LENGTH.

LastMsgDate (MQCFST)

Date last message was sent, or MQI call was handled, in the form yyyy-mm-dd (parameter identifier: MQCACH_LAST_MSG_DATE).

The maximum length of the string is MQ_CHANNEL_DATE_LENGTH.

LastMsgTime (MQCFST)

Time last message was sent, or MQI call was handled, in the form hh.mm.ss (parameter identifier: MQCACH_LAST_MSG_TIME).

The maximum length of the string is MQ_CHANNEL_TIME_LENGTH.

LastSequenceNumber (MQCFIN)

Sequence number of last message in last committed batch (parameter identifier: MQIACH_LAST_SEQ_NUMBER).

LocalAddress (MQCFST)

Local communications address for the channel (parameter identifier: MQCACH_LOCAL_ADDRESS).

The maximum length of the string is MQ_LOCAL_ADDRESS_LENGTH.

LongRetriesLeft (MQCFIN)

Number of long retry attempts remaining (parameter identifier: MQIACH_LONG_RETRIES_LEFT).

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: MQIACH_MAX_MSG_LENGTH). This parameter is valid only on z/OS.

MaxSharingConversations (MQCFIN)

Maximum number of conversations permitted on this channel instance. (parameter identifier: MQIACH_MAX_SHARING_CONVS)

This parameter is returned only for TCP/IP server-connection channels.

A value of zero indicates that the channel instance is running in a mode before IBM WebSphere MQ 7.0, regarding:

- Administrator stop-quiet
- Heartbeating
- Read ahead
- Client asynchronous consumption

MCAJobName (MQCFST)

Name of MCA job (parameter identifier: MQCACH_MCA_JOB_NAME).

The maximum length of the string is MQ_MCA_JOB_NAME_LENGTH.

MCAStatus (MQCFIN)

MCA status (parameter identifier: MQIACH_MCA_STATUS).

The value can be any of the following values:

MQMCAS_STOPPED

Message channel agent stopped.

MQMCAS_RUNNING

Message channel agent running.

MCAUserIdentifier (MQCFST)

The user ID used by the MCA (parameter identifier: MQCACH_MCA_USER_ID).

This parameter applies only to server-connection, receiver, requester, and cluster-receiver channels.

The maximum length of the string is MQ_MCA_USER_ID_LENGTH.

MessageCompression (MQCFIL)

Whether the message data sent by the channel is compressed (parameter identifier: MQIACH_MSG_COMPRESSION). Two values are returned:

- The default message data compression value negotiated for this channel.
- The message data compression value used for the last message sent. The message data compression value can be altered in a sending channels message exit. If no message has been sent, the second value is MQCOMPRESS_NOT_AVAILABLE.

The values can be:

MQCOMPRESS_NONE

No message data compression is performed. MQCOMPRESS_NONE is the default value.

MQCOMPRESS_RLE

Message data compression is performed using run-length encoding.

MQCOMPRESS_ZLIBFAST

Message data compression is performed using ZLIB encoding with speed prioritized.

MQCOMPRESS_ZLIBHIGH

Message data compression is performed using ZLIB encoding with compression prioritized.

MQCOMPRESS_NOT_AVAILABLE

No message has been sent by the channel.

Msgs (MQCFIN)

Number of messages sent or received, or number of MQI calls handled (parameter identifier: MQIACH_MSGS).

MsgsAvailable (MQCFIN)

Number of messages available (parameter identifier: MQIACH_XMITQ_MSGS_AVAILABLE). Number of messages queued on the transmission queue available to the channel for MQGETs.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned.

This parameter applies to cluster sender channels only.

NetTime (MQCFIL)

Indicator of the time of a network operation (parameter identifier: MQIACH_NETWORK_TIME_INDICATOR). Amount of time, in microseconds, to send a request to the remote end of the channel and receive a response. This time only measures the network time for such an operation. Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned.

NonPersistentMsgSpeed (MQCFIN)

Speed at which nonpersistent messages are to be sent (parameter identifier: MQIACH_NPM_SPEED).

The value can be any of the following values:

MQNPMS_NORMAL

Normal speed.

MQNPMS_FAST

Fast speed.

QMgrName (MQCFST)

Name of the queue manager that owns the channel instance (parameter identifier: MQCA_Q_MGR_NAME). This parameter is valid only on z/OS.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

RemoteApplTag (MQCFST)

The remote partner application name. This parameter is the name of the client application at the remote end of the channel. This parameter applies only to server-connection channels (parameter identifier: MQCACH_REMOTE_APPL_TAG).

RemoteProduct (MQCFST)

The remote partner product identifier. This parameter is the product identifier of the IBM MQ code running at the remote end of the channel (parameter identifier: MQCACH_REMOTE_PRODUCT).

The possible values are shown in the following table:

Product Identifier	Description
MQMM	Queue Manager (non z/OS Platform)
MQMV	Queue Manager on z/OS
MQCC	IBM MQ C client
MQNM	IBM MQ .NET fully managed client
MQJB	IBM MQ Classes for JAVA
MQJM	IBM MQ Classes for JMS (normal mode)

Table 211. Product Identifier values (continued)

Product Identifier	Description
MQJN	IBM MQ Classes for JMS (migration mode)
MQJU	Common Java interface to the MQI
MQXC	XMS client C/C++ (normal mode)
MQXD	XMS client C/C++ (migration mode)
MQXN	XMS client .NET (normal mode)
MQXM	XMS client .NET (migration mode)
MQXU	IBM MQ .NET XMS client (unmanaged/XA)
MQNU	IBM MQ .NET unmanaged client

RemoteVersion (MQCFST)

The remote partner version. This parameter is the version of the IBM MQ code running at the remote end of the channel (parameter identifier: MQCACH_REMOTE_VERSION).

The remote version is displayed as **VVRRMMFF**, where

VV

Version

RR

Release

MM

Maintenance level

FF

Fix level

RemoteQMgrName (MQCFST)

Name of the remote queue manager, or queue sharing group (parameter identifier: MQCA_REMOTE_Q_MGR_NAME).

ShortRetriesLeft (MQCFIN)

Number of short retry attempts remaining (parameter identifier: MQIACH_SHORT_RETRIES_LEFT).

SecurityProtocol (MQCFIN)

Defines the security protocol currently in use (parameter identifier: MQIACH_SECURITY_PROTOCOL).

Does not apply to client-connection channels.

Set automatically, based on the value you set for [SSLCipherSpecification](#).

Possible values are:

MQSECPROT_NONE

No security protocol

MQSECPROT_SSLV30

SSL 3.0

This protocol is deprecated. See [Deprecated CipherSpecs](#)

MQSECPROT_TLSV10

TLS 1.0

This protocol is deprecated. See [Deprecated CipherSpecs](#)

MQSECPROT_TLSV12

TLS 1.2

The product supports the TLS 1.3 security protocol on all platforms.  On IBM MQ for z/OS, TLS 1.3 is supported only on z/OS 2.4 or later.

SSLCertRemoteIssuerName (MQCFST)

The full Distinguished Name of the issuer of the remote certificate. The issuer is the certificate authority that issued the certificate (parameter identifier: MQCACH_SSL_CERT_ISSUER_NAME).

The maximum length of the string is MQ_SHORT_DNAME_LENGTH.

SSLCertUserId (MQCFST)

The local user ID associated with the remote certificate (parameter identifier: MQCACH_SSL_CERT_USER_ID).

This parameter is valid only on z/OS.

The maximum length of the string is MQ_USER_ID_LENGTH.

SSLCipherSpecification (MQCFST)

The CipherSpec that is being used by the connection (parameter identifier: MQCACH_SSL_CIPHER_SPEC).

The maximum length of the string is MQ_SSL_CIPHER_SPEC_LENGTH.

For more information, see [the SSLCipherSpec property in Change, Copy, and Create Channel](#).

The value for this parameter is also used to set the value of [SecurityProtocol](#)

SSLKeyResetDate (MQCFST)

Date of the previous successful TLS secret key reset, in the form yyyy-mm-dd (parameter identifier: MQCACH_SSL_KEY_RESET_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

SSLKeyResets (MQCFIN)

TLS secret key resets (parameter identifier: MQIACH_SSL_KEY_RESETS).

The number of successful TLS secret key resets that have occurred for this channel instance since the channel started. If TLS secret key negotiation is enabled, the count is incremented whenever a secret key reset is performed.

SSLKeyResetTime (MQCFST)

Time of the previous successful TLS secret key reset, in the form hh.mm.ss (parameter identifier: MQCACH_SSL_KEY_RESET_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

SSLShortPeerName (MQCFST)

Distinguished Name of the peer queue manager or client at the other end of the channel (parameter identifier: MQCACH_SSL_SHORT_PEER_NAME).

The maximum length is MQ_SHORT_DNAME_LENGTH, so longer Distinguished Names are truncated.

StopRequested (MQCFIN)

Whether user stop request is outstanding (parameter identifier: MQIACH_STOP_REQUESTED).

The value can be any of the following values:

MQCHSR_STOP_NOT_REQUESTED

User stop request has not been received.

MQCHSR_STOP_REQUESTED

User stop request has been received.

SubState (MQCFIN)

Current action being performed by the channel (parameter identifier: MQIACH_CHANNEL_SUBSTATE).

The value can be any of the following values:

MQCHSSTATE_CHADEXIT

Running channel auto-definition exit.

MQCHSSTATE_COMPRESSING

Compressing or decompressing data.

MQCHSSTATE_END_OF_BATCH

End of batch processing.

MQCHSSTATE_HANDSHAKING

TLS handshaking.

MQCHSSTATE_HEARTBEATING

Heartbeating with partner.

MQCHSSTATE_IN_MQGET

Performing MQGET.

MQCHSSTATE_IN_MQI_CALL

Executing an IBM MQ API call, other than an MQPUT or MQGET.

MQCHSSTATE_IN_MQPUT

Performing MQPUT.

MQCHSSTATE_MREXIT

Running retry exit.

MQCHSSTATE_MSGEXIT

Running message exit.

MQCHSSTATE_NAME_SERVER

Name server request.

MQCHSSTATE_NET_CONNECTING

Network connect.

MQCHSSTATE_OTHER

Undefined state.

MQCHSSTATE_RCVEXIT

Running receive exit.

MQCHSSTATE_RECEIVING

Network receive.

MQCHSSTATE_RESYNCHING

Resynching with partner.

MQCHSSTATE_SCYEXIT

Running security exit.

MQCHSSTATE_SENDEXIT

Running send exit.

MQCHSSTATE_SENDING

Network send.

MQCHSSTATE_SERIALIZING

Serialized on queue manager access.

XmitQName (MQCFST)

Transmission queue name (parameter identifier: MQCACH_XMIT_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

XQTime (MQCFIL)

This parameter applies to only sender, server, and cluster-sender channels.

Transmission queue time indicator (parameter identifier: MQIACH_XMITQ_TIME_INDICATOR). The time, in microseconds, that messages remained on the transmission queue before being retrieved.

The time is measured from when the message is put onto the transmission queue until it is retrieved

to be sent on the channel and, therefore, includes any interval caused by a delay in the putting application.

Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned.

[“DISPLAY CHSTATUS \(display channel status\)” on page 712](#)

Use the MQSC command **DISPLAY CHSTATUS** to display the status of one or more channels.

ALW **MQCMD_INQUIRE_CHANNEL_STATUS (inquire channel status) Response AMQP on AIX, Linux, and Windows**

The response to the Inquire Channel Status (MQCMD_INQUIRE_CHANNEL_STATUS) PCF command consists of the response header followed by the *ChannelName* structure and the requested combination of attribute parameter structures.

One PCF response message is generated for each channel instance found that matches the criteria that are specified on the command.

If the **ClientIdentifier** parameter is not specified, the output of the Inquire Channel Status command is a summary of statuses of all clients that are connected to the channel. One PCF response message is returned per channel.

Always returned:

ChannelName, ChannelStatus, ChannelType,

If the **ClientIdentifier** parameter is specified, separate PCF response messages are returned for each client connection. The **ClientIdentifier** parameter might be a wildcard, in which the status for all clients that match the **ClientIdentifier** string is returned.

Always returned:

ChannelName, ChannelStatus, ChannelType, ClientIdentifier

Returned if requested:

ChannelStartDate, ChannelStartTime, ClientUser, ConnectionName, Connections, KeepAliveInterval, LastMsgDate, LastMsgTime, MCAUser, MsgsReceived, MsgsSent, Protocol

Response data

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelStartDate (MQCFST)

Date on which the channel started, in the form yyyy-mm-dd (parameter identifier: MQCACH_CHANNEL_START_DATE).

The maximum length of the string is MQ_CHANNEL_DATE_LENGTH.

ChannelStartTime (MQCFST)

Time at which the channel started, in the form hh.mm.ss (parameter identifier: MQCACH_CHANNEL_START_TIME).

The maximum length of the string is MQ_CHANNEL_TIME_LENGTH.

ChannelStatus (MQCFIN)

Channel status (parameter identifier: MQIACH_CHANNEL_STATUS).

The value can be:

MQCHS_DISCONNECTED

Channel is disconnected.

MQCHS_RUNNING

Channel is transferring or waiting for messages.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

The value must be:

MQCHT_AMQP

AMQP

ClientUser (MQCFST)

Client Id of the client (parameter identifier: MQCACH_CLIENT_USER_ID).

The maximum length of the string is MQ_CLIENT_USER_ID_LENGTH.

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

The maximum length of the string is MQ_CONN_NAME_LENGTH.

Connections (MQCFIN)

Current number of AMQP connections connected to this channel (parameter identifier: MQIACH_NAME_LENGTH).

KeepAliveInterval (MQCFIN)

Keep alive interval (parameter identifier: MQIACH_KEEP_ALIVE_INTERVAL).

The interval in milliseconds after which the client is disconnected because of inactivity.

LastMsgDate (MQCFST)

Date on which the last message was sent, or the MQI call was handled, in the form yyyy-mm-dd (parameter identifier: MQCACH_LAST_MSG_DATE).

The maximum length of the string is MQ_CHANNEL_DATE_LENGTH.

LastMsgTime (MQCFST)

Time at which the last message was sent, or the MQI call was handled, in the form hh.mm.ss (parameter identifier: MQCACH_LAST_MSG_TIME).

The maximum length of the string is MQ_CHANNEL_TIME_LENGTH.

MCAUser (MQCFST)

Message channel agent user identifier (parameter identifier: MQCACH_MCA_USER_ID).

The maximum length of the MCA user identifier is MQ_MCA_USER_ID_LENGTH.

MsgsReceived (MQCFIN64)

Number of messages received by the client since it last connected (parameter identifier: MQIACH_MSGS_RECEIVED or MQIACH_MSGS_RCVD).

MsgsSent (MQCFIN64)

Number of messages sent by the client since it last connected (parameter identifier: MQIACH_MSGS_SENT).

Protocol (MQCFST)

AMQP protocol supported by this channel (parameter identifier: MQIACH_PROTOCOL).

The value will be:

MQPROTO_AMQP

AMQP

MQCMD_INQUIRE_CHANNEL_STATUS (Inquire Channel Status) Response **MQTT on AIX, Linux, and Windows**

The response to the Inquire Channel Status (MQCMD_INQUIRE_CHANNEL_STATUS) PCF command consists of the response header followed by the *ChannelName* structure and the requested combination of attribute parameter structures.

One PCF response message is generated for each channel instance found that matches the criteria that are specified on the command.

If the **ClientIdentifier** parameter is not specified, the output of the Inquire Channel Status command is a summary of statuses of all clients that are connected to the channel. One PCF response message is returned per channel.

Always returned:

ChannelName, ChannelStatus, ChannelType, Connections,

If the **ClientIdentifier** parameter is specified, separate PCF response messages are returned for each client connection. The **ClientIdentifier** parameter might be a wildcard, in which the status for all clients that match the **ClientIdentifier** string is returned (within the limits of **MaxResponses** and **ResponseRestartPoint** if they are set).

Always returned:

ChannelName, ChannelStatus, ChannelType, ClientId

Returned if requested:

ChannelStartDate, ChannelStatusTime, ClientUser, InDoubtInput, InDoubtOutput, KeepAliveInterval, LastMessageSentDate, LastMessageSentTime, MCAUser, MessagesReceived, MessagesSent, PendingOutbound, Protocol

Response data

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelStartDate (MQCFST)

Date on which the channel started, in the form yyyy-mm-dd (parameter identifier: MQCACH_CHANNEL_START_DATE).

The maximum length of the string is MQ_CHANNEL_DATE_LENGTH.

ChannelStartTime (MQCFST)

Time at which the channel started, in the form hh.mm.ss (parameter identifier: MQCACH_CHANNEL_START_TIME).

The maximum length of the string is MQ_CHANNEL_TIME_LENGTH.

ChannelStatus (MQCFIN)

Channel status (parameter identifier: MQIACH_CHANNEL_STATUS).

The value can be:

MQCHS_DISCONNECTED

Channel is disconnected.

MQCHS_RUNNING

Channel is transferring or waiting for messages.

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

The value must be:

MQCHT_MQTT

Telemetry.

ClientUser (MQCFST)

ClientID of the client (parameter identifier: MQCACH_CLIENT_USER_ID).

The maximum length of the string is MQ_CLIENT_USER_ID_LENGTH.

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

The maximum length of the string is MQ_CONN_NAME_LENGTH.

Connections (MQCFIN)

Current number of MQTT connections connected to this channel (parameter identifier: MQIACH_NAME_LENGTH).

InDoubtInput (MQCFIN)

The number of inbound messages to the client that are in doubt (parameter identifier: MQIACH_IN_DOUBT_IN).

InDoubtOutput (MQCFIN)

The number of outbound messages from the client that are in doubt (parameter identifier: MQIACH_IN_DOUBT_OUT).

KeepAliveInterval (MQCFIN)

KeepAlive interval (parameter identifier: MQIACH_KEEP_ALIVE_INTERVAL).

The interval in milliseconds after which the client is disconnected because of inactivity. If the MQXR service does not receive any communication from the client within the keep alive interval, it disconnects from the client. This interval is calculated based on the MQTT keep alive time sent by the client when it connects. The maximum size is MQ_MQTT_MAX_KEEP_ALIVE.

LastMsgDate (MQCFST)

Date on which the last message was sent, or the MQI call was handled, in the form yyyy-mm-dd (parameter identifier: MQCACH_LAST_MSG_DATE).

The maximum length of the string is MQ_CHANNEL_DATE_LENGTH.

LastMsgTime (MQCFST)

Time at which the last message was sent, or the MQI call was handled, in the form hh.mm.ss (parameter identifier: MQCACH_LAST_MSG_TIME).

The maximum length of the string is MQ_CHANNEL_TIME_LENGTH.

MCAUser (MQCFST)

Message channel agent user identifier (parameter identifier: MQCACH_MCA_USER_ID).

The maximum length of the MCA user identifier is MQ_MCA_USER_ID_LENGTH.

MsgsReceived (MQCFIN64)

Number of messages received by the client since it last connected (parameter identifier: MQIACH_MSGS_RECEIVED / MQIACH_MSGS_RCVD).

MsgsSent (MQCFIN64)

Number of messages sent by the client since it last connected (parameter identifier: MQIACH_MSGS_SENT).

PendingOutbound (MQCFIN)

The number of outbound messages pending (parameter identifier: MQIACH_PENDING_OUT).

Protocol (MQCFST)

MQTT protocol supported by this channel (parameter identifier: MQIACH_PROTOCOL).

Specify one or more of the following options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

MQTTv311 (constant: MQPROTO_MQTTV311)

MQTTv3 (constant: MQPROTO_MQTTV3)

HTTP (constant: MQPROTO_HTTP)

MQCMD_INQUIRE_CHLAUTH_RECS (Inquire Channel Authentication Records)

The Inquire Channel Authentication Records (MQCMD_INQUIRE_CHLAUTH_RECS) PCF command retrieves the allowed partner details and mappings to MCAUSER for a channel or set of channels.

Required parameters

generic-channel-name (MQCFST)

The name of the channel or set of channels on which you are inquiring (parameter identifier: MQCACH_CHANNEL_NAME).

You can use the asterisk (*) as a wildcard to specify a set of channels, unless you set Match to MQMATCH_RUNCHECK. If you set Type to BLOCKADDR, you must set the generic channel name to a single asterisk, which matches all channel names.

Optional parameters

Address (MQCFST)

The IP address to be mapped (parameter identifier: MQCACH_CONNECTION_NAME).

This parameter is valid only when **Match** is MQMATCH_RUNCHECK and must not be generic.

ByteStringFilterCommand (MQCFBF)

Byte string filter command descriptor. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFBF - PCF byte string filter parameter”](#) on page 1548 for information about using this filter condition.

If you specify a byte string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter, or a string filter using the **StringFilterCommand** parameter.

ChannelAuthAttrs (MQCFIL)

Authority record attributes (parameter identifier: MQIACF_CHLAUTH_ATTRS).

You can specify the following value in the attribute list on its own. This is the default value if the parameter is not specified.

MQIACF_ALL

All attributes.

If MQIACF_ALL is not specified, specify a combination of the following values:

MQCA_ALTERATION_DATE

Alteration Date.

MQCA_ALTERATION_TIME

Alteration Time.

MQCA_CHLAUTH_DESC

Description.

MQCA_CUSTOM

Custom.

MQCACH_CONNECTION_NAME

IP address filter.

MQCACH_MCA_USER_ID

MCA User ID mapped on the record.

MQIACH_USER_SOURCE

The source of the user ID for this record.

MQIACH_WARNING

Warning mode.

CheckClient (MQCFIN)

The user ID and password requirements for the client connection to be successful. The following values are valid:

MQCHK_REQUIRED_ADMIN

A valid user ID and password are required for the connection to be allowed if you are using a privileged user ID.

Any connections using a non-privileged user ID are not required to provide a user ID and password.

The user ID and password are checked against the user repository details provided in an authentication information object, and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

A privileged user is one that has full administrative authorities for IBM MQ. See [Privileged users](#) for more information.

This option is not valid on z/OS platforms.

MQCHK_REQUIRED

A valid user ID and password are required for the connection to be allowed.

The user ID and password are checked against the user repository details provided in an authentication information object and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

MQCHK_AS_Q_MGR

In order for the connection to be allowed, it must meet the connection authentication requirements defined on the queue manager.

If the CONNAUTH field provides an authentication information object, and the value of CHCKCLNT is REQUIRED, the connection fails unless a valid user ID and password are supplied.

If the CONNAUTH field does not provide an authentication information object, or the value of CHCKCLNT is not REQUIRED, the user ID and password are not required.

Attention: If you select MQCHK_REQUIRED or MQCHK_REQUIRED_ADMIN on [Multiplatforms](#) and you have not set the **Connauth** field on the queue manager, or if the value of **CheckClient** is None, the connection fails. On Multiplatforms, you receive message AMQ9793. On z/OS, you receive message CSQX793E.

ClntUser (MQCFST)

The client asserted user ID to be mapped to a new user ID, allowed through unchanged, or blocked (parameter identifier: MQCACH_CLIENT_USER_ID).

This can be the user ID flowed from the client indicating the user ID the client side process is running under, or the user ID presented by the client on an MQCONN call using MQCSP.

This parameter is valid only with TYPE(USERMAP) and when **Match** is MQMATCH_RUNCHECK.

z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following values:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which the command was entered, you must be using a queue sharing group environment, and the command server must be enabled.

- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1553 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or a string filter using the **StringFilterCommand** parameter.

Match (MQCFIN)

Indicates the type of matching to be applied (parameter identifier MQIACH_MATCH). You can specify any one of the following values:

MQMATCH_RUNCHECK

A specific match is made against the supplied channel name and optionally supplied **Address**, **SSLPeer**, **QMName**, and **ClntUser** attributes to find the channel authentication record that will be matched by the channel at runtime if it connects into this queue manager. If the record discovered has **Warn** set to MQWARN_YES, a second record might also be displayed to show the actual record the channel will use at runtime. The channel name supplied in this case cannot be generic. This option must be combined with **Type** MQCAUT_ALL.

MQMATCH_EXACT

Return only those records which exactly match the channel profile name supplied. If there are no asterisks in the channel profile name, this option returns the same output as MQMATCH_GENERIC.

MQMATCH_GENERIC

Any asterisks in the channel profile name are treated as wildcards. If there are no asterisks in the channel profile name, this returns the same output as MQMATCH_EXACT. For example, a profile of ABC* could result in records for ABC, ABC*, and ABCD being returned.

MQMATCH_ALL

Return all possible records that match the channel profile name supplied. If the channel name is generic in this case, all records that match the channel name are returned even if more specific matches exist. For example, a profile of SYSTEM*.SVRCONN could result in records for SYSTEM.*, SYSTEM.DEF.*, SYSTEM.DEF.SVRCONN, and SYSTEM.ADMIN.SVRCONN being returned.

QMName (MQCFST)

The name of the remote partner queue manager to be matched (parameter identifier: MQCA_REMOTE_Q_MGR_NAME).

This parameter is valid only when **Match** is MQMATCH_RUNCHECK. The value cannot be generic.

SSLCertIssuer (MQCFST)

This parameter is additional to the **SSLPeer** parameter.

SSLCertIssuer restricts matches to being within certificates issued by a particular Certificate Authority.

SSLPeer (MQCFST)

The Distinguished Name of the certificate to be matched (parameter identifier: MQCACH_SSL_PEER_NAME).

This parameter is valid only when **Match** is MQMATCH_RUNCHECK.

The **SSLPeer** value is specified in the standard form used to specify a Distinguished Name and cannot be a generic value.

The maximum length of the parameter is MQ_SSL_PEER_NAME_LENGTH.

StringFilterCommand (MQCFSF)

String filter command descriptor. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1560 for information about using this filter condition.

If you specify a string filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or an integer filter using the **IntegerFilterCommand** parameter.

Type (MQCFIN)

The type of channel authentication record for which to set allowed partner details or mappings to MCAUSER (parameter identifier: MQIACF_CHLAUTH_TYPE). The following values are valid:

MQCAUT_BLOCKUSER

This channel authentication record prevents a specified user or users from connecting.

MQCAUT_BLOCKADDR

This channel authentication record prevents connections from a specified IP address or addresses.

MQCAUT_SSLPEERMAP

This channel authentication record maps TLS Distinguished Names (DNs) to MCAUSER values.

MQCAUT_ADDRESSMAP

This channel authentication record maps IP addresses to MCAUSER values.

MQCAUT_USERMAP

This channel authentication record maps asserted user IDs to MCAUSER values.

MQCAUT_QMGRMAP

This channel authentication record maps remote queue manager names to MCAUSER values.

MQCAUT_ALL

Inquire on all types of record. This is the default value.

Related concepts

[Channel authentication records](#)

MQCMD_INQUIRE_CHLAUTH_RECS (Inquire Channel Authentication Records)

Response

The response to the Inquire Channel Authentication Records (MQCMD_INQUIRE_CHLAUTH_RECS) PCF command consists of the response header followed by the requested combination of attribute parameter structures.

Always returned:

ChlAuth, Type, Warn (yes)

Always returned if type is MQCAUT_BLOCKUSER:

UserList

Always returned if type is MQCAUT_BLOCKADDR:

AddrList

Always returned if type is MQCAUT_SSLPEERMAP:

Address (unless blanks), MCAUser (unless blanks), SSLCertIssuer, SSLPeer, UserSrc

Always returned if type is MQCAUT_ADDRESSMAP:

Address (unless blanks), MCAUser (unless blanks), UserSrc

Always returned if type is MQCAUT_USERMAP:

Address (unless blanks), ClnUser, MCAUser (unless blanks), UserSrc

Always returned if type is MQCAUT_QMGRMAP:

Address (unless blanks), MCAUser (unless blanks), QMName, UserSrc

Returned if requested:

Address, AlterationDate, AlterationTime, Custom, Description, MCAUser, SSLPeer, UserSrc, Warn

Response data**AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered, in the form hh.mm.ss.

Address (MQCFST)

The filter used to compare with the IP address, or host name, of the partner queue manager or client at the other end of the channel (parameter identifier: MQCACH_CONNECTION_NAME).

AddrList (MQCFSL)

A list of up to 100 IP address patterns which are banned from accessing this queue manager on any channel (parameter identifier: MQCACH_CONNECTION_NAME_LIST).

Chlauth (MQCFST)

The name of the channel, or pattern that matches a set of channels, to which the channel authentication record applies (parameter identifier: MQCACH_CHANNEL_NAME).

CheckClient (MQCFIN)

The user ID and password requirements for the client connection to be successful (parameter identifier: MQIA_CHECK_CLIENT_BINDING).

ClntUser (MQCFST)

The client asserted user ID to be mapped to a new user ID, allowed through unchanged, or blocked (parameter identifier: MQCACH_CLIENT_USER_ID).

Description (MQCFST)

Descriptive information about the channel authentication record (parameter identifier: MQCA_CHLAUTH_DESC).

MCAUser (MQCFST)

The user identifier to be used when the inbound connection matches the TLS DN, IP address, client asserted user ID or remote queue manager name supplied (parameter identifier: MQCACH_MCA_USER_ID).

QMName (MQCFST)

The name of the remote partner queue manager to be mapped to a user ID, allowed through unchanged, or blocked (parameter identifier: MQCA_REMOTE_Q_MGR_NAME).

SSLCertIssuer (MQCFST)

This parameter is additional to the **SSLPeer** parameter.

SSLCertIssuer restricts matches to being within certificates issued by a particular Certificate Authority (parameter identifier: MQCA_SSL_CERT_ISSUER_NAME).

SSLPeer (MQCFST)

The filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel (parameter identifier: MQCACH_SSL_PEER_NAME).

Type (MQCFIN)

The type of channel authentication record for which to set allowed partner details or mappings to MCAUSER (parameter identifier: MQIACF_CHLAUTH_TYPE). The following values can be returned:

MQCAUT_BLOCKUSER

This channel authentication record prevents a specified user or users from connecting.

MQCAUT_BLOCKADDR

This channel authentication record prevents connections from a specified IP address or addresses.

MQCAUT_SSLPEERMAP

This channel authentication record maps TLS Distinguished Names (DNs) to MCAUSER values.

MQCAUT_ADDRESSMAP

This channel authentication record maps IP addresses to MCAUSER values.

MQCAUT_USERMAP

This channel authentication record maps asserted user IDs to MCAUSER values.

MQCAUT_QMGRMAP

This channel authentication record maps remote queue manager names to MCAUSER values.

UserList (MQCFSL)

A list of up to 100 user IDs which are banned from use of this channel or set of channels (parameter identifier: MQCACH_MCA_USER_ID_LIST). Use the special value *MQADMIN to mean privileged or administrative users. The definition of this value depends on the operating system, as follows:

- On AIX and Linux, all members of the mqm group.
- On Windows, all members of the mqm group, the Administrators group and SYSTEM.
- On IBM i, the profiles (users) qmqm and qmqmadm and all members of the qmqmadm group, and any user defined with the *ALLOBJ special setting.
- On z/OS, the user ID that the channel initiator, queue manager and advanced message security address spaces are running under.

UserSrc (MQCFIN)

The source of the user ID to be used for MCAUSER at run time (parameter identifier: MQIACH_USER_SOURCE).

The following values can be returned:

MQUSRC_MAP

Inbound connections that match this mapping use the user ID specified in the **MCAUser** attribute.

MQUSRC_NOACCESS

Inbound connections that match this mapping have no access to the queue manager and the channel ends immediately.

MQUSRC_CHANNEL

Inbound connections that match this mapping use the flowed user ID or any user defined on the channel object in the MCAUSER field.

Warn (MQCFIN)

Indicates whether this record operates in warning mode (parameter identifier: MQIACH_WARNING).

MQWARN_NO

This record does not operate in warning mode. Any inbound connection that matches this record is blocked. This is the default value.

MQWARN_YES

This record operates in warning mode. Any inbound connection that matches this record and would therefore be blocked is allowed access. An error message is written and, if events are configured, an event message is created showing the details of what would have been blocked. The connection is allowed to continue.

MQCMD_INQUIRE_CLUSTER_Q_MGR (Inquire Cluster Queue Manager)

The Inquire Cluster Queue Manager (MQCMD_INQUIRE_CLUSTER_Q_MGR) PCF command inquires about the attributes of IBM MQ queue managers in a cluster.

Required parameters

ClusterQMgrName (MQCFST)

Queue manager name (parameter identifier: MQCA_CLUSTER_Q_MGR_NAME).

Generic queue manager names are supported. A generic name is a character string followed by an asterisk "*", for example ABC*. It selects all queue managers having names that start with the selected character string. An asterisk on its own matches all possible names.

The queue manager name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

Optional parameters

Channel (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

Specifies that eligible cluster queue managers are limited to those having the specified channel name.

Generic channel names are supported. A generic name is a character string followed by an asterisk "*", for example ABC*. It selects all queue managers having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

If you do not specify a value for this parameter, channel information about *all* queue managers in the cluster is returned.

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

Specifies that eligible cluster queue managers are limited to those having the specified cluster name.

Generic cluster names are supported. A generic name is a character string followed by an asterisk "*", for example ABC*. It selects all queue managers having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

If you do not specify a value for this parameter, cluster information about *all* queue managers inquired is returned.

ClusterQMgrAttrs (MQCFIL)

Attributes (parameter identifier: MQIACF_CLUSTER_Q_MGR_ATTRS).

Some parameters are relevant only for cluster channels of a particular type or types. Attributes that are not relevant for a particular type of channel cause no output, and do not cause an error. To check which attributes apply to which channel types; see [Channel attributes and channel types](#).

The attribute list might specify the following value on its own. If the parameter is not specified, a default value is used.

MQIACF_ALL

All attributes.

Alternative, supply a combination of the following values:

MQCA_ALTERATION_DATE

The date on which the information was last altered.

MQCA_ALTERATION_TIME

The time at which the information was last altered.

MQCA_CLUSTER_DATE

The date on which the information became available to the local queue manager.

MQCA_CLUSTER_NAME

The name of the cluster to which the channel belongs.

MQCA_CLUSTER_Q_MGR_NAME

The name of the cluster to which the channel belongs.

MQCA_CLUSTER_TIME

The time at which the information became available to the local queue manager.

MQCA_Q_MGR_IDENTIFIER

The unique identifier of the queue manager.

MQCA_VERSION

The version of the IBM MQ installation that the cluster queue manager is associated with.

MQCA_XMIT_Q_NAME

The cluster transmission queue used by the queue manager.

MQCACH_CONNECTION_NAME

Connection name.

MQCACH_DESCRIPTION

Description.

MQCACH_LOCAL_ADDRESS

Local communications address for the channel.

MQCACH_MCA_NAME

Message channel agent name.

You cannot use MQCACH_MCA_NAME as a parameter to filter on.

MQCACH_MCA_USER_ID

MCA user identifier.

MQCACH_MODE_NAME

Mode name.

MQCACH_MR_EXIT_NAME

Message-retry exit name.

MQCACH_MR_EXIT_USER_DATA

Message-retry exit user data.

MQCACH_MSG_EXIT_NAME

Message exit name.

MQCACH_MSG_EXIT_USER_DATA

Message exit user data.

MQCACH_PASSWORD

Password.

This parameter is not valid on z/OS.

MQCACH_RCV_EXIT_NAME

Receive exit name.

MQCACH_RCV_EXIT_USER_DATA

Receive exit user data.

MQCACH_SEC_EXIT_NAME

Security exit name.

MQCACH_SEC_EXIT_USER_DATA

Security exit user data.

MQCACH_SEND_EXIT_NAME

Send exit name.

MQCACH_SEND_EXIT_USER_DATA

Send exit user data.

MQCACH_SSL_CIPHER_SPEC

TLS cipher spec.

MQIACH_SSL_CLIENT_AUTH

TLS client authentication.

MQCACH_SSL_PEER_NAME

TLS peer name.

MQCACH_TP_NAME

Transaction program name.

MQCACH_USER_ID

User identifier.

This parameter is not valid on z/OS.

MQIA_MONITORING_CHANNEL

Online monitoring data collection.

MQIA_USE_DEAD_LETTER_Q

Determines whether the dead-letter queue is used when messages cannot be delivered by channels.

MQIACF_Q_MGR_DEFINITION_TYPE

How the cluster queue manager was defined.

MQIACF_Q_MGR_TYPE

The function of the queue manager in the cluster.

MQIACF_SUSPEND

Specifies whether the queue manager is suspended from the cluster.

MQIACH_BATCH_HB

The value being used for the batch heartbeat.

MQIACH_BATCH_INTERVAL

Batch wait interval (seconds).

MQIACH_BATCH_DATA_LIMIT

Batch data limit (kilobytes).

MQIACH_BATCH_SIZE

Batch size.

MQIACH_CHANNEL_STATUS

Channel status.

MQIACH_CLWL_CHANNEL_PRIORITY

Cluster workload channel priority.

MQIACH_CLWL_CHANNEL_RANK

Cluster workload channel rank.

MQIACH_CLWL_CHANNEL_WEIGHT

Cluster workload channel weight.

MQIACH_DATA_CONVERSION

Specifies whether sender must convert application data.

MQIACH_DISC_INTERVAL

Disconnection interval.

MQIACH_HB_INTERVAL

Heartbeat interval (seconds).

MQIACH_HDR_COMPRESSION

The list of header data compression techniques supported by the channel.

MQIACH_KEEP_ALIVE_INTERVAL

KeepAlive interval (valid on z/OS only).

MQIACH_LONG_RETRY

Count of long duration attempts.

MQIACH_LONG_TIMER

Long duration timer.

MQIACH_MAX_MSG_LENGTH

Maximum message length.

MQIACH_MCA_TYPE

MCA type.

MQIACH_MR_COUNT

Count of send message attempts.

MQIACH_MR_INTERVAL

Interval between attempting to resend a message in milliseconds.

MQIACH_MSG_COMPRESSION

List of message data compression techniques supported by the channel.

MQIACH_NETWORK_PRIORITY

Network priority.

MQIACH_NPM_SPEED

Speed of nonpersistent messages.

MQIACH_PUT_AUTHORITY

Put authority.

MQIACH_SEQUENCE_NUMBER_WRAP

Sequence number wrap.

MQIACH_SHORT_RETRY

Count of short duration attempts.

MQIACH_SHORT_TIMER

Short duration timer.

MQIACH_XMIT_PROTOCOL_TYPE

Transmission protocol type.

 **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment. The command server must be enabled.
- An asterisk " * ". The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ClusterQMGrAttrs* except MQIACF_ALL and others as noted. Use this parameter to

restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1553 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ClusterQMGrAttrs* except MQCA_CLUSTER_Q_MGR_NAME and others as noted. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1560 for information about using this filter condition.

If you specify a string filter for *Channel* or *ClusterName*, you cannot also specify the *Channel* or *ClusterName* parameter.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

MQCMD_INQUIRE_CLUSTER_Q_MGR (Inquire Cluster Queue Manager) Response

The response to the Inquire Cluster Queue Manager (MQCMD_INQUIRE_CLUSTER_Q_MGR) PCF command consists of three parts. The response header is followed by the *QMGrName* structure and the requested combination of attribute parameter structures.

Always returned:

ChannelName, ClusterName, QMGrName,

Returned if requested:

AlterationDate, AlterationTime, BatchHeartbeat, BatchInterval, BatchSize, ChannelDesc, ChannelMonitoring, ChannelStatus, ClusterDate, ClusterInfo, ClusterTime, CLWLChannelPriority, CLWLChannelRank, CLWLChannelWeight, ConnectionName, DataConversion, DiscInterval, HeaderCompression, HeartbeatInterval, z/OS KeepAliveInterval, LocalAddress, LongRetryCount, LongRetryInterval, MaxMsgLength, MCAName, MCAType, MCAUserIdentifier, MessageCompression, ModeName, MsgExit, MsgRetryCount, MsgRetryExit, MsgRetryInterval, MsgRetryUserData, MsgUserData, NetworkPriority, NonPersistentMsgSpeed, Password, PutAuthority, QMgrDefinitionType, QMgrIdentifier, QMgrType, ReceiveExit, ReceiveUserData, SecurityExit, SecurityUserData, SendExit, SendUserData, SeqNumberWrap, ShortRetryCount, ShortRetryInterval, SSLCipherSpec, SSLClientAuth, SSLPeerName, Suspend, TpName, TransmissionQName, TransportType, UseDLQ, UserIdentifier, Version

Response data

AlterationDate (MQCFST)

Alteration date, in the form yyyy-mm-dd (parameter identifier: MQCA_ALTERATION_DATE).

The date at which the information was last altered.

AlterationTime (MQCFST)

Alteration time, in the form hh.mm.ss (parameter identifier: MQCA_ALTERATION_TIME).

The time at which the information was last altered.

BatchHeartbeat (MQCFIN)

The value being used for the batch heartbeat (parameter identifier: MQIACH_BATCH_HB).

The value can be 0 - 999,999. A value of 0 indicates that the batch heartbeat is not being used.

BatchInterval (MQCFIN)

Batch interval (parameter identifier: MQIACH_BATCH_INTERVAL).

BatchSize (MQCFIN)

Batch size (parameter identifier: MQIACH_BATCH_SIZE).

ChannelDesc (MQCFST)

Channel description (parameter identifier: MQCACH_DESC).

The maximum length of the string is MQ_CHANNEL_DESC_LENGTH.

ChannelMonitoring (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA_MONITORING_CHANNEL).

The value can be:

MQMON_OFF

Online monitoring data collection is turned off for this channel.

MQMON_Q_MGR

The value of the queue manager's **ChannelMonitoring** parameter is inherited by the channel. MQMON_Q_MGR is the default value.

MQMON_LOW

Online monitoring data collection is turned on, with a low rate of data collection, for this channel unless the queue manager's **ChannelMonitoring** parameter is MQMON_NONE.

MQMON_MEDIUM

Online monitoring data collection is turned on, with a moderate rate of data collection, for this channel unless the queue manager's **ChannelMonitoring** parameter is MQMON_NONE.

MQMON_HIGH

Online monitoring data collection is turned on, with a high rate of data collection, for this channel unless the queue manager's **ChannelMonitoring** parameter is MQMON_NONE.

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelStatus (MQCFIN)

Channel status (parameter identifier: MQIACH_CHANNEL_STATUS).

The value can be:

MQCHS_BINDING

Channel is negotiating with the partner.

MQCHS_INACTIVE

Channel is not active.

MQCHS_STARTING

Channel is waiting to become active.

MQCHS_RUNNING

Channel is transferring or waiting for messages.

MQCHS_PAUSED

Channel is paused.

MQCHS_STOPPING

Channel is in process of stopping.

MQCHS_RETRYING

Channel is reattempting to establish connection.

MQCHS_STOPPED

Channel is stopped.

MQCHS_REQUESTING

Requester channel is requesting connection.

MQCHS_INITIALIZING

Channel is initializing.

ClusterDate (MQCFST)

Cluster date, in the form yyyy-mm-dd (parameter identifier: MQCA_CLUSTER_DATE).

The date at which the information became available to the local queue manager.

ClusterInfo (MQCFIN)

Cluster information (parameter identifier: MQIACF_CLUSTER_INFO).

The cluster information available to the local queue manager.

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

ClusterTime (MQCFST)

Cluster time, in the form hh.mm.ss (parameter identifier: MQCA_CLUSTER_TIME).

The time at which the information became available to the local queue manager.

CLWLChannelPriority (MQCFIN)

Channel priority (parameter identifier: MQIACH_CLWL_CHANNEL_PRIORITY).

CLWLChannelRank (MQCFIN)

Channel rank (parameter identifier: MQIACH_CLWL_CHANNEL_RANK).

CLWLChannelWeight (MQCFIN)

Channel weighting (parameter identifier: MQIACH_CLWL_CHANNEL_WEIGHT).

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

The maximum length of the string is MQ_CONN_NAME_LENGTH. On z/OS, it is MQ_LOCAL_ADDRESS_LENGTH.

DataConversion (MQCFIN)

Specifies whether sender must convert application data (parameter identifier: MQIACH_DATA_CONVERSION).

The value can be:

MQCDC_NO_SENDER_CONVERSION

No conversion by sender.

MQCDC_SENDER_CONVERSION

Conversion by sender.

DiscInterval (MQCFIN)

Disconnection interval (parameter identifier: MQIACH_DISC_INTERVAL).

HeaderCompression (MQCFIL)

Header data compression techniques supported by the channel (parameter identifier: MQIACH_HDR_COMPRESSION). The values specified are in order of preference.

The value can be one, or more, of

MQCOMPRESS_NONE

No header data compression is performed.

MQCOMPRESS_SYSTEM

Header data compression is performed.

HeartbeatInterval (MQCFIN)

Heartbeat interval (parameter identifier: MQIACH_HB_INTERVAL).

 **KeepAliveInterval (MQCFIN)**

KeepAlive interval (parameter identifier: MQIACH_KEEP_ALIVE_INTERVAL). This parameter applies to z/OS only.

LocalAddress (MQCFST)

Local communications address for the channel (parameter identifier: MQCACH_LOCAL_ADDRESS).

The maximum length of the string is MQ_LOCAL_ADDRESS_LENGTH.

LongRetryCount (MQCFIN)

Long retry count (parameter identifier: MQIACH_LONG_RETRY).

LongRetryInterval (MQCFIN)

Long timer (parameter identifier: MQIACH_LONG_TIMER).

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: MQIACH_MAX_MSG_LENGTH).

MCAName (MQCFST)

Message channel agent name (parameter identifier: MQCACH_MCA_NAME).

The maximum length of the string is MQ_MCA_NAME_LENGTH.

MCAType (MQCFIN)

Message channel agent type (parameter identifier: MQIACH_MCA_TYPE).

The value can be:

MQMCAT_PROCESS

Process.

MQMCAT_THREAD

Thread (Windows only).

MCAUserIdentifier (MQCFST)

Message channel agent user identifier (parameter identifier: MQCACH_MCA_USER_ID).

The maximum length of the string is MQ_USER_ID_LENGTH.

MessageCompression (MQCFIL)

Message data compression techniques supported by the channel (parameter identifier: MQIACH_MSG_COMPRESSION). The values specified are in order of preference.

The value can be one, or more, of:

MQCOMPRESS_NONE

No message data compression is performed.

MQCOMPRESS_RLE

Message data compression is performed using run-length encoding.

MQCOMPRESS_ZLIBFAST

Message data compression is performed using ZLIB encoding with speed prioritized.

MQCOMPRESS_ZLIBHIGH

Message data compression is performed using ZLIB encoding with compression prioritized.

ModeName (MQCFST)

Mode name (parameter identifier: MQCACH_MODE_NAME).

The maximum length of the string is MQ_MODE_NAME_LENGTH.

MsgExit (MQCFST)

Message exit name (parameter identifier: MQCACH_MSG_EXIT_NAME).

The maximum length of the string is MQ_EXIT_NAME_LENGTH.

 On Multiplatforms, more than one message exit can be defined for a channel. If more than one message exit is defined, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

 On z/OS, an MQCFSL structure is always used.

MsgRetryCount (MQCFIN)

Message retry count (parameter identifier: MQIACH_MR_COUNT).

MsgRetryExit (MQCFST)

Message retry exit name (parameter identifier: MQCACH_MR_EXIT_NAME).

The maximum length of the string is MQ_EXIT_NAME_LENGTH.

MsgRetryInterval (MQCFIN)

Message retry interval (parameter identifier: MQIACH_MR_INTERVAL).

MsgRetryUserData (MQCFST)

Message retry exit user data (parameter identifier: MQCACH_MR_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

MsgUserData (MQCFST)

Message exit user data (parameter identifier: MQCACH_MSG_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

Multi On [Multiplatforms](#), more than one message exit user data string can be defined for a channel. If more than one string is defined, the list of strings is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

NetworkPriority (MQCFIN)

Network priority (parameter identifier: MQIACH_NETWORK_PRIORITY).

NonPersistentMsgSpeed (MQCFIN)

Speed at which non-persistent messages are to be sent (parameter identifier: MQIACH_NPM_SPEED).

The value can be:

MQNPMS_NORMAL

Normal speed.

MQNPMS_FAST

Fast speed.

Password (MQCFST)

Password (parameter identifier: MQCACH_PASSWORD). This parameter is not available on z/OS.

If a nonblank password is defined, it is returned as asterisks. Otherwise, it is returned as blanks.

The maximum length of the string is MQ_PASSWORD_LENGTH. However, only the first 10 characters are used.

PutAuthority (MQCFIN)

Put authority (parameter identifier: MQIACH_PUT_AUTHORITY).

The value can be:

MQPA_DEFAULT

Default user identifier is used.

MQPA_CONTEXT

Context user identifier is used.

MQPA_ALTERNATE_OR_MCA

The user identifier from the *UserIdentifier* field of the message descriptor is used. Any user ID received from the network is not used. This value is valid only on z/OS.

MQPA_ONLY_MCA

The default user identifier is used. Any user ID received from the network is not used. This value is valid only on z/OS.

QMgrDefinitionType (MQCFIN)

Queue manager definition type (parameter identifier: MQIACF_Q_MGR_DEFINITION_TYPE).

The value can be:

MQQMDT_EXPLICIT_CLUSTER_SENDER

A cluster-sender channel from an explicit definition.

MQQMDT_AUTO_CLUSTER_SENDER

A cluster-sender channel by auto-definition.

MQQMDT_CLUSTER_RECEIVER

A cluster-receiver channel.

MQQMDT_AUTO_EXP_CLUSTER_SENDER

A cluster-sender channel, both from an explicit definition and by auto-definition.

QMgrIdentifier (MQCFST)

Queue manager identifier (parameter identifier: MQCA_Q_MGR_IDENTIFIER).

The unique identifier of the queue manager.

QMgrName (MQCFST)

Queue manager name (parameter identifier: MQCA_CLUSTER_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

QMgrType (MQCFIN)

Queue manager type (parameter identifier: MQIACF_Q_MGR_TYPE).

The value can be:

MQQMT_NORMAL

A normal queue manager.

MQQMT_REPOSITORY

A repository queue manager.

ReceiveExit (MQCFST)

Receive exit name (parameter identifier: MQCACH_RCV_EXIT_NAME).

The maximum length of the string is MQ_EXIT_NAME_LENGTH.

Multi On Multiplatforms, more than one receive exit can be defined for a channel. If more than one receive exit is defined, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

ReceiveUserData (MQCFST)

Receive exit user data (parameter identifier: MQCACH_RCV_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

Multi On Multiplatforms, more than one receive exit user data string can be defined for a channel. If more than one string is defined, the list of strings is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

SecurityExit (MQCFST)

Security exit name (parameter identifier: MQCACH_SEC_EXIT_NAME).

The maximum length of the string is MQ_EXIT_NAME_LENGTH.

SecurityUserData (MQCFST)

Security exit user data (parameter identifier: MQCACH_SEC_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

SendExit (MQCFST)

Send exit name (parameter identifier: MQCACH_SEND_EXIT_NAME).

The maximum length of the string is MQ_EXIT_NAME_LENGTH.

Multi On Multiplatforms, more than one send exit can be defined for a channel. If more than one send exit is defined, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

SendUserData (MQCFST)

Send exit user data (parameter identifier: MQCACH_SEND_EXIT_USER_DATA).

The maximum length of the string is MQ_EXIT_DATA_LENGTH.

Multi On Multiplatforms, more than one send exit user data string can be defined for a channel. If more than one string is defined, the list of names is returned in an MQCFSL structure instead of an MQCFST structure.

z/OS On z/OS, an MQCFSL structure is always used.

SeqNumberWrap (MQCFIN)

Sequence wrap number (parameter identifier: MQIACH_SEQUENCE_NUMBER_WRAP).

ShortRetryCount (MQCFIN)

Short retry count (parameter identifier: MQIACH_SHORT_RETRY).

ShortRetryInterval (MQCFIN)

Short timer (parameter identifier: MQIACH_SHORT_TIMER).

SSLCipherSpec (MQCFST)

CipherSpec (parameter identifier: MQCACH_SSL_CIPHER_SPEC).

The length of the string is MQ_SSL_CIPHER_SPEC_LENGTH.

SSLClientAuth (MQCFIN)

Client authentication (parameter identifier: MQIACH_SSL_CLIENT_AUTH).

The value can be:

MQSCA_REQUIRED

Client authentication required

MQSCA_OPTIONAL

Client authentication is optional.

Defines whether IBM MQ requires a certificate from the TLS client.

SSLPeerName (MQCFST)

Peer name (parameter identifier: MQCACH_SSL_PEER_NAME).

The length of the string is MQ_SSL_PEER_NAME_LENGTH. On z/OS, it is MQ_SHORT_PEER_NAME_LENGTH.

Specifies the filter to use to compare with the distinguished name of the certificate from the peer queue manager or client at the other end of the channel. (A distinguished name is the identifier of the TLS certificate.) If the distinguished name in the certificate received from the peer does not match the SSLPEER filter, the channel does not start.

Suspend (MQCFIN)

Specifies whether the queue manager is suspended (parameter identifier: MQIACF_SUSPEND).

The value can be:

MQSUS_NO

The queue manager is not suspended from the cluster.

MQSUS_YES

The queue manager is suspended from the cluster.

TpName (MQCFST)

Transaction program name (parameter identifier: MQCACH_TP_NAME).

The maximum length of the string is MQ_TP_NAME_LENGTH.

TransmissionQName (MQCFST)

Transmission queue name (parameter identifier: MQCA_XMIT_Q_NAME). The cluster transmission queue used by the queue manager.

The maximum length of the string is MQ_Q_NAME_LENGTH.

TransportType (MQCFIN)

Transmission protocol type (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value can be:

MQXPT_LU62

LU 6.2.

MQXPT_TCP

TCP.

MQXPT_NETBIOS

NetBIOS.

MQXPT_SPX

SPX.

MQXPT_DECNET

DECnet.

UseDLQ (MQCFIN)

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA_USE_DEAD_LETTER_Q).

UserIdentifier (MQCFST)

Task user identifier (parameter identifier: MQCACH_USER_ID). This parameter is not available on z/OS.

The maximum length of the string is MQ_USER_ID_LENGTH. However, only the first 10 characters are used.

Version (MQCFST)

The version of the IBM MQ installation that the cluster queue manager is associated with. (parameter identifier: MQCA_VERSION). The version has the format VVRRMMFF:

VV: Version

RR: Release

MM: Maintenance level

FF: Fix level

MQCMD_INQUIRE_COMM_INFO (Inquire Communication Information Object) on Multiplatforms

The Inquire Communication Information Object (MQCMD_INQUIRE_COMM_INFO) PCF command inquires about the attributes of existing IBM MQ communication information objects.

Required parameters:

ComminfoName

Optional parameters:

ComminfoAttrs, **IntegerFilterCommand**, **StringFilterCommand**

Required parameters**ComminfoName (MQCFST)**

The name of the communication information definition about which information is to be returned (parameter identifier: MQCA_COMM_INFO_NAME).

The communication information name is always returned regardless of the attributes requested.

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

Optional parameters

ComminfoAttrs (MQCFIL)

Comminfo attributes (parameter identifier: MQIACF_COMM_INFO_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQIA_CODED_CHAR_SET_ID

CCSID for transmitted messages.

MQIA_COMM_EVENT

Comminfo event control.

MQIA_MCAST_BRIDGE

Multicast bridging.

MQIA_MONITOR_INTERVAL

Frequency of update for monitoring information.

MQIACF_ENCODING

Encoding for transmitted messages.

MQIACH_MC_HB_INTERVAL

Multicast heartbeat interval.

MQIACH_MSG_HISTORY

Amount of message history being kept.

MQIACH_MULTICAST_PROPERTIES

Multicast properties control.

MQIACH_NEW_SUBSCRIBER_HISTORY

New subscriber history.

MQIACH_PORT

Port Number.

MQCA_ALTERATION_DATE

The date on which the information was last altered.

MQCA_ALTERATION_TIME

The time at which the information was last altered.

MQCA_COMM_INFO_DESC

Comminfo description.

MQCA_COMM_INFO_TYPE

Comminfo type

MQCACH_GROUP_ADDRESS

Group Address.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ComminfoAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you specify an integer filter for *ComminfoType* (MQIA_COMM_INFO_TYPE), you cannot also specify the **ComminfoType** parameter.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ComminfoAttrs* except MQCA_COMM_INFO_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1560 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Multi MQCMD_INQUIRE_COMM_INFO (Inquire Communication Information Object) Response on Multiplatforms

The response to the Inquire Communication Information Object (MQCMD_INQUIRE_COMM_INFO) PCF command consists of the response header followed by the *ComminfoName* structure, and the requested combination of attribute parameter structures (where applicable).

If a generic communication information name was specified, one such message is generated for each object found.

Always returned:

ComminfoName

Returned if requested:

AlterationDate, AlterationTime, Bridge, CCSID, CommEvent, Description, Encoding, GrpAddress, MonitorInterval, MulticastHeartbeat, MulticastPropControl, MsgHistory, NewSubHistory, PortNumber, Type

Response data

AlterationDate (MQCFST)

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered, in the form hh.mm.ss.

Bridge (MQCFIN)

Multicast Bridging (parameter identifier: MQIA_MCAST_BRIDGE).

Controls whether publications from applications not using Multicast are bridged to applications using multicast.

CCSID (MQCFIN)

CCSID that messages are transmitted in (parameter identifier: MQIA_CODED_CHAR_SET_ID).

The coded character set identifier that messages are transmitted in.

CommEvent (MQCFIN)

Event Control (parameter identifier: MQIA_COMM_EVENT).

Controls whether event messages are generated for multicast handles that are created using this COMMINFO object. The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

MQEVR_EXCEPTION

Reporting of events for message reliability below the reliability threshold enabled.

ComminfoName (MQCFST)

The name of the communication information definition (parameter identifier: MQCA_COMM_INFO_NAME).

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

Description (MQCFST)

Description of the communication information definition (parameter identifier: MQCA_COMM_INFO_DESC).

The maximum length of the string is MQ_COMM_INFO_DESC_LENGTH.

Encoding (MQCFIN)

Encoding that messages are transmitted in (parameter identifier: MQIACF_ENCODING).

The encoding that messages are transmitted in. The value can be any of the following values:

MQENC_AS_PUBLISHED

Encoding taken from published message.

MQENC_NORMAL**MQENC_REVERSED****MQENC_S390****MQENC_TNS****GrpAddress (MQCFST)**

The group IP address or DNS name (parameter identifier: MQCACH_GROUP_ADDRESS).

The maximum length of the string is MQ_GROUP_ADDRESS_LENGTH.

MonitorInterval (MQCFIN)

Frequency of monitoring (parameter identifier: MQIA_MONITOR_INTERVAL).

How frequently, in seconds, monitoring information is updated and event messages are generated.

MulticastHeartbeat (MQCFIN)

Heartbeat Interval for multicast (parameter identifier: MQIACH_MC_HB_INTERVAL).

The heartbeat interval, in milliseconds, for multicast transmitters.

MulticastPropControl (MQCFIN)

Multicast property control (parameter identifier: MQIACH_MULTICAST_PROPERTIES).

Control which MQMD properties and user properties flow with the message. The value can be any of the following values:

MQMCP_ALL

All MQMD and user properties.

MQMAP_REPLY

Properties related to replying to messages.

MQMAP_USER

Only user properties.

MQMAP_NONE

No MQMD or user properties.

MQMAP_COMPAT

Properties are transmitted in a format compatible with previous Multicast clients.

MsgHistory (MQCFIN)

Message History (parameter identifier: MQIACH_MSG_HISTORY).

The amount of message history, in kilobytes, that is kept by the system to handle retransmissions in the case of NACKS.

NewSubHistory (MQCFIN)

New Subscriber History (parameter identifier: MQIACH_NEW_SUBSCRIBER_HISTORY).

Controls how much historical data a new subscriber receives. The value can be any of the following values:

MQNSH_NONE

Only publications from the time of the subscription are sent.

MQNSH_ALL

As much history as is known is retransmitted.

PortNumber (MQCFIN)

Port Number (parameter identifier: MQIACH_PORT).

The port number to transmit on.

Type (MQCFIN)

The type of the communications information definition (parameter identifier: MQIA_COMM_INFO_TYPE).

The value can be:

MQCIT_MULTICAST

Multicast.

MQCMD_INQUIRE_CONNECTION (Inquire Connection)

The Inquire connection (MQCMD_INQUIRE_CONNECTION) PCF command inquires about the applications which are connected to the queue manager, the status of any transactions that those applications are running, and the objects which the application has open.

Required parameters

ConnectionId (MQCFBS)

Connection identifier (parameter identifier: MQBACF_CONNECTION_ID).

This parameter is the unique connection identifier associated with an application that is connected to the queue manager. Specify either this parameter **or** *GenericConnectionId*.

All connections are assigned a unique identifier by the queue manager regardless of how the connection is established.

If you need to specify a generic connection identifier, use the **GenericConnectionId** parameter instead.

The length of the string is MQ_CONNECTION_ID_LENGTH.

GenericConnectionId (MQCFBS)

Generic specification of a connection identifier (parameter identifier: MQBACF_GENERIC_CONNECTION_ID).

Specify either this parameter **or** *ConnectionId*.

If you specify a byte string of zero length, or one which contains only null bytes, information about all connection identifiers is returned. This value is the only value permitted for *GenericConnectionId*.

The length of the string is MQ_CONNECTION_ID_LENGTH.

Optional parameters

ByteStringFilterCommand (MQCFBF)

Byte string filter command descriptor. The parameter identifier must be MQBACF_EXTERNAL_UOW_ID, MQBACF_ORIGIN_UOW_ID, or MQBACF_Q_MGR_UOW_ID. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFBF - PCF byte string filter parameter” on page 1548](#) for information about using this filter condition.

If you specify a byte string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter, or a string filter using the **StringFilterCommand** parameter.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_Q_MGR_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

ConnectionAttrs (MQCFIL)

Connection attributes (parameter identifier: MQIACF_CONNECTION_ATTRS).

The attribute list can specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes of the selected *ConnInfoType*.

or, if you select a value of MQIACF_CONN_INFO_CONN for *ConnInfoType*, a combination of the following:

MQBACF_CONNECTION_ID

Connection identifier.

Multi MQBACF_CONN_TAG

Connection tag.

MQBACF_EXTERNAL_UOW_ID

External unit of recovery identifier associated with the connection.

MQBACF_ORIGIN_UOW_ID

Unit of recovery identifier assigned by the originator (valid on z/OS only).

MQBACF_Q_MGR_UOW_ID

Unit of recovery identifier assigned by the queue manager.

MQCACF_APPL_TAG

Name of an application that is connected to the queue manager.

MQCACF_ASID

The 4-character address-space identifier of the application identified in MQCACF_APPL_TAG (valid on z/OS only).

MQCACF_ORIGIN_NAME

Originator of the unit of recovery (valid on z/OS only).

MQCACF_PSB_NAME

The 8-character name of the program specification block (PSB) associated with the running IMS transaction (valid on z/OS only).

MQCACF_PST_ID

The 4-character IMS program specification table (PST) region identifier for the connected IMS region (valid on z/OS only).

MQCACF_TASK_NUMBER

A 7-digit CICS task number (valid on z/OS only).

MQCACF_TRANSACTION_ID

A 4-character CICS transaction identifier (valid on z/OS only).

MQCACF_UOW_LOG_EXTENT_NAME

Name of the first extent required to recover the transaction. MQCACF_UOW_LOG_EXTENT_NAME is not valid on z/OS.

MQCACF_UOW_LOG_START_DATE

Date on which the transaction associated with the current connection first wrote to the log.

MQCACF_UOW_LOG_START_TIME

Time at which the transaction associated with the current connection first wrote to the log.

MQCACF_UOW_START_DATE

Date on which the transaction associated with the current connection was started.

MQCACF_UOW_START_TIME

Time at which the transaction associated with the current connection was started.

MQCACF_USER_IDENTIFIER

User identifier of the application that is connected to the queue manager.

MQCACH_CHANNEL_NAME

Name of the channel associated with the connected application.

MQCACH_CONNECTION_NAME

Connection name of the channel associated with the application.

MQIA_APPL_TYPE

Type of the application that is connected to the queue manager.

MQIACF_CONNECT_OPTIONS

Connect options currently in force for this application connection.

You cannot use the value MQCNO_STANDARD_BINDING as a filter value.

MQIACF_PROCESS_ID

Process identifier of the application that is currently connected to the queue manager.

This parameter is not valid on z/OS.

MQIACF_THREAD_ID

Thread identifier of the application that is currently connected to the queue manager.

This parameter is not valid on z/OS.

MQIACF_UOW_STATE

State of the unit of work.

MQIACF_UOW_TYPE

Type of external unit of recovery identifier as understood by the queue manager.

or, if you select a value of MQIACF_CONN_INFO_HANDLE for *ConnInfoType*, a combination of the following:

MQCACF_OBJECT_NAME

Name of each object that the connection has open.

MQCACH_CONNECTION_NAME

Connection name of the channel associated with the application.

 **MQIA_QSG_DISP**

Disposition of the object (valid on z/OS only).

You cannot use MQIA_QSG_DISP as a parameter to filter on.

MQIA_READ_AHEAD

The read ahead connection status.

MQIA_UR_DISP

The unit of recovery disposition associated with the connection (valid on z/OS only).

MQIACF_HANDLE_STATE

Whether an API call is in progress.

MQIACF_OBJECT_TYPE

Type of each object that the connection has open.

MQIACF_OPEN_OPTIONS

Options used by the connection to open each object.

or, if you select a value of MQIACF_CONN_INFO_ALL for *ConnInfoType*, any of the previous values.

ConnInfoType (MQCFIN)

Type of connection information to be returned (parameter identifier: MQIACF_CONN_INFO_TYPE).

The value can be any of the following values:

MQIACF_CONN_INFO_CONN

Connection information. On z/OS, MQIACF_CONN_INFO_CONN includes threads which might be logically or actually disassociated from a connection, together with those threads that are in-doubt and for which external intervention is needed to resolve them. MQIACF_CONN_INFO_CONN is the default value used if the parameter is not specified.

MQIACF_CONN_INFO_HANDLE

Information pertaining only to those objects opened by the specified connection.

MQIACF_CONN_INFO_ALL

Connection information and information about those objects that the connection has open.

You cannot use *ConnInfoType* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ConnectionAttrs* except as noted and MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. You cannot use the value MQCNO_STANDARD_BINDING on the MQIACF_CONNECT_OPTIONS parameter with either the MQCFOP_CONTAINS or MQCFOP_EXCLUDES operator. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you filter on MQIACF_CONNECT_OPTIONS or MQIACF_OPEN_OPTIONS, in each case the filter value must have only 1 bit set.

If you specify an integer filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or a string filter using the **StringFilterCommand** parameter.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ConnectionAttrs*. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1560](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or an integer filter using the **IntegerFilterCommand** parameter.

URDisposition (MQCFIN)

The unit of recovery disposition associated with the connection (parameter identifier: MQI_UR_DISP). This parameter is valid only on z/OS.

The value can be any of the following values:

MQQSGD_ALL

Specifies that all connections must be returned.

MQQSGD_GROUP

Specifies that only connections with a GROUP unit of recovery disposition must be returned.

MQQSGD_Q_MGR

Specifies that only connections with a QMGR unit of recovery disposition must be returned.

Error code

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CONNECTION_ID_ERROR

Connection identifier not valid.

MQCMD_INQUIRE_CONNECTION (Inquire Connection) Response

The response to the Inquire Connection (MQCMD_INQUIRE_CONNECTION) PCF command consists of the response header followed by the *ConnectionId* structure and a set of attribute parameter structures determined by the value of *ConnInfoType* in the Inquire command.

If the value of *ConnInfoType* was MQIACF_CONN_INFO_ALL, there is one message for each connection found with MQIACF_CONN_INFO_CONN, and *n* more messages per connection with MQIACF_CONN_INFO_HANDLE (where *n* is the number of objects that the connection has open).

Always returned:

ConnectionId, *ConnInfoType*

Always returned if *ConnInfoType* is MQIACF_CONN_INFO_HANDLE:

ObjectName, *ObjectType*,  *QSGDisposition*

Returned if requested and *ConnInfoType* is MQIACF_CONN_INFO_CONN:

ApplDesc, *ApplTag*, *ApplType*,  *ASID*, *AsynchronousState*, *ChannelName*,
ClientIdentifier, *ConnectionName*, *ConnectionOptions*,  *ConnectionTag*,
 *OriginName*,  *OriginUOWId*,  *ProcessId*, *PSBName*,
 *PSTId*, *QMgrUOWId*, *StartUOWLogExtent*, *TaskNumber*, *ThreadId*, 
TransactionId, *UOWIdentifier*, *UOWLogStartDate*, *UOWLogStartTime*, *UOWStartDate*,
UOWStartTime, *UOWState*, *UOWType*,  *URDisposition*, *UserId*

Returned if requested and *ConnInfoType* is MQIACF_CONN_INFO_HANDLE:

AsynchronousState, *Destination*, *DestinationQueueManager*, *HandleState*,
OpenOptions, *ReadAhead*, *SubscriptionID*, *SubscriptionName*, *TopicString*

Response data

ApplDesc (MQCFST)

Application description (parameter identifier: MQCACF_APPL_DESC).

The maximum length is MQ_APPL_DESC_LENGTH.

ApplTag (MQCFST)

Application tag (parameter identifier: MQCACF_APPL_TAG).

The maximum length is MQ_APPL_TAG_LENGTH.

ApplType (MQCFIN)

Application type (parameter identifier: MQIA_APPL_TYPE).

The value can be any of the following values:

MQAT_QMGR

Queue manager process.

MQAT_CHANNEL_INITIATOR

Channel initiator.

MQAT_USER

User application.

MQAT_BATCH

Application using a batch connection (only on z/OS).

MQAT_RRS_BATCH

RRS-coordinated application using a batch connection (only on z/OS).

MQAT_CICS

CICS transaction (only on z/OS).

MQAT_IMS

IMS transaction (only on z/OS).

MQAT_SYSTEM_EXTENSION

Application performing an extension of function that is provided by the queue manager.

z/OS**ASID (MQCFST)**

Address space identifier (parameter identifier: MQCACF_ASID).

The four character address-space identifier of the application identified by *AppLTag*. It distinguishes duplicate values of *AppLTag*.

This parameter is valid only on z/OS.

The length of the string is MQ_ASID_LENGTH.

AsynchronousState (MQCFIN)

The state of asynchronous consumption on this handle (parameter identifier: MQIACF_ASYNC_STATE).

The value can be:

MQAS_NONE

If *ConnInfoType* is MQIACF_CONN_INFO_CONN, an MQCTL call has not been issued against the handle. Asynchronous message consumption cannot currently proceed on this connection. If *ConnInfoType* is MQIACF_CONN_INFO_HANDLE, an MQCB call has not been issued against this handle, so no asynchronous message consumption is configured on this handle.

MQAS_SUSPENDED

The asynchronous consumption callback has been suspended so that asynchronous message consumption cannot currently proceed on this handle. This situation can be either because an MQCB or MQCTL call with *Operation* MQOP_SUSPEND has been issued against this object handle by the application, or because it has been suspended by the system. If it has been suspended by the system, as part of the process of suspending asynchronous message consumption the callback function is called with the reason code that describes the problem resulting in suspension. This reason code is reported in the *Reason* field in the MQCBC structure passed to the callback. In order for asynchronous message consumption to proceed, the application must issue an MQCB or MQCTL call with *Operation* MQOP_RESUME. This reason code can be returned if *ConnInfoType* is MQIACF_CONN_INFO_CONN or MQIACF_CONN_INFO_HANDLE.

MQAS_SUSPENDED_TEMPORARY

The asynchronous consumption callback has been temporarily suspended by the system so that asynchronous message consumption cannot currently proceed on this object handle. As part of the process of suspending asynchronous message consumption, the callback function is called with the reason code that describes the problem resulting in suspension. MQAS_SUSPENDED_TEMPORARY is reported in the *Reason* field in the MQCBC structure passed to the callback. The callback function is called again when asynchronous message consumption is resumed by the system when the temporary condition has been resolved. MQAS_SUSPENDED_TEMPORARY is returned only if *ConnInfoType* is MQIACF_CONN_INFO_HANDLE.

MQAS_STARTED

An MQCTL call with *Operation* MQOP_START has been issued against the connection handle so that asynchronous message consumption can proceed on this connection. MQAS_STARTED is returned only if *ConnInfoType* is MQIACF_CONN_INFO_CONN.

MQAS_START_WAIT

An MQCTL call with *Operation* MQOP_START_WAIT has been issued against the connection handle so that asynchronous message consumption can proceed on this connection. MQAS_START_WAIT is returned only if *ConnInfoType* is MQIACF_CONN_INFO_CONN.

MQAS_STOPPED

An MQCTL call with *Operation* MQOP_STOP has been issued against the connection handle so that asynchronous message consumption cannot currently proceed on this connection. MQAS_STOPPED is returned only if *ConnInfoType* is MQIACF_CONN_INFO_CONN.

MQAS_ACTIVE

An MQCB call has set up a function to call back to process messages asynchronously and the connection handle has been started so that asynchronous message consumption can proceed. MQAS_ACTIVE is returned only if *ConnInfoType* is MQIACF_CONN_INFO_HANDLE.

MQAS_INACTIVE

An MQCB call has set up a function to call back to process messages asynchronously but the connection handle has not yet been started, or has been stopped or suspended, so that asynchronous message consumption cannot currently proceed. MQAS_INACTIVE is returned only if *ConnInfoType* is MQIACF_CONN_INFO_HANDLE.

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ClientId (MQCFST)

Client identifier (parameter identifier: MQCACH_CLIENT_ID). The client identifier of the client that is using the connection. If there is no client identifier associated with the connection, this attribute is blank.

The maximum length of the string is MQ_CLIENT_ID_LENGTH.

ConnectionId (MQCFBS)

Connection identifier (parameter identifier: MQBACF_CONNECTION_ID).

The length of the string is MQ_CONNECTION_ID_LENGTH.

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

The maximum length of the string is MQ_CONN_NAME_LENGTH.

ConnectionOptions (MQCFIL)

Connect options currently in force for the connection (parameter identifier: MQIACF_CONNECT_OPTIONS).

Multi ConnectionTag (MQCFBS)

Connection tag (parameter identifier: MQBACF_CONN_TAG).

Identifies related connections, which collectively represent a single instance of an application. The length of the string is MQ_CONN_TAG_LENGTH.

ConnInfoType (MQCFIN)

Type of information returned (parameter identifier: MQIACF_CONN_INFO_TYPE).

The value can be any of the following values:

MQIACF_CONN_INFO_CONN

Generic information for the specified connection.

MQIACF_CONN_INFO_HANDLE

Information pertinent only to those objects opened by the specified connection.

Destination (MQCFST)

The destination queue for messages published to this subscription (parameter identifier MQCACF_DESTINATION).

This parameter is relevant only for handles of subscriptions to topics.

DestinationQueueManager (MQCFST)

The destination queue manager for messages published to this subscription (parameter identifier MQCACF_DESTINATION_Q_MGR).

This parameter is relevant only for handles of subscriptions to topics. If *Destination* is a queue hosted on the local queue manager, this parameter contains the local queue manager name. If *Destination* is a queue hosted on a remote queue manager, this parameter contains the name of the remote queue manager.

HandleState (MQCFIN)

State of the handle (parameter identifier: MQIACF_HANDLE_STATE).

The value can be any of the following values:

MQHSTATE_ACTIVE

An API call from this connection is currently in progress for this object. If the object is a queue, this condition can arise when an MQGET WAIT call is in progress.

If there is an MQGET SIGNAL outstanding, then this situation does not mean, by itself, that the handle is active.

MQHSTATE_INACTIVE

No API call from this connection is currently in progress for this object. If the object is a queue, this condition can arise when no MQGET WAIT call is in progress.

ObjectName (MQCFST)

Object name (parameter identifier: MQCACF_OBJECT_NAME).

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

ObjectType (MQCFIN)

Object type (parameter identifier: MQIACF_OBJECT_TYPE).

If this parameter is a handle of a subscription to a topic, the SUBID parameter identifies the subscription and can be used with the Inquire Subscription command to find all the details about the subscription.

The value can be any of the following values:

MQOT_Q

Queue.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process.

MQOT_Q_MGR

Queue manager.

MQOT_CHANNEL

Channel.

MQOT_AUTH_INFO

Authentication information object.

MQOT_TOPIC

Topic.

OpenOptions (MQCFIN)

Open options currently in force for the object for connection (parameter identifier: MQIACF_OPEN_OPTIONS).

This parameter is not relevant for a subscription. Use the SUBID field of the DISPLAY SUB command to find all the details about the subscription.

z/OS **OriginName (MQCFST)**

Origin name (parameter identifier: MQCACF_ORIGIN_NAME).

Identifies the originator of the unit of recovery, except where *AppType* is MQAT_RRS_BATCH when it is omitted.

This parameter is valid only on z/OS.

The length of the string is MQ_ORIGIN_NAME_LENGTH.

z/OS **OriginUOWId (MQCFBS)**

Origin UOW identifier (parameter identifier: MQBACF_ORIGIN_UOW_ID).

The unit of recovery identifier assigned by the originator. It is an 8-byte value.

This parameter is valid only on z/OS.

The length of the string is MQ_UOW_ID_LENGTH.

z/OS **ProcessId (MQCFIN)**

Process identifier (parameter identifier: MQIACF_PROCESS_ID).

PSBName (MQCFST)

Program specification block name (parameter identifier: MQCACF_PSB_NAME).

The 8-character name of the program specification block (PSB) associated with the running IMS transaction.

This parameter is valid only on z/OS.

The length of the string is MQ_PSB_NAME_LENGTH.

z/OS **PSTId (MQCFST)**

Program specification table identifier (parameter identifier: MQCACF_PST_ID).

The 4-character IMS program specification table (PST) region identifier for the connected IMS region.

This parameter is valid only on z/OS.

The length of the string is MQ_PST_ID_LENGTH.

QMGrUOWId (MQCFBS)

Unit of recovery identifier assigned by the queue manager (parameter identifier: MQBACF_Q_MGR_UOW_ID).

z/OS On z/OS platforms, this parameter is returned as an 8-byte RBA.

Multi On Multiplatforms, this parameter is an 8-byte transaction identifier.

The maximum length of the string is MQ_UOW_ID_LENGTH.

z/OS **QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid only on z/OS. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED.

ReadAhead (MQCFIN)

The read ahead connection status (parameter identifier: MQIA_READ_AHEAD).

The value can be any of the following values:

MQREADA_NO

Read ahead for browsing messages, or of non-persistent messages is not enabled for the object that the connection has open.

MQREADA_YES

Read ahead for browsing messages, or of non-persistent messages is enabled for the object that the connection has open and is being used efficiently.

MQREADA_BACKLOG

Read ahead for browsing messages, or of non-persistent messages is enabled for this object. Read ahead is not being used efficiently because the client has been sent many messages which are not being consumed.

MQREADA_INHIBITED

Read ahead was requested by the application but has been inhibited because of incompatible options specified on the first MQGET call.

StartUOWLogExtent (MQCFST)

Name of the first extent needed to recover the transaction (parameter identifier: MQCACF_UOW_LOG_EXTENT_NAME).

The 8-character name of the program specification block (PSB) associated with the running IMS transaction.

This parameter is not valid on z/OS.

The maximum length of the string is MQ_LOG_EXTENT_NAME_LENGTH.

SubscriptionID (MQCFBS)

The internal, all time unique identifier of the subscription (parameter identifier MQBACF_SUB_ID).

This parameter is relevant only for handles of subscriptions to topics.

Not all subscriptions can be seen using Inquire Connection; only those subscriptions that have current handles open to the subscriptions can be seen. Use the Inquire Subscription command to see all subscriptions.

SubscriptionName (MQCFST)

The unique subscription name of the application associated with the handle (parameter identifier MQCACF_SUB_NAME).

This parameter is relevant only for handles of subscriptions to topics. Not all subscriptions have a subscription name.

ThreadId (MQCFIN)

Thread identifier (parameter identifier: MQIACF_THREAD_ID).

TopicString (MQCFST)

Resolved topic string (parameter identifier: MQCA_TOPIC_STRING).

This parameter is relevant for handles with an ObjectType of MQOT_TOPIC. For any other object type, this parameter is blank.

 TransactionId (MQCFST)

Transaction identifier (parameter identifier: MQCACF_TRANSACTION_ID).

The 4-character CICS transaction identifier.

This parameter is valid only on z/OS.

The maximum length of the string is MQ_TRANSACTION_ID_LENGTH.

UOWIdentifier (MQCFBS)

External unit of recovery identifier associated with the connection (parameter identifier: MQBACF_EXTERNAL UOW_ID).

This parameter is the recovery identifier for the unit of recovery. The value of *UOWType* determines its format.

The maximum length of the byte string is MQ_UOW_ID_LENGTH.

UOWLogStartDate (MQCFST)

Logged unit of work start date, in the form yyyy-mm-dd (parameter identifier: MQCACF_UOW_LOG_START_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

UOWLogStartTime (MQCFST)

Logged unit of work start time, in the form hh.mm.ss (parameter identifier: MQCACF_UOW_LOG_START_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

UOWStartDate (MQCFST)

Unit of work creation date (parameter identifier: MQCACF_UOW_START_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

UOWStartTime (MQCFST)

Unit of work creation time (parameter identifier: MQCACF_UOW_START_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

UOWState (MQCFIN)

State of the unit of work (parameter identifier: MQIACF_UOW_STATE).

The value can be any of the following values:

MQUOWST_NONE

There is no unit of work.

MQUOWST_ACTIVE

The unit of work is active.

MQUOWST_PREPARED

The unit of work is in the process of being committed.

MQUOWST_UNRESOLVED

The unit of work is in the second phase of a two-phase commit operation. IBM MQ holds resources on behalf of the unit of work and external intervention is required to resolve it. It might be as simple as starting the recovery coordinator (such as CICS, IMS, or RRS) or it might involve a more complex operation such as using the RESOLVE INDOUBT command. This value can occur only on z/OS.

UOWType (MQCFIN)

Type of external unit of recovery identifier as perceived by the queue manager (parameter identifier: MQIACF_UOW_TYPE).

The value can be any of the following values:

MQUOWT_Q_MGR**MQUOWT_CICS****MQUOWT_RRS****MQUOWT_IMS****MQUOWT_XA****z/OS URDisposition (MQCFIN)**

The unit of recovery disposition associated with the connection.

This parameter is valid only on z/OS.

The value can be:

MQQSGD_GROUP

This connection has a GROUP unit of recovery disposition.

MQQSGD_Q_MGR

This connection has a QMGR unit of recovery disposition.

UserId (MQCFST)

User identifier (parameter identifier: MQCACF_USER_IDENTIFIER).

The maximum length of the string is MQ_MAX_USER_ID_LENGTH.

Multi **MQCMD_INQUIRE_ENTITY_AUTH (Inquire Entity Authority) on Multiplatforms**

The Inquire Entity Authority (MQCMD_INQUIRE_ENTITY_AUTH) PCF command inquires about authorizations of an entity to a specified object.

Required parameters

EntityName (MQCFST)

Entity name (parameter identifier: MQCACF_ENTITY_NAME).

Depending on the value of *EntityType*, this parameter is either:

- A principal name. This name is the name of a user for whom to retrieve authorizations to the specified object. On IBM MQ for Windows, the name of the principal can optionally include a domain name, specified in this format: `user@domain`.
- A group name. This name is the name of the user group on which to make the inquiry. You can specify one name only and this name must be the name of an existing user group.

Windows For IBM MQ for Windows only, the group name can optionally include a domain name, specified in the following formats:

```
GroupName@domain  
domain\GroupName
```

The maximum length of the string is MQ_ENTITY_NAME_LENGTH.

EntityType (MQCFIN)

Entity type (parameter identifier: MQIACF_ENTITY_TYPE).

The value can be:

MQZAET_GROUP

The value of the **EntityName** parameter refers to a group name.

MQZAET_PRINCIPAL

The value of the **EntityName** parameter refers to a principal name.

ObjectType (MQCFIN)

The type of object referred to by the profile (parameter identifier: MQIACF_OBJECT_TYPE).

The value can be any of the following values:

MQOT_AUTH_INFO

Authentication information.

MQOT_CHANNEL

Channel object.

MQOT_CLNTCONN_CHANNEL

Client-connection channel object.

MQOT_COMM_INFO

Communication information object

MQOT_LISTENER

Listener object.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process.

MQOT_Q

Queue, or queues, that match the object name parameter.

MQOT_Q_MGR

Queue manager.

MQOT_REMOTE_Q_MGR_NAME

Remote queue manager.

MQOT_SERVICE

Service object.

MQOT_TOPIC

Topic object.

Options (MQCFIN)

Options to control the set of authority records that is returned (parameter identifier: MQIACF_AUTH_OPTIONS).

This parameter is required and you must set it to the value MQAUTHOPT_CUMULATIVE. It returns a set of authorities representing the cumulative authority that an entity has to a specified object.

If a user ID is a member of more than one group, this command displays the combined authorizations of all groups.

Optional parameters**ObjectName (MQCFST)**

Object name (parameter identifier: MQCACF_OBJECT_NAME).

The name of the queue manager, queue, process definition, or generic profile on which to make the inquiry.

You must include a parameter if the *ObjectType* is not MQOT_Q_MGR. If you do not include this parameter, it is assumed that you are making an inquiry on the queue manager.

You cannot specify a generic object name although you can specify the name of a generic profile.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

ProfileAttrs (MQCFIL)

Profile attributes (parameter identifier: MQIACF_AUTH_PROFILE_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCACF_ENTITY_NAME

Entity name.

MQIACF_AUTHORIZATION_LIST

Authorization list.

MQIACF_ENTITY_TYPE

Entity type.

MQIACF_OBJECT_TYPE

Object type.

ServiceComponent (MQCFST)

Service component (parameter identifier: MQCACF_SERVICE_COMPONENT).

If installable authorization services are supported, this parameter specifies the name of the authorization service to which the authorizations apply.

If you omit this parameter, the authorization inquiry is made to the first installable component for the service.

The maximum length of the string is MQ_SERVICE_COMPONENT_LENGTH.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands”](#) on page 1018.

Reason (MQLONG)

The value can be any of the following values:

MQRC_UNKNOWN_ENTITY

User ID not authorized, or unknown.

MQRCCF_OBJECT_TYPE_MISSING

Object type missing.

Multi MQCMD_INQUIRE_ENTITY_AUTH (Inquire Entity Authority) Response on**Multiplatforms**

Each response to the Inquire Entity Authority (MQCMD_INQUIRE_ENTITY_AUTH) PCF command consists of the response header followed by the *QMgrName*, *Options*, and *ObjectName* structures and the requested combination of attribute parameter structures.

Always returned:

ObjectName, *Options*, *QMgrName*

Returned if requested:

AuthorizationList, *EntityName*, *EntityType*, *ObjectType*

Response data**AuthorizationList (MQCFIL)**

Authorization list(parameter identifier: MQIACF_AUTHORIZATION_LIST).

This list can contain zero or more authorization values. Each returned authorization value means that any user ID in the specified group or principal has the authority to perform the operation defined by that value. The value can be any of the following values:

MQAUTH_NONE

The entity has authority set to 'none'.

MQAUTH_ALT_USER_AUTHORITY

Specify an alternate user ID on an MQI call.

MQAUTH_BROWSE

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

MQAUTH_CHANGE

Change the attributes of the specified object, using the appropriate command set.

MQAUTH_CLEAR

Clear a queue.

MQAUTH_CONNECT

Connect the application to the specified queue manager by issuing an MQCONN call.

MQAUTH_CREATE

Create objects of the specified type using the appropriate command set.

MQAUTH_DELETE

Delete the specified object using the appropriate command set.

MQAUTH_DISPLAY

Display the attributes of the specified object using the appropriate command set.

MQAUTH_INPUT

Retrieve a message from a queue by issuing an MQGET call.

MQAUTH_INQUIRE

Make an inquiry on a specific queue by issuing an MQINQ call.

MQAUTH_OUTPUT

Put a message on a specific queue by issuing an MQPUT call.

MQAUTH_PASS_ALL_CONTEXT

Pass all context.

MQAUTH_PASS_IDENTITY_CONTEXT

Pass the identity context.

MQAUTH_SET

Set attributes on a queue from the MQI by issuing an MQSET call.

MQAUTH_SET_ALL_CONTEXT

Set all context on a queue.

MQAUTH_SET_IDENTITY_CONTEXT

Set the identity context on a queue.

MQAUTH_CONTROL

For listeners and services, start and stop the specified channel, listener, or service.

For channels, start, stop, and ping the specified channel.

For topics, define, alter, or delete subscriptions.

MQAUTH_CONTROL_EXTENDED

Reset or resolve the specified channel.

MQAUTH_PUBLISH

Publish to the specified topic.

MQAUTH_SUBSCRIBE

Subscribe to the specified topic.

MQAUTH_RESUME

Resume a subscription to the specified topic.

MQAUTH_SYSTEM

Use queue manager for internal system operations.

MQAUTH_ALL

Use all operations applicable to the object.

MQAUTH_ALL_ADMIN

Use all administration operations applicable to the object.

MQAUTH_ALL_MQI

Use all MQI calls applicable to the object.

Use the *Count* field in the MQCFIL structure to determine how many values are returned.

EntityName (MQCFST)

Entity name (parameter identifier: MQCACF_ENTITY_NAME).

This parameter can either be a principal name or a group name.

The maximum length of the string is MQ_ENTITY_NAME_LENGTH.

EntityType (MQCFIN)

Entity type (parameter identifier: MQIACF_ENTITY_TYPE).

The value can be:

MQZAET_GROUP

The value of the **EntityName** parameter refers to a group name.

MQZAET_PRINCIPAL

The value of the **EntityName** parameter refers to a principal name.

MQZAET_UNKNOWN

On Windows, an authority record still exists from a previous queue manager which did not originally contain entity type information.

ObjectName (MQCFST)

Object name (parameter identifier: MQCACF_OBJECT_NAME).

The name of the queue manager, queue, process definition, or generic profile on which the inquiry is made.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

ObjectType (MQCFIN)

Object type (parameter identifier: MQIACF_OBJECT_TYPE).

The value can be:

MQOT_AUTH_INFO

Authentication information.

MQOT_CHANNEL

Channel object.

MQOT_CLNTCONN_CHANNEL

Client-connection channel object.

MQOT_COMM_INFO

Communication information object

MQOT_LISTENER

Listener object.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process.

MQOT_Q

Queue, or queues, that match the object name parameter.

MQOT_Q_MGR

Queue manager.

MQOT_REMOTE_Q_MGR_NAME

Remote queue manager.

MQOT_SERVICE

Service object.

QMgrName (MQCFST)

Name of the queue manager on which the Inquire command is issued (parameter identifier: MQCA_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

MQCMD_INQUIRE_QSG (Inquire Group) on z/OS

The Inquire Group (MQCMD_INQUIRE_QSG) PCF command inquires about the queue sharing group to which the queue manager is connected.

Note: This command is supported only on z/OS when the queue manager is a member of a queue sharing group.

Optional parameters

ObsoleteDB2Msgs (MQCFIN)

Whether to look for obsolete Db2 messages (parameter identifier: MQIACF_OBSOLETE_MSGS).

The value can be any of the following values:

MQOM_NO

Obsolete messages in Db2 are not looked for. MQOM_NO is the default value used if the parameter is not specified.

MQOM_YES

Obsolete messages in Db2 are looked for and messages containing information about any found are returned.

MQCMD_INQUIRE_QSG (Inquire Group) Response on z/OS

The response to the Inquire Group (MQCMD_INQUIRE_QSG) PCF command consists of the response header followed by the *QMgrName* structure and a number of other parameter structures. One such message is generated for each queue manager in the queue sharing group.

If there are any obsolete Db2 messages, and that information is requested, one message, identified by a value of MQCMDI_DB2_OBSOLETE_MSGS in the **CommandInformation** parameter, is returned for each such message.

Always returned for the queue manager:

CommandLevel, DB2ConnectStatus, DB2Name, QmgrCPF, QmgrName, QmgrNumber, QmgrStatus, QSGName

Always returned for obsolete Db2 messages:

CommandInformation, CFMsgIdentifier

Response data relating to the queue manager

CommandLevel (MQCFIN)

Command level supported by the queue manager (parameter identifier: MQIA_COMMAND_LEVEL).

The value can be any of the following values:

MQCMDL_LEVEL_800

Level 800 of system control commands.

MQCMDL_LEVEL_802

Level 802 of system control commands.

MQCMDL_LEVEL_900

Level 900 of system control commands.

MQCMDL_LEVEL_901

Level 901 of system control commands.

MQCMDL_LEVEL_902

Level 902 of system control commands.

MQCMDL_LEVEL_903

Level 903 of system control commands.

MQCMDL_LEVEL_904

Level 904 of system control commands.

MQCMDL_LEVEL_905

Level 905 of system control commands.

MQCMDL_LEVEL_910

Level 910 of system control commands.

MQCMDL_LEVEL_911

Level 911 of system control commands.

MQCMDL_LEVEL_912

Level 912 of system control commands.

MQCMDL_LEVEL_913

Level 913 of system control commands.

MQCMDL_LEVEL_914

Level 914 of system control commands.

MQCMDL_LEVEL_915

Level 915 of system control commands.

MQCMDL_LEVEL_920

Level 920 of system control commands.

MQCMDL_LEVEL_921

Level 921 of system control commands.

MQCMDL_LEVEL_922

Level 922 of system control commands.

MQCMDL_LEVEL_923

Level 923 of system control commands.

MQCMDL_LEVEL_924

Level 924 of system control commands.

MQCMDL_LEVEL_925

Level 925 of system control commands.

MQCMDL_LEVEL_930

Level 930 of system control commands.

MQCMDL_LEVEL_931

Level 931 of system control commands.

MQCMDL_LEVEL_932

Level 932 of system control commands.

DB2ConnectStatus (MQCFIN)

The current status of the connection to Db2 (parameter identifier: MQIACF_DB2_CONN_STATUS).

The current status of the queue manager. The value can be any of the following values:

MQQSGS_ACTIVE

The queue manager is running and is connected to Db2.

MQQSGS_INACTIVE

The queue manager is not running and is not connected to Db2.

MQQSGS_FAILED

The queue manager is running but not connected because Db2 has terminated abnormally.

MQQSGS_PENDING

The queue manager is running but not connected because Db2 has terminated normally.

MQQSGS_UNKNOWN

The status cannot be determined.

DB2Name (MQCFST)

The name of the Db2 subsystem or group to which the queue manager is to connect (parameter identifier: MQCACF_DB2_NAME).

The maximum length is MQ_DB2_NAME_LENGTH.

QMGrCPF (MQCFST)

The command prefix of the queue manager (parameter identifier: MQCACF_Q_MGR_CPF).

The maximum length is MQ_Q_MGR_CPF_LENGTH.

QMGrName (MQCFST)

Name of the queue manager (parameter identifier: MQCA_Q_MGR_NAME).

The maximum length is MQ_Q_MGR_NAME_LENGTH.

QmgrNumber (MQCFIN)

The number, generated internally, of the queue manager in the group.(parameter identifier: MQIACF_Q_MGR_NUMBER).

QMGrStatus (MQCFIN)

Recovery (parameter identifier: MQIACF_Q_MGR_STATUS).

The current status of the queue manager. The value can be any of the following values:

MQQSGS_ACTIVE

The queue manager is running.

MQQSGS_INACTIVE

The queue manager is not running, having terminated normally.

MQQSGS_FAILED

The queue manager is not running, having terminated abnormally.

MQQSGS_CREATED

The queue manager has been defined to the group, but has not yet been started.

MQQSGS_UNKNOWN

The status cannot be determined.

QSGName (MQCFST)

The name of the queue sharing group (parameter identifier: MQCA_QSG_NAME).

The maximum length is MQ_QSG_NAME_LENGTH.

Response data relating to obsolete Db2 messages**CFMsgIdentifier (MQCFBS)**

CF list entry identifier (parameter identifier: MQBACF_CF_LEID).

The maximum length is MQ_CF_LEID_LENGTH.

CommandInformation (MQCFIN)

Command information (parameter identifier: MQIACF_COMMAND_INFO). This indicates whether queue managers in the group contain obsolete messages. The value is MQCMDI_DB2_OBSOLETE_MSGS.

Multi

MQCMD_INQUIRE_LISTENER (Inquire Channel Listener) on Multiplatforms

The Inquire Channel Listener (MQCMD_INQUIRE_LISTENER) PCF command inquires about the attributes of existing IBM MQ listeners.

Required parameters**ListenerName (MQCFST)**

Listener name (parameter identifier: MQCACH_LISTENER_NAME).

This parameter is the name of the listener with attributes that are required. Generic listener names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all listeners having names that start with the selected character string. An asterisk on its own matches all possible names.

The listener name is always returned regardless of the attributes requested.

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

Optional parameters

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ListenerAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

ListenerAttrs (MQCFIL)

Listener attributes (parameter identifier: MQIACF_LISTENER_ATTRS).

The attribute list might specify the following value on its own- default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_ALTERATION_DATE

Date on which the definition was last altered.

MQCA_ALTERATION_TIME

Time at which the definition was last altered.

MQCACH_IP_ADDRESS

IP address for the listener.

MQCACH_LISTENER_DESC

Description of listener definition.

MQCACH_LISTENER_NAME

Name of listener definition.

MQCACH_LOCAL_NAME

NetBIOS local name that the listener uses. MQCACH_LOCAL_NAME is valid only on Windows.

MQCACH_TP_NAME

The LU 6.2 transaction program name. MQCACH_TP_NAME is valid only on Windows.

MQIACH_ADAPTER

Adapter number on which NetBIOS listens. MQIACH_ADAPTER is valid only on Windows.

MQIACH_BACKLOG

Number of concurrent connection requests that the listener supports.

MQIACH_COMMAND_COUNT

Number of commands that the listener can use. MQIACH_COMMAND_COUNT is valid only on Windows.

MQIACH_LISTENER_CONTROL

Specifies when the queue manager starts and stops the listener.

MQIACH_NAME_COUNT

Number of names that the listener can use. MQIACH_NAME_COUNT is valid only on Windows.

MQIACH_PORT

Port number.

MQIACH_SESSION_COUNT

Number of sessions that the listener can use. MQIACH_SESSION_COUNT is valid only on Windows.

MQIACH_SOCKET

SPX socket on which to listen. MQIACH_SOCKET is valid only on Windows.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ListenerAttrs* except MQCACH_LISTENER_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1560 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

TransportType (MQCFIN)

Transport protocol type (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

If you specify this parameter, information is returned relating only to those listeners defined with the specified transport protocol type. If you specify an attribute in the *ListenerAttrs* list which is valid only for listeners of a different transport protocol type, it is ignored and no error is raised. If you specify this parameter, it must occur immediately after the **ListenerName** parameter.

If you do not specify this parameter, or if you specify it with a value of MQXPT_ALL, information about all listeners is returned. Valid attributes in the *ListenerAttrs* list which are not applicable to the listener are ignored, and no error messages are issued. The value can be any of the following values:

MQXPT_ALL

All transport types.

MQXPT_LU62

SNA LU 6.2. MQXPT_LU62 is valid only on Windows.

MQXPT_NETBIOS

NetBIOS. MQXPT_NETBIOS is valid only on Windows.

MQXPT_SPX

SPX. MQXPT_SPX is valid only on Windows.

MQXPT_TCP

Transmission Control Protocol/Internet Protocol (TCP/IP).

Multi *MQCMD_INQUIRE_LISTENER (Inquire Channel Listener) Response on Multiplatforms*

The response to the Inquire Channel Listener (MQCMD_INQUIRE_LISTENER) PCF command consists of the response header followed by the *ListenerName* structure and the requested combination of attribute parameter structures.

If a generic listener name was specified, one such message is generated for each listener found.

Always returned:

ListenerName

Returned if requested:

Adapter, AlterationDate, AlterationTime, Backlog, Commands, IPAddress, ListenerDesc, LocalName, NetbiosNames, Port, Sessions, Socket, StartMode, TPname, TransportType

Response data

AlterationDate (MQCFST)

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date, in the form yyyy-mm-dd, on which the information was last altered.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time, in the form hh.mm.ss, at which the information was last altered.

Adapter (MQCFIN)

Adapter number (parameter identifier: MQIACH_ADAPTER).

The adapter number on which NetBIOS listens. This parameter is valid only on Windows.

Backlog (MQCFIN)

Backlog (parameter identifier: MQIACH_BACKLOG).

The number of concurrent connection requests that the listener supports.

Commands (MQCFIN)

Adapter number (parameter identifier: MQIACH_COMMAND_COUNT).

The number of commands that the listener can use. This parameter is valid only on Windows.

IPAddress (MQCFST)

IP address (parameter identifier: MQCACH_IP_ADDRESS).

IP address for the listener specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric host name form.

The maximum length of the string is MQ_CONN_NAME_LENGTH

ListenerDesc (MQCFST)

Description of listener definition (parameter identifier: MQCACH_LISTENER_DESC).

The maximum length of the string is MQ_LISTENER_DESC_LENGTH.

ListenerName (MQCFST)

Name of listener definition (parameter identifier: MQCACH_LISTENER_NAME).

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

LocalName (MQCFST)

NetBIOS local name (parameter identifier: MQCACH_LOCAL_NAME).

The NetBIOS local name that the listener uses. This parameter is valid only on Windows.

The maximum length of the string is MQ_CONN_NAME_LENGTH

NetbiosNames (MQCFIN)

NetBIOS names (parameter identifier: MQIACH_NAME_COUNT).

The number of names that the listener supports. This parameter is valid only on Windows.

Port (MQCFIN)

Port number (parameter identifier: MQIACH_PORT).

The port number for TCP/IP. This parameter is valid only if the value of *TransportType* is MQXPT_TCP.

Sessions (MQCFIN)

NetBIOS sessions (parameter identifier: MQIACH_SESSION_COUNT).

The number of sessions that the listener can use. This parameter is valid only on Windows.

Socket (MQCFIN)

SPX socket number (parameter identifier: MQIACH_SOCKET).

The SPX socket on which to listen. This parameter is valid only if the value of *TransportType* is MQXPT_SPX.

StartMode (MQCFIN)

Service mode (parameter identifier: MQIACH_LISTENER_CONTROL).

Specifies how the listener is to be started and stopped. The value can be any of the following values:

MQSVC_CONTROL_MANUAL

The listener is not to be started automatically or stopped automatically. It is to be controlled by user command. MQSVC_CONTROL_MANUAL is the default value.

MQSVC_CONTROL_Q_MGR

The listener being defined is to be started and stopped at the same time as the queue manager is started and stopped.

MQSVC_CONTROL_Q_MGR_START

The listener is to be started at the same time as the queue manager is started, but is not request to stop when the queue manager is stopped.

TPName (MQCFST)

Transaction program name (parameter identifier: MQCACH_TP_NAME).

The LU 6.2 transaction program name. This parameter is valid only on Windows.

The maximum length of the string is MQ_TP_NAME_LENGTH

TransportType (MQCFIN)

Transmission protocol (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value can be:

MQXPT_TCP

TCP.

MQXPT_LU62

LU 6.2. MQXPT_LU62 is valid only on Windows.

MQXPT_NETBIOS

NetBIOS. MQXPT_NETBIOS is valid only on Windows.

MQXPT_SPX

SPX. MQXPT_SPX is valid only on Windows.

Multi *MQCMD_INQUIRE_LISTENER_STATUS (Inquire Channel Listener Status) on Multiplatforms*

The Inquire Channel Listener Status (MQCMD_INQUIRE_LISTENER_STATUS) PCF command inquires about the status of one or more IBM MQ listener instances.

You must specify the name of a listener for which you want to receive status information. You can specify a listener by using either a specific listener name or a generic listener name. By using a generic listener name, you can display either:

- Status information for all listener definitions, by using a single asterisk (*), or
- Status information for one or more listeners that match the specified name.

Required parameters

ListenerName (MQCFST)

Listener name (parameter identifier: MQCACH_LISTENER_NAME).

Generic listener names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all listeners having names that start with the selected character string. An asterisk on its own matches all possible names.

The listener name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

Optional parameters

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ListenerStatusAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the

StringFilterCommand parameter.

ListenerStatusAttrs (MQCFIL)

Listener status attributes (parameter identifier: MQIACF_LISTENER_STATUS_ATTRS).

The attribute list can specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCACH_IP_ADDRESS

IP address of the listener.

MQCACH_LISTENER_DESC

Description of listener definition.

MQCACH_LISTENER_NAME

Name of listener definition.

MQCACH_LISTENER_START_DATE

The date on which the listener was started.

MQCACH_LISTENER_START_TIME

The time at which the listener was started.

MQCACH_LOCAL_NAME

NetBIOS local name that the listener uses. MQCACH_LOCAL_NAME is valid only on Windows.

MQCACH_TP_NAME

LU6.2 transaction program name. MQCACH_TP_NAME is valid only on Windows.

MQIACF_PROCESS_ID

Operating system process identifier associated with the listener.

MQIACH_ADAPTER

Adapter number on which NetBIOS listens. MQIACH_ADAPTER is valid only on Windows.

MQIACH_BACKLOG

Number of concurrent connection requests that the listener supports.

MQIACH_COMMAND_COUNT

Number of commands that the listener can use. MQIACH_COMMAND_COUNT is valid only on Windows.

MQIACH_LISTENER_CONTROL

How the listener is to be started and stopped.

MQIACH_LISTENER_STATUS

Status of the listener.

MQIACH_NAME_COUNT

Number of names that the listener can use. MQIACH_NAME_COUNT is valid only on Windows.

MQIACH_PORT

Port number for TCP/IP.

MQIACH_SESSION_COUNT

Number of sessions that the listener can use. MQIACH_SESSION_COUNT is valid only on Windows.

MQIACH_SOCKET

SPX socket. MQIACH_SOCKET is valid only on Windows.

MQIACH_XMIT_PROTOCOL_TYPE

Transport type.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ListenerStatusAttrs* except MQCACH_LISTENER_NAME. Use this parameter to restrict the

output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1560](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Error code

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_LSTR_STATUS_NOT_FOUND

Listener status not found.

Multi MQCMD_INQUIRE_LISTENER_STATUS (Inquire Channel Listener Status)

Response on Multiplatforms

The response to the Inquire Channel Listener Status (MQCMD_INQUIRE_LISTENER_STATUS) PCF command consists of the response header followed by the *ListenerName* structure and the requested combination of attribute parameter structures.

If a generic listener name was specified, one such message is generated for each listener found.

Always returned:

ListenerName

Returned if requested:

Adapter, Backlog, ChannelCount, Commands, IPAddress, ListenerDesc, LocalName, NetbiosNames, Port, ProcessId, Sessions, Socket, StartDate, StartMode, StartTime, Status, TPname, TransportType

Response data

Adapter (MQCFIN)

Adapter number (parameter identifier: MQIACH_ADAPTER).

The adapter number on which NetBIOS listens.

Backlog (MQCFIN)

Backlog (parameter identifier: MQIACH_BACKLOG).

The number of concurrent connection requests that the listener supports.

Commands (MQCFIN)

Adapter number (parameter identifier: MQIACH_COMMAND_COUNT).

The number of commands that the listener can use.

IPAddress (MQCFST)

IP address (parameter identifier: MQCACH_IP_ADDRESS).

IP address for the listener specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric host name form.

The maximum length of the string is MQ_CONN_NAME_LENGTH

ListenerDesc (MQCFST)

Description of listener definition (parameter identifier: MQCACH_LISTENER_DESC).

The maximum length of the string is MQ_LISTENER_DESC_LENGTH.

ListenerName (MQCFST)

Name of listener definition (parameter identifier: MQCACH_LISTENER_NAME).

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

LocalName (MQCFST)

NetBIOS local name (parameter identifier: MQCACH_LOCAL_NAME).

The NetBIOS local name that the listener uses.

The maximum length of the string is MQ_CONN_NAME_LENGTH

NetbiosNames (MQCFIN)

NetBIOS names (parameter identifier: MQIACH_NAME_COUNT).

The number of names that the listener supports.

Port (MQCFIN)

Port number (parameter identifier: MQIACH_PORT).

The port number for TCP/IP.

ProcessId (MQCFIN)

Process identifier (parameter identifier: MQIACF_PROCESS_ID).

The operating system process identifier associated with the listener.

Sessions (MQCFIN)

NetBIOS sessions (parameter identifier: MQIACH_SESSION_COUNT).

The number of sessions that the listener can use.

Socket (MQCFIN)

SPX socket number (parameter identifier: MQIACH_SOCKET).

The SPX socket on which the listener is to listen.

StartDate (MQCFST)

Start date (parameter identifier: MQCACH_LISTENER_START_DATE).

The date, in the form yyyy-mm-dd, on which the listener was started.

The maximum length of the string is MQ_DATE_LENGTH

StartMode (MQCFIN)

Service mode (parameter identifier: MQIACH_LISTENER_CONTROL).

Specifies how the listener is to be started and stopped. The value can be any of the following values:

MQSVC_CONTROL_MANUAL

The listener is not to be started automatically or stopped automatically. It is to be controlled by user command. MQSVC_CONTROL_MANUAL is the default value.

MQSVC_CONTROL_Q_MGR

The listener being defined is to be started and stopped at the same time as the queue manager is started and stopped.

MQSVC_CONTROL_Q_MGR_START

The listener is to be started at the same time as the queue manager is started, but is not request to stop when the queue manager is stopped.

StartTime (MQCFST)

Start date (parameter identifier: MQCACH_LISTENER_START_TIME).

The time, in the form hh.mm.ss, at which the listener was started.

The maximum length of the string is MQ_TIME_LENGTH

Status (MQCFIN)

Listener status (parameter identifier: MQIACH_LISTENER_STATUS).

The status of the listener. The value can be any of the following values:

MQSVC_STATUS_STARTING

The listener is in the process of initializing.

MQSVC_STATUS_RUNNING

The listener is running.

MQSVC_STATUS_STOPPING

The listener is stopping.

TPName (MQCFST)

Transaction program name (parameter identifier: MQCACH_TP_NAME).

The LU 6.2 transaction program name.

The maximum length of the string is MQ_TP_NAME_LENGTH

TransportType (MQCFIN)

Transmission protocol (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value can be:

MQXPT_TCP

TCP.

MQXPT_LU62

LU 6.2. MQXPT_LU62 is valid only on Windows.

MQXPT_NETBIOS

NetBIOS. MQXPT_NETBIOS is valid only on Windows.

MQXPT_SPX

SPX. MQXPT_SPX is valid only on Windows.

MQCMD_INQUIRE_LOG (Inquire Log) on z/OS

The Inquire Log (MQCMD_INQUIRE_LOG) PCF command returns log system parameters and information.

Optional parameters**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

MQCMD_INQUIRE_LOG (Inquire Log) Response on z/OS

The response to the Inquire Log (MQCMD_INQUIRE_LOG) PCF command consists of the response header followed by the *ParameterType* structure and the combination of attribute parameter structures determined by the value of *ParameterType*.

Always returned:

ParameterType. Specifies the type of archive information being returned. The value can be any of the following values:

MQSYSP_TYPE_INITIAL

The initial settings of the log parameters.

MQSYSP_TYPE_SET

The settings of the log parameters if they have been altered since their initial setting.

MQSYSP_TYPE_LOG_COPY

Information relating to the active log copy.

MQSYSP_TYPE_LOG_STATUS

Information relating to the status of the logs.

Returned if *ParameterType* is MQSYSP_TYPE_INITIAL (one message is returned):

DeallocateInterval, DualArchive, DualActive, DualBSDS, InputBufferSize, LogArchive, LogCompression, MaxArchiveLog, MaxConcurrentOffloads, MaxReadTapeUnits, OutputBufferCount, OutputBufferSize, ZHyperWrite, ZHyperLink

Returned if *ParameterType* is MQSYSP_TYPE_SET and any value is set (one message is returned):

DeallocateInterval, DualArchive, DualActive, DualBSDS, InputBufferSize, LogArchive, MaxArchiveLog, MaxConcurrentOffloads, MaxReadTapeUnits, OutputBufferCount, OutputBufferSize, ZHyperWrite, ZHyperLink

Returned if *ParameterType* is MQSYSP_TYPE_LOG_COPY (one message is returned for each log copy):

DataSetName, LogCopyNumber, LogUsed, ZHyperWrite, ZHyperLink, Encrypted

Returned if *ParameterType* is MQSYSP_TYPE_LOG_STATUS (one message is returned):

FullLogs, LogCompression, LogRBA, LogSuspend, OffloadStatus, QMgrStartDate, QMgrStartRBA, QMgrStartTime, TotalLogs

Response data - log parameter information**DeallocateInterval (MQCFIN)**

Deallocation interval (parameter identifier: MQIACF_SYSP_DEALLOC_INTERVAL).

Specifies the length of time, in minutes, that an allocated archive read tape unit is allowed to remain unused before it is deallocated. The value can be in the range zero through 1440. If it is zero, the tape unit is deallocated immediately. If it is 1440, the tape unit is never deallocated.

DualActive (MQCFIN)

Specifies whether dual logging is being used (parameter identifier: MQIACF_SYSP_DUAL_ACTIVE).

The value can be any of the following values:

MQSYSP_YES

Dual logging is being used.

MQSYSP_NO

Dual logging is not being used.

DualArchive (MQCFIN)

Specifies whether dual archive logging is being used (parameter identifier: MQIACF_SYSP_DUAL_ARCHIVE).

The value can be any of the following values:

MQSYSP_YES

Dual archive logging is being used.

MQSYSP_NO

Dual archive logging is not being used.

DualBSDS (MQCFIN)

Specifies whether dual BSDS is being used (parameter identifier: MQIACF_SYSP_DUAL_BSDS).

The value can be any of the following values:

MQSYSP_YES

Dual BSDS is being used.

MQSYSP_NO

Dual BSDS is not being used.

InputBufferSize (MQCFIN)

Specifies the size of input buffer storage for active and archive log data sets (parameter identifier: MQIACF_SYSP_IN_BUFFER_SIZE).

LogArchive (MQCFIN)

Specifies whether archiving is on or off (parameter identifier: MQIACF_SYSP_ARCHIVE).

The value can be any of the following values:

MQSYSP_YES

Archiving is on.

MQSYSP_NO

Archiving is off.

LogCompression (MQCFIN)

Specifies which log compression parameter is used (parameter identifier: MQIACF_LOG_COMPRESSION).

The value can be any of the following values:

MQCOMPRESS_NONE

No log compression is performed.

MQCOMPRESS_RLE

Run-length encoding compression is performed.

MQCOMPRESS_ANY

Enable the queue manager to select the compression algorithm that gives the greatest degree of log record compression. Using this option currently results in RLE compression.

MaxArchiveLog (MQCFIN)

Specifies the maximum number of archive log volumes that can be recorded in the BSDS (parameter identifier: MQIACF_SYSP_MAX_ARCHIVE).

MaxConcurrentOffloads (MQCFIN)

Specifies the maximum number of concurrent log offload tasks (parameter identifier: MQIACF_SYSP_MAX_CONC_OFFLOADS).

MaxReadTapeUnits (MQCFIN)

The maximum number of dedicated tape units that can be set to read archive log tape volumes (parameter identifier: MQIACF_SYSP_MAX_READ_TAPES).

OutputBufferCount (MQCFIN)

Specifies the number of output buffers to be filled before they are written to the active log data sets (parameter identifier: MQIACF_SYSP_OUT_BUFFER_COUNT).

OutputBufferSize (MQCFIN)

Specifies the size of output buffer storage for active and archive log data sets (parameter identifier: MQIACF_SYSP_OUT_BUFFER_SIZE).

ZHyperWrite (MQCFIN)

For *MQSYSP_TYPE_INITIAL* and *MQSYSP_TYPE_SET*, shows whether writes to the active logs are made with zHyperWrite being enabled, if the logs are on zHyperWrite capable volumes (parameter identifier: MQIACF_SYSP_ZHYPERWRITE).

The value can be one of the following values:

MQSYSP_YES

Writes are made with zHyperWrite enabled, regardless of whether the active log copies are on zHyperWrite capable volumes.

MQSYSP_NO

Writes are not made using zHyperWrite.

For *MQSYSP_TYPE_LOG_COPY*, shows whether the log copy is on a zHyperWrite capable volume (parameter identifier: MQIACF_SYSP_ZHYPERWRITE).

The value can be one of the following values:

MQSYSP_YES

The log data set is on a zHyperWrite capable volume.

MQSYSP_NO

The log data set is not on a zHyperWrite capable volume.

V 9.4.0 zHyperLink (MQCFIN)

For *MQSYSP_TYPE_INITIAL* and *MQSYSP_TYPE_SET*, shows whether writes to the active logs are made with zHyperLink being enabled, if the logs are on zHyperLink capable volumes (parameter identifier: MQIACF_SYSP_ZHYPERLINK).

The value can be one of the following values:

MQSYSP_YES

Writes are made with zHyperLink enabled, regardless of whether the active log copies are on zHyperLink capable volumes.

MQSYSP_NO

Writes are not made using zHyperLink.

For *MQSYSP_TYPE_LOG_COPY*, shows whether the log copy is on a zHyperLink capable volume (parameter identifier: MQIACF_SYSP_ZHYPERLINK).

The value can be one of the following values:

MQSYSP_YES

The log data set is on a zHyperLink capable volume.

MQSYSP_NO

The log data set is not on a zHyperLink capable volume.

Response data - to log status information**DataSetName (MQCFST)**

The data set name of the active log data set (parameter identifier: MQCACF_DATA_SET_NAME).

If the copy is not currently active, this parameter is returned as blank.

The maximum length of the string is MQ_DATA_DATA_SET_NAME_LENGTH.

Encrypted (MQCFIN)

For *MQSYSP_TYPE_LOG_COPY*, shows whether the log copy is an encrypted data set (parameter identifier: MQIACF_DS_ENCRYPTED)

The value can be one of the following values:

MQSYSP_YES

The log data set is encrypted.

MQSYSP_NO

The log data set is not encrypted.

FullLogs (MQCFIN)

The total number of full active log data sets that have not yet been archived (parameter identifier: MQIACF_SYSP_FULL_LOGS).

LogCompression (MQCFIN)

Specifies the current log compression option (parameter identifier: MQIACF_LOG_COMPRESSION).

The value can be any of the following values:

MQCOMPRESS_NONE

Log compression is not enabled.

MQCOMPRESS_RLE

Run-length encoding log compression is enabled.

MQCOMPRESS_ANY

Any compression algorithm supported by the queue manager is enabled.

LogCopyNumber (MQCFIN)

Copy number (parameter identifier: MQIACF_SYSP_LOG_COPY).

LogRBA (MQCFST)

The RBA of the most recently written log record (parameter identifier: MQCACF_SYSP_LOG_RBA).

The maximum length of the string is MQ_RBA_LENGTH.

LogSuspend (MQCFIN)

Specifies whether logging is suspended (parameter identifier: MQIACF_SYSP_LOG_SUSPEND).

The value can be any of the following values:

MQSYSP_YES

Logging is suspended.

MQSYSP_NO

Logging is not suspended.

LogUsed (MQCFIN)

The percentage of the active log data set that has been used (parameter identifier: MQIACF_SYSP_LOG_USED).

OffloadStatus (MQCFIN)

Specifies the status of the offload task (parameter identifier: MQIACF_SYSP_OFFLOAD_STATUS).

The value can be any of the following values:

MQSYSP_STATUS_ALLOCATING_ARCHIVE

The offload task is busy, allocating the archive data set. MQSYSP_STATUS_ALLOCATING_ARCHIVE could indicate that a tape mount request is pending.

MQSYSP_STATUS_COPYING_BSDS

The offload task is busy, copying the BSDS data set.

MQSYSP_STATUS_COPYING_LOG

The offload task is busy, copying the active log data set.

MQSYSP_STATUS_BUSY

The offload task is busy with other processing.

MQSYSP_STATUS_AVAILABLE

The offload task is waiting for work.

QMgrStartDate (MQCFST)

The date on which the queue manager was started, in the form yyyy-mm-dd (parameter identifier: MQCACF_SYSP_Q_MGR_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

QMgrStartRBA (MQCFST)

The RBA from which logging began when the queue manager was started (parameter identifier: MQCACF_SYSP_Q_MGR_RBA).

The maximum length of the string is MQ_RBA_LENGTH.

QMgrStartTime (MQCFST)

The time that the queue manager was started, in the form hh.mm.ss (parameter identifier: MQCACF_SYSP_Q_MGR_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

TotalLogs (MQCFIN)

The total number of active log data sets (parameter identifier: MQIACF_SYSP_TOTAL_LOGS).

MQCMD_INQUIRE_NAMELIST (Inquire Namelist)

The Inquire Namelist (MQCMD_INQUIRE_NAMELIST) PCF command inquires about the attributes of existing IBM MQ namelists.

Required parameters:

NamelistName

Optional parameters:

 *CommandScope, IntegerFilterCommand, NamelistAttrs,*  *QSGDisposition, StringFilterCommand*

Required parameters

NamelistName (MQCFST)

Namelist name (parameter identifier: MQCA_NAMELIST_NAME).

This parameter is the name of the namelist with attributes that are required. Generic namelist names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all namelists having names that start with the selected character string. An asterisk on its own matches all possible names.

The namelist name is always returned regardless of the attributes requested.

The maximum length of the string is MQ_NAMELIST_NAME_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *NamelistAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you specify an integer filter for *NamelistType* (MQIA_NAMELIST_TYPE), you cannot also specify the **NamelistType** parameter.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

NamelistAttrs (MQCFIL)

Namelist attributes (parameter identifier: MQIACF_NAMELIST_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_NAMELIST_NAME

Name of namelist object.

MQCA_NAMELIST_DESC

Namelist description.

MQCA_NAMES

Names in the namelist.

MQCA_ALTERATION_DATE

The date on which the information was last altered.

MQCA_ALTERATION_TIME

The time at which the information was last altered.

MQIA_NAME_COUNT

Number of names in the namelist.

MQIA_NAMELIST_TYPE

Namelist type (valid only on z/OS)

NamelistType (MQCFIN)

Namelist attributes (parameter identifier: MQIA_NAMELIST_TYPE). This parameter applies to z/OS only.

Specifies the type of names in the namelist. The value can be any of the following values:

MQNT_NONE

The names are of no particular type.

MQNT_Q

A namelist that holds a list of queue names.

MQNT_CLUSTER

A namelist that is associated with clustering, containing a list of the cluster names.

MQNT_AUTH_INFO

The namelist is associated with TLS, and contains a list of authentication information object names.

z/OS QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *NameListAttrs* except MQCA_NAMELIST_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1560 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

MQCMD_INQUIRE_NAMELIST (Inquire Namelist) Response

The response to the Inquire Namelist (MQCMD_INQUIRE_NAMELIST) PCF command consists of the response header followed by the *NamelistName* structure and the requested combination of attribute parameter structures.

If a generic namelist name was specified, one such message is generated for each namelist found.

Always returned:

NamelistName,  *QSGDisposition*

Returned if requested:

AlterationDate, *AlterationTime*, *NameCount*, *NamelistDesc*,  *NamelistType*, *Names*

Response data**AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered, in the form hh.mm.ss.

NameCount (MQCFIN)

Number of names in the namelist (parameter identifier: MQIA_NAME_COUNT).

The number of names contained in the namelist.

NamelistDesc (MQCFST)

Description of namelist definition (parameter identifier: MQCA_NAMELIST_DESC).

The maximum length of the string is MQ_NAMELIST_DESC_LENGTH.

NamelistName (MQCFST)

The name of the namelist definition (parameter identifier: MQCA_NAMELIST_NAME).

The maximum length of the string is MQ_NAMELIST_NAME_LENGTH.

NamelistType (MQCFIN)

Type of names in the namelist (parameter identifier: MQIA_NAMELIST_TYPE). This parameter applies to z/OS only.

Specifies the type of names in the namelist. The value can be any of the following values:

MQNT_NONE

The names are of no particular type.

MQNT_Q

A namelist that holds a list of queue names.

MQNT_CLUSTER

A namelist that is associated with clustering, containing a list of the cluster names.

MQNT_AUTH_INFO

The namelist is associated with TLS, and contains a list of authentication information object names.

Names (MQCFSL)

A list of the names contained in the namelist (parameter identifier: MQCA_NAMES).

The number of names in the list is given by the *Count* field in the MQCFSL structure. The length of each name is given by the *StringLength* field in that structure. The maximum length of a name is MQ_OBJECT_NAME_LENGTH.

QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter applies only to z/OS. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQCMD_INQUIRE_NAMELIST_NAMES (Inquire Namelist Names)

The Inquire Namelist Names (MQCMD_INQUIRE_NAMELIST_NAMES) PCF command inquires for a list of namelist names that match the generic namelist name specified.

Required parameters

NamelistName (MQCFST)

Name of namelist (parameter identifier: MQCA_NAMELIST_NAME).

Generic namelist names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

Optional parameters

z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being processed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined with either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

MQCMD_INQUIRE_NAMELIST_NAMES (Inquire Namelist Names) Response

The response to the Inquire Namelist Names (MQCMD_INQUIRE_NAMELIST_NAMES) PCF command consists of the response header followed by a single parameter structure giving zero or more names that match the specified namelist name.

 z/OS

Additionally, on z/OS only, the *QSGDispositions* structure (with the same number of entries as the *NamelistNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *NamelistNames* structure.

Always returned:

NamelistNames,  *QSGDispositions*

Returned if requested:

None

Response data

NamelistNames (MQCFSL)

List of namelist names (parameter identifier: MQCACF_NAMELIST_NAMES).

QSGDispositions (MQCFIL)

List of queue sharing group dispositions (parameter identifier: MQIACF_QSG_DISPS). This parameter is valid only on z/OS. Possible values for fields in this structure are:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQCMD_INQUIRE_PROCESS (Inquire Process)

The Inquire Process (MQCMD_INQUIRE_PROCESS) PCF command inquires about the attributes of existing IBM MQ processes.

Required parameters

ProcessName (MQCFST)

Process name (parameter identifier: MQCA_PROCESS_NAME).

Generic process names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all processes having names that start with the selected character string. An asterisk on its own matches all possible names.

The process name is always returned regardless of the attributes requested.

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ProcessAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

ProcessAttrs (MQCFIL)

Process attributes (parameter identifier: MQIACF_PROCESS_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_ALTERATION_DATE

The date at which the information was last altered.

MQCA_ALTERATION_TIME

The time at which the information was last altered.

MQCA_APPL_ID

Application identifier.

MQCA_ENV_DATA

Environment data.

MQCA_PROCESS_DESC

Description of process definition.

MQCA_PROCESS_NAME

Name of process definition.

MQCA_USER_DATA

User data.

MQIA_APPL_TYPE

Application type.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ProcessAttrs* except MQCA_PROCESS_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1560](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

MQCMD_INQUIRE_PROCESS (Inquire Process) Response

The response to the Inquire Process (MQCMD_INQUIRE_PROCESS) PCF command consists of the response header followed by the *ProcessName* structure and the requested combination of attribute parameter structures.

If a generic process name was specified, one such message is generated for each process found.

Always returned:

ProcessName,  *QSGDisposition*

Returned if requested:

AlterationDate, *AlterationTime*, *ApplId*, *ApplType*, *EnvData*, *ProcessDesc*, *UserData*

Response data

AlterationDate (MQCFST)

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered, in the form hh.mm.ss.

ApplId (MQCFST)

Application identifier (parameter identifier: MQCA_APPL_ID).

The maximum length of the string is MQ_PROCESS_APPL_ID_LENGTH.

ApplType (MQCFIN)

Application type (parameter identifier: MQIA_APPL_TYPE).

The value can be:

MQAT_AIX

AIX application (same value as MQAT_UNIX)

MQAT_CICS

CICS transaction

MQAT_DOS

DOS client application

MQAT_MVS

z/OS application

MQAT_OS400

IBM i application

MQAT_QMGR

Queue manager

MQAT_UNIX

UNIX application

MQAT_WINDOWS

16-bit Windows application

MQAT_WINDOWS_NT

32-bit Windows application

integer

System-defined application type in the range zero through 65 535 or a user-defined application type in the range 65 536 through 999 999 999

EnvData (MQCFST)

Environment data (parameter identifier: MQCA_ENV_DATA).

The maximum length of the string is MQ_PROCESS_ENV_DATA_LENGTH.

ProcessDesc (MQCFST)

Description of process definition (parameter identifier: MQCA_PROCESS_DESC).

The maximum length of the string is MQ_PROCESS_DESC_LENGTH.

ProcessName (MQCFST)

The name of the process definition (parameter identifier: MQCA_PROCESS_NAME).

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

 **QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

UserData (MQCFST)

User data (parameter identifier: MQCA_USER_DATA).

The maximum length of the string is MQ_PROCESS_USER_DATA_LENGTH.

MQCMD_INQUIRE_PROCESS_NAMES (Inquire Process Names)

The Inquire Process Names (MQCMD_INQUIRE_PROCESS_NAMES) PCF command inquires for a list of process names that match the generic process name specified.

Required parameters**ProcessName (MQCFST)**

Name of process-definition for queue (parameter identifier: MQCA_PROCESS_NAME).

Generic process names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

Optional parameters

 **z/OS**

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined with either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

MQCMD_INQUIRE_PROCESS_NAMES (Inquire Process Names) Response

The response to the Inquire Process Names (MQCMD_INQUIRE_PROCESS_NAMES) PCF command consists of the response header followed by a single parameter structure giving zero or more names that match the specified process name.

Additionally, on z/OS only, a parameter structure *QSGDispositions* is returned. This parameter structure has the same number of entries as the *ProcessNames* structure. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *ProcessNames* structure.

This response is not supported on Windows.

Always returned:

ProcessNames, QSGDispositions

Returned if requested:

None

Response data**ProcessNames (MQCFSL)**

List of process names (parameter identifier: MQCACF_PROCESS_NAMES).

QSGDispositions (MQCFIL)

List of queue sharing group dispositions (parameter identifier: MQIACF_QSG_DISPS). This parameter applies only to z/OS. Possible values for fields in this structure are:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

Multi *MQCMD_INQUIRE_PROT_POLICY (inquire security policy) on***Multiplatforms**

The Inquire Policy (MQCMD_INQUIRE_PROT_POLICY) PCF command inquires about the policy, or policies, set on a queue.

Required parameters**policy-name (MQCFST)**

Policy name (parameter identifier: MQCA_POLICY_NAME).

This parameter is the name of the policy with attributes that are required. Generic policy names are not supported, however, an asterisk on its own can be used to return all policy objects.

The name of the policy, or policies (or part of the policy name or names) to inquire is the same as the name of the queue, or queues, that the policies control. The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

The policy name is always returned regardless of the attributes requested.

Optional parameters**PolicyAttrs (MQCFIL)**

Policy attributes (parameter identifier: MQIACF_POLICY_ATTRS).

The attribute list might specify the following value on its own- default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_POLICY_NAME

Name of the policy.

MQIA_SIGNATURE_ALGORITHM

The digital signature algorithm.

MQIA_ENCRYPTION_ALGORITHM

The encryption algorithm.

MQCA_SIGNER_DN

The distinguished name of an authorized signer, or signers.

MQCA_RECIPIENT_DN

The distinguished name of an intended recipient, or recipients.

MQIA_TOLERATE_UNPROTECTED

Whether the policy is enforced or unprotected messages tolerated.

MQIA_KEY_REUSE_COUNT

The number of times that an encryption key can be re-used.

MQIACF_ACTION

The action taken on the command with regards to signer and recipient parameters.

Expected behavior for inquiring a policy

When inquiring a policy name, a policy object is always returned even if one does not exist. When a policy object does not exist, the policy object returned is a default policy object that specifies plain text protection, that is, no signing or encryption of message data.

To view policy objects that exist, the policy name should be set to '*'. This returns all policy objects that exist.

Related information

[Managing security policies in AMS](#)

MQCMD_INQUIRE_PROT_POLICY (inquire security policy) Response on Multiplatforms

The response to the Inquire Policy (MQCMD_INQUIRE_PROT_POLICY) PCF command consists of the response header followed by the *PolicyName* structure and the requested combination of attribute parameter structures.

If a generic security policy name was specified, one such message is generated for each policy found.

Always returned:

PolicyName

The name of the policy, or policies (or part of the policy name or names) to inquire are the same as the name of the queue, or queues, that the policies control.

Returned if requested:

Action, EncAlg, Enforce and Tolerate, KeyReuse Recipient, Recipient, SignAlg, Signer

Response data**Action (MQCFIL)**

Action (parameter identifier: MQIACF_ACTION).

The action taken on the command with regards to signer and recipient parameters.

EncAlg (MQCFIL)

Encryption algorithm (parameter identifier: MQIA_ENCRYPTION_ALGORITHM).

The encryption algorithm specified.

Enforce and Tolerate (MQCFST)

Indicates whether the security policy should be enforced or whether unprotected messages are tolerated (parameter identifier: MQIA_TOLERATE_UNPROTECTED).

KeyReuse (MQCFIN)

Specifies the number of times that an encryption key can be re-used (parameter identifier: MQIA_KEY_REUSE_COUNT)

Recipient (MQCFIL)

Specifies the distinguished name of the intended recipient (parameter identifier: MQCA_RECIPIENT_DN)

This parameter can be specified multiple times.

The maximum length of the string is MQ_DISTINGUISHED_NAME_LENGTH.

SignAlg (MQCFIL)

Specifies the digital signature algorithm (parameter identifier: MQIA_SIGNATURE_ALGORITHM).

Signer (MQCFST)

Specifies the distinguished name of an authorized signer (parameter identifier: MQCA_SIGNER_DN)

This parameter can be specified multiple times.

The maximum length of the string is MQ_DISTINGUISHED_NAME_LENGTH.

MQCMD_INQUIRE_PUBSUB_STATUS (Inquire Publish/Subscribe Status)

The Inquire Pub/Sub Status (MQCMD_INQUIRE_PUBSUB_STATUS) PCF command inquires about the status of publish/subscribe connections.

Optional parameters

z/OS CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

blank (or omit the parameter altogether)

The command is executed on the queue manager on which it was entered.

a queue manager name

The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

an asterisk (*)

The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use CommandScope as a parameter to filter on.

PubSubStatusAttrs (MQCFIL)

Publish/subscribe status attributes (parameter identifier: MQIACF_PUBSUB_STATUS_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQIA_SUB_COUNT

The total number of subscriptions against the local tree.

MQIA_TOPIC_NODE_COUNT

The total number of topic nodes in the local tree.

MQIACF_PUBSUB_STATUS

Hierarchy status.

MQIACF_PS_STATUS_TYPE

Hierarchy type.

Type (MQCFIN)

Type (parameter identifier: MQIACF_PS_STATUS_TYPE).

The type can specify one of the following:

MQPSST_ALL

Return status of both parent and child connections. MQPSST_ALL is the default value if the parameter is not specified.

MQPSST_LOCAL

Return local status information.

MQPSST_PARENT

Return status of the parent connection.

MQPSST_CHILD

Return status of the child connections.

MQCMD_INQUIRE_PUBSUB_STATUS (Inquire Publish/Subscribe Status) Response

The response to the Inquire publish/subscribe Status (MQCMD_INQUIRE_PUBSUB_STATUS) PCF command consists of the response header followed by the attribute structures.

A group of parameters is returned containing the following attributes: *Type*, *QueueManagerName*, *Status*, *SubCount*, and *TopicNodeCount*.

Always returned:

QueueManagerName, *Status*, *Type*, *SubCount*, and *TopicNodeCount*.

Returned if requested:

None

Response data

QueueManagerName (MQCFST)

Either the name of the local queue manager when TYPE is LOCAL, or the name of the hierarchically connected queue manager (parameter identifier: MQCA_Q_MGR_NAME).

Type (MQCFIN)

Type of status that is being returned (parameter identifier: MQIACF_PS_STATUS_TYPE).

The value can be:

MQPSST_CHILD

Publish/subscribe status for a child hierarchical connection.

MQPSST_LOCAL

Publish/subscribe status for the local queue manager.

MQPSST_PARENT

Publish/subscribe status for the parent hierarchical connection.

Status (MQCFIN)

The status of the publish/subscribe engine or the hierarchical connection (parameter identifier: MQIACF_PUBSUB_STATUS).

When TYPE is LOCAL the following values can be returned:

MQPS_STATUS_ACTIVE

The publish/subscribe engine and the queued publish/subscribe interface are running. It is therefore possible to publish or subscribe using the application programming interface and the queues that are monitored by the queued publish/subscribe interface appropriately.

MQPS_STATUS_COMPAT

The publish/subscribe engine is running. It is therefore possible to publish or subscribe using the application programming interface. The queued publish/subscribe interface is not running. Therefore, any message that is put to the queues monitored by the queued publish/subscribe interface is not acted upon by IBM MQ.

MQPS_STATUS_ERROR

The publish/subscribe engine has failed. Check your error logs to determine the reason for the failure.

MQPS_STATUS_INACTIVE

The publish/subscribe engine and the queued publish/subscribe interface are not running. It is therefore not possible to publish or subscribe using the application programming interface. Any publish/subscribe messages that are put to the queues that are monitored by the queued publish/subscribe interface is not acted upon by IBM MQ.

If inactive and you want to start the publish/subscribe engine, on the Change Queue Manager command set PubSubMode to **MQPSM_ENABLED**.

MQPS_STATUS_STARTING

The publish/subscribe engine is initializing and is not yet operational.

MQPS_STATUS_STOPPING

The publish/subscribe engine is stopping.

When TYPE is PARENT, the following values can be returned:

MQPS_STATUS_ACTIVE

The connection with the parent queue manager is active.

MQPS_STATUS_ERROR

This queue manager is unable to initialize a connection with the parent queue manager because of a configuration error.

A message is produced in the queue manager logs to indicate the specific error. If you receive error message AMQ5821 or on z/OS systems CSQT821E, possible causes include:

- Transmit queue is full
- Transmit queue put disabled

If you receive error message AMQ5814 or on z/OS systems CSQT814E, take the following actions:

- Check that the parent queue manager is correctly specified.
- Ensure that broker is able to resolve the queue manager name of the parent broker.

To resolve the queue manager name, at least one of the following resources must be configured:

- A transmission queue with the same name as the parent queue manager name.
- A queue manager alias definition with the same name as the parent queue manager name.
- A cluster with the parent queue manager a member of the same cluster as this queue manager.
- A cluster queue manager alias definition with the same name as the parent queue manager name.
- A default transmission queue.

After you have set up the configuration correctly, modify the parent queue manager name to blank. Then set with the parent queue manager name.

MQPS_STATUS_REFUSED

The connection has been refused by the parent queue manager.

This situation might be caused by the parent queue manager already having another child queue manager of the same name as this queue manager.

Alternatively, the parent queue manager has used the RESET QMGR TYPE(PUBSUB) CHILD command to remove this queue manager as one of its children.

MQPS_STATUS_STARTING

The queue manager is attempting to request that another queue manager is its parent.

If the parent status remains in starting status without progressing to active status, take the following actions:

- Check that the sender channel to parent queue manager is running
- Check that the receiver channel from parent queue manager is running

MQPS_STATUS_STOPPING

The queue manager is disconnecting from its parent.

If the parent status remains in stopping status, take the following actions:

- Check that the sender channel to parent queue manager is running
- Check that the receiver channel from parent queue manager is running

When TYPE is CHILD, the following values can be returned:

MQPS_STATUS_ACTIVE

The connection with the parent queue manager is active.

MQPS_STATUS_ERROR

This queue manager is unable to initialize a connection with the parent queue manager because of a configuration error.

A message is produced in the queue manager logs to indicate the specific error. If you receive error message AMQ5821 or on z/OS systems CSQT821E, possible causes include:

- Transmit queue is full
- Transmit queue put disabled

If you receive error message AMQ5814 or on z/OS systems CSQT814E, take the following actions:

- Check that the child queue manager is correctly specified.
- Ensure that broker is able to resolve the queue manager name of the child broker.

To resolve the queue manager name, at least one of the following resources must be configured:

- A transmission queue with the same name as the child queue manager name.
- A queue manager alias definition with the same name as the child queue manager name.
- A cluster with the child queue manager a member of the same cluster as this queue manager.
- A cluster queue manager alias definition with the same name as the child queue manager name.
- A default transmission queue.

After you have set up the configuration correctly, modify the child queue manager name to blank. Then set with the child queue manager name.

MQPS_STATUS_STARTING

The queue manager is attempting to request that another queue manager is its parent.

If the child status remains in starting status without progressing to active status, take the following actions:

- Check that the sender channel to child queue manager is running
- Check that the receiver channel from child queue manager is running

MQPS_STATUS_STOPPING

The queue manager is disconnecting from its parent.

If the child status remains in stopping status, take the following actions:

- Check that the sender channel to child queue manager is running
- Check that the receiver channel from child queue manager is running

SubCount (MQCFIN)

When *Type* is MQPSST_LOCAL, the total number of subscriptions against the local tree is returned.

When *Type* is MQPSST_CHILD or MQPSST_PARENT, queue manager relations are not inquired and the value MQPSCT_NONE is returned. (parameter identifier: MQIA_SUB_COUNT).

TopicNodeCount (MQCFIN)

When *Type* is MQPSST_LOCAL, the total number of topic nodes in the local tree is returned. When

Type is MQPSST_CHILD or MQPSST_PARENT, queue manager relations are not inquired and the value MQPSCT_NONE is returned. (parameter identifier: MQIA_TOPIC_NODE_COUNT).

MQCMD_INQUIRE_Q (Inquire Queue)

Use the Inquire Queue (MQCMD_INQUIRE_Q) PCF command to query the attributes of IBM MQ queues.

Required parameters

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

Generic queue names are supported. A generic name is a character string followed by an asterisk * ; for example ABC*. It selects all queues having names that start with the selected character string. An asterisk on its own matches all possible names.

The queue name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Optional parameters

Multi

V 9.4.0

CapExpiry (MQCFIN)

Capped expiry processing (parameter identifier MQIA_CAP_EXPIRY) which can be an integer value or can take the value of MQCEX_NOLIMIT.

Specifies a lifetime limit for messages put using the object, expressed in 10ths of a second. A value of -1, displayed as NOLIMIT, has no effect on processing.

CapExpiry provides, or limits, the value in the MQMD [Expiry](#) field of any message put.

An application provided MQMD **Expiry** that is less than any resolved CapExpiry value is passed. This value is not replaced by that resolved CapExpiry value.

This process allows an IBM MQ administrator to limit the life of messages put by an application that overlooked (or was unable to provide, in the case of MQTT) message expiration criteria.

However, this option does not allow an administrator to override application behavior where the required lifetime of messages was under-estimated.

The new capped value for expiry is used during the put processing as if it had been provided by the application in the MQMD structure.

The *capped* value is evaluated for each put being performed, and so is sensitive to the resolution of the put operation. For example, in a cluster, where the put operation is performed with BIND NOT FIXED, messages might pick up different expiry values depending on the CapExpiry value set for the transmission queue used by the channel.

z/OS

CFStructure (MQCFST)

CF structure (parameter identifier: MQCA_CF_STRUC_NAME). Specifies the name of the CF structure. This parameter is valid only on z/OS.

This parameter specifies that eligible queues are limited to those having the specified *CFStructure* value. If this parameter is not specified, then all queues are eligible.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk * ; for example ABC*. It selects all CF structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

ClusterInfo (MQCFIN)

Cluster information (parameter identifier: MQIACF_CLUSTER_INFO).

This parameter requests that cluster information about these queues and other queues in the repository that match the selection criteria is displayed. The cluster information is displayed in addition to information about attributes of queues defined on this queue manager.

In this case, there might be multiple queues with the same name displayed. The cluster information is shown with a queue type of MQQT_CLUSTER.

You can set this parameter to any integer value, the value used does not affect the response to the command.

The cluster information is obtained locally from the queue manager.

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

This parameter specifies that eligible queues are limited to those having the specified *ClusterName* value. If this parameter is not specified, then all queues are eligible.

Generic cluster names are supported. A generic name is a character string followed by an asterisk * ; for example ABC*. It selects all clusters having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

ClusterNameList (MQCFST)

Cluster namelist (parameter identifier: MQCA_CLUSTER_NAMELIST).

This parameter specifies that eligible queues are limited to those having the specified *ClusterNameList* value. If this parameter is not specified, then all queues are eligible.

Generic cluster namelists are supported. A generic name is a character string followed by an asterisk * ; for example ABC*. It selects all cluster namelists having names that start with the selected character string. An asterisk on its own matches all possible names.

z/OS CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment. The command server must be enabled.
- An asterisk " * ". The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *QAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you specify an integer filter for *Qtype* or *PageSetID*, you cannot also specify the *Qtype* or *PageSetID* parameter.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

z/OS PageSetID (MQCFIN)

Page set identifier (parameter identifier: MQIA_PAGESET_ID). This parameter applies to z/OS only.

This parameter specifies that eligible queues are limited to those having the specified *PageSetID* value. If this parameter is not specified, then all queues are eligible.

QAttrs (MQCFIL)

Queue attributes (parameter identifier: MQIACF_Q_ATTRS).

The attribute list might specify the following value on its own. If the parameter is not specified, this value is the default:

MQIACF_ALL

All attributes.

You can also specify a combination of the parameters in the following table:

<i>Table 212. Inquire Queue command, queue attributes</i>					
	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQCA_ALTERATION_DATE The date on which the information was last altered	✓	✓	✓	✓	✓
MQCA_ALTERATION_TIME The time at which the information was last altered	✓	✓	✓	✓	✓
MQCA_BACKOUT_REQ_Q_NAME Excessive backout requeue name	✓	✓			
MQCA_BASE_NAME Name of queue that alias resolves to			✓		
MQCA_CF_STRUC_NAME Coupling facility structure name. This attribute is valid on z/OS only	✓	✓			
MQCA_CLUS_CHL_NAME The generic name of the cluster-sender channels that use this queue as a transmission queue.	✓	✓			
MQCA_CLUSTER_DATE Date when the definition became available to the local queue manager					✓
MQCA_CLUSTER_NAME Cluster name	✓		✓	✓	✓
MQCA_CLUSTER_NAMELIST Cluster namelist	✓		✓	✓	
MQCA_CLUSTER_Q_MGR_NAME Queue manager name that hosts the queue					✓

Table 212. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQCA_CLUSTER_TIME Time when the definition became available to the local queue manager					✓
MQCA_CREATION_DATE Queue creation date	✓	✓			
MQCA_CREATION_TIME Queue creation time	✓	✓			
MQCA_CUSTOM The custom attribute for new features	✓	✓	✓	✓	✓
MQCA_INITIATION_Q_NAME Initiation queue name	✓	✓			
MQCA_PROCESS_NAME Name of process definition	✓	✓			
MQCA_Q_DESC Queue description	✓	✓	✓	✓	✓
MQCA_Q_MGR_IDENTIFIER Internally generated queue manager name					✓
MQCA_Q_NAME Queue name	✓	✓	✓	✓	✓
MQCA_REMOTE_Q_MGR_NAME Name of remote queue manager				✓	
MQCA_REMOTE_Q_NAME Name of remote queue as known locally on the remote queue manager				✓	
  MQCA_STORAGE_CLASS Storage class. MQCA_STORAGE_CLASS is valid on z/OS only	✓	✓			
 MQCA_STREAM_QUEUE_NAME Name of streaming queue	✓	✓			

Table 212. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQCA_TPIPE_NAME The TPIPE name used for communication with OTMA using the IBM MQ IMS bridge	✓				
MQCA_TRIGGER_DATA Trigger data	✓	✓			
MQCA_XMIT_Q_NAME Transmission queue name				✓	
MQIA_ACCOUNTING_Q Accounting data collection	✓	✓			
MQIA_BACKOUT_THRESHOLD Backout threshold	✓	✓			
MQIA_BASE_TYPE Type of object	✓	✓	✓	✓	✓
MQIA_CLUSTER_Q_TYPE Cluster queue type					✓
MQIA_CLWL_Q_PRIORITY Cluster workload queue priority	✓		✓	✓	✓
MQIA_CLWL_Q_RANK Cluster workload queue rank	✓		✓	✓	✓
MQIA_CLWL_USEQ Cluster workload use remote setting	✓				
MQIA_CURRENT_Q_DEPTH Number of messages on queue	✓				
MQIA_DEF_BIND Default binding	✓		✓	✓	✓
MQIA_DEF_INPUT_OPEN_OPTION Default open-for-input option	✓	✓			
MQIA_DEF_PERSISTENCE Default message persistence	✓	✓	✓	✓	✓
MQIA_DEF_PRIORITY Default message priority	✓	✓	✓	✓	✓

Table 212. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQIA_DEF_PUT_RESPONSE_TYPE Default put response type	✓	✓	✓	✓	✓
MQIA_DEF_READ_AHEAD Default put response type	✓	✓	✓	✓	✓
MQIA_DEFINITION_TYPE Queue definition type	✓	✓			
MQIA_DIST_LISTS Distribution list support. MQIA_DIST_LISTS is not valid on z/OS	✓	✓			
MQIA_HARDEN_GET_BACKOUT Whether to harden backout count	✓	✓			
MQIA_INDEX_TYPE Index type. This attribute is valid on z/OS only.	✓	✓			
MQIA_INHIBIT_GET Whether get operations are allowed	✓	✓	✓		
MQIA_INHIBIT_PUT Whether put operations are allowed	✓	✓	✓	✓	✓
MQIA_MAX_MSG_LENGTH Maximum message length	✓	✓			
MQIA_MAX_Q_DEPTH Maximum number of messages allowed on queue	✓	✓			
MQIA_MEDIA_IMAGE_RECOVER_Q Whether a queue object is recoverable from a media image, if linear logging is being used.	✓	✓			
MQIA_MONITORING_Q Online monitoring data collection	✓	✓			
MQIA_MSG_DELIVERY_SEQUENCE Whether message priority is relevant	✓	✓			
MQIA_NPM_CLASS Level of reliability assigned to non-persistent messages that are put to the queue	✓	✓			

Table 212. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQIA_OPEN_INPUT_COUNT Number of MQOPEN calls that have the queue open for input	✓				
MQIA_OPEN_OUTPUT_COUNT Number of MQOPEN calls that have the queue open for output	✓				
<div style="background-color: #800000; color: white; padding: 2px; display: inline-block;">z/OS</div> <div style="background-color: #800000; color: white; padding: 2px; display: inline-block; margin-left: 10px;">z/OS</div> MQIA_PAGESET_ID Page set identifier	✓				
MQIA_PROPERTY_CONTROL Property control attribute	✓	✓	✓		
MQIA_Q_DEPTH_HIGH_EVENT Control attribute for queue depth high events. You cannot use MQIA_Q_DEPTH_HIGH_EVENT as a filter attribute.	✓	✓			
MQIA_Q_DEPTH_HIGH_LIMIT High limit for queue depth	✓	✓			
MQIA_Q_DEPTH_LOW_EVENT Control attribute for queue depth low events. You cannot use MQIA_Q_DEPTH_LOW_EVENT as a filter attribute.	✓	✓			
MQIA_Q_DEPTH_LOW_LIMIT Low limit for queue depth	✓	✓			
MQIA_Q_DEPTH_MAX_EVENT Control attribute for queue depth max events	✓	✓			
MQIA_Q_SERVICE_INTERVAL Limit for queue service interval	✓	✓			
MQIA_Q_SERVICE_INTERVAL_EVENT Control attribute for queue service interval events	✓	✓			

Table 212. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQIA_Q_TYPE Queue type	✓	✓	✓	✓	✓
MQIA_RETENTION_INTERVAL Queue retention interval	✓	✓			
MQIA_SCOPE Queue definition scope. MQIA_SCOPE is not valid on z/OS or IBM i	✓		✓	✓	
MQIA_SHAREABILITY Whether queue can be shared	✓	✓			
MQIA_STATISTICS_Q Statistics data collection. MQIA_STATISTICS_Q is valid only on Multiplatforms.	✓	✓			
Multi MQIA_STREAM_QUEUE_QOS Quality of service on streaming queue	✓	✓			
MQIA_TRIGGER_CONTROL Trigger control	✓	✓			
MQIA_TRIGGER_DEPTH Trigger depth	✓	✓			
MQIA_TRIGGER_MSG_PRIORITY Threshold message priority for triggers	✓	✓			
MQIA_TRIGGER_MTYPE Trigger type	✓	✓			
MQIA_USAGE Usage	✓	✓			

z/OS MQSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned. The meaning of "the disposition of an object" is where the object is defined and how it behaves. The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. In a shared queue manager environment, if the command is run on the queue manager where it was issued, MQQSGD_LIVE

also returns information for objects defined with MQQSGD_SHARED. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

In a shared queue manager environment, if the command is run on the queue manager where it was issued, MQQSGD_ALL also displays information for objects defined with MQQSGD_GROUP or MQQSGD_SHARED.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names, with different dispositions.

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined with either MQQSGD_Q_MGR or MQQSGD_COPY.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED. MQQSGD_SHARED is permitted only in a shared queue environment.

You cannot use *QSGDisposition* as a parameter to filter on.

QType (MQCFIN)

Queue type (parameter identifier: MQIA_Q_TYPE).

If this parameter is present, eligible queues are limited to the specified type. Any attribute selector specified in the *QAttrs* list which is valid only for queues of a different type or types is ignored; no error is raised.

If this parameter is not present, or if MQQT_ALL is specified, queues of all types are eligible. Each attribute specified must be a valid queue attribute selector. The attribute can apply to some of the queues returned. It does not have to apply to all the queues. Queue attribute selectors that are valid but not applicable to the queue are ignored, no error messages occur and no attribute is returned. The following lists contains the value of all valid queue attribute selectors:

MQQT_ALL

All queue types.

MQQT_LOCAL

Local queue.

MQQT_ALIAS

Alias queue definition.

MQQT_REMOTE

Local definition of a remote queue.

MQQT_CLUSTER

Cluster queue.

MQQT_MODEL

Model queue definition.

Note:  On Multiplatforms, if this parameter is present, it must occur immediately after the **QName** parameter.

StorageClass (MQCFST)

Storage class (parameter identifier: MQCA_STORAGE_CLASS). Specifies the name of the storage class. This parameter is valid only on z/OS.

This parameter specifies that eligible queues are limited to those having the specified *StorageClass* value. If this parameter is not specified, then all queues are eligible.

Generic names are supported. A generic name is a character string followed by an asterisk * ; for example ABC*. It selects all storage classes having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *QAttrs* except MQCA_Q_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1560 for information about using this filter condition.

If you specify a string filter for *ClusterName*, *ClusterNameList*, *StorageClass*, or *CFStructure*, you cannot also specify that as a parameter.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1018.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_Q_TYPE_ERROR

Queue type not valid.

MQCMD_INQUIRE_Q (Inquire Queue) Response

The response to the Inquire Queue (MQCMD_INQUIRE_Q) PCF command consists of the response header followed by the *QName* structure. On z/OS only, response includes the *QSGDisposition* structure, and the requested combination of attribute parameter structures.

If a generic queue name was specified, or cluster queues requested, by setting either MQQT_CLUSTER or MQIACF_CLUSTER_INFO, one message is generated for each queue found.

Always returned:

QName, *QSGDisposition*, *QType*

Returned if requested:

AlterationDate, *AlterationTime*, *BackoutRequeueName*, *BackoutThreshold*, *BaseQName*, *CapExpiry*, *CFStructure*, *ClusterChannelName*, *ClusterDate*, *ClusterName*, *ClusterNameList*, *ClusterQType*, *ClusterTime*, *CLWLQueuePriority*, *CLWLQueueRank*, *CLWLUseQ*, *CreationDate*, *CreationTime*, *CurrentQDepth*, *Custom*, *DefaultPutResponse*, *DefBind*, *DefinitionType*, *DefInputOpenOption*, *DefPersistence*, *DefPriority*, *DefReadAhead*, *DistLists*, *HardenGetBackout*, *Imgrcovq*, *IndexType*, *InhibitGet*, *InhibitPut*, *InitiationQName*, *MaxMsgLength*, *MaxQDepth*, *MsgDeliverySequence*, *NonPersistentMessageClass*, *OpenInputCount*, *OpenOutputCount*, *PageSetID*, *ProcessName*, *PropertyControl*, *QDepthHighEvent*, *QDepthHighLimit*, *QDepthLowEvent*, *QDepthLowLimit*, *QDepthMaxEvent*, *QDesc*, *QMgrIdentifier*, *QMgrName*, *QServiceInterval*, *QServiceIntervalEvent*, *QueueAccounting*, *QueueMonitoring*, *QueueStatistics*, *RemoteQMgrName*, *RemoteQName*, *RetentionInterval*, *Scope*, *Shareability*, *StorageClass*, *StreamQ*, *StreamQService*, *TpipeNames*, *TriggerControl*, *TriggerData*, *TriggerDepth*, *TriggerMsgPriority*, *TriggerType*, *Usage*, *XmitQName*

Response data

AlterationDate (MQCFST)

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered, in the form hh.mm.ss.

BackoutRequeueName (MQCFST)

Excessive backout requeue name (parameter identifier: MQCA_BACKOUT_REQ_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

BackoutThreshold (MQCFIN)

Backout threshold (parameter identifier: MQIA_BACKOUT_THRESHOLD).

BaseQName (MQCFST)

Queue name to which the alias resolves (parameter identifier: MQCA_BASE_Q_NAME).

The name of a queue that is defined to the local queue manager.

The maximum length of the string is MQ_Q_NAME_LENGTH.

CapExpiry (MQCFIN)

Capped message expiry processing (parameter identifier MQIA_CAP_EXPIRY).

Specifies a lifetime limit for messages put using the object, expressed in 10ths of a second.

CFStructure (MQCFST)

Coupling facility structure name (parameter identifier: MQCA_CF_STRUC_NAME). This parameter applies to z/OS only.

Specifies the name of the coupling facility structure where you want to store messages when you use shared queues.

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

ClusterChannelName (MQCFST)

Cluster-sender channel name (parameter identifier: MQCA_CLUS_CHL_NAME).

ClusterChannelName is the generic name of the cluster-sender channels that use this queue as a transmission queue.

The maximum length of the channel name is: MQ_CHANNEL_NAME_LENGTH.

ClusterDate (MQCFST)

Cluster date (parameter identifier: MQCA_CLUSTER_DATE).

The date on which the information became available to the local queue manager, in the form yyyy-mm-dd.

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

ClusterNamelist (MQCFST)

Cluster namelist (parameter identifier: MQCA_CLUSTER_NAMELIST).

ClusterQType (MQCFIN)

Cluster queue type (parameter identifier: MQIA_CLUSTER_Q_TYPE).

The value can be:

MQCQT_LOCAL_Q

The cluster queue represents a local queue.

MQCQT_ALIAS_Q

The cluster queue represents an alias queue.

MQCQT_REMOTE_Q

The cluster queue represents a remote queue.

MQCQT_Q_MGR_ALIAS

The cluster queue represents a queue manager alias.

ClusterTime (MQCFST)

Cluster time (parameter identifier: MQCA_CLUSTER_TIME).

The time at which the information became available to the local queue manager, in the form hh.mm.ss.

CLWLQueuePriority (MQCFIN)

Cluster workload queue priority (parameter identifier: MQIA_CLWL_Q_PRIORITY).

Priority of the queue in cluster workload management. The value is in the range zero through 9, where zero is the lowest priority and 9 is the highest.

CLWLQueueRank (MQCFIN)

Cluster workload queue rank (parameter identifier: MQIA_CLWL_Q_RANK).

Rank of the queue in cluster workload management. The value is in the range zero through 9, where zero is the lowest rank and 9 is the highest.

CLWLUseQ (MQCFIN)

Cluster workload queue rank (parameter identifier: MQIA_CLWL_USEQ).

The value can be:

MQCLWL_USEQ_AS_Q_MGR

Use the value of the **CLWLUseQ** parameter on the queue manager's definition.

MQCLWL_USEQ_ANY

Use remote and local queues.

MQCLWL_USEQ_LOCAL

Do not use remote queues.

CreationDate (MQCFST)

Queue creation date, in the form yyyy-mm-dd (parameter identifier: MQCA_CREATION_DATE).

The maximum length of the string is MQ_CREATION_DATE_LENGTH.

CreationTime (MQCFST)

Creation time, in the form hh.mm.ss (parameter identifier: MQCA_CREATION_TIME).

The maximum length of the string is MQ_CREATION_TIME_LENGTH.

CurrentQDepth (MQCFIN)

Current queue depth (parameter identifier: MQIA_CURRENT_Q_DEPTH).

Custom (MQCFST)

Custom attribute for new features (parameter identifier: MQCA_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes are named. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE).

This description is updated when features using this attribute are introduced.

DefaultPutResponse (MQCFIN)

Default put response type definition (parameter identifier: MQIA_DEF_PUT_RESPONSE_TYPE).

The parameter specifies the type of response to be used for put operations to the queue when an application specifies MQPMO_RESPONSE_AS_Q_DEF. The value can be any of the following values:

MQPRT_SYNC_RESPONSE

The put operation is issued synchronously, returning a response.

MQPRT_ASYNC_RESPONSE

The put operation is issued asynchronously, returning a subset of MQMD fields.

DefBind (MQCFIN)

Default binding (parameter identifier: MQIA_DEF_BIND).

The value can be:

MQBND_BIND_ON_OPEN

Binding fixed by MQOPEN call.

MQBND_BIND_NOT_FIXED

Binding not fixed.

MQBND_BIND_ON_GROUP

Allows an application to request that a group of messages are all allocated to the same destination instance.

DefinitionType (MQCFIN)

Queue definition type (parameter identifier: MQIA_DEFINITION_TYPE).

The value can be:

MQQDT_PREDEFINED

Predefined permanent queue.

MQQDT_PERMANENT_DYNAMIC

Dynamically defined permanent queue.

MQQDT_SHARED_DYNAMIC

Dynamically defined shared queue. This option is available on z/OS only.

MQQDT_TEMPORARY_DYNAMIC

Dynamically defined temporary queue.

DefInputOpenOption (MQCFIN)

Default input open option for defining whether queues can be shared (parameter identifier: MQIA_DEF_INPUT_OPEN_OPTION).

The value can be:

MQOO_INPUT_EXCLUSIVE

Open queue to get messages with exclusive access.

MQOO_INPUT_SHARED

Open queue to get messages with shared access.

DefPersistence (MQCFIN)

Default persistence (parameter identifier: MQIA_DEF_PERSISTENCE).

The value can be:

MQPER_PERSISTENT

Message is persistent.

MQPER_NOT_PERSISTENT

Message is not persistent.

DefPriority (MQCFIN)

Default priority (parameter identifier: MQIA_DEF_PRIORITY).

DefReadAhead (MQCFIN)

Default read ahead (parameter identifier: MQIA_DEF_READ_AHEAD).

Specifies the default read ahead behavior for non-persistent messages delivered to the client.

The value can be any of the following values:

MQREADA_NO

Non-persistent messages are not sent ahead to the client before an application requests them. A maximum of one non-persistent message can be lost if the client ends abnormally.

MQREADA_YES

Non-persistent messages are sent ahead to the client before an application requests them. Non-persistent messages can be lost if the client ends abnormally or if the client does not consume all the messages it is sent.

MQREADA_DISABLED

Read ahead of non-persistent messages is not enabled for this queue. Messages are not sent ahead to the client regardless of whether read ahead is requested by the client application.

Multi**DistLists (MQCFIN)**

Distribution list support (parameter identifier: MQIA_DIST_LISTS).

The value can be:

MQDL_SUPPORTED

Distribution lists supported.

MQDL_NOT_SUPPORTED

Distribution lists not supported.

This parameter is supported only on Multiplatforms.

HardenGetBackout (MQCFIN)

Harden backout, or not: (parameter identifier: MQIA_HARDEN_GET_BACKOUT).

The value can be:

MQQA_BACKOUT_HARDENED

Backout count remembered.

MQQA_BACKOUT_NOT_HARDENED

Backout count may not be remembered.

ImageRecoverQueue (MQCFST)

Specifies whether a local or permanent dynamic queue object is recoverable from a media image, if linear logging is being used (parameter identifier: MQIA_MEDIA_IMAGE_RECOVER_Q).

This parameter is not valid on z/OS. Possible values are:

MQIMGRCOV_YES

These queue objects are recoverable.

MQIMGRCOV_NO

Automatic media images, if enabled, are not written for these objects.

MQIMGRCOV_AS_Q_MGR

If the **ImageRecoverQueue** attribute for the queue manager specifies MQIMGRCOV_YES, these queue objects are recoverable.

If the **ImageRecoverQueue** attribute for the queue manager specifies MQIMGRCOV_NO, the [“rcdmqimg \(record media image\)”](#) on page 139 and [“rcrmqobj \(re-create object\)”](#) on page 142 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

IndexType (MQCFIN)

Index type (parameter identifier: MQIA_INDEX_TYPE). This parameter applies to z/OS only.

Specifies the type of index maintained by the queue manager to expedite MQGET operations on the queue. The value can be any of the following values:

MQIT_NONE

No index.

MQIT_MSG_ID

The queue is indexed using message identifiers.

MQIT_CORREL_ID

The queue is indexed using correlation identifiers.

MQIT_MSG_TOKEN

The queue is indexed using message tokens.

MQIT_GROUP_ID

The queue is indexed using group identifiers.

InhibitGet (MQCFIN)

Get operations are allowed or inhibited: (parameter identifier: MQIA_INHIBIT_GET).

The value can be:

MQQA_GET_ALLOWED

Get operations are allowed.

MQQA_GET_INHIBITED

Get operations are inhibited.

InhibitPut (MQCFIN)

Put operations are allowed or inhibited: (parameter identifier: MQIA_INHIBIT_PUT).

The value can be:

MQQA_PUT_ALLOWED

Put operations are allowed.

MQQA_PUT_INHIBITED

Put operations are inhibited.

InitiationQName (MQCFST)

Initiation queue name (parameter identifier: MQCA_INITIATION_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: MQIA_MAX_MSG_LENGTH).

MaxQDepth (MQCFIN)

Maximum queue depth (parameter identifier: MQIA_MAX_Q_DEPTH).

MsgDeliverySequence (MQCFIN)

Messages ordered by priority or sequence: (parameter identifier: MQIA_MSG_DELIVERY_SEQUENCE).

The value can be:

MQMDS_PRIORITY

Messages are returned in priority order.

MQMDS_FIFO

Messages are returned in FIFO order (first in, first out).

NonPersistentMessageClass (MQCFIN)

The level of reliability assigned to non-persistent messages that are put to the queue (parameter identifier: MQIA_NPM_CLASS).

Specifies the circumstances under which non-persistent messages put to the queue may be lost. The value can be any of the following values:

MQNPM_CLASS_NORMAL

Non-persistent messages are limited to the lifetime of the queue manager session. They are discarded in the event of a queue manager restart. MQNPM_CLASS_NORMAL is the default value.

MQNPM_CLASS_HIGH

The queue manager attempts to retain non-persistent messages for the lifetime of the queue. Non-persistent messages may still be lost in the event of a failure.

OpenInputCount (MQCFIN)

Number of MQOPEN calls that have the queue open for input (parameter identifier: MQIA_OPEN_INPUT_COUNT).

OpenOutputCount (MQCFIN)

Number of MQOPEN calls that have the queue open for output (parameter identifier: MQIA_OPEN_OUTPUT_COUNT).

PageSetID (MQCFIN)

Page set identifier (parameter identifier: MQIA_PAGESET_ID).

Specifies the identifier of the page set on which the queue resides.

This parameter applies to z/OS only when the queue is actively associated with a page set.

ProcessName (MQCFST)

Name of process definition for queue (parameter identifier: MQCA_PROCESS_NAME).

The maximum length of the string is MQ_PROCESS_NAME_LENGTH.

PropertyControl (MQCFIN)

Property control attribute (parameter identifier MQIA_PROPERTY_CONTROL).

Specifies how message properties are handled for messages that are retrieved from queues using the MQGET call with the MQGMO_PROPERTIES_AS_Q_DEF option. The value can be any of the following values:

MQPROP_COMPATIBILITY

If the message contains a property with a prefix of **mcd.**, **jms.**, **usr.** or **mqext.**, all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except properties contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

MQPROP_COMPATIBILITY is the default value. It allows applications which expect JMS-related properties to be in an MQRFH2 header in the message data to continue to work unmodified.

MQPROP_NONE

All properties of the message are removed from the message before the message is sent to the remote queue manager. Properties in the message descriptor (or extension) are not removed.

MQPROP_ALL

All properties of the message are included with the message when it is sent to the remote queue manager. The properties are placed in one or more MQRFH2 headers in the message data. Properties in the message descriptor (or extension) are not placed in MQRFH2 headers.

MQPROP_FORCE_MQRFH2

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

A valid message handle supplied in the `MsgHandle` field of the MQGMO structure on the MQGET call is ignored. Properties of the message are not accessible via the message handle.

This parameter is applicable to local, alias, and model queues.

QDepthHighEvent (MQCFIN)

Controls whether Queue Depth High events are generated (parameter identifier: MQIA_Q_DEPTH_HIGH_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

QDepthHighLimit (MQCFIN)

High limit for queue depth (parameter identifier: MQIA_Q_DEPTH_HIGH_LIMIT).

The threshold against which the queue depth is compared to generate a Queue Depth High event.

QDepthLowEvent (MQCFIN)

Controls whether Queue Depth Low events are generated (parameter identifier: MQIA_Q_DEPTH_LOW_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

QDepthLowLimit (MQCFIN)

Low limit for queue depth (parameter identifier: MQIA_Q_DEPTH_LOW_LIMIT).

The threshold against which the queue depth is compared to generate a Queue Depth Low event.

QDepthMaxEvent (MQCFIN)

Controls whether Queue Full events are generated (parameter identifier: MQIA_Q_DEPTH_MAX_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

QDesc (MQCFST)

Queue description (parameter identifier: MQCA_Q_DESC).

The maximum length of the string is MQ_Q_DESC_LENGTH.

QMgrIdentifier (MQCFST)

Queue manager identifier (parameter identifier: MQCA_Q_MGR_IDENTIFIER).

The unique identifier of the queue manager.

QMgrName (MQCFST)

Name of local queue manager (parameter identifier: MQCA_CLUSTER_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

QServiceInterval (MQCFIN)

Target for queue service interval (parameter identifier: MQIA_Q_SERVICE_INTERVAL).

The service interval used for comparison to generate Queue Service Interval High and Queue Service Interval OK events.

QServiceIntervalEvent (MQCFIN)

Controls whether Service Interval High or Service Interval OK events are generated (parameter identifier: MQIA_Q_SERVICE_INTERVAL_EVENT).

The value can be:

MQQSIE_HIGH

Queue Service Interval High events enabled.

MQQSIE_OK

Queue Service Interval OK events enabled.

MQQSIE_NONE

No queue service interval events enabled.

QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). *QSGDisposition* is valid only on z/OS. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED.

QType (MQCFIN)

Queue type (parameter identifier: MQIA_Q_TYPE).

The value can be:

MQQT_ALIAS

Alias queue definition.

MQQT_CLUSTER

Cluster queue definition.

MQQT_LOCAL

Local queue.

MQQT_REMOTE

Local definition of a remote queue.

MQQT_MODEL

Model queue definition.

QueueAccounting (MQCFIN)

Controls the collection of accounting (thread-level and queue-level accounting) data (parameter identifier: MQIA_ACCOUNTING_Q).

The value can be:

MQMON_Q_MGR

The collection of accounting data for the queue is performed based upon the setting of the **QueueAccounting** parameter on the queue manager.

MQMON_OFF

Do not collect accounting data for the queue.

MQMON_ON

Collect accounting data for the queue.

QueueMonitoring (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA_MONITORING_Q).

The value can be:

MQMON_OFF

Online monitoring data collection is turned off for this queue.

MQMON_Q_MGR

The value of the queue manager's **QueueMonitoring** parameter is inherited by the queue.

MQMON_LOW

Online monitoring data collection is turned on, with a low rate of data collection, for this queue unless *QueueMonitoring* for the queue manager is MQMON_NONE.

MQMON_MEDIUM

Online monitoring data collection is turned on, with a moderate rate of data collection, for this queue unless *QueueMonitoring* for the queue manager is MQMON_NONE.

MQMON_HIGH

Online monitoring data collection is turned on, with a high rate of data collection, for this queue unless *QueueMonitoring* for the queue manager is MQMON_NONE.

Multi **QueueStatistics (MQCFIN)**

Controls the collection of statistics data (parameter identifier: MQIA_STATISTICS_Q).

The value can be:

MQMON_Q_MGR

The collection of statistics data for the queue is performed based upon the setting of the **QueueStatistics** parameter on the queue manager.

MQMON_OFF

Do not collect statistics data for the queue.

MQMON_ON

Collect statistics data for the queue unless *QueueStatistics* for the queue manager is MQMON_NONE.

This parameter is supported only on [Multiplatforms](#).

RemoteQMgrName (MQCFST)

Name of remote queue manager (parameter identifier: MQCA_REMOTE_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

RemoteQName (MQCFST)

Name of remote queue as known locally on the remote queue manager (parameter identifier: MQCA_REMOTE_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

RetentionInterval (MQCFIN)

Retention interval (parameter identifier: MQIA_RETENTION_INTERVAL).

Scope (MQCFIN)

Scope of the queue definition (parameter identifier: MQIA_SCOPE).

The value can be:

MQSCO_Q_MGR

Queue manager scope.

MQSCO_CELL

Cell scope.

This parameter is not valid on IBM i or z/OS.

Shareability (MQCFIN)

The queue can be shared, or not: (parameter identifier: MQIA_SHAREABILITY).

The value can be:

MQQA_SHAREABLE

Queue is shareable.

MQQA_NOT_SHAREABLE

Queue is not shareable.

StorageClass (MQCFST)

Storage class (parameter identifier: MQCA_STORAGE_CLASS). This parameter applies to z/OS only.

Specifies the name of the storage class.

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

Multi StreamQ (MQCFST)

Name of the streaming queue (parameter identifier: MQCA_STREAM_QUEUE_NAME)

Multi StreamQService (MQCFIN)

Quality of service used when delivering messages to **Streamq** (parameter identifier: MQIA_STREAM_QUEUE_QOS)

The value can be:

MQST_BEST_EFFORT

If the original message can be delivered, but the streamed message cannot, the original message is still delivered to its queue.

This is the default value.

MQST_MUST_DUP

The queue manager ensures that both the original message and the streamed message are successfully delivered to their queues.

If, for some reason, the streamed message cannot be delivered to its queue, the original message is not delivered to its queue either.

TpipeNames (MQCFSL)

TPIPE names (parameter identifier: MQCA_TPIPE_NAME). This parameter applies to local queues on z/OS only.

Specifies the TPIPE names used for communication with OTMA via the IBM MQ IMS bridge, if the bridge is active.

The maximum length of the string is MQ_TPIPE_NAME_LENGTH.

TriggerControl (MQCFIN)

Trigger control (parameter identifier: MQIA_TRIGGER_CONTROL).

The value can be:

MQTC_OFF

Trigger messages not required.

MQTC_ON

Trigger messages required.

TriggerData (MQCFST)

Trigger data (parameter identifier: MQCA_TRIGGER_DATA).

The maximum length of the string is MQ_TRIGGER_DATA_LENGTH.

TriggerDepth (MQCFIN)

Trigger depth (parameter identifier: MQIA_TRIGGER_DEPTH).

TriggerMsgPriority (MQCFIN)

Threshold message priority for triggers (parameter identifier: MQIA_TRIGGER_MSG_PRIORITY).

TriggerType (MQCFIN)

Trigger type (parameter identifier: MQIA_TRIGGER_TYPE).

The value can be:

MQTT_NONE

No trigger messages.

MQTT_FIRST

Trigger message when queue depth goes from 0 to 1.

MQTT EVERY

Trigger message for every message.

MQTT_DEPTH

Trigger message when depth threshold exceeded.

Usage (MQCFIN)

Usage (parameter identifier: MQIA_USAGE).

The value can be:

MQUS_NORMAL

Normal usage.

MQUS_TRANSMISSION

Transmission queue.

XmitQName (MQCFST)

Transmission queue name (parameter identifier: MQCA_XMIT_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

MQCMD_INQUIRE_Q_MGR (Inquire Queue Manager)

The Inquire Queue Manager (MQCMD_INQUIRE_Q_MGR) PCF command inquires about the attributes of a queue manager.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment. The command server must be enabled.
- An asterisk " * ". The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

QMGrAttrs (MQCFIL)

Queue manager attributes (parameter identifier: MQIACF_Q_MGR_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

Or a combination of the following values:

MQCA_ALTERATION_DATE

Date at which the definition was last altered.

MQCA_ALTERATION_TIME

Time at which the definition was last altered.

MQCA_CERT_LABEL

Queue manager certificate label.

MQCA_CHANNEL_AUTO_DEF_EXIT

Automatic channel definition exit name. **MQCA_CHANNEL_AUTO_DEF_EXIT** is not valid on z/OS.

MQCA_CLUSTER_WORKLOAD_DATA

Data passed to the cluster workload exit.

MQCA_CLUSTER_WORKLOAD_EXIT

Name of the cluster workload exit.

MQCA_COMMAND_INPUT_Q_NAME

System command input queue name.

MQCA_CONN_AUTH

Name of the authentication information object that is used to provide the location of user ID and password authentication.

MQCA_CREATION_DATE

Queue manager creation date.

MQCA_CREATION_TIME

Queue manager creation time.

MQCA_CUSTOM

The custom attribute for new features.

MQCA_DEAD_LETTER_Q_NAME

Name of dead-letter queue.

MQCA_DEF_XMIT_Q_NAME

Default transmission queue name.

z/OS MQCA_DNS_GROUP

The name of the group that the TCP listener handling inbound transmissions for the queue sharing group must join when using Workload Manager for Dynamic Domain Name Services support (DDNS). **MQCA_DNS_GROUP** is valid on z/OS only.

z/OS MQCA_IGQ_USER_ID

Intra-group queuing user identifier. This parameter is valid on z/OS only.

Multi MQCA_INITIAL_KEY

The initial key for the password protection system.

z/OS MQCA_LU_GROUP_NAME

Generic LU name for the LU 6.2 listener. **MQCA_LU_GROUP_NAME** is valid on z/OS only.

z/OS MQCA_LU_NAME

LU name to use for outbound LU 6.2 transmissions. **MQCA_LU_NAME** is valid on z/OS only.

z/OS MQCA_LU62_ARM_SUFFIX

APPCPM suffix. **MQCA_LU62_ARM_SUFFIX** is valid on z/OS only.

MQCA_PARENT

The name of the hierarchically connected queue manager that is nominated as the parent of this queue manager.

MQCA_Q_MGR_DESC

Queue manager description.

MQCA_Q_MGR_IDENTIFIER

Internally generated unique queue manager name.

MQCA_Q_MGR_NAME

Name of local queue manager.

z/OS MQCA_QSG_CERT_LABEL

Queue sharing group certificate label. This parameter attribute is valid on z/OS only.

z/OS MQCA_QSG_NAME

Queue sharing group name. This parameter attribute is valid on z/OS only.

MQCA_REPOSITORY_NAME

Cluster name for the queue manager repository.

MQCA_REPOSITORY_NAMELIST

Name of the list of clusters for which the queue manager is providing a repository manager service.

MQCA_SSL_CRL_NAMELIST

TLS certificate revocation location namelist.

ALW**MQCA_SSL_CRYPTO_HARDWARE**

Parameters to configure the TLS cryptographic hardware. This parameter is supported only on AIX, Linux, and Windows.

ALW**MQCA_SSL_KEY_REPO_PASSWORD**

The password to access the TLS key repository.

MQCA_SSL_KEY_REPOSITORY

Location and name of the TLS key repository.

z/OS**MQCA_TCP_NAME**

Name of the TCP/IP system that you are using. **MQCA_TCP_NAME** is valid on z/OS only.

MQCA_VERSION

The version of the IBM MQ installation, the queue manager is associated with. The version has the format *VVRRMMFF*:

VV: Version

RR: Release

MM: Maintenance level

FF: Fix level

ALW**MQIA_ACCOUNTING_CONN_OVERRIDE**

Specifies whether the settings of the **MQIAccounting** and **QueueAccounting** queue manager parameters can be overridden. **MQIA_ACCOUNTING_CONN_OVERRIDE** is valid only on AIX, Linux, and Windows.

ALW**MQIA_ACCOUNTING_INTERVAL**

Intermediate accounting data collection interval. **MQIA_ACCOUNTING_INTERVAL** is valid only on AIX, Linux, and Windows.

ALW**MQIA_ACCOUNTING_MQI**

Specifies whether accounting information is to be collected for MQI data.

MQIA_ACCOUNTING_MQI is valid only on AIX, Linux, and Windows.

MQIA_ACCOUNTING_Q

Accounting data collection for queues.

z/OS**MQIA_ACTIVE_CHANNELS**

Maximum number of channels that can be active at any time. **MQIA_ACTIVE_CHANNELS** is valid on z/OS only.

MQIA_ACTIVITY_CONN_OVERRIDE

Specifies whether the value of application activity trace can be overridden.

MQIA_ACTIVITY_RECORDING

Specifies whether activity reports can be generated.

MQIA_ACTIVITY_TRACE

Specifies whether application activity trace reports can be generated.

z/OS**MQIA_ADOPTNEWMCA_CHECK**

Elements checked to determine whether an MCA must be adopted when a new inbound channel is detected with the same name as an MCA that is already active. **MQIA_ADOPTNEWMCA_CHECK** is valid on z/OS only.

z/OS **MQIA_ADOPTNEWMCA_TYPE**

Specifies whether an orphaned instance of an MCA must be restarted automatically when a new inbound channel request matching the **AdoptNewMCACheck** parameter is detected. **MQIA_ADOPTNEWMCA_TYPE** is valid on z/OS only.

MQ Adv. **MQIA_ADVANCED_CAPABILITY**

Specifies whether IBM MQ Advanced extended capabilities are available for a queue manager.

ALW **MQIA_AMQP_CAPABILITY**

Specifies whether AMQP capabilities are available for a queue manager.

MQIA_AUTHORITY_EVENT

Control attribute for authority events.

z/OS **MQIA_BRIDGE_EVENT**

Control attribute for IMS bridge events. **MQIA_BRIDGE_EVENT** is valid only on z/OS.

ALW **MQIA_CERT_VAL_POLICY**

Specifies which TLS certificate validation policy is used to validate digital certificates received from remote partner systems. This attribute controls how strictly the certificate chain validation conforms to industry security standards. **MQIA_CERT_VAL_POLICY** is valid only on AIX, Linux, and Windows. For more information, see [Certificate validation policies in IBM MQ](#).

z/OS **MQIA_CHANNEL_AUTO_DEF**

Control attribute for automatic channel definition. **MQIA_CHANNEL_AUTO_DEF** is not valid on z/OS.

z/OS **MQIA_CHANNEL_AUTO_DEF_EVENT**

Control attribute for automatic channel definition events. **MQIA_CHANNEL_AUTO_DEF_EVENT** is not valid on z/OS.

MQIA_CHANNEL_EVENT

Control attribute for channel events.

z/OS **MQIA_CHINIT_ADAPTERS**

Number of adapter subtasks to use for processing IBM MQ calls. **MQIA_CHINIT_ADAPTERS** is valid on z/OS only.

MQIA_CHINIT_CONTROL

Start channel initiator automatically when queue manager starts.

z/OS **MQIA_CHINIT_DISPATCHERS**

Number of dispatchers to use for the channel initiator. **MQIA_CHINIT_DISPATCHERS** is valid on z/OS only.

z/OS **MQIA_CHINIT_SERVICE_PARM**

Reserved for use by IBM. **MQIA_CHINIT_SERVICE_PARM** is valid only on z/OS.

z/OS **MQIA_CHINIT_TRACE_AUTO_START**

Specifies whether the channel initiator trace must start automatically. **MQIA_CHINIT_TRACE_AUTO_START** is valid on z/OS only.

z/OS **MQIA_CHINIT_TRACE_TABLE_SIZE**

Size, in megabytes, of the trace data space of the channel initiator. **MQIA_CHINIT_TRACE_TABLE_SIZE** is valid on z/OS only.

MQIA_CHLAUTH_RECORDS

Control attribute for checking of channel authentication records.

MQIA_CLUSTER_WORKLOAD_LENGTH

Maximum length of the message passed to the cluster workload exit.

MQIA_CLWL_MRU_CHANNELS

Cluster workload most recently used channels.

MQIA_CLWL_USEQ

Cluster workload remote queue use.

MQIA_CMD_SERVER_CONTROL

Start command server automatically when queue manager starts.

MQIA_CODED_CHAR_SET_ID

Coded character set identifier.

MQIA_COMMAND_EVENT

Control attribute for command events.

MQIA_COMMAND_LEVEL

Command level supported by queue manager.

MQIA_CONFIGURATION_EVENT

Control attribute for configuration events.

MQIA_CPI_LEVEL

Reserved for use by IBM.

MQIA_DEF_CLUSTER_XMIT_Q_TYPE

Default transmission queue type to be used for cluster-sender channels.

Multi MQIA_DIST_LISTS

Distribution list support. This parameter is not valid on z/OS.

z/OS MQIA_DNS_WLM

Specifies whether the TCP listener that handles inbound transmissions for the queue sharing group must register with Workload Manager (WLM) for DDNS. **MQIA_DNS_WLM** is valid on z/OS only.

z/OS MQIA_EXPIRY_INTERVAL

Expiry interval. This parameter is valid on z/OS only.

z/OS MQIA_GROUP_UR

Control attribute for whether transactional applications can connect with a GROUP unit of recovery disposition. This parameter is valid only on z/OS.

z/OS MQIA_IGQ_PUT_AUTHORITY

Intra-group queuing put authority. This parameter is valid on z/OS only.

MQIA_INHIBIT_EVENT

Control attribute for inhibit events.

z/OS MQIA_INTRA_GROUP_QUEUING

Intra-group queuing support. This parameter is valid on z/OS only.

MQIA_IP_ADDRESS_VERSION

IP address version selector.

z/OS MQIA_LISTENER_TIMER

Listener restart interval. **MQIA_LISTENER_TIMER** is valid on z/OS only.

MQIA_LOCAL_EVENT

Control attribute for local events.

MQIA_LOGGER_EVENT

Control attribute for recovery log events.

z/OS MQIA_LU62_CHANNELS

Maximum number of LU 6.2 channels. **MQIA_LU62_CHANNELS** is valid on z/OS only.

MQIA_MSG_MARK_BROWSE_INTERVAL

Interval for which messages that were browsed, remain marked.

z/OS MQIA_MAX_CHANNELS

Maximum number of channels that can be current. **MQIA_MAX_CHANNELS** is valid on z/OS only.

MQIA_MAX_HANDLES

Maximum number of handles.

MQIA_MAX_MSG_LENGTH

Maximum message length.

MQIA_MAX_PRIORITY

Maximum priority.

MQIA_MAX_PROPERTIES_LENGTH

Maximum properties length.

MQIA_MAX_UNCOMMITTED_MSGS

Maximum number of uncommitted messages within a unit of work.

ALW MQIA_MEDIA_IMAGE_INTERVAL

The target frequency with which the queue manager automatically writes media images.

ALW MQIA_MEDIA_IMAGE_LOG_LENGTH

The target size of the recovery log.

ALW MQIA_MEDIA_IMAGE_RECOVER_OBJ

Specifies the recoverable objects from a media image, if linear logging is being used.

ALW MQIA_MEDIA_IMAGE_RECOVER_Q

Specifies whether local and permanent dynamic queues defined with **ImageRecoverQueue** set to **MQIMGRCOV_AS_Q_MGR** are recoverable from a media image.

ALW MQIA_MEDIA_IMAGE_SCHEDULING

Whether the queue manager automatically writes media images.

MQIA_MONITORING_AUTO_CLUSSDR

Default value of the **ChannelMonitoring** attribute of automatically defined cluster-sender channels.

MQIA_MONITORING_CHANNEL

Specifies whether channel monitoring is enabled.

MQIA_MONITORING_Q

Specifies whether queue monitoring is enabled.

z/OS MQIA_OUTBOUND_PORT_MAX

Maximum value in the range for the binding of outgoing channels. **MQIA_OUTBOUND_PORT_MAX** is valid on z/OS only.

z/OS MQIA_OUTBOUND_PORT_MIN

Minimum value in the range for the binding of outgoing channels. **MQIA_OUTBOUND_PORT_MIN** is valid on z/OS only.

MQIA_PERFORMANCE_EVENT

Control attribute for performance events.

MQIA_PLATFORM

Platform on which the queue manager resides.

z/OS MQIA_PROT_POLICY_CAPABILITY

Specifies whether Advanced Message Security is installed for the version of IBM MQ that the queue manager is running.

MQIA_PUBSUB_CLUSTER

Controls whether this queue manager participates in the publish/subscribe clustering.

MQIA_PUBSUB_MAXMSG_RETRY_COUNT

The number of retries when processing (under sync point) a failed command message

MQIA_PUBSUB_MODE

Inquires if the publish/subscribe engine and the queued publish/subscribe interface are running, which allow applications to publish/subscribe by using the application programming interface and the queues that are being monitored by the queued publish/subscribe interface.

MQIA_PUBSUB_NP_MSG

Specifies whether to discard (or keep) an undelivered input message.

MQIA_PUBSUB_NP_RESP

The behavior of undelivered response messages.

MQIA_PUBSUB_SYNC_PT

Specifies whether only persistent (or all) messages must be processed under sync point.

z/OS MQIA_QMGR_CFCONLOS

Specifies action to be taken when the queue manager loses connectivity to the administration structure, or any CF structure with CFCONLOS set to **ASQMGR**. **MQIA_QMGR_CFCONLOS** is valid on z/OS only.

z/OS MQIA_RECEIVE_TIMEOUT

How long a TCP/IP channel waits to receive data from its partner. **MQIA_RECEIVE_TIMEOUT** is valid on z/OS only.

z/OS MQIA_RECEIVE_TIMEOUT_MIN

Minimum length of time that a TCP/IP channel waits to receive data from its partner . **MQIA_RECEIVE_TIMEOUT_MIN** is valid on z/OS only.

z/OS MQIA_RECEIVE_TIMEOUT_TYPE

Qualifier to apply to the **ReceiveTimeout** parameter. **MQIA_RECEIVE_TIMEOUT_TYPE** is valid on z/OS only.

MQIA_REMOTE_EVENT

Control attribute for remote events.

z/OS MQIA_SECURITY_CASE

Specifies whether the queue manager supports security profile names either in mixed case, or in uppercase only. **MQIA_SECURITY_CASE** is valid only on z/OS.

z/OS MQIA_SHARED_Q_Q_MGR_NAME

When a queue manager makes an MQOPEN call for a shared queue and the queue manager that is specified in the **ObjectQmgrName** parameter of the MQOPEN call is in the same queue sharing group as the processing queue manager, the SQQMNAME attribute specifies whether the **ObjectQmgrName** is used or whether the processing queue manager opens the shared queue directly. **MQIA_SHARED_Q_Q_MGR_NAME** is valid only on z/OS.

MQIA_SSL_EVENT

Control attribute for TLS events.

MQIA_SSL_FIPS_REQUIRED

Specifies whether only FIPS-certified algorithms are to be used if cryptography is executed in IBM MQ rather than in the cryptographic hardware itself.

MQIA_SSL_RESET_COUNT

TLS key reset count.

z/OS MQIA_SSL_TASKS

TLS tasks. This parameter is valid on z/OS only.

MQIA_START_STOP_EVENT

Control attribute for start stop events.

MQIA_STATISTICS_AUTO_CLUSSDR

Specifies whether statistics data is to be collected for auto-defined cluster-sender channels and, if so, the rate of data collection.

MQIA_STATISTICS_CHANNEL

Specifies whether statistics monitoring data is to be collected for channels and, if so, the rate of data collection.

ALW MQIA_STATISTICS_INTERVAL

Statistics data collection interval. **MQIA_STATISTICS_INTERVAL** is valid only on AIX, Linux, and Windows.

ALW MQIA_STATISTICS_MQI

Specifies whether statistics monitoring data is to be collected for the queue manager. **MQIA_STATISTICS_MQI** is valid only on AIX, Linux, and Windows.

ALW MQIA_STATISTICS_Q

Specifies whether statistics monitoring data is to be collected for queues. **MQIA_STATISTICS_Q** is valid only on AIX, Linux, and Windows.

MQIA_SUITE_B_STRENGTH

Specifies whether Suite B-compliant cryptography is used and the level of strength employed. For more information about Suite B configuration and its effect on TLS channels, see [NSA Suite B Cryptography in IBM MQ](#).

MQIA_SYNCPOINT

Sync point availability.

MQIA_TCP_CHANNELS

Maximum number of channels that can be current, or clients that can be connected, that use the TCP/IP transmission protocol This is valid only on z/OS.

z/OS MQIA_TCP_KEEP_ALIVE

Specifies whether the TCP KEEPALIVE facility is to be used to check whether the other end of a connection is still available. **MQIA_TCP_KEEP_ALIVE** is valid only on z/OS.

z/OS MQIA_TCP_STACK_TYPE

Specifies whether the channel initiator can use only the TCP/IP address space specified in the **TCPName** parameter, or can optionally bind to any selected TCP/IP address. **MQIA_TCP_STACK_TYPE** is valid only on z/OS.

MQIA_TRACE_ROUTE_RECORDING

Specifies whether trace-route information can be recorded and reply messages generated.

MQIA_TREE_LIFE_TIME

The lifetime of non-administrative topics.

MQIA_TRIGGER_INTERVAL

Trigger interval.

MQIA_XR_CAPABILITY

Specifies whether telemetry commands are supported.

MQIACF_Q_MGR_CLUSTER

All clustering attributes. These attributes are:

- **MQCA_CLUSTER_WORKLOAD_DATA**
- **MQCA_CLUSTER_WORKLOAD_EXIT**
- **MQCA_CHANNEL_AUTO_DEF_EXIT**
- **MQCA_REPOSITORY_NAME**
- **MQCA_REPOSITORY_NAMELIST**
- **MQIA_CLUSTER_WORKLOAD_LENGTH**
- **MQIA_CLWL_MRU_CHANNELS**
- **MQIA_CLWL_USEQ**
- **MQIA_MONITORING_AUTO_CLUSSDR**
- **MQCA_Q_MGR_IDENTIFIER**

MQIACF_Q_MGR_DQM

All distributed queuing attributes. These attributes are:

- **MQCA_CERT_LABEL**
- **MQCA_CHANNEL_AUTO_DEF_EXIT**
- **MQCA_DEAD_LETTER_Q_NAME**
- **MQCA_DEF_XMIT_Q_NAME**
- **MQCA_DNS_GROUP**
- **MQCA_IGQ_USER_ID**
- **MQCA_LU_GROUP_NAME**
- **MQCA_LU_NAME**
- **MQCA_LU62_ARM_SUFFIX**
- **MQCA_Q_MGR_IDENTIFIER**
- **MQCA_QSG_CERT_LABEL**
- **MQCA_SSL_CRL_NAMELIST**
- **MQCA_SSL_CRYPTO_HARDWARE**
- **MQCA_SSL_KEY_REPO_PASSWORD**
- **MQCA_SSL_KEY_REPOSITORY**
- **MQCA_TCP_NAME**
- **MQIA_ACTIVE_CHANNELS**

MQIACF_Q_MGR_EVENT

All event control attributes. These attributes are:

- MQIA_AUTHORITY_EVENT
- MQIA_BRIDGE_EVENT
- MQIA_CHANNEL_EVENT
- MQIA_COMMAND_EVENT
- MQIA_CONFIGURATION_EVENT
- MQIA_INHIBIT_EVENT
- MQIA_LOCAL_EVENT
- MQIA_LOGGER_EVENT
- MQIA_PERFORMANCE_EVENT
- MQIA_REMOTE_EVENT
- MQIA_SSL_EVENT
- MQIA_START_STOP_EVENT

MQIACF_Q_MGR_PUBSUB

All queue manager publish/subscribe attributes. These attributes are:

- MQCA_PARENT
- MQIA_PUBSUB_MAXMSG_RETRY_COUNT
- MQIA_PUBSUB_MODE
- MQIA_PUBSUB_NP_MSG
- MQIA_PUBSUB_NP_RESP
- MQIA_PUBSUB_SYNC_PT
- MQIA_TREE_LIFE_TIME

MQIACF_Q_MGR_SYSTEM

All queue manager system attributes. These attributes are:

- MQCA_ALTERATION_DATE
- MQCA_ALTERATION_TIME
- MQCA_COMMAND_INPUT_Q_NAME
- MQCA_CONN_AUTH
- MQCA_CREATION_DATE
- MQCA_CREATION_TIME
- MQCA_CUSTOM

MQCMD_INQUIRE_Q_MGR (Inquire Queue Manager) Response

The response to the Inquire Queue Manager (MQCMD_INQUIRE_Q_MGR) PCF command consists of the response header followed by the *QMgrName* structure and the requested combination of attribute parameter structures.

Always returned:

QMgrName

Returned if requested:

AccountingConnOverride, AccountingInterval, ActivityConnOverride, ActivityRecording, ActivityTrace, AdoptNewMCACheck, AdoptNewMCAType, AdvancedCapability, AlterationDate, AlterationTime, AMQPCapability, AuthorityEvent, z/OS BridgeEvent, CertificateLabel, CertificateValPolicy, z/OS CFConlos, ChannelAutoDef, ChannelAutoDefEvent, ChannelAutoDefExit, ChannelAuthenticationRecords, ChannelEvent, ChannelInitiatorControl, ChannelMonitoring, ChannelStatistics, z/OS ChinitAdapters, z/OS ChinitDispatchers, z/OS ChinitServiceParm, z/OS ChinitTraceAutoStart, z/OS ChinitTraceTableSize, ClusterSenderMonitoringDefault, ClusterSenderStatistics, ClusterWorkloadData, ClusterWorkloadExit, ClusterWorkloadLength, CLWLMRUChannels, CLWLUseQ, CodedCharSetId, CommandEvent, CommandInputQName, CommandLevel, CommandServerControl, ConfigurationEvent, ConnAuth, CreationDate, CreationTime, Custom, DeadLetterQName, DefClusterXmitQueueType, DefXmitQName, DistLists, DNSGroup, z/OS DNSWLM, EncryptionPolicySuiteB, z/OS GroupUR, z/OS IGQPutAuthority, z/OS IGQUserId, ImageInterval, ImagelogLength, ImageRecoverObject, ImageRecoverQueue, ImageSchedule, InhibitEvent, InitialKey, z/OS IntraGroupQueuing, IPAddressVersion, ListenerTimer, LocalEvent, LoggerEvent, z/OS LUGroupName, z/OS LUName, z/OS LU62ARMSuffix, z/OS LU62Channels, z/OS MaxChannels, z/OS MaxActiveChannels, MaxHandles, MaxMsgLength, MaxPriority, MaxPropertiesLength, MaxUncommittedMsgs, MQIAccounting, MQIStatistics, z/OS OutboundPortMax, z/OS OutboundPortMin, Parent, PerformanceEvent, Platform, PubSubClus, PubSubMaxMsgRetryCount, PubSubMode, QmgrDesc, QMgrIdentifier, z/OS QSGCertificateLabel, z/OS QSGName, QueueAccounting, QueueMonitoring, QueueStatistics, ReceiveTimeout, ReceiveTimeoutMin, ReceiveTimeoutType, RemoteEvent, RepositoryName, RepositoryNameList, RevDns, z/OS SecurityCase, SharedQQmgrName, Splcap, SSLCRLNameList, SSLCryptoHardware, SSLEvent, SSLFIPSRequired, SSLKeyRepository, SSLKeyRepositoryPassword, SSLKeyResetCount, SSLTasks, StartStopEvent, StatisticsInterval, SyncPoint, TCPChannels, TCPKeepAlive, TCPName, TCPStackType, TraceRouteRecording, TreeLifeTime, TriggerInterval, Version

Response data

AccountingConnOverride (MQCFIN)

Specifies whether applications can override the settings of the *QueueAccounting* and *MQIAccounting* queue manager parameters (parameter identifier: MQIA_ACCOUNTING_CONN_OVERRIDE).

The value can be any of the following values:

MQMON_DISABLED

Applications cannot override the settings of the **QueueAccounting** and **MQIAccounting** parameters.

MQMON_ENABLED

Applications can override the settings of the **QueueAccounting** and **MQIAccounting** parameters by using the options field of the MQCNO structure of the MQCONN API call.

This parameter applies only to AIX, Linux, and Windows.

AccountingInterval (MQCFIN)

The time interval, in seconds, at which intermediate accounting records are written (parameter identifier: MQIA_ACCOUNTING_INTERVAL).

It is a value in the range 1 through 604 000.

This parameter applies only to AIX, Linux, and Windows.

ActivityConnOverride (MQCFIN)

Specifies whether applications can override the setting of the ACTVTRC value in the queue manager attribute (parameter identifier: MQIA_ACTIVITY_CONN_OVERRIDE).

The value can be any of the following values:

MQMON_DISABLED

Applications cannot override the setting of the ACTVTRC queue manager attribute using the Options field in the MQCNO structure on the MQCONN call. This is the default value.

MQMON_ENABLED

Applications can override the ACTVTRC queue manager attribute using the Options field in the MQCNO structure.

Changes to this value are only effective for connections to the queue manager after the change to the attribute.

This parameter applies only to IBM i, AIX, Linux, and Windows.

ActivityRecording (MQCFIN)

Whether activity reports can be generated (parameter identifier: MQIA_ACTIVITY_RECORDING).

The value can be:

MQRECORDING_DISABLED

Activity reports cannot be generated.

MQRECORDING_MSG

Activity reports can be generated and sent to the destination specified by the originator of the message causing the report.

MQRECORDING_Q

Activity reports can be generated and sent to SYSTEM.ADMIN.ACTIVITY.QUEUE.

Multi ActivityTrace (MQCFIN)

Whether activity reports can be generated (parameter identifier: MQIA_ACTIVITY_TRACE).

The value can be:

MQMON_OFF

Do not collect IBM MQ MQI application activity trace. This is the default value.

If you set the queue manager attribute ACTVCON0 to ENABLED, this value might be overridden for individual connections using the Options field in the MQCNO structure.

MQMON_ON

Collect IBM MQ MQI application activity trace.

Changes to this value are only effective for connections to the queue manager after the change to the attribute.

This parameter applies only to IBM i, AIX, Linux, and Windows.

z/OS **AdoptNewMCACheck (MQCFIN)**

The elements checked to determine whether an MCA must be adopted (restarted) when a new inbound channel is detected. It is adopted if it has the same name as a currently active MCA (parameter identifier: MQIA_ADOPTNEWMCA_CHECK).

The value can be:

MQADOPT_CHECK_Q_MGR_NAME

Check the queue manager name.

MQADOPT_CHECK_NET_ADDR

Check the network address.

MQADOPT_CHECK_ALL

Check the queue manager name and network address.

MQADOPT_CHECK_NONE

Do not check any elements.

This parameter is valid only on z/OS.

z/OS **AdoptNewMCAType (MQCFIL)**

Adoption of orphaned channel instances (parameter identifier: MQIA_ADOPTNEWMCA_TYPE).

The value can be:

MQADOPT_TYPE_NO

Do not adopt orphaned channel instances.

MQADOPT_TYPE_ALL

Adopt all channel types.

This parameter is valid only on z/OS.

MQ Adv. **AdvancedCapability (MQCFIN)**

Whether IBM MQ Advanced extended capabilities are available for a queue manager (parameter identifier: MQIA_ADVANCED_CAPABILITY).

z/OS On z/OS, the queue manager sets the value to be MQCAP_SUPPORTED, only if the value of **QMGRPROD** is ADVANCEDVUE. For any other value of **QMGRPROD**, or if **QMGRPROD** is not set, the queue manager sets the value to MQCAP_NOTSUPPORTED. See [“START QMGR \(start queue manager\) on z/OS” on page 981](#) for more information.

Multi On Multiplatforms, from IBM MQ 9.1, the queue manager sets the value to be MQCAP_SUPPORTED, only if you have installed Managed File Transfer, XR, or Advanced Message Security. If you have not installed Managed File Transfer, XR, or Advanced Message Security, **AdvancedCapability** is set to MQCAP_NOTSUPPORTED. See [IBM MQ components and features](#) for more information.

AlterationDate (MQCFST)

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date, in the form yyyy-mm-dd, on which the information was last altered.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time, in the form hh.mm.ss, at which the information was last altered.

ALW **AMQPCapability (MQCFIN)**

Whether AMQP capabilities are available on a queue manager (parameter identifier: MQIA_AMQP_CAPABILITY).

The value can be one of the following values:

MQCAP_SUPPORTED

AMQP capability has been installed.

MQCAP_NOT_SUPPORTED

AMQP capability has not been installed.

AuthorityEvent (MQCFIN)

Controls whether authorization (Not Authorized) events are generated (parameter identifier: MQIA_AUTHORITY_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

z/OS

BridgeEvent (MQCFIN)

Controls whether IMS bridge events are generated (parameter identifier: MQIA_BRIDGE_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

This parameter is valid only on z/OS.

CertificateLabel (MQCFST)

Certificate label in the key repository for this queue manager to use (parameter identifier: MQCA_CERT_LABEL).

The maximum length of the string is MQ_CERT_LABEL_LENGTH.

ALW

CertificateValPolicy (MQCFIN)

Specifies which TLS certificate validation policy is used to validate digital certificates received from remote partner systems (parameter identifier: MQIA_CERT_VAL_POLICY).

This attribute can be used to control how strictly the certificate chain validation conforms to industry security standards. This parameter is valid only on AIX, Linux, and Windows. For more information, see [Certificate validation policies in IBM MQ](#).

The value can be any of the following values:

MQ_CERT_VAL_POLICY_ANY

Apply each of the certificate validation policies supported by the secure sockets library and accept the certificate chain if any of the policies considers the certificate chain valid. This setting can be used for maximum backwards compatibility with older digital certificates which do not comply with the modern certificate standards.

MQ_CERT_VAL_POLICY_RFC5280

Apply only the RFC 5280 compliant certificate validation policy. This setting provides stricter validation than the ANY setting, but rejects some older digital certificates.

z/OS

CFConlos (MQCFIN)

Specifies the action to be taken when the queue manager loses connectivity to the administration structure, or any CF structures with CFCONLOS set to ASQMGR (parameter identifier: MQIA_QMGR_CFCONLOS).

The value can be:

MQCFCONLOS_TERMINATE

The queue manager terminates when connectivity to CF structures is lost.

MQCFCONLOS_TOLERATE

The queue manager tolerates loss of connectivity to CF structures without terminating.

This parameter is valid only on z/OS.

ChannelAutoDef (MQCFIN)

Controls whether receiver and server-connection channels can be auto-defined (parameter identifier: MQIA_CHANNEL_AUTO_DEF).

The value can be:

MQCHAD_DISABLED

Channel auto-definition disabled.

MQCHAD_ENABLED

Channel auto-definition enabled.

ChannelAutoDefEvent (MQCFIN)

Controls whether channel auto-definition events are generated (parameter identifier: MQIA_CHANNEL_AUTO_DEF_EVENT), when a receiver, server-connection, or cluster-sender channel is auto-defined.

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

ChannelAutoDefExit (MQCFST)

Channel auto-definition exit name (parameter identifier: MQCA_CHANNEL_AUTO_DEF_EXIT).

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

ChannelAuthenticationRecords (MQCFIN)

Controls whether channel authentication records are checked (parameter identifier: MQIA_CHLAUTH_RECORDS).

The value can be:

MQCHLA_DISABLED

Channel authentication records are not checked.

MQCHLA_ENABLED

Channel authentication records are checked.

ChannelEvent (MQCFIN)

Controls whether channel events are generated (parameter identifier: MQIA_CHANNEL_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

MQEVR_EXCEPTION

Reporting of exception channel events enabled.

ChannelInitiatorControl (MQCFIN)

Start the channel initiator during queue manager start (parameter identifier: MQIA_CHINIT_CONTROL). This parameter is not available on z/OS.

The value can be:

MQSVC_CONTROL_MANUAL

The channel initiator is not to be started automatically when the queue manager starts.

MQSVC_CONTROL_Q_MGR

The channel initiator is to be started automatically when the queue manager starts.

ChannelMonitoring (MQCFIN)

Default setting for online monitoring for channels (parameter identifier: MQIA_MONITORING_CHANNEL).

If the *ChannelMonitoring* channel attribute is set to MQMON_Q_MGR , this attribute specifies the value which is assumed by the channel. The value can be any of the following values:

MQMON_OFF

Online monitoring data collection is turned off.

MQMON_NONE

Online monitoring data collection is turned off for channels regardless of the setting of their **ChannelMonitoring** attribute.

MQMON_LOW

Online monitoring data collection is turned on, with a low ratio of data collection.

MQMON_MEDIUM

Online monitoring data collection is turned on, with a moderate ratio of data collection.

MQMON_HIGH

Online monitoring data collection is turned on, with a high ratio of data collection.

▶ **z/OS ChannelStatistics (MQCFIN)**

Specifies whether statistics data is to be collected for channels (parameter identifier: MQIA_STATISTICS_CHANNEL).

The value can be:

MQMON_OFF

Statistics data collection is turned off.

MQMON_LOW

Statistics data collection is turned on, with a low ratio of data collection.

MQMON_MEDIUM

Statistics data collection is turned on, with a moderate ratio of data collection.

MQMON_HIGH

Statistics data collection is turned on, with a high ratio of data collection.

On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

This parameter is valid only on z/OS.

▶ **z/OS ChinitAdapters (MQCFIN)**

Number of adapter subtasks (parameter identifier: MQIA_CHINIT_ADAPTERS).

The number of adapter subtasks to use for processing IBM MQ calls. This parameter is valid only on z/OS.

▶ **z/OS ChinitDispatchers (MQCFIN)**

Number of dispatchers (parameter identifier: MQIA_CHINIT_DISPATCHERS).

The number of dispatchers to use for the channel initiator. This parameter is valid only on z/OS.

▶ **z/OS ChinitServiceParm (MQCFST)**

Reserved for use by IBM (parameter identifier: MQCA_CHINIT_SERVICE_PARM).

► **z/OS** **ChinitTraceAutoStart (MQCFIN)**

Specifies whether the channel initiator trace must start automatically (parameter identifier: MQIA_CHINIT_TRACE_AUTO_START).

The value can be:

MQTRAXSTR_YES

Channel initiator trace is to start automatically.

MQTRAXSTR_NO

Channel initiator trace is not to start automatically.

This parameter is valid only on z/OS.

► **z/OS** **ChinitTraceTableSize (MQCFIN)**

The size, in megabytes, of the trace data space of the channel initiator (parameter identifier: MQIA_CHINIT_TRACE_TABLE_SIZE).

This parameter is valid only on z/OS.

ClusterSenderMonitoringDefault (MQCFIN)

Setting for online monitoring for automatically defined cluster-sender channels (parameter identifier: MQIA_MONITORING_AUTO_CLUSSDR).

The value can be:

MQMON_Q_MGR

Collection of online monitoring data is inherited from the setting of the queue manager's **ChannelMonitoring** parameter.

MQMON_OFF

Monitoring for the channel is disabled.

MQMON_LOW

Specifies a low rate of data collection with a minimal effect on system performance unless **ChannelMonitoring** for the queue manager is MQMON_NONE. The data collected is not likely to be the most current.

MQMON_MEDIUM

Specifies a moderate rate of data collection with limited effect on system performance unless **ChannelMonitoring** for the queue manager is MQMON_NONE.

MQMON_HIGH

Specifies a high rate of data collection with a likely effect on system performance unless **ChannelMonitoring** for the queue manager is MQMON_NONE. The data collected is the most current available.

► **z/OS** On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

ClusterSenderStatistics (MQCFIN)

Specifies whether statistics data is to be collected for auto-defined cluster-sender channels (parameter identifier: MQIA_STATISTICS_AUTO_CLUSSDR).

The value can be:

MQMON_Q_MGR

Collection of statistics data is inherited from the setting of the queue manager's **ChannelStatistics** parameter.

MQMON_OFF

Statistics data collection for the channel is disabled.

MQMON_LOW

Specifies a low rate of data collection with a minimal effect on system performance.

MQMON_MEDIUM

Specifies a moderate rate of data collection.

MQMON_HIGH

Specifies a high rate of data collection.

 On z/OS systems, enabling this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results. This parameter must be enabled in order to collect channel accounting records.

ClusterWorkLoadData (MQCFST)

Data passed to the cluster workload exit (parameter identifier: MQCA_CLUSTER_WORKLOAD_DATA).

ClusterWorkLoadExit (MQCFST)

Name of the cluster workload exit (parameter identifier: MQCA_CLUSTER_WORKLOAD_EXIT).

The maximum length of the exit name depends on the environment in which the exit is running. MQ_EXIT_NAME_LENGTH gives the maximum length for the environment in which your application is running. MQ_MAX_EXIT_NAME_LENGTH gives the maximum for all supported environments.

ClusterWorkLoadLength (MQCFIN)

Cluster workload length (parameter identifier: MQIA_CLUSTER_WORKLOAD_LENGTH).

The maximum length of the message passed to the cluster workload exit.

CLWLMRUChannels (MQCFIN)

Cluster workload most recently used (MRU) channels (parameter identifier: MQIA_CLWL_MRU_CHANNELS).

The maximum number of active most recently used outbound channels.

CLWLUseQ (MQCFIN)

Use of remote queue (parameter identifier: MQIA_CLWL_USEQ).

Specifies whether a cluster queue manager is to use remote puts to other queues defined in other queue managers within the cluster during workload management.

The value can be any of the following values:

MQCLWL_USEQ_ANY

Use remote queues.

MQCLWL_USEQ_LOCAL

Do not use remote queues.

CodedCharSetId (MQCFIN)

Coded character set identifier (parameter identifier: MQIA_CODED_CHAR_SET_ID).

CommandEvent (MQCFIN)

Controls whether command events are generated (parameter identifier: MQIA_COMMAND_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

MQEVR_NODISPLAY

Event reporting enabled for all successful commands except Inquire commands.

CommandInputQName (MQCFST)

Command input queue name (parameter identifier: MQCA_COMMAND_INPUT_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

CommandLevel (MQCFIN)

Command level supported by queue manager (parameter identifier: MQIA_COMMAND_LEVEL).

The value can be:

MQCMDL_LEVEL_800

Level 800 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 8.0
- IBM MQ for IBM i 8.0
- IBM MQ for Linux 8.0
- IBM MQ for Windows 8.0
- IBM MQ for z/OS 8.0

MQCMDL_LEVEL_801

Level 801 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 8.0.0 Fix Pack 2
- IBM MQ for HP-UX 8.0.0 Fix Pack 2
- IBM MQ for IBM i 8.0.0 Fix Pack 2
- IBM MQ for Linux 8.0.0 Fix Pack 2

MQCMDL_LEVEL_802

Level 802 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 8.0.0 Fix Pack 3
- IBM MQ for IBM i 8.0.0 Fix Pack 3
- IBM MQ for Linux 8.0.0 Fix Pack 3
- IBM MQ for Windows 8.0.0 Fix Pack 3

MQCMDL_LEVEL_900

Level 900 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.0
- IBM MQ for IBM i 9.0
- IBM MQ for Linux 9.0
- IBM MQ for Windows 9.0
- IBM MQ for z/OS 9.0

MQCMDL_LEVEL_901

Level 901 of system control commands.

This value is returned by the following versions:

- IBM MQ for Linux 9.0.1
- IBM MQ for Windows 9.0.1
- IBM MQ for z/OS 9.0.1

MQCMDL_LEVEL_902

Level 902 of system control commands.

This value is returned by the following versions:

- IBM MQ for Linux 9.0.2

- IBM MQ for Windows 9.0.2
- IBM MQ for z/OS 9.0.2

MQCMDL_LEVEL_903

Level 903 of system control commands.

This value is returned by the following versions:

- IBM MQ for Linux 9.0.3
- IBM MQ for Windows 9.0.3
- IBM MQ for z/OS 9.0.3

MQCMDL_LEVEL_904

Level 904 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.0.4
- IBM MQ for Linux 9.0.4
- IBM MQ for Windows 9.0.4
- IBM MQ for z/OS 9.0.4

MQCMDL_LEVEL_905

Level 905 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.0.5
- IBM MQ for Linux 9.0.5
- IBM MQ for Windows 9.0.5
- IBM MQ for z/OS 9.0.5

MQCMDL_LEVEL_910

Level 910 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.1
- IBM MQ for IBM i 9.1
- IBM MQ for Linux 9.1
- IBM MQ for Windows 9.1
- IBM MQ for z/OS 9.1

MQCMDL_LEVEL_911

Level 911 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.1.1
- IBM MQ for Linux 9.1.1
- IBM MQ for Windows 9.1.1
- IBM MQ for z/OS 9.1.1

MQCMDL_LEVEL_912

Level 912 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.1.2
- IBM MQ for Linux 9.1.2
- IBM MQ for Windows 9.1.2

- IBM MQ for z/OS 9.1.2

MQCMDL_LEVEL_913

Level 913 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.1.3
- IBM MQ for Linux 9.1.3
- IBM MQ for Windows 9.1.3
- IBM MQ for z/OS 9.1.3

MQCMDL_LEVEL_914

Level 914 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.1.4
- IBM MQ for Linux 9.1.4
- IBM MQ for Windows 9.1.4
- IBM MQ for z/OS 9.1.4

MQCMDL_LEVEL_915

Level 915 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.1.5
- IBM MQ for Linux 9.1.5
- IBM MQ for Windows 9.1.5
- IBM MQ for z/OS 9.1.5

MQCMDL_LEVEL_910

Level 910 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.1
- IBM MQ for IBM i 9.1
- IBM MQ for Linux 9.1
- IBM MQ for Windows 9.1
- IBM MQ for z/OS 9.1

MQCMDL_LEVEL_920

Level 920 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.2
- IBM MQ for IBM i 9.2
- IBM MQ for Linux 9.2
- IBM MQ for Windows 9.2
- IBM MQ for z/OS 9.2

MQCMDL_LEVEL_921

Level 921 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.2.1
- IBM MQ for Linux 9.2.1

- IBM MQ for Windows 9.2.1
- IBM MQ for z/OS 9.2.1

MQCMDL_LEVEL_922

Level 922 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.2.2
- IBM MQ for Linux 9.2.2
- IBM MQ for Windows 9.2.2
- IBM MQ for z/OS 9.2.2

MQCMDL_LEVEL_923

Level 923 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.2.3
- IBM MQ for Linux 9.2.3
- IBM MQ for Windows 9.2.3
- IBM MQ for z/OS 9.2.3

MQCMDL_LEVEL_924

Level 924 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.2.4
- IBM MQ for Linux 9.2.4
- IBM MQ for Windows 9.2.4
- IBM MQ for z/OS 9.2.4

MQCMDL_LEVEL_925

Level 925 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.2.5
- IBM MQ for Linux 9.2.5
- IBM MQ for Windows 9.2.5
- IBM MQ for z/OS 9.2.5

MQCMDL_LEVEL_930

Level 930 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.3
- IBM MQ for IBM i 9.3
- IBM MQ for Linux 9.3
- IBM MQ for Windows 9.3
- IBM MQ for z/OS 9.3

MQCMDL_LEVEL_931

Level 931 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.3.1
- IBM MQ for Linux 9.3.1

- IBM MQ for Windows 9.3.1
- IBM MQ for z/OS 9.3.1

MQCMDL_LEVEL_932

Level 932 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.3.2
- IBM MQ for Linux 9.3.2
- IBM MQ for Windows 9.3.2
- IBM MQ for z/OS 9.3.2

MQCMDL_LEVEL_933

Level 933 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.3.3
- IBM MQ for Linux 9.3.3
- IBM MQ for Windows 9.3.3
- IBM MQ for z/OS 9.3.3

MQCMDL_LEVEL_934

Level 934 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.3.4
- IBM MQ for Linux 9.3.4
- IBM MQ for Windows 9.3.4
- IBM MQ for z/OS 9.3.4

MQCMDL_LEVEL_935

Level 935 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.3.5
- IBM MQ for Linux 9.3.5
- IBM MQ for Windows 9.3.5
- IBM MQ for z/OS 9.3.5

MQCMDL_LEVEL_940

Level 940 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX 9.4.0
- IBM MQ for Linux 9.4.0
- IBM MQ for Windows 9.4.0
- IBM MQ for z/OS 9.4.0

The set of system control commands that corresponds to a particular value of the **CommandLevel** attribute varies. It varies according to the value of the **Platform** attribute; both must be used to decide which system control commands are supported.

Note: Support for the HP-UX operating system for all IBM MQ components, including server and clients, is removed from IBM MQ 9.1.0.

CommandServerControl (MQCFIN)

Start the command server during queue manager start (parameter identifier: MQIA_CMD_SERVER_CONTROL). This parameter is not available on z/OS.

The value can be:

MQSVC_CONTROL_MANUAL

The command server is not to be started automatically when the queue manager starts.

MQSVC_CONTROL_Q_MGR

The command server is to be started automatically when the queue manager starts.

ConfigurationEvent (MQCFIN)

Controls whether configuration events are generated (parameter identifier: MQIA_CONFIGURATION_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

ConnAuth (MQCFST)

Name of the authentication information object that is used to provide the location of user ID and password authentication (parameter identifier: MQCA_CONN_AUTH).

CreationDate (MQCFST)

Creation date, in the form yyyy-mm-dd (parameter identifier: MQCA_CREATION_DATE).

The maximum length of the string is MQ_CREATION_DATE_LENGTH.

CreationTime (MQCFST)

Creation time, in the form hh.mm.ss (parameter identifier: MQCA_CREATION_TIME).

The maximum length of the string is MQ_CREATION_TIME_LENGTH.

Custom (MQCFST)

Custom attribute for new features (parameter identifier: MQCA_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes are introduced. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME(VALUE).

This description is updated when features using this attribute are introduced.

DeadLetterQName (MQCFST)

Dead letter (undelivered message) queue name (parameter identifier: MQCA_DEAD_LETTER_Q_NAME).

Specifies the name of the local queue that is to be used for undelivered messages. Messages are put on this queue if they cannot be routed to their correct destination.

The maximum length of the string is MQ_Q_NAME_LENGTH.

DefClusterXmitQueueType (MQCFIN)

The DefClusterXmitQueueType attribute controls which transmission queue is selected by default by cluster-sender channels to get messages from, to send the messages to cluster-receiver channels. (Parameter identifier: MQIA_DEF_CLUSTER_XMIT_Q_TYPE.)

The values of **DefClusterXmitQueueType** are MQCLXQ_SCTQ or MQCLXQ_CHANNEL.

MQCLXQ_SCTQ

All cluster-sender channels send messages from `SYSTEM.CLUSTER.TRANSMIT.QUEUE`. The `correlID` of messages placed on the transmission queue identifies which cluster-sender channel the message is destined for.

SCTQ is set when a queue manager is defined.

MQCLXQ_CHANNEL

Each cluster-sender channel sends messages from a different transmission queue. Each transmission queue is created as a permanent dynamic queue from the model queue `SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE`.

DefXmitQName (MQCFST)

Default transmission queue name (parameter identifier: `MQCA_DEF_XMIT_Q_NAME`).

The default transmission queue is used for the transmission of messages to remote queue managers. It is used if there is no other indication of which transmission queue to use.

The maximum length of the string is `MQ_Q_NAME_LENGTH`.

DistLists (MQCFIN)

Distribution list support (parameter identifier: `MQIA_DIST_LISTS`).

The value can be:

MQDL_SUPPORTED

Distribution lists supported.

MQDL_NOT_SUPPORTED

Distribution lists not supported.

z/OS DNSGroup (MQCFST)

DNS group name (parameter identifier: `MQCA_DNS_GROUP`).

This parameter is no longer used. See [z/OS: WLM/DNS no longer supported](#).

This parameter is valid only on z/OS.

z/OS DNSWLM (MQCFIN)

WLM/DNS Control: (parameter identifier: `MQIA_DNS_WLM`).

This parameter is no longer used. See [z/OS: WLM/DNS no longer supported](#).

The value can be any of the following values:

MQDNSWLM_NO

`MQDNSWLM_NO` is the only value supported by the queue manager.

This parameter is valid only on z/OS.

EncryptionPolicySuiteB (MQCFIL)

Specifies whether Suite B-compliant cryptography is used and what level of strength is employed (parameter identifier: `MQIA_SUITE_B_STRENGTH`). For more information about Suite B configuration and its effect on TLS channels, see [NSA Suite B Cryptography in IBM MQ](#).

The value can be one, or more, of:

MQ_SUITE_B_NONE

Suite B-compliant cryptography is not used.

MQ_SUITE_B_128_BIT

Suite B 128-bit strength security is used.

MQ_SUITE_B_192_BIT

Suite B 192-bit strength security is used.

MQ_SUITE_B_128_BIT, MQ_SUITE_B_192_BIT

Suite B 128-bit and Suite B 192-bit strength security is used.

z/OS ExpiryInterval (MQCFIN)

Interval between scans for expired messages (parameter identifier: MQIA_EXPIRY_INTERVAL).

Specifies the frequency with which the queue manager scans the queues looking for expired messages. This parameter is a time interval in seconds in the range 1 through 99 999 999, or the following special value:

MQEXPI_OFF

No scans for expired messages.

This parameter is valid only on z/OS.

z/OS GroupUR (MQCFIN)

Identifies whether XA client applications can establish transactions with a GROUP unit of recovery disposition.

The value can be:

MQGUR_DISABLED

XA client applications must connect using a queue manager name.

MQGUR_ENABLED

XA client applications can establish transactions with a group unit of recovery disposition by specifying a queue sharing group name when they connect.

This parameter is valid only on z/OS.

z/OS IGQPutAuthority (MQCFIN)

Type of authority checking used by the intra-group queuing agent (parameter identifier: MQIA_IGQ_PUT_AUTHORITY).

The attribute indicates the type of authority checking that is performed by the local intra-group queuing agent (IGQ agent). The checking is performed when the IGQ agent removes a message from the shared transmission queue and places the message on a local queue. The value can be any of the following values:

MQIGQPA_DEFAULT

Default user identifier is used.

MQIGQPA_CONTEXT

Context user identifier is used.

MQIGQPA_ONLY_IGQ

Only the IGQ user identifier is used.

MQIGQPA_ALTERNATE_OR_IGQ

Alternate user identifier or IGQ-agent user identifier is used.

This parameter is valid only on z/OS.

z/OS IGQUserId (MQCFST)

User identifier used by the intra-group queuing agent (parameter identifier: MQCA_IGQ_USER_ID).

The maximum length of the string is MQ_USER_ID_LENGTH. This parameter is valid only on z/OS.

ImageInterval (MQCFIN)

The target frequency with which the queue manager automatically writes media images (parameter identifier: MQIA_MEDIA_IMAGE_INTERVAL). This parameter is not valid on z/OS.

The value can be:

The time interval, at which the queue manager automatically writes media images.

MQMEDIMGINTVL_OFF

Automatic media images are not written on a time interval basis.

ImageLogLength (MQCFIN)

The target size of the recovery log (parameter identifier: MQIA_MEDIA_IMAGE_LOG_LENGTH). This parameter is not valid on z/OS.

The value can be:

The size of the recovery log.

MQMEDIMGLOGLN_OFF

Automatic media images are not written.

ImageRecoverObject (MQCFST)

Specifies the recoverable objects from a media image, if linear logging is being used (parameter identifier: MQIA_MEDIA_IMAGE_RECOVER_OBJ). This parameter is not valid on z/OS.

The value can be:

MQIMGRCOV_NO

Automatic media images, if enabled, are not written for these objects.

MQIMGRCOV_YES

These objects are recoverable.

ImageRecoverQueue (MQCFST)

Displays the default **ImageRecoverQueue** attribute for local and permanent dynamic queue objects, when used with this parameter (parameter identifier: MQIA_MEDIA_IMAGE_RECOVER_Q). This parameter is not valid on z/OS.

The value can be:

MQIMGRCOV_NO

The **ImageRecoverQueue** attribute for local and permanent dynamic queue objects is set to MQIMGRCOV_NO .

MQIMGRCOV_YES

The **ImageRecoverQueue** attribute for local and permanent dynamic queue objects is set to MQIMGRCOV_YES .

ImageSchedule (MQCFST)

Whether the queue manager automatically writes media images (parameter identifier: MQIA_MEDIA_IMAGE_SCHEDULING). This parameter is not valid on z/OS.

The value can be:

MQMEDIMGSCHEM_AUTO

The queue manager automatically writes a media image for an object.

MQMEDIMGSCHEM_MANUAL

Automatic media images are not written.

InhibitEvent (MQCFIN)

Controls whether inhibit (Inhibit Get and Inhibit Put) events are generated (parameter identifier: MQIA_INHIBIT_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

Multi InitialKey (MQCFST)

The initial key for the password protection system (parameter identifier: MQCA_INITIAL_KEY).

The length of the string is MQ_INITIAL_KEY_LENGTH. If this attribute is set to a custom value, the value is returned as *****.

A blank string is returned when the default initial key is in use.

This parameter is valid only on IBM MQ for Multiplatforms.

z/OS IntraGroupQueuing (MQCFIN)

Specifies whether intra-group queuing is used (parameter identifier: MQIA_INTRA_GROUP_QUEUING).

The value can be:

MQIGQ_DISABLED

Intra-group queuing is disabled. All messages destined for other queue managers in the queue sharing group are transmitted using conventional channels.

MQIGQ_ENABLED

Intra-group queuing is enabled.

This parameter is valid only on z/OS.

IPAddressVersion (MQCFIN)

IP address version selector (parameter identifier: MQIA_IP_ADDRESS_VERSION).

Specifies which IP address version, either IPv4 or IPv6, is used. The value can be:

MQIPADDR_IPV4

IPv4 is used.

MQIPADDR_IPV6

IPv6 is used.

ListenerTimer (MQCFIN)

Listener restart interval (parameter identifier: MQIA_LISTENER_TIMER).

The time interval, in seconds, between attempts by IBM MQ to restart the listener after an APPC or TCP/IP failure.

z/OS LocalEvent (MQCFIN)

Controls whether local error events are generated (parameter identifier: MQIA_LOCAL_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

This parameter is valid only on z/OS.

LoggerEvent (MQCFIN)

Controls whether recovery log events are generated (parameter identifier: MQIA_LOGGER_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

This parameter applies only to AIX, Linux, and Windows.

z/OS LUGroupName (MQCFST)

Generic LU name for the LU 6.2 listener (parameter identifier: MQCA_LU_GROUP_NAME).

The generic LU name to be used by the LU 6.2 listener that handles inbound transmissions for the queue sharing group. This parameter is valid only on z/OS.

z/OS LUName (MQCFST)

LU name to use for outbound LU 6.2 transmissions (parameter identifier: MQCA_LU_NAME).

The name of the LU to use for outbound LU 6.2 transmissions. This parameter is valid only on z/OS.

z/OS LU62ARMSuffix (MQCFST)

APPCPM suffix (parameter identifier: MQCA_LU62_ARM_SUFFIX).

The suffix of the APPCPM member of SYS1.PARMLIB. This suffix nominates the LUADD for this channel initiator. This parameter is valid only on z/OS.

z/OS LU62Channels (MQCFIN)

Maximum number of LU 6.2 channels (parameter identifier: MQIA_LU62_CHANNELS).

The maximum number of channels that can be current, or clients that can be connected, that use the LU 6.2 transmission protocol. This parameter is valid only on z/OS.

z/OS MaxActiveChannels (MQCFIN)

Maximum number of channels (parameter identifier: MQIA_ACTIVE_CHANNELS).

The maximum number of channels that can be active at any time. This parameter is valid only on z/OS.

z/OS MaxChannels (MQCFIN)

Maximum number of current channels (parameter identifier: MQIA_MAX_CHANNELS).

The maximum number of channels that can be current (including server-connection channels with connected clients). This parameter is valid only on z/OS.

MaxHandles (MQCFIN)

Maximum number of handles (parameter identifier: MQIA_MAX_HANDLES).

Specifies the maximum number of handles that any one connection can have open at the same time.

MaxMsgLength (MQCFIN)

Maximum message length (parameter identifier: MQIA_MAX_MSG_LENGTH).

MaxPriority (MQCFIN)

Maximum priority (parameter identifier: MQIA_MAX_PRIORITY).

MaxPropertiesLength (MQCFIN)

Maximum properties length (parameter identifier: MQIA_MAX_PROPERTIES_LENGTH).

MaxUncommittedMsgs (MQCFIN)

Maximum number of uncommitted messages within a unit of work (parameter identifier: MQIA_MAX_UNCOMMITTED_MSGS).

This number is the sum of the following number of messages under any one sync point. :

- The number of messages that can be retrieved, plus
- The number of messages that can be put on a queue, plus
- Any trigger messages generated within this unit of work

The limit does not apply to messages that are retrieved or put outside sync point.

MQIAccounting (MQCFIN)

Specifies whether accounting information for MQI data is to be collected (parameter identifier: MQIA_ACCOUNTING_MQI).

The value can be:

MQMON_OFF

MQI accounting data collection is disabled.

MQMON_ON

MQI accounting data collection is enabled.

This parameter applies only to AIX, Linux, and Windows.

MQIStatistics (MQCFIN)

Specifies whether statistics monitoring data is to be collected for the queue manager (parameter identifier: MQIA_STATISTICS_MQI).

The value can be:

MQMON_OFF

Data collection for MQI statistics is disabled. MQMON_OFF is the initial default value of the queue manager.

MQMON_ON

Data collection for MQI statistics is enabled.

This parameter applies only to AIX, Linux, and Windows.

MsgMarkBrowseInterval (MQCFIN)

Mark-browse interval (parameter identifier: MQIA_MSG_MARK_BROWSE_INTERVAL).

The time interval in milliseconds after which the queue manager can automatically unmark messages.

Attention: This value should not be below the default of 5000.

z/OS OutboundPortMax (MQCFIN)

The maximum value in the range for the binding of outgoing channels (parameter identifier: MQIA_OUTBOUND_PORT_MAX).

The maximum value in the range of port numbers to be used when binding outgoing channels. This parameter is valid only on z/OS.

z/OS OutboundPortMin (MQCFIN)

The minimum value in the range for the binding of outgoing channels (parameter identifier: MQIA_OUTBOUND_PORT_MIN).

The minimum value in the range of port numbers to be used when binding outgoing channels. This parameter is valid only on z/OS.

Parent (MQCFST)

The name of the hierarchically connected queue manager nominated as the parent of this queue manager (parameter identifier: MQCA_PARENT).

PerformanceEvent (MQCFIN)

Controls whether performance-related events are generated (parameter identifier: MQIA_PERFORMANCE_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

Platform (MQCFIN)

Platform on which the queue manager resides (parameter identifier: MQIA_PLATFORM).

The value can be:

MQPL_AIX

AIX (same value as MQPL_UNIX).

MQPL_APPLIANCE

IBM MQ Appliance

MQPL_OS400

IBM i.

MQPL_UNIX

UNIX.

MQPL_WINDOWS_NT

Windows.

MQPL_ZOS

z/OS

PubSubClus (MQCFIN)

Controls whether the queue manager participates in publish/subscribe clustering (parameter identifier: MQIA_PUBSUB_CLUSTER).

The value can be:

MQPSCLUS_ENABLED

The creating or receipt of clustered topic definitions and cluster subscriptions is permitted.

Note: The introduction of a clustered topic into a large IBM MQ cluster can cause a degradation in performance. This degradation occurs because all partial repositories are notified of all the other members of the cluster. Unexpected subscriptions might be created at all other nodes; for example, where `proxysub(FORCE)` is specified. Large numbers of channels might be started from a queue manager; for example, on resync after a queue manager failure.

MQPSCLUS_DISABLED

The creating or receipt of clustered topic definitions and cluster subscriptions is inhibited. The creations or receipts are recorded as warnings in the queue manager error logs.

PubSubMaxMsgRetryCount (MQCFIN)

The number of attempts to reprocess a failed command message under sync point (parameter identifier: MQIA_PUBSUB_MAXMSG_RETRY_COUNT).

PubSubMode (MQCFIN)

Specifies whether the publish/subscribe engine and the queued publish/subscribe interface are running. The publish/subscribe engine enables applications to publish or subscribe by using the application programming interface. The publish/subscribe interface monitors the queues used the queued publish/subscribe interface (parameter identifier: MQIA_PUBSUB_MODE).

The values can be as follows:

MQPSM_COMPAT

The publish/subscribe engine is running. It is therefore possible to publish or subscribe by using the application programming interface. The queued publish/subscribe interface is not running. Therefore any message that is put to the queues that are monitored by the queued publish/subscribe interface is not acted on. MQPSM_COMPAT is used for compatibility with versions of IBM Integration Bus, (formerly known as WebSphere Message Broker) prior to version 7 that use this queue manager.

MQPSM_DISABLED

The publish/subscribe engine and the queued publish/subscribe interface are not running. It is therefore not possible to publish or subscribe by using the application programming interface. Any publish/subscribe messages that are put to the queues that are monitored by the queued publish/subscribe interface are not acted on.

MQPSM_ENABLED

The publish/subscribe engine and the queued publish/subscribe interface are running. It is therefore possible to publish or subscribe by using the application programming interface and the queues that are being monitored by the queued publish/subscribe interface. MQPSM_ENABLED is the initial default value of the queue manager.

PubSubNPInputMsg (MQCFIN)

Specifies whether to discard or keep an undelivered input message (parameter identifier: MQIA_PUBSUB_NP_MSG).

The values can be as follows:

MQUNDELIVERED_DISCARD

Non-persistent input messages can be discarded if they cannot be processed. MQUNDELIVERED_DISCARD is the default value.

MQUNDELIVERED_KEEP

Non-persistent input messages are not discarded if they cannot be processed. The queued publish/subscribe interface continues to try the process again at appropriate intervals. It does not continue processing subsequent messages.

PubSubNPResponse (MQCFIN)

Controls the behavior of undelivered response messages (parameter identifier: MQIA_PUBSUB_NP_RESP).

The values can be as follows:

MQUNDELIVERED_NORMAL

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If they cannot be placed on the dead letter queue, they are discarded.

MQUNDELIVERED_SAFE

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If the response cannot be sent and cannot be placed on the dead letter queue the queued publish/subscribe interface rolls back the current operation. The operation is tried again at appropriate intervals and does not continue processing subsequent messages.

MQUNDELIVERED_DISCARD

Non-persistent responses that cannot be placed on the reply queue are discarded. MQUNDELIVERED_DISCARD is the default value for new queue managers.

MQUNDELIVERED_KEEP

Non-persistent responses are not placed on the dead letter queue or discarded. Instead, the queued publish/subscribe interface backs out the current operation and then tries it again at appropriate intervals.

PubSubSyncPoint (MQCFIN)

Specifies whether only persistent messages or all messages are processed under sync point (parameter identifier: MQIA_PUBSUB_SYNC_PT).

The values can be as follows:

MQSYNCPOINT_IFPER

This makes the queued publish/subscribe interface receive non-persistent messages outside sync point. If the daemon receives a publication outside sync point, the daemon forwards the publication to subscribers known to it outside sync point. MQSYNCPOINT_IFPER is the default value.

MQSYNCPOINT_YES

MQSYNCPOINT_YES makes the queued publish/subscribe interface receive all messages under sync point.

QMGrDesc (MQCFST)

Queue manager description (parameter identifier: MQCA_Q_MGR_DESC).

This parameter is text that briefly describes the object.

The maximum length of the string is MQ_Q_MGR_DESC_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the queue manager on which the command is executing. Using this character set ensures that the text is translated correctly.

QMGrIdentifier (MQCFST)

Queue manager identifier (parameter identifier: MQCA_Q_MGR_IDENTIFIER).

The unique identifier of the queue manager.

QMGrName (MQCFST)

Name of local queue manager (parameter identifier: MQCA_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

z/OS **QSGCertificateLabel (MQCFST)**

Certificate label in the key repository for this queue sharing group to use (parameter identifier: MQCA_QSG_CERT_LABEL).

The maximum length of the string is MQ_QSG_CERT_LABEL_LENGTH. This parameter is valid only on z/OS.

z/OS **QSGName (MQCFST)**

Queue sharing group name (parameter identifier: MQCA_QSG_NAME).

The maximum length of the string is MQ_QSG_NAME_LENGTH. This parameter is valid only on z/OS.

QueueAccounting (MQCFIN)

Collection of accounting (thread-level and queue-level accounting) data for queues (parameter identifier: MQIA_ACCOUNTING_Q).

The value can be:

MQMON_NONE

Accounting data collection for queues is disabled.

MQMON_OFF

Accounting data collection is disabled for queues specifying a value of MQMON_Q_MGR in the **QueueAccounting** parameter.

MQMON_ON

Accounting data collection is enabled for queues specifying a value of MQMON_Q_MGR in the **QueueAccounting** parameter.

QueueMonitoring (MQCFIN)

Default setting for online monitoring for queues (parameter identifier: MQIA_MONITORING_Q).

If the **QueueMonitoring** queue attribute is set to MQMON_Q_MGR, this attribute specifies the value which is assumed by the channel. The value can be any of the following values:

MQMON_OFF

Online monitoring data collection is turned off.

MQMON_NONE

Online monitoring data collection is turned off for queues regardless of the setting of their **QueueMonitoring** attribute.

MQMON_LOW

Online monitoring data collection is turned on, with a low ratio of data collection.

MQMON_MEDIUM

Online monitoring data collection is turned on, with a moderate ratio of data collection.

MQMON_HIGH

Online monitoring data collection is turned on, with a high ratio of data collection.

Multi **QueueStatistics (MQCFIN)**

Specifies whether statistics data is to be collected for queues (parameter identifier: MQIA_STATISTICS_Q).

The value can be:

MQMON_NONE

Statistics data collection is turned off for queues regardless of the setting of their **QueueStatistics** parameter.

MQMON_OFF

Statistics data collection is turned off for queues specifying a value of MQMON_Q_MGR in their **QueueStatistics** parameter.

MQMON_ON

Statistics data collection is turned on for queues specifying a value of MQMON_Q_MGR in their **QueueStatistics** parameter.

This parameter is valid only on Multiplatforms.

z/OS ReceiveTimeout (MQCFIN)

How long a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA_RECEIVE_TIMEOUT).

The length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state.

This parameter is valid only on z/OS.

z/OS ReceiveTimeoutMin (MQCFIN)

The minimum length of time that a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA_RECEIVE_TIMEOUT_MIN).

The minimum length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state. This parameter is valid only on z/OS.

z/OS ReceiveTimeoutType (MQCFIN)

The qualifier to apply to *ReceiveTimeout* (parameter identifier: MQIA_RECEIVE_TIMEOUT_TYPE).

The qualifier to apply to *ReceiveTimeoutType* to calculate how long a TCP/IP channel waits to receive data from its partner. The wait includes heartbeats. If the wait interval expires the channel returns to the inactive state. This parameter is valid only on z/OS.

The value can be:

MQRCVTIME_MULTIPLY

The *ReceiveTimeout* value is a multiplier to be applied to the negotiated value of *HeartbeatInterval* to determine how long a channel waits.

MQRCVTIME_ADD

ReceiveTimeout is a value, in seconds, to be added to the negotiated value of *HeartbeatInterval* to determine how long a channel waits.

MQRCVTIME_EQUAL

ReceiveTimeout is a value, in seconds, representing how long a channel waits.

RemoteEvent (MQCFIN)

Controls whether remote error events are generated (parameter identifier: MQIA_REMOTE_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

RepositoryName (MQCFST)

Repository name (parameter identifier: MQCA_REPOSITORY_NAME).

The name of a cluster for which this queue manager is to provide a repository service.

RepositoryNamelist (MQCFST)

Repository name list (parameter identifier: MQCA_REPOSITORY_NAMELIST).

The name of a list of clusters for which this queue manager is to provide a repository service.

RevDns (MQCFIN)

Whether reverse lookup of the host name from a Domain Name Server is carried out. (parameter identifier: MQIA_REVERSE_DNS_LOOKUP).

This attribute has an effect only on channels using a transport type (TRPTYPE) of TCP.

The value can be:

MQRDNS_DISABLED

DNS host names are not reverse looked-up for the IP addresses of inbound channels. With this setting any CHLAUTH rules using host names are not matched.

MQRDNS_ENABLED

DNS host names are reverse looked-up for the IP addresses of inbound channels when this information is required. This setting is required for matching against CHLAUTH rules that contain host names, and for writing out error messages.

z/OS SecurityCase (MQCFIN)

Security case supported (parameter identifier: MQIA_SECURITY_CASE).

Specifies whether the queue manager supports security profile names in mixed case, or in uppercase only. The value is activated when a Refresh Security command is run with *SecurityType* (MQSECTYPE_CLASSES) specified.

The value can be:

MQSCYC_UPPER

Security profile names must be in uppercase.

MQSCYC_MIXED

Security profile names can be in uppercase or in mixed case.

This parameter is valid only on z/OS.

z/OS SharedQMgrName (MQCFIN)

Shared-queue queue manager name (parameter identifier: MQIA_SHARED_Q_Q_MGR_NAME).

A queue manager makes an MQOPEN call for a shared queue. The queue manager that is specified in the **ObjectMgrName** parameter of the MQOPEN call is in the same queue sharing group as the processing queue manager. The SQQMNAME attribute specifies whether the *ObjectMgrName* is used or whether the processing queue manager opens the shared queue directly.

The value can be any of the following values:

MQSQQM_USE

ObjectMgrName is used and the appropriate transmission queue is opened.

MQSQQM_IGNORE

The processing queue manager opens the shared queue directly.

This parameter is valid only on z/OS.

Splcap (MQCFIN)

Specifies whether the Advanced Message Security component is installed for the version of IBM MQ that the queue manager is running under (parameter identifier: MQIA_PROT_POLICY_CAPABILITY).

The value can be one of the following values:

MQCAP_SUPPORTED

If the AMS component is installed for the version of IBM MQ that the queue manager is running under.

MQCAP_NOT_SUPPORTED

If the AMS component is not installed.

SSLCRLNamelist (MQCFST)

The TLS certificate revocation location namelist (parameter identifier: MQCA_SSL_CRL_NAMELIST).

The length of the string is MQ_NAMELIST_NAME_LENGTH.

Indicates the name of a namelist of authentication information objects to be used for certificate revocation checking by the queue manager.

Only authentication information objects with types of CRLLDAP or OCSP are allowed in the namelist referred to by *SSLCRLNamelist* (MQCFST). Any other type results in an error message when the list is processed and is subsequently ignored.

Multi

SSLCryptoHardware (MQCFST)

Parameters to configure the TLS cryptographic hardware (parameter identifier: MQCA_SSL_CRYPTO_HARDWARE).

The length of the string is MQ_SSL_CRYPTO_HARDWARE_LENGTH.

Sets the name of the parameter string required to configure the cryptographic hardware present on the system.

This parameter is valid only on [Multiplatforms](#).

SSLEvent (MQCFIN)

Controls whether TLS events are generated (parameter identifier: MQIA_SSL_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

SSLFipsRequired (MQCFIN)

Controls whether only FIPS-certified algorithms are to be used if cryptography is executed in IBM MQ itself (parameter identifier: MQIA_SSL_FIPS_REQUIRED). This parameter is valid only on z/OS, AIX, Linux, and Windows.

The value can be:

MQSSL_FIPS_NO

Any supported CipherSpec can be used.

MQSSL_FIPS_YES

Only FIPS-certified cryptographic algorithms are to be used if cryptography is executed in IBM MQ rather than cryptographic hardware.

SSLKeyRepository (MQCFST)

Location and name of the TLS key repository (parameter identifier: MQCA_SSL_KEY_REPOSITORY).

The length of the string is MQ_SSL_KEY_REPOSITORY_LENGTH.

Indicates the name of the Secure Sockets Layer key repository.

The format of the name depends on the environment.

ALW

SSLKeyRepositoryPassword (MQCFST)

The password to access the TLS key repository (parameter identifier: MQCA_SSL_KEY_REPO_PASSWORD).

The length of the string is MQ_SSL_ENCRYPT_KEY_REPO_PWD_LEN.

If a value is set for this attribute, it is always returned as *****.

This parameter is valid only on AIX, Linux, and Windows.

SSLKeyResetCount (MQCFIN)

TLS key reset count (parameter identifier: MQIA_SSL_RESET_COUNT).

The number of unencrypted bytes that initiating TLS channel MCAs send or receive before renegotiating the secret key.

z/OS

SSLTasks (MQCFIN)

Number of server subtasks used for processing TLS calls (parameter identifier: MQIA_SSL_TASKS).

