## About this publication

---

This publication provides overview, planning, installation, and user instructions for IBM Storage Protect Plus.

## Who should read this publication

---

This publication is intended for administrators and users who are responsible for implementing a backup and recovery solution with IBM Storage Protect Plus in one of the supported environments.

In this publication, it is assumed that you have an understanding of the applications that support IBM Storage Protect Plus as described in [IBM Storage Protect Plus System Requirements](#).

## Publications

---

The IBM Storage Protect product family includes IBM Storage Protect Plus, IBM Storage Protect for Virtual Environments, IBM Storage Protect for Databases, and several other storage management products from IBM®.

To view IBM product documentation, see [IBM Documentation](#).

---

# Chapter 1. IBM Storage Protect Plus overview

IBM Storage Protect Plus is a data protection and availability solution for virtual environments and database applications that can be deployed in minutes and protect your environment within an hour.

IBM Storage Protect Plus can be implemented as a stand-alone solution or integrated with cloud storage or a repository server such as an IBM Storage Protect server for long-term data storage.

---

## Product components

The IBM Storage Protect Plus solution is provided as a virtual appliance that includes storage and data movement components.

**Sizing component requirements:** Some environments might require more instances of these components to support greater workloads. For guidance about sizing, building, and integrating components in your IBM Storage Protect Plus environment, see the [IBM Storage Protect Plus Blueprints](#).

The following are the base components of IBM Storage Protect Plus:

### IBM Storage Protect Plus server

This component manages the entire system. The server consists of several catalogs that track various system aspects such as restore points, configuration, permissions, and customizations. Typically, there is one IBM Storage Protect Plus server in a deployment, even if the deployment is spread across multiple locations.

### Site

This component is an IBM Storage Protect Plus policy construct that is used to manage data placement in the environment. A site can be physical, such as a data center, or logical, such as a department or organization. IBM Storage Protect Plus components are assigned to sites to localize and optimize data paths. A deployment always has at least one site per physical location. The placement of backup data to a site is governed by service level agreement (SLA) policies.

If you are using a vSnap server as your primary backup storage location, the preferred method is to localize data movement to sites by placing vSnap servers and VADP proxies together at a single site.

### vSnap server

This component is a pool of disk storage that receives data from production systems for data protection or reuse. The vSnap server consists of one or more disks and can be scaled up (by adding disks to increase capacity) or scaled out (by introducing multiple vSnap servers to improve overall performance).

The vSnap server is the required primary backup storage location for most, but not all, workload types in IBM Storage Protect Plus. For information about available primary backup storage by workload type, see [Chapter 6, “Managing backup storage,” on page 57](#).

In larger enterprise environments that use the vSnap server as the primary backup storage location, additional vSnap servers might be required. Each site can include one or more vSnap servers.

### vSnap pool

This component is the logical organization of disks into a pool of storage space, which is used by the vSnap server component. This component is also referred to as a storage pool.

### VADP proxy

This component is responsible for moving data from vSphere data stores to provide protection for VMware virtual machines and is required only for protection of VMware resources. Each site can include one or more VADP proxies.

## Example VMware deployment

The following figure shows IBM Storage Protect Plus deployed in two active locations. Each location has inventory that requires protection. Location 1 has a vCenter server and two vSphere datacenters (and an

inventory of virtual machines) and Location 2 has a single datacenter (and a smaller inventory of virtual machines).

The IBM Storage Protect Plus server is deployed in only one of the sites. VADP proxies and vSnap servers (with their corresponding disks) are deployed in each site to localize data movement in the context of the protected vSphere resources.

Bidirectional replication is configured to take place between the vSnap servers at the two sites.

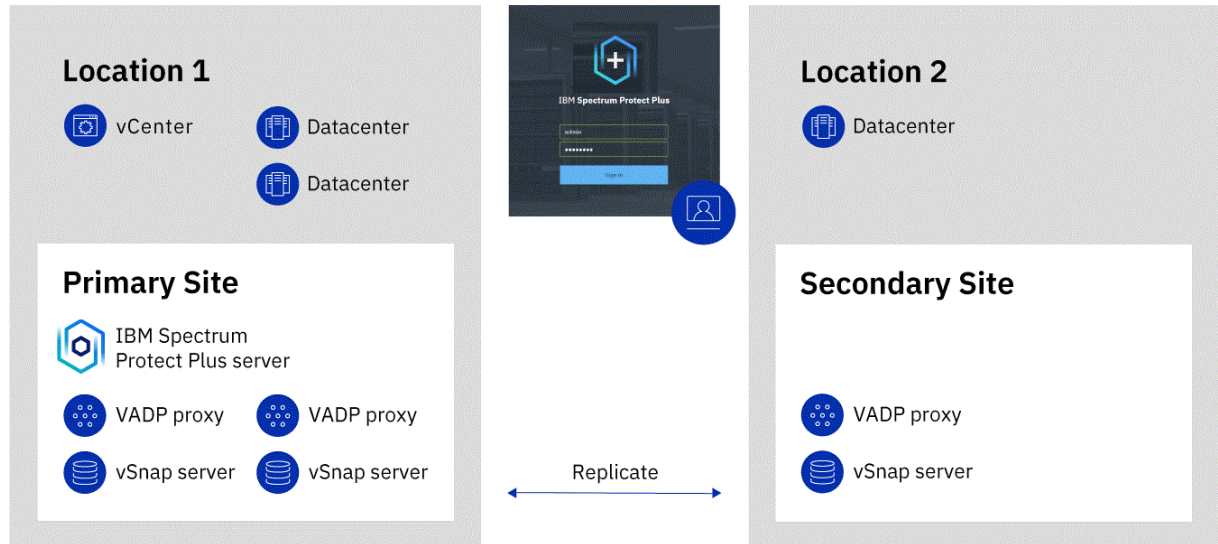

Figure 1. IBM Storage Protect Plus deployment across two geographical locations

## Overview of the serveradmin user account

The `serveradmin` user account is a system user account that is a preconfigured on IBM Storage Protect Plus and the vSnap server. It is used to manage both virtual appliances deployed in VMware and Microsoft Hyper-V environments.

The `serveradmin` account can be used to authenticate to the IBM Storage Protect Plus virtual appliance administrative console, the virtual console and using secure shell (SSH). It can also be used to access the vSnap server through the virtual console and using SSH. The initial password for the `serveradmin` user account is `sppDP758-SysXyz`. When authenticating using the `serveradmin` user account for the first time through the administrative console, the virtual console, or via SSH, you will be prompted to set a new password. For default configuration, the `serveradmin` user account password policy has these characteristics:

- The password for the user account does not expire.
- The user account is not locked after a number of failed attempts.

This may not be suitable for some environments. To harden the `serveradmin` user account password policy for IBM Storage Protect Plus and the vSnap server, the configuration for the account must be updated in the underlying Red Hat Enterprise Linux (RHEL) system.

Before modifying the `serveradmin` user account password properties, consider these statements:

- On vSnap servers, the operating system credentials are used for authenticating management requests from IBM Storage Protect Plus and for authenticating access to SMB/CIFS file shares during backup and restore operations. If you enable and configure password aging and then later change an operating system password when it expires, the change can cause interruptions to routine IBM Storage Protect Plus operations. Use command `vsnap user update` to change the operating system password for an account that has been used to register the vSnap server into IBM Storage Protect Plus. This ensures passwords used for application programming interface (API) access and SMB/CIFS access stay in sync with the operating system password.

**Note:** Even if you have changed the password using other means, repeat the change by running `vsnap user update` on the vSnap server.

- In IBM Storage Protect Plus, edit the registration of the vSnap server to update the credentials to specify the new password.
- On IBM Storage Protect Plus and vSnap servers, if you enable account locking for the `serveradmin` account, you may be unable to log in to the appliance if there are too many failed attempts. Depending on how you configure the account locking, the access should unlock after a certain amount of time has passed.
- You may want to log in and reset the `serveradmin` account password without waiting for the configured time to pass. This can be done through using the `root` account. By default on IBM Storage Protect Plus and vSnap server OVAs, the `root` account can only be accessed through the virtual console and the password for the account is unknown. The `root` account password must first be reset in order to reset the `serveradmin` account password. For more information, see [Chapter 8, “Resetting the serveradmin password,”](#) on page 85.

## Replicate backup-storage data

---

When you enable replication of backup data, data from one vSnap server is asynchronously replicated to another vSnap server. For example, you can replicate backup data from a vSnap server on a primary site to a vSnap server on a secondary site.

### Enabling replication of backup-storage data

Enable backup-storage data replication by taking the following actions:

1. Establish a replication partnership between vSnap servers. Replication partnerships are established in the Manage pane of a registered vSnap server. In the **Configure Storage Partners** section, select another registered vSnap server as a storage partner to serve as the target of the replication operations.

Ensure that the pool on the partner server is sufficiently large enough to hold replicated data from the primary server's pool.

2. Enable replication of backup-storage data. The replication feature is enabled by using backup policies, which are also referred to as service level agreement (SLA) policies.

You can define the backup storage replication options in the **Operational Protection > Replication Policy** section of an SLA policy. Options include the frequency of the replication, the target site, and the retention of the replication.

### Considerations for enabling replication of backup-storage data

Review the considerations for enabling replication of backup-storage data:

- In environments that contain more than one vSnap server, all of the vSnap servers must have a partnership established.
- If your environment includes a mixture of encrypted and unencrypted vSnap servers, select **Only use encrypted disk storage** to replicate data to encrypted vSnap servers. If this option is selected and no encrypted vSnap servers are available, the associated job will fail.
- To create one-to-many replication scenarios, where a single set of backup data is replicated to multiple vSnap servers, create multiple SLA policies for each replication site.

## Copying snapshots to secondary backup storage

---

If your primary backup storage is a vSnap server, you can copy snapshots from the primary backup storage to secondary storage for longer-term data protection. Secondary storage is not available for container data that is backed up to cloud storage.

The following secondary backup storage targets are available for copy operations:

- IBM Cloud® Object Storage (including IBM Cloud Object Storage Systems)
- Amazon Simple Storage Service (Amazon S3)
- Microsoft Azure
- Repository servers (for the current release of IBM Storage Protect Plus, the repository server must be an IBM Storage Protect server)

These targets support the following storage types. The storage type that you use depends on factors such as your recovery time and security goals.

### **Standard object storage**

Standard object storage is a method of storing data in which data is stored as discrete units, or objects, in a storage pool or repository that does not use a file hierarchy but that stores all objects at the same level.

Standard object storage is an option when you copy snapshot data to an IBM Storage Protect server or a cloud storage system. When snapshot data is copied to standard object storage, only the most recent backup is copied. Previous backups are not transferred during cloud copy operations.

Copying snapshots to standard object storage is useful if you want relatively fast backup and recovery times and do not require the longer-term protection, cost, and security benefits that are provided by tape or cloud archive storage.

### **Tape or cloud archive storage**

Tape storage means that data is stored on physical tape media or in a virtual tape library (VTL). Tape storage is an option when you copy snapshot data to an IBM Storage Protect server.

Cloud archive storage is long-term storage method that copies data to one of the following storage services: Amazon Glacier, IBM Cloud Object Storage Archive Tier, or Microsoft Azure Archive.

When you copy snapshot data to tape or to a cloud storage system, a full copy of the data is created.

Copying snapshots to tape or cloud object archive storage provides extra cost and security benefits. By storing tape volumes at a secure, offsite location that is not connected to the internet, you can help to protect your data from online threats such as malware and hackers. However, because copying to these storage types requires a full data copy, the time required to copy data increases. In addition, the recovery time can be unpredictable and the data might take longer to process before it is usable.

When you are copying data to tape from IBM Storage Protect Plus to the IBM Storage Protect server, it is not a good idea to use the IBM Storage Protect tiering function. If you are archiving data to tape, you must use a cold cache storage pool. For more information about tiering, see [“How do I tier data to tape or cloud storage?”](#) on page 87. For different scenarios and more information about how to set up storage, see [“Configuration for copying or archiving data to IBM Storage Protect”](#) on page 5.

## **Example deployments**

The following figure shows IBM Storage Protect Plus deployed in two active locations. Each location has inventory that requires protection. Location 1 has a vCenter server and two vSphere datacenters (and an inventory of virtual machines) and Location 2 has a single datacenter (and a smaller inventory of virtual machines).

The IBM Storage Protect Plus server is deployed in only one of the sites. VADP proxies and vSnap servers (with their corresponding disks) are deployed in each site to localize data movement in the context of the protected vSphere resources.

Bi-directional replication is configured to take place between the vSnap servers at the two sites.

Snapshots are copied from the vSnap server at the secondary site to cloud storage for long-term data protection.

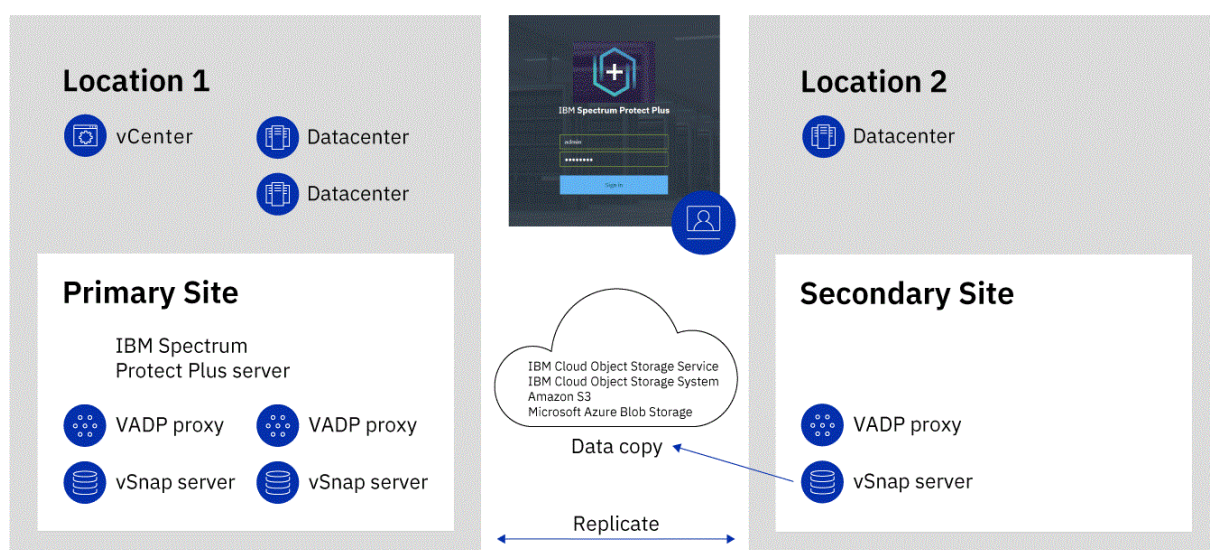

Figure 2. IBM Storage Protect Plus deployment across two geographical locations with copy to cloud storage

The following figure shows the same deployment as the previous figure.

However, in this deployment, snapshots are copied from the vSnap server at the secondary site to IBM Storage Protect for long-term data protection.

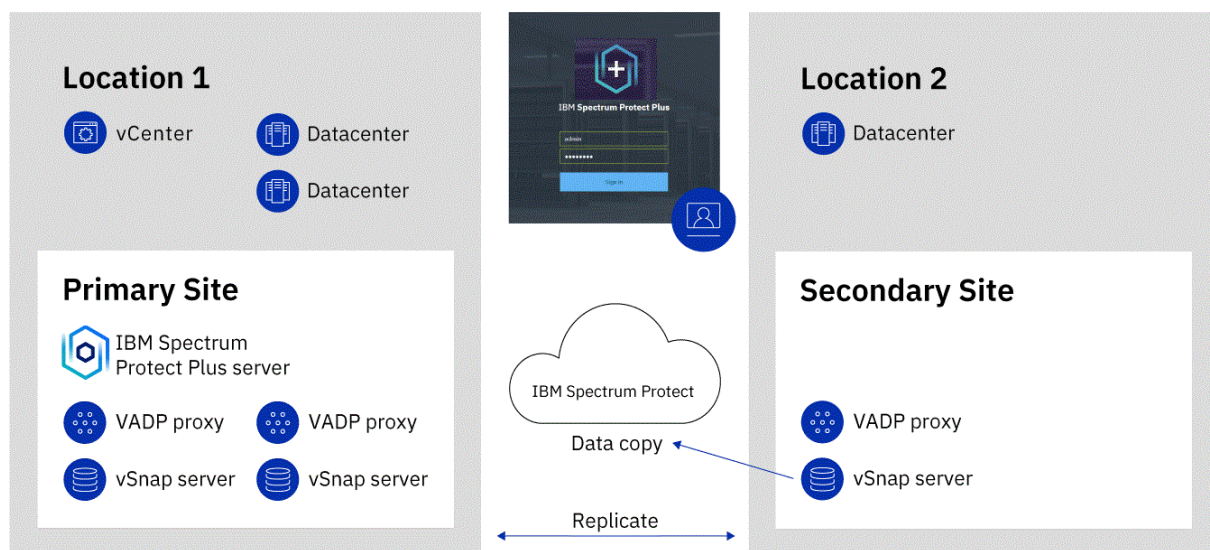

Figure 3. IBM Storage Protect Plus deployment across two geographical locations with copy to IBM Storage Protect

### Related concepts

[“Managing backup storage” on page 57](#)

All IBM Storage Protect Plus environments must include a primary backup storage location for workload snapshots.

## Configuration for copying or archiving data to IBM Storage Protect

If you are planning to copy or archive IBM Storage Protect Plus data to an IBM Storage Protect server, there are three possible configurations. Choosing which one to configure depends on which scenario

applies to your data protection needs. For each scenario, there are steps that are required in both the IBM Storage Protect Plus and IBM Storage Protect server environments to complete the setup.

## Tasks for configuring IBM Storage Protect

You must configure the IBM Storage Protect server to communicate with the IBM Storage Protect Plus server, and to enable process requests for backup and restore operations. The Amazon Simple Storage Service (S3) protocol enables communication between the two servers.

User scenario	Purpose	Steps
Copying to standard object storage when you are running daily or less frequent copies to standard object storage.	Copy data to standard object storage. In the first copy operation, a full backup copy is created. Subsequent copies are incremental. Copying data to standard object storage is useful if you want relatively fast backup and recovery times and do not require the longer-term protection, cost, and security benefits that are provided by tape storage.	To copy data to standard object storage to the IBM Storage Protect server, you must create a cloud-container or directory-container storage pool, and set up the object agent component of IBM Storage Protect. Adding the object agent is a mandatory step. In addition to setting up the required storage pool, follow steps 2-4 listed, <a href="#">here</a> .
Copying to tape when you are creating a weekly or less frequent full-copy of your data to tape storage.  <b>Important:</b> Archiving data to tape cannot be run more frequently than once a week. Recovery time objectives (RTO) should be considered when recovering data from archive copies in your disaster recovery action plan. Therefore, for disaster recovery, recovering from archive data should only be used as a last resort.	When you copy data to tape, a full copy of the data is created at the time of the copy process. Copying data to tape provides extra security benefits. By storing tape volumes at a secure, offsite location that is not connected to the internet, you can help to protect your data from online threats such as malware and hackers. However, because copying to these storage types requires a full data copy, the time that is required to copy data increases. In addition, the recovery time can be unpredictable and the data might take longer to process before it is usable. Some of the data may be duplicated on the tape storage pool and cache storage pool.	To copy data to tape, you must create a tape storage pool first and then you must create a disk storage pool which is where the cold-data-cache storage pool will reside on the IBM Storage Protect server. Adding the object agent is a mandatory step. Follow steps 1-4 listed, <a href="#">here</a> .
Mixture of both standard object storage and long-term copying to tape	Secure your data in incremental backups on the IBM Storage Protect server, as well as retaining data on tape for longer term security.	This is a combination of the previous cases: data is stored to tape and data is stored on standard object storage at the IBM Storage Protect server. As well as setting up the required data storage pools for both scenarios, the creation of an object agent is mandatory.

The four steps required to set up and configure the data transfer communication between IBM Storage Protect Plus and the IBM Storage Protect server are as follows:

1. If you are setting up storage pools for copying data to tape follow Step1. Create storage pools on the IBM Storage Protect server by using the IBM Storage Protect Operations Center. For instructions, see [“Step 1: Creating a tape storage pool and a cold-data-cache storage pool for copying data to tape”](#) on page 66. This step is required only if you are setting IBM Storage Protect for archiving with copies run once a week or less frequently.
2. Create a policy domain that points to the storage pool or pools. The policy domain defines the rules that control the backup services for IBM Storage Protect Plus. For instructions, see [“Step 2: Configuring an object policy domain”](#) on page 68.
3. If you are copying data to a standard storage pool or to tape, you must add standard object storage on the IBM Storage Protect server. For instructions, see [“Step 3: Setting up standard object storage”](#) on page 70.
4. Add an object agent on the IBM Storage Protect server. The object agent provides a gateway between the IBM Storage Protect Plus server and the IBM Storage Protect server. For instructions, see [“Step 4: Adding an object agent for copying data ”](#) on page 72.
5. To complete the setup, you must add an object client on the IBM Storage Protect server. The object client identifies the IBM Storage Protect Plus server and enables it to store objects at the IBM Storage Protect server. The same credentials as those that you used for IBM Storage Protect Plus are used for the object client, which is the object client that is associated with the policy domain as set up in Step 2. For instructions to set up an object client, see [“Step 5: Adding and configuring an object client for copying data”](#) on page 74.

**Tip:** Alternatively, enter the **DEFINE STGPOOL** command to create a storage pool as described in the following topics:

## What to do next

1. After you complete the tasks required for IBM Storage Protect storage, you must add the IBM Storage Protect server to IBM Storage Protect Plus. For information about how to do this, follow the instructions in [“Registering a repository server as a backup storage provider”](#) on page 76.
2. When that is done, you can create an SLA policy that defines the IBM Storage Protect server as the backup storage target. For more information to help you choose which type of policy you need, see [Managing SLA policies for backup operations](#).

---

## Chapter 2. Installing and managing vSnap servers

The vSnap server is the required primary backup storage location for most, but not all, workload types in IBM Storage Protect Plus.

For information about available primary backup storage by workload type, see [Chapter 6, “Managing backup storage,”](#) on page 57.

In larger enterprise environments that use the vSnap server as the primary backup storage location, additional vSnap servers might be required. For guidance about sizing, building, and placing vSnap servers and other components in your IBM Storage Protect Plus environment, see the [IBM Storage Protect Plus Blueprints](#).

Additional vSnap servers can be installed on either virtual or physical appliances any time after the IBM Storage Protect Plus virtual appliance is deployed. After deployment, some registration and configuration steps are required for these stand-alone vSnap servers.

The process for setting up a stand-alone vSnap server is as follows:

1. Install the vSnap server.
2. Add the vSnap server as Disk Storage in IBM Storage Protect Plus.
3. Initialize the system and create a storage pool.

---

### Installing a vSnap server

If you are using a vSnap server as your primary backup storage location, you must have at least one vSnap server installed as part of your IBM Storage Protect Plus environment. The [IBM Storage Protect Plus Blueprints](#) will help you determine how many vSnap servers are required.

#### Before you begin

Complete the following steps:

1. Review the vSnap system requirements. For more information, see [Component requirements](#).
2. Download the installation package. Different installation files are provided for installation on physical or virtual machines. Ensure that you download the correct files for your environment. For more information about downloading files, see [technote 7184652](#).

**Note:** Both the IBM Storage Protect Plus virtual appliance and the vSnap server are closed systems and anti-virus (AV) installation is not supported on virtual or physical deployments.

**Important:** IBM Storage Protect Plus components, including vSnap, should not be installed on the same machine, physical or virtual, as IBM Storage Protect Server.

### Installing a physical vSnap server

A Linux operating system that supports physical vSnap installations is required to install a vSnap server on a physical machine.

#### Procedure

1. Install a Linux operating system that supports physical vSnap installations.

See [Component requirements](#) for supported operating systems.

The minimum installation configuration is sufficient, but you can also install additional packages including a graphical user interface (GUI). The root partition must have at least 8 GB of free space after installation.

2. Edit the `/etc/selinux/config` file to change the SELinux mode to Permissive:

```
SELINUX=permissive
```

3. Issue the `setenforce 0` to apply the setting immediately without requiring a restart:

```
$ setenforce 0
```

4. Download the vSnap server installation file `<part_number>.run` from Passport Advantage Online. For information about downloading files, see [technote 7184652](#).
5. Make the file executable and then run the executable.

```
$ chmod +x <part_number>.run
```

6. Run the executable. The vSnap packages are installed, plus all of required components.

```
$ ./<part_number>.run
```

Alternatively, non-interactive installations or updates of vSnap may be initiated using the `noprompt` option. When this option is used, the vSnap installer will skip prompting for responses and assume an answer of "yes" to the following prompts:

- License agreement
- Kernel installation or update
- Reboot at the end of the installation or update if necessary

To use the `noprompt` option, issue the following command. Observe the deliberate space both before and after the double dashes:

```
$ sudo ./<part_number>.run -- noprompt
```

## What to do next

After you install the vSnap server, complete the following action:

Action	How to
Add the vSnap server to IBM Storage Protect Plus and configure the vSnap environment.	See <a href="#">Chapter 4, "Managing vSnap servers,"</a> on page 35.

## Installing a virtual vSnap server in a VMware environment

To install a virtual vSnap server in a VMware environment, deploy an Open Virtualization Format (OVF) template. This creates a machine that contains the vSnap server.

### Before you begin

For easier network administration, use a static IP address for the virtual machine. Assign the address by using the NetworkManager Text User Interface (nmtui) tool.

### Procedure

1. Download the vSnap server template file `<part_number>.ova` from Passport Advantage Online. For information about downloading files, see [technote 7184652](#).
2. Deploy the vSnap server. Using the vSphere Client (HTML5) or the vSphere Web Client (FLEX), click the **Actions** menu and then click **Deploy OVF Template**.
3. Specify the location of the `<part_number>.ova` file and select it. Click **Next**.
4. Provide a meaningful name for the template, which becomes the name of your virtual machine. Identify an appropriate location to deploy the virtual machine. Click **Next**.
5. Select an appropriate destination to compute resource. Click **Next**.
6. Review the template details. Click **Next**.

7. Read and accept the End User License Agreement. Check **I accept all license agreements** for vSphere Client or click **Accept** for vSphere Web Client. Click **Next**.
8. Select the storage to which the virtual appliance is to be installed. The datastore of this storage must be configured with the destination host. The virtual appliance configuration file and the virtual disk files will be stored in it. Ensure the storage is large enough to accommodate the virtual appliance including the virtual disk files associated with it. Select a disk format of the virtual disks. Thick provisioning allows for better performance of the virtual appliance. Thin provisioning uses less disk space at the expense of performance. Click **Next**.
9. Select networks for the deployed template to use. Several available networks on the ESX server may be available by clicking Destination Networks. Select a destination network that allows you to define the appropriate IP address allocation for the virtual machine deployment. Click **Next**.
10. Enter network properties for the virtual machine default gateway, DNS, search domain, IP address, network prefix, and machine host name. If you are using a Dynamic Host Configuration Protocol (DHCP) configuration, leave all fields blank.

**Restriction:** A default gateway must be properly configured before deployment of the OVF template. Multiple DNS strings are supported, and must be separated by commas without the use of spaces. The network prefix should be specified by a network administrator. The network prefix must be entered using CIDR notation; valid values are 1 - 24.

11. Click **Next**.
12. Review your template selections. Click **Finish** to exit the wizard and to start deployment of the OVF template. Deployment might take significant time.
13. After the OVF template is deployed, power on your newly created virtual machine. You can power on the VM from the vSphere Client.

**Important:** It is important to keep the VM powered on.

14. Record the IP address of the newly created VM.

The IP address is required to access and register the vSnap server. Find the IP address in vSphere Client by clicking the VM and reviewing the **Summary** tab.

**Note:** By default, the deployed virtual machine has an older virtual hardware version to maintain compatibility with a range of older VMware vSphere versions. You can continue to run the VM as-is, or you can update the virtual hardware as needed to bring it up to date with the latest version of VMware vSphere. For more information about upgrading the virtual hardware version of a VM, refer to the VMware ESXi documentation.

## What to do next

After you install the vSnap server, complete the following actions:

- Add the vSnap server to IBM Storage Protect Plus and configure the vSnap environment. For more information, see Chapter 4, “Managing vSnap servers,” on page 35.
- For easier network administration, assign a static IP address for the virtual machine. Use the NetworkManager Text User Interface (nmtui) tool to assign the IP address. For instructions, see [Assigning a static IP address](#).

For instructions, see [Assigning a static IP address](#). Work with your network administrator when configuring network properties.

- All vSnap servers running in VMware environment will need to make sure that Enhanced vMotion Compatibility (EVC) is enabled with a CPU mode that supports Advanced Vector Extensions (AVX).
  - See, VMware article that describes how to enable EVC: [Enable EVC on an Existing Cluster](#)
  - See, VMware article that contains a list of EVC settings supported by each vSphere version: [VMware EVC and CPU Compatibility FAQ](#)
  - See, VMware compatibility guide for EVC: [VMware Compatibility Guide](#)

## Installing a virtual vSnap server in a Hyper-V environment

To install a vSnap server in a Hyper-V environment, import a Hyper-V template. This creates a virtual appliance containing the vSnap server on a Hyper-V virtual machine.

### Before you begin

All Hyper-V servers, including cluster nodes, must have the Microsoft iSCSI initiator service running in their Services list. Set the service to Automatic so that it is available when the machine is restarted.

### Procedure

1. Download the vSnap installation file *<part\_number>.exe* from Passport Advantage Online. For information about downloading files, see [technote 7184652](#).
2. Copy the installation file to your Hyper-V server.
3. Start the installer and complete the installation steps.
4. Open Hyper-V Manager and select the required server.  
For Hyper-V system requirements, see [System requirements for Hyper-V on Windows Server](#).
5. From the **Actions** menu in Hyper-V Manager, click **Import Virtual Machine**, and then click **Next**. The **Locate Folder** dialog opens.
6. Browse to the location of the Virtual Machines folder within the unzipped vSnap folder. Click **Next**. The **Select Virtual Machine** dialog opens.
7. Select vSnap, and then click **Next**. The **Choose Import Type** dialog opens.
8. Choose the following import type: **Register the virtual machine in place**. Click **Next**.
9. If the Connect Network dialog opens, specify the virtual switch to use, and then click **Next**. The Completing Import dialog opens.
10. Review the description, and then click **Finish** to complete the import process and close the **Import Virtual Machine** wizard. The virtual machine is imported.
11. Right-click the newly deployed VM, and then click **Settings**.
12. Under the section named IDE Controller 0, select **Hard Drive**.
13. Click **Edit**, and then click **Next**.
14. In the **Choose Action** screen, choose **Convert** then click **Next**.
15. For the Disk Format, select **VHDX**.
16. For the Disk Type, select **Fixed Size**.
17. For the Configure Disk option, give the disk a new name and optionally, a new location.
18. Review the description, and then click **Finish** to complete the conversion.
19. Click **Browse**, and then locate and select the newly created VHDX.
20. Repeat steps 12 through 18 for each disk under the SCSI Controller section.
21. Power on the VM from **Hyper-V Manager**. If prompted, select the option where the kernel starts in rescue mode.
22. Use Hyper-V Manager to identify the IP address of the new virtual machine if automatically assigned. To assign a static IP to the virtual machine using NetworkManager Text User Interface, see the following section.
23. If the address of the new VM is automatically assigned, use Hyper-V Manager to identify the IP address. To assign a static IP to a VM, use the NetworkManager Text User Interface (nmtui) tool. For instructions, see [Assigning a static IP address](#).

