

The New zEnterprise – A Smarter System For A Smarter Planet

Deploying Web Applications

zEnterprise Offers A Choice Of Platforms For Deploying Web Applications

**WebSphere on
x86 blade in zBX**

**WebSphere on
Power blades in zBX**

**WebSphere for
Linux on z**

**WebSphere
for z/OS**

**Groups of
Applications
With Different
Requirements**

Power and x86 Blades

- Access to back-end data and transactions via secure, private network
- Blades managed by Unified Resource Manager

Linux on z

- Optimized access to z/OS via hipersockets
- Resource management via z/VM
- Uses IFLs for lower costs

WebSphere for z/OS

- Best integration with local back-end data access
- Advanced workload management
- Highest security
- Large scale clustering, high availability, and disaster recovery

What's the best choice for deploying our Web applications?

**Development
Manager**

Best Fit for Purpose depends on application requirements

IBM

Let's consider three kinds of applications to compare deployment tradeoffs

1. Low cost application with basic Quality of Service (QoS) requirements
2. A transactional application with higher quality of service requirements
3. A mission-critical application requiring continuous availability and disaster recovery

Scenario #1: Simple Java Application

A Java application reads and updates a modest database on the same server

- Low cost is a key requirement
- No back-end access is needed
- Basic security and QoS requirements
- Application, Application Server and Database are co-located on the same server in all cases

Which is the best zEnterprise deployment option?

Results Of Benchmark And 3 Year Cost Study For Simple Application

**WebSphere and DB2
on x86 Blade in zBX**

x86 Blade running 4 cores
675 transactions/second
\$428 per TPS

**WebSphere and DB2
on Power Blade in zBX**

PS701 running 4 cores
2,425 transactions/second
\$106 per TPS

Lowest Cost Solution

Self-contained
WebSphere
Application
with DB2

**WebSphere and DB2
for Linux on z**

Linux on z running on 4 IFLs
2,275 transactions/second
\$317 per TPS

**WebSphere and DB2
for z/OS**

z/OS running on 2 zAAPs and 2 GP cores
1,005 transactions/second
\$763* per TPS

* Price based on 2009 Solution Edition for WebSphere on System z10. z196 pricing is not available yet.

Which Is The Best Fit For Purpose?

- The application requirements can be satisfied easily with any of the platforms
 - The main requirement is lowest cost, and for this case costs vary widely
- ⇒ The Power Blade solution offers lowest cost and good Qualities of Service

