

M09 Virtualization Engine Systems Technologies and Services**by Tom Monza**

Virtualizing and managing resources within a server, or across the enterprise is a challenge for customers today. A single server environment is not a reality for most customers, and they need help with dealing with the complexity and simplifying the environment. The IBM Virtualization Engine™ is a set of integrated systems technologies and systems services to help a customer deal with this challenge, virtualizing and offering resource management across multiple operating systems, whether those systems exist in a single server, or across different server platforms. Learn how existing xSeries offerings like IBM Director, Remote Deployment Manager and VMware complement and work with some of the components of the VE — IBM Director Multiplatform, Systems Provisioning, Enterprise Workload Manager and the VE Console.