### What to do next

After you install the vSnap server, complete the following action:

Action	How to
Add the vSnap server to IBM Storage Protect Plus and configure the vSnap environment.	See <a href="#">Chapter 4, “Managing vSnap servers,”</a> on page 35.

## Start IBM Storage Protect Plus

Start IBM Storage Protect Plus to begin using the application and its features.

### Procedure

To start IBM Storage Protect Plus, complete the following steps:

1. In a supported web browser, enter the following URL:

```
https://hostname
```

The *hostname* value depends on whether IBM Storage Protect Plus installed as a set of OpenShift® containers or as a virtual appliance.

#### Hostname for a container installation

The hostname must be in the following format:

```
instancename-spp.routerCanonicalHostname
```

where *instancename* is the name of the IBM Storage Protect Plus instance and *routerCanonicalHostname* is the external host name for the OpenShift router.

#### Hostname for a virtual appliance installation

The hostname is the IP address of the virtual machine where the application is deployed.

2. Enter your username and password to log on to IBM Storage Protect Plus.

If this is your first time logging on, the default username is `admin` and the password is `password`. You are prompted to reset the default username and password. You cannot reset the username to `admin`, `root`, or `test`.

This user account is the superuser account and is assigned the `SUPERUSER` role. This role is assigned to only one IBM Storage Protect Plus user. The `SUPERUSER` role provides the user with access to all IBM Storage Protect Plus functions.

3. Click **Sign In**.

4. If IBM Storage Protect Plus is installed on a virtual appliance and you are logging in for the first time, you are prompted to change the `serveradmin` password. The initial password is `sppDP758-SysXyz`. The `serveradmin` user is used to access the administrative console and the IBM Storage Protect Plus virtual appliance. The password for `serveradmin` must be changed before accessing the administrative console and IBM Storage Protect Plus virtual appliance.

The following rules are enforced when creating a new password:

- The minimum acceptable password length is 15 characters.
- There must be eight characters in the new password that are not present in the previous password.
- The new password must contain at least one character from each of the classes (numbers, uppercase letters, lowercase letters, and other).
- The maximum number of identical consecutive characters that are allowed in the new password is three characters.
- The maximum number of identical consecutive class of characters that are allowed in the new password is four characters.

## Updating IBM Storage Protect Plus components

---

You can update the IBM Storage Protect Plus components to get the latest features and enhancements. Software patches and updates are installed by using the IBM Storage Protect Plus user interface or command-line interface for these components.

**Important:** Ensure that all vSnap servers are updated before you begin the IBM Storage Protect Plus server update to a newer version.

Before you update IBM Storage Protect Plus components, review the hardware and software requirements for the components to confirm any changes that might have occurred from previous versions.

Review the following restrictions and tips:

- The update process through the IBM Storage Protect Plus user interface updates IBM Storage Protect Plus features and the underlying infrastructure components including the operating system and file system. Do not use another method to update these components.
- Do not update any of the underlying components for IBM Storage Protect Plus unless the component is provided in an IBM Storage Protect Plus update package. Infrastructure updates are managed by IBM update facilities. The IBM Storage Protect Plus user interface is the primary means for updating IBM Storage Protect Plus features and underlying infrastructure components including the operating system and file system.

Before you update components, it is important that you back up your IBM Storage Protect Plus environment as described in [Backing up the IBM Storage Protect Plus application](#).

## Updating vSnap servers

vSnap servers, both virtually deployed or physically installed, must occasionally be updated.

### Before you begin

You can update the IBM Storage Protect Plus and vSnap servers version 10.1.17 from version 10.1.16.4 only. If you are using an older version, you must first update to 10.1.16.4.

You can use the vSnap server physical appliances that are running on RHEL 8.10 by just by updating the RHEL 8.10 kernel and the associated vSnap packages. The vSnap server version is the last version that supports RHEL 8.10 for physical appliance. For any update from vSnap server 10.1.17 and later, you need to update to the RHEL 9.5 operating system.

Review the system requirements before you update the vSnap servers.

To check the current version and operating system for your vSnap servers, complete the following steps:

1. Log on to the vSnap server as the `serveradmin` user.
2. To check the vSnap server version and operating system, use the vSnap command-line interface to issue the following command:

```
$ vsnap system info
```

Ensure that no jobs that use the vSnap server are running during the update procedure. Pause the schedule for any jobs that do not have a status of IDLE or COMPLETED.

### Updating a virtual vSnap server to RHEL 9.5

Follow the procedure to update the vSnap server that is deployed as a virtual appliance in VMware or Hyper-V.

### Before you begin

Before you begin the update process, complete the following steps:

- You can update the vSnap server to version 10.1.17 from version 10.1.16.4 only. If you are using an older version, you must first update the v Snap server to version 10.1.16.4.
- Ensure that you have completed a successful catalog backup of IBM Storage Protect Plus server if the vSnap is the target server for catalog backups. For complete instructions, see [Backing up the IBM Storage Protect Plus catalog](#).
- Ensure that no jobs are running before starting the update procedure. Pause the schedule for any jobs that have a status of IDLE or COMPLETED. For instructions, see [Pausing and resuming jobs](#).
- Download the following scripts that you need during the update process:
  - [vsnap\\_config\\_backup.sh](#)
  - [vsnap\\_config\\_restore.sh](#)
- Download the vSnap update file. The image name that contains *vsnap-dist-el9-<version>* is for RHEL 9.5. The correct image file must be used for the update. For information about downloading files, see [technote 7184652](#).
- If update fails, see [Troubleshooting update issues](#).

**Warning:** Follow the procedure carefully. If not followed, the procedure can result in the loss of data.

## Procedure

To update the virtual vSnap server on RHEL 9.5, complete the following steps:

1. Collect the vSnap server hardware and storage pool information.
  - a) For virtual vSnap servers running in VMware or Hyper-V, note the following properties of the virtual machine by using the VMware vSphere UI or Hyper-V Management Console:
    - CPU configuration
    - Memory configuration
    - Network adapter configuration
    - Hard disk configuration

Alternatively, you can use VMware PowerCLI to collect the required information. For example:

```
PS /Users/spike> get-vm -Name "vSnap-VM" | fl
PS /Users/spike> get-vm -Name "vSnap-VM" | get-harddisk | fl
PS /Users/spike> get-vm -Name "vSnap-VM" | Select-Object -Property
Name,@{Name='Cluster';Expression={$_.VMHost.Parent}}
PS /Users/spike> get-vm -name "vSnap-VM" | Get-NetworkAdapter
PS /Users/spike> (get-VM "vSnap-VM").Guest.Nics | fl
```

- b) Use SSH to login to the vSnap server as the serveradmin user.
- c) Find the server network hostname and fully qualified names by using the following commands:

```
# Short hostname
hostname -s

# Fully qualified domain name
hostname --fqdn
```

- d) To check the vSnap server network configuration, run the following command:

```
nmcli device show
```

Alternatively, examine the content of the following configuration files:

```
/etc/sysconfig/network-scripts/ifcfg-*
```

- e) To check the vSnap server version and operating system, run the following command:

```
vsnap system info
```

- f) To check the vSnap pool information and determine the list of disks that are part of storage pool, run the following commands:

- i) To collect the general pool information, run the following command:

```
vsnap pool show
```

- ii) To identify the disks that are part of the storage pool, run the following command:

```
vsnap disk show
```

**Note:** The disks in the pool are labeled as vsnap\_pool1 or crypto\_LUKS (for encrypted pools). Compare the disk information collected by both commands to ensure that the information is correct. The storage pool comprises all data disks, optional log, and cache disks.

- iii) To collect the information about disk partition and identify the disks are in use, such as LVM or multipathing, run the following command:

```
vsnap disk lsblk
```

- iv) To determine the number of volumes and snapshots in the pool, run the following commands:

```
vsnap volume show | wc -l  
vsnap snapshot show | wc -l
```

**Note:** You can use this information to verify the pool content after the update process is complete.

- g) If multipath disks are attached to the vSnap server, which enables the multipathd service, make a manual backup copy of the configuration file by using the following command:

```
/etc/multipath.conf
```

**Note:** Transfer the backup copy to another system by using Secure Copy Protocol. You can rename the backup file to make it easier to identify. The renaming is useful when you migrate files from multiple vSnap servers.

## 2. Pause all jobs in IBM Storage Protect Plus server.

- Log in to the IBM Storage Protect Plus server.
- Verify that jobs are not be actively running or scheduled to run during the update procedure. Pause the schedule for all jobs to ensure that jobs do not attempt to run while the update is in progress. Click **Jobs and Operations** > **Schedule**, and then click **Pause All Jobs**.
- Verify that no jobs are running by clicking **Jobs and Operations** > **Running Jobs**. If one or more jobs are running, wait for them to complete.

## 3. If the vSnap server is registered as a VADP proxy, complete the following steps to unregister the VADP proxy on the vSnap server. The step is optional. If the vSnap server is not registered as a VADP proxy, then proceed step “4” on page 16.

- In the navigation panel, click **System Configuration** > **VADP Proxy** and select the proxy that is associated with the vSnap server that you want to migrate.
- Note of the site under which the proxy is registered.
- Click **Proxy Options** and, then click the VADP proxy that you want to uninstall.
- Click **Unregister** to remove the proxy from the IBM Storage Protect Plus server.

**Note:** Ensure that you document all proxy settings before you unregister VADP proxy from vSnap server for the later use.

## 4. Complete the following steps to stop vSnap services, export the storage pool, and back up the vSnap configuration.

- Log in to the vSnap server as the serveradmin user by using SSH.
- Disable the vSnap services by using the following command to ensure that the services do not start automatically on boot.

```
sudo systemctl disable vsnap
```

- c) Reboot the vSnap server by using the following command. The reboot is required to ensure that the storage pool is unmounted and the system is in the clean state before you back up the configuration.

```
sudo reboot -n
```

- d) Wait for the reboot to complete. When the system is online, login as the `serveradmin` user and run the following command to view the status of all services. Verify that the status of all services is listed as `inactive`.

```
vsnap_status
```

- e) Upload the script `vsnap_config_backup.sh` to the vSnap server by using Secure Copy Protocol to the `/home/serveradmin` directory or another suitable directory, such as `/tmp`. Go to the directory and make the script executable file by using the following command:

```
chmod +x vsnap_config_backup.sh
```

- f) Create a backup of the vSnap configuration.

The `-f` argument to the script specifies the full path to the output file where the backup is created. In the following example, the output is created in the `/home/serveradmin` directory. You can also specify any other suitable directory, such as `/tmp`. The output of the script is piped to the **tee** command to copy it to a log file for troubleshooting.

```
sudo ./vsnap_config_backup.sh -f /home/serveradmin/vsnap_config_backup.tar.gz | tee -a /home/serveradmin/backup.log
```

Verify that the output of the script ends with the following lines, which indicate that the backup was successful:

```
*** CONFIG BACKUP SUCCESSFUL ***
Generated output file: /home/serveradmin/vsnap_config_backup.tar.gz
```

- g) Transfer the backup copy to another system by using Secure Copy Protocol. You can rename the backup file to make it easier to identify. The renaming is useful when you update multiple vSnap servers.
- h) Shut down the vSnap server by using the following command:

```
sudo shutdown
```

**Note:** If the vSnap server is running as a virtual machine, ensure that the virtual machine is powered off.

## 5. Detach the storage pool disks from the vSnap server if you are using encryption.

In case if the pool disks are encrypted due to encryption used during vSnap pool initialization, then you need to detach disks, else the leapp update to RHEL 9.5 can fail due to this inhibitor. The encrypted pool disks are displayed as `crypto_LUKS` disk. Identify the storage disks that comprise the storage pool and detach them from the vSnap server based on the disk information that is gathered in step “1.f” on page 16. You can reattach the disks to the vSnap server after the update is complete.

**Note:** The steps to detach disks from the vSnap server can vary depending on the type of the vSnap server, the backup storage, and the method used to attach disks. The step lists most common scenarios. For more details, consult your storage administrator.

- a) Virtual disks or RDM disks that are attached to a virtual vSnap server that is running in VMware.
- i) Log in to the VMware vSphere UI and go to the vSnap virtual machine.
  - ii) Right-click the vSnap virtual machine and select **Snapshots > Manage Snapshots**. Ensure that there are no snapshots present on the virtual machine. Delete the snapshots if present, and wait for the disk consolidation to complete.

- iii) Right-click the vSnap virtual machine and select **Edit Settings**. Before you remove the hard disk from virtual machine, note the details datastore name, file path for virtual disks, and device identifier for RDM disks. The details are needed when you reattach the same disks to the new vSnap virtual machine. Select the row that contains hard disk details, and click the delete icon to remove it from the virtual machine.

**Warning:** Do not select the **Delete files from datastore** checkbox when you remove a hard disk from the virtual machine. If selected, the option permanently deletes all data, which cannot be recovered.

- b) Virtual disks attached to a virtual vSnap server running in Hyper-V.
    - i) Log in to the Hyper-V Manager console and go to the vSnap virtual machine.
    - ii) Select the vSnap virtual machine and go to the **Snapshots** window. Ensure that there are no snapshots present on the virtual machine. Delete the snapshots if present, and wait for the disk consolidation to complete.
    - iii) Right-click the vSnap virtual machine and select **Settings**. Before you remove the hard disk from virtual machine, note the details of location and full path of the VHD file. The details are needed when you reattach the same disks to the new vSnap virtual machine. Click **Remove** to remove the disk from the virtual machine.
  - c) SAN disks attached to a vSnap server by using Fibre Channel or iSCSI.

On the SAN array, detach the LUNs from the vSnap server host. Refer to the documentation for your specific SAN array for detailed instructions, or consult to your storage administrator.
  - d) Local disks that are directly attached to a physical vSnap server.

If possible, physically detach the disks from the system or disconnect them in the local RAID controller configuration.

**Note:** When you perform in-place update to RHEL 9.5 on the same physical server, the disks must be detached from the vSnap server. When you update the operating system, ensure that the contents of the pool disks are preserved. The pool disks must not be formatted or overwritten.
6. Update the virtual vSnap server to 10.1.17 and operating system to RHEL 9.5.
- a) Download the RHEL 9.5 base operating system ISO image from the official RedHat portal.
  - b) Copy the RHEL 8 run and RHEL 9 run files to /home/serveradmin.
  - c) Copy RHEL9.5 ISO to the /tmp and rename it to vsnap\_rhel9.iso.
  - d) Execute the run file for RHEL 8.10 *vsnap-dist-el8-<version>.run* on the vSnap server to update the RHEL 8.10 kernel and the ZFS version. The file also installs the leapp update and other miscellaneous packages.
  - e) Select to reboot the vSnap server at the prompt to set the new kernel as the current kernel of the vSnap server.
  - f) Verify that vSnap services are running properly and online by running the following commands:
    - Run the **vsnap\_status** command and verify that all services are running. This can take some time after a reboot.
    - Run the **vsnap pool show** command and verify that a pool is visible with status as **ONLINE**.
- Note:** The step is not applicable for users who have completed [Step 5. Detach the storage pool disks from the vSnap server if you are using encryption.](#)
- g) Copy the os\_upgrade script from /opt/vsnap/bin/ to /home/serveradmin.
  - h) Update the operating system by executing the os\_upgrade script. The script updates the RHEL 8.10 packages to RHEL 9.5. Reboot the vSnap server manually by using the **sudo reboot -n** command. The server takes 15 to 16 minutes time to restart.
  - i) Execute the run file for RHEL 9.5 (*vsnap-dist-el9-<version>.run*) on the vSnap server to update the RHEL 9.5 kernel and also update the ZFS version along with vSnap packages.
7. Reattach the storage pool disks to the updated vSnap server in case if you detached them in step [“5” on page 17.](#)

Reattach the pool disks to the vSnap server including all data disks, optional log, and cache disks. The steps to attach disks to the vSnap server can vary depending on the type of the vSnap server, the backup storage, and the method in which they are attached. The step lists the most common scenarios. For more details, consult your storage administrator.

a) Virtual disks or RDM disks that are attached to a virtual vSnap server that is running in VMware.

- i) Log in to the VMware vSphere UI and go to the vSnap virtual machine.
- ii) Right-click the vSnap virtual machine and select **Edit Settings**.
- iii) For each virtual disk you want to add, select **Add New Device > Existing Hard Disk**. For each RDM disk, select **Add New Device > RDM Disk**. Specify the path to the existing virtual disk or RDM device that you noted in step 5.a.

**Warning:** For virtual disks, setting the disk type to Independent is advised. Refer to the IBM Storage Protect Plus blueprint for details and best practices about virtual disk configuration.

b) Virtual disks attached to a virtual vSnap server running in Hyper-V.

- i) Log in to the Hyper-V Manager console and go to the vSnap virtual machine.
- ii) Right-click the vSnap virtual machine and select **Settings**.
- iii) For each virtual disk to be added, select **SCSI Controller > Hard Drive > Add**, then select **Browse** and locate the existing VHD file that you noted in step 5.b.

c) SAN disks attached to a vSnap server by using Fibre Channel or iSCSI.

On the SAN array, configure a host for the new vSnap server and attach the LUNs to it. Refer to the documentation for your specific SAN array for detailed instructions, or consult to your storage administrator.

Configuring the host can require extra Fibre Channel or iSCSI configuration on the vSnap server. If it is necessary to power on the new vSnap server to configure the storage, ensure that the vSnap services are stopped by using the **sudo systemctl stop vsnap** command. After the storage is configured, shut down the server.

d) Local disks that are directly attached to a physical vSnap server.

Reattach the disks as described in the previous step.

**Note:** Attach disks to the system physically or connect them in the local RAID controller configuration.

8. Start services and run health checks on the updated vSnap server.

- a. Log in to the vSnap server as the `serveradmin` user by using SSH.
- b. To check the status of vSnap services, run the command:

```
vsnap_status
```

- If all storage pool disks are intact and discovered correctly, the pool is mounted when the `vsnap-data` service starts. Depending on the configuration of the storage pool, it can take an extra 15 minutes for the pool deduplication table (DDT) to be loaded in memory, the `vsnap-data` service remains in `activating` status during that time.
  - Ensure that all services are in the `active` state before you proceed further.
  - If one or more services fail to start, run the `sudo vsnap_journal` command to examine startup messages for troubleshooting.
- c. Run the following commands to view information about the system and the storage pool. Verify that the system ID, pool size, and status is same as collected in step “1.f” on page 16. Ensure that the numbers of disks are accurate. It is normal for the names of the pool disks to differ before and after updated.

```
vsnap_status  
vsnap system info
```

```
vsnap pool show
vsnap disk show
```

d. To check the volumes and snapshots in the pool, run the following commands.

```
vsnap volume show
vsnap snapshot show
```

Verify that the number of volumes and snapshots information is same as collected in step “1.f” on page 16.

```
vsnap volume show | wc -l
vsnap snapshot show | wc -l
```

- e. Verify that version is 10.1.17. In IBM Storage Protect Plus UI, if the vSnap is shown as offline or shows the older version, click **Refresh** in the menu for that specific vSnap server. It can take a few minutes to refresh the information.
9. Reinstall the VADP proxy if you have removed it in step “3” on page 16.

The step is optional. If the old vSnap server is used as a VADP proxy server and if you previously removed it in step “3” on page 16, update the proxy to RHEL 9.5 package and re-register it IBM Storage Protect Plus. If not removed, the VADP proxy is auto-updated to RHEL 9.5 package. Refer the [Updating VADP Proxies](#) for more information.

- In IBM Storage Protect Plus, go to **System Configuration > VADP Proxy**.
- Add the vSnap server as a VADP proxy. When prompted to select a site, specify the same site that you noted in step 3.b. When prompted to enter credentials, specify the serveradmin user or another user that has password-less **sudo** privileges.
- After you add the VADP proxy, select **Proxy Options**, and modify the values to match the settings that you noted in step 3.c.

## Updating a physical vSnap server to RHEL 9.5

Follow the procedure to update the physical vSnap server on the RHEL 9.5 operating system.

### Before you begin

Before you begin the update process, complete the following steps:

- You can update the vSnap server to version 10.1.17 from version 10.1.16.4 only. If you are using an older version, you must first update the v Snap server to version 10.1.16.4.
- Ensure that you have completed a successful catalog backup of IBM Storage Protect Plus server if the vSnap is the target server for catalog backups. For complete instructions, see [Backing up the IBM Storage Protect Plus catalog](#).
- Ensure that no jobs are running before starting the update procedure. Pause the schedule for any jobs that have a status of IDLE or COMPLETED. For instructions, see [Pausing and resuming jobs](#).
- Download the following scripts that you need during the update process:
  - [vsnap\\_config\\_backup.sh](#)
  - [vsnap\\_config\\_restore.sh](#)
- Download the vSnap update file. The image name that contains *vsnap-dist-el9-<version>* is for REHL 9.5. The correct image file must be used for the update. For information about downloading files, see [technote 7184652](#).
- If update fails, see [Troubleshooting update issues](#).

**Warning:** Follow the procedure carefully. If not followed, the procedure can result in a loss of data.

## Procedure

To update the vSnap server, complete the following steps:

1. Collect the vSnap server hardware and storage pool information.

a) Use SSH to login to the vSnap server as the `serveradmin` user.

b) Note the server network hostname and fully qualified names by using the following commands:

```
# Short hostname
hostname -s

# Fully qualified domain name
hostname --fqdn
```

c) To check the vSnap server network configuration, run the following command:

```
nmcli device show
```

Alternatively, examine the contents of the following configuration files:

```
/etc/sysconfig/network-scripts/ifcfg-*
```

d) To check the vSnap server version and operating system, run the following command:

```
vsnap system info
```

e) To check the vSnap pool information and determine the list of disks that are part of storage pool, run the following commands:

i) To collect the general pool information, run the following command:

```
vsnap pool show
```

ii) To identify the disks that are part of the storage pool, run the following command:

```
vsnap disk show
```

**Note:** The disks in the pool are labeled as `vsnap_pool` or `crypto_LUKS` (for encrypted pools). Compare the disk information collected by both commands to ensure that the information is correct. The storage pool comprises all data disks, optional log, and cache disks.

iii) To collect the information about disk partition and identify which disks are in use, such as LVM or multipathing, run the following command:

```
vsnap disk lsblk
```

iv) To determine the number of volumes and snapshots in the pool, run the following commands:

```
vsnap volume show | wc -l
vsnap snapshot show | wc -l
```

**Note:** You can use this information to verify that pool contents after the upgrade is complete.

f) If multipath disks are attached to the vSnap server, which `multipathd` service is enabled, make a manual backup copy of the configuration file by using the following command:

```
/etc/multipath.conf
```

**Note:** Transfer the backup copy to another system by using Secure Copy Protocol. You can rename the backup file to make it easier to identify. The renaming is useful when you migrate files from multiple vSnap servers.

2. Pause all jobs in IBM Storage Protect Plus server.

a) Log in to the IBM Storage Protect Plus server.

- b) Verify that jobs are not be actively running or scheduled to run during the update procedure. Pause the schedule for all jobs to ensure that jobs do not attempt to run while the update is in progress. Click **Jobs and Operations > Schedule**, and then click **Pause All Jobs**.
  - c) Verify that no jobs are running by clicking **Jobs and Operations > Running Jobs**. If one or more jobs are running, wait for them to complete.
3. If the vSnap server is registered as a VADP proxy, complete the following steps to unregister the VADP proxy on the vSnap server. The step is optional. If the vSnap server is not registered as a VADP proxy, then proceed step “4” on page 22.
  - a) In the navigation panel, click **System Configuration > VADP Proxy** and select the proxy that is associated with the vSnap server that you want to migrate.
  - b) Note of the site under which the proxy is registered.
  - c) Click **Proxy Options** and, then click the VADP proxy that you want to uninstall.
  - d) Click **Unregister** to remove the proxy from the IBM Storage Protect Plus server.

**Note:** Ensure that you document all proxy settings before you unregister VADP proxy from vSnap server for the later use.
4. Complete the following steps to stop vSnap services, export the storage pool, and back up the vSnap configuration.
  - a) Log in to the vSnap server as the `serveradmin` user by using SSH.
  - b) Disable the vSnap services by using the following command to ensure that the services do not start automatically on boot.

```
sudo systemctl disable vsnap
```

- c) Reboot the vSnap server by using the following command. The reboot is required to ensure that the storage pool is unmounted and the system is in the clean state before you back up the configuration.

```
sudo reboot -n
```

- d) Wait for the reboot to complete. When the system is online, login as the `serveradmin` user and run the following command to view the status of all services. Verify that the status of all services is listed as `inactive`.

```
vsnap_status
```

- e) Upload the script `vsnap_config_backup.sh` to the vSnap server by using Secure Copy Protocol to the `/home/serveradmin` directory or another suitable directory, such as `/tmp`. Go to the directory and make the script executable file by using the following command:

```
chmod +x vsnap_config_backup.sh
```

- f) Create a backup of the vSnap configuration.

The `-f` argument to the script specifies the full path to the output file where the backup is created. In the following example, the output is created in the `/home/serveradmin` directory. You can also specify any other suitable directory, such as `/tmp`. The output of the script is piped to the **tee** command to copy it to a log file for troubleshooting.

```
sudo ./vsnap_config_backup.sh -f /home/serveradmin/vsnap_config_backup.tar.gz | tee -a /home/serveradmin/backup.log
```

Verify that the output of the script ends with the following lines, which indicate that the backup was successful:

```
*** CONFIG BACKUP SUCCESSFUL ***
Generated output file: /home/serveradmin/vsnap_config_backup.tar.gz
```

- g) Transfer the backup copy to another system by using Secure Copy Protocol. You can rename the backup file to make it easier to identify. The renaming is useful when you update multiple vSnap servers.
- h) Shut down the vSnap server by using the following command:

```
sudo shutdown
```

**Note:** If the vSnap server is running as a virtual machine, ensure that the virtual machine is powered off.

5. Detach the storage pool disks from the vSnap server if you are using encryption.

In case if the pool disks are encrypted due to encryption used during vSnap pool initialization, then you need to detach disks, else the leapp update to RHEL 9.5 can fail due to this inhibitor. The encrypted pool disks are displayed as `crypto_LUKS` disk. Identify the storage disks that comprise the storage pool and detach them from the vSnap server based on the disk information that is gathered in step “1.f” on page 21. You can reattach the disks to the vSnap server after the update is complete.

**Note:** The steps to detach disks from the vSnap server can vary depending on the type of the vSnap server, the backup storage, and the method used to attach disks. The step lists most common scenarios. For more details, consult your storage administrator.

- a) Virtual disks or RDM disks that are attached to a virtual vSnap server that is running in VMware.
  - i) Log in to the VMware vSphere UI and go to the vSnap virtual machine.
  - ii) Right-click the vSnap virtual machine and select **Snapshots > Manage Snapshots**. Ensure that there are no snapshots present on the virtual machine. Delete the snapshots if present, and wait for the disk consolidation to complete.
  - iii) Right-click the vSnap virtual machine and select **Edit Settings**. Before you remove the hard disk from virtual machine, note the details of datastore name, file path for virtual disks, and device identifier for RDM disks. The details are needed when you reattach the same disks to the new vSnap virtual machine. Select the row that contains hard disk details, and click the delete icon to remove it from the virtual machine.

**Warning:** Do not select the **Delete files from datastore** checkbox when you remove a hard disk from the virtual machine. If selected, the option permanently deletes all data, which cannot be recovered.

- b) Virtual disks attached to a virtual vSnap server running in Hyper-V.
  - i) Log in to the Hyper-V Manager console and go to the vSnap virtual machine.
  - ii) Select the vSnap virtual machine and go to the **Snapshots** window. Ensure that there are no snapshots present on the virtual machine. Delete the snapshots if present, and wait for the disk consolidation to complete.
  - iii) Right-click the vSnap virtual machine and select **Settings**. Before you remove the hard disk from virtual machine, note the details of location and full path of the VHD file. The details are needed when you reattach the same disks to the new vSnap virtual machine. Click **Remove** to remove the disk from the virtual machine.
- c) SAN disks attached to a vSnap server by using Fibre Channel or iSCSI.

On the SAN array, detach the LUNs from the vSnap server host. Refer to the documentation for your specific SAN array for detailed instructions, or consult to your storage administrator.
- d) Local disks that are directly attached to a physical vSnap server.

If possible, physically detach the disks from the system or disconnect them in the local RAID controller configuration.

**Note:** When you perform in-place update to RHEL 9.5 on the same physical server, the disks must be detached from the vSnap server. When you update the operating system, ensure that the contents of the pool disks are preserved. The pool disks must not be formatted or overwritten.

6. Update the physical vSnap server to 10.1.17 and operating system to RHEL 9.5.

- a) Execute the run file for RHEL 8.10 *vsnap-dist-el8-<version>.run* on the vSnap server to update the RHEL 8.10 kernel and the ZFS version. The file also installs the leapp update and other miscellaneous packages.
- b) Select to reboot the vSnap server at the prompt to set the new kernel as the current kernel of the vSnap server.
- c) Verify that vSnap services are running properly and online by executing the following scripts:
  - Run the **vsnap\_status** command and verify that all services are running. This can take some time after a reboot.
  - Run the **vsnap pool show** command and verify that a pool is visible with status as **ONLINE**.
- d) Update the operating system from 8.10 to 9.5 by using the following steps:
  - i) Uninstall the vSnap RPM by using the following command:

```
sudo rpm -e --nodeps nginx nginx-filessystem libtcmu tcmu-runner vsnap
```

The vSnap RHEL8 RPM is not compatible with RHEL9 and gets reinstalled with the RHEL9 version when you update the vSnap server. Uninstalling the vSnap RPM does not affect any configuration preferences or backup data.