WebSphere and DB2
on zBX Power blade

Scenario #2: Application Interfacing With Mission-Critical Transactions

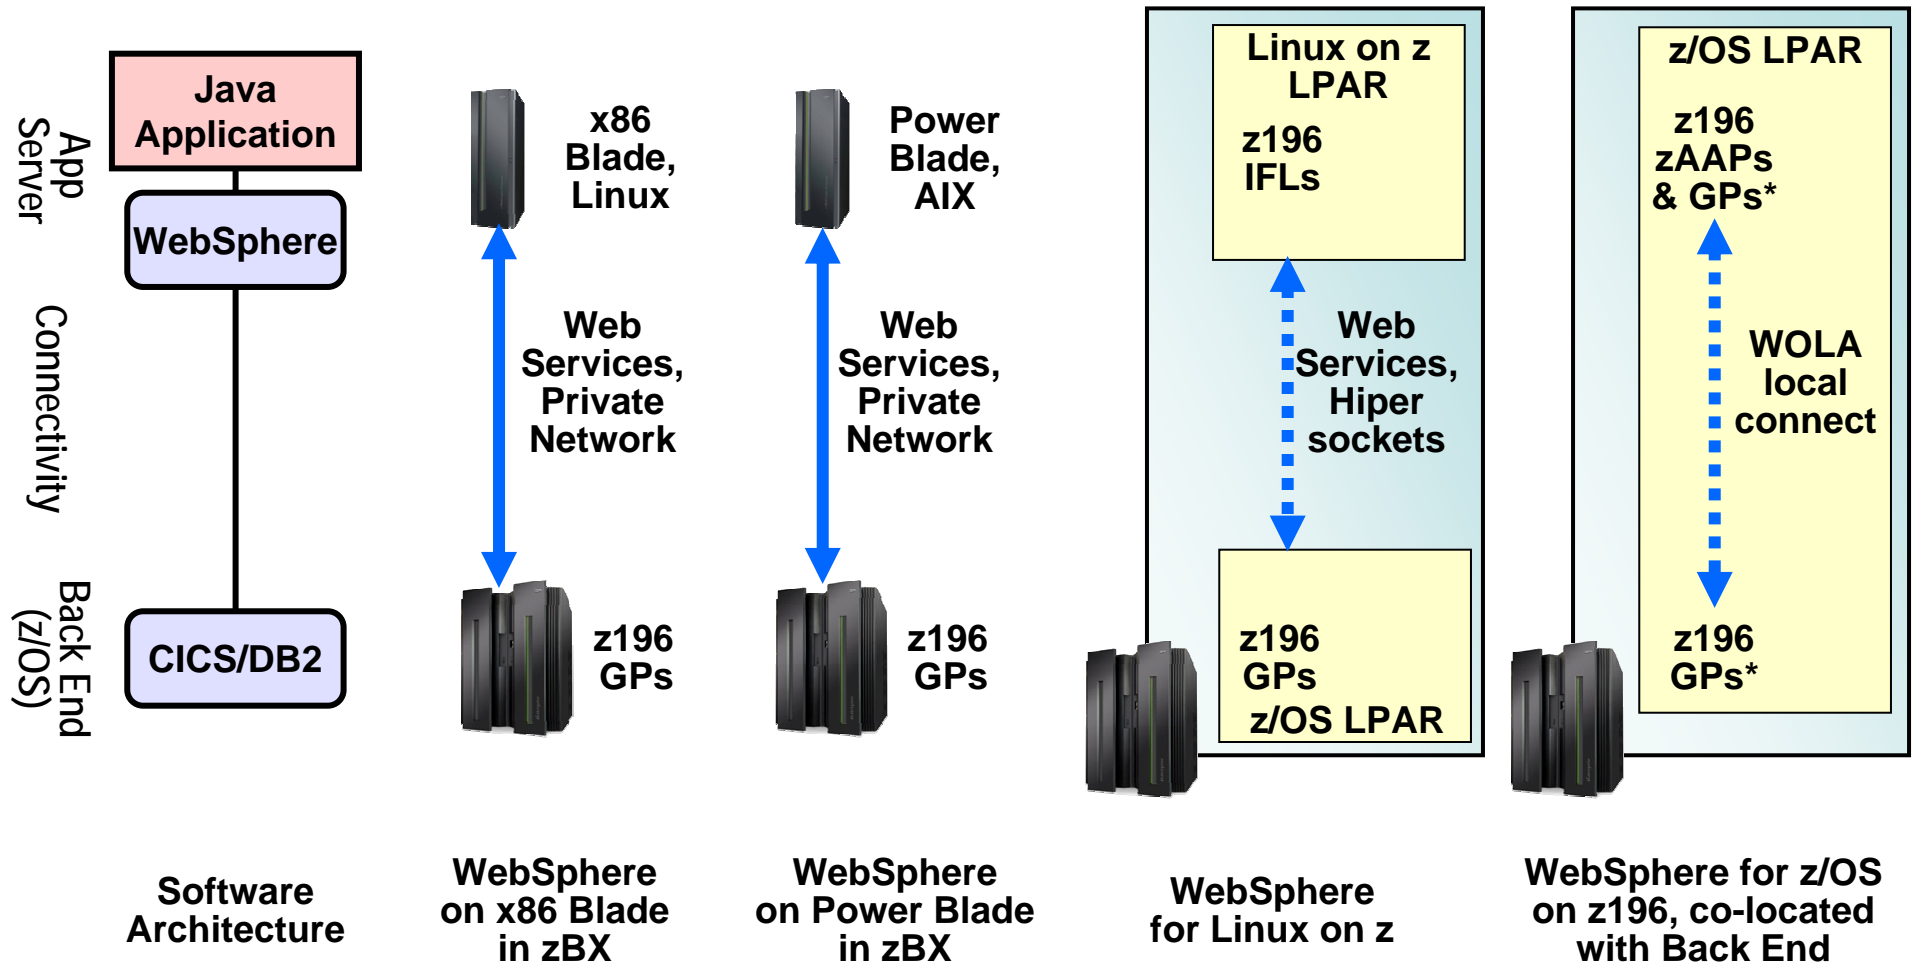

A Java application provides a Web interface to business data and transactions hosted by DB2 and CICS on a zEnterprise

- Higher QoS requirements
 - ▶ Transaction integrity
 - ▶ Typical security requirements
- Solution cost is important, but is second to meeting QoS requirements

Which is the best zEnterprise deployment option?

Let's Compare Four Deployment Options

* Shared GP processor pool

Results Of Benchmark And 3 Year Cost Study For Bank Transaction Application

WebSphere on x86 Blade in zBX

WAS on 5 cores on x86 Blade in zBX
 Incremental CICS on 2 added GPs
 1,950 transactions per second
\$3,346 per TPS **Low Cost Solution**

WebSphere on Power Blade in zBX

WAS on 5 Power cores on PS701 blade in zBX
 Incremental CICS on 2 added GPs
 1,975 transactions per second
\$3,330 per TPS **Low Cost Solution**

WebSphere for Linux on z

WAS on 4 Added IFLs, Solution Edition Pricing
 Incremental CICS on 2 added GPs
 2,035 transactions per second
\$3,498 per TPS **Low Cost Solution**

WebSphere for z/OS

Incremental WAS z/OS and CICS on 12 added cores (4 GPs, 8 zAAPs*)
 2,480 transactions/second
\$4,012 per TPS ← 1.21x Power Blade cost

* Existing workload (435 MSUs) uses 4 GPs, allowing 8 zAAPs total.