The number of server subtasks used for processing TLS calls. This parameter is valid only on z/OS.

StartStopEvent (MQCFIN)

Controls whether start and stop events are generated (parameter identifier: MQIA_START_STOP_EVENT).

The value can be:

MQEVR_DISABLED

Event reporting disabled.

MQEVR_ENABLED

Event reporting enabled.

Multi StatisticsInterval (MQCFIN)

The time interval, in seconds, at which statistics monitoring data is written to the monitoring queue (parameter identifier: MQIA_STATISTICS_INTERVAL).

This parameter is valid only on [Multiplatforms](#).

SyncPoint (MQCFIN)

Sync point availability (parameter identifier: MQIA_SYNCPOINT).

The value can be:

MQSP_AVAILABLE

Units of work and sync pointing available.

MQSP_NOT_AVAILABLE

Units of work and sync pointing not available.

z/OS TCPChannels (MQCFIN)

The maximum number of channels that can be current, or clients that can be connected, that use the TCP/IP transmission protocol (parameter identifier: MQIA_TCP_CHANNELS).

This parameter is valid only on z/OS.

z/OS TCPKeepAlive (MQCFIN)

Specifies whether the TCP KEEPALIVE facility is to be used to check whether the other end of the connection is still available (parameter identifier: MQIA_TCP_KEEP_ALIVE).

The value can be:

MQTCPKEEP_YES

The TCP KEEPALIVE facility is to be used as specified in the TCP profile configuration data set. The interval is specified in the *KeepAliveInterval* channel attribute.

MQTCPKEEP_NO

The TCP KEEPALIVE facility is not to be used.

This parameter is valid only on z/OS.

z/OS TCPName (MQCFST)

The name of the TCP/IP system that you are using (parameter identifier: MQIA_TCP_NAME).

This parameter is valid only on z/OS.

TCPStackType (MQCFIN)

Specifies whether the channel initiator can use only the TCP/IP address space specified in *TCPName*, or can optionally bind to any selected TCP/IP address (parameter identifier: MQIA_TCP_STACK_TYPE).

The value can be:

MQTCPSTACK_SINGLE

The channel initiator can use only the TCP/IP address space specified in *TCPName*.

MQTCPSTACK_MULTIPLE

The channel initiator can use any TCP/IP address space available to it.

This parameter is valid only on z/OS.

TraceRouteRecording (MQCFIN)

Specifies whether trace-route information can be recorded and a reply message generated (parameter identifier: MQIA_TRACE_ROUTE_RECORDING).

The value can be:

MQRECORDING_DISABLED

Trace-route information cannot be recorded.

MQRECORDING_MSG

Trace-route information can be recorded and sent to the destination specified by the originator of the message causing the trace route record.

MQRECORDING_Q

Trace-route information can be recorded and sent to SYSTEM.ADMIN.TRACE.ROUTE.QUEUE.

TreeLifeTime (MQCFIN)

The lifetime in seconds of non-administrative topics (parameter identifier: MQIA_TREE_LIFE_TIME).

Non-administrative topics are those topics created when an application publishes to, or subscribes on, a topic string that does not exist as an administrative node. When this non-administrative node no longer has any active subscriptions, this parameter determines how long the queue manager waits before removing that node. Only non-administrative topics that are in use by a durable subscription remain after the queue manager it recycled.

The value can be in the range 0 - 604,000. A value of 0 means that non-administrative topics are not removed by the queue manager. The initial default value of the queue manager is 1800.

TriggerInterval (MQCFIN)

Trigger interval (parameter identifier: MQIA_TRIGGER_INTERVAL).

Specifies the trigger time interval, expressed in milliseconds, for use only with queues where *TriggerType* has a value of MQTT_FIRST.

Version (MQCFST)

The version of the IBM MQ code (parameter identifier: MQCA_VERSION).

The version of the IBM MQ code is shown as VVRRMMFF:

VV: Version

RR: Release

MM: Maintenance level

FF: Fix level

Multi XrCapability (MQCFIN)

Specifies whether the MQ Telemetry capability and commands are supported by the queue manager where *XrCapability* has a value of MQCAP_SUPPORTED or MQCAP_NOT_SUPPORTED (parameter identifier: MQIA_XR_CAPABILITY).

This parameter applies only to Multiplatforms.

[Federal Information Processing Standards \(FIPS\) for AIX, Linux, and Windows](#)

MQCMD_INQUIRE_Q_MGR_STATUS (Inquire Queue Manager Status) on Multiplatforms

The Inquire Queue Manager Status (MQCMD_INQUIRE_Q_MGR_STATUS) PCF command inquires about the status of the local queue manager.

Optional parameters

IntegerFilterCommand

Integer filter command descriptor. The parameter identifier must be one of the following Native HA integer type parameters:

- MQIACF_NHA_INSTANCE_ROLE
- MQIACF_NHA_INSTANCE_BACKLOG
- MQIACF_NHA_INSTANCE_ACTV_CONNS
- MQIACF_NHA_INSTANCE_IN_SYNC

Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

QMStatusAttrs (MQCFIL)

Queue manager status attributes (parameter identifier: MQIACF_Q_MGR_STATUS_ATTRS).

The attribute list might specify the following value on its own and is the default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

A combination of the following attributes returns status information for a queue manager:

Where **StatusType** is MQIACF_Q_MGR_STATUS_INFO_Q_MGR:

MQCA_Q_MGR_NAME

Name of the local queue manager.

MQCA_INSTALLATION_DESC

Description of the installation associated with the queue manager.

MQCA_INSTALLATION_NAME

Name of the installation associated with the queue manager.

MQCA_INSTALLATION_PATH

Path of the installation associated with the queue manager.

MQCACF_ARCHIVE_LOG_EXTENT_NAME

Name of the oldest log extent for which the queue manager is waiting for archive notification.

The maximum length of the string is MQ_LOG_EXTENT_NAME_LENGTH.

If the queue manager is not using archive log management, this attribute is blank. This parameter is not valid on IBM i.

MQCACF_CURRENT_LOG_EXTENT_NAME

Name of the log extent currently being written to by the logger.

MQCACF_CURRENT_LOG_EXTENT_NAME is available only on queue managers using linear logging. On other queue managers, MQCACF_CURRENT_LOG_EXTENT_NAME is blank.

V9.4.0

MQCACF_HOST_NAME

The name of the host that the queue manager is running on. The length of this attribute is given by MQ_HOST_NAME_LENGTH.

MQCACF_LOG_PATH

Location of the recovery log extents.

V 9.4.0 MQCACF_LOG_START_DATE

The date for the last log record recovered when the queue manager started (in the form *yyyy-mm-dd*). The length of this attribute is given by `MQ_DATE_LENGTH`.

This attribute is not valid on IBM i.

V 9.4.0 MQCACF_LOG_START_LSN

The log sequence number (LSN) for the last log record recovered when the queue manager started. Given in the form *<nnnnn : nnnnn : nnnnn : nnnnn>*. The length of this attribute is given by `MQ_LSN_LENGTH`.

This attribute is not valid on IBM i.

V 9.4.0 MQCACF_LOG_START_TIME

The time for the last log record recovered when the queue manager started (in the form *hh.mm.ss*). The length of this attribute is given by `MQ_TIME_LENGTH`.

This attribute is not valid on IBM i.

MQCACF_MEDIA_LOG_EXTENT_NAME

Name of the earliest log extent required to perform media recovery.

`MQCACF_MEDIA_LOG_EXTENT_NAME` is available only on queue managers using linear logging.

On other queue managers, `MQCACF_MEDIA_LOG_EXTENT_NAME` is blank.

CP4I V 9.4.0 MQCACF_NHA_INSTANCE_NAME

The name of the local Native HA instance if the queue manager is running in a Native HA environment, or blank otherwise. The length of this attribute is given by `MQ_NHA_INSTANCE_NAME_LENGTH`.

MQCACF_RESTART_LOG_EXTENT_NAME

Name of the earliest log extent required to perform restart recovery.

`MQCACF_RESTART_LOG_EXTENT_NAME` is available only on queue managers using linear logging.

On other queue managers, `MQCACF_RESTART_LOG_EXTENT_NAME` is blank.

V 9.4.0 MQCACF_Q_MGR_DATA_PATH

Location of the queue manager data. This parameter identifies the directory where queue manager data files are created by the queue manager. The length of this attribute is given by `MQ_Q_MGR_DATA_PATH_LENGTH`.

MQCACF_Q_MGR_START_DATE

The date on which the queue manager was started (in the form *yyyy-mm-dd*). The length of this attribute is given by `MQ_DATE_LENGTH`.

MQCACF_Q_MGR_START_TIME

The time at which the queue manager was started (in the form *hh.mm.ss*). The length of this attribute is given by `MQ_TIME_LENGTH`.

V 9.4.0 MQCACF_UNIFORM_CLUSTER_NAME

Indicates the name of the uniform cluster that the queue manager is a member of, or blank otherwise. The length of this attribute is given by `MQ_CLUSTER_NAME_LENGTH`.

MQIACF_ARCHIVE_LOG_SIZE

Current size of the amount of space occupied, in megabytes, by log extents no longer required for restart or media recovery but waiting to be archived.

This attribute is not valid on IBM i.

V 9.4.0 MQIACF_AUTO_CLUSTER_TYPE

The type of automatic cluster that the queue manager is a member of.

MQIACF_CHINIT_STATUS

Current status of the channel initiator.

MQIACF_CMD_SERVER_STATUS

Current status of the command server.

MQIACF_CONNECTION_COUNT

Current number of connections to the queue manager.

V 9.4.0 MQIACF_DATA_FS_SIZE

The size of the dedicated queue manager data file system in MB, rounded up.

V 9.4.0 MQIACF_DATA_FS_IN_USE

The percentage of the dedicated queue manager data file system that is used, rounded up to the nearest percent.

MQIACF_LDAP_CONNECTION_STATUS

Current status of the connection to the LDAP server.

V 9.4.0 MQIACF_LOG_EXTENT_SIZE

The size of each log file in KB or the threshold of the currently attached journal receiver on IBM i.

V 9.4.0 MQIACF_LOG_FS_SIZE

The size of the dedicated recovery log file system in MB, rounded up. The amount of file system space is different from the amount of the active log being used and is based on the configuration of the log, the space may not be useable.

V 9.4.0 MQIACF_LOG_FS_IN_USE

The percentage of the recovery log file system that is used, rounded up to the nearest percent.

MQIACF_LOG_IN_USE

Current size of the percentage of the primary log space in use for restart recovery at this point in time.

This attribute is not valid on IBM i.

V 9.4.0 MQIACF_LOG_PRIMARYES

The number of primary log files.

This attribute is not valid on IBM i.

V 9.4.0 MQIACF_LOG_SECONDARIES

The maximum number of secondary log files.

This attribute is not valid on IBM i.

V 9.4.0 MQIACF_LOG_TYPE

The type of logging used by the queue manager.

MQIACF_LOG_UTILIZATION

Current percentage estimate of how well the queue manager workload is contained within the primary log space.

This attribute is not valid on IBM i.

MQIACF_MEDIA_LOG_SIZE

Current size of the log data required for media recovery in megabytes.

This attribute is not valid on IBM i.

MQIACF_NHA_IN_SYNC_INSTANCES

How many of the configured instances are in-sync with the active instance in a Native HA configuration.

MQIACF_NHA_TOTAL_INSTANCES

Total number of configured instances of the queue manager in a Native HA configuration.

MQIACF_PERMIT_STANDBY

Whether a standby instance is permitted.

▶ **V 9.4.0** **MQIACF_Q_MGR_FS_ENCRYPTED**

Indicates whether the queue manager file system is encrypted or not.

▶ **MQ Appliance** Returned on the IBM MQ Appliance only.

▶ **V 9.4.0** **MQIACF_Q_MGR_FS_SIZE**

The size of the queue manager data and recovery log file systems in MB, rounded up.

▶ **V 9.4.0** **MQIACF_Q_MGR_FS_IN_USE**

The percentage of the queue manager data and recovery log file systems that are used, rounded up to the nearest percent.

MQIACF_Q_MGR_STATUS

Current status of the queue manager.

MQIACF_Q_MGR_STATUS_LOG

Current status of all the log attributes. The attributes can be any of the following:

- MQCACF_ARCHIVE_LOG_EXTENT_NAME
- MQIACF_ARCHIVE_LOG_SIZE
- MQCACF_CURRENT_LOG_EXTENT_NAME
- MQIACF_LOG_IN_USE
- MQIACF_LOG_UTILIZATION
- MQCACF_MEDIA_LOG_EXTENT_NAME
- MQIACF_MEDIA_LOG_SIZE
- MQCACF_RESTART_LOG_EXTENT_NAME
- MQIACF_RESTART_LOG_SIZE
- MQIACF_REUSABLE_LOG_SIZE

MQIACF_RESTART_LOG_SIZE

Size of the log data required for restart recovery in megabytes.

This attribute is not valid on IBM i.

MQIACF_REUSABLE_LOG_SIZE

The amount of space occupied, in megabytes, by log extents available to be reused.

This attribute is not valid on IBM i.

▶ **CP4I** ▶ **V 9.4.0** Where **StatusType** is MQIACF_Q_MGR_STATUS_INFO_NHA:

▶ **V 9.4.0**

MQCACF_NHA_INSTANCE_NAME

The name of the instance. The length of this attribute is given by MQ_NHA_INSTANCE_NAME_LENGTH.

MQIACF_NHA_INSTANCE_ROLE

The current role of the instance in the Native HA group.

MQIACF_NHA_INSTANCE_BACKLOG

How many KB of recovery log data the active instance has written that have not yet been acknowledged by the named instance.

MQIACF_NHA_INSTANCE_ACTV_CONNS

Whether the instance currently has a pair of active connections to the active instance.

MQCACF_NHA_GROUP_INITIAL_DATE

The date of the last log record recovered when the Native HA group initially became active. The length of this attribute is given by MQ_DATE_LENGTH.

MQCACF_NHA_GROUP_INITIAL_LSN

The log sequence number (LSN) of the last log record recovered when the Native HA group initially became active. The length of this attribute is given by MQ_LSN_LENGTH.

MQCACF_NHA_GROUP_INITIAL_TIME

The time of the last log record recovered when the Native HA group initially became active. The length of this attribute is given by MQ_TIME_LENGTH.

MQIACF_NHA_INSTANCE_IN_SYNC

Whether this instance is currently considered in-sync with the active instance.

MQCACF_NHA_REPL_ADDRESS

The network address and port to use when sending data to and from the specified instance. The length of this attribute is given by MQ_NHA_REPL_ADDRESS_LENGTH.

V 9.4.0

StatusType (MQCFIN)

Queue manager status type (parameter identifier: MQIACF_Q_MGR_STATUS_INFO_TYPE). Specifies the type of status information required. Can be any of the following values:

MQIACF_Q_MGR_STATUS_INFO_Q_MGR

Selects general status information relating to the queue manager.

MQIACF_Q_MGR_STATUS_INFO_NHA

Selects status information relating to Native HA instances.

The default value, if this parameter is not specified, is MQIACF_Q_MGR_STATUS_INFO_Q_MGR.

You cannot use **StatusType** as a parameter to filter on.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be one of the following Native HA string type parameters:

- MQCACF_NHA_INSTANCE_NAME
- MQCACF_NHA_GROUP_INITIAL_DATE
- MQCACF_NHA_GROUP_INITIAL_LSN
- MQCACF_NHA_GROUP_INITIAL_TIME
- MQCACF_NHA_REPL_ADDRESS

Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1560](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Error codes

CP4I V 9.4.0

This command might return the following error code in the response format header [“Error codes applicable to all commands” on page 1018](#)

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_NHA_NOT_AVAILABLE

Native HA status not available.

Multi MQCMD_INQUIRE_Q_MGR_STATUS (Inquire Queue Manager Status)

Response on Multiplatforms

The response to the Inquire Queue Manager Status (MQCMD_INQUIRE_Q_MGR_STATUS) PCF command consists of the response header followed by a set of attribute parameter structures determined by the value of **StatusType** in the Inquire command.

Always returned:

V 9.4.0 *StatusType*

Possible values of *StatusType* are:

MQIACF_Q_MGR_STATUS_INFO_Q_MGR

Returns general status information relating to the queue manager.

CP4I V 9.4.0 **MQIACF_Q_MGR_STATUS_INFO_NHA**

Returns status information relating to Native HA instances.

QMgrName, *QMgrStatus* (if *StatusType* is MQIACF_Q_MGR_STATUS_INFO_Q_MGR)

CP4I V 9.4.0 *Instance*, *Role* (if *StatusType* is MQIACF_Q_MGR_STATUS_INFO_NHA)

Returned if requested and *StatusType* is MQIACF_Q_MGR_STATUS_INFO_Q_MGR:

ArchiveLog, *ArchiveLogSize*, *AutoCluster*, *ChannelInitiatorStatus*, *CommandServerStatus*, *ConnectionCount*, *CurrentLog*, *DataFSSize*, *DataFSUse*, *DataPath*, *HostName*, *InstallationDesc*, *InstallationName*, *InstallationPath*, *InSyncInstances*, *LDAPConnectionStatus*, *LogExtSize*, *LogFSSize*, *LogFSUse*, *LogInUse*, *LogPath*, *LogPrim*, *LogSec*, *LogStartDate*, *LogStartLSN*, *LogStartTime*, *LogType*, *LogUtilization*, *MediaRecoveryLog*, *MediaRecoveryLogSize*, *NativeHAInstanceName*, *PermitStandby*, *QMgrEncryption*, *QMgrFSSize*, *QMgrFSUse*, *RestartRecoveryLogSize*, *ReusableLogSize*, *StartDate*, *StartTime*, *TotalInstances*, *UniClusterName*

CP4I V 9.4.0 Returned if requested and *StatusType* is

MQIACF_Q_MGR_STATUS_INFO_NHA:

Backlog, *ConnActv*, *HAInitDate*, *HAInitLSN*, *HAInitTime*, *InSync*, *Instance*, *ReplAddr*, *Role*

Response data (if *StatusType* is MQIACF_Q_MGR_STATUS_INFO_Q_MGR)

ArchiveLog (MQCFST)

Name of the oldest log extent for which the queue manager is waiting for archive notification or blank if they have all been archived (parameter identifier MQCACF_ARCHIVE_LOG_EXTENT_NAME).

ArchiveLogSize (MQCFIN)

Current size of the amount of space occupied, in megabytes, by log extents no longer required for restart or media recovery but waiting to be archived (parameter identifier MQIACF_ARCHIVE_LOG_SIZE).

V 9.4.0 **AutoCluster (MQCFIN)**

Whether the queue manager is a member of an automatic cluster (parameter identifier MQIACF_AUTO_CLUSTER_TYPE).

The value can be:

MQAUTOCLUS_TYPE_NONE

The queue manager is not a member of an automatic cluster.

MQAUTOCLUS_TYPE_UNIFORM

The queue manager is a member of an automatic uniform cluster.

See [Using automatic cluster configuration](#)

ChannelInitiatorStatus (MQCFIN)

Status of the channel initiator reading SYSTEM.CHANNEL.INITQ (parameter identifier: MQIACF_CHINIT_STATUS).

The value can be:

MQSVC_STATUS_STOPPED

The channel initiator is not running.

MQSVC_STATUS_STARTING

The channel initiator is in the process of initializing.

MQSVC_STATUS_RUNNING

The channel initiator is fully initialized and is running.

MQSVC_STATUS_STOPPING

The channel initiator is stopping.

CommandServerStatus (MQCFIN)

Status of the command server (parameter identifier: MQIACF_CMD_SERVER_STATUS).

The value can be:

MQSVC_STATUS_STARTING

The command server is in the process of initializing.

MQSVC_STATUS_RUNNING

The command server is fully initialized and is running.

MQSVC_STATUS_STOPPING

The command server is stopping.

ConnectionCount (MQCFIN)

Connection count (parameter identifier: MQIACF_CONNECTION_COUNT).

The current number of connections to the queue manager.

CurrentLog (MQCFST)

Log extent name (parameter identifier: MQCACF_CURRENT_LOG_EXTENT_NAME).

The name of the log extent that was being written to at the time of the Inquire command. If the queue manager is using circular logging, this parameter is blank.

The maximum length of the string is MQ_LOG_EXTENT_NAME_LENGTH.

V 9.4.0 DataFSSize (MQCFIN)

The size of the dedicated queue manager data file system in MB, rounded up. If the queue manager data and recovery log are on the same file system, the value is MQFS_SHARED (parameter identifier: MQIACF_DATA_FS_SIZE).

V 9.4.0 DataFSUse (MQCFIN)

The percentage of the queue manager data file system that is used, rounded up to the nearest percent. If the queue manager data and recovery log are on the same file system, the value is MQFS_SHARED (parameter identifier: MQIACF_DATA_FS_IN_USE).

V 9.4.0 DataPath (MQCFST)

Location of the queue manager data. This parameter identifies the directory where queue manager data files are created by the queue manager (parameter identifier: MQCACF_Q_MGR_DATA_PATH). The length of this attribute is given by MQ_Q_MGR_DATA_PATH_LENGTH.

V 9.4.0 HostName (MQCFST)

The name of the host that the queue manager is running on. Usually, this is the value reported by the O/S but it can be overridden by the MQS_IPC_HOST environment variable (parameter identifier: MQCACF_HOST_NAME). The length of this attribute is given by MQ_HOST_NAME_LENGTH.

InstallationDesc (MQCFST)

Installation Description (parameter identifier: MQCA_INSTALLATION_DESC).

The installation description for this queue manager.

InstallationName (MQCFST)

Installation Name (parameter identifier: MQCA_INSTALLATION_NAME).

The installation name for this queue manager.

InstallationPath (MQCFST)

Installation Path (parameter identifier: MQCA_INSTALLATION_PATH).

The installation path for this queue manager.

CP4I V 9.4.0 InSyncInstances (MQCFIN)

How many of the configured instances are in-sync with the active instance (parameter identifier: MQIACF_NHA_IN_SYNC_INSTANCES).

LDAPConnectionStatus (MQCFIN)

Current status of the queue manager's connection to the LDAP server (parameter identifier: MQIACF_LDAP_CONNECTION_STATUS).

The value can be:

MQLDAPC_CONNECTED

The queue manager currently has a connection to the LDAP server.

MQLDAPC_ERROR

The queue manager attempted to make a connection to the LDAP server and failed.

MQLDAPC_INACTIVE

The queue manager is not configured to use an LDAP server or has not yet made a connection to the LDAP server.

V 9.4.0 LogExtSize (MQCFIN)

The size of each log file in kilobytes or the threshold of the currently attached journal receiver on IBM i (parameter identifier: MQIACF_LOG_EXTENT_SIZE).

V 9.4.0 LogFSSize (MQCFIN)

The size of the dedicated recovery log file system in MB, rounded up. If the queue manager data and recovery log are on the same file system, the value is MQFS_SHARED (parameter identifier: MQIACF_LOG_FS_SIZE).

V 9.4.0 LogFSUse (MQCFIN)

The percentage of the recovery log file system that is used, rounded up to the nearest percent. If the queue manager data and recovery log are on the same file system, the value is MQFS_SHARED (parameter identifier: MQIACF_LOG_FS_IN_USE).

LogInUse (MQCFIN)

Current size of the percentage of the primary log space in use for restart recovery at this point in time (parameter identifier MQIACF_LOG_IN_USE).

LogPath (MQCFST)

Location of the recovery log extents (parameter identifier: MQCACF_LOG_PATH).

This parameter identifies the directory where log files are created by the queue manager. The maximum length of the string is MQ_LOG_PATH_LENGTH.

V 9.4.0 LogPrim (MQCFIN)

The number of primary log files (parameter identifier MQIACF_LOG_PRIMARYES).

V 9.4.0 LogSec (MQCFIN)

The maximum number of secondary log files (parameter identifier MQIACF_LOG_SECONDARIES).

V 9.4.0 LogStartDate (MQCFST)

The date for the last log record recovered when the queue manager started (in the form *yyyy-mm-dd*) (parameter identifier MQCACF_LOG_START_DATE). The length of this attribute is given by MQ_DATE_LENGTH.

V 9.4.0 LogStartLSN (MQCFST)

The log sequence number (LSN) for the last log record recovered when the queue manager started (in the form *<nnnnn:nnnnn:nnnnn:nnnnn>*) (parameter identifier MQCACF_LOG_START_LSN). The length of this attribute is given by MQ_LSN_LENGTH.

V 9.4.0 LogStartTime (MQCFST)

The time for the last log record recovered when the queue manager started (in the form *hh.mm.ss*) (parameter identifier MQCACF_LOG_START_TIME). The length of this attribute is given by MQ_TIME_LENGTH.

V 9.4.0 LogType (MQCFIN)

The type of logging used by the queue manager (parameter identifier MQIACF_LOG_TYPE).

The value can be:

MQLOGTYPE_CIRCULAR

Circular logging.

MQLOGTYPE_LINEAR

Linear logging.

MQLOGTYPE_REPLICATED

Replicated logging.

For information about logging types, see [Types of logging](#).

LogUtilization (MQCFIN)

Current percentage estimate of how well the queue manager workload is contained within the primary log space (parameter identifier MQIACF_LOG_UTILIZATION).

MediaRecoveryLog (MQCFST)

Name of the oldest log extent required by the queue manager to perform media recovery (parameter identifier: MQCACF_MEDIA_LOG_EXTENT_NAME). This parameter is available only on queue managers using linear logging. If the queue manager is using circular logging, this parameter is blank.

The maximum length of the string is MQ_LOG_EXTENT_NAME_LENGTH.

MediaRecoveryLogSize (MQCFIN)

Current size of the log data required for media recovery in megabytes (parameter identifier MQIACF_MEDIA_LOG_SIZE).

CP4I V 9.4.0 NativeHAInstanceName (MQCFST)

The name of the local Native HA instance when the queue manager is part of a Native HA group. It is blank otherwise (parameter identifier: MQCACF_NHA_INSTANCE_NAME). The length of this attribute is given by MQ_NHA_INSTANCE_NAME_LENGTH.

PermitStandby (MQCFIN)

Whether a standby instance is permitted (parameter identifier: MQIACF_PERMIT_STANDBY).

The value can be:

MQSTDBY_NOT_PERMITTED

Standby instances are not permitted.

MQSTDBY_PERMITTED

Standby instances are permitted.

QMgrName (MQCFST)

Name of the local queue manager (parameter identifier: MQCA_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

QMgrStatus (MQCFIN)

Current execution status of the queue manager (parameter identifier: MQIACF_Q_MGR_STATUS).

The value can be:

MQQMSTA_STARTING

The queue manager is initializing.

MQQMSTA_RUNNING

The queue manager is fully initialized and is running.

MQQMSTA QUIESCING

The queue manager is quiescing.

V 9.4.0 **QMGrEncryption (MQCFIN)**

Indicates whether the queue manager file system is encrypted or not (parameter identifier: MQIACF_Q_MGR_FS_ENCRYPTED).

The value can be:

MQFSENC_NO

File system is encrypted.

MQFSENC_YES

File system not encrypted.

MQFSENC_UNKNOWN

Not known if file system is encrypted.

Returned on the IBM MQ Appliance only.

V 9.4.0 **QMGrFSSize (MQCFIN)**

The size of the queue manager data and recovery log file systems in MB, rounded up. If the queue manager data and recovery log are on the same file system, the value will be the usage of that file system (parameter identifier: MQIACF_Q_MGR_FS_SIZE).

V 9.4.0 **QMGrFSUse (MQCFIN)**

The percentage of the queue manager data and recovery log file systems that are full, rounded up to the nearest percent. If the queue manager data and recovery log are on the same file system, the value will be the usage of that file system. (parameter identifier: MQIACF_Q_MGR_FS_IN_USE).

RestartRecoveryLog (MQCFST)

Name of the oldest log extent required by the queue manager to perform restart recovery (parameter identifier: MQCACF_RESTART_LOG_EXTENT_NAME).

This parameter is available only on queue managers using linear logging. If the queue manager is using circular logging, this parameter is blank.

The maximum length of the string is MQ_LOG_EXTENT_NAME_LENGTH.

RestartRecoveryLogSize (MQCFIN)

Size of the log data required for restart recovery in megabytes (parameter identifier: MQIACF_RESTART_LOG_SIZE).

ReusableLogSize (MQCFIN)

The amount of space occupied, in megabytes, by log extents available to be reused (parameter identifier: MQIACF_REUSABLE_LOG_SIZE).

StartDate (MQCFST)

Date when this queue manager was started (in the form yyyy-mm-dd) (parameter identifier: MQCACF_Q_MGR_START_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

StartTime (MQCFST)

Time when this queue manager was started (in the form hh:mm:ss) (parameter identifier: MQCACF_Q_MGR_START_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

V 9.4.0 **StatusType**

The type of status being returned:

MQIACF_Q_MGR_STATUS_INFO_Q_MGR

Returns general status information relating to the queue manager.

V 9.4.0 TotalInstances (MQCFIN)

Total number of configured instances of the queue manager (parameter identifier: MQIACF_NHA_TOTAL_INSTANCES).

V 9.4.0 UniClusterName (MQCFST)

The name of the uniform cluster that the queue manager is a member of, or blank otherwise. (parameter identifier: MQCACF_UNIFORM_CLUSTER_NAME). The length of this attribute is given by MQ_CLUSTER_NAME_LENGTH.

Response data (if StatusType is MQIACF_Q_MGR_STATUS_INFO_NHA)

CP4I V 9.4.0

Backlog (MQCFIN)

How far 'out of sync' the instance currently is (parameter identifier: MQIACF_NHA_INSTANCE_BACKLOG). For REPLICIA instances only.

ConnActv (MQCFIN)

Whether the instance currently has a pair of active connections to the active instance (parameter identifier: MQIACF_NHA_INSTANCE_ACTV_CONNS). For REPLICIA instances only.

The value can be:

MQNHACONNACTV_NO

No pair of active connections.

MQNHACONNACTV_YES

Has a pair of active connections.

HAInitDate (MQCFST)

The date of the last log record recovered when the Native HA group initially became active (in the form *yyyy-mm-dd*) (parameter identifier: MQCACF_NHA_GROUP_INITIAL_DATE). For ACTIVE instances only.

HAInitLSN (MQCFST)

The log sequence number (LSN) of the last log record recovered when the Native HA group initially became active (in the form *<nnnnn:nnnnn:nnnn:nnnn>*) (parameter identifier: MQCACF_NHA_GROUP_INITIAL_LSN). For ACTIVE instances only.

HAInitTime (MQCFST)

The time of the last log record recovered when the Native HA group initially became active (in the form *hh.mm.ss*) (parameter identifier: MQCACF_NHA_GROUP_INITIAL_TIME). For ACTIVE instances only.

InSync (MQCFIN)

Whether this instance is currently considered in-sync with the active instance (parameter identifier: MQIACF_NHA_INSTANCE_IN_SYNC). For REPLICIA instances only.

The value can be:

MQNHAINSYNC_NO

Is not in sync.

MQNHAINSYNC_YES

Is in sync.

Instance (MQCFST)

The name of the local Native HA instance (parameter identifier: MQCACF_NHA_INSTANCE_NAME). The length of this attribute is given by MQ_NHA_INSTANCE_NAME_LENGTH.

ReplAddr (MQCFST)

The network address and port to use when sending data to and from the specified instance (parameter identifier: MQCACF_NHA_REPL_ADDRESS). The length of this attribute is given by MQ_NHA_REPL_ADDRESS_LENGTH.

Role (MQCFIN)

The role that the instance is currently playing in the Native HA group (parameter identifier: MQIACF_NHA_INSTANCE_ROLE).

The value can be:

MQNHAROLE_UNKNOWN

Role is not known.

MQNHAROLE_ACTIVE

Role is ACTIVE.

MQNHAROLE_REPLICA

Role is REPLICA.

See [Native HA](#) for a description of these roles.

StatusType

The type of status being returned:

MQIACF_Q_MGR_STATUS_INFO_NHA

Returns status information relating to Native HA instances.

MQCMD_INQUIRE_Q_NAMES (Inquire Queue Names)

The Inquire Queue Names (MQCMD_INQUIRE_Q_NAMES) PCF command inquires a list of queue names that match the generic queue name, and the optional queue type specified.

Required parameters

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

Generic queue names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_Q_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

When a value other than blank is specified, the maximum response size is limited to 32KB from each queue manager. If the response from a queue manager would be larger than this, an error response with reason code [MQRCCF_COMMAND_LENGTH_ERROR \(3230\)](#) is returned by that queue manager.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED. MQQSGD_SHARED is permitted only in a shared queue environment.

QType (MQCFIN)

Queue type (parameter identifier: MQIA_Q_TYPE).

If present, this parameter limits the queue names returned to queues of the specified type. If this parameter is not present, queues of all types are eligible. The value can be any of the following values:

MQQT_ALL

All queue types.

MQQT_LOCAL

Local queue.

MQQT_ALIAS

Alias queue definition.

MQQT_REMOTE

Local definition of a remote queue.

MQQT_MODEL

Model queue definition.

The default value if this parameter is not specified is MQQT_ALL.

MQCMD_INQUIRE_Q_NAMES (Inquire Queue Names) Response

The response to the Inquire Queue Names (MQCMD_INQUIRE_Q_NAMES) PCF command consists of the response header followed by a single parameter structure giving zero or more names that match the specified queue name. The response header is followed by the *QTypes* structure, with the same number of entries as the *QNames* structure. Each entry gives the type of the queue with the corresponding entry in the *QNames* structure.

Additionally, on z/OS only, the **QSGDispositions** parameter structure (with the same number of entries as the *QNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *QNames* structure.

Always returned:

QNames, **z/OS** *QSGDispositions*, *QTypes*

Returned if requested:

None

Response data

QNames (MQCFSL)

List of queue names (parameter identifier: MQACF_Q_NAMES).

QSGDispositions (MQCFIL)

List of queue sharing group dispositions (parameter identifier: MQIACF_QSG_DISPS). This parameter is valid on z/OS only. Possible values for fields in this structure are:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED.

QTypes (MQCFIL)

List of queue types (parameter identifier: MQIACF_Q_TYPES). Possible values for fields in this structure are:

MQQT_ALIAS

Alias queue definition.

MQQT_LOCAL

Local queue.

MQQT_REMOTE

Local definition of a remote queue.

MQQT_MODEL

Model queue definition.

MQCMD_INQUIRE_Q_STATUS (Inquire Queue Status)

The Inquire Queue Status (MQCMD_INQUIRE_Q_STATUS) PCF command inquires about the status of a local IBM MQ queue. You must specify the name of a local queue for which you want to receive status information.

Required parameters

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

Generic queue names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all queues having names that start with the selected character string. An asterisk on its own matches all possible names.

The queue name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Optional parameters (Inquire Queue Status)

ByteStringFilterCommand (MQCFBF)

Byte string filter command descriptor. The parameter identifier must be MQBACF_EXTERNAL_UOW_ID or MQBACF_Q_MGR_UOW_ID. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFBF - PCF byte string filter parameter” on page 1548 for information about using this filter condition.

If you specify a byte string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter, or a string filter using the **StringFilterCommand** parameter.

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is initiated when the queue manager is a member of a queue sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is initiated on the queue manager on which it was entered.
- Queue manager name. The command is initiated on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be initiated.
- An asterisk (*). The command is initiated on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *QStatusAttrs* except MQIACF_ALL, MQIACF_MONITORING, and MQIACF_Q_TIME_INDICATOR. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1553 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or a string filter using the **StringFilterCommand** parameter.

OpenType (MQCFIN)

Queue status open type (parameter identifier: MQIACF_OPEN_TYPE).

It is always returned, regardless of the queue instance attributes requested.

The value can be:

MQQSOT_ALL

Selects status for queues that are open with any type of access.

MQQSOT_INPUT

Selects status for queues that are open for input.

MQQSOT_OUTPUT

Selects status for queues that are open for output.

The default value if this parameter is not specified is MQQSOT_ALL.

Filtering is not supported for this parameter.

QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid only on z/OS. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED.

You cannot use *QSGDisposition* as a parameter to filter on.

QStatusAttrs (MQCFIL)

Queue status attributes (parameter identifier: MQIACF_Q_STATUS_ATTRS).

The attribute list can specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

Where *StatusType* is MQIACF_Q_STATUS:

MQCA_Q_NAME

Queue name.

MQCACF_LAST_GET_DATE

Date of the last message successfully destructively read from the queue.

MQCACF_LAST_GET_TIME

Time of the last message successfully destructively read from the queue.

MQCACF_LAST_PUT_DATE

Date of the last message successfully put to the queue.

MQCACF_LAST_PUT_TIME

Time of the last message successfully put to the queue.

MQCACF_MEDIA_LOG_EXTENT_NAME

Identity of the oldest log extent required to perform media recovery of the queue.

On IBM i, this parameter identifies the name of the oldest journal receiver require to perform media recovery of the queue.

MQIA_CURRENT_Q_DEPTH

The current number of messages on the queue.

MQIA_MONITORING_Q

Current level of monitoring data collection.

MQIA_OPEN_INPUT_COUNT

The number of handles that are currently open for input for the queue.

MQIA_OPEN_INPUT_COUNT does not include handles that are open for browse.

MQIA_OPEN_OUTPUT_COUNT

The number of handles that are currently open for output for the queue.

MQIACF_HANDLE_STATE

Whether an API call is in progress.

MQIACF_MONITORING

All the queue status monitoring attributes. These attributes are:

- MQCACF_LAST_GET_DATE
- MQCACF_LAST_GET_TIME
- MQCACF_LAST_PUT_DATE

- MQCACF_LAST_PUT_TIME
- MQIA_MONITORING_Q
- MQIACF_OLDEST_MSG_AGE
- MQIACF_Q_TIME_INDICATOR

Filtering is not supported for this parameter.

MQIACF_CUR_MAX_FILE_SIZE

Current maximum queue file size

MQIACF_CUR_Q_FILE_SIZE)

Current queue file size

MQIACF_OLDEST_MSG_AGE

Age of oldest message on the queue.

MQIACF_Q_TIME_INDICATOR

Indicator of the time that messages remain on the queue.

MQIACF_UNCOMMITTED_MSGS

The number of uncommitted messages on the queue.

Where *StatusType* is MQIACF_Q_HANDLE:

MQBACF_EXTERNAL_UOW_ID

Unit of recovery identifier assigned by the queue manager.

MQBACF_Q_MGR_UOW_ID

External unit of recovery identifier associated with the connection.

MQCA_Q_NAME

Queue name.

MQCACF_APPL_TAG

This parameter is a string containing the tag of the application connected to the queue manager.

 **MQCACF_ASID**

Address-space identifier of the application identified by *Appl.Tag*. This parameter is valid on z/OS only.

MQCACF_PSB_NAME

Name of the program specification block (PSB) associated with the running IMS transaction. This parameter is valid on z/OS only.

MQCACF_PSTID

Identifier of the IMS program specification table (PST) for the connected IMS region. This parameter is valid on z/OS only.

MQCACF_TASK_NUMBER

CICS task number. This parameter is valid on z/OS only.

MQCACF_TRANSACTION_ID

CICS transaction identifier. This parameter is valid on z/OS only.

MQCACF_USER_IDENTIFIER

The user name of the application that has opened the specified queue.

MQCACH_CHANNEL_NAME

The name of the channel that has the queue open, if any.

MQCACH_CONNECTION_NAME

The connection name of the channel that has the queue open, if any.

MQIA_APPL_TYPE

The type of application that has the queue open.

MQIACF_OPEN_BROWSE

Open browse.

Filtering is not supported for this parameter.

MQIACF_OPEN_INPUT_TYPE

Open input type.

Filtering is not supported for this parameter.

MQIACF_OPEN_INQUIRE

Open inquire.

Filtering is not supported for this parameter.

MQIACF_OPEN_OPTIONS

The options used to open the queue.

If this parameter is requested, the following parameter structures are also returned:

- *OpenBrowse*
- *OpenInputType*
- *OpenInquire*
- *OpenOutput*
- *OpenSet*

Filtering is not supported for this parameter.

MQIACF_OPEN_OUTPUT

Open output.

Filtering is not supported for this parameter.

MQIACF_OPEN_SET

Open set.

Filtering is not supported for this parameter.

MQIACF_PROCESS_ID

The process identifier of the application that has opened the specified queue.

MQIACF_ASYNC_STATE**MQIACF_THREAD_ID**

The thread identifier of the application that has opened the specified queue.

MQIACF_UOW_TYPE

Type of external unit of recovery identifier as seen by the queue manager.

StatusType (MQCFIN)

Queue status type (parameter identifier: MQIACF_Q_STATUS_TYPE).

Specifies the type of status information required.

The value can be any of the following values:

MQIACF_Q_STATUS

Selects status information relating to queues.

MQIACF_Q_HANDLE

Selects status information relating to the handles that are accessing the queues.

The default value, if this parameter is not specified, is MQIACF_Q_STATUS.

You cannot use *StatusType* as a parameter to filter on.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *QStatusAttrs* except MQCA_Q_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1560](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or an integer filter using the **IntegerFilterCommand** parameter.

Error codes

This command might return the following error code in the response format header “[Error codes applicable to all commands](#)” on page 1018 along with any additional pertinent values.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_Q_TYPE_ERROR

Queue type not valid.

MQCMD_INQUIRE_Q_STATUS (Inquire Queue Status) Response

The response to the Inquire Queue Status (MQCMD_INQUIRE_Q_STATUS) PCF command consists of the response header followed by the *QName* structure and a set of attribute parameter structures determined by the value of *StatusType* in the Inquire command.

Always returned:

QName, *ApplTag*, *ApplType*, **z/OS** *QSGDisposition*, *StatusType*,
Multi *UserIdentifier*

Possible values of *StatusType* are:

MQIACF_Q_STATUS

Returns status information relating to queues.

MQIACF_Q_HANDLE

Returns status information relating to the handles that are accessing the queues.

Returned if requested and *StatusType* is **MQIACF_Q_STATUS**:

Multi *CurrentMaxQFileSize*, **Multi** *CurrentQFileSize*, *CurrentQDepth*,
LastGetDate, *LastGetTime*, *LastPutDate*, *LastPutTime*, **Multi** *MediaRecoveryLogExtent*,
OldestMsgAge, *OnQTime*, *OpenInputCount*, *OpenOutputCount*,
QueueMonitoring, *UncommittedMsgs*

Returned if requested and *StatusType* is **MQIACF_Q_HANDLE**:

ApplDesc, *ApplTag*, *ApplType*, **z/OS** *ASId*, *AsynchronousState*, *ChannelName*,
ConnectionName, **z/OS** *ExternalUOWId*, *HandleState*, *OpenOptions*, **Multi** *ProcessId*,
z/OS *PSBName*, **z/OS** *PSTId*, *QMgrUOWId*, **z/OS** *TaskNumber*, **Multi** *ThreadId*,
z/OS *TransactionId*, *UOWIdentifier*, *UOWType*, *UserIdentifier*

Response data if *StatusType* is **MQIACF_Q_STATUS**

Multi **CurrentMaxQFileSize (MQCFIN)**

Current maximum queue file size (parameter identifier MQIACF_CUR_MAX_FILE_SIZE)

The current maximum size the queue file can grow to, rounded up to the nearest megabyte, given the current block size in use on a queue

Multi **CurrentQFileSize (MQCFIN)**

Current queue file size (parameter identifier MQIACF_CUR_Q_FILE_SIZE)

The current size of the queue file in megabytes, rounded up to the nearest megabyte.

CurrentQDepth (MQCFIN)

Current queue depth (parameter identifier: MQIA_CURRENT_Q_DEPTH).

LastGetDate (MQCFST)

Date on which the last message was destructively read from the queue (parameter identifier: MQCACF_LAST_GET_DATE).

The date, in the form yyyy-mm-dd, on which the last message was successfully read from the queue. The date is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ_DATE_LENGTH.

LastGetTime (MQCFST)

Time at which the last message was destructively read from the queue (parameter identifier: MQCACF_LAST_GET_TIME).

The time, in the form hh.mm.ss, at which the last message was successfully read from the queue. The time is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ_TIME_LENGTH.

LastPutDate (MQCFST)

Date on which the last message was successfully put to the queue (parameter identifier: MQCACF_LAST_PUT_DATE).

The date, in the form yyyy-mm-dd, on which the last message was successfully put to the queue. The date is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ_DATE_LENGTH.

LastPutTime (MQCFST)

Time at which the last message was successfully put to the queue (parameter identifier: MQCACF_LAST_PUT_TIME).

The time, in the form hh.mm.ss, at which the last message was successfully put to the queue. The time is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ_TIME_LENGTH.

Multi MediaRecoveryLogExtent (MQCFST)

Name of the oldest log extent required to perform media recovery of the queue (parameter identifier: MQCACF_MEDIA_LOG_EXTENT_NAME).

On IBM i, this parameter identifies the name of the oldest journal receiver required to perform media recovery of the queue.

The name returned is of the form Snnnnnnn.LOG and is not a fully qualified path name. The use of this parameter provides the ability for the name to be easily correlated with the messages issued, following an **rcdmqimg** command to identify those queues causing the media recovery LSN not to move forwards.

This parameter is valid only on [Multiplatforms](#).

The maximum length of the string is MQ_LOG_EXTENT_NAME_LENGTH.

OldestMsgAge (MQCFIN)

Age of the oldest message (parameter identifier: MQIACF_OLDEST_MSG_AGE). Age, in seconds, of the oldest message on the queue.

If the value is unavailable, MQMON_NOT_AVAILABLE is returned. If the queue is empty, 0 is returned. If the value exceeds 999 999 999, it is returned as 999 999 999.

OnQTime (MQCFIL)

Indicator of the time that messages remain on the queue (parameter identifier: MQIACF_Q_TIME_INDICATOR). Amount of time, in microseconds, that a message spent on the queue. Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON_NOT_AVAILABLE is returned. If the value exceeds 999 999 999, it is returned as 999 999 999.

OpenInputCount (MQCFIN)

Open input count (parameter identifier: MQIA_OPEN_INPUT_COUNT).

OpenOutputCount (MQCFIN)

Open output count (parameter identifier: MQIA_OPEN_OUTPUT_COUNT).

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

z/OS QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Returns the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED.

QueueMonitoring (MQCFIN)

Current level of monitoring data collection for the queue (parameter identifier: MQIA_MONITORING_Q). The value can be any of the following values:

MQMON_OFF

Monitoring for the queue is disabled.

MQMON_LOW

Low rate of data collection.

MQMON_MEDIUM

Medium rate of data collection.

MQMON_HIGH

High rate of data collection.

StatusType (MQCFST)

Queue status type (parameter identifier: MQIACF_Q_STATUS_TYPE).

Specifies the type of status information.

UncommittedMsgs (MQCFIN)

The number of uncommitted changes (puts and gets) pending for the queue (parameter identifier: MQIACF_UNCOMMITTED_MSGS). The value can be any of the following values:

MQQSUM_YES

On z/OS, there are one or more uncommitted changes pending.

MQQSUM_NO

There are no uncommitted changes pending.

n

Multi On Multiplatforms, an integer value indicating how many uncommitted changes are pending.

Response data if StatusType is MQIACF_Q_HANDLE**ApplDesc (MQCFST)**

Application description (parameter identifier: MQCACF_APPL_DESC).

The maximum length is MQ_APPL_DESC_LENGTH.

ApplTag (MQCFST)

Open application tag (parameter identifier: MQCACF_APPL_TAG).

The maximum length of the string is MQ_APPL_TAG_LENGTH.

ApplType (MQCFIN)

Open application type (parameter identifier: MQIA_APPL_TYPE).

The value can be any of the following values:

MQAT_QMGR

A queue manager process.

MQAT_CHANNEL_INITIATOR

The channel initiator.

MQAT_USER

A user application.

z/OS MQAT_BATCH

Application using a batch connection. MQAT_BATCH applies only to z/OS.

z/OS MQAT_RRS_BATCH

RRS-coordinated application using a batch connection. MQAT_RRS_BATCH applies only to z/OS.

z/OS MQAT_CICS

A CICS transaction. MQAT_CICS applies only to z/OS.

z/OS MQAT_IMS

An IMS transaction. MQAT_IMS applies only to z/OS.

MQAT_SYSTEM_EXTENSION

Application performing an extension of function that is provided by the queue manager.

z/OS ASId (MQCFST)

Address-space identifier (parameter identifier: MQCACF_ASID).

The 4-character address-space identifier of the application identified by *ApplTag*. It distinguishes duplicate values of *ApplTag*. This parameter applies only to z/OS.

The length of the string is MQ_ASID_LENGTH.

AsynchronousState (MQCFIN)

The state of the asynchronous consumer on this queue (parameter identifier: MQIACF_ASYNC_STATE).

The value can be any of the following values:

MQAS_ACTIVE

An MQCB call has set up a function to call back to process messages asynchronously and the connection handle has been started so that asynchronous message consumption can proceed.

MQAS_INACTIVE

An MQCB call has set up a function to call back to process messages asynchronously but the connection handle has not yet been started, or has been stopped or suspended, so that asynchronous message consumption cannot currently proceed.

MQAS_SUSPENDED

The asynchronous consumption callback has been suspended so that asynchronous message consumption cannot currently proceed on this handle. This situation can be either because an MQCB or MQCTL call with *Operation* MQOP_SUSPEND has been issued against this object handle by the application, or because it has been suspended by the system. If it has been suspended by the system, as part of the process of suspending asynchronous message consumption the callback function is called with the reason code that describes the problem resulting in suspension. This situation is reported in the *Reason* field in the MQCBC structure passed to the

callback. In order for asynchronous message consumption to proceed, the application must issue an MQCB or MQCTL call with *Operation* MQOP_RESUME.

MQAS_SUSPENDED_TEMPORARY

The asynchronous consumption callback has been temporarily suspended by the system so that asynchronous message consumption cannot currently proceed on this object handle. As part of the process of suspending asynchronous message consumption the callback function is called with the reason code that describes the problem resulting in suspension. This situation is reported in the *Reason* field in the MQCBC structure passed to the callback. The callback function is called again when asynchronous message consumption is resumed by the system after the temporary condition has been resolved.

MQAS_NONE

An MQCB call has not been issued against this handle, so no asynchronous message consumption is configured on this handle.

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH_CONNECTION_NAME).

The maximum length of the string is MQ_CONN_NAME_LENGTH.

z/OS ExternalUOWId (MQCFBS)

RRS unit-of-recovery identifier (parameter identifier: MQBACF_EXTERNAL_UOW_ID).

The RRS unit-of-recovery identifier associated with the handle. This parameter is valid only on z/OS only.

The length of the string is MQ_EXTERNAL_UOW_ID_LENGTH.

HandleState (MQCFIN)

State of the handle (parameter identifier: MQIACF_HANDLE_STATE).

The value can be any of the following values:

MQHSTATE_ACTIVE

An API call from a connection is currently in progress for this object. For a queue, this condition can arise when an MQGET WAIT call is in progress.

If there is an MQGET SIGNAL outstanding, it does not mean, by itself, that the handle is active.

MQHSTATE_INACTIVE

No API call from a connection is currently in progress for this object. For a queue, this condition can arise when no MQGET WAIT call is in progress.

OpenBrowse (MQCFIN)

Open browse (parameter identifier: MQIACF_OPEN_BROWSE).

The value can be any of the following values:

MQQSO_YES

The queue is open for browsing.

MQQSO_NO

The queue is not open for browsing.

OpenInputType (MQCFIN)

Open input type (parameter identifier: MQIACF_OPEN_INPUT_TYPE).

The value can be any of the following values:

MQQSO_NO

The queue is not open for inputting.

MQQSO_SHARED

The queue is open for shared input.

MQQSO_EXCLUSIVE

The queue is open for exclusive input.

OpenInquire (MQCFIN)

Open inquire (parameter identifier: MQIACF_OPEN_INQUIRE).

The value can be any of the following values:

MQQSO_YES

The queue is open for inquiring.

MQQSO_NO

The queue is not open for inquiring.

OpenOptions (MQCFIN)

Open options currently in force for the queue (parameter identifier: MQIACF_OPEN_OPTIONS).

OpenOutput (MQCFIN)

Open output (parameter identifier: MQIACF_OPEN_OUTPUT).

The value can be any of the following values:

MQQSO_YES

The queue is open for output.

MQQSO_NO

The queue is not open for output.

OpenSet (MQCFIN)

Open set (parameter identifier: MQIACF_OPEN_SET).

The value can be any of the following values:

MQQSO_YES

The queue is open for setting.

MQQSO_NO

The queue is not open for setting.

Multi ProcessId (MQCFIN)

Open application process ID (parameter identifier: MQIACF_PROCESS_ID).

z/OS PSBName (MQCFST)

Program specification block (PSB) name (parameter identifier: MQCACF_PSB_NAME).

The 8-character name of the PSB associated with the running IMS transaction. This parameter is valid on z/OS only.

The length of the string is MQ_PSB_NAME_LENGTH.

z/OS PSTId (MQCFST)

Program specification table (PST) identifier (parameter identifier: MQCACF_PST_ID).

The 4-character identifier of the PST region identifier for the connected IMS region. This parameter is valid on z/OS only.

The length of the string is MQ_PST_ID_LENGTH.

QMgrUOWId (MQCFBS)

The unit of recovery assigned by the queue manager (parameter identifier: MQBACF_Q_MGR_UOW_ID).

z/OS On z/OS, this parameter is an 8-byte log RBA, displayed as 16 hexadecimal characters.

Multi On Multiplatforms, this parameter is an 8-byte transaction identifier, displayed as 16 hexadecimal characters.

The maximum length of the string is MQ_UOW_ID_LENGTH.

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

z/OS QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Returns the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED.

StatusType (MQCFST)

Queue status type (parameter identifier: MQIACF_Q_STATUS_TYPE).

Specifies the type of status information.

z/OS TaskNumber (MQCFST)

CICS task number (parameter identifier: MQCACF_TASK_NUMBER).

A 7-digit CICS task number. This parameter is valid on z/OS only.

The length of the string is MQ_TASK_NUMBER_LENGTH.

Multi ThreadId (MQCFIN)

The thread ID of the open application (parameter identifier: MQIACF_THREAD_ID).

A value of zero indicates that the handle was opened by a shared connection. A handle created by a shared connection is logically open to all threads.

z/OS TransactionId (MQCFST)

CICS transaction identifier (parameter identifier: MQCACF_TRANSACTION_ID).

A 4-character CICS transaction identifier. This parameter is valid on z/OS only.

The length of the string is MQ_TRANSACTION_ID_LENGTH.

UOWIdentifier (MQCFBS)

The external unit of recovery associated with the connection (parameter identifier: MQBACF_EXTERNAL_UOW_ID).

This parameter is the recovery identifier for the unit of recovery. Its format is determined by the value of *UOWType*.

The maximum length of the string is MQ_UOW_ID_LENGTH.

UOWType (MQCFIN)

Type of external unit of recovery identifier as perceived by the queue manager (parameter identifier: MQIACF_UOW_TYPE).

The value can be any of the following values:

MQUOWT_Q_MGR

z/OS MQUOWT_CICS

Valid only on z/OS.

z/OS >MQUOWT_RRS

Valid only on z/OS.

z/OS >MQUOWT_IMS

Valid only on z/OS.

MQUOWT_XA

UOWType identifies the *UOWIdentifier* type and not the type of the transaction coordinator. When the value of *UOWType* is MQUOWT_Q_MGR, the associated identifier is in *QMgrUOWId* (and not *UOWIdentifier*).

UserIdentifier (MQCFST)

Open application user name (parameter identifier: MQCACF_USER_IDENTIFIER).

The maximum length of the string is MQ_MAX_USER_ID_LENGTH.

z/OS **MQCMD_INQUIRE_SECURITY (Inquire Security) on z/OS**

The Inquire Security (MQCMD_INQUIRE_SECURITY) PCF command returns information about the current settings for the security parameters.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

SecurityAttrs (MQCFIL)

Security parameter attributes (parameter identifier: MQIACF_SECURITY_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQIACF_SECURITY_SWITCH

Current setting of the switch profiles. If the subsystem security switch is off, no other switch profile settings are returned.

MQIACF_SECURITY_TIMEOUT

Timeout value.

MQIACF_SECURITY_INTERVAL

Time interval between checks.

z/OS **MQCMD_INQUIRE_SECURITY (Inquire Security) Response on z/OS**

The response to the Inquire Security (MQCMD_INQUIRE_SECURITY) PCF command consists of the response header followed by the requested combination of attribute parameter structures.

One message is returned if either **SecurityTimeout** or **SecurityInterval** is specified on the command. If **SecuritySwitch** is specified, one message per security switch found is returned. This

message includes the **SecuritySwitch**, **SecuritySwitchSetting**, and **SecuritySwitchProfile** parameter structures.

Returned if requested:

SecurityInterval, **SecuritySwitch**, **SecuritySwitchProfile**, **SecuritySwitchSetting**, **SecurityTimeout**

Response data

SecurityInterval (MQCFIN)

Time interval between checks (parameter identifier: MQIACF_SECURITY_INTERVAL).

The interval, in minutes, between checks for user IDs and their associated resources to determine whether **SecurityTimeout** has expired.

SecuritySwitch (MQCFIN)

Security switch profile (parameter identifier: MQIA_CF_LEVEL). The value can be any of the following values:

MQSECSW_SUBSYSTEM

Subsystem security switch.

MQSECSW_Q_MGR

Queue manager security switch.

MQSECSW_QSG

Queue sharing group security switch.

MQSECSW_CONNECTION

Connection security switch.

MQSECSW_COMMAND

Command security switch.

MQSECSW_CONTEXT

Context security switch.

MQSECSW_ALTERNATE_USER

Alternate user security switch.

MQSECSW_PROCESS

Process security switch.

MQSECSW_NAMELIST

Namelist security switch.

MQSECSW_TOPIC

Topic security switch.

MQSECSW_Q

Queue security switch.

MQSECSW_COMMAND_RESOURCES

Command resource security switch.

SecuritySwitchProfile (MQCFST)

Security switch profile (parameter identifier: MQCACF_SECURITY_PROFILE).

The maximum length of the string is MQ_SECURITY_PROFILE_LENGTH.

SecuritySwitchSetting (MQCFIN)

Setting of the security switch (parameter identifier: MQIACF_SECURITY_SETTING).

The value can be:

MQSECSW_ON_FOUND

Switch ON, profile found.

MQSECSW_OFF_FOUND

Switch OFF, profile found.

MQSECSW_ON_NOT_FOUND

Switch ON, profile not found.

MQSECSW_OFF_NOT_FOUND

Switch OFF, profile not found.

MQSECSW_OFF_ERROR

Switch OFF, profile error.

MQSECSW_ON_OVERRIDDEN

Switch ON, profile overridden.

SecurityTimeout (MQCFIN)

Timeout value (parameter identifier: MQIACF_SECURITY_TIMEOUT).

How long, in minutes, security information about an unused user ID and associated resources is retained.

 **MQCMD_INQUIRE_SERVICE (Inquire Service) on Multiplatforms**

The Inquire Service (MQCMD_INQUIRE_SERVICE) PCF command inquires about the attributes of existing IBM MQ services.

Required parameters**ServiceName (MQCFST)**

Service name (parameter identifier: MQCA_SERVICE_NAME).

This parameter is the name of the service whose attributes are required. Generic service names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all services having names that start with the selected character string. An asterisk on its own matches all possible names.

The service name is always returned regardless of the attributes requested.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Optional parameters**IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ServiceAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

ServiceAttrs (MQCFIL)

Service attributes (parameter identifier: MQIACF_SERVICE_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_ALTERATION_DATE

Date on which the definition was last altered.

MQCA_ALTERATION_TIME

Time at which the definition was last altered.

MQCA_SERVICE_DESC

Description of service definition.

MQCA_SERVICE_NAME

Name of service definition.

MQCA_SERVICE_START_ARGS

Arguments to be passed to the service program.

MQCA_SERVICE_START_COMMAND

Name of program to run to start the service.

MQCA_SERVICE_STOP_ARGS

Arguments to be passed to the stop program to stop the service.

MQCA_STDERR_DESTINATION

Destination of standard error for the process.

MQCA_STDOUT_DESTINATION

Destination of standard output for the process.

MQCA_SERVICE_START_ARGS

Arguments to be passed to the service program.

MQIA_SERVICE_CONTROL

When the queue manager must start the service.

MQIA_SERVICE_TYPE

Mode in which the service is to run.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ServiceAttrs* except MQCA_SERVICE_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1560 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Multi MQCMD_INQUIRE_SERVICE (Inquire Service) Response on Multiplatforms

The response to the Inquire Service (MQCMD_INQUIRE_SERVICE) PCF command consists of the response header followed by the *ServiceName* structure and the requested combination of attribute parameter structures.

If a generic service name was specified, one such message is generated for each service found.

Always returned:

ServiceName

Returned if requested:

AlterationDate, AlterationTime, Arguments, ServiceDesc, ServiceType, StartArguments, StartCommand, StartMode, StderrDestination, StdoutDestination, StopArguments, StopCommand

Response data**AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date on which the information was last altered in the form yyyy-mm-dd.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time at which the information was last altered in the form hh.mm.ss.

ServiceDesc (MQCFST)

Description of service definition (parameter identifier: MQCA_SERVICE_DESC).

The maximum length of the string is MQ_SERVICE_DESC_LENGTH.

ServiceName (MQCFST)

Name of service definition (parameter identifier: MQCA_SERVICE_NAME).

The maximum length of the string is MQ_SERVICE_NAME_LENGTH.

ServiceType (MQCFIN)

The mode in which the service is to run (parameter identifier: MQIA_SERVICE_TYPE).

The value can be:

MQSVC_TYPE_SERVER

Only one instance of the service can be executed at a time, with the status of the service made available by the Inquire Service Status command.

MQSVC_TYPE_COMMAND

Multiple instances of the service can be started.

StartArguments (MQCFST)

The arguments to be passed to the user program at queue manager startup (parameter identifier: MQCA_SERVICE_START_ARGS).

The maximum length of the string is MQ_SERVICE_ARGS_LENGTH.

StartCommand (MQCFST)

Service program name (parameter identifier: MQCA_SERVICE_START_COMMAND).

The name of the program which is to run.

The maximum length of the string is MQ_SERVICE_COMMAND_LENGTH.

StartMode (MQCFIN)

Service mode (parameter identifier: MQIA_SERVICE_CONTROL).

Specifies how the service is to be started and stopped. The value can be any of the following values:

MQSVC_CONTROL_MANUAL

The service is not to be started automatically or stopped automatically. It is to be controlled by user command.

MQSVC_CONTROL_Q_MGR

The service is to be started and stopped at the same time as the queue manager is started and stopped.

MQSVC_CONTROL_Q_MGR_START

The service is to be started at the same time as the queue manager is started, but is not requested to stop when the queue manager is stopped.

StderrDestination (MQCFST)

The path to a file to which the standard error (stderr) of the service program is to be redirected (parameter identifier: MQCA_STDERR_DESTINATION).

The maximum length of the string is MQ_SERVICE_PATH_LENGTH.

StdoutDestination (MQCFST)

The path to a file to which the standard output (stdout) of the service program is to be redirected (parameter identifier: MQCA_STDOUT_DESTINATION).

The maximum length of the string is MQ_SERVICE_PATH_LENGTH.

StopArguments (MQCFST)

The arguments to be passed to the stop program when instructed to stop the service (parameter identifier: MQCA_SERVICE_STOP_ARGS).

The maximum length of the string is MQ_SERVICE_ARGS_LENGTH.

StopCommand (MQCFST)

Service program stop command (parameter identifier: MQCA_SERVICE_STOP_COMMAND).

This parameter is the name of the program that is to run when the service is requested to stop.

The maximum length of the string is MQ_SERVICE_COMMAND_LENGTH.

Multi **MQCMD_INQUIRE_SERVICE_STATUS (Inquire Service Status) on Multiplatforms**

The Inquire Service Status (MQCMD_INQUIRE_SERVICE_STATUS) PCF command inquires about the status of one or more IBM MQ service instances.

Required parameters

ServiceName (MQCFST)

Service name (parameter identifier: MQCA_SERVICE_NAME).

Generic service names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all services having names that start with the selected character string. An asterisk on its own matches all possible names.

The service name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Optional parameters (Inquire Service Status)

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ServiceStatusAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

ServiceStatusAttrs (MQCFIL)

Service status attributes (parameter identifier: MQIACF_SERVICE_STATUS_ATTRS).

The attribute list can specify the following value on its own - is the default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_SERVICE_DESC

Description of service definition.

MQCA_SERVICE_NAME

Name of service definition.

MQCA_SERVICE_START_ARGS

The arguments to pass to the service program.

MQCA_SERVICE_START_COMMAND

The name of the program to run to start the service.

MQCA_SERVICE_STOP_ARGS

The arguments to pass to the stop command to stop the service.

MQCA_SERVICE_STOP_COMMAND

The name of the program to run to stop the service.

MQCA_STDERR_DESTINATION

Destination of standard error for the process.

MQCA_STDOUT_DESTINATION

Destination of standard output for the process.

MQCACF_SERVICE_START_DATE

The date on which the service was started.

MQCACF_SERVICE_START_TIME

The time at which the service was started.

MQIA_SERVICE_CONTROL

How the service is to be started and stopped.

MQIA_SERVICE_TYPE

The mode in which the service is to run.

MQIACF_PROCESS_ID

The process identifier of the operating system task under which this service is executing.

MQIACF_SERVICE_STATUS

Status of the service.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ServiceStatusAttrs* except MQCA_SERVICE_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1560](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_SERV_STATUS_NOT_FOUND

Service status not found.

MQCMD_INQUIRE_SERVICE_STATUS (Inquire Service Status) Response on Multiplatforms

The response to the Inquire Service Status (MQCMD_INQUIRE_SERVICE_STATUS) PCF command consists of the response header followed by the *ServiceName* structure and the requested combination of attribute parameter structures.

If a generic service name was specified, one such message is generated for each service found.

Always returned:

ServiceName

Returned if requested:

ProcessId, ServiceDesc, StartArguments, StartCommand, StartDate, StartMode, StartTime, Status, StderrDestination, StdoutDestination, StopArguments, StopCommand

Response data**ProcessId (MQCFIN)**

Process identifier (parameter identifier: MQIACF_PROCESS_ID).

The operating system process identifier associated with the service.

ServiceDesc (MQCFST)

Description of service definition (parameter identifier: MQCACH_SERVICE_DESC).

The maximum length of the string is MQ_SERVICE_DESC_LENGTH.

ServiceName (MQCFST)

Name of the service definition (parameter identifier: MQCA_SERVICE_NAME).

The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

StartArguments (MQCFST)

Arguments to be passed to the program on startup (parameter identifier: MQCA_SERVICE_START_ARGS).

The maximum length of the string is MQ_SERVICE_ARGS_LENGTH.

StartCommand (MQCFST)

Service program name (parameter identifier: MQCA_SERVICE_START_COMMAND).

Specifies the name of the program which is to run.

The maximum length of the string is MQ_SERVICE_COMMAND_LENGTH.

StartDate (MQCFST)

Start date (parameter identifier: MQIACF_SERVICE_START_DATE).

The date, in the form yyyy-mm-dd, on which the service was started.

The maximum length of the string is MQ_DATE_LENGTH.

StartMode (MQCFIN)

Service mode (parameter identifier: MQIA_SERVICE_CONTROL).

How the service is to be started and stopped. The value can be:

MQSVC_CONTROL_MANUAL

The service is not to be started automatically or stopped automatically. It is to be controlled by user command.

MQSVC_CONTROL_Q_MGR

The service is to be started and stopped at the same time as the queue manager is started and stopped.

MQSVC_CONTROL_Q_MGR_START

The service is to be started at the same time as the queue manager is started, but is not request to stop when the queue manager is stopped.

StartTime (MQCFST)

Start date (parameter identifier: MQIACF_SERVICE_START_TIME).

The time, in the form hh.mm.ss, at which the service was started.

The maximum length of the string is MQ_TIME_LENGTH.

Status (MQCFIN)

Service status (parameter identifier: MQIACF_SERVICE_STATUS).

The status of the service. The value can be any of the following values:

MQSVC_STATUS_STARTING

The service is in the process of initializing.

MQSVC_STATUS_RUNNING

The service is running.

MQSVC_STATUS_STOPPING

The service is stopping.

StderrDestination (MQCFST)

Specifies the path to a file to which the standard error (stderr) of the service program is to be redirected (parameter identifier: MQCA_STDERR_DESTINATION).

The maximum length of the string is MQ_SERVICE_PATH_LENGTH.

StdoutDestination (MQCFST)

Specifies the path to a file to which the standard output (stdout) of the service program is to be redirected (parameter identifier: MQCA_STDOUT_DESTINATION).

The maximum length of the string is MQ_SERVICE_PATH_LENGTH.

StopArguments (MQCFST)

Specifies the arguments to be passed to the stop program when instructed to stop the service (parameter identifier: MQCA_SERVICE_STOP_ARGS).

The maximum length of the string is MQ_SERVICE_ARGS_LENGTH.

StopCommand (MQCFST)

Service program stop command (parameter identifier: MQCA_SERVICE_STOP_COMMAND).

This parameter is the name of the program that is to run when the service is requested to stop.

The maximum length of the string is MQ_SERVICE_COMMAND_LENGTH.

z/OS MQCMD_INQUIRE_SMDS (Inquire SMDS) on z/OS

The Inquire SMDS (MQCMD_INQUIRE_SMDS) PCF command inquires about the attributes of shared message data sets for a CF application structure.

Required parameters

SMDS (qmgr_name)

Specifies the queue manager for which the shared message data set properties are to be displayed, or an asterisk to display the properties for all shared message data sets associated with the specified CFSTRUCT (parameter identifier: MQCACF_CF_SMDS).

CFStrucName (MQCFST)

The name of the CF application structure with SMDS properties that you want to inquire on (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters

CFSMDSAttrs (MQCFIL)

CF application structure SMDS attributes (parameter identifier: MQIACF_SMDS_ATTRS).

The default value used if this parameter is not specified is:

MQIACF_ALL

All attributes.

The attribute list might specify MQIACF_ALL on its own, or may specify a combination of the following:

MQIA_CF_SMDS_BUFFERS

The shared message data set DSBUFS property.

MQIACF_CF_SMDS_EXPAND

The shared message data set DSEXPAND property.

z/OS MQCMD_INQUIRE_SMDS (Inquire SMDS) Response on z/OS

The response to the Inquire SMDS (MQCMD_INQUIRE_SMDS) PCF command returns the attribute parameters of the shared message data set connection.

Response data

SMDS (MQCFST)

The queue manager name for which the shared message data set properties are displayed (parameter identifier: MQCACF_CF_SMDS).

CFStrucName (MQCFST)

CF Structure name (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length is MQ_CF_STRUC_NAME_LENGTH.

DSBUFS (MQCFIN)

The CF DSBUFS property (parameter identifier: MQIA_CF_SMDS_BUFFERS).

The returned value is in the range 0 - 9999.

The value is the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

DSEXPAND (MQCFIN)

The CF DSEXPAND property (parameter identifier: MQIACF_CF_SMDS_EXPAND).

MQDSE_YES

The data set can be expanded.

MQDSE_NO

The data set cannot be expanded.

MQDSE_DEFAULT

Only returned on Inquire CF Struct when not explicitly set

MQCMD_INQUIRE_SMDSCONN (Inquire SMDS Connection) on z/OS

The response to the Inquire SMDS Connection (MQCMD_INQUIRE_SMDSCONN) PCF command returns status and availability information about the connection between the queue manager and the shared message data sets for the specified *CFStrucName*.

Required parameters**SMDSCONN (MQCFST)**

Specify the queue manager which owns the SMDS for which the connection information is to be returned, or an asterisk to return the connection information for all shared message data sets associated with the specified *CFStrucName* (parameter identifier: MQCACF_CF_SMDSCONN).

CFStrucName (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to inquire on (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

MQCMD_INQUIRE_SMDSCONN (Inquire SMDS Connection) Response on

z/OS

The response to the Inquire SMDS Connection (MQCMD_INQUIRE_SMDSCONN) PCF command returns status and availability information about the connection between the queue manager and the shared message data sets for the specified *CFStrucName*.

Response data

SMDSCONN (MQCFST)

The queue manager which owns the SMDS for which the connection information is returned (parameter identifier: MQCACF_CF_SMDSCONN).

CFStrucName (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to inquire on (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

Avail (MQCFIN)

The availability of this data set connection as seen by this queue manager (parameter identifier MQIACF_SMDS_AVAIL).

This is one of the following values:

MQS_AVAIL_NORMAL

The connection can be used and no error has been detected.

MQS_AVAIL_ERROR

The connection is unavailable because of an error.

The queue manager may try to enable access again automatically if the error may no longer be present, for example when recovery completes or the status is manually set to RECOVERED. Otherwise, it can be enabled again using the START SMDSCONN command in order to retry the action which originally failed.

MQS_AVAIL_STOPPED

The connection cannot be used because it has been explicitly stopped using the STOP SMDSCONN command. It can only be made available again by using a START SMDSCONN command to enable it.

ExpandST (MQCFIN)

The data set automatic expansion status (parameter identifier MQIACF_SMDS_EXPANDST).

This is one of the following values:

MQS_EXPANDST_NORMAL

No problem has been noted which would affect automatic expansion.

MQS_EXPANDST_FAILED

A recent expansion attempt failed, causing the DSEXPAND option to be set to NO for this specific data set. This status is cleared when ALTER SMDS is used to set the DSEXPAND option back to YES or DEFAULT.

MQS_EXPANDST_MAXIMUM

The maximum number of extents has been reached, so future expansion is not possible (except by taking the data set out of service and copying it to larger extents).

OpenMode (MQCFIN)

Indicates the mode in which the shared message data set is currently open by this queue manager (parameter identifier MQIACF_SMDS_OPENMODE).

This is one of the following values:

MQS_OPENMODE_NONE

The shared message data set is not open.

MQS_OPENMODE_READONLY

The shared message data set is owned by another queue manager, and is open for read-only access.

MQS_OPENMODE_UPDATE

The shared message data set is owned by this queue manager, and is open for update access.

MQS_OPENMODE_RECOVERY

The shared message data set is open for recovery processing

Status (MQCFIN)

Indicates the shared message data set connection status as seen by this queue manager parameter identifier MQIACF_SMDS_STATUS).

This is one of the following values:

MQS_STATUS_CLOSED

This data set is not currently open.

MQS_STATUS_CLOSING

This queue manager is currently in the process of closing this data set, including quiescing normal I/O activity and storing the saved space map if necessary.

MQS_STATUS_OPENING

This queue manager is currently in the process of opening and validating this data set (including space map restart processing when necessary).

MQS_STATUS_OPEN

This queue manager has successfully opened this data set and it is available for normal use.

MQS_STATUS_NOTENABLED

The SMDS definition is not in the ACCESS(ENABLED) state so the data set is not currently available for normal use. This status is only set when the SMDSCONN status does not already indicate some other form of failure.

MQS_STATUS_ALLOCFAIL

This queue manager was unable to locate or allocate this data set.

MQS_STATUS_OPENFAIL

This queue manager was able to allocate the data set but was unable to open it, so it has now been deallocated.

MQS_STATUS_STGFAIL

The data set could not be used because the queue manager was unable to allocate associated storage areas for control blocks, or for space map or header record processing.

MQS_STATUS_DATAFAIL

The data set was successfully opened but the data was found to be invalid or inconsistent, or a permanent I/O error occurred, so it has now been closed and deallocated.

This might result in the shared message data set itself being marked as STATUS(FAILED).

MQCMD_INQUIRE_STG_CLASS (Inquire Storage Class) on z/OS

The Inquire Storage Class (MQCMD_INQUIRE_STG_CLASS) PCF command returns information about storage classes.

Required parameters**StorageClassName (MQCFST)**

Storage class name (parameter identifier: MQCA_STORAGE_CLASS).

Generic storage class names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all storage classes having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *StgClassAttrs* except MQIACF_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you specify an integer filter for *PageSetId*, you cannot also specify the **PageSetId** parameter.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

PageSetId (MQCFIN)

Page set identifier that the storage class is associated with (parameter identifier: MQIA_PAGESET_ID).

If you omit this parameter, storage classes with any page set identifiers qualify.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). The value can be:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined with either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

StgClassAttrs (MQCFIL)

Storage class parameter attributes (parameter identifier: MQIACF_STORAGE_CLASS_ATTRS).

The attribute list might specify the following value on its own - is the default value used if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_STORAGE_CLASS

Storage class name.

MQCA_STORAGE_CLASS_DESC

Description of the storage class.

MQIA_PAGESET_ID

The page set identifier to which the storage class maps.

MQCA_XCF_GROUP_NAME

The name of the XCF group of which IBM MQ is a member.

MQIA_XCF_MEMBER_NAME

The XCF member name of the IMS system within the XCF group specified in MQCA_XCF_GROUP_NAME.

MQCA_ALTERATION_DATE

The date on which the definition was last altered.

MQCA_ALTERATION_TIME

The time at which the definition was last altered.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *StgClassAttrs* except MQCA_STORAGE_CLASS. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1560 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the

IntegerFilterCommand parameter.

 **MQCMD_INQUIRE_STG_CLASS (Inquire Storage Class) Response on z/OS**

The response to the Inquire Storage Class (MQCMD_INQUIRE_STG_CLASS) PCF command consists of the response header followed by the *StgClassName* structure, the *PageSetId* structure and the *QSGDisposition* structure which are followed by the requested combination of attribute parameter structures.

Always returned:

PageSetId, QSGDisposition, StgClassName

Returned if requested:

AlterationDate, AlterationTime, PassTicketApplication, StorageClassDesc, XCFGroupName, XCFMemberName,

Response data**AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

This parameter is the date, in the form yyyy-mm-dd, on which the definition was last altered.

The maximum length of the string is MQ_DATE_LENGTH.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

This parameter is the time, in the form hh.mm.ss, at which the definition was last altered.

The maximum length of the string is MQ_TIME_LENGTH.

PageSetId (MQCFIN)

Page set identifier (parameter identifier: MQIA_PAGESET_ID).

The page set identifier to which the storage class maps.

PassTicketApplication (MQCFST)

PassTicket application (parameter identifier: MQCA_PASS_TICKET_APPL).

The application name that is passed to RACF when authenticating the PassTicket specified in the MQIIH header.

The maximum length is MQ_PASS_TICKET_APPL_LENGTH.

QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

StorageClassDesc (MQCFST)

Description of the storage class (parameter identifier: MQCA_STORAGE_CLASS_DESC).

The maximum length is MQ_STORAGE_CLASS_DESC_LENGTH.

StgClassName (MQCFST)

Name of the storage class (parameter identifier: MQCA_STORAGE_CLASS).

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

XCFGroupName (MQCFST)

Name of the XCF group of which IBM MQ is a member (parameter identifier: MQCA_XCF_GROUP_NAME).

The maximum length is MQ_XCF_GROUP_NAME_LENGTH.

XCFMemberName (MQCFST)

Name of the XCF group of which IBM MQ is a member (parameter identifier: MQCA_XCF_MEMBER_NAME).

The maximum length is MQ_XCF_MEMBER_NAME_LENGTH.

 **MQCMD_INQUIRE_STG_CLASS_NAMES (Inquire Storage Class Names) on z/OS**

The Inquire Storage Class Names (MQCMD_INQUIRE_STG_CLASS_NAMES) PCF command inquires a list of storage class names that match the generic storage class name specified.

Required parameters

StorageClassName (MQCFST)

Storage class name (parameter identifier: MQCA_STORAGE_CLASS).

Generic storage class names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all storage classes having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_STORAGE_CLASS_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined with either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

MQCMD_INQUIRE_STG_CLASS_NAMES (Inquire Storage Class Names)

Response on z/OS

The response to the Inquire Storage Class Names (MQCMD_INQUIRE_STG_CLASS_NAMES) PCF command consists of the response header followed by a parameter structure giving zero or more names that match the specified namelist name.

In addition to this, the *QSGDispositions* structure (with the same number of entries as the *StorageClassNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *StorageClassNames* structure.

Always returned:

StorageClassNames, QSGDispositions

Returned if requested:

None

Response data

StorageClassNames (MQCFSL)

List of storage class names (parameter identifier: MQCACF_STORAGE_CLASS_NAMES).

QSGDispositions (MQCFIL)

List of queue sharing group dispositions (parameter identifier: MQIACF_QSG_DISPS). Possible values for fields in this structure are those permitted for the *QSGDisposition* parameter (MQQSGD_*). Possible values for fields in this structure are:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQCMD_INQUIRE_SUBSCRIPTION (Inquire Subscription)

The Inquire Subscription (MQCMD_INQUIRE_SUBSCRIPTION) PCF command inquires about the attributes of a subscription.

Required parameters

SubName (MQCFST)

The unique identifier of the application for a subscription (parameter identifier: MQCACF_SUB_NAME).

If *SubName* is not provided, *SubId* must be specified to identify the subscription to be inquired.

The maximum length of the string is MQ_SUB_NAME_LENGTH.

SubId (MQCFBS)

Subscription identifier (parameter identifier: MQBACF_SUB_ID).

Specifies the unique internal subscription identifier. If the queue manager is generating the *CorrelId* for a subscription, then the *SubId* is used as the *DestinationCorrelId*.

You must supply a value for *SubId* if you have not supplied a value for *SubName*.

The maximum length of the string is MQ_CORREL_ID_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

Durable (MQCFIN)

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF_DURABLE_SUBSCRIPTION).

MQSUB_DURABLE_YES

Information about durable subscriptions only is displayed.

MQSUB_DURABLE_NO

Information about nondurable subscriptions only is displayed.

MQSUB_DURABLE_ALL

Information about all subscriptions is displayed.

SubscriptionAttrs (MQCFIL)

Subscription attributes (parameter identifier: MQIACF_SUB_ATTRS).

Use one of the following parameters to select the attributes you want to display:

- ALL to display all attributes.
- SUMMARY to display a subset of the attributes (see MQIACF_SUMMARY for a list).
- Any of the following parameters individually or in combination.

MQIACF_ALL

All attributes.

MQIACF_SUMMARY

Use this parameter to display:

- MQBACF_DESTINATION_CORREL_ID
- MQBACF_SUB_ID
- MQCACF_DESTINATION
- MQCACF_DESTINATION_Q_MGR
- MQCACF_SUB_NAME
- MQCA_TOPIC_STRING
- MQIACF_SUB_TYPE

MQBACF_ACCOUNTING_TOKEN

The accounting token passed by the subscriber for propagation into messages sent to this subscription in the AccountingToken field of the MQMD.

MQBACF_DESTINATION_CORREL_ID

The CorrelId used for messages sent to this subscription.

MQBACF_SUB_ID

The internal unique key identifying a subscription.

MQCA_ALTERATION_DATE

The date of the most recent MQSUB with MQSO_ALTER or ALTER SUB command.

MQCA_ALTERATION_TIME

The time of the most recent MQSUB with MQSO_ALTER or ALTER SUB command.

MQCA_CREATION_DATE

The date of the first MQSUB command that caused this subscription to be created.

MQCA_CREATION_TIME

The time of the first MQSUB that caused this subscription to be created.

MQCA_TOPIC_STRING

The resolved topic string the subscription is for.

MQCACF_APPL_IDENTITY_DATA

The identity data passed by the subscriber for propagation into messages sent to this subscription in the ApplIdentity field of the MQMD.

MQCACF_DESTINATION

The destination for messages published to this subscription.

MQCACF_DESTINATION_Q_MGR

The destination queue manager for messages published to this subscription.

MQCACF_SUB_NAME

The unique identifier of an application for a subscription.

MQCACF_SUB_SELECTOR

The SQL 92 selector string to be applied to messages published on the named topic to select whether they are eligible for this subscription.

MQCACF_SUB_USER_DATA

The user data associated with the subscription.

MQCACF_SUB_USER_ID

The userid that owns the subscription. MQCACF_SUB_USER_ID is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription.

MQCA_TOPIC_NAME

The name of the topic object that identifies a position in the topic hierarchy to which the topic string is concatenated.

MQIACF_DESTINATION_CLASS

Indicated whether this subscription is a managed subscription.

MQIACF_DURABLE_SUBSCRIPTION

Whether the subscription is durable, persisting over queue manager restart.

MQIACF_EXPIRY

The time to live from creation date and time.

MQIACF_PUB_PRIORITY

The priority of the messages sent to this subscription.

MQIACF_PUBSUB_PROPERTIES

The manner in which publish/subscribe related message properties are added to messages sent to this subscription.

MQIACF_REQUEST_ONLY

Indicates whether the subscriber polls for updates by using MQSUBRQ API, or whether all publications are delivered to this subscription.

MQIACF_SUB_TYPE

The type of subscription - how it was created.

MQIACF_SUBSCRIPTION_SCOPE

Whether the subscription forwards messages to all other queue managers directly connected by using a Publish/Subscribe collective or hierarchy, or the subscription forwards messages on this topic within this queue manager only.

MQIACF_SUB_LEVEL

The level within the subscription interception hierarchy at which this subscription is made.

MQIACF_VARIABLE_USER_ID

Users other than the creator of this subscription that can connect to it (subject to topic and destination authority checks).

MQIACF_WILDCARD_SCHEMA

The schema to be used when interpreting wildcard characters in the topic string.

MQIA_DISPLAY_TYPE

Controls the output returned in the **TOPICSTR** and **TOPICOBJ** attributes.

SubscriptionType (MQCFIN)

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF_SUB_TYPE).

MQSUBTYPE_ADMIN

Subscriptions which have been created by an admin interface or modified by an admin interface are selected.

MQSUBTYPE_ALL

All subscription types are displayed.

MQSUBTYPE_API

Subscriptions created by applications by way of the IBM MQ API are displayed.

MQSUBTYPE_PROXY

System created subscriptions relating to inter-queue manager subscriptions are displayed.

MQSUBTYPE_USER

USER subscriptions (with SUBTYPE of either ADMIN or API) are displayed. MQSUBTYPE_USER is the default value.

DisplayType (MQCFIN)

Controls the output returned in the **MQCA_TOPIC_STRING** and **MQCA_TOPIC_NAME** attributes (parameter identifier: MQIA_DISPLAY_TYPE).

MQDOPT_RESOLVED

Returns the resolved (full) topic string in the **MQCA_TOPIC_STRING** attribute. The value of the **MQCA_TOPIC_NAME** attribute is also returned.

MQDOPT_DEFINED

Returns the values of the **MQCA_TOPIC_NAME** and **MQCA_TOPIC_STRING** attributes provided when the subscription was created. The **MQCA_TOPIC_STRING** attribute will contain the application part of the topic string only. You can use the values returned with **MQCA_TOPIC_NAME** and **MQCA_TOPIC_STRING** to fully re-create the subscription by using **MQDOPT_DEFINED**.

MQCMD_INQUIRE_SUBSCRIPTION (Inquire Subscription) Response

The response to the Inquire Subscription (MQCMD_INQUIRE_SUBSCRIPTION) PCF command consists of the response header followed by the *SubId* and *SubName* structures, and the requested combination of attribute parameter structures (where applicable).

Always returned

SubID, SubName

Returned if requested

AlterationDate, AlterationTime, CreationDate, CreationTime, Destination, DestinationClass, DestinationCorrelId, DestinationQueueManager, Expiry, PublishedAccountingToken, PublishedApplicationIdentityData, PublishPriority, PublishSubscribeProperties, Requestonly, Selector, SelectorType, SubscriptionLevel, SubscriptionScope, SubscriptionType, SubscriptionUser, TopicObject, TopicString, Userdata, VariableUser, WildcardSchema

Response Data**AlterationDate (MQCFST)**

The date of the most recent **MQSUB** or **Change Subscription** command that modified the properties of the subscription (parameter identifier: MQCA_ALTERATION_DATE).

AlterationTime (MQCFST)

The time of the most recent **MQSUB** or **Change Subscription** command that modified the properties of the subscription (parameter identifier: MQCA_ALTERATION_TIME).

CreationDate (MQCFST)

The creation date of the subscription, in the form yyyy-mm-dd (parameter identifier: MQCA_CREATION_DATE).

CreationTime (MQCFST)

The creation time of the subscription, in the form hh.mm.ss (parameter identifier: MQCA_CREATION_TIME).

Destination (MQCFST)

Destination (parameter identifier: MQCACF_DESTINATION).

Specifies the name of the alias, local, remote, or cluster queue to which messages for this subscription are put.

DestinationClass (MQCFIN)

Destination class (parameter identifier: MQIACF_DESTINATION_CLASS).

Whether the destination is managed.

The value can be any of the following values:

MQDC_MANAGED

The destination is managed.

MQDC_PROVIDED

The destination queue is as specified in the *Destination* field.

DestinationCorrelId (MQCFBS)

Destination correlation identifier (parameter identifier: MQBACF_DESTINATION_CORREL_ID).

A correlation identifier that is placed in the *CorrelId* field of the message descriptor for all the messages sent to this subscription.

The maximum length is MQ_CORREL_ID_LENGTH.

DestinationQueueManager (MQCFST)

Destination queue manager (parameter identifier: MQCACF_DESTINATION_Q_MGR).

Specifies the name of the destination queue manager, either local or remote, to which messages for the subscription are forwarded.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

DisplayType (MQCFIN)

The type of output requested for **MQCA_TOPIC_STRING** and **MQCA_TOPIC_NAME** is returned (parameter identifier: MQIA_DISPLAY_TYPE).

MQDOPT_RESOLVED

Returns the resolved (full) topic string in the **MQCA_TOPIC_STRING** attribute. The value of the **MQCA_TOPIC_NAME** attribute is also returned.

MQDOPT_DEFINED

The application portion of the topic string is returned in the **MQCA_TOPIC_STRING** attribute. **MQCA_TOPIC_NAME** contains the name of the **TOPIC** Object used when defining the subscription.

Durable (MQCFIN)

Whether this subscription is a durable subscription (parameter identifier: MQIACF_DURABLE_SUBSCRIPTION).

The value can be any of the following values:

MQSUB_DURABLE_YES

The subscription persists, even if the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. The queue manager reinstates the subscription during restart.

MQSUB_DURABLE_NO

The subscription is non-durable. The queue manager removes the subscription when the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. If the subscription has a destination class (DESTCLAS) of MANAGED, the queue manager removes any messages not yet consumed when it closes the subscription.

Expiry (MQCFIN)

The time, in tenths of a second, at which a subscription expires after its creation date and time (parameter identifier: MQIACF_EXPIRY).

A value of unlimited means that the subscription never expires.

After a subscription has expired it becomes eligible to be discarded by the queue manager and receives no further publications.

PublishedAccountingToken (MQCFBS)

Value of the accounting token used in the *AccountingToken* field of the message descriptor (parameter identifier: MQBACF_ACCOUNTING_TOKEN).

The maximum length of the string is MQ_ACCOUNTING_TOKEN_LENGTH.

PublishedApplicationIdentityData (MQCFST)

Value of the application identity data used in the *AppIdentityData* field of the message descriptor (parameter identifier: MQCACF_APPL_IDENTITY_DATA).

The maximum length of the string is MQ_APPL_IDENTITY_DATA_LENGTH.

PublishPriority (MQCFIN)

The priority of messages sent to this subscription (parameter identifier: MQIACF_PUB_PRIORITY).

The value can be any of the following values:

MQPRI_PRIORITY_AS_PUBLISHED

The priority of messages sent to this subscription is taken from that priority supplied to the published message. MQPRI_PRIORITY_AS_PUBLISHED is the supplied default value.

MQPRI_PRIORITY_AS_QDEF

The priority of messages sent to this subscription is determined by the default priority of the queue defined as a destination.

0-9

An integer value providing an explicit priority for messages sent to this subscription.

PublishSubscribeProperties (MQCFIN)

Specifies how publish/subscribe related message properties are added to messages sent to this subscription (parameter identifier: MQIACF_PUBSUB_PROPERTIES).

The value can be any of the following values:

MQPSPROP_NONE

Publish/subscribe properties are not added to the messages. MQPSPROP_NONE is the supplied default value.

MQPSPROP_MSGPROP

Publish/subscribe properties are added as PCF attributes.

MQPSPROP_COMPAT

If the original publication is a PCF message, then the publish/subscribe properties are added as PCF attributes. Otherwise, publish/subscribe properties are added within an MQRFH version 1 header. This method is compatible with applications coded for use with previous versions of IBM MQ.

MQPSPROP_RFH2

Publish/subscribe properties are added within an MQRFH version 2 header. This method is compatible with applications coded for use with IBM Integration Bus brokers.

Requestonly (MQCFIN)

Indicates whether the subscriber polls for updates using the MQSUBRQ API call, or whether all publications are delivered to this subscription (parameter identifier: MQIACF_REQUEST_ONLY).

The value can be:

MQRU_PUBLISH_ALL

All publications on the topic are delivered to this subscription.

MQRU_PUBLISH_ON_REQUEST

Publications are only delivered to this subscription in response to an MQSUBRQ API call.

Selector (MQCFST)

Specifies the selector applied to messages published to the topic (parameter identifier: MQCACF_SUB_SELECTOR).

Only those messages that satisfy the selection criteria are put to the destination specified by this subscription.

SelectorType (MQCFIN)

The type of selector string that has been specified (parameter identifier: MQIACF_SELECTOR_TYPE).

The value can be any of the following values:

MQSELTYPE_NONE

No selector has been specified.

MQSELTYPE_STANDARD

The selector references only the properties of the message, not its content, using the standard IBM MQ selector syntax. Selectors of this type are to be handled internally by the queue manager.

MQSELTYPE_EXTENDED

The selector uses extended selector syntax, typically referencing the content of the message. Selectors of this type cannot be handled internally by the queue manager; extended selectors can be handled only by another program, such as IBM Integration Bus.

SubID (MQCFBS)

The internal, unique key identifying a subscription (parameter identifier: MQBACF_SUB_ID).

SubscriptionLevel (MQCFIN)

The level within the subscription interception hierarchy at which this subscription is made (parameter identifier: MQIACF_SUB_LEVEL).

The value can be:

0 - 9

An integer in the range 0-9. The default value is 1. Subscribers with a subscription level of 9 will intercept publications before they reach subscribers with lower subscription levels.

SubscriptionScope (MQCFIN)

Determines whether this subscription is passed to other queue managers in the network (parameter identifier: MQIACF_SUBSCRIPTION_SCOPE).

The value can be:

MQTSCOPE_ALL

The subscription is forwarded to all queue managers directly connected through a publish/subscribe collective or hierarchy. MQTSCOPE_ALL is the supplied default value.

MQTSCOPE_QMGR

The subscription only forwards messages published on the topic within this queue manager.

SubscriptionType (MQCFIN)

Indicates how the subscription was created (parameter identifier: MQIACF_SUB_TYPE).

MQSUBTYPE_PROXY

An internally created subscription used for routing publications through a queue manager.

MQSUBTYPE_ADMIN

Created using **DEF SUB** MQSC or PCF command. This **SUBTYPE** also indicates that a subscription has been modified using an administrative command.

MQSUBTYPE_API

Created using an **MQSUB** API request.

SubscriptionUser (MQCFST)

The userid that 'owns' this subscription. This parameter is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription. (parameter identifier: MQCACF_SUB_USER_ID).

The maximum length of the string is MQ_USER_ID_LENGTH.

TopicObject (MQCFST)

The name of a previously defined topic object from which is obtained the topic name for the subscription (parameter identifier: MQCA_TOPIC_NAME).

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

TopicString (MQCFST)

The resolved topic string (parameter identifier: MQCA_TOPIC_STRING).

The maximum length of the string is MQ_TOPIC_STR_LENGTH.

Userdata (MQCFST)

User data (parameter identifier: MQCACF_SUB_USER_DATA).

Specifies the user data associated with the subscription

The maximum length of the string is MQ_USER_DATA_LENGTH.

VariableUser (MQCFIN)

Specifies whether a user other than the one who created the subscription, that is, the user shown in *SubscriptionUser* can take over the ownership of the subscription (parameter identifier: MQIACF_VARIABLE_USER_ID).

The value can be any of the following values:

MQVU_ANY_USER

Any user can take over the ownership. MQVU_ANY_USER is the supplied default value.

MQVU_FIXED_USER

No other user can take over the ownership.

WildcardSchema (MQCFIN)

Specifies the schema to be used when interpreting any wildcard characters contained in the *TopicString* (parameter identifier: MQIACF_WILDCARD_SCHEMA).

The value can be any of the following values:

MQWS_CHAR

Wildcard characters represent portions of strings; it is for compatibility with IBM MQ V6.0 broker.

MQWS_TOPIC

Wildcard characters represent portions of the topic hierarchy; this is for compatibility with IBM Integration Bus brokers. MQWS_TOPIC is the supplied default value.

MQCMD_INQUIRE_SUB_STATUS (Inquire Subscription Status)

The Inquire Subscription Status (MQCMD_INQUIRE_SUB_STATUS) PCF command inquires about the status of a subscription.

Required parameters

SubName (MQCFST)

The unique identifier of an application for a subscription (parameter identifier: MQCACF_SUB_NAME).

If *SubName* is not provided, *SubId* must be specified to identify the subscription to be inquired.

The maximum length of the string is MQ_SUB_NAME_LENGTH.

SubId (MQCFBS)

Subscription identifier (parameter identifier: MQBACF_SUB_ID).

Specifies the unique internal subscription identifier. If the queue manager is generating the CorrelId for a subscription, then the *SubId* is used as the *DestinationCorrelId*.

You must supply a value for *SubId* if you have not supplied a value for *SubName*.

The maximum length of the string is MQ_CORREL_ID_LENGTH.

Optional parameters

z/OS CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter on which to filter.

Durable (MQCFIN)

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF_DURABLE_SUBSCRIPTION).

MQSUB_DURABLE_YES

Information about durable subscriptions only is displayed. MQSUB_DURABLE_YES is the default.

MQSUB_DURABLE_NO

Information about non-durable subscriptions only is displayed.

SubscriptionType (MQCFIN)

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF_SUB_TYPE).

MQSUBTYPE_ADMIN

Subscriptions which have been created by an admin interface or modified by an admin interface are selected.

MQSUBTYPE_ALL

All subscription types are displayed.

MQSUBTYPE_API

Subscriptions created by applications through an IBM MQ API call are displayed.

MQSUBTYPE_PROXY

System created subscriptions relating to inter-queue manager subscriptions are displayed.

MQSUBTYPE_USER

USER subscriptions (with SUBTYPE of either ADMIN or API) are displayed. MQSUBTYPE_USER is the default value.

StatusAttrs (MQCFIL)

Subscription status attributes (parameter identifier: MQIACF_SUB_STATUS_ATTRS).

To select the attributes you want to display you can specify;

- ALL to display all attributes.
- any of the following parameters individually or in combination.

MQIACF_ALL

All attributes.

MQBACF_CONNECTION_ID

The currently active *ConnectionID* that has opened the subscription.

MQIACF_DURABLE_SUBSCRIPTION

Whether the subscription is durable, persisting over queue manager restart.

MQCACF_LAST_MSG_DATE

The date that a message was last sent to the destination specified by the subscription.

MQCACF_LAST_MSG_TIME

The time when a message was last sent to the destination specified by the subscription.

MQIACF_MESSAGE_COUNT

The number of messages put to the destination specified by the subscription.

MQCA_RESUME_DATE

The date of the most recent MQSUB command that connected to the subscription.

MQCA_RESUME_TIME

The time of the most recent MQSUB command that connected to the subscription.

MQIACF_SUB_TYPE

The type of subscription - how it was created.

MQCACF_SUB_USER_ID

The userid owns the subscription.

MQCA_TOPIC_STRING

Returns the fully resolved topic string of the subscription.

MQCMD_INQUIRE_SUB_STATUS (Inquire Subscription Status) Response

The response to the Inquire Subscription Status (MQCMD_INQUIRE_SUB_STATUS) PCF command consists of the response header followed by the *SubId* and *SubName* structures, and the requested combination of attribute parameter structures (where applicable).

Always returned

SubID, SubName

Returned if requested

ActiveConnection, Durable, LastPublishDate, LastPublishTime, MCastRelIndicator, NumberMsgs, ResumeDate, ResumeTime, SubType, TopicString

Response Data**ActiveConnection (MQCFBS)**

The *ConnId* of the *HConn* that currently has this subscription open (parameter identifier: MQBACF_CONNECTION_ID).

Durable (MQCFIN)

A durable subscription is not deleted when the creating application closes its subscription handle (parameter identifier: MQIACF_DURABLE_SUBSCRIPTION).

MQSUB_DURABLE_NO

The subscription is removed when the application that created it is closed or disconnected from the queue manager.

MQSUB_DURABLE_YES

The subscription persists even when the creating application is no longer running or has been disconnected. The subscription is reinstated when the queue manager restarts.

LastMessageDate (MQCFST)

The date that a message was last sent to the destination specified by the subscription (parameter identifier: MQCACF_LAST_MSG_DATE).

LastMessageTime (MQCFST)

The time when a message was last sent to the destination specified by the subscription (parameter identifier: MQCACF_LAST_MSG_TIME).

MCastRelIndicator (MQCFIN)

The multicast reliability indicator (parameter identifier: MQIACF_MCAST_REL_INDICATOR).

NumberMsgs (MQCFIN)

The number of messages put to the destination specified by this subscription (parameter identifier: MQIACF_MESSAGE_COUNT).

ResumeDate (MQCFST)

The date of the most recent **MQSUB** API call that connected to the subscription (parameter identifier: MQCA_RESUME_DATE).

ResumeTime (MQCFST)

The time of the most recent **MQSUB** API call that connected to the subscription (parameter identifier: MQCA_RESUME_TIME).

SubscriptionUser (MQCFST)

The userid that 'owns' this subscription. This parameter is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription. (parameter identifier: MQCACF_SUB_USER_ID).

The maximum length of the string is MQ_USER_ID_LENGTH.

SubID (MQCFBS)

The internal, unique key identifying a subscription (parameter identifier: MQBACF_SUB_ID).

SubName (MQCFST)

The unique identifier of a subscription (parameter identifier: MQCACF_SUB_NAME).

SubType (MQCFIN)

Indicates how the subscription was created (parameter identifier: MQIACF_SUB_TYPE).

MQSUBTYPE_PROXY

An internally created subscription used for routing publications through a queue manager.

MQSUBTYPE_ADMIN

Created using the **DEF SUB MQSC** or **Create Subscription** PCF command. This Subtype also indicates that a subscription has been modified using an administrative command.

MQSUBTYPE_API

Created using an **MQSUB** API call.

TopicString (MQCFST)

The resolved topic string (parameter identifier: MQCA_TOPIC_STRING). The maximum length of the string is MQ_TOPIC_STR_LENGTH.

MQCMD_INQUIRE_SYSTEM (Inquire System) on z/OS

The Inquire System (MQCMD_INQUIRE_SYSTEM) PCF command returns general system parameters and information.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

MQCMD_INQUIRE_SYSTEM (Inquire System) Response on z/OS

The response to the Inquire System (MQCMD_INQUIRE_SYSTEM) PCF command consists of the response header followed by the *ParameterType* structure and the combination of attribute parameter structures determined by the value of the parameter type.

Always returned:

ParameterType

Possible values of *ParameterType* are:

MQSYSP_TYPE_INITIAL

The initial settings of the system parameters.

MQSYSP_TYPE_SET

The settings of the system parameters if they have been altered since their initial setting.

Returned if *ParameterType* is **MQSYSP_TYPE_INITIAL** or **MQSYSP_TYPE_SET** (and a value is set):

From IBM MQ for z/OS 9.3.0, the following parameters are returned: *CheckpointCount*, *ClusterCacheType*, *CodedCharSetId*, *CommandUserId*, *DB2BlobTasks*, *DB2Name*, *DB2Tasks*, *DSGName*, *Exclmsg*, *ExitInterval*, *ExitTasks*, *MaximumAcePool*, *MULCCapture*, *OTMADruExit*, *OTMAGroup*, *OTMAInterval*, *OTMAMember*, *OTMSTpipePrefix*, *QIndexDefer*, *QSGName*, *RESLEVELAudit*, *RoutingCode*, *Service*, *SMFAccounting*, *SMFAcctIntervalMins*, *SMFAcctIntervalSecs*, *SMFStatistics*, *SMFstatsIntervalMins*, *SMFstatsIntervalSecs*, *Splcap*, *TraceClass*, *TraceSize*, *WLMInterval*, *WLMIntervalUnits*

Response data

CheckpointCount (MQCFIN)

The number of log records written by IBM MQ between the start of one checkpoint and the next (parameter identifier: MQIACF_SYSP_CHKPOINT_COUNT).

ClusterCacheType (MQCFIN)

The type of the cluster cache (parameter identifier: MQIACF_SYSP_CLUSTER_CACHE).

The value can be any of the following values:

MQCLCT_STATIC

Static cluster cache.

MQCLCT_DYNAMIC

Dynamic cluster cache.

CodedCharSetId (MQCFIN)

Archive retention period (parameter identifier: MQIA_CODED_CHAR_SET_ID).

The coded character set identifier for the queue manager.

CommandUserId (MQCFST)

Command user ID (parameter identifier: MQCACF_SYSP_CMD_USER_ID).

Specifies the default user ID for command security checks.

The maximum length of the string is MQ_USER_ID_LENGTH.

DB2BlobTasks (MQCFIN)

The number of Db2 server tasks to be used for BLOBs (parameter identifier: MQIACF_SYSP_DB2_BLOB_TASKS).

DB2Name (MQCFST)

The name of the Db2 subsystem or group attachment to which the queue manager is to connect (parameter identifier: MQCACF_DB2_NAME).

The maximum length of the string is MQ_DB2_NAME_LENGTH.

DB2Tasks (MQCFIN)

The number of Db2 server tasks to use (parameter identifier: MQIACF_SYSP_DB2_TASKS).

DSGName (MQCFST)

The name of the Db2 data-sharing group to which the queue manager is to connect (parameter identifier: MQCACF_DSG_NAME).

The maximum length of the string is MQ_DSG_NAME_LENGTH.

Exclmsg (MQCFSL)

A list of message identifiers to be excluded from being written to any log (parameter identifier: MQCACF_EXCL_OPERATOR_MESSAGES).

The maximum length of each message identifier is MQ_OPERATOR_MESSAGE_LENGTH.

The list can contain a maximum of 16 message identifiers.

ExitInterval (MQCFIN)

The time, in seconds, for which queue manager exits can execute during each invocation (parameter identifier: MQIACF_SYSP_EXIT_INTERVAL).

ExitTasks (MQCFIN)

Specifies how many started server tasks to use to run queue manager exits (parameter identifier: MQIACF_SYSP_EXIT_TASKS).

MaximumAcePool (MQCFIN)

The maximum ACE storage pool size in 1 KB blocks (parameter identifier: MQIACF_SYSP_MAX_ACE_POOL).

MULCCapture (MQCFIN)

The Measured Usage Pricing property is used to control the algorithm for gathering data used by Measured Usage License Charging (MULC) (parameter identifier: MQIACF_MULC_CAPTURE).

The returned values can be MQMULC_STANDARD or MQMULC_REFINED.

OTMADruExit (MQCFST)

The name of the OTMA destination resolution user exit to be run by IMS (parameter identifier: MQCACF_SYSP_OTMA_DRU_EXIT).

The maximum length of the string is MQ_EXIT_NAME_LENGTH.

OTMAGroup (MQCFST)

The name of the XCF group to which this instance of IBM MQ belongs (parameter identifier: MQCACF_SYSP_OTMA_GROUP).

The maximum length of the string is MQ_XCF_GROUP_NAME_LENGTH.

OTMAInterval (MQCFIN)

The length of time, in seconds, that a user ID from IBM MQ is considered previously verified by IMS (parameter identifier: MQIACF_SYSP_OTMA_INTERVAL).

OTMAMember (MQCFST)

The name of the XCF member to which this instance of IBM MQ belongs (parameter identifier: MQCACF_SYSP_OTMA_MEMBER).

The maximum length of the string is MQ_XCF_MEMBER_NAME_LENGTH.

OTMSTpipePrefix (MQCFST)

The prefix to be used for Tpipe names (parameter identifier: MQCACF_SYSP_OTMA_TPIPE_PFX).

The maximum length of the string is MQ_TPIPE_PFX_LENGTH.

QIndexDefer (MQCFIN)

Specifies whether queue manager restart completes before all indexes are built deferring building to later, or waits until all indexes are built (parameter identifier: MQIACF_SYSP_Q_INDEX_DEFER).

The value can be any of the following values:

MQSYSP_YES

Queue manager restart completes before all indexes are built.

MQSYSP_NO

Queue manager restart waits until all indexes are built.

QSGName (MQCFST)

The name of the queue sharing group to which the queue manager belongs (parameter identifier: MQCA_QSG_NAME).

The maximum length of the string is MQ_QSG_NAME_LENGTH.

RESLEVELAudit (MQCFIN)

Specifies whether RACF audit records are written for RESLEVEL security checks performed during connection processing (parameter identifier: MQIACF_SYSP_RESLEVEL_AUDIT).

The value can be any of the following values:

MQSYSP_YES

RACF audit records are written.

MQSYSP_NO

RACF audit records are not written.

RoutingCode (MQCFIL)

z/OS routing code list (parameter identifier: MQIACF_SYSP_ROUTING_CODE).

Specifies the list of z/OS routing codes for messages that are not sent in direct response to an MQSC command. There can be in the range 1 through 16 entries in the list.

Service (MQCFST)

Service parameter setting (parameter identifier: MQCACF_SYSP_SERVICE).

The maximum length of the string is MQ_SERVICE_NAME_LENGTH.

SMFAccounting (MQCFIN)

Specifies whether IBM MQ sends accounting data to SMF automatically when the queue manager starts (parameter identifier: MQIACF_SYSP_SMF_ACCOUNTING).

The value can be any of the following values:

MQSYSP_YES

Accounting data is sent automatically.

MQSYSP_NO

Accounting data is not sent automatically.

SMFAcctIntervalMins (MQCFIN)

From IBM MQ for z/OS 9.2.4 onwards, the minutes value of the default time between each gathering of accounting data (parameter identifier: MQIACF_SYSP_SMF_ACCT_TIME_MINS).

SMFAcctIntervalSecs (MQCFIN)

From IBM MQ for z/OS 9.2.4 onwards, the seconds value of the default time between each gathering of accounting data (parameter identifier: MQIACF_SYSP_SMF_ACCT_TIME_SECS).

SMFInterval (MQCFIN)

The default time, in minutes, between each gathering of statistics (parameter identifier: MQIACF_SYSP_SMF_INTERVAL).

SMFStatistics (MQCFIN)

Specifies whether IBM MQ sends statistics data to SMF automatically when the queue manager starts (parameter identifier: MQIACF_SYSP_SMF_STATS).

The value can be any of the following values:

MQSYSP_YES

Statistics data is sent automatically.

MQSYSP_NO

Statistics data is not sent automatically.

SMFStatsIntervalMins (MQCFIN)

From IBM MQ for z/OS 9.2.4 onwards, the minutes value of the default time between each gathering of statistics data (parameter identifier: MQIACF_SYSP_SMF_STAT_TIME_MINS and parameter identifier: MQIACF_SYSP_SMF_INTERVAL).

SMFStatsIntervalSecs (MQCFIN)

From IBM MQ for z/OS 9.2.4 onwards, the seconds value of the default time between each gathering of statistics data (parameter identifier: MQIACF_SYSP_SMF_STAT_TIME_SECS).

Splcap (MQCFIN)

If the AMS component is installed for the version of IBM MQ that the queue manager is running under, the attribute has a value YES (MQCAP_SUPPORTED). If the AMS component is not installed, the value is NO (MQCAP_NOT_SUPPORTED) (parameter identifier MQIA_PROT_POLICY_CAPABILITY).

The value can be one of the following values:

MQCAP_SUPPORTED

If the AMS component is installed for the version of IBM MQ that the queue manager is running under.

MQCAP_NOT_SUPPORTED

If the AMS component is not installed.

TraceClass (MQCFIL)

Classes for which tracing is started automatically (parameter identifier: MQIACF_SYSP_TRACE_CLASS). There can be in the range 1 through 4 entries in the list.

TraceSize (MQCFIN)

The size of the trace table, in 4 KB blocks, to be used by the global trace facility (parameter identifier: MQIACF_SYSP_TRACE_SIZE).

WLMInterval (MQCFIN)

The time between scans of the queue index for WLM-managed queues (parameter identifier: MQIACF_SYSP_WLM_INTERVAL).

WLMIntervalUnits (MQCFIN)

Whether the value of *WLMInterval* is given in seconds or minutes (parameter identifier: MQIACF_SYSP_WLM_INT_UNITS). The value can be any of the following values:

MQTIME_UNITS_SEC

The value of *WLMInterval* is given in seconds.

MQTIME_UNITS_MINS

The value of *WLMInterval* is given in minutes.

MQCMD_INQUIRE_TOPIC (Inquire Topic)

The Inquire Topic (MQCMD_INQUIRE_TOPIC) PCF command inquires about the attributes of existing IBM MQ administrative topic objects

Required parameters

TopicName (MQCFST)

Administrative topic object name (parameter identifier: MQCA_TOPIC_NAME).

Specifies the name of the administrative topic object about which information is to be returned. Generic topic object names are supported. A generic name is a character string followed by an asterisk (*). For example, ABC* selects all administrative topic objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

Optional parameters

V 9.4.0 CapExpiry (MQCFIN)

Capped expiry processing (parameter identifier MQIA_CAP_EXPIRY) which can be an integer value or take values of MQCEX_NOLIMIT or MQCEX_AS_PARENT.

Specifies a lifetime limit for messages put using the object, expressed in 10ths of a second. A value of -1, displayed as NOLIMIT, has no effect on processing.

Note that in addition to the CapExpiry attribute itself, you can use an attribute of the **CUSTOM** parameter, which is a string. Therefore passing a string PCF parameter MQCA_CUSTOM, has a string value of CAEXPRY(integer).

CapExpiry provides, or limits, the value in the MQMD Expiry field of any message put.

An application provided MQMD **Expiry** that is less than any resolved CapExpiry value is passed. This value is not replaced by that resolved CapExpiry value.

This process allows an IBM MQ administrator to limit the life of messages put by an application that overlooked (or was unable to provide, in the case of MQTT) message expiration criteria.

However, this option does not allow an administrator to override application behavior where the required lifetime of messages was under-estimated.

If you specify **CAEXPRY(ASPARENT)**, the value is established by moving up the tree towards the root, until the point of first resolution to a non *ASPARENT* value. Additionally you can use the **CUSTOM CAEXPRY** option. See [Making CAEXPRY a first-class MQSC attribute in MQ 9.3.1](#) for more information.

As for queues, the smallest **CAEXPRY** found during a put operation, is used. Further limiting can be set for specific subscribers, based on **CAEXPRY** resolution applied on the path to resolve the destination for a subscription.

The new capped value for expiry is used during the put processing as if it had been provided by the application in the MQMD structure.

The *capped* value is evaluated for each put being performed, and so is sensitive to the resolution of the put operation. For example, in a cluster, where the put operation is performed with BIND NOT FIXED, messages might pick up different expiry values depending on the CapExpiry value set for the transmission queue used by the channel.

ClusterInfo (MQCFIN)

Cluster information (parameter identifier: MQIACF_CLUSTER_INFO).

This parameter requests that, in addition to information about attributes of topics defined on this queue manager, cluster information about these topics and other topics in the repository that match the selection criteria is returned.

In this case, there might be multiple topics with the same name returned.

You can set this parameter to any integer value: the value used does not affect the response to the command.

The cluster information is obtained locally from the queue manager.

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *TopicAttrs* except MQIACF_ALL.

Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFIF - PCF integer filter parameter” on page 1553](#) for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the **StringFilterCommand** parameter.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *TopicAttrs* except MQCA_TOPIC_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See [“MQCFSF - PCF string filter parameter” on page 1560](#) for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

TopicAttrs (MQCFIL)

Topic object attributes (parameter identifier: MQIACF_TOPIC_ATTRS).

The attribute list can specify the following value on its own - default value if the parameter is not specified:

MQIACF_ALL

All attributes.

or a combination of the following:

MQCA_ALTERATION_DATE

The date on which the information was last altered.

MQCA_ALTERATION_TIME

The time at which the information was last altered.

MQCA_CLUSTER_NAME

The cluster that is to be used for the propagation of publications and subscription to publish/subscribe cluster-connected queue managers for this topic.

MQCA_CLUSTER_DATE

The date on which this information became available to the local queue manager.

MQCA_CLUSTER_TIME

The time at which this information became available to the local queue manager.

MQCA_CLUSTER_Q_MGR_NAME

Queue manager that hosts the topic.

MQCA_CUSTOM

The custom attribute for new features.

MQCA_MODEL_DURABLE_Q

Name of the model queue for durable managed subscriptions.

MQCA_MODEL_NON_DURABLE_Q

Name of the model queue for non-durable managed subscriptions.

MQCA_TOPIC_DESC

Description of the topic object.

MQCA_TOPIC_NAME

Name of the topic object.

MQCA_TOPIC_STRING

The topic string for the topic object.

MQIA_CLUSTER_OBJECT_STATE

The current state of the clustered topic definition.

MQIA_CLUSTER_PUB_ROUTE

The routing behavior of publications between queue managers in a cluster.

MQIA_DEF_PRIORITY

Default message priority.

MQIA_DEF_PUT_RESPONSE_TYPE

Default put response.

MQIA_DURABLE_SUB

Whether durable subscriptions are permitted.

MQIA_INHIBIT_PUB

Whether publications are allowed.

MQIA_INHIBIT_SUB

Whether subscriptions are allowed.

MQIA_NPM_DELIVERY

The delivery mechanism for non-persistent messages.

MQIA_PM_DELIVERY

The delivery mechanism for persistent messages.

MQIA_PROXY_SUB

Whether a proxy subscription is to be sent for this topic, even if no local subscriptions exist.

MQIA_PUB_SCOPE

Whether this queue manager propagates publications to queue managers as part of a hierarchy or a publish/subscribe cluster.

MQIA_SUB_SCOPE

Whether this queue manager propagates subscriptions to queue managers as part of a hierarchy or a publish/subscribe cluster.

MQIA_TOPIC_DEF_PERSISTENCE

Default message persistence.

MQIA_USE_DEAD_LETTER_Q

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue.

TopicType (MQCFIN)

Cluster information (parameter identifier: MQIA_TOPIC_TYPE).

If this parameter is present, eligible queues are limited to the specified type. Any attribute selector that is specified in the TopicAttrs list and that is valid only for topics of different type is ignored; no error is raised.

If this parameter is not present (or if MQIACF_ALL is specified), queues of all types are eligible. Each attribute specified must be a valid topic attribute selector (that is, it must be in the following list), but it need not be applicable to all or any of the topics returned. Topic attribute selectors that are valid but not applicable to the queue are ignored; no error messages occur and no attribute is returned.

The value can be any of the following values:

MQTOPT_ALL

All topic types are displayed. MQTOPT_ALL includes cluster topics, if ClusterInfo is also specified. MQTOPT_ALL is the default value.

MQTOPT_CLUSTER

Topics that are defined in publish/subscribe clusters are returned.

MQTOPT_LOCAL

Locally defined topics are displayed.

MQCMD_INQUIRE_TOPIC (Inquire Topic) Response

The response to the Inquire Topic (MQCMD_INQUIRE_TOPIC) PCF command consists of the response header followed by the *TopicName* structure (and on z/OS only, the *QSG Disposition* structure), and the requested combination of attribute parameter structures (where applicable).

Always returned:

TopicName, *TopicType*,  *QSGDisposition*

Returned if requested:

AlterationDate, AlterationTime, CapExpiry, ClusterName, ClusterObjectState, ClusterPubRoute, CommInfo, Custom, DefPersistence, DefPriority, DefPutResponse, DurableModelQName, DurableSubscriptions, InhibitPublications, InhibitSubscriptions, Multicast, NonDurableModelQName, NonPersistentMsgDelivery, PersistentMsgDelivery, ProxySubscriptions, PublicationScope, QMgrName, SubscriptionScope, TopicDesc, TopicString, UseDLQ, WildcardOperation

Response data**AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA_ALTERATION_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

AlterationTime (MQCFST)

Alteration time (parameter identifier: MQCA_ALTERATION_TIME).

The time when the information was last altered, in the form hh.mm.ss.

CapExpiry (MQCFIN)

Capped message expiry processing (parameter identifier MQIA_CAP_EXPIRY).

Specifies a lifetime limit for messages put using the object, expressed in 10ths of a second.

ClusterName (MQCFST)

The name of the cluster to which this topic belongs. (parameter identifier: **MQCA_CLUSTER_NAME**).

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH. Setting this parameter to a cluster that this queue manager is a member of makes all queue managers in the cluster aware of this topic. Any publication to this topic or a topic string below it put to any queue manager in the cluster is propagated to subscriptions on any other queue manager in the cluster. For more details, see [Distributed publish/subscribe networks](#).

The value can be any of the following values:

Blank

If no topic object above this topic in the topic tree has set this parameter to a cluster name, then this topic does not belong to a cluster. Publications and subscriptions for this topic are not propagated to publish/subscribe cluster-connected queue managers. If a topic node higher in the topic tree has a cluster name set, publications and subscriptions to this topic are also propagated throughout the cluster.

This value is the default value for this parameter if no value is specified.

String

The topic belongs to this cluster. It is not recommended that this is set to a different cluster from a topic object above this topic object in the topic tree. Other queue managers in the cluster will honor this object's definition unless a local definition of the same name exists on those queue managers.

Additionally, if **PublicationScope** or **SubscriptionScope** are set to MQSCOPE_ALL, this value is the cluster to be used for the propagation of publications and subscriptions, for this topic, to publish/subscribe cluster-connected queue managers.

ClusterObjectState (MQCFIN)

The current state of the clustered topic definition (parameter identifier: MQIA_CLUSTER_OBJECT_STATE).

The value can be any of the following values:

MQCLST_ACTIVE

The cluster topic is correctly configured and being adhered to by this queue manager.

MQCLST_PENDING

Only seen by a hosting queue manager, this state is reported when the topic has been created but the full repository has not yet propagated it to the cluster. This might be because the host queue manager is not connected to a full repository, or because the full repository has deemed the topic to be invalid.

MQCLST_INVALID

This clustered topic definition conflicts with an earlier definition in the cluster and is therefore not currently active.

MQCLST_ERROR

An error has occurred with respect to this topic object.

This parameter is typically used to aid diagnosis when multiple definitions of the same clustered topic are defined on different queue managers, and the definitions are not identical. See [Routing for publish/subscribe clusters: Notes on behavior](#).

ClusterPubRoute (MQCFIN)

The routing behavior of publications between queue managers in a cluster (parameter identifier: MQIA_CLUSTER_PUB_ROUTE).

The value can be any of the following values:

MQCLROUTE_DIRECT

When you configure a direct routed clustered topic on a queue manager, all queue managers in the cluster become aware of all other queue managers in the cluster. When performing publish and subscribe operations, each queue manager can connect direct to any other queue manager in the cluster.

MQCLROUTE_TOPIC_HOST

When you use topic host routing, all queue managers in the cluster become aware of the cluster queue managers that host the routed topic definition (that is, the queue managers on which you have defined the topic object). When performing publish and subscribe operations, queue managers in the cluster connect only to these topic host queue managers, and not directly to each other. The topic host queue managers are responsible for routing publications from queue managers on which publications are published to queue managers with matching subscriptions.

CommInfo (MQCFST)

The name of the communication information object (parameter identifier: MQCA_COMM_INFO_NAME).

Shows the resolved value of the name of the communication information object to be used for this topic node.

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

Custom (MQCFST)

Custom attribute for new features (parameter identifier: MQCA_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes have been introduced. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs have the form NAME (VALUE).

This description will be updated when features using this attribute are introduced.

DefPersistence (MQCFIN)

Default persistence (parameter identifier: MQIA_TOPIC_DEF_PERSISTENCE).

The value can be:

MQPER_PERSISTENCE_AS_PARENT

The default persistence is based on the setting of the closest parent administrative topic object in the topic tree.

MQPER_PERSISTENT

Message is persistent.

MQPER_NOT_PERSISTENT

Message is not persistent.

DefPriority (MQCFIN)

Default priority (parameter identifier: MQIA_DEF_PRIORITY).