- ii) Refer to [Red Hat Official documentation](#) and run the pre-upgrade steps. To access the link you need a Red Hat subscription.

The inhibitors found during the leapp preupgrade can vary depending on the environment.

- iii) Run leapp upgrade command as follows:

```
leapp upgrade --target 9.5 --verbose --debug
```

- iv) Reboot the vSnap server.
- e) Execute the run file for RHEL 9.5 (*vsnap-dist-el9-<version>.run*) on the vSnap server to update the RHEL 9.5 kernel and also update the ZFS version along with vSnap packages.

**Note:** For official Red Hat procedure to update the operating system on a physical server, see [Performing the upgrade from RHEL 8.10 to RHEL 9.4 and 9.5](#). For troubleshooting any failures, see [Troubleshooting common issues while upgrading from RHEL 8 to RHEL 9](#). You need an active Red Hat account and subscription to login to the portal.

7. Reattach the storage pool disks to the updated vSnap server in case if you detached them in step “5” on page 23.

Reattach the pool disks to the vSnap server including all data disks, optional log, and cache disks. The steps to attach disks to the vSnap server can vary depending on the type of the vSnap server, the backup storage, and the method in which they are attached. The step lists the most common scenarios. For more details, consult your storage administrator.

- a) Virtual disks or RDM disks that are attached to a virtual vSnap server that is running in VMware.
  - i) Log in to the VMware vSphere UI and go to the vSnap virtual machine.
  - ii) Right-click the vSnap virtual machine and select **Edit Settings**.
  - iii) For each virtual disk you want to add, select **Add New Device > Existing Hard Disk**. For each RDM disk, select **Add New Device > RDM Disk**. Specify the path to the existing virtual disk or RDM device that you noted in step 5.a.

**Warning:** For virtual disks, setting the disk type to Independent is advised. Refer to the IBM Storage Protect Plus blueprint for details and best practices about virtual disk configuration.

- b) Virtual disks attached to a virtual vSnap server running in Hyper-V.
  - i) Log in to the Hyper-V Manager console and go to the vSnap virtual machine.
  - ii) Right-click the vSnap virtual machine and select **Settings**.

- iii) For each virtual disk to be added, select **SCSI Controller > Hard Drive > Add**, then select **Browse** and locate the existing VHD file that you noted in step 5.b.
  - c) SAN disks attached to a vSnap server by using Fibre Channel or iSCSI.
 

On the SAN array, configure a host for the new vSnap server and attach the LUNs to it. Refer to the documentation for your specific SAN array for detailed instructions, or consult to your storage administrator.

Configuring the host can require extra Fibre Channel or iSCSI configuration on the vSnap server. If it is necessary to power on the new vSnap server to configure the storage, ensure that the vSnap services are stopped by using the **sudo systemctl stop vsnap** command. After the storage is configured, shut down the server.
  - d) Local disks that are directly attached to a physical vSnap server.
 

Reattach the disks as described in the previous step.

**Note:** Attach disks to the system physically or connect them in the local RAID controller configuration.
8. Start services and run health checks on the updated vSnap server.
- a. Log in to the vSnap server as the `serveradmin` user by using SSH.
  - b. To check the status of vSnap services, run the command:
 

```
vsnap_status
```

    - If all storage pool disks are intact and discovered correctly, the pool is mounted when the `vsnap-data` service starts. Depending on the configuration of the storage pool, it can take an extra 15 minutes for the pool deduplication table (DDT) to be loaded in memory, the `vsnap-data` service remains in activating status during that time.
    - Ensure that all services are in the active state before you proceed further.
    - If one or more services fail to start, run the `sudo vsnap_journal` command to examine startup messages for troubleshooting.
  - c. Run the following commands to view information about the system and the storage pool. Verify that the system ID, pool size, and status is same as collected in step “1.f” on page 21. Ensure that the numbers of disks are accurate. It is normal for the names of the pool disks to differ before and after updated.
 

```
vsnap_status
vsnap system info
vsnap pool show
vsnap disk show
```
  - d. To check the volumes and snapshots in the pool, run the following commands.
 

```
vsnap volume show
vsnap snapshot show
```

Verify that the number of volumes and snapshots information is same as collected in step “1.f” on page 21.

```
vsnap volume show | wc -l
vsnap snapshot show | wc -l
```
  - e. Verify that version is 10.1.17. In IBM Storage Protect Plus UI, if the vSnap is shown as offline or shows the older version, click **Refresh** in the menu for that specific vSnap server. It can take a few minutes to refresh the information.
9. Reinstall the VADP proxy if you have removed it in step “3” on page 22.
- The step is optional. If the old vSnap server is used as a VADP proxy server and if you previously removed it in step “3” on page 22, update the proxy to RHEL 9.5 package and re-register it IBM

Storage Protect Plus. If not removed, the VADP proxy is auto-updated to RHEL 9.5 package. Refer the [Updating VADP Proxies](#) for more information.

- a) In IBM Storage Protect Plus, go to **System Configuration > VADP Proxy**.
- b) Add the vSnap server as a VADP proxy. When prompted to select a site, specify the same site that you noted in step 3.b. When prompted to enter credentials, specify the serveradmin user or another user that has password-less **sudo** privileges.
- c) After you add the VADP proxy, select **Proxy Options**, and modify the values to match the settings that you noted in step 3.c.

## Updating a physical vSnap server running on RHEL 8.10

Follow the procedure to update the physical vSnap server on the RHEL 8.10 operating system.

### Before you begin

Before you begin the update process, complete the following steps:

- You can update the vSnap server to version 10.1.17 from version 10.1.16.4 only. If you are using an older version, you must first update the vSnap server to version 10.1.16.4.
- Ensure that you have completed a successful catalog backup of IBM Storage Protect Plus server if the vSnap is the target server for catalog backups. For complete instructions, see [Backing up the IBM Storage Protect Plus catalog](#).
- Ensure that no jobs are running before starting the update procedure. Pause the schedule for any jobs that have a status of IDLE or COMPLETED. For instructions, see [Pausing and resuming jobs](#).
- Download the following scripts that you need during the update process:
  - [vsnap\\_config\\_backup.sh](#)
  - [vsnap\\_config\\_restore.sh](#)
- Download the vSnap update file. The image name that contains *vsnap-dist-el8-**<version>*** is for RHEL 8.10. The correct image file must be used for updates. For information about downloading files, see [technote 7184652](#).
- If update fails, see [Troubleshooting update issues](#).

**Warning:** Follow the procedure carefully. If not followed, the procedure can result in the loss of data.

### Procedure

To update the vSnap server, complete the following steps:

1. Collect the vSnap server hardware and storage pool information.
  - a) The virtual vSnap servers running on VMware or Hyper-V, note the following properties of the virtual machine by using the VMware vSphere UI or Hyper-V Management Console:
    - CPU configuration
    - Memory configuration
    - Network adapter configuration
    - Hard disk configuration

Alternatively, you can use VMware PowerCLI to collect the required information. For example:

```
PS /Users/spike> get-vm -Name "vSnap-VM" | fl
PS /Users/spike> get-vm -Name "vSnap-VM" | get-harddisk | fl
PS /Users/spike> get-vm -Name "vSnap-VM" | Select-Object -Property
Name,@{Name='Cluster';Expression={$_.VMHost.Parent}}
PS /Users/spike> get-vm -name "vSnap-VM" | Get-NetworkAdapter
PS /Users/spike> (get-VM "vSnap-VM").Guest.Nics | fl
```

- b) Use SSH to login to the vSnap server as the serveradmin user.
- c) Note the server network hostname and fully qualified names by using the following commands:

```
# Short hostname
hostname -s

# Fully qualified domain name
hostname --fqdn
```

- d) To check the vSnap server network configuration, run the following command:

```
nmcli device show
```

Alternatively, examine the contents of the following configuration files:

```
/etc/sysconfig/network-scripts/ifcfg-*
```

- e) To check the vSnap server version and operating system, run the following command:

```
vsnap system info
```

- f) To check the vSnap pool information and determine the list of disks that are part of storage pool, run the following commands:

- i) To collect the general pool information, run the following command:

```
vsnap pool show
```

- ii) To identify the disks that are part of the storage pool, run the following command:

```
vsnap disk show
```

**Note:** The disks in the pool are labeled as vsnap\_pool1 or crypto\_LUKS (for encrypted pools). Compare the disk information collected by both commands to ensure that the information is correct. The storage pool comprises all data disks, optional log, and cache disks.

- iii) To collect the information about disk partition and identify which disks are in use, such as LVM or multipathing, run the following command:

```
vsnap disk lsblk
```

- iv) To determine the number of volumes and snapshots in the pool, run the following commands:

```
vsnap volume show | wc -l
vsnap snapshot show | wc -l
```

**Note:** You can use this information to verify that pool contents after the upgrade is complete.

- g) If multipath disks are attached to the vSnap server, which multipathd service is enabled, make a manual backup copy of the configuration file by using the following command:

```
/etc/multipath.conf
```

**Note:** Transfer the backup copy to another system by using Secure Copy Protocol. You can rename the backup file to make it easier to identify. The renaming is useful when you migrate files from multiple vSnap servers.

## 2. Pause all jobs in IBM Storage Protect Plus server.

- a) Log in to the IBM Storage Protect Plus server.
- b) Verify that jobs are not be actively running or scheduled to run during the update procedure. Pause the schedule for all jobs to ensure that jobs do not attempt to run while the update is in progress. Click **Jobs and Operations > Schedule**, and then click **Pause All Jobs**.
- c) Verify that no jobs are running by clicking **Jobs and Operations > Running Jobs**. If one or more jobs are running, wait for them to complete.

3. If the vSnap server is registered as a VADP proxy, complete the following steps to unregister the VADP proxy on the vSnap server.
  - a) In the navigation panel, click **System Configuration > VADP Proxy** and select the proxy that is associated with the vSnap server that you want to migrate.
  - b) Note of the site under which the proxy is registered.
  - c) Click **Proxy Options** and, then click the VADP proxy that you want to uninstall.
  - d) Click **Unregister** to remove the proxy from the IBM Storage Protect Plus server.

**Note:** Ensure that you document all proxy settings before you unregister VADP proxy from vSnap server for the later use.

4. Complete the following steps to stop vSnap services, export the storage pool, and back up the vSnap configuration.
  - a) Log in to the vSnap server as the `serveradmin` user by using SSH.
  - b) Disable the vSnap services by using the following command to ensure that the services do not start automatically on boot.

```
sudo systemctl disable vsnap
```

- c) Reboot the vSnap server by using the following command. The reboot is required to ensure that the storage pool is unmounted and the system is in the clean state before you back up the configuration.

```
sudo reboot -n
```

- d) Wait for the reboot to complete. When the system is online, login as the `serveradmin` user and run the following command to view the status of all services. Verify that the status of all services is listed as `inactive`.

```
vsnap_status
```

- e) Upload the script `vsnap_config_backup.sh` to the vSnap server by using Secure Copy Protocol to the `/home/serveradmin` directory or another suitable directory, such as `/tmp`. Go to the directory and make the script executable file by using the following command:

```
chmod +x vsnap_config_backup.sh
```

- f) Create a backup of the vSnap configuration.

The `-f` argument to the script specifies the full path to the output file where the backup is created. In the following example, the output is created in the `/home/serveradmin` directory. You can also specify any other suitable directory, such as `/tmp`. The output of the script is piped to the **tee** command to copy it to a log file for troubleshooting.

```
sudo ./vsnap_config_backup.sh -f /home/serveradmin/vsnap_config_backup.tar.gz | tee -a /home/serveradmin/backup.log
```

Verify that the output of the script ends with the following lines, which indicate that the backup was successful:

```
*** CONFIG BACKUP SUCCESSFUL ***
Generated output file: /home/serveradmin/vsnap_config_backup.tar.gz
```

- g) Transfer the backup copy to another system by using Secure Copy Protocol. You can rename the backup file to make it easier to identify. The renaming is useful when you update multiple vSnap servers.
  - h) Shut down the vSnap server by using the following command:

```
sudo shutdown
```

**Note:** If the vSnap server is running as a virtual machine, ensure that the virtual machine is powered off.

5. Update the physical vSnap server to 10.1.17.

- a) Execute the run file for RHEL 8.10 (`vsnap-dist-el8-<version>.run`) on the vSnap server to update the RHEL 8.10 kernel and also update the ZFS version. It also installs the leapp update and other miscellaneous packages.
- b) At the prompt select to reboot the vSnap server to let the new kernel be the current kernel of the vSnap server.

6. Start services and run health checks on the updated vSnap server.

- a. Log in to the vSnap server as the `serveradmin` user by using SSH.
- b. To check the status of vSnap services, run the command:

```
vsnap_status
```

- If all storage pool disks are intact and discovered correctly, the pool is mounted when the `vsnap-data` service starts. Depending on the configuration of the storage pool, it can take an extra 15 minutes for the pool deduplication table (DDT) to be loaded in memory, the `vsnap-data` service remains in activating status during that time.
  - Ensure that all services are in the active state before you proceed further.
  - If one or more services fail to start, run the `sudo vsnap_journal` command to examine startup messages for troubleshooting.
- c. Run the following commands to view information about the system and the storage pool. Verify that the system ID, pool size, and status is same as collected in step “1.f” on page 27. Ensure that the numbers of disks are accurate. It is normal for the names of the pool disks to differ before and after updated.

```
vsnap_status  
vsnap_system info  
vsnap pool show  
vsnap disk show
```

- d. To check the volumes and snapshots in the pool, run the following commands.

```
vsnap volume show  
vsnap snapshot show
```

Verify that the number of volumes and snapshots information is same as collected in step “1.f” on page 27.

```
vsnap volume show | wc -l  
vsnap snapshot show | wc -l
```

- e. Verify that version is 10.1.17. In IBM Storage Protect Plus UI, if the vSnap is shown as offline or shows the older version, click **Refresh** in the menu for that specific vSnap server. It can take a few minutes to refresh the information.
7. Move the VADP that previously was running on the vSnap server to the standalone RHEL 9.5 server.

Update the proxy to RHEL 9.5 package and re-register it by using IBM Storage Protect Plus. For more information, see [Updating VADP proxies](#).

## Updating the operating system for a virtual vSnap server

Updating the vSnap server operating system with the ISO file, provides you with the latest available patches and security updates. An ISO file is downloaded and used to update the operating system for virtual vSnap servers.

### Procedure

1. Download the ISO file `<part_number>.iso`.
2. Move the ISO file to the `/temp` directory and rename it to `vsnap_rhel9.iso`.

**Important:** It is critical to rename the downloaded ISO file as described in this step and move it to the `/temp` directory on the vSnap server if you wish to update the operating system to RHEL 9.5 version.

3. Next, follow the instructions found in the [“Updating a virtual vSnap server to RHEL 9.5” on page 14](#) topic.

### Related tasks

[“Updating a virtual vSnap server to RHEL 9.5” on page 14](#)

Follow the procedure to update the vSnap server that is deployed as a virtual appliance in VMware or Hyper-V.

## Updating the operating system for a physical vSnap server

To update the operating system for the vSnap server on a machine that is running Red Hat Enterprise Linux, see the [Performing the upgrade from RHEL 8.10 to RHEL 9.4 and 9.5](#).

### Related tasks

[“Updating a virtual vSnap server to RHEL 9.5” on page 14](#)

Follow the procedure to update the vSnap server that is deployed as a virtual appliance in VMware or Hyper-V.

## Uninstalling a vSnap server

---

You can remove a vSnap server from your IBM Storage Protect Plus environment.

### Before you begin

When permanently deleting the vSnap server, you must clean up the IBM Storage Protect Plus server. Items that must be cleaned up in this case, are as follows:

- Records of backups that are stored on the vSnap server.
- Replication relationships to other vSnap servers.
- Ensure that no jobs use SLA policies that define the vSnap server as a backup location.

To view the SLA policies that are associated with jobs, see the **Backup** page for the hypervisor or application that is scheduled for backup. For example, for VMware backup jobs, click **Manage Protection > Virtualized Systems > VMware**. You must unregister the vSnap server from the IBM Storage Protect Plus server. See [“Unregistering a vSnap server” on page 47](#) for more information.

**Attention:** Uninstalling a vSnap server can result in loss of data.

### Procedure

1. Log on to the vSnap server console with the user ID `serveradmin`. The initial password is `sppDP758-SysXyz`. You are prompted to change this password during the first logon. Certain rules are enforced when creating a new password. For more information, see the password requirement rules in [“Start IBM Storage Protect Plus” on page 13](#).

You can also use a user ID that has vSnap administrator privileges that you create by using the **vsnap user create** command. For more information about using console commands, see [Chapter 7, “vSnap server administration reference,”](#) on page 79.

2. Run the following commands:

```
$ systemctl stop vsnap
$ yum remove vsnap
```

3. Optional: If you do not plan to reinstall the vSnap server after it is uninstalled, remove the data and configuration by running the following commands:

```
$ rm -rf /etc/vsnap
$ rm -rf /etc/nginx
$ rm -rf /etc/uwsgi.d
$ rm -f /etc/uwsgi.ini
```

4. Reboot the system to ensure kernel modules are unloaded and detach the data disks containing vSnap pool data.

**Note:** To uninstall IBM Storage Protect Plus in a Hyper-V environment, delete the IBM Storage Protect Plus appliance from Hyper-V and then delete the installation directory.

## Results

After a vSnap server is uninstalled, the configuration is retained in the `/etc/vsnap` directory. The configuration is reused if the vSnap server is reinstalled. The configuration is removed if you ran the optional commands to remove the configuration data.

---

## Chapter 3. Initializing the vSnap server

The initialization process prepares a new vSnap server for use by loading and configuring software components and initializing the internal configuration. This is a one-time process that must be run for new installations.

### About this task

During the initialization process, vSnap creates a storage pool using any available unused disks attached to the system for a physical installation. If no unused disks are found, the initialization process completes without creating a pool. For a virtual deployment of vSnap, a default 100 GB unused virtual disk is defined and used to create the pool.

For information about how to expand, create, and administer storage pools, see [“Storage management” on page 79](#).

You can use the IBM Storage Protect Plus user interface or the vSnap command line interface (CLI) to initialize vSnap servers.

For servers that are deployed and added to IBM Storage Protect Plus, the IBM Storage Protect Plus user interface provides a simple method to run the initialization operation.

For servers that are deployed in a physical environment, the vSnap command line interface (CLI) offers more options for initializing the server, including the ability to create a storage pool by using advanced redundancy options and a specific list of disks.

---

## Completing a simple initialization

To prepare a vSnap server for use, you must initialize the vSnap server. Use the IBM Storage Protect Plus to initialize a vSnap server that is deployed in a virtual environment.

### Procedure

To initialize a vSnap server by using the IBM Storage Protect Plus user interface, complete the following steps:

1. In the navigation panel, click **System Configuration > Storage > vSnap servers**.
2. Select the vSnap server that you want to initialize, and then click one of the following options:

#### Initialize

Initialize the vSnap server without encryption enabled.

#### Initialize with Encryption

Enable encryption of backup data on the vSnap server.

The initialization process runs in the background and requires no further user interaction. The process might take 5 - 10 minutes to complete.

---

## Completing an advanced initialization

Use the vSnap server console to initialize a vSnap server that is deployed in your environment. Initializing by using the vSnap server console offers more options for initializing the server, including the ability to create a storage pool by using advanced redundancy options and a specific list of disks.

### Procedure

To initialize a vSnap server by using the vSnap server console, complete the following steps:

1. Log in to the vSnap server console with the user ID `serveradmin` by using SSH. When deployed virtually, the initial password is `sppDP758-SysXyz`. You will be prompted to change this password

during the first logon. Certain rules are enforced when creating a new password. For more information, see the password requirement rules in [“Start IBM Storage Protect Plus” on page 13](#). If deployed physically, use the password that you created for the `serveradmin` account during installation.

You can also use a user ID that has vSnap privileges that was previously created using the **vsnap user create** command. For more information about using console commands, see [Chapter 7, “vSnap server administration reference,” on page 79](#).

2. Issue the **\$ vsnap system init** command with the **--skip\_pool** option to initialize the vSnap server without creating a storage pool. The process might take 5 - 10 minutes to complete. Issue the following command:

```
$ vsnap system init --skip_pool
```

## What to do next

After you complete the initialization, complete the following action:

Action	How to
Create a storage pool	See <a href="#">“Storage management” on page 79</a> .

---

## Chapter 4. Managing vSnap servers

Each vSnap server is a stand-alone appliance, which is deployed virtually or installed physically on a system that meets the minimum requirements. Each vSnap server in the environment must be registered in IBM Storage Protect Plus so that the server is recognized.

---

### Registering a vSnap server as a backup storage provider

Any vSnap server that is deployed virtually or installed physically must be registered in IBM Storage Protect Plus so that it can be recognized as a backup storage provider.

#### Before you begin

After you add and register a vSnap server as a backup storage provider, you can choose to configure and administer certain aspects of the vSnap, such as network configuration or storage pool management. For more information, see [Chapter 5, “Configuring backup storage options,” on page 49](#).

If the vSnap server will also be registered as a VADP proxy, the account added in the **Storage Properties** field for the vSnap must have **sudo** privileges for the VADP proxy registration to succeed. For more information, see [Permission types](#).

#### Procedure

To register a vSnap server as a backup storage device, complete the following steps:

1. Log on to the vSnap server console with the user ID `serveradmin`. The initial password is `sppDP758-SysXyz`.  
You are prompted to change this password during the first logon. Certain rules are enforced when creating a new password. For more information, see the password requirement rules in [“Start IBM Storage Protect Plus” on page 13](#).
2. Run the **vsnap user create** command to create a user name and password for the vSnap server.
3. Start the IBM Storage Protect Plus user interface by entering the host name or IP address of the virtual machine where IBM Storage Protect Plus is deployed in a supported browser.
4. In the navigation panel, click **System Configuration > Storage > vSnap servers**.
5. Click **Add vSnap server**.  
The **Add vSnap server** wizard opens.
6. Complete the fields on the **vSnap server details** page, and then click **Next**.

##### Hostname/IP

Enter the resolvable IP address or hostname of the backup storage.

**Note:** The hostname or IP of the vSnap server as entered in the IBM Storage Protect Plus UI must exactly match one of the Subject Alternative Names (SANs) embedded in the vSnap certificate. Refer to [Certificate management](#) for detailed information on how to obtain and customize the vSnap certificate.

If you plan to protect Kubernetes or Red Hat® OpenShift container workloads, you must enter the IP address or fully qualified domain name (FQDN) of the backup storage.

##### Site

Select a site for the backup storage. Available options are **Primary**, **Secondary**, or **Add a new site**. If more than one primary, secondary, or user-defined site is available to IBM Storage Protect Plus, the site with the largest amount of available storage is used first.

##### Use existing user

Enable this option to select the user name for the vSnap server that you created in step [“2” on page 35](#).

If you do not select this option, complete the following fields to add a user:

**Username**

Enter a user name for the vSnap server.

**Password**

Enter a password for the user.

**Certificate**

In the **Certificate** field, select one of the following options to import the certificate:

**Upload**

- a. Download the `/etc/vsnap/ssl/spp-vsnap.crt` file from the vSnap server to the local machine where you are running the browser.
- b. Click **Choose file** and search for the downloaded certificate in your system.
- c. Click **Upload**.

**Copy and paste**

Enter a name for the certificate, such as `spp-vsnap.crt`. Then, paste the contents of the certificate in the **Copy and paste certificate here** field and click **Create**.

**Use existing certificate**

Click **Choose file** to select an existing certificate from the **Select a certificate** list. This option is the default.

**Note:** If the vSnap server is configured to use a custom CA-signed certificate, you need to make sure that the certificate uploaded or pasted is in the same format as installed on the vSnap server. The certificate must contain the full chain that consists of the server certificate, intermediate certificate (if any), and root certificate. For more information, see [Certificate management](#).

Obtain the server key and verify that the key type and key fingerprint match the host. Click **Get server key**

**Get server key**

The SSH server key for the Linux-based host. You must complete this step when adding servers for the first time or if the key on the server changes.

When upgrading to the IBM Storage Protect Plus latest version, systems that are already registered in the previous version are set to trust on first use (TOFU) and the SSH key fingerprint will automatically be added to the registration information in the catalog.

**Key type**

The type of key for the Linux-based host is displayed. The following key types are supported:

- RSA with a minimum key size of 2048 bits
- ECDSA
- DSA

**Key fingerprint**

The MD5 hash of the SSH key fingerprint is displayed. Confirm that the key fingerprint matches the key fingerprint of the host that you are adding.

**Requirement:** If the `serveradmin` account is to be used, ensure that the default password is changed through the vSnap server console prior to registering the vSnap server as a backup storage provider in IBM Storage Protect Plus.

7. Review your selections, and then click **Submit**.

IBM Storage Protect Plus confirms a network connection and adds the backup storage device to the database.

**What to do next**

After you add a backup storage provider, take the following actions:

Action	How to
Initialize the vSnap server.	See <a href="#">Chapter 3, “Initializing the vSnap server,” on page 33.</a>
Expand the vSnap storage pool.	See <a href="#">“Configuring backup storage partners” on page 50.</a>
If necessary, configure and administer certain aspects of vSnap, such as network configuration or storage pool management.	See <a href="#">Chapter 5, “Configuring backup storage options,” on page 49</a>

### Related tasks

[“Start IBM Storage Protect Plus” on page 13](#)

Start IBM Storage Protect Plus to begin using the application and its features.

## Expanding a vSnap storage pool

If IBM Storage Protect Plus reports that a vSnap server is reaching its storage capacity, the vSnap storage pool must be expanded. To expand a vSnap storage pool, you must first add virtual or physical disks on the vSnap server. To add disks, choose to either add virtual disks to the vSnap virtual machine or add physical disks to the vSnap physical server.

### Before you begin

Virtual or physical disks must be added to the vSnap server before you follow this procedure. Expanding existing volumes is not supported. See the vSphere documentation for information about creating new virtual disks.

#### Note:

Once a disk has been added to the storage pool, it cannot be removed. Detaching a disk that is in use by the pool can make the pool unusable.

### Procedure

To expand a vSnap storage pool, complete the following steps:

1. In the navigation panel, click **System Configuration > Storage > vSnap servers**.
2. Select the vSnap server that you want to configure, and then click **Manage**.
3. Open the **Storage disk** tab, and then click **Rescan**.

The rescan discovers newly attached disks on the vSnap server. When the rescan completes, any disks that are unpartitioned and unformatted, and therefore unused, are displayed in the list.

4. Select one or more disks from the list, and then click **Save**.

The selected disks are added to the vSnap storage pool, which expands the capacity of the vSnap pool by the size of the disks that are added.

### What to do next

After you expand the storage pool, rescan the disk or vSnap server to pick up the new disks. For instructions on how to run a rescan operation, see [“Rescanning a vSnap server after the storage is expanded” on page 50.](#)

## Establishing a replication partnership for a vSnap server

By using backup storage replication, you can asynchronously backup data from one vSnap server to another.

### Before you begin

All vSnap servers must be at the same version level for replication to function. Replication between different versions is not supported.

### Procedure

To establish a replication partnership, complete the following steps:

1. In the navigation panel, click **System Configuration > Backup Storage > Disk**.
2. Click the manage icon  that is associated with the vSnap server that you want to add a replication partnership to, and then expand the **Configure Storage Partners** section.
3. Click the add icon .
4. From the **Select Partner** list, select a vSnap server with which to establish a replication partnership.
5. Click **Add Partner**.

## Certificate management

You can manage your unique self-signed vSnap certificate in the IBM Storage Protect Plus environment.

### Managing vSnap certificates

Beginning with IBM Storage Protect Plus version 10.1.11, each vSnap generates a unique self-signed certificate during the initial registration or deployment of the vSnap server. The certificate is configured with a hostname that is automatically detected during the initialization.

- The following hostname are embedded in the certificate by default:

#### Common Name (CN)

This is set to the fully qualified domain name (FQDN) of the vSnap server. Determine the **Common name** by using the following command:

```
hostname --fqdn
```

#### Subject Alternative Names (SAN)

Determine the **Short name** and **IP address** by using the following commands:

**Note:** When registering a vSnap in IBM Storage Protect Plus server, the vSnap certificate must be pasted or uploaded. The hostname or IP of the vSnap as entered in the IBM Storage Protect Plus UI must exactly match one of the SANs embedded in the vSnap certificate.

```
$ hostname
```

```
$ hostname -I
```

- Refer to the inline help on the vSnap server using the following commands:

```
$ vsnap system cert show --help
```

```
$ vsnap system cert regenerate --help
```

- To view the current certificate in PEM format, use the following command:

```
$ vsnap system cert show
```

This can be used to obtain the certificate that should be pasted or uploaded in the IBM Storage Protect Plus UI while registering a vSnap.

- If the existing CN or SAN in the certificate are incorrect, use the following command to regenerate a new self-signed certificate with the correct names.

```
$ vsnap system cert regenerate --hostnames <list_of_comma_separated_hostnames> --ipaddrs <optional_list_of_comma_separated_IPs>
```

For example:

```
vsnap system cert regenerate --hostnames "vsnap1.example.com,vsnap1" --ipaddrs "10.11.128.1"
```

- After regenerating or replacing the certificate, the vSnap API service must be restarted by using the following command:

```
$ sudo systemctl restart vsnap-api
```

- Check if the new certificate is installed correctly by using the following command:

```
$ vsnap system cert show
```

## Using a custom CA-signed certificate

The default self-signed certificate on vSnap can be optionally replaced with a custom CA-signed certificate. You need to make sure that the custom certificate meets the following requirements:

- Each vSnap must have a unique TLS certificate where the CN (Common Name) or SAN (Subject Alternative Name) matches the hostname or IP address of the vSnap server.
- The private key that is associated with the certificate must not be encrypted. Hence, the private key must be generated without a passphrase.
- If the certificate is signed by using a private CA (Certificate Authority), then the full certificate chain must be provided as a single file. The file must contain the vSnap server certificate, followed by the intermediate certificate (if any), followed by the root certificate, with all certificates in the PEM format.

Sample of a single file that contains the full chain:

```
# vSnap server certificate
-----BEGIN CERTIFICATE-----
XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
-----END CERTIFICATE-----
# Intermediate CA certificate
-----BEGIN CERTIFICATE-----
XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
-----END CERTIFICATE-----
# Root CA certificate
-----BEGIN CERTIFICATE-----
XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX
-----END CERTIFICATE-----
```

For example, the single file that contains the full chain can be generated by using the following command:

```
cat server.crt intermediate.crt root.crt > fullchain.crt
```

To install the custom certificate, complete the following steps:

1. Copy the certificate file to the path: `/etc/vsnap/ssl/spp-vsnap.crt`.

The default certificate at that path can be overwritten.