Banking transaction application on WebSphere with CICS/DB2

Similar costs invite other considerations

Results Of Benchmark And 3 Year Cost Study For Bank Transaction Application

WebSphere on x86 Blade in zBX

WAS on 5 cores on x86 Blade in zBX
 Incremental CICS on 2 added GPs
 1,950 transactions per second
\$3,346 per TPS **Low Cost Solution**

WebSphere on Power Blade in zBX

WAS on 5 Power cores on PS701 blade in zBX
 Incremental CICS on 2 added GPs
 1,975 transactions per second
\$3,330 per TPS **Low Cost Solution**

WebSphere for Linux on z

WAS on 4 Added IFLs, Solution Edition Pricing
 Incremental CICS on 2 added GPs
 2,035 transactions per second
\$3,498 per TPS **Low Cost Solution**

WebSphere for z/OS

WAS z/OS and CICS on 12 cores (4 GPs, 8 zAAPs*)
 2,480 transactions/second
\$3,868 per TPS ← 1.16x Power Blade cost

* Existing workload (435 MSUs) uses 4 GPs, allowing 8 zAAPs total.

Banking transaction application on WebSphere with CICS/DB2

IBM CONFIDENTIAL Similar costs invite other considerations

- 
- This chart intentionally blank.
 - It's purpose is to keep this presentation in sync with the recording and script.

Considerations Of The Power Blade/zBX Solution

- Lowest cost
- Unified Resource Manager provides centralized system monitoring and management
- Connect to z196 using a high-speed **private** network
 - ▶ Software security between the Power blade and the z196 is not required

WebSphere on
zBX Power blade

Advantages Of The x86 Blade/zBX Solution

- Low cost
- Unified Resource Manager provides centralized system monitoring and management
- Connect to z196 using a high-speed **private** network
 - ▶ Software security between the x86 blade and the z196 is not required

WebSphere on
zBX x86 Blade

Linux On System z Is Great For Consolidation

- Low cost
- Linux on z leverages System z reliability
- Both WebSphere and commercial applications work well on Linux on z
- Very good security
 - ▶ Virtual network cannot be hacked like a real network

**WebSphere
for Linux on z**

What about new mission-critical applications? We need absolute 24x7 availability for them.

**Development
Manager**

**WebSphere for z/OS
is the best choice for
vital applications!**

IBM

Quality Of Service Advantages From WebSphere For z/OS May Be Worth The Extra Cost

- Advanced Workload Management
 - ▶ On other platforms, you need WebSphere Virtual Enterprise at extra cost
- Co-location benefits: running WebSphere in the same LPAR with back-end systems
 - ▶ WOLA communications between WebSphere and CICS significantly reduces CICS MSU cost compared to hybrid and distributed solutions using Web services
 - ▶ Local JDBC Type 2 and WOLA communications give faster response time compared to hybrid and distributed solutions
 - ▶ Robust, high-speed two-phase commit between WAS and CICS
- Leverages System z High Availability and security features to provide the most secure, robust and reliable solution
 - ▶ Disaster Recovery options are also available
- These and other advantages come at extra cost
 - ▶ In the previous study, the cost was **1.21x** the lowest-cost solution