DefPutResponse (MQCFIN)

Default put response (parameter identifier: MQIA_DEF_PUT_RESPONSE_TYPE).

The value can be:

MQPRT_ASYNC_RESPONSE

The put operation is issued asynchronously, returning a subset of MQMD fields.

MQPRT_RESPONSE_AS_PARENT

The default put response is based on the setting of the closest parent administrative topic object in the topic tree.

MQPRT_SYNC_RESPONSE

The put operation is issued synchronously, returning a response.

DurableModelQName (MQCFST)

Name of the model queue to be used for durable managed subscriptions (parameter identifier: MQCA_MODEL_DURABLE_Q).

The maximum length of the string is MQ_Q_NAME_LENGTH.

DurableSubscriptions (MQCFIN)

Whether applications are permitted to make durable subscriptions (parameter identifier: MQIA_DURABLE_SUB).

The value can be:

MQSUB_DURABLE_AS_PARENT

Whether durable subscriptions are permitted is based on the setting of the closest parent administrative topic object in the topic tree.

MQSUB_DURABLE_ALLOWED

Durable subscriptions are permitted.

MQSUB_DURABLE_INHIBITED

Durable subscriptions are not permitted.

InhibitPublications (MQCFIN)

Whether publications are allowed for this topic (parameter identifier: MQIA_INHIBIT_PUB).

The value can be:

MQTA_PUB_AS_PARENT

Whether messages can be published to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

MQTA_PUB_INHIBITED

Publications are inhibited for this topic.

MQTA_PUB_ALLOWED

Publications are allowed for this topic.

InhibitSubscriptions (MQCFIN)

Whether subscriptions are allowed for this topic (parameter identifier: MQIA_INHIBIT_SUB).

The value can be:

MQTA_SUB_AS_PARENT

Whether applications can subscribe to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

MQTA_SUB_INHIBITED

Subscriptions are inhibited for this topic.

MQTA_SUB_ALLOWED

Subscriptions are allowed for this topic.

Multicast (MQCFIN)

Whether multicast is used for this topic (parameter identifier: MQIA_MULTICAST).

Returned value:

MQMC_ENABLED

Multicast can be used.

MQMC_DISABLED

Multicast is not used.

MQMC_ONLY

Only Multicast publish/subscribe can be used on this topic.

NonDurableModelQName (MQCFST)

Name of the model queue to be used for non-durable managed subscriptions (parameter identifier: MQCA_MODEL_NON_DURABLE_Q).

The maximum length of the string is MQ_Q_NAME_LENGTH.

NonPersistentMsgDelivery (MQCFIN)

The delivery mechanism for non-persistent messages published to this topic (parameter identifier: MQIA_NPM_DELIVERY).

The value can be:

MQDLV_AS_PARENT

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQDLV_ALL

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_DUR

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a non-persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_AVAIL

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

PersistentMsgDelivery (MQCFIN)

The delivery mechanism for persistent messages published to this topic (parameter identifier: MQIA_PM_DELIVERY).

The value can be:

MQDLV_AS_PARENT

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQDLV_ALL

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_DUR

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery

failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

MQDLV_ALL_AVAIL

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

ProxySubscriptions (MQCFIN)

Whether a proxy subscription is to be sent for this topic, even if no local subscriptions exist, to directly connected queue managers (parameter identifier: MQIA_PROXY_SUB).

The value can be:

MQTA_PROXY_SUB_FORCE

A proxy subscription is sent to connected queue managers even if no local subscriptions exist.

MQTA_PROXY_SUB_FIRSTUSE

A proxy subscription is sent for this topic only when a local subscription exists.

PublicationScope (MQCFIN)

Whether this queue manager propagates publications to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA_PUB_SCOPE).

The value can be:

MQSCOPE_ALL

Publications for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

MQSCOPE_AS_PARENT

Whether this queue manager propagates publications to queue managers as part of a hierarchy or as part of a publish/subscribe cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQSCOPE_AS_PARENT is the default value for this parameter if no value is specified.

MQSCOPE_QMGR

Publications for this topic are not propagated to other queue managers.

Note: You can override this behavior on a publication-by-publication basis, using MQPMO_SCOPE_QMGR on the Put Message Options.

QMgrName (MQCFST)

Name of local queue manager (parameter identifier: MQCA_CLUSTER_Q_MGR_NAME).

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH

SubscriptionScope (MQCFIN)

Whether this queue manager propagates subscriptions to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA_SUB_SCOPE).

The value can be:

MQSCOPE_ALL

Subscriptions for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

MQSCOPE_AS_PARENT

Whether this queue manager propagates subscriptions to queue managers as part of a hierarchy or as part of a publish/subscribe cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQSCOPE_AS_PARENT is the default value for this parameter if no value is specified.

MQSCOPE_QMGR

Subscriptions for this topic are not propagated to other queue managers.

Note: You can override this behavior on a subscription-by-subscription basis, using MQSO_SCOPE_QMGR on the Subscription Descriptor or SUBSCOPE(QMGR) on DEFINE SUB.

TopicDesc (MQCFST)

Topic description (parameter identifier: MQCA_TOPIC_DESC).

The maximum length is MQ_TOPIC_DESC_LENGTH.

TopicName (MQCFST)

Topic object name (parameter identifier: MQCA_TOPIC_NAME).

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

TopicString (MQCFST)

The topic string (parameter identifier: MQCA_TOPIC_STRING).

The '/' character within this string has special meaning. It delimits the elements in the topic tree. A topic string can start with the '/' character but is not required to. A string starting with the '/' character is not the same as the string which starts without the '/' character. A topic string cannot end with the '/' character.

The maximum length of the string is MQ_TOPIC_STR_LENGTH.

TopicType (MQCFIN)

Whether this object is a local or cluster topic (parameter identifier: MQIA_TOPIC_TYPE).

The value can be:

MQTOPT_LOCAL

This object is a local topic.

MQTOPT_CLUSTER

This object is a cluster topic.

UseDLQ (MQCFIN)

Whether the dead-letter queue (or undelivered message queue) should be used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA_USE_DEAD_LETTER_Q).

The value might be:

MQUSEDLQ_NO

Publication messages that cannot be delivered to their correct subscriber queue are treated as a failure to put the message and the application's MQPUT to a topic will fail in accordance with the settings of NPMGDLV and PMSGDLV.

MQUSEDLQ_YES

If the queue manager DEADQ attribute provides the name of a dead-letter queue then it will be used, otherwise the behaviour will be as for MQUSEDLQ_NO.

MQUSEDLQ_AS_PARENT

Whether to use the dead-letter queue is based on the setting of the closest administrative topic object in the topic tree.

WildcardOperation (MQCFIN)

Behavior of subscriptions including wildcards made to this topic (parameter identifier: MQIA_WILDCARD_OPERATION).

The value can be:

MQTA_PASSTHRU

Subscriptions made using wildcard topic names that are less specific than the topic string at this topic object receive publications made to this topic and to topic strings more specific than this topic. MQTA_PASSTHRU is the default supplied with IBM MQ.

MQTA_BLOCK

Subscriptions made using wildcard topic names that are less specific than the topic string at this topic object do not receive publications made to this topic or to topic strings more specific than this topic.

MQCMD_INQUIRE_TOPIC_NAMES (Inquire Topic Names)

The Inquire Topic Names (MQCMD_INQUIRE_TOPIC_NAMES) PCF command inquires a list of administrative topic names that match the generic topic name specified.

Required parameters

TopicName (MQCFST)

Administrative topic object name (parameter identifier: MQCA_TOPIC_NAME).

Specifies the name of the administrative topic object that information is to be returned for.

Generic topic object names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_LIVE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_LIVE is the default value if the parameter is not specified.

MQQSGD_ALL

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD_GROUP.

If MQQSGD_LIVE is specified or defaulted, or if MQQSGD_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP. MQQSGD_GROUP is permitted only in a shared queue environment.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQQSGD_PRIVATE

The object is defined as MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE returns the same information as MQQSGD_LIVE.

MQCMD_INQUIRE_TOPIC_NAMES (Inquire Topic Names) Response

The response to the Inquire Topic Names (MQCMD_INQUIRE_TOPIC_NAMES) PCF command consists of the response header followed by a parameter structure giving zero or more names that match the specified administrative topic name.

z/OS Additionally, on z/OS only, the **QSGDispositions** parameter structure (with the same number of entries as the *TopicNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *TopicNames* structure.

Always returned:

TopicNames, **z/OS** *QSGDispositions*

Returned if requested:

None

Response data**TopicNames (MQCFSL)**

List of topic object names (parameter identifier: MQCACF_TOPIC_NAMES).

z/OS QSGDispositions (MQCFIL)

List of queue sharing group dispositions (parameter identifier: MQIACF_QSG_DISPS). This parameter is valid on z/OS only. The value can be:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_GROUP

The object is defined as MQQSGD_GROUP.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

MQCMD_INQUIRE_TOPIC_STATUS (Inquire Topic Status)

The Inquire Topic Status (MQCMD_INQUIRE_TOPIC_STATUS) PCF command inquires the status of a particular topic, or of a topic and its child topics. The Inquire Topic Status command has a required parameter. The Inquire Topic Status command has optional parameters.

Required parameters**TopicString (MQCFST)**

The topic string (parameter identifier: MQCA_TOPIC_STRING).

The name of the topic string to display. IBM MQ uses the topic wildcard characters ('#' and '+') and does not treat a trailing asterisk as a wildcard. For more information about using wildcard characters, refer to the related topic.

The maximum length of the string is MQ_TOPIC_STR_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQIACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command runs on the queue manager on which you enter it.
- A queue manager name. The command runs on the queue manager that you specify, if it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which you entered the command, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (*). The command runs on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

You cannot use CommandScope as a filter parameter.

IntegerFilterCommand (MQCFIF)

Integer filter command descriptor that you use to restrict the output from the command. The parameter identifier must be an integer type and must be one of the values allowed for *MQIACF_TOPIC_SUB_STATUS*, *MQIACF_TOPIC_PUB_STATUS* or *MQIACF_TOPIC_STATUS*, except *MQIACF_ALL*.

If you specify an integer filter, you cannot also specify a string filter with the **StringFilterCommand** parameter.

StatusType (MQCFIN)

The type of status to return (parameter identifier: MQIACF_TOPIC_STATUS_TYPE).

The value can be:

MQIACF_TOPIC_STATUS
MQIACF_TOPIC_SUB
MQIACF_TOPIC_PUB

This command ignores any attribute selectors specified in the *TopicStatusAttrs* list that are not valid for the selected *StatusType* and the command raises no error.

The default value if this parameter is not specified is **MQIACF_TOPIC_STATUS**.

StringFilterCommand (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed for *MQIACF_TOPIC_SUB_STATUS*, *MQIACF_TOPIC_PUB_STATUS* or *MQIACF_TOPIC_STATUS*, except *MQIACF_ALL*, or the identifier *MQCA_TOPIC_STRING_FILTER* to filter on the topic string.

Use the parameter identifier to restrict the output from the command by specifying a filter condition. Ensure that the parameter is valid for the type selected in *StatusType*. If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

TopicStatusAttrs (MQCFIL)

Topic status attributes (parameter identifier: MQIACF_TOPIC_STATUS_ATTRS)

The default value used if the parameter is not specified is:

MQIACF_ALL

You can specify any of the parameter values listed in “[MQCMD_INQUIRE_TOPIC_STATUS \(Inquire Topic Status\) Response](#)” on page 1471. It is not an error to request status information that is not relevant for a particular status type, but the response contains no information for the value concerned.

MQCMD_INQUIRE_TOPIC_STATUS (Inquire Topic Status) Response

The response of the Inquire topic (MQCMD_INQUIRE_TOPIC_STATUS) PCF command consists of the response header, followed by the *TopicString* structure, and the requested combination of attribute parameter structures (where applicable). The Inquire Topic Status command returns the values requested when the *StatusType* is MQIACF_TOPIC_STATUS. The Inquire Topic Status command returns the values requested when the *StatusType* is MQIACF_TOPIC_STATUS_SUB. The Inquire Topic Status command returns the values requested when the *StatusType* is MQIACF_TOPIC_STATUS_PUB.

Always returned:

TopicString

Returned if requested and StatusType is MQIACF_TOPIC_STATUS:

CapExpiry, Cluster, ClusterPubRoute, CommInfo, DefPriority, DefaultPutResponse, DefPersistence, DurableSubscriptions, InhibitPublications, InhibitSubscriptions, AdminTopicName, Multicast, DurableModelQName, NonDurableModelQName, PersistentMessageDelivery, NonPersistentMessageDelivery, RetainedPublication, PublishCount, SubscriptionScope, SubscriptionCount, PublicationScope, UseDLQ

Note: The Inquire Topic Status command returns only resolved values for the topic, and no AS_PARENT values.

Returned if requested and StatusType is MQIACF_TOPIC_SUB:

SubscriptionId, SubscriptionUserId, Durable, SubscriptionType, ResumeDate, ResumeTime, LastMessageDate, LastMessageTime, NumberOfMessages, ActiveConnection

Returned if requested and StatusType is MQIACF_TOPIC_PUB:

LastPublishDate, LastPublishTime, NumberOfPublishes, ActiveConnection

Response data (TOPIC_STATUS)

Multi V 9.4.0 CapExpiry (MQCFIN)

Capped message expiry processing (parameter identifier MQIA_CAP_EXPIRY).

Specifies a lifetime limit for messages put using the object, expressed in 10ths of a second.

ClusterName (MQCFST)

The name of the cluster to which this topic belongs. (parameter identifier: MQCA_CLUSTER_NAME).

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH. Setting this parameter to a cluster that this queue manager is a member of makes all queue managers in the cluster aware of this topic. Any publication to this topic or a topic string below it put to any queue manager in the cluster is propagated to subscriptions on any other queue manager in the cluster. For more details, see [Distributed publish/subscribe networks](#).

The value can be any of the following values:

Blank

If no topic object above this topic in the topic tree has set this parameter to a cluster name, then this topic does not belong to a cluster. Publications and subscriptions for this topic are not propagated to publish/subscribe cluster-connected queue managers. If a topic node higher in the topic tree has a cluster name set, publications and subscriptions to this topic are also propagated throughout the cluster.

This value is the default value for this parameter if no value is specified.

String

The topic belongs to this cluster. It is not recommended that this is set to a different cluster from a topic object above this topic object in the topic tree. Other queue managers in the cluster will honor this object's definition unless a local definition of the same name exists on those queue managers.

Additionally, if **PublicationScope** or **SubscriptionScope** are set to MQSCOPE_ALL, this value is the cluster to be used for the propagation of publications and subscriptions, for this topic, to publish/subscribe cluster-connected queue managers.

ClusterPubRoute (MQCFIN)

The routing behavior to use for this topic in the cluster (parameter identifier: MQIA_CLUSTER_PUB_ROUTE).

The values can be as follows:

MQCLROUTE_DIRECT

A publication on this topic string, originating from this queue manager, is sent direct to any queue manager in the cluster with a matching subscription.

MQCLROUTE_TOPIC_HOST

A publication on this topic string, originating from this queue manager, is sent to one of the queue managers in the cluster that hosts a definition of the corresponding clustered topic object, and from there to any queue manager in the cluster with a matching subscription.

MQCLROUTE_NONE

This topic node is not clustered.

CommInfo (MQCFST)

The name of the communication information object (parameter identifier: MQCA_COMM_INFO_NAME).

Shows the resolved value of the name of the communication information object to be used for this topic node.

The maximum length of the string is MQ_COMM_INFO_NAME_LENGTH.

DefPersistence (MQCFIN)

Default persistence (parameter identifier: MQIA_TOPIC_DEF_PERSISTENCE).

Returned value:

MQPER_PERSISTENT

Message is persistent.

MQPER_NOT_PERSISTENT

Message is not persistent.

DefaultPutResponse (MQCFIN)

Default put response (parameter identifier: MQIA_DEF_PUT_RESPONSE_TYPE).

Returned value:

MQPRT_SYNC_RESPONSE

The put operation is issued synchronously, returning a response.

MQPRT_ASYNC_RESPONSE

The put operation is issued asynchronously, returning a subset of MQMD fields.

DefPriority (MQCFIN)

Default priority (parameter identifier: MQIA_DEF_PRIORITY).

Shows the resolved default priority of messages published to the topic.

DurableSubscriptions (MQCFIN)

Whether applications are permitted to make durable subscriptions (parameter identifier: MQIA_DURABLE_SUB).

Returned value:

MQSUB_DURABLE_ALLOWED

Durable subscriptions are permitted.

MQSUB_DURABLE_INHIBITED

Durable subscriptions are not permitted.

InhibitPublications (MQCFIN)

Whether publications are allowed for this topic (parameter identifier: MQIA_INHIBIT_PUB).

Returned value:

MQTA_PUB_INHIBITED

Publications are inhibited for this topic.

MQTA_PUB_ALLOWED

Publications are allowed for this topic.

InhibitSubscriptions (MQCFIN)

Whether subscriptions are allowed for this topic (parameter identifier: MQIA_INHIBIT_SUB).

Returned value:

MQTA_SUB_INHIBITED

Subscriptions are inhibited for this topic.

MQTA_SUB_ALLOWED

Subscriptions are allowed for this topic.

AdminTopicName (MQCFST)

Topic object name (parameter identifier: MQCA_ADMIN_TOPIC_NAME).

If the topic is an admin-node, the command displays the associated topic object name containing the node configuration. If the field is not an admin-node the command displays a blank.

The maximum length of the string is MQ_TOPIC_NAME_LENGTH.

Multicast (MQCFIN)

Whether multicast is used for this topic (parameter identifier: MQIA_MULTICAST).

Returned value:

MQMC_ENABLED

Multicast can be used.

MQMC_DISABLED

Multicast is not used.

MQMC_ONLY

Only Multicast publish/subscribe can be used on this topic.

DurableModelQName (MQCFST)

The name of the model queue used for managed durable subscriptions (parameter identifier: MQCA_MODEL_DURABLE_Q).

Shows the resolved value of the name of the model queue to be used for durable subscriptions that request the queue manager to manage the destination of publications.

The maximum length of the string is MQ_Q_NAME_LENGTH.

NonDurableModelQName (MQCFST)

The name of the model queue for managed non-durable subscriptions (parameter identifier: MQCA_MODEL_NON_DURABLE_Q).

The maximum length of the string is MQ_Q_NAME_LENGTH.

PersistentMessageDelivery (MQCFIN)

Delivery mechanism for persistent messages published to this topic (parameter identifier: MQIA_PM_DELIVERY).

Returned value:

MQDLV_ALL

Persistent messages must be delivered to all subscribers, irrespective of durability, for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

MQDLV_ALL_DUR

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

MQDLV_ALL_AVAIL

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

NonPersistentMessageDelivery (MQCFIN)

Delivery mechanism for non-persistent messages published to this topic (parameter identifier: MQIA_NPM_DELIVERY).

Returned value:

MQDLV_ALL

Non-persistent messages must be delivered to all subscribers, irrespective of durability, for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

MQDLV_ALL_DUR

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a non-persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

MQDLV_ALL_AVAIL

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

RetainedPublication (MQCFIN)

Whether there is a retained publication for this topic (parameter identifier: MQIACF_RETAINED_PUBLICATION).

Returned value:

MQQSO_YES

There is a retained publication for this topic.

MQQSO_NO

There is no retained publication for this topic.

PublishCount (MQCFIN)

Publish count (parameter identifier: MQIA_PUB_COUNT).

The number of applications currently publishing to the topic.

SubscriptionCount (MQCFIN)

Subscription count (parameter identifier: MQIA_SUB_COUNT).

The number of subscribers for this topic string, including durable subscribers who are not currently connected.

SubscriptionScope (MQCFIN)

Determines whether this queue manager propagates subscriptions for this topic to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA_SUB_SCOPE).

Returned value:

MQSCOPE_QMGR

The queue manager does not propagate subscriptions for this topic to other queue managers.

MQSCOPE_ALL

The queue manager propagates subscriptions for this topic to hierarchically connected queue managers and to publish/subscribe cluster connected queues.

PublicationScope (MQCFIN)

Determines whether this queue manager propagates publications for this topic to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA_PUB_SCOPE).

Returned value:

MQSCOPE_QMGR

The queue manager does not propagate publications for this topic to other queue managers.

MQSCOPE_ALL

The queue manager propagates publications for this topic to hierarchically connected queue managers and to publish/subscribe cluster connected queues.

UseDLQ (MQCFIN)

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA_USE_DEAD_LETTER_Q).

The value can be any of the following values:

MQUSEDLQ_NO

Publication messages that cannot be delivered to their correct subscriber queue are treated as a failure to put the message. The MQPUT of an application to a topic fails in accordance with the settings of MQIA_NPM_DELIVERY and MQIA_PM_DELIVERY.

MQUSEDLQ_YES

If the DEADQ queue manager attribute provides the name of a dead-letter queue then it is used, otherwise the behavior is as for MQUSEDLQ_NO.

Response data (TOPIC_STATUS_SUB)

SubscriptionId (MQCFBS)

Subscription identifier (parameter identifier: MQBACF_SUB_ID).

The queue manager assigns *SubscriptionId* as an all time unique identifier for this subscription.

The maximum length of the string is MQ_CORREL_ID_LENGTH.

SubscriptionUserId (MQCFST)

The user ID that owns this subscription (parameter identifier: MQCACF_SUB_USER_ID).

The maximum length of the string is MQ_USER_ID_LENGTH.

Durable (MQCFIN)

Whether this subscription is a durable subscription (parameter identifier: MQIACF_DURABLE_SUBSCRIPTION).

MQSUB_DURABLE_YES

The subscription persists, even if the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. The queue manager reinstates the subscription during restart.

MQSUB_DURABLE_NO

The subscription is non-durable. The queue manager removes the subscription when the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. If the subscription has a destination class (DESTCLAS) of MANAGED, the queue manager removes any messages not yet consumed when it closes the subscription.

SubscriptionType (MQCFIN)

The type of subscription (parameter identifier: MQIACF_SUB_TYPE).

The value can be:

MQSUBTYPE_ADMIN

MQSUBTYPE_API

MQSUBTYPE_PROXY

ResumeDate (MQCFST)

Date of the most recent MQSUB call that connected to this subscription (parameter identifier: MQCA_RESUME_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

ResumeTime (MQCFST)

Time of the most recent MQSUB call that connected to this subscription (parameter identifier: MQCA_RESUME_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

LastMessageDate (MQCFST)

Date on which an MQPUT call last sent a message to this subscription. The queue manager updates the date field after the MQPUT call successfully puts a message to the destination specified by this subscription (parameter identifier: MQCACF_LAST_MSG_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

Note: An MQSUBRQ call updates this value.

LastMessageTime (MQCFST)

Time at which an MQPUT call last sent a message to this subscription. The queue manager updates the time field after the MQPUT call successfully puts a message to the destination specified by this subscription (parameter identifier: MQCACF_LAST_MSG_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

Note: An MQSUBRQ call updates this value.

NumberOfMessages (MQCFIN)

Number of messages put to the destination specified by this subscription (parameter identifier: MQIACF_MESSAGE_COUNT).

Note: An MQSUBRQ call updates this value.

ActiveConnection (MQCFBS)

The currently active *ConnectionId* (CONNID) that opened this subscription (parameter identifier: MQBACF_CONNECTION_ID).

The maximum length of the string is MQ_CONNECTION_ID_LENGTH.

Response data (TOPIC_STATUS_PUB)**LastPublicationDate (MQCFST)**

Date on which this publisher last sent a message (parameter identifier: MQCACF_LAST_PUB_DATE).

The maximum length of the string is MQ_DATE_LENGTH.

LastPublicationTime (MQCFST)

Time at which this publisher last sent a message (parameter identifier: MQCACF_LAST_PUB_TIME).

The maximum length of the string is MQ_TIME_LENGTH.

NumberOfPublishes (MQCFIN)

Number of publishes made by this publisher (parameter identifier: MQIACF_PUBLISH_COUNT).

ActiveConnection (MQCFBS)

The currently active *ConnectionId* (CONNID) associated with the handle that has this topic open for publish (parameter identifier: MQBACF_CONNECTION_ID).

The maximum length of the string is MQ_CONNECTION_ID_LENGTH.

z/OS MQCMD_INQUIRE_USAGE (Inquire Usage) on z/OS

The Inquire Usage (MQCMD_INQUIRE_USAGE) PCF command inquires about the current state of a page set, or information about the log data sets.

Optional parameters**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

PageSetId (MQCFIN)

Page set identifier (parameter identifier: MQIA_PAGESET_ID). If you omit this parameter, all page set identifiers are returned.

UsageType (MQCFIN)

The type of information to be returned (parameter identifier: MQIACF_USAGE_TYPE).

The value can be any of the following values:

MQIACF_USAGE_PAGESET

Return page set (MQIACF_USAGE_PAGESET) and buffer pool information (MQIACF_USAGE_BUFFER_POOL).

MQIACF_USAGE_DATA_SET

Return data set information for log data sets (MQIACF_USAGE_DATA_SET).

MQIACF_ALL

Return page set, buffer pool, and data set information (MQIACF_USAGE_PAGESET), (MQIACF_USAGE_BUFFER_POOL), and (MQIACF_USAGE_DATA_SET).

MQIACF_USAGE_SMDS

Return shared message data set usage (MQIACF_USAGE_SMDS) and buffer pool information (MQIACF_USAGE_BUFFER_POOL).

This includes the allocated, and used space for each data set, and information about the number of buffers currently active, the number with valid contents, and the number of free buffers.

MQCMD_INQUIRE_USAGE (Inquire Usage) Response on z/OS

The response to the Inquire Usage (MQCMD_INQUIRE_USAGE) PCF command consists of the response header followed by one or more *UsageType* structure and a set of attribute parameter structures determined by the value of *UsageType* in the Inquire command.

Always returned:

UsageType

Possible values of *ParameterType* are:

MQIACF_USAGE_PAGESET

Page set information.

MQIACF_USAGE_BUFFER_POOL

Buffer pool information.

MQIACF_USAGE_DATA_SET

Data set information for log data sets.

MQIACF_USAGE_SMDS

Return shared message data set usage and buffer pool information.

This includes the allocated, and used space for each data set, and information about the number of buffers currently active, the number with valid contents, and the number of free buffers.

Returned if *UsageType* is MQIACF_USAGE_PAGESET:

BufferPoolId, Encrypted, ExpandCount, ExpandType, LogRBA, NonPersistentDataPages, PageSetId, PageSetStatus, PersistentDataPages, TotalPages, UnusedPages

Returned if *UsageType* is MQIACF_USAGE_BUFFER_POOL:

BufferPoolId, FreeBuffers, FreeBuffersPercentage, TotalBuffers, BufferPoolLocation, PageClass

Returned if *UsageType* is MQIACF_USAGE_DATA_SET:

DataSetName, DataSetType, LogRBA, LogLRSN

Returned if *UsageType* is MQIACF_USAGE_SMDs:

DataSetName, DataSetType, Encrypted

Response data if *UsageType* is MQIACF_USAGE_PAGESET

BufferPoolId (MQCFIN)

Buffer pool identifier (parameter identifier: MQIACF_BUFFER_POOL_ID).

This parameter identifies the buffer pool being used by the page set.

Encrypted (MQCFIN)

Shows whether the page set is encrypted (parameter identifier: MQIACF_DS_ENCRYPTED)

The value can be one of the following values:

MQSYSP_YES

The page set is encrypted.

MQSYSP_NO

The page set is not encrypted.

ExpandCount (MQCFIN)

The number of times the page set has been dynamically expanded since restart (parameter identifier: MQIACF_USAGE_EXPAND_COUNT).

ExpandType (MQCFIN)

How the queue manager expands a page set when it becomes nearly full, and further pages are required within it (parameter identifier: MQIACF_USAGE_EXPAND_TYPE).

The value can be:

MQUSAGE_EXPAND_NONE

No further page set expansion is to take place.

MQUSAGE_EXPAND_USER

The secondary extent size that was specified when the page set was defined is used. If no secondary extent size was specified, or it was specified as zero, then no dynamic page set expansion can take place.

At restart, if a previously used page set has been replaced with a data set that is smaller, it is expanded until it reaches the size of the previously used data set. Only one extent is required to reach this size.

MQUSAGE_EXPAND_SYSTEM

A secondary extent size that is approximately 10 per cent of the current size of the page set is used. MQUSAGE_EXPAND_SYSTEM can be rounded up to the nearest cylinder of DASD.

NonPersistentDataPages (MQCFIN)

The number of pages holding nonpersistent data (parameter identifier: MQIACF_USAGE_NONPERSIST_PAGES).

These pages are being used to store nonpersistent message data.

PageSetId (MQCFIN)

Page set identifier (parameter identifier: MQIA_PAGESET_ID).

The string consists of two numeric characters, in the range 00 through 99.

PageSetStatus (MQCFIN)

Current status of the page set (parameter identifier: MQIACF_PAGESET_STATUS).

The value can be any of the following values:

MQUSAGE_PS_AVAILABLE

The page set is available.

MQUSAGE_PS_DEFINED

The page set has been defined but has never been used.

MQUSAGE_PS_OFFLINE

The page set is currently not accessible by the queue manager, for example because the page set has not been defined to the queue manager.

MQUSAGE_PS_NOT_DEFINED

The command was issued for a specific page set that is not defined to the queue manager.

MQUSAGE_PS_SUSPENDED

The page set has been suspended.

PersistentDataPages (MQCFIN)

The number of pages holding persistent data (parameter identifier: MQIACF_USAGE_PERSIST_PAGES).

These pages are being used to store object definitions and persistent message data.

TotalPages (MQCFIN)

The total number of 4 KB pages in the page set (parameter identifier: MQIACF_USAGE_TOTAL_PAGES).

UnusedPages (MQCFIN)

The number of pages that are not used (that is, available page sets) (parameter identifier: MQIACF_USAGE_UNUSED_PAGES).

LogRBA (MQCFST)

Log RBA (parameter identifier: MQCACF_USAGE_LOG_RBA).

The maximum length is MQ_RBA_LENGTH.

This response is returned only if PageSetStatus is set to MQUSAGE_PS_NOT_DEFINED or MQUSAGE_PS_SUSPENDED. However, the response is not always returned if PageSetStatus is set to MQUSAGE_PS_NOT_DEFINED.

A value of 'FFFFFFFFFFFFFFFF' indicates that the page set has never been online.

Response data if UsageType is MQIACF_USAGE_BUFFER_POOL**BufferPoolId (MQCFIN)**

Buffer pool identifier (parameter identifier: MQIACF_BUFFER_POOL_ID).

This parameter identifies the buffer pool being used by the page set.

FreeBuffers (MQCFIN)

Number of free buffers (parameter identifier: MQIACF_USAGE_FREE_BUFF).

FreeBuffersPercentage (MQCFIN)

Number of free buffers as a percentage of all buffers in the buffer pool (parameter identifier: MQIACF_USAGE_FREE_BUFF_PERC).

TotalBuffers (MQCFIN)

The number of buffers defined for specified buffer pool (parameter identifier: MQIACF_USAGE_TOTAL_BUFFERS).

BufferPoolLocation (MQCFIN)

The location of the buffers in this buffer pool relative to the bar. This is one of the following values:

MQBPLOCATION_ABOVE

All buffer pool buffers are above the bar.

MQBPLOCATION_BELOW

All buffer pool buffers are below the bar.

MQBPLOCATION_SWITCHING_ABOVE

Buffer pool buffers are being moved above the bar.

MQBPLOCATION_SWITCHING_BELOW

Buffer pool buffers are being moved below the bar.

PageClass (MQCFIN)

The type of virtual storage pages used for backing the buffers in the buffer pool. This is one of the following values:

MQPAGECLAS_4KB

Pageable 4 KB pages are used.

MQPAGECLAS_FIXED4KB

Fixed 4 KB pages are used.

Response data if UsageType is MQIACF_USAGE_DATA_SET**DataSetName (MQCFST)**

Data set name (parameter identifier: MQCACF_DATA_SET_NAME).

The maximum length is MQ_DATA_SET_NAME_LENGTH.

DataSetType (MQCFIN)

The type of data set, and circumstance (parameter identifier: MQIACF_USAGE_DATA_SET_TYPE).

The value can be:

MQUSAGE_DS_OLDEST_ACTIVE_UOW

The log data set containing the start RBA of the oldest active unit of work for the queue manager

MQUSAGE_DS_OLDEST_PS_RECOVERY

The log data set containing the oldest restart RBA of any page set for the queue manager.

MQUSAGE_DS_OLDEST_CF_RECOVERY

The log data set containing the LRSN which matches the time of the oldest current backup of any CF structure in the queue sharing group.

LogRBA (MQCFST)

Log RBA (parameter identifier: MQCACF_USAGE_LOG_RBA).

The maximum length is MQ_RBA_LENGTH.

LogLRSN (MQCFST)

Log LRSN (parameter identifier: MQIACF_USAGE_LOG_LRSN).

The length of the string is MQ_LRSN_LENGTH.

Response data if UsageType is MQIACF_USAGE_SMDS**Encrypted (MQCFIN)**

Shows whether the SMDS is encrypted (parameter identifier: MQIACF_DS_ENCRYPTED)

The value can be one of the following values:

MQSYSP_YES

The SMDS is encrypted.

MQSYSP_NO

The SMDS is not encrypted.

SMDSStatus (MQCFIN)

SMDS status (parameter identifier: MQIACF_SMDS_STATUS).

MQUSAGE_SMDS_NO_DATA

There is no SMDS data available. Nothing further is returned.

MQUSAGE_SMDS_AVAILABLE

For each CF structure two sets of PCF data are returned:

A

CFStrucNames (MQCFSL)

List of CF application structure names (parameter identifier: MQCACF_CF_STRUC_NAME).

MQIACF_USAGE_OFFLOAD_MSGS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_OFFLOAD_MSGS).

MQIACF_USAGE_TOTAL_BLOCKS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_TOTAL_BLOCKS).

MQIACF_USAGE_DATA_BLOCKS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_DATA_BLOCKS).

MQIACF_USAGE_USED_BLOCKS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_USED_BLOCKS).

MQIACF_USAGE_USED_RATE (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_USED_RATE).

MQIACF_SMDS_STATUS (MQCFIN)

Description required (parameter identifier: MQIACF_SMDS_STATUS). The value is MQUSAGE_SMDS_AVAILABLE.

MQIACF_USAGE_TYPE (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_TYPE).

B

CFStrucNames (MQCFSL)

List of CF application structure names (parameter identifier: MQCACF_CF_STRUC_NAME).

MQIACF_USAGE_BLOCK_SIZE (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_BLOCK_SIZE).

MQIACF_USAGE_TOTAL_BUFFERS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_TOTAL_BUFFERS).

MQIACF_USAGE_INUSE_BUFFERS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_INUSE_BUFFERS).

MQIACF_USAGE_SAVED_BUFFERS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_SAVED_BUFFERS).

MQIACF_USAGE_EMPTY_BUFFERS (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_EMPTY_BUFFERS).

MQIACF_USAGE_READS_SAVED (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_READS_SAVED).

MQIACF_USAGE_LOWEST_FREE (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_LOWEST_FREE).

MQIACF_USAGE_WAIT_RATE (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_WAIT_RATE).

MQIACF_SMDS_STATUS (MQCFIN)

Description required (parameter identifier: MQIACF_SMDS_STATUS). The value is MQUSAGE_SMDS_AVAILABLE.

MQIACF_USAGE_TYPE (MQCFIN)

Description required (parameter identifier: MQIACF_USAGE_TYPE).

MQCMD_MOVE_Q (Move Queue) on z/OS

The Move Queue (MQCMD_MOVE_Q) PCF command moves all the messages from one local queue to another.

Required parameters

FromQName (MQCFST)

From queue name (parameter identifier: MQCACF_FROM_Q_NAME).

The name of the local queue from which messages are moved. The name must be defined to the local queue manager.

The command fails if the queue contains uncommitted messages.

If an application has this queue open, or has open a queue that eventually resolves to this queue, the command fails. For example, the command fails if this queue is a transmission queue, and any queue that is, or resolves to, a remote queue that references this transmission queue, is open.

An application can open this queue while the command is in progress but the application waits until the command has completed.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Optional parameters (Move Queue)

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

MoveType (MQCFIN)

Move type (parameter identifier: MQIA_QSG_DISP).

Specifies how the messages are moved. The value can be any of the following values:

MQIACF_MOVE_TYPE_MOVE

Move the messages from the source queue to the empty target queue.

The command fails if the target queue already contains one or more messages. The messages are deleted from the source queue. MQIACF_MOVE_TYPE_MOVE is the default value.

MQIACF_MOVE_TYPE_ADD

Move the messages from the source queue and add them to any messages already on the target queue.

The messages are deleted from the source queue.

QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

MQQSGD_PRIVATE

The object is defined as either MQQSGD_Q_MGR or MQQSGD_COPY. MQQSGD_PRIVATE is the default value.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED. MQQSGD_SHARED is valid only in a shared queue environment.

ToQName (MQCFST)

To queue name (parameter identifier: MQCACF_TO_Q_NAME).

The name of the local queue to which messages are moved. The name must be defined to the local queue manager.

The name of the target queue can be the same as the name of the source queue only if the queue exists as both a shared and a private queue. In this case, the command moves messages to the queue that has the opposite disposition (shared or private) from that disposition specified for the source queue on the **QSGDisposition** parameter.

If an application has this queue open, or has open a queue that eventually resolves to this queue, the command fails. The command also fails if this queue is a transmission queue, and any queue that is, or resolves to, a remote queue that references this transmission queue, is open.

No application can open this queue while the command is in progress.

If you specify a value of MQIACF_MOVE_TYPE_MOVE on the **MoveType** parameter, the command fails if the target queue already contains one or more messages.

The **DefinitionType**, **HardenGetBackout**, **Usage** parameters of the target queue must be the same as those parameters of the source queue.

The maximum length of the string is MQ_Q_NAME_LENGTH.

MQCMD_PING_CHANNEL (Ping Channel)

The Ping Channel (MQCMD_PING_CHANNEL) PCF command tests a channel by sending data as a special message to the remote message queue manager and checking that the data is returned. The data is generated by the local queue manager.

This command can only be used for channels with a *ChannelType* value of MQCHT_SENDER, MQCHT_SERVER, or MQCHT_CLUSSDR.

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

The command is not valid if the channel is running; however it is valid if the channel is stopped or in retry mode.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel to be tested. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Optional parameters

DataCount (MQCFIN)

Data count (parameter identifier: MQIACH_DATA_COUNT).

Specifies the length of the data.

Specify a value in the range 16 through 32 768. The default value is 64 bytes.

z/OS CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

z/OS ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH_CHANNEL_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be tested.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

MQCHLD_PRIVATE

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD_SHARED.

MQCHLD_SHARED

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD_SHARED.

MQCHLD_FIXSHARED

Tests shared channels, tied to a specific queue manager.

The combination of the **ChannelDisposition** and **CommandScope** parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.
- On the most suitable queue manager in the group, determined automatically by the queue manager itself.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in [Table 213 on page 1484](#)

<i>Table 213. ChannelDisposition and CommandScope for PING CHANNEL</i>			
ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name	CommandScope (*)
MQCHLD_PRIVATE	Ping private channel on the local queue manager	Ping private channel on the named queue manager	Ping private channel on all active queue managers

Table 213. ChannelDisposition and CommandScope for PING CHANNEL (continued)

ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name	CommandScope (*)
MQCHLD_SHARED	<p>Ping a shared channel on the most suitable queue manager in the group</p> <p>MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted	Not permitted
MQCHLD_FIXSHARED	Ping a shared channel on the local queue manager	Ping a shared channel on the named queue manager	Not permitted

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands”](#) on page 1018.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_ALLOCATE_FAILED

Allocation failed.

MQRCCF_BIND_FAILED

Bind failed.

MQRCCF_CCSID_ERROR

Coded character-set identifier error.

MQRCCF_CHANNEL_CLOSED

Channel closed.

MQRCCF_CHANNEL_IN_USE

Channel in use.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHANNEL_TYPE_ERROR

Channel type not valid.

MQRCCF_CONFIGURATION_ERROR

Configuration error.

MQRCCF_CONNECTION_CLOSED

Connection closed.

MQRCCF_CONNECTION_REFUSED

Connection refused.

MQRCCF_DATA_TOO_LARGE

Data too large.

MQRCCF_ENTRY_ERROR

Connection name not valid.

MQRCCF_HOST_NOT_AVAILABLE

Remote system not available.

MQRCCF_NO_COMMS_MANAGER

Communications manager not available.

MQRCCF_PING_DATA_COMPARE_ERROR

Ping Channel command failed.

MQRCCF_PING_DATA_COUNT_ERROR

Data count not valid.

MQRCCF_PING_ERROR

Ping error.

MQRCCF_RECEIVE_FAILED

Receive failed.

MQRCCF_RECEIVED_DATA_ERROR

Received data error.

MQRCCF_REMOTE_QM_TERMINATING

Remote queue manager terminating.

MQRCCF_REMOTE_QM_UNAVAILABLE

Remote queue manager not available.

MQRCCF_SEND_FAILED

Send failed.

MQRCCF_STRUCTURE_TYPE_ERROR

Structure type not valid.

MQRCCF_TERMINATED_BY_SEC_EXIT

Channel terminated by security exit.

MQRCCF_UNKNOWN_REMOTE_CHANNEL

Remote channel not known.

MQRCCF_USER_EXIT_NOT_AVAILABLE

User exit not available.

Multi MQCMD_PING_Q_MGR (Ping Queue Manager) on Multiplatforms

The Ping Queue Manager (MQCMD_PING_Q_MGR) PCF command tests whether the queue manager and its command server is responsive to commands. If the queue manager is responding a positive reply is returned.

Required parameters:

None

Optional parameters:

None

ALW MQCMD_PURGE_CHANNEL (Purge Channel) on AIX, Linux, and Windows

The Purge Channel (MQCMD_PURGE_CHANNEL) PCF command stops and purges an IBM MQ telemetry or AMQP channel.

This command can only be issued to channel of type MQTT or AMQP.

Purging a telemetry or AMQP channel disconnects all the MQTT or AMQP clients connect to it, cleans up the state of the MQTT or AMQP clients, and stops the telemetry or AMQP channel. Cleaning the state of a client deletes all the pending publications and removes all the subscriptions from the client.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel to be stopped and purged. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Optional parameters

ChannelType (MQCFIN)

Channel type (parameter identifier: MQIACH_CHANNEL_TYPE).

This parameter is required to purge an MQTT channel. It can not be specified for other types of channels. If specified, this parameter must follow immediately after the **ChannelName** parameter, and the value must be MQCHT_MQTT.

ClientIdentifier (MQCFST)

Client identifier (parameter identifier: MQCACH_CLIENT_ID).

The client identifier is a 23 byte string that identifies an MQ Telemetry Transport or AMQP client. When the Purge Channel command specifies a *ClientIdentifier*, only the connection for the specified client identifier is purged. If the *ClientIdentifier* is not specified, all the connections on the channel are purged.

The maximum length of the string is MQ_CLIENT_ID_LENGTH.

z/OS MQCMD_RECOVER_CF_STRUC (Recover CF Structure) on z/OS

The Recover CF Structure (MQCMD_RECOVER_CF_STRUC) PCF command initiates recovery of CF application structures.

Note: This command is valid only on z/OS when the queue manager is a member of a queue sharing group.

Required parameters

CFStrucName (MQCFST)

CF application structure name (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.

- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_Q_MGR_NAME_LENGTH.

Purge (MQCFIN)

Recover to empty CF structure (parameter identifier: MQIACF_PURGE).

Specifies whether the CF application structure is emptied. The value can be any of the following values:

MQPO_YES

Recover to empty CF structure. Any messages in the CF structure are lost.

MQPO_NO

Performs a true recovery of the CF structure. MQPO_NO is the default value.

MQCMD_REFRESH_CLUSTER (Refresh Cluster)

The Refresh Cluster (MQCMD_REFRESH_CLUSTER) PCF command discards all locally held cluster information, including any auto-defined channels that are not in doubt, and forces the repository to be rebuilt.

Note: For large clusters, use of the **REFRESH CLUSTER** command can be disruptive to the cluster while it is in progress, and again at 27 day intervals thereafter when the cluster objects automatically send status updates to all interested queue managers. See [Refreshing in a large cluster can affect performance and availability of the cluster](#).

Required parameters

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

The name of the cluster to be refreshed.

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

This parameter is the name of the cluster to be refreshed. If an asterisk (*) is specified for the name, the queue manager is refreshed in all the clusters to which it belongs.

If an asterisk (*) is specified with *RefreshRepository* set to MQCFO_REFRESH_REPOSITORY_YES, the queue manager restarts its search for repository queue managers, using information in the local cluster-sender channel definitions.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

RefreshRepository (MQCFIN)

Whether repository information is refreshed (parameter identifier: MQIACF_REFRESH_REPOSITORY).

This parameter indicates whether the information about repository queue managers is refreshed.

The value can be:

MQCFO_REFRESH_REPOSITORY_YES

Refresh repository information.

This value cannot be specified if the queue manager is itself a repository queue manager.

MQCFO_REFRESH_REPOSITORY_YES specifies that in addition to MQCFO_REFRESH_REPOSITORY_NO behavior, objects representing full repository cluster queue managers are also refreshed. Do not use this option if the queue manager is itself a full repository.

If it is a full repository, you must first alter it so that it is not a full repository for the cluster in question.

The full repository location is recovered from the manually defined cluster-sender channel definitions. After the refresh with MQCFO_REFRESH_REPOSITORY_YES has been issued the queue manager can be altered so that it is once again a full repository.

MQCFO_REFRESH_REPOSITORY

Do not refresh repository information. MQCFO_REFRESH_REPOSITORY is the default.

If you select MQCFO_REFRESH_REPOSITORY_YES, check that all cluster-sender channels in the relevant cluster are inactive or stopped before you issue the Refresh Cluster command. If there are cluster-sender channels running at the time when the Refresh is processed, and they are used exclusively by the cluster or clusters being refreshed and MQCFO_REFRESH_REPOSITORY_YES is used, the channels are stopped, by using the Stop Channel command with a value of MQMODE_FORCE in the **Mode** parameter if necessary.

This scenario ensures that the Refresh can remove the channel state and that the channel will run with the refreshed version after the Refresh has completed. If the state of a channel cannot be deleted, for example because it is in doubt, or because it is also running as part of another cluster, its state is not new after the refresh and it does not automatically restart if it was stopped.

Related information

[Clustering: Using REFRESH CLUSTER best practices](#)

MQCMD_REFRESH_Q_MGR (Refresh Queue Manager)

Use the Refresh Queue Manager (MQCMD_REFRESH_Q_MGR) PCF command to perform special operations on queue managers.

Required parameters

RefreshType (MQCFIN)

Type of information to be refreshed (parameter identifier: MQIACF_REFRESH_TYPE).

Use this parameter to specify the type of information to be refreshed. The value can be any of the following values:

MQRT_CONFIGURATION

MQRT_CONFIGURATION causes the queue manager to generate configuration event messages for every object definition that matches the selection criteria specified by the **ObjectType**, **ObjectName**, and **RefreshInterval** parameters.

A Refresh Queue Manager command with a **RefreshType** value of MQRT_CONFIGURATION is generated automatically when the value of the queue manager's **ConfigurationEvent** parameter changes from MQEVR_DISABLED to MQEVR_ENABLED.

Use this command with a **RefreshType** of MQRT_CONFIGURATION to recover from problems such as errors on the event queue. In such cases, use appropriate selection criteria, to avoid excessive processing time and event message generation.

MQRT_EXPIRY

This requests that the queue manager performs a scan to discard expired messages for every queue that matches the selection criteria specified by the **ObjectName** parameter.

Note:  Valid only on z/OS.

MQRT_EARLY

Requests that the subsystem function routines (generally known as early code) for the queue manager replace themselves with the corresponding routines in the linkpack area (LPA).

You need to use this command only after you install new subsystem function routines (provided as corrective maintenance or with a new version or release of IBM MQ). This command instructs the queue manager to use the new routines.

 See [Task 3: Update the z/OS link list and LPA](#) for more information about IBM MQ early code routines.

MQRT_PROXYSUB

Requests that the queue manager resynchronizes the proxy subscriptions that are held with, and on behalf of, queue managers that are connected in a hierarchy or publish/subscribe cluster.

You should only resynchronize the proxy subscriptions in exceptional circumstances. See [Resynchronization of proxy subscriptions](#).

Optional parameters (Refresh Queue Manager)

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

ObjectName (MQCFST)

Name of object to be included in the processing of this command (parameter identifier: MQCACF_OBJECT_NAME).

Use this parameter to specify the name of the object to be included in the processing of this command.

Generic names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ_OBJECT_NAME_LENGTH.

ObjectType (MQCFIN)

Object type for which configuration data is to be refreshed (parameter identifier: MQIACF_OBJECT_TYPE).

Use this parameter to specify the object type for which configuration data is to be refreshed. This parameter is valid only if the value of *RefreshType* is MQRT_CONFIGURATION. The default value, in that case, is MQOT_ALL. The value can be one of:

MQOT_AUTH_INFO

Authentication information object.

MQOT_CF_STRUC

CF structure.

MQOT_CHANNEL

Channel.

MQOT_CHLAUTH

Channel authentication

MQOT_LISTENER

Listener.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process definition.

MQOT_Q

Queue.

MQOT_LOCAL_Q

Local queue.

MQOT_MODEL_Q

Model queue.

MQOT_ALIAS_Q

Alias queue.

MQOT_REMOTE_Q

Remote queue.

MQOT_Q_MGR

Queue manager.

MQOT_CFSTRUC

CF structure.

MQOT_SERVICE

Service.

Note:  z/OS Not valid on z/OS.

MQOT_STORAGE_CLASS

Storage class.

MQOT_TOPIC

Topic name.

RefreshInterval (MQCFIN)

Refresh interval (parameter identifier: MQIACF_REFRESH_INTERVAL).

Use this parameter to specify a value, in minutes, defining a period immediately before the current time. This requests that only objects that have been created or altered within that period (as defined by their *AlterationDate* and **AlterationTime** attributes) are included.

Specify a value in the range zero through 999 999. A value of zero means there is no time limit (0 is the default).

This parameter is valid only if the value of *RefreshType* is MQRT_CONFIGURATION.

Usage Notes for Refresh Queue Manager

1. Issue this command with *RefreshType*(MQRT_CONFIGURATION) after setting the MQRT_CONFIGURATION queue manager attribute to ENABLED, to bring the queue manager configuration up to date. To ensure that complete configuration information is generated, include

all objects; if you have many objects, it might be preferable to use several commands, each with a different selection of objects, but such that all are included.

2. You can also use the command with *RefreshType*(MQRT_CONFIGURATION) to recover from problems such as errors on the event queue. In such cases, use appropriate selection criteria, to avoid excessive processing time and event messages generation.
3. Issue the command with *RefreshType* (MQRT_EXPIRY) at any time when you believe that a queue could contain numbers of expired messages.
4. If *RefreshType* (MQRT_EARLY) is specified, no other keywords are allowed and the command can be issued only from the z/OS console and only if the queue manager is not active.
5. You are unlikely to use **Refresh Queue Manager RefreshType (MQRT_PROXYSUB)** other than in exceptional circumstances. See [Resynchronization of proxy subscriptions](#).
6. If a **Refresh Queue Manager Object Type(MQRT_PROXYSUB)** command is issued on z/OS when the CHINIT is not running, the command is queued up and will be processed when the CHINIT starts.
7. Running the command Refresh Queue Manager RefreshType (MQRT_CONFIGURATION) Object Type(MQOT_ALL) includes authority records.

You cannot specify the **Refresh Interval** and **Object Name** parameters if you explicitly specify Authority Record events. If you specify **Object Type(MQOT_ALL)** the **Refresh Interval** and **Object Name** parameters are ignored.

MQCMD_REFRESH_SECURITY (Refresh Security)

The Refresh Security (MQCMD_REFRESH_SECURITY) PCF command refreshes the list of authorizations held internally by the authorization service component.

Optional parameters

z/OS CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

z/OS SecurityItem (MQCFIN)

Resource class for which the security refresh is to be performed (parameter identifier: MQIACF_SECURITY_ITEM). This parameter applies to z/OS only.

Use this parameter to specify the resource class for which the security refresh is to be performed. The value can be any of the following values:

MQSECITEM_ALL

A full refresh of the type specified is performed. MQSECITEM_ALL is the default value.

MQSECITEM_MQADMIN

Specifies that administration type resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MQNLIST

Specifies that namelist resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MQPROC

Specifies that process resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MQQUEUE

Specifies that queue resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MXADMIN

Specifies that administration type resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MXNLIST

Specifies that namelist resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MXPROC

Specifies that process resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MXQUEUE

Specifies that queue resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

MQSECITEM_MXTOPIC

Specifies that topic resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE_CLASSES.

SecurityType (MQCFIN)

Security type (parameter identifier: MQIACF_SECURITY_TYPE).

Use this parameter to specify the type of security refresh to be performed. The value can be any of the following values:

Multi **MQSECTYPE_AUTHSERV**

The list of authorizations held internally by the authorization services component is refreshed. Valid only on Multiplatforms, on which it is the default value.

z/OS **MQSECTYPE_CLASSES**

Permits you to select specific resource classes for which to perform the security refresh. Valid only on z/OS, on which it is the default value.

MQSECTYPE_CONNAUTH

Refreshes the cached view of the configuration for connection authentication.

Multi On Multiplatforms this is also a synonym for MQSECTYPE_AUTHSERV.

MQSECTYPE_SSL

MQSECTYPE_SSL refreshes the locations of the LDAP servers to be used for Certified Revocation Lists and the key repository. It also refreshes any cryptographic hardware parameters specified through IBM MQ and the cached view of the Secure Sockets Layer key repository. It also allows updates to become effective on successful completion of the command.

MQSECTYPE_SSL updates all TLS channels currently running, as follows:

- Sender, server, and cluster-sender channels using TLS are allowed to complete the current batch. In general, they then run the TLS handshake again with the refreshed view of the TLS key repository. However, you must manually restart a requester-server channel on which the server definition has no CONNAME parameter.
- AMQP channels using TLS are restarted, with any currently connected clients being forcibly disconnected. The client receives an `amqp:connection:forced` AMQP error message.

- All other channel types using TLS are stopped with a STOP CHANNEL MODE(FORCE) STATUS(INACTIVE) command. If the partner end of the stopped message channel has retry values defined, the channel tries again and the new TLS handshake uses the refreshed view of the contents of the TLS key repository, the location of the LDAP server to be used for Certification Revocation Lists, and the location of the key repository. If there is a server-connection channel, the client application loses its connection to the queue manager and must reconnect in order to continue.

MQCMD_RESET_CF_STRUC (Reset coupling facility structure) on z/OS

The Reset coupling facility (CF) structure (MQCMD_RESET_CF_STRUC) PCF command modifies the status of a specific application structure.

Required parameters

CFStructName (MQCFST)

The name of the coupling facility application structure that you want to reset (parameter identifier: MQCA_CF_STRUC_NAME). The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

Action (MQCFIN)

The action to perform to reset the named application structure (parameter identifier: MQIACF_ACTION).

MQACT_FAIL

A structure failure is simulated and the status of the application structure is set to FAILED.

Note: Failing a structure deletes all nonpersistent messages stored in the structure, and makes the structure unavailable until recovery is complete. Structure recovery can take a long time to complete. Therefore, this action should be used only in a situation where you can resolve a problem with the structure by forcing the structure to be reallocated and recovered.

MQCMD_RESET_CHANNEL (Reset Channel)

The Reset Channel (MQCMD_RESET_CHANNEL) PCF command resets the message sequence number for an IBM MQ channel with, optionally, a specified sequence number to be used the next time that the channel is started.

This command can be issued to a channel of any type (except MQCHT_SVRCONN and MQCHT_CLNTCONN). However, if it is issued to a sender (MQCHT_SENDER), server (MQCHT_SERVER), or cluster-sender (MQCHT_CLUSSDR) channel, the value at both ends (issuing end and receiver or requester end), is reset when the channel is next initiated or resynchronized. The value at both ends is reset to be equal.

If the command is issued to a receiver (MQCHT_RECEIVER), requester (MQCHT_REQUESTER), or cluster-receiver (MQCHT_CLUSRCVR) channel, the value at the other end is not reset as well; this step must be done separately if necessary.

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel to be reset. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Optional parameters

z/OS **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

z/OS **ChannelDisposition (MQCFIN)**

Channel disposition (parameter identifier: MQIACH_CHANNEL_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be reset.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

MQCHLD_PRIVATE

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD_SHARED.

MQCHLD_SHARED

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD_SHARED.

The combination of the **ChannelDisposition** and **CommandScope** parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in [Table 214 on page 1495](#)

ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name
MQCHLD_PRIVATE	Reset private channel on the local queue manager	Reset private channel on the named queue manager

<i>Table 214. ChannelDisposition and CommandScope for RESET CHANNEL (continued)</i>		
ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name
MQCHLD_SHARED	<p>Reset a shared channel on all active queue managers.</p> <p>MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted

MsgSeqNumber (MQCFIN)

Message sequence number (parameter identifier: MQIACH_MSG_SEQUENCE_NUMBER).

Specifies the new message sequence number.

The value must be in the range 1 through 999 999 999. The default value is one.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQCMD_RESET_CLUSTER (Reset Cluster)

The Reset Cluster (MQCMD_RESET_CLUSTER) PCF command forces a queue manager to leave a cluster.

Required parameters

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

The name of the cluster to be reset.

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

QMgrIdentifier (MQCFST)

Queue manager identifier (parameter identifier: MQCA_Q_MGR_IDENTIFIER).

This parameter is the unique identifier of the queue manager to be forcibly removed from the cluster. Only one of *QMgrIdentifier* and *QMgrName* can be specified. Use *QMgrIdentifier* in preference to *QMgrName*, because *QMgrName* might not be unique.

QMgrName (MQCFST)

Queue manager name (parameter identifier: MQCA_Q_MGR_NAME).

This parameter is the name of the queue manager to be forcibly removed from the cluster. Only one of `QMgrIdentifier` and `QMgrName` can be specified. Use `QMgrIdentifier` in preference to `QMgrName`, because `QMgrName` might not be unique.

Action (MQCFIN)

Action (parameter identifier: `MQIACF_ACTION`).

Specifies the action to take place. This parameter can be requested only by a repository queue manager.

The value can be any of the following values:

MQACT_FORCE_REMOVE

Requests that a queue manager is forcibly removed from a cluster.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: `MQCACF_COMMAND_SCOPE`). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is `MQ_QSG_NAME_LENGTH`.

RemoveQueues (MQCFIN)

Whether cluster queues are removed from the cluster (parameter identifier: `MQIACF_REMOVE_QUEUES`).

This parameter indicates whether the cluster queues that belong to the queue manager being removed from the cluster are to be removed from the cluster. This parameter can be specified even if the queue manager identified by the `QMgrName` parameter is not currently in the cluster.

The value can be any of the following values:

MQCFO_REMOVE_QUEUES_YES

Remove queues belonging to the queue manager being removed from the cluster.

MQCFO_REMOVE_QUEUES_NO

Do not remove queues belonging to the queue manager being removed.
`MQCFO_REMOVE_QUEUES_NO` is the default.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_ACTION_VALUE_ERROR

Value not valid.

MQCMD_RESET_Q_MGR (Reset Queue Manager)

Use the Reset Queue Manager (`MQCMD_RESET_Q_MGR`) PCF command as part of your backup and recovery procedures. The **Archive** option enables you to notify the queue manager that all log extents,

up to the specified one, have been archived. If the log management type is not **ArchivedLog** the command fails. The **ReduceLog** option enables you to request that the queue manager reduces the number of log extents, provided they are no longer required.

You can use this command to request that the queue manager starts writing to a new log extent, making the previous log extent available for archiving.

Use the Reset Queue Manager (MQCMD_RESET_Q_MGR) command to forcibly remove a publish/subscribe hierarchical connection for which this queue manager is nominated as either the parent or the child in a hierarchical connection. Valid on all supported platforms.

Archive option

This option requires change authority on the queue manager object.

The command fails if the log extent is not recognized, or is being written.

If, for some reason, the programmatic way that your enterprise notifies your log extents are archived is not working, and the disk is filling up with log extents, your administrator can use this command.

You need to determine yourself, the name to pass in from your archiving process, as to what has already been archived.

This option is not valid on IBM i.

ReduceLog option

This option requires change authority on the queue manager object.

You should not need this command in normal circumstances. In general, when using automatic management of log files, you should leave it up to the queue manager to reduce the number of log extents as necessary.

For circular logging, this can remove inactive secondary log extents. The increase in secondary log extents is usually noticed by an increase in disk usage, often due to some specific issue in the past.

Note: For circular logging the command might not be able reduce the log extents by the required number immediately. In that case, the command returns, and the reduction takes place asynchronously at some later point.

For linear logging this can remove log extents that are not required for recovery (and have been archived) as noticed by a high value for [ReusableLogSize](#) on the Inquire Queue Manager Status command.

You should run this command only after some specific event that has caused the number of log extents to be extraordinarily large.

The command blocks until the chosen number of extents have been deleted. Note that the command does not return the number of extents that have been removed, but a queue manager error log message is written, indicating what has taken place.

This option is not valid on IBM i.

Required parameters

Action (MQCFIN)

Action (parameter identifier: MQIACF_ACTION).

Specifies the action to take place.

The value can be any of the following values, but you can specify one only:

MQACT_ADVANCE_LOG

Requests that the queue manager starts writing to a new log extent, making the previous log extent available for archiving. This command is accepted only if the queue manager is configured to use linear logging.

Note: Not valid on z/OS.

MQACT_COLLECT_STATISTICS

Requests that the queue manager ends the current statistics collection period, and writes the statistics collected.

Note: Not valid on z/OS.

MQACT_PUBSUB

Requests a publish/subscribe reset. This value requires that one of the optional parameters, ChildName or ParentName, is specified.

MQACT_ARCHIVE_LOG (11)

Requests that log extents are archived.

The command fails if the log extent is not recognized, or is the current log.

If, for some reason, the programmatic way that your enterprise notifies your log extents are archived is not working, and the disk is filling up with log extents, your administrator can use this command.

MQACT_REDUCE_LOG (10)

You should not need this command in normal circumstances. In general, when using automatic management of log files, you should leave it up to the queue manager to reduce the number of log extents as necessary.

For circular logging, you can use this option to remove inactive secondary log extents. A growth in secondary log extents is usually noticed by an increase in disk usage, often due to some specific issue in the past.

You should run this command only after some specific event that has caused the number of log extents to be extraordinarily large.

The command blocks until the chosen number of extents have been deleted. Note that the command does not return the number of extents that have been removed, but a queue manager error log message is written, indicating what has taken place.

Optional parameters

ArchivedLog (MQCFST)

Specifies the name of the log extent to be archived (parameter identifier: MQCACF_ARCHIVE_LOG_EXTENT_NAME).

The maximum length of the string is MQ_LOG_EXTENT_NAME_LENGTH.

ChildName (MQCFST)

The name of the child queue manager for which the hierarchical connection is to be forcibly canceled (parameter identifier: MQCA_CHILD).

This attribute is valid only when the Action parameter has the value MQACT_PUBSUB.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

ParentName (MQCFST)

The name of the parent queue manager for which the hierarchical connection is to be forcibly canceled (parameter identifier: MQCA_PARENT).

This attribute is valid only when the Action parameter has the value MQACT_PUBSUB.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

LogReduction (MQCFIN)

Specifies that the type of log reduction (parameter identifier: MQIACF_LOG_REDUCTION).

The value can be one of:

MQLR_AUTO

-1. The default value. Reduce the log extents by an amount chosen by the queue manager.

MQLR_ONE

1. Reduce the log extents by one extent, if possible.

MQLR_MAX

-2. Reduce the log extents by the maximum number possible.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CURRENT_LOG_EXTENT

The specified log extent is the current log extent, and cannot have been validly archived yet.

MQRCCF_LOG_EXTENT_NOT_FOUND

The specified log extent was not found or is not valid.

MQRCCF_LOG_NOT_REDUCED

No log events could be removed.

MQRC_RESOURCE_PROBLEM

Insufficient system resources available.

MQCMD_RESET_Q_STATS (Reset Queue Statistics)

The Reset Queue Statistics (MQCMD_RESET_Q_STATS) PCF command reports the performance data for a queue and then resets the performance data. Performance data is maintained for each local queue (including transmission queues).

Performance data is reset at the following times:

- When a Reset Queue Statistics command is issued
- When the queue manager is restarted
- When a performance event is generated for a queue

Required parameters**QName (MQCFST)**

Queue name (parameter identifier: MQCA_Q_NAME).

The name of the local queue to be tested and reset.

Generic queue names are supported. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Optional parameters** CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.

- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_Q_WRONG_TYPE

Action not valid for the queue of specified type.

MQRCCF_EVENTS_DISABLED

The queue manager performance events are disabled (PERFMEV). On z/OS, you must enable queue manager performance events to use this command. For more details, see the **PerformanceEvent** property in the [“MQCMD_CHANGE_Q_MGR \(Change Queue Manager\)” on page 1134](#) command.

MQCMD_RESET_Q_STATS (Reset Queue Statistics) Response

The response to the Reset Queue Statistics (MQCMD_RESET_Q_STATS) PCF command consists of the response header followed by the *QName* structure and the attribute parameter structures shown in the following sections.

If a generic queue name was specified, one such message is generated for each queue found.

Always returned:

HighQDepth, MsgDeqCount, MsgEnqCount, QName, z/OS QSGDisposition, TimeSinceReset

Response data

HighQDepth (MQCFIN)

Maximum number of messages on a queue (parameter identifier: MQIA_HIGH_Q_DEPTH).

This count is the peak value of the *CurrentQDepth* local queue attribute since the last reset. The *CurrentQDepth* is incremented during an MQPUT call, and during backout of an MQGET call, and is decremented during a (nonbrowse) MQGET call, and during backout of an MQPUT call.

MsgDeqCount (MQCFIN)

Number of messages dequeued (parameter identifier: MQIA_MSG_DEQ_COUNT).

This count includes messages that have been successfully retrieved (with a nonbrowse MQGET) from the queue, even though the MQGET has not yet been committed. The count is not decremented if the MQGET is later backed out.

z/OS On z/OS, if the value exceeds 999 999 999, it is returned as 999 999 999

MsgEnqCount (MQCFIN)

Number of messages enqueued (parameter identifier: MQIA_MSG_ENQ_COUNT).

This count includes messages that have been put to the queue, but have not yet been committed. The count is not decremented if the put is later backed out.

z/OS On z/OS, if the value exceeds 999 999 999, it is returned as 999 999 999

QName (MQCFST)

Queue name (parameter identifier: MQCA_Q_NAME).

The maximum length of the string is MQ_Q_NAME_LENGTH.

z/OS QSGDisposition (MQCFIN)

QSG disposition (parameter identifier: MQIA_QSG_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

MQQSGD_COPY

The object is defined as MQQSGD_COPY.

MQQSGD_SHARED

The object is defined as MQQSGD_SHARED.

MQQSGD_Q_MGR

The object is defined as MQQSGD_Q_MGR.

TimeSinceReset (MQCFIN)

Time since statistics reset in seconds (parameter identifier: MQIA_TIME_SINCE_RESET).

z/OS MQCMD_RESET_SMDS (Reset shared message data sets) on z/OS

The Reset SMDS (MQCMD_RESET_SMDS) PCF command modifies the availability or status information relating to one or more shared message data sets associated with a specific application structure

Required parameters**SMDS (MQCFST)**

Specifies the queue manager for which the shared message data set availability or status information is to be modified or an asterisk to modify the information for all data sets associated with the specified CFSTRUCT. (parameter identifier: MQCACF_CF_SMDS).

The maximum length of the string is 4 characters.

CFStrucName (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to reset (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

Optional parameters**Access (MQCFIN)**

Availability of the share message data set (parameter identifier: MQIACF_CF_STRUC_ACCESS).

MQCFACCESS_ENABLED

The shared message data set is available for use.

MQCFACCESS_DISABLED

The shared message data set is disabled.

Status (MQCFIN)

Status information indicates the state of a resource (parameter identifier: MQIACF_CF_STRUC_STATUS).

MQCFSTATUS_FAILED

The shared message data set is in an unusable state.

MQCFSTATUS_RECOVERED

The data set is set to recovered, and is ready for use again, but requires some restart processing the next time it is opened. This restart processing ensures that obsolete references to any deleted messages have been removed from the coupling facility structure before the data set is made available again. The restart processing also rebuilds the data set space map.

MQCMD_RESOLVE_CHANNEL (Resolve Channel)

The Resolve Channel (MQCMD_RESOLVE_CHANNEL) PCF command requests a channel to commit or back out in-doubt messages. This command is used when the other end of a link fails during the confirmation stage, and for some reason it is not possible to reestablish the connection. In this situation the sending end remains in an in-doubt state, whether the messages were received. Any outstanding units of work must be resolved using Resolve Channel with either backout or commit.

Care must be exercised in the use of this command. If the resolution specified is not the same as the resolution at the receiving end, messages can be lost or duplicated.

This command can only be used for channels with a *ChannelType* value of MQCHT_SENDER, MQCHT_SERVER, or MQCHT_CLUSSDR.

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel to be resolved. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

InDoubt (MQCFIN)

Indoubt resolution (parameter identifier: MQIACH_IN_DOUBT).

Specifies whether to commit or back out the in-doubt messages.

The value can be:

MQIDO_COMMIT

Commit.

MQIDO_BACKOUT

Backout.

Optional parameters

z/OS CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

z/OS ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH_CHANNEL_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be resolved.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

MQCHLD_PRIVATE

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD_SHARED.

MQCHLD_SHARED

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD_SHARED.

The combination of the **ChannelDisposition** and **CommandScope** parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in [Table 215 on page 1504](#)

<i>Table 215. ChannelDisposition and CommandScope for RESOLVE CHANNEL</i>		
ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name
MQCHLD_PRIVATE	Resolve private channel on the local queue manager	Resolve private channel on the named queue manager
MQCHLD_SHARED	Resolve a shared channel on all active queue managers. MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails. The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.	Not permitted

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_INDOUBT_VALUE_ERROR

In-doubt value not valid.

z/OS MQCMD_RESUME_Q_MGR (Resume Queue Manager) on z/OS

The Resume Queue Manager (MQCMD_RESUME_Q_MGR) PCF command renders the queue manager available again for the processing of IMS or Db2 messages. It reverses the action of the Suspend Queue Manager (MQCMD_SUSPEND_Q_MGR) command.

Required parameters

Facility (MQCFIN)

Facility (parameter identifier: MQIACF_Q_MGR_FACILITY).

The type of facility for which activity is to be resumed. The value can be:

MQQMFACT_DB2

Resumes normal activity with Db2.

MQQMFACT_IMS_BRIDGE

Resumes normal IMS bridge activity.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

MQCMD_RESUME_Q_MGR_CLUSTER (Resume Queue Manager Cluster)

The Resume Queue Manager Cluster (MQCMD_RESUME_Q_MGR_CLUSTER) PCF command informs other queue managers in a cluster that the local queue manager is again available for processing, and can be sent messages. It reverses the action of the Suspend Queue Manager Cluster (MQCMD_SUSPEND_Q_MGR_CLUSTER) command.

Required parameters

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

The name of the cluster for which availability is to be resumed.

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

ClusterNamelist (MQCFST)

Cluster Namelist (parameter identifier: MQCA_CLUSTER_NAMELIST).

The name of the namelist specifying a list of clusters for which availability is to be resumed.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CLUSTER_NAME_CONFLICT

Cluster name conflict.

MQCMD_REVERIFY_SECURITY (Reverify Security) on z/OS

The Reverify Security (MQCMD_REVERIFY_SECURITY) PCF command sets a reverification flag for all specified users. The user is reverified the next time that security is checked for that user.

Required parameters

UserId (MQCFST)

User ID (parameter identifier: MQCACF_USER_IDENTIFIER).

Use this parameter to specify one or more user IDs. Each user ID specified is signed off and signed back on again the next time that a request requiring a security check is issued on behalf of that user.

The maximum length of the string is MQ_USER_ID_LENGTH.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

MQCMD_SET_ARCHIVE (Set Archive) on z/OS

The Set Archive (MQCMD_SET_ARCHIVE) PCF command dynamically changes certain archive system parameter values initially set by your system parameter module at queue manager startup.

Required parameters

ParameterType (MQCFIN)

Parameter type (parameter identifier: MQIACF_SYSP_TYPE).

Specifies how the parameters are to be reset:

MQSYSP_TYPE_INITIAL

The initial settings of the archive system parameters. MQSYSP_TYPE_INITIAL resets all the archive system parameters to the values set at queue manager startup.

MQSYSP_TYPE_SET

MQSYSP_TYPE_SET indicates that you intend to change one, or more, of the archive system parameter settings.

Optional parameters

AllocPrimary (MQCFIN)

Primary space allocation for DASD data sets (parameter identifier: MQIACF_SYSP_ALLOC_PRIMARY).

Specifies the primary space allocation for DASD data sets in the units specified in the **AllocUnits** parameter.

Specify a value greater than zero. This value must be sufficient for a copy of either the log data set or its corresponding BSDS, whichever is the larger.

AllocSecondary (MQCFIN)

Secondary space allocation for DASD data sets (parameter identifier: MQIACF_SYSP_ALLOC_SECONDARY).

Specifies the secondary space allocation for DASD data sets in the units specified in the **AllocUnits** parameter.

Specify a value greater than zero.

AllocUnits (MQCFIN)

Allocation unit (parameter identifier: MQIACF_SYSP_ALLOC_UNIT).

Specifies the unit in which primary and secondary space allocations are made. The value can be any of the following values:

MQSYSP_ALLOC_BLK

Blocks.

MQSYSP_ALLOC_TRK

Tracks.

MQSYSP_ALLOC_CYL

Cylinders.

ArchivePrefix1 (MQCFST)

Specifies the prefix for the first archive log data set name (parameter identifier: MQCACF_SYSP_ARCHIVE_PFX1).

The maximum length of the string is MQ_ARCHIVE_PFX_LENGTH.

ArchivePrefix2 (MQCFST)

Specifies the prefix for the second archive log data set name (parameter identifier: MQCACF_SYSP_ARCHIVE_PFX2).

The maximum length of the string is MQ_ARCHIVE_PFX_LENGTH.

ArchiveRetention (MQCFIN)

Archive retention period (parameter identifier: MQIACF_SYSP_ARCHIVE_RETAIN).

Specifies the retention period, in days, to be used when the archive log data set is created. Specify a value in the range zero through 9999.

For more information, see [Discarding archive log data sets](#).

ArchiveUnit1 (MQCFST)

Specifies the device type or unit name of the device that is used to store the first copy of the archive log data set (parameter identifier: MQCACF_SYSP_ARCHIVE_UNIT1).

Specify a device type or unit name of 1-8 characters.

If you archive to DASD, you can specify a generic device type with a limited volume range.

The maximum length of the string is MQ_ARCHIVE_UNIT_LENGTH.

ArchiveUnit2 (MQCFST)

Specifies the device type or unit name of the device that is used to store the second copy of the archive log data set (parameter identifier: MQCACF_SYSP_ARCHIVE_UNIT2).

Specify a device type or unit name of 1-8 characters.

If this parameter is blank, the value set for the **ArchiveUnit1** parameter is used.

The maximum length of the string is MQ_ARCHIVE_UNIT_LENGTH.

ArchiveWTOR (MQCFIN)

Specifies whether a message is to be sent to the operator and a reply is received before attempting to mount an archive log data set (parameter identifier: MQIACF_SYSP_ARCHIVE_WTOR).

Other IBM MQ users might be forced to wait until the data set is mounted, but they are not affected while IBM MQ is waiting for the reply to the message.

The value can be any of the following values:

MQSYSP_YES

A message is to be sent and a reply received before an attempt to mount an archive log data set.

MQSYSP_NO

A message is not to be sent and a reply received before an attempt to mount an archive log data set.

BlockSize (MQCFIN)

Block size of the archive log data set (parameter identifier: MQIACF_SYSP_BLOCK_SIZE).

The block size you specify must be compatible with the device type you specify in the **ArchiveUnit1** and **ArchiveUnit2** parameters.

Specify a value in the range 4 097 through 28 672. The value you specify is rounded up to a multiple of 4 096.

This parameter is ignored for data sets that are managed by the storage management system (SMS).

Catalog (MQCFIN)

Specifies whether archive log data sets are cataloged in the primary integrated catalog facility (parameter identifier: MQIACF_SYSP_CATALOG).

The value can be:

MQSYSP_YES

Archive log data sets are cataloged.

MQSYSP_NO

Archive log data sets are not cataloged.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Compact (MQCFIN)

Specifies whether data written to archive logs is to be compacted (parameter identifier: MQIACF_SYSP_COMPACT).

This parameter applies to a 3480 or 3490 device that has the improved data recording capability (IDRC) feature. When this feature is turned on, hardware in the tape control unit writes data at a much higher density than normal, allowing for more data on each volume. Specify MQSYSP_NO if you do not use a 3480 device with the IDRC feature or a 3490 base model, except for the 3490E. Specify MQSYSP_YES if you want the data to be compacted.

The value can be:

MQSYSP_YES

Data is to be compacted.

MQSYSP_NO

Data is not to be compacted.

Protect (MQCFIN)

Protection by external security manager (ESM) (parameter identifier: MQIACF_SYSP_PROTECT).

Specifies whether archive log data sets are protected by ESM profiles when the data sets are created.

If you specify MQSYSP_YES, ensure that:

- ESM protection is active for IBM MQ.
- The user ID associated with the IBM MQ address space has authority to create these profiles.
- The TAPEVOL class is active if you are archiving to tape.

otherwise, offload processing fails.

The value can be any of the following values:

MQSYSP_YES

Data set profiles are created when logs are offloaded.

MQSYSP_NO

Profiles are not created.

QuiesceInterval (MQCFIN)

Maximum time allowed for the quiesce (parameter identifier: MQIACF_SYSP_QUIESCE_INTERVAL).

Specifies the maximum time, in seconds, allowed for the quiesce.

Specify a value in the range 1 through 999.

RoutingCode (MQCFIL)

z/OS routing code list (parameter identifier: MQIACF_SYSP_ROUTING_CODE).

Specifies the list of z/OS routing codes for messages about the archive log data sets to the operator.

Specify up to 14 routing codes, each with a value in the range zero through 16. You must specify at least one code.

TimeStampFormat (MQCFIN)

Time stamp included (parameter identifier: MQIACF_SYSP_TIMESTAMP).

Specifies whether the archive log data set name has a time stamp in it.

The value can be:

MQSYSP_YES

Names include a time stamp. The archive log data sets are named:

```
arcpxi.cyyddd.T hhmsst.A nnnnnn
```

where *c* is 'D' for the years up to and including 1999 or 'E' for the year 2000 and later, and *arcpxi* is the data set name prefix specified by *ArchivePrefix1* or *ArchivePrefix2*. *arcpxi* can have up to 19 characters.

MQSYSP_NO

Names do not include a time stamp. The archive log data sets are named:

```
arcpxi.A nnnnnn
```

Where *arcpxi* is the data set name prefix specified by *ArchivePrefix1* or *ArchivePrefix2*. *arcpxi* can have up to 35 characters.

MQSYSP_EXTENDED

Names include a time stamp. The archive log data sets are named:

```
arcpxi.D yyyyddd.T hhmsst.A nnnnnn
```

Where *arcpxi* is the data set name prefix specified by *ArchivePrefix1* or *ArchivePrefix2*. *arcpxi* can have up to 17 characters.

MQCMD_SET_AUTH_REC (Set Authority Record) on Multiplatforms

The Set Authority Record (MQCMD_SET_AUTH_REC) PCF command sets the authorizations of a profile, object, or class of objects. Authorizations can be granted to, or revoked from, any number of principals or groups.

Required parameters

ProfileName (MQCFST)

Profile name (parameter identifier: MQCACF_AUTH_PROFILE_NAME).

The authorizations apply to all IBM MQ objects with names that match the profile name specified. You can define a generic profile. If you specify an explicit profile name, the object must exist.

The maximum length of the string is MQ_AUTH_PROFILE_NAME_LENGTH.

ObjectType (MQCFIN)

The type of object for which to set authorizations (parameter identifier: MQIACF_OBJECT_TYPE).

The value can be any of the following values:

MQOT_AUTH_INFO

Authentication information.

MQOT_CHANNEL

Channel object.

MQOT_CLNTCONN_CHANNEL

Client-connection channel object.

MQOT_COMM_INFO

Communication information object

MQOT_LISTENER

Listener object.

MQOT_NAMELIST

Namelist.

MQOT_PROCESS

Process.

MQOT_Q

Queue, or queues, that match the object name parameter.

MQOT_Q_MGR

Queue manager.

MQOT_REMOTE_Q_MGR_NAME

Remote queue manager.

MQOT_SERVICE

Service object.

MQOT_TOPIC

Topic object.

Note: The required parameters must be in the order **ProfileName** followed by **ObjectType**.

Optional parameters**AuthorityAdd (MQCFIL)**

Authority values to set (parameter identifier: MQIACF_AUTH_ADD_AUTHS).

This parameter is a list of authority values to set for the named profile. The values can be:

MQAUTH_NONE

The entity has authority set to 'none'.

MQAUTH_ALT_USER_AUTHORITY

Specify an alternate user ID on an MQI call.

MQAUTH_BROWSE

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

MQAUTH_CHANGE

Change the attributes of the specified object, using the appropriate command set.

MQAUTH_CLEAR

Clear a queue.

MQAUTH_CONNECT

Connect the application to the specified queue manager by issuing an MQCONN call.

MQAUTH_CREATE

Create objects of the specified type using the appropriate command set.

MQAUTH_DELETE

Delete the specified object using the appropriate command set.

MQAUTH_DISPLAY

Display the attributes of the specified object using the appropriate command set.

MQAUTH_INPUT

Retrieve a message from a queue by issuing an MQGET call.

MQAUTH_INQUIRE

Make an inquiry on a specific queue by issuing an MQINQ call.

MQAUTH_OUTPUT

Put a message on a specific queue by issuing an MQPUT call.

MQAUTH_PASS_ALL_CONTEXT

Pass all context.

MQAUTH_PASS_IDENTITY_CONTEXT

Pass the identity context.

MQAUTH_SET

Set attributes on a queue from the MQI by issuing an MQSET call.

MQAUTH_SET_ALL_CONTEXT

Set all context on a queue.

MQAUTH_SET_IDENTITY_CONTEXT

Set the identity context on a queue.

MQAUTH_CONTROL

For listeners and services, start and stop the specified channel, listener, or service.

For channels, start, stop, and ping the specified channel.

For topics, define, alter, or delete subscriptions.

MQAUTH_CONTROL_EXTENDED

Reset or resolve the specified channel.

MQAUTH_PUBLISH

Publish to the specified topic.

MQAUTH_SUBSCRIBE

Subscribe to the specified topic.

MQAUTH_RESUME

Resume a subscription to the specified topic.

MQAUTH_SYSTEM

Use queue manager for internal system operations.

MQAUTH_ALL

Use all operations applicable to the object.

MQAUTH_ALL_ADMIN

Use all administration operations applicable to the object.

MQAUTH_ALL_MQI

Use all MQI calls applicable to the object.

The contents of the *AuthorityAdd* and *AuthorityRemove* lists must be mutually exclusive. You must specify a value for either *AuthorityAdd* or *AuthorityRemove*. An error occurs if you do not specify either.

AuthorityRemove (MQCFIL)

Authority values to remove (parameter identifier: MQIACF_AUTH_REMOVE_AUTHS).

This parameter is a list of authority values to remove from the named profile. The values can be:

MQAUTH_NONE

The entity has authority set to 'none'.

MQAUTH_ALT_USER_AUTHORITY

Specify an alternate user ID on an MQI call.

MQAUTH_BROWSE

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

MQAUTH_CHANGE

Change the attributes of the specified object, using the appropriate command set.

MQAUTH_CLEAR

Clear a queue.

MQAUTH_CONNECT

Connect the application to the specified queue manager by issuing an MQCONN call.

MQAUTH_CREATE

Create objects of the specified type using the appropriate command set.

MQAUTH_DELETE

Delete the specified object using the appropriate command set.

MQAUTH_DISPLAY

Display the attributes of the specified object using the appropriate command set.

MQAUTH_INPUT

Retrieve a message from a queue by issuing an MQGET call.

MQAUTH_INQUIRE

Make an inquiry on a specific queue by issuing an MQINQ call.

MQAUTH_OUTPUT

Put a message on a specific queue by issuing an MQPUT call.

MQAUTH_PASS_ALL_CONTEXT

Pass all context.

MQAUTH_PASS_IDENTITY_CONTEXT

Pass the identity context.

MQAUTH_SET

Set attributes on a queue from the MQI by issuing an MQSET call.

MQAUTH_SET_ALL_CONTEXT

Set all context on a queue.

MQAUTH_SET_IDENTITY_CONTEXT

Set the identity context on a queue.

MQAUTH_CONTROL

For listeners and services, start and stop the specified channel, listener, or service.

For channels, start, stop, and ping the specified channel.

For topics, define, alter, or delete subscriptions.

MQAUTH_CONTROL_EXTENDED

Reset or resolve the specified channel.

MQAUTH_PUBLISH

Publish to the specified topic.

MQAUTH_SUBSCRIBE

Subscribe to the specified topic.

MQAUTH_RESUME

Resume a subscription to the specified topic.

MQAUTH_SYSTEM

Use queue manager for internal system operations.

MQAUTH_ALL

Use all operations applicable to the object.

MQAUTH_ALL_ADMIN

Use all administration operations applicable to the object.

MQAUTH_ALL_MQI

Use all MQI calls applicable to the object.

The contents of the *AuthorityAdd* and *AuthorityRemove* lists must be mutually exclusive. You must specify a value for either *AuthorityAdd* or *AuthorityRemove*. An error occurs if you do not specify either.

GroupNames (MQCFSL)

Group names (parameter identifier: MQCACF_GROUP_ENTITY_NAMES).

The names of groups having their authorizations set. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ_ENTITY_NAME_LENGTH.

PrincipalNames (MQCFSL)

Principal names (parameter identifier: MQCACF_PRINCIPAL_ENTITY_NAMES).

The names of principals having their authorizations set. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ_ENTITY_NAME_LENGTH.

ServiceComponent (MQCFST)

Service component (parameter identifier: MQCACF_SERVICE_COMPONENT).

If installable authorization services are supported, this parameter specifies the name of the authorization service to which the authorizations apply.

If you omit this parameter, the authorization inquiry is made to the first installable component for the service.

The maximum length of the string is MQ_SERVICE_COMPONENT_LENGTH.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRC_UNKNOWN_ENTITY

Userid not authorized, or unknown.

MQRCCF_AUTH_VALUE_ERROR

Invalid authorization.

MQRCCF_AUTH_VALUE_MISSING

Authorization missing.

MQRCCF_ENTITY_NAME_MISSING

Entity name missing.

MQRCCF_OBJECT_TYPE_MISSING

Object type missing.

MQRCCF_PROFILE_NAME_ERROR

Invalid profile name.

MQCMD_SET_CHLAUTH_REC (Set Channel Authentication Record)

The Set Channel Authentication Record (MQCMD_SET_CHLAUTH_REC) PCF command sets the allowed partner details and mappings to MCAUSER for a channel or set of channels.

Syntax diagram

See the syntax diagram in the MQSC [“SET CHLAUTH \(create or modify a channel authentication record\)” on page 954](#) command for combinations of parameters and values that are allowed.

Required parameters

The required parameters are valid for the **Action** values of:

- MQACT_ADD or MQACT_REPLACE
- MQACT_REMOVE
- MQACT_REMOVEALL

ProfileName (MQCFST)

The name of the channel or set of channels for which you are setting channel authentication configuration (parameter identifier: MQCACH_CHANNEL_NAME). You can use one or more asterisks

(*), in any position, as wildcards to specify a set of channels. If you set Type to MQCAUT_BLOCKADDR, you must set the generic channel name to a single asterisk, which matches all channel names.

The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

Type (MQCFIN)

The **Type** parameter must follow the **ProfileName** parameter.

The type of channel authentication record for which to set allowed partner details or mappings to MCAUSER (parameter identifier: MQIACF_CHLAUTH_TYPE). The following values are valid:

MQCAUT_BLOCKUSER

This channel authentication record prevents a specified user or users from connecting. The MQCAUT_BLOCKUSER parameter must be accompanied by a **UserList**.

MQCAUT_BLOCKADDR

This channel authentication record prevents connections from a specified IP address or addresses. The MQCAUT_BLOCKADDR parameter must be accompanied by an **AddrList**.

MQCAUT_SSLPEERMAP

This channel authentication record maps TLS Distinguished Names (DNs) to MCAUSER values. The MQCAUT_SSLPEERMAP parameter must be accompanied by an **SSLPeer**.

MQCAUT_ADDRESSMAP

This channel authentication record maps IP addresses to MCAUSER values. The MQCAUT_ADDRESSMAP parameter must be accompanied by an **Address**.

MQCAUT_USERMAP

This channel authentication record maps asserted user IDs to MCAUSER values. The MQCAUT_USERMAP parameter must be accompanied by a **ClntUser**.

MQCAUT_QMGRMAP

This channel authentication record maps remote queue manager names to MCAUSER values. The MQCAUT_QMGRMAP parameter must be accompanied by a **QMName**.

Optional parameters

The following table shows which parameters are valid for each value of **Action**:

Parameter	MQACT_ADD or MQACT_REPLACE	MQACT_REMOVE	MQACT_REMOVEALL
 z/OS	✓	✓	✓
 z/OS			
CommandScope			
Action	✓	✓	✓
Address	✓	✓	
Addrlist	✓	✓	
CheckClient	✓	✓	
ClntUser	✓	✓	
MCAUser	✓		
QMName	✓	✓	
SSLCertIssuer	✓	✓	

Table 216. Optional parameters for ChannelAttrs (continued)

Parameter	MQACT_ADD or MQACT_REPLACE	MQACT_REMOVE	MQACT_REMOVEALL
SSLPeer	✓	✓	
UserList	✓	✓	
UserSrc	✓		
Warn	✓		
Description	✓		

Action (MQCFIN)

The action to perform on the channel authentication record (parameter identifier: MQIACF_ACTION). The following values are valid:

MQACT_ADD

Add the specified configuration to a channel authentication record. This is the default value.

For types MQCAUT_SSLPEERMAP, MQCAUT_ADDRESSMAP, MQCAUT_USERMAP and MQCAUT_QMGRMAP, if the specified configuration exists, the command fails.

For types MQCAUT_BLOCKUSER and MQCAUT_BLOCKADDR, the configuration is added to the list.

MQACT_REPLACE

Replace the current configuration of a channel authentication record.

For types MQCAUT_SSLPEERMAP, MQCAUT_ADDRESSMAP, MQCAUT_USERMAP and MQCAUT_QMGRMAP, if the specified configuration exists, it is replaced with the new configuration. If it does not exist it is added.

For types MQCAUT_BLOCKUSER and MQCAUT_BLOCKADDR, the configuration specified replaces the current list, even if the current list is empty. If you replace the current list with an empty list, this acts like MQACT_REMOVEALL.

MQACT_REMOVE

Remove the specified configuration from the channel authentication records. If the configuration does not exist the command fails. If you remove the last entry from a list, this acts like MQACT_REMOVEALL.

MQACT_REMOVEALL

Remove all members of the list and thus the whole record (for MQCAUT_BLOCKADDR and MQCAUT_BLOCKUSER) or all previously defined mappings (for MQCAUT_ADDRESSMAP, MQCAUT_SSLPEERMAP, MQCAUT_QMGRMAP and MQCAUT_USERMAP) from the channel authentication records. This option cannot be combined with specific values supplied in **AddrList**, **UserList**, **Address**, **SSLPeer**, **QMName** or **CIntUser**. If the specified type has no current configuration the command still succeeds.

Address (MQCFST)

The filter to be used to compare with the IP address, or host name, of the partner queue manager or client at the other end of the channel (parameter identifier: MQCACH_CONNECTION_NAME).

This parameter is mandatory when **Type** is MQCAUT_ADDRESMAP and is also valid when **Type** is MQCAUT_SSLPEERMAP, MQCAUT_USERMAP, or MQCAUT_QMGRMAP and **Action** is MQACT_ADD, MQACT_REPLACE, or MQACT_REMOVE. You can define more than one channel authentication object with the same main identity, for example the same TLS peer name, with different addresses. See [“Generic IP addresses for channel authentication records”](#) on page 961 for more information about filtering IP addresses.

The maximum length of the string is MQ_CONN_NAME_LENGTH.

AddrList (MQCFSL)

A list of up to 100 generic IP addresses which are banned from accessing this queue manager on any channel (parameter identifier: MQCACH_CONNECTION_NAME_LIST).

This parameter is only valid when **Type** is MQCAUT_BLOCKADDR.

The maximum length of each address is MQ_CONN_NAME_LENGTH.

CheckClient (MQCFIN)

The user ID and password requirements for the client connection to be successful. The following values are valid:

MQCHK_REQUIRED_ADMIN

A valid user ID and password are required for the connection to be allowed if you are using a privileged user ID. The password cannot contain single quotation marks (').

Any connections using a non-privileged user ID are not required to provide a user ID and password.

The user ID and password are checked against the user repository details provided in an authentication information object, and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

A privileged user is one that has full administrative authorities for IBM MQ. See [Privileged users](#) for more information.

This option is not valid on z/OS platforms.

MQCHK_REQUIRED

A valid user ID and password are required for the connection to be allowed. The password cannot contain single quotation marks (').

The user ID and password are checked against the user repository details provided in an authentication information object and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

MQCHK_AS_Q_MGR

In order for the connection to be allowed, it must meet the connection authentication requirements defined on the queue manager.

If the CONNAUTH field provides an authentication information object, and the value of CHCKCLNT is REQUIRED, the connection fails unless a valid user ID and password are supplied.

If the CONNAUTH field does not provide an authentication information object, or the value of CHCKCLNT is not REQUIRED, the user ID and password are not required.

ClntUser (MQCFST)

The client asserted user ID to be mapped to a new user ID, allowed through unchanged, or blocked (parameter identifier: MQCACH_CLIENT_USER_ID).

This can be the user ID flowed from the client indicating the user ID the client side process is running under, or the user ID presented by the client on an MQCONN call using MQCSP.

This parameter is valid only with TYPE(USERMAP) and when **Match** is MQMATCH_RUNCHECK.

The maximum length of the string is MQ_CLIENT_USER_ID_LENGTH.

z/OS CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is run when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is run on the queue manager on which it was entered.
- a queue manager name. The command is run on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which the command was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is run on the local queue manager and is also passed to every active queue manager in the queue sharing group.

Custom (MQCFST)

Reserved for future use.

Description (MQCFST)

Provides descriptive information about the channel authentication record, which is displayed when you issue the Inquire Channel Authentication Records command (parameter identifier: MQCA_CHLAUTH_DESC).

This parameter must contain only displayable characters. In a DBCS installation, it can contain DBCS characters. The maximum length of the string is MQ_CHLAUTH_DESC_LENGTH.

Note: Use characters from the coded character set identifier (CCSID) for this queue manager. Other characters might be translated incorrectly if the information is sent to another queue manager.

MCAUser (MQCFST)

The user identifier to be used when the inbound connection matches the TLS DN, IP address, client asserted user ID or remote queue manager name supplied (parameter identifier: MQCACH_MCA_USER_ID).

This parameter is mandatory when **UserSrc** is MQUSRC_MAP and is valid when **Type** is MQCAUT_SSLPEERMAP, MQCAUT_ADDRESSMAP, MQCAUT_USERMAP, or MQCAUT_QMGRMAP.

This parameter is valid only when **Action** is MQACT_ADD or MQACT_REPLACE.

The maximum length of the string is MQ_MCA_USER_ID_LENGTH.

QMName (MQCFST)

The name of the remote partner queue manager, or pattern that matches a set of queue manager names, to be mapped to a user ID or blocked (parameter identifier: MQCA_REMOTE_Q_MGR_NAME).

This parameter is valid only when **Type** is MQCAUT_QMGRMAP.

The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

SSLCertIssuer (MQCFST)

This parameter is additional to the **SSLPeer** parameter.

SSLCertIssuer restricts matches to being within certificates issued by a particular Certificate Authority.

SSLPeer (MQCFST)

The filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel (parameter identifier: MQCACH_SSL_PEER_NAME).

The **SSLPeer** value is specified in the standard form used to specify a Distinguished Name. See [Distinguished Names](#) and [IBM MQ rules for SSLPEER values](#).

The maximum length of the string is MQ_SSL_PEER_NAME_LENGTH.

UserList (MQCFSL)

A list of up to 100 user IDs which are banned from using this channel or set of channels (parameter identifier: MQCACH_MCA_USER_ID_LIST).

The following special value can be used:

***MQADMIN**

The exact meaning of this value is determined at runtime. If you are using the OAM supplied with IBM MQ, the meaning depends on platform, as follows:

- On Windows, all members of the mqm group, the Administrators group and SYSTEM
- On AIX and Linux, all members of the mqm group
- On IBM i, the profiles (users) qmqm and qmqmadm and all members of the qmqmadm group, and any user defined with the *ALLOBJ special setting
-  On z/OS, the user ID that the CHINIT and the user ID that the MSTR address spaces are running under

This parameter is only valid when **TYPE** is MQCAUT_BLOCKUSER.

The maximum length of each user ID is MQ_MCA_USER_ID_LENGTH .

UserSrc (MQCFIN)

The source of the user ID to be used for MCAUSER at run time (parameter identifier: MQIACH_USER_SOURCE).

The following values are valid:

MQUSRC_MAP

Inbound connections that match this mapping use the user ID specified in the **MCAUser** attribute. This is the default value.

MQUSRC_NOACCESS

Inbound connections that match this mapping have no access to the queue manager and the channel ends immediately.

MQUSRC_CHANNEL

Inbound connections that match this mapping use the flowed user ID or any user defined on the channel object in the MCAUSER field.

Note that *Warn* and MQUSRC_CHANNEL, or MQUSRC_MAP are incompatible. This is because channel access is never blocked in these cases, so there is never a reason to generate a warning.

Warn (MQCFIN)

Indicates whether this record operates in warning mode (parameter identifier: MQIACH_WARNING).

MQWARN_NO

This record does not operate in warning mode. Any inbound connection that matches this record is blocked. This is the default value.

MQWARN_YES

This record operates in warning mode. Any inbound connection that matches this record and would therefore be blocked is allowed access. An error message is written and, if events are configured, an event message is created showing the details of what would have been blocked. The connection is allowed to continue. An attempt is made to find another record that is set to WARN(NO) to set the credentials for the inbound channel.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown at [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHLAUTH_TYPE_ERROR

Channel authentication record type not valid.

MQRCCF_CHLAUTH_ACTION_ERROR

Channel authentication record action not valid.

MQRCCF_CHLAUTH_USERSRC_ERROR

Channel authentication record user source not valid.

MQRCCF_WRONG_CHLAUTH_TYPE

Parameter not allowed for this channel authentication record type.

MQRCCF_CHLAUTH_ALREADY_EXISTS

Channel authentication record already exists

Related concepts

[Channel authentication records](#)

ALW MQCMD_SET_LOG (notify completion of log archiving) on AIX, Linux, and Windows

The Set Log (MQCMD_SET_LOG) PCF command on AIX, Linux, and Windows enables you to notify the queue manager that archiving of a log is complete. If the log management type is not **Archive** the command fails. This command requires change authority on the queue manager object.

Required parameters:

ParameterType

Optional parameters:

Archive

Required parameters**ParameterType (MQCFIN)**

Specifies the type of the log (parameter identifier: MQIACF_SYSP_TYPE).

The value must be MQSYSP_TYPE_SET

Optional parameters**Archive (MQCFST)**

Specifies the log extent that is being marked as archived (parameter identifier: MQCACF_ARCHIVE_LOG_EXTENT_NAME).

The command fails if the log extent is not recognized, or is the current log. The command does not fail if the extent has already been marked as having been archived.

A message is written to the error log if the queue manager is notified about an extent more than once.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown at [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_LOG_EXTENT_NOT_FOUND

The specified log extent was not found or is not valid.

MQRCCF_CURRENT_LOG_EXTENT

The specified log extent is the current log extent, and cannot have been validly archived yet.

MQRCCF_LOG_TYPE_ERROR

The command has been run on a log that is not an archive log.

MQRCCF_LOG_EXTENT_ERROR

The specified log extent is corrupt.

MQCMD_SET_LOG (Set Log) on z/OS

The Set Log (MQCMD_SET_LOG) PCF command dynamically changes certain log system parameter values initially set by your system parameter module at queue manager startup.

Required parameters:

ParameterType

Optional parameters (if the value of *ParameterType* is MQSYSP_TYPE_SET:

CommandScope, DeallocateInterval, LogCompression, MaxArchiveLog, MaxConcurrentOffloads, MaxReadTapeUnits, OutputBufferCount, zHyperWrite, ZHyperLink

Optional parameters if *ParameterType* type is MQSYSP_TYPE_INITIAL:

CommandScope

Required parameters

ParameterType (MQCFIN)

Parameter type (parameter identifier: MQIACF_SYSP_TYPE).

Specifies how the parameters are to be set:

MQSYSP_TYPE_INITIAL

The initial settings of the log system parameters. This MQSYSP_TYPE_INITIAL resets all the log system parameters to the values at queue manager startup.

MQSYSP_TYPE_SET

This MQSYSP_TYPE_SET indicates that you intend to change one, or more, of the archive log system parameter settings.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is run when the queue manager is a member of a queue sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is run on the queue manager on which it was entered.
- A queue manager name. The command is run on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- An asterisk (*). The command is run on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

DeallocateInterval (MQCFIN)

Deallocation interval (parameter identifier: MQIACF_SYSP_DEALLOC_INTERVAL).

Specifies the length of time, in minutes, that an allocated archive read tape unit is allowed to remain unused before it is deallocated. This parameter, together with the **MaxReadTapeUnits** parameter, allows IBM MQ to optimize archive log reading from tape devices. You are recommended to specify the maximum values, within system constraints, for both parameters, in order to achieve the optimum performance for reading archive tapes.

Specify a value in the range zero and 1440. Zero means that a tape unit is deallocated immediately. If you specify a value of 1440, the tape unit is never deallocated.

LogCompression (MQCFIN)

Log compression parameter (parameter identifier: MQIACF_LOG_COMPRESSION).

Specifies the log compression algorithm to enable.

The possible values are:

MQCOMPRESS_NONE

Log compression is disabled.

MQCOMPRESS_RLE

Enable run-length encoding log compression.

MQCOMPRESS_ANY

Enable the queue manager to select the compression algorithm that gives the greatest degree of log record compression.

 For more details see [The log files](#).

MaxArchiveLog (MQCFIN)

Specifies the maximum number of archive log volumes that can be recorded in the BSDS (parameter identifier: MQIACF_SYSP_MAX_ARCHIVE).

When this value is exceeded, recording recommences at the start of the BSDS.

Specify a value in the range 10 through 100.

MaxConcurrentOffloads (MQCFIN)

Specifies the maximum number of concurrent log offload tasks (parameter identifier: MQIACF_SYSP_MAX_CONC_OFFLOADS).

Specify a decimal number between 1 and 31. If no value is specified the default of 31 applies.

Configure a number lower than the default if your archive logs are allocated on a tape device, and there are constraints on the number of such devices that can be concurrently allocated to the queue manager.

MaxReadTapeUnits (MQCFIN)

Specifies the maximum number of dedicated tape units that can be allocated to read archive log tape volumes (parameter identifier: MQIACF_SYSP_MAX_READ_TAPES).

This parameter, together with the *DeallocateInterval* parameter, allows IBM MQ to optimize archive log reading from tape devices.

Specify a value in the range 1 through 99.

If you specify a value that is greater than the current specification, the maximum number of tape units allowable for reading archive logs increases. If you specify a value that is less than the current specification, tape units that are not being used are immediately deallocated to adjust to the new value. Active, or premounted, tapes remain allocated.

OutputBufferCount (MQCFIN)

Specifies the number of 4 KB output buffers to be filled before they are written to the active log data sets (parameter identifier: MQIACF_SYSP_OUT_BUFFER_COUNT).

Specify the number of buffers in the range 1 through 256.

The larger the number of buffers and the less often the write takes place improves the performance of IBM MQ. The buffers might be written before this number is reached if significant events, such as a commit point, occur.

zHyperWrite (MQCFIN)

Specifies whether writes to the active logs are made with zHyperWrite enabled (parameter identifier: MQIACF_SYSP_ZHYPERWRITE).

You can enable zHyperWrite, regardless of whether the logs are capable or not. When enabled, zHyperWrite is always attempted, but if the log is not zHyperWrite capable then the writes are not completed using zHyperWrite.

For more information on enabling active logs with zHyperWrite, see [Using zHyperWrite with IBM MQ active logs](#).

The possible values are:

MQSYSP_NO

zHyperWrite is not enabled.

MQSYSP_YES

zHyperWrite is enabled.

V 9.4.0

zHyperLink (MQCFIN)

Specifies whether writes to the active logs are made with zHyperLink enabled (parameter identifier: MQIACF_SYSP_ZHYPERLINK).

For more information on enabling active logs with zHyperLink, see [Using zHyperLink with IBM MQ active logs](#).

The possible values are:

MQSYSP_NO

zHyperLink is not enabled.

MQSYSP_YES

zHyperLink is enabled.

The queue manager issues log writes with zHyperLink enabled, regardless of whether the active log copies are on zHyperLink capable volumes.

z/OS

MQCMD_SET_SYSTEM (Set System) on z/OS

The Set System (MQCMD_SET_SYSTEM) PCF command dynamically changes certain general system parameter values initially set from your system parameter module at queue manager startup.

Required parameters:

ParameterType

Optional parameters (if the value of *ParameterType* is MQSYSP_TYPE_SET:

From IBM MQ for z/OS 9.3.0, *CheckpointCount*, *CommandScope*, *Exclmsg*, *MaxConnects*, *MaxConnectsBackground*, *MaxConnectsForeground*, *Service*, *SMFAcctIntervalMins*, *SMFAcctIntervalSecs*, *SMFStatsIntervalMins*, *SMFStatsIntervalSecs*, *TraceSize*

Optional parameters if *ParameterType* type is MQSYSP_INITIAL:

CommandScope

Required parameters

ParameterType (MQCFIN)

Parameter type (parameter identifier: MQIACF_SYSP_TYPE).

Specifies how the parameters are to be set:

MQSYSP_TYPE_INITIAL

The initial settings of the system parameters. MQSYSP_TYPE_INITIAL resets the parameters to the values specified in the system parameters at queue manager startup.

MQSYSP_TYPE_SET

MQSYSP_TYPE_SET indicates that you intend to change one, or more, of the system parameter settings.

Optional parameters

CheckpointCount (MQCFIN)

The number of log records written by IBM MQ between the start of one checkpoint and the next (parameter identifier: MQIACF_SYSP_CHKPOINT_COUNT).

IBM MQ starts a new checkpoint after the number of records that you specify has been written.

Specify a value in the range 200 through 16 000 000.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

Exclmsg (MQCFSL)

A list of message identifiers to be excluded from being written to any log (parameter identifier: MQCACF_EXCL_OPERATOR_MESSAGES).

Specify a list of error message identifiers to be excluded from being written to any log. For example, to exclude message CSQX500I, add X500 to this list. Messages in this list are not sent to the z/OS console and hardcopy log. As a result using the EXCLMSG parameter to exclude messages is more efficient from a CPU perspective than using z/OS mechanisms such as the message processing facility list and should be used instead where possible.

The maximum length of each message identifier is MQ_OPERATOR_MESSAGE_LENGTH.

The list can contain a maximum of 16 message identifiers.

Service (MQCFST)

Service parameter setting (parameter identifier: MQCACF_SYSP_SERVICE).

This parameter is reserved for use by IBM.

SMFACctIntervalMins (MQCFIN)

From IBM MQ for z/OS 9.3.0, the minutes value of the default time between each gathering of accounting data (parameter identifier: MQIACF_SYSP_SMF_ACCT_TIME_MINS).

Specify a value in the range -1 through 1440.

Note: You should also set *SMFACctIntervalSecs*, otherwise it defaults to 0.

If you specify a value of 0, without specifying a non-zero value for *SMFACctIntervalSecs*, accounting data is collected at the SMF data collection broadcast.

If you specify a value of -1, accounting data is collected using the statistics interval values.

SMFACctIntervalSecs(MQCFIN)

From IBM MQ for z/OS 9.3.0, the seconds value of the default time between each gathering of accounting data (parameter identifier: MQIACF_SYSP_SMF_ACCT_TIME_SECS).

Specify a value in the range 0 through 59.

Note: You should also set *SMFACctIntervalMins*, otherwise it defaults to 0.

If you specify a value of 0, without specifying a non-zero value for *SMFACctIntervalMins*, accounting data is collected at the SMF data collection broadcast.

SMFStatsIntervalMins (MQCFIN)

From IBM MQ for z/OS 9.3.0, the minutes value of the default time between each gathering of statistics data (parameter identifier: MQIACF_SYSP_SMF_STAT_TIME_MINS or parameter identifier: MQIACF_SYSP_SMF_INTERVAL).

Specify a value in the range 0 through 1440.

Note: You should also set *SMFStatsIntervalSecs*, otherwise it defaults to 0.

If you specify a value of 0, without specifying a non-zero value for *SMFStatsIntervalSecs*, accounting data is collected at the SMF data collection broadcast.

SMFStatsIntervalSecs (MQCFIN)

From IBM MQ for z/OS 9.3.0 onwards, the seconds value of the default time between each gathering of accounting data (parameter identifier: MQIACF_SYSP_SMF_ACCT_TIME_SECS).

Specify a value in the range 0 through 59.

Note: You should also set *SMFStatsIntervalMins*, otherwise it defaults to zero.

If you specify a value of 0, without specifying a non-zero value for *SMFStatsIntervalMins*, statistics data is collected at the SMF data collection broadcast.

TraceSize (MQCFIN)

The size of the trace table, in 4 KB blocks, to be used by the global trace facility (parameter identifier: MQIACF_SYSP_TRACE_SIZE).

Specify a value in the range zero through 999.

MQCMD_START_CHANNEL (Start Channel)

The Start Channel (MQCMD_START_CHANNEL) PCF command starts an IBM MQ channel. This command can be issued to a channel of any type (except MQCHT_CLNTCONN). If, however, it is issued to a channel with a *ChannelType* value of MQCHT_RECEIVER, MQCHT_SVRCONN, or MQCHT_CLUSRCVR, the only action is to enable the channel, not start it.

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

None of the following attributes are applicable to MQTT channels unless specifically mentioned in the parameter description.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel to be started. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

This parameter is required for all channel types including MQTT channels.

Optional parameters for z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH_CHANNEL_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be started.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be:

MQCHLD_PRIVATE

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD_SHARED.

MQCHLD_SHARED

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD_SHARED.

MQCHLD_FIXSHARED

Shared channels tied to a specific queue manager.

The combination of the **ChannelDisposition** and **CommandScope** parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.
- On every active queue manager in the group.
- On the most suitable queue manager in the group, determined automatically by the queue manager itself.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in [Table 217 on page 1526](#)

ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name	CommandScope (*)
MQCHLD_PRIVATE	Start as a private channel on the local queue manager	Start as a private channel on the named queue manager	Start as a private channel on all active queue managers

Table 217. ChannelDisposition and CommandScope for START CHANNEL (continued)

ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name	CommandScope (*)
MQCHLD_SHARED	<p>For channels of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, start as a shared channel on the most suitable queue manager in the group.</p> <p>For a shared channel of <i>ChannelType</i> MQCHT_RECEIVER and MQCHT_SVRCONN, start the channel on all active queue managers.</p> <p>For a shared channel of <i>ChannelType</i> MQCHT_CLUSSDR and MQCHT_CLUSRCVR, this option is not permitted.</p> <p>MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted	Not permitted
MQCHLD_FIXSHARED	For a shared channel of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, with a nonblank <i>ConnectionName</i> , start as a shared channel on the local queue manager.	For a shared channel of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, with a nonblank <i>ConnectionName</i> , start as a shared channel on the named queue manager.	Not permitted

Optional parameters for Multiplatforms

MQIACF_IGNORE_STATE

Specifies whether the command fails if the channel is already running. The possible values are:

MQIS_NO

The command fails if the channel is already running. This is the default value.

MQIS_YES

The command succeeds regardless of the current state of the channel.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_INDOUBT

Channel in-doubt.

MQRCCF_CHANNEL_IN_USE

Channel in use.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_CHANNEL_TYPE_ERROR

Channel type not valid.

MQRCCF_MQCONN_FAILED

MQCONN call failed.

MQRCCF_MQINQ_FAILED

MQINQ call failed.

MQRCCF_MQOPEN_FAILED

MQOPEN call failed.

MQRCCF_NOT_XMIT_Q

Queue is not a transmission queue.

MQCMD_START_CHANNEL (Start Channel) MQTT on AIX, Linux, and Windows

The Start Channel (MQCMD_START_CHANNEL) PCF command starts an IBM MQ channel. This command can be issued to a channel of type MQCHT_MQTT.

Required parameters**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel to be started. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

This parameter is required for all channel types including MQTT channels.

ChannelType (MQCFIN)

The type of channel (parameter identifier: MQIACH_CHANNEL_TYPE). This parameter is currently only used with MQTT Telemetry channels, and is required when starting a Telemetry channel. The only value that can currently be given to the parameter is MQCHT_MQTT.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_PARM_SYNTAX_ERROR

The parameter specified contained a syntax error.

MQRCCF_PARM_MISSING

Parameters are missing.

MQRCCF_CHANNEL_NOT_FOUND

The channel specified does not exist.

MQRCCF_CHANNEL_IN_USE

The command did not specify a parameter or parameter value that was required.

MQRCCF_NO_STORAGE

Insufficient storage is available.

MQRCCF_COMMAND_FAILED

The command has failed.

MQRCCF_PORT_IN_USE

The port is in use.

MQRCCF_BIND_FAILED

The bind to a remote system during session negotiation has failed.

MQRCCF_SOCKET_ERROR

Socket error has occurred.

MQRCCF_HOST_NOT_AVAILABLE

An attempt to allocate a conversation to a remote system was unsuccessful. The error might be transitory, and the allocate might succeed later. This reason can occur if the listening program at the remote system is not running.

MQCMD_START_CHANNEL_INIT (Start Channel Initiator)

The Start Channel Initiator (MQCMD_START_CHANNEL_INIT) PCF command starts an IBM MQ channel initiator.

Required parameters**InitiationQName (MQCFST)**

Initiation queue name (parameter identifier: MQCA_INITIATION_Q_NAME).

The name of the initiation queue for the channel initiation process. That is, the initiation queue that is specified in the definition of the transmission queue.

This parameter is not valid on z/OS.

The maximum length of the string is MQ_Q_NAME_LENGTH.

Optional parameters**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

EnvironmentInfo (MQCFST)

Environment information (parameter identifier: MQCACF_ENV_INFO).

The parameters and values to be substituted in the JCL procedure (xxxxCHIN, where xxxx is the queue manager name) that is used to start the channel initiator address space. This parameter applies to z/OS only.

The maximum length of the string is MQ_ENV_INFO_LENGTH.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_MQCONN_FAILED

MQCONN call failed.

MQRCCF_MQGET_FAILED

MQGET call failed.

MQRCCF_MQOPEN_FAILED

MQOPEN call failed.

MQCMD_START_CHANNEL_LISTENER (Start Channel Listener)

The Start Channel Listener (MQCMD_START_CHANNEL_LISTENER) PCF command starts an IBM MQ listener. On z/OS, this command is valid for any transmission protocol; on other platforms, it is valid only for TCP transmission protocols.

Optional parameters

z/OS CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_Q_MGR_NAME_LENGTH.

z/OS InboundDisposition (MQCFIN)

Inbound transmission disposition (parameter identifier: MQIACH_INBOUND_DISP). This parameter applies to z/OS only.

Specifies the disposition of the inbound transmissions that are to be handled. The value can be any of the following values:

MQINBD_Q_MGR

Listen for transmissions directed to the queue manager. MQINBD_Q_MGR is the default.

MQINBD_GROUP

Listen for transmissions directed to the queue sharing group. MQINBD_GROUP is permitted only if there is a shared queue manager environment.

z/OS **IPAddress (MQCFST)**

IP address (parameter identifier: MQCACH_IP_ADDRESS). This parameter applies to z/OS only.

The IP address for TCP/IP specified in IPv4 dotted decimal, IPv6 hexadecimal, or alphanumeric form. This parameter is valid only for channels that have a *TransportType* of MQXPT_TCP.

The maximum length of the string is MQ_IP_ADDRESS_LENGTH.

ListenerName (MQCFST)

Listener name (parameter identifier: MQCACH_LISTENER_NAME). This parameter does not apply to z/OS.

The name of the listener definition to be started. On those platforms on which this parameter is valid, if this parameter is not specified, the default listener SYSTEM.DEFAULT.LISTENER is assumed. If this parameter is specified, no other parameters can be specified.

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

z/OS **LUName (MQCFST)**

LU name (parameter identifier: MQCACH_LU_NAME). This parameter applies to z/OS only.

The symbolic destination name for the logical unit (LU) as specified in the APPC side information data set. The LU must be the same LU that is specified in the channel initiator parameters to be used for outbound transmissions. This parameter is valid only for channels with a *TransportType* of MQXPT_LU62.

The maximum length of the string is MQ_LU_NAME_LENGTH.

z/OS **Port (MQCFIN)**

Port number for TCP (parameter identifier: MQIACH_PORT_NUMBER). This parameter applies to z/OS only.

The port number for TCP. This parameter is valid only for channels with a *TransportType* of MQXPT_TCP.

z/OS **TransportType (MQCFIN)**

Transmission protocol type (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value can be:

MQXPT_LU62

LU 6.2.

MQXPT_TCP

TCP.

MQXPT_NETBIOS

NetBIOS.

MQXPT_SPX

SPX.

Multi **MQIACF_IGNORE_STATE**

Specifies whether the command fails if the listener is already running. The possible values are:

MQIS_NO

The command fails if the listener is already running. This is the default value.

MQIS_YES

The command succeeds regardless of the current state of the listener.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_COMMS_LIBRARY_ERROR

Communications protocol library error.

MQRCCF_LISTENER_NOT_STARTED

Listener not started.

MQRCCF_LISTENER_RUNNING

Listener already running.

MQRCCF_NETBIOS_NAME_ERROR

NetBIOS listener name error.

MQCMD_START_SERVICE (Start Service) on Multiplatforms

The Start Service (MQCMD_START_SERVICE) PCF command starts an existing IBM MQ service definition.

Required parameters

ServiceName (MQCFST)

Service name (parameter identifier: MQCA_SERVICE_NAME).

This parameter is the name of the service definition to be started. The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Optional parameters

MQIACF_IGNORE_STATE

Specifies whether the command fails if the service is already running. The possible values are:

MQIS_NO

The command fails if the service is already running. This is the default value.

MQIS_YES

The command succeeds regardless of the current state of the service.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_NO_START_CMD

The **StartCommand** parameter of the service is blank.

MQRCCF_SERVICE_RUNNING

Service is already running.

MQCMD_START_SMDSCONN (Start SMDS Connection) on z/OS

Use the Start SMDS Connection (MQCMD_START_SMDSCONN) PCF command after connections have been put into the AVAIL(STOPPED) state by a previous MQCMD_STOP_SMDSCONN command. It can also be used to signal to the queue manager to retry a connection which is in the AVAIL(ERROR) state after a previous error.

Required parameters

SMDSConn (MQCFST)

Specifies the queue manager name relating to the connection between the shared message data set and the queue manager (parameter identifier: MQCACF_CF_SMDSCONN).

An asterisk value can be used to denote all shared message data sets associated with a specific CFSTRUCT name.

The maximum length of the string is 4 characters.

CFStrucName (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to start (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

MQCMD_STOP_CHANNEL (Stop Channel)

The Stop Channel (MQCMD_STOP_CHANNEL) PCF command stops an IBM MQ channel.

This command can be issued to a channel of any type (except MQCHT_CLNTCONN).

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

None of the following attributes are applicable to MQTT channels unless specifically mentioned in the parameter description.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

The name of the channel to be stopped. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

This parameter is required for all channel types..

Optional parameters

ChannelDisposition (MQCFIN)

Channel disposition (parameter identifier: MQIACH_CHANNEL_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be stopped.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

MQCHLD_PRIVATE

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD_SHARED.

MQCHLD_SHARED

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD_SHARED.

The combination of the **ChannelDisposition** and **CommandScope** parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.
- On every active queue manager in the group.
- On the most suitable queue manager in the group, determined automatically by the queue manager itself.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in [Table 218 on page 1534](#)

ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name	CommandScope (*)
MQCHLD_PRIVATE	Stop as a private channel on the local queue manager	Stop as a private channel on the named queue manager	Stop as a private channel on all active queue managers

Table 218. ChannelDisposition and CommandScope for STOP CHANNEL (continued)

ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name	CommandScope (*)
MQCHLD_SHARED	<p>For channels of <i>ChannelType</i> MQCHT_RECEIVER or MQCHT_SVRCONN, stop as shared channel on all active queue managers.</p> <p>For channels of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, stop as a shared channel on the queue manager where it is running. If the channel is in an inactive state (not running), or if it is in RETRY state because the channel initiator on which it was running has stopped, a STOP request for the channel is issued on the local queue manager.</p> <p>MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted	Not permitted

ChannelStatus (MQCFIN)

The new state of the channel after the command is executed (parameter identifier: MQIACH_CHANNEL_STATUS).

The value can be any of the following values:

MQCHS_INACTIVE

Channel is inactive.

MQCHS_STOPPED

Channel is stopped. MQCHS_STOPPED is the default if nothing is specified.

 **CommandScope (MQCFST)**

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

ConnectionName (MQCFST)

Connection name of channel to be stopped (parameter identifier: MQCACH_CONNECTION_NAME).

This parameter is the connection name of the channel to be stopped. If this parameter is omitted, all channels with the specified channel name and remote queue manager name are stopped. On Multiplatforms, the maximum length of the string is MQ_CONN_NAME_LENGTH. On z/OS, the maximum length of the string is MQ_LOCAL_ADDRESS_LENGTH.

If this parameter is specified, ChannelStatus must be MQCHS_INACTIVE.

Mode (MQCFIN)

How the channel must be stopped (parameter identifier: MQIACF_MODE).

The value can be:

MQMODE_QUIESCE

Quiesce the channel. MQMODE_QUIESCE is the default.

If you issue a `Stop Channel channelname Mode(MQMODE_QUIESCE)` command on a server-connection channel with the sharing conversations feature enabled, the IBM MQ client infrastructure becomes aware of the stop request in a timely manner; this time is dependent upon the speed of the network. The client application becomes aware of the stop request as a result of issuing a subsequent call to IBM MQ.

MQMODE_FORCE

Stop the channel immediately; the thread or process of the channel is not terminated. Stops transmission of any current batch.

For server-connection channels, breaks the current connection, returning MQRC_CONNECTION_BROKEN.

For other types of channels, this situation is likely to result in in-doubt situations.

z/OS On z/OS, this option interrupts any message reallocation in progress, which can leave BIND_NOT_FIXED messages partially reallocated or out of order.

MQMODE_TERMINATE

Multi On Multiplatforms, stop the channel immediately; the thread or process of the channel is terminated.

z/OS On z/OS, MQMODE_TERMINATE is synonymous with FORCE.

z/OS On z/OS, this option interrupts any message reallocation in progress, which can leave BIND_NOT_FIXED messages partially reallocated or out of order.

Note: This parameter was previously called *Quiesce* (MQIACF_QUIESCE), with values MQQO_YES and MQQO_NO. The old names can still be used.

QMgrName (MQCFST)

Name of remote queue manager (parameter identifier: MQCA_Q_MGR_NAME).

This parameter is the name of the remote queue manager to which the channel is connected. If this parameter is omitted, all channels with the specified channel name and connection name are stopped. The maximum length of the string is MQ_Q_MGR_NAME_LENGTH.

If this parameter is specified, ChannelStatus must be MQCHS_INACTIVE.

Multi MQIACF_IGNORE_STATE

Specifies whether the command fails if the channel is already stopped. The possible values are:

MQIS_NO

The command fails if the channel is already stopped. This is the default value.