2. Copy the private key file to the path: `/etc/vsnap/ssl/spp-vsnap.key`.

The default key at that path can be overwritten.

3. Restart the vSnap API service that uses the following command:

```
sudo systemctl restart vsnap-api
```

Wait a few seconds for the restart to complete.

Use the following command to monitor the status of all services and ensure that the `vsnap-api` service is in the **Active** state.

```
vsnap_status
```

4. Verify the contents of the installed certificate by using the following command:

```
vsnap system cert show
```

After the custom certificate is installed, it must be specified as part of the registration of the vSnap server in IBM Storage Protect Plus. Refer to the following topics for more information:

- [“Registering a vSnap server as a backup storage provider” on page 35](#)
- [“Editing settings for a vSnap server” on page 44](#)

## Migrating onboard vSnap data to a stand-alone vSnap server

Beginning with IBM Storage Protect Plus Version 10.1.7, the onboard vSnap server is no longer included. If you upgrade your system to IBM Storage Protect Plus 10.1.7 or later, but data remains in an onboard vSnap server from a previous release prior to version 10.1.7, you must migrate the data to a new, stand-alone vSnap server.

### Before you begin

Beginning with IBM Storage Protect Plus 10.1.7, new deployments will no longer contain an onboard vSnap server. Systems upgraded from a previous version of IBM Storage Protect Plus still contain an onboard vSnap server which can be part of the Demo site. The onboard vSnap server will no longer be upgraded as part of general updates to IBM Storage Protect Plus.

The **LocalvSnapAdmin** identity was used as the identity to connect to the onboard vSnap server. In some cases, this identity may have been used to access other vSnap servers. If the identity was used to connect to other vSnap servers, a new identity for those servers must be created. Use the **serveradmin** account to connect to vSnap servers.

Do not unregister the onboard vSnap server from IBM Storage Protect Plus until prompted.

Ensure that sufficient space is available on the datastore for a stand-alone vSnap server deployment.

Do not explicitly initialize the new vSnap server that will be deployed as part of this procedure. Instead, the configuration of the onboard vSnap server will be copied to the new vSnap server.

**Attention:** Follow the procedure carefully. If not followed, this procedure can result in a loss of data.

### About this task

In previous releases, an onboard vSnap server was included for proof-of-concept (POC) and demo purposes. The vSnap server was named localhost and was part of the Primary site by default. Beginning with IBM Storage Protect Plus 10.1.5, the onboard vSnap server was part of a Demo site that provided limited functionality. Users were able to manually remove the onboard vSnap from the Demo site and then register it with another site at which point the vSnap server was no longer limited in functionality.

Determine whether an onboard vSnap server was used in the previous release. Users who did not unregister the onboard vSnap from the Demo site will follow a different procedure from users who unregistered the onboard vSnap server from the Demo site and assigned the server to another site. Consider the two scenarios below:

**Scenario 1:** If the onboard vSnap was unused or previously used only in the Demo site, stop using the onboard vSnap. Unregister the vSnap from IBM Storage Protect Plus, for more information, see [“Unregistering a vSnap server” on page 47](#). After completing those steps, uninstall the vSnap software from the IBM Storage Protect Plus server. Skip the steps and begin with Step 9 in this procedure.

**Scenario 2:** If the onboard vSnap was unregistered from the Demo site and used in production under another site, do not unregister the onboard vSnap server from IBM Storage Protect Plus. The procedure in this topic will reference other topics. It may be helpful to have these topics open when:

- Manually upgrade the onboard vSnap server using the appropriate `.run` file. Follow to the general procedure for upgrading an external vSnap server as described in the [“Updating a virtual vSnap server to RHEL 9.5” on page 14](#) topic.
- Deploy a new stand-alone vSnap server using the most recent OVA. For more information, see [“Installing a virtual vSnap server in a VMware environment” on page 10](#).
- Upon completing the migration of data, uninstall the vSnap software from the IBM Storage Protect Plus server. These steps are detailed in this procedure beginning with Step 9.

## Procedure

1. Update the onboard vSnap server and collect the vSnap pool information.
  - a) Using secure shell (SSH), log in to the onboard vSnap as the **serveradmin** user.
  - b) Upgrade the vSnap server to the most recent release. For more information, see [“Updating a virtual vSnap server to RHEL 9.5” on page 14](#).
  - c) Determine the version level of the vSnap server. At the command prompt, issue the following command:

```
$ vsnap system info
```

- d) Determine all the disks labeled `vsnap_pool1`. The storage pool is comprised of these disks which will be detached from the onboard vSnap server and attached to the new vSnap server later in this procedure. At the command prompt, issue the following command to identify the disks:

```
$ vsnap disk show
```

2. Deploy a new, stand-alone vSnap server using the most recent `.ova`, apply custom settings, and verify the version level.
  - a) Log in to the vSphere Client.
  - b) Deploy a new stand-alone vSnap server using the most recent version of the vSnap `.ova`. For more information, see [“Installing a virtual vSnap server in a VMware environment” on page 10](#).
  - c) The new, stand-alone vSnap server will contain an unused 100GB disk that is used as the initial disk for creating a new storage pool. Detach this disk from the stand-alone vSnap server and delete it.
  - d) Configure the network properties as appropriate to your environment on the newly created vSnap server. Document the IP address or hostname for later use in this procedure.
  - e) Using secure shell (SSH), log in to the newly created vSnap as the **serveradmin** user.
  - f) Determine the version level of the newly created vSnap server. At the command prompt enter the **vsnap system info** command:

```
$ vsnap system info
```

This version should match the version level of the onboard vSnap server that was upgraded and verified in the first step. If not, upgrade one or both of the vSnap servers to the latest release to ensure that they are at the same version level.

3. Pause all jobs in IBM Storage Protect Plus, document replication partnerships, and delete the partnerships from the onboard vSnap.
  - a) Log on to the IBM Storage Protect Plus server.

- b) Jobs must not be actively running or scheduled to run during the migration procedure. Pause the schedule for all jobs to ensure that they do not attempt to run while the migration is occurring. Click **Jobs and Operations > Schedule** and then click **Pause All Jobs**. Verify that no jobs are running by clicking **Jobs and Operations > Running Jobs**.
  - c) Modify the settings for the onboard vSnap server. Navigate to **System Configuration > Storage > vSnap servers**, select the onboard vSnap server, and then click **Manage**.
  - d) Open the **Storage Partners** tab. Note the IP address or hostname of each replication partner for later use in this procedure.
  - e) Remove each replication partner. Removing the partnerships will not affect the replication data. The partnerships will be re-created in a subsequent step after the migration is complete.
4. Backup the onboard vSnap server configuration, transfer the configuration file to the new stand-alone vSnap server, and stop and disable the vSnap services on the onboard vSnap server.
  - a) Using secure shell (SSH), log in to the onboard vSnap server as the **serveradmin** user.
  - b) Create a backup of the vSnap configuration using the **vsnap system config backup** command. In this example, the config backup is saved in the root of the **serveradmin** user's home directory:
 

```
$ vsnap system config backup --outfile /home/serveradmin/vsnap_config_backup.tar.gz
```
  - c) Copy the **vsnap\_config\_backup.tar.gz** from the onboard vSnap server to the newly created stand-alone vSnap server into the **/home/serveradmin** directory. SCP can be used to copy the file. In this example, *ip\_address\_new\_vsnap* is a variable used to denote the IP address of the newly created stand-alone vSnap server. If prompted, accept the fingerprint and enter **yes** to continue connecting.
 

```
$ scp vsnap_config_backup.tar.gz serveradmin@ip_address_new_vsnap:/home/serveradmin
```
  - d) Enter the password for the **serveradmin** account on the stand-alone vSnap server. The file will begin transferring.
  - e) Disable the vSnap services for the onboard vSnap server using the **systemctl stop** and **systemctl disable** commands:
 

```
$ sudo systemctl stop vsnap
```

```
$ sudo systemctl disable vsnap
```
5. Restore the onboard vSnap server configuration to the new stand-alone vSnap server.
  - a) Using secure shell (SSH), log in to the newly created vSnap as the **serveradmin** user.
  - b) Restore the config backup from the onboard vSnap server to the stand-alone vSnap server using the **vsnap system config restore** command:
 

```
$ vsnap system config restore --file /home/serveradmin/vsnap_config_backup.tar.gz
```
6. Power off the onboard vSnap server and the stand-alone vSnap server, detach the disks from the onboard vSnap and attach the disks to the stand-alone vSnap server. Power on both vSnap servers.
  - a) Log in to the vSphere Client.
  - b) Power off the onboard vSnap and the stand-alone vSnap virtual machines and edit the settings of the virtual machine that has the onboard vSnap.
  - c) Detach the disks associated with the vSnap pool that is to be migrated as identified in Step 1d.
  - d) Edit the settings of the stand-alone vSnap virtual machine and attach the disks that were detached from the onboard vSnap server in Step 6c.
  - e) Power on the onboard vSnap and the stand-alone vSnap virtual machines.
7. Verify the status of both the onboard vSnap server and the newly deployed stand-alone vSnap server.
  - a) Using secure shell (SSH), log in to the onboard vSnap server as the **serveradmin** user.

- b) Run the **vsnap\_status** command to determine the status of the vSnap services on the onboard vSnap server. It is expected that the services will no longer be running since the **systemctl stop** and **systemctl disable** commands were previously executed in Step 4.

```
$ vsnap_status
```

- c) Using secure shell (SSH), log in to the newly created vSnap as the **serveradmin** user.
- d) Run the **vsnap\_status** command to determine the status of the vSnap services on the stand-alone vSnap server. The expected outcome is that the services will start and mount the storage pool.

```
$ vsnap_status
```

**Note:** It may take up to 15 minutes for all services to start. Periodically run the **vsnap\_status** command to check the status.

- e) After all vSnap services are active, execute the **vsnap pool show** command to verify that the storage pool is online:

```
$ vsnap pool show
```

8. Update the vSnap server registration, the associated credentials, re-add the replication partners, and release the job schedules.
  - a) Log on to the IBM Storage Protect Plus server.
  - b) Click **System Configuration > Storage > vSnap servers**, select the onboard vSnap server, and then click **Edit**.
  - c) Enter the IP address or the hostname in the **Hostname/IP** field of the newly created stand-alone vSnap server.
  - d) The existing user may display as **LocalvSnapAdmin** or as another identity. Deselect **Use existing user**. Enter **serveradmin** in the **User ID** field and the associated password for the stand-alone vSnap server in the **Password** field.
  - e) Click **Save**.
  - f) On the **vSnap servers** section, select the vSnap server that you edited and click **Refresh**.
  - g) After the refresh operation, verify that the information for the vSnap server is accurate.
  - h) Click **Manage** and then open the **Storage Partners** tab.
    - i) Re-enter the replication partners that were removed in Step 3. For instructions for entering partners, see “Configuring backup storage partners” on page 50.
    - j) Release schedules for all jobs that were paused in Step 3. Navigate to **Jobs and Operations > Schedule**, and then click **Release All Schedules**.
9. Remove the vSnap software from the IBM Storage Protect Plus server.
  - a) Using secure shell (SSH), log in to the IBM Storage Protect Plus server as the **serveradmin** user.
  - b) Execute the **yum remove** commands to remove the vSnap server software from the IBM Storage Protect Plus server:

```
$ sudo yum remove vsnap
```

```
$ sudo yum remove vsnap-dist
```

## Results

The migration from the onboard vSnap to a newly created stand-alone vSnap server is complete. All jobs that used the onboard vSnap will now use the new vSnap server. All data previously backed up to the onboard vSnap can be restored from the new vSnap server. Previously scheduled backup, replication, and cloud copy jobs will continue, as data is incrementally transferred to the new vSnap server.

## Registering a VADP proxy on a vSnap server

---

You can install and register a VADP proxy on a physical or virtual vSnap server. When you install and register a VADP proxy locally on a vSnap server, no NFS mount is needed. Data movement is optimized because the file system is on the same machine and can be referenced directly for both backup and restore jobs. VADP proxies that are not installed and registered on a vSnap server still require an NFS mount.

### Before you begin

One or more stand-alone vSnap servers must be properly deployed and configured in your environment and added to IBM Storage Protect Plus backup storage providers. For instructions, see [“Registering a vSnap server as a backup storage provider”](#) on page 35.

For the combined system requirements of a vSnap server and the VADP proxy, see [VADP proxy on vSnap server requirements](#).

Ensure that you have the required user permissions to work with VADP proxies. For instructions about managing VADP proxy permissions, see [Permission types](#).

The identity associated with a vSnap server is the account that is used to register the VADP proxy on the vSnap server. When you register a VADP proxy on a vSnap server, an installer is pushed and requires sudo privileges to successfully install the VADP proxy software. The identity associated with a vSnap server must have sudo privileges.

**Tip:** Use the `serveradmin` User ID when adding a vSnap server to IBM Storage Protect Plus. When you deploy a VADP proxy to a vSnap server, this account is used which already has all of the necessary privileges.

### Procedure

1. In the navigation panel, click **System Configuration > Storage > vSnap servers**.
2. Select the vSnap server on which the VADP proxy is to be installed and registered.
3. Click **Register as VADP Proxy**.
4. In the Confirm dialog box, click **Yes**.

### Results

When the process is complete, a green checkmark will appear in the **VADP Proxy** column in the table of the Disk Storage pane.

## Editing settings for a vSnap server

---

You can edit the configuration settings for a vSnap server to reflect changes in your IBM Storage Protect Plus environment.

### Procedure

To edit the settings for a vSnap server, complete the following steps:

1. In the navigation panel, click **System Configuration > Storage > vSnap servers**.
2. Select the vSnap server, and then click **Edit**.

#### Certificate

In the **Certificate** field, select one of the following options to import the certificate:

#### Upload

- a. Download the `spp-vsnap.crt` file from the vSnap server, located under `/etc/vsnap/ssl` to your local machine where you are running the browser on.
- b. Click **Choose file** and search for the downloaded certificate in your system.

- c. Click **Upload**.

#### **Copy and paste**

Enter a name for the certificate, such as `spp-vsnap.crt`. Then, paste the contents of the certificate that you exported into the **Copy and paste certificate here** field.

Click **Create**. After the certificate is created, click **Save**

#### **Use existing certificate**

It is a default option.

**Note:** If the vSnap server is configured to use a custom CA-signed certificate, you need to make sure that the certificate uploaded or pasted is in the same format as installed on the vSnap server. The certificate must contain the full chain that consists of the server certificate, intermediate certificate (if any), and root certificate. For more information, see [Certificate management](#).

3. Obtain the server key and verify that the key type and key fingerprint match the host. Click **Get server key**.

#### **Get server key**

The SSH server key for the Linux-based host. You must complete this step when adding servers for the first time or if the key on the server changes.

When upgrading to the IBM Storage Protect Plus latest version, systems that are already registered in the previous version are set to trust on first use (TOFU) and the SSH key fingerprint will automatically be added to the registration information in the catalog.

#### **Key type**

The type of key for the Linux-based host is displayed. The following key types are supported:

- RSA with a minimum key size of 2048 bits
- ECDSA
- DSA

#### **Key fingerprint**

The MD5 hash of the SSH key fingerprint is displayed. Confirm that the key fingerprint matches the key fingerprint of the host that you are adding.

4. Revise the vSnap server settings, and then click **Save**.

## **Refreshing a vSnap server**

You can refresh the disk storage view for vSnap servers to show up-to-date status and capacity usage.

### **Procedure**

1. In the navigation panel, click **System Configuration > Backup Storage > Disk**.
2. Click the actions icon  for the disk that you want to refresh.
3. Click **Refresh** to refresh the details of the disk. For example, if the **Status/Capacity** percentage has changed due to usage, the update is refreshed in the table.

## **Removing the Demo environment**

The IBM Storage Protect Plus appliance includes an onboard vSnap server that is named `localhost`, a site for demonstration purposes that is named `Demo`, and an associated SLA policy that is named `Demo`. For larger production environments, do not use the onboard vSnap server. Instead use, one or more stand-alone vSnap servers. The `Demo` SLA policy, `Demo` site, and onboard vSnap server, collectively as the `Demo` environment, can be safely removed to conserve disk space.

## Before you begin

For IBM Storage Protect Plus appliances that are in production, back up the IBM Storage Protect Plus application. For instructions, see [Backing up the IBM Storage Protect Plus application](#). For new deployments, backing up the application is not necessary.

Verify that the data on the localhost vSnap server is not needed.

Ensure that at least one stand-alone vSnap server is deployed as a backup destination.

## About this task

When deployed, an IBM Storage Protect Plus appliance has six virtual hard disks. When you remove the Demo configuration and localhost vSnap server from the IBM Storage Protect Plus appliance, you can free storage through the removal of two of the associated virtual hark disks.

The procedure in this topic must be followed in order to remove the Demo environment from IBM Storage Protect Plus.

## Procedure

1. Disable SLA policies that are assigned to the Demo environment by completing the following steps:
  - a) From a supported browser, log in to the IBM Storage Protect Plus user interface.
  - b) View any jobs that are assigned to the Demo SLA. In the navigation panel, click **Jobs and Operations**, and then click the **Schedule** tab. Locate any jobs that follow the naming pattern *Job\_Name\_Demo*, where *Job\_Name* is the name of the job. This naming pattern indicates that the Demo SLA is used.
  - c) Pause the schedule for every Demo job. Click the actions menu icon  and select **Pause Schedule** for each job that ends in *\_Demo*.
2. Delete the Demo SLA by completing the following steps:
  - a) In the navigation panel, click **Manage Protection > Policy Overview**. Scroll down to the table in the SLA Policies pane and locate the Demo policy.
  - b) Click the delete icon  beside the Demo SLA.
  - c) Enter the code in the **Confirm** dialog box and click **OK**.
3. Delete the localhost vSnap disk storage by completing the following steps:
  - a) In the navigation panel, click **System Configuration > Backup Storage > Disk**. Locate the localhost vSnap storage that is assigned to the Demo site.
  - b) Click the delete icon  beside the localhost vSnap storage.
  - c) Enter the code in the **Confirm** dialog box and click **DELETE**.
4. Delete the Demo site by completing the following steps:
  - a) In the navigation panel, click **System Configuration > Site**. Locate the site that is named Demo.
  - b) Click the delete icon  beside the Demo site.
  - c) Click **Yes** in the **Confirm** dialog box to complete the removal of the Demo site.
5. Remove the LocalvSnapAdmin identity by completing the following steps:
  - a) In the navigation panel, click on **Accounts > Identity**.
  - b) Click the delete icon  beside the LocalvSnapAdmin identity.
  - c) Click on **Yes** in the **Confirm** dialog box to remove the identity.
6. Clean up the file system and LVM configurations by completing the following steps:
  - a) Log in to the IBM Storage Protect Plus by using the Secure Shell (SSH) protocol or through the hypervisor console by using the `serveradmin` account.
  - b) Obtain the ID of the localhost vSnap storage pool. Issue the following command:

```
$ vsnap pool show
```

**Attention:** To ensure that no data is lost, verify that the ID obtained is the ID of the localhost vSnap storage pool.

- c) Delete the localhost vSnap storage pool. Issue the following command where *<ID>* is the ID obtained in the previous step:

```
$ vsnap pool delete --id <ID>
```

- d) Unmount the localhost vSnap storage cloud cache. Issue the following command:

```
$ sudo umount -f /opt/vsnap-data
```

- e) Edit the `fstab` file to disable the cloud cache from starting. Using `sudo` and a text editor, comment out the line starting with `/dev/mapper/vsnapdata-vsnapdata1v`.

- f) Deactivate the LVM volume group that is associated with the cloud cache. Issue the following command:

```
$ sudo vgchange -an vsnapdata
```

7. By using vSphere or Hyper-V Manager, detach the virtual hard disks that are no longer needed from the IBM Storage Protect Plus appliance. Proceed with caution to ensure that the correct disks are detached. The localhost vSnap server has two associated virtual hard disks, which are 100 GB and 128 GB in size. For detailed instructions about detaching or removing virtual hard disks, see the appropriate hypervisor documentation.

**Attention:** Power off the IBM Storage Protect Plus appliance before you detach the virtual hard disks. Do not delete the virtual hard disks until proper functionality has been confirmed after powering on the appliance and running a maintenance job.

8. Rescan the SCSI bus and disable the vSnap service by completing the following steps:

- a) Log in to the IBM Storage Protect Plus by using the Secure Shell (SSH) protocol or through the hypervisor console by using the `serveradmin` account.

- b) Rescan the SCSI bus by issuing the following command:

```
$ sudo rescan-scsi-bus.sh
```

- c) Stop the vSnap service by issuing the following command:

```
$ sudo systemctl stop vsnap
```

- d) Disable the vSnap service by issuing the following command:

```
$ sudo systemctl disable vsnap
```

## Unregistering a vSnap server

If required, you can unregister a vSnap server that is no longer used in your IBM Storage Protect Plus environment.

### Before you begin

When a vSnap server is unregistering, all recovery points that are associated with the vSnap server are purged from IBM Storage Protect Plus during the next maintenance job.

**Attention:** Unregistering of a vSnap server can result in loss of data.

Before you unregister a vSnap server, review the scenarios to determine whether unregistering is appropriate or whether other action must be taken.

**Scenario 1:** The vSnap server is temporarily down due to storage or network issues.

- Do not unregister the vSnap server. If you unregister the vSnap server, recovery points that are associated with the server will be purged and backups will be rebased.
- Complete the necessary storage or network maintenance to bring the vSnap server back online.

**Scenario 2:** The vSnap server is assigned a new host name or IP address.

- Do not unregister the vSnap server. If you unregister the vSnap server, recovery points that are associated with the server will be purged and backups will be rebased.
- Edit the settings for the vSnap server to specify the new host name or IP address. To edit the settings for a vSnap server, follow the instructions [“Editing settings for a vSnap server”](#) on page 44.

**Scenario 3:** The vSnap server is not in use, and there are no plans to reuse it.

- Unregister the vSnap server and run a maintenance job to ensure that recovery points that are associated with the vSnap server are purged from IBM Storage Protect Plus.
  - Incremental backups of the data that was present on the vSnap server will no longer be possible.
  - Recovering data that was present on the vSnap server will no longer be possible.
- Subsequent runs of backup jobs will automatically create new volumes on another vSnap server in the same site and will perform new base backups.

**Scenario 4:** The vSnap pool is lost and you want to build a new pool on the same vSnap server.

1. Unregister the vSnap server and run a maintenance job to ensure that recovery points that are associated with the old vSnap pool are purged from IBM Storage Protect Plus.
  - Incremental backups of the data that was present in the old pool will no longer be possible.
  - Recovering data that was present in the old pool will no longer be possible.
2. On the vSnap server, create a pool.
3. Add the vSnap server back into IBM Storage Protect Plus. To add a vSnap server to IBM Storage Protect Plus, see [“Registering a vSnap server as a backup storage provider”](#) on page 35.
  - Subsequent runs of backup jobs will automatically create volumes on this or another vSnap server in the same site and will perform new base backups.

**Scenario 5:** The vSnap pool or server is lost and you intend to repair it. This can be achieved by replicating data from a vSnap replication server.

- Do not unregister the vSnap server from IBM Storage Protect Plus. The deletion process will cause backups to be rebased.
- Replace the vSnap server. For information about replacing a failed, primary vSnap server, see this section [Chapter 9, “Troubleshooting vSnap servers,”](#) on page 87.

## Procedure

To unregister a vSnap server, complete the following steps:

1. In the navigation panel, click **System Configuration > Storage > vSnap servers**.
2. Select the vSnap server, and then click **Delete device**.
3. Confirm removal of the vSnap server by entering the code in the text box. Click **UNREGISTER** to delete the server from IBM Storage Protect Plus.

## Chapter 5. Configuring backup storage options

You can configure additional storage-related options for your primary and secondary backup storage hosts.

### Procedure

To configure backup storage options for registered disks, complete the following steps:

1. In the navigation panel, click **System Configuration > Storage > vSnap servers**.
2. Select the vSnap server that you want to configure, and then click **Manage**.
3. Open the **Storage efficiency** tab.
4. Specify one or more storage options:

The screenshot shows the 'Storage efficiency' tab in the vSnap configuration interface. It features a 'Set Advanced Options' section with three checkboxes: 'Enable compression' (checked), 'Enable deduplication' (checked), and 'Enable encryption' (unchecked). Each option has a 'Learn more' link. Below these options is a blue information box stating: 'The Encryption setting can only be applied during vSnap initialization. This option is for informational purposes only.' At the bottom of the panel are 'Cancel' and 'Save' buttons.

**Enable Compression:** Select this option to compress each incoming block of data by using a compression algorithm before the data is written to the storage pool. Compression consumes a moderate amount of additional CPU resources.

**Enable Deduplication:** Select this option so that each incoming block of data is hashed and compared against existing blocks in the storage pool. If compression is enabled, the data is compared after it is compressed. Duplicate blocks are skipped instead of being written to the pool. Deduplication is deselected by default because it consumes a large amount of memory resources (proportional to the amount of data in the pool) to maintain the deduplication table of block hashes.

**Encryption Enabled:** This option displays the encryption status of the primary or secondary backup storage host. Encryption can be enabled only during vSnap initialization. This option cannot be changed in this pane.

5. Click **Save**.

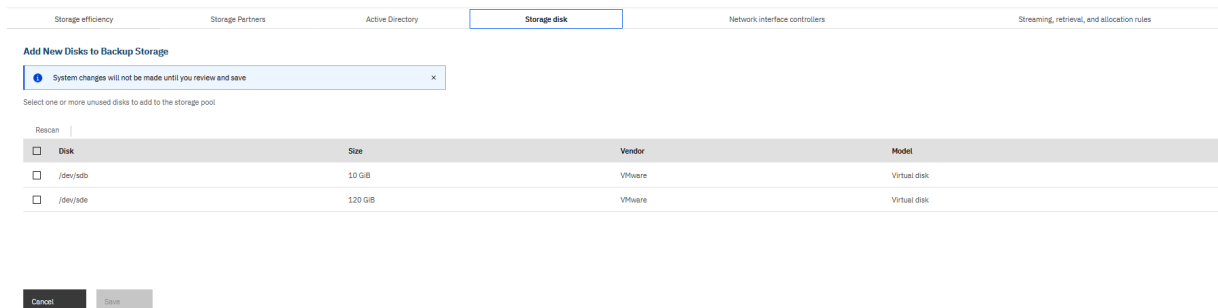

## Adding new disks to backup storage

If you require more space for backup operations in a selected storage pool, you can add unused disk storage.

### Procedure

To add new unused disks to a disk storage pool, complete the following steps:

1. In the navigation panel, click **System Configuration > Storage > vSnap servers**.
2. Select the vSnap server that you want to configure, and then click **Manage**.
3. Open the **Storage disk** tab.
4. Select a disk to add to your storage environment from the list of available disks.

5. Click **Save**.

## Rescanning a vSnap server after the storage is expanded

If you recently expanded the vSnap server storage pool by adding physical or virtual disks, you can rescan the vSnap server to pick up the additions. The operation rescans the entire vSnap server to pick up any recent storage pool additions.

### Procedure

1. In the navigation panel, click **System Configuration > Storage > vSnap servers**.
2. Select the vSnap server that you want to refresh, and then click **Manage**.
3. Open the **Storage disk** tab.
4. Click **Rescan** to scan the vSnap server for any storage pool expansion or changes.  
This operation can several minutes to finish. The disk remains fully operational during the scanning process.
5. Optional: Select **Refresh** to refresh the details of the disk. For example, if the **Status/Capacity** figure has changed due to usage, the update is refreshed in the table.

## Refreshing the disk storage for a vSnap server

You can refresh the disk storage view for your vSnap servers to show up-to-date status and capacity usage.

### Procedure

1. In the navigation panel, click **System Configuration > Storage > vSnap servers**.
2. Select the vSnap server that you want to refresh, and then click **Refresh**.  
The information that is shown for the vSnap server is updated to reflect any changes. For example, if the **Status/Capacity** percentage changed due to usage or because you recently expanded the storage pool, the information is refreshed.

## Configuring backup storage partners

You can configure your backup storage primary and secondary sites to establish replication partnerships with other sites to extend your environment. After you configure replication partners, you can copy data from one site to another for an added layer of data protection.

### Before you begin

All vSnap servers must be at the same version level for replication to function. Replication between different versions is not supported.

### Procedure

To add partners to a server in your storage environment, complete the following steps:

3. Open the **Network interface controllers** tab.
4. Select the configuration that you want for your listed NICs:
  - To configure an NIC for transfers of data for backup and restore operations only, select **Backup**. During backup and restore operations, connections are established to the vSnap server by using the IP address of this NIC. If the **Backup** option is specified by multiple NICs, the first one that connects successfully is used.
  - To configure an NIC for transfers of data for replication purposes only, select **Replication**. During incoming replication operations to a vSnap server, connections are established using the IP address of this NIC on the target vSnap server. If the **Replication** option is specified for multiple NICs on the target vSnap server, the first target IP address that connects successfully from the source vSnap server is used.
  - To configure a NIC for both replication, and backup and restore data transfers, select both **Backup** and **Replication**.

**Configure Network Interface Controllers**  
 Configure a specific network interface controller to function as the backup or replication network.  
[Learn more](#)

Name	MAC Address	IP Address	Backup	Replication
ens192	00:56:56:96:c0:01	9.11.67.134	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

Cancel Save

5. Click **Save**.

## Configuring an Active Directory

IBM Storage Protect Plus versions 10.1.5 and earlier require the use of a local staging area on the application server in order to perform log backup of Microsoft SQL Server. If you want to avoid the use of a local staging area, you can optionally associate your primary and secondary backup storage with an active directory domain. When the vSnap server is added to a domain, any Microsoft SQL Server log backup jobs that are associated with that host will use domain authentication to mount the log backup volume and will write the log backups directly to the vSnap volume without using an intermediate staging area. IBM Storage Protect Plus versions 10.1.6 and later no longer require the use of a local staging area for Microsoft SQL Server log backups. There is no requirement or benefit to joining vSnap servers to an Active Directory domain if you use IBM Storage Protect Plus versions 10.1.6 and later.

### Before you begin

You might have to configure the Domain Name System (DNS) server so that the domain controller is available to the network and can be associated with the primary or secondary host.