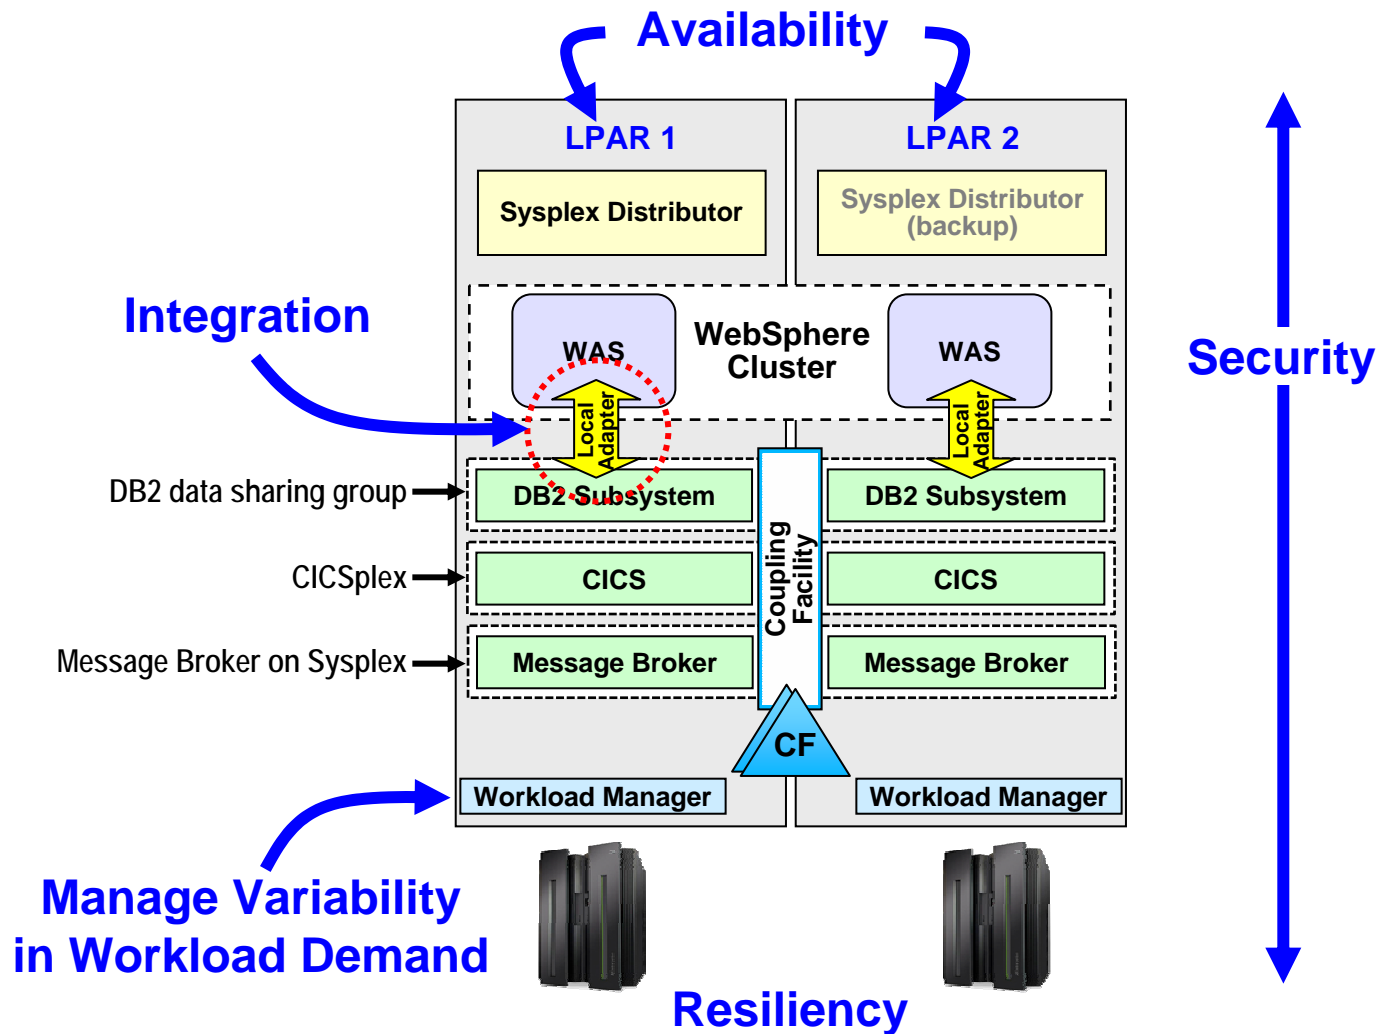

WebSphere
for z/OS

Scenario 3: Multi-tier Application – Connect To Backend Systems, HA With DR

- Requirement: Mission-critical Java applications with back-end support for
 - ▶ Database read/update from one or more databases
 - ▶ Invoke back-end transactions
- Substantial QoS requirements:
 - ▶ Transaction Integrity and Security
 - ▶ High Availability and Disaster Recovery
 - ▶ Workload Management to ensure Service Level Agreements are met
- Solution cost is important, but second to QoS requirements