MQIS_YES

The command succeeds regardless of the current state of the channel.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_DISABLED

Channel disabled.

MQRCCF_CHANNEL_NOT_ACTIVE

Channel not active.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_MODE_VALUE_ERROR

Mode value not valid.

MQRCCF_MQCONN_FAILED

MQCONN call failed.

MQRCCF_MQOPEN_FAILED

MQOPEN call failed.

MQRCCF_MQSET_FAILED

MQSET call failed.

ALW MQCMD_STOP_CHANNEL (Stop Channel) MQTT on AIX, Linux, and Windows

The Stop Channel (MQCMD_STOP_CHANNEL) PCF command stops an MQ Telemetry channel.

Required parameters

ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH_CHANNEL_NAME).

This parameter is required.

The name of the channel to be stopped. The maximum length of the string is MQ_CHANNEL_NAME_LENGTH.

ChannelType (MQCFIN)

The type of channel (parameter identifier: MQIACH_CHANNEL_TYPE). This parameter is currently only used with MQTT Telemetry channels, and is required when stopping a Telemetry channel. The only value that can currently be given to the parameter is **MQCHT_MQTT**.

Optional parameters

ClientIdentifier (MQCFST)

Client identifier. The client identifier is a 23-byte string that identifies an MQ Telemetry Transport client. When the Stop Channel command specifies a *ClientIdentifier*, only the connection for the specified client identifier is stopped. If the CLIENTID is not specified, all the connections on the channel are stopped.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CHANNEL_DISABLED

Channel disabled.

MQRCCF_CHANNEL_NOT_ACTIVE

Channel not active.

MQRCCF_CHANNEL_NOT_FOUND

Channel not found.

MQRCCF_MODE_VALUE_ERROR

Mode value not valid.

MQRCCF_MQCONN_FAILED

MQCONN call failed.

MQRCCF_MQOPEN_FAILED

MQOPEN call failed.

MQRCCF_MQSET_FAILED

MQSET call failed.

MQCMD_STOP_CHANNEL_INIT (Stop Channel Initiator) on z/OS

The Stop Channel Initiator (MQCMD_STOP_CHANNEL_INIT) PCF command stops an IBM MQ channel initiator.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

SharedChannelRestart (MQCFIN)

Shared channel restart (parameter identifier: MQIACH_SHARED_CHL_RESTART).

Specifies whether the channel initiator attempts to restart any active sending channels, started with the **ChannelDisposition** parameter set to MQCHLD_SHARED, that it owns on another queue manager. The value can be:

MQCHSH_RESTART_YES

Shared sending channels are to be restarted. MQCHSH_RESTART_YES is the default.

MQCHSH_RESTART_NO

Shared sending channels are not to be restarted, so become inactive.

Active channels started with the **ChannelDisposition** parameter set to MQCHLD_FIXSHARED are not restarted, and always become inactive.

MQCMD_STOP_CHANNEL_LISTENER (Stop Channel Listener)

The Stop Channel Listener (MQCMD_STOP_CHANNEL_LISTENER) PCF command stops an IBM MQ listener.

Required parameters

ListenerName (MQCFST)

Listener name (parameter identifier: MQCACH_LISTENER_NAME). This parameter does not apply to z/OS.

The name of the listener definition to be stopped. If this parameter is specified, no other parameters can be specified.

The maximum length of the string is MQ_LISTENER_NAME_LENGTH.

Optional parameters for z/OS

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

This parameter is valid only on z/OS.

The maximum length is MQ_QSG_NAME_LENGTH.

InboundDisposition (MQCFIN)

Inbound transmission disposition (parameter identifier: MQIACH_INBOUND_DISP).

Specifies the disposition of the inbound transmissions that the listener handles. The value can be any of the following values:

MQINBD_Q_MGR

Handling for transmissions directed to the queue manager. MQINBD_Q_MGR is the default.

MQINBD_GROUP

Handling for transmissions directed to the queue sharing group. MQINBD_GROUP is permitted only if there is a shared queue manager environment.

This parameter is valid only on z/OS.

IPAddress (MQCFST)

IP address (parameter identifier: MQCACH_IP_ADDRESS).

The IP address for TCP/IP specified in dotted decimal or alphanumeric form. This parameter is valid on z/OS only where channels have a *TransportType* of MQXPT_TCP.

The maximum length of the string is MQ_IP_ADDRESS_LENGTH.

Port (MQCFIN)

Port number for TCP (parameter identifier: MQIACH_PORT_NUMBER).

The port number for TCP. This parameter is valid only on z/OS where channels have a *TransportType* of MQXPT_TCP.

TransportType (MQCFIN)

Transmission protocol type (parameter identifier: MQIACH_XMIT_PROTOCOL_TYPE).

The value can be:

MQXPT_LU62

LU 6.2.

MQXPT_TCP

TCP.

This parameter is valid only on z/OS.

Optional parameters for Multiplatforms

Multi

MQIACF_IGNORE_STATE

Specifies whether the command fails if the listener is already stopped. The possible values are:

MQIS_NO

The command fails if the listener is already stopped. This is the default value.

MQIS_YES

The command succeeds regardless of the current state of the listener.

Error codes

This command might return the following error code in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_LISTENER_STOPPED

Listener not running.

Multi

MQCMD_STOP_CONNECTION (Stop Connection) on Multiplatforms

The Stop Connection (MQCMD_STOP_CONNECTION) PCF command attempts to break a connection between an application and the queue manager. There might be circumstances in which the queue manager cannot implement this command.

Required parameters

ConnectionId (MQCFBS)

Connection identifier (parameter identifier: MQBACF_CONNECTION_ID).

This parameter is the unique connection identifier associated with an application that is connected to the queue manager.

The length of the byte string is MQ_CONNECTION_ID_LENGTH.

MQCMD_STOP_SERVICE (Stop Service) on Multiplatforms

The Stop Service (MQCMD_STOP_SERVICE) PCF command stops an existing IBM MQ service definition that is running.

Required parameters**ServiceName (MQCFST)**

Service name (parameter identifier: MQCA_SERVICE_NAME).

This parameter is the name of the service definition to be stopped. The maximum length of the string is MQ_OBJECT_NAME_LENGTH.

Optional parameters**MQIACF_IGNORE_STATE**

Specifies whether the command fails if the service is already stopped. The possible values are:

MQIS_NO

The command fails if the service is already stopped. This is the default value.

MQIS_YES

The command succeeds regardless of the current state of the service.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown on page [“Error codes applicable to all commands”](#) on page 1018.

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_NO_STOP_CMD

The **StopCommand** parameter of the service is blank.

MQRCCF_SERVICE_STOPPED

Service is not running.

MQCMD_STOP_SMDSCONN (stop shared message data sets connection) on**z/OS**

The Stop SMDS Connection (MQCMD_STOP_SMDSCONN) PCF command terminates the connection from this queue manager to one or more specified shared message data sets. This causes the data sets to be closed and deallocated, and marks the connection as STOPPED.

Required parameters**SMDSConn (MQCFST)**

Specifies the queue manager name relating to the connection between the shared message data set and the queue manager (parameter identifier: MQCACF_CF_SMDSCONN).

An asterisk value can be used to denote all shared message data sets associated with a specific CFSTRUCT name.

The maximum length of the string is 4 characters.

CFStrucName (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to stop (parameter identifier: MQCA_CF_STRUC_NAME).

The maximum length of the string is MQ_CF_STRUC_NAME_LENGTH.

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.
- an asterisk (*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue sharing group.

The maximum length is MQ_QSG_NAME_LENGTH.

MQCMD_SUSPEND_Q_MGR (Suspend Queue Manager) on z/OS

The Suspend Queue Manager (MQCMD_SUSPEND_Q_MGR) PCF command renders the local queue manager unavailable for the processing of IMS or Db2 messages. Its action can be reversed by the Resume Queue Manager command (MQCMD_RESUME_Q_MGR) command.

Required parameters

Facility (MQCFIN)

Facility (parameter identifier: MQIACF_Q_MGR_FACILITY).

The type of facility for which activity is to be suspended. The value can be:

MQQMFACT_DB2

The existing connection to Db2 is terminated.

Any in-flight or subsequent MQGET or MQPUT requests are suspended and applications wait until the Db2 connection is re-established by the Resume Queue Manager command, or if the queue manager is stopped.

MQQMFACT_IMS_BRIDGE

Resumes normal IMS bridge activity.

Stops the sending of messages from IMS bridge queues to OTMA. No further messages are sent to IMS until one of these events occurs:

- OTMA is stopped and restarted
- IMS or IBM MQ is stopped or restarted
- A Resume Queue Manager command is processed

Messages returning from IMS OTMA to the queue manager are unaffected.

Optional parameters

CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF_COMMAND_SCOPE).

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

MQCMD_SUSPEND_Q_MGR_CLUSTER (Suspend Queue Manager Cluster)

The Suspend Queue Manager Cluster (MQCMD_SUSPEND_Q_MGR_CLUSTER) PCF command informs other queue managers in a cluster that the local queue manager is not available for processing, and cannot be sent messages. Its action can be reversed by the Resume Queue Manager Cluster (MQCMD_RESUME_Q_MGR_CLUSTER) command.

Required parameters

ClusterName (MQCFST)

Cluster name (parameter identifier: MQCA_CLUSTER_NAME).

The name of the cluster for which availability is to be suspended.

The maximum length of the string is MQ_CLUSTER_NAME_LENGTH.

ClusterNamelist (MQCFST)

Cluster Namelist (parameter identifier: MQCA_CLUSTER_NAMELIST).

The name of the namelist specifying a list of clusters for which availability is to be suspended.

Optional parameters

z/OS CommandScope (MQCFST)

Command scope (parameter identifier: MQACF_COMMAND_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue sharing group environment, and the command server must be enabled.

The maximum length is MQ_QSG_NAME_LENGTH.

Mode (MQCFIN)

How the local queue manager is suspended from the cluster (parameter identifier: MQIACF_MODE).

The value can be:

MQMODE QUIESCE

Other queue managers in the cluster are told not to send further messages to the local queue manager.

MQMODE FORCE

All inbound and outbound channels to other queue managers in the cluster are stopped forcibly.

Note: This parameter was previously called *Quiesce* (MQIACF QUIESCE), with values MQQO_YES and MQQO_NO. The old names can still be used.

Error codes

This command might return the following error codes in the response format header, in addition to the values shown in [“Error codes applicable to all commands” on page 1018](#).

Reason (MQLONG)

The value can be any of the following values:

MQRCCF_CLUSTER_NAME_CONFLICT

Cluster name conflict.

MQRCCF_MODE_VALUE_ERROR

Mode value not valid.

Structures for PCF commands and responses

PCF commands and responses have a consistent structure including of a header and any number of parameter structures of defined types.

Commands and responses have the following form:

- PCF header (MQCFH) structure (described in topic [“MQCFH - PCF header” on page 1545](#)), followed by
- Zero or more parameter structures. Each of these is one of the following:
 - PCF byte string filter parameter (MQCFBF, see topic [“MQCFBF - PCF byte string filter parameter” on page 1548](#))
 - PCF byte string parameter (MQCFBS, see topic [“MQCFBS - PCF byte string parameter” on page 1551](#))
 - PCF integer filter parameter (MQCFIF, see topic [“MQCFIF - PCF integer filter parameter” on page 1553](#))
 - PCF integer list parameter (MQCFIL, see topic [“MQCFIL - PCF integer list parameter” on page 1556](#))
 - PCF integer parameter (MQCFIN, see topic [“MQCFIN - PCF integer parameter” on page 1558](#))
 - PCF string filter parameter (MQCFSF, see topic [“MQCFSF - PCF string filter parameter” on page 1560](#))
 - PCF string list parameter (MQCFSL, see topic [“MQCFSL - PCF string list parameter” on page 1564](#))
 - PCF string parameter (MQCFST, see topic [“MQCFST - PCF string parameter” on page 1568](#))

How the PCF command structures are shown

The PCF command structures are described in a language-independent form.

The declarations are shown in the following programming languages:

- C
- COBOL
- PL/I
- S/390 assembler
- Visual Basic

Data types

For each field of the structure, the data type is given in brackets after the field name. These data types are the elementary data types described in [Data types used in the MQI](#).

Initial values and default structures

See [IBM MQ COPY](#), header, include, and module files for details of the supplied header files that contain the structures, constants, initial values, and default structures.

PCF structures: Usage notes

The format of the strings in the PCF message determines the settings of the character set fields in the message descriptor to enable conversion of strings within the message.

If all of the strings in a PCF message have the same coded character-set identifier, the *CodedCharSetId* field in the message descriptor MQMD should be set to that identifier when the message is put, and the *CodedCharSetId* fields in the MQCFST, MQCFSL, and MQCFSF structures within the message should be set to MQCCSI_DEFAULT.

If the format of the PCF message is MQFMT_ADMIN, MQFMT_EVENT, or MQFMT_PCF and some of the strings in the message have different character-set identifiers, the *CodedCharSetId* field in MQMD should be set to MQCCSI_EMBEDDED when the message is put, and the *CodedCharSetId* fields in the MQCFST, MQCFSL, and MQCFSF structures within the message should all be set to the identifiers that apply.

This enables conversions of the strings within the message, to the *CodedCharSetId* value in the MQMD specified on the MQGET call, if the MQGMO_CONVERT option is also specified.

For more information about the MQEPH structure, see [MQEPH - Embedded PCF header](#).

Note: If you request conversion of the internal strings in the message, the conversion will occur only if the value of the *CodedCharSetId* field in the MQMD of the message is different from the *CodedCharSetId* field of the MQMD specified on the MQGET call.

Do not specify MQCCSI_EMBEDDED in MQMD when the message is put, with MQCCSI_DEFAULT in the MQCFST, MQCFSL, or MQCFSF structures within the message, as this will prevent conversion of the message.

MQCFH - PCF header

The MQCFH PCF structure describes the information that is present at the start of the message data of a command message, or a response to a command message. In either case, the message descriptor *Format* field is MQFMT_ADMIN.

The PCF structures are also used for event messages. In this case the message descriptor *Format* field is MQFMT_EVENT.

The PCF structures can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT_PCF (see [Message descriptor for a PCF command](#)). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *StrucLength* and *ParameterCount* fields to the values appropriate to the data.

Fields for MQCFH

Type (MQLONG)

Structure type.

This field indicates the content of the message. The following values are valid for commands:

MQCFT_COMMAND

Message is a command.

MQCFT_COMMAND_XR

Message is a command to which standard or extended responses might be sent.

This value is required on z/OS.

MQCFT_RESPONSE

Message is a response to a command.

MQCFT_XR_MSG

Message is an extended response to a command. It contains informational or error details.

MQCFT_XR_ITEM

Message is an extended response to an Inquire command. It contains item data.

MQCFT_XR_SUMMARY

Message is an extended response to a command. It contains summary information.

MQCFT_USER

User-defined PCF message.

StrucLength (MQLONG)

Structure length.

This field is the length in bytes of the MQCFH structure. The value must be:

MQCFH_STRUC_LENGTH

Length of command format header structure.

Version (MQLONG)

Structure version number.

For z/OS, the value must be:

MQCFH_VERSION_3

Version number for command format header structure.

The following constant specifies the version number of the current version:

MQCFH_CURRENT_VERSION

Current version of command format header structure.

Command (MQLONG)

Command identifier.

For a command message, this field identifies the function to be performed. For a response message, it identifies the command to which this field is the reply. See the description of each command for the value of this field.

MsgSeqNumber (MQLONG)

Message sequence number.

This field is the sequence number of the message within a set of related messages. For a command, this field must have the value one (because a command is always contained within a single message). For a response, the field has the value one for the first (or only) response to a command, and increases by one for each successive response to that command.

The last (or only) message in a set has the MQCFC_LAST flag set in the *Control* field.

Control (MQLONG)

Control options.

The following values are valid:

MQCFC_LAST

Last message in the set.

For a command, this value must always be set.

MQCFC_NOT_LAST

Not the last message in the set.

CompCode (MQLONG)

Completion code.

This field is meaningful only for a response; its value is not significant for a command. The following values are possible:

MQCC_OK

Command completed successfully.

MQCC_WARNING

Command completed with warning.

MQCC_FAILED

Command failed.

MQCC_UNKNOWN

Whether command succeeded is not known.

Reason (MQLONG)

Reason code qualifying completion code.

This field is meaningful only for a response; its value is not significant for a command.

The possible reason codes that can be returned in response to a command are listed in, [“Definitions of the Programmable Command Formats”](#) on page 1012 and in the description of each command.

ParameterCount (MQLONG)

Count of parameter structures.

This field is the number of parameter structures (MQCFBF, MQCFBS, MQCFIF, MQCFIL, MQCFIN, MQCFSL, MQCFSF, and MQCFST) that follow the MQCFH structure. The value of this field is zero or greater.

C language declaration

```

MQCFBF - PCF byte string filter parameter

The MQCFBF PCF structure describes a byte string filter parameter. The format name in the message descriptor is MQFMT_ADMIN.

The MQCFBF structure is used in Inquire commands to provide a filter description. This filter description is used to filter the results of the Inquire command and return to the user only those objects that satisfy the filter description.

When an MQCFBF structure is present, the Version field in the MQCFH structure at the start of the PCF must be MQCFH_VERSION_3 or higher.

 On z/OS, a single filter parameter only is allowed. If multiple MQCFIF, MQCFSF and MQCFBF, or MQCFBF, parameters are specified, the PCF command fails with error MQRCCF_TOO_MANY_FILTERS (MQRCCF 3248).

Fields for MQCFBF

Type (MQLONG)

Structure type.

This indicates that the structure is a MQCFBF structure describing a byte string filter parameter. The value must be:

MQCFT_BYTE_STRING_FILTER

Structure defining a byte string filter.

StrucLength (MQLONG)

Structure length.

This is the length, in bytes, of the MQCFBF structure, including the string at the end of the structure (the *FilterValue* field). The length must be a multiple of 4, and must be sufficient to contain the string. Bytes between the end of the string and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *FilterValue* field:

MQCFBF_STRUC_LENGTH_FIXED

Length of fixed part of command format filter string-parameter structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter that is to be filtered on. The value of this identifier depends on the parameter to be filtered on.

The parameter is one of the following:

- MQBACF_EXTERNAL_UOW_ID
- MQBACF_Q_MGR_UOW_ID
- MQBACF_ORIGIN_UOW_ID (on z/OS only)

Operator (MQLONG)

Operator identifier.

This identifies the operator that is being used to evaluate whether the parameter satisfies the filter-value.

Possible values are:

MQCFOP_GREATER

Greater than

MQCFOP_LESS

Less than

MQCFOP_EQUAL

Equal to

MQCFOP_NOT_EQUAL

Not equal to

MQCFOP_NOT_LESS

Greater than or equal to

MQCFOP_NOT_GREATER

Less than or equal to

FilterValueLength (MQLONG)

Length of filter-value string.

This is the length, in bytes, of the data in the *FilterValue* field. This must be zero or greater, and does not need to be a multiple of 4.

FilterValue (MQBYTE x FilterValueLength)

Filter value.

This specifies the filter-value that must be satisfied. Use this parameter where the response type of the filtered parameter is a byte string.

Note: If the specified byte string is shorter than the standard length of the parameter in MQFMT_ADMIN command messages, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.

C language declaration

```
typedef struct tagMQCFBF {
    MQLONG  Type;           /* Structure type */
    MQLONG  StructLength;  /* Structure length */
    MQLONG  Parameter;     /* Parameter identifier */
    MQLONG  Operator;      /* Operator identifier */
    MQLONG  FilterValueLength; /* Filter value length */

MQCFBS - PCF byte string parameter

The MQCFBS PCF structure describes a byte-string parameter in a PCF message. The format name in the message descriptor is MQFMT_ADMIN.

When an MQCFBS structure is present, the *Version* field in the MQCFH structure at the start of the PCF must be MQCFH_VERSION_2 or greater.

In a user PCF message, the *Parameter* field has no significance, and can be used by the application for its own purposes.

The structure ends with a variable-length byte string; see the *String* field in the following section for further details.

Fields for MQCFBS

Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFBS structure describing byte string parameter. The value must be:

MQCFT_BYTE_STRING

Structure defining a byte string.

StruLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFBS structure, including the variable-length string at the end of the structure (the *String* field). The length must be a multiple of four, and must be sufficient to contain the string; any bytes between the end of the string and the length defined by the *StruLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *String* field:

MQCFBS_STRUC_LENGTH_FIXED

Length of fixed part of MQCFBS structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter with a value that is contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see “MQCFH - PCF header” on page 1545 for details. In user PCF messages (MQCFT_USER), this field has no significance.

The parameter is from the MQBACF_* group of parameters.

StringLength (MQLONG)

Length of string.

This is the length in bytes of the data in the *string* field; it must be zero or greater. This length does not need to be a multiple of four.

String (MQBYTE x StringLength)

String value.

This is the value of the parameter identified by the *parameter* field. The string is a byte string, and so is not subject to character-set conversion when sent between different systems.

Note: A null character in the string is treated as normal data, and does not act as a delimiter for the string. For MQFMT_ADMIN messages, if the specified string is shorter than the standard length of the *parameter*, the omitted characters are assumed to be nulls. If the specified string is longer than the standard length, it is an error.

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For other programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, you must include MQCFBS in a larger structure, and declare additional fields following MQCFBS, to represent the *String* field as required.

C language declaration

```
typedef struct tagMQCFBS {
    MQLONG  Type;          /* Structure type */
    MQLONG  StrucLength;   /* Structure length */
    MQLONG  Parameter;    /* Parameter identifier */
    MQLONG  StringLength; /* Length of string */
    MQBYTE  String[1];    /* String value - first byte */

} MQCFBS;
```

MQCFIF - PCF integer filter parameter

The MQCFIF PCF structure describes an integer filter parameter. The format name in the message descriptor is MQFMT_ADMIN.

The MQCFIF structure is used in Inquire commands to provide a filter condition. This filter condition is used to filter the results of the Inquire command and return to the user only those objects that satisfy the filter condition.

When an MQCFIF structure is present, the Version field in the MQCFH structure at the start of the PCF must be MQCFH_VERSION_3 or higher.

 On z/OS, a single filter parameter only is allowed. If multiple MQCFIF, MQCFSF and MQCFBF, or MQCFBF, parameters are specified, the PCF command fails with error MQRCCF_TOO_MANY_FILTERS (MQRCCF 3248).

Fields for MQCFIF

Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFIF structure describing an integer filter parameter. The value must be:

MQCFT_INTEGER_FILTER

Structure defining an integer filter.

StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFIF structure. The value must be:

MQCFIF_STRUC_LENGTH

Length of command format integer-parameter structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter that is to be filtered on. The value of this identifier depends on the parameter to be filtered on. Any of the parameters which can be used in the Inquire command can be used in this field.

The parameter is from the following groups of parameters:

- MQIA_*
- MQIACF_*
- MQIAMO_*
- MQIACH_*

Operator (MQLONG)

Operator identifier.

This identifies the operator that is being used to evaluate whether the parameter satisfies the filter-value.

Possible values are:

MQCFOP_GREATER

Greater than

MQCFOP_LESS

Less than

MQCFOP_EQUAL

Equal to

MQCFOP_NOT_EQUAL

Not equal to

MQCFOP_NOT_LESS

Greater than or equal to

MQCFOP_NOT_GREATER

Less than or equal to

MQCFOP_CONTAINS

Contains a specified value. Use MQCFOP_CONTAINS when filtering on lists of values or integers.

MQCFOP_EXCLUDES

Does not contain a specified value. Use MQCFOP_EXCLUDES when filtering on lists of values or integers.

See the *FilterValue* description for details telling you which operators can be used in which circumstances.

FilterValue (MQLONG)

Filter value identifier.

This specifies the filter-value that must be satisfied.

Depending on the parameter, the value and the permitted operators can be:

- An explicit integer value, if the parameter takes a single integer value.

You can only use the following operators:

- MQCFOP_GREATER
 - MQCFOP_LESS
 - MQCFOP_EQUAL
 - MQCFOP_NOT_EQUAL
 - MQCFOP_NOT_GREATER
 - MQCFOP_NOT_LESS
- An MQ constant, if the parameter takes a single value from a possible set of values (for example, the value MQCHT_SENDER on the **ChannelType** parameter). You can only use MQCFOP_EQUAL or MQCFOP_NOT_EQUAL.
 - An explicit value or an MQ constant, as the case might be, if the parameter takes a list of values. You can use either MQCFOP_CONTAINS or MQCFOP_EXCLUDES. For example, if the value 6 is specified with the operator MQCFOP_CONTAINS, all items where one of the parameter values is 6 are listed.

For example, if you need to filter on queues that are enabled for put operations in your Inquire Queue command, the parameter would be MQIA_INHIBIT_PUT and the filter-value would be MQQA_PUT_ALLOWED.

The filter value must be a valid value for the parameter being tested.

C language declaration

```
typedef struct tagMQCFIF {
    MQLONG Type; /* Structure type */
    MQLONG StrucLength; /* Structure length */
    MQLONG Parameter; /* Parameter identifier */
    MQLONG Operator; /* Operator identifier */
    MQLONG FilterValue; /* Filter value */
} MQCFIF;

MQCFIL - PCF integer list parameter

The MQCFIL PCF structure describes an integer-list parameter in a message that is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT_ADMIN.

The MQCFIL structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT_PCF (see [Message descriptor for a PCF command](#)). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *StrucLength*, *Count*, and *Values* fields to the values appropriate to the data.

The structure ends with a variable-length array of integers; see the *Values* field in the following section for further details.

Fields for MQCFIL

Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFIL structure describing an integer-list parameter. The value must be:

MQCFT_INTEGER_LIST

Structure defining an integer list.

StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFIL structure, including the array of integers at the end of the structure (the *Values* field). The length must be a multiple of four, and must be sufficient to contain the array; any bytes between the end of the array and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *Values* field:

MQCFIL_STRUC_LENGTH_FIXED

Length of fixed part of command format integer-list parameter structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter with values that are contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see [“MQCFH - PCF header” on page 1545](#) for details.

The parameter is from the following groups of parameters:

- MQIA_*
- MQIACF_*
- MQIAMO_*
- MQIACH_*

Count (MQLONG)

Count of parameter values.

This is the number of elements in the *Values* array; it must be zero or greater.

Values (MQLONG x Count)

Parameter values.

This is an array of values for the parameter identified by the *Parameter* field. For example, for MQIACF_Q_ATTRS, this field is a list of attribute selectors (MQCA_* and MQIA_* values).

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For the COBOL, PL/I, RPG, and System/390 assembler programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, you must include MQCFIL in a larger structure, and declare additional fields following MQCFIL, to represent the *Values* field as required.

C language declaration

```
typedef struct tagMQCFIL {
    MQLONG  Type;          /* Structure type */
    MQLONG  StrucLength;  /* Structure length */
    MQLONG  Parameter;    /* Parameter identifier */
    MQLONG  Count;        /* Count of parameter values */
    MQLONG  Values[1];    /* Parameter values - first element */
} MQCFIL;
```

COBOL language declaration

```

MQCFIN - PCF integer parameter

The MQCFIN PCF structure describes an integer parameter in a message that is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT_ADMIN.

The MQCFIN structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT_PCF (see Message descriptor for a PCF command). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *Value* field to the value appropriate to the data.

Fields for MQCFIN

Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFIN structure describing an integer parameter. The value must be:

MQCFT_INTEGER

Structure defining an integer.

StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFIN structure. The value must be:

MQCFIN_STRUC_LENGTH

Length of command format integer-parameter structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter with a value that is contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see [“MQCFH - PCF header” on page 1545](#) for details.

The parameter is from the following groups of parameters:

- MQIA_*
- MQIACF_*
- MQIAMO_*
- MQIACH_*

Value (MQLONG)

Parameter value.

This is the value of the parameter identified by the *Parameter* field.

C language declaration

```
typedef struct tagMQCFIN {
    MQLONG  Type;          /* Structure type */
    MQLONG  StrucLength;  /* Structure length */
    MQLONG  Parameter;    /* Parameter identifier */
    MQLONG  Value;        /* Parameter value */
} MQCFIN;

MQCFSF - PCF string filter parameter

The MQCFSF PCF structure describes a string filter parameter. The format name in the message descriptor is MQFMT_ADMIN.

The MQCFSF structure is used in Inquire commands to provide a filter condition. This filter condition is used to filter the results of the Inquire command and return to the user only those objects that satisfy the filter condition.

 On z/OS, a single filter parameter only is allowed. If multiple MQCFIF, MQCFSF and MQCFBF, or MQCFBF, parameters are specified, the PCF command fails with error MQRCCF_TOO_MANY_FILTERS (MQRCCF 3248).

The results of filtering character strings on EBCDIC-based systems might be different from those results achieved on ASCII-based systems. This difference is because comparison of character strings is based on the collating sequence of the internal built-in values representing the characters.

When an MQCFSF structure is present, the Version field in the MQCFH structure at the start of the PCF must be MQCFH_VERSION_3 or higher.

Fields for MQCFSF

Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFSF structure describing a string filter parameter. The value must be:

MQCFT_STRING_FILTER

Structure defining a string filter.

StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFSF structure. The value must be:

MQCFSF_STRUC_LENGTH

MQCFSF_STRUC_LENGTH is the length, in bytes, of the MQCFSF structure, including the string at the end of the structure (the *FilterValue* field). The length must be a multiple of 4, and must be sufficient to contain the string. Bytes between the end of the string and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *FilterValue* field:

MQCFSF_STRUC_LENGTH_FIXED

Length of fixed part of command format filter string-parameter structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter that is to be filtered on. The value of this identifier depends on the parameter to be filtered on. Any of the parameters which can be used in the Inquire command can be used in this field.

The parameter is from the following groups of parameters:

- MQCA_*
- MQCACF_*
- MQCAMO_*
- MQCACH_*

Operator (MQLONG)

Operator identifier.

This identifies the operator that is being used to evaluate whether the parameter satisfies the filter-value.

Possible values are:

MQCFOP_GREATER

Greater than

MQCFOP_LESS

Less than

MQCFOP_EQUAL

Equal to

MQCFOP_NOT_EQUAL

Not equal to

MQCFOP_NOT_LESS

Greater than or equal to

MQCFOP_NOT_GREATER

Less than or equal to

MQCFOP_LIKE

Matches a generic string

MQCFOP_NOT_LIKE

Does not match a generic string

MQCFOP_CONTAINS

Contains a specified string. Use MQCFOP_CONTAINS when filtering on lists of strings.

MQCFOP_EXCLUDES

Does not contain a specified string. Use MQCFOP_EXCLUDES when filtering on lists of strings.

MQCFOP_CONTAINS_GEN

Contains an item which matches a generic string. Use MQCFOP_CONTAINS_GEN when filtering on lists of strings.

MQCFOP_EXCLUDES_GEN

Does not contain any item which matches a generic string. Use MQCFOP_EXCLUDES_GEN when filtering on lists of strings.

See the *FilterValue* description for details telling you which operators can be used in which circumstances.

CodedCharSetId (MQLONG)

Coded character set identifier.

This specifies the coded character set identifier of the data in the *FilterValue* field. The following special value can be used:

MQCCSI_DEFAULT

Default character set identifier.

The string data is in the character set defined by the *CodedCharSetId* field in the MQ header structure that *precedes* the MQCFH structure, or by the *CodedCharSetId* field in the MQMD if the MQCFH structure is at the start of the message.

FilterValueLength (MQLONG)

Length of filter-value string.

This is the length, in bytes, of the data in the *FilterValue* field. This parameter must be zero or greater, and does not need to be a multiple of 4.

Note:  On z/OS there is a 256 character limit for the filter-value of the MQSC **WHERE** clause. This limit is not in place for other platforms.

FilterValue (MQCHAR x FilterValueLength)

Filter value.

This specifies the filter-value that must be satisfied. Depending on the parameter, the value and the permitted operators can be:

- An explicit string value.

You can only use the following operators:

- MQCFOP_GREATER
- MQCFOP_LESS
- MQCFOP_EQUAL
- MQCFOP_NOT_EQUAL
- MQCFOP_NOT_GREATER
- MQCFOP_NOT_LESS

- A generic string value. This field is a character string with an asterisk at the end, for example ABC*. The operator must be either MQCFOP_LIKE or MQCFOP_NOT_LIKE. The characters must be valid for the attribute you are testing. If the operator is MQCFOP_LIKE, all items where the attribute value begins with the string (ABC in the example) are listed. If the operator is MQCFOP_NOT_LIKE, all items where the attribute value does not begin with the string are listed.

- If the parameter takes a list of string values, the operator can be:
 - MQCFOP_CONTAINS

- MQCFOP_EXCLUDES
- MQCFOP_CONTAINS_GEN
- MQCFOP_EXCLUDES_GEN

An item in a list of values. The value can be explicit or generic. If it is explicit, use MQCFOP_CONTAINS or MQCFOP_EXCLUDES as the operator. For example, if the value DEF is specified with the operator MQCFOP_CONTAINS, all items where one of the attribute values is DEF are listed. If it is generic, use MQCFOP_CONTAINS_GEN or MQCFOP_EXCLUDES_GEN as the operator. If ABC* is specified with the operator MQCFOP_CONTAINS_GEN, all items where one of the attribute values begins with ABC are listed.

Note:

1. If the specified string is shorter than the standard length of the parameter in MQFMT_ADMIN command messages, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.
2. When the queue manager reads an MQCFSF structure in an MQFMT_ADMIN message from the command input queue, the queue manager processes the string as though it had been specified on an MQI call. This processing means that within the string, the first null and the characters following it (up to the end of the string) are treated as blanks.
3. On z/OS there is a 256 character limit for the filter-value of the MQSC **WHERE** clause. This limit is not in place for other platforms.

The filter value must be a valid value for the parameter being tested.

C language declaration

```
typedef struct tagMQCFSF {
    MQLONG  Type;           /* Structure type */
    MQLONG  StrucLength;    /* Structure length */
    MQLONG  Parameter;     /* Parameter identifier */
    MQLONG  Operator;      /* Operator identifier */
    MQLONG  CodedCharSetId; /* Coded character set identifier */
    MQLONG  FilterValueLength /* Filtervalue length */
    MQCHAR[1]  FilterValue; /* Filter value */
} MQCFSF;

MQCF SL - PCF string list parameter

The MQCF SL PCF structure describes a string-list parameter in a message which is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT_ADMIN.

The MQCF SL structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT_PCF (see [Message descriptor for a PCF command](#)). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields,

but the application must set the *StrucLength*, *Count*, *StringLength*, and *Strings* fields to the values appropriate to the data.

The structure ends with a variable-length array of character strings; see the *Strings* field section for further details.

See [“PCF structures: Usage notes” on page 1544](#) for further information about how to use the structure.

Fields for MQCFSL

Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFSL structure describing a string-list parameter. The value must be:

MQCFT_STRING_LIST

Structure defining a string list.

StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFSL structure, including the data at the end of the structure (the *Strings* field). The length must be a multiple of four, and must be sufficient to contain all the strings; any bytes between the end of the strings and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *Strings* field:

MQCFSL_STRUC_LENGTH_FIXED

Length of fixed part of command format string-list parameter structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter with values that are contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see [“MQCFH - PCF header” on page 1545](#) for details.

The parameter is from the following groups of parameters:

- MQCA_*
- MQCACF_*
- MQCAMO_*
- MQCACH_*

CodedCharSetId (MQLONG)

Coded character set identifier.

This specifies the coded character set identifier of the data in the *Strings* field. The following special value can be used:

MQCCSI_DEFAULT

Default character set identifier.

The string data is in the character set defined by the *CodedCharSetId* field in the MQ header structure that *precedes* the MQCFH structure, or by the *CodedCharSetId* field in the MQMD if the MQCFH structure is at the start of the message.

Count (MQLONG)

Count of parameter values.

This is the number of strings present in the *Strings* field; it must be zero or greater.

StringLength (MQLONG)

Length of one string.

This is the length in bytes of one parameter value, that is the length of one string in the *Strings* field; all the strings are this length. The length must be zero or greater, and need not be a multiple of four.

Strings (MQCHAR x StringLength x Count)

String values.

This is a set of string values for the parameter identified by the *Parameter* field. The number of strings is given by the *Count* field, and the length of each string is given by the *StringLength* field. The strings are concatenated together, with no bytes skipped between adjacent strings. The total length of the strings is the length of one string multiplied by the number of strings present (that is, *StringLength* x *Count*).

- In MQFMT_ADMIN command messages, if the specified string is shorter than the standard length of the parameter, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.
- In MQFMT_ADMIN response messages, string parameters might be returned padded with blanks to the standard length of the parameter.
- In MQFMT_EVENT messages, trailing blanks might be omitted from string parameters (that is, the string might be shorter than the standard length of the parameter).

In all cases, *StringLength* gives the length of the string present in the message.

The strings can contain any characters that are in the character set defined by *CodedCharSetId*, and that are valid for the parameter identified by *Parameter*.

Note: When the queue manager reads an MQCFSL structure in an MQFMT_ADMIN message from the command input queue, the queue manager processes each string in the list as though it had been specified on an MQI call. This processing means that within each string, the first null, and the characters following it (up to the end of the string) are treated as blanks.

In responses and all other cases, a null character in a string is treated as normal data, and does not act as a delimiter for the string. This treatment means that when a receiving application reads a MQFMT_PCF, MQFMT_EVENT, or MQFMT_ADMIN message, the receiving application receives all the data specified by the sending application.

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For the COBOL, PL/I, RPG, and System/390 assembler programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, you must include MQCFSL in a larger structure, and declare additional fields following MQCFSL, to represent the *Strings* field as required.

C language declaration

```
typedef struct tagMQCFSL {
    MQLONG  Type;           /* Structure type */
    MQLONG  StringLength;  /* Structure length */

MQCFST - PCF string parameter

The MQCFST PCF structure describes a string parameter in a message that is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT_ADMIN.

The MQCFST structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT_PCF (see [Message descriptor for a PCF command](#)). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *StrucLength*, *StringLength*, and *String* fields to the values appropriate to the data.

The structure ends with a variable-length character string; see the *String* field section for further details.

See [“PCF structures: Usage notes” on page 1544](#) for further information about how to use the structure.

Fields for MQCFST

Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFST structure describing a string parameter. The value must be:

MQCFT_STRING

Structure defining a string.

StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFST structure, including the string at the end of the structure (the *String* field). The length must be a multiple of four, and must be sufficient to contain the string; any bytes between the end of the string and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *String* field:

MQCFST_STRUC_LENGTH_FIXED

Length of fixed part of command format string-parameter structure.

Parameter (MQLONG)

Parameter identifier.

This identifies the parameter with a value that is contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see [“MQCFH - PCF header” on page 1545](#) for details.

The parameter is from the following groups of parameters:

- MQCA_*
- MQCACF_*
- MQCAMO_*
- MQCACH_*

CodedCharSetId (MQLONG)

Coded character set identifier.

This specifies the coded character set identifier of the data in the *String* field. The following special value can be used:

MQCCSI_DEFAULT

Default character set identifier.

The string data is in the character set defined by the *CodedCharSetId* field in the MQ header structure that *precedes* the MQCFH structure, or by the *CodedCharSetId* field in the MQMD if the MQCFH structure is at the start of the message.

StringLength (MQLONG)

Length of string.

This is the length in bytes of the data in the *String* field; it must be zero or greater. This length does not need to be a multiple of four.

String (MQCHAR x StringLength)

String value.

This is the value of the parameter identified by the *Parameter* field:

- In MQFMT_ADMIN command messages, if the specified string is shorter than the standard length of the parameter, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.
- In MQFMT_ADMIN response messages, string parameters might be returned padded with blanks to the standard length of the parameter.
- In MQFMT_EVENT messages, trailing blanks might be omitted from string parameters (that is, the string can be shorter than the standard length of the parameter).

The value of *StringLength* depends on whether, when the specified string is shorter than the standard length, padding blanks have been added to the string. If so, the value of *StringLength* is the sum of the actual length of the string plus the padded blanks.

The string can contain any characters that are in the character set defined by *CodedCharSetId*, and that are valid for the parameter identified by *Parameter*.

Note: When the queue manager reads an MQCFST structure in an MQFMT_ADMIN message from the command input queue, the queue manager processes the string as though it had been specified on an MQI call. This processing means that within the string, the first null and the characters following it (up to the end of the string) are treated as blanks.

In responses and all other cases, a null character in the string is treated as normal data, and does not act as a delimiter for the string. This treatment means that when a receiving application reads a MQFMT_PCF, MQFMT_EVENT, or MQFMT_ADMIN message, the receiving application receives all the data specified by the sending application.

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For the COBOL, PL/I, and System/390 assembler programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, the user must include MQCFST in a larger structure, and declare an additional field or additional fields following MQCFST, to represent the *String* field as required.

C language declaration

```
typedef struct tagMQCFST {
    MQLONG  Type;          /* Structure type */
    MQLONG  StrucLength;   /* Structure length */
    MQLONG  Parameter;    /* Parameter identifier */
    MQLONG  CodedCharSetId; /* Coded character set identifier */
    MQLONG  StringLength; /* Length of string */
    MQCHAR  String[1];    /* String value - first
                          character */
} MQCFST;
```

COBOL language declaration

```
**      MQCFST structure
10 MQCFST.
**      Structure type
15 MQCFST-TYPE          PIC S9(9) BINARY.
**      Structure length
15 MQCFST-STRUCLNGTH  PIC S9(9) BINARY.
**      Parameter identifier
15 MQCFST-PARAMETER    PIC S9(9) BINARY.
**      Coded character set identifier
15 MQCFST-CODEDCHARSETID PIC S9(9) BINARY.
**      Length of string
15 MQCFST-STRINGLENGTH PIC S9(9) BINARY.
```

PL/I language declaration (z/OS only)

```
dcl
  1 MQCFST based,
  3 Type          fixed bin(31), /* Structure type */
  3 StructLength  fixed bin(31), /* Structure length */
  3 Parameter     fixed bin(31), /* Parameter identifier */
  3 CodedCharSetId fixed bin(31), /* Coded character set identifier */
  3 StringLength  fixed bin(31); /* Length of string */
```

System/390 assembler-language declaration (z/OS only)

```

```

PCF example

In this example the compiled program, written in C language, uses IBM MQ for Windows. The program inquires of the default queue manager about a subset of the attributes for all local queues defined to it. It then produces an output file, SAVEQMGR.TST, in the directory from which it was run for use with RUNMQSC.

Inquire local queue attributes

This following section provides an example of how Programmable Command Formats can be used in a program for administration of IBM MQ queues.

The program is given as an example of using PCFs and has been limited to a simple case. This program is of most use as an example if you are considering the use of PCFs to manage your IBM MQ environment.

Program listing

```
/*=====*/
/*
/* This is a program to inquire of the default queue manager about the
/* local queues defined to it.
/*
/* The program takes this information and appends it to a file
/* SAVEQMGR.TST which is of a format suitable for RUNMQSC. It could,
/* therefore, be used to re-create or clone a queue manager.
/*
/* It is offered as an example of using Programmable Command Formats (PCFs)
/* as a method for administering a queue manager.
/*
/*=====*/

ADDMQMINF (Add Queue Manager Information)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Add Message Queue Manager Information (ADDMQMINF) command adds configuration information for a queue manager. This command may be used, for example, to create a secondary queue manager instance by adding a reference to shared queue manager data.

Parameters

Table 219. Command parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1
<u>PREFIX</u>	Queue Manager Prefix	Character value	Required, Positional 2
<u>MQMDIR</u>	Queue Manager Directory	Character value	Required, Positional 3
<u>MQMLIB</u>	Queue Manager Library	Name	Required, Positional 4
<u>DATAPATH</u>	Queue Manager Data Path	Character value	Optional, Positional 5

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager to add information for.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Queue Manager Prefix (PREFIX)

Specifies the prefix for the queue manager filesystem, for example, '/QIBM/UserData/mqm'

The possible values are:

queue-manager-directory-prefix

The prefix for the queue manager filesystem.

Queue Manager Directory (MQMDIR)

Specifies the directory name for the queue manager filesystem. In most cases this will be the same as the queue manager name, unless the directory name has been modified to cater for characters that are not allowed in directory names, or to avoid a clash with an existing directory name.

The possible values are:

queue-manager-directory-name

The prefix for the queue manager filesystem. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Queue Manager Library (MQMLIB)

Specifies the library to be used by the queue manager.

The possible values are:

library name

Specify the library to be used by the queue manager.

Queue Manager Data Path (DATAPATH)

Specifies the fully qualified directory path for the queue manager data. This parameter is optional and if specified, overrides the prefix and directory name for the queue managers data files. Typically this parameter could be used to reference queue data stored on a networked filesystem, such as NFSv4.

The possible values are:

queue-manager-data-path

Specify the data path to be used by the queue manager.

ADDMQMJRN (Add Queue Manager Journal)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Add Queue Manager Journals command (ADDMQMJRN) adds a journal to a queue manager. This command can be used, for example, to configure remote journal replication for a backup or multi-instance queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 1
<u>JRN</u>	Queue Manager Journal	Character value, *DFT	Optional, Positional 2
<u>RMTJRNRDB</u>	Remote Relational Database	Character value	Optional, Positional 3
<u>RMTJRNSTS</u>	Remote Journal Status	*ACTIVE, *INACTIVE	Optional, Positional 4
<u>RMTJRNDLV</u>	Remote Journal Delivery	*SYNC, *ASYNC	Optional, Positional 5
<u>RMTJRNTIMO</u>	Remote Journal Sync. Timeout	1-3600, *DFT	Optional, Positional 6

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager associated with the journal.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Queue Manager Journal (JRN)

Specifies the journal name to create.

The possible values are:

*DFT

The journal name is chosen by the system. If a local journal already exists for the queue manager on this system - the existing local journal name is used, otherwise a unique name is generated of the format AMQxJRN where x is a character in the range 'A - Z'.

journal-name

Specify the name of the journal. The name can contain up to 10 characters. Journal receiver names will be derived from this journal name by truncating at the 4th character (or at the last character if the journal name is shorter than 4 characters) and appending zeroes. If the local queue manager library already contains a local journal, its name must match that supplied. Only one local journal can exist in a queue manager library. DLTMQM will not remove journal artifacts from a queue manager library unless they are prefixed with "AMQ".

Remote Relational Database (RMTJRNRDB)

Specifies the name of the relational database directory entry that contains the remote location name of the target system. Use the WRKRDBDIRE command to locate and existing entry or configure a new relational database directory entry for the target system.

relational-database-directory-entry

Specify the name of the relational database directory entry. The name can contain up to 18 characters.

Remote Journal Status (RMTJRNSTS)

Specifies whether the remote journal is ready to receive journal entries from the queue managers local journal.

The possible values are:

***ACTIVE**

The remote journal is ready to receive journal entries from the local queue manager journal. Replication of journal entries starts with the oldest local journal receiver required to perform a full media recovery and queue manager restart. If these recovery points do not exist, replication starts with the currently attached local journal receiver.

***INACTIVE**

The remote journal is not ready to receive journal entries from the local queue manager journal.

Remote Journal Delivery (RMTJRNDLV)

Specifies whether the journal entries are replicated synchronously or asynchronously when the remote journal is activated. Note that this parameter is ignored when RMTJRNSTS(*INACTIVE) is specified.

The possible values are:

***SYNC**

The remote journal is replicated synchronously with the local queue manager journal.

***ASYNC**

The remote journal is replicated asynchronously with the local queue manager journal.

Remote Journal Sync. Timeout (RMTJRNTIMO)

Specifies the maximum amount of time in seconds to wait for a response from the remote system when using synchronous replication with remote journaling. If a response is not received from the remote system within the timeout period, the remote journal environment will automatically be deactivated. Note that this parameter is ignored when RMTJRNDLV(*ASYNC) or RMTJRNSTS(*INACTIVE) are specified.

The possible values are:

***DFT**

The system uses the default value of 60 seconds to wait for a response from the remote system.

1-3600

Specify the maximum number of seconds to wait for a response from the remote system. Note that this option is only available on IBM i V6R1M0 and later operating systems.

IBM i CCTMQM (Connect MQ)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Connect Message Queue Manager (CCTMQM) command does not perform any function and is only provided for compatibility with previous releases of IBM MQ and MQSeries®.

Parameters

None

IBM i CHGMQM (Change Message Queue Manager)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Change Message Queue Manager (CHGMQM) command changes the specified attributes of the local queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 1
<u>FORCE</u>	Force	*NO , *YES	Optional, Positional 2
<u>TEXT</u>	Text 'description'	Character value, *BLANK, *SAME	Optional, Positional 3
<u>TRGITV</u>	Trigger interval	0-999999999, *SAME	Optional, Positional 4
<u>UDLMSGQ</u>	Undelivered message queue	Character value, *NONE, *SAME	Optional, Positional 5
<u>DFTTMQ</u>	Default transmission queue	Character value, *NONE, *SAME	Optional, Positional 6
<u>MAXHDL</u>	Maximum handle limit	0-999999999, *SAME	Optional, Positional 7
<u>MAXUMSG</u>	Maximum uncommitted messages	1-999999999, *SAME	Optional, Positional 8
<u>AUTEVT</u>	Authorization events enabled	*SAME , *YES, *NO	Optional, Positional 9
<u>INHEVT</u>	Inhibit events enabled	*SAME , *YES, *NO	Optional, Positional 10
<u>LCLERREVT</u>	Local error events enabled	*SAME , *YES, *NO	Optional, Positional 11
<u>RMTERREVT</u>	Remote error events enabled	*SAME , *YES, *NO	Optional, Positional 12
<u>PFREVT</u>	Performance events enabled	*SAME , *YES, *NO	Optional, Positional 13

Table 221. Queue manager attributes (continued)

Keyword	Description	Choices	Notes
STRSTPEVT	Start and stop events enabled	*SAME , *YES, *NO	Optional, Positional 14
CHAD	Automatic Channel Definition	*SAME , *YES, *NO	Optional, Positional 15
CHADEV	Automatic Channel Definition events enabled	*SAME , *YES, *NO	Optional, Positional 16
CHADEXIT	Automatic Channel Definition exit program	Single values: *SAME , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 17
	Qualifier 1: Automatic Channel Definition exit program	Name	
	Qualifier 2: Library	Name	
MAXMSGL	Max message length	32768-104857600, *SAME	Optional, Positional 18
CCSID	Coded Character Set	<i>Integer</i> , *SAME	Optional, Positional 19
CLWLDATA	Cluster workload exit data	<i>Character value</i> , *SAME , *NONE	Optional, Positional 20
CLWLEXIT	Cluster workload exit	Single values: *SAME , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 21
	Qualifier 1: Cluster workload exit	Name	
	Qualifier 2: Library	Name	
CLWLLEN	Cluster workload exit length	0-999999999, *SAME	Optional, Positional 22
REPOS	Repository name	<i>Character value</i> , *NONE, *SAME	Optional, Positional 23
REPOSNL	Repository name list	<i>Character value</i> , *NONE, *SAME	Optional, Positional 24
SSLCRLNL	TLS CRL Namelist	<i>Character value</i> , *NONE, *SAME	Optional, Positional 25
SSLKEYR	TLS Key Repository	<i>Character value</i> , *NONE, *SAME , *SYSTEM	Optional, Positional 26
SSLKEYRPWD	TLS Repository Password	<i>Character value</i> , *NONE, *SAME	Optional, Positional 27
SSLRSTCNT	TLS key reset count	0-999999999, *SAME , *NONE	Optional, Positional 28
IPADDRV	IP protocol	*SAME , *IPv4, *IPv6	Optional, Positional 29
CLWLMRUC	Cluster workload channels	0-999999999, *SAME	Optional, Positional 30
CLWLUSEQ	Cluster workload queue use	*SAME , *LOCAL, *ANY	Optional, Positional 31

Table 221. Queue manager attributes (continued)

Keyword	Description	Choices	Notes
<u>LOGGEREVT</u>	Log recovery events enabled	*SAME , *YES, *NO	Optional, Positional 32
<u>CHLEVT</u>	Channel events enabled	*SAME , *YES, *NO, *EXCEPTION	Optional, Positional 33
<u>SSLEVT</u>	TLS events enabled	*SAME , *YES, *NO	Optional, Positional 34
<u>SCHINIT</u>	Channel initiator control	*SAME , *QMGR, *MANUAL	Optional, Positional 35
<u>SCMDSERV</u>	Command server control	*SAME , *QMGR, *MANUAL	Optional, Positional 36
<u>MONQ</u>	Queue Monitoring	*SAME , *NONE, *OFF, *LOW, *MEDIUM, *HIGH	Optional, Positional 37
<u>MONCHL</u>	Channel Monitoring	*SAME , *NONE, *OFF, *LOW, *MEDIUM, *HIGH	Optional, Positional 38
<u>MONACLS</u>	Cluster Sender Monitoring	*SAME , *QMGR, *NONE, *LOW, *MEDIUM, *HIGH	Optional, Positional 39
<u>STATMQI</u>	Queue Manager Statistics	*SAME , *OFF, *ON	Optional, Positional 40
<u>STATQ</u>	Queue Statistics	*SAME , *NONE, *OFF, *ON	Optional, Positional 41
<u>STATCHL</u>	Channel Statistics	*SAME , *NONE, *OFF, *LOW, *MEDIUM, *HIGH	Optional, Positional 42
<u>STATACLS</u>	Cluster Sender Statistics	*SAME , *QMGR, *NONE, *LOW, *MEDIUM, *HIGH	Optional, Positional 43
<u>STATINT</u>	Statistics Interval	1-604800, *SAME	Optional, Positional 44
<u>ACCTMQI</u>	MQI Accounting	*SAME , *OFF, *ON	Optional, Positional 45
<u>ACCTQ</u>	Queue Accounting	*SAME , *NONE, *OFF, *ON	Optional, Positional 46
<u>ACCTINT</u>	Accounting Interval	1-604800, *SAME	Optional, Positional 47
<u>ACCTCONO</u>	Accounting Override	*SAME , *ENABLED, *DISABLED	Optional, Positional 48
<u>ROUTEREC</u>	Trace Route Recording	*SAME , *MSG, *QUEUE, *DISABLED	Optional, Positional 49
<u>ACTIVREC</u>	Activity Recording	*SAME , *MSG, *QUEUE, *DISABLED	Optional, Positional 50
<u>MAXPROPLEN</u>	Maximum Property Data Length	0-104857600, *SAME , *ANY	Optional, Positional 51
<u>MARKINT</u>	Message mark-browse interval	0-999999999, *SAME , *ANY	Optional, Positional 52
<u>PSRTYCNT</u>	PubSub max msg retry count	0-999999999, *SAME	Optional, Positional 53
<u>PSNPMSG</u>	PubSub NPM msg	*SAME , *DISCARD, *KEEP	Optional, Positional 54

Table 221. Queue manager attributes (continued)

Keyword	Description	Choices	Notes
<u>PSNPMRES</u>	PubSub NPM msg response	*SAME , *NORMAL, *SAFE, *DISCARD, *KEEP	Optional, Positional 55
<u>PSSYNCPT</u>	PubSub syncpoint	*SAME , *YES, *IFPER	Optional, Positional 56
<u>PSMODE</u>	Pubsub Engine Control	*SAME , *ENABLED, *DISABLED, *COMPATIBLE	Optional, Positional 57
<u>TREELIFE</u>	Topic Tree Life Time	0-604000, *SAME	Optional, Positional 58
<u>CFGEVT</u>	Configuration events enabled	*SAME , *YES, *NO	Optional, Positional 59
<u>CMDEVT</u>	Command events enabled	*SAME , *YES, *NO, *NODSP	Optional, Positional 60
<u>ACTVTRC</u>	Activity tracing	<i>Character value</i> , *ON, *SAME , *OFF	Optional, Positional 61
<u>ACTVCONO</u>	Override activity tracing	<i>Character value</i> , *DISABLED, *SAME , *ENABLED	Optional, Positional 62
<u>CHLAUTH</u>	Channel authentication	<i>Character value</i> , *DISABLED, *SAME , *ENABLED	Optional, Positional 63
<u>CUSTOM</u>	Custom attribute	<i>Character value</i> , *NONE, *SAME , 128 character string	Optional, Positional 64
<u>DFTCLXQ</u>	Default cluster transmission queue type	*SAME , *SCTQ, *CHANNEL	Optional, Positional 65
<u>CERTLABL</u>	Certificate label	*SAME , *DFT	Optional, Positional 66
<u>REVDNS</u>	Reverse lookup of host name	*SAME , *DISABLED, *ENABLED	Optional, Positional 67
<u>CONNAUTH</u>	Connection authentication object	*SAME , *NONE, 48 character string	Optional, Positional 68
<u>IMGSCHEd</u>	Media image scheduling	*SAME , *MANUAL, *AUTO	Optional, Positional 69
<u>IMGINTVL</u>	Media image write interval	*SAME , *OFF, 1 - 999999999	Optional, Positional 70
<u>IMGLOGLN</u>	Recovery log target size	*SAME , *OFF, 1 - 999999999	Optional, Positional 71
<u>IMGRCOVO</u>	Whether objects recoverable	*SAME , *NO, *YES	Optional, Positional 72
<u>IMGRCOVQ</u>	Queue object attribute	*SAME , *NO, *YES	Optional, Positional 73

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Force (FORCE)

Specifies whether the command should be forced to complete if both of the following statements are true:

- DFTTMQ is specified.
- An application has a remote queue open, the resolution of which will be affected by this change.

The possible values are:

***NO**

The command fails if an open remote queue will be affected.

***YES**

The command is forced to complete.

Text 'description' (TEXT)

Specifies the text that briefly describes the queue manager definition.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Trigger interval (TRGITV)

Specifies the trigger time interval, expressed in milliseconds, to be used with queues that have TRGTYPE(*FIRST) specified.

When TRGTYPE(*FIRST) is specified the arrival of a message on a previously empty queue causes a trigger message to be generated. Any further messages that arrive on the queue within the specified interval will not cause a further trigger message to be generated.

The possible values are:

***SAME**

The attribute is unchanged.

interval-value

Specify a value in the range 0 through 999999999.

Undelivered message queue (UDLMSGQ)

Specifies the name of the local queue that is to be used for undelivered messages. Messages are put on this queue if they cannot be routed to their correct destination.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

There is no undelivered-message queue. The attribute is set to a blank string.

undelivered-message-queue-name

Specify the name of a local queue that is to be used as the undelivered-message queue.

Default transmission queue (DFTTMQ)

Specifies the name of the local transmission queue that is to be used as the default transmission queue. Messages transmitted to a remote queue manager are put on the default transmission queue if there is no transmission queue defined for their destination.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

There is no default transmission queue. The attribute is set to a blank string.

default-transmission-queue-name

Specify the name of a local transmission queue that is to be used as the default transmission queue.

Maximum handle limit (MAXHDL)

Specifies the maximum number of handles that any one job can have open at the same time.

The possible values are:

***SAME**

The attribute is unchanged.

maximum-handle-limit

Specify a value in the range 0 through 999999999.

Maximum uncommitted messages (MAXUMSG)

Specifies the maximum number of uncommitted messages. That is:

- The number of messages that can be retrieved, plus
- The number of messages that can be put, plus
- Any trigger and report messages generated within this unit of work, under any one syncpoint.

This limit does not apply to messages that are retrieved or put outside syncpoint.

The possible values are:

***SAME**

The attribute is unchanged.

maximum-uncommitted-messages

Specify a value in the range 1 through 999999999.

Authorization events enabled (AUTEVT)

Specifies whether authorization (Not Authorized) events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Authorization events are not generated.

***YES**

Authorization events are generated.

Inhibit events enabled (INHEVT)

Specifies whether inhibit events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Inhibit events are not generated.

***YES**

Inhibit events are generated.

Local error events enabled (LCLERREVT)

Specifies whether local error events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Local error events are not generated.

***YES**

Local error events are generated.

Remote error events enabled (RMTERREVT)

Specifies whether remote error events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Remote error events are not generated.

***YES**

Remote error events are generated.

Performance events enabled (PFREVT)

Specifies whether performance events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Performance events are not generated.

***YES**

Performance events are generated.

Start and stop events enabled (STRSTPEVT)

Specifies whether start and stop events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Start and stop events are not generated.

***YES**

Start and stop events are generated.

Automatic Channel Definition (CHAD)

Specifies whether receiver and server-connection channels are automatically defined.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Receiver and server-connection channels are not automatically defined.

***YES**

Receiver and server-connection channels are automatically defined.

Automatic Channel Definition events enabled (CHADEV)

Specifies whether automatic channel definition events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Automatic channel definition events are not generated.

***YES**

Automatic channel definition events are generated.

Automatic Channel Definition exit program (CHADEXIT)

Specifies the entry point of the program to be called as the automatic channel-definition exit.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No automatic channel definition exit is invoked.

channel-definition-exit-name

Specify the name of the channel definition exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified and the values *LIBL and *CURLIB are not permitted.

Maximum Message Length (MAXMSGL)

Specifies the maximum message length of messages (in bytes) allowed on queues for this queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

maximum-message-length

Specify a value in bytes, in the range 32 KB through 100 MB.

Coded Character Set (CCSID)

The coded character set identifier for the queue manager.

The CCSID is the identifier used with all character string fields defined by the API. It does not apply to application data carried in the text of messages unless the CCSID in the message descriptor is set to the value MQCCSI_Q_MGR when the message is put to a queue.

If you use this keyword to change the CCSID, applications that are running when the change is applied continue to use the original CCSID. You must stop and restart all running applications before you continue. This includes the command server and channel programs. You are recommended to stop and restart the queue manager after making the change to achieve this.

The possible values are:

***SAME**

The attribute is unchanged.

number

Specify a value in the range 1 through 65535. The value must represent a coded character set identifier (CCSID) that is recognised by the system.

Cluster Workload Exit Data (CLWLDATA)

Specifies the cluster workload exit data (maximum length 32 characters).

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The cluster workload exit data is not specified.

cluster-workload-exit-data

This is passed to the cluster-workload exit when it is called.

Cluster Workload Exit (CLWLEXIT)

Specifies the entry point of the program to be called as the cluster-workload exit.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No cluster-workload exit is invoked.

cluster-workload-exit

You must specify a fully-qualified name, when you specify a cluster-workload exit. In this instance, the libraries defined as *LIBL and *CURLIB are not permitted.

Cluster Workload Exit Data Length (CLWLLEN)

The maximum number of bytes of message data that is passed to the cluster workload exit.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-exit-data-length

Specify a value in bytes, in the range 0 through 999999999.

Repository name (REPOS)

The name of a cluster for which this queue manager is to provide a repository manager service.

If the parameter REPOSNL is non-blank this parameter must be blank.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

A cluster is not specified.

clustername

The maximum length is 48 characters conforming to the rules for naming IBM MQ objects.

Repository name list (REPOSNL)

The name of a namelist of clusters for which this queue manager is to provide a repository manager service.

If the parameter REPOS is non-blank this parameter must be blank.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

A namelist of clusters is not specified.

namelist

The name of the namelist.

TLS CRL Namelist (SSLCRLNL)

The name of a namelist of authinfo objects which this queue manager uses to check certificate status.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

A namelist of authinfo objects is not specified.

namelist

The name of the namelist.

TLS Key Repository (SSLKEYR)

The location of a key repository for this queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

***SYSTEM**

The queue manager uses the *SYSTEM key repository. Setting the SSLKEYR repository to this value causes the queue manager to be registered as an application to Digital Certificate Manager. You can assign any client or server certificate in the *SYSTEM store to the queue manager through Digital Certificate Manager. If you specify this value you are not required to set the key repository password (SSLKEYRPWD).

***NONE**

A key repository is not specified.

filename

The location of the CMS key repository. If you specify this value you must ensure the key repository contains a correctly labeled digital certificate and also set the key repository password (SSLKEYRPWD) to enable channels to access the key repository. See the IBM MQ Security information for more details.

TLS Repository Password (SSLKEYRPWD)

The password of a key repository for this queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

A key repository password is not specified.

password

The password of the repository.

Attention: The keystore password is encrypted using the IBM MQ password protection system. Prior to setting the password, you should set a unique initial key in the queue manager.

TLS key reset count (SSLRSTCNT)

Specifies when TLS channel MCAs that initiate communication reset the secret key used for encryption on the channel. The value represents the total number of unencrypted bytes that are sent and received on the channel before the secret key is renegotiated. The number of bytes includes control information sent by the message channel agent.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Secret key renegotiation is disabled.

key-reset-byte-count

Specify a value in bytes, in the range 0 through 999999999. A value of 0 indicates that secret key renegotiation is disabled.

IP protocol (IPADDRV)

The IP protocol to use for channel connections.

This attribute is only relevant for systems enabled for both IPv4 and IPv6. The attribute affects channels with TRPTYPE defined as TCP when the CONNAME is defined as a host name that resolves to both an IPv4, and an IPv6 address, and one of the following is true:

- LOCLADDR is not specified.
- LOCLADDR also resolves to both an IPv4 and an IPv6 address.

The possible values are:

***SAME**

The attribute is unchanged.

***IPv4**

The IPv4 stack is used.

***IPv6**

The IPv6 stack is used.

Cluster workload channels (CLWLMRUC)

Specifies the maximum number of most-recently-used cluster channels, to be considered for use by the cluster workload choice algorithm.

The possible values are:

***SAME**

The attribute is unchanged.

maximum-cluster-workload-channels

Specify a value in the range 0 through 999999999.

Cluster workload queue use (CLWLUSEQ)

Specifies the behavior of an MQPUT when the target queue has both a local instance and at least one remote cluster instance. If the put originates from a cluster channel then this attribute does not apply. This value is used for queues where the CLWLUSEQ value is *QMGR.

The possible values are:

***SAME**

The attribute is unchanged.

***LOCAL**

The local queue will be the sole target of the MQPUT.

***ANY**

The queue manager will treat such a local queue as another instance of the cluster queue for the purposes of workload distribution.

Log recovery events enabled (LOGGEREVT)

Specifies whether log recovery events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Log recovery events are not generated.

***YES**

Log recovery events are generated.

Channel events enabled (CHLEVT)

Specifies whether channel events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Channel events are not generated.

***EXCEPTION**

Exception channel events are generated.

Only the following channel events are generated:

- MQRC_CHANNEL_ACTIVATED
- MQRC_CHANNEL_CONV_ERROR
- MQRC_CHANNEL_NOT_ACTIVATED
- MQRC_CHANNEL_STOPPED

The channel events are issued with the following reason qualifiers:

- MQRQ_CHANNEL_STOPPED_ERROR
- MQRQ_CHANNEL_STOPPED_RETRY
- MQRQ_CHANNEL_STOPPED_DISABLED
- MQRQ_CHANNEL_STOPPED_BY_USER

***YES**

All channel events are generated.

In addition to those generated by *EXCEPTION the following channel events are also generated:

- MQRQ_CHANNEL_STARTED
 - MQRQ_CHANNEL_STOPPED
- with the following reason qualifier:
- MQRQ_CHANNEL_STOPPED_OK

TLS events enabled (SSLEVT)

Specifies whether TLS events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

TLS events are not generated.

***YES**

TLS events are generated.

The following event is generated:

- MQRQ_CHANNEL_SSL_ERROR

Channel initiator control (SCHINIT)

Specifies the channel initiator control.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

Start and stop the channel initiator with the queue manager.

***MANUAL**

Do not automatically start the channel initiator with the queue manager.

Command server control (SCMDSERV)

Specifies the command server control.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

Start and stop the command server with the queue manager.

***MANUAL**

Do not automatically start the command server with the queue manager.

Queue Monitoring (MONQ)

Controls the collection of online monitoring data for queues.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Online monitoring data for queues is disabled regardless of the setting of the MONQ queue attribute.

***OFF**

Monitoring data collection is turned off for queues specifying *QMGR in the MONQ queue attribute.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection for queues specifying *QMGR in the MONQ queue attribute.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection for queues specifying *QMGR in the MONQ queue attribute.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection for queues specifying *QMGR in the MONQ queue attribute.

Channel Monitoring (MONCHL)

Controls the collection of online monitoring data for channels.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Online monitoring data for channels is disabled regardless of the setting of the MONCHL channel attribute.

***OFF**

Monitoring data collection is turned off for channels specifying 'QMGR' in the MONCHL queue attribute.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection for channels specifying *QMGR in the MONCHL channel attribute.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection for channels specifying *QMGR in the MONCHL channel attribute.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection for channels specifying *QMGR in the MONCHL channel attribute.

Cluster Sender Monitoring (MONACLS)

Controls the collection of online monitoring data for auto-defined cluster sender channels. The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Online monitoring data for auto-defined cluster sender channels is disabled.

***QMGR**

The collection of Online Monitoring Data is inherited from the setting of the MONCHL attribute in the QMGR object.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection for auto-defined cluster sender channels.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection for auto-defined cluster sender channels.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection for auto-defined cluster sender channels.

Queue Manager Statistics (STATMQI)

Controls the collection of statistics monitoring information for the queue manager. The possible values are:

***SAME**

The attribute is unchanged.

***OFF**

Data collection for MQI statistics is disabled.

***ON**

Data collection for MQI statistics is enabled.

Queue Statistics (STATQ)

Controls the collection of statistics data for queues. The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Data collection for queue statistics is disabled for all queues regardless of the setting of the STATQ queue attribute.

***OFF**

Statistics data collection is turned off for queues specifying *QMGR in the STATQ queue attribute.

***ON**

Statistics data collection is turned on for queues specifying *QMGR in the STATQ queue attribute.

Channel Statistics (STATCHL)

Controls the collection of statistics data for channels. The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Data collection for channel statistics is disabled for all channels regardless of the setting of the STATCHL channel attribute.

***OFF**

Statistics data collection is turned off for channels specifying *QMGR in the STATCHL channel attribute.

***LOW**

Statistics data collection is turned on with a low ratio of data collection for channels specifying *QMGR in the STATCHL channel attribute.

***MEDIUM**

Statistics data collection is turned on with a moderate ratio of data collection for channels specifying *QMGR in the STATCHL channel attribute.

***HIGH**

Statistics data collection is turned on with a high ratio of data collection for channels specifying *QMGR in the STATCHL channel attribute.

Cluster Sender Statistics (STATACLS)

Controls the collection of statistics data for auto-defined cluster sender channels. The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Statistics data collection for auto-defined cluster sender channels is disabled.

***LOW**

Statistics data collection for auto-defined cluster sender channels is enabled with a low ratio of data collection.

***MEDIUM**

Statistics data collection for auto-defined cluster sender channels is enabled with a moderate ratio of data collection.

***HIGH**

Statistics data collection for auto-defined cluster sender channels is enabled with a high ratio of data collection.

Statistics Interval (STATINT)

How often (in seconds) statistics monitoring data is written to the monitoring Queue.

The possible values are:

***SAME**

The attribute is unchanged.

statistics-interval

Specify a value in the range 1 through 604800.

MQI Accounting (ACCTMQI)

Controls the collection of accounting information for MQI data. The possible values are:

***SAME**

The attribute is unchanged.

***OFF**

API accounting data collection is disabled.

***ON**

API accounting data collection is enabled.

Queue Accounting (ACCTQ)

Controls the collection of accounting information for queues. The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Accounting data collection for queues is disabled and may not be overridden using the queue attribute ACCTQ.

***OFF**

Accounting data collection is turned off for queues specifying *QMGR in the ACCTQ queue attribute.

***ON**

Accounting data collection is turned on for queues specifying *QMGR in the ACCTQ queue attribute.

Accounting Interval (ACCTINT)

After how long in seconds, intermediate accounting records are written.

The possible values are:

***SAME**

The attribute is unchanged.

accounting-interval

Specify a value in the range 1 through 604800.

Accounting Override (ACCTCONO)

Whether applications can override the setting of the ACCTMQI and the ACCTQ values in the QMGR attribute. The possible values are:

***SAME**

The attribute is unchanged.

***ENABLED**

Application may override the setting of the ACCTMQI and ACCTQ QMGR attributes using the Options field in the MQCNO structure on the MQCONN api call.

***DISABLED**

Application may not override the setting of the ACCTMQI and ACCTQ QMGR attributes using the Options field in the MQCNO structure on the MQCONN api call.

Trace Route Recording (ROUTEREC)

Controls the recording of trace route information.

The possible values are:

***SAME**

The attribute is unchanged.

***MSG**

Reply put to destination specified by the message.

***QUEUE**

Reply put to fixed name queue.

***DISABLED**

No appending to trace route messages allowed.

Activity Recording (ACTIVREC)

Controls the generation of activity reports.

The possible values are:

***SAME**

The attribute is unchanged.

***MSG**

Report put to destination specified by the message.

***QUEUE**

Report put to fixed name queue.

***DISABLED**

No activity reports are generated.

Maximum Property Data Length (MAXPROPLEN)

Specifies a maximum length for property data.

The possible values are:

***SAME**

The attribute is unchanged.

***ANY**

There is no limit on the length of property data.

max-property-data-length

Specify a value in bytes, in the range 0 through 104857600 (ie: 10 MB).

Message mark-browse interval (MARKINT)

An approximate time interval in milliseconds, for which messages that have been marked-browsed by a call to MQGET with the get message option MQGMO_MARK_BROWSE_CO_OP are expected to remain marked-browsed.

The possible values are:

***SAME**

The attribute is unchanged.

***ANY**

Messages will remain marked-browsed indefinitely.

A time interval

A time interval expressed in milliseconds, up to a maximum of 999999999. The default value is 5000.

Attention: You should not reduce the value below the default of 5000.

PubSub max msg retry count (PSRTCNT)

The number of retries when processing (under syncpoint) a failed command message.

The possible values are:

***SAME**

The attribute is unchanged.

Retry count

Specify a value in the range 0 through 999999999.

PubSub NPM msg (PSNPMMSG)

Whether to discard (or keep) a undelivered input message

The possible values are:

***SAME**

The attribute is unchanged.

***DISCARD**

Non-persistent input messages may be discarded if they cannot be processed.

***KEEP**

Non-persistent input messages will not be discarded if they cannot be processed. In this situation the queued pubsub daemon will continue to retry processing the message. Subsequent input messages are not processed until the message is successfully processed.

PubSub NPM msg response (PSNPMRES)

Controls the behavior of undelivered response messages

The possible values are:

***SAME**

The attribute is unchanged.

***NORMAL**

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If they cannot be placed on the dead letter queue then they are discarded.

***SAFE**

Non-persistent responses which cannot be placed on the reply queue are put on the dead letter queue. If the response cannot be placed on the dead letter queue then the message will be rolled back and then retried. Subsequent messages are not processed until the message is delivered.

***DISCARD**

Non-persistent responses are not placed on the reply queue but are discarded.

***KEEP**

Non-persistent responses that cannot be delivered will be rolled back and the delivery retried. Subsequent messages are not processed until the message is delivered.

PubSub syncpoint (PSSYNCP)

Whether only persistent (or all) messages should be processed under syncpoint

The possible values are:

***SAME**

The attribute is unchanged.

***IFPER**

This makes the queued pubsub daemon receive non-persistent messages outside syncpoint. If the daemon receives a publication outside syncpoint, the daemon forwards the publication to subscribers known to it outside syncpoint.

***YES**

This makes the queued pubsub daemon receive all messages under syncpoint.

Pubsub Engine Control (PSMODE)

Pubsub Engine Control.

The possible values are:

***SAME**

The attribute is unchanged.

***ENABLED**

The publish/subscribe engine and the queued publish/subscribe interface are running. It is therefore possible to publish/subscribe by using the application programming interface, the queues that are being monitored by the queued publish/subscribe interface, or both.

***DISABLED**

The publish/subscribe engine and the queued publish/subscribe interface are not running. It is not possible to publish/subscribe by using the application programming interface. Any publish/subscribe messages put to the queues that are monitored by the queued publish/subscribe interface will not be acted upon.

***COMPATIBLE**

The publish/subscribe engine is running. It is possible to publish subscribe by using the application programming interface. The queued publish/subscribe interface is not running. Any publish/subscribe messages put to the queues that are monitored by the queued publish/subscribe interface will not be

acted upon. Use this for compatibility with WebSphere Message Broker V6, or earlier versions, using this queue manager

Topic Tree Life Time (TREELIFE)

Specifies a lifetime in seconds of non-administrative topics. Non-administrative topics are those created when an application publishes to, or subscribes on, a topic string that does not exist as an administrative node. When this non-administrative node no longer has any active subscriptions, this parameter determines how long the queue manager will wait before removing that node. Only non-administrative topics that are in use by a durable subscription remain after the queue manager is recycled.

The possible values are:

***SAME**

The attribute is unchanged.

tree-life-time

Specify a value in seconds, in the range 0 through 604000. A value of 0 means that non-administrative topics are not removed by the queue manager.

Configuration events enabled (CFG EVT)

Specifies whether configuration events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Configuration events are not generated.

***YES**

Configuration events are generated. After setting this value, issue MQSC REFRESH QMGR TYPE(CONFIGEV) commands for all objects to bring the queue manager configuration up to date.

Command events enabled (CMDEVT)

Specifies whether command events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Command events are not generated.

***YES**

Command events are generated for all successful commands.

***NODSP**

Command events are generated for all successful commands, other than DISPLAY commands.

ACTVTRC

This attribute specifies whether MQI application activity tracing information is to be collected. See [Setting ACTVTRC to control collection of activity trace information](#).

***SAME**

The attribute is unchanged.

***OFF**

IBM MQ MQI application activity tracing information collection is not enabled.

***ON**

IBM MQ MQI application activity tracing information collection is enabled.

If the queue manager attribute ACTVCON0 is set to ENABLED, the value of this parameter can be overridden using the options field of the MQCNO structure.

ACTVCON0

This attribute specifies whether applications can override the settings of the ACTVTRC queue manager parameter:

*SAME

The attribute is unchanged. This is the default value

*DISABLED

Applications cannot override the settings of the ACTVTRC queue manager parameter.

*ENABLED

Applications can override the settings of the ACTVTRC queue manager parameter by using the options field of the MQCNO structure of the MQCONN API call.

Changes to this parameter are effective for connections to the queue manager that occur after the change.

CHLAUTH

This attribute specifies whether the rules defined by channel authentication records are used. CHLAUTH rules can still be set and displayed regardless of the value of this attribute.

Changes to this parameter take effect the next time that an inbound channel attempts to start.

Channels that are currently started are unaffected by changes to this parameter.

*SAME

The attribute is unchanged. This is the default value

*DISABLED

Channel authentication records are not checked.

*ENABLED

Channel authentication records are checked.

Custom attribute (CUSTOM)

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

*SAME

The attribute is unchanged.

*NONE

The text is set to a blank string.

128 character custom string

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

Default cluster transmission queue type (DFTCLXQ)

The **DEFCLXQ** attribute controls which transmission queue is selected by default by cluster-sender channels to get messages from, to send the messages to cluster-receiver channels.

The possible values are:

***SAME**

The attribute is unchanged.

***SCTQ**

All cluster-sender channels send messages from `SYSTEM.CLUSTER.TRANSMIT.QUEUE`. The `correlID` of messages placed on the transmission queue identifies which cluster-sender channel the message is destined for.

SCTQ is set when a queue manager is defined.

***CHANNEL**

Each cluster-sender channel sends messages from a different transmission queue. Each transmission queue is created as a permanent dynamic queue from the model queue `SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE`.

CERTLABL

This attribute specifies the certificate label for this queue manager to use. The label identifies which personal certificate in the key repository has been selected.

The default and migrated queue manager values on IBM i, are:

- If you specified `SSLKEYR(*SYSTEM)`, the value is blank.

Note that it is forbidden to use a nonblank queue manager `CERTLABL` with `SSLKEYR(*SYSTEM)`. Attempting to do so results in an `MQRCCF_Q_MGR_ATTR_CONFLICT` error.

- Otherwise, *ibmwebspheremqxxxx* where *xxxx* is the queue manager name folded to lowercase.

The possible values are:

***SAME**

The attribute is unchanged.

***DFT**

Leaving `CERTLABL` as a blank value on the queue manager is interpreted by the system to mean the default values specified.

REVDNS

This attribute controls whether reverse lookup of the host name from a Domain Name Server (DNS) is done for the IP address from which a channel has connected. This attribute has an effect only on channels using a transport type (TRPTYPE) of TCP.

The possible values are:

***SAME**

The attribute is unchanged.

***ENABLED**

DNS host names are reverse looked-up for the IP addresses of inbound channels when this information is required. This setting is required for matching against `CHLAUTH` rules that contain host names, and to include the host name in error messages. The IP address is still included in messages that provide a connection identifier.

This is the initial default value for the queue manager.

***DISABLED**

DNS host names are not reverse looked-up for the IP addresses of inbound channels. With this setting any `CHLAUTH` rules using host names are not matched.

CONNAUTH

This attribute specifies the name of an authentication information object that is used to provide the location of user ID and password authentication. If **CONNAUTH** is *NONE, no user ID and password checking is done by the queue manager.

Changes to this configuration, or the object to which it refers, take effect when a **REFRESH SECURITY TYPE(CONNAUTH)** command is issued.

If you set **CONNAUTH** to *NONE, and attempt to connect to a channel that has the REQDADM option set in the **CHCKCLNT** field, the connection fails.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No user ID and password checking is done by the queue manager

48 character conn auth string

The specific name of an authentication information object that is used to provide the location of user ID and password authentication.

IMGSCHED

This attribute specifies whether the queue manager automatically writes media images.

The possible values are:

***SAME**

The attribute is unchanged.

***AUTO**

The queue manager attempts to automatically write a media image for an object, before **IMGINTVL** minutes have elapsed, or **IMGLOGLN** megabytes of recovery log have been written, since the previous media image for the object was taken.

The previous media image might have been taken manually or automatically, depending on the settings of **IMGINTVL** or **IMGLOGLN**.

***MANUAL**

Automatic media images are not written.

IMGINTVL

This attribute specifies the target frequency with which the queue manager automatically writes media images, in minutes since the previous media image for the object.

The possible values are:

***SAME**

The attribute is unchanged.

1 - 999 999 999

The time in minutes at which the queue manager automatically writes media images.

***OFF**

Automatic media images are not written on a time interval basis.

IMGLOGLN

This attribute specifies the target size of recovery log, written before the queue manager automatically writes media images, in number of megabytes since the previous media image for the object. This limits the amount of log to be read when recovering an object.

The possible values are:

***SAME**

The attribute is unchanged.

1 - 999 999 999

The target size of the recovery log in megabytes.

***OFF**

Automatic media images are not written based on the size of log written.

IMGRCOVO

This attribute specifies whether authentication information, channel, client connection, listener, namelist, process, alias queue, remote queue, and service objects are recoverable from a media image, if linear logging is being used.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

The “[RCDMQMIMG \(Record MQ Object Image\)](#)” on page 1887 and “[RCRMQMOBJ \(Re-create MQ Object\)](#)” on page 1890 commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

***YES**

These objects are recoverable.

IMGRCOVQ

This attribute specifies the **IMGRCOVQ** attribute for local and permanent dynamic queue objects, when used with this parameter.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

The **IMGRCOVQ** attribute for local and permanent dynamic queue objects is set to *NO.

***YES**

The **IMGRCOVQ** attribute for local and permanent dynamic queue objects is set to *YES.

 **CHGMQMAUTI (Change MQ AuthInfo object)**
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Change MQ AuthInfo object (CHGMQMAUTI) command changes the specified attributes of an existing MQ authentication information object.

Parameters

Keyword	Description	Choices	Notes
<u>AINAME</u>	AuthInfo name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 2

Table 222. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>AUTHTYPE</u>	AuthInfo type	*CRLLDAP, *OCSP, *IDPWOS, *IDPWLDAP	Optional, Positional 3
<u>CONNNAME</u>	Connection name	<i>Character value</i> , *SAME	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *SAME , *NONE	Optional, Positional 5
<u>USERNAME</u>	User name	<i>Character value</i> , *SAME , *NONE	Optional, Positional 6
<u>PASSWORD</u>	User password	<i>Character value</i> , *SAME , *NONE	Optional, Positional 7
<u>OCSPURL</u>	OCSP Responder URL	<i>Character value</i> , *SAME	Optional, Positional 8
<u>CHCKCLNT</u>	Authentication checks required	*ASQMGR, *REQUIRED, *REQADM	Optional, Positional 9
<u>CHCKLOCL</u>	Authentication checks required	*NONE, *OPTIONAL, *REQUIRED, *REQADM	Optional, Positional 10
<u>FAILDELAY</u>	Failure delay	<i>Integer value</i>	Optional, Positional 11
<u>BASEDNU</u>	Base user DN	<i>Character value</i> , *SAME	Optional, Positional 12
<u>ADOPTCTX</u>	Context adoption	<i>Integer value</i>	Optional, Positional 13
<u>CLASSUSER</u>	LDAP object class	<i>Character value</i> , *SAME	Optional, Positional 14
<u>USERFIELD</u>	LDAP user record	<i>Character value</i> , *SAME	Optional, Positional 15
<u>SHORTUSER</u>	User record	<i>Character value</i> , *SAME	Optional, Positional 16
<u>SECCOMM</u>	LDAP communications	<i>Character value</i> , *SAME	Optional, Positional 17
<u>AUTHORMD</u>	Authorization method	<i>Character value</i> , *OS , *SEARCHGRP, *SEARCHUSR, *SRCHGRPSN	Optional, Positional 18
<u>BASEDNG</u>	Base DN for groups	<i>Character value</i> , *SAME	Optional, Positional 19
<u>CLASSGRP</u>	Object class for group	<i>Character value</i> , *SAME	Optional, Positional 20
<u>FINDGRP</u>	Attribute to find group membership	<i>Character value</i> , *SAME	Optional, Positional 21
<u>GRPFIELD</u>	Simple name for group	<i>Character value</i> , *SAME	Optional, Positional 22
<u>NESTGRP</u>	Group nesting	*NO *YES	Optional, Positional 23
<u>AUTHENMD</u>	Authentication method	*OS Cannot be changed	Optional, Positional 24

AuthInfo name (Ainame)

The name of the authentication information object to change.

The possible values are:

authentication-information-name

Specify the name of the authentication information object. The maximum string length is 48 characters.

Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

Adopt context (ADOPTCTX)

Whether to use the presented credentials as the context for this application. This means that they are used for authorization checks, shown on administrative displays, and appear in messages.

YES

The user ID presented in the MQCSP structure, which has been successfully validated by password, is adopted as the context to use for this application. Therefore, this user ID will be the credentials checked for authorization to use IBM MQ resources.

If the user ID presented is an LDAP user ID, and authorization checks are done using operating system user IDs, the [SHORTUSR](#) associated with the user entry in LDAP will be adopted as the credentials for authorization checks to be done against.

NO

Authentication will be performed on the user ID and password presented in the MQCSP structure, but then the credentials will not be adopted for further use. Authorization will be performed using the user ID the application is running under.

This attribute is only valid for an AUTHTYPE of *IDPWOS and *IDPWLDAP.

Authentication method (AUTHENMD)

The authentication method used for this application.

***OS**

Use operating system groups to determine permissions associated with a user.

You can use only ***OS** to set the authentication method.

This attribute is valid only for an **AUTHTYPE** of *IDPWOS.

Authorization method (AUTHORMD)

The authorization method used for this application.

***OS**

Use operating system groups to determine permissions associated with a user.

This is how IBM MQ has previously worked, and is the default value.

***SEARCHGRP**

A group entry in the LDAP repository contains an attribute listing the Distinguished Name of all the users belonging to that group. Membership is indicated by the attribute defined in [FINDGRP](#). This value is typically *member* or *uniqueMember*.

***SEARCHUSR**

A user entry in the LDAP repository contains an attribute listing the Distinguished Name of all the groups to which the specified user belongs. The attribute to query is defined by the [FINDGRP](#) value, typically *memberOf*.

***SRCHGRPSN**

A group entry in the LDAP repository contains an attribute listing the short user name of all the users belonging to that group. The attribute in the user record that contains the short user name is specified by SHORTUSR.

Membership is indicated by the attribute defined in FINDGRP. This value is typically *memberUid*.

Note: This authorization method should only be used if all user short names are distinct.

Many LDAP servers use an attribute of the group object to determine group membership and you should, therefore, set this value to *SEARCHGRP*.

Microsoft Active Directory typically stores group memberships as a user attribute. The IBM Tivoli Directory Server supports both methods.

In general, retrieving memberships through a user attribute will be faster than searching for groups that list the user as a member.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

AuthInfo type (AUTHTYPE)

The type of the authentication information object. There is no default value

The possible values are:

***CRLLDAP**

The type of the authentication information object is CRLLDAP.

***OCSP**

The type of the authentication information objects is OCSPURL.

***IDPWOS**

Connection authentication user ID and password checking is done using the operating system.

***IDPWLDAP**

Connection authentication user ID and password checking is done using an LDAP server.

Base DN for groups (BASEDNG)

In order to be able to find group names, this parameter must be set with the base DN to search for groups in the LDAP server.

This attribute is valid only for **AUTHTYPE** of **IDPWLDAP*.

Base user DN (BASEDNU)

In order to be able to find the short user name attribute (see SHORTUSR) this parameter must be set with the base DN to search for users within the LDAP server. This attribute is valid only for **AUTHTYPE** of **IDPWLDAP*.

Check client (CHKCLNT)

Whether connection authentication checks are required by all locally bound connections, or only checked when a user ID and password are provided in the MQCSP structure.

These attributes are valid only for an **AUTHTYPE** of **IDPWOS* or **IDPWLDAP*. The possible values are:

***ASQMGR**

In order for the connection to be allowed in, it must meet the connection authentication requirements defined on the queue manager. If the CONNAUTH field provides an authentication information object, and the value of CHKCLNT is **REQUIRED*, the connection will not be successful unless a valid user ID and password are supplied. If the CONNAUTH field does not provide an authentication information object, or the value of CHKCLNT is not **REQUIRED*, then the user ID and password are not required.

***REQUIRED**

Requires that all applications provide a valid user ID and password.

***REQDADM**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the *OPTIONAL setting.

Check local (CHCKLOCL)

Whether connection authentication checks are required by all locally bound connections, or only checked when a user ID and password are provided in the MQCSP structure.

These attributes are valid only for an **AUTHTYPE** of *IDPWOS or *IDPWLDAP. The possible values are:

***NONE**

Switches off checking.

***OPTIONAL**

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

***REQUIRED**

Requires that all applications provide a valid user ID and password.

***REQDADM**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the *OPTIONAL setting.

Class group (CLASSGRP)

The LDAP object class used for group records in the LDAP repository.

If the value is blank, **groupOfNames** is used.

Other commonly used values include *groupOfUniqueNames* or *group*.

This attribute is valid only for **AUTHTYPE** of *IDPWLDAP.

Class user (CLASSUSR)

The LDAP object class used for user records in the LDAP repository.

If blank, the value defaults to *inetOrgPerson*, which is generally the value needed.

For Microsoft Active Directory, the value you require required is often *user*.

This attribute is valid only for an **AUTHTYPE** of *IDPWLDAP.

Connection name (CONNAME)

The DNS name or IP address of the host on which the LDAP server is running, together with an optional port number. The default port number is 389. No default is provided for the DNS name or IP address.

This field is only valid for *CRLLDAP or *IDPWLDAP authentication information objects, when it is required.

When used with IDPWLDAP authentication information objects, this can be a comma separated list of connection names.

The possible values are:

***SAME**

The connection name remains unchanged from the original authentication information object.

connection-name

Specify the fully qualified DNS name or IP address of the host together with an optional port number. The maximum string length is 264 characters.

Failure delay (FAILDELAY)

When a user ID and password are provided for connection authentication, and the authentication fails due to the user ID or password being incorrect, this is the delay, in seconds, before the failure is returned to the application.

This can aid in avoiding busy loops from an application that simply retries, continuously, after receiving a failure.

The value must be in the range 0 - 60 seconds. The default value is 1.

This attribute is only valid for AUTHTYPE of *IDPWOS and *IDPWLDAP.

Group membership attribute (FINDGRP)

Name of the attribute used within an LDAP entry to determine group membership.

When AUTHORMD = *SEARCHGRP, this attribute is typically set to *member* or *uniqueMember*.

When AUTHORMD = *SEARCHUSR, this attribute is typically set to *memberOf*.

When AUTHORMD = *SRCHGRPSN, this attribute is typically set to *memberUid*.

When left blank, if:

- AUTHORMD = *SEARCHGRP, this attribute defaults to *memberOf*
- AUTHORMD = *SEARCHUSR, this attribute defaults to *member*
- AUTHORMD = *SRCHGRPSN, this attribute defaults to *memberUid*

This attribute is valid only for an **AUTHTYPE** of *IDPWLDAP.

Simple name for group (GRPFIELD)

If the value is blank, commands like setmqaut must use a qualified name for the group. The value can either be a full DN, or a single attribute.

This attribute is valid only for an **AUTHTYPE** of *IDPWLDAP.

Group nesting (NESTGRP)

The possible values are:

***NO**

Only the initially discovered groups are considered for authorization.

***YES**

The group list is searched recursively to enumerate all the groups to which a user belongs.

The group's Distinguished Name is used when searching the group list recursively, regardless of the authorization method selected in AUTHORMD.

This attribute is valid only for an **AUTHTYPE** of *IDPWLDAP.

OCSP Responder URL (OCSPURL)

The URL of the OCSP Responder used to check for certificate revocation. This must be an HTTP URL containing the host name and port number of the OCSP Responder. If the OCSP Responder is using port 80, which is the default for HTTP, then the port number may be omitted.

This field is only valid for OCSP authentication information objects.

The possible values are:

***SAME**

The OCSP Responder URL is unchanged.

OCSP-Responder-URL

The OCSP Responder URL. The maximum string length is 256 characters.

Secure comms (SECCOMM)

Whether connectivity to the LDAP server should be done securely using TLS

YES

Connectivity to the LDAP server is made securely using TLS.

The certificate used is the default certificate for the queue manager, named in CERTLABL on the queue manager object, or if that is blank, the one described in [Digital certificate labels, understanding the requirements](#).

The certificate is located in the key repository specified in SSLKEYR on the queue manager object. A cipherspec will be negotiated that is supported by both IBM MQ and the LDAP server.

If the queue manager is configured to use SSLFIPS(YES) or SUITEB cipher specs, then this is taken account of in the connection to the LDAP server as well.

ANON

Connectivity to the LDAP server is made securely using TLS just as for SECCOMM(YES) with one difference.

No certificate is sent to the LDAP server; the connection will be made anonymously. To use this setting, ensure that the key repository specified in SSLKEYR, on the queue manager object, does not contain a certificate marked as the default.

NO

Connectivity to the LDAP server does not use TLS.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*

Short user (SHORTUSR)

A field in the user record to be used as a short user name in IBM MQ.

This field must contain values of 12 characters or less. This short user name is used for the following purposes:

- If LDAP authentication is enabled, but LDAP authorization is not enabled, this is used as an operating system user ID for authorization checks. In this case, the attribute must represent an operating system user ID.
- If LDAP authentication and authorization are both enabled, this is used as the user ID carried with the message in order for the LDAP user name to be rediscovered when the user ID inside the message needs to be used.

For example, on another queue manager, or when writing report messages. In this case, the attribute does not need to represent an operating system user ID, but must be a unique string. An employee serial number is an example of a good attribute for this purpose.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP* and is mandatory.

Text 'description' (TEXT)

A short text description of the authentication information object.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SAME**

The text string is unchanged.

***NONE**

The text is set to a blank string.

description

The string length can be up to 64 characters enclosed in apostrophes.

User name (USERNAME)

The distinguished name of the user that is binding to the directory. The default user name is blank.

This field is only valid for **CRLLDAP* or **IDPWLDAP* authentication information objects.

The possible values are:

***SAME**

The user name is unchanged.

***NONE**

The user name is blank.

LDAP-user-name

Specify the distinguished name of the LDAP user. The maximum string length is 1024 characters.

User field (USRFIELD)

If the user ID provided by an application for authentication does not contain a qualifier for the field in the LDAP user record, that is, it does not contain an '=' sign, this attribute identifies the field in the LDAP user record that is used to interpret the provided user ID.

This field can be blank. If this is the case, any unqualified user IDs use the [SHORTUSR](#) parameter to interpret the provided user ID.

The contents of this field will be concatenated with an '=' sign, together with the value provided by the application, to form the full user ID to be located in an LDAP user record. For example, the application provides a user of fred and this field has the value cn, then the LDAP repository will be searched for cn=fred.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

User password (PASSWORD)

The password for the LDAP user.

This field is only valid for **CRLLDAP* or **IDPWLDAP* authentication information objects.

The possible values are:

***SAME**

The password is unchanged.

***NONE**

The password is blank.

LDAP-password

The LDAP user password. The maximum string length is 32 characters.

 **CHGMQMCHL (Change MQ Channel)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Change MQ Channel (CHGMQMCHL) command changes the specified attributes of an existing MQ channel definition.

Note:

- Changes take effect after the channel is next started.
- For cluster channels, if an attribute can be set on both channels, set it on both and ensure that the settings are identical. If there is any discrepancy between the settings, those that you specify on the cluster receiver channel are likely to be used, This is explained in [Cluster channels](#).
- If you change the XMITQ name or the CONNAME, you must reset the sequence number at both ends of the channel. (See “RESET CHANNEL (reset message sequence number for a channel)” on page 923 for information about the SEQNUM parameter.)

Parameters

<i>Table 223. Command parameters</i>			
Keyword	Description	Choices	Notes
CHLNAME	Channel name	Character value	Required, Key, Positional 1
MQMNAME	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 2
CHLTYPE	Channel type	*RCVR, *SDR, *SVR, *RQSTR, *SVRCN, *CLUSSDR, *CLUSRCVR, *CLTCN	Optional, Key, Positional 3
TRPTYPE	Transport type	*LU62, *TCP, *SAME	Optional, Positional 4
TEXT	Text 'description'	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 5
TGTMQMNAME	Target Queue Manager	<i>Character value</i> , *NONE, *SAME	Optional, Positional 6
CONNAME	Connection name	<i>Character value</i> , *NONE, *SAME	Optional, Positional 7
TPNAME	Transaction Program Name	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 8
MODENAME	Mode Name	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 9
TMQNAME	Transmission queue	<i>Character value</i> , *SAME	Optional, Positional 10
MCANAME	Message channel agent	Single values: *SAME , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 11
	Qualifier 1: Message channel agent	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
MCAUSRID	Message channel agent user ID	<i>Character value</i> , *NONE, *PUBLIC, *SAME	Optional, Positional 12
MCATYPE	Message channel agent Type	*PROCESS, *THREAD, *SAME	Optional, Positional 13
BATCHINT	Batch Interval	0-999999999, *SAME	Optional, Positional 14
BATCHSIZE	Batch size	1-9999, *SAME	Optional, Positional 15

Table 223. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>DSCITV</u>	Disconnect interval	0-9999999, *SAME	Optional, Positional 16
<u>SHORTTMR</u>	Short retry interval	0-9999999999, *SAME	Optional, Positional 17
<u>SHORTRTY</u>	Short retry count	0-9999999999, *SAME	Optional, Positional 18
<u>LONGTMR</u>	Long retry interval	0-9999999999, *SAME	Optional, Positional 19
<u>LONGRTY</u>	Long retry count	0-9999999999, *SAME	Optional, Positional 20
<u>SCYEXIT</u>	Security exit	Single values: *SAME , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 21
	Qualifier 1: Security exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
<u>CSCYEXIT</u>	Security exit	<i>Character value</i> , *SAME , *NONE	Optional, Positional 22
<u>SCYUSRDATA</u>	Security exit user data	<i>Character value</i> , *SAME , *NONE	Optional, Positional 23
<u>SNDEXIT</u>	Send exit	Single values: *SAME , *NONE Other values (up to 10 repetitions): <i>Qualified object name</i>	Optional, Positional 24
	Qualifier 1: Send exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
<u>CSNDEXIT</u>	Send exit	Single values: *SAME , *NONE Other values (up to 10 repetitions): <i>Character value</i>	Optional, Positional 25
<u>SNDUSRDATA</u>	Send exit user data	Values (up to 10 repetitions): <i>Character value</i> , *SAME , *NONE	Optional, Positional 26
<u>RCVEXIT</u>	Receive exit	Single values: *SAME , *NONE Other values (up to 10 repetitions): <i>Qualified object name</i>	Optional, Positional 27
	Qualifier 1: Receive exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
<u>CRCVEXIT</u>	Receive exit	Single values: *SAME , *NONE Other values (up to 10 repetitions): <i>Character value</i>	Optional, Positional 28
<u>RCVUSRDATA</u>	Receive exit user data	Values (up to 10 repetitions): <i>Character value</i> , *SAME , *NONE	Optional, Positional 29

Table 223. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>MSGEXIT</u>	Message exit	Single values: *SAME , *NONE Other values (up to 10 repetitions): <i>Qualified object name</i>	Optional, Positional 30
	Qualifier 1: Message exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
<u>MSGUSRDATA</u>	Message exit user data	Values (up to 10 repetitions): <i>Character value</i> , *SAME , *NONE	Optional, Positional 31
<u>MSGRTYEXIT</u>	Message retry exit	Single values: *SAME , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 32
	Qualifier 1: Message retry exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
<u>MSGRTYDATA</u>	Message retry exit data	<i>Character value</i> , *SAME , *NONE	Optional, Positional 33
<u>MSGRTYNBR</u>	Number of message retries	0-999999999, *SAME	Optional, Positional 34
<u>MSGRTYITV</u>	Message retry interval	0-999999999, *SAME	Optional, Positional 35
<u>CVTMSG</u>	Convert message	*YES , *NO , *SAME	Optional, Positional 36
<u>PUTAUT</u>	Put authority	*DFT , *CTX , *SAME	Optional, Positional 37
<u>SEQNUMWRAP</u>	Sequence number wrap	100-999999999, *SAME	Optional, Positional 38
<u>MAXMSGLEN</u>	Maximum message length	0-104857600, *SAME	Optional, Positional 39
<u>HRTBTINTVL</u>	Heartbeat interval	0-999999999, *SAME	Optional, Positional 40
<u>NPMSPEED</u>	Non Persistent Message Speed	*FAST , *NORMAL , *SAME	Optional, Positional 41
<u>CLUSTER</u>	Cluster Name	<i>Character value</i> , *NONE , *SAME	Optional, Positional 42
<u>CLUSNL</u>	Cluster Name List	<i>Character value</i> , *NONE , *SAME	Optional, Positional 43
<u>NETPRTY</u>	Network Connection Priority	0-9, *SAME	Optional, Positional 44

Table 223. Command parameters (continued)

Keyword	Description	Choices	Notes
SSLCIPH	TLS CipherSpec	Supported CipherSpecs are listed here: CipherSpecs you can use with IBM MQ TLS support . Deprecated Deprecated CipherSpecs that you can re-enable if necessary are listed here: Deprecated CipherSpecs .	Optional, Positional 45
SSLCAUTH	TLS Client Authentication	*REQUIRED, *OPTIONAL, *SAME	Optional, Positional 46
SSLPEER	TLS Peer name	Character value, *NONE, *SAME	Optional, Positional 47
LOCLADDR	Local communication address	Character value, *NONE, *SAME	Optional, Positional 48
BATCHHB	Batch Heartbeat Interval	0-999999999, *SAME	Optional, Positional 49
USERID	Task user identifier	Character value, *NONE, *SAME	Optional, Positional 50
PASSWORD	Password	Character value, *NONE, *SAME	Optional, Positional 51
KAINT	Keep Alive Interval	0-99999, *SAME , *AUTO	Optional, Positional 52
COMPHDR	Header Compression	Values (up to 2 repetitions): *NONE, *SYSTEM, *SAME	Optional, Positional 53
COMPMSG	Message Compression	Single values: *ANY Other values (up to 4 repetitions): *NONE, *RLE, *ZLIBHIGH, *ZLIBFAST, V9.4.0 , *LZ4HIGH, *LZ4HIGH *SAME	Optional, Positional 54
MONCHL	Channel Monitoring	*QMGR, *OFF, *LOW, *MEDIUM, *HIGH, *SAME	Optional, Positional 55
STATCHL	Channel Statistics	*QMGR, *OFF, *LOW, *MEDIUM, *HIGH, *SAME	Optional, Positional 56
CLWLRANK	Cluster Workload Rank	0-9, *SAME	Optional, Positional 57
CLWLPRTY	Cluster Workload Priority	0-9, *SAME	Optional, Positional 58
CLWLWGHT	Cluster Channel Weight	1-99, *SAME	Optional, Positional 59
SHARECNV	Sharing Conversations	0-999999999, *SAME	Optional, Positional 60
PROPCTL	Property Control	*COMPAT, *NONE, *ALL, *SAME	Optional, Positional 61
MAXINST	Maximum Instances	0-999999999, *SAME	Optional, Positional 62

Table 223. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>MAXINSTC</u>	Maximum Instances Per Client	0-999999999, *SAME	Optional, Positional 63
<u>CLNTWGHT</u>	Client Channel Weight	0-99, *SAME	Optional, Positional 64
<u>AFFINITY</u>	Connection Affinity	*PREFERRED, *NONE, *SAME	Optional, Positional 65
<u>BATCHLIM</u>	Batch Data Limit	0-999999, *SAME	Optional, Positional 66
<u>DFTRECON</u>	Default client reconnection	*NO, *YES, *QMGR, *DISABLED, *SYSDFTCHL	Optional, Positional 67

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

channel-name

Specify the channel name.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

Channel type (CHLTYPE)

Specifies the type of the channel being changed.

The possible values are:

*SDR

Sender channel

*SVR

Server channel

*RCVR

Receiver channel

*RQSTR

Requester channel

*SVRCN

Server-connection channel

*CLUSSDR

Cluster-sender channel

*CLUSRCVR

Cluster-receiver channel

*CLTCN

Client-connection channel

Transport type (TRPTYPE)

Specifies the transmission protocol.

The possible values are:

***SAME**

The attribute is unchanged.

***LU62**

SNA LU 6.2.

***TCP**

Transmission Control Protocol / Internet Protocol (TCP/IP).

Text 'description' (TEXT)

Specifies text that briefly describes the channel definition.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Target Queue Manager (TGTMQMNAME)

Specifies the name of the target queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The name of the target queue manager for a client connection channel (CHLTYPE) *CLTCN is unspecified.

message-queue-manager-name

The name of the target message queue manager for a client connection channel (CHLTYPE) *CLTCN.

For other channel types this parameter must not be specified.

Connection name (CONNAME)

Specifies the name of the machine to connect.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The connection name is blank.

connection-name

Specify the connection name as required by the transmission protocol:

- For *LU62, specify the name of the CSI object.

- For *TCP, specify either the host name, or the network address of the remote machine (or the local machine for cluster-receiver channels). This can be followed by an optional port number enclosed in parentheses.

Multi On [Multiplatforms](#), the TCP/IP connection name parameter of a cluster-receiver channel is optional. If you leave the connection name blank, IBM MQ generates a connection name for you, assuming the default port and using the current IP address of the system. You can override the default port number, but still use the current IP address of the system. For each connection name leave the IP name blank, and provide the port number in parentheses; for example:

```
(1415)
```

The generated **CONNNAME** is always in the dotted decimal (IPv4) or hexadecimal (IPv6) form, rather than in the form of an alphanumeric DNS host name.

Where a port is not specified the default port 1414 is assumed.

For cluster-receiver channels the connection name relates to the local queue manager, and for other channels it relates to the target queue manager.

This parameter is required for channels with channel type (CHLTYPE) of *SDR, *RQSTR, *CLTCN and *CLUSSDR. It is optional for *SVR and *CLUSRCVR channels, and is not valid for *RCVR or *SVRCN channels.

Transaction Program Name (TPNAME)

This parameter is valid for channels with a TRPTYPE defined as LU 6.2 only.

This parameter must be set to the SNA transaction program name, unless the CONNAME contains a side-object name in which case it must be set to blanks. The name is taken instead from the CPI-C Communications Side Object.

This parameter is not valid for channels with a CHLTYPE defined as *RCVR.

The possible values are:

***SAME**

The value of this attribute does not change.

***NONE**

No transaction program name is specified.

***BLANK**

The transaction program name is taken from CPI-C Communications Side Object. The side object name must be specified in the CONNAME parameter.

transaction-program-name

Specify the SNA transaction program name.

Mode Name (MODENAME)

This parameter is valid for channels with a TRPTYPE defined as LU 6.2. If TRPTYPE is not defined as LU 6.2 the data is ignored and no error message is issued.

If specified, the value must be set to the SNA mode name, unless the CONNAME contains a side-object name, in which case it must be set to blanks. The name is then taken from the CPI-C Communications Side Object.

This parameter is not valid for channels with CHLTYPE defined as *RCVR or *SVRCONN.

The possible values are:

***SAME**

The value of this attribute does not change.

***NONE**

No mode name is specified.

***BLANK**

Name will be taken from the CPI-C Communications Side Object. This must be specified in the CONNAME parameter.

SNA-mode-name

Specify the SNA Mode Name

Transmission queue (TMQNAME)

Specifies the name of the transmission queue.

The possible values are:

***SAME**

The attribute is unchanged.

transmission-queue-name

Specify the name of the transmission queue. A transmission queue name is required if the CHLTYPE is defined as *SDR or *SVR.

For other channel types this parameter must not be specified.

Message channel agent (MCANAME)

This parameter is reserved and should not be used.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The MCA program name is blank.

This parameter cannot be specified if the CHLTYPE is defined as *RCVR, *SVRCN, or *CLTCN.

Message channel agent user ID (MCAUSRID)

Specifies the message channel agent user identifier which is to be used by the message channel agent for authorization to access MQ resources, including (if PUTAUT is *DFT) authorization to put the message to the destination queue for receiver or requester channels.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The message channel agent uses its default user identifier.

***PUBLIC**

Uses the public authority.

mca-user-identifier

Specify the user identifier to be used.

This parameter cannot be specified for a channel type (CHLTYPE) of *CLTCN.

Message channel agent Type (MCATYPE)

Specifies whether the message channel agent program should run as a thread or as a process.

The possible values are:

***SAME**

The attribute is unchanged.

***PROCESS**

The message channel agent runs as a separate process.

***THREAD**

The message channel agent runs as a separate thread.

This parameter can only be specified for channels with CHLTYPE defined as *SDR, *SVR, *RQSTR, *CLUSSDR or *CLUSRCVR.

Batch Interval (BATCHINT)

The minimum amount of time, in milliseconds, that a channel will keep a batch open.

The batch is terminated by which ever of the following occurs first: BATCHSZ messages have been sent, BATCHLIM bytes have been sent, or the transmission queue is empty and BATCHINT is exceeded.

The default value is 0, which means that the batch is terminated as soon as the transmission queue becomes empty (or the BATCHSZ limit is reached).

The value must be in the range 0 through 999999999.

This parameter is valid for channels with CHLTYPE defined as *SDR, *SVR, *CLUSSDR, or *CLUSRCVR.

The possible values are:

***SAME**

The value of this attribute does not change.

batch-interval

Specify a value ranging from 0 through 999999999.

Batch size (BATCHSIZE)

Specifies the maximum number of messages that can be sent down a channel before a checkpoint is taken.

The possible values are:

***SAME**

The attribute is unchanged.

batch-size

Specify a value ranging from 1 through 9999.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Disconnect interval (DSCITV)

Specifies the disconnect interval, which defines the maximum number of seconds that the channel waits for messages to be put on a transmission queue before closing the channel.

The possible values are:

***SAME**

The attribute is unchanged.

disconnect-interval

Specify a value ranging from 0 through 999999.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR or *CLTCN.

Short retry interval (SHORTTMR)

Specifies the short retry wait interval for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. This defines the interval between attempts to establish a connection to the remote machine.

The possible values are:

***SAME**

The attribute is unchanged.

short-retry-interval

Specify a value ranging from 0 through 999999999.

Short retry count (SHORTRTY)

Specifies the short retry count for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. This defines the maximum number of attempts that are made to establish a connection to the remote machine, at intervals specified by SHORTTMR, before the (normally longer) LONGRTY and LONGTMR are used.

The possible values are:

***SAME**

The attribute is unchanged.

short-retry-count

Specify a value ranging from 0 through 999999999. A value of 0 means that no retries are allowed.

Long retry interval (LONGTMR)

Specifies the long retry wait interval for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. It defines the interval in seconds between attempts to establish a connection to the remote machine, after the count specified by SHORTRTY has been exhausted.

The possible values are:

***SAME**

The attribute is unchanged.

long-retry-interval

Specify a value in the range 0 through 999999999.

Note: For implementation reasons, the maximum retry interval that can be used is 999999; values exceeding this are treated as 999999.

Long retry count (LONGRTY)

Specifies the long retry count for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. This defines the maximum number of further attempts that are made to connect to the remote machine, at intervals specified by LONGTMR, after the count specified by SHORTRTY has been exhausted. An error message is logged if the connection is not established after the defined number of attempts.

The possible values are:

***SAME**

The attribute is unchanged.

long-retry-count

Specify a value in the range 0 through 999999999. A value of 0 means that no retries are allowed.

Security exit (SCYEXIT)

Specifies the name of the program to be called as the security exit. If a nonblank name is defined, the exit is invoked at the following times:

- Immediately after establishing a channel.

Before any messages are transferred, the exit is given the opportunity to instigate security flows to validate connection authorization.

- On receipt of a response to a security message flow.

Any security message flows received from the remote processor on the remote machine are passed to the exit.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The security exit program is not invoked.

security-exit-name

Specify the name of the security exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

Security exit (CSCYEXIT)

Specifies the name of the program to be called as the client security exit. If a nonblank name is defined, the exit is invoked at the following times:

- Immediately after establishing a channel.

Before any messages are transferred, the exit is given the opportunity to instigate security flows to validate connection authorization.

- On receipt of a response to a security message flow.

Any security message flows received from the remote processor on the remote machine are passed to the exit.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The client security exit program is not invoked.

security-exit-name

Specify the name of the client security exit program.

Security exit user data (SCYUSRDATA)

Specifies a maximum of 32 characters of user data that is passed to the security exit program.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The user data for the security exit program is not specified.

security-exit-user-data

Specify the user data for the security exit.

Send exit (SNDEXIT)

Specifies the entry point of the program to be called as the send exit. If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The send exit program is not invoked.

send-exit-name

Specify the name of the send exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

Send exit (CSNDEXIT)

Specifies the entry point of the program to be called as the client send exit. If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The client send exit program is not invoked.

send-exit-name

Specify the name of the client send exit program.

Send exit user data (SNDUSRDATA)

Specifies a maximum of 32 characters of user data that is passed to the send exit program.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The user data for the send exit program is not specified.

send-exit-user-data

Specify the user data for the send exit program.

Receive exit (CRCVEXIT)

Specifies the entry point of the program to be called as the client receive exit. If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The client receive exit program is not invoked.

receive-exit-name

Specify the name of the client receive exit program.

Receive exit (RCVEXIT)

Specifies the entry point of the program to be called as the receive exit. If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The receive exit program is not invoked.

receive-exit-name

Specify the name of the receive exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

Receive exit user data (RCVUSRDATA)

Specifies a maximum of 32 characters of user data that is passed to the receive exit program.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The user data for the receive exit program is not specified.

receive-exit-user-data

Specify a maximum of 32 characters of user data for the receive exit.

Message exit (MSGEXIT)

Specifies the entry point of the program to be called as the message exit. If a nonblank name is defined, the exit is invoked immediately after a message has been retrieved from the transmission queue. The exit is given the entire application message and message descriptor for modification.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The message exit program is not invoked.

message-exit-name

Specify the name of the message exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Message exit user data (MSGUSRDATA)

Specifies user data that is passed to the message exit program.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The user data for the message exit program is not specified.

message-exit-user-data

Specify a maximum of 32 characters of user data that is passed to the message exit program.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Message retry exit (MSGRTYEXIT)

Specifies the entry point of the program to be called as the message retry exit.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The message retry exit program is not invoked.

message-retry-exit-name

Specify the name of the message retry exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Message retry exit data (MSGRTYDATA)

Specifies user data that is passed to the message retry exit program.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The user data for the message retry exit program is not specified.

message-retry-exit-user-data

Specify a maximum of 32 characters of user data that is passed to the message retry exit program.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Number of message retries (MSGRTYNBR)

Specifies the number of times the channel will retry before it decides it cannot deliver the message.

This parameter is used by the channel as an alternative to a message retry exit when MSGRTYEXIT is defined as *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

message-retry-number

Specify a value ranging from 0 through 999999999. A value of 0 indicates no retries will be performed.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Message retry interval (MSGRTYITV)

Specifies the minimum interval of time that must pass before the channel can retry the MQPUT operation. This time is in milliseconds.

This parameter is used by the channel as an alternative to a message retry exit when MSGRTYEXIT is defined as *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

message-retry-number

Specify a value ranging from 0 through 999999999. A value of 0 indicates that the retry will be performed as soon as possible.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Convert message (CVTMSG)

Specifies whether the application data in the message should be converted before the message is transmitted.

The possible values are:

***SAME**

The value of this attribute does not change.

***YES**

The application data in the message is converted before sending.

***NO**

The application data in the message is not converted before sending.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Put authority (PUTAUT)

Specifies whether the user identifier in the context information associated with a message is used to establish authority to put the message on the destination queue. This applies only to receiver and requester (*CLUSRCVR, *RCVR and *RQSTR) channels.

The possible values are:

***SAME**

The attribute is unchanged.

***DFT**

No authority check is made before the message is put on the destination queue.

***CTX**

The user identifier in the message context information is used to establish authority to put the message.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Sequence number wrap (SEQNUMWRAP)

Specifies the maximum message sequence number. When the maximum is reached, sequence numbers wrap to start again at 1.

Note: The maximum message sequence number is not negotiable; the local and remote channels must wrap at the same number.

The possible values are:

***SAME**

The attribute is unchanged.

sequence-number-wrap-value

Specify a value ranging from 100 through 999999999.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Maximum message length (MAXMSGLEN)

Specifies the maximum message length that can be transmitted on the channel. This is compared with the value for the remote channel and the actual maximum is the lower of the two values.

The possible values are:

***SAME**

The attribute is unchanged.

maximum-message-length

Specify a value ranging from 0 through 104857600. A value of 0 indicates that the maximum length is unlimited.

Heartbeat interval (HRTBTINTVL)

Specifies the time, in seconds, between heartbeat flows passed from the sending MCA when there are no messages on the transmission queue. The heartbeat exchange gives the receiving MCA the opportunity to quiesce the channel. This applies only to sender, server, cluster sender and cluster receiver (*SDR, *SVR, *CLUSDR and *CLUSRCVR) channels.

The possible values are:

***SAME**

The attribute is unchanged.

heart-beat-interval

Specify a value ranging from 0 through 999999999. A value of 0 means that no heartbeat exchanges are to take place.

Non Persistent Message Speed (NPMSPEED)

Specifies whether the channel supports fast non persistent messages.

The possible values are:

***SAME**

The value of this attribute does not change.

***FAST**

The channel supports fast non persistent messages.

***NORMAL**

The channel does not support fast non persistent messages.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Cluster Name (CLUSTER)

The name of the cluster to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

This parameter is valid only for *CLUSDR and *CLUSRCVR channels. If the CLUSNL parameter is non-blank, this parameter must be blank.

The possible values are:

***SAME**

The value of this attribute does not change.

***NONE**

No cluster name is specified.

cluster-name

The name of the cluster to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

Cluster Name List (CLUSNL)

The name of the namelist that specifies a list of clusters to which the channel belongs

This parameter is valid only for *CLUSDR and *CLUSRCVR channels. If the CLUSTER parameter is non-blank, this parameter must be blank.

The possible values are:

***SAME**

The value of this attribute does not change.

***NONE**

No cluster namelist is specified.

cluster-name-list

The name of the namelist specifying a list of clusters to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

Network Connection Priority (NETPTY)

The priority for the network connection. Distributed queuing chooses the path with the highest priority if there are multiple paths available. The value must be in the range between 0 and 9 where 0 is the lowest priority.

This parameter is valid only for *CLUSRCVR channels.

The possible values are:

***SAME**

The value of this attribute does not change.

network-connection-priority

Specify a value ranging from 0 through 9 where 0 is the lowest priority.

TLS CipherSpec (SSLCIPH)

SSLCIPH specifies the CipherSpec used in TLS channel negotiation. The possible values are:

***SAME**

The value of this attribute does not change.

cipherspec

The name of the CipherSpec.

Note:  From IBM MQ 8.0.0 Fix Pack 2, the SSLv3 protocol and the use of some IBM MQ CipherSpecs is deprecated. For more information, see [Deprecated CipherSpecs](#).

TLS Client Authentication (SSLCAUTH)

SSLCAUTH specifies whether the channel carries out client authentication over TLS. The parameter is used only for channels with SSLCIPH specified.

The possible values are:

***SAME**

The value of this attribute does not change.

***REQUIRED**

Client authentication is required.

***OPTIONAL**

Client authentication is optional.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *CLTCN or *CLUSSDR.

TLS Peer name (SSLPEER)

SSLPEER specifies the X500 peer name used in TLS channel negotiation. The possible values are:

***SAME**

The value of this attribute does not change.

x500peername

The X500 peer name to use.

Note: An alternative way of restricting connections into channels by matching against the TLS Subject Distinguished Name, is to use channel authentication records. With channel authentication records, different TLS Subject Distinguished Name patterns can be applied to the same channel. If both SSLPEER on the channel and a channel authentication record are used to apply to the same channel, the inbound certificate must match both patterns in order to connect. For more information, see [Channel authentication records](#).

Local communication address (LOCLADDR)

Specifies the local communication address for the channel.

This parameter is only valid for *SDR, *SVR, *RQSTR, *CLUSSDR, *CLUSRCVR and *CLTCN channels.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The connection is blank.

local-address

Only valid for transport type TCP/IP. Specify the optional IP address and optional port or port range used for outbound TCP/IP communications. The format is:

```
LOCLADDR([ip-addr][low-port[,high-port]][, [ip-addr][low-port[,high-port]]])
```

Batch Heartbeat Interval (BATCHHB)

The time in milliseconds used to determine whether batch heartbeating occurs on this channel. Batch heartbeating allows channels to determine whether the remote channel instance is still active before going indoubt. A batch heartbeat will occur if a channel MCA has not communicated with the remote channel within the specified time.

The possible values are:

***SAME**

The attribute is unchanged.

batch-heartbeat-interval

Specify a value ranging from 0 through 999999999. A value of 0 indicates that batch heartbeating is not to be used.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Task user identifier (USERID)

This is used by the message channel agent when attempting to initiate a secure LU 6.2 session with a remote message channel agent.

This parameter is valid only for channels with a channel type (CHLTYPE) of *SDR, *SVR, *RQSTR, *CLTCN or *CLUSDR.

Although the maximum length of the attribute is 12 characters, only the first 10 characters are used.

The possible values are:

***SAME**

The value of this attribute does not change.

***NONE**

No user identifier is specified.

user-identifier

Specify the task user identifier.

Password (PASSWORD)

This is used by the message channel agent when attempting to initiate a secure LU 6.2 session with a remote message channel agent.

This parameter is valid only for channels with a channel type (CHLTYPE) of *SDR, *SVR, *RQSTR, *CLTCN or *CLUSDR.

Although the maximum length of the attribute is 12 characters, only the first 10 characters are used.

The possible values are:

***SAME**

The value of this attribute does not change.

***NONE**

No password is specified.

password

Specify the password.

Keep Alive Interval (KAINT)

Specifies the keep alive timing interval for this channel.

The possible values are:

***SAME**

The attribute is unchanged.

***AUTO**

The keep alive interval is calculated based upon the negotiated heartbeat value as follows:

- If the negotiated HBINT is greater than 0, keep alive interval is set to that value plus 60 seconds.
- If the negotiated HBINT is 0, the value used is that specified by the KEEPALIVEOPTIONS statement in the TCP profile configuration data set.

keep-alive-interval

Specify a value ranging from 0 through 99999.

Header Compression (COMPHDR)

The list of header data compression techniques supported by the channel.

For channel types sender, server, cluster sender, cluster receiver and client connection (*SDR, *SVR, *CLUSSDR, *CLUSRCVR and *CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No header data compression is performed.

***SYSTEM**

Header data compression is performed.

Message Compression (COMPMSG)

The list of message data compression techniques supported by the channel.