### Procedure

To add an Active Directory for backup and restore operations, complete the following steps:

1. In the navigation panel, click **System Configuration > Storage > vSnap servers**.
2. Select the vSnap server that you want to configure, and then click **Manage**.
3. Open the **Active Directory** tab.
4. Enter the domain name of the Active Directory, along with the user name and password for the Active Directory administrator as shown in the following figure.

Storage efficiency	Storage Partners	Active Directory	Storage disk	Network interface controllers	Streaming, retrieval, and allocation rules
<b>Join Active Directory</b>					
Domain Name		cupoftea.storage.n.com			
Domain Administrator Username		admin			
Domain Administrator Password		*****			
<div>Cancel</div> <div>Join</div>					

5. Click **Join**.

## Configuring advanced storage options

You can set advanced storage-related options for the primary or secondary backup storage in your environment.

### Procedure

To configure advanced options for your backup storage, complete the following steps:

1. In the navigation panel, click **System Configuration > Storage > vSnap servers**.
2. Select the vSnap server that you want to configure, and then click **Manage**.
3. Open the **Storage and Transport Options** tab.
4. Configure the advanced options.

#### Set Storage Options

Concurrent stream limit for copy to archive object storage	5	-	+
Concurrent stream limit for copy to standard object storage	5	-	+
Concurrent stream limit for replication	5	-	+
Enable Transport Encryption (has additional requirements, see documentation)	<input checked="" type="checkbox"/>		
Interval in seconds between volume/snapshot deletions during space reclamation	300	-	+
Retrieval tier for restore from AWS archive object storage (Bulk, Standard, or Expedited)	Bulk		

Figure 4. Manage backup storage advanced options.

- **Concurrent stream limit for copy to archive object storage:** This value defines the maximum number of concurrent streams that are used by this backup host when you are copying data to archive Object Storage.
- **Concurrent stream limit for copy to standard object storage:** This value defines the maximum number of concurrent streams that are used by this backup host when you are copying data to standard Object Storage.

- **Concurrent stream limit for replication:** This value defines the maximum number of concurrent streams that are used by this backup host when you are replicating data to other backup hosts.
- **Enable Transport encryption:** Select this option to enable encryption of backup data while it is transferred to or from the vSnap Server. For more information about transport encryption, see [“Transport encryption” on page 55](#).

**Note:** By default, this option is disabled to preserve the legacy behavior and also to ensure that backup and restores can continue seamlessly when updating vSnaps.

- **Interval in seconds between volume/snapshot deletions during space reclamation:** This value defines the interval in seconds between successive deletions of volumes or snapshots on the vSnap server when space is reclaimed following a run of Maintenance jobs. Lowering the interval allows space to be reclaimed more aggressively, particularly when a large amount of data has expired in bulk.

**Important:** Aggressive reclamation can put input and output load on the vSnap pool which can result in slower performance for other concurrent workloads.

- **Retrieval tier for restore from AWS archive object storage (Bulk, Standard, or Expedited):** This value specifies the retrieval tier that is used by this backup host during restore operations from Amazon Glacier archive Object Storage. This value must be specified as Bulk, Standard, or Expedited. The retrieval tier can be modified to achieve faster restore operation times at the cost of higher data charges. For information about the available retrieval tier options and associated pricing, see the Amazon Web Services documentation.
- **Concurrent Backup:** This option specifies the maximum number of parallel backup streams to the host when multiple jobs that run concurrently. For application backup operations, each database is treated as a single stream. For hypervisor backup operations, each virtual disk is treated as a single stream. The concurrent backup options can be used to prevent multiple or large SLA policies from sending too many data streams to a small backup host that cannot accommodate the load. To reduce processing time for backup operations, set this option to one of the following options:
  - Unlimited: an unlimited number of concurrent backup streams can run.
  - Pause: to pause the use of this backup host. Jobs attempting to utilize this backup host will pause while this setting is selected. This option should be used in situations where the backup host requires emergency maintenance and will temporarily prevent it from being used by any jobs.
  - Limit: to set a maximum limit on the number of backup streams that can run concurrently. Enter a numerical value specifying the maximum number of concurrent streams.
- **Disable New Application:** Enabling this option will make it so that the vSnap server will not be used for new storage application for virtual machine (VM) backups. Existing virtual machine backups will continue using the vSnap server. If a virtual machine backup requires new storage, it will not use the vSnap regardless of the remaining free space or VM allocation setting for the assigned site.

**Tip:** When you change an option value, the new value is applied when you click into the next option field. Alongside the updated option, the following message is displayed,  **Updated**.

5. Click **Close**.

#### Related reference

[“Transport encryption” on page 55](#)

IBM Storage Protect Plus 10.1.13 introduces **Transport Encryption** feature to protect the data transport between application host and vSnap during backup and restore. With the transport encryption, each data path of data between the application host and the vSnap can be encrypted and decrypted.

## Transport encryption

---

IBM Storage Protect Plus 10.1.13 introduces **Transport Encryption** feature to protect the data transport between application host and vSnap during backup and restore. With the transport encryption, each data path of data between the application host and the vSnap can be encrypted and decrypted.

### Considerations to use transport encryption

To enable transport encryption, ensure that the prerequisite software is at the required level and all security-related patches are applied. For system requirements, see [System requirements](#).

#### Important:

- If you are using IBM Storage Protect Plus for backup storage and want to protect the data transport with transport encryption option, you must update both IBM Storage Protect Plus and vSnap to 10.1.13 or later releases.
- After installing or updating to IBM Storage Protect Plus and vSnap to 10.1.13 or later, the transport encryption option is disabled by default. To enable the transport encryption option, see [“Configuring advanced storage options”](#) on page 53.
- After you enable transport encryption in IBM Storage Protect Plus 10.1.13 or later and plan to disable it, you must manually disable the transport encryption option.

Review the following information before you enable transport encryption:

- When you enable the transport encryption, each data stream of data between the application host and the vSnap will be encrypted and decrypted. Each stream is handled by one CPU core. Data transport encryption can increase CPU usage, which can affect the system performance. The potential impact on performance depends on CPU types, number of vSnaps, hosts involved in an service level agreement (SLA) and various other factors. The performance may reduce 10% to 50% depending on data types and setup.
- You can fully protect the following data types:
  - SQL database and log backups
  - Exchange database and log backups
  - Windows file system
  - Oracle database and log backups on the Linux® systems
  - Db2 database and Log backups on the Linux® systems
  - MongoDB

**Note:** MongoDB does not have log backup.
- You can partially protect the following data types:
  - SAP HANA: You can enable transport encryption feature for SAP HANA DB. Due to technical limitations, you cannot protect SAP HANA log backups with transport encryption. To protect your SAP HANA log backup data, you must enable SAP HANA backup encryption.
  - VMware: You can protect the data transport between the vSnap and a remote VADP with the IBM Storage Protect Plus transport encryption feature. Also, the path is always protected when you back up VMware data to Open Snap Store Manager (OSSM). When you backup VMware data, the VADP reads the data from the data store and sends it to vSnap. You cannot enable IBM Storage Protect Plus transport encryption to the data store connection.
- Due to technical limitations, you cannot protect the following data types:
  - Hyper-V

- Oracle database and log backups on the AIX® systems
- Db2 database and log backups on the AIX® systems
- SAP HANA database and log backups on the AIX® systems
- Microsoft 365

## Changing the throughput rate

Change the throughput for site replication and copy operations so that you can manage your network activity on a defined schedule.

### Procedure

1. In the navigation panel, click **System Configuration > Storage > Sites**.
2. Select the site that you want to configure, and then click **Edit**.
3. Click **Enabled** for **Throughput throttle** option.
4. Adjust the throughput:
  - Change the numerical rate of throughput by clicking the up and down arrows.
  - Select a unit for the throughput. The default throughput is 100 MB per second.

Figure 5. Enabling different throttles for different times to improve throughput

5. Select times for the changed throughput in the weekly schedule table, or specify a day and time for the changed rate.

**Tip:** To clear a time slot, click the time slot. The scheduled selections are listed underneath the schedule table.

6. Click **Save** to commit the changes and close the panel.

# Chapter 6. Managing backup storage

All IBM Storage Protect Plus environments must include a primary backup storage location for workload snapshots.

If your primary storage is a vSnap server, you can copy snapshots from the primary backup storage to secondary storage for longer-term data protection.

The following table shows the backup storage types that are available for IBM Storage Protect Plus. Depending on the workloads that you are backing up, a storage type can be available for primary backup storage only, for secondary backup storage only, or for both primary and secondary backup storage.

Table 1.		
Backup storage type	Available as primary or secondary storage?	Description
vSnap server	Can be used as primary storage for all workloads other than container and Amazon EC2 workloads.	<p>The vSnap server is a stand-alone appliance that is deployed virtually or installed physically on a system that meets the minimum requirements. Each vSnap server in the environment must be registered in IBM Storage Protect Plus.</p> <p>To install and manage vSnap servers, follow the instructions in <a href="#">Chapter 2, “Installing and managing vSnap servers,”</a> on <a href="#">page 9</a>.</p>

Table 1. (continued)

Backup storage type	Available as primary or secondary storage?	Description
Cloud storage systems	<p>Can be used as primary storage for container workloads and the IBM Storage Protect Plus catalog.</p> <p>Can be used as secondary storage for data that is backed up to a vSnap server.</p>	<p>A cloud storage system is hosted by one of the following cloud providers:</p> <ul style="list-style-type: none"> <li>• Amazon S3</li> <li>• IBM Cloud Object Storage</li> <li>• Microsoft Azure</li> <li>• S3 compatible object storage providers</li> </ul> <p><b>Limitations:</b></p> <ul style="list-style-type: none"> <li>• For IBM Cloud Object Storage, support for retention-enabled vaults is not available.</li> <li>• For S3 compatible storage, generic S3 support is based on external certification processes. For the list of supported S3 compatible providers, see <a href="#">technote 1087149</a>.</li> </ul> <p>To add and manage cloud providers, see the instructions in <a href="#">“Managing cloud storage” on page 58</a>.</p>
Repository server	Available only as secondary storage for data that is backed up to a vSnap server.	<p>The repository server must be IBM Storage Protect server 8.1.7 or later to copy data to standard object storage. To copy data to tape, IBM Storage Protect server 8.1.8 or later is required.</p> <p>To add and manage repository servers, see the instructions in <a href="#">“Managing repository server storage” on page 64</a>.</p>

### Related concepts

[“Copying snapshots to secondary backup storage” on page 3](#)

If your primary backup storage is a vSnap server, you can copy snapshots from the primary backup storage to secondary storage for longer-term data protection. Secondary storage is not available for container data that is backed up to cloud storage.

## Managing cloud storage

You can use cloud storage as primary backup storage for container workloads and the IBM Storage Protect Plus catalog, or as secondary storage from the vSnap server.

The steps required to add cloud storage to IBM Storage Protect Plus are the same for primary and secondary storage.

### Limitations:

- For IBM Cloud Object Storage, support for retention-enabled vaults is not available.
- For S3 compatible storage, generic S3 support is based on external certification processes. For the list of supported S3 compatible providers, see [technote 1087149](#).

## Configuration for copying or archiving data to cloud

If you are planning to copy or archive IBM Storage Protect Plus data to cloud storage for long-term retention or for snapshot storage, you must configure secondary storage.

### Tasks for configuring cloud storage

You must configure IBM Storage Protect Plus for backup and restore operations to cloud storage as shown in Table 1.

User scenario	Purpose	Steps
Store deduplicated data and non-deduplicated data in a cloud-container storage pool and restore the data as required.	Copy data to cloud storage. In the first copy operation, a full backup copy is created. Subsequent copies are incremental.	Choose one of the following providers: <ul style="list-style-type: none"><li>• <a href="#">“Adding Amazon S3 Object Storage” on page 59</a></li><li>• <a href="#">“Adding IBM Cloud Object Storage as a backup storage provider” on page 60</a></li><li>• <a href="#">“Adding Microsoft Azure cloud storage as a backup storage provider” on page 62</a></li><li>• <a href="#">“Adding S3 compatible object storage” on page 63</a></li></ul>

## Adding Amazon S3 Object Storage

You can add Amazon Simple Storage Service (S3) as primary backup storage for container workloads and the IBM Storage Protect Plus catalog, or as secondary storage from the vSnap server.

### Before you begin

Configure the key that is required for the cloud object. For instructions, see [Adding an access key](#).

Ensure that cloud storage buckets are created for the IBM Storage Protect Plus data. For instructions about creating buckets, see [Amazon Simple Storage Service Documentation](#).

### Procedure

To add Amazon S3 cloud storage as a backup object storage provider, complete the following steps:

1. In the navigation panel, click **System Configuration > Storage > Cloud storage**.
2. Click **Add cloud storage** to open the **Add cloud storage** wizard.
3. Click **Amazon S3**, and then click **Next**.
4. Complete the fields on the **Cloud details** page, and then click **Next**:

#### Name

Enter a meaningful name that helps to identify the cloud storage.

#### Use existing access key

Enable this option to select a previously entered key for the storage, and then select the key from the **Select a key** list.

If you do not select this option, complete the following fields to add a key:

**Key name**

Enter a meaningful name to identify the key.

**Access key**

Enter the AWS access key. Access keys are created in the AWS Management Console.

**Secret key**

Enter the AWS secret key. Secret keys are created in the AWS Management Console.

5. Complete the fields on the **Get buckets** page, and then click **Next**:

**Region**

Select the region for the cloud storage, and then click **Update buckets** to select the buckets that you want to use for storage backup, copy, and archive operations. The buckets that you select depend on the backup configuration that you want to use.

If you are backing up container workloads, you can use cloud storage as your primary backup storage.

If your primary backup storage location is a vSnap server, you can use cloud storage as a copy or archive location.

**Backup object storage bucket**

Select a bucket to serve as the backup storage target.

**Standard object storage bucket**

Select a bucket to serve as the copy target.

**Archive object storage bucket**

Select a cloud storage resource to serve as the archive target.

Archiving data creates a full data copy and can provide longer-term protection, cost, and security benefits.

**Deep archive**

Select to register Amazon S3 Glacier Deep Archive buckets for long-term archiving. This field is optional.

6. Review your selections, and then click **Submit**.

The cloud storage is added to the cloud servers table.

## Adding IBM Cloud Object Storage as a backup storage provider

You can add IBM Cloud Object Storage as primary backup storage for container workloads and the IBM Storage Protect Plus catalog, or as secondary storage from the vSnap server.

### Before you begin

When creating a bucket on IBM Cloud Object Storage (COS), ensure that both **Add Archive rule** and **Add Expiration rules** are not selected when creating buckets that are to be used for copy or archive. This can result in a failure with the “bucket has an unsupported lifecycle configuration” error when the job attempts to run in IBM Storage Protect Plus. The **Add Retention policy** option may be set for a bucket to be used for copy, but should not be set for a bucket that will be used for archiving.

The Cold Vault bucket of type should only be used when archiving, as it is the lowest-cost option and is described as ideal for long-term retention of data that will be minimally accessed.

For on-premises IBM Cloud Object Storage (COS), the user associated with the access key and secret key that is registered in IBM Storage Protect Plus must be assigned as an Owner of the vault in the IBM COS Manager interface. It is not sufficient for the user to have only Read/Write access to the vault.

When adding IBM Cloud Object Storage (COS), the method for obtaining the access and secret key will depend on the deployment model. If on-premise, keys can be obtained from the IBM COS Manager Console. For IBM COS IaaS, keys are created when a service account is created and can be obtained from the softlayer portal. If using IBM COS (COS as a Service), the access and secret key are not

created by default; when a service account is created, check the **Include HMAC Credential** box, and add `{"HMAC":true}` to the **Add Inline Configuration Parameters** text area.

## Procedure

To add IBM Cloud Object Storage as a backup storage provider, complete the following steps:

1. In the navigation panel, click **System Configuration > Storage > Cloud storage**.
2. Click **Add cloud storage** to open the **Add cloud storage** wizard.
3. Click **IBM Cloud Object Storage**, and then click **Next**.
4. Complete the fields on the **Cloud details** page, and then click **Next**:

### Name

Enter a meaningful name to help identify the cloud storage.

### Use existing access key

Enable to select a previously entered key for the storage, and then select the key from the **Select a key** list.

If you do not select this option, complete the following fields to add a key:

### Key name

Enter a meaningful name to identify the key.

### Access key

Enter the access key.

### Secret key

Enter the secret key.

### Certificate

Select a method of associating a certificate with the resource:

#### Upload

Select and click **Browse** to locate the certificate, and then click **Upload**.

#### Copy and paste

Select to enter the name of the certificate, copy and paste the contents of the certificate, and then click **Create**.

#### Use existing

Select to use a previously uploaded certificate.

A certificate is not required if you are adding public IBM Cloud Object Storage.

5. Complete the fields on the **Get buckets** page, and then click **Next**:

### Endpoint

Enter the endpoint path for the cloud storage, and then click **Update buckets** to select the buckets that you want to use for storage backup, copy, and archive operations. The buckets that you select depend on the backup configuration that you want to use.

If you are backing up container workloads, you can use cloud storage as your primary backup storage.

If your primary backup storage location is a vSnap server, you can use cloud storage as a copy or archive location.

### Backup object storage bucket

Select a bucket to serve as the backup storage target.

### Standard object storage bucket

Select a bucket to serve as the copy target.

### Archive object storage bucket

Select a cloud storage resource to serve as the archive target.

Archiving data creates a full data copy and can provide longer-term protection, cost, and security benefits.

6. Review your selections, and then click **Submit**.

The cloud storage is added to the cloud servers table.

## Adding Microsoft Azure cloud storage as a backup storage provider

You can add Microsoft Azure cloud storage as primary backup storage for container workloads and the IBM Storage Protect Plus catalog, or as secondary storage from the vSnap server.

### Before you begin

Ensure that there are cloud storage buckets created for the IBM Storage Protect Plus data before you add the cloud storage in the following steps. For information about how to create buckets, see the Azure documentation.

### Procedure

To add Microsoft Azure cloud storage as a backup storage provider, complete the following steps:

1. In the navigation panel, click **System Configuration > Storage > Cloud storage**.
2. Click **Add cloud storage** to open the **Add cloud storage** wizard.
3. Click **Microsoft Azure Blob Storage**, and then click **Next**.
4. Complete the fields on the **Cloud details** page, and then click **Next**:

#### **Name**

Enter a meaningful name to identify the cloud storage.

#### **Use existing access key**

Enable to select a previously entered key for the storage, and then select the key from the **Select a key** list.

If you do not select this option, complete the following fields to add a key:

#### **Key name**

Enter a meaningful name to identify the key.

#### **Storage account name**

Enter the Microsoft Azure access storage account name. This name can be obtained from the Azure Management Portal.

#### **Storage account shared key**

Enter the Microsoft Azure key from any one of the key fields in the Azure Management Portal: key1 or key2.

5. Complete the fields on the **Get buckets** page, and then click **Next**:

#### **Endpoint**

Select the endpoint for the cloud storage, and then click **Update buckets** to select the buckets that you want to use for storage backup, copy, and archive operations. The buckets that you select depend on the backup configuration that you want to use.

If you are backing up container workloads, you can use cloud storage as your primary backup storage.

If your primary backup storage location is a vSnap server, you can use cloud storage as a copy or archive location.

#### **Backup object storage bucket**

Select a bucket to serve as the backup storage target.

#### **Standard object storage bucket**

Select a bucket to serve as the copy target.

#### **Archive object storage bucket**

Select a cloud storage resource to serve as the archive target.

Archiving data creates a full data copy and can provide longer-term protection, cost, and security benefits.

6. Review your selections, and then click **Submit**.

The cloud storage is added to the cloud servers table.

## Adding S3 compatible object storage

You can add the S3 compatible storage providers that are listed in [technote 1087149](#). Support for S3 compatible providers is based on external certification processes.

### Before you begin

Configure the key that is required for the cloud object. For instructions, see [Adding an access key](#).

Ensure that cloud storage buckets are available. For more information about cloud storage buckets, see the documentation for the S3 compatible storage provider.

### Procedure

To add S3 compatible cloud storage as a backup target, complete the following steps:

1. In the navigation panel, click **System Configuration > Storage > Cloud storage**.
2. Click **Add cloud storage**.
3. Click **S3 Compatible Storage**, and then click **Next**.
4. Complete the fields on the **Cloud details** page, and then click **Next**:

#### Name

Enter a meaningful name to identify the cloud storage.

#### Use existing access key

Enable this option to select a previously entered key for the storage, and then select the key from the **Select a key** list.

If you do not select this option, complete the following fields to add a key:

#### Key name

Enter a meaningful name to identify the key.

#### Access key

Enter the S3 compatible access key. For instructions about obtaining access keys, see the documentation for the S3 compatible storage provider.

#### Secret key

Enter the S3 compatible secret key. For instructions about obtaining access keys, see the documentation for the S3 compatible storage provider.

#### Certificate

Select the appropriate option to add a certificate for the S3 compatible storage:

##### Upload

To upload a certificate, click **Browse** to locate and select the certificate. Click **Upload**.

##### Copy and paste

Enter a name for the certificate and paste the certificate into the text area. Click **Create**.

##### Use existing

If a certificate exists, select the certificate from the **Select a certificate** list.

5. Complete the fields on the **Get buckets** page, and then click **Next**:

#### Endpoint

Enter the endpoint path for the cloud storage, and then click **Update buckets** to select the buckets that you want to use for storage backup, copy, and archive operations. The buckets that you select depend on the backup configuration that you want to use.

If you are backing up container workloads, you can use cloud storage as your primary backup storage.

If your primary backup storage location is a vSnap server, you can use cloud storage as a copy or archive location.

**Backup object storage bucket**

Select a bucket to serve as the backup storage target.

**Standard object storage bucket**

Select a bucket to serve as the copy target.

**Archive object storage bucket**

Select a cloud storage resource to serve as the archive target.

Archiving data creates a full data copy and can provide longer-term protection, cost, and security benefits.

6. Review your selections, and then click **Submit**.

The cloud storage is added to the cloud servers table.

## Editing settings for cloud storage

Edit the settings for a cloud storage provider to reflect changes in your cloud environment.

### Procedure

To edit a cloud storage provider, complete the following steps:

1. In the navigation panel, click **System Configuration > Storage > Cloud storage**.
2. Select the cloud storage provider, and then click **Edit** to open the **Edit cloud storage** wizard.
3. Revise the settings for the cloud provider, and then click **Save**.

## Deleting cloud storage

Delete a cloud storage provider to reflect changes in your cloud environment. Ensure that the provider is not associated with any SLA policies before deleting the provider.

### Before you begin

**Attention:** Deleting a cloud storage provider could result in a loss of data. Ensure that any required data is backed up before you delete the cloud storage provider.

### Procedure

To delete a cloud storage provider, complete the following steps:

1. In the navigation panel, click **System Configuration > Storage > Cloud storage**.
2. Select the cloud storage provider, and then click **Remove**.
3. Click **Yes** to delete the provider.

## Managing repository server storage

---

You can copy data to a repository server for longer-term data protection. The repository server must be IBM Storage Protect server 8.1.7 or later to copy data to standard object storage. To copy data to tape, IBM Storage Protect server 8.1.8 or later is required.

You can choose to replicate the IBM Storage Protect Plus data that is copied to the IBM Storage Protect server to a target server. However, IBM Storage Protect Plus is not aware of subsequent IBM Storage Protect server replication operations and you cannot restore the replicated data from the target IBM Storage Protect server to IBM Storage Protect Plus.

## Configuration for copying or archiving data to IBM Storage Protect

If you are planning to copy or archive IBM Storage Protect Plus data to an IBM Storage Protect server, there are three possible configurations. Choosing which one to configure depends on which scenario applies to your data protection needs. For each scenario, there are steps that are required in both the IBM Storage Protect Plus and IBM Storage Protect server environments to complete the setup.

### Tasks for configuring IBM Storage Protect

You must configure the IBM Storage Protect server to communicate with the IBM Storage Protect Plus server, and to enable process requests for backup and restore operations. The Amazon Simple Storage Service (S3) protocol enables communication between the two servers.

User scenario	Purpose	Steps
Copying to standard object storage when you are running daily or less frequent copies to standard object storage.	Copy data to standard object storage. In the first copy operation, a full backup copy is created. Subsequent copies are incremental. Copying data to standard object storage is useful if you want relatively fast backup and recovery times and do not require the longer-term protection, cost, and security benefits that are provided by tape storage.	To copy data to standard object storage to the IBM Storage Protect server, you must create a cloud-container or directory-container storage pool, and set up the object agent component of IBM Storage Protect. Adding the object agent is a mandatory step. In addition to setting up the required storage pool, follow steps 2-4 listed, <a href="#">here</a> .
Copying to tape when you are creating a weekly or less frequent full-copy of your data to tape storage.  <b>Important:</b> Archiving data to tape cannot be run more frequently than once a week. Recovery time objectives (RTO) should be considered when recovering data from archive copies in your disaster recovery action plan. Therefore, for disaster recovery, recovering from archive data should only be used as a last resort.	When you copy data to tape, a full copy of the data is created at the time of the copy process. Copying data to tape provides extra security benefits. By storing tape volumes at a secure, offsite location that is not connected to the internet, you can help to protect your data from online threats such as malware and hackers. However, because copying to these storage types requires a full data copy, the time that is required to copy data increases. In addition, the recovery time can be unpredictable and the data might take longer to process before it is usable. Some of the data may be duplicated on the tape storage pool and cache storage pool.	To copy data to tape, you must create a tape storage pool first and then you must create a disk storage pool which is where the cold-data-cache storage pool will reside on the IBM Storage Protect server. Adding the object agent is a mandatory step. Follow steps 1-4 listed, <a href="#">here</a> .

User scenario	Purpose	Steps
Mixture of both standard object storage and long-term copying to tape	Secure your data in incremental backups on the IBM Storage Protect server, as well as retaining data on tape for longer term security.	This is a combination of the previous cases: data is stored to tape and data is stored on standard object storage at the IBM Storage Protect server. As well as setting up the required data storage pools for both scenarios, the creation of an object agent is mandatory.

The four steps required to set up and configure the data transfer communication between IBM Storage Protect Plus and the IBM Storage Protect server are as follows:

1. If you are setting up storage pools for copying data to tape follow Step1. Create storage pools on the IBM Storage Protect server by using the IBM Storage Protect Operations Center. For instructions, see [“Step 1: Creating a tape storage pool and a cold-data-cache storage pool for copying data to tape”](#) on page 66. This step is required only if you are setting IBM Storage Protect for archiving with copies run once a week or less frequently.
2. Create a policy domain that points to the storage pool or pools. The policy domain defines the rules that control the backup services for IBM Storage Protect Plus. For instructions, see [“Step 2: Configuring an object policy domain”](#) on page 68.
3. If you are copying data to a standard storage pool or to tape, you must add standard object storage on the IBM Storage Protect server. For instructions, see [“Step 3: Setting up standard object storage”](#) on page 70.
4. Add an object agent on the IBM Storage Protect server. The object agent provides a gateway between the IBM Storage Protect Plus server and the IBM Storage Protect server. For instructions, see [“Step 4: Adding an object agent for copying data ”](#) on page 72.
5. To complete the setup, you must add an object client on the IBM Storage Protect server. The object client identifies the IBM Storage Protect Plus server and enables it to store objects at the IBM Storage Protect server. The same credentials as those that you used for IBM Storage Protect Plus are used for the object client, which is the object client that is associated with the policy domain as set up in Step 2. For instructions to set up an object client, see [“Step 5: Adding and configuring an object client for copying data”](#) on page 74.

**Tip:** Alternatively, enter the **DEFINE STGPOOL** command to create a storage pool as described in the following topics:

## What to do next

1. After you complete the tasks required for IBM Storage Protect storage, you must add the IBM Storage Protect server to IBM Storage Protect Plus. For information about how to do this, follow the instructions in [“Registering a repository server as a backup storage provider”](#) on page 76.
2. When that is done, you can create an SLA policy that defines the IBM Storage Protect server as the backup storage target. For more information to help you choose which type of policy you need, see [Managing SLA policies for backup operations](#).

## Step 1: Creating a tape storage pool and a cold-data-cache storage pool for copying data to tape

Before you can copy data from IBM Storage Protect Plus to the IBM Storage Protect server for archiving purposes, you must configure an object agent service. For long-term archiving of data, you must configure

a cold data storage pool. If you are not planning to archive data to tape on the IBM Storage Protect server, you can skip this step.

## About this task

Before you start, ensure that you have sized your cold cache storage needs by using the sizing tool and the Blueprints. For information about how to do this, see the [Blueprints](#).

Object client data that is specified with an S3 Glacier storage class is not frequently accessed. To enable the copying of this data, which is often called *cold data*, to tape storage, the data is written temporarily to a storage pool that meets the requirements for handling object data. The data is then moved to the tape device or VTL. This storage pool, called a *cold-data-cache storage pool*, is assigned to a policy domain for object clients. Only data from object clients can be written to or restored from a cold-data-cache storage pool.

## Procedure

If you are not using the Operations Center, you can use the **define stgpool** command. The command can be defined as follows:

```
define stgpool NAME
stgtype=colddatacache
```

**Note:** To configure standard pools for object storage, follow these steps but when you define the type of storage pool, select Standard.

To configure the IBM Storage Protect server to copy data from an object client to physical tape media or a VTL, complete the following configuration steps:

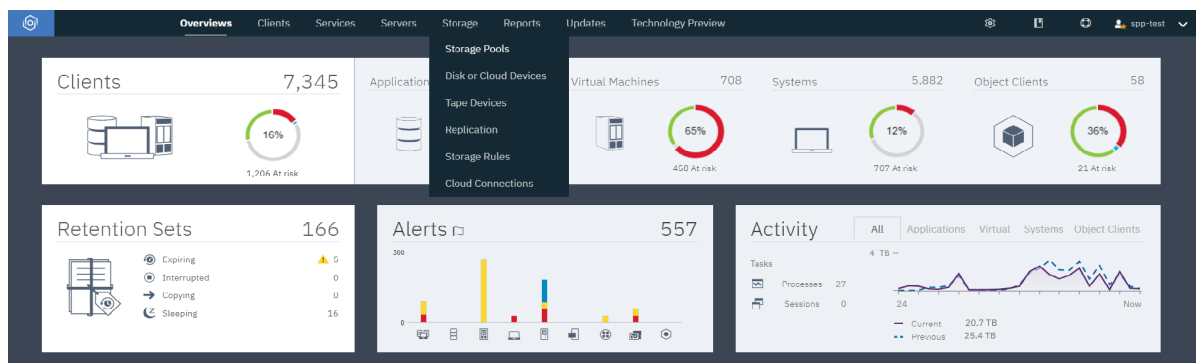

1. On the IBM Storage Protect server, configure a primary storage pool that represents a tape device or VTL. This primary storage pool is the destination for the object data that you want to copy.