WebSphere For z/OS Can Be Deployed In A Parallel Sysplex Configuration

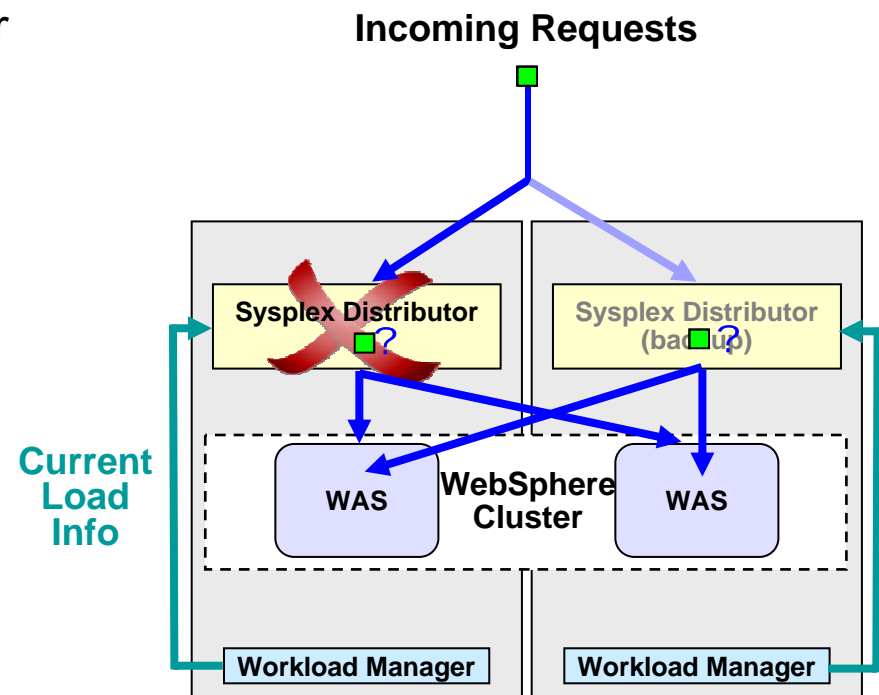

Let's see how WAS for z/OS provides these capabilities

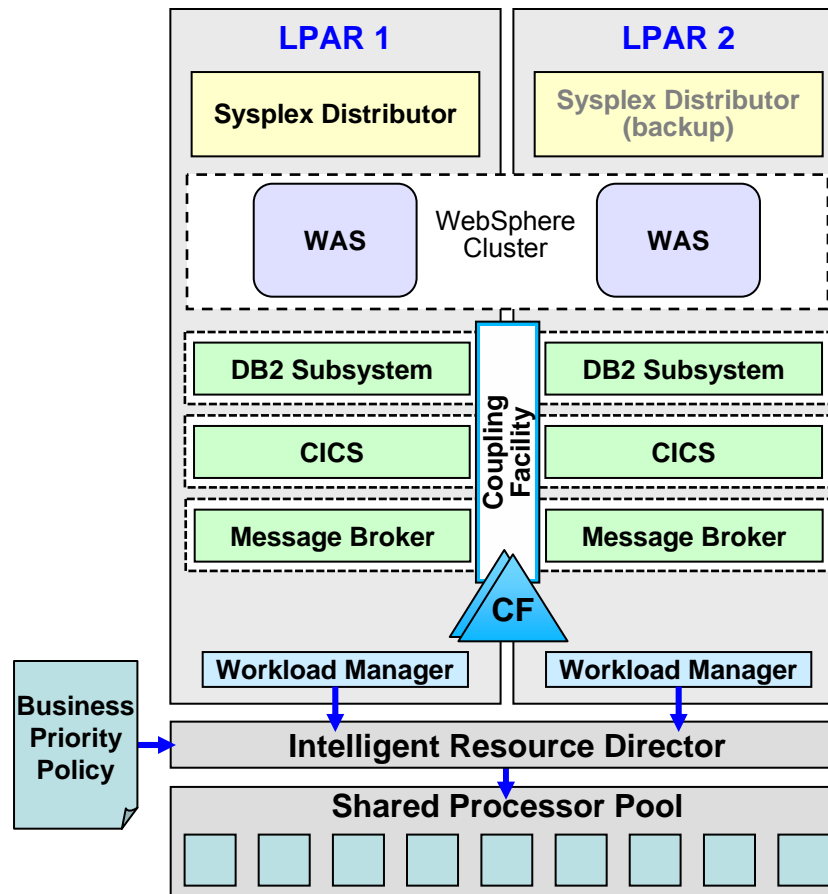

Sysplex Distributor Sends Incoming Requests To Best Available Server

- Sysplex Distributor is an intelligent router
 - ▶ Receives incoming requests
 - ▶ Determines which potential target LPAR is the best
 - ▶ Redirects the request to that LPAR
- It uses current load information from Workload Manager to support dynamic load balancing among WebSphere instances
- In the event of a failure in the LPAR or TCP stack, Sysplex Distributor functions **automatically** move to a backup TCP/IP stack
- All of this is transparent to the user and the applications