For channel types sender, server, cluster sender, cluster receiver and client connection (*SDR, *SVR, *CLUSSDR, *CLUSRCVR and *CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No message data compression is performed.

***RLE**

Message data compression is performed using run-length encoding.

***ZLIBFAST**

Message data compression is performed using the zlib compression technique. A fast compression time is preferred.

***ZLIBHIGH**

Message data compression is performed using the zlib compression technique. A high level of compression is preferred.

> V 9.4.0 *LZ4FAST

Message data compression is performed using the LZ4 compression technique. A fast compression time is preferred.

> V 9.4.0 *LZ4HIGH

Message data compression is performed using the LZ4 compression technique. A high level of compression is preferred.

***ANY**

Any compression technique supported by the queue manager can be used. This option is only valid for channel types receiver, requester and server connection (*RCVR, *RQSTR and *SVRCN).

Channel Monitoring (MONCHL)

Controls the collection of online monitoring data.

Online monitoring data is not collected when the queue manager attribute MONCHL is set to *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

The collection of online monitoring data is inherited from the setting of the queue manager attribute MONCHL.

***OFF**

Online Monitoring Data collection for this channel is switched off.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for a channel type (CHLTYPE) of *CLTCN.

Channel Statistics (STATCHL)

Controls the collection of statistics data.

Statistics data is not collected when the queue manager attribute STATCHL is set to *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATCHL.

***OFF**

Statistics data collection for this channel is disabled.

***LOW**

Statistics data collection is turned on with a low ratio of data collection.

***MEDIUM**

Statistics data collection is turned on with a moderate ratio of data collection.

***HIGH**

Statistics data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Cluster Workload Rank (CLWLRANK)

Specifies the cluster workload rank of the channel.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-rank

The cluster workload rank of the channel in the range 0 through 9.

Cluster Workload Priority (CLWLPRTY)

Specifies the cluster workload priority of the channel.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-priority

The cluster workload priority of the channel in the range 0 through 9.

Cluster Channel Weight (CLWLWGHT)

Specifies the cluster workload weight of the channel.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-weight

The cluster workload weight of the channel in the range 1 through 99.

Sharing Conversations (SHARECNV)

Specifies the maximum the number of conversations which can be shared over a particular TCP/IP client channel instance (socket).

This parameter is valid for channels with CHLTYPE defined as *CLTCN or *SVRCN.

The possible values are:

***SAME**

The attribute is unchanged.

0

Specifies no sharing of conversations over a TCP/IP socket. The channel instance runs in a mode prior to that of IBM WebSphere MQ 7.0, with regard to:

- Administrator stop-quietce
- Heartbeating
- Read ahead

1

Specifies no sharing of conversations over a TCP/IP socket. Client heartbeating and read ahead are available, whether in an MQGET call or not, and channel quiescing is more controllable.

shared-conversations

The number of shared conversations in the range 2 through 999999999.

This parameter is only valid for client-connection and server-connection channels.

Note: If the client-connection SHARECNV value does not match the server-connection SHARECNV value, the lower of the two values is used.

Property Control (PROPCTL)

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor).

The possible values are:

***SAME**

The attribute is unchanged.

***COMPAT**

If the message contains a property with a prefix of "mcd.", "jms.", "usr." or "mqext." then all optional message properties, except those in the message descriptor (or extension) will be placed in one or more MQRFH2 headers in the message data before the message is sent to the remote queue manager.

***NONE**

All properties of the message, except those in the message descriptor (or extension), will be removed from the message before the message is sent to the remote queue manager.

***ALL**

All properties of the message will be included with the message when it is sent to the remote queue manager. The properties, except those in the message descriptor (or extension), will be placed in one or more MQRFH2 headers in the message data.

Maximum Instances (MAXINST)

Specifies the maximum number of clients that can simultaneously connect to the queue manager via this server-connection channel object.

This attribute is valid only for server-connection channels.

The possible values are:

***SAME**

The attribute is unchanged.

maximum-instances

The maximum number of simultaneous instances of the channel in the range 0 through 99999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

Maximum Instances Per Client (MAXINSTC)

Specifies the maximum number of simultaneous instances of an individual server-connection channel which can be started from a single client.

In this context, multiple client connections originating from the same remote network address are considered to be a single client.

This attribute is valid only for server-connection channels.

The possible values are:

***SAME**

The attribute is unchanged.

maximum-instances-per-client

The maximum number of simultaneous instances of the channel which can be in the started from a single client in the range 0 through 99999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running from individual clients, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

Client Channel Weight (CLNTWGHT)

The client channel weighting attribute is used so client channel definitions can be selected at random based on their weighting when more than one suitable definition is available.

The possible values are:

***SAME**

The attribute is unchanged.

client-channel-weight

The client channel weight in the range 0 through 99.

Connection Affinity (AFFINITY)

The channel affinity attribute is used so client applications that connect multiple times using the same queue manager name can choose whether to use the same client channel definition for each connection.

The possible values are:

***SAME**

The attribute is unchanged.

***PREFERRED**

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any applicable CLNTWGHT(0) definitions first and in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful non CLNTWGHT(0) definitions are moved to the end of the list. CLNTWGHT(0) definitions remain at the start of the list and are selected first for each connection.

***NONE**

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process select an applicable definition based on the weighting with any applicable CLNTWGHT(0) definitions selected first in alphabetical order.

Batch Data Limit (BATHLIM)

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

The batch is terminated when one of the following conditions is met:

- **BATCHSZ** messages have been sent.
- **BATHLIM** bytes have been sent.
- The transmission queue is empty and **BATCHINT** is exceeded.

The value must be in the range 0 - 999999. The default value is 5000.

The **BATHLIM** parameter is supported on all platforms.

The possible values are:

***SAME**

The value of this attribute does not change.

batch-data-limit

Specify a value ranging from 0 through 999999.

This parameter can only be specified for channel types (CHLTYPE) *SDR, *SVR, *CLUSDR, or *CLUSRCVR.

Default client reconnection (DFTRECON)

Specifies whether a client connection automatically reconnects a client application if its connection breaks.

***SAME**

The value of this attribute does not change.

***NO**

Unless overridden by **MQCONN**, the client is not reconnected automatically.

***YES**

Unless overridden by **MQCONN**, the client reconnects automatically.

***QMGR**

Unless overridden by **MQCONN**, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO_RECONNECT_Q_MGR.

***DISABLED**

Reconnection is disabled, even if requested by the client program using the **MQCONN** MQI call.

This parameter is specified for a client connection channel, (CHLTYPE) *CLTCN

CHGMQMJRN (Change Queue Manager Journal)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Change Queue Manager Journal command (CHGMQMJRN) changes a queue manager journal. This command can be used, for example, to change the type of remote journal replication used for a backup or multi-instance queue manager.

Parameters

Table 224. Command parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 1
<u>JRN</u>	Queue Manager Journal	Character value, *DFT	Optional, Positional 2
<u>RMTJRNRDB</u>	Remote Relational Database	Character value	Optional, Positional 3
<u>RMTJRNSTS</u>	Remote Journal Status	*ACTIVE , *INACTIVE	Optional, Positional 4
<u>RMTJRNDLV</u>	Remote Journal Delivery	*SYNC , *ASYNC	Optional, Positional 5
<u>RMTJRNTIMO</u>	Remote Journal Sync. Timeout	1-3600, *DFT	Optional, Positional 6

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager associated with the journal.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Queue Manager Journal (JRN)

Specifies the journal name to create.

The possible values are:

***DFT**

The journal name is chosen by the system. If a local journal already exists for the queue manager on this system - the existing local journal name is used, otherwise a unique name is generated of the format AMQxJRN where x is a character in the range 'A - Z'.

journal-name

Specify the name of the journal. The name can contain up to 10 characters. Journal receiver names will be derived from this journal name by truncating at the 4th character (or at the last character if the journal name is shorter than 4 characters) and appending zeroes. If the local queue manager library already contains a local journal, its name must match that supplied. Only one local journal can exist in a queue manager library. DLTMQM will not remove journal artifacts from a queue manager library unless they are prefixed with "AMQ".

Remote Relational Database (RMTJRNRDB)

Specifies the name of the relational database directory entry that contains the remote location name of the target system. Use the WRKRDBDIRE command to locate and existing entry or configure a new relational database directory entry for the target system.

relational-database-directory-entry

Specify the name of the relational database directory entry. The name can contain up to 18 characters.

Remote Journal Status (RMTJRNSTS)

Specifies whether the remote journal is ready to receive journal entries from the queue managers local journal.

The possible values are:

***ACTIVE**

The remote journal is ready to receive journal entries from the local queue manager journal. Replication of journal entries starts with the oldest local journal receiver required to perform a full media recovery and queue manager restart. If these recovery points do not exist, replication starts with the currently attached local journal receiver.

***INACTIVE**

The remote journal is not ready to receive journal entries from the local queue manager journal.

Remote Journal Delivery (RMTJRNDLV)

Specifies whether the journal entries are replicated synchronously or asynchronously when the remote journal is activated. Note that this parameter is ignored when RMTJRNSTS(*INACTIVE) is specified.

The possible values are:

***SYNC**

The remote journal is replicated synchronously with the local queue manager journal.

***ASYNC**

The remote journal is replicated asynchronously with the local queue manager journal.

Remote Journal Sync. Timeout (RMTJRNTIMO)

Specifies the maximum amount of time in seconds to wait for a response from the remote system when using synchronous replication with remote journaling. If a response is not received from the remote system within the timeout period, the remote journal environment will automatically be deactivated. Note that this parameter is ignored when RMTJRNDLV(*ASYNC) or RMTJRNSTS(*INACTIVE) are specified.

The possible values are:

***DFT**

The system uses the default value of 60 seconds to wait for a response from the remote system.

1-3600

Specify the maximum number of seconds to wait for a response from the remote system. Note that this option is only available on IBM i V6R1M0 and later operating systems.

 **CHGMQMLSR (Change MQ Listener)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Change MQ Listener (CHGMQMLSR) command changes the specified attributes of an existing MQ listener definition.

Parameters

Table 225. Command parameters			
Keyword	Description	Choices	Notes
<u>LSRNAME</u>	Listener name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 2
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 3
<u>CONTROL</u>	Listener control	*SAME , *MANUAL, *QMGR, *STARTONLY	Optional, Positional 4
<u>PORT</u>	Port number	0-65535, *SAME	Optional, Positional 5
<u>IPADDR</u>	IP Address	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 6
<u>BACKLOG</u>	Listener backlog	0-999999999, *SAME	Optional, Positional 7

Listener name (LSRNAME)

The name of the listener definition to be changed.

The possible values are:

listener-name

Specify the name of the listener definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Text 'description' (TEXT)

Specifies text that briefly describes the listener definition.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

*SAME

The attribute is unchanged.

*BLANK

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Listener control (CONTROL)

Whether the listener starts automatically when the queue manager is started.

The possible values are:

***SAME**

The attribute is unchanged.

***MANUAL**

The listener is not automatically started or stopped.

***QMGR**

The listener is started and stopped as the queue manager is started and stopped.

***STARTONLY**

The listener is started as the queue manager is started, but is not automatically stopped when the queue manager is stopped.

Port number (PORT)

The port number to be used by the listener.

The possible values are:

***SAME**

The attribute is unchanged.

port-number

The port number to be used.

IP Address (IPADDR)

The IP address to be used by the listener.

The possible values are:

***SAME**

The attribute is unchanged.

ip-addr

The IP address to be used.

Listener backlog (BACKLOG)

The number of concurrent connection requests the listener supports.

The possible values are:

***SAME**

The attribute is unchanged.

backlog

The number of concurrent connection requests supported.

CHGMQMNL (Change MQ Namelist)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Change MQ Namelist (CHGMQMNL) command changes a list of names in the namelist specified on the selected local queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>NAMELIST</u>	Namelist	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 2
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 3
<u>NAMES</u>	List of Names	Values (up to 256 repetitions): <i>Character value</i> , *BLANKS, *SAME , *NONE	Optional, Positional 4

Namelist (NAMELIST)

The name of the namelist to be changed.

namelist

Specify the name of the namelist. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used.

message-queue-manager-name

Specify the name of the queue manager.

Text 'description' (TEXT)

Specifies text that briefly describes the namelist.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

***SAME**

The attribute is unchanged.

description

Specify no more than 64 characters enclosed in apostrophes.

List of Names (NAMES)

List of names. This is the list of names to be created. The names can be of any type, but must conform to the rules for naming MQ objects.

***SAME**

The attribute is unchanged.

namelist

The list to create. An empty list is valid.

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Change MQ Process (CHGMQMPRC) command changes the specified attributes of an existing MQ process definition.

Parameters

Keyword	Description	Choices	Notes
<u>PRCNAME</u>	Process name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 2
<u>TEXT</u>	Text 'description'	Character value, *BLANK, *SAME	Optional, Positional 3
<u>APPTYPE</u>	Application type	Integer, *DEF , *CICS, *UNIX, *OS400, *WINDOWS, *WINDOWS_NT,	Optional, Positional 4
<u>APPID</u>	Application identifier	Character value, *SAME	Optional, Positional 5
<u>USRDATA</u>	User data	Character value, *SAME , *NONE	Optional, Positional 6
<u>ENVDATA</u>	Environment data	Character value, *SAME , *NONE	Optional, Positional 7

Process name (PRCNAME)

The name of the process definition to be changed.

The possible values are:

process-name

Specify the name of the process definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Text 'description' (TEXT)

Specifies text that briefly describes the process definition.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Application type (APPTYPE)

The type of application started.

The possible values are:

***DEF**

Specifying DEF causes the default application type for the platform at which the command is interpreted to be stored in the process definition. This default cannot be changed by the installation. If the platform supports clients, the default is interpreted as the default application type of the server.

***CICS**

Represents a CICS/400® application.

***UNIX**

Represents a UNIX or Linux application.

***OS400**

Represents an IBM i application.

***WINDOWS**

Represents a Windows application.

***WINDOWS_NT**

Represents a Windows NT application.

integer

User-defined application type in the range 65536 through 999999999.

Application identifier (APPID)

Application identifier. This is the name of the application to be started, on the platform for which the command is processing. It is typically a program name and library name.

The possible values are:

***SAME**

The attribute is unchanged.

application-id

The maximum length is 256 characters.

User data (USRDATA)

A character string that contains user information pertaining to the application, as defined by APPID, to start.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The user data is blank.

user-data

Specify up to 128 characters of user data.

Environment data (ENVDATA)

A character string that contains environment information pertaining to the application, as defined by APPID, to start.

The possible values are:

*SAME

The attribute is unchanged.

*NONE

The environment data is blank.

environment-data

The maximum length is 128 characters.

CHGMQM (Change MQ Queue)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Change MQ Queue (**CHGMQM**) command changes the specified attributes of an existing MQ queue.

Parameters

Table 228. Command parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 2
<u>QTYPE</u>	Queue type	Character value	Optional, Positional 3
<u>FORCE</u>	Force	*NO , *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	Character value, *BLANK, *SAME	Optional, Positional 5
<u>PUTENBL</u>	Put enabled	*SAME , *NO, *YES	Optional, Positional 6

<u>TARGETYPE</u>	Target Type	*SAME , *QUEUE, *TOPIC	Optional, Positional 53
<u>CUSTOM</u>	Custom attribute	Character value, *BLANK, *SAME	Optional, Positional 54
<u>“CLCHNAME” on page 1667</u>	Cluster-sender channel name	Character value, *NONE, *SAME	Optional, Positional 55
<u>IMGRCOVQ</u>	Queue object attribute	*SAME , *NO, *YES, *QMGR	Optional, Positional 57

Queue name (QNAME)

The name of the queue to be changed.

The possible values are:

queue-name

Specify the name of the queue.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Queue type (QTYPE)

Specifies the type of queue that is to be changed.

The possible values are:

***ALS**

An alias queue.

***LCL**

A local queue.

***RMT**

A remote queue.

***MDL**

A model queue.

Force (FORCE)

Specifies whether the command should be forced to complete when conditions are such that completing the command affects an open queue. The conditions depend on the type of the queue that is being changed:

Alias Queue

The TGTQNAME keyword is specified with a queue name and an application has the alias queue open.

Local Queue

Either of the following conditions indicate that a local queue will be affected:

- SHARE(*NO) is specified and more than one application has the local queue open for input.
- The USAGE attribute is changed and one or more applications has the local queue open, or, there are one or more messages on the queue. (The USAGE attribute should not normally be changed while there are messages on the queue; the format of messages changes when they are put on a transmission queue.)

Remote Queue

Either of the following conditions indicate that a remote queue will be affected:

- The TMQNAME keyword is specified with a transmission-queue name (or *NONE) and an application with the remote queue open will be affected by this change.
- Any of the RMTQNAME, RMTMQMNAME or TMQNAME keywords is specified with a queue or queue manager name, and one or more applications has a queue open that resolves through this definition as a queue manager alias.

Note: FORCE(*YES) is not required if this definition is in use as a reply-to queue definition only.

The possible values are:

***NO**

The command fails if the relevant conditions are true.

***YES**

The command is forced to complete successfully even if the relevant conditions are true.

Text 'description' (TEXT)

Specifies text that briefly describes the queue definition.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Put enabled (PUTENBL)

Specifies whether messages can be put on the queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Messages cannot be added to the queue.

***YES**

Messages can be added to the queue by authorized applications.

Default message priority (DFTPTY)

Specifies the default priority of messages put on the queue.

The possible values are:

***SAME**

The attribute is unchanged.

priority-value

Specify a value ranging from 0 through 9, where 9 is the highest priority.

Default message persistence (DFTMSGPST)

Specifies the default for message-persistence on the queue. Message persistence determines whether messages are preserved across restarts of the queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

By default, messages are lost across a restart of the queue manager.

***YES**

By default, messages are preserved across a restart of the queue manager.

Process name (PRCNAME)

Specifies the local name of the MQ process that identifies the application that should be started when a trigger event occurs.

The process does not have to be available when the queue is created, but it must be available for a trigger event to occur.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The process name is blank.

process-name

Specify the name of the MQ process.

Triggering enabled (TRGENBL)

Specifies whether trigger messages are written to the initiation queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Triggering is not enabled. Trigger messages are not written to the initiation queue.

***YES**

Triggering is enabled. Trigger messages are written to the initiation queue.

Get enabled (GETENBL)

Specifies whether applications are to be permitted to get messages from this queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Applications cannot retrieve messages from the queue.

***YES**

Suitably authorized applications can retrieve messages from the queue.

Sharing enabled (SHARE)

Specifies whether multiple instances of applications can open this queue for input simultaneously.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Only a single application instance can open the queue for input.

***YES**

More than one application instance can open the queue for input.

Default share option (DFTSHARE)

Specifies the default share option for applications opening this queue for input.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

By default, the open request is for exclusive use of the queue for input.

***YES**

By default, the open request is for shared use of the queue for input.

Message delivery sequence (MSGDLYSEQ)

Specifies the message delivery sequence.

The possible values are:

***SAME**

The attribute is unchanged.

***PTY**

Messages are delivered in first-in-first-out (FIFO) order within priority.

***FIFO**

Messages are delivered in FIFO order regardless of priority.

Harden backout count (HDNBKTCNT)

Specifies whether the count of backed out messages is saved (hardened) across restarts of the message queue manager.

Note: On IBM MQ for IBM i the count is ALWAYS hardened, regardless of the setting of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

The backout count is not hardened.

***YES**

The backout count is hardened.

Trigger type (TRGTYPE)

Specifies the condition that initiates a trigger event. When the condition is true, a trigger message is sent to the initiation queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***FIRST**

When the number of messages on the queue goes from 0 to 1.

***ALL**

Every time a message arrives on the queue.

***DEPTH**

When the number of messages on the queue equals the value of the TRGDEPTH attribute.

***NONE**

No trigger messages are written.

Trigger depth (TRGDEPTH)

Specifies, for TRGTYPE(*DEPTH), the number of messages that initiate a trigger message to the initiation queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

depth-value

Specify a value ranging from 1 through 999999999.

Trigger message priority (TRGMSGPTY)

Specifies the minimum priority that a message must have before it can result in a trigger event.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

priority-value

Specify a value ranging from 0 through 9, where 9 is the highest priority.

Trigger data (TRGDATA)

Specifies up to 64 characters of user data that the queue manager includes in the trigger message. This data is made available to the monitoring application that processes the initiation queue, and to the application started by the monitor.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No trigger data is specified.

trigger-data

Specify up to 64 characters enclosed in apostrophes. For a transmission queue you can use this parameter to specify the name of the channel to be started.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Retention interval (RTNITV)

Specifies the retention interval. This interval is the number of hours for which the queue might be needed, based on the date and time when the queue was created.

This information is available to a housekeeping application or an operator and can be used to determine when a queue is no longer required.

Note: The message queue manager does not delete queues, nor does it prevent your queues from being deleted if their retention interval has not expired. It is your responsibility to take any required action.

The possible values are:

***SAME**

The attribute is unchanged.

interval-value

Specify a value ranging from 0 through 999999999.

Maximum queue depth (MAXDEPTH)

Specifies the maximum number of messages allowed on the queue. However, other factors can cause the queue to be treated as full; for example, it appears to be full if there is no storage available for a message.

Note: If this value is subsequently reduced by using the CHGMQM command, any messages that are on the queue remain intact even if they cause the new maximum to be exceeded.

The possible values are:

***SAME**

The attribute is unchanged.

depth-value

Specify a value ranging from 0 through 999999999.

Maximum message length (MAXMSGLEN)

Specifies the maximum length for messages on the queue.

Note: If this value is subsequently reduced by using the CHGMQM command, any messages that are on the queue remain intact even if they exceed the new maximum length.

Applications might use the value of this attribute to determine the size of buffer they need to retrieve messages from the queue. Therefore change the value only if you know this will not cause an application to operate incorrectly.

The possible values are:

***SAME**

The attribute is unchanged.

length-value

Specify a value ranging from 0 through 100 MB in bytes. The default is 4MB.

Backout threshold (BKTTHLD)

Specifies the backout threshold.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine if a message should be backed out. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

***SAME**

The attribute is unchanged.

threshold-value

Specify a value ranging from 0 through 999999999.

Backout requeue name (BKTQNAME)

Specifies the backout-queue name.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine where messages that have been backed out should go. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No backout queue is specified.

backout-queue-name

Specify the backout queue name.

Initiation queue (INITQNAME)

Specifies the name of the initiation queue.

Note: The initiation queue must be on the same instance of a message queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No initiation queue is specified.

initiation-queue-name

Specify the initiation queue name.

Usage (USAGE)

Specifies whether the queue is for normal usage, or for transmitting messages to a remote message queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

***NORMAL**

Normal usage (the queue is not a transmission queue)

***TMQ**

The queue is a transmission queue that is used to hold messages destined for a remote message queue manager. If the queue is intended for use in situations where a transmission queue name is not explicitly specified, the queue name must be the same as the name of the remote message queue manager. For further information, see IBM MQ Intercommunication.

Definition type (DFNTYPE)

Specifies the type of dynamic queue definition that is created when an application issues an MQOPEN API call with the name of this model queue specified in the object descriptor.

Note: This parameter only applies to a model queue definition.

The possible values are:

***SAME**

The attribute is unchanged.

***TEMPDYN**

A temporary dynamic queue is created. This value should not be specified with a DEFMSGPST value of *YES.

***PERMDYN**

A permanent dynamic queue is created.

Target object (TGTQNAME)

Specifies the name of the object for which this queue is an alias.

The object can be a local or remote queue, a topic or a message queue manager.

Note: The target object does not need to exist at this time but it must exist when a process attempts to open the alias queue.

The possible values are:

***SAME**

The attribute is unchanged.

target-object-name

Specify the name of the target object.

Remote queue (RMTQNAME)

Specifies the name of the remote queue. That is, the local name of the remote queue as defined on the queue manager specified by RMTMQMNAME.

If this definition is used for a queue manager alias definition, RMTQNAME must be blank when the open occurs.

If this definition is used for a reply-to alias, this name is the name of the queue that is to be the reply-to queue.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No remote-queue name is specified (that is, the name is blank). This can be used if the definition is a queue manager alias definition.

remote-queue-name

Specify the name of the queue at the remote queue manager.

Note: The name is not checked to ensure that it contains only those characters normally allowed for queue names.

Remote Message Queue Manager (RMTMQMNAME)

Specifies the name of the remote queue manager on which the queue RMTQNAME is defined.

If an application opens the local definition of a remote queue, RMTMQMNAME must not be the name of the connected queue manager. If TMQNAME is blank there must be a local queue of this name, which is to be used as the transmission queue.

If this definition is used for a queue manager alias, RMTMQMNAME is the name of the queue manager, which can be the name of the connected queue manager. Otherwise, if TMQNAME is blank, when the queue is opened there must be a local queue of this name, with USAGE(*TMQ) specified, which is to be used as the transmission queue.

If this definition is used for a reply-to alias, this name is the name of the queue manager that is to be the reply-to queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

remote-queue-manager-name

Specify the name of the remote queue manager.

Note: Ensure this name contains only those characters normally allowed for queue manager names.

Transmission queue (TMQNAME)

Specifies the local name of the transmission queue to be used for messages destined for the remote queue, for either a remote queue or for a queue manager alias definition.

If TMQNAME is blank, a queue with the same name as RMTMQMNAME is used as the transmission queue.

This attribute is ignored if the definition is being used as a queue manager alias and RMTMQMNAME is the name of the connected queue manager.

It is also ignored if the definition is used as a reply-to queue alias definition.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No specific transmission queue name is defined for this remote queue. The value of this attribute is set to all blanks.

transmission-queue-name

Specify the transmission queue name.

Queue depth high threshold (HIGHTHLD)

Specifies the threshold against which the queue depth is compared to generate a queue depth high event.

The possible values are:

***SAME**

The attribute is unchanged.

threshold-value

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

Queue depth low threshold (LOWTHLD)

Specifies the threshold against which the queue depth is compared to generate a queue depth low event.

The possible values are:

***SAME**

The attribute is unchanged.

threshold-value

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

Queue full events enabled (FULLEVT)

Specifies whether queue full events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Queue full events are not generated.

***YES**

Queue full events are generated.

Queue high events enabled (HIGHEVT)

Specifies whether queue depth high events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Queue depth high events are not generated.

***YES**

Queue depth high events are generated.

Queue low events enabled (LOWEVT)

Specifies whether queue depth low events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Queue depth low events are not generated.

***YES**

Queue depth low events are generated.

Service interval (SRVITV)

Specifies the service interval. This interval is used for comparison to generate service interval high and service interval OK events.

The possible values are:

***SAME**

The attribute is unchanged.

interval-value

Specify a value ranging from 0 through 999999999. The value is in units of milliseconds.

Service interval events (SRVEVT)

Specifies whether service interval high or service interval OK events are generated.

A service interval high event is generated when a check indicates that no messages have been retrieved from the queue for the time indicated by the SRVITV parameter as a minimum.

A service interval OK event is generated when a check indicates that messages have been retrieved from the queue within the time indicated by the SRVITV parameter.

The possible values are:

***SAME**

The attribute is unchanged.

***HIGH**

Service interval high events are generated.

***OK**

Service interval OK events are generated.

***NONE**

No service interval events are generated.

Distribution list support (DISTLIST)

Specifies whether the queue supports distribution lists.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

The queue will not support distribution lists.

***YES**

The queue will support distribution lists.

Cluster Name (CLUSTER)

The name of the cluster to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-name

Only one of the resultant values of CLUSTER or CLUSNL can be non-blank; you cannot specify a value for both.

Cluster Name List (CLUSNL)

The name of the namelist which specifies a list of clusters to which the queue belongs. Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

***SAME**

The attribute is unchanged.

namelist-name

Only one of the resultant values of CLUSTER or CLUSNL can be non-blank; you cannot specify a value for both.

Default Binding (DEFBIND)

Specifies the binding to be used when the application specifies MQOO_BIND_AS_Q_DEF on the MQOPEN call and the queue is a cluster queue.

The possible values are:

***SAME**

The attribute is unchanged.

***OPEN**

The queue handle is bound to a specific instance of the cluster queue when the queue is opened.

***NOTFIXED**

The queue handle is not bound to any particular instance of the cluster queue. This allows the queue manager to select a specific queue instance when the message is put using MQPUT and to change that selection subsequently if necessary.

The MQPUT1 call always behaves as if NOTFIXED had been specified.

***GROUP**

When the queue is opened, the queue handle is bound to a specific instance of the cluster queue for as long as there are messages in a message group. All messages in a message group are allocated to the same destination instance.

Cluster Workload Rank (CLWLRANK)

Specifies the cluster workload rank of the queue.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-rank

Specify a value ranging from 0 through 9.

Cluster Workload Priority (CLWLPRTY)

Specifies the cluster workload priority of the queue.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-priority

Specify a value ranging from 0 through 9.

Cluster workload queue use (CLWLUSEQ)

Specifies the behavior of an MQPUT when the target queue has both a local instance and at least one remote cluster instance. If the put originates from a cluster channel then this attribute does not apply.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

The value is inherited from the Queue Manager CLWLUSEQ attribute.

***LOCAL**

The local queue will be the sole target of the MQPUT.

***ANY**

The queue manager will treat such a local queue as another instance of the cluster queue for the purposes of workload distribution.

Queue Monitoring (MONQ)

Controls the collection of Online Monitoring Data.

Online Monitoring Data is not collected when the queue manager attribute MONQ is set to *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

The collection of online monitoring data is inherited from the setting of the queue manager attribute MONQ.

***OFF**

Online monitoring data collection for this queue is disabled.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

Queue Statistics (STATQ)

Controls the collection of statistics data.

Online monitoring data is not collected when the queue manager attribute STATQ is set to *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATQ.

***OFF**

Statistics data collection for this queue is disabled.

***ON**

Statistics data collection is enabled for this queue.

Queue Accounting (ACCTQ)

Controls the collection of accounting data.

Accounting data is not collected when the queue manager attribute ACCTQ is set to *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

Accounting data collection is based upon the setting of the queue manager attribute ACCTQ.

***OFF**

Accounting data collection for this queue is disabled.

***ON**

Accounting data collection is enabled for this queue.

Non Persistent Message Class (NPMCLASS)

Specifies the level of reliability for non-persistent messages put to this queue.

The possible values are:

***SAME**

The attribute is unchanged.

***NORMAL**

Non-persistent messages put to this queue are only lost following a failure, or a queue manager shutdown. Non-persistent message put to this queue will be discarded in the event of a queue manager restart.

***HIGH**

Non-persistent messages put to this queue are not discarded in the event of a queue manager restart. Non-persistent messages put to this queue may still be lost in the event of a failure.

Message Read Ahead (MSGREADAHD)

Specifies whether non persistent messages are sent to the client ahead of an application requesting them.

The possible values are:

***SAME**

The attribute is unchanged.

***DISABLED**

Read ahead is disabled for this queue. Messages are not sent to the client ahead of an application requesting them regardless of whether read ahead is requested by the client application.

***NO**

Non-persistent messages are not sent to the client ahead of an application requesting them. A maximum of one non-persistent message can be lost if the client ends abnormally.

***YES**

Non-persistent messages are sent to the client ahead of an application requesting them. Non-persistent messages can be lost if the client ends abnormally or if the client application does not consume all the messages it is sent.

Default Put Response (DFTPUTRESP)

The default put response type (DFTPUTRESP) attribute specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO_RESPONSE_AS_Q_DEF option.

The possible values are:

***SAME**

The attribute is unchanged.

***SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are issued as if MQPMO_SYNC_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application. This is the default value supplied with IBM MQ, but your installation might have changed it.

***ASYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are always issued as if MQPMO_ASYNC_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application; but an improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

Property Control (PROPCTL)

Specifies what happens to properties of messages that are retrieved from queues using the MQGET call when the MQGMO_PROPERTIES_AS_Q_DEF option is specified.

The possible values are:

***SAME**

The attribute is unchanged.

***COMPAT**

If the message contains a property with a prefix of mcd . , jms . , us1 . or mqext . then all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

***NONE**

All properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

***ALL**

All properties of the message, except those contained in the message descriptor (or extension), are contained in one or more MQRFH2 headers in the message data.

***FORCE**

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

***V6COMPAT**

When set, *V6COMPAT must be set both on one of the queue definitions resolved by MQPUT and one of the queue definitions resolved by MQGET. It must also be set on any other intervening transmission queues. It causes an MQRFH2 header to be passed unchanged from the sending application to the receiving application. It overrides other settings of **PROPCTL** found in a queue name resolution chain.

If the property is set on a cluster queue, the setting is not cached locally on other queue managers. You must set *V6COMPAT on an alias queue that resolves to the cluster queue. Define the alias queue on the same queue manager that the putting application is connected to.

Target Type (TARGTYPE)

Specifies the type of object to which the alias resolves.

The possible values are:

*SAME

The attribute is unchanged.

*QUEUE

Queue object.

*TOPIC

Topic object.

Custom attribute (CUSTOM)

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

*SAME

The attribute is unchanged.

*BLANK

The text is set to a blank string.

custom

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

CLCHNAME

This parameter is supported only on transmission queues.

*SAME

The attribute is unchanged.

*NONE

The attribute is removed.

cluster-sender channel name

ClusterChannelName is the generic name of the cluster-sender channels that use this queue as a transmission queue. The attribute specifies which cluster-sender channels send messages to a cluster-receiver channel from this cluster transmission queue.

By specifying asterisks, "*", in **ClusterChannelName**, you can associate a transmission queue with a set of cluster-sender channels. The asterisks can be at the beginning, end, or any number of places in the middle of the channel name string. **ClusterChannelName** is limited to a length of 20 characters: MQ_CHANNEL_NAME_LENGTH.

IMGRCOVQ

Specifies whether a local or permanent dynamic queue object is recoverable from a media image, if linear logging is being used.

The possible values are:

***SAME**

The attribute is unchanged.

***YES**

These queue objects are recoverable.

***NO**

The “[RCDMQMIMG \(Record MQ Object Image\)](#)” on [page 1887](#) and “[RCRMQMOBJ \(Re-create MQ Object\)](#)” on [page 1890](#) commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

***QMGR**

If you specify *QMGR, and the **IMGRCOVQ** attribute for the queue manager specifies *YES, these queue objects are recoverable.

If you specify *QMGR and the **IMGRCOVQ** attribute for the queue manager specifies *NO, the “[RCDMQMIMG \(Record MQ Object Image\)](#)” on [page 1887](#) and “[RCRMQMOBJ \(Re-create MQ Object\)](#)” on [page 1890](#) commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

CHGMQMSUB (Change MQ Subscription)
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Change MQ Subscription (CHGMQMSUB) command changes the specified attributes of an existing MQ subscription.

Parameters

Table 229. Command parameters

Keyword	Description	Choices	Notes
SUBID	Subscription identifier	Character value, *SAME	Optional, Key, Positional 2
SUBNAME	Subscription name	Character value, *SAME	Optional, Key, Positional 1
MQMNAME	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 3
TOPICSTR	Topic string	Character value, *NONE, *SAME	Optional, Positional 4
TOPICOBJ	Topic object	Character value, *NONE, *SAME	Optional, Positional 5
DEST	Destination	Character value, *SAME	Optional, Positional 6
DESTMQM	Destination Queue Manager	Character value, *NONE, *SAME	Optional, Positional 7
DESTCRLID	Destination Correlation Id	Character value, *NONE, *SAME	Optional, Positional 8
PUBACCT	Publish Accounting Token	Character value, *NONE, *SAME	Optional, Positional 9
PUBAPPID	Publish Application Id	Character value, *NONE, *SAME	Optional, Positional 10
SUBUSER	Subscription User Id	Character value, *SAME	Optional, Positional 11

Table 229. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>USERDATA</u>	Subscription User Data	Character value, *NONE, *SAME	Optional, Positional 12
<u>SELECTOR</u>	Selector String	Character value, *NONE, *SAME	Optional, Positional 13
<u>PSPROP</u>	PubSub Property	*SAME, *NONE, *COMPAT, *RFH2, *MSGPROP	Optional, Positional 14
<u>DESTCLASS</u>	Destination Class	*SAME, *MANAGED, *PROVIDED	Optional, Positional 15
<u>VARUSER</u>	Variable User	*SAME, *ANY, *FIXED	Optional, Positional 16
<u>REQONLY</u>	Request Publications	*SAME, *YES, *NO	Optional, Positional 17
<u>PUBPTY</u>	Publish Priority	0-9, *SAME, *ASQDEF, *ASQDEF	Optional, Positional 18
<u>WSHEMA</u>	Wildcard Schema	*SAME, *CHAR, *TOPIC	Optional, Positional 19
<u>EXPIRY</u>	Expiry Time	0-999999999, *SAME, *UNLIMITED	Optional, Positional 20

Subscription identifier (SUBID)

The subscription identifier of the subscription to be changed.

The possible values are:

subscription-identifier

Specify the 48 character hexadecimal string representing the 24 byte subscription identifier.

Subscription name (SUBNAME)

The name of the subscription to be changed.

The possible values are:

subscription-name

Specify a maximum of 256 bytes for the subscription name.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

*DFT

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Topic string (TOPICSTR)

Specifies the topic string associated with this subscription.

The possible values are:

topic-string

Specify a maximum of 256 bytes for the topic string.

Note: Topic strings of greater than 256 bytes can be specified using MQSC.

Topic object (TOPICOBJ)

Specifies the topic object associated with this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

topic-object

Specify the name of the topic object.

Destination (DEST)

Specifies the destination queue for messages published to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

destination-queue

Specify the name of the destination queue.

Destination Queue Manager (DESTMQM)

Specifies the destination queue manager for messages published to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No destination queue manager is specified.

destination-queue

Specify the name of the destination queue manager.

Destination Correlation Id (DESTCRLID)

Specifies the correlation identifier for messages published to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Messages are placed on the destination with a correlation identifier of MQCI_NONE.

correlation-identifier

Specify the 48 character hexadecimal string representing the 24 byte correlation identifier.

Publish Accounting Token (PUBACCT)

Specifies the accounting token for messages published to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Messages are placed on the destination with an accounting token of MQACT_NONE.

publish-accounting-token

Specify the 64 character hexadecimal string representing the 32 byte publish accounting token.

Publish Application Id (PUBAPPID)

Specifies the publish application identity for messages published to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No publish application identifier is specified.

publish-application-identifier

Specify the publish application identifier.

Subscription User Id (SUBUSER)

Specifies the user profile that owns this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

user-profile

Specify the user profile.

Subscription User Data (USERDATA)

Specifies the user data associated with the subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No user data is specified.

user-data

Specify a maximum of 256 bytes for user data.

Note: User data of greater than 256 bytes can be specified using MQSC.

Selector String (SELECTOR)

Specifies the SQL 92 selector string to be applied to messages published on the named topic to select whether they are eligible for this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No selection string is specified.

selection-string

Specify a maximum of 256 bytes for selection string.

Note: Selection strings of greater than 256 bytes can be specified using MQSC.

PubSub Property (PSPROP)

Specifies the manner in which publish / subscribe related message properties are added to messages sent to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Publish / subscribe properties are not added to the message.

***COMPAT**

Publish / subscribe properties are added to the message to maintain compatibility with IBM MQ V6.0 Publish / Subscribe.

***RFH2**

Publish / subscribe properties are added to the message within an RFH 2 header.

***MSGPROP**

Publish / subscribe properties are added as message properties.

Destination Class (DESTCLASS)

Specifies whether this is a managed subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***MANAGED**

The destination is managed.

***PROVIDED**

The destination is a queue.

Variable User (VARUSER)

Specifies whether user profiles other than the creator of the subscription can connect to it (subject to topic and destination authority checks).

The possible values are:

***SAME**

The attribute is unchanged.

***ANY**

Any user profiles can connect to the subscription.

***FIXED**

Only the user profile that created the subscription can connect to it.

Request Publications (REQONLY)

Specifies whether the subscriber will poll for updates via MQSUBRQ API, or whether all publications are delivered to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***YES**

Publications are only delivered to this subscription in response to an MQSUBRQ API.

***NO**

All publications on the topic are delivered to this subscription.

Publish Priority (PUBPTY)

Specifies the priority of the message sent to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPUB**

The priority of the message sent to this subscription is taken from that supplied in the published message.

***ASQDEF**

The priority of the message sent to this subscription is taken from the default priority of the queue defined as the destination.

priority-value

Specify a priority ranging from 0 through 9.

Wildcard Schema (WSCHEMA)

Specifies the schema to be used when interpreting wildcard characters in the topic string.

The possible values are:

***SAME**

The attribute is unchanged.

***TOPIC**

Wildcard characters represent portions of the topic hierarchy.

***CHAR**

Wildcard characters represent portions of strings.

Expiry Time (EXPIRY)

Specifies the expiry time of the subscription. After a subscription's expiry time has elapsed, it becomes eligible to be discarded by the queue manager and will receive no further publications.

The possible values are:

***SAME**

The attribute is unchanged.

***UNLIMITED**

The subscription does not expire.

expiry-time

Specify an expiry time in tenths of a second ranging from 0 through 999999999.

CHGMQMSVC (Change MQ Service)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Change MQ Service (CHGMQMSVC) command changes the specified attributes of an existing MQ service definition.

Parameters

<i>Table 230. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Key, Positional 2
<u>TEXT</u>	Text 'description'	<i>Character value, *BLANK, *SAME</i>	Optional, Positional 3
<u>STRCMD</u>	Start program	Single values: *SAME , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 4
	Qualifier 1: Start program	Name	
	Qualifier 2: Library	Name	
<u>STRARG</u>	Start program arguments	<i>Character value, *BLANK, *SAME</i>	Optional, Positional 5
<u>ENDCMD</u>	End program	Single values: *SAME , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 6
	Qualifier 1: End program	Name	
	Qualifier 2: Library	Name	
<u>ENDARG</u>	End program arguments	<i>Character value, *BLANK, *SAME</i>	Optional, Positional 7
<u>STDOUT</u>	Standard output	<i>Character value, *BLANK, *SAME</i>	Optional, Positional 8
<u>STDERR</u>	Standard error	<i>Character value, *BLANK, *SAME</i>	Optional, Positional 9
<u>TYPE</u>	Service type	*SAME , *CMD, *SVR	Optional, Positional 10
<u>CONTROL</u>	Service control	*SAME , *MANUAL, *QMGR, *STARTONLY	Optional, Positional 11

Service name (SVCNAME)

The name of the service definition to be changed.

The possible values are:

service-name

Specify the name of the service definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Text 'description' (TEXT)

Specifies text that briefly describes the service definition.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Start program (STRCMD)

The name of the program to run.

The possible values are:

***SAME**

The attribute is unchanged.

start-command

The name of the start command executable.

Start program arguments (STRARG)

The arguments passed to the program at startup.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

No arguments are passed to the start command.

start-command-arguments

The arguments passed to the start command.

End program (ENDCMD)

The name of the executable to run when the service is requested to stop.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

No end command is executed.

end-command

The name of the end command executable.

End program arguments (ENDARG)

The arguments passed to the end program when the service is requested to stop.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

No arguments are passed to the end command.

end-command-arguments

The arguments passed to the end command.

Standard output (STDOUT)

The path to a file to which the standard output of the service program is redirected.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The standard output is discarded.

stdout-path

The standard output path.

Standard error (STDERR)

The path to a file to which the standard error of the service program is redirected.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The standard error is discarded.

stderr-path

The standard error path.

Service type (TYPE)

Mode in which to run service.

The possible values are:

***SAME**

The attribute is unchanged.

***CMD**

When started the command is executed but no status is collected or displayed.

***SVR**

The status of the executable started will be monitored and displayed.

Service control (CONTROL)

Whether the service should be started automatically at queue manager start.

The possible values are:

***SAME**

The attribute is unchanged.

***MANUAL**

The service is automatically started or stopped.

***QMGR**

The service is started and stopped as the queue manager is started and stopped.

***STARTONLY**

The service is started as the queue manager is started, but will not be requested to stop when the queue manager is stopped.

CHGMQMTOP (Change MQ Topic)
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Change MQ Topic (CHGMQMTOP) command changes the specified attributes of an existing MQ topic object.

Parameters

Table 231. Command parameters

Keyword	Description	Choices	Notes
<u>TOPNAME</u>	Topic name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 2
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 3
<u>TOPICSTR</u>	Topic string	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 4
<u>DURSUB</u>	Durable subscriptions	*SAME , *ASPARENT, *YES, *NO	Optional, Positional 5
<u>MGDDURMDL</u>	Durable model queue	<i>Character value</i> , *NONE, *SAME	Optional, Positional 6
<u>MGDNDURMDL</u>	Non-durable model queue	<i>Character value</i> , *NONE, *SAME	Optional, Positional 7
<u>PUBENBL</u>	Publish	*SAME , *ASPARENT, *YES, *NO	Optional, Positional 8
<u>SUBENBL</u>	Subscribe	*SAME , *ASPARENT, *YES, *NO	Optional, Positional 9
<u>DFTPTY</u>	Default message priority	0-9, *SAME , *ASPARENT	Optional, Positional 10
<u>DFTMSGPST</u>	Default message persistence	*SAME , *ASPARENT, *YES, *NO	Optional, Positional 11
<u>DFTPUTRESP</u>	Default Put Response	*SAME , *ASPARENT, *SYNC, *ASYN	Optional, Positional 12
<u>WILDCARD</u>	Wildcard behavior	*SAME , *PASSTHRU, *BLOCK	Optional, Positional 13
<u>PMSGDLV</u>	Persistent message delivery	*SAME , *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 14

Table 231. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>NPMSGDLV</u>	Non-persistent message deliver	*SAME , *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 15
<u>CUSTOM</u>	Custom attribute	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 16

Topic name (TOPNAME)

The name of the topic object to be changed.

The possible values are:

topic-name

Specify the name of the topic object. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

*DFT

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Text 'description' (TEXT)

Specifies text that briefly describes the topic object.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

*SAME

The attribute is unchanged.

*BLANK

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Topic string (TOPICSTR)

Specifies the topic string represented by this topic object definition.

The possible values are:

*SAME

The attribute is unchanged.

topic-string

Specify a maximum of 256 bytes for the topic string.

Note: Topic strings of greater than 256 bytes can be specified using MQSC.

Durable subscriptions (DURSUB)

Specifies whether applications are permitted to make durable subscriptions on this topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

Whether durable subscriptions can be made on this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Durable subscriptions can be made on this topic.

***NO**

Durable subscriptions cannot be made on this topic.

Durable model queue (MGDDURMDL)

Specifies the name of the model queue to be used for durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

***SAME**

The attribute is unchanged.

durable-model-queue

Specify the name of the model queue.

Non-durable model queue (MGDNDURMDL)

Specifies the name of the model queue to be used for non-durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

***SAME**

The attribute is unchanged.

non-durable-model-queue

Specify the name of the model queue.

Publish (PUBENBL)

Specifies whether messages can be published to the topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

Whether messages can be published to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Messages can be published to the topic.

***NO**

Messages cannot be published to the topic.

Subscribe (SUBENBL)

Specifies whether applications are to be permitted to subscribe to this topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

Whether applications can subscribe to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Subscriptions can be made to this topic.

***NO**

Applications cannot subscribe to this topic.

Default message priority (DFTPTY)

Specifies the default priority of messages published to the topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

The default priority is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

priority-value

Specify a value ranging from 0 through 9.

Default message persistence (DFTMSGPST)

Specifies the message persistence to be used when applications specify the MQPER_PERSISTENCE_AS_TOPIC_DEF option.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

The default persistence is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Messages on this queue survive a restart of the queue manager.

***NO**

Messages on this queue are lost across a restart of the queue manager.

Default Put Response (DFTPUTRESP)

Specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO_RESPONSE_AS_Q_DEF option.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

The default response type is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are issued as if MQPMO_SYNC_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application.

***ASYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are always issued as if MQPMO_ASYNC_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application. An improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

Wildcard behavior (WILDCARD)

Specifies the behavior of wildcard subscriptions with respect to this topic.

The possible values are:

***SAME**

The attribute is unchanged.

***PASSTHRU**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will receive publications made to this topic and to topic strings more specific than this topic.

***BLOCK**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will not receive publications made to this topic or to topic strings more specific than this topic.

Persistent message delivery (PMSGDLV)

Specifies the delivery mechanism for persistent messages published to this topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***ALL**

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

***ALLDUR**

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

***ALLAVAIL**

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

Non-persistent message delivery (NPMSGDLV)

Specifies the delivery mechanism for non-persistent messages published to this topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***ALL**

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

***ALLDUR**

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

***ALLAVAIL**

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

Custom attribute (CUSTOM)

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

custom

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

**CLRMQMBRK (Clear MQ Pub/Sub Broker)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Clear IBM MQ broker (CLRMQMBRK) command does not perform any function and is only provided for compatibility with previous releases of IBM MQ.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1
<u>BRKPARENT</u>	Break Parent link	*NO , *YES	Optional, Positional 2
<u>CHILDMQM</u>	Child Message Queue Manager	Character value	Optional, Positional 3

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

queue-manager-name

Specify the name of the queue manager.

Break Parent link (BRKPARENT)

Specifies how the broker is ended.

The possible values are:

***YES**

Specifies that the link is to be broken with the parent broker. If you specify this parameter you must not specify a value for CHILDMQM.

***NO**

Specifies that the link is to be broken with a child broker. Use the CHILDMQM parameter to specify the name of the queue manager that hosts the child broker.

Child Message Queue Manager (CHILDMQM)

Specifies the name of the queue manager that hosts the child broker that the link is to be broken with.

CLRMQM (Clear MQ Queue)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Clear MQ Queue (CLRMQM) command deletes all of the messages from a local queue.

The command fails if the queue contains uncommitted messages, or if an application has the queue open.

Parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 2

Queue name (QNAME)

The name of the queue to be cleared.

The possible values are:

queue-name

Specify the name of the queue.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

IBM i **CLRMQMTOP (Clear MQ Topic String)**

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Clear MQ Topic String (CLRMQMTOP) command clears the specified topic string.

Parameters

Keyword	Description	Choices	Notes
<u>TOPICSTR</u>	Topic string	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2
<u>CLRTYPE</u>	Clear type	*RETAINED	Optional, Positional 3

Topic string (TOPICSTR)

The topic string to be cleared.

The possible values are:

topic-string

Specify a maximum of 256 bytes for the topic string.

Note: Topic strings of greater than 256 bytes can be specified using MQSC.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

*DFT

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Clear type (CLRTYPE)

The type of clear topic string to be performed.

The value must be:

*RETAINED

Remove the retained publication from the specified topic string.

IBM i **CPYMQMAUTI (Copy MQ AuthInfo object)**

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Copy MQ AuthInfo object (CPYMQMAUTI) command creates an authentication information object of the same type and, for attributes not specified in the command, with the same attribute values as an existing object.

Parameters

<i>Table 235. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>FROMAI</u>	From AuthInfo name	Character value	Required, Key, Positional 1
<u>TOAI</u>	To AuthInfo name	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Key, Positional 3
<u>AUTHTYPE</u>	AuthInfo type	*CRLLDAP, *OCSP, *IDPWOS, *IDPWLDAP	Optional, Positional 4
<u>CONNNAME</u>	Connection name	<i>Character value, *SAME</i>	Optional, Positional 5
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 6
<u>TEXT</u>	Text 'description'	<i>Character value, *SAME, *NONE</i>	Optional, Positional 7
<u>USERNAME</u>	User name	<i>Character value, *SAME, *NONE</i>	Optional, Positional 8
<u>PASSWORD</u>	User password	<i>Character value, *SAME, *NONE</i>	Optional, Positional 9
<u>OCSPURL</u>	OCSP Responder URL	<i>Character value, *SAME</i>	Optional, Positional 10
<u>CHKCLNT</u>	Authentication checks required	*ASQMGR, *REQUIRED, *REQADM	Optional, Positional 11
<u>CHKLOCL</u>	Authentication checks required	*NONE, *OPTIONAL, *REQUIRED, *REQADM	Optional, Positional 12
<u>FAILDELAY</u>	Failure delay	<i>Integer value</i>	Optional, Positional 13
<u>BASEDNU</u>	Base user DN	<i>Character value, *SAME</i>	Optional, Positional 14
<u>ADOPTCTX</u>	Context adoption	<i>Integer value</i>	Optional, Positional 15
<u>CLASSUSR</u>	LDAP object class	<i>Character value, *SAME</i>	Optional, Positional 16
<u>SHORTUSR</u>	Short user name	<i>Character value, *SAME</i>	Optional, Positional 17
<u>USRFIELD</u>	User field	<i>Character value, *SAME</i>	Optional, Positional 18
<u>SECCOMM</u>	LDAP communications	<i>Character value, *SAME</i>	Optional, Positional 19
<u>AUTHORMD</u>	Authorization method	<i>Character value, *OS, *SEARCHGRP, *SEARCHUSR, *SRCHGRPSN</i>	Optional, Positional 20
<u>BASEDNG</u>	Base DN for groups	<i>Character value, *SAME</i>	Optional, Positional 21
<u>CLASSGRP</u>	Object class for group	<i>Character value, *SAME</i>	Optional, Positional 22

Table 235. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>FINDGRP</u>	Attribute to find group membership	Character value, *SAME	Optional, Positional 23
<u>GRPFIELD</u>	Simple name for group	Character value, *SAME	Optional, Positional 24
<u>NESTGRP</u>	Group nesting	*NO *YES	Optional, Positional 25
<u>AUTHENMD</u>	Authentication method	*OS Cannot be changed	Optional, Positional 26

From AuthInfo name (FROMAI)

The name of an existing authentication information object to provide values for the attributes not specified in this command.

The possible values are:

authentication-information-name

Specify the name of the authentication information object. The maximum string length is 48 characters.

To AuthInfo name (TOAI)

The name of the new authentication information object to create.

If an authentication information object with this name already exists, REPLACE(*YES) must be specified.

The possible values are:

authentication-information-name

Specify the name of the authentication information object. The maximum string length is 48 characters.

Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

Adopt context (ADOPTCTX)

Whether to use the presented credentials as the context for this application. This means that they are used for authorization checks, shown on administrative displays, and appear in messages.

YES

The user ID presented in the MQCSP structure, which has been successfully validated by password, is adopted as the context to use for this application. Therefore, this user ID will be the credentials checked for authorization to use IBM MQ resources.

If the user ID presented is an LDAP user ID, and authorization checks are done using operating system user IDs, the SHORTUSR associated with the user entry in LDAP will be adopted as the credentials for authorization checks to be done against.

NO

Authentication will be performed on the user ID and password presented in the MQCSP structure, but then the credentials will not be adopted for further use. Authorization will be performed using the user ID the application is running under.

This attribute is only valid for an **AUTHTYPE** of **IDPWOS* and **IDPWLDAP*.

Authentication method (AUTHENMD)

The authentication method used for this application.

***OS**

Use operating system groups to determine permissions associated with a user.

You can use only ***OS** to set the authentication method.

This attribute is valid only for an **AUTHTYPE** of **IDPWOS*.

Authorization method (AUTHORMD)

The authorization method used for this application.

***OS**

Use operating system groups to determine permissions associated with a user.

This is how IBM MQ has previously worked, and is the default value.

***SEARCHGRP**

A group entry in the LDAP repository contains an attribute listing the Distinguished Name of all the users belonging to that group. Membership is indicated by the attribute defined in [FINDGRP](#). This value is typically *member* or *uniqueMember*.

***SEARCHUSR**

A user entry in the LDAP repository contains an attribute listing the Distinguished Name of all the groups to which the specified user belongs. The attribute to query is defined by the [FINDGRP](#) value, typically *memberOf*.

***SRCHGRPSN**

A group entry in the LDAP repository contains an attribute listing the short user name of all the users belonging to that group. The attribute in the user record that contains the short user name is specified by [SHORTUSR](#).

Membership is indicated by the attribute defined in [FINDGRP](#). This value is typically *memberUid*.

Note: This authorization method should only be used if all user short names are distinct.

Many LDAP servers use an attribute of the group object to determine group membership and you should, therefore, set this value to *SEARCHGRP*.

Microsoft Active Directory typically stores group memberships as a user attribute. The IBM Tivoli Directory Server supports both methods.

In general, retrieving memberships through a user attribute will be faster than searching for groups that list the user as a member.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

AuthInfo type (AUTHTYPE)

The type of the authentication information object. There is no default value

The possible values are:

***CRLLDAP**

The type of the authentication information object is CRLLDAP.

***OCSP**

The type of the authentication information objects is OCSPURL.

***IDPWOS**

Connection authentication user ID and password checking is done using the operating system.

***IDPWLDAP**

Connection authentication user ID and password checking is done using an LDAP server.

Base DN for groups (BASEDNG)

In order to be able to find group names, this parameter must be set with the base DN to search for groups in the LDAP server.

This attribute is valid only for **AUTHTYPE** of **IDPWLDAP*.

Base user DN (BASEDNU)

In order to be able to find the short user name attribute (see [SHORTUSR](#)) this parameter must be set with the base DN to search for users within the LDAP server. This attribute is valid only for **AUTHTYPE** of **IDPWLDAP*.

Check client (CHCKCLNT)

Whether connection authentication checks are required by all locally bound connections, or only checked when a user ID and password are provided in the MQCSP structure.

These attributes are valid only for an **AUTHTYPE** of **IDPWOS* or **IDPWLDAP*. The possible values are:

***ASQMGR**

In order for the connection to be allowed in, it must meet the connection authentication requirements defined on the queue manager. If the CONNAUTH field provides an authentication information object, and the value of CHCKCLNT is **REQUIRED*, the connection will not be successful unless a valid user ID and password are supplied. If the CONNAUTH field does not provide an authentication information object, or the value of CHCKCLNT is not **REQUIRED*, then the user ID and password are not required.

***REQUIRED**

Requires that all applications provide a valid user ID and password.

***REQDADM**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the **OPTIONAL* setting.

Check local (CHCKLOCL)

Whether connection authentication checks are required by all locally bound connections, or only checked when a user ID and password are provided in the MQCSP structure.

These attributes are valid only for an **AUTHTYPE** of **IDPWOS* or **IDPWLDAP*. The possible values are:

***NONE**

Switches off checking.

***OPTIONAL**

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

***REQUIRED**

Requires that all applications provide a valid user ID and password.

***REQDADM**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the **OPTIONAL* setting.

Class group (CLASSGRP)

The LDAP object class used for group records in the LDAP repository.

If the value is blank, **groupOfNames** is used.

Other commonly used values include *groupOfUniqueNames* or *group*.

This attribute is valid only for **AUTHTYPE** of **IDPWLDAP*.

Class user (CLASSUSR)

The LDAP object class used for user records in the LDAP repository.

If blank, the value defaults to *inetOrgPerson*, which is generally the value needed.

For Microsoft Active Directory, the value you require required is often *user*.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

Connection name (CONNAME)

The DNS name or IP address of the host on which the LDAP server is running, together with an optional port number. The default port number is 389. No default is provided for the DNS name or IP address.

This field is only valid for **CRLLDAP* or **IDPWLDAP* authentication information objects, when it is required.

When used with *IDPWLDAP* authentication information objects, this can be a comma separated list of connection names.

The possible values are:

***SAME**

The connection name remains unchanged from the original authentication information object.

connection-name

Specify the fully qualified DNS name or IP address of the host together with an optional port number. The maximum string length is 264 characters.

Failure delay (FAILDELAY)

When a user ID and password are provided for connection authentication, and the authentication fails due to the user ID or password being incorrect, this is the delay, in seconds, before the failure is returned to the application.

This can aid in avoiding busy loops from an application that simply retries, continuously, after receiving a failure.

The value must be in the range 0 - 60 seconds. The default value is 1.

This attribute is only valid for an **AUTHTYPE** of **IDPWOS* and **IDPWLDAP*.

Group membership attribute (FINDGRP)

Name of the attribute used within an LDAP entry to determine group membership.

When AUTHORMD = **SEARCHGRP*, this attribute is typically set to *member* or *uniqueMember*.

When AUTHORMD = **SEARCHUSR*, this attribute is typically set to *memberOf*.

When AUTHORMD = **SRCHGRPSN*, this attribute is typically set to *memberUid*.

When left blank, if:

- AUTHORMD = **SEARCHGRP*, this attribute defaults to *memberOf*
- AUTHORMD = **SEARCHUSR*, this attribute defaults to *member*
- AUTHORMD = **SRCHGRPSN*, this attribute defaults to *memberUid*

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

Simple name for group (GRPFIELD)

If the value is blank, commands like [setmqaut](#) must use a qualified name for the group. The value can either be a full DN, or a single attribute.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

Group nesting (NESTGRP)

The possible values are:

***NO**

Only the initially discovered groups are considered for authorization.

***YES**

The group list is searched recursively to enumerate all the groups to which a user belongs.

The group's Distinguished Name is used when searching the group list recursively, regardless of the authorization method selected in [AUTHORMD](#).

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

Replace (REPLACE)

Specifies whether the new authentication information object should replace an existing authentication information object with the same name.

The possible values are:

***NO**

This definition does not replace any existing authentication information object with the same name. The command fails if the named authentication information object already exists.

***YES**

Replace an existing authentication information object. A new object is created if the named authentication information object does not exist.

Secure comms (SECCOMM)

Whether connectivity to the LDAP server should be done securely using TLS

YES

Connectivity to the LDAP server is made securely using TLS.

The certificate used is the default certificate for the queue manager, named in [CERTLABL](#) on the queue manager object, or if that is blank, the one described in [Digital certificate labels, understanding the requirements](#).

The certificate is located in the key repository specified in [SSLKEYR](#) on the queue manager object. A cipherspec will be negotiated that is supported by both IBM MQ and the LDAP server.

If the queue manager is configured to use [SSLFIPS\(YES\)](#) or [SUITEB](#) cipher specs, then this is taken account of in the connection to the LDAP server as well.

ANON

Connectivity to the LDAP server is made securely using TLS just as for [SECCOMM\(YES\)](#) with one difference.

No certificate is sent to the LDAP server; the connection will be made anonymously. To use this setting, ensure that the key repository specified in [SSLKEYR](#), on the queue manager object, does not contain a certificate marked as the default.

NO

Connectivity to the LDAP server does not use TLS.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*

Short user (SHORTUSR)

A field in the user record to be used as a short user name in IBM MQ.

This field must contain values of 12 characters or less. This short user name is used for the following purposes:

- If LDAP authentication is enabled, but LDAP authorization is not enabled, this is used as an operating system user ID for authorization checks. In this case, the attribute must represent an operating system user ID.
- If LDAP authentication and authorization are both enabled, this is used as the user ID carried with the message in order for the LDAP user name to be rediscovered when the user ID inside the message needs to be used.

For example, on another queue manager, or when writing report messages. In this case, the attribute does not need to represent an operating system user ID, but must be a unique string. An employee serial number is an example of a good attribute for this purpose.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP* and is mandatory.

Text 'description' (TEXT)

A short text description of the authentication information object.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SAME**

The text string is unchanged.

***NONE**

The text is set to a blank string.

description

The string length can be up to 64 characters enclosed in apostrophes.

User field (USRFIELD)

If the user ID provided by an application for authentication does not contain a qualifier for the field in the LDAP user record, that is, it does not contain an '=' sign, this attribute identifies the field in the LDAP user record that is used to interpret the provided user ID.

This field can be blank. If this is the case, any unqualified user IDs use the [SHORTUSR](#) parameter to interpret the provided user ID.

The contents of this field will be concatenated with an '=' sign, together with the value provided by the application, to form the full user ID to be located in an LDAP user record. For example, the application provides a user of fred and this field has the value cn, then the LDAP repository will be searched for cn=fred.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

User name (USERNAME)

The distinguished name of the user that is binding to the directory. The default user name is blank.

This field is only valid for **CRLLDAP* or **IDPWLDAP* authentication information objects.

The possible values are:

***SAME**

The user name is unchanged.

***NONE**

The user name is blank.

LDAP-user-name

Specify the distinguished name of the LDAP user. The maximum string length is 1024 characters.

User password (PASSWORD)

The password for the LDAP user.

This field is only valid for **CRLLDAP* or **IDPWLDAP* authentication information objects.

The possible values are:

***SAME**

The password is unchanged.

***NONE**

The password is blank.

LDAP-password

The LDAP user password. The maximum string length is 32 characters.

OCSP Responder URL (OCSPURL)

The URL of the OCSP Responder used to check for certificate revocation. This must be an HTTP URL containing the host name and port number of the OCSP Responder. If the OCSP Responder is using port 80, which is the default for HTTP, then the port number may be omitted.

This field is only valid for OCSP authentication information objects.

The possible values are:

***SAME**

The OCSP Responder URL is unchanged.

OCSP-Responder-URL

The OCSP Responder URL. The maximum string length is 256 characters.

Examples

None

Error messages

Unknown

 **CPYMQMCHL (Copy MQ Channel)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Copy MQ Channel (CPYMQMCHL) command creates a new MQ channel definition of the same type and, for attributes not specified in the command, with the same attribute values as an existing channel definition.

Parameters

Table 236. Command parameters			
Keyword	Description	Choices	Notes
<u>FROMCHL</u>	From channel	Character value	Required, Key, Positional 1
<u>TOCHL</u>	To channel	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 3
<u>CHLTYPE</u>	Channel type	*RCVR, *SDR, *SVR, *RQSTR, *SVRCN, *CLUSSDR, *CLUSRCVR, *CLTCN	Optional, Key, Positional 4
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 5
<u>TRPTYPE</u>	Transport type	*LU62, *TCP, *SAME	Optional, Positional 6
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 7
<u>TGTMQMNAME</u>	Target Queue Manager	<i>Character value</i> , *NONE, *SAME	Optional, Positional 8
<u>CONNNAME</u>	Connection name	<i>Character value</i> , *NONE, *SAME	Optional, Positional 9
<u>TPNAME</u>	Transaction Program Name	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 10
<u>MODENAME</u>	Mode Name	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 11
<u>TMQNAME</u>	Transmission queue	<i>Character value</i> , *SAME	Optional, Positional 12
<u>MCANAME</u>	Message channel agent	Single values: *SAME , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 13
	Qualifier 1: Message channel agent	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
<u>MCAUSRID</u>	Message channel agent user ID	<i>Character value</i> , *NONE, *PUBLIC, *SAME	Optional, Positional 14
<u>MCATYPE</u>	Message channel agent Type	*PROCESS, *THREAD, *SAME	Optional, Positional 15
<u>BATCHINT</u>	Batch Interval	0-999999999, *SAME	Optional, Positional 16
<u>BATCHSIZE</u>	Batch size	1-9999, *SAME	Optional, Positional 17
<u>DSCITV</u>	Disconnect interval	0-999999, *SAME	Optional, Positional 18
<u>SHORTTMR</u>	Short retry interval	0-999999999, *SAME	Optional, Positional 19
<u>SHORTRTY</u>	Short retry count	0-999999999, *SAME	Optional, Positional 20
<u>LONGTMR</u>	Long retry interval	0-999999999, *SAME	Optional, Positional 21

Table 236. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>LONGRTY</u>	Long retry count	0-999999999, *SAME	Optional, Positional 22
<u>SCYEXIT</u>	Security exit	Single values: *SAME , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 23
	Qualifier 1: Security exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
<u>CSCYEXIT</u>	Security exit	<i>Character value</i> , *SAME , *NONE	Optional, Positional 24
<u>SCYUSRDATA</u>	Security exit user data	<i>Character value</i> , *SAME , *NONE	Optional, Positional 25
<u>SINDEXIT</u>	Send exit	Single values: *SAME , *NONE Other values (up to 10 repetitions): <i>Qualified object name</i>	Optional, Positional 26
	Qualifier 1: Send exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
<u>CSINDEXIT</u>	Send exit	Single values: *SAME , *NONE Other values (up to 10 repetitions): <i>Character value</i>	Optional, Positional 27
<u>SNDUSRDATA</u>	Send exit user data	Values (up to 10 repetitions): <i>Character value</i> , *SAME , *NONE	Optional, Positional 28
<u>RCVEXIT</u>	Receive exit	Single values: *SAME , *NONE Other values (up to 10 repetitions): <i>Qualified object name</i>	Optional, Positional 29
	Qualifier 1: Receive exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
<u>CRCVEXIT</u>	Receive exit	Single values: *SAME , *NONE Other values (up to 10 repetitions): <i>Character value</i>	Optional, Positional 30
<u>RCVUSRDATA</u>	Receive exit user data	Values (up to 10 repetitions): <i>Character value</i> , *SAME , *NONE	Optional, Positional 31
<u>MSGEXIT</u>	Message exit	Single values: *SAME , *NONE Other values (up to 10 repetitions): <i>Qualified object name</i>	Optional, Positional 32
	Qualifier 1: Message exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	

Table 236. Command parameters (continued)

Keyword	Description	Choices	Notes
MSGUSRDATA	Message exit user data	Values (up to 10 repetitions): <i>Character value</i> , *SAME , *NONE	Optional, Positional 33
MSGRTYEXIT	Message retry exit	Single values: *SAME , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 34
	Qualifier 1: Message retry exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
MSGRTYDATA	Message retry exit data	<i>Character value</i> , *SAME , *NONE	Optional, Positional 35
MSGRTYNBR	Number of message retries	0-999999999, *SAME	Optional, Positional 36
MSGRTYITV	Message retry interval	0-999999999, *SAME	Optional, Positional 37
CVTMSG	Convert message	*YES, *NO, *SAME	Optional, Positional 38
PUTAUT	Put authority	*DFT, *CTX, *SAME	Optional, Positional 39
SEQNUMWRAP	Sequence number wrap	100-999999999, *SAME	Optional, Positional 40
MAXMSGLEN	Maximum message length	0-104857600, *SAME	Optional, Positional 41
HRTBTINTVL	Heartbeat interval	0-999999999, *SAME	Optional, Positional 42
NPMSPEED	Non Persistent Message Speed	*FAST, *NORMAL, *SAME	Optional, Positional 43
CLUSTER	Cluster Name	<i>Character value</i> , *NONE, *SAME	Optional, Positional 44
CLUSNL	Cluster Name List	<i>Character value</i> , *NONE, *SAME	Optional, Positional 45
NETPRTY	Network Connection Priority	0-9, *SAME	Optional, Positional 46
SSLCIPH	TLS CipherSpec	Supported CipherSpecs are listed here: CipherSpecs you can use with IBM MQ TLS support .  Deprecated CipherSpecs that you can re-enable if necessary are listed here: Deprecated CipherSpecs .	Optional, Positional 47
SSLCAUTH	TLS Client Authentication	*REQUIRED, *OPTIONAL, *SAME	Optional, Positional 48
SSLPEER	TLS Peer name	<i>Character value</i> , *NONE, *SAME	Optional, Positional 49

Table 236. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>LOCLADDR</u>	Local communication address	Character value, *NONE, *SAME	Optional, Positional 50
<u>BATCHHB</u>	Batch Heartbeat Interval	0-999999999, *SAME	Optional, Positional 51
<u>USERID</u>	Task user identifier	Character value, *NONE, *SAME	Optional, Positional 52
<u>PASSWORD</u>	Password	Character value, *NONE, *SAME	Optional, Positional 53
<u>KAINT</u>	Keep Alive Interval	0-99999, *SAME , *AUTO	Optional, Positional 54
<u>COMPHDR</u>	Header Compression	Values (up to 2 repetitions): *NONE, *SYSTEM, *SAME	Optional, Positional 55
<u>COMPMSG</u>	Message Compression	Single values: *ANY Other values (up to 4 repetitions): *NONE, *RLE, *ZLIBHIGH, *ZLIBFAST, V 9.4.0 , *LZ4HIGH, *LZ4HIGH *SAME	Optional, Positional 56
<u>MONCHL</u>	Channel Monitoring	*QMGR, *OFF, *LOW, *MEDIUM, *HIGH, *SAME	Optional, Positional 57
<u>STATCHL</u>	Channel Statistics	*QMGR, *OFF, *LOW, *MEDIUM, *HIGH, *SAME	Optional, Positional 58
<u>CLWLRANK</u>	Cluster Workload Rank	0-9, *SAME	Optional, Positional 59
<u>CLWLPRTY</u>	Cluster Workload Priority	0-9, *SAME	Optional, Positional 60
<u>CLWLWGHT</u>	Cluster Channel Weight	1-99, *SAME	Optional, Positional 61
<u>SHARECNV</u>	Sharing Conversations	0-999999999, *SAME	Optional, Positional 62
<u>PROPCTL</u>	Property Control	*COMPAT, *NONE, *ALL, *SAME	Optional, Positional 63
<u>MAXINST</u>	Maximum Instances	0-999999999, *SAME	Optional, Positional 64
<u>MAXINSTC</u>	Maximum Instances Per Client	0-999999999, *SAME	Optional, Positional 65
<u>CLNTWGHT</u>	Client Channel Weight	0-99, *SAME	Optional, Positional 66
<u>AFFINITY</u>	Connection Affinity	*PREFERRED, *NONE, *SAME	Optional, Positional 67
<u>BATCHLIM</u>	Batch Data Limit	0-999999, *SAME	Optional, Positional 68
<u>DFTRECON</u>	Default client reconnection	*NO, *YES, *QMGR, *DISABLED, *SYSDFTCHL	Optional, Positional 69

From channel (FROMCHL)

Specifies the name of the existing channel definition that contains values for the attributes that are not specified in this command.

The possible values are:

from-channel-name

Specify the name of the source MQ channel.

To channel (TOCHL)

Specifies the name of the new channel definition. The name can contain a maximum of 20 characters. Channel names must be unique. If a channel definition with this name already exists, REPLACE(*YES) must be specified.

The possible values are:

to-channel-name

Specify the name of MQ channel being created.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

Channel type (CHLTYPE)

Specifies the type of the channel being copied.

The possible values are:

***SDR**

Sender channel

***SVR**

Server channel

***RCVR**

Receiver channel

***RQSTR**

Requester channel

***SVRCN**

Server-connection channel

***CLUSSDR**

Cluster-sender channel

***CLUSRCVR**

Cluster-receiver channel

***CLTCN**

Client-connection channel

Replace (REPLACE)

Specifies whether the new channel definition replaces an existing channel definition with the same name.

The possible values are:

***NO**

Do not replace the existing channel definition. The command fails if the named channel definition already exists.

***YES**

Replace the existing channel definition. If there is no definition with the same name a new definition is created.

Transport type (TRPTYPE)

Specifies the transmission protocol.

The possible values are:

***SAME**

The attribute is unchanged.

***LU62**

SNA LU 6.2.

***TCP**

Transmission Control Protocol / Internet Protocol (TCP/IP).

Text 'description' (TEXT)

Specifies text that briefly describes the channel definition.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Target Queue Manager (TGTMQMNAME)

Specifies the name of the target queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The name of the target queue manager for a client connection channel (CHLTYPE) *CLTCN is unspecified.

message-queue-manager-name

The name of the target message queue manager for a client connection channel (CHLTYPE) *CLTCN.

For other channel types this parameter must not be specified.

Connection name (CONNAME)

Specifies the name of the machine to connect.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The connection name is blank.

connection-name

Specify the connection name as required by the transmission protocol:

- For *LU62, specify the name of the CSI object.
- For *TCP, specify either the host name, or the network address of the remote machine (or the local machine for cluster-receiver channels). This can be followed by an optional port number enclosed in parentheses.

 On [Multiplatforms](#), the TCP/IP connection name parameter of a cluster-receiver channel is optional. If you leave the connection name blank, IBM MQ generates a connection name for you, assuming the default port and using the current IP address of the system. You can override the default port number, but still use the current IP address of the system. For each connection name leave the IP name blank, and provide the port number in parentheses; for example:

```
(1415)
```

The generated **CONNNAME** is always in the dotted decimal (IPv4) or hexadecimal (IPv6) form, rather than in the form of an alphanumeric DNS host name.

Where a port is not specified the default port 1414 is assumed.

For cluster-receiver channels the connection name relates to the local queue manager, and for other channels it relates to the target queue manager.

This parameter is required for channels with channel type (CHLTYPE) of *SDR, *RQSTR, *CLTCN and *CLUSDR. It is optional for *SVR and *CLUSRCVR channels, and is not valid for *RCVR or *SVRCN channels.

Transaction Program Name (TPNAME)

This parameter is valid for channels with a TRPTYPE defined as LU 6.2 only.

This parameter must be set to the SNA transaction program name, unless the CONNAME contains a side-object name in which case it must be set to blanks. The name is taken instead from the CPI-C Communications Side Object.

This parameter is not valid for channels with a CHLTYPE defined as *RCVR.

The possible values are:

*SAME

The value of this attribute does not change.

*NONE

No transaction program name is specified.

*BLANK

The transaction program name is taken from CPI-C Communications Side Object. The side object name must be specified in the CONNAME parameter.

transaction-program-name

Specify the SNA transaction program name.

Mode Name (MODENAME)

This parameter is valid for channels with a TRPTYPE defined as LU 6.2. If TRPTYPE is not defined as LU 6.2 the data is ignored and no error message is issued.

If specified, the value must be set to the SNA mode name, unless the CONNAME contains a side-object name, in which case it must be set to blanks. The name is then taken from the CPI-C Communications Side Object.

This parameter is not valid for channels with CHLTYPE defined as *RCVR or *SVRCONN.

The possible values are:

***SAME**

The value of this attribute does not change.

***NONE**

No mode name is specified.

***BLANK**

Name will be taken from the CPI-C Communications Side Object. This must be specified in the CONNAME parameter.

SNA-mode-name

Specify the SNA Mode Name

Transmission queue (TMQNAME)

Specifies the name of the transmission queue.

The possible values are:

***SAME**

The attribute is unchanged.

transmission-queue-name

Specify the name of the transmission queue. A transmission queue name is required if the CHLTYPE is defined as *SDR or *SVR.

For other channel types this parameter must not be specified.

Message channel agent (MCANAME)

This parameter is reserved and should not be used.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The MCA program name is blank.

This parameter cannot be specified if the CHLTYPE is defined as *RCVR, *SVRCN, or *CLTCN.

Message channel agent user ID (MCAUSRID)

Specifies the message channel agent user identifier which is to be used by the message channel agent for authorization to access MQ resources, including (if PUTAUT is *DFT) authorization to put the message to the destination queue for receiver or requester channels.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The message channel agent uses its default user identifier.

***PUBLIC**

Uses the public authority.

mca-user-identifier

Specify the user identifier to be used.

This parameter cannot be specified for a channel type (CHLTYPE) of *CLTCN.

Message channel agent Type (MCATYPE)

Specifies whether the message channel agent program should run as a thread or as a process.

The possible values are:

***SAME**

The attribute is unchanged.

***PROCESS**

The message channel agent runs as a separate process.

***THREAD**

The message channel agent runs as a separate thread.

This parameter can only be specified for channels with CHLTYPE defined as *SDR, *SVR, *RQSTR, *CLUSSDR or *CLUSRCVR.

Batch Interval (BATCHINT)

The minimum amount of time, in milliseconds, that a channel will keep a batch open.

The batch is terminated by which ever of the following occurs first: BATCHSZ messages have been sent, BATCHLIM bytes have been sent, or the transmission queue is empty and BATCHINT is exceeded.

The default value is 0, which means that the batch is terminated as soon as the transmission queue becomes empty (or the BATCHSZ limit is reached).

The value must be in the range 0 through 999999999.

This parameter is valid for channels with CHLTYPE defined as *SDR, *SVR, *CLUSSDR, or *CLUSRCVR.

The possible values are:

***SAME**

The value of this attribute does not change.

batch-interval

Specify a value ranging from 0 through 999999999

Batch size (BATCHSIZE)

Specifies the maximum number of messages that can be sent down a channel before a checkpoint is taken.

The possible values are:

***SAME**

The attribute is unchanged.

batch-size

Specify a value ranging from 1 through 9999.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Disconnect interval (DSCITV)

Specifies the disconnect interval, which defines the maximum number of seconds that the channel waits for messages to be put on a transmission queue before closing the channel.

The possible values are:

***SAME**

The attribute is unchanged.

disconnect-interval

Specify a value ranging from 0 through 999999.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR or *CLTCN.

Short retry interval (SHORTTMR)

Specifies the short retry wait interval for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. This defines the interval between attempts to establish a connection to the remote machine.

The possible values are:

***SAME**

The attribute is unchanged.

short-retry-interval

Specify a value ranging from 0 through 999999999.

Short retry count (SHORTRTY)

Specifies the short retry count for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. This defines the maximum number of attempts that are made to establish a connection to the remote machine, at intervals specified by SHORTTMR, before the (normally longer) LONGRTY and LONGTMR are used.

The possible values are:

***SAME**

The attribute is unchanged.

short-retry-count

Specify a value ranging from 0 through 999999999. A value of 0 means that no retries are allowed.

Long retry interval (LONGTMR)

Specifies the long retry wait interval for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. It defines the interval in seconds between attempts to establish a connection to the remote machine, after the count specified by SHORTRTY has been exhausted.

The possible values are:

***SAME**

The attribute is unchanged.

long-retry-interval

Specify a value in the range 0 through 999999999.

Note: For implementation reasons, the maximum retry interval that can be used is 999999; values exceeding this are treated as 999999.

Long retry count (LONGRTY)

Specifies the long retry count for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. This defines the maximum number of further attempts that are made to connect to the remote machine, at intervals specified by LONGTMR, after the count specified by SHORTRTY has been exhausted. An error message is logged if the connection is not established after the defined number of attempts.

The possible values are:

***SAME**

The attribute is unchanged.

long-retry-count

Specify a value in the range 0 through 999999999. A value of 0 means that no retries are allowed.

Security exit (SCYEXIT)

Specifies the name of the program to be called as the security exit. If a nonblank name is defined, the exit is invoked at the following times:

- Immediately after establishing a channel.

Before any messages are transferred, the exit is given the opportunity to instigate security flows to validate connection authorization.

- On receipt of a response to a security message flow.

Any security message flows received from the remote processor on the remote machine are passed to the exit.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The security exit program is not invoked.

security-exit-name

Specify the name of the security exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

Security exit (CSCYEXIT)

Specifies the name of the program to be called as the client security exit. If a nonblank name is defined, the exit is invoked at the following times:

- Immediately after establishing a channel.

Before any messages are transferred, the exit is given the opportunity to instigate security flows to validate connection authorization.

- On receipt of a response to a security message flow.

Any security message flows received from the remote processor on the remote machine are passed to the exit.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The client security exit program is not invoked.

security-exit-name

Specify the name of the client security exit program.

Security exit user data (SCYUSRDATA)

Specifies a maximum of 32 characters of user data that is passed to the security exit program.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The user data for the security exit program is not specified.

security-exit-user-data

Specify the user data for the security exit.

Send exit (SNDEXIT)

Specifies the entry point of the program to be called as the send exit. If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The send exit program is not invoked.

send-exit-name

Specify the name of the send exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

Send exit (CSNDEXIT)

Specifies the entry point of the program to be called as the client send exit. If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The client send exit program is not invoked.

send-exit-name

Specify the name of the client send exit program.

Send exit user data (SNDUSRDATA)

Specifies a maximum of 32 characters of user data that is passed to the send exit program.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The user data for the send exit program is not specified.

send-exit-user-data

Specify the user data for the send exit program.

Receive exit (RCVEXIT)

Specifies the entry point of the program to be called as the receive exit. If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The receive exit program is not invoked.

receive-exit-name

Specify the name of the receive exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

Receive exit (CRCVEXIT)

Specifies the entry point of the program to be called as the client receive exit. If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The client receive exit program is not invoked.

receive-exit-name

Specify the name of the client receive exit program.

Receive exit user data (RCVUSRDATA)

Specifies a maximum of 32 characters of user data that is passed to the receive exit program.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The user data for the receive exit program is not specified.

receive-exit-user-data

Specify a maximum of 32 characters of user data for the receive exit.

Message exit (MSGEXIT)

Specifies the entry point of the program to be called as the message exit. If a nonblank name is defined, the exit is invoked immediately after a message has been retrieved from the transmission queue. The exit is given the entire application message and message descriptor for modification.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The message exit program is not invoked.

message-exit-name

Specify the name of the message exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Message exit user data (MSGUSRDATA)

Specifies user data that is passed to the message exit program.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The user data for the message exit program is not specified.

message-exit-user-data

Specify a maximum of 32 characters of user data that is passed to the message exit program.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Message retry exit (MSGRTYEXIT)

Specifies the entry point of the program to be called as the message retry exit.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The message retry exit program is not invoked.

message-retry-exit-name

Specify the name of the message retry exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Message retry exit data (MSGRTYDATA)

Specifies user data that is passed to the message retry exit program.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The user data for the message retry exit program is not specified.

message-retry-exit-user-data

Specify a maximum of 32 characters of user data that is passed to the message retry exit program.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Number of message retries (MSGRTYNBR)

Specifies the number of times the channel will retry before it decides it cannot deliver the message.

This parameter is used by the channel as an alternative to a message retry exit when MSGRTYEXIT is defined as *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

message-retry-number

Specify a value ranging from 0 through 999999999. A value of 0 indicates no retries will be performed.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Message retry interval (MSGRTYITV)

Specifies the minimum interval of time that must pass before the channel can retry the MQPUT operation. This time is in milliseconds.

This parameter is used by the channel as an alternative to a message retry exit when MSGRTYEXIT is defined as *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

message-retry-number

Specify a value ranging from 0 through 999999999. A value of 0 indicates that the retry will be performed as soon as possible.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Convert message (CVTMSG)

Specifies whether the application data in the message should be converted before the message is transmitted.

The possible values are:

***SAME**

The value of this attribute does not change.

***YES**

The application data in the message is converted before sending.

***NO**

The application data in the message is not converted before sending.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Put authority (PUTAUT)

Specifies whether the user identifier in the context information associated with a message is used to establish authority to put the message on the destination queue. This applies only to receiver and requester (*CLUSRCVR, *RCVR and *RQSTR) channels.

The possible values are:

***SAME**

The attribute is unchanged.

***DFT**

No authority check is made before the message is put on the destination queue.

***CTX**

The user identifier in the message context information is used to establish authority to put the message.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Sequence number wrap (SEQNUMWRAP)

Specifies the maximum message sequence number. When the maximum is reached, sequence numbers wrap to start again at 1.

Note: The maximum message sequence number is not negotiable; the local and remote channels must wrap at the same number.

The possible values are:

***SAME**

The attribute is unchanged.

sequence-number-wrap-value

Specify a value ranging from 100 through 999999999.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Maximum message length (MAXMSGLEN)

Specifies the maximum message length that can be transmitted on the channel. This is compared with the value for the remote channel and the actual maximum is the lower of the two values.

The possible values are:

***SAME**

The attribute is unchanged.

maximum-message-length

Specify a value ranging from 0 through 104857600. A value of 0 indicates that the maximum length is unlimited.

Heartbeat interval (HRTBTINTVL)

Specifies the time, in seconds, between heartbeat flows passed from the sending MCA when there are no messages on the transmission queue. The heartbeat exchange gives the receiving MCA the opportunity to quiesce the channel. This applies only to sender, server, cluster sender and cluster receiver (*SDR, *SVR, *CLUSDR and *CLUSRCVR) channels.

The possible values are:

***SAME**

The attribute is unchanged.

heart-beat-interval

Specify a value ranging from 0 through 999999999. A value of 0 means that no heartbeat exchanges are to take place.

Non Persistent Message Speed (NPMSPEED)

Specifies whether the channel supports fast non persistent messages.

The possible values are:

***SAME**

The value of this attribute does not change.

***FAST**

The channel supports fast non persistent messages.

***NORMAL**

The channel does not support fast non persistent messages.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Cluster Name (CLUSTER)

The name of the cluster to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

This parameter is valid only for *CLUSDR and *CLUSRCVR channels. If the CLUSNL parameter is non-blank, this parameter must be blank.

The possible values are:

***SAME**

The value of this attribute does not change.

***NONE**

No cluster name is specified.

cluster-name

The name of the cluster to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

Cluster Name List (CLUSNL)

The name of the namelist that specifies a list of clusters to which the channel belongs

This parameter is valid only for *CLUSDR and *CLUSRCVR channels. If the CLUSTER parameter is non-blank, this parameter must be blank.

The possible values are:

***SAME**

The value of this attribute does not change.

***NONE**

No cluster namelist is specified.

cluster-name-list

The name of the namelist specifying a list of clusters to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

Network Connection Priority (NETPTY)

The priority for the network connection. Distributed queuing chooses the path with the highest priority if there are multiple paths available. The value must be in the range between 0 and 9 where 0 is the lowest priority.

This parameter is valid only for *CLUSRCVR channels.

The possible values are:

***SAME**

The value of this attribute does not change.

network-connection-priority

Specify a value ranging from 0 through 9 where 0 is the lowest priority.

TLS CipherSpec (SSLCIPH)

SSLCIPH specifies the CipherSpec used in TLS channel negotiation. The possible values are:

***SAME**

The value of this attribute does not change.

cipherspec

The name of the CipherSpec.

Note:  From IBM MQ 8.0.0 Fix Pack 2, the SSLv3 protocol and the use of some IBM MQ CipherSpecs is deprecated. For more information, see [Deprecated CipherSpecs](#).

TLS Client Authentication (SSLCAUTH)

SSLCAUTH specifies whether the channel carries out client authentication over TLS. The parameter is used only for channels with SSLCIPH specified.

The possible values are:

***SAME**

The value of this attribute does not change.

***REQUIRED**

Client authentication is required.

***OPTIONAL**

Client authentication is optional.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *CLTCN or *CLUSSDR.

TLS Peer name (SSLPEER)

SSLPEER specifies the X500 peer name used in TLS channel negotiation. The possible values are:

***SAME**

The value of this attribute does not change.

x500peername

The X500 peer name to use.

Note: An alternative way of restricting connections into channels by matching against the TLS Subject Distinguished Name, is to use channel authentication records. With channel authentication records, different TLS Subject Distinguished Name patterns can be applied to the same channel. If both SSLPEER on the channel and a channel authentication record are used to apply to the same channel, the inbound certificate must match both patterns in order to connect. For more information, see [Channel authentication records](#).

Local communication address (LOCLADDR)

Specifies the local communication address for the channel.

This parameter is only valid for *SDR, *SVR, *RQSTR, *CLUSSDR, *CLUSRCVR and *CLTCN channels.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The connection is blank.

local-address

Only valid for transport type TCP/IP. Specify the optional IP address and optional port or port range used for outbound TCP/IP communications. The format is:

```
LOCLADDR([ip-addr][[low-port[,high-port]]][, [ip-addr][[low-port[,high-port]]]])
```

Batch Heartbeat Interval (BATCHEHB)

The time in milliseconds used to determine whether batch heartbeating occurs on this channel. Batch heartbeating allows channels to determine whether the remote channel instance is still active before going indoubt. A batch heartbeat will occur if a channel MCA has not communicated with the remote channel within the specified time.

The possible values are:

***SAME**

The attribute is unchanged.

batch-heartbeat-interval

Specify a value ranging from 0 through 999999999. A value of 0 indicates that batch heartbeating is not to be used.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Task user identifier (USERID)

This is used by the message channel agent when attempting to initiate a secure LU 6.2 session with a remote message channel agent.

This parameter is valid only for channels with a channel type (CHLTYPE) of *SDR, *SVR, *RQSTR, *CLTCN or *CLUSSDR.

Although the maximum length of the attribute is 12 characters, only the first 10 characters are used.

The possible values are:

***SAME**

The value of this attribute does not change.

***NONE**

No user identifier is specified.

user-identifier

Specify the task user identifier.

Password (PASSWORD)

This is used by the message channel agent when attempting to initiate a secure LU 6.2 session with a remote message channel agent.

This parameter is valid only for channels with a channel type (CHLTYPE) of *SDR, *SVR, *RQSTR, *CLTCN or *CLUSSDR.

Although the maximum length of the attribute is 12 characters, only the first 10 characters are used.

The possible values are:

***SAME**

The value of this attribute does not change.

***NONE**

No password is specified.

password

Specify the password.

Keep Alive Interval (KAINT)

Specifies the keep alive timing interval for this channel.

The possible values are:

***SAME**

The attribute is unchanged.

***AUTO**

The keep alive interval is calculated based upon the negotiated heartbeat value as follows:

- If the negotiated HBINT is greater than 0, keep alive interval is set to that value plus 60 seconds.
- If the negotiated HBINT is 0, the value used is that specified by the KEEPALIVEOPTIONS statement in the TCP profile configuration data set.

keep-alive-interval

Specify a value ranging from 0 through 99999.

Header Compression (COMPHDR)

The list of header data compression techniques supported by the channel.

For channel types sender, server, cluster sender, cluster receiver and client connection (*SDR, *SVR, *CLUSSDR, *CLUSRCVR and *CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No header data compression is performed.

***SYSTEM**

Header data compression is performed.

Message Compression (COMPMSG)

The list of message data compression techniques supported by the channel.

For channel types sender, server, cluster sender, cluster receiver and client connection (*SDR, *SVR, *CLUSSDR, *CLUSRCVR and *CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No message data compression is performed.

***RLE**

Message data compression is performed using run-length encoding.

***ZLIBFAST**

Message data compression is performed using the zlib compression technique. A fast compression time is preferred.

***ZLIBHIGH**

Message data compression is performed using the zlib compression technique. A high level of compression is preferred.

> V 9.4.0 *LZ4FAST

Message data compression is performed using the LZ4 compression technique. A fast compression time is preferred.

> V 9.4.0 *LZ4HIGH

Message data compression is performed using the LZ4 compression technique. A high level of compression is preferred.

***ANY**

Any compression technique supported by the queue manager can be used. This option is only valid for channel types receiver, requester and server connection (*RCVR, *RQSTR and *SVRCN).

Channel Monitoring (MONCHL)

Controls the collection of online monitoring data.

Online monitoring data is not collected when the queue manager attribute MONCHL is set to *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

The collection of online monitoring data is inherited from the setting of the queue manager attribute MONCHL.

***OFF**

Online Monitoring Data collection for this channel is disabled.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for a channel type (CHLTYPE) of *CLTCN.

Channel Statistics (STATCHL)

Controls the collection of statistics data.

Statistics data is not collected when the queue manager attribute STATCHL is set to *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATCHL.

***OFF**

Statistics data collection for this channel is disabled.

***LOW**

Statistics data collection is turned on with a low ratio of data collection.

***MEDIUM**

Statistics data collection is turned on with a moderate ratio of data collection.

***HIGH**

Statistics data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Cluster Workload Rank (CLWLRANK)

Specifies the cluster workload rank of the channel.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-rank

The cluster workload rank of the channel in the range 0 through 9.

Cluster Workload Priority (CLWLPRTY)

Specifies the cluster workload priority of the channel.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-priority

The cluster workload priority of the channel in the range 0 through 9.

Cluster Channel Weight (CLWLWGHT)

Specifies the cluster workload weight of the channel.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-weight

The cluster workload weight of the channel in the range 1 through 99.

Sharing Conversations (SHARECNV)

Specifies the maximum the number of conversations which can be shared over a particular TCP/IP client channel instance (socket).

This parameter is valid for channels with CHLTYPE defined as *CLTCN or *SVRCN.

The possible values are:

***SAME**

The attribute is unchanged.

0

Specifies no sharing of conversations over a TCP/IP socket. The channel instance runs in a mode prior to that of IBM WebSphere MQ 7.0, with regard to:

- Administrator stop-quietce
- Heartbeating
- Read ahead

1

Specifies no sharing of conversations over a TCP/IP socket. Client heartbeating and read ahead are available, whether in an MQGET call or not, and channel quiescing is more controllable.

shared-conversations

The number of shared conversations in the range 2 through 999999999.

This parameter is only valid for client-connection and server-connection channels.

Note: If the client-connection SHARECNV value does not match the server-connection SHARECNV value, the lower of the two values is used.

Property Control (PROPCTL)

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor).

The possible values are:

***SAME**

The attribute is unchanged.

***COMPAT**

If the message contains a property with a prefix of "mcd.", "jms.", "usr." or "mqext." then all optional message properties, except those in the message descriptor (or extension) will be placed in one or more MQRFH2 headers in the message data before the message is sent to the remote queue manager.

***NONE**

All properties of the message, except those in the message descriptor (or extension), will be removed from the message before the message is sent to the remote queue manager.

***ALL**

All properties of the message will be included with the message when it is sent to the remote queue manager. The properties, except those in the message descriptor (or extension), will be placed in one or more MQRFH2 headers in the message data.

Maximum Instances (MAXINST)

Specifies the maximum number of clients that can simultaneously connect to the queue manager via this server-connection channel object.

This attribute is valid only for server-connection channels.

The possible values are:

***SAME**

The attribute is unchanged.

maximum-instances

The maximum number of simultaneous instances of the channel in the range 0 through 99999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

Maximum Instances Per Client (MAXINSTC)

Specifies the maximum number of simultaneous instances of an individual server-connection channel which can be started from a single client.

In this context, multiple client connections originating from the same remote network address are considered to be a single client.

This attribute is valid only for server-connection channels.

The possible values are:

***SAME**

The attribute is unchanged.

maximum-instances-per-client

The maximum number of simultaneous instances of the channel which can be in the started from a single client in the range 0 through 99999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running from individual clients, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

Client Channel Weight (CLNTWGHT)

The client channel weighting attribute is used so client channel definitions can be selected at random based on their weighting when more than one suitable definition is available.

The possible values are:

***SAME**

The attribute is unchanged.

client-channel-weight

The client channel weight in the range 0 through 99.

Connection Affinity (AFFINITY)

The channel affinity attribute is used so client applications that connect multiple times using the same queue manager name can choose whether to use the same client channel definition for each connection.

The possible values are:

***SAME**

The attribute is unchanged.

***PREFERRED**

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any applicable CLNTWGHT(0) definitions first and in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful non CLNTWGHT(0) definitions are moved to the end of the list. CLNTWGHT(0) definitions remain at the start of the list and are selected first for each connection.

***NONE**

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process select an applicable definition based on the weighting with any applicable CLNTWGHT(0) definitions selected first in alphabetical order.

Batch Data Limit (BATHLIM)

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

The batch is terminated when one of the following conditions is met:

- **BATCHSZ** messages have been sent.
- **BATHLIM** bytes have been sent.
- The transmission queue is empty and **BATCHINT** is exceeded.

The value must be in the range 0 - 999999. The default value is 5000.

The **BATHLIM** parameter is supported on all platforms.

The possible values are:

***SAME**

The value of this attribute does not change.

batch-data-limit

Specify a value ranging from 0 through 999999.

This parameter can only be specified for channel types (CHLTYPE) *SDR, *SVR, *CLUSDR, or *CLUSRCVR.

Default client reconnection (DFTRECON)

Specifies whether a client connection automatically reconnects a client application if its connection breaks.

***SAME**

The value of this attribute does not change.

***NO**

Unless overridden by **MQCONN**, the client is not reconnected automatically.

***YES**

Unless overridden by **MQCONN**, the client reconnects automatically.

***QMGR**

Unless overridden by **MQCONN**, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO_RECONNECT_Q_MGR.

***DISABLED**

Reconnection is disabled, even if requested by the client program using the **MQCONN** MQI call.

This parameter is specified for a client connection channel, (CHLTYPE) *CLTCN

CPYMQMLSR (Copy MQ Listener)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Copy MQ Listener (CPYMQMLSR) command creates an MQ listener definition of the same type and, for attributes not specified in the command, with the same attribute values as an existing listener definition.

Parameters

Table 237. Command parameters

Keyword	Description	Choices	Notes
<u>FROMLSR</u>	From Listener	Character value	Required, Key, Positional 1
<u>TOLSR</u>	To Listener	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK , *SAME	Optional, Positional 5
<u>CONTROL</u>	Listener control	*SAME , *MANUAL , *QMGR , *STARTONLY	Optional, Positional 6
<u>PORT</u>	Port number	0-65535, *SAME	Optional, Positional 7
<u>IPADDR</u>	IP Address	<i>Character value</i> , *BLANK , *SAME	Optional, Positional 8
<u>BACKLOG</u>	Listener backlog	0-999999999, *SAME	Optional, Positional 9

From Listener (FROMLSR)

Specifies the name of the existing listener definition to provide values for the attributes not specified in this command.

The possible values are:

from-listener-name

Specify the name of the source MQ listener.

To Listener (TOLSR)

Specifies the name of the new listener definition to be created. The name can contain a maximum of 48 characters.

If a listener definition with this name already exists, REPLACE(*YES) must be specified.

The possible values are:

to-listener-name

Specify the name of the new listener being created.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Replace (REPLACE)

Specifies whether the new listener definition will replace an existing listener definition with the same name.

The possible values are:

***NO**

This definition does not replace any existing listener definition with the same name. The command fails if the named listener definition already exists.

***YES**

Replace the existing listener definition. If there is no definition with the same name, a new definition is created.

Text 'description' (TEXT)

Specifies text that briefly describes the listener definition.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Listener control (CONTROL)

Whether the listener starts automatically when the queue manager is started.

The possible values are:

***SAME**

The attribute is unchanged.

***MANUAL**

The listener is not automatically started or stopped.

***QMGR**

The listener is started and stopped as the queue manager is started and stopped.

***STARTONLY**

The listener is started as the queue manager is started, but is not automatically stopped when the queue manager is stopped.

Port number (PORT)

The port number to be used by the listener.

The possible values are:

***SAME**

The attribute is unchanged.

port-number

The port number to be used.

IP Address (IPADDR)

The IP address to be used by the listener.

The possible values are:

***SAME**

The attribute is unchanged.

ip-addr

The IP address to be used.

Listener backlog (BACKLOG)

The number of concurrent connection requests the listener supports.

The possible values are:

***SAME**

The attribute is unchanged.

backlog

The number of concurrent connection requests supported.

 **CPYMQMNL (Copy MQ Namelist)**
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Copy MQ Namelist (CPYMQMNL) command copies an MQ namelist.

Parameters

<i>Table 238. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>FROMNL</u>	From Namelist	Character value	Required, Key, Positional 1
<u>TONL</u>	To Namelist	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 5
<u>NAMES</u>	List of Names	Values (up to 256 repetitions): <i>Character value</i> , *BLANKS, *SAME , *NONE	Optional, Positional 6

From Namelist (FROMNL)

Specifies the name of the existing namelist, to provide values for the attributes not specified in this command.

from-namelist

Specify the name of the source namelist.

To Namelist (TONL)

The name of the new namelist to be created. The name can contain a maximum of 48 characters.

If a namelist with this name already exists, REPLACE(*YES) must be specified.

to-namelist

Specify the name of the MQ namelist being created.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used.

message-queue-manager-name

Specify the name of the queue manager.

Replace (REPLACE)

Specifies whether the new namelist should replace an existing namelist with the same name.

***NO**

Do not replace the existing namelist. The command fails if the named namelist already exists.

***YES**

Replace the existing namelist. If there is no namelist with the same name, a new namelist is created.

Text 'description' (TEXT)

Specifies text that briefly describes the namelist.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

***SAME**

The attribute is unchanged.

description

Specify no more than 64 characters enclosed in apostrophes.

List of Names (NAMES)

List of names. This is the list of names to be created. The names can be of any type, but must conform to the rules for naming MQ objects.

***SAME**

The attribute is unchanged.

namelist

The list to create. An empty list is valid.

IBM i CPYMQMPRC (Copy MQ Process)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Copy MQ Process (CPYMQMPRC) command creates an MQ process definition of the same type and, for attributes not specified in the command, with the same attribute values as an existing process definition.

Parameters

Keyword	Description	Choices	Notes
<u>FROMPRC</u>	From process	Character value	Required, Key, Positional 1
<u>TOPRC</u>	To process	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	Character value, *BLANK, *SAME	Optional, Positional 5
<u>APPTYPE</u>	Application type	Integer, *DEF , *CICS, *UNIX, *OS400, *WINDOWS, *WINDOWS_NT,	Optional, Positional 6
<u>APPID</u>	Application identifier	Character value, *SAME	Optional, Positional 7
<u>USRDATA</u>	User data	Character value, *SAME , *NONE	Optional, Positional 8
<u>ENVDATA</u>	Environment data	Character value, *SAME , *NONE	Optional, Positional 9

From process (FROMPRC)

Specifies the name of the existing process definition to provide values for the attributes not specified in this command.

The possible values are:

from-process-name

Specify the name of the source MQ process.

To process (TOPRC)

The name of the new process definition to be created. The name can contain a maximum of 48 characters.

If a process definition with this name already exists, REPLACE(*YES) must be specified.

The possible values are:

to-process-name

Specify the name of the MQ process being created.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Replace (REPLACE)

Specifies whether the new process definition should replace an existing process definition with the same name.

The possible values are:

***NO**

This definition does not replace any existing process definition with the same name. The command fails if the named process definition already exists.

***YES**

Replace the existing process definition. If there is no definition with the same name, a new definition is created.

Text 'description' (TEXT)

Specifies text that briefly describes the process definition.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Application type (APPTYPE)

The type of application started.

The possible values are:

***DEF**

Specifying DEF causes the default application type for the platform at which the command is interpreted to be stored in the process definition. This default cannot be changed by the installation. If the platform supports clients, the default is interpreted as the default application type of the server.

***CICS**

Represents a CICS/400 application.

***UNIX**

Represents a UNIX or Linux application.

***OS400**

Represents an IBM i application.

***WINDOWS**

Represents a Windows application.

***WINDOWS_NT**

Represents a Windows NT application.

integer

User-defined application type in the range 65536 through 999999999.

Application identifier (APPID)

Application identifier. This is the name of the application to be started, on the platform for which the command is processing. It is typically a program name and library name.

The possible values are:

***SAME**

The attribute is unchanged.

application-id

The maximum length is 256 characters.

User data (USRDATA)

A character string that contains user information pertaining to the application, as defined by APPID, to start.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The user data is blank.

user-data

Specify up to 128 characters of user data.

Environment data (ENVDATA)

A character string that contains environment information pertaining to the application, as defined by APPID, to start.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The environment data is blank.

environment-data

The maximum length is 128 characters.

 **CPYMQMQ (Copy MQ Queue)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Copy MQ Queue (**CPYMQMQ**) command creates a queue definition of the same type and, for attributes not specified in the command, with the same attribute values as an existing queue definition.

Parameters

Table 240. Command parameters			
Keyword	Description	Choices	Notes
<u>FROMQ</u>	From queue name	Character value	Required, Key, Positional 1
<u>TOQ</u>	To queue name	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 3
<u>QTYPE</u>	Queue type	Character value	Optional, Positional 4
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 5
<u>TEXT</u>	Text 'description'	Character value, *BLANK, *SAME	Optional, Positional 6
<u>PUTENBL</u>	Put enabled	*SAME , *NO, *YES	Optional, Positional 7
<u>DFTPTY</u>	Default message priority	0-9, *SAME	Optional, Positional 8
<u>DFTMSGPST</u>	Default message persistence	*SAME , *NO, *YES	Optional, Positional 9
<u>PRCNAME</u>	Process name	Character value, *NONE, *SAME	Optional, Positional 10
<u>TRGENBL</u>	Triggering enabled	*SAME , *NO, *YES	Optional, Positional 11
<u>GETENBL</u>	Get enabled	*SAME , *NO, *YES	Optional, Positional 12
<u>SHARE</u>	Sharing enabled	*SAME , *NO, *YES	Optional, Positional 13
<u>DFTSHARE</u>	Default share option	*SAME , *NO, *YES	Optional, Positional 14
<u>MSGDLYSEQ</u>	Message delivery sequence	*SAME , *PTY, *FIFO	Optional, Positional 15
<u>HDNBKTCNT</u>	Harden backout count	*SAME , *NO, *YES	Optional, Positional 16
<u>TRGTYPE</u>	Trigger type	*SAME , *FIRST, *ALL, *DEPTH, *NONE	Optional, Positional 17
<u>TRGDEPTH</u>	Trigger depth	1-999999999, *SAME	Optional, Positional 18
<u>TRGMSGPTY</u>	Trigger message priority	0-9, *SAME	Optional, Positional 19
<u>TRGDATA</u>	Trigger data	Character value, *NONE, *SAME	Optional, Positional 20
<u>RTNITV</u>	Retention interval	0-999999999, *SAME	Optional, Positional 21
<u>MAXDEPTH</u>	Maximum queue depth	0-999999999, *SAME	Optional, Positional 22
<u>MAXMSGLEN</u>	Maximum message length	0-104857600, *SAME	Optional, Positional 23
<u>BKTTHLD</u>	Backout threshold	0-999999999, *SAME	Optional, Positional 24
<u>BKTQNAME</u>	Backout requeue name	Character value, *NONE, *SAME	Optional, Positional 25
<u>INITQNAME</u>	Initiation queue	Character value, *NONE, *SAME	Optional, Positional 26

Table 240. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>USAGE</u>	Usage	*SAME , *NORMAL, *TMQ	Optional, Positional 27
<u>DFNTYPE</u>	Definition type	*SAME , *TEMPDYN, *PERMDYN	Optional, Positional 28
<u>TGTQNAME</u>	Target object	Character value, *SAME	Optional, Positional 29
<u>RMTQNAME</u>	Remote queue	Character value, *SAME , *NONE	Optional, Positional 30
<u>RMTMQMNAME</u>	Remote Message Queue Manager	Character value, *SAME	Optional, Positional 31
<u>TMQNAME</u>	Transmission queue	Character value, *NONE, *SAME	Optional, Positional 32
<u>HIGHTHLD</u>	Queue depth high threshold	0-100, *SAME	Optional, Positional 33
<u>LOWTHLD</u>	Queue depth low threshold	0-100, *SAME	Optional, Positional 34
<u>FULLEVT</u>	Queue full events enabled	*SAME , *NO, *YES	Optional, Positional 35
<u>HIGHEVT</u>	Queue high events enabled	*SAME , *NO, *YES	Optional, Positional 36
<u>LOWEVT</u>	Queue low events enabled	*SAME , *NO, *YES	Optional, Positional 37
<u>SRVITV</u>	Service interval	0-999999999, *SAME	Optional, Positional 38
<u>SRVEVT</u>	Service interval events	*SAME , *HIGH, *OK, *NONE	Optional, Positional 39
<u>DISTLIST</u>	Distribution list support	*SAME , *NO, *YES	Optional, Positional 40
<u>CLUSTER</u>	Cluster Name	Character value, *SAME , *NONE	Optional, Positional 41
<u>CLUSNL</u>	Cluster Name List	Character value, *NONE, *SAME	Optional, Positional 42
<u>DEFBIND</u>	Default Binding	*SAME , *OPEN, *NOTFIXED, *GROUP	Optional, Positional 43
<u>CLWLRANK</u>	Cluster Workload Rank	0-9, *SAME	Optional, Positional 44
<u>CLWLPRTY</u>	Cluster Workload Priority	0-9, *SAME	Optional, Positional 45
<u>CLWLUSEQ</u>	Cluster workload queue use	*SAME , *QMGR, *LOCAL, *ANY	Optional, Positional 46
<u>MONQ</u>	Queue Monitoring	*SAME , *QMGR, *OFF, *LOW, *MEDIUM, *HIGH	Optional, Positional 47
<u>STATQ</u>	Queue Statistics	*SAME , *QMGR, *OFF, *ON	Optional, Positional 48
<u>ACCTQ</u>	Queue Accounting	*SAME , *QMGR, *OFF, *ON	Optional, Positional 49
<u>NPMCLASS</u>	Non Persistent Message Class	*SAME , *NORMAL, *HIGH	Optional, Positional 50

Table 240. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>MSGREADAHD</u>	Message Read Ahead	*SAME , *DISABLED, *NO, *YES	Optional, Positional 51
<u>DFTPUTRESP</u>	Default Put Response	*SAME , *SYNC, *ASYNQ	Optional, Positional 52
<u>PROPCTL</u>	Property Control	*SAME , *COMPAT, *NONE, *ALL, *FORCE, *V6COMPAT	Optional, Positional 53
<u>TARGTYPE</u>	Target Type	*SAME , *QUEUE, *TOPIC	Optional, Positional 54
<u>CUSTOM</u>	Custom attribute	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 55
<u>CLCHNAME</u>	Cluster-sender channel name	<i>Character value</i> , *NONE, *SAME	Optional, Positional 56
<u>IMGRCOVQ</u>	Queue object attribute	*SAME , *NO, *YES, *QMGR	Optional, Positional 58

From queue name (FROMQ)

Specifies the name of the existing queue definition, to provide values for the attributes not specified in this command.

The possible values are:

from-queue-name

Specify the name of the source queue.

To queue name (TOQ)

Specifies the name of the new queue definition. The name can contain a maximum of 48 characters. Queue name and type combinations must be unique; if a queue definition already exists with the name and type of the new queue, REPLACE(*YES) must be specified.

Note: The field length is 48 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

The possible values are:

to-queue-name

Specify the name of the queue being created.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Queue type (QTYPE)

Specifies the type of queue that is to be copied.

The possible values are:

***ALS**

An alias queue.

***LCL**

A local queue.

***RMT**

A remote queue.

***MDL**

A model queue.

Replace (REPLACE)

Specifies whether the new queue will replace an existing queue definition with the same name and type.

The possible values are:

***NO**

Do not replace the existing queue definition. The command fails if the named queue already exists.

***YES**

Replace the existing queue definition with the attributes of the FROMQ and the specified attributes.

The command fails if an application has the queue open or the USAGE attribute is changed.

Note: If the queue is a local queue, and a queue with the same name already exists, any messages already on that queue are retained.

Text 'description' (TEXT)

Specifies text that briefly describes the object.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Put enabled (PUTENBL)

Specifies whether messages can be put on the queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Messages cannot be added to the queue.

***YES**

Messages can be added to the queue by authorized applications.

Default message priority (DFTPTY)

Specifies the default priority of messages put on the queue.

The possible values are:

***SAME**

The attribute is unchanged.

priority-value

Specify a value ranging from 0 through 9, where 9 is the highest priority.

Default message persistence (DFTMSGPST)

Specifies the default for message-persistence on the queue. Message persistence determines whether messages are preserved across restarts of the queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

By default, messages are lost across a restart of the queue manager.

***YES**

By default, messages are preserved across a restart of the queue manager.

Process name (PRCNAME)

Specifies the local name of the MQ process that identifies the application that should be started when a trigger event occurs.

The process does not have to be available when the queue is created, but it must be available for a trigger event to occur.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The process name is blank.

process-name

Specify the name of the MQ process.

Triggering enabled (TRGENBL)

Specifies whether trigger messages are written to the initiation queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Triggering is not enabled. Trigger messages are not written to the initiation queue.

***YES**

Triggering is enabled. Trigger messages are written to the initiation queue.

Get enabled (GETENBL)

Specifies whether applications are to be permitted to get messages from this queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Applications cannot retrieve messages from the queue.

***YES**

Suitably authorized applications can retrieve messages from the queue.

Sharing enabled (SHARE)

Specifies whether multiple instances of applications can open this queue for input simultaneously.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Only a single application instance can open the queue for input.

***YES**

More than one application instance can open the queue for input.

Default share option (DFTSHARE)

Specifies the default share option for applications opening this queue for input.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

By default, the open request is for exclusive use of the queue for input.

***YES**

By default, the open request is for shared use of the queue for input.

Message delivery sequence (MSGDLYSEQ)

Specifies the message delivery sequence.

The possible values are:

***SAME**

The attribute is unchanged.

***PTY**

Messages are delivered in first-in-first-out (FIFO) order within priority.

***FIFO**

Messages are delivered in FIFO order regardless of priority.

Harden backout count (HDNBKTCNT)

Specifies whether the count of backed out messages is saved (hardened) across restarts of the message queue manager.

Note: On IBM MQ for IBM i the count is ALWAYS hardened, regardless of the setting of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

The backout count is not hardened.

***YES**

The backout count is hardened.

Trigger type (TRGTYPE)

Specifies the condition that initiates a trigger event. When the condition is true, a trigger message is sent to the initiation queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***FIRST**

When the number of messages on the queue goes from 0 to 1.

***ALL**

Every time a message arrives on the queue.

***DEPTH**

When the number of messages on the queue equals the value of the TRGDEPTH attribute.

***NONE**

No trigger messages are written.

Trigger depth (TRGDEPTH)

Specifies, for TRGTYPE(*DEPTH), the number of messages that initiate a trigger message to the initiation queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

depth-value

Specify a value ranging from 1 through 999999999.

Trigger message priority (TRGMSGPTY)

Specifies the minimum priority that a message must have before it can produce, or be counted for, a trigger event.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

priority-value

Specify a value ranging from 0 through 9, where 9 is the highest priority.

Trigger data (TRGDATA)

Specifies up to 64 characters of user data that the queue manager includes in the trigger message. This data is made available to the monitoring application that processes the initiation queue, and to the application started by the monitor.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No trigger data is specified.

trigger-data

Specify up to 64 characters enclosed in apostrophes. For a transmission queue you can use this parameter to specify the name of the channel to be started.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Retention interval (RTNITV)

Specifies the retention interval. This interval is the number of hours for which the queue might be needed, based on the date and time when the queue was created.

This information is available to a housekeeping application or an operator and can be used to determine when a queue is no longer required.

Note: The message queue manager does not delete queues, nor does it prevent your queues from being deleted if their retention interval has not expired. It is your responsibility to take any required action.

The possible values are:

***SAME**

The attribute is unchanged.

interval-value

Specify a value ranging from 0 through 999999999.

Maximum queue depth (MAXDEPTH)

Specifies the maximum number of messages allowed on the queue. However, other factors can cause the queue to be treated as full; for example, it appears to be full if there is no storage available for a message.

Note: If this value is subsequently reduced by using the CHGMQMQ command, any messages that are on the queue remain intact even if they cause the new maximum to be exceeded.

The possible values are:

***SAME**

The attribute is unchanged.

depth-value

Specify a value ranging from 0 through 999999999.

Maximum message length (MAXMSGLEN)

Specifies the maximum length for messages on the queue.

Note: If this value is subsequently reduced by using the CHGMQMQ command, any messages that are on the queue remain intact even if they exceed the new maximum length.

Applications might use the value of this attribute to determine the size of buffer they need to retrieve messages from the queue. Therefore change the value only if you know this will not cause an application to operate incorrectly.

The possible values are:

***SAME**

The attribute is unchanged.

length-value

Specify a value ranging from 0 through 100 MB in bytes. The default is 4MB.

Backout threshold (BKTTHLD)

Specifies the backout threshold.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine if a message should be backed out. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

***SAME**

The attribute is unchanged.

threshold-value

Specify a value ranging from 0 through 999999999.

Backout requeue name (BKTQNAME)

Specifies the backout-queue name.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine where messages that have been backed out should go. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No backout queue is specified.

backout-queue-name

Specify the backout queue name.

Initiation queue (INITQNAME)

Specifies the name of the initiation queue.

Note: The initiation queue must be on the same instance of a message queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No initiation queue is specified.

initiation-queue-name

Specify the initiation queue name.

Usage (USAGE)

Specifies whether the queue is for normal usage, or for transmitting messages to a remote message queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

***NORMAL**

Normal usage (the queue is not a transmission queue)

***TMQ**

The queue is a transmission queue that is used to hold messages destined for a remote message queue manager. If the queue is intended for use in situations where a transmission queue name is

not explicitly specified, the queue name must be the same as the name of the remote message queue manager. For further information, see IBM MQ Intercommunication.

Definition type (DFNTYPE)

Specifies the type of dynamic queue definition that is created when an application issues an MQOPEN API call with the name of this model queue specified in the object descriptor.

Note: This parameter only applies to a model queue definition.

The possible values are:

***SAME**

The attribute is unchanged.

***TEMPDYN**

A temporary dynamic queue is created. This value should not be specified with a DEFMSGPST value of *YES.

***PERMDYN**

A permanent dynamic queue is created.

Target object (TGTQNAME)

Specifies the name of the object for which this queue is an alias.

The object can be a local or remote queue, a topic or a message queue manager.

Note: The target object does not need to exist at this time but it must exist when a process attempts to open the alias queue.

The possible values are:

***SAME**

The attribute is unchanged.

target-object-name

Specify the name of the target object.

Remote queue (RMTQNAME)

Specifies the name of the remote queue. That is, the local name of the remote queue as defined on the queue manager specified by RMTMQMNAME.

If this definition is used for a queue manager alias definition, RMTQNAME must be blank when the open occurs.

If this definition is used for a reply-to alias, this name is the name of the queue that is to be the reply-to queue.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No remote-queue name is specified (that is, the name is blank). This can be used if the definition is a queue manager alias definition.

remote-queue-name

Specify the name of the queue at the remote queue manager.

Note: The name is not checked to ensure that it contains only those characters normally allowed for queue names.

Remote Message Queue Manager (RMTMQMNAME)

Specifies the name of the remote queue manager on which the queue RMTQNAME is defined.

If an application opens the local definition of a remote queue, RMTMQMNAME must not be the name of the connected queue manager. If TMQNAME is blank there must be a local queue of this name, which is to be used as the transmission queue.

If this definition is used for a queue manager alias, RMTMQMNAME is the name of the queue manager, which can be the name of the connected queue manager. Otherwise, if TMQNAME is blank, when the queue is opened there must be a local queue of this name, with USAGE(*TMQ) specified, which is to be used as the transmission queue.

If this definition is used for a reply-to alias, this name is the name of the queue manager that is to be the reply-to queue manager.

The possible values are:

***SAME**

The attribute is unchanged.

remote-queue-manager-name

Specify the name of the remote queue manager.

Note: Ensure this name contains only those characters normally allowed for queue manager names.

Transmission queue (TMQNAME)

Specifies the local name of the transmission queue to be used for messages destined for the remote queue, for either a remote queue or for a queue manager alias definition.

If TMQNAME is blank, a queue with the same name as RMTMQMNAME is used as the transmission queue.

This attribute is ignored if the definition is being used as a queue manager alias and RMTMQMNAME is the name of the connected queue manager.

It is also ignored if the definition is used as a reply-to queue alias definition.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No specific transmission queue name is defined for this remote queue. The value of this attribute is set to all blanks.

transmission-queue-name

Specify the transmission queue name.

Queue depth high threshold (HIGHTHLD)

Specifies the threshold against which the queue depth is compared to generate a queue depth high event.

The possible values are:

***SAME**

The attribute is unchanged.

threshold-value

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

Queue depth low threshold (LOWTHLD)

Specifies the threshold against which the queue depth is compared to generate a queue depth low event.

The possible values are:

***SAME**

The attribute is unchanged.

threshold-value

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

Queue full events enabled (FULLEVT)

Specifies whether queue full events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Queue full events are not generated.

***YES**

Queue full events are generated.

Queue high events enabled (HIGHEVT)

Specifies whether queue depth high events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Queue depth high events are not generated.

***YES**

Queue depth high events are generated.

Queue low events enabled (LOWEVT)

Specifies whether queue depth low events are generated.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

Queue depth low events are not generated.

***YES**

Queue depth low events are generated.

Service interval (SRVITV)

Specifies the service interval. This interval is used for comparison to generate service interval high and service interval OK events.

The possible values are:

***SAME**

The attribute is unchanged.

interval-value

Specify a value ranging from 0 through 999999999. The value is in units of milliseconds.

Service interval events (SRVEVT)

Specifies whether service interval high or service interval OK events are generated.

A service interval high event is generated when a check indicates that no messages have been retrieved from the queue for the time indicated by the SRVITV parameter as a minimum.

A service interval OK event is generated when a check indicates that messages have been retrieved from the queue within the time indicated by the SRVITV parameter.

The possible values are:

***SAME**

The attribute is unchanged.

***HIGH**

Service interval high events are generated.

***OK**

Service interval OK events are generated.

***NONE**

No service interval events are generated.

Distribution list support (DISTLIST)

Specifies whether the queue supports distribution lists.

The possible values are:

***SAME**

The attribute is unchanged.

***NO**

The queue will not support distribution lists.

***YES**

The queue will support distribution lists.

Cluster Name (CLUSTER)

The name of the cluster to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-name

Only one of the resultant values of CLUSTER or CLUSNL can be non-blank; you cannot specify a value for both.

Cluster Name List (CLUSNL)

The name of the namelist which specifies a list of clusters to which the queue belongs. Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

***SAME**

The attribute is unchanged.

namelist-name

Only one of the resultant values of CLUSTER or CLUSNL can be non-blank; you cannot specify a value for both.

Default Binding (DEFBIND)

Specifies the binding to be used when the application specifies MQOO_BIND_AS_Q_DEF on the MQOPEN call and the queue is a cluster queue.

The possible values are:

***SAME**

The attribute is unchanged.