Later, when you define the cold-data-cache storage pool, you must specify this tape pool as the next storage pool for the cold-data-cache pool.

**Restrictions:** The following restrictions apply to the tape storage pool:

- You cannot replicate object client data to or from the tape storage pool.
- The tape storage pool cannot be deduplicated.
- A next storage pool cannot be specified for the tape storage pool.

- a) On the Operations Center menu bar, click **Storage > Storage Pools**.

- b) On the **Storage Pools** page, click **Storage Pool**.
  - c) In the **Add Storage Pool** wizard, select **Object Client** to enable object clients to copy data to tape.
2. Step through the wizard steps to configure a cold-data-cache storage pool.

A cold-data-cache storage pool consists of one or more file system directories on disk. It is an intermediary storage pool between the object client and a tape device or VTL and is linked to the primary sequential access storage pool that represents the tape device or VTL. Identify one or more

existing file system directories for temporary disk storage and the primary sequential access storage pool that represents the tape device or VTL.

3. On the **Cold Data Cache** page, specify one or more existing file system directories for disk storage. Enter a fully qualified path name that conforms to the syntax that is used by the server operating system.

For example, enter `c:\temp\dir1\` for Microsoft Windows, or `/tmp/dir1/` for UNIX.

The object data is stored in sequential volumes in the file system directories. An object client can copy infrequently accessed data, or cold data, to physical tape media or to a VTL. When an object client copies cold data, the data is first stored in the cold data cache. The data is then migrated, without a migration delay, to the primary tape storage pool that represents the physical tape media or VTL. After the data is migrated to tape, it is deleted from the cold data cache. The cold data cache is used as a staging area for restoring cold data to the object client. During restore operations, the data is copied to the cold data cache. The data remains in the cold data cache for a period that is specified by the object client. Data is restored to the object client from the cold data cache, and not directly from the tape or VTL.

If you specify multiple directories for performance enhancement, ensure that the directories correspond to separate physical volumes. Although the cold data cache is used for temporary storage, it must be large enough to hold the data that is copied from the object client before the data is migrated to tape. It must also be large enough to hold data during restore operations for the period that is specified by the object client.

## What to do next

When you complete the configuration of the cold data cache storage pool, create the object domain. For instructions about how to do that, see [“Step 2: Configuring an object policy domain” on page 68](#).

## Step 2: Configuring an object policy domain

Before you copy data from IBM Storage Protect Plus to the IBM Storage Protect server, you must create and configure an object policy domain. The policy domain defines the rules that control the backup services for IBM Storage Protect Plus. You must add a standard storage pool which is with a directory or cloud container based storage for copies, and a cold pool if you are copying data to tape or archiving data.

## Procedure

1. Verify the settings for the policy domain that you plan to use for copying data. Object clients that are defined or updated in the IBM Storage Protect server 8.1.8 or later must be assigned to policy domains that are created with the **DEFINE OBJECTDOMAIN** command. An object client node is associated with this policy domain when the node is registered or updated with the **REGISTER NODE** or **UPDATE NODE** command.

**Restriction:** Beginning with IBM Storage Protect server 8.1.8, all new object client nodes must be assigned to object policy domains.

For object client nodes that were assigned to non-object policy domains before v8.1.8, you do not have to update the assignment after you upgrade the server to IBM Storage Protect server 8.1.8. However, if any update to the object client node's domain is required, the node must be assigned to an object policy domain.

2. Review the following considerations for specifying policy domains for copy operations.
  - For IBM Storage Protect server, a policy domain can specify management classes for standard storage pools (cloud-container or directory-container storage pools), cold-data-cache storage pools, or both standard and cold-data-cache storage pools.

However, to copy data from IBM Storage Protect Plus, you must specify the following management classes depending on whether you are copying data to a cloud-container or directory-container storage pool or are copying data to a cold-data-cache storage pool for storage on physical tape media or in a virtual tape library (VTL):

- To copy data to a cloud-container or directory-container storage pool, use the **STANDARDPOOL** parameter to define the storage pool for the policy domain as shown in the following example:

```
define objectdomain mydomain standardpool=hotpool
```

- To copy data to a cold-data-cache storage pool, you must specify both a standard pool and a cold pool for the policy domain. A standard pool is required to store metadata that is used for restore and other IBM Storage Protect Plus operations. To define a cold-data-cache storage pool for the policy domain, use the **COLDPOOL** parameter, as shown in the following example:

```
define objectdomain mydomain standardpool=hotpool coldpool=coldpool
```

- All objects are uniquely named. There are no inactive versions of objects. When you define a policy domain, the following Storage Management policies are specified automatically:
  - The Versions Data Exists field is set to 1.
  - The Retain Extra Versions and the Retain Only Version fields are set to 0.
- The IBM Storage Protect Plus server controls the time when objects are deleted.

### Example: Display detailed information about a policy domain for an IBM Storage Protect Plus copy operation

When the policy domain was created, it was assigned management classes and copy groups. You can use the **QUERY COPYGROUP** command to view information about the destination storage pools for the policy domain. In the following example, the policy domain name is XYZ. The destination storage pools are HOTPOOL and COLDPOOL.

```
query copygroup xyz standard f=d
```

```

Policy Domain Name: XYZ
Policy Set Name: STANDARD
Mgmt Class Name: COLD
Copy Group Name: STANDARD
Copy Group Type: Backup
Versions Data Exists: 1
Versions Data Deleted: 1
Retain Extra Versions: 0

## What to do next

After you create the object domain, proceed to the next step [“Step 3: Setting up standard object storage”](#) on page 70.

## Step 3: Setting up standard object storage

To set up standard object storage for copying data from IBM Storage Protect Plus to the IBM Storage Protect server, log in to the Operations Center and follow the procedure to set up storage pools. Complete the process by following the steps to create an object agent service by using the Operations Center wizard.

### Before you begin

Before you start you must set up storage pools for standard storage or for copying to tape. If you are copying to tape, you must set up the cold data cache storage pool, and for standard object storage you must create and configure storage pools as required. For instructions about how to set up the cold data cache storage pool, see [“Step 1: Creating a tape storage pool and a cold-data-cache storage pool for copying data to tape”](#) on page 66.

### Procedure

1. Create a directory-container storage pool by completing the following steps:

a) On the Operations Center menu bar, click **Storage > Storage Pools**.

b) On the **Storage Pools** page, click **Storage Pool**.

c) Complete the steps in the **Add Storage Pool** wizard.

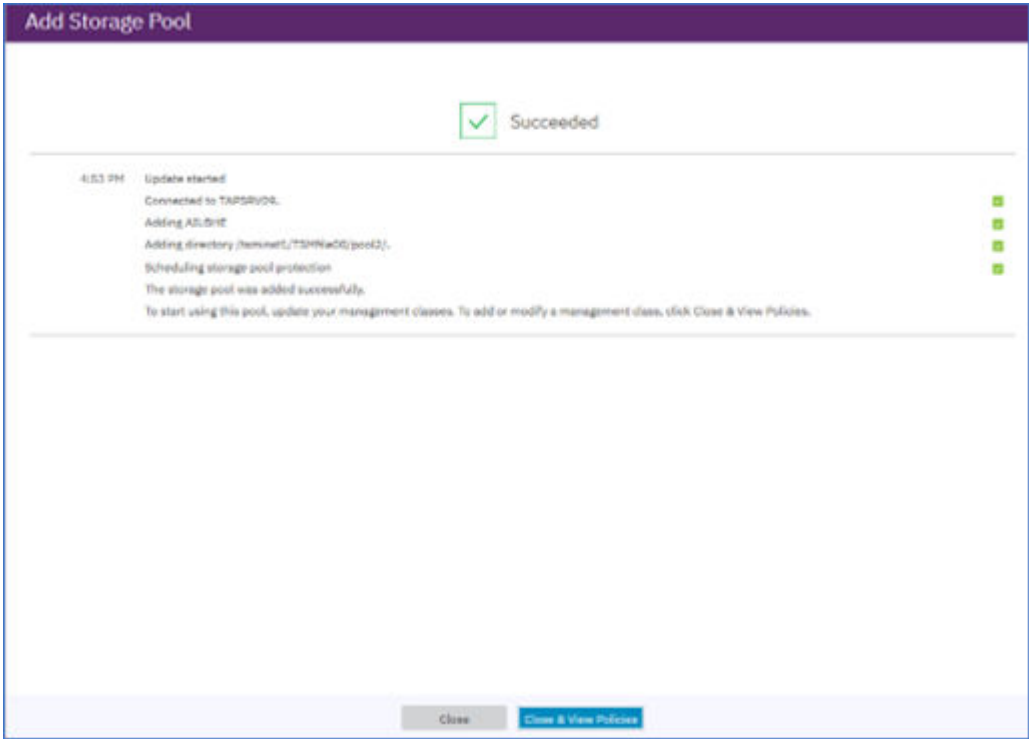

**Tip:** Select **Directory** for the type of container-based storage, and add directories with the + icon. Click **Next** to continue.

d) Review the **Protect Pool** summary, and click **Next**.

e) Specify an overflow pool is that is required.

f) Click **Add Storage Pool** to complete the creation of the storage pool.

If the operation was successful, you will see an icon to indicate success with a summary of the

storage pool.

2. In the **Services > Policies** page, select a policy, and click **Details**.

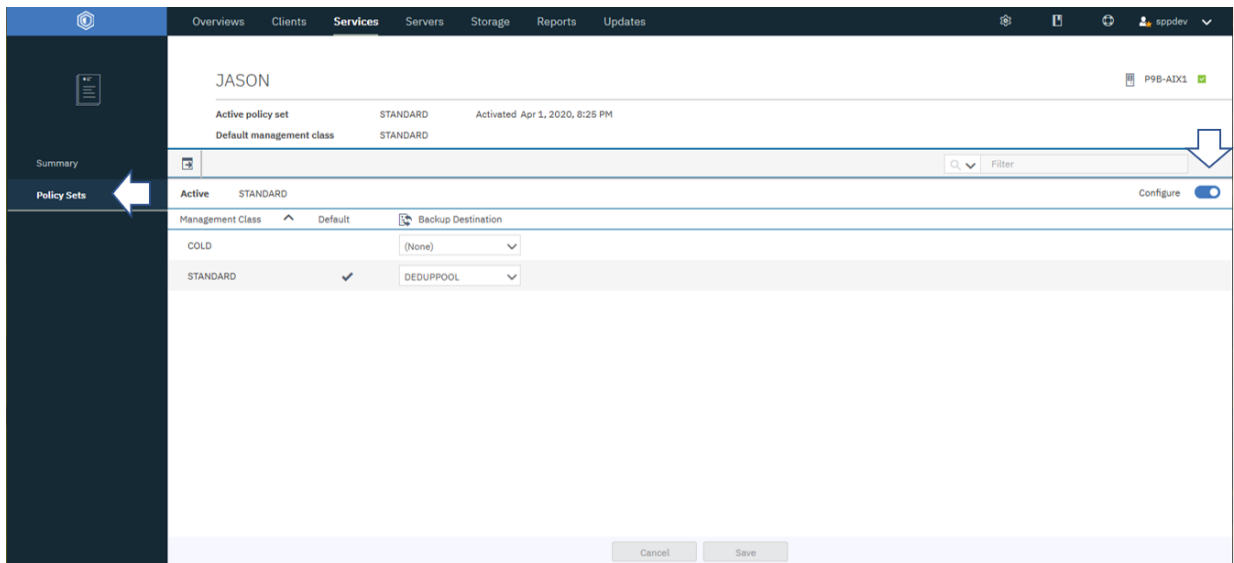

Navigation: Overview Clients **Services** Servers Storage Reports Updates Technology Preview

▼ Policies

Backup & Restore Archive & Retrieve Migrate & Recall

Policy Domain	Server	Clients	Mgmt Classes	Option Sets	Schedules	Default Mgmt Class	Backup Destination	Archive Destination
207695	ION	1	1	0	0	207695	207695	207695
ADP	PROTO	1	4	0	0	LTOSPOOL	LTOSPOOL	
APITESTDOM	PROTO	3	6	1	0	NOTHING1	BACKUPPOOL	ARCHIVEPOOL

- You can edit an existing domain policy by following these steps:
    - Update one or more management classes to use the new pool by editing the **Backup Destination** field of the table.
    - Click **Save**.
  - Or, you can create a new domain by running the **define objectdomain** command. For more information, see the previous step “Step 2: Configuring an object policy domain” on page 68.
3. On the **Details** page, click **Policy Sets**. Click the **Configure** toggle to make the policy sets editable.

4. Change the Backup Destination to the newly created storage pool, or add a new management class,

to point to the new storage pool.

5. Click **Activate**.

Changing the active policy set might result in data loss. A summary of the differences between the active policy set and the new policy set is displayed before the change is made.

6. Review the differences between corresponding management classes in the two policy sets, and consider the consequences on client files. Client files that are bound to management classes in the currently active policy set are, after activation, bound to the management classes with the same names in the new policy set.
7. Identify management classes in the currently active policy set that do not have counterparts in the new policy set, and consider the consequences on client files. Client files that are bound to these management classes are, after activation, managed by the default management class in the new policy set.
8. If the changes implemented by the policy set are acceptable, select the **I understand that these updates can cause data loss** checkbox and click **Activate**.

## What to do next

Create and configure an object client for the storage pool or pools you created. For more information, see [“Step 5: Adding and configuring an object client for copying data” on page 74](#)

## Step 4: Adding an object agent for copying data

Before you can copy data from IBM Storage Protect Plus to the IBM Storage Protect server, you must add and configure the object agent. This step is the fourth step in setting up IBM Storage Protect Plus with the IBM Storage Protect server for archiving data or copying data to object storage.

## Before you begin

Ensure that the following steps are complete before you start to create the object client.

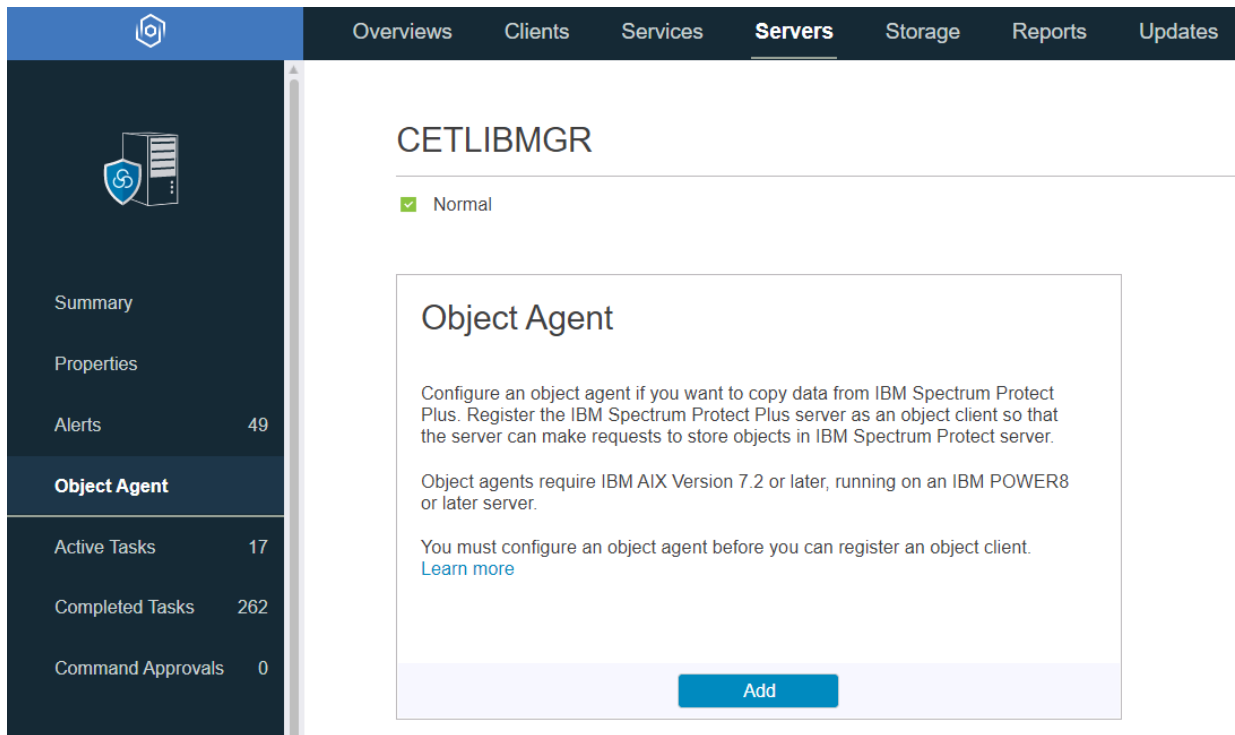

1. Ensure that you are logged in to the IBM Storage Protect server with an instance user ID.
2. Ensure that you have set up storage pools either for standard storage or for copying to tape. For instructions, see [“Step 1: Creating a tape storage pool and a cold-data-cache storage pool for copying data to tape” on page 66](#) or [“Step 3: Setting up standard object storage” on page 70](#).
3. Ensure that you have created an object domain.

## About this task

This procedure is based on an environment where the IBM Storage Protect server is installed on an IBM AIX® operating system AIX Version 7.2 TL 1 and SP 4 or later, running on an IBM POWER8 or later server. (LINK TO a previous version)

## Procedure

1. On the Operations Center menu bar, click **Servers** .
2. Select a server and click **Details**.
3. From the navigation panel, click **Object Agent**; click **Add** to add an object agent.

**Tip:** If you are using the command line, run the **DEFINE SERVER** command to create an object agent. Specify OBJECTAGENT=YES. Follow the instructions in the command output. When these actions are completed, the object agent service automatically starts on the system that is hosting the IBM Storage Protect server.

4. To authenticate to the object agent, use the certificate that is generated.

5. Install the object agent service by running the command that can be copied from the wizard like in the following examples:

```
[root@servername-os: /]# /opt/tivoli/tsm/server/bin/spObjectAgent service install
/home/tsminst1/tsminst1/SPP0BJAGENT/spObjectAgent_SPP0BJAGENT_1500.config
2020-03-31 15:50:07.631021 I | Installed and started system service as
nameportnumberobjectagentname
```

Here is an example

```
[root@p9b-aix1: /]# /opt/tivoli/tsm/server/bin/spObjectAgent service install
/home/tsminst1/tsminst1/SPP0BJAGENT/spObjectAgent_SPP0BJAGENT_1500.config
2020-03-31 15:50:07.631021 I | Installed and started system service as spoa9000SPP0BJAGENT
```

6. Complete the configuration by starting an object agent service by running the **startObjectAgent** command. Here is an example for **AGENTOBJECTA** object agent.

```
"/opt/tivoli/tsm/server/bin/spObjectAgent" service install
"/home/tsminst1/tsminst1/AGENTOBJECTA/spObjectAgent_AGENTOBJECTA_1500.config"
```

7. Set up the object agent service to start automatically on startup by running a command similar to the following command for AIX:

```
spobj:2:once:/usr/bin/startsrc -s nameportnumberobjectagentname
```

Here is an example:

```
spobj:2:once:/usr/bin/startsrc -s spoa9000SPP0BJAGENT
```

## Step 5: Adding and configuring an object client for copying data

Before you can copy data from IBM Storage Protect Plus to the IBM Storage Protect server, you must configure the object client. This step is the last step in setting up the IBM Storage Protect server for archiving and copying of data with the Operations Center.

### Before you begin

Ensure that the following steps are complete before you start to create the object client.

1. Ensure that you are logged in to the IBM Storage Protect server with an instance user ID.
2. Ensure that the storage pools for either standard storage or for copying to tape are set up and ready. For instructions, see [“Step 1: Creating a tape storage pool and a cold-data-cache storage pool for copying data to tape” on page 66](#) or [“Step 3: Setting up standard object storage” on page 70](#).
3. Ensure that an object domain and an object agent are created before you start.

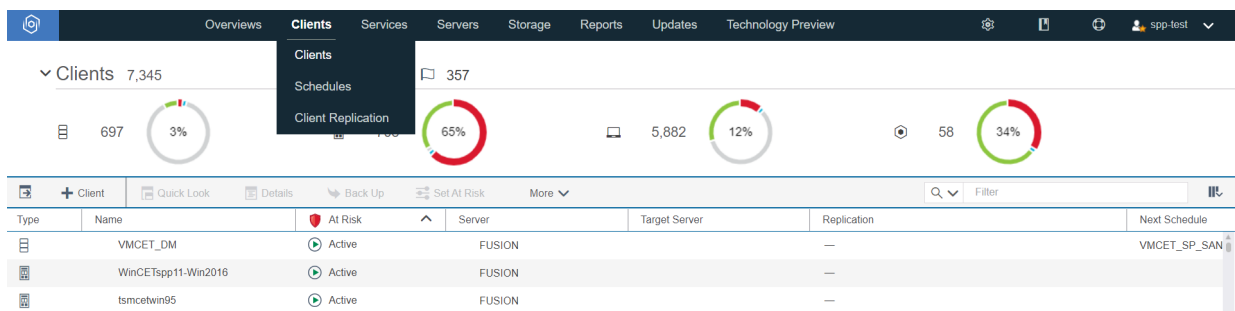

**Tip:** If you create an object client before you create the corresponding object agent, the **Add Client** wizard forces the creation of the object agent.

## About this task

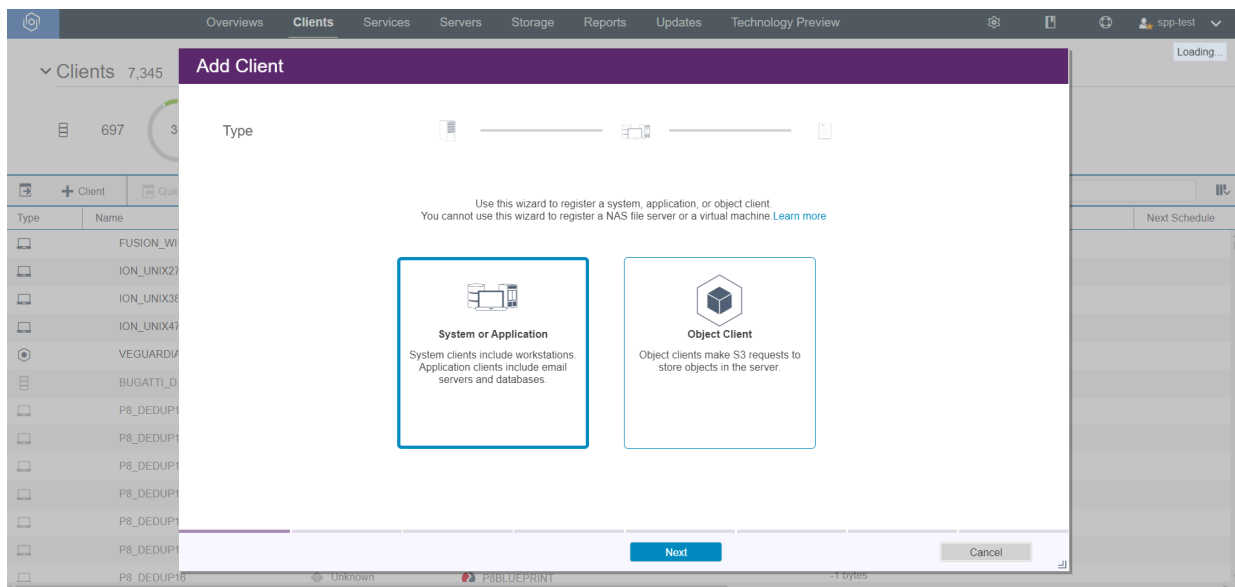

This procedure is based on an environment where the IBM Storage Protect server is installed on an IBM AIX operating system AIX Version 7.2 TL 1 and SP 4 or later, running on an IBM POWER8 or later server.

## Procedure

1. On the Operations Center menu bar, click **Clients**.

2. Click **Client** to add a client as shown.

3. Select **Object Client** and click **Next** to start the **Add Client** wizard.

In the wizard screens, you are asked for to make the following choices and definitions for the client you are setting up.

- You can also choose to enable replication for this client.
- You must assign a client name and contact name, and an email address for reporting which you define in the final step of the wizard.
- You must assign a policy domain, which you set up in step 2, [“Step 2: Configuring an object policy domain” on page 68](#).

- You can define at risk reporting for the client, such as a once-a-day report to the email address that you specified.

#### 4. Click **Add Client**.

##### **Note:**

After the process finishes, you are provided with the endpoint for communicating with the object agent on the server, the access key ID, the secret access key, and the certificate for connecting securely. When IBM Storage Protect Plus is an object client, it directs requests to the endpoint, and uses this information in the form of the access key ID, the secret access key, and the secure certificate.

**Important:** Ensure that a copy of each credential is saved to a secure location.

**Tip:** If you are using the command line, run the **REGISTER NODE** command to create an object client. Specify TYPE=OBJECTCLIENT. The script runs under the instance user ID.

## What to do next

As a next step, you must register the IBM Storage Protect server as a repository server. For information about how to do this, see [“Registering a repository server as a backup storage provider”](#) on page 76. Once that is completed, you can create SLA policy jobs to copy data to the IBM Storage Protect server for standard storage or for archive to tape.

## Registering a repository server as a backup storage provider

Add and register a repository server to enable IBM Storage Protect Plus to copy data to the server.

### Before you begin

Configure the key and certificate that are required for the repository server. For instructions, see [Adding an access key](#) and [Adding a certificate](#).

For the current release of IBM Storage Protect Plus, the repository server must be an IBM Storage Protect server.

Configure IBM Storage Protect Plus as an object client to the IBM Storage Protect server. The object client node transfers and stores copied data. After you complete the setup procedure, the wizard provides you with the endpoint for communicating with the object agent on the server, and the access ID, secret key, and certificate for connecting securely.

**Important:** Each IBM Storage Protect Plus server must be registered as its own object-client node in the IBM Storage Protect server.

Certificates can be obtained from the IBM Storage Protect server Operations Center by navigating to the following pane: **Server > Object Agent > Agent Certificate**. Alternatively, the certificate can be obtained from the IBM Storage Protect Plus appliance by running the following command: `openssl s_client -showcerts -connect <ip-address>:9000 </dev/null 2>/dev/null | openssl x509`

Copy retention settings are fully controlled through associated SLA policies in IBM Storage Protect Plus. IBM Storage Protect server copygroup retention settings are not used for copy operations.

## Procedure

To add and register an IBM Storage Protect server as a backup storage provider, complete the following steps:

1. In the navigation panel, click **System Configuration > Storage > Repository servers**.
2. Click **Add repository server** to open the **Add repository server** wizard.
3. Complete the fields on the **Repository server details** page, and then click **Next**:

##### **Name**

Enter a meaningful name to identify the repository server.

**Hostname**

Enter the high-level address (HLA) of the repository server object agent.

**Tip:** To retrieve the HLA, run the following command from the IBM Storage Protect server:

**query server server\_name format=detailed**

where *server\_name* specifies the object agent.

**Port**

Enter the communications port of the repository server.

**Use existing key**

Enable to select a previously entered key for the repository, and then select the key from the **Select a key** list.

If you do not select this option, complete the following fields to add a key:

**Key name**

Enter a meaningful name to identify the key.

**Access key**

Enter the access key.

**Secret key**

Enter the secret key.

**Certificate**

Select a method of associating a certificate with the resource. If copying the certificate, the BEGIN and END lines of text must be included.

**Upload**

Select and click **Browse** to locate the certificate, and then click **Upload**.

**Copy and paste**

Select to enter the name of the certificate, copy and paste the contents of the certificate, and then click **Create**.

**Use existing**

Select to use a previously uploaded certificate.

4. Review your selections, and then click **Submit**.

The repository server is added to the servers table.

**Related concepts**

[“Configuration for copying or archiving data to IBM Storage Protect” on page 5](#)

If you are planning to copy or archive IBM Storage Protect Plus data to an IBM Storage Protect server, there are three possible configurations. Choosing which one to configure depends on which scenario applies to your data protection needs. For each scenario, there are steps that are required in both the IBM Storage Protect Plus and IBM Storage Protect server environments to complete the setup.

**Editing settings for a repository server**

Edit the settings for a repository server provider to reflect changes in your cloud environment.

**Procedure**

To edit a repository server provider, complete the following steps:

1. In the In the navigation panel, click **System Configuration > Storage > Repository servers**.
2. Revise the settings for the repository server provider, and then click **Save**.
3. Select the server, and then click **Edit**.

The **Editing** pane is displayed.

## Deleting a repository server

Delete a repository server provider to reflect changes in your environment. Ensure that the provider is not associated with any SLA policies before deleting the provider.

### Before you begin

**Attention:** Deleting a repository server could result in a loss of data. Ensure that any data that you require is backed up before you delete the repository server.

### Procedure

To delete a repository server provider, complete the following steps:

1. In the In the navigation panel, click **System Configuration > Storage > Repository servers**.
2. Select the server, and then click **Remove**.
3. Click **Yes** to delete the provider.

---

## Chapter 7. vSnap server administration reference

After the vSnap server is installed, registered, and initialized, IBM Storage Protect Plus automatically manages its use as a backup target. Volumes and snapshots are created and managed automatically based on the SLA policies that are defined in IBM Storage Protect Plus.

You might have to configure and administer certain aspects of vSnap, such as network configuration or storage pool management.

### Managing vSnap by using the command line interface

The vSnap server can be managed through the command-line interface and is the primary means of administering a vSnap server. Run the **vsnap** command from the vSnap server's interface after connecting through SSH using the user ID `serveradmin` or any other operating system user who has been assigned vSnap admin privileges. The initial `serveradmin` password is `sppDP758-SysXyz`. You are prompted to change this password during the first login. Certain rules are enforced when creating a new password. For more information, see the password requirement rules in [“Start IBM Storage Protect Plus” on page 13](#).

The command line interface consists of several commands and sub-commands that manage various aspects of the system. You can also pass the **--help** flag to any command or subcommand to view usage help, for example, **vsnap --help** or **vsnap pool create --help**.

### Managing vSnap by using the IBM Storage Protect Plus user interface

Some common operations can be completed from the IBM Storage Protect Plus user interface. Log in to the user interface and click **System Configuration > Storage > vSnap servers** in the navigation panel. Select a vSnap server, and then click **Manage** to configure the server settings.

#### Related tasks

[“Managing vSnap servers” on page 35](#)

Each vSnap server is a stand-alone appliance, which is deployed virtually or installed physically on a system that meets the minimum requirements. Each vSnap server in the environment must be registered in IBM Storage Protect Plus so that the server is recognized.

[“Configuring advanced storage options” on page 53](#)

You can set advanced storage-related options for the primary or secondary backup storage in your environment.

---

## Storage management

You can create and manage storage pools for a vSnap server. You can also manage the cache and the log files for the server.

### Managing disks

The vSnap server creates a storage pool by using the disks that are provisioned to the vSnap server. In the case of virtual deployments, the disks can be RDM or virtual disks provisioned from datastores on any backing storage. In the case of physical deployments, the disks can be local or be attached to the physical server in a storage area network (SAN). The local disks might already have external redundancy enabled via a hardware Redundant Array of Independent Disks (RAID) controller, but if not, the vSnap server can create RAID-based storage pools for internal redundancy.

**Attention:** Disks that are attached to vSnap servers must be thick provisioned. If disks are thin provisioned, the amount of free space in the storage pool might not be adequately reported. This situation might lead to data corruption if the underlying datastore runs out of space.

After a disk is added to a storage pool, do not remove the disk. Removing the disk will corrupt the storage pool.

If the vSnap server was deployed as part of a virtual appliance, the appliance already contains a 100 GB starter virtual disk. For instructions about managing this disk, see the [Blueprints](#). You can add more disks before or after creating a pool and accordingly use them to create a larger pool or expand an existing pool. If job logs report that a vSnap server is reaching its storage capacity, additional disks can be added to the vSnap pool. Or you can create an SLA policy and specify that backup operations use an alternative vSnap server as the target.

You can prevent data corruption, which can occur when a VMware datastore on a vSnap server reaches its capacity. Create a stable environment for virtual vSnap servers that use RAID configurations and utilize thick provisioned VMDKs. By replicating data to external vSnap servers, you can provide additional protection.

A vSnap server will become invalidated if the vSnap pool is deleted or if a vSnap disk is deleted. All data on the vSnap server will be lost. If your vSnap server becomes invalidated, you must unregister the vSnap server by using the IBM Storage Protect Plus interface, and then run the maintenance job. When the maintenance job is complete, register the vSnap server again.

## Enabling encryption

To enable encryption of backup data on a vSnap server, select **Initialize with encryption enabled** when you initialize the server. Encryption settings cannot be changed after the server is initialized and a pool is created. All disks of a vSnap pool use the same encryption key file, which is generated upon pool creation. Data is encrypted when at rest on the vSnap server.

vSnap encryption utilizes the following algorithm:

**Cipher name**

Advanced Encryption Standard (AES)

**Cipher mode**

xts-plain64

**Key**

256 bits

**Linux Unified Key Setup (LUKS) header hashing**

sha256

## Managing encryption keys

The disk encryption key files that are generated during pool creation are stored under the directory `/etc/vsnap/keys/` on each vSnap server. For disaster recovery purposes, back up the key files manually to another location outside of the vSnap server. After a pool is created, use the following commands as the `serveradmin` user to copy the keys to a temporary location and then copy them to a secure backup location outside the vSnap host. Complete the following steps:

1. Create a directory to which the keys will be backed up:

```
$ mkdir /tmp/keybackup-$(hostname)
```

2. Copy the key files to the temporary location:

```
$ sudo cp -r /etc/vsnap/keys /tmp/keybackup-$(hostname)
```

3. Copy the `keybackup-<hostname>` directory to a secure backup location outside of the vSnap host.

## Detecting disks

If you add disks to a vSnap server, use the command line or the IBM Storage Protect Plus user interface to detect the newly attached disks.

**Command line:** Run the **\$ vsnap disk rescan** command.

**User interface:** In the navigation panel, click **System Configuration > Storage > vSnap servers**. Then, click **Manage**. Open the **Storage disk** tab, and then click **Rescan**.

## Showing disks

To view a list of all disks in the vSnap system, run the **\$ vsnap disk show** command.

The USED AS column in the output shows whether each disk is in use. Any disk that is unformatted and unpartitioned is marked as unused. All other disks are marked as used.

Only disks that are marked as unused can be used to create a storage pool or be added to a storage pool. If a disk that you plan to add to a storage pool is not marked as unused, it might be because the disk was previously in use and thus contains remnants of an older partition table or file system. You can correct this issue by using system commands like **parted** or **dd** to wipe the disk partition table.

## Showing storage pool information

To view information about each storage pool, run the **\$ vsnap pool show** command.

## Creating a storage pool

If you completed the simple initialization procedure that is described in [“Completing a simple initialization” on page 33](#), a storage pool was created automatically and the information in this section is not applicable.

To complete an advanced initialization, use the **vsnap pool create** command to create a storage pool manually. Before you run the command, ensure that one or more unused disks are available as described in [“Showing disks” on page 81](#). For information about available options, use the **--help** option for any command or subcommand.

Specify a display name for the pool and a list of one or more disks. If no disks are specified, all available unused disks are used. You can enable compression and deduplication for the pool during creation. You can also update the compression and deduplication settings later by using the **vsnap pool update** command.

The pool type that you specify during the creation of the storage pool specifies the redundancy of the pool:

### raid0

This is the default option when no pool type is specified. If this option is used, vSnap assumes that your disks have external redundancy. This setting is appropriate, for example, if you use virtual disks on a datastore that is backed by redundant storage. In this case, the storage pool has no internal redundancy.

After a disk is added to a raid0 pool, the disk cannot be removed. If you remove the disk, the pool becomes unavailable. This issue can be resolved only by destroying and re-creating the pool.

### raid5

When you select this option, the pool is comprised of one or more RAID5 group, each consisting of three or more disks. The number of RAID5 groups and the number of disks in each group depend on the total number of disks that you specify during pool creation. Based on the number of available disks, vSnap uses values that maximize total capacity while also helping to optimize redundancy of metadata.

### raid6

When you select this option, the pool is comprised of one or more RAID6 group, each consisting of four or more disks. The number of RAID6 groups and the number of disks in each group depend on the total number of disks that you specify during pool creation. Based on the number of available disks, vSnap uses values that maximize total capacity while also helping to optimize redundancy of metadata.

## Expanding a storage pool

Before you expand a pool, ensure that one or more unused disks are available as described in [“Showing disks”](#) on page 81.

Use the command line or the IBM Storage Protect Plus user interface to expand a storage pool.

**Command line:** Run the `$ vsnap pool expand` command. For information about available options, use the `--help` option for any command or subcommand.

**User interface:** In the navigation panel, click **System Configuration > Storage > vSnap servers**. Then, click **Manage**. Open the **Storage disk** tab. The tab displays all unused disks that are detected on the system. Select one or more disks and click **Save** to add them to the storage pool.

## Managing the cache and log for storage pools

To store cache and log data for vSnap storage, use solid-state drive (SSD) flash or non-volatile memory express (NVMe) disks. By adding cache and log space to storage pools, you can help to optimize the performance of the vSnap server by decreasing redundant input and output (I/O) to the server. For more information about configuring cache and log space for storage pools, see the [IBM Storage Protect Plus Blueprints](#).

You must use the command line to add or remove the cache and log. Because the cache and log do not store data permanently, you can remove them when the pool is online. However, ensure that no backup, restore, or replication operations are occurring before you issue the remove command.

Use the following commands to add and remove the cache or log. For information about the available options for a command, use the `--help` option. For examples of these commands as used in vSnap installation and configuration steps, see the [IBM Storage Protect Plus Blueprints](#).

**Attention:** Do not remove the devices that are providing space for the log and cache from the vSnap system without first removing the log and cache from the storage pool by using the appropriate remove command.

- `vsnap pool addcache`
- `vsnap pool addlog`
- `vsnap pool removecache`
- `vsnap pool removelog`

## Installing kernel headers and tools

---

Kernel headers and tools are not installed by default. If you plan to compile and use custom drivers, modules, or other software, install the appropriate kernel header or tool on the vSnap server.

### About this task

When a vSnap server is installed or updated on RHEL 8 or later, a compatible Linux kernel version 4.18 is used. Kernel headers and tools headers and tools associated with the kernel are not installed. If you plan to compile or use custom drivers, modules, or other software, you must install the kernel packages. The Red Hat Package Manager (RPM) installers for the kernel headers and tools are available in the vSnap installation directory.

### Procedure

1. Log on to the vSnap server as the `serveradmin` user. The initial password is `sppDP758-SysXyz`. You are prompted to change this password during the first logon. Certain rules are enforced when creating a new password. For more information, see the password requirement rules in [“Start IBM Storage Protect Plus”](#) on page 13.
2. To determine the Linux kernel version, open a command line and issue the following command:

```
$ uname -r
```

The output is displayed, where *xxxx* represents the revision number of the kernel:

```
$ 3.10.xxxx
```

3. Navigate to this directory:

```
$ cd /opt/vsnap/config/pkgs/kernel/
```

4. In the directory, locate the *xxxxxxxx.rpm* file, which is the package to be installed. Be sure that the correct package is identified for the installed Linux kernel version. To install the kernel header or tool, issue the following command:

```
$ sudo yum localinstall xxxxxxxx.rpm
```

## Results

The kernel header or tool is installed.

## User management

---

You can manage vSnap server users by issuing the **vsnap user** command. This command and available options are used to create users, grant and revoke user privileges, query users, and update a user's password.

Users that are created on a vSnap server are operating system users that are added to the vSnap operating system group. Users in the vSnap operating system group are not assigned **sudo** privileges. As a result, these users require a password to run a command.

You can create a vSnap user by issuing the **create** command. In this way, you create an operating system user that is assigned to the **vsnap** group that can run vSnap commands and make API calls. Issue the **create** command:

```
$ vsnap user create
```

If running interactively, you are prompted to enter the username, password, and the password a second time for confirmation. If running non-interactively, the following options are available to the **create** command:

**--username <username>**

Enter the username of the user.

**--password <password>**

Enter the password of the user.

You can grant privileges to an existing operating system account to ensure that the user can run vSnap commands and make API calls. To grant privileges, issue the **grant** command:

```
$ vsnap user grant
```

If running interactively, you are prompted to enter the username, password, and the password a second time for confirmation. If running non-interactively, the following options are available to the **grant** command:

**--username <username>**

Enter the username of the user.

**--password <password>**

Enter the password of the user. This must be the operating system account password if the account already exists on the system.

You can revoke privileges from a user who is assigned to the **vsnap** group. The user will remain as an operating system user but will no longer be able to run vSnap commands or make API calls. To revoke privileges, issue the **revoke** command:

```
$ vsnap user revoke
```

If running interactively, you are prompted to enter the username. If running non-interactively, the following options are available to the **revoke** command:

**--username <username>**

Enter the username of the user.

To display a list of vSnap users who are part of the **vsnap** group on the vSnap server, issue the **show** command:

```
$ vsnap user show
```

A vSnap user can have the account password changed which will update that user's password on the system. Issue the **update** command:

```
$ vsnap user update
```

If running interactively, you are prompted to enter the username, old password, new password, and the new password a second time for confirmation. If running non-interactively, the following options are available to the **update** command:

**--username <username>**

Enter the username of the user.

**--password <old\_password>**

Enter the old password of the user.

**--new\_password <new\_password>**

Enter the new password of the user.

If you have already changed the vSnap system password using an external command instead of the `vsnap user update` command, then the SMB/CIFS password can be output of sync with the system password. Issue the following command to synchronize the SMB/CIFS passwords.

```
vsnap user resyncsmbpass
```

If running interactively, you are prompted to enter the username and the current system password. If running non-interactively, the following options are available to the **resyncsmbpass** command.

**--username <username>**

Enter the username of the account to be synced.

**--password <password>**

Enter the current system password of the account to be synced.

---

## Chapter 8. Resetting the serveradmin password

The `serveradmin` account is a system user account that is a preconfigured on IBM Storage Protect Plus and vSnap server. It is used to manage both of the virtual appliances. If you forget the `serveradmin` password, you must use the `root` account to reset the password. Because the password for the `root` account is not provided for deployments of IBM Storage Protect Plus or vSnap server, you must reset the `root` password and then reset the `serveradmin` through the virtual console.

### About this task

Changing the `root` password will require that the IBM Storage Protect Plus virtual appliance be rebooted.

For IBM Storage Protect Plus, the preferred method is to avoid using the `root` account and instead use the `serveradmin` account for administration purposes.

**Important:** Pick a strong password that is a minimum of 15 characters in length and must contain at least one character from each of the classes (numbers, uppercase letters, lowercase letters, and other).

### Procedure

1. Prepare to restart the IBM Storage Protect Plus virtual appliance by pausing all scheduled jobs. Then, wait for any running jobs to be completed.

**Important:** By ensuring that no jobs are running when you shut down the virtual appliance, you help to prevent possible issues.

2. Log in to the vSphere Client.
3. Restart the IBM Storage Protect Plus or vSnap server virtual appliance from the Actions menu by selecting Restart Guest OS.
4. Launch the web console. During the restart, the boot loader will appear.
5. Select the Red Hat Enterprise Linux (RHEL) 9.5 version from the list and press the **e** key.
6. Locate the line that begins with `linux /vmlinuz`. In that line, locate `ro`.
7. Replace `ro` with the following string:

```
rw init=/sysroot/bin/sh
```

8. Press **Ctrl + X** to start in single user mode. A prompt appears.
9. Enter the `chroot` command:

```
:/# chroot /sysroot
```

10. Initiate the password change for the `root` account:

```
:/# passwd root
```

11. Enter the new password for the `root` account. You will be prompted to enter the password a second time.
12. Update the Security-Enhanced Linux parameters:

```
:/# touch /.autorelabel
```

13. Exit the current context with the `exit` command:

```
:/# exit
```

14. Restart the IBM Storage Protect Plus or vSnap server virtual appliance:

```
:/# reboot
```

15. Using secure shell (SSH) or the console, log in to the IBM Storage Protect Plus or vSnap server virtual appliance with the username `root` and the password that was created in a previous step.
16. Change the `serveradmin` password with the `passwd` command at the prompt:

```
:/# passwd serveradmin
```

17. Enter the new password for the `serveradmin` account. You will be prompted to enter the password a second time.
18. Close the SSH session to the IBM Storage Protect Plus or vSnap server virtual appliance.
19. Log in to IBM Storage Protect Plus or vSnap server using the `serveradmin` account with the newly created password to verify that the new password is set.
20. **For vSnap servers only:** Run the following command to re-sync the SMB/CIFS password with the new system password. When prompted to enter the password, specify the newly created password for the `serveradmin` account.

```
vsnap user resyncsmbpass --username serveradmin
```

## Results

The `root` and `serveradmin` account passwords for the IBM Storage Protect Plus or vSnap server virtual appliance will be reset to the specified password.

---

## Chapter 9. Troubleshooting vSnap servers

The vSnap servers in an IBM Storage Protect Plus environment provide disk storage for protecting data through backup and replication processes. The vSnap server configured in your environment might be used as the target, the source, or both server and target. In order to repair or replace a vSnap server that has failed, there are steps to follow so that the affected vSnap server is brought to a working state first so that backup and replication services can resume. This is to ensure minimum loss of data.

### Preventing job failures by synchronizing vSnap and CIFS passwords

---

Communications between a vSnap server and a Common Internet File System (CIFS) share can be disrupted if credentials are shared, but passwords are out of sync. To prevent jobs from failing, you must synchronize the vSnap and CIFS passwords.

#### About this task

If you have already changed the vSnap system password, run the following command to synchronize the SMB/CIFS password with the system password. When prompted to enter a username, specify the account (for example, `serveradmin`) that is used to register the vSnap server in IBM Storage Protect Plus. When prompted to enter the password, specify the current system password for that account.

```
vsnap user resyncsmbpass
```

For information about how to synchronize passwords, see [“User management”](#) on page 83.

### How do I tier data to tape or cloud storage?

---

You cannot tier data from IBM Storage Protect Plus to tape storage. You can copy data from IBM Storage Protect Plus to cloud storage, but only to cloud storage classes that support the rapid recall of data. When you are copying data to tape from IBM Storage Protect Plus to the IBM Storage Protect server, it is not a good idea to use the IBM Storage Protect tiering function. If you are archiving data to tape, you must use a cold cache storage pool.

Review the guidelines about tape and cloud storage:

- Although you cannot tier data from IBM Storage Protect Plus to tape, you can archive or copy IBM Storage Protect Plus data to tape. To do this, define a cold-data-cache storage pool, as described in [Step 1: Creating a tape storage pool and cold-data-cache storage pool for copying data to tape](#).
- You can copy data from IBM Storage Protect Plus to cloud-container storage pools, but only to cloud storage classes that support the rapid recall of data. If you are using Amazon Web Services (AWS) with the Simple Storage Service (S3) protocol to move data to cloud container pools, do not move the data to Amazon S3 Glacier. For scenarios and instructions about copying or archiving data to cloud storage, see [Configuration for copying or archiving data](#). For instructions about tiering data to the cloud, see [Tiering data to cloud, tape, or file storage](#) in the IBM Storage Protect product documentation.

You cannot tier data from IBM Storage Protect Plus to tape. To store IBM Storage Protect Plus data on tape, copy the data to an IBM Storage Protect server for storage on physical tape media or in a virtual tape library. For different scenarios and more information about how to set up storage, see [“Configuration for copying or archiving data to IBM Storage Protect”](#) on page 5 and [Chapter 6, “Managing backup storage,”](#) on page 57.

To set up a cold cache storage pool for archiving or copying data to tape, see [“Step 1: Creating a tape storage pool and a cold-data-cache storage pool for copying data to tape”](#) on page 66.

## Why is the vSnap server still offline?

---

After you restart the vSnap server, it continues to show a status of offline on the IBM Storage Protect Plus user interface.

If data deduplication is enabled or was previously enabled on a vSnap server, the deduplication table (DDT) is preloaded into memory during the vSnap server startup process. The DDT preloading process can introduce a 15-minute delay in the startup of the vSnap server services. During this time, the vSnap server shows with a status of **Offline** is displayed. Wait for at least 15 minutes for the process to be completed and for the vSnap server to return to the **Online** status. You can run the `vsnap_status` command to monitor the vSnap server services.

If any of the vSnap services is in the **activating** state, it means that the vSnap services are starting. When all services are in the **active** state, the vSnap server is back online.

## How does SAN work with IBM Storage Protect Plus and a vSnap server?

---

VMware production or clone restore operations can use VMware SAN transport mode, which transports data in a storage area network (SAN) environment. To run a SAN-based restore operation, you can use the advanced setting **Enable Streaming (VADP) restore**, which was introduced in IBM Storage Protect Plus 10.1.5. This restore operation option is set by default. Coupled with this option, you can specify SAN transport mode in the VADP proxy options for a particular site.

By using the SAN transport mode, you can restore your data by using SAN transport for the VADP transport method to read/write to the datastore over the SAN. The logical unit numbers (LUNs) that comprise that datastore must be mapped to the machine by running an initial backup. This backup operation uses the zone and LUN mask as if they were members of the vSphere cluster to access the datastore over the SAN.

**Tip:** To view the advanced options when you are running a production or clone restore operation, switch the job options from **Default Setup** to **Advanced Setup**.

IBM Storage Protect Plus restores data by creating a datastore that vSphere detects, then a storage vMotion back to the target datastore is initiated. IBM Storage Protect Plus does not restore data by writing directly to the datastore. For this reason, using the SAN transport mode as a communication method for block-level incremental forever processing has fewer benefits. However, for initial full backup operations, by using SAN as a transport method, works well.

### Communication

In IBM Storage Protect Plus, SAN backup is available through a physical proxy. Data transfer from storage to proxy is through the SAN. Communication from the proxy to the vSnap server is through the Network File System (NFS) protocol. The proxy and vSnap server can be installed on the same physical or virtual server. Review the proxy and vSnap server system requirements.

### Specifying SAN as a data transport mode

To specify SAN as a transport mode, follow these steps:

1. Go to **System Configuration > VADP Proxy**. The **VADP Proxy** page opens.
2. From the table, select the server whose settings you want to edit. The **Proxy Details** pane shows the details for that server.
3. Click the actions icon  and select **Proxy Options**. The **Set VADP Proxy Options** dialog opens.

**VADP Proxy**

**VADP Proxies**

Server Name	Version	Status	Site	
spicemo...	10.1.6.409	Enabled	Secondary	
doorknob...	10.1.6.409	Unreacha...	third	
localhost	10.1.6.409	Enabled	Secondary	
cetvm79...	10.1.6.409	Enabled	Primary	

Total: 4

Auto Refresh

**Proxy Details**

Server Address: spicemouse12.storage.clifden.golf.ie

Site: Secondary

Number of Cores: 8

Available Memory: 8.8 GB

View Tasks

Context Menu:

- Suspend
- Proxy Options
- Uninstall
- Unregister
- Edit

4. From the **Transport Modes** list, select SAN.

**Tip:** When selection options include multiple transport modes, the first listed mode will be used. If that mode cannot be used, the next transport mode listed for that selection option will be used for transporting the data.

5. Click **Save**.

## How do I repair a failed source vSnap in an IBM Storage Protect Plus environment?

The vSnap servers in an IBM Storage Protect Plus environment provide disk storage for protecting data through backup and replication processes. You can repair and replace a failed vSnap server that is configured in your IBM Storage Protect Plus environment to act as the *source* for backup and replication services. The source vSnap server must be repaired so that backup and replication services can resume.

### Before you begin

**Important:** It is assumed that all vSnap servers in the environment are protected by replication. If a vSnap server is not replicated and it fails, it cannot be recovered to a state that would allow it to continue as a disk storage source or target. In the absence of replication processes, you must create a new vSnap server and set up service level agreement (SLA) policies. When you run the policies, a new full backup process runs to the new vSnap server.

To determine which type of repair process is applicable to your vSnap server, see [technote 1103847](#).

### About this task

**Important:** Do not unregister or delete the failed vSnap server from IBM Storage Protect Plus. The failed vSnap server must remain registered for the replacement procedure to work correctly.

This procedure establishes a new source vSnap server in your IBM Storage Protect Plus environment to replace the failed source vSnap server. The new source vSnap server will contain only the most recent recovery points.

**Note:** The version of the new vSnap server must match the version of the deployed IBM Storage Protect Plus appliance.

## Procedure

1. Log in to the target vSnap server console with the ID serveradmin by using Secure Shell (SSH) protocol.

Enter the following command: `$ ssh serveradmin@MGMT_ADDRESS`

For example, `$ ssh serveradmin@10.10.10.2`

2. Obtain the ID of the failed source vSnap server by opening a command prompt and entering the following command:

`$ vsnap partner show`

The output is similar to the following example:

```
ID: 12345678901234567890123456789012
PARTNER TYPE: vsnap
MGMT ADDRESS: 10.10.10.1
API PORT: 8900
SSH PORT: 22
```

3. Verify that the MGMT ADDRESS is the address of the failed source vSnap server. Take note of the failed source vSnap server's ID number.
4. In the environment with the source vSnap server, install a new vSnap server of the same type and version, and with the same storage allocation, as the failed source vSnap server.

For instructions about installing a vSnap server, see [Installing a physical vSnap server](#).

**Important:** Do not register the new vSnap server with IBM Storage Protect Plus. Do not use the **Add vSnap server** wizard.

- a) You will first need to initialize the vSnap server with the following command:

`$ vsnap system init --skip_pool --id partner_id`

For example: `$ vsnap system init --skip_pool --id`

`12345678901234567890123456789012` using the failed source vSnap partner ID. A message indicates when the initialization is completed.

**Note:** This command is different to the vSnap initialization command listed in the IBM Documentation and in the Blueprints.

5. Complete the vSnap server and pool creation process as outlined in *Chapter 6: vSnap Server Installation and Setup* in the [Blueprints](#).
6. Place the new source vSnap server into maintenance mode by entering the following command:

`$ vsnap system maintenance begin`

Placing the vSnap server into maintenance mode suspends operations such as snapshot creation, data restore jobs, and replication operations.

7. Initialize the new source vSnap server with the failed source vSnap server's partner ID. Enter the following command:

`$ vsnap system init --id partner_id`

The following command is an example: `$ vsnap system init --id 12345678901234567890123456789012`

8. Collect the SSH host key of both vSnap servers and collect the TLS certificate of the partner server. For example, if you are running a command on vSnap1 to create a partnership with vSnap2, you must obtain the SSH host key from both the vSnap servers and obtain the TLS certificate from vSnap2.

To obtain the SSH host key, run this command on both vSnap1 and vSnap2:

```
sudo cat /etc/ssh/ssh_host_ed25519_key
```

Note the Key Type and the Key Value. The Key Type is the initial prefix in the output, which is similar to the following example: `ssh-ed25519`, and the Key Value is the remaining text of the output.

To obtain the TLS certificate, run the following command on vSnap2:

```
sudo cat /etc/vsnap/ssl/spp-vsnap.crt
```

Copy the full output and save in a new temporary file on vSnap1, which can be similar to the following example: `/tmp/partner-cert.crt`.

9. On the new source vSnap server, add the partner vSnap servers. Each partner must be added separately.

To add a partner, enter the following command:

```
$ vsnap partner add --remote_addr remote_ip_address --local_addr local_ip_address
```

where, *remote\_ip\_address* specifies the IP address of the source vSnap server, and *local\_ip\_address* specifies the IP address of the new source vSnap server.

The following command is an example:

```
$ vsnap partner add --remote_addr 10.10.10.2 --local_addr 10.10.10.1
```

10. When prompted for username and password, specify the credentials of the remote vSnap that is being added as a partner.

Also specify the values for the following respective prompts:

- When prompted for the local server's certificate, specify the local path `/etc/vsnap/ssl/spp-vsnap.crt`.
- When prompted for the remote server's certificate, specify the local temporary file created in the step “8” on page 90, for example: `/tmp/partner-cert.crt`.
- When prompted for the local and remote server's SSH key type, paste the value noted in the step “8” on page 90, for example: `ssh-ed25519`.
- When prompted for the local and remote server's SSH key value, paste the value of the key (excluding the prefix) as noted in the step “8” on page 90.

Informational messages indicate when the partners are created and updated successfully.

11. Create a repair task on the new source vSnap server by entering the following command:

```
$ vsnap repair create --async
```

The output of this command is similar to the following example:

```
ID: 12345678901234567890123456789012
PARTNER TYPE: vsnap
PARTNER ID: abcdef7890abcdef7890abcdef7890ab
TOTAL VOLUMES: N/A
SNAPSHOTS RESTORED: N/A
RETRY: No
CREATED: 2019-11-01 15:49:31 UTC
UPDATED: 2019-11-01 15:49:31 UTC
ENDED: N/A
STATUS: PENDING
MESSAGE: The repair has been scheduled
```

12. Monitor the number of volumes that are involved in the repair operation by entering the following command:

```
$ vsnap repair show
```

The output of this command is similar to the following example:

```
ID: 12345678901234567890123456789012
PARTNER TYPE: vsnap
PARTNER ID: abcdef7890abcdef7890abcdef7890ab
TOTAL VOLUMES: 3
SNAPSHOTS RESTORED: N/A
RETRY: No
CREATED: 2019-11-01 15:49:31 UTC
UPDATED: 2019-11-01 15:49:31 UTC
```

```
ENDED: N/A
STATUS: ACTIVE
MESSAGE: Created 0 volumes. There are 3 primary volumes that have recoverable snapshots,
the latest snapshot of each will be restored. Restoring 3 snapshots: 3 active, 0 pending, 0
completed, and 0 failed
```

The number of volumes that are involved in the repair operation is indicated in the TOTAL VOLUMES field.

13. Monitor the status of the repair task by viewing the repair.log file on the new source vSnap server, in the following directory /opt/vsnap/log/repair.log. Alternatively, you can enter the following command:

```
$ vsnap repair show
```

The output of this command is similar to the previous example. The following status messages can be displayed during the repair process:

- STATUS: PENDING indicates that the repair job is about to run.
- STATUS: ACTIVE indicates that the repair job is active.
- STATUS: COMPLETED indicates that the repair job is completed.
- STATUS: FAILED indicates that the repair job failed and must be resubmitted.

14. During the repair operation, run the vsnap repair show command to verify when the status is COMPLETED.