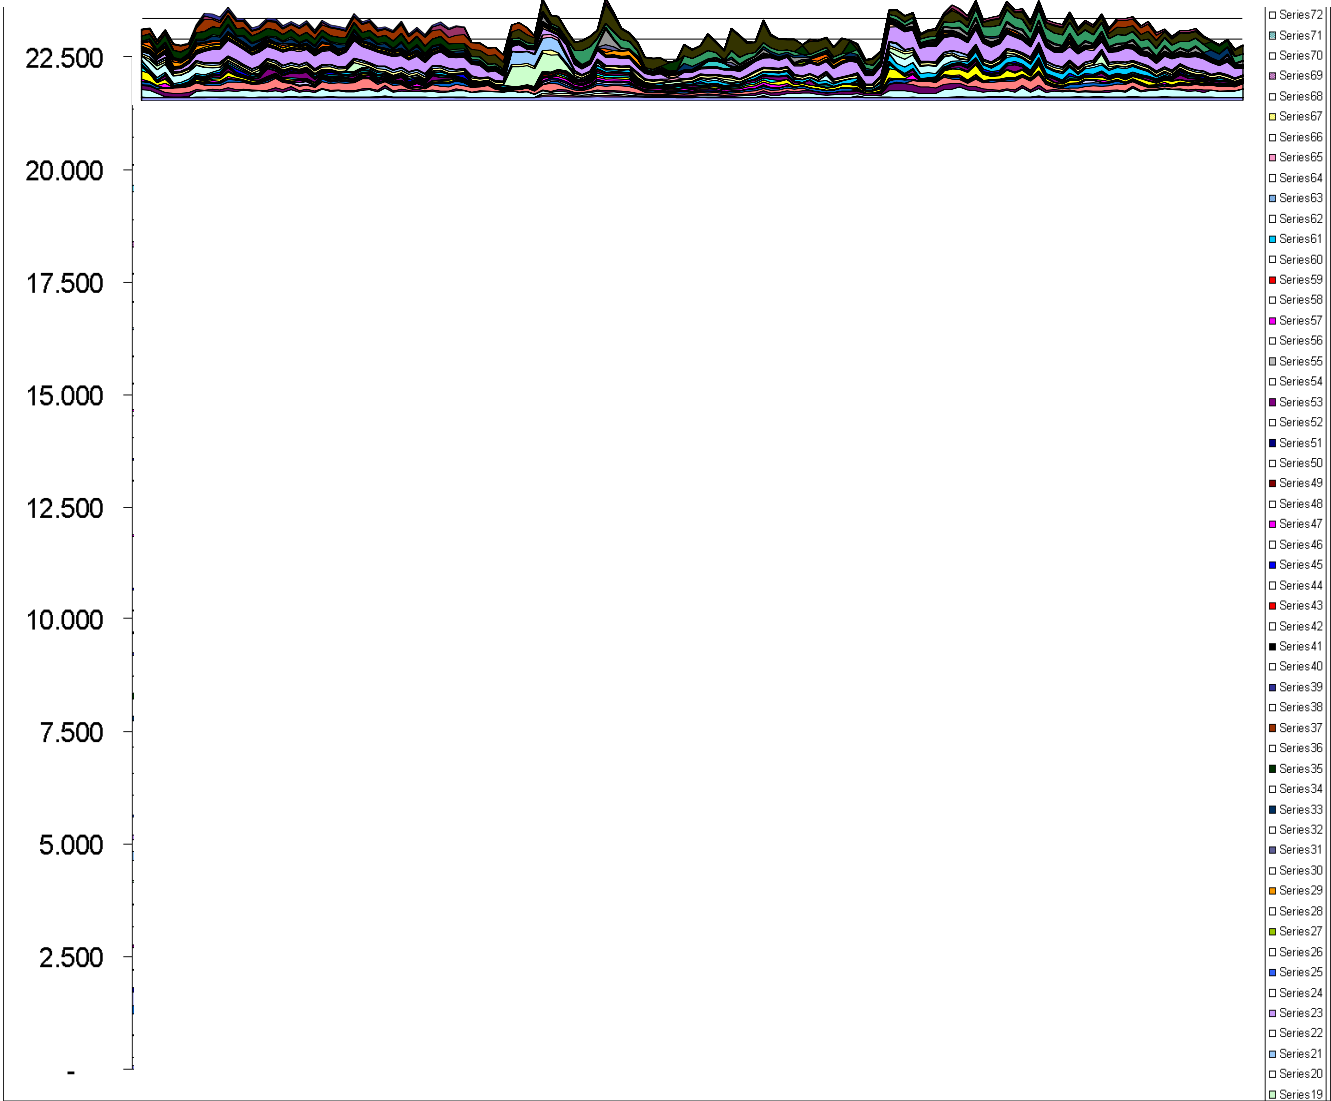

Mixed Workloads Share Pooled Processing Resources

Workloads with light, medium, and heavy variation share the same pool of processors