***OPEN**

The queue handle is bound to a specific instance of the cluster queue when the queue is opened.

***NOTFIXED**

The queue handle is not bound to any particular instance of the cluster queue. This allows the queue manager to select a specific queue instance when the message is put using MQPUT and to change that selection subsequently if necessary.

The MQPUT1 call always behaves as if NOTFIXED had been specified.

***GROUP**

When the queue is opened, the queue handle is bound to a specific instance of the cluster queue for as long as there are messages in a message group. All messages in a message group are allocated to the same destination instance.

Cluster Workload Rank (CLWLRANK)

Specifies the cluster workload rank of the queue.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-rank

Specify a value ranging from 0 through 9.

Cluster Workload Priority (CLWLPRTY)

Specifies the cluster workload priority of the queue.

The possible values are:

***SAME**

The attribute is unchanged.

cluster-workload-priority

Specify a value ranging from 0 through 9.

Cluster workload queue use (CLWLUSEQ)

Specifies the behavior of an MQPUT when the target queue has both a local instance and at least one remote cluster instance. If the put originates from a cluster channel then this attribute does not apply.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

The value is inherited from the Queue Manager CLWLUSEQ attribute.

***LOCAL**

The local queue will be the sole target of the MQPUT.

***ANY**

The queue manager will treat such a local queue as another instance of the cluster queue for the purposes of workload distribution.

Queue Monitoring (MONQ)

Controls the collection of Online Monitoring Data.

Online Monitoring Data is not collected when the queue manager attribute MONQ is set to *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

The collection of online monitoring data is inherited from the setting of the queue manager attribute MONQ.

***OFF**

Online monitoring data collection for this queue is disabled.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

Queue Statistics (STATQ)

Controls the collection of statistics data.

Online monitoring data is not collected when the queue manager attribute STATQ is set to *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATQ.

***OFF**

Statistics data collection for this queue is disabled.

***ON**

Statistics data collection is enabled for this queue.

Queue Accounting (ACCTQ)

Controls the collection of accounting data.

Accounting data is not collected when the queue manager attribute ACCTQ is set to *NONE.

The possible values are:

***SAME**

The attribute is unchanged.

***QMGR**

Accounting data collection is based upon the setting of the queue manager attribute ACCTQ.

***OFF**

Accounting data collection for this queue is disabled.

***ON**

Accounting data collection is enabled for this queue.

Non Persistent Message Class (NPMCLASS)

Specifies the level of reliability for non-persistent messages put to this queue.

The possible values are:

***SAME**

The attribute is unchanged.

***NORMAL**

Non-persistent messages put to this queue are only lost following a failure, or a queue manager shutdown. Non-persistent message put to this queue will be discarded in the event of a queue manager restart.

***HIGH**

Non-persistent messages put to this queue are not discarded in the event of a queue manager restart. Non-persistent messages put to this queue may still be lost in the event of a failure.

Message Read Ahead (MSGREADAHD)

Specifies whether non persistent messages are sent to the client ahead of an application requesting them.

The possible values are:

***SAME**

The attribute is unchanged.

***DISABLED**

Read ahead is disabled for this queue. Messages are not sent to the client ahead of an application requesting them regardless of whether read ahead is requested by the client application.

***NO**

Non-persistent messages are not sent to the client ahead of an application requesting them. A maximum of one non-persistent message can be lost if the client ends abnormally.

***YES**

Non-persistent messages are sent to the client ahead of an application requesting them. Non-persistent messages can be lost if the client ends abnormally or if the client application does not consume all the messages it is sent.

Default Put Response (DFTPUTRESP)

The default put response type (DFTPUTRESP) attribute specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO_RESPONSE_AS_Q_DEF option.

The possible values are:

***SAME**

The attribute is unchanged.

***SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are issued as if MQPMO_SYNC_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application. This is the default value supplied with IBM MQ, but your installation might have changed it.

***ASYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are always issued as if MQPMO_ASYNC_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application; but an improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

Property Control (PROPCTL)

Specifies what happens to properties of messages that are retrieved from queues using the MQGET call when the MQGMO_PROPERTIES_AS_Q_DEF option is specified.

The possible values are:

***SAME**

The attribute is unchanged.

***COMPAT**

If the message contains a property with a prefix of mcd . , jms . , us1 . or mqext . then all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

***NONE**

All properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

***ALL**

All properties of the message, except those contained in the message descriptor (or extension), are contained in one or more MQRFH2 headers in the message data.

***FORCE**

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

***V6COMPAT**

When set, *V6COMPAT must be set both on one of the queue definitions resolved by MQPUT and one of the queue definitions resolved by MQGET. It must also be set on any other intervening transmission queues. It causes an MQRFH2 header to be passed unchanged from the sending application to the receiving application. It overrides other settings of **PROPCTL** found in a queue name resolution chain. If the property is set on a cluster queue, the setting is not cached locally on other queue managers. You must set *V6COMPAT on an alias queue that resolves to the cluster queue. Define the alias queue on the same queue manager that the putting application is connected to.

Target Type (TARGTYPE)

Specifies the type of object to which the alias resolves.

The possible values are:

***SAME**

The attribute is unchanged.

***QUEUE**

Queue object.

***TOPIC**

Topic object.

Custom attribute (CUSTOM)

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

custom

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

CLCHNAME

This parameter is supported only on transmission queues.

***SAME**

The attribute is unchanged.

***NONE**

The attribute is removed.

cluster-sender channel name

ClusterChannelName is the generic name of the cluster-sender channels that use this queue as a transmission queue. The attribute specifies which cluster-sender channels send messages to a cluster-receiver channel from this cluster transmission queue.

By specifying asterisks, "*", in **ClusterChannelName**, you can associate a transmission queue with a set of cluster-sender channels. The asterisks can be at the beginning, end, or any number of places in the middle of the channel name string. **ClusterChannelName** is limited to a length of 20 characters: MQ_CHANNEL_NAME_LENGTH.

IMGRCOVQ

Specifies whether a local or permanent dynamic queue object is recoverable from a media image, if linear logging is being used.

The possible values are:

***SAME**

The attribute is unchanged.

***YES**

These queue objects are recoverable.

***NO**

The [“RCDMQMIMG \(Record MQ Object Image\)” on page 1887](#) and [“RCRMQMOBJ \(Re-create MQ Object\)” on page 1890](#) commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

***QMGR**

If you specify *QMGR, and the **IMGRCOVQ** attribute for the queue manager specifies *YES, these queue objects are recoverable.

If you specify *QMGR and the **IMGRCOVQ** attribute for the queue manager specifies *NO, the [“RCDMQMIMG \(Record MQ Object Image\)” on page 1887](#) and [“RCRMQMOBJ \(Re-create MQ Object\)” on page 1890](#) commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

CPYMQMSUB (Copy MQ Subscription)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Copy MQ Subscription (CPYMQMSUB) command creates an MQ subscription of the same type and, for attributes not specified in the command, with the same attribute values as an existing subscription.

Parameters

Keyword	Description	Choices	Notes
<u>FROMSUBID</u>	From subscription identifier	Character value, *SAME	Optional, Key, Positional 3
<u>FROMSUB</u>	From subscription	Character value, *SAME	Optional, Key, Positional 2
<u>TOSUB</u>	To subscription	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 4
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 5
<u>TOPICSTR</u>	Topic string	Character value, *NONE, *SAME	Optional, Positional 6
<u>TOPICOBJ</u>	Topic object	Character value, *NONE, *SAME	Optional, Positional 7
<u>DEST</u>	Destination	Character value, *NONE, *SAME	Optional, Positional 8
<u>DESTMQM</u>	Destination Queue Manager	Character value, *NONE, *SAME	Optional, Positional 9
<u>DESTCRLID</u>	Destination Correlation Id	Character value, *NONE, *SAME	Optional, Positional 10
<u>PUBACCT</u>	Publish Accounting Token	Character value, *NONE, *SAME	Optional, Positional 11
<u>PUBAPPID</u>	Publish Application Id	Character value, *NONE, *SAME	Optional, Positional 12
<u>SUBUSER</u>	Subscription User Id	Character value, *CURRENT, *SAME	Optional, Positional 13
<u>USERDATA</u>	Subscription User Data	Character value, *NONE, *SAME	Optional, Positional 14
<u>SELECTOR</u>	Selector String	Character value, *NONE, *SAME	Optional, Positional 15
<u>PSPROP</u>	PubSub Property	*SAME , *NONE, *COMPAT, *RFH2, *MSGPROP	Optional, Positional 16
<u>DESTCLASS</u>	Destination Class	*SAME , *MANAGED, *PROVIDED	Optional, Positional 17
<u>SUBSCOPE</u>	Subscription Scope	*SAME , *ALL, *QMGR	Optional, Positional 18
<u>VARUSER</u>	Variable User	*SAME , *ANY, *FIXED	Optional, Positional 19

Table 241. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>REQONLY</u>	Request Publications	*SAME , *YES, *NO	Optional, Positional 20
<u>PUBPTY</u>	Publish Priority	0-9, *SAME , *ASPUB, *ASQDEF	Optional, Positional 21
<u>WSHEMA</u>	Wildcard Schema	*SAME , *CHAR, *TOPIC	Optional, Positional 22
<u>EXPIRY</u>	Expiry Time	0-999999999, *SAME , *UNLIMITED	Optional, Positional 23

From subscription identifier (FROMSUBID)

Specifies the subscription identifier of the existing subscription to provide values for the attributes not specified in this command.

The possible values are:

from-subscription-identifier

Specify the 48 character hexadecimal string representing the 24 byte subscription identifier.

From subscription (FROMSUB)

Specifies the name of the existing subscription to provide values for the attributes not specified in this command.

The possible values are:

from-subscription-name

Specify a maximum of 256 bytes for the subscription name.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

To subscription (TOSUB)

The name of the new subscription to be created.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

If a subscription with this name already exists, REPLACE(*YES) must be specified.

The possible values are:

to-subscription-name

Specify a maximum of 256 bytes for name of the MQ subscription being created.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

*DFT

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Replace (REPLACE)

Specifies whether the new subscription should replace an existing subscription with the same name.

The possible values are:

***NO**

This subscription does not replace any existing subscription with the same name or subscription identifier. The command fails if the subscription already exists.

***YES**

Replace the existing subscription. If there is no subscription with the same name or subscription identifier, a new subscription is created.

Topic string (TOPICSTR)

Specifies the topic string associated with this subscription.

The possible values are:

topic-string

Specify a maximum of 256 bytes for the topic string.

Note: Topic strings of greater than 256 bytes can be specified using MQSC.

Topic object (TOPICOBJ)

Specifies the topic object associated with this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

topic-object

Specify the name of the topic object.

Destination (DEST)

Specifies the destination queue for messages published to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

destination-queue

Specify the name of the destination queue.

Destination Queue Manager (DESTMQM)

Specifies the destination queue manager for messages published to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No destination queue manager is specified.

destination-queue

Specify the name of the destination queue manager.

Destination Correlation Id (DESTCRLID)

Specifies the correlation identifier for messages published to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Messages are placed on the destination with a correlation identifier of MQCI_NONE.

correlation-identifier

Specify the 48 character hexadecimal string representing the 24 byte correlation identifier.

Publish Accounting Token (PUBACCT)

Specifies the accounting token for messages published to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Messages are placed on the destination with an accounting token of MQACT_NONE.

publish-accounting-token

Specify the 64 character hexadecimal string representing the 32 byte publish accounting token.

Publish Application Id (PUBAPPID)

Specifies the publish application identity for messages published to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No publish application identifier is specified.

publish-application-identifier

Specify the publish application identifier.

Subscription User Id (SUBUSER)

Specifies the user profile that owns this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***CURRENT**

The current user profile is the owner of the new subscription.

user-profile

Specify the user profile.

Subscription User Data (USERDATA)

Specifies the user data associated with the subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No user data is specified.

user-data

Specify a maximum of 256 bytes for user data.

Note: User data of greater than 256 bytes can be specified using MQSC.

Selector String (SELECTOR)

Specifies the SQL 92 selector string to be applied to messages published on the named topic to select whether they are eligible for this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

No selection string is specified.

selection-string

Specify a maximum of 256 bytes for selection string.

Note: Selection strings of greater than 256 bytes can be specified using MQSC.

PubSub Property (PSPROP)

Specifies the manner in which publish / subscribe related message properties are added to messages sent to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

Publish / subscribe properties are not added to the message.

***COMPAT**

Publish / subscribe properties are added to the message to maintain compatibility with IBM MQ V6.0 Publish / Subscribe.

***RFH2**

Publish / subscribe properties are added to the message within an RFH 2 header.

***MSGPROP**

Publish / subscribe properties are added as message properties.

Destination Class (DESTCLASS)

Specifies whether this is a managed subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***MANAGED**

The destination is managed.

***PROVIDED**

The destination is a queue.

Subscription Scope (SUBSCOPE)

Specifies whether this subscription should be forwarded (as a proxy subscription) to other brokers, so that the subscriber will receive messages published at those other brokers.

The possible values are:

***SAME**

The attribute is unchanged.

***ALL**

The subscription will be forwarded to all queue managers directly connected via a publish / subscribe collective or hierarchy.

***QMGR**

The subscription will only forward messages published on the topic within this queue manager.

Variable User (VARUSER)

Specifies whether user profiles other than the creator of the subscription can connect to it (subject to topic and destination authority checks).

The possible values are:

***SAME**

The attribute is unchanged.

***ANY**

Any user profiles can connect to the subscription.

***FIXED**

Only the user profile that created the subscription can connect to it.

Request Publications (REQONLY)

Specifies whether the subscriber will poll for updates via MQSUBRQ API, or whether all publications are delivered to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***YES**

Publications are only delivered to this subscription in response to an MQSUBRQ API.

***NO**

All publications on the topic are delivered to this subscription.

Publish Priority (PUBPTY)

Specifies the priority of the message sent to this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPUB**

The priority of the message sent to this subscription is taken from that supplied in the published message.

***ASQDEF**

The priority of the message sent to this subscription is taken from the default priority of the queue defined as the destination.

priority-value

Specify a priority ranging from 0 through 9.

Wildcard Schema (WSHEMA)

Specifies the schema to be used when interpreting wildcard characters in the topic string.

The possible values are:

***SAME**

The attribute is unchanged.

***TOPIC**

Wildcard characters represent portions of the topic hierarchy.

***CHAR**

Wildcard characters represent portions of strings.

Expiry Time (EXPIRY)

Specifies the expiry time of the subscription. After a subscription's expiry time has elapsed, it becomes eligible to be discarded by the queue manager and will receive no further publications.

The possible values are:

***SAME**

The attribute is unchanged.

***UNLIMITED**

The subscription does not expire.

expiry-time

Specify an expiry time in tenths of a second ranging from 0 through 999999999.

 **CPYMQMSVC (Copy MQ Service)**
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Copy MQ Service (CPYMQMSVC) command creates an MQ service definition of the same type and, for attributes not specified in the command, with the same attribute values as an existing service definition.

Parameters

Table 242. Command parameters

Keyword	Description	Choices	Notes
<u>FROMSVC</u>	From Service	Character value	Required, Key, Positional 1
<u>TOSVC</u>	To Service	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 5
<u>STRCMD</u>	Start program	Single values: *SAME , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 6
	Qualifier 1: Start program	Name	
	Qualifier 2: Library	Name	
<u>STRARG</u>	Start program arguments	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 7

Table 242. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>ENDCMD</u>	End program	Single values: *SAME , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 8
	Qualifier 1: End program	Name	
	Qualifier 2: Library	Name	
<u>ENDARG</u>	End program arguments	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 9
<u>STDOUT</u>	Standard output	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 10
<u>STDERR</u>	Standard error	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 11
<u>TYPE</u>	Service type	*SAME , *CMD, *SVR	Optional, Positional 12
<u>CONTROL</u>	Service control	*SAME , *MANUAL, *QMGR, *STARTONLY	Optional, Positional 13

From Service (FROMSVC)

Specifies the name of the existing service definition to provide values for the attributes not specified in this command.

The possible values are:

from-service-name

Specify the name of the source service.

To Service (TOSVC)

The name of the new service definition to be created. The name can contain a maximum of 48 characters.

If a service definition with this name already exists, REPLACE(*YES) must be specified.

The possible values are:

to-service-name

Specify the name of the service being created.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Replace (REPLACE)

Specifies whether the new service definition should replace an existing service definition with the same name.

The possible values are:

***NO**

This definition does not replace any existing service definition with the same name. The command fails if the named service definition already exists.

***YES**

Replace the existing service definition. If there is no definition with the same name, a new definition is created.

Text 'description' (TEXT)

Specifies text that briefly describes the service definition.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Start program (STRCMD)

The name of the program to run.

The possible values are:

***SAME**

The attribute is unchanged.

start-command

The name of the start command executable.

Start program arguments (STRARG)

The arguments passed to the program at startup.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

No arguments are passed to the start command.

start-command-arguments

The arguments passed to the start command.

End program (ENDCMD)

The name of the executable to run when the service is requested to stop.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

No end command is executed.

end-command

The name of the end command executable.

End program arguments (ENDARG)

The arguments passed to the end program when the service is requested to stop.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

No arguments are passed to the end command.

end-command-arguments

The arguments passed to the end command.

Standard output (STDOUT)

The path to a file to which the standard output of the service program is redirected.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The standard output is discarded.

stdout-path

The standard output path.

Standard error (STDERR)

The path to a file to which the standard error of the service program is redirected.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The standard error is discarded.

stderr-path

The standard error path.

Service type (TYPE)

Mode in which to run service.

The possible values are:

***SAME**

The attribute is unchanged.

***CMD**

When started the command is executed but no status is collected or displayed.

***SVR**

The status of the executable started will be monitored and displayed.

Service control (CONTROL)

Whether the service should be started automatically at queue manager start.

The possible values are:

***SAME**

The attribute is unchanged.

***MANUAL**

The service is automatically started or stopped.

***QMGR**

The service is started and stopped as the queue manager is started and stopped.

***STARTONLY**

The service is started as the queue manager is started, but will not be requested to stop when the queue manager is stopped.

CPYMQMTOPT (Copy MQ Topic)
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Copy MQ Topic (CPYMQMTOPT) command creates an MQ topic object of the same type and, for attributes not specified in the command, with the same attribute values as an existing topic object.

Parameters

Table 243. Command parameters

Keyword	Description	Choices	Notes
<u>FROMTOP</u>	From topic	Character value	Required, Key, Positional 1
<u>TOTOP</u>	To topic	Character value	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 5
<u>TOPICSTR</u>	Topic string	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 6
<u>DURSUB</u>	Durable subscriptions	*SAME , *ASPARENT, *YES, *NO	Optional, Positional 7
<u>MGDDURMDL</u>	Durable model queue	<i>Character value</i> , *NONE, *SAME	Optional, Positional 8
<u>MGDNDURMDL</u>	Non-durable model queue	<i>Character value</i> , *NONE, *SAME	Optional, Positional 9
<u>PUBENBL</u>	Publish	*SAME , *ASPARENT, *YES, *NO	Optional, Positional 10
<u>SUBENBL</u>	Subscribe	*SAME , *ASPARENT, *YES, *NO	Optional, Positional 11
<u>DFTPTY</u>	Default message priority	0-9, *SAME , *ASPARENT	Optional, Positional 12
<u>DFTMSGPST</u>	Default message persistence	*SAME , *ASPARENT, *YES, *NO	Optional, Positional 13
<u>DFTPUTRESP</u>	Default Put Response	*SAME , *ASPARENT, *SYNC, *ASYNCR	Optional, Positional 14

Table 243. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>WILDCARD</u>	Wildcard behavior	*SAME , *PASSTHRU, *BLOCK	Optional, Positional 15
<u>PMSGDLV</u>	Persistent message delivery	*SAME , *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 16
<u>NPMSGDLV</u>	Non-persistent message deliver	*SAME , *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 17
<u>CUSTOM</u>	Custom attribute	<i>Character value</i> , *BLANK, *SAME	Optional, Positional 18

From topic (FROMTOP)

Specifies the name of the existing topic object to provide values for the attributes not specified in this command.

The possible values are:

from-topic-name

Specify the name of the source MQ topic.

To topic (TOTOP)

The name of the new topic object to be created. The name can contain a maximum of 48 characters.

If a topic object with this name already exists, REPLACE(*YES) must be specified.

The possible values are:

to-topic-name

Specify the name of the MQ topic being created.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

***DFT**

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Replace (REPLACE)

Specifies whether the new topic object should replace an existing topic object with the same name.

The possible values are:

***NO**

This object does not replace any existing topic object with the same name. The command fails if the named topic object already exists.

***YES**

Replace the existing topic object. If there is no object with the same name, a new object is created.

Text 'description' (TEXT)

Specifies text that briefly describes the topic object.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Topic string (TOPICSTR)

Specifies the topic string represented by this topic object definition.

The possible values are:

topic-string

Specify a maximum of 256 bytes for the topic string.

Note: Topic strings of greater than 256 bytes can be specified using MQSC.

Durable subscriptions (DURSUB)

Specifies whether applications are permitted to make durable subscriptions on this topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

Whether durable subscriptions can be made on this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Durable subscriptions can be made on this topic.

***NO**

Durable subscriptions cannot be made on this topic.

Durable model queue (MGDDURMDL)

Specifies the name of the model queue to be used for durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

***SAME**

The attribute is unchanged.

durable-model-queue

Specify the name of the model queue.

Non-durable model queue (MGDNDURMDL)

Specifies the name of the model queue to be used for non-durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

***SAME**

The attribute is unchanged.

non-durable-model-queue

Specify the name of the model queue.

Publish (PUBENBL)

Specifies whether messages can be published to the topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

Whether messages can be published to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Messages can be published to the topic.

***NO**

Messages cannot be published to the topic.

Subscribe (SUBENBL)

Specifies whether applications are to be permitted to subscribe to this topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

Whether applications can subscribe to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Subscriptions can be made to this topic.

***NO**

Applications cannot subscribe to this topic.

Default message priority (DFTPTY)

Specifies the default priority of messages published to the topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

The default priority is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

priority-value

Specify a value ranging from 0 through 9.

Default message persistence (DFTMSGPST)

Specifies the message persistence to be used when applications specify the MQPER_PERSISTENCE_AS_TOPIC_DEF option.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

The default persistence is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Messages on this queue survive a restart of the queue manager.

***NO**

Messages on this queue are lost across a restart of the queue manager.

Default Put Response (DFTPUTRESP)

Specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO_RESPONSE_AS_Q_DEF option.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

The default response type is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are issued as if MQPMO_SYNC_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application.

***ASYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are always issued as if MQPMO_ASYNC_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application. An improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

Wildcard behavior (WILDCARD)

Specifies the behavior of wildcard subscriptions with respect to this topic.

The possible values are:

***SAME**

The attribute is unchanged.

***PASSTHRU**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will receive publications made to this topic and to topic strings more specific than this topic.

***BLOCK**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will not receive publications made to this topic or to topic strings more specific than this topic.

Persistent message delivery (PMSGDLV)

Specifies the delivery mechanism for persistent messages published to this topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***ALL**

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

***ALLDUR**

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

***ALLAVAIL**

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

Non-persistent message delivery (NPMSGDLV)

Specifies the delivery mechanism for non-persistent messages published to this topic.

The possible values are:

***SAME**

The attribute is unchanged.

***ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***ALL**

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

***ALLDUR**

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

***ALLAVAIL**

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

Custom attribute (CUSTOM)

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

***SAME**

The attribute is unchanged.

***BLANK**

The text is set to a blank string.

custom

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

 **CRTMQM (Create Message Queue Manager)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Create Message Queue Manager (CRTMQM) command creates a local queue manager that can be started with the Start Message Queue Manager (STRMQM) command.

Parameters

Table 244. Command parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK	Optional, Positional 2
<u>TRGITV</u>	Trigger interval	0-999999999, 999999999	Optional, Positional 3
<u>UDLMSGQ</u>	Undelivered message queue	<i>Character value</i> , *NONE	Optional, Positional 4
<u>DFTTMQ</u>	Default transmission queue	<i>Character value</i> , *NONE	Optional, Positional 5
<u>MAXHDL</u>	Maximum handle limit	0-999999999, 256	Optional, Positional 6
<u>MAXUMSG</u>	Maximum uncommitted messages	1-999999999, 10000	Optional, Positional 7
<u>DFTQMGR</u>	Default Queue Manager	*YES , *NO	Optional, Positional 8
<u>MQMLIB</u>	Queue Manager Library	<i>Name</i> , *AUTO	Optional, Positional 9
<u>MQMDIRP</u>	Data Directory Prefix	<i>Character value</i> , *DFT	Optional, Positional 10
<u>ASP</u>	ASP Number	1-32, *SYSTEM , *ASPDEV	Optional, Positional 11
<u>ASPDEV</u>	ASP device	<i>Character value</i> , *ASP	Optional, Positional 12
<u>THRESHOLD</u>	Journal receiver threshold	100000-1000000000, *DFT , *MIN , *MAX	Optional, Positional 13
<u>JRNBUFSIZ</u>	Journal buffer size	32000-15761440, *DFT	Optional, Positional 14

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Text 'description' (TEXT)

Specifies text that briefly describes the queue manager definition.

The possible values are:

***BLANK**

No text is specified.

description

Specify no more than 64 characters enclosed in apostrophes.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Trigger interval (TRGITV)

Specifies the trigger time interval, expressed in milliseconds, for use with queues that have TRGTYPE(*FIRST) specified.

When the arrival of a message on a queue causes a trigger message to be put on the initiation queue, then any message that arrives on the same queue within the specified interval does not cause another trigger message to be put on the initiation queue.

The possible values are:

999999999

The trigger time interval is 999999999 milliseconds.

interval-value

Specify a value in milliseconds, in the range 0 through 999999999.

Undelivered message queue (UDLMSGQ)

Specifies the name of the local queue that is to be used for undelivered messages. Messages are put on this queue if they cannot be routed to their correct destination.

The possible values are:

***NONE**

There is no undelivered-message queue. The attribute is set to a blank string.

undelivered-message-queue-name

Specify the name of a local queue that is to be used as the undelivered-message queue.

Default transmission queue (DFTTMQ)

Specifies the name of the local transmission queue that is to be used as the default transmission queue. Messages transmitted to a remote queue manager are put on the default transmission queue if there is no transmission queue defined for their destination.

The possible values are:

***NONE**

There is no default transmission queue. The attribute is set to a blank string.

default-transmission-queue-name

Specify the name of a local transmission queue that is to be used as the default transmission queue.

Maximum handle limit (MAXHDL)

Specifies the maximum number of handles that any one job can have open at the same time.

The possible values are:

256

The default number of open handles is 256.

maximum-handle-limit

Specify a value in the range 0 through 999999999.

Maximum uncommitted messages (MAXUMSG)

Specifies the maximum number of uncommitted messages. That is:

- The number of messages that can be retrieved, plus
- The number of messages that can be put on a queue, plus

- Any trigger messages generated within this unit of work, under any one syncpoint. This limit does not apply to messages that are retrieved or put outside syncpoint.

The possible values are:

10000

The default value is 10000 uncommitted messages.

maximum-uncommitted-messages

Specify a value in the range 1 through 999999999.

Default Queue Manager (DFTQMGR)

Specifies whether the queue manager being created is the default queue manager.

The possible values are:

***NO**

The queue manager is not to be the default queue manager.

***YES**

The queue manager is to be the default queue manager.

Queue Manager Library (MQMLIB)

Specifies the library to be used by the queue manager.

The possible values are:

***AUTO**

The library to be used by the queue manager is chosen automatically.

library name

Specify the library to be used by the queue manager.

Data Directory Prefix (MQMDIRP)

Specifies the data directory prefix to be used by the queue manager. The queue manager creates a directory here to store its data files, principally message data residing on queues.

The possible values are:

***DFT**

The default data directory prefix is '/QIBM/UserData/mqm'.

directory-prefix

Specify the data directory prefix to be used by the queue manager. This directory prefix may be located in a filesystem either in a local disk pool or in a networked filesystem e.g. NFS.

The queue manager directory can be placed into an independent auxiliary storage pool by setting the data directory prefix accordingly. For example specifying MQMDIRP('/MYASPDEV/QIBM/UserData/mqm/qmgrs') would store queue manager data in the MYASPDEV device.

The queue manager library, journals and journal receivers can be placed into an independent auxiliary storage pool by setting the ASP and ASPDEV parameters.

Independent auxiliary storage pools can be switched between systems to increase the availability of a queue manager. Refer to the IBM MQ documentation on configuring a queue manager for high availability.

ASP Number (ASP)

Specifies the auxiliary storage pool from which the system allocates storage for the queue manager library, journal and journal receivers.

Note that the auxiliary storage pool identified in this parameter will not be used for the queue manager data files which are located in the integrated file system (IFS). To allocate queue manager data files in a specific auxiliary storage pool refer to the MQMDIRP parameter.

The possible values are:

***SYSTEM**

The system auxiliary storage pool (ASP 1) provides the storage for the queue manager library, journal and journal receivers.

***ASPDEV**

Storage for the queue manager library, journal and journal receivers is allocated from the primary or secondary ASP specified for the ASPDEV parameter.

auxiliary-storage-pool-number

Specify a value in the range 1 through 32 to specify the number of the system or basic user ASP to provide storage for the queue manager library, journal and journal receivers.

Independent auxiliary storage pools can be switched between systems to increase the availability of a queue manager. Refer to the IBM MQ documentation on configuring a queue manager for high availability.

ASP device (ASPDEV)

Specifies the auxiliary storage pool (ASP) device name where storage is allocated for the queue manager library, journal and journal receivers.

Note that the auxiliary storage pool device name identified in this parameter will not be used for the queue manager data files which are located in the integrated file system (IFS). To allocate queue manager data files in a specific auxiliary storage pool refer to the MQMDIRP parameter.

The possible values are:

***ASP**

The storage for the queue manager library, journal and journal receivers is allocated from the system or basic user ASP specified for the ASP parameter.

device-name

Specify the name of a primary or secondary ASP device. The storage for the queue manager library, journal and journal receivers is allocated from the primary or secondary ASP. The primary or secondary ASP must have already been activated (by varying on the ASP device) and have a status of 'Available'.

Independent auxiliary storage pools can be switched between systems to increase the availability of a queue manager. Refer to the IBM MQ documentation on configuring a queue manager for high availability.

Journal receiver threshold (THRESHOLD)

Specifies the threshold in kilobytes for the queue managers journal receivers.

The possible values are:

***DFT**

Use the default threshold of 100000 KB.

threshold-value

Specify a value in the range 100000 through 1000000000 in kilobytes (KB) of storage. Each 1000 KB specifies 1024000 bytes of storage space. When the size of the space for the journal receiver is larger than the size specified by this value, a message is sent to the identified message queue if appropriate, and journaling continues.

Journal buffer size (JRNBUFSIZ)

Specifies the journal buffer size in bytes

The possible values are:

***DFT**

Use the default journal buffer size of 32000 bytes.

journal-buffer-size

Specify a value in bytes, in the range 32000 through 15761440.

CRMQMAUTI (Create MQ AuthInfo object)
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Create MQ AuthInfo object (CRMQMAUTI) command creates a new authentication information object, specifying those attributes that are different from the system default.

Parameters

<i>Table 245. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>AINAME</u>	AuthInfo name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Required, Key, Positional 2
<u>AUTHTYPE</u>	AuthInfo type	*CRLLDAP, *OCSP, *IDPWOS, *IDPWLDAP	Required, Key, Positional 3
<u>CONNNAME</u>	Connection name	<i>Character value</i> , *SYSDFTAI	Optional, Positional 4
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 5
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *SYSDFTAI , *NONE	Optional, Positional 6
<u>USERNAME</u>	User name	<i>Character value</i> , *SYSDFTAI , *NONE	Optional, Positional 7
<u>PASSWORD</u>	User password	<i>Character value</i> , *SYSDFTAI , *NONE	Optional, Positional 8
<u>OCSPURL</u>	OCSP Responder URL	<i>Character value</i> , *SAME	Optional, Positional 9
<u>CHCKCLNT</u>	Authentication checks required	*ASQMGR, *REQUIRED, *REQADM	Optional, Positional 10
<u>CHCKLOCL</u>	Authentication checks required	*NONE, *OPTIONAL, *REQUIRED, *REQADM	Optional, Positional 11
<u>FAILDELAY</u>	Failure delay	<i>Integer value</i>	Optional, Positional 12
<u>BASEDNU</u>	Base user DN	<i>Character value</i> , *SAME	Optional, Positional 13
<u>ADOPTCTX</u>	Context adoption	<i>Integer value</i>	Optional, Positional 14
<u>CLASSUSR</u>	LDAP object class	<i>Character value</i> , *SAME	Optional, Positional 15
<u>SHORTUSR</u>	Short user name	<i>Character value</i> , *SAME	Optional, Positional 16
<u>USRFIELD</u>	User field	<i>Character value</i> , *SAME	Optional, Positional 17
<u>SECCOMM</u>	LDAP communications	<i>Character value</i> , *SAME	Optional, Positional 18

Table 245. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>AUTHORMD</u>	Authorization method	Character value, *OS , *SEARCHGRP, *SEARCHUSR, *SRCHGRPSN	Optional, Positional 19
<u>BASEDNG</u>	Base DN for groups	Character value, *SAME	Optional, Positional 20
<u>CLASSGRP</u>	Object class for group	Character value, *SAME	Optional, Positional 21
<u>FINDGRP</u>	Attribute to find group membership	Character value, *SAME	Optional, Positional 22
<u>GRPFIELD</u>	Simple name for group	Character value, *SAME	Optional, Positional 23
<u>NESTGRP</u>	Group nesting	*NO *YES	Optional, Positional 24
<u>AUTHENMD</u>	Authentication method	*OS Cannot be changed	Optional, Positional 25

AuthInfo name (AINAME)

The name of the new authentication information object to create.

The possible values are:

authentication-information-name

Specify the name of the authentication information object. The maximum string length is 48 characters.

Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

Adopt context (ADOPTCTX)

Whether to use the presented credentials as the context for this application. This means that they are used for authorization checks, shown on administrative displays, and appear in messages.

YES

The user ID presented in the MQCSP structure, which has been successfully validated by password, is adopted as the context to use for this application. Therefore, this user ID will be the credentials checked for authorization to use IBM MQ resources.

If the user ID presented is an LDAP user ID, and authorization checks are done using operating system user IDs, the SHORTUSR associated with the user entry in LDAP will be adopted as the credentials for authorization checks to be done against.

NO

Authentication will be performed on the user ID and password presented in the MQCSP structure, but then the credentials will not be adopted for further use. Authorization will be performed using the user ID the application is running under.

This attribute is only valid for an **AUTHTYPE** of *IDPWOS and *IDPWLDP.

Authentication method (AUTHENMD)

The authentication method used for this application.

***OS**

Use operating system groups to determine permissions associated with a user.

You can use only ***OS** to set the authentication method.

This attribute is valid only for an **AUTHTYPE** of **IDPWOS*.

Authorization method (AUTHORMD)

The authorization method used for this application.

***OS**

Use operating system groups to determine permissions associated with a user.

This is how IBM MQ has previously worked, and is the default value.

***SEARCHGRP**

A group entry in the LDAP repository contains an attribute listing the Distinguished Name of all the users belonging to that group. Membership is indicated by the attribute defined in FINDGRP. This value is typically *member* or *uniqueMember*.

***SEARCHUSR**

A user entry in the LDAP repository contains an attribute listing the Distinguished Name of all the groups to which the specified user belongs. The attribute to query is defined by the FINDGRP value, typically *memberOf*.

***SRCHGRPSN**

A group entry in the LDAP repository contains an attribute listing the short user name of all the users belonging to that group. The attribute in the user record that contains the short user name is specified by SHORTUSR.

Membership is indicated by the attribute defined in FINDGRP. This value is typically *memberUid*.

Note: This authorization method should only be used if all user short names are distinct.

Many LDAP servers use an attribute of the group object to determine group membership and you should, therefore, set this value to *SEARCHGRP*.

Microsoft Active Directory typically stores group memberships as a user attribute. The IBM Tivoli Directory Server supports both methods.

In general, retrieving memberships through a user attribute will be faster than searching for groups that list the user as a member.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

AuthInfo type (AUTHTYPE)

The type of the authentication information object. There is no default value

The possible values are:

***CRLLDAP**

The type of the authentication information object is CRLLDAP.

***OCSP**

The type of the authentication information objects is OCSPURL.

***IDPWOS**

Connection authentication user ID and password checking is done using the operating system.

***IDPWLDAP**

Connection authentication user ID and password checking is done using an LDAP server.

Base DN for groups (BASEDNG)

In order to be able to find group names, this parameter must be set with the base DN to search for groups in the LDAP server.

This attribute is valid only for **AUTHTYPE** of **IDPWLDAP*.

Base user DN (BASEDNU)

In order to be able to find the short user name attribute (see [SHORTUSR](#)) this parameter must be set with the base DN to search for users within the LDAP server.

This attribute is valid only for **AUTHTYPE** of **IDPWLDAP*.

Check client (CHCKCLNT)

Whether connection authentication checks are required by all locally bound connections, or only checked when a user ID and password are provided in the MQCSP structure.

These attributes are valid only for an **AUTHTYPE** of **IDPWOS* or **IDPWLDAP*. The possible values are:

***ASQMGR**

In order for the connection to be allowed in, it must meet the connection authentication requirements defined on the queue manager. If the CONNAUTH field provides an authentication information object, and the value of CHCKCLNT is **REQUIRED*, the connection will not be successful unless a valid user ID and password are supplied. If the CONNAUTH field does not provide an authentication information object, or the value of CHCKCLNT is not **REQUIRED*, then the user ID and password are not required.

***REQUIRED**

Requires that all applications provide a valid user ID and password.

***REQDADM**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the **OPTIONAL* setting.

Check local (CHCKLOCL)

Whether connection authentication checks are required by all locally bound connections, or only checked when a user ID and password are provided in the MQCSP structure.

These attributes are valid only for an **AUTHTYPE** of **IDPWOS* or **IDPWLDAP*. The possible values are:

***NONE**

Switches off checking.

***OPTIONAL**

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

***REQUIRED**

Requires that all applications provide a valid user ID and password.

***REQDADM**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the **OPTIONAL* setting.

Class group (CLASSGRP)

The LDAP object class used for group records in the LDAP repository.

If the value is blank, **groupOfNames** is used.

Other commonly used values include *groupOfUniqueNames* or *group*.

This attribute is valid only for **AUTHTYPE** of **IDPWLDAP*.

Class user (CLASSUSR)

The LDAP object class used for user records in the LDAP repository.

If blank, the value defaults to *inetOrgPerson*, which is generally the value needed.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

Connection name (CONNAME)

The DNS name or IP address of the host on which the LDAP server is running, together with an optional port number. The default port number is 389. No default is provided for the DNS name or IP address.

This field is only valid for **CRLLDAP* or **IDPWLDAP* authentication information objects, when it is required.

When used with *IDPWLDAP* authentication information objects, this can be a comma separated list of connection names.

The possible values are:

***SYSDFTAI**

The connection name is set to the system default value in SYSTEM.DEFAULT.AUTHINFO.CRLLDAP.

connection-name

Specify the fully qualified DNS name or IP address of the host together with an optional port number. The maximum string length is 264 characters.

Failure delay (FAILDELAY)

When a user ID and password are provided for connection authentication, and the authentication fails due to the user ID or password being incorrect, this is the delay, in seconds, before the failure is returned to the application.

This can aid in avoiding busy loops from an application that simply retries, continuously, after receiving a failure.

The value must be in the range 0 - 60 seconds. The default value is 1.

This attribute is only valid for an **AUTHTYPE** of **IDPWOS* and **IDPWLDAP*.

Group membership attribute (FINDGRP)

Name of the attribute used within an LDAP entry to determine group membership.

When AUTHORMD = **SEARCHGRP*, this attribute is typically set to *member* or *uniqueMember*.

When AUTHORMD = **SEARCHUSR*, this attribute is typically set to *memberOf*.

When AUTHORMD = **SRCHGRPSN*, this attribute is typically set to *memberUid*.

When left blank, if:

- AUTHORMD = **SEARCHGRP*, this attribute defaults to *memberOf*
- AUTHORMD = **SEARCHUSR*, this attribute defaults to *member*
- AUTHORMD = **SRCHGRPSN*, this attribute defaults to *memberUid*

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

Simple name for group (GRPFIELD)

If the value is blank, commands like setmqaut must use a qualified name for the group. The value can either be a full DN, or a single attribute.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

Group nesting (NESTGRP)

The possible values are:

***NO**

Only the initially discovered groups are considered for authorization.

***YES**

The group list is searched recursively to enumerate all the groups to which a user belongs.

The group's Distinguished Name is used when searching the group list recursively, regardless of the authorization method selected in `AUTHORMD`.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

OCSP Responder URL (OCSPURL)

The URL of the OCSP Responder used to check for certificate revocation. This must be an HTTP URL containing the host name and port number of the OCSP Responder. If the OCSP Responder is using port 80, which is the default for HTTP, then the port number may be omitted.

This field is only valid for OCSP authentication information objects.

The possible values are:

***SYSDFTAI**

The OCSP Responder URL is set to the system default value in `SYSTEM.DEFAULT.AUTHINFO.OCSP`.

OCSP-Responder-URL

The OCSP Responder URL. The maximum string length is 256 characters.

Replace (REPLACE)

If an authentication information object with the same name already exists, this specifies whether it is replaced.

The possible values are:

***NO**

This definition does not replace any existing authentication information object with the same name. The command fails if the named authentication information object already exists.

***YES**

Replace an existing authentication information object. A new object is created if the named authentication information object does not exist.

Secure comms (SECCOMM)

Whether connectivity to the LDAP server should be done securely using TLS

YES

Connectivity to the LDAP server is made securely using TLS.

The certificate used is the default certificate for the queue manager, named in `CERTLABL` on the queue manager object, or if that is blank, the one described in [Digital certificate labels, understanding the requirements](#).

The certificate is located in the key repository specified in `SSLKEYR` on the queue manager object. A cipherspec will be negotiated that is supported by both IBM MQ and the LDAP server.

If the queue manager is configured to use `SSLFIPS(YES)` or `SUITEB` cipher specs, then this is taken account of in the connection to the LDAP server as well.

ANON

Connectivity to the LDAP server is made securely using TLS just as for `SECCOMM(YES)` with one difference.

No certificate is sent to the LDAP server; the connection will be made anonymously. To use this setting, ensure that the key repository specified in `SSLKEYR`, on the queue manager object, does not contain a certificate marked as the default.

NO

Connectivity to the LDAP server does not use TLS.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*

Short user (SHORTUSR)

A field in the user record to be used as a short user name in IBM MQ.

This field must contain values of 12 characters or less. This short user name is used for the following purposes:

- If LDAP authentication is enabled, but LDAP authorization is not enabled, this is used as an operating system user ID for authorization checks. In this case, the attribute must represent an operating system user ID.
- If LDAP authentication and authorization are both enabled, this is used as the user ID carried with the message in order for the LDAP user name to be rediscovered when the user ID inside the message needs to be used.

For example, on another queue manager, or when writing report messages. In this case, the attribute does not need to represent an operating system user ID, but must be a unique string. An employee serial number is an example of a good attribute for this purpose.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP* and is mandatory.

Text 'description' (TEXT)

A short text description of the authentication information object.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SYSDFTAI**

The text string is set to the system default value in `SYSTEM.DEFAULT.AUTHINFO.CRLLDAP`.

***NONE**

The text is set to a blank string.

description

The string length can be up to 64 characters enclosed in apostrophes.

User field (USRFIELD)

If the user ID provided by an application for authentication does not contain a qualifier for the field in the LDAP user record, that is, it does not contain an '=' sign, this attribute identifies the field in the LDAP user record that is used to interpret the provided user ID.

This field can be blank. If this is the case, any unqualified user IDs use the [SHORTUSR](#) parameter to interpret the provided user ID.

The contents of this field will be concatenated with an '=' sign, together with the value provided by the application, to form the full user ID to be located in an LDAP user record. For example, the application provides a user of `fred` and this field has the value `cn`, then the LDAP repository will be searched for `cn=fred`.

This attribute is valid only for an **AUTHTYPE** of **IDPWLDAP*.

User name (USERNAME)

The distinguished name of the user that is binding to the directory. The default user name is blank.

This field is only valid for *CRLLDAP or *IDPWLDAP authentication information objects.

The possible values are:

*SYSDFTAI

The user name is set to the system default value in SYSTEM.DEFAULT.AUTHINFO.CRLLDAP.

*NONE

The user name is blank.

LDAP-user-name

Specify the Distinguished name of the LDAP user. The maximum string length is 1024 characters.

User password (PASSWORD)

The password for the LDAP user.

This field is only valid for *CRLLDAP or *IDPWLDAP authentication information objects.

The possible values are:

*SYSDFTAI

The password is set to the system default value in SYSTEM.DEFAULT.AUTHINFO.CRLLDAP.

*NONE

The password is blank.

LDAP-password

The LDAP user password. The maximum string length is 32 characters.

CRTMQMCHL (Create MQ Channel)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Create MQ Channel (CRTMQMCHL) command creates a new MQ channel definition, specifying those attributes that are to be different from the default values.

Parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Key, Positional 1
<u>CHLTYPE</u>	Channel type	*RCVR, *SDR, *SVR, *RQSTR, *SVRCN, *CLUSSDR, *CLUSRCVR, *CLTCN	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 4
<u>TRPTYPE</u>	Transport type	*LU62, *TCP, *SYSDFTCHL	Optional, Positional 5

Table 246. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SYSDFTCHL	Optional, Positional 6
<u>TGTMQMNAME</u>	Target Queue Manager	<i>Character value</i> , *NONE, *SYSDFTCHL	Optional, Positional 7
<u>CONNNAME</u>	Connection name	<i>Character value</i> , *NONE, *SYSDFTCHL	Optional, Positional 8
<u>TPNAME</u>	Transaction Program Name	<i>Character value</i> , *BLANK, *SYSDFTCHL	Optional, Positional 9
<u>MODENAME</u>	Mode Name	<i>Character value</i> , *BLANK, *SYSDFTCHL	Optional, Positional 10
<u>TMQNAME</u>	Transmission queue	<i>Character value</i> , *SYSDFTCHL	Optional, Positional 11
<u>MCANAME</u>	Message channel agent	Single values: *SYSDFTCHL , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 12
	Qualifier 1: Message channel agent	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
<u>MCAUSRID</u>	Message channel agent user ID	<i>Character value</i> , *NONE, *PUBLIC, *SYSDFTCHL	Optional, Positional 13
<u>MCATYPE</u>	Message channel agent Type	*PROCESS, *THREAD, *SYSDFTCHL	Optional, Positional 14
<u>BATCHINT</u>	Batch Interval	0-999999999, *SYSDFTCHL	Optional, Positional 15
<u>BATCHSIZE</u>	Batch size	1-9999, *SYSDFTCHL	Optional, Positional 16
<u>DSCITV</u>	Disconnect interval	0-999999, *SYSDFTCHL	Optional, Positional 17
<u>SHORTTMR</u>	Short retry interval	0-999999999, *SYSDFTCHL	Optional, Positional 18
<u>SHORTRTY</u>	Short retry count	0-999999999, *SYSDFTCHL	Optional, Positional 19
<u>LONGTMR</u>	Long retry interval	0-999999999, *SYSDFTCHL	Optional, Positional 20
<u>LONGRTY</u>	Long retry count	0-999999999, *SYSDFTCHL	Optional, Positional 21
<u>SCYEXIT</u>	Security exit	Single values: *SYSDFTCHL , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 22
	Qualifier 1: Security exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	

Table 246. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>CSCYEXIT</u>	Security exit	Character value, *SYSDFTCHL , *NONE	Optional, Positional 23
<u>SCYUSRDATA</u>	Security exit user data	Character value, *SYSDFTCHL , *NONE	Optional, Positional 24
<u>SNDEXIT</u>	Send exit	Single values: *SYSDFTCHL , *NONE Other values (up to 10 repetitions): <i>Qualified object name</i>	Optional, Positional 25
	Qualifier 1: Send exit	Name	
	Qualifier 2: Library	Name, *CURLIB	
<u>CSNDEXIT</u>	Send exit	Single values: *SYSDFTCHL , *NONE Other values (up to 10 repetitions): <i>Character value</i>	Optional, Positional 26
<u>SNDUSRDATA</u>	Send exit user data	Values (up to 10 repetitions): <i>Character value</i> , *SYSDFTCHL , *NONE	Optional, Positional 27
<u>RCVEXIT</u>	Receive exit	Single values: *SYSDFTCHL , *NONE Other values (up to 10 repetitions): <i>Qualified object name</i>	Optional, Positional 28
	Qualifier 1: Receive exit	Name	
	Qualifier 2: Library	Name, *CURLIB	
<u>CRCVEXIT</u>	Receive exit	Single values: *SYSDFTCHL , *NONE Other values (up to 10 repetitions): <i>Character value</i>	Optional, Positional 29
<u>RCVUSRDATA</u>	Receive exit user data	Values (up to 10 repetitions): <i>Character value</i> , *SYSDFTCHL , *NONE	Optional, Positional 30
<u>MSGEXIT</u>	Message exit	Single values: *SYSDFTCHL , *NONE Other values (up to 10 repetitions): <i>Qualified object name</i>	Optional, Positional 31
	Qualifier 1: Message exit	Name	
	Qualifier 2: Library	Name, *CURLIB	

Table 246. Command parameters (continued)

Keyword	Description	Choices	Notes
MSGUSRDATA	Message exit user data	Values (up to 10 repetitions): <i>Character value</i> , *SYSDFTCHL , *NONE	Optional, Positional 32
MSGRTYEXIT	Message retry exit	Single values: *SYSDFTCHL , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 33
	Qualifier 1: Message retry exit	Name	
	Qualifier 2: Library	<i>Name</i> , *CURLIB	
MSGRTYDATA	Message retry exit data	<i>Character value</i> , *SYSDFTCHL , *NONE	Optional, Positional 34
MSGRTYNBR	Number of message retries	0-999999999, *SYSDFTCHL	Optional, Positional 35
MSGRTYITV	Message retry interval	0-999999999, *SYSDFTCHL	Optional, Positional 36
CVTMSG	Convert message	*YES , *NO , *SYSDFTCHL	Optional, Positional 37
PUTAUT	Put authority	*DFT , *CTX , *SYSDFTCHL	Optional, Positional 38
SEQNUMWRAP	Sequence number wrap	100-999999999, *SYSDFTCHL	Optional, Positional 39
MAXMSGLEN	Maximum message length	0-104857600, *SYSDFTCHL	Optional, Positional 40
HRTBTINTVL	Heartbeat interval	0-999999999, *SYSDFTCHL	Optional, Positional 41
NPMSPEED	Non Persistent Message Speed	*FAST , *NORMAL , *SYSDFTCHL	Optional, Positional 42
CLUSTER	Cluster Name	<i>Character value</i> , *NONE , *SYSDFTCHL	Optional, Positional 43
CLUSNL	Cluster Name List	<i>Character value</i> , *NONE , *SYSDFTCHL	Optional, Positional 44
NETPRTY	Network Connection Priority	0-9, *SYSDFTCHL	Optional, Positional 45
SSLCIPH	TLS CipherSpec	Supported CipherSpecs are listed here: CipherSpecs you can use with IBM MQ TLS support .  Deprecated CipherSpecs that you can re-enable if necessary are listed here: Deprecated CipherSpecs .	Optional, Positional 46

Table 246. Command parameters (continued)

Keyword	Description	Choices	Notes
SSLCAUTH	TLS Client Authentication	*REQUIRED, *OPTIONAL, * SYSDFTCHL	Optional, Positional 47
SSLPEER	TLS Peer name	Character value, *NONE, * SYSDFTCHL	Optional, Positional 48
LOCLADDR	Local communication address	Character value, *NONE, * SYSDFTCHL	Optional, Positional 49
BATCHHB	Batch Heartbeat Interval	0-999999999, * SYSDFTCHL	Optional, Positional 50
USERID	Task user identifier	Character value, *NONE, * SYSDFTCHL	Optional, Positional 51
PASSWORD	Password	Character value, *NONE, * SYSDFTCHL	Optional, Positional 52
KAINT	Keep Alive Interval	Integer, *AUTO, * SYSDFTCHL	Optional, Positional 53
COMPHDR	Header Compression	Values (up to 2 repetitions): *NONE, *SYSTEM, * SYSDFTCHL	Optional, Positional 54
COMPMSG	Message Compression	Single values: *ANY Other values (up to 4 repetitions): *NONE, *RLE, *ZLIBHIGH, *ZLIBFAST, V 9.4.0 , *LZ4HIGH, *LZ4HIGH, * SYSDFTCHL	Optional, Positional 55
MONCHL	Channel Monitoring	*QMGR, *OFF, *LOW, *MEDIUM, *HIGH, * SYSDFTCHL	Optional, Positional 56
STATCHL	Channel Statistics	*QMGR, *OFF, *LOW, *MEDIUM, *HIGH, * SYSDFTCHL	Optional, Positional 57
CLWLRANK	Cluster Workload Rank	0-9, * SYSDFTCHL	Optional, Positional 58
CLWLPRTY	Cluster Workload Priority	0-9, * SYSDFTCHL	Optional, Positional 59
CLWLWGHT	Cluster Channel Weight	1-99, * SYSDFTCHL	Optional, Positional 60
SHARECNV	Sharing Conversations	0-999999999, * SYSDFTCHL	Optional, Positional 61
PROPCTL	Property Control	*COMPAT, *NONE, *ALL, * SYSDFTCHL	Optional, Positional 62
MAXINST	Maximum Instances	0-999999999, * SYSDFTCHL	Optional, Positional 63
MAXINSTC	Maximum Instances Per Client	0-999999999, * SYSDFTCHL	Optional, Positional 64
CLNTWGHT	Client Channel Weight	0-99, * SYSDFTCHL	Optional, Positional 65

Table 246. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>AFFINITY</u>	Connection Affinity	*PREFERRED, *NONE, *SYSDFTCHL	Optional, Positional 66
<u>BATCHLIM</u>	Batch Data Limit	0-9999999, *SYSDFTCHL	Optional, Positional 67
<u>DFTRECON</u>	Default client reconnection	*NO, *YES, *QMGR, *DISABLED, *SYSDFTCHL	Optional, Positional 68

Channel name (CHLNAME)

Specifies the name of the new channel definition; the name can contain a maximum of 20 characters. Channel names must be unique. If a channel definition with this name already exists, REPLACE(*YES) must be specified.

Channel type (CHLTYPE)

Specifies the type of the channel being defined.

The possible values are:

***SDR**

Sender channel

***SVR**

Server channel

***RCVR**

Receiver channel

***RQSTR**

Requester channel

***SVRCN**

Server-connection channel

***CLUSSDR**

Cluster-sender channel

***CLUSRCVR**

Cluster-receiver channel

***CLTCN**

Client-connection channel

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

Replace (REPLACE)

Specifies whether the new channel definition should replace an existing channel definition with the same name.

The possible values are:

***NO**

Do not replace the existing channel definition. The command fails if the named channel definition already exists.

***YES**

Replace the existing channel definition. If there is no definition with the same name, a new definition is created.

Transport type (TRPTYPE)

Specifies the transmission protocol.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***LU62**

SNA LU 6.2.

***TCP**

Transmission Control Protocol / Internet Protocol (TCP/IP).

Text 'description' (TEXT)

Specifies text that briefly describes the channel definition.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Target Queue Manager (TGTMQMNAME)

Specifies the name of the target queue manager.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The name of the target queue manager for a client connection channel (CHLTYPE) *CLTCN is unspecified.

message-queue-manager-name

The name of the target message queue manager for a client connection channel (CHLTYPE) *CLTCN.

For other channel types this parameter must not be specified.

Connection name (CONNAME)

Specifies the name of the machine to connect.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The connection name is blank.

connection-name

Specify the connection name as required by the transmission protocol:

- For *LU62, specify the name of the CSI object.
- For *TCP, specify either the host name, or the network address of the remote machine (or the local machine for cluster-receiver channels). This can be followed by an optional port number enclosed in parentheses.

 On Multiplatforms, the TCP/IP connection name parameter of a cluster-receiver channel is optional. If you leave the connection name blank, IBM MQ generates a connection name for you, assuming the default port and using the current IP address of the system. You can override the default port number, but still use the current IP address of the system. For each connection name leave the IP name blank, and provide the port number in parentheses; for example:

```
(1415)
```

The generated **CONNNAME** is always in the dotted decimal (IPv4) or hexadecimal (IPv6) form, rather than in the form of an alphanumeric DNS host name.

Where a port is not specified the default port 1414 is assumed.

For cluster-receiver channels the connection name relates to the local queue manager, and for other channels it relates to the target queue manager.

This parameter is required for channels with channel type (CHLTYPE) of *SDR, *RQSTR, *CLTCN and *CLUSDR. It is optional for *SVR and *CLUSRCVR channels, and is not valid for *RCVR or *SVRCN channels.

Transaction Program Name (TPNAME)

This parameter is valid for channels with a TRPTYPE defined as LU 6.2 only.

This parameter must be set to the SNA transaction program name, unless the CONNAME contains a side-object name in which case it must be set to blanks. The name is taken instead from the CPI-C Communications Side Object.

This parameter is not valid for channels with a CHLTYPE defined as *RCVR.

The possible values are:

***SAME**

The value of this attribute does not change.

***NONE**

No transaction program name is specified.

***BLANK**

The transaction program name is taken from CPI-C Communications Side Object. The side object name must be specified in the CONNAME parameter.

Transaction Program Name

Specify the SNA transaction program name.

Mode Name (MODENAME)

This parameter is valid for channels with a TRPTYPE defined as LU 6.2. If TRPTYPE is not defined as LU 6.2 the data is ignored and no error message is issued.

If specified, the value must be set to the SNA mode name, unless the CONNAME contains a side-object name, in which case it must be set to blanks. The name is then taken from the CPI-C Communications Side Object.

This parameter is not valid for channels with CHLTYPE defined as *RCVR or *SVRCONN.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***BLANK**

Name will be taken from the CPI-C Communications Side Object. This must be specified in the CONNAME parameter.

***NONE**

No mode name is specified.

SNA-mode-name

Specify the SNA Mode Name

Transmission queue (TMQNAME)

Specifies the name of the transmission queue.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

transmission-queue-name

Specify the name of the transmission queue.

A transmission queue name is required if the channel type (CHLTYPE) is *SDR or *SVR. For other channel types, the parameter must not be specified.

Message channel agent (MCANAME)

This parameter is reserved and should not be used.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The MCA program name is blank.

This parameter cannot be specified for a channel type (CHLTYPE) of *RCVR, *SVRCN, or *CLTCN.

Message channel agent user ID (MCAUSRID)

Specifies the message channel agent user identifier which is to be used by the message channel agent for authorization to access MQ resources, including (if PUTAUT is *DFT) authorization to put the message to the destination queue for receiver or requester channels.

The possible values are:

***SYSDFTCHL**

The value is taken from the system default channel for the type of the channel being created.

***NONE**

The message channel agent uses its default user identifier.

***PUBLIC**

Uses the public authority.

mca-user-identifier

Specify the user identifier to be used.

This parameter cannot be specified for a channel type (CHLTYPE) of *CLTCN.

Message channel agent Type (MCATYPE)

Specifies whether the message-channel-agent program should run as a thread or a process.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***PROCESS**

The message channel agent runs as a separate process.

***THREAD**

The message channel agent runs as a separate thread.

This parameter can only be specified for a channel type (CHLTYPE) of *SDR, *SVR, *RQSTR, *CLUSSDR or *CLUSRCVR.

Batch Interval (BATCHINT)

The minimum amount of time, in milliseconds, that a channel will keep a batch open.

The batch is terminated by which ever of the following occurs first: BATCHSZ messages have been sent, BATCHLIM bytes have been sent, or the transmission queue is empty and BATCHINT is exceeded.

The default value is 0, which means that the batch is terminated as soon as the transmission queue becomes empty (or the BATCHSZ limit is reached).

The value must be in the range 0 through 999999999.

This parameter is valid for channels with CHLTYPE defined as *SDR, *SVR, *CLUSSDR, or *CLUSRCVR.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

batch-interval

Specify a value in the range 0 through 999999999. A value of 0 indicates the batch will be terminated as soon as the transmission queue is empty,

Batch size (BATCHSIZE)

Specifies the maximum number of messages that should be sent down a channel before a checkpoint is taken.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

batch-size

Specify a value in the range 1 through 9999

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Disconnect interval (DSCITV)

Specifies the disconnect interval, which defines the maximum number of seconds that the channel waits for messages to be put on a transmission queue before closing the channel.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

disconnect-interval

Specify a value in the range 0 through 999999. A value of 0 indicates an indefinite wait.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR or *CLTCN.

Short retry interval (SHORTTMR)

Specifies the short retry wait interval for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. This defines the interval between attempts to establish a connection to the remote machine.

The possible values are:

*SYSDFTCHL

The value of this attribute is taken from the system default channel of the specified type.

short-retry-interval

Specify a value in the range 0 through 999999999.

Note: For implementation reasons, the maximum retry interval that can be used is 999999; values exceeding this are treated as 999999.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Short retry count (SHORTRTY)

Specifies the short retry count for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. This defines the maximum number of attempts that are made to establish a connection to the remote machine, at intervals specified by SHORTTMR, before the (normally longer) LONGRTY and LONGTMR are used.

The possible values are:

*SYSDFTCHL

The value of this attribute is taken from the system default channel of the specified type.

short-retry-count

Specify a value in the range 0 through 999999999. A value of 0 means that no retries are allowed.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Long retry interval (LONGTMR)

Specifies the long retry wait interval for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. It defines the interval in seconds between attempts to establish a connection to the remote machine, after the count specified by SHORTRTY has been exhausted.

The possible values are:

*SYSDFTCHL

The value of this attribute is taken from the system default channel of the specified type.

long-retry-interval

Specify a value in the range 0 through 999999999.

Note: For implementation reasons, the maximum retry interval that can be used is 999999; values exceeding this are treated as 999999.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Long retry count (LONGRTY)

Specifies the long retry count for a sender, server or cluster channel (*SDR, *SVR, *CLUSSDR or *CLUSRCVR) that is started automatically by the channel initiator. This defines the maximum number of further attempts that are made to connect to the remote machine, at intervals specified by LONGTMR, after the count specified by SHORTRTY has been exhausted. An error message is logged if the connection is not established after the defined number of attempts.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

long-retry-count

Specify a value in the range 0 through 999999999. A value of 0 means that no retries are allowed.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Security exit (SCYEXIT)

Specifies the name of the program to be called as the security exit. If a nonblank name is defined, the exit is invoked at the following times:

- Immediately after establishing a channel.

Before any messages are transferred, the exit is given the opportunity to instigate security flows to validate connection authorization.

- On receipt of a response to a security message flow.

Any security message flows received from the remote processor on the remote machine are passed to the exit.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The security exit program is not invoked.

security-exit-name

Specify the name of the security exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

Security exit (CSCYEXIT)

Specifies the name of the program to be called as the client security exit. If a nonblank name is defined, the exit is invoked at the following times:

- Immediately after establishing a channel.

Before any messages are transferred, the exit is given the opportunity to instigate security flows to validate connection authorization.

- On receipt of a response to a security message flow.

Any security message flows received from the remote processor on the remote machine are passed to the exit.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the SYSTEM.DEF.CLNTCONN channel.

***NONE**

The client security exit program is not invoked.

security-exit-name

Specify the name of the client security exit program.

Security exit user data (SCYUSRDATA)

Specifies a maximum of 32 characters of user data that is passed to the channel security exit program.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The user data for the security exit is not specified.

security-exit-user-data

Specify the user data for the security exit program.

Send exit (SNDEXIT)

Specifies the entry point of the program to be called as the send exit. If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The send exit is not invoked.

send-exit-name

Specify the name of the send exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

Send exit (CSNDEXIT)

Specifies the entry point of the program to be called as the client send exit. If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the SYSTEM.DEF.CLNTCONN channel.

***NONE**

The client send exit is not invoked.

send-exit-name

Specify the name of the client send exit program.

Send exit user data (SNDUSRDATA)

Specifies a maximum of 32 characters of user data that is passed to the send exit program.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The user data for the send exit program is not specified.

send-exit-user-data

Specify a maximum of 32 characters of user data for the send exit program.

Receive exit (RCVEXIT)

Specifies the entry point of the program to be called as the receive exit. If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The receive exit program is not invoked.

receive-exit-name

Specify the name of the receive exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

Receive exit (CRCVEXIT)

Specifies the entry point of the program to be called as the client receive exit. If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the SYSTEM.DEF.CLNTCONN channel.

***NONE**

The client receive exit program is not invoked.

receive-exit-name

Specify the name of the client receive exit program.

Receive exit user data (RCVUSRDATA)

Specifies user data that is passed to the receive exit.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The user data for the receive exit program is not specified.

receive-exit-user-data

Specify a maximum of 32 characters of user data for the receive exit program.

Message exit (MSGEXIT)

Specifies the entry point of the program to be called as the message exit. If a nonblank name is defined, the exit is invoked immediately after a message has been retrieved from the transmission queue. The exit is given the entire application message and message descriptor for modification.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The message exit program is not invoked.

message-exit-name

Specify the name of the message exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Message exit user data (MSGUSRDATA)

Specifies user data that is passed to the message exit program.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The user data for the message exit program is not specified.

message-exit-user-data

Specify a maximum of 32 characters of user data for the message exit program.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Message retry exit (MSGRTYEXIT)

Specifies the entry point of the program to be called as the message retry exit.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The message retry exit program is not invoked.

message-retry-exit-name

Specify the name of the message retry exit program.

library-name

Specify the name of the library that contains the exit program. This parameter must be present if an exit program name is specified.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Message retry exit data (MSGRTYDATA)

Specifies user data that is passed to the message retry exit program.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

The user data for the message retry exit program is not specified.

message-retry-exit-user-data

Specify a maximum of 32 characters of user data for the message retry exit program.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Number of message retries (MSGRTYNBR)

Specifies the number of times the channel will retry before it decides it cannot deliver the message. This attribute controls the action of the MCA only if the message-retry exit name is blank, the value of MSGRTYNBR is passed to the exit for the exit's use, but the number of retries performed is controlled by the exit, and not by this attribute.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

message-retry-number

Specify a value in the range 0 through 999999999. A value of 0 signifies no retries will be performed.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Message retry interval (MSGRTYITV)

Specifies the minimum interval of time that must pass before the channel can retry the MQPUT operation. This time is in milliseconds.

This attribute controls the action of the MCA only if the message-retry exit name is blank, the value of MSGRTYITV is passed to the exit for the exit's use, but the retry interval is controlled by the exit, and not by this attribute.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

message-retry-number

Specify a value in the range 0 through 999999999. A value of 0 signifies that the retry will be performed as soon as possible.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Convert message (CVTMSG)

Specifies whether the application data in the message should be converted before the message is transmitted.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel for the type of channel being created.

***YES**

The application data in the message is converted before sending.

***NO**

The application data in the message is not converted before sending.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Put authority (PUTAUT)

Specifies whether the user identifier in the context information associated with a message should be used to establish authority to put the message on the destination queue. This applies only to receiver and requester (*CLUSRCVR, *RCVR and *RQSTR) channels.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***DFT**

No authority check is made before the message is put on the destination queue.

***CTX**

The user identifier in the message context information is used to establish authority to put the message.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *SVR, *CLTCN, *SVRCN or *CLUSSDR.

Sequence number wrap (SEQNUMWRAP)

Specifies the maximum message sequence number. When the maximum is reached, sequence numbers wrap to start again at 1.

Note: The maximum message sequence number is not negotiable; the local and remote channels must wrap at the same number.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

sequence-number-wrap-value

Specify a value in the range 100 through 999999999.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Maximum message length (MAXMSGLEN)

Specifies the maximum message length that can be transmitted on the channel. This is compared with the value for the remote channel and the actual maximum is the lower of the two values.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

maximum-message-length

Specify a value in the range 0 through 104857600. A value of 0 signifies that the maximum length is unlimited.

Heartbeat interval (HRTBTINTVL)

Specifies The time, in seconds, between heartbeat flows passed from the sending MCA when there are no messages on the transmission queue. The heartbeat exchange gives the receiving MCA the opportunity to quiesce the channel.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

heart-beat-interval

Specify a value in the range 0 through 999999999. A value of 0 means that no heartbeat exchanges are to take place.

Note: For implementation reasons, the maximum heartbeat interval that can be used is 999999; values exceeding this are treated as 999999.

Non Persistent Message Speed (NPMSPEED)

Specifies whether the channel supports Fast Non Persistent Messages.

The possible values are:

***SYSDFTCHL**

The value of this attribute does not change.

***FAST**

The channel supports fast non persistent messages.

***NORMAL**

The channel does not support fast non persistent messages.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Cluster Name (CLUSTER)

The name of the cluster to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

This parameter is valid only for *CLUSDR and *CLUSRCVR channels. If the CLUSNL parameter is non-blank, this parameter must be blank.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

No cluster name is specified.

cluster-name

The name of the cluster to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

Cluster Name List (CLUSNL)

The name of the namelist that specifies a list of clusters to which the channel belongs

This parameter is valid only for *CLUSDR and *CLUSRCVR channels. If the CLUSTER parameter is non-blank, this parameter must be blank.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

No cluster namelist is specified.

cluster-name-list

The name of the namelist specifying a list of clusters to which the channel belongs. The maximum length is 48 characters conforming to the rules for naming MQ objects.

Network Connection Priority (NETPRTY)

The priority for the network connection. Distributed queuing chooses the path with the highest priority if there are multiple paths available. The value must be in the range between 0 and 9 where 0 is the lowest priority.

This parameter is valid only for *CLUSRCVR channels.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

network-connection-priority

Specify a value in the range 0 through 9; 0 is the lowest priority.

TLS CipherSpec (SSLCIPH)

SSLCIPH specifies the CipherSpec used in TLS channel negotiation. The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

cipherspec

The name of the CipherSpec.

Note:  From IBM MQ 8.0.0 Fix Pack 2, the SSLv3 protocol and the use of some IBM MQ CipherSpecs is deprecated. For more information, see [Deprecated CipherSpecs](#).

TLS Client Authentication (SSLCAUTH)

SSLCAUTH specifies whether the channel should carry out client authentication over TLS. The parameter is used only for channels with SSLCIPH specified.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***REQUIRED**

Client authentication is required.

***OPTIONAL**

Client authentication is optional.

This parameter cannot be specified for channel types (CHLTYPE) *SDR, *CLTCN or *CLUSSDR.

TLS Peer name (SSLPEER)

SSLPEER specifies the X500 peer name used in TLS channel negotiation. The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

x500peername

The X500 peer name to use.

Note: An alternative way of restricting connections into channels by matching against the TLS Subject Distinguished Name, is to use channel authentication records. With channel authentication records, different TLS Subject Distinguished Name patterns can be applied to the same channel. If both SSLPEER on the channel and a channel authentication record are used to apply to the same channel, the inbound certificate must match both patterns in order to connect. For more information, see [Channel authentication records](#).

Local communication address (LOCLADDR)

Specifies the local communication address for the channel.

This parameter is only valid for *SDR, *SVR, *RQSTR, *CLUSSDR, *CLUSRCVR and *CLTCN channels.

The possible values are:

***SAME**

The attribute is unchanged.

***NONE**

The connection is blank.

local-address

Only valid for transport type TCP/IP. Specify the optional IP address and optional port or port range used for outbound TCP/IP communications. The format is:

```
LOCLADDR([ip-addr][(low-port[,high-port])][, [ip-addr][(low-port[,high-port])]])
```

Batch Heartbeat Interval (BATCHHB)

The time in milliseconds used to determine whether batch heartbeating occurs on this channel. Batch heartbeating allows sender-type channels to determine whether the remote channel instance is still active before going in-doubt. A batch heartbeat will occur if a sender-type channel has not communicated with the remote channel within the specified time.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

batch-heartbeat-interval

Specify a value in the range 0 through 999999999. A value of 0 indicates that batch heartbeating is not to be used.

Note: For implementation reasons, the maximum batch heartbeat interval that can be used is 999999; values exceeding this are treated as 999999.

This parameter cannot be specified for channel types (CHLTYPE) *RCVR, *RQSTR, *CLTCN or *SVRCN.

Task user identifier (USERID)

This is used by the message channel agent when attempting to initiate a secure LU 6.2 session with a remote message channel agent.

This parameter is valid only for channels with a channel type (CHLTYPE) of *SDR, *SVR, *RQSTR, *CLTCN or *CLUSSDR.

Although the maximum length of the attribute is 12 characters, only the first 10 characters are used.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

No user identifier is specified.

user-identifier

Specify the task user identifier.

Password (PASSWORD)

This is used by the message channel agent when attempting to initiate a secure LU 6.2 session with a remote message channel agent.

This parameter is valid only for channels with a channel type (CHLTYPE) of *SDR, *SVR, *RQSTR, *CLTCN or *CLUSSDR.

Although the maximum length of the attribute is 12 characters, only the first 10 characters are used.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

No password is specified.

Password

Specify the password.

Keep Alive Interval (KAINT)

Specifies the Keep Alive timing interval for this channel.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel for the type of channel being created.

***AUTO**

The Keep Alive interval is calculated based upon the negotiated heartbeat value as follows:

- If the negotiated HBINT is greater than 0, Keep Alive interval is set to that value plus 60 seconds.
- If the negotiated HBINT is 0, the value used is that specified by the KEEPALIVEOPTIONS statement in the TCP profile configuration data set.

keep-alive-interval

Specify a value in the range 0 through 99999.

Header Compression (COMPHDR)

The list of header data compression techniques supported by the channel.

For channel types sender, server, cluster sender, cluster receiver and client connection (*SDR, *SVR, *CLUSSDR, *CLUSRCVR and *CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

No header data compression is performed.

***SYSTEM**

Header data compression is performed.

Message Compression (COMPMSG)

The list of message data compression techniques supported by the channel.

For channel types sender, server, cluster sender, cluster receiver and client connection (*SDR, *SVR, *CLUSSDR, *CLUSRCVR and *CLTCN) the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NONE**

No message data compression is performed.

***RLE**

Message data compression is performed using run-length encoding.

***ZLIBFAST**

Message data compression is performed using the zlib compression technique. A fast compression time is preferred.

***ZLIBHIGH**

Message data compression is performed using the zlib compression technique. A high level of compression is preferred.

V 9.4.0 *LZ4FAST

Message data compression is performed using the LZ4 compression technique. A fast compression time is preferred.

V 9.4.0 *LZ4HIGH

Message data compression is performed using the LZ4 compression technique. A high level of compression is preferred.

***ANY**

Any compression technique supported by the queue manager can be used. Only valid for channel types Receiver, Requester and Server-Connection.

Channel Monitoring (MONCHL)

Controls the collection of online monitoring data.

Online monitoring data is not collected when the queue manager attribute MONCHL is set to *NONE.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***QMGR**

The collection of Online Monitoring Data is inherited from the setting of the queue manager attribute MONCHL.

***NONE**

Online Monitoring Data collection for this channel is disabled.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for a channel type (CHLTYPE) of *CLTCN.

Channel Statistics (STATCHL)

Controls the collection of statistics data.

Statistics data is not collected when the queue manager attribute STATCHL is set to *NONE.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATCHL.

***NONE**

Statistics data collection for this channel is disabled.

***LOW**

Statistics data collection is turned on with a low ratio of data collection.

***MEDIUM**

Statistics data collection is turned on with a moderate ratio of data collection.

***HIGH**

Statistics data collection is turned on with a high ratio of data collection.

This parameter cannot be specified for channel types (CHLTYPE) *CLTCN or *SVRCN.

Cluster Workload Rank (CLWLRANK)

Specifies the cluster workload rank of the channel.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

cluster-workload-rank

The cluster workload rank of the channel in the range 0 through 9.

Cluster Workload Priority (CLWLPRTY)

Specifies the cluster workload priority of the channel.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

cluster-workload-rank

The cluster workload priority of the channel in the range 0 through 9.

Cluster Channel Weight (CLWLWGHT)

Specifies the cluster workload weight of the channel.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

cluster-workload-rank

The cluster workload weight of the channel in the range 1 through 99.

Sharing Conversations (SHARECNV)

Specifies the maximum the number of conversations which can be shared over a particular TCP/IP client channel instance (socket).

This parameter is valid for channels with CHLTYPE defined as *CLTCN or *SVRCN.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

0

Specifies no sharing of conversations over a TCP/IP socket. The channel instance runs in a mode prior to that of IBM WebSphere MQ 7.0, with regard to:

- Administrator stop-quietce
- Heartbeating
- Read ahead

1

Specifies no sharing of conversations over a TCP/IP socket. Client heartbeating and read ahead are available, whether in an MQGET call or not, and channel quiescing is more controllable.

shared-conversations

The number of shared conversations in the range 2 through 999999999.

Note: If the client-connection SHARECNV value does not match the server-connection SHARECNV value, the lower of the two values is used.

Property Control (PROPCTL)

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor).

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***COMPAT**

If the message contains a property with a prefix of "mcd.", "jms.", "usr." or "mqext." then all optional message properties, except those in the message descriptor (or extension) will be placed in one or more MQRFH2 headers in the message data before the message is sent to the remote queue manager.

***NONE**

All properties of the message, except those in the message descriptor (or extension), will be removed from the message before the message is sent to the remote queue manager.

***ALL**

All properties of the message will be included with the message when it is sent to the remote queue manager. The properties, except those in the message descriptor (or extension), will be placed in one or more MQRFH2 headers in the message data.

Maximum Instances (MAXINST)

Specifies the maximum number of clients that can simultaneously connect to the queue manager via this server-connection channel object.

This attribute is valid only for server-connection channels.

The possible values are:

***SYSDFT**

The value of this attribute is taken from the system default channel of the specified type.

maximum-instances

The maximum number of simultaneous instances of the channel in the range 0 through 99999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

Maximum Instances Per Client (MAXINSTC)

Specifies the maximum number of simultaneous instances of an individual server-connection channel which can be started from a single client.

In this context, multiple client connections originating from the same remote network address are considered to be a single client.

This attribute is valid only for server-connection channels.

The possible values are:

***SYSDFT**

The value of this attribute is taken from the system default channel of the specified type.

maximum-instances-per-client

The maximum number of simultaneous instances of the channel which can be in the started from a single client in the range 0 through 99999999.

A value of zero prevents all client access. If the value is reduced below the number of instances of the server connection channel currently running from individual clients, the running channels will not be affected, but new instances will not be able to start until sufficient existing ones have ceased to run.

Client Channel Weight (CLNTWGHT)

The client channel weighting attribute is used so client channel definitions can be selected at random based on their weighting when more than one suitable definition is available.

The possible values are:

***SYSDFT**

The value of this attribute is taken from the system default channel of the specified type.

client-channel-weight

The client channel weight in the range 0 through 99.

Connection Affinity (AFFINITY)

The channel affinity attribute is used so client applications that connect multiple times using the same queue manager name can choose whether to use the same client channel definition for each connection.

The possible values are:

***SYSDFT**

The value of this attribute is taken from the system default channel of the specified type.

***PREFERRED**

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any applicable CLNTWGHT(0) definitions first and in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful non CLNTWGHT(0) definitions are moved to the end of the list. CLNTWGHT(0) definitions remain at the start of the list and are selected first for each connection.

***NONE**

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process select an applicable definition based on the weighting with any applicable CLNTWGHT(0) definitions selected first in alphabetical order.

Batch Data Limit (BATCHLIM)

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

The batch is terminated when one of the following conditions is met:

- **BATCHSZ** messages have been sent.
- **BATCHLIM** bytes have been sent.
- The transmission queue is empty and **BATCHINT** is exceeded.

The value must be in the range 0 - 999999. The default value is 5000.

The **BATCHLIM** parameter is supported on all platforms.

The possible values are:

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

batch-data-limit

Specify a value in the range 0 through 999999.

This parameter can only be specified for channel types (CHLTYPE) *SDR, *SVR, *CLUSSDR, or *CLUSRCVR.

Pending Reset Sequence Number (RESETSEQ)

Pending reset sequence number.

This is the sequence number from an outstanding request and it indicates a user RESET CHANNEL command request is outstanding.

The possible value is:

pending-reset-sequence-number

A value of zero indicates that there is no outstanding RESET CHANNEL. The value can be in the range 1 - 999999999.

Default client reconnection (DFTRECON)

Specifies whether a client connection automatically reconnects a client application if its connection breaks.

***SYSDFTCHL**

The value of this attribute is taken from the system default channel of the specified type.

***NO**

Unless overridden by **MQCONN**, the client is not reconnected automatically.

***YES**

Unless overridden by **MQCONN**, the client reconnects automatically.

***QMGR**

Unless overridden by **MQCONN**, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO_RECONNECT_Q_MGR.

***DISABLED**

Reconnection is disabled, even if requested by the client program using the **MQCONN** MQI call.

This parameter is specified for a client connection channel, (CHLTYPE) *CLTCN

 **CRTMQMLSR (Create MQ Listener)**

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Create MQ Listener (CRTMQMLSR) command creates a new MQ listener definition, specifying those attributes that are to be different from the default.

Parameters

Table 247. Command parameters

Keyword	Description	Choices	Notes
<u>LSRNAME</u>	Listener name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 3
<u>TEXT</u>	Text 'description'	Character value, *BLANK, *SYSDFTLSR	Optional, Positional 4
<u>CONTROL</u>	Listener control	*SYSDFTLSR , *MANUAL, *QMGR, *STARTONLY	Optional, Positional 5
<u>PORT</u>	Port number	0-65535, *SYSDFTLSR	Optional, Positional 6
<u>IPADDR</u>	IP Address	Character value, *BLANK, *SYSDFTLSR	Optional, Positional 7

Table 247. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>BACKLOG</u>	Listener backlog	0-999999999, *SYSDFTLSR	Optional, Positional 8

Listener name (LSRNAME)

The name of the new MQ listener definition to be created.

The possible values are:

listener-name

Specify the name of the listener definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Replace (REPLACE)

If a listener definition with the same name already exists, this specifies whether it is to be replaced.

The possible values are:

*NO

This definition does not replace any existing listener definition with the same name. The command fails if the named listener definition already exists.

*YES

Replace the existing listener definition. If there is no definition with the same name, a new definition is created.

Text 'description' (TEXT)

Specifies text that briefly describes the listener definition.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

*SYSDFTLSR

The value of this attribute is taken from the system default listener.

*BLANK

The text is set to a blank string.

description

Specify the new descriptive information.

Listener control (CONTROL)

Whether the listener starts automatically when the queue manager is started.

The possible values are:

***SYSDFTLSR**

The value for this attribute is taken from the system default listener.

***MANUAL**

The listener is not automatically started or stopped.

***QMGR**

The listener is started and stopped as the queue manager is started and stopped.

***STARTONLY**

The listener is started as the queue manager is started, but is not requested to stop when the queue manager is stopped.

Port number (PORT)

The port number to be used by the listener.

The possible values are:

***SYSDFTLSR**

The value for this attribute is taken from the system default listener.

port-number

The port number to be used.

IP Address (IPADDR)

The IP address to be used by the listener.

The possible values are:

***SYSDFTLSR**

The value for this attribute is taken from the system default listener.

ip-addr

The IP address to be used.

Listener backlog (BACKLOG)

The number of concurrent connection requests the listener supports.

The possible values are:

***SYSDFTLSR**

The value for this attribute is taken from the system default listener.

backlog

The number of concurrent connection requests supported.

 **CRTMQMNL (Create MQ Namelist)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Create MQ Namelist (CRTMQMNL) command creates a new MQ namelist. A namelist is an MQ object that contains a list of other MQ objects. Typically, namelists are used by applications, for example trigger monitors, where they are used to identify a group of queues. A namelist is maintained independently of applications, therefore you can update it without stopping any of the applications that use it.

Parameters

Table 248. Command parameters			
Keyword	Description	Choices	Notes
<u>NAMELIST</u>	Namelist	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 3
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SYSDFTNL	Optional, Positional 4
<u>NAMES</u>	List of Names	Values (up to 256 repetitions): <i>Character value</i> , *BLANKS, *SYSDFTNL , *NONE	Optional, Positional 5

Namelist (NAMELIST)

The name of the namelist to be created.

namelist

Specify the name of the namelist. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used.

message-queue-manager-name

Specify the name of the queue manager.

Replace (REPLACE)

Specifies whether the new namelist should replace an existing namelist with the same name.

***NO**

Do not replace the existing namelist. The command fails if the named namelist already exists.

***YES**

Replace the existing namelist. If there is no namelist with the same name, a new namelist is created.

Text 'description' (TEXT)

Specifies text that briefly describes the namelist.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

***SYSDFTNL**

The value of the attribute is taken from the system default namelist.

description

Specify no more than 64 characters enclosed in apostrophes.

List of Names (NAMES)

List of names. This is the list of names to be created. The names can be of any type, but must conform to the rules for naming MQ objects.

*SYSDFTNL

The value of the attribute is taken from the system default namelist.

namelist

The list to create. An empty list is valid.

IBM i CRTMQMPRC (Create MQ Process)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Create MQ Process (CRTMQMPRC) command creates a new MQ process definition, specifying those attributes that are different from the default.

Parameters

Table 249. Command parameters

Keyword	Description	Choices	Notes
<u>PRCNAME</u>	Process name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 3
<u>TEXT</u>	Text 'description'	Character value, *BLANK, *SYSDFTPRC	Optional, Positional 4
<u>APPTYPE</u>	Application type	Integer, *DEF, *CICS, *UNIX, *OS400, *WINDOWS, *WINDOWS_NT,	Optional, Positional 5
<u>APPID</u>	Application identifier	Character value, *SYSDFTPRC	Optional, Positional 6
<u>USRDATA</u>	User data	Character value, *SYSDFTPRC, *NONE	Optional, Positional 7
<u>ENVDATA</u>	Environment data	Character value, *SYSDFTPRC, *NONE	Optional, Positional 8

Process name (PRCNAME)

The name of the new MQ process definition to be created.

The possible values are:

process-name

Specify the name of the new MQ process definition. The name can contain up to 48 characters.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Replace (REPLACE)

If a process definition with the same name already exists, this specifies whether it is replaced.

The possible values are:

***NO**

This definition does not replace any existing process definition with the same name. The command fails if the named process definition already exists.

***YES**

Replace the existing process definition. If there is no definition with the same name, a new definition is created.

Text 'description' (TEXT)

Specifies text that briefly describes the process definition.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SYSDFTPRC**

The value of this attribute is taken from the system default process.

***BLANK**

The text is set to a blank string.

description

Specify the new descriptive information.

Application type (APPTYPE)

The type of application started.

The possible values are:

***DEF**

Specifying DEF causes the default application type for the platform at which the command is interpreted to be stored in the process definition. This default cannot be changed by the installation. If the platform supports clients, the default is interpreted as the default application type of the server.

***CICS**

Represents a CICS/400 application.

***UNIX**

Represents a UNIX or Linux application.

***OS400**

Represents an IBM i application.

***WINDOWS**

Represents a Windows application.

***WINDOWS_NT**

Represents a Windows NT application.

integer

User-defined application type in the range 65536 through 999999999.

Application identifier (APPID)

Application identifier. This is the name of the application to be started, on the platform for which the command is processing. It is typically a program name and library name.

The possible values are:

***SYSDFTPRC**

The value for this attribute is taken from the system default process.

application-id

The maximum length is 256 characters.

User data (USRDATA)

A character string that contains user information pertaining to the application, as defined by APPID, to start.

The possible values are:

***SYSDFTPRC**

The value for this attribute is taken from the system default process.

***NONE**

The user data is blank.

user-data

Specify up to 128 characters of user data.

Environment data (ENVDATA)

A character string that contains environment information pertaining to the application, as defined by APPID, to start.

The possible values are:

***SYSDFTPRC**

The value for this attribute is taken from the system default process.

***NONE**

The environment data is blank.

environment-data

The maximum length is 128 characters.

 **CRTMQMQ (Create MQ Queue)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Create MQ Queue (CRTMQMQ) command creates a queue definition with the specified attributes. All attributes that are not specified are set to the default value for the type of queue that is created.

Parameters

<i>Table 250. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value	Required, Key, Positional 1
<u>QTYPE</u>	Queue type	*ALS, *LCL, *MDL, *RMT	Required, Key, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 3
<u>REPLACE</u>	Replace	*NO, *YES	Optional, Positional 4
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SYSDFTQ	Optional, Positional 5
<u>PUTENBL</u>	Put enabled	*SYSDFTQ, *NO, *YES	Optional, Positional 6
<u>DFTPTY</u>	Default message priority	0-9, *SYSDFTQ	Optional, Positional 7
<u>DFTMSGPST</u>	Default message persistence	*SYSDFTQ, *NO, *YES	Optional, Positional 8
<u>PRCNAME</u>	Process name	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 9
<u>TRGENBL</u>	Triggering enabled	*SYSDFTQ, *NO, *YES	Optional, Positional 10
<u>GETENBL</u>	Get enabled	*SYSDFTQ, *NO, *YES	Optional, Positional 11
<u>SHARE</u>	Sharing enabled	*SYSDFTQ, *NO, *YES	Optional, Positional 12
<u>DFTSHARE</u>	Default share option	*SYSDFTQ, *NO, *YES	Optional, Positional 13
<u>MSGDLYSEQ</u>	Message delivery sequence	*SYSDFTQ, *PTY, *FIFO	Optional, Positional 14
<u>HDNBKTCNT</u>	Harden backout count	*SYSDFTQ, *NO, *YES	Optional, Positional 15
<u>TRGTYPE</u>	Trigger type	*SYSDFTQ, *FIRST, *ALL, *DEPTH, *NONE	Optional, Positional 16
<u>TRGDEPTH</u>	Trigger depth	1-999999999, *SYSDFTQ	Optional, Positional 17
<u>TRGMSGPTY</u>	Trigger message priority	0-9, *SYSDFTQ	Optional, Positional 18
<u>TRGDATA</u>	Trigger data	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 19
<u>RTNITV</u>	Retention interval	0-999999999, *SYSDFTQ	Optional, Positional 20
<u>MAXDEPTH</u>	Maximum queue depth	0-999999999, *SYSDFTQ	Optional, Positional 21
<u>MAXMSGLEN</u>	Maximum message length	0-104857600, *SYSDFTQ	Optional, Positional 22
<u>BKTTHLD</u>	Backout threshold	0-999999999, *SYSDFTQ	Optional, Positional 23
<u>BKTQNAME</u>	Backout requeue name	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 24
<u>INITQNAME</u>	Initiation queue	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 25
<u>USAGE</u>	Usage	*SYSDFTQ, *NORMAL, *TMQ	Optional, Positional 26

Table 250. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>DFNTYPE</u>	Definition type	*SYSDFTQ , *TEMPDYN, *PERMDYN	Optional, Positional 27
<u>TGTQNAME</u>	Target object	<i>Character value</i> , *SYSDFTQ	Optional, Positional 28
<u>RMTQNAME</u>	Remote queue	<i>Character value</i> , *SYSDFTQ , *NONE	Optional, Positional 29
<u>RMTMQMNAME</u>	Remote Message Queue Manager	<i>Character value</i> , *SYSDFTQ	Optional, Positional 30
<u>TMQNAME</u>	Transmission queue	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 31
<u>HIGHTHLD</u>	Queue depth high threshold	0-100, *SYSDFTQ	Optional, Positional 32
<u>LOWTHLD</u>	Queue depth low threshold	0-100, *SYSDFTQ	Optional, Positional 33
<u>FULLEVT</u>	Queue full events enabled	*SYSDFTQ , *NO, *YES	Optional, Positional 34
<u>HIGHEVT</u>	Queue high events enabled	*SYSDFTQ , *NO, *YES	Optional, Positional 35
<u>LOWEVT</u>	Queue low events enabled	*SYSDFTQ , *NO, *YES	Optional, Positional 36
<u>SRVITV</u>	Service interval	0-999999999, *SYSDFTQ	Optional, Positional 37
<u>SRVEVT</u>	Service interval events	*SYSDFTQ , *HIGH, *OK, *NONE	Optional, Positional 38
<u>DISTLIST</u>	Distribution list support	*SYSDFTQ , *NO, *YES	Optional, Positional 39
<u>CLUSTER</u>	Cluster Name	<i>Character value</i> , *SYSDFTQ , *NONE	Optional, Positional 40
<u>CLUSNL</u>	Cluster Name List	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 41
<u>DEFBIND</u>	Default Binding	*SYSDFTQ , *OPEN, *NOTFIXED, *GROUP	Optional, Positional 42
<u>CLWLRANK</u>	Cluster Workload Rank	0-9, *SYSDFTQ	Optional, Positional 43
<u>CLWLPRTY</u>	Cluster Workload Priority	0-9, *SYSDFTQ	Optional, Positional 44
<u>CLWLUSEQ</u>	Cluster workload queue use	*SYSDFTQ , *QMGR, *LOCAL, *ANY	Optional, Positional 45
<u>MONQ</u>	Queue Monitoring	*SYSDFTQ , *QMGR, *OFF, *LOW, *MEDIUM, *HIGH	Optional, Positional 46
<u>STATQ</u>	Queue Statistics	*SYSDFTQ , *QMGR, *OFF, *ON	Optional, Positional 47
<u>ACCTQ</u>	Queue Accounting	*SYSDFTQ , *QMGR, *OFF, *ON	Optional, Positional 48
<u>NPMCLASS</u>	Non Persistent Message Class	*SYSDFTQ , *NORMAL, *HIGH	Optional, Positional 49

Table 250. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>MSGREADAHD</u>	Message Read Ahead	*SYSDFTQ , *DISABLED, *NO, *YES	Optional, Positional 50
<u>DFTPURRESP</u>	Default Put Response	*SYSDFTQ, *SYNC , *ASYN	Optional, Positional 51
<u>PROPCTL</u>	Property Control	*SYSDFTQ , *COMPAT, *NONE, *ALL, *FORCE, *V6COMPAT	Optional, Positional 52
<u>TARGTYPE</u>	Target Type	*SYSDFTQ , *QUEUE, *TOPIC	Optional, Positional 53
<u>CUSTOM</u>	Custom attribute	<i>Character value</i> , *BLANK, *SYSDFTQ	Optional, Positional 54
<u>CLCHNAME</u>	Cluster-sender channel name	<i>Character value</i> , *NONE, *SYSDFTQ	Optional, Positional 55
<u>IMGRCOVQ</u>	Queue object attribute	*SAME , *NO, *YES, *QMGR	Optional, Positional 57

Queue name (QNAME)

Specifies the name of the queue definition. Queue names must be unique. If a queue definition with this name already exists, you must specify REPLACE(*YES).

The name can contain up to 48 characters.

Note: The field length is 48 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

The possible values are:

queue-name

Specify the name of the new queue.

Queue type (QTYPE)

Specifies the type of queue that is to be created.

If the queue already exists, REPLACE(*YES) must be specified, and the value specified by QTYPE must be the type of the existing queue.

The possible values are:

*ALS

An alias queue.

*LCL

A local queue.

*RMT

A remote queue.

*MDL

A model queue.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Replace (REPLACE)

Specifies whether the new queue will replace an existing queue definition with the same name and type.

The possible values are:

***NO**

Do not replace the existing queue. The command fails if the named queue already exists.

***YES**

Replace the existing queue definition with the attributes of the FROMQ and the specified attributes.

The command will fail if an application has the Queue open or the USAGE attribute is changed.

Note: If the queue is a local queue, and a queue with the same name already exists, any messages already on that queue are retained.

Text 'description' (TEXT)

Specifies text that briefly describes the queue definition.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***BLANK**

The text is set to a blank string.

description

Specify no more than 64 characters enclosed in apostrophes.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Put enabled (PUTENBL)

Specifies whether messages can be put on the queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

Messages cannot be added to the queue.

***YES**

Messages can be added to the queue by authorized applications.

Default message priority (DFTPTY)

Specifies the default priority of messages put on the queue.

The possible values are:

***SYSDFTQ**

The value of this attribute taken from the system default queue of the specified type.

priority-value

Specify a value ranging from 0 through 9.

Default message persistence (DFTMSGPST)

Specifies the default for message-persistence on the queue. Message persistence determines whether messages are preserved across restarts of the queue manager.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

By default, messages are lost across a restart of the queue manager.

***YES**

By default, messages are preserved across a restart of the queue manager.

Process name (PRCNAME)

Specifies the local name of the MQ process that identifies the application that should be started when a trigger event occurs.

The process does not have to be available when the queue is created, but it must be available for a trigger event to occur.

The possible values are:

***SYSDFTQ**

The value of this attribute taken from the system default queue of the specified type.

***NONE**

No process is specified.

process-name

Specify the name of the process.

Triggering enabled (TRGENBL)

Specifies whether trigger messages are written to the initiation queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

Do not write trigger messages to the initiation queue.

***YES**

Triggering is active; trigger messages are written to the initiation queue.

Get enabled (GETENBL)

Specifies whether applications are to be permitted to get messages from this queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

Applications cannot retrieve messages from the queue.

***YES**

Suitably authorized applications can retrieve messages from the queue.

Sharing enabled (SHARE)

Specifies whether multiple instances of applications can open this queue for input.

The possible values are:

***SYSDFTQ**

The value of this attribute is from the system default queue of the specified type.

***NO**

Only a single application instance can open the queue for input.

***YES**

More than one application instance can open the queue for input.

Default share option (DFTSHARE)

Specifies the default share option for applications opening this queue for input.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

The open request is for exclusive use of the queue for input.

***YES**

The open request is for shared use of the queue for input.

Message delivery sequence (MSGDLYSEQ)

Specifies the message delivery sequence.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***PTY**

Messages are delivered in first-in-first-out (FIFO) order within priority.

***FIFO**

Messages are delivered in FIFO order regardless of priority.

Harden backout count (HDNBKTCNT)

Specifies whether the count of backed out messages should be saved (hardened) across restarts of the message queue manager.

Note: On IBM MQ for IBM i the count is ALWAYS hardened, regardless of the setting of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

The backout count is not hardened.

***YES**

The backout count is hardened.

Trigger type (TRGTYPE)

Specifies the condition that initiates a trigger event. When the condition is true, a trigger message is sent to the initiation queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***FIRST**

When the number of messages on the queue goes from zero to one.

***ALL**

Every time a message arrives on the queue.

***DEPTH**

When the number of messages on the queue equals the value of the TRGDEPTH attribute.

***NONE**

No trigger messages are written.

Trigger depth (TRGDEPTH)

Specifies, for TRGTYPE(*DEPTH), the number of messages that initiate a trigger message to the initiation queue.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

depth-value

Specify a value ranging from 1 through 999999999.

Trigger message priority (TRGMSGPTY)

Specifies the minimum priority that a message must have before it can produce, or be counted for, a trigger event.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

priority-value

Specify a value ranging from 0 through 9.

Trigger data (TRGDATA)

Specifies up to 64 characters of user data that the queue manager includes in the trigger message. This data is made available to the monitoring application that processes the initiation queue and to the application started by the monitor.

Note: An application program can issue a call to MQSET to change the value of this attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NONE**

No trigger data is specified.

trigger-data

Specify up to 64 characters enclosed in apostrophes. For a transmission queue you can use this parameter to specify the name of the channel to be started.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Retention interval (RTNITV)

Specifies the retention interval. This interval is the number of hours for which the queue might be needed, based on the date and time when the queue was created.

This information is available to a housekeeping application or an operator and can be used to determine when a queue is no longer required.

Note: The message queue manager does not delete queues, nor does it prevent your queues from being deleted if their retention interval has not expired. It is your responsibility to take any required action.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

interval-value

Specify a value ranging from 0 through 999999999.

Maximum queue depth (MAXDEPTH)

Specifies the maximum number of messages allowed on the queue. However, other factors can cause the queue to be treated as full; for example, it appears to be full if there is no storage available for a message.

Note: If this value is subsequently reduced by using the CHGMQMQ command, any messages that are on the queue remain intact even if they cause the new maximum to be exceeded.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

depth-value

Specify a value ranging from 0 through 999999999.

Maximum message length (MAXMSGLEN)

Specifies the maximum length for messages on the queue.

Note: If this value is subsequently reduced by using the CHGMQMQ command, any messages that are on the queue remain intact even if they exceed the new maximum length.

Applications might use the value of this attribute to determine the size of buffer they need to retrieve messages from the queue. Therefore change the value only if you know this will not cause an application to operate incorrectly.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified queue type.

length-value

Specify a value ranging from 0 through 104 857 600.

Backout threshold (BKTTHLD)

Specifies the backout threshold.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine if a message should be backed out. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified queue type.

threshold-value

Specify a value ranging from 0 through 999999999.

Backout requeue name (BKTQNAME)

Specifies the backout-queue name.

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine where messages that have been backed out should go. For all other applications, apart from allowing this attribute to be queried, the queue manager takes no action based on the value of the attribute.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified queue type.

***NONE**

No backout queue is specified.

backout-queue-name

Specify the backout queue name.

Initiation queue (INITQNAME)

Specifies the name of the initiation queue.

Note: The initiation queue must be on the same instance of a message queue manager.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified queue type.

***NONE**

No initiation queue is specified.

initiation-queue-name

Specify the initiation queue name.

Usage (USAGE)

Specifies whether the queue is for normal usage, or for transmitting messages to a remote message queue manager.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified queue type.

***NORMAL**

Normal usage (the queue is not a transmission queue)

***TMQ**

The queue is a transmission queue that is used to hold messages destined for a remote message queue manager. If the queue is intended for use in situations where a transmission queue name is

not explicitly specified, the queue name must be the same as the name of the remote message queue manager. For further information, see the IBM MQ Intercommunication.

Definition type (DFNTYPE)

Specifies the type of dynamic queue definition that is created when an application issues an MQOPEN API call with the name of this model queue specified in the object descriptor.

Note: This parameter only applies to a model queue definition.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***TEMPDYN**

Creates a temporary dynamic queue. Do not specify with a DEFMSGPST value of *YES.

***PERMDYN**

Creates a permanent dynamic queue.

Target object (TGTQNAME)

Specifies the name of the target object for which this queue is an alias.

The object can be a local or remote queue, a topic or a message queue manager.

Do not leave this field blank. If you do so, it is possible that you will create an alias queue, that has to be subsequently modified, by the addition of a TGTNAME.

When a message queue manager name is specified, it identifies the message queue manager that handles the messages posted to the alias queue. You can specify either the local message queue manager or a transmission queue name.

Note: The target object does not need to exist at this time but it must exist when a process attempts to open the alias queue.

The possible values are:

***SYSDFTQ**

The name of the target object is taken from the SYSTEM.DEFAULT.ALIAS.QUEUE.

target-object-name

Specify the name of the target object.

Remote queue (RMTQNAME)

Specifies the name of the remote queue. That is, the local name of the remote queue as defined on the queue manager specified by RMTQMNAME.

If this definition is used for a queue manager alias definition, RMTQNAME must be blank when the open occurs.

If this definition is used for a reply-to alias, this name is the name of the queue that is to be the reply-to queue.

The possible values are:

***SYSDFTQ**

The name of the remote queue is taken from the SYSTEM.DEFAULT.REMOTE.QUEUE.

***NONE**

No remote-queue name is specified (that is, the name is blank). This can be used if the definition is a queue manager alias definition.

remote-queue-name

Specify the name of the queue at the remote queue manager.

Note: The name is not checked to ensure that it contains only those characters normally allowed for queue names

Remote Message Queue Manager (RMTMQMNAME)

Specifies the name of the remote queue manager on which the queue RMTQNAME is defined.

If an application opens the local definition of a remote queue, RMTMQMNAME must not be the name of the connected queue manager. If TMQNAME is blank there must be a local queue of this name, which is to be used as the transmission queue.

If this definition is used for a queue manager alias, RMTMQMNAME is the name of the queue manager, which can be the name of the connected queue manager. Otherwise, if TMQNAME is blank, when the queue is opened there must be a local queue of this name, with USAGE(*TMQ) specified, which is to be used as the transmission queue.

If this definition is used for a reply-to alias, this name is the name of the queue manager that is to be the reply-to queue manager.

The possible values are:

***SYSDFTQ**

The name of the remote queue manager is taken from the SYSTEM.DEFAULT.REMOTE.QUEUE.

remote-queue-manager-name

Specify the name of the remote queue manager.

Note: Ensure this name contains only those characters normally allowed for queue manager names.

Transmission queue (TMQNAME)

Specifies the local name of the transmission queue to be used for messages destined for the remote queue, for either a remote queue or for a queue manager alias definition.

If TMQNAME is blank, a queue with the same name as RMTMQMNAME is used as the transmission queue.

This attribute is ignored if the definition is being used as a queue manager alias and RMTMQMNAME is the name of the connected queue manager.

It is also ignored if the definition is used as a reply-to queue alias definition.

The possible values are:

***SYSDFTQ**

The transmission queue name is taken from the SYSTEM.DEFAULT.REMOTE.QUEUE.

***NONE**

No specific transmission queue name is defined for this remote queue. The value of this attribute is set to all blanks.

transmission-queue-name

Specify the transmission queue name.

Queue depth high threshold (HIGHTHLD)

Specifies the threshold against which the queue depth is compared to generate a queue depth high event.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

threshold-value

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

Queue depth low threshold (LOWTHLD)

Specifies the threshold against which the queue depth is compared to generate a queue depth low event.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

threshold-value

Specify a value ranging from 0 through 100. This value is used as a percentage of the maximum queue depth (MAXDEPTH parameter).

Queue full events enabled (FULLEVT)

Specifies whether queue full events are generated.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

Queue Full events are not generated.

***YES**

Queue Full events are generated.

Queue high events enabled (HIGHEVT)

Specifies whether queue depth high events are generated.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

Queue Depth High events are not generated.

***YES**

Queue Depth High events are generated.

Queue low events enabled (LOWEVT)

Specifies whether queue depth low events are generated.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

Queue Depth Low events are not generated.

***YES**

Queue Depth Low events are generated.

Service interval (SRVITV)

Specifies the service interval. This interval is used for comparison to generate service interval high and service interval OK events.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

interval-value

Specify a value ranging from 0 through 999999999. The value is in units of milliseconds.

Service interval events (SRVEVT)

Specifies whether service interval high or service interval OK events are generated.

A service interval high event is generated when a check indicates that no messages have been retrieved from the queue for the time indicated by the SRVITV parameter as a minimum.

A service interval OK event is generated when a check indicates that messages have been retrieved from the queue within the time indicated by the SRVITV parameter.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***HIGH**

Service Interval High events are generated.

***OK**

Service Interval OK events are generated.

***NONE**

No service interval events are generated.

Distribution list support (DISTLIST)

Specifies whether the queue supports distribution lists.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NO**

Distribution Lists are not supported.

***YES**

Distribution Lists are supported.

Cluster Name (CLUSTER)

The name of the cluster to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

cluster-name

Only one of the resultant values of CLUSTER or CLUSNL can be non-blank; you cannot specify a value for both.

Cluster Name List (CLUSNL)

The name of the namelist which specifies a list of clusters to which the queue belongs. Changes to this parameter do not affect instances of the queue that are already open.

This parameter cannot be set for dynamic, transmission, SYSTEM.CHANNEL.xx, SYSTEM.CLUSTER.xx or SYSTEM.COMMAND.xx queues.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

namelist-name

The name of the namelist that specifies a list of clusters to which the queue belongs.

Default Binding (DEFBIND)

Specifies the binding to be used when the application specifies MQOO_BIND_AS_Q_DEF on the MQOPEN call and the queue is a cluster queue.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***OPEN**

The queue handle is bound to a specific instance of the cluster queue when the queue is opened.

***NOTFIXED**

The queue handle is not bound to any particular instance of the cluster queue. This allows the queue manager to select a specific queue instance when the message is put using MQPUT and to change that selection subsequently if necessary.

The MQPUT1 call always behaves as if NOTFIXED had been specified.

***GROUP**

When the queue is opened, the queue handle is bound to a specific instance of the cluster queue for as long as there are messages in a message group. All messages in a message group are allocated to the same destination instance.

Cluster Workload Rank (CLWLRANK)

Specifies the cluster workload rank of the queue.

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

cluster-workload-rank

Specify a value ranging from 0 through 9.

Cluster Workload Priority (CLWLPRTY)

Specifies the cluster workload priority of the queue.

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

cluster-workload-priority

Specify a value ranging from 0 through 9.

Cluster workload queue use (CLWLUSEQ)

Specifies the behavior of an MQPUT when the target queue has both a local instance and at least one remote cluster instance. If the put originates from a cluster channel then this attribute does not apply.

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***QMGR**

The value is inherited from the Queue Manager CLWLUSEQ attribute.

***LOCAL**

The local queue will be the sole target of the MQPUT.

***ANY**

The queue manager will treat such a local queue as another instance of the cluster queue for the purposes of workload distribution.

Queue Monitoring (MONQ)

Controls the collection of Online Monitoring Data.

Online Monitoring Data is not collected when the queue manager attribute MONQ is set to *NONE.

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***QMGR**

The collection of Online Monitoring Data is inherited from the setting of the queue manager attribute MONQ.

***OFF**

Online Monitoring Data collection for this queue is disabled.

***LOW**

Monitoring data collection is turned on with a low ratio of data collection.

***MEDIUM**

Monitoring data collection is turned on with a moderate ratio of data collection.

***HIGH**

Monitoring data collection is turned on with a high ratio of data collection.

Queue Statistics (STATQ)

Controls the collection of statistics data.

Online monitoring data is not collected when the queue manager attribute STATQ is set to *NONE.

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***QMGR**

Statistics data collection is based upon the setting of the queue manager attribute STATQ.

***OFF**

Statistics data collection for this queue is disabled.

***ON**

Statistics data collection is enabled for this queue.

Queue Accounting (ACCTQ)

Controls the collection of accounting data.

Accounting data is not collected when the queue manager attribute ACCTQ is set to *NONE.

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***QMGR**

Accounting data collection is based upon the setting of the queue manager attribute ACCTQ.

***OFF**

Accounting data collection for this queue is disabled.

***ON**

Accounting data collection is enabled for this queue.

Non Persistent Message Class (NPMCLASS)

Specifies the level of reliability for non-persistent messages put to this queue.

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***NORMAL**

Non-persistent messages put to this queue are only lost following a failure, or a queue manager shutdown. Non-persistent message put to this queue are discarded in the event of a queue manager restart.

***HIGH**

Non-persistent messages put to this queue are not discarded in the event of a queue manager restart. Non-persistent messages put to this queue may still be lost in the event of a failure.

Message Read Ahead (MSGREADAHD)

Specifies whether nonpersistent messages are sent to the client ahead of an application requesting them.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***DISABLED**

Read ahead is disabled for this queue. Messages are not sent to the client ahead of an application requesting them regardless of whether read ahead is requested by the client application.

***NO**

Non-persistent messages are not sent to the client ahead of an application requesting them. A maximum of one non-persistent message can be lost if the client ends abnormally.

***YES**

Non-persistent messages are sent to the client ahead of an application requesting them. Non-persistent messages can be lost if the client ends abnormally or if the client application does not consume all the messages it is sent.

Default Put Response (DFTPUTRESP)

The default put response type (DFTPUTRESP) attribute specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO_RESPONSE_AS_Q_DEF option.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are issued as if MQPMO_SYNC_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application. This is the default value supplied with IBM MQ, but your installation might have changed it.

***ASYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are always issued as if MQPMO_ASYNC_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application; but an improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

Property Control (PROPCTL)

Specifies what happens to properties of messages that are retrieved from queues using the MQGET call when the MQGMO_PROPERTIES_AS_Q_DEF option is specified.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***COMPAT**

If the message contains a property with a prefix of `mcd.`, `jms.`, `usr.` or `mqext.` then all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

***NONE**

All properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

***ALL**

All properties of the message, except those contained in the message descriptor (or extension), are contained in one or more MQRFH2 headers in the message data.

***FORCE**

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

***V6COMPAT**

When set, `*V6COMPAT` must be set both on one of the queue definitions resolved by MQPUT and one of the queue definitions resolved by MQGET. It must also be set on any other intervening transmission queues. It causes an MQRFH2 header to be passed unchanged from the sending application to the receiving application. It overrides other settings of **PROPCTL** found in a queue name resolution chain. If the property is set on a cluster queue, the setting is not cached locally on other queue managers. You must set `*V6COMPAT` on an alias queue that resolves to the cluster queue. Define the alias queue on the same queue manager that the putting application is connected to.

Target Type (TARGTYPE)

Specifies the type of object to which the alias resolves.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***QUEUE**

Queue object.

***TOPIC**

Topic object.

Custom attribute (CUSTOM)

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

***SYSDFTQ**

The value of this attribute is taken from the system default queue of the specified type.

***BLANK**

The text is set to a blank string.

custom

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form `NAME (VALUE)` and be specified in uppercase. Single quotes must be escaped with another single quote.

CLCHNAME

This parameter is supported only on transmission queues.

*SYSDFTQ

The value of this attribute is taken from the system default queue of the specified type.

*NONE

The attribute is removed.

custom

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

By specifying asterisks, "*", in **ClusterChannelName**, you can associate a transmission queue with a set of cluster-sender channels. The asterisks can be at the beginning, end, or any number of places in the middle of the channel name string. **ClusterChannelName** is limited to a length of 20 characters: MQ_CHANNEL_NAME_LENGTH.

IMGRCOVQ

Specifies whether a local or permanent dynamic queue object is recoverable from a media image, if linear logging is being used.

The possible values are:

*SAME

The attribute is unchanged.

*YES

These queue objects are recoverable.

*NO

The [“RCDMQMIMG \(Record MQ Object Image\)” on page 1887](#) and [“RCRMQMOBJ \(Re-create MQ Object\)” on page 1890](#) commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

*QMGR

If you specify *QMGR, and the **IMGRCOVQ** attribute for the queue manager specifies *YES, these queue objects are recoverable.

If you specify *QMGR and the **IMGRCOVQ** attribute for the queue manager specifies *NO, the [“RCDMQMIMG \(Record MQ Object Image\)” on page 1887](#) and [“RCRMQMOBJ \(Re-create MQ Object\)” on page 1890](#) commands are not permitted for these objects, and automatic media images, if enabled, are not written for these objects.

CRTMQMSUB (Create MQ Subscription)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Create MQ Subscription (CRTMQMSUB) command creates a new MQ subscription, specifying those attributes that are different from the default.

Parameters

<i>Table 251. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>SUBNAME</u>	Subscription name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Key, Positional 3
<u>TOPICSTR</u>	Topic string	<i>Character value, *NONE, *SYSDFTSUB</i>	Optional, Positional 4
<u>TOPICOBJ</u>	Topic object	<i>Character value, *NONE, *SYSDFTSUB</i>	Optional, Positional 5
<u>DEST</u>	Destination	<i>Character value, *SYSDFTSUB</i>	Optional, Positional 6
<u>DESTMQM</u>	Destination Queue Manager	<i>Character value, *NONE, *SYSDFTSUB</i>	Optional, Positional 7
<u>DESTCRLID</u>	Destination Correlation Id	<i>Character value, *NONE, *SYSDFTSUB</i>	Optional, Positional 8
<u>PUBACCT</u>	Publish Accounting Token	<i>Character value, *CURRENT, *SYSDFTSUB</i>	Optional, Positional 9
<u>PUBAPPID</u>	Publish Application Id	<i>Character value, *NONE, *SYSDFTSUB</i>	Optional, Positional 10
<u>SUBUSER</u>	Subscription User Id	<i>Character value, *CURRENT, *SYSDFTSUB</i>	Optional, Positional 11
<u>USERDATA</u>	Subscription User Data	<i>Character value, *NONE, *SYSDFTSUB</i>	Optional, Positional 12
<u>SELECTOR</u>	Selector String	<i>Character value, *NONE, *SYSDFTSUB</i>	Optional, Positional 13
<u>PSPROP</u>	PubSub Property	*SYSDFTSUB , *NONE, *COMPAT, *RFH2, *MSGPROP	Optional, Positional 14
<u>DESTCLASS</u>	Destination Class	*SYSDFTSUB , *MANAGED, *PROVIDED	Optional, Positional 15
<u>SUBSCOPE</u>	Subscription Scope	*SYSDFTSUB , *ALL, *QMGR	Optional, Positional 16
<u>VARUSER</u>	Variable User	*SYSDFTSUB , *ANY, *FIXED	Optional, Positional 17
<u>REQONLY</u>	Request Publications	*SYSDFTSUB , *YES, *NO	Optional, Positional 18
<u>PUBPTY</u>	Publish Priority	0-9, *SYSDFTSUB , *ASPUB, *ASQDEF	Optional, Positional 19
<u>WSHEMA</u>	Wildcard Schema	*SYSDFTSUB , *TOPIC, *CHAR	Optional, Positional 20

Table 251. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>EXPIRY</u>	Expiry Time	0-9999999999, *SYSDFTSUB , *UNLIMITED	Optional, Positional 21

Subscription name (SUBNAME)

The name of the new MQ subscription to be created.

The possible values are:

subscription-name

Specify a maximum of 256 bytes for the subscription name.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

*DFT

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Replace (REPLACE)

If a subscription with the same name already exists, this specifies whether it is replaced.

The possible values are:

*NO

This subscription does not replace any existing subscription with the same name or subscription identifier. The command fails if the subscription already exists.

*YES

Replace the existing subscription. If there is no subscription with the same name or subscription identifier, a new subscription is created.

Topic string (TOPICSTR)

Specifies the topic string associated with this subscription.

The possible values are:

*SYSDFTSUB

The value of this attribute is taken from the system default subscription.

topic-string

Specify a maximum of 256 bytes for the topic string.

Note: Topic strings of greater than 256 bytes can be specified using MQSC.

Topic object (TOPICOBJ)

Specifies the topic object associated with this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

topic-object

Specify the name of the topic object.

Destination (DEST)

Specifies the destination queue for messages published to this subscription.

The possible values are:

destination-queue

Specify the name of the destination queue.

Destination Queue Manager (DESTMQM)

Specifies the destination queue manager for messages published to this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

destination-queue-manager

Specify the name of the destination queue manager.

Destination Correlation Id (DESTCRRID)

Specifies the correlation identifier for messages published to this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

destination-correlation-identifier

Specify the 48 character hexadecimal string representing the 24 byte correlation identifier.

Publish Accounting Token (PUBACCT)

Specifies the accounting token for messages published to this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***NONE**

Messages are placed on the destination with an accounting token of MQACT_NONE.

publish-accounting-token

Specify the 64 character hexadecimal string representing the 32 byte publish accounting token.

Publish Application Id (PUBAPPID)

Specifies the publish application identity for messages published to this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***NONE**

No publish application identifier is specified.

publish-application-identifier

Specify the publish application identifier.

Subscription User Id (SUBUSER)

Specifies the user profile that owns this subscription.

The possible values are:

***SAME**

The attribute is unchanged.

***CURRENT**

The current user profile is the owner of the new subscription.

user-profile

Specify the user profile.

Subscription User Data (USERDATA)

Specifies the user data associated with the subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***NONE**

No user data is specified.

user-data

Specify a maximum of 256 bytes for user data.

Note: User data of greater than 256 bytes can be specified using MQSC.

Selector String (SELECTOR)

Specifies the SQL 92 selector string to be applied to messages published on the named topic to select whether they are eligible for this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***NONE**

No selection string is specified.

selection-string

Specify a maximum of 256 bytes for selection string.

Note: Selection strings of greater than 256 bytes can be specified using MQSC.

PubSub Property (PSPROP)

Specifies the manner in which publish / subscribe related message properties are added to messages sent to this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***NONE**

Publish / subscribe properties are not added to the message.

***COMPAT**

Publish / subscribe properties are added to the message to maintain compatibility with V6 Publish / Subscribe.

***RFH2**

Publish / subscribe properties are added to the message within an RFH 2 header.

***MSGPROP**

Publish / subscribe properties are added as message properties.

Destination Class (DESTCLASS)

Specifies whether this is a managed subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***MANAGED**

The destination is managed.

***PROVIDED**

The destination is a queue.

Subscription Scope (SUBSCOPE)

Specifies whether this subscription should be forwarded (as a proxy subscription) to other brokers, so that the subscriber will receive messages published at those other brokers.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***ALL**

The subscription will be forwarded to all queue managers directly connected via a publish / subscribe collective or hierarchy.

***QMGR**

The subscription will only forward messages published on the topic within this queue manager.

Variable User (VARUSER)

Specifies whether user profiles other than the creator of the subscription can connect to it (subject to topic and destination authority checks).

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***ANY**

Any user profiles can connect to the subscription.

***FIXED**

Only the user profile that created the subscription can connect to it.

Request Publications (REQONLY)

Specifies whether the subscriber will poll for updates via MQSUBRQ API, or whether all publications are delivered to this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***YES**

Publications are only delivered to this subscription in response to an MQSUBRQ API.

***NO**

All publications on the topic are delivered to this subscription.

Publish Priority (PUBPTY)

Specifies the priority of the message sent to this subscription.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***ASPUB**

The priority of the message sent to this subscription is taken from that supplied in the published message.

***ASQDEF**

The priority of the message sent to this subscription is taken from the default priority of the queue defined as the destination.

priority-value

Specify a priority ranging from 0 through 9.

Wildcard Schema (WSCHEMA)

Specifies the schema to be used when interpreting wildcard characters in the topic string.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***TOPIC**

Wildcard characters represent portions of the topic hierarchy.

***CHAR**

Wildcard characters represent portions of strings.

Expiry Time (EXPIRY)

Specifies the expiry time of the subscription. After a subscription's expiry time has elapsed, it becomes eligible to be discarded by the queue manager and will receive no further publications.

The possible values are:

***SYSDFTSUB**

The value of this attribute is taken from the system default subscription.

***UNLIMITED**

The subscription does not expire.

expiry-time

Specify an expiry time in tenths of a second ranging from 0 through 999999999.

 **CRTMQMSVC (Create MQ Service)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Create MQ Service (CRTMQMSVC) command creates a new MQ service definition, specifying those attributes that are to be different from the default.

Parameters

Table 252. Command parameters			
Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 3
<u>TEXT</u>	Text 'description'	Character value, *BLANK, *SYSDFTSVC	Optional, Positional 4
<u>STRCMD</u>	Start program	Single values: *SYSDFTSVC , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 5
	Qualifier 1: Start program	Name	
	Qualifier 2: Library	Name	
<u>STRARG</u>	Start program arguments	Character value, *BLANK, *SYSDFTSVC	Optional, Positional 6
<u>ENDCMD</u>	End program	Single values: *SYSDFTSVC , *NONE Other values: <i>Qualified object name</i>	Optional, Positional 7
	Qualifier 1: End program	Name	
	Qualifier 2: Library	Name	
<u>ENDARG</u>	End program arguments	Character value, *BLANK, *SYSDFTSVC	Optional, Positional 8
<u>STDOUT</u>	Standard output	Character value, *BLANK, *SYSDFTSVC	Optional, Positional 9
<u>STDERR</u>	Standard error	Character value, *BLANK, *SYSDFTSVC	Optional, Positional 10
<u>TYPE</u>	Service type	*SYSDFTSVC , *CMD, *SVR	Optional, Positional 11
<u>CONTROL</u>	Service control	*SYSDFTSVC , *MANUAL, *QMGR, *STARTONLY	Optional, Positional 12

Service name (SVCNAME)

The name of the new MQ service definition.

The possible values are:

service-name

Specify the name of the service definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Replace (REPLACE)

If a service definition with the same name already exists, this specifies whether it is replaced.

The possible values are:

***NO**

This definition does not replace any existing service definition with the same name. The command fails if the named service definition already exists.

***YES**

Replace the existing service definition. If there is no definition with the same name, a new definition is created.

Text 'description' (TEXT)

Specifies text that briefly describes the service definition.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SYSDFTSVC**

The value of this attribute is taken from the system default service.

***BLANK**

The text is set to a blank string.

description

Specify the new descriptive information.

Start program (STRCMD)

The name of the program to run.

The possible values are:

***SYSDFTSVC**

The value of this attribute is taken from the system default service.

start-command

The name of the start command executable.

Start program arguments (STRARG)

The arguments passed to the program at startup.

The possible values are:

***SYSDFTSVC**

The value of this attribute is taken from the system default service.

***BLANK**

No arguments are passed to the start command.

start-command-arguments

The arguments passed to the start command.