```
$ vsnap repair session show
```

The output of this command is similar to the following example:

```
ID: 1 RELATIONSHIP: 72b19f6a9116a46aae6c642566906b31
PARTNER TYPE: vsnap
LOCAL SNAP: 1313
REMOTE SNAP: 311
STATUS: ACTIVE
SENT: 102.15GB
STARTED: 2019-11-01 15:51:18 UTC
ENDED: N/A
Created 0 volumes.
There are 3 replica volumes whose snapshots will be restored on next replication.
```

A session for each volume involved in the repair operation is displayed.

Periodically issue the `$ vsnap repair session show` command to ensure that the amount of data being sent for each volume is increasing in increments. As the sessions finish you will see the status change to COMPLETED. When all the sessions finish, issue the `$ vsnap repair session show` command to verify that the overall status is COMPLETED. A final message indicating the number of volumes for which snapshots were restored is displayed. The message output is similar to the following example:

```
Created 0 volumes.
There are 3 primary volumes that have recoverable snapshots, the latest snapshot of each
will be restored.
Restored 3 snapshots.
```

15. For any snapshots that are not restored and that indicate a FAILED status, resubmit the repair process by entering the following command:

```
$ vsnap repair create --async --retry
```

16. When the repair process reports a COMPLETED status, you can resume normal operations for the vSnap server by moving it out of maintenance mode. To resume normal processing, enter the following command:

```
$ vsnap system maintenance complete
```

17. Remove saved SSH host keys from the repaired source vSnap server and the target vSnap servers.

Run the following commands on both the source and target vSnap servers:

```
$ sudo rm -f /home/vsnap/.ssh/known_hosts
```

```
$ sudo rm -f /root/.ssh/known_hosts
```

Removing the SSH keys ensures that subsequent replication transfers do not produce errors that result from the changed host key of the repaired vSnap server.

18. Restart the vSnap service on the replaced server by entering the following command:

```
$ sudo systemctl restart vsnap
```

19. Click **System Configuration > Storage > vSnap servers** to verify that the new vSnap server is correctly registered, as follows:

- If the new vSnap server is using the same host name or IP address for registration, no change is required.
- If the new vSnap server is using a different host name or IP address for registration, click **Edit** to update the registration information.

20. To remove recovery points that are no longer available on the source vSnap server, start a maintenance job from the IBM Storage Protect Plus user interface.

For instructions, see [Creating jobs and job schedules](#).

**Tip:** You might see informational messages that are similar to the following example:

```
CTGGA1843 storage snapshot spp_1004_2102_2_16de41fc3 not found on live Storage2101  
Snapshot Type vsnap
```

21. To resume jobs that failed after the vSnap server became unavailable, run a storage server inventory job. For instructions, see [Creating jobs and job schedules](#).

## Results

The source vSnap server has been repaired with only the most recent recovery points. The next backup job that runs as part of an SLA will back up data incrementally. If you create a restore job, only the most recent recovery point will be available in the backup repository. All other recovery points will be available in the replication repositories, and in the object storage and archive storage repositories if applicable to your environment.

## How do I repair a failed target vSnap in an IBM Storage Protect Plus environment?

The vSnap servers in an IBM Storage Protect Plus environment provide disk storage for protecting data through backup and replication processes. You can repair and replace a failed vSnap server that is configured in your IBM Storage Protect Plus environment to act as the *target* for backup and replication services. The source vSnap server must be repaired so that backup and replication services can resume.

### Before you begin

**Important:** It is assumed that all vSnap servers in the environment are protected by replication. If a vSnap server is not replicated and it fails, it cannot be recovered to a state that would allow it to continue as a disk storage source or target. In the absence of replication processes, you must create a new vSnap server and set up service level agreement (SLA) policies. When you run the policies, a new full backup process runs to the new vSnap server.

### About this task

**Important:** Do not unregister or delete the failed vSnap server from IBM Storage Protect Plus. The failed vSnap server must remain registered for the replacement procedure to work correctly.

This procedure establishes a new target vSnap server in your IBM Storage Protect Plus environment to replace the failed target vSnap server. The new target vSnap server will not contain any data but will be populated with the most recent recovery points during the next scheduled replication operation.

**Requirement:** The version of the new vSnap server must match the version of the deployed IBM Storage Protect Plus appliance.

To determine which type of repair process is applicable to your vSnap server, see [technote 1103847](#).

## Procedure

1. Log in to the functioning vSnap server console with the ID `serveradmin` by using Secure Shell (SSH) protocol.

Enter the following command: `$ ssh serveradmin@MGMT_ADDRESS`

For example, `$ ssh serveradmin@10.10.10.1`

2. Obtain the ID of the failed vSnap server by opening a command prompt and entering the following command:

```
$ vsnap partner show
```

The output is similar to the following example:

```
ID: 12345678901234567890123456789012
PARTNER TYPE: vsnap
MGMT ADDRESS: 10.10.10.2
API PORT: 8900
SSH PORT: 22
```

3. Verify that the MGMT ADDRESS is the address of the failed vSnap server. Take note of the failed vSnap server's ID number.
4. In the environment with the target vSnap server, install a new vSnap server of the same type and version, and with the same storage allocation, as the failed target vSnap server.

For instructions about installing a vSnap server, see [Installing a physical vSnap server](#).

**Important:** Do not register the new vSnap server with IBM Storage Protect Plus. Do not use the **Add vSnap server** wizard.

- a) Initialize the vSnap server with the following command:

```
$ vsnap system init --skip_pool --id <partner_id>
```

For example, to use the partner ID of the failed source vSnap server, issue the following command:

```
$ vsnap system init --skip_pool --id 12345678901234567890123456789012
```

A message indicates when the initialization is completed.

**Tip:** This command is different from the vSnap initialization command listed in the Blueprints.

5. Complete the vSnap server and pool creation process as outlined in *Chapter 6: vSnap Server Installation and Setup* in the [Blueprints](#).
6. Place the new vSnap server into maintenance mode by entering the following command:

```
$ vsnap system maintenance begin
```

Placing the vSnap server into maintenance mode suspends operations such as snapshot creation, data restore jobs, and replication operations.

7. Initialize the new target vSnap server with the failed target vSnap server's partner ID. Enter the following command:

```
$ vsnap system init --id <partner_id>
```

The following command is an example:

```
$ vsnap system init --id 12345678901234567890123456789012
```

8. Collect the SSH host key of both vSnap servers and collect the TLS certificate of the partner server. For example, if you are running a command on vSnap1 to create a partnership with vSnap2, you must obtain the SSH host key from both the vSnap servers and obtain the TLS certificate from vSnap2.

To obtain the SSH host key, run this command on both vSnap1 and vSnap2:

```
sudo cat /etc/ssh/ssh_host_ed25519_key
```

Note the Key Type and the Key Value. The Key Type is the initial prefix in the output, which is similar to the following example: `ssh-ed25519`, and the Key Value is the remaining text of the output.

To obtain the TLS certificate, run the following command on vSnap2:

```
sudo cat /etc/vsnap/ssl/spp-vsnap.crt
```

Copy the full output and save in a new temporary file on vSnap1, which can be similar to the following example: `/tmp/partner-cert.crt`.

9. On the new target vSnap server, add the partner vSnap servers. Each partner must be added separately.

To add a partner, enter the following command:

```
$ vsnap partner add --remote_addr <remote_ip_address> --local_addr <local_ip_address>
```

where, `<remote_ip_address>` specifies the IP address of the source vSnap server, and `<local_ip_address>` specifies the IP address of the new target vSnap server.

The following command is an example:

```
$ vsnap partner add --remote_addr 10.10.10.1 --local_addr 10.10.10.2
```

10. When prompted for username and password, specify the credentials of the remote vSnap that is being added as a partner.

Also specify the values for the following respective prompts:

- When prompted for the local server's certificate, specify the local path `/etc/vsnap/ssl/spp-vsnap.crt`.
- When prompted for the remote server's certificate, specify the local temporary file created in the step “8” on page 95, for example: `/tmp/partner-cert.crt`.
- When prompted for the local and remote server's SSH key type, paste the value noted in the step “8” on page 95, for example: `ssh-ed25519`.
- When prompted for the local and remote server's SSH key value, paste the value of the key (excluding the prefix) as noted in the step “8” on page 95.

Informational messages indicate when the partners are created and updated successfully.

11. Create a repair task on the new source vSnap server by entering the following command:

```
$ vsnap repair create --async
```

The output of this command is similar to the following example:

```
ID: 12345678901234567890123456789012
PARTNER TYPE: vsnap
PARTNER ID: abcdef7890abcdef7890abcdef7890ab
TOTAL VOLUMES: N/A
SNAPSHOTS RESTORED: N/A
RETRY: No
CREATED: 2019-11-01 15:49:31 UTC
UPDATED: 2019-11-01 15:49:31 UTC
ENDED: N/A
```

```
STATUS: PENDING
MESSAGE: The repair has been scheduled
```

12. Monitor the number of volumes that are involved in the repair operation by entering the following command:

```
$ vsnap repair show
```

The output of this command is similar to the following example:

```
ID: 12345678901234567890123456789012
PARTNER TYPE: vsnap
PARTNER ID: abcdef7890abcdef7890abcdef7890ab
TOTAL VOLUMES: 3
SNAPSHOTS RESTORED: N/A
RETRY: No
CREATED: 2019-11-01 15:49:31 UTC
UPDATED: 2019-11-01 15:49:31 UTC
ENDED: N/A
STATUS: ACTIVE
MESSAGE: Creating 3 volumes for partner 670d61a10f78456bb895b87c45e20999
```

The number of volumes that are involved in the repair operation is indicated in the TOTAL VOLUMES field.

13. Monitor the status of the repair task by viewing the repair.log file on the new source vSnap server, in the following directory /opt/vsnap/log/repair.log. Alternatively, you can enter the following command:

```
$ vsnap repair show
```

The output of this command is similar to the previous example. The following status messages can be displayed during the repair process:

- STATUS: PENDING indicates that the repair job is about to run.
- STATUS: ACTIVE indicates that the repair job is active.
- STATUS: COMPLETED indicates that the repair job is completed.
- STATUS: FAILED indicates that the repair job failed and must be resubmitted.

14. During the repair operation, run the vSnap repair show command to verify when the status is COMPLETED.

```
$ vsnap repair session show
```

The final message indicates the number of volumes whose snapshots will be restored on the next replication, as follows:

```
Created 0 volumes.
There are 3 replica volumes whose snapshots will be restored on next replication.
```

15. For any snapshots that are not restored and indicate a FAILED status, resubmit the repair process by entering the following command:

```
$ vsnap repair create --async --retry
```

16. When the repair process reports a COMPLETED status, you can resume normal operations for the vSnap server by moving it out of maintenance mode. To resume normal processing, enter the following command:

```
$ vsnap system maintenance complete
```

17. Remove saved SSH host keys from the repaired source vSnap server and the target vSnap servers.

Run the following commands on both the source and target vSnap servers:

```
$ sudo rm -f /home/vsnap/.ssh/<known_hosts>
```

```
$ sudo rm -f /root/.ssh/<known_hosts>
```

Removing the SSH keys ensures that subsequent replication transfers do not produce errors that result from the changed host key of the repaired vSnap server.

18. Restart the vSnap service on the replaced server by entering the following command.

```
$ sudo systemctl restart vsnap
```

19. Click **System Configuration > Storage > vSnap servers** to verify that the new vSnap server is correctly registered, as follows:

- If the new vSnap server is using the existing hostname or IP address for registration, no change is required.
- If the new vSnap server is using a different hostname or IP address for registration, click **Edit** to update the registration information.

20. To remove recovery points that are no longer available on the source vSnap server, start a maintenance job from the IBM Storage Protect Plus user interface.

**Tip:** You might see informational messages that are similar to the following example:

```
CTGGA1843 storage snapshot spp_1004_2102_2_16de41fcbc3 not found on live Storage2101  
Snapshot Type vsnap
```

21. To resume jobs that failed after the vSnap server became unavailable, run a storage server inventory job.

## Results

The target vSnap server has been repaired. A new backup job must be run on the source vSnap server before any additional action is taken on the new target vSnap server.

If a replication job is attempted on the new target vSnap server, a message is displayed as follows:

```
CTGGA0289 - Skipping volume <volume_id> because there are no new snapshots since last backup
```

After a new backup job is run on the source vSnap server, the next scheduled replication job replicates the recovery points that are created by the backup job. At this point, if you create a restore job, only the most recent recovery point will be available in the replication repository. If the target vSnap server was also acting as a copy source to object or archive storage, the replication job must first run on the target vSnap server before any additional copy operations can complete successfully. The first copy of data to object storage will be a full copy.

## How do I repair a failed dual-role vSnap in an IBM Storage Protect Plus environment?

You can repair and replace a failed vSnap server that is configured in your IBM Storage Protect Plus environment to act as both the *source* and *target* for backup and replication services.

### About this task

**Important:** Do not unregister or delete the failed vSnap server from IBM Storage Protect Plus. The failed vSnap server must remain registered for the replacement procedure to work correctly.

This procedure establishes a new vSnap server in your IBM Storage Protect Plus environment to replace the failed vSnap server. After the repair process is completed, the new vSnap server is recovered to a point where backup jobs can continue to back up incremental changes (no full backup required) and replication jobs can continue.

To determine which type of repair process is applicable to your vSnap server, see [technote 1103847](#).

**Note:** The version of the new vSnap server must match the version of the deployed IBM Storage Protect Plus appliance.

## Procedure

1. Log in to the functioning vSnap server in your environment console with the ID serveradmin by using Secure Shell (SSH) protocol.

Enter the following command: `$ ssh serveradmin@MGMT_ADDRESS`

For example, `$ ssh serveradmin@10.10.10.2`

2. Obtain the ID of the failed vSnap server by opening a command prompt and entering the following command:

`$ vsnap partner show`

The output is similar to the following example:

```
ID: 12345678901234567890123456789012
PARTNER TYPE: vsnap
MGMT ADDRESS: 10.10.10.1
API PORT: 8900
SSH PORT: 22
```

3. Verify that the MGMT ADDRESS is the address of the failed vSnap server. Take note of the failed vSnap server's ID number.
4. On the target vSnap server, install a new vSnap server of the same type and version, and with the same storage allocation, as the failed source vSnap server.

For instructions about installing a vSnap server, see [Installing a physical vSnap server](#).

**Important:** Do not register the new vSnap server with IBM Storage Protect Plus. Do not use the **Add vSnap server** wizard.

- a) Initialize the vSnap server with the following command:

`$ vsnap system init --skip_pool --id partner_id`

For example, to use the partner ID of the failed source vSnap server, issue the following command:

`$ vsnap system init --skip_pool --id 12345678901234567890123456789012`

A message indicates when the initialization is completed.

**Tip:** This command is different from the vSnap initialization command listed in the Blueprints.

5. Complete the vSnap server and pool creation process as outlined in *Chapter 6: vSnap Server Installation and Setup* in the [Blueprints](#).
6. Place the new vSnap server into maintenance mode by entering the following command:

`$ vsnap system maintenance begin`

Placing the vSnap server into maintenance mode suspends operations such as snapshot creation, data restore jobs, and replication operations.

7. Initialize the new target vSnap server with the failed target vSnap server's partner ID. Enter the following command to initialize the vSnap:

`$ vsnap system init --id partner_id`

The following command is an example: `$ vsnap system init --id 12345678901234567890123456789012`

8. Collect the SSH host key of both vSnap servers and collect the TLS certificate of the partner server. For example, if you are running a command on vSnap1 to create a partnership with vSnap2, you must obtain the SSH host key from both the vSnap servers and obtain the TLS certificate from vSnap2.

To obtain the SSH host key, run this command on both vSnap1 and vSnap2:

```
sudo cat /etc/ssh/ssh_host_ed25519_key
```

Note the Key Type and the Key Value. The Key Type is the initial prefix in the output, which is similar to the following example: `ssh-ed25519`, and the Key Value is the remaining text of the output.

To obtain the TLS certificate, run the following command on vSnap2:

```
sudo cat /etc/vsnap/ssl/spp-vsnap.crt
```

Copy the full output and save in a new temporary file on vSnap1, which can be similar to the following example: `/tmp/partner-cert.crt`.

9. On the new target vSnap server, add the partner vSnap servers. If there is more than one partner server, each partner must be added separately.

To add a partner, enter the following command:

```
$ vsnap partner add --remote_addr remote_ip_address --local_addr local_ip_address
```

where, `remote_ip_address` specifies the IP address of the source vSnap server, and `local_ip_address` specifies the IP address of the new target vSnap server.

The following command is an example:

```
$ vsnap partner add --remote_addr 10.10.10.1 --local_addr 10.10.10.2
```

10. When prompted for username and password, specify the credentials of the remote vSnap that is being added as a partner.

Also specify the values for the following respective prompts:

- When prompted for the local server's certificate, specify the local path `/etc/vsnap/ssl/spp-vsnap.crt`.
- When prompted for the remote server's certificate, specify the local temporary file created in the step “8” on page 98, for example: `/tmp/partner-cert.crt`.
- When prompted for the local and remote server's SSH key type, paste the value noted in the step “8” on page 98, for example: `ssh-ed25519`.
- When prompted for the local and remote server's SSH key value, paste the value of the key (excluding the prefix) as noted in the step “8” on page 98.

Informational messages indicate when the partners are created and updated successfully.

11. Create a repair task on the new source vSnap server by entering the following command:

```
$ vsnap repair create --async
```

The output of this command is similar to the following example:

```
ID: 12345678901234567890123456789012
PARTNER TYPE: vsnap
PARTNER ID: abcdef7890abcdef7890abcdef7890ab
TOTAL VOLUMES: N/A
SNAPSHOTS RESTORED: N/A
RETRY: No
CREATED: 2019-11-01 15:49:31 UTC
UPDATED: 2019-11-01 15:49:31 UTC
ENDED: N/A
STATUS: PENDING
MESSAGE: The repair has been scheduled
```

12. Monitor the number of volumes that are involved in the repair operation by entering the following command:

```
$ vsnap repair show
```

The output of this command is similar to the following example:

```
ID: 12345678901234567890123456789012
PARTNER TYPE: vsnap
```

```

PARTNER ID: abcdef7890abcdef7890abcdef7890ab
TOTAL VOLUMES: 6
SNAPSHOTS RESTORED: N/A
RETRY: No
CREATED: 2019-11-01 15:49:31 UTC
UPDATED: 2019-11-01 15:49:31 UTC
ENDED: N/A
STATUS: ACTIVE
MESSAGE: Created 0 volumes
There are 3 replica volumes whose snapshots will be restored on next replication.
There are 3 primary volumes that have recoverable snapshots, the latest snapshot of each
will be restored.
The number of volumes that are involved in the repair operation are indicated in the TOTAL
VOLUMES field

```

13. Monitor the status of the repair task by viewing the repair.log file on the new source vSnap server, in the following directory /opt/vsnap/log/repair.log. Alternatively, you can enter the following command:

```
$ vsnap repair show
```

14. When the status of the repair operation is in the ACTIVE state, you can view the status of individual repair sessions by entering the following command:

```
$ vsnap repair session show
```

The output is similar to this example:

```

ID: 1
RELATIONSHIP: 72b19f6a9116a46aae6c642566906b31
PARTNER TYPE: vsnap
LOCAL SNAP: 1313
REMOTE SNAP: 311
STATUS: ACTIVE
SENT: 102.15GB
STARTED: 2019-11-01 15:51:18 UTC
ENDED: N/A

```

View a session for each of the source volumes in the repair operation. The amount of data that is sent for each volume shows increasing incremental values until the process completes. The final message indicates the number of volumes whose snapshots will be restored by the next replication operation, as shown in this example:

```
Created 0 volumes. There are 3 replica volumes whose snapshots will be restored on next replication.
```

15. For any snapshots that are not restored and indicate a FAILED status, resubmit the repair process by entering the following command:

```
$ vsnap repair create --async --retry
```

16. When the repair process reports a COMPLETED status, you can resume normal operations for the vSnap server by moving it out of maintenance mode. To resume normal processing, enter the following command:

```
$ vsnap system maintenance complete
```

17. Optional: To view the total volumes and number of snapshots that were restored during the repair operation, run the show command for the vSnap server.

The output includes the following information:

- **Total volumes** lists the total number of volumes that were inspected during the repair operation. This list includes the source volumes (primary volumes) where the latest recovery point backup was restored, and target volumes (replica volumes) that are repopulated during upcoming replication operations as scheduled in SLAs.
- **SNAPSHOTS RESTORED** lists the number of source volumes that were restored.

18. Remove saved SSH host keys from the repaired source vSnap server and the target vSnap servers.

Run the following commands on both the source and target vSnap servers:

```
$ sudo rm -f /home/vsnap/.ssh/known_hosts
```

```
$ sudo rm -f /root/.ssh/known_hosts
```

Removing the SSH keys ensures that subsequent replication transfers do not produce errors that result from the changed host key of the repaired vSnap server.

- Restart the vSnap service on the replaced server by entering the following command:

```
$ sudo systemctl restart vsnap
```

- Click **System Configuration > Storage > vSnap servers** to verify that the new vSnap server is correctly registered, as follows:

- If the new vSnap server is using the same hostname or IP address for registration, no change is required.
- If the new vSnap server is using a different host name or IP address for registration, click **Edit** to update the registration information.

- To remove recovery points that are no longer available on the source vSnap server, start a maintenance job from the IBM Storage Protect Plus user interface.

For instructions, see [Creating jobs and job schedules](#).

**Tip:** You might see informational messages that are similar to the following example:

```
CTGGA1843 storage snapshot spp_1005_2102_2_16de41fcbc3 not found on live Storage2101  
Snapshot Type vsnap
```

- To resume jobs that failed after the vSnap server became unavailable, run a storage server inventory job. For instructions, see [Creating jobs and job schedules](#).

## Results

For primary backup data that is stored on the repaired vSnap server, the latest recovery point for primary backup data is now available. Subsequent backups to the repaired vSnap server continue to send only incremental changes since the last backup. For replicated data stored on the repaired vSnap server, no replicated data is available immediately after the repair. Subsequent replication jobs from the partner vSnap server will repopulate any backups that are created on the partner vSnap server after the repair process was completed. If a replication job is attempted on the partner vSnap server before a backup is completed on the partner vSnap server, a warning message is displayed indicating that there are no new snapshots since the last backup:

```
CTGGA0289 - Skipping volume <volume_id> because there are no new snapshots since last backup
```

If the repaired vSnap server was acting as a copy source to object or archive storage, a backup job must first be run on the repaired vSnap server before any additional copy operations will be successful. The first copy of data to object storage will be a full copy.

## How do I delete and recreate a vSnap storage pool?

When a scenario arises that results in the requirement to delete a vSnap storage pool due to corruption or any other reason, you can follow the steps to delete and recreate the storage pool. This procedure is a destructive operation that discards all data in an existing vSnap storage pool. All backup data in the pool is lost, and is no longer recoverable so caution is needed before you proceed. After that is done, you can create a replacement empty pool.

### Procedure

- To prepare for the removal of a storage pool, you must first unregister the vSnap server by removing it.

For more information about unregistering the vSnap server, see [“Unregistering a vSnap server”](#) on page 47.

2. Run a maintenance job on the vSnap server by opening **Jobs and Operations > Schedule**. Select a job in the list, and then click **Start**.

When the maintenance job is completed, all the information about the vSnap server is removed from the IBM Storage Protect Plus catalog. All recovery points and metadata that are associated with the VM backups, and all replica copies that are stored in the unregistered vSnap, are removed. All data is removed and is no longer available for recovery.

For more information about maintenance jobs, see [Job types](#).

3. On the vSnap server, run the following command to initialize the cleaned vSnap server.

```
$ vsnap system init --skip_pool
```

If the system was initialized previously, it is safe to run this command again. This step ensures that required kernel modules are installed and loaded.

4. Identify the existing storage pool identifier by running the following command:

```
$ vsnap pool show
```

If the storage pool is online, the identifier is displayed in the *ID* field. If the storage pool is offline, an error message displays that indicates the pool information cannot be displayed. The identifier of the pool is shown in this error message.

5. Run the delete command for the storage pool identifier to forcibly delete the storage pool.

```
$ vsnap pool delete --id <ID> --force
```

When the command is finished, the following message is displayed:

```
Storage pool was deleted successfully but the pool was not unmounted because the 'force'
option was set.
Reboot the system to ensure disks that were previously in use are released.
```

6. Restart the system to release any disks that are still in use. Enter the following command:

```
$ sudo reboot -n
```

It is important to restart the system after you run this command to ensure that any disks that are still in use by older pools are released.

7. When the restart finishes, run the status command:

```
$ vsnap_status
```

This output of this command shows the status of all vSnap server services. Ensure that all services are active. If one or more services are activating, check the status later until they are all in the active state.

8. Identify the disks that must be added to the pool.

If you are reusing the same set of disks that comprised the old pool, the following command can help you to identify them:

```
$ vsnap disk show
```

In the output of the show command, the **USED AS** column indicates whether a file system or partition table exists on the disk. Disks that were part of the old pool are identified as `vsnap_pool1`. If the old pool was encrypted, some or all disks can be identified as `crypto_LUKS`.

Sample output

UUID		TYPE	VENDOR	MODEL	SIZE	USED AS	
KNAME	NAME						
-----							

```

-----
6000c299371bdc647c80720602079bc | SCSI | VMware | Virtual disk | 70.00GB | LVM2_member |
sda | /dev/sda
6000c29b8ea25349e3a884d58f72e640 | SCSI | VMware | Virtual disk | 100.00GB | vsnap_pool |
sdb | /dev/sdb
6000c297cb8078cf9f56ab688a326a24 | SCSI | VMware | Virtual disk | 128.00GB | LVM2_member |
sdc | /dev/sdc
6000c2950248c5d831b6661ab0ec8843 | SCSI | VMware | Virtual disk | 16.00GB | vsnap_pool |
sdd | /dev/sdd
6000c29359661cbd915a7f24c8b44cf8 | SCSI | VMware | Virtual disk | 16.00GB | vsnap_pool |
sde | /dev/sde

```

9. **Important:** The command in this step deletes partition tables and file system metadata from the specified disks, and marks them as unused. Use this command with caution, and ensure that you specify only disks that are no longer in use.

Run the following command to specify a comma-separated list of disk names to mark as unused.

```
$ vsnap disk wipe <disk_list>
```

The following command is an example of the disk wipe command: `$ vsnap disk wipe /dev/sdb, /dev/sdd, /dev/sde`.

10. Create the new pool with the following command:

```
$ vsnap pool create --name <pool_name> <options> --disk_list <disk_list>
```

Where *pool\_name* is the name of the new pool; *options* specifies RAID type or encryption options. Leaving this option blank applies the default options. *disk\_list* represents the comma-separated list of disks to be added to the pool. The disks that you specify must have a status of unused when you run the **vsnap disk show** command.

The following command is an example of the create command:

```
$ vsnap pool create --name primary --disk_list /dev/sdb,/dev/sdd
```

When you are specifying the list of disks, specify only the disks that you intend to use as the main data disks. Cache or log disks can be added later by running separate commands. For more information about recommendations and instructions for configuring cache and log disks, see the [Blueprints](#).

#### Tip:

To open help, run the `vsnap pool create --help` command.

11. To view the pool information, run the following command:

```
$ vsnap pool show
```

Ensure that the command displays the correct pool information and that the command completes without an error.

12. Register the vSnap server in IBM Storage Protect Plus under a chosen site to finalize the setup. For more information about how to register a vSnap server, see [“Registering a vSnap server as a backup storage provider” on page 35](#).

# Chapter 10. Product messages

IBM Storage Protect Plus components send messages with prefixes that help to identify which component they come from. Use the search option to find a particular message by using its unique identifier.

Messages consist of the following elements:

- A five-letter prefix.
- A number to identify the message.
- Message text that is displayed on screen and written to message logs.

**Tip:** Use your browser's search capability by using Ctrl+F to find the message code you are looking for.

The following example contains the Db2® agent prefix. When you click More, extra details that explain the reason for the message are shown.

```
Warning
Apr 16, 2019
9:14:37 AM
GTGGH0098
[myserver1.myplace.irl.ibm.com]
Database AC7 will not be backed up as it is ineligible for the backup operation. More
```

## IBM Storage Protect Plus message prefixes

Messages have different prefixes to help you to identify the component that issues the message.

The following table identifies the prefix that is associated with each component.

Table 2. Messages prefixes by component	
Prefix	Component
CTGGA	IBM Storage Protect Plus
CTGGE	IBM Storage Protect Plus for Microsoft SQL Server
CTGGF	IBM Storage Protect Plus for Oracle
CTGGG	IBM Storage Protect Plus for Microsoft Exchange Server
CTGGH	IBM Storage Protect Plus for IBM Db2
CTGGI	IBM Storage Protect Plus for MongoDB
CTGGK	IBM Storage Protect Plus for Containers
CTGGL	IBM Storage Protect Plus for Amazon EC2
CTGGR	IBM Storage Protect Plus for Microsoft Office 365
CTGGS	IBM Storage Protect Plus for SAP HANA
CTGGT	IBM Storage Protect Plus for file systems

For a list of all messages, see IBM Documentation [here](#).

---

## Appendix A. Search guidelines

Use filters to search for an entity such as a file or a restore point.

You can enter a character string to find objects with a name that exactly matches the character string. For example, searching for the term `string.txt` returns the exact match, `string.txt`.

Regular expression search entries are also supported. For more information, see [Search Text with Regular Expressions](#).

You can also include the following special characters in the search. You must use a backslash (\) escape character before any of the special characters:

```
+ - & | ! ( ) { } [ ] ^ " ~ * ? : \
```

For example, to search for the file `string[2].txt`, enter the `string\[2\].txt`.

### Searching with wildcards

You can position wildcards at the beginning, middle, or end of a string, and combine them within a string.

#### Match a character string with an asterisk

The following examples show search text with an asterisk:

- `string*` searches for terms like `string`, `strings`, or `stringency`
- `str*ing` searches for terms like `string`, `straying`, or `straightening`
- `*string` searches for terms like `string` or `shoestring`

You can use multiple asterisk wildcards in a single text string, but multiple wildcards might considerably slow down a large search.

#### Match a single character with a question mark:

The following examples show search text with a question mark:

- `string?` searches for terms like `strings`, `stringy`, or `string1`
- `st??ring` searches for terms like `starring` or `steering`
- `???string` searches for terms like `hamstring` or `bowstring`

---

## Appendix B. Accessibility features for the IBM Storage Protect product family

Accessibility features assist users who have a disability, such as restricted mobility or limited vision, to use information technology content successfully.

### Overview

The IBM Storage Protect family of products includes the following major accessibility features:

- Keyboard-only operation
- Operations that use a screen reader

The IBM Storage Protect family of products uses the latest W3C Standard, WAI-ARIA 1.0 ([www.w3.org/TR/wai-aria/](http://www.w3.org/TR/wai-aria/)), to ensure compliance with US Section 508 ([www.access-board.gov/guidelines-and-standards/communications-and-it/about-the-section-508-standards/section-508-standards](http://www.access-board.gov/guidelines-and-standards/communications-and-it/about-the-section-508-standards/section-508-standards)) and Web Content Accessibility Guidelines (WCAG) 2.0 ([www.w3.org/TR/WCAG20/](http://www.w3.org/TR/WCAG20/)). To take advantage of accessibility features, use the latest release of your screen reader and the latest web browser that is supported by the product.

The product documentation in IBM Documentation is enabled for accessibility.

### Keyboard navigation

This product uses standard navigation keys.

### Interface information

User interfaces do not have content that flashes 2 - 55 times per second.

Web user interfaces rely on cascading style sheets to render content properly and to provide a usable experience. The application provides an equivalent way for low-vision users to use system display settings, including high-contrast mode. You can control font size by using the device or web browser settings.

Web user interfaces include WAI-ARIA navigational landmarks that you can use to quickly navigate to functional areas in the application.

### Vendor software

The IBM Storage Protect product family includes certain vendor software that is not covered under the IBM license agreement. IBM makes no representation about the accessibility features of these products. Contact the vendor for accessibility information about its products.

### Related accessibility information

In addition to standard IBM help desk and support websites, IBM has a TTY telephone service for use by deaf or hard of hearing customers to access sales and support services:

TTY service  
800-IBM-3383 (800-426-3383)  
(within North America)

For more information about the commitment that IBM has to accessibility, see [IBM Accessibility \(www.ibm.com/able\)](http://www.ibm.com/able).

## Notices

---

This information was developed for products and services offered in the US. This material might be available from IBM in other languages. However, you may be required to own a copy of the product or product version in that language in order to access it.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. ## **Terms and conditions for product documentation**

Permissions for the use of these publications are granted subject to the following terms and conditions.

### **Applicability**

These terms and conditions are in addition to any terms of use for the IBM website.

### **Personal use**

You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

### **Commercial use**

You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

### **Rights**

Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

## **Privacy policy considerations**

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM's Privacy Policy at [IBM Privacy Policy](#) and IBM's Online Privacy Statement at [IBM Product Privacy](#) in the section entitled "Cookies, Web Beacons and Other Technologies," and the "IBM Software Products and Software-as-a-Service Privacy Statement" at [IBM Product Privacy](#).