Sharing Processors Eliminates Wasted Resources Of Distributed Servers

zEnterprise Shared Processors Achieve Competitive Costs Per Workload

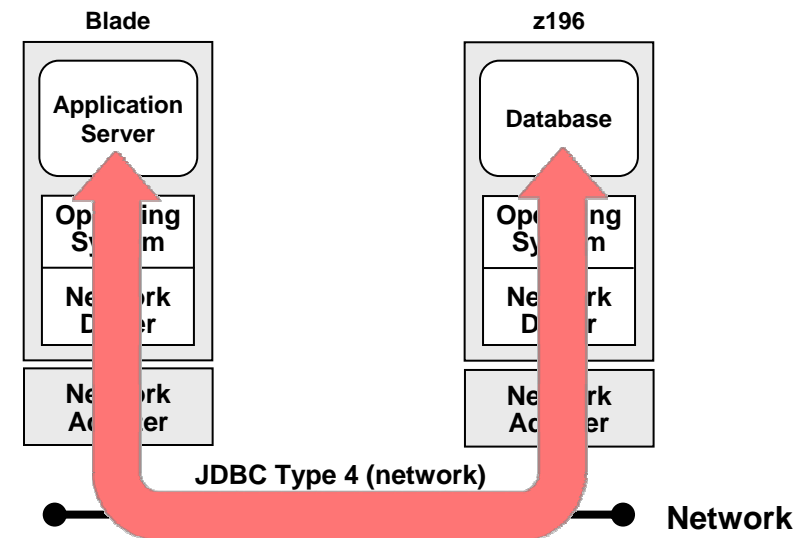

Webplex Co-locates Applications With Backend Systems For Efficiency and Security

WAS on z/OS

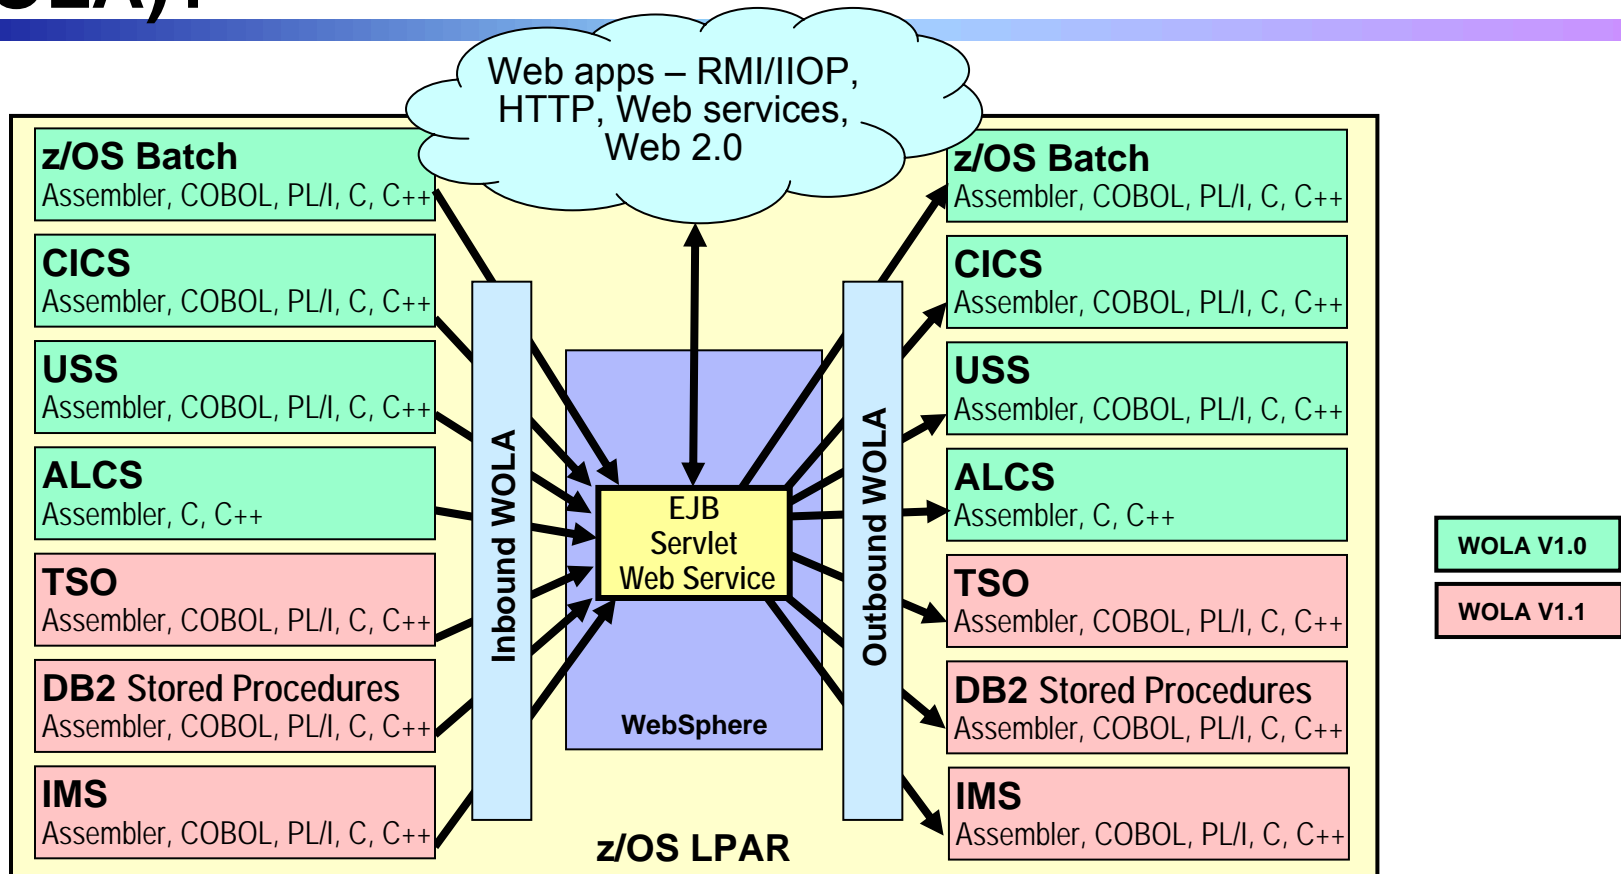

- Data can be shared in memory between WAS, DB2, and CICS by co-locating in same LPAR
 - ▶ Local adapters provide direct, cross-memory access
 - ▶ Optimal performance, faster response time
 - ▶ Security - data stays in same physical host

Hybrid Design

- Hybrid design separates applications from data and transactions
 - ▶ Accumulates network latency
 - ▶ Web services overhead – XML Parsing, serializing and deserializing Java objects, etc

What Are WebSphere Optimized Local Adapters (WOLA)?