End program (ENDCMD)

The name of the executable to run when the service is requested to stop.

The possible values are:

***SYSDFTSVC**

The value of this attribute is taken from the system default service.

***BLANK**

No end command is executed.

end-command

The name of the end command executable.

End program arguments (ENDARG)

The arguments passed to the end program when the service is requested to stop.

The possible values are:

***SYSDFTSVC**

The value of this attribute is taken from the system default service.

***BLANK**

No arguments are passed to the end command.

end-command-arguments

The arguments passed to the end command.

Standard output (STDOUT)

The path to a file to which the standard output of the service program is redirected.

The possible values are:

***SYSDFTSVC**

The value of this attribute is taken from the system default service.

***BLANK**

The standard output is discarded.

stdout-path

The standard output path.

Standard error (STDERR)

The path to a file to which the standard error of the service program is redirected.

The possible values are:

***SYSDFTSVC**

The value of this attribute is taken from the system default service.

***BLANK**

The standard error is discarded.

stderr-path

The standard error path.

Service type (TYPE)

Mode in which to run service.

The possible values are:

***SYSDFTSVC**

The value for this attribute is taken from the system default service.

***CMD**

When started the command is executed but no status is collected or displayed.

***SVR**

The status of the executable started will be monitored and displayed.

Service control (CONTROL)

Whether the service should be started automatically at queue manager start.

The possible values are:

***SYSDFTSVC**

The value for this attribute is taken from the system default service.

***MANUAL**

The service will not be automatically started or stopped.

***QMGR**

The service will be started and stopped as the queue manager is started and stopped.

***STARTONLY**

The service will be started as the queue manager is started, but will not be requested to stop when the queue manager is stopped.

CRTMQMTOPT (Create MQ Topic)
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Create MQ Topic (CRTMQMTOPT) command creates a new MQ topic object, specifying those attributes that are different from the default.

Parameters

<i>Table 253. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>TOPNAME</u>	Topic name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 2
<u>REPLACE</u>	Replace	*NO , *YES	Optional, Positional 3
<u>TEXT</u>	Text 'description'	<i>Character value</i> , *BLANK, *SYSDFTTOP	Optional, Positional 4
<u>TOPICSTR</u>	Topic string	<i>Character value</i> , *BLANK, *SYSDFTTOP	Optional, Positional 5
<u>DURSUB</u>	Durable subscriptions	*SYSDFTTOP , *ASPARENT, *YES, *NO	Optional, Positional 6
<u>MGDDURMDL</u>	Durable model queue	<i>Character value</i> , *NONE, *SYSDFTTOP	Optional, Positional 7
<u>MGDNDURMDL</u>	Non-durable model queue	<i>Character value</i> , *NONE, *SYSDFTTOP	Optional, Positional 8

Table 253. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>PUBENBL</u>	Publish	*SYSDFTTOP , *ASPARENT, *YES, *NO	Optional, Positional 9
<u>SUBENBL</u>	Subscribe	*SYSDFTTOP , *ASPARENT, *YES, *NO	Optional, Positional 10
<u>DFTPTY</u>	Default message priority	0-9, *SYSDFTTOP , *ASPARENT	Optional, Positional 11
<u>DFTMSGPST</u>	Default message persistence	*SYSDFTTOP , *ASPARENT, *YES, *NO	Optional, Positional 12
<u>DFTPUTRESP</u>	Default Put Response	*SYSDFTTOP , *ASPARENT, *SYNC, *ASync	Optional, Positional 13
<u>WILDCARD</u>	Wildcard behavior	*SYSDFTTOP , *PASSTHRU, *BLOCK	Optional, Positional 14
<u>PMSGDLV</u>	Persistent message delivery	*SYSDFTTOP , *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 15
<u>NPMSGDLV</u>	Non-persistent message deliver	*SYSDFTTOP , *ASPARENT, *ALL, *ALLDUR, *ALLAVAIL	Optional, Positional 16
<u>CUSTOM</u>	Custom attribute	<i>Character value</i> , *BLANK, *SYSDFTTOP	Optional, Positional 17

Topic name (TOPNAME)

The name of the new MQ topic object to be created.

The possible values are:

topic-name

Specify the name of the new MQ topic object. The name can contain up to 48 characters.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

*DFT

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Replace (REPLACE)

If a topic object with the same name already exists, this specifies whether it is replaced.

The possible values are:

*NO

This object does not replace any existing topic object with the same name. The command fails if the named topic object already exists.

***YES**

Replace the existing topic object. If there is no object with the same name, a new object is created.

Text 'description' (TEXT)

Specifies text that briefly describes the topic object.

Note: The field length is 64 bytes and the maximum number of characters is reduced if the system is using a double-byte character set (DBCS).

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***BLANK**

The text is set to a blank string.

description

Specify the new descriptive information.

Topic string (TOPICSTR)

Specifies the topic string represented by this topic object definition.

The possible values are:

topic-string

Specify a maximum of 256 bytes for the topic string.

Note: Topic strings of greater than 256 bytes can be specified using MQSC.

Durable subscriptions (DURSUB)

Specifies whether applications are permitted to make durable subscriptions on this topic.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

Whether durable subscriptions can be made on this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Durable subscriptions can be made on this topic.

***NO**

Durable subscriptions cannot be made on this topic.

Durable model queue (MGDDURMDL)

Specifies the name of the model queue to be used for durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

durable-model-queue

Specify the name of the model queue.

Non-durable model queue (MGDNDURMDL)

Specifies the name of the model queue to be used for non-durable subscriptions which request the queue manager manage the destination of publications.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

non-durable-model-queue

Specify the name of the model queue.

Publish (PUBENBL)

Specifies whether messages can be published to the topic.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

Whether messages can be published to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Messages can be published to the topic.

***NO**

Messages cannot be published to the topic.

Subscribe (SUBENBL)

Specifies whether applications are to be permitted to subscribe to this topic.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

Whether applications can subscribe to this topic is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Subscriptions can be made to this topic.

***NO**

Applications cannot subscribe to this topic.

Default message priority (DFTPTY)

Specifies the default priority of messages published to the topic.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

The default priority is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

priority-value

Specify a value ranging from 0 through 9.

Default message persistence (DFTMSGPST)

Specifies the message persistence to be used when applications specify the MQPER_PERSISTENCE_AS_TOPIC_DEF option.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

The default persistence is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***YES**

Messages on this queue survive a restart of the queue manager.

***NO**

Messages on this queue are lost across a restart of the queue manager.

Default Put Response (DFTPUTRESP)

Specifies the type of response required for MQPUT and MQPUT1 calls when applications specify the MQPMO_RESPONSE_AS_Q_DEF option.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

The default response type is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***SYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are issued as if MQPMO_SYNC_RESPONSE had been specified instead. Fields in the MQMD and MQPMO are returned by the queue manager to the application.

***ASYNC**

Specifying this value ensures that the put operations to the queue that specify MQPMO_RESPONSE_AS_Q_DEF are always issued as if MQPMO_ASYNC_RESPONSE had been specified instead. Some fields in the MQMD and MQPMO are not returned by the queue manager to the application. An improvement in performance may be seen for messages put in a transaction or any non-persistent messages.

Wildcard behavior (WILDCARD)

Specifies the behavior of wildcard subscriptions with respect to this topic.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***PASSTHRU**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will receive publications made to this topic and to topic strings more specific than this topic.

***BLOCK**

Subscriptions made to a wildcarded topic less specific than the topic string at this topic object will not receive publications made to this topic or to topic strings more specific than this topic.

Persistent message delivery (PMSGDLV)

Specifies the delivery mechanism for persistent messages published to this topic.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***ALL**

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

***ALLDUR**

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

***ALLAVAIL**

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

Non-persistent message delivery (NPMSGDLV)

Specifies the delivery mechanism for non-persistent messages published to this topic.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***ASPARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

***ALL**

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

***ALLDUR**

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

***ALLAVAIL**

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

Custom attribute (CUSTOM)

This attribute is reserved for the configuration of new features before separate attributes have been introduced. This description will be updated when features using this attribute are introduced. At the moment there are no meaningful values for *CUSTOM*, so leave it empty.

The possible values are:

***SYSDFTTOP**

The value of this attribute is taken from the system default topic.

***BLANK**

The text is set to a blank string.

custom

Specify zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name-value pairs must have the form NAME (VALUE) and be specified in uppercase. Single quotes must be escaped with another single quote.

IBM i CVTMQMDTA (Convert MQ Data Type)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Convert MQ Data Type (CVTMQMDTA) command produces a fragment of code to perform data conversion on data type structures, for use by the data-conversion exit program.

For information on how to use the data-conversion exit, see the IBM MQ Application Programming Guide.

Support is provided for the C programming language only.

Parameters

Table 254. Command parameters

Keyword	Description	Choices	Notes
<u>FROMFILE</u>	Input file	Qualified object name	Required, Positional 1
	Qualifier 1: Input file	Name	
	Qualifier 2: Library	Name, *LIBL, *CURLIB	
<u>FROMMBR</u>	Member containing input	Name	Required, Positional 2
<u>TOFILE</u>	File to receive output	Qualified object name	Required, Positional 3
	Qualifier 1: File to receive output	Name	
	Qualifier 2: Library	Name, *LIBL, *CURLIB	
<u>TOMBR</u>	Member to receive output	Name, *FROMMBR	Optional, Positional 4
<u>RPLTOMBR</u>	Replace to member	*YES, *NO	Optional, Positional 5

Input file (FROMFILE)

Specifies the qualified name of the file, in the form LIBRARY/FILE, that contains the data to convert.

The possible values are:

*LIBL

The library list is searched for the file name.

*CURLIB

The current library is used.

from-library-name

Specify the name of the library to be used.

from-file-name

Specify the name of the file containing the data to convert.

Member containing input (FROMMBR)

Specifies the name of the member containing the data to be converted.

The possible values are:

from-member-name

Specifies the name of the member containing the data to convert.

File to receive output (TOFILE)

Specifies the qualified name of the file, in the form LIBRARY/FILE, that contains the converted data.

The possible values are:

***LIBL**

The library list is searched for the file name.

***CURLIB**

The current library is used.

to-library-name

Specify the name of the library to be used.

to-file-name

Specify the name of the file to contain the converted data.

Member to receive output (TOMBR)

Specifies the name of the member containing the converted data.

The possible values are:

***FROMMBR**

The from-member name is used.

to-member-name

Specify the name of the member containing the converted data.

Replace to member (RPLTOMBR)

Specifies whether the converted data replaces the existing member.

The possible values are:

***YES**

The converted data replaces the existing member.

***NO**

The converted data does not replace the existing member.

 **DLTMQM (Delete Message Queue Manager)**

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete Message Queue Manager (DLTMQM) command deletes the specified local queue manager.

Parameters

<i>Table 255. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

DLTMQMAUTI (Delete MQ AuthInfo object)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ AuthInfo object (DLTMQMAUTI) command deletes an existing MQ authentication information object.

Parameters

Table 256. Command parameters			
Keyword	Description	Choices	Notes
<u>AINAME</u>	AuthInfo name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 2

AuthInfo name (AINAME)

The name of the authentication information object to delete.

If an application has this open, the command fails.

The possible values are:

authentication-information-name

Specify the name of the authentication information object. The maximum string length is 48 characters.

Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

DLTMQMBRK (Delete MQ Pub/Sub Broker)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The delete IBM MQ broker command (DLTMQMBRK) is used to delete the broker. The broker must be stopped when this command is issued, and the queue manager must be running. If the broker is already started, you must issue ENDMQMBRK before issuing this command. To delete more than one broker in the

hierarchy, it is essential that you stop (using the ENDMQMBRK command) and delete each broker one at a time. You should not attempt to stop all the brokers in the hierarchy that you want to delete first and then try to delete them.

Parameters

Table 257. Command parameters			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

queue-manager-name

Specify the name of the queue manager.

DLTMQMCHL (Delete MQ Channel)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Channel (DLTMQMCHL) command deletes the specified channel definition.

Parameters

Table 258. Command parameters			
Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2
<u>CHLTYPE</u>	Channel type	*RCVR, *SDR, *SVR, *RQSTR, *SVRCN, *CLUSSDR, *CLUSRCVR, *NONCLT, *CLTCN	Optional, Positional 3

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

channel-name

Specify the channel name.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

Channel type

Specifies the type of the channel to delete.

The possible values are:

***NONCLT**

Any channel type, that is not a client-connection channel, that matches the channel name.

***SDR**

Sender channel

***SVR**

Server channel

***RCVR**

Receiver channel

***RQSTR**

Requester channel

***SVRCN**

Server-connection channel

***CLUSSDR**

Cluster-sender channel

***CLUSRCVR**

Cluster-receiver channel

***CLTCN**

Client-connection channel

 **DLTMQMSR (Delete MQ Listener)**
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Listener object (DSPMQMSR) command deletes an existing MQ listener object.

Parameters

<i>Table 259. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>LSRNAME</u>	Listener name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Listener name (LSRNAME)

The name of the listener object to delete.

The possible values are:

listener-name

Specify the name of the listener definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

 **DLTMQMNL (Delete MQ Namelist)**
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Namelist (DLTMQMNL) command deletes the specified namelist on the selected local queue manager.

Parameters

<i>Table 260. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>NAMELIST</u>	Namelist	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Namelist (NAMELIST)

The name of the namelist to delete.

namelist

Specify the name of the namelist. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used.

message-queue-manager-name

Specify the name of the queue manager.

 **DLTMQMPRC (Delete MQ Process)**
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Process (DLTMQMPRC) command deletes an existing MQ process definition.

Parameters

Table 261. Command parameters			
Keyword	Description	Choices	Notes
<u>PRCNAME</u>	Process name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2

Process name (PRCNAME)

The name of the process definition to delete. If an application has this process open, the command fails.

The possible values are:

process-name

Specify the name of the process definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

DLTMQMQ (Delete MQ Queue)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Queue (DLTMQMQ) command deletes an MQ queue.

If the queue is a local queue, it must be empty for the command to succeed. CLRMQMQ can be used to clear all of the messages from a local queue.

The command fails if an application has:

- This queue open
- A queue that resolves to this queue open
- A queue open that resolves through this definition as a queue manager alias.

An application using the definition as a reply-to queue alias, however, does not cause this command to fail.

Parameters

Table 262. Command parameters			
Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2

Queue name (QNAME)

The name of the queue.

The possible values are:

queue-name

Specify the name of the queue.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

DLTMQMSUB (Delete MQ Subscription)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Subscription (DLTMQMSUB) command deletes an existing MQ subscription.

Parameters

Keyword	Description	Choices	Notes
<u>SUBID</u>	Subscription identifier	Character value, *NONE	Optional, Positional 1
<u>SUBNAME</u>	Subscription name	Character value, *NONE	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 3

Subscription identifier (SUBID)

The subscription identifier of the subscription to delete.

The possible values are:

subscription-name

Specify a maximum of 256 bytes for the subscription name.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

Subscription name (SUBNAME)

The name of the subscription to delete.

The possible values are:

subscription-name

Specify a maximum of 256 bytes for the subscription name.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

***DFT**

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

DLTMQMSVC (Delete MQ Service)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Service object (DLTMQMSVC) command deletes an existing MQ service object.

Parameters

<i>Table 264. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Service name (SVCNAME)

The name of the service object to delete.

The possible values are:

service-name

Specify the name of the service definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

DLTMQMTOP (Delete MQ Topic)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Delete MQ Topic (DLTMQMTOP) command deletes an existing MQ topic object.

Parameters

Table 265. Command parameters			
Keyword	Description	Choices	Notes
<u>TOPNAME</u>	Topic name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2

Topic name (TOPNAME)

The name of the topic object to delete. If an application has this topic open, the command fails.

The possible values are:

topic-name

Specify the name of the topic object. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

*DFT

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

DMPMQMCFG (Dump MQ Configuration)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Dump MQ Configuration (DMPMQMCFG) command is used to dump the configuration objects and authorities for a queue manager.

Parameters

Table 266. Command parameters			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *ALL	Optional, Positional 1
<u>OBJ</u>	Object name	Character value, *ALL	Optional, Positional 2
<u>OBJTYPE</u>	Object type	*ALL , *AUTHINFO, *CHL, *CLTCN, *COMMINFO, *LSR, *NMLIST, *PRC, *Q, *MQM, *SVC, *SUB, *TOPIC	Optional, Positional 3
<u>EXPTYPE</u>	Export type	*ALL , *OBJECT, *AUTHREC, *CHLAUTH	Optional, Positional 4
<u>EXPATTR</u>	Export attributes	*NONDEF , *ALL	Optional, Positional 5
<u>WARN</u>	Warnings	*NO , *YES	Optional, Positional 6

Keyword	Description	Choices	Notes
<u>OUTPUT</u>	Output	*MQSC , *ONELINE, *SETMQAUT, *GRTMQMAUT	Optional, Positional 7
CLIENT	Client connection	*NO , *YES, *CHL	Optional, Positional 8
<u>CLIENTCHL</u>	MQSC Channel Definition	<i>Character value</i> , *NONE	Optional, Positional 9
<u>MSGSEQNUM</u>	Message sequence number	1-999999999, *NORESET	Optional, Positional 10
<u>RPLYQ</u>	Reply Queue	<i>Character value</i> , 'SYSTEM.DEFAULT.MODEL.QUEUE'	Optional, Positional 11
<u>RMTMQMNAME</u>	Remote Message Queue Manager	<i>Character value</i> , *NONE	Optional, Positional 12
<u>TOFILE</u>	File to receive output	<i>Qualified object name</i>	Optional, Positional 13
	Qualifier 1: File to receive output	<i>Name</i>	
	Qualifier 2: Library	<i>Name</i> , *LIBL	
<u>TOMBR</u>	Member to receive output	<i>Name</i>	Optional, Positional 14

Message Queue Manager name (MQMNAME)

Specifies the name of the IBM MQ queue manager for which object information is to displayed.

The possible values are:

***DFT**

queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

Object name (OBJ)

Specifies the name of the objects to dump. It is a 48-character MQ object or generic object name.

The possible values are:

***ALL**

All objects of the specified type (OBJTYPE) are dumped.

generic-object-name

Specify the generic name of the objects. A generic name is a character string followed by an asterisk (*). For example, ABC*. It selects all objects having names that start with the selected character string.

Specifying the required name within quotation marks ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

object-name

The name of an object for which the corresponding name and type is to be displayed.

Object type (OBJTYPE)

Specifies the type of the objects to be dumped.

The possible values are:

***ALL**

All MQ Objects with names specified by OBJ.

***AUTHINFO**

All MQ authentication information objects with names specified by OBJ.

***CHL**

All MQ channel objects with names specified by OBJ.

***CLTCN**

All MQ client connection objects with names specified by OBJ.

***COMMINFO**

All MQ communication information objects with names specified by OBJ.

***LSR**

All MQ listener objects with names specified by OBJ.

***NMLIST**

All MQ namelist objects with names specified by OBJ.

***PRC**

All MQ process objects with names specified by OBJ.

***Q**

All MQ queue objects with names specified by OBJ.

***MQM**

The queue manager object.

***SVC**

All MQ service objects with names specified by OBJ.

***TOPIC**

All MQ topic objects with names specified by OBJ.

Export type (EXPTYPE)

Specifies the type of the export.

The possible values are:

***ALL**

All MQ object, authority and subscription configuration information is dumped.

***OBJECT**

Only MQ object information is dumped.

***AUTHREC**

Only MQ authority information is dumped.

***CHLAUTH**

Only MQ channel authority records are dumped.

***SUB**

Only MQ durable subscription information is dumped.

Export attributes (EXPATTR)

Specifies the attributes to export.

The possible values are:

***NONDEF**

Only non-default attribute values are dumped.

***ALL**

All attribute values are dumped.

Warnings (WARN)

Specifies whether warnings should be generated during the dump, for example if the command is issued against a newer queue manager or encounters a damaged object.

The possible values are:

***NO**

No warnings messages will be issued during the dump.

***YES**

Warning messages may be issued during the dump.

Output (OUTPUT)

Specifies the output format from the dump.

The possible values are:

***MQSC**

The output format is in the form of MQSC commands that could be used as input to the RUNMQSC or STRMQMMQSC commands.

***ONELINE**

The output format is in the form of MQSC commands formatted into single line records, suitable for use with line comparison tools.

***SETMQAUT**

The output format is in the form of setmqaut commands, suitable for use with AIX, Linux, and Windows.

***GRMQMAUT**

The output format is in the form of GRMQMAUT commands, suitable for use generating a CL program on the IBM i platform.

Client connection (CLIENT)

Specifies whether to use a client connection to the queue manager.

The possible values are:

***NO**

The command will first attempt a server bindings connection, if this connection fails a client connection will be attempted.

***YES**

The command will attempt to connect via a client connection using the default client connection process. If the MQSERVER environment variable is set it will override use of a client connection channel table.

***CHL**

The command will attempt to connect to the queue manager using a temporary channel definition defined by the MQSC string specified in the CLIENTCHL parameter.

MQSC Channel Definition (CLIENTCHL)

Specifies, via MQSC syntax, a temporary client channel definition to use in connecting to the queue manager.

The possible values are:

***NONE**

Do not use a temporary client channel definition when connecting to the queue manager.

mqsc-define-channel-string

The command will attempt to construct a temporary client channel definition from the using the MQSC command supplied on this parameter. The MQSC command must define all required attributes for a client connection channel, for example:

```
"DEFINE CHANNEL(MY.CHL) CHLTYPE(CLNTCONN) CONNAME(MYHOST.MYCORP.COM(1414))"
```

Message sequence number (MSGSEQNUM)

Specifies whether to generate reset channel commands for sender, server and cluster sender channel types when dumping channel objects.

The possible values are:

***NORESET**

Do not include any reset channel commands in the dumped output.

1 - 999999999

Specify a message sequence number for the reset channel commands included in the dump.

Reply Queue (RPLYQ)

Specifies the name of the queue to use for receiving PCF replies when inquiring configuration information.

The possible values are:

SYSTEM.DEFAULT.MODEL.QUEUE

The default model queue, a dynamic queue will be generated to receive replies.

reply-to-queue-name

Specify the name of the reply to queue.

Remote Message Queue Manager (RMTMQMNAME)

Specifies the name of a remote MQ queue manager for which object information is to be displayed.

The possible values are:

***NONE**

The configuration information is collected from the queue manager specified in the MQMNAME parameter.

remote-queue-manager-name

Specify the name of the remote queue manager. PCF inquiry commands are issued to the queue manager specified in RMTMQMNAME via the queue manager specified in MQMNAME, this is known as queued mode. \

File to receive output (TOFILE)

Specifies the qualified name of the file, in the form LIBRARY/FILE, that will be used to store the dumped configuration data. The FILE should have been created with a record length of 240, otherwise the configuration information might be truncated.

The possible values are:

***LIBL**

The library list is searched for the file name.

***CURLIB**

The current library is used.

to-library-name

Specify the name of the library to be used.

to-file-name

Specify the name of the file to contain the configuration data.

Member to receive output (TOMBR)

Specifies the name of the member to store the dumped configuration data.

The possible values are:

to-member-name

Specify the name of the member to contain the configuration data.

Examples

To make these examples work you need to ensure that your system is set up for remote MQSC operation. See [Configuring queue managers for remote administration](#).

```
DMPMQMCFG MQMNAME('MYQMGR') CLIENT(*YES) CLIENTCHL('' DEFINE CHANNEL(SYSTEM.ADMIN.SVRCONN)
CHLTYPE(CLNTCONN) CONNAME('myhost.mycorp.com(1414)') ''')
```

umps all the configuration information from remote queue manager *MYQMGR* in MQSC format and creates an ad-hoc client connection to the queue manager using a client channel called *SYSTEM.ADMIN.SVRCONN*.

Note: You need to ensure that a server-connection channel with the same name exists.

```
DMPMQMCFG MQMNAME('LOCALQM') RMTMQMNAME('MYQMGR')
```

umps all configuration information from remote queue manager *MYQMGR*, in MQSC format, connects initially to local queue manager *LOCALQM*, and sends inquiry messages through this local queue manager.

Note: You need to ensure that the local queue manager has a transmission queue named *MYQMGR*, with channel pairings defined in both directions, to send and receive replies between queue managers.

 [Backing up queue manager configuration](#)

 [Restoring queue manager configuration](#)

DSCMQM (Disconnect MQ)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Disconnect Message Queue Manager (DSCMQM) command does not perform any function and is provided only for compatibility with previous releases of IBM MQ and MQSeries.

Parameters

None

DSPMQM (Display Message Queue Manager)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display Message Queue Manager (DSPMQM) command displays the attributes of the specified local queue manager.

Parameters

Table 267. Command parameters			
Keyword	Description	Choices	Notes
OUTPUT	Output	* , *PRINT	Optional, Positional 1
MQMNAME	Message Queue Manager name	Character value, *DFT	Optional, Positional 2

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

DSPMQMAUT (Display MQ Object Authority)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Authority (DSPMQMAUT) command shows, for the specified object, the current authorizations to the object. If a user ID is a member of more than one group, this command displays the combined authorizations of all of the groups.

- The 48-character MQ object name
- The MQ object type
- Authorizations for object, context and MQI calls

Parameters

Table 268. Command parameters			
Keyword	Description	Choices	Notes
OBJ	Object name	Character value	Required, Positional 1

Table 268. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>OBJTYPE</u>	Object type	*Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *MQM, *NMLIST, *PRC, *LSR, *SVC, *CHL, *CLTCN, *TOPIC, *RMTMQMNAME	Required, Positional 2
<u>USER</u>	User name	Name, *PUBLIC	Optional, Positional 3
<u>OUTPUT</u>	Output	*, *PRINT	Optional, Positional 4
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 5
<u>SRVCOMP</u>	Service Component name	Character value, *DFT	Optional, Positional 6

Object name (OBJ)

Specifies the name of the MQ object for which the authorizations are displayed.

Object type (OBJTYPE)

Specifies the type of the object for which the authorizations are displayed.

*Q

All queue object types.

*ALSQ

Alias queue.

*LCLQ

Local queue.

*MDLQ

Model queue.

*RMTQ

Remote queue.

*AUTHINFO

Authentication Information object.

*MQM

Message Queue Manager.

*NMLIST

Namelist object.

*PRC

Process definition.

*CHL

Channel object.

*CLTCN

Client Connection Channel object.

*LSR

Listener object.

*SVC

Service object.

*TOPIC

Topic object.

***RMTMQMNAME**

Remote queue manager name.

User name (USER)

Specifies the name of the user for whom authorities for the named object are displayed.

The possible values are:

***PUBLIC**

All users of the system.

user-profile-name

Specify the name of the user.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Service Component name (SRVCOMP)

Specifies the name of the installed authorization service in which to search for the authority to display.

The possible values are:

***DFT**

All installed authorization components are searched for the specified object name, object type and user.

Authorization-service-component-name

The component name of the required authorization service as specified in the Queue manager's qm.ini file.

 **DSPMQMAUTI (Display MQ AuthInfo object)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Display MQ AuthInfo object (DSPMQMAUTI) command displays the attributes of an existing MQ authentication information object.

Parameters

Keyword	Description	Choices	Notes
<u>AINAME</u>	AuthInfo name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2
<u>OUTPUT</u>	Output	<i>Character value, *, *PRINT</i>	Optional, Positional 3

AuthInfo name (AINAME)

The name of the authentication information object to display.

The possible values are:

authentication-information-name

Specify the name of the authentication information object. The maximum string length is 48 characters.

Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

*

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

*PRINT

The output is printed with the job's spooled output.

DSPMQMBRK (Display MQ Pub/Sub Broker)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display IBM MQ broker (DSPMQMBRK) command does not perform any function and is only provided for compatibility with previous releases of IBM MQ.

Parameters

Table 270. Command parameters			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1

Message Queue Manager name (MQMNAME)

The name of the queue manager.

The value is:

queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

DSPMQMCHL (Display MQ Channel)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Channel (DSPMQMCHL) command displays the attributes of an existing MQ channel definition.

Parameters

Table 271. Command parameters			
Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 3
<u>CHLTYPE</u>	Channel type	*RCVR, *SDR, *SVR, *RQSTR, *SVRCN, *CLUSDR, *CLUSRCVR, *NONCLT , *CLTCN	Optional, Positional 4

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

channel-name

Specify the channel name.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

*

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

Channel type (CHLTYPE)

Specifies the type of the channel to be displayed.

The possible values are:

***NONCLT**

Any channel type, that is not a client-connection channel, that matches the channel name.

***SDR**

Sender channel

***SVR**

Server channel

***RCVR**

Receiver channel

***RQSTR**

Requester channel

***SVRCN**

Server-connection channel

***CLUSSDR**

Cluster-sender channel

***CLUSRCVR**

Cluster-receiver channel

***CLTCN**

Client-connection channel

DSPMQMCSVR (Display MQ Command Server)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Command Server (DSPMQMCSVR) command displays the status of the MQ command server.

The status of the command server can be one of the following:

Enabled

Available to process messages

Disabled

Not available to process messages

Starting

STRMQMCSVR command in progress

Stopping

ENDMQMCSVR command in progress

Stopped

ENDMQMCSVR command completed

Running

Processing a message

Waiting

Waiting for a message

Parameters

<i>Table 272. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 1

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

DSPMQMLSR (Display MQ Listener)
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Listener object (DSPMQMLSR) command displays the attributes of an existing MQ listener object.

Parameters

<i>Table 273. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>LSRNAME</u>	Listener name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Key, Positional 2
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 3

Listener name (LSRNAME)

The name of the listener object to display.

The possible values are:

listener-name

Specify the name of the listener definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

*PRINT

The output is printed with the job's spooled output.

DSPMQMNL (Display MQ Namelist)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Namelist (DSPMQMNL) command displays an MQ namelist.

Parameters

Keyword	Description	Choices	Notes
<u>NAMELIST</u>	Namelist	Character value	Required, Positional 1
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3

Namelist (NAMELIST)

The name of the namelist to be displayed.

namelist

Specify the name of the namelist. The maximum length of the string is 48 bytes.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used.

message-queue-manager-name

Specify the name of the queue manager.

DSPMQMOBJN (Display MQ Object Names)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Object Names (DSPMQMOBJN) command is used to provide the name, type, and fully-qualified file name for a specified MQ object.

Parameters

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	Character value, *ALL	Required, Positional 1
<u>OBJTYPE</u>	Object type	*ALLMQM , *Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *CTLG, *CHL, *CLTCN, *SVC, *MQM, *NMLIST, *PRC, *LSR, *TOPIC	Optional, Positional 2
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 3
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 4

Object name (OBJ)

Specifies the name of the objects for which the corresponding name, type and file name to display. It is a 48-character MQ object or generic object name.

The possible values are:

***ALL**

All objects of the specified type (OBJTYPE) are displayed.

generic-object-name

Specify the generic name of the objects. A generic name is a character string followed by an asterisk (*). For example, ABC*. It selects all objects having names that start with the selected character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

object-name

The name of an object for which the corresponding name and type is to be displayed.

Object type (OBJTYPE)

Specifies the type of the objects to be displayed.

The possible values are:

***ALLMQM**

All MQ Objects with names specified by OBJ.

***Q**

All MQ queues with names specified by OBJ.

***ALSQ**

All MQ alias queues with names specified by OBJ.

***LCLQ**

All MQ local queues with names specified by OBJ.

***MDLQ**

All MQ model queues with names specified by OBJ.

***RMTQ**

All MQ remote queues with names specified by OBJ.

***AUTHINFO**

All MQ authentication information objects with names specified by OBJ.

***CHL**

All MQ channel objects with names specified by OBJ.

***CLTCN**

All MQ MQI client connection channel objects with names specified by OBJ.

***SVC**

All MQ service objects with names specified by OBJ.

***LSR**

All MQ listener objects with names specified by OBJ.

***CTLG**

The MQ queue manager catalog object with name specified by OBJ. This has the same name as the queue manager object.

***MQM**

The Message Queue Manager object with name specified by OBJ.

***NMLIST**

All MQ namelists with names specified by OBJ.

***PRC**

All MQ process definitions with names specified by OBJ.

***LOBJ**

All MQ listener objects with names specified by OBJ.

***TOPIC**

All MQ topic objects with names specified by OBJ.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the MQ queue manager for which object information is to displayed.

The possible values are:

***DFT**

The default queue manager.

queue-manager-name

Specify the name of the queue manager.

 **DSPMQMPRC (Display MQ Process)**
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Process (DSPMQMPRC) command displays the attributes of an existing MQ process definition.

Parameters

<i>Table 276. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>PRCNAME</u>	Process name	Character value	Required, Positional 1
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3

Process name (PRCNAME)

The name of the process definition to be displayed.

The possible values are:

process-name

Specify the name of the process definition. The maximum length of the string is 48 bytes.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

DSPMQMQ (Display MQ Queue)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Queue (DSPMQMQ) command displays the attributes of an existing MQ queue definition.

Parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value	Required, Positional 1
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3

Queue name (QNAME)

The name of the queue.

The possible values are:

queue-name

Specify the name of the queue.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

*

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

 **DSPMQMRTE (Display MQ Route Information)**

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The DSPMQMRTE command generates a trace route message based on user specified parameters and puts it to a specified queue. One or more reports about the route the message takes to its final destination might be generated, as well as a reply. These will be got from a specified reply queue and the information contained within them will be written to the job's spooled output when it is received.

Parameters

Table 278. Command parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Target object	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2
<u>CRRLID</u>	Correlation Identifier	Character value, *NONE	Optional, Positional 3
<u>MSGPST</u>	Message Persistence	*YES, *NO , *QUEUE	Optional, Positional 4
<u>MSGPRTY</u>	Message Priority	0-9, *QUEUE	Optional, Positional 5
<u>OPTION</u>	Report Option	Single values: *DFT , *NONE Other values (up to 6 repetitions): *ACTIVITY, *COA, *COD, *DISCARD, *EXCEPTION, *EXPIRATION	Optional, Positional 6
<u>RPLYQ</u>	Reply Queue	Character value, *DFT	Optional, Positional 7
<u>RPLYMQM</u>	Reply Queue Manager	Character value, *DFT	Optional, Positional 8
<u>EXPIRY</u>	Message Expiry	0-999999999, *DFT	Optional, Positional 9
<u>EXPRPT</u>	Pass Expiry	*YES , *NO	Optional, Positional 10
<u>RTEINF</u>	Route Accumulation	*YES, *NO	Optional, Positional 11

Table 278. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>RPLYMSG</u>	Reply Message	*YES, *NO	Optional, Positional 12
<u>DLVRMSG</u>	Deliver Message	*YES, *NO	Optional, Positional 13
<u>FWDMSG</u>	Forward Message	*SUPPORT, *ALL	Optional, Positional 14
<u>MAXACTS</u>	Maximum Activities	1-999999999, *NOMAX	Optional, Positional 15
<u>DETAIL</u>	Route Detail	*LOW, *MEDIUM, *HIGH	Optional, Positional 16
<u>BROWSE</u>	Browse Only	*YES, *NO	Optional, Positional 17
<u>DSPMSG</u>	Display Message	*YES, *NO	Optional, Positional 18
<u>TGTMQM</u>	Target Queue Manager	Character value, *DFT	Optional, Positional 19
<u>DSPINF</u>	Display Information	Single values: *ALL, *SUMMARY, *NONE Other values (up to 6 repetitions): *ACTGRP, *ID, *MSGGRP, *MSGDELTA, *OPGRP, *TRGRP	Optional, Positional 20
<u>WAIT</u>	Wait Time	0-999999999, *DFT	Optional, Positional 21
<u>BIND</u>	Bind Option	*OPEN, *NOTFIXED	Optional, Positional 22

Target object (QNAME)

Specifies the name of the target queue of the trace route message or, if displaying previously gathered information, the name of the queue storing the information.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

Use the default queue manager.

message-queue-manager-name

Specify the name of the queue manager.

Correlation Identifier (CRRLID)

Specifies the CorrelId to use when retrieving previously gathered information. The format of the 24 byte CorrelId is a 48 character hexadecimal string. You must supply a CorrelId if you are retrieving previously gathered information, rather than generating a trace route message.

The possible values are:

*NONE

No CorrelId is supplied.

correlation-identifier

The 48 character hexadecimal string representing the 24 byte CorrelId.

Message Persistence (MSGPST)

Specifies the persistence of the trace route message.

The possible values are:

***NO**

The message will be put with MQPER_NOT_PERSISTENT.

***YES**

The message will be put with MQPER_PERSISTENT.

***QUEUE**

The message will be put with MQPER_PERSISTENCE_AS_Q_DEF.

Message Priority (MSGPRTY)

Specifies the priority of the trace route message.

The possible values are:

***QUEUE**

The message will be put with MQPRI_PRIORITY_AS_Q_DEF.

message-priority

The priority of the message ranging 0 through 9.

Report Option (OPTION)

Specifies the report options of the trace route message. Reports generated on a non trace route enabled queue manager can potentially remain in the network undelivered, which is why most report options are disabled by default. By requesting full data to be returned, it allows the trace route information contained in the message to be returned in the result of a problem.

The possible values are:

***DFT**

Turns on MQRO_ACTIVITY and MQRO_DISCARD_MSG.

***NONE**

No report options are set.

***ACTIVITY**

Turns on MQRO_ACTIVITY.

***COA**

Turns on MQRO_COA_WITH_FULL_DATA.

***COD**

Turns on MQRO_COD_WITH_FULL_DATA.

***DISCARD**

Turns on MQRO_DISCARD_MSG.

***EXCEPTION**

Turns on MQRO_EXCEPTION_WITH_FULL_DATA.

***EXPIRATION**

Turns on MQRO_EXPIRATION_WITH_FULL_DATA.

Reply Queue (RPLYQ)

Specifies the name of the reply queue to which the reply and all report messages should be sent. This must exist on the local queue manager unless the RPLYMQM parameter is also specified. The reply queue should not be a temporary queue if the trace route message is to be persistent.

The possible values are:

***DFT**

The SYSTEM.DEFAULT.MODEL.QUEUE is used and the reply queue is by default a temporary dynamic queue.

reply-queue

The name of the reply queue to use.

Reply Queue Manager (RPLYMQM)

Specifies the queue manager to which replies are sent.

The possible values are:

***DFT**

Replies are sent to the local queue manager.

reply-queue-manager

The name of the reply to queue manager.

Message Expiry (EXPIRY)

Specifies the Expiry time, in seconds, of the trace route message.

The possible values are:

***DFT**

The default expiry time of 60 seconds is used.

expiry-time

The expiry time of the message ranging from 0 through 999999999.

Pass Expiry (EXPRPT)

Specifies whether the expiry of the trace route message is passed to reports or the reply message. This effectively turns MQRO_PASS_DISCARD_AND_EXPIRY on and off. This allows users to keep the reports indefinitely if required.

The possible values are:

***YES**

Expiry is passed to reports or the reply message.

***NO**

Expiry is not passed to reports or the reply message.

Route Accumulation (RTEINF)

Specifies that the route information is accumulated within the trace route message as it flows through the queue manager network.

The possible values are:

***NO**

No information is accumulated within the trace route message.

***YES**

Information is accumulated within the trace route message.

Reply Message (RPLYMSG)

Requests that a reply message containing all accumulated information is returned to the reply to queue when the trace route message reaches its final destination (if this is permitted by the queue manager hosting the final destination queue).

The possible values are:

***NO**

No reply message is returned.

***YES**

A reply message is returned to the the reply to queue.

Deliver Message (DLVRMSG)

Specifies whether the trace route message is delivered to getting applications if the message successfully arrives at the destination queue.

The possible values are:

***NO**

If the trace route message successfully arrives at the target queue it is not delivered to getting applications.

***YES**

The trace route message is delivered to a getting application if the message successfully arrives at the target queue. Specifying this option effectively gives permission for the message to arrive on a queue manager, whether it supports trace route or not.

Forward Message (FWDMSG)

Specifies whether the trace route message is forwarded to the next queue manager in the route.

The possible values are:

***SUPPORT**

The trace route message is forwarded only to queue managers that can ensure that the delivery option is honoured.

***ALL**

The trace route message is forwarded on without any regard given to the next queue manager in the route. This option can be used to force a non-trace route enabled queue manager to accept trace route messages, even when they cannot process them in line with the delivery option.

Maximum Activities (MAXACTS)

Specifies the maximum number of activities that can take place on the trace route message before it is discarded.

The possible values are:

***NOMAX**

No maximum number of activities are specified.

maximum-activities

The maximum number of activities ranging from 1 through 999999999.

Route Detail (DETAIL)

Specifies how much detail about the route is requested.

The possible values are:

***LOW**

At this level of detail no information about queue manager activities is requested. This gives a very high level view of what user activity has taken place on the message.

***MEDIUM**

Low detail information, as well as information on the movements of the message within the queue manager is requested. This includes the work of the MCA.

***HIGH**

Low and medium detail, as well as more detailed information about the route the message took is requested. For example, in clustering this might include detail about why the route was chosen.

Browse Only (BROWSE)

Specifies whether messages returned are browsed only. This means that the information remains on the queue for future display operations.

The possible values are:

***NO**

Messages returned are not browse only.

***YES**

Messages returned are browse only.

Display Message (DSPMSG)

Specifies whether when a trace route message is generated the information returned is displayed.

The possible values are:

***YES**

The returned information is displayed.

***NO**

The returned information is not displayed. This allows DSPMQMRTE to exit as soon as the trace route message has been put to the target queue. On exit, a 48 character hexadecimal string is output, which is the MsgId on the trace route message that was generated and can be used as the CRRLID supplied to a subsequent DSPMQMRTE call.

Target Queue Manager (TGTMQM)

Specifies the target queue manager for the trace route message.

The possible values are:

***DFT**

No target queue manager is specified. Either the destination queue is a local queue, or there is a local definition of the queue.

target-queue-manager

The target queue manager for the trace route message.

Display Information (DSPINF)

Specifies how much of the information gathered should be displayed.

The possible values are:

***ALL**

All available information is displayed.

***SUMMARY**

Displays only the queues which the message was routed through.

***NONE**

None of the available information will be displayed.

***ACTGRP**

All non-group parameters in the Activity groups will be displayed.

***ID**

Values with parameters identifiers MQBACF_MSG_ID or MQBACF_CORREL_ID are always displayed. This overrides *MSGDELTA which normally prevents certain values in the Message groups from being displayed.

***MSGGRP**

All non-group parameters in the Message groups are displayed.

***MSGDELTA**

Like *MSGGRP, except that information in the Message groups is only displayed where it has changed since the last operation took place.

***OPGRP**

All non-group parameters in the Operation groups are displayed.

***TRGRP**

All parameters in the TraceRoute groups are displayed.

Wait Time (WAIT)

Specifies how long, in seconds, that DSPMQMRTE should wait before assuming that all a reply message or all the reports (depending on the options specified) that were generated en route that can be delivered to the reply queue have now done so.

The possible values are:

***DFT**

DSPMQMRTE waits for 60 seconds longer than the Expiry time of the trace route message.

wait-time

The time that DSPMQMRTE should wait.

Bind Option (BIND)

Specifies whether the target queue is bound to a specific destination.

The possible values are:

***OPEN**

The target queue is bound to a specific destination. The queue is opened with option MQOO_BIND_ON_OPEN.

***NOTFIXED**

The target queue is not bound to a specific destination. Typically this parameter is used when the trace route message is to be put across a cluster. The queue is opened with option MQOO_BIND_NOT_FIXED.

 **DSPMQMSPL (Display MQM Security Policies)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Display MQM Security Policies (DSPMQMSPL) command displays security policies, that are used by Advanced Message Security to control how messages should be protected when being put, browsed, or destructively removed from queues.

The policy name associates digital signing and encryption protection for messages with queues matching the policy name.

Parameters

Keyword	Description	Choices	Notes
<u>OUTPUT</u>	Output	* , *PRINT	Optional, Positional 1
<u>POLICY</u>	Policy name	Character value	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

Policy name (POLICY)

Specifies the name of the security policy, the name of the policy matches the name of the queue that the policy applies to.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

DSPMQMSTS (Display Queue Manager Status)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display Message Queue Manager Status (DSPMQMSTS) command displays the status attributes of the specified local queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 1

Table 280. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>OUTPUT</u>	Output	*, *PRINT	Optional, Positional 2

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

*

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

*PRINT

The output is printed with the job's spooled output.

DSPMQMSUB (Display MQ Subscription)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Subscription (DSPMQMSUB) command displays the attributes of an existing MQ subscription.

Parameters

Table 281. Command parameters

Keyword	Description	Choices	Notes
<u>SUBID</u>	Subscription identifier	Character value, *NONE	Optional, Positional 1
<u>SUBNAME</u>	Subscription name	Character value, *NONE	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 3
<u>OUTPUT</u>	Output	*, *PRINT	Optional, Positional 4

Subscription identifier (SUBID)

The subscription identifier of the subscription to be displayed.

The possible values are:

subscription-name

Specify a maximum of 256 bytes for the subscription name.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

Subscription name (SUBNAME)

The name of the subscription to be displayed.

The possible values are:

subscription-name

Specify a maximum of 256 bytes for the subscription name.

Note: Subscription names of greater than 256 bytes can be specified using MQSC.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

***DFT**

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

 **DSPMQMSVC (Display MQ Service)**
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Service object (DSPMQMSVC) command displays the attributes of an existing MQ service object.

Parameters

Table 282. Command parameters

Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Key, Positional 2

Table 282. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>OUTPUT</u>	Output	*, *PRINT	Optional, Positional 3

Service name (SVCNAME)

The name of the service object to display.

The possible values are:

service-name

Specify the name of the service definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

*

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

*PRINT

The output is printed with the job's spooled output.

DSPMQMTOP (Display MQ Topic)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Topic (DSPMQMTOP) command displays the attributes of an existing MQ topic object.

Parameters

Table 283. Command parameters

Keyword	Description	Choices	Notes
<u>TOPNAME</u>	Topic name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2
<u>OUTPUT</u>	Output	*, *PRINT	Optional, Positional 3

Topic name (TOPNAME)

The name of the topic object to be displayed.

The possible values are:

topic-name

Specify the name of the topic object. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the Queue Manager.

The possible values are:

*DFT

Use the default Queue Manager.

queue-manager-name

The name of a Queue Manager.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation or printed with the job's spooled output.

The possible values are:

*

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

*PRINT

The output is printed with the job's spooled output.

DSPMQMVER (Display MQ Version)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Display MQ Version (DSPMQMVER) command provides the current MQ version.

Parameters

Keyword	Description	Choices	Notes
<u>OUTPUT</u>	Output	*, *PRINT	Optional, Positional 1

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

*

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

The output is printed with the job's spooled output.

IBM i **ENDMQM (End Message Queue Manager)**

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The End Message Queue Manager (**ENDMQM**) command ends the specified local message queue manager or all queue managers. The attributes of the message queue managers are not affected and it can be restarted using the Start Message Queue Manager (**STRMQM**) command.

You can also use this command to fully quiesce all application programs connected to the queue manager or all queue managers.

The **ENDMQM** command's default parameters should not be changed with the CHGCMDDEF (Change Command Default) command.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 1
<u>OPTION</u>	Option	*CNTRLD , *IMMED, *WAIT, *PREEMPT	Optional, Positional 2
<u>INSTANCE</u>	Instance To End	*ALL , *STANDBY	Optional, Positional 3
<u>ALWSWITCH</u>	Allow Switchover	*NO , *YES	Optional, Positional 4
<u>RECONN</u>	Reconnect	*NO , *YES	Optional, Positional 5
<u>ENDCCTJOB</u>	End connected jobs	*NO , *YES	Optional, Positional 6
<u>RCDMQMIMG</u>	Record MQ Object Image	*NO, *YES	Optional, Positional 7
<u>TIMEOUT</u>	Timeout interval (seconds)	0-3600, 30	Optional, Positional 8

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

***ALL**

All queue managers are ended.

Option (OPTION)

Specifies whether processes that are connected to the queue manager are allowed to complete.

The possible values are:

***CNTRLD**

Allow programs currently being processed to complete. An MQCONN call (or an MQOPEN or MQPUT1, which perform an implicit connection) fails. If ENDCCTJOB(*YES) is specified, a controlled shutdown of the queue manager is attempted ten times. If the queue manager shuts down successfully, it is followed by immediate termination of the processes that are still connected to it.

***IMMED**

End the queue manager immediately. All current MQI calls complete, but subsequent requests for MQI calls fail. Incomplete units of work are rolled back when the queue manager is next started. If ENDCCTJOB(*YES) is specified, a controlled shutdown of the queue manager is followed if necessary, after an interval of TIMEOUT seconds, by an immediate shutdown of the queue manager. This is followed by immediate termination of processes connected to it.

***WAIT**

End the queue manager in the same way as the *CNTRLD option. However, control is returned only after the queue manager has stopped. This option is not allowed with MQMNAME(*ALL). If ENDCCTJOB(*YES) is specified, a single controlled shutdown of the queue manager is issued, which waits for all processes to disconnect. When this completes it is followed by the actions described in the ENDCCTJOB parameter.

***PREEMPT**

Use this type of shutdown only in exceptional circumstances The queue manager stops without waiting for applications to disconnect or for MQI calls to complete. This can give unpredictable results for IBM MQ applications. All processes in the queue manager that fail to stop are ended 30 seconds after the command is issued. This option is not allowed with ENDCCTJOB(*YES).

Instance To End (INSTANCE)

Specifies whether to end all instances of a queue manager, or to end just a standby queue manager instance.

The possible values are:

***ALL**

All instances of a queue manager are to be ended. This option can only be requested against a non-standby queue manager instance.

If a standby instance is running elsewhere, the ALWSWITCH parameter on the ENDMQM command will control whether the standby instance is itself ended.

***STANDBY**

Only the standby queue manager instance should be ended, any active queue manager instance will continue to run. This option can only be requested against a standby queue manager instance.

Allow Switchover (ALWSWITCH)

Specifies whether switchover to a standby instance of the queue manager is allowed when the active queue manager instance has ended.

The possible values are:

***NO**

Switchover to a standby queue manager instance is not allowed. Any standby instances that are running will also end on successful completion of this command. P.: Reconnectable client applications connected to this queue manager are instructed to disconnect.

***YES**

Switchover to a standby queue manager instance is attempted, if a standby queue manager instance is not running this command will fail and the active queue manager instance will remain active.

Reconnectable client applications connected to this queue manager instance are instructed to begin reconnect processing, to maintain connectivity.

Reconnect (RECONN)

Specifies whether client applications currently connected to this queue manager should attempt to reconnect to a queue manager instance.

The possible values are:

***NO**

Reconnectable client applications connected to this queue manager are instructed to disconnect.

***YES**

Reconnectable client applications connected to this queue manager are instructed to begin reconnect processing, to maintain connectivity.

End connected jobs (ENDCCTJOB)

Specifies whether all processes connected to the queue manager are forcibly terminated.

The possible values are:

***NO**

The queue manager or queue managers are ended but no further action is taken.

***YES**

The following steps are taken for each queue manager to be ended:

- If the queue manager is running and RCDMQMIMG(*YES) has been specified, media images for all objects defined for the queue manager are recorded.
- The queue manager is ended in the appropriate manner (*CNTRLD, *WAIT, or *IMMED).
- All shared memory and semaphores used by the queue manager are deleted irrespective of whether applications have disconnected from the queue manager. Applications that have not disconnected from a shared memory resource when this option is specified receive a return code of MQRC_CONNECTION_BROKEN (2009) the next time an MQI call is issued with an existing connection handle.

Record MQ Object Image (RCDMQMIMG)

Specifies whether media images are recorded for a queue manager.

The possible values are:

***YES**

If the queue manager is running, media images for all queue manager objects are recorded.

***NO**

Media images of queue manager objects are not recorded as part of the quiesce.

Timeout interval (seconds) (TIMEOUT)

Specifies the time interval in seconds between the controlled and immediate shutdowns of the queue manager when *IMMED is specified. It also determines the number of seconds between attempts to shut down the queue manager when *CNTRLD is specified.

The possible values are:

30

The default value is 30 seconds.

timeout-interval

Specify a value in seconds, in the range 0 through 3600.

IBM i ENDMQMBRK (End MQ Pub/Sub Broker)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The End IBM MQ Broker (ENDMQMBRK) command is used to stop a broker.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1
<u>OPTION</u>	Option	*CNTRLD, *IMMED	Optional, Positional 2

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

queue-manager-name

Specify the name of the queue manager.

Option (OPTION)

Specifies how the broker is ended.

The possible values are:

*CNTRLD

Allows the broker to complete processing for any message that it has already started.

*IMMED

Ends the broker immediately. The broker does not attempt any further gets or puts, and backs out any in-flight units-of-work. This might mean that a nonpersistent input message is published only to a subset of subscribers, or lost, depending on the broker configuration parameters.

IBM i ENDMQMCHL (End MQ Channel)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The End MQ Channel (ENDMQMCHL) command closes an MQ channel, and the channel is no longer enabled for automatic restarts.

Parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>OPTION</u>	Option	*CNTRLD, *IMMED, *ABNORMAL	Optional, Positional 2

Table 287. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 3
<u>STATUS</u>	Channel status	*STOPPED , *INACTIVE	Optional, Positional 4
<u>CONNNAME</u>	Connection name	Character value, *NONE	Optional, Positional 5
<u>RQMNAME</u>	Remote queue manager	Character value, *NONE	Optional, Positional 6

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

channel-name

Specify the channel name.

Option (OPTION)

Specifies whether processing for the current batch of messages is allowed to finish in a controlled manner.

The possible values are:

*CNTRLD

Allows processing of the current batch of messages to complete. No new batch is allowed to start.

*IMMED

Ends processing of the current batch of messages immediately. This is likely to result in 'in-doubt' situations.

*ABNORMAL

Ends processing of the current batch of messages immediately and terminates the channel thread or job. This is likely to result in 'in-doubt' situations.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

Channel status (STATUS)

Specifies the required status of the channel after successful completion of the command.

The possible values are:

*STOPPED

The channel status is set to STOPPED.

*INACTIVE

The channel status is set to INACTIVE.

Connection name (CONNAME)

Specifies the connection name of the channel instance that you want to end.

Remote queue manager (RQMNAME)

Specifies the name of the remote queue manager of the channel instance that you want to end.

ENDMQMCONN (End Queue Manager Connection)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The End MQ Connections (ENDMQMCONN) command allows you to end a connection to the queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>CONN</u>	Connection Identifier	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2

Connection Identifier (CONN)

The connection identifier to end.

The connection identifier is a 16 character hex string.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

ENDMQMCSVR (End MQ Command Server)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The End MQ Command Server (ENDMQMCSVR) command stops the MQ command server for the specified local queue manager.

Parameters

Table 289. Command parameters			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1
<u>OPTION</u>	Option	*CNTRLD , *IMMED	Optional, Positional 2

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

queue-manager-name

Specify the name of the queue manager.

Option (OPTION)

Specifies whether the command message currently being processed is allowed to complete.

The possible values are:

*CNTRLD

Allows the command server to complete processing any command message that it has already started. No new message is read from the queue.

*IMMED

Ends the command server immediately. Any action associated with a command message currently being processed might not be completed.

ENDMQMLSR (End MQ Listeners)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The End MQ Listener (ENDMQMLSR) command ends an MQ TCP/IP listener.

This command is valid only for TCP/IP transmission protocols.

Either a listener object or specific port can be specified.

Parameters

Table 290. Command parameters			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 1
<u>PORT</u>	Port number	1-65535, *ALL	Optional, Positional 2
<u>OPTION</u>	Option	*CNTRLD , *WAIT , *FORCE	Optional, Positional 3
<u>LSRNAME</u>	Listener name	Character value, *NONE	Optional, Positional 4

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

Port number (PORT)

The port number to be used by the listener.

The possible values are:

***SAME**

The attribute is unchanged.

port-number

The port number to be used.

Option (OPTION)

Specifies the action taken after processes to end the listeners have been started.

***CNTRLD**

Processes are started to end all the listeners for the specified queue manager and control is returned before the listeners actually end.

***WAIT**

End the listeners for the specified queue manager in the same way as the *CNTRLD option. However, control is returned only after all the listeners have ended.

Listener name (LSRNAME)

The name of the MQ listener object to end.

The possible values are:

***NONE**

No listener object is specified.

listener-name

Specify the name of the listener definition. The maximum length of the string is 48 bytes.

 **ENDMQMSVC (End MQ Service)**

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The End MQ Service (ENDMQMSVC) command ends an MQ service.

Parameters

<i>Table 291. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 2

Service name (SVCNAME)

The name of the MQ service object to end.

The possible values are:

*NONE

No service object is specified.

service-name

Specify the name of the service definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

*DFT

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

GRMQMAUT (Grant MQ Object Authority)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Grant MQ Authority (GRMQMAUT) command is used to grant specific authority for the MQ objects named in the command to another user or group of users.

Authority can be given to:

- Named users.
- Users (*PUBLIC) who do not have authority specifically given to them.
- Groups of users who do not have any authority to the object.

The GRMQMAUT command can be used by anyone in the QMQMADM group, that is, anyone whose user profile specifies QMQMADM as a primary or supplemental group profile.

Parameters

Keyword	Description	Choices	Notes
OBJ	Object name	Character value	Required, Positional 1
OBJTYPE	Object type	*ALL, *Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *MQM, *NMLIST, *PRC, *LSR, *SVC, *CHL, *CLTCN, *TOPIC, *RMTMQMNAME	Required, Positional 2
USER	User names	Single values: *PUBLIC, Other values (up to 50 repetitions): <i>Name</i>	Required, Positional 3

Table 292. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>AUT</u>	Authority	Values (up to 22 repetitions): *ALTUSR, *BROWSE, *CONNECT, *GET, *INQ, *PUT, *SET, *PUB, *SUB, *RESUME, *PASSALL, *PASSID, *SETALL, *SETID, *ADMCHG, *ADMCLR, *ADMCRRT, *ADMDLT, *ADM DSP, *ALL, *ALLADM, *ALLMQI, *NONE, *CTRL, *CTRLX, *SYSTEM	Required, Positional 4
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 5
<u>SRVCOMP</u>	Service Component name	Character value, *DFT	Optional, Positional 6

Object name (OBJ)

Specifies the name of the objects for which specific authorities are granted.

The possible values are:

***ALL**

All objects of the type specified by the value of the OBJTYPE parameter at the time the command is issued. *ALL cannot represent a generic profile.

object-name

Specify the name of an MQ object for which specific authority is given to one or more users.

generic profile

Specify the generic profile of the objects to be selected. A generic profile is a character string containing one or more generic characters anywhere in the string. This profile is used to match the object name of the object under consideration at the time of use. The generic characters are (?), (*) and (**).

? matches a single character in an object name.

* matches any string contained within a qualifier, where a qualifier is the string between periods (.). For example ABC* matches ABCDEF but not ABCDEF.XYZ.

** matches one or more qualifiers. For example ABC.**.XYZ matches ABC.DEF.XYZ and ABC.DEF.GHI.XYZ, ** can appear only once in a generic profile.

Specify the name required within quotation marks to ensure that your selection is precisely what you entered.

Object type (OBJTYPE)

Specifies the type of the objects for which specific authorities are granted.

***ALL**

All MQ object types.

***Q**

All queue object types.

***ALSQ**

Alias queue.

- *LCLQ**
Local queue.
- *MDLQ**
Model queue.
- *RMTQ**
Remote queue.
- *AUTHINFO**
Authentication Information object.
- *MQM**
Message Queue Manager.
- *NMLIST**
Namelist object.
- *PRC**
Process definition.
- *CHL**
Channel object.
- *CLTCN**
Client Connection Channel object.
- *LSR**
Listener object.
- *SVC**
Service object.
- *TOPIC**
Topic object.
- *RMTMQMNAME**
Remote queue manager name.

User names (USER)

Specifies the name or names of users to whom authorities for the named object are being given. If user names are specified, the authorities are given specifically to those users. Authority given by this command can be revoked specifically by the Revoke MQ Authority (RVKMQMAUT) command.

- *PUBLIC**
All users of the system.

user-profile-name

Specify the names of one or more users who are to be granted specific authority for the object. These names can also be group names. You can specify up to 50 user profile names.

Authority (AUT)

Specifies the authority being given to the named users. Values for AUT can be specified as a list of specific and general authorities in any order, where the general authorities can be:

- *NONE, which creates a profile for the user with no authority to the specified object, or leaves the authority unchanged if a profile already exists.
- *ALL, which confers all authorities to the specified users.
- *ALLADM, which confers all of *ADMCHG, *ADMCLR, *ADMCRRT, *ADMDLT, *ADMDSP, *CTRL and *CTRLX.
- *ALLMQI, which confers all of *ALTUSR, *BROWSE, *CONNECT, *GET, *INQ, *PUT, *SET, *PUB, *SUB and *RESUME.

Authorizations for different object types

- *ALL**
All authorizations. Applies to all objects.
- *ADMCHG**
Change an object. Applies to all objects except remote queue manager name.
- *ADMCLR**
Clear a queue. Applies to queues only.
- *ADMCRT**
Create an object. Applies to all objects except remote queue manager name.
- *ADMDLT**
Delete an object. Applies to all objects except remote queue manager name.
- *ADMDSP**
Display the attributes of an object. Applies to all objects except remote queue manager name.
- *ALLADM**
Perform administration operations on an object. Applies to all objects except remote queue manager name.
- *ALLMQI**
Use all MQI calls applicable to an object. Applies to all objects.
- *ALTUSR**
Allow another user's authority to be used for MQOPEN and MQPUT1 calls. Applies to queue manager objects only.
- *BROWSE**
Retrieve a message from a queue by issuing an MQGET call with the BROWSE option. Applies to queue objects only.
- *CONNECT**
Connect the application to a queue manager by issuing an MQCONN call. Applies to queue manager objects only.
- *CTRL**
Control startup and shutdown of channels, listeners and services.
- *CTRLX**
Reset sequence number and resolve indoubt channels.
- *GET**
Retrieve a message from a queue using an MGET call. Applies to queue objects only.
- *INQ**
Make an inquiry on an object using an MQINQ call. Applies to all objects except remote queue manager name.
- *PASSALL**
Pass all context on a queue. Applies to queue objects only.
- *PASSID**
Pass identity context on a queue. Applies to queue objects only.
- *PUT**
Put a message on a queue using an MQPUT call. Applies to queue objects and remote queue manager names only.
- *SET**
Set the attributes of an object using an MQSET call. Applies to queue, queue manager, and process objects only.
- *SETALL**
Set all context on an object. Applies to queue and queue manager objects only.
- *SETID**
Set identity context on an object. Applies to queue and queue manager objects only.

***SYSTEM**

Connect the application to a queue manager for system operations. Applies to queue manager objects only.

Authorizations for MQI calls

***ALTUSR**

Allow another user's authority to be used for MQOPEN and MQPUT1 calls.

***BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

***CONNECT**

Connect the application to the specified queue manager by issuing an MQCONN call.

***GET**

Retrieve a message from a queue by issuing an MQGET call.

***INQ**

Make an inquiry on a specific queue by issuing an MQINQ call.

***PUT**

Put a message on a specific queue by issuing an MQPUT call.

***SET**

Set attributes on a queue from the MQI by issuing an MQSET call.

***PUB**

Open a topic to publish a message using the MQPUT call.

***SUB**

Create, Alter or Resume a subscription to a topic using the MQSUB call.

***RESUME**

Resume a subscription using the MQSUB call.

If you open a queue for multiple options, you must be authorized for each of them.

Authorizations for context

***PASSALL**

Pass all context on the specified queue. All the context fields are copied from the original request.

***PASSID**

Pass identity context on the specified queue. The identity context is the same as that of the request.

***SETALL**

Set all context on the specified queue. This is used by special system utilities.

***SETID**

Set identity context on the specified queue. This is used by special system utilities.

Authorizations for MQSC and PCF commands

***ADMCHG**

Change the attributes of the specified object.

***ADMCLR**

Clear the specified queue (PCF Clear queue command only).

***ADMCR**

Create objects of the specified type.

***ADMDEL**

Delete the specified object.

***ADMDS**

Display the attributes of the specified object.

***CTRL**

Control startup and shutdown of channels, listeners and services.

***CTRLX**

Reset sequence number and resolve indoubt channels.

Authorizations for generic operations

***ALL**

Use all operations applicable to the object.

all authority is equivalent to the union of the authorities alladm, allmqi, and system appropriate to the object type.

***ALLADM**

Perform all administration operations applicable to the object.

***ALLMQI**

Use all MQI calls applicable to the object.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Service Component name (SRVCOMP)

Specifies the name of the installed authorization service to which the authorizations apply.

The possible values are:

***DFT**

Use the first installed authorization component.

Authorization-service-component-name

The component name of the required authorization service as specified in the queue manager qm.ini file.

PNGMQMCHL (Ping MQ Channel)
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Ping MQ Channel (PNGMQMCHL) command tests a channel by sending data as a special message, to the remote message queue manager and checks that the data is returned. This command is successful only from the sending end of an inactive channel, and the data used is generated by the local message queue manager.

Parameters

<i>Table 293. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2
<u>DATAcnt</u>	Data count	16-32768, 64	Optional, Positional 3

Table 293. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>CNT</u>	Count	1-16, 1	Optional, Positional 4

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

channel-name

Specify the channel name.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

Data count (DATAcnt)

Specifies the length of the data in bytes. The actual number of bytes might be less than the amount requested depending on the operating system and communication protocol being used.

The possible values are:

64

The default value is 64 bytes.

data-count Specify a value ranging from 16 through 32768.

Count (CNT)

Specifies the number of times that the channel is to be pinged.

The possible values are:

1

The channel is pinged once.

ping-count Specify a value ranging from 1 through 16.

RCDMQMIMG (Record MQ Object Image)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Record MQ Object Image (RCDMQMIMG) command is used to provide a marker for the selected set of MQ objects, so that the Re-create MQM Object (RCRMQMOBJ) command can recover this set of objects from journal data recorded subsequently.

This command is intended to enable journal receivers, detached prior to the current date, to be disconnected. On successful completion of this command those journals are no longer required to be present for a Re-create MQ Object (RCRMQMOBJ) command on this set of MQM Objects to succeed.

Parameters

<i>Table 294. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	<i>Character value</i> , *ALL	Required, Positional 1
<u>OBJTYPE</u>	Object type	*ALL, *Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *CTLG, *MQM, *NMLIST, *PRC, *CHL, *CLTCN, *LSR, *SVC, *SYNCFILE, *TOPIC	Required, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3
<u>DSPJRNDTA</u>	Display Journal Receiver Data	*YES, *NO	Optional, Positional 4

Object name (OBJ)

Specifies the name of the objects that should be recorded. This is a 48-character MQ object or generic object name.

The possible values are:

***ALL**

All MQ objects of the specified type (OBJTYPE) are recorded.

generic-object-name

Specify the generic name of the objects to be recorded. A generic name is a character string followed by an asterisk (*). For example, ABC*. It selects all objects that have names which start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

object-name

The name of an MQ object to be recorded.

Object type (OBJTYPE)

Specifies the type of the objects to be re-created.

The possible values are:

***ALL**

Specifies all MQ object types.

***Q**

Specifies MQ queue objects with names specified by OBJ.

***ALSQ**

Specifies MQ alias queue objects with names specified by OBJ.

***LCLQ**

Specifies MQ local queue objects with names specified by OBJ.

***MDLQ**

Specifies MQ model queues objects with names specified by OBJ.

***RMTQ**

Specifies MQ remote queue objects with names specified by OBJ.

***AUTHINFO**

Specifies MQ authentication information objects with names specified by OBJ.

***CTLG**

Specifies the MQ queue manager catalog object. This has the same name as the queue manager object.

***MQM**

Specifies the Message Queue Manager object.

***CHL**

Specifies MQ channel objects with names specified by OBJ.

***CLTCN**

Specifies MQ MQI client connection channel objects with names specified by OBJ.

***NMLIST**

Specifies MQ namelist objects with names specified by OBJ.

***PRC**

Specifies MQ process objects with names specified by OBJ.

***LSR**

Specifies MQ listener objects with names specified by OBJ.

***SVC**

Specifies MQ service objects with names specified by OBJ.

***SYNCFILE**

Specifies the MQ channel synchronisation file.

***TOPIC**

Specifies the MQ topic objects with names specified by OBJ.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

message-queue-manager-name

Specify the name of the queue manager.

Display Journal Receiver Data (DSPJRNDTA)

Specifies whether additional messages should be written to the job log when the command completes to inform the user which journal receivers are still required by IBM MQ.

The possible values are:

***NO**

No messages are written to the job log.

***YES**

Messages will be sent to the job log when the command completes. The messages will contain details about which journal receivers are required by IBM MQ.

IBM i RCRMQMOBJ (Re-create MQ Object)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Re-create MQ Object (RCRMQMOBJ) command is used to provide a recovery mechanism for damaged MQ objects. The command completely re-creates the objects from information recorded in the MQ journals. If no damaged objects exist, no action is performed.

Parameters

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	<i>Character value</i> , *ALL	Required, Positional 1
<u>OBJTYPE</u>	Object type	*ALL, *Q, *ALSQ, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *CTLG, *MQM, *NMLIST, *PRC, *CHL, *CLTCN, *LSR, *SVC, *SYNCFILE, *CLCHLTAB, *TOPIC	Required, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3

Object name (OBJ)

Specifies the name of the objects which should be re-created if they are damaged. This is a 48-character MQ object or generic object name.

The possible values are:

*ALL

All damaged MQ objects of the specified type (OBJTYPE) are re-created.

generic-object-name

Specify the generic name of the objects to be re-created. A generic name is a character string followed by an asterisk (*). For example, ABC*. It selects all objects that have names that start with the character string.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

object-name

The name of an MQ object to be re-created if it is damaged.

Object type (OBJTYPE)

Specifies the object type of the objects to be re-created.

The possible values are:

*ALL

Specifies all MQ object types.

***Q**

Specifies MQ queue objects with names specified by OBJ.

***ALSQ**

Specifies MQ alias queue objects with names specified by OBJ.

***LCLQ**

Specifies MQ local queue objects with names specified by OBJ.

***MDLQ**

Specifies MQ model queues with names specified by OBJ.

***RMTQ**

Specifies MQ remote queue objects with names specified by OBJ.

***AUTHINFO**

Specifies MQ authentication information objects with names specified by OBJ.

***CTLG**

Specifies the message queue manager catalog object. The catalog object has the same name as the message queue manager object. It holds the names of MQ objects. A user needs authorities on this object to be able to start or stop the message queue manager, or, to create or delete MQ queues and process definitions.

***MQM**

Specifies the message queue manager. This object holds the attributes of the message queue manager.

***CHL**

Specifies MQ channel objects with names specified by OBJ.

***CLTCN**

Specifies MQ MQI client connection channel objects with names specified by OBJ.

***NMLIST**

Specifies MQ namelist objects with names specified by OBJ.

***PRC**

Specifies MQ process objects with names specified by OBJ.

***LSR**

Specifies MQ listener objects with names specified by OBJ.

***SVC**

Specifies MQ service objects with names specified by OBJ.

***SYNCFILE**

Specifies the MQ channel synchronisation file.

***SYNCFILE**

Specifies the MQ MQI client channel table file.

***TOPIC**

Specifies MQ topic objects with names specified by OBJ.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

message-queue-manager-name

Specify the name of the queue manager.

IBM i RFRMQM (Refresh Message Queue Manager)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Refresh Message Queue manager (RFRMQM) performs special operations on queue managers.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Required, Positional 1
<u>TYPE</u>	Refresh Type	*CONFIGEV , <i>*PROXYSUB</i>	Required, Positional 2
<u>OBJECT</u>	Object Type	*ALL , <i>Specified objects</i>	Optional, Positional 3
<u>NAME</u>	Object Name	*ALL , <i>generic- object-name, object-name</i>	Optional, Positional 4
<u>INCLINT</u>	Include Interval	*NONE , <i>include- interval</i>	Optional, Positional 5

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue_manager_name

Specify the name of the queue manager.

Refresh Type (TYPE)

The type of queue manager refresh to be performed.

The possible values are:

***CONFIGEV**

Requests that the queue manager generates a configuration event message for every object that matches the selection criteria specified by the OBJECT, NAME, and INCLINT parameters.

***PROXYSUB**

Requests that the queue manager resynchronizes the proxy subscriptions that are held with, and on behalf of, queue managers that are connected in a hierarchy or publish/subscribe cluster.

Object Type (OBJECT)

Requests that only objects of the specified type are included in the refresh.

This parameter is only valid for TYPE(*CONFIGEV)

The possible values are:

***ALL**

All specified objects.

Specific objects

Select from:

- *QUEUE
- *QLOCAL
- *QMODEL
- *QALIAS
- *QREMOTE
- *CHANNEL
- *NAMELIST
- *POLICY
- *PROCESS
- *QMGR
- *AUTHINFO
- *AUTHREC

Object Name (NAME)

Requests that only objects whose names match the name specified are included in the refresh.

This parameter is only valid for TYPE(*CONFIGEV)

The possible values are:

***ALL**

All object names are included.

generic-object-name

Specify the generic name of the objects to be included. A generic name is a character string, followed by an asterisk (*), for example ABC*, and it selects all queues having names that start with the character string.

object-name

Specify the object name to be included.

Include Interval (INCLINT)

Specifies a value in minutes, defining a period immediately before the current time, and requests that only objects that have been created or changed within that period are included in the refresh.

This parameter is only valid for TYPE(*CONFIGEV)

The possible values are:

***NONE**

No time limit is used.

include-interval

Specify the include interval in minutes (0-999999).

RFRMQMAUT (Refresh IBM MQ Authority)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The IBM MQ security cache refresh (RFRMQMAUT) command refreshes the IBM MQ object authority manager security cache.

Parameters

Table 297. Command parameters			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 1
<u>TYPE</u>	Refresh Type	*AUTHSERV , *SSL	Optional, Positional 2

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager to perform the security refresh.

The possible values are:

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

*DFT

Specifies that the default queue manager should be used.

Refresh Type (TYPE)

The type of security refresh to be performed. The possible values are:

*AUTHSERV

Refreshes the list of authorizations held internally by the authorization services component.

*SSL

Refreshes the cached view of the TLS Key Repository allowing updates to become effective when the command has completed successfully. Also refreshes the locations of the LDAP servers to be used for Certificate Revocation Lists and the Key Repository.

RFRMQMCL (Refresh MQ Cluster)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Refresh MQ Cluster (RFRMQMCL) command refreshes locally held cluster information (including any autodefined channels that are in doubt), and forces it to be rebuilt. This enables you to perform a "cold-start" on the cluster.

Parameters

Table 298. Command parameters			
Keyword	Description	Choices	Notes
<u>CLUSTER</u>	Cluster Name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2
<u>REPOS</u>	Refresh Repository	*NO , *YES	Optional, Positional 3

Cluster Name (CLUSTER)

The name of the cluster to be refreshed.

The possible values are:

The queue manager is refreshed in all of the clusters to which it belongs.

If Refresh Repository is also set to *YES, then the queue manager restarts its search for repository queue managers, using information in the local cluster-sender channel definitions.

name

Specify the name of the cluster.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Refresh Repository (REPOS)

Specifies whether the information about repository queue managers should be refreshed.

The possible values are:

***NO**

Do not refresh repository information.

***YES**

Refresh repository information. This value cannot be specified if the queue manager is itself a repository manager.

RMVMQMINF (Remove Queue Manager Info.)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Remove Message Queue Manager Information (RMVMQMINF) command removes configuration information for a queue manager. This command can be used, for example, to remove a secondary queue manager instance by removing reference to shared queue manager data.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Optional, Positional 1

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager to remove information for.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

IBM i RMVMQMJRN (Remove Queue Manager Journal)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Remove Queue Manager Journal command (RMVMQMJRN) removes a queue manager journal. This command can be used, for example, to remove a remote journal previously used for a standby or multi-instance queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 1
<u>JRN</u>	Queue Manager Journal	Character value, *DFT	Optional, Positional 2
<u>RMTJRNRDB</u>	Remote Relational Database	Character value	Optional, Positional 3

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager associated with the journal.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Queue Manager Journal (JRN)

Specifies the journal name to create.

The possible values are:

*DFT

The journal name is chosen by the system. If a local journal already exists for the queue manager on this system - the existing local journal name is used, otherwise a unique name is generated of the format AMQxJRN where x is a character in the range 'A - Z'.

journal-name

Specify the name of the journal. The name can contain up to 10 characters. Journal receiver names will be derived from this journal name by truncating at the 4th character (or at the last character if the journal name is shorter than 4 characters) and appending zeroes. If the local queue manager library already contains a local journal, its name must match that supplied. Only one local journal can exist in a queue manager library. DLTMQM will not remove journal artifacts from a queue manager library unless they are prefixed with "AMQ".

Remote Relational Database (RMTJRNRDB)

Specifies the name of the relational database directory entry that contains the remote location name of the target system. Use the WRKRDBDIRE command to locate and existing entry or configure a new relational database directory entry for the target system.

relational-database-directory-entry

Specify the name of the relational database directory entry. The name can contain up to 18 characters.

IBM i **RSMMQMCLQM (Resume Cluster Queue Manager)**

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

Use the RSMMQMCLQM command to inform other queue managers in a cluster that the local queue manager is again available for processing and can be sent messages. It reverses the action of the SPDMQMCLQM command.

Parameters

Keyword	Description	Choices	Notes
<u>CLUSTER</u>	Cluster Name	Character value	Optional, Positional 1
<u>CLUSNL</u>	Cluster Name List	Character value	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 3

Cluster Name (CLUSTER)

Specifies the name of the cluster for which the queue manager is available for processing.

cluster-name

Specify the name of the cluster.

Cluster Name List (CLUSNL)

Specifies the namelist specifying a list of clusters for which the queue manager is available for processing.

namelist

Specify the name of the namelist.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

*DFT

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

IBM i **RSTMQMCHL (Reset MQ Channel)**

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Reset MQ Channel (RSTMQMCHL) command resets the message sequence number for an MQ channel to a specified sequence number for use the next time that the channel is started.

You are recommended to use this command for Sender(*SDR), Server (*SVR) and Cluster-sender (*CLUSSDR) channels only.

If you use this command for a Receiver (*RCVR), Requester (*RQSTR) or Cluster-receiver (*CLUSRCVR) channel, the value at the other end of the channel is NOT reset. You must reset the values separately.

The command does not work for Server-connection (*SVRCN) channels.

Parameters

Table 302. Command parameters

Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>MSGSEQNUM</u>	Message sequence number	1-999999999, 1	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 3

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

channel-name

Specify the channel name.

Message sequence number (MSGSEQNUM)

Specifies the new message sequence number.

The possible values are:

1

The new message sequence number is 1.

message-sequence-number

Specify the new message sequence number ranging from 1 through 999999999.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

RSTMQMCL (Reset Cluster)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

Use the Reset Cluster (RSTMQMCL) command to forcibly remove a queue manager from a cluster.

Parameters

Keyword	Description	Choices	Notes
<u>CLUSTER</u>	Cluster Name	Character value	Required, Positional 1
<u>QMNAME</u>	Queue Manager Name for removal	<i>Character value</i> , *QMID	Required, Positional 2
<u>ACTION</u>	Action	*FRCRMV	Optional, Positional 3
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 4
<u>QUEUES</u>	Remove Queues	*NO, *YES	Optional, Positional 5
<u>QMID</u>	Queue Manager Id for removal	Character value	Optional, Positional 6

Cluster Name (CLUSTER)

Specifies the name of cluster from which the queue manager is to be forcibly removed.

cluster-name

Specify the name of the cluster.

Queue Manager Name for removal (QMNAME)

Specifies the name of the queue manager to be forcibly removed.

The possible values are:

***QMID**

This enables you to specify the identifier of the queue manager to be forcibly removed.

queue-manager-name

Specify the name of the queue manager.

Action (ACTION)

Specifies the action to take on the specified queue manager.

***FRCRMV**

Requests that the queue manager is forcibly removed from the cluster. This might be needed to ensure correct cleanup after a queue manager has been deleted. This action can be requested by a repository queue manager only.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Remove Queues (QUEUES)

Specifies whether cluster queues should be removed from the cluster.

The possible values are:

***NO**

Do not remove the queues belonging to the queue manager being removed from the cluster.

***YES**

Remove queues belonging to the queue manager being removed from the cluster.

Queue Manager Id for removal (QMID)

Specifies the identifier of the queue manager to be forcibly removed.

queue-manager-identifier

Specify the identifier of the queue manager.

RSVMQMCHL (Resolve MQ Channel)
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Resolve MQ Channel (RSVMQMCHL) command requests a channel to commit or backout in-doubt messages.

This command is used when the other end of a link fails during the confirmation period, and for some reason it is not possible to reestablish the connection.

In this situation, the sending end remains in an in-doubt state, about whether the messages were received. Any outstanding units of work need to be resolved with either backout or commit.

*BCK restores messages to the transmission queue and *CMT discards them.

Use this command for sender (*SDR) and server (*SVR) channels only.

Parameters

<i>Table 304. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>OPTION</u>	Resolve option	*CMT, *BCK	Required, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 3

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

channel-name

Specify the channel name.

Resolve option (OPTION)

Specifies whether to back out or commit the messages.

The possible values are:

***CMT**

The messages are committed, that is, they are deleted from the transmission queue.

***BCK**

The messages are backed out, that is, they are restored to the transmission queue.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

 **RUNMQSC (Run MQSC commands)**
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Run IBM MQ Commands (RUNMQSC) command allows you to issue MQSC commands interactively for the specified queue manager.

Parameters

<i>Table 305. Command parameters</i>			
Keyword	Description	Choices	Notes
MQMNAME	Message Queue Manager name	Character value	Required, Positional 1

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

queue-manager-name

Specify the name of the queue manager.

 **RVKMQMAUT (Revoke MQ Object Authority)**
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Revoke MQ Authority (RVKMQMAUT) command is used to reset, or take away specific or all authority for the named objects from the users named in the command.

The RVKMQMAUT command can be used by anyone in the QMQMADM group, that is, anyone whose user profile specifies QMQMADM as a primary or supplemental group profile.

Parameters

Table 306. Command parameters			
Keyword	Description	Choices	Notes
<u>OBJ</u>	Object name	Character value	Required, Positional 1
<u>OBJTYPE</u>	Object type	*ALL, *Q, *ALSO, *LCLQ, *MDLQ, *RMTQ, *AUTHINFO, *MQM, *NMLIST, *PRC, *LSR, *SVC, *CHL, *CLTCN, *TOPIC, *RMTMQMNAME	Required, Positional 2
<u>USER</u>	User names	Single values: *PUBLIC, Other values (up to 50 repetitions): <i>Name</i>	Required, Positional 3
<u>AUT</u>	Authority	Values (up to 22 repetitions): *ALTUSR, *BROWSE, *CONNECT, *GET, *INQ, *PUT, *SET, *PUB, *SUB, *RESUME, *PASSALL, *PASSID, *SETALL, *SETID, *ADMCHG, *ADMCLR, *ADMCRRT, *ADMDLT, *ADMDSP, *ALL, *ALLADM, *ALLMQI, *REMOVE, *CTRL, *CTRLX, *SYSTEM	Required, Positional 4
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 5
<u>SRVCOMP</u>	Service Component name	<i>Character value</i> , *DFT	Optional, Positional 6

Object name (OBJ)

Specifies the name of the objects for which specific authorities are revoked.

The possible values are:

*ALL

All objects of the type specified by the value of the OBJTYPE parameter at the time the command is issued. *ALL cannot represent a generic profile.

object-name

Specify the name of an MQ object for which specific authority is given to one or more users.

generic profile

Specify the generic profile of the objects to be selected. A generic profile is a character string containing one or more generic characters anywhere in the string. This profile is used to match the object name of the object under consideration at the time of use. The generic characters are (?), (*) and (**).

? matches a single character in an object name.

* matches any string contained within a qualifier, where a qualifier is the string between fullstops (.). For example ABC* matches ABCDEF but not ABCDEF.XYZ.

** matches one or more qualifiers. For example ABC.**.XYZ matches ABC.DEF.XYZ and ABC.DEF.GHI.XYZ, ** can only appear once in a generic profile.

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

Object type (OBJTYPE)

Specifies the type of the objects for which specific authorities are revoked.

***ALL**

All MQ object types.

***Q**

All queue object types.

***ALSQ**

Alias queue.

***LCLQ**

Local queue.

***MDLQ**

Model queue.

***RMTQ**

Remote queue.

***AUTHINFO**

Authentication Information object.

***MQM**

Message Queue Manager.

***NMLIST**

Namelist object.

***PRC**

Process definition.

***CHL**

Channel object.

***CLTCN**

Client Connection Channel object.

***LSR**

Listener object.

***SVC**

Service object.

***TOPIC**

Topic object.

***RMTMQMNAME**

Remote queue manager name.

User names (USER)

Specifies the user names of one or more users whose specific authorities to the named object are being removed. If a user was given the authority by USER(*PUBLIC) being specified in the Grant MQ Authority (GRTMQMAUT) command, the same authorities are revoked by *PUBLIC being specified in this parameter. Users given specific authority by having their names identified in the GRTMQMAUT command must have their names specified on this parameter to remove the same authorities.

The possible values are:

***PUBLIC**

The specified authorities are taken away from users who do not have specific authority for the object, who are not on the authorization list, and whose user group has no authority. Users who have specific authority still retain their authorities to the object.

user-profile-name

Specify the user names of one or more users who are having the specified authorities revoked. The authorities listed in the AUT parameter are being specifically taken away from each identified user. This parameter cannot be used to remove public authority from specific users; only authorities that were specifically given to them can be specifically revoked. You can specify up to 50 user profile names.

Authority (AUT)

Specifies the authority being reset or taken away from the users specified in the USER parameter. You can specify values for AUT as a list of specific and general authorities in any order, where the general authorities can be:

***REMOVE**, which deletes the profile. It is not the same as ***ALL**, because ***ALL** leaves the profile in existence with no authorities. ***REMOVE** cannot be specified with user QMQMADM unless the object is a generic profile or with user QMQM when the object type is ***MQM**.

***ALL**, which confers all authorities to the specified users.

***ALLADM**, which confers all of ***ADMCHG**, ***ADMCLR**, ***ADMCRRT**, ***ADMDLT**, ***ADMDSP**, ***CTRL** and ***CTRLX**.

***ALLMQI**, which confers all of ***ALTUSR**, ***BROWSE**, ***CONNECT**, ***GET**, ***INQ**, ***PUT**, ***SET**, ***PUB**, ***SUB** and ***RESUME**.

Authorizations for different object types

***ALL**

All authorizations. Applies to all objects.

***ADMCHG**

Change an object. Applies to all objects except remote queue manager name.

***ADMCLR**

Clear a queue. Applies to queues only.

***ADMCRRT**

Create an object. Applies to all objects except remote queue manager name.

***ADMDLT**

Delete an object. Applies to all objects except remote queue manager name.

***ADMDSP**

Display the attributes of an object. Applies to all objects except remote queue manager name.

***ALLADM**

Perform administration operations on an object. Applies to all objects except remote queue manager name.

***ALLMQI**

Use all MQI calls applicable to an object. Applies to all objects.

***ALTUSR**

Allow another user's authority to be used for MQOPEN and MQPUT1 calls. Applies to queue manager objects only.

***BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option. Applies to queue objects only.

***CONNECT**

Connect the application to a queue manager by issuing an MQCONN call. Applies to queue manager objects only.

***CTRL**

Control startup and shutdown of channels, listeners and services.

***CTRLX**

Reset sequence number and resolve indoubt channels.

***GET**

Retrieve a message from a queue using an MGET call. Applies to queue objects only.

***INQ**

Make an inquiry on an object using an MQINQ call. Applies to all objects except remote queue manager name.

***PASSALL**

Pass all context on a queue. Applies to queue objects only.

***PASSID**

Pass identity context on a queue. Applies to queue objects only.

***PUT**

Put a message on a queue using an MQPUT call. Applies to queue objects and remote queue manager names only.

***SET**

Set the attributes of an object using an MQSET call. Applies to queue, queue manager, and process objects only.

***SETALL**

Set all context on an object. Applies to queue and queue manager objects only.

***SETID**

Set identity context on an object. Applies to queue and queue manager objects only.

***SYSTEM**

Connect the application to a queue manager for system operations. Applies to queue manager objects only.

Authorizations for MQI calls

***ALTUSR**

Allow another user's authority to be used for MQOPEN and MQPUT1 calls.

***BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

***CONNECT**

Connect the application to the specified queue manager by issuing an MQCONN call.

***GET**

Retrieve a message from a queue by issuing an MQGET call.

***INQ**

Make an inquiry on a specific queue by issuing an MQINQ call.

***PUT**

Put a message on a specific queue by issuing an MQPUT call.

***SET**

Set attributes on a queue from the MQI by issuing an MQSET call.

***PUB**

Open a topic to publish a message using the MQPUT call.

***SUB**

Create, Alter or Resume a subscription to a topic using the MQSUB call.

***RESUME**

Resume a subscription using the MQSUB call.

If you open a queue for multiple options, you must be authorized for each of them.

Authorizations for context

***PASSALL**

Pass all context on the specified queue. All the context fields are copied from the original request.

***PASSID**

Pass identity context on the specified queue. The identity context is the same as that of the request.

***SETALL**

Set all context on the specified queue. This is used by special system utilities.

***SETID**

Set identity context on the specified queue. This is used by special system utilities.

Authorizations for MQSC and PCF commands

***ADMCHG**

Change the attributes of the specified object.

***ADMCLR**

Clear the specified queue (PCF Clear queue command only).

***ADMCR**

Create objects of the specified type.

***ADMDLT**

Delete the specified object.

***ADMDS**

Display the attributes of the specified object.

***CTRL**

Control startup and shutdown of channels, listeners and services.

***CTRLX**

Reset sequence number and resolve indoubt channels.

Authorizations for generic operations

***ALL**

Use all operations applicable to the object.

all authority is equivalent to the union of the authorities alladm, allmqi, and system appropriate to the object type.

***ALLADM**

Perform all administration operations applicable to the object.

***ALLMQI**

Use all MQI calls applicable to the object.

***REMOVE**

Delete the authority profile to the specified object.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Service Component name (SRVCOMP)

Specifies the name of the installed authorization service to which the authorizations apply.

The possible values are:

***DFT**

Use the first installed authorization component.

Authorization-service-component-name

The component name of the required authorization service as specified in the Queue manager's qm.ini file.

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Set MQM Security Policy (SETMQMSPL) command sets security policies that are used by Advanced Message Security to control how messages should be protected when being put, browsed, or destructively removed from queues.

The policy name associates digital signing and encryption protection for messages with queues matching the policy name.

Parameters

Table 307. Command parameters

Keyword	Description	Choices	Notes
<u>POLICY</u>	Policy name	Character value	Required, Key, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Required, Key, Positional 2
<u>SIGNALG</u>	Signature algorithm	*NONE, Deprecated *MD5, Deprecated *SHA1, *SHA256, *SHA384, *SHA512	Optional, Positional 3
<u>ENCALG</u>	Encryption algorithm	*NONE, Deprecated *RC2, Deprecated *DES, Deprecated *TRIPLEDES, *AES128, *AES256	Optional, Positional 4
<u>SIGNER</u>	Authorized signers	*NONE , Character value	Optional, Positional 5
<u>RECIP</u>	Intended recipients	*NONE , Character value	Optional, Positional 6
<u>TOLERATE</u>	Tolerate unprotected	*NO , *YES	Optional, Positional 7
<u>REMOVE</u>	Remove policy	*NO , *YES	Optional, Positional 8
<u>KEYREUSE</u>	Key reuse	*DISABLED , *UNLIMITED, integer value	Optional, Positional 9

Policy name (POLICY)

Name of the policy, required.

The policy name must match the name of the queue which is to be protected.

The name of the new authentication information object to create.

Message Queue Manager name (MQMNAME)

The name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of an existing message queue manager. The maximum string length is 48 characters.

Signature algorithm (SIGNALG)

Specifies the digital signature algorithm from one of the following values:

***NONE**

Messages are not signed.

 ***MD5**

Messages are signed using the MD5 message digest algorithm.

 ***SHA1**

Messages are signed using the SHA-1 secure hash algorithm.

***SHA256**

Messages are signed using the SHA-256 secure hash algorithm.

***SHA384**

Messages are signed using the SHA-384 secure hash algorithm.

***SHA512**

Messages are signed using the SHA-512 secure hash algorithm.

Encryption algorithm (ENCALG)

Specifies the encryption algorithm to use when protecting messages from one of the following values:

***NONE**

Messages are not encrypted.

 ***RC2**

Messages are encrypted using the [RC2](#) Rivest Cipher algorithm.

 ***DES**

Messages are encrypted using the [DES](#) Data Encryption Standard algorithm.

 ***TRIPLEDES**

Messages are encrypted using the [Triple DES](#) Data Encryption Standard algorithm.

***AES128**

Messages are encrypted using the AES 128-bit key Advanced Encryption Standard algorithm.

***AES256**

Messages are encrypted using the AES 256-bit key Advanced Encryption Standard algorithm.

Authorized signers (SIGNER)

Specifies a list of *X500* distinguished names representing authorized message signers that are checked when browsing or destructively removing a message from a queue. If an authorized signer list is specified, only messages that are signed with a certificate identified in the list are accepted during message retrieval, even if the recipient keystore can verify the message signer.

This parameter is valid only when a signature algorithm ([SIGNALG](#)) has also been specified.

Note that distinguished names are case sensitive, and it is important that you enter the distinguished names exactly as they appear in the digital certificate.

The possible values are:

***NONE**

When handling signed messages, beyond checking the signers certificate validity, the policy does not restrict the identity of the message signer when retrieving messages.

x500-distinguished-name

When handling signed messages, beyond checking certificate validity, the message must have been signed by a certificate matching one of the distinguished names.

Intended recipients (RECIP)

Specifies a list of *X500* distinguished names representing the intended recipients that are used when putting a encrypted message to a queue. If a policy has specified an encryption algorithm (ENCALG) then at least one recipient distinguished name must be specified.

This parameter is valid only when an encryption algorithm ([ENCALG](#)) has also been specified.

Note that distinguished names are case sensitive, and it is important that you enter the distinguished names exactly as they appear in the digital certificate.

The possible values are:

***NONE**

Messages are not encrypted.

x500-distinguished-name

When putting messages, the message data is encrypted using the distinguished name as an intended recipient. Only the listed recipients are able to retrieve and decrypt the message.

Tolerate unprotected (TOLERATE)

Specifies whether messages that are not protected can still be browsed or destructively removed from a queue. This parameter can be used to gradually introduce a security policy for applications, allowing any messages that were created before the policy was introduced to be processed.

The possible values are:

***NO**

Messages that do not conform to the current policy are not returned to applications.

***YES**

Messages that have not been protected are allowed to be retrieved by applications.

Remove policy (REMOVE)

Specifies whether a policy is being created or removed.

The possible values are:

***NO**

The policy is created or altered if it already exists.

***YES**

The policy is removed. The only other parameters that are valid with this parameter value are policy name ([POLICY](#)) and queue manager name ([MQMNAME](#)).

Key reuse (KEYREUSE)

Specifies the number of times that an encryption key can be re-used, in the range 1-9,999,999, or the special values **DISABLED* or **UNLIMITED*.

Note that this is a maximum number of times a key can be reused, therefore a value of 1 means, at most, two messages can use the same key.

***DISABLED**

Prevents a symmetric key from being reused

*UNLIMITED

Allows a symmetric key to be reused any number of times.

Attention: Key reuse is valid only for CONFIDENTIALITY policies, that is, **SIGNALG** set to **NONE* and **ENCALG** set to an algorithm value. For all other policy types, you must omit the parameter, or set the **KEYREUSE** value to **DISABLED*.

IBM i

SPDMQMCLQM (Suspend Cluster Queue Manager)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

Use the SPDMQMCLQM command to inform other queue managers in a cluster that the local queue manager is not available for processing and cannot be sent messages. Its action can be reversed by the RSMMQMCLQM command.

Parameters

Keyword	Description	Choices	Notes
<u>CLUSTER</u>	Cluster Name	Character value	Optional, Positional 1
<u>CLUSNL</u>	Cluster Name List	Character value	Optional, Positional 2
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 3
<u>MODE</u>	Mode	*QUIESCE , *FORCE	Optional, Positional 4

Cluster Name (CLUSTER)

Specifies the name of the cluster for which the queue manager is no longer available for processing.

cluster-name

Specify the name of the cluster.

Cluster Name List (CLUSNL)

Specifies the name of the namelist specifying a list of clusters for which the queue manager is no longer available for processing.

namelist

Specify the name of the namelist.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

*DFT

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Mode (MODE)

Specifies how the suspension of availability is to take effect:

***QUIESCE**

Other queue managers in the cluster are advised that the local queue manager should not be sent further messages.

***FORCE**

All inbound and outbound channels to other queue managers in the cluster are stopped forcibly.

STRMQM (Start Message Queue Manager)
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start Message Queue Manager (STRMQM) command starts the local queue manager.

Parameters

<i>Table 309. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 1
<u>RDEFSYS</u>	Redefine system objects	*YES, *NO	Optional, Positional 2
<u>FIXDIRS</u>	Fix directories	*YES, *NO	Optional, Positional 3
<u>STRSTSDTL</u>	Startup Status Detail	*ALL, *MIN	Optional, Positional 4
<u>STRSVC</u>	Service startup	*YES, *NO	Optional, Positional 5
<u>REPLAY</u>	Perform replay only	*YES, *NO	Optional, Positional 6
<u>ACTIVATE</u>	Activate backup	*YES, *NO	Optional, Positional 7
<u>STANDBY</u>	Permit Standby Queue Manager	*YES, *NO	Optional, Positional 8

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Redefine system objects (RDEFSYS)

Specifies whether the default and system objects are redefined.

***NO**

Do not redefine the system objects.

***YES**

Starts the queue manager, redefines the default and system objects, then stops the queue manager. Any existing system and default objects belonging to the queue manager are replaced if you specify this flag.

Fix directories (FIXDIRS)

Specifies whether missing or damaged queue manager directories are re-created.

***NO**

Do not re-create any missing queue manager directories. If any damaged or missing directories are encountered during startup, the startup attempt will report an error and the STRMQM command will end immediately.

***YES**

Starts the queue manager and if required re-creates any damaged or missing directories. This option should be used when performing media recovery of a queue manager.

Startup Status Detail (STRSTSDL)

Specifies the detail of status messages that are issued while starting the queue manager.

***ALL**

Display all startup status messages. This level of detail includes periodically displaying messages detailing transaction recovery and log replay. This level of detail can be useful in tracking queue manager startup progress following the abnormal termination of a queue manager.

***MIN**

Displays a minimum level of status messages.

Service startup (STRSVC)

Specifies whether the additional following QMGR components are started when the queue manager is started:

- The Channel Initiator
- The Command Server
- Listeners with CONTROL set to QMGR or STARTONLY
- Services with CONTROL set to QMGR or STARTONLY

***YES**

Start the channel initiator, command server, listeners and services when the queue manager is started.

***NO**

Do not start the channel initiator, command server, listeners or services when the queue manager is started.

Perform replay only (REPLAY)

Whether the queue manager is being started to perform replay only. This enables a backup copy of a queue manager on a remote machine to replay logs created by the corresponding active machine, and to allow the backup queue manager to be activated in the event of a disaster on the active machine.

***NO**

The queue manager is not being started to perform replay only.

***YES**

The queue manager is being started to perform replay only. The STRMQM command will end when replay is complete.

Activate backup (ACTIVATE)

Specifies whether to mark a queue manager as active. A queue manager that has been started with the REPLAY option is marked as a backup queue manager and cannot be started before it has been activated.

***NO**

The queue manager is not to be marked as active.

***YES**

The queue manager is to be marked as active. Once a queue manager has been activated then it can be started as a normal queue manager using the STRMQM command without the REPLAY and ACTIVATE options.

Permit Standby Queue Manager (STANDBY)

Specifies whether the queue manager can start as a standby instance if an active instance of the queue manager is already running on another system. Also specifies whether this instance of the queue manager will permit standby instances of the same queue manager on other systems in preparation for failover.

***NO**

The queue manager is started normally.

***YES**

The queue manager is permitted to start as a standby instance, and it permits other standby instances of the same queue manager to be started.

STRMQMBRK (Start MQ Pub/Sub Broker)
Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start IBM MQ broker (STRMQMBRK) command starts a broker for a specified queue manager.

Parameters

<i>Table 310. Command parameters</i>			
Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	Character value	Required, Positional 1
<u>PARENTMQM</u>	Parent Message Queue Manager	Character value	Optional, Positional 2

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

queue-manager-name

Specify the name of the queue manager.

Parent Message Queue Manager (PARENTMQM)

Specifies the name of the queue manager that provides the parent broker function. Before you can add a broker to the network, channels in both directions must exist between the queue manager that hosts the new broker, and the queue manager that hosts the parent.

On restart, this parameter is optional. If present, it must be the same as it was when previously specified. If this is the root-node broker, the queue manager specified becomes its parent. You cannot specify the name of the parent broker when you use triggering to start a broker.

After a parent has been specified, it is only possible to change parentage in exceptional circumstances in conjunction with the CLRMQMBRK command. By changing a root node to become the child of an existing broker, two hierarchies can be joined. This causes subscriptions to be propagated across the two hierarchies, which now become one. After that, publications start to flow across them. To ensure predictable results, it is essential that you quiesce all publishing applications at this time.

If the changed broker detects a hierarchical error (that is, if the new parent is found also to be a descendant), it immediately shuts down. The administrator must then use CLRMQMGRK at both the changed broker and the new, false parent to restore the previous status. A hierarchical error is detected by propagating a message up the hierarchy, which can complete only when the relevant brokers and links are available.

IBM i STRMQMCHL (Start MQ Channel)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start MQ Channel (STRMQMCHL) command starts an MQ channel.

Parameters

Table 311. Command parameters			
Keyword	Description	Choices	Notes
<u>CHLNAME</u>	Channel name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2

Channel name (CHLNAME)

Specifies the name of the channel definition.

The possible values are:

channel-name

Specify the channel name.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

IBM i STRMQMCHLI (Start MQ Channel Initiator)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start MQ Channel Initiator (STRMQMCHLI) command starts an MQ channel initiator.

Parameters

Keyword	Description	Choices	Notes
<u>QNAME</u>	Queue name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 2

Queue name (QNAME)

Specifies the name of the initiation queue for the channel initiation process. That is, the initiation queue that is specified in the definition of the transmission queue.

The possible values are:

queue-name

Specify the name of the initiation queue.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

*DFT

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

STRMQMCSVR (Start MQ Command Server)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start MQ Command Server (STRMQMCSVR) command starts the MQ command server for the specified queue manager.

Parameters

Keyword	Description	Choices	Notes
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value, *DFT</i>	Optional, Positional 1

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

queue-manager-name

Specify the name of the queue manager.

IBM i STRMQMDLQ (Start IBM MQ DLQ Handler)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

Use the Start IBM MQ Dead-Letter Queue Handler (STRMQMDLQ) command to perform various actions on selected messages. The command specifies a set of rules that can both select a message and perform the action on that message.

The STRMQMDLQ command takes its input from the rules table as specified by SRCFILE and SRCMBR. When the command processes, the results and a summary are written to the printer spooler file.

Note:

The WAIT keyword, defined in the rules table, determines whether the dead-letter queue handler ends immediately after processing messages, or waits for new messages to arrive.

Parameters

Table 314. Command parameters

Keyword	Description	Choices	Notes
<u>UDLMSGQ</u>	Undelivered message queue	Character value, *DFT, *NONE	Required, Positional 1
<u>SRCMBR</u>	Member containing input	Name, *FIRST	Required, Positional 2
<u>SRCFILE</u>	Input file	Qualified object name	Optional, Positional 3
	Qualifier 1: Input file	Name, QXTSRC	
	Qualifier 2: Library	Name, *LIBL, *CURLIB	
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT, *NONE	Optional, Positional 4

Undelivered message queue (UDLMSGQ)

Specifies the name of the local undelivered message queue that is to be processed.

The possible values are:

*DFT

The local undelivered-message queue used is taken from the default queue manager for the installation. If this option is specified, the INPUTQ keyword stated in the rules table is overridden by the default undelivered-message queue for the queue manager.

undelivered-message-queue-name

Specify the name of the local undelivered-message queue to be used. If this option is specified, the INPUTQ keyword stated in the rules table is overridden by the stated undelivered-message queue.

*NONE

The queue that is named by the INPUTQ keyword in the rules table is used, or the system-default dead-letter queue if the INPUTQ keyword in the rules table is blank.

Member containing input (SRCMBR)

Specifies the name of the source member, containing the user-written rules table to be processed.

The possible values are:

***FIRST**

The first member of the file is used.

source-member-name

Specify the name of the source member.

Input file (SRCFILE)

Specifies the name of the source file and library, in the form LIBRARY/FILE, that contains the user-written rules table to be processed.

The possible values are:

***LIBL**

Search the library list for the file name.

***CURLIB**

Use the current library.

source-library-name

Specify the name of the library that is being used.

The possible values are:

QTXTSRC

Use QTXTSRC.

source-file-name

Specify the name of the source file.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

***NONE**

The queue manager that is named by the INPUTQM keyword in the rules table is used, or the system-default queue manager if the INPUTQM keyword in the rules table is blank.

 **STRMQMLSR (Start MQ Listener)****Where allowed to run**

All environments (*ALL)

Threadsafe

Yes

The Start MQ Listener (STRMQMLSR) command starts an MQ TCP/IP listener.

This command is valid for TCP/IP transmission protocols only.

You can specify either a listener object or specific listener attributes.

Parameters

Keyword	Description	Choices	Notes
<u>PORT</u>	Port number	1-65535, *DFT	Optional, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 2
<u>IPADDR</u>	IP Address	<i>Character value</i> , *DFT	Optional, Positional 3
<u>BACKLOG</u>	Listener backlog	0-999999999, *DFT	Optional, Positional 4
<u>LSRNAME</u>	Listener name	<i>Character value</i> , *NONE	Optional, Positional 5

Port number (PORT)

The port number to be used by the listener.

The possible values are:

***DFT**

Port number 1414 is used.

port-number

The port number to be used.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

IP Address (IPADDR)

The IP address to be used by the listener.

The possible values are:

***DFT**

The listener will listen on all IP addresses available to the TCP/IP stack.

ip-addr

The IP address to be used.

Listener backlog (BACKLOG)

The number of concurrent connection requests the listener supports.

The possible values are:

***DFT**

255 concurrent connection requests are supported.

backlog

The number of concurrent connection requests supported.

Listener name (LSRNAME)

The name of the MQ listener object to be started.

The possible values are:

*NONE

No listener object is specified.

listener-name

Specify the name of the listener object to be started.

STRMQMMQSC (Start MQSC Commands)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start MQSC Commands (STRMQMMQSC) command initiates a set of IBM MQ Commands (MQSC) and writes a report to the printer spooler file.

Attention: Do not use the QTEMP library as the input library to STRMQMMQSC, as the usage of the QTEMP library is limited. You must use another library as an input file to the command.

Each report consists of the following elements:

- A header identifying MQSC as the source of the report.
- A numbered listing of the input MQSC commands.
- A syntax error message for any commands in error.
- A message indicating the outcome of running each correct command.
- Other messages for general errors running MQSC, as needed.
- A summary report at the end.

Parameters

Keyword	Description	Choices	Notes
<u>SRCMBR</u>	Member containing input	<i>Name</i> , *FIRST	Required, Positional 1
<u>SRCFILE</u>	Input file	Qualified object name	Optional, Positional 2
	Qualifier 1: Input file	<i>Name</i> , QMQSC	
	Qualifier 2: Library	<i>Name</i> , *LIBL, *CURLIB	
<u>OPTION</u>	Option	*RUN, *VERIFY, *MVS	Optional, Positional 3
<u>WAIT</u>	Wait time	1-999999	Optional, Positional 4
<u>LCLMQMNAME</u>	Local Message Queue Manager	Character value	Optional, Positional 5
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 6

Member containing input (SRCMBR)

Specifies the name of the source member, containing the MQSC, to be processed.

The possible values are:

source-member-name

Specify the name of the source member.

***FIRST**

The first member of the file is used.

Input file (SRCFILE)

Specifies the qualified name of the file, in the form LIBRARY/FILE, that contains the MQSC to be processed.

The possible values are:

***LIBL**

The library list is searched for the file name.

***CURLIB**

The current library is used.

source-library-name

Specify the name of the library to be used.

The possible values are:

QMQSC

QMQSC is used.

source-file-name

Specify the name of the source file.

Option (OPTION)

Specifies how the MQSC commands are to be processed.

The possible values are:

***RUN**

If this value is specified and a value for the WAIT parameter is not specified the MQSC commands are processed directly by the local queue manager. If this value is specified and a value is also specified for the WAIT parameter the MQSC commands are processed indirectly by a remote queue manager,

***VERIFY**

The MQSC commands are verified and a report is written, but the commands are not run.

***MVS**

The MQSC commands are processed indirectly by a remote queue manager running under MVS/ESA. If you specify this option you must also specify a value for the WAIT parameter.

Wait time (WAIT)

Specifies the time in seconds that the STRMQMMQSC command waits for replies to indirect MQSC commands. Specifying a value for this parameter indicates that MQSC commands are executed in indirect mode by a remote queue manager. Specifying a value for this parameter is only valid when the OPTION parameter is specified as *RUN or *MVS.

In indirect mode, MQSC commands are queued on the command queue of a remote queue manager. Reports from the commands are then returned to the local queue manager specified in MQMNAME. Any replies received after this time are discarded, however, the MQSC command is still run.

The possible values are:

1 - 999999

Specify the waiting time in seconds.

Local Message Queue Manager (LCLMQMNAME)

Specifies the name of the local queue manager through which indirect mode operation is to be performed.

Message Queue Manager name (MQMNAME)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

Use the default queue manager.

message-queue-manager-name

Specify the name of the queue manager.

STRMQMSVC (Start MQ Service)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start MQ Service (STRMQMSVC) command starts an MQ service.

Parameters

Keyword	Description	Choices	Notes
<u>SVCNAME</u>	Service name	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2

Service name (SVCNAME)

The name of the MQ service object to be started.

The possible values are:

***NONE**

No service object is specified.

service-name

Specify the name of the service definition. The maximum length of the string is 48 bytes.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

The possible values are:

***DFT**

Use the default queue manager.

queue-manager-name

The name of a message queue manager.

STRMQMTRM (Start MQ Trigger Monitor)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Start MQ Trigger Monitor (STRMQMTRM) command starts the MQ trigger monitor for the specified queue manager.

Parameters

Table 318. Command parameters

Keyword	Description	Choices	Notes
<u>INITQNAME</u>	Initiation queue	Character value	Required, Positional 1
<u>MQMNAME</u>	Message Queue Manager name	Character value, *DFT	Optional, Positional 2

Initiation queue **INITQNAME**

Specifies the name of the initiation queue.

initiation-queue-name

Specify the name of the initiation queue

Message Queue Manager name (**MQMNAME**)

Specifies the name of the message queue manager.

The possible values are:

***DFT**

The default queue manager is used. If you do not have a default queue manager defined on the system, the command fails.

message-queue-manager-name

The name of a message queue manager.

TRCMQM (Trace MQ)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Trace MQ (TRCMQM) command controls tracing for all MQ jobs. TRCMQM, which sets tracing on or off, can trace message queue interface (MQI) functions, function flow, and IBM MQ for IBM i components together with any messages issued by IBM MQ.

Parameters

Table 319. Command parameters

Keyword	Description	Choices	Notes
<u>TRCEARLY</u>	Trace early	*NO , *YES	Optional, Positional 1
<u>SET</u>	Trace option setting	*ON , *OFF, *STS, *END	Optional, Positional 2
<u>OUTPUT</u>	Output	*MQM , *MQMFMT, *PEX, *ALL	Optional, Positional 3
<u>TRCLEVEL</u>	Trace level	*DFT , *DETAIL, *PARMS	Optional, Positional 4

Table 319. Command parameters (continued)

Keyword	Description	Choices	Notes
<u>TRCTYPE</u>	Trace types	Single values: *ALL Other values (up to 14 repetitions): *API, *CMTRY, *COMMS, *CSDATA, *CSFLOW, *LQMDATA, *LQMFLOW, *OTHDATA, *OTHFLOW, *RMTDATA, *RMTFLOW, *SVCDATA, *SVCFLOW, *VSNDATA	Optional, Positional 5
<u>EXCLUDE</u>	Exclude types	Single values: *NONE Other values (up to 14 repetitions): *API, *CMTRY, *COMMS, *CSDATA, *CSFLOW, *LQMDATA, *LQMFLOW, *OTHDATA, *OTHFLOW, *RMTDATA, *RMTFLOW, *SVCDATA, *SVCFLOW, *VSNDATA	Optional, Positional 6
<u>INTERVAL</u>	Trace interval	1-32000000, *NONE	Optional, Positional 7
<u>MAXSTG</u>	Maximum storage to use	1-16, *DFT	Optional, Positional 8
<u>DATASIZE</u>	Trace data size	1-99999999, *DFT, *ALL, *NONE	Optional, Positional 9
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 10
<u>JOB</u>	Job information	Values (up to 8 repetitions): <i>Element list</i>	Optional, Positional 11
	Element 1: Job name	Qualified job name	
	Qualifier 1: Job name	Generic name, name	
	Qualifier 2: User	<i>Character value</i> , X"	
	Qualifier 3: Number	<i>Character value</i> , X"	
	Element 2: Thread identifier	<i>Character value</i> , *NONE, *INITIAL	
<u>STRCTL</u>	Trace start control	Values (up to 8 repetitions): <i>Character value</i> , *NONE	Optional, Positional 12
<u>ENDCTL</u>	Trace end control	Values (up to 8 repetitions): <i>Character value</i> , *NONE	Optional, Positional 13

Trace early (TRCEARLY)

Specifies whether early tracing is selected.

Early tracing applies to all jobs for all queue managers. If a queue manager is not currently active or does not exist, then early trace will become effective during start-up or creation.

***NO**

Early tracing is not enabled.

***YES**

Early tracing is enabled.

Trace option setting (SET)

Specifies the collection of trace records.

The possible values are:

***ON**

The collection of trace records is started.

For TRCEARLY(*NO), the collection of trace records will not be started until after the queue manager is available.

***OFF**

The collection of trace records is stopped. Trace records are written to files in the trace collection directory.

***STS**

The status of any active trace collections are written to a spool file. Any other parameters specified on the TRCMQM will be ignored.

***END**

The collection of trace records is stopped for all queue managers.

Output (OUTPUT)

Identifies the type of trace output that this command applies.

The possible values are:

***MQM**

This command applies to the collection of binary IBM MQ trace output in the directory specified by the TRCDIR parameter.

***MQMfmt**

This command applies to the collection of formatted IBM MQ trace output in the directory specified by the TRCDIR parameter.

***PEX**

This command applies to the collection of Performance Explorer (PEX) trace output.

***ALL**

This option applies to the collection of both IBM MQ unformatted trace and PEX trace output.

Trace level (TRCLEVEL)

Activates tracing level for flow processing trace points.

The possible values are:

***DFT**

Activates tracing at default level for flow processing trace points.

***DETAIL**

Activates tracing at high-detail level for flow processing trace points.

***PARMS**

Activates tracing at default-detail level for flow processing trace points.

Trace types (TRCTYPE)

Specifies the type of trace data to store in the trace file. If this parameter is omitted, all trace points are enabled.

The possible values are:

***ALL**

All the trace data as specified by the following keywords is stored in the trace file.

trace-type-list

You can specify more than one option from the following keywords, but each option can occur only once.

***API**

Output data for trace points associated with the MQI and major queue manager components.

***CMTRY**

Output data for trace points associated with comments in the MQ components.

***COMMS**

Output data for trace points associated with data flowing over communications networks.

***CSDATA**

Output data for trace points associated with internal data buffers in common services.

***CSFLOW**

Output data for trace points associated with processing flow in common services.

***LQMDATA**

Output data for trace points associated with internal data buffers in the local queue manager.

***LQMFLOW**

Output data for trace points associated with processing flow in the local queue manager.

***OTHDATA**

Output data for trace points associated with internal data buffers in other components.

***OTHFLOW**

Output data for trace points associated with processing flow in other components.

***RMTDATA**

Output data for trace points associated with internal data buffers in the communications component.

***RMTFLOW**

Output data for trace points associated with processing flow in the communications component.

***SVCDATA**

Output data for trace points associated with internal data buffers in the service component.

***SVCFLOW**

Output data for trace points associated with processing flow in the service component.

***VSNDATA**

Output data for trace points associated with the version of IBM MQ running.

Exclude types (EXCLUDE)

Specifies the type of trace data to omit from the trace file. If this parameter is omitted, all trace points specified in TRCTYPE are enabled.

The possible values are:

***ALL**

All the trace data as specified by the following keywords is stored in the trace file.

trace-type-list

You can specify more than one option from the following keywords, but each option can occur only once.

***API**

Output data for trace points associated with the MQI and major queue manager components.

***CMTRY**

Output data for trace points associated with comments in the MQ components.

***COMMS**

Output data for trace points associated with data flowing over communications networks.

***CSDATA**

Output data for trace points associated with internal data buffers in common services.

***CSFLOW**

Output data for trace points associated with processing flow in common services.

***LQMDATA**

Output data for trace points associated with internal data buffers in the local queue manager.

***LQMFLOW**

Output data for trace points associated with processing flow in the local queue manager.

***OTHDATA**

Output data for trace points associated with internal data buffers in other components.

***OTHFLOW**

Output data for trace points associated with processing flow in other components.

***RMTDATA**

Output data for trace points associated with internal data buffers in the communications component.

***RMTFLOW**

Output data for trace points associated with processing flow in the communications component.

***SVCDATA**

Output data for trace points associated with internal data buffers in the service component.

***SVCFLOW**

Output data for trace points associated with processing flow in the service component.

***VSNDATA**

Output data for trace points associated with the version of IBM MQ running.

Trace interval (INTERVAL)

Specifies an interval in seconds that trace should be collected for. If this parameter is omitted then trace will continue to be collected until it is stopped manually via the TRCMQM commands or an FDC with a probe identifier specified in ENDCTL is encountered.

The possible values are:

collection-interval

Specify a value in seconds ranging from 1 through 32000000.

You cannot specify a value for both INTERVAL and ENDCTL.

Maximum storage to use (MAXSTG)

Specifies the maximum size of storage to be used for the collected trace records.

The possible values are:

***DFT**

The default maximum is 1 megabyte (1024 kilobytes).

maximum-megabytes

Specify a value ranging from 1 through 16.

Trace data size (DATASIZE)

Specifies the number of bytes of user data included in the trace.

The possible values are:

***DFT**

The default trace value is used.

***ALL**

All the user data is traced.

***NONE**

This option will turn off the trace for sensitive user data.

data-size-in-bytes

Specify a value in ranging from 1 through 99999999.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

This parameter is only valid when TRCEARLY is set to *NO.

When TRCEARLY is set to *YES all queue managers are traced.

The possible values are:

***DFT**

Trace the default queue manager.

queue-manager-name

Specify the name of the queue manager to trace.

Job information (JOB)

Specifies which jobs are to be traced.

The value of this parameter can be one of the following:

generic-jobname

A generic 10 character jobname. All jobs that match the jobname will be enabled to collect trace. For example 'AMQ*' will collect trace for all jobs with a prefix of AMQ.

Job-name/User/Number

A fully qualified jobname. Only the job specified by the qualified jobname will be traced.

Job-name/User/Number/thread-identifier

A fully qualified jobname and associated thread identifier. Only the thread in the job specified by the qualified jobname will be traced. Note that the thread identifier is the internal identifier allocated by IBM MQ, it is not related to the IBM i thread identifier.

Trace start control (STRCTL)

Specifies that trace is started when an FDC with one of the specified probe identifiers is generated.

AANNNNNN

A probe identifier is an 8 character string of the format (AANNNNNN) where A represents alphabetic characters and N represents numeric digits.

Up to 8 probe identifiers may be specified.

Trace end control (ENDCTL)

Specifies that trace is ended when an FDC with one of the specified probe identifiers is generated.

AANNNNNN

A probe identifier is an 8 character string of the format (AANNNNNN) where A represents alphabetic characters and N represents numeric digits.

Up to 8 probe identifiers may be specified.

You cannot specify a value for both ENDCTL and INTERVAL.

Related tasks

[Using trace on IBM i](#)

WRKMQM (Work with MQ Queue Manager)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with Queue Managers (WRKMQM) command allows you to work with one or more queue manager definitions, and allows you to perform the following operations:

- Change a queue manager
- Create a queue manager
- Delete a queue manager
- Start a queue manager
- Display a queue manager
- End a queue manager
- Work with channels of a queue manager
- Work with namelists of a queue manager
- Work with queues of a queue manager
- Work with processes of a queue manager

Parameters

Keyword	Description	Choices	Notes
MQMNAME	Message Queue Manager name	Character value, *ALL	Optional, Positional 1

Message Queue Manager name (MQMNAME)

Specifies the name or names of the message queue managers to select.

The possible values are:

*ALL

All queue managers are selected.

generic-queue-manager-name

Specify the generic name of the queue managers to select. A generic name is a character string followed by an asterisk (*), for example ABC*, and it selects all queue managers having names that start with the character string. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

Note: You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered. You cannot select all the uppercase and lowercase versions of a generic name on a single panel, without requesting all the names.

queue-manager-name

Specify the name of the queue manager. The name can contain up to 48 characters. The maximum number of characters is reduced if the system is using a double byte character set (DBCS).

IBM i WRKMQMAUT (Work with MQ Authority)

Where allowed to run

All environments (*ALL)

Threadsafe

Yes

The Work with MQ Authority (WRKMQMAUT) displays a list of all the authority profile names and their types, which match the specified parameters. This enables you to delete, work with and create the authority records for an MQM authority profile record.

Parameters

Keyword	Description	Choices	Notes
<u>OBJ</u>	Object/Profile name	<i>Character value</i> , *ALL	Optional, Positional 1
<u>OBJTYPE</u>	Object type	*Q, *PRC, *MQM, *NMLIST, *AUTHINFO, *LSR, *SVC, *CHL, *CLTCN, *ALL, *TOPIC, *RMTMQMNAME	Optional, Positional 2
<u>OUTPUT</u>	Output	*, *PRINT	Optional, Positional 3
<u>MQMNAME</u>	Message Queue Manager name	<i>Character value</i> , *DFT	Optional, Positional 4
<u>SRVCOMP</u>	Service Component name	<i>Character value</i> , *DFT	Optional, Positional 5

Object name (OBJ)

Specify the object name or authority profile name of the object to select.

The possible values are:

*ALL

All authority records matching the specified object type are listed. *ALL cannot represent a generic profile.

object-name

Specify the name of an MQ object; all authority records for which the object name or generic profile name match this object name are selected.

generic profile

Specify the generic profile of an MQ object; only the authority record which exactly matches the generic profile is selected. A generic profile is a character string containing one or more generic characters anywhere in the string. The generic characters are (?), (*) and (**).

You are recommended to specify the name required within quotation marks. Using this format ensures that your selection is precisely what you entered.

Object type (OBJTYPE)

Specifies the object type of the authority profile to select.

***ALL**

All MQ object types.

***Q**

All queue object types.

***AUTHINFO**

Authentication Information object.

***MQM**

Message Queue Manager.

***NMLIST**

Namelist object.

***PRC**

Process definition.

***CHL**

Channel object.

***CLTCN**

Client Connection Channel object.

***LSR**

Listener object.

***SVC**

Service object.

***TOPIC**

Topic object.

***RMTMQMNAME**

Remote queue manager name.

Output (OUTPUT)

Specifies whether the output from the command is shown at the requesting workstation, or printed with the job's spooled output.

The possible values are:

Output requested by an interactive job is shown on the display. Output requested by a batch job is printed with the job's spooled output.

***PRINT**

A detailed list of the users and their authorities registered with the selected authority profile record is printed with the job's spooled output.

Message Queue Manager name (MQMNAME)

Specifies the name of the queue manager.

***DFT**

Use the default queue manager.

queue-manager-name

Specify the name of the queue manager.

Service Component name (SRVCOMP)

Specify the name of the installed authorization service in which to search for the authorities to display.

The possible values are:

***DFT**

All installed authorization components are searched for the specified authority profile name and object type.

Authorization-service-component-name