WOLA supports fast, **bi-directional**, local calls between z/OS native apps and WebSphere apps for

- Global transactions, security propagation, WLM context passing
- 1-phase and 2-phase commit from WAS to CICS
- WOLA v2 improves CICS Transactions support

A Secure Foundation

- **zEnterprise has the highest commercial common criteria ratings**
 - ▶ PR/SM rated at EAL 5
- **Workload Isolation**
 - ▶ zEnterprise Hypervisor maintains strict isolation between workloads
 - ▶ Hardware coded storage protect keys protects system and user workloads
 - ▶ Architecture design makes typical buffer overflows and virus payloads inoperable
- **Integrated access control throughout the stack**
 - ▶ RACF enforces access control and logs security events
- **Secure cryptographic encoding**
 - ▶ On-chip crypto hardware assist
 - ▶ Optional high speed cryptographic processors
 - ▶ Support for Advanced Encryption Standard (AES) 192 and 256, SHA-384 and SHA-512

z/OS Provides Essential Network Security For Applications

- Communication Server for z/OS ensures that
 1. The partner is who it claims to be (endpoint authentication)
 2. Data came from the intended partner (data origin authentication)
 3. Data was not changed since it was sent via digital signatures (data integrity)
 4. Only the intended receiver can understand the data via encryption (data confidentiality)

- Data integrity and confidentiality are accelerated by zEnterprise cryptographic hardware

z/OS Provides Advanced Network Security

- Communications Server for z/OS provides the first line of defense against **network attacks**
 - ▶ Intrusion detection services
 - ▶ Dynamic defensive filtering protect from denial of service attacks
 - ▶ IPsec can encrypt data end-to-end, or across any portion, as controlled by a policy document
 - ▶ IPsec VPN offers system-to-system security, transparently to applications
 - ▶ SSL/TLS provides application-to-application security
- Communications Server for z/OS supports **memory-to-memory hipersocket connections** for internal communications
- z/OS HTTPS conforms 100% to the standard, but adds:
 - ▶ Ability to store keys in SAF (RACF) or file stores
 - ▶ Use of crypto hardware accelerator to speed up the encryption and decryption processes

Deploy Web Application Without Disaster Recovery On zEnterprise vs. SPARC Servers

*Existing Mainframes
Parallel Sysplex*

Existing configuration, per site:
zEnterprise system with
5 GP, 4,616 MIPS workload

*Add 1 LPAR to each z10
for New Web Applications*

8,382 MIPS
Additional workload
per site, WAS + DB2
(16,762 MIPS total)

Incremental upgrade, per site:
6 zAAPs 5,261 MIPS WAS (85% zAAP eligible)
1 zIIP 877 MIPS DB2 (40% zIIP eligible)
3 GP 2,244 MIPS (WAS+DB2 ineligible)
40 GB memory

*Or: Add 11 SPARC Enterprise T5440
Servers, 1.4 GHz, 2 chip / 16 core
619,376 Performance Units per site
(22 servers, 1,238,753 Performance Units total)*

*3 year
cost of
acquisition
\$13.79M*

*3 year
cost of
acquisition
\$16.98M*

WebSphere Application Server For z/OS Is The Ideal Web Infrastructure

- WebSphere Application Server (WAS) for z/OS is also the foundation for
 - ▶ WebSphere Process Server for z/OS
 - ▶ WebSphere Enterprise Service Bus for z/OS
 - ▶ WebSphere Portal for z/OS

We are building SOA and use XML, but we use many other data formats – from COBOL copybook to industry-specific formats

Development Manager

DataPower appliances provide any-to-any data transformations – with full integration with System z!

IBM

DataPower XI50B Advanced Data Integration Appliance Reduces Mainframe Processing

- An SOA appliance in a blade form
 - ▶ **Any-to-Any data transformation at wire speed**
 - between XML, COBOL copybooks, text, industry standards, or custom formats
 - ▶ **Built-in XML parsing and transformation**
 - Convert between XML schemas
 - ▶ **Content-based routing**
 - ▶ **Creates bridges between messaging protocols**
 - MQ, WebSphere JMS, third-party JMS, FTP, HTTP
 - ▶ **Direct-to-database access** for DB2, Oracle, and Sybase
 - Use XML to directly insert, modify, query, and retrieve database info
 - ▶ **Advanced security capabilities** based on industry standards
 - ▶ Data validation,
 - ▶ Field-level security
 - ▶ Web services management
 - ▶ Access control

WebSphere DataPower XI50B

System z With WebSphere DataPower XI50B Is A Powerful Synergy

- Higher performance with DataPower hardware acceleration, reduces CPU usage
- Enables Web services for z backend systems
 - ▶ IMS, COBOL via copybook, DB2 (and other databases), CICS
- z/OS Sysplex Distributor performs load distribution to multiple DataPower blades
- XI50B Complementary High Availability features
 - ▶ Dual power supplies
 - ▶ Active/passive failover support
 - ▶ No spinning media
 - ▶ Self-healing capability
- Remote SAF/RACF and Crypto security integration

In the first half of 2011, IBM intends to offer a WebSphere DataPower appliance for IBM zEnterprise System on zBX model 002

Deploying Web Applications v2.16

Summary: Deployment Options For WebSphere on zEnterprise

- Power and x86 blades in a zBX offer the lowest-cost solution for simple Web applications, while benefiting from Unified Resource Management
- WebSphere for z/OS provides the most secure and reliable deployment platform, with the best Qualities of Service available and automated Disaster Recovery
- WebSphere DataPower offloads data transformation and message routing, provides security, and will soon be available for zEnterprise

The Best Fit for Purpose depends on application requirements – zEnterprise gives you four choices for optimal WebSphere deployment!
