1 About this Documentation

1.1 Audience

The target audience of this document is IBM Performance Manager for Wireless customers. They should be familiar with telecommunication and IT principles and should also have a good understanding of Solaris.

IMPORTANT: Before attempting an installation of Performance Manager for Wireless you are strongly advised to read the release notes and any readme files distributed with your Performance Manager for Wireless software. Readme files and release notes may contain information specific to your installation not contained in this guide. Failure to consult readme files and release notes may result in a corrupt, incomplete or failed installation.

Note: Performance Manager for Wireless Administrators should not, without prior consultation and agreement from IBM, make any changes to the Index Organized tables or database schema. Changes to the Index Organized tables or database schema may result in corruption of data and failure of the Performance Manager for Wireless System. This applies to all releases of Performance Manager for Wireless using all versions of interfaces.

1.2 Required Skills and Knowledge

This guide assumes you are familiar with the following:

- General IT Principles
- Sun Solaris Operating System
- Oracle Database
- Windows operating systems
- Graphical User Interfaces
- Network Operator's OSS and BSS systems architecture

This guide also assumes that you are familiar with your company's network and with procedures for configuring, monitoring, and solving problems on your network.

2 Overview

2.1 The Gateway Framework

The Alcatel NSS Gateway uses the Gateway Framework as a container for the execution of its transfer, engine and post parser stages. The Gateway Framework and the Alcatel NSS Gateway are decoupled into two separate installations. The Gateway Framework consists of a library of perl modules that provide functionality such as:

- a container for the execution of the Vendor Engine and Post Parser rules for of data transformation
- Intermediate (PIF) and output data (LIF) storage and management
- logging utilities
- cleanup and crash recovery
- statistics gathering

The Alcatel NSS Gateway plugs into the Gateway Framework and extends this functionality to provide the Gateway functionality that processes the vendor data.

More information on the standard Gateway configuration is contained in the [Gateway Framework User Guide].

Only vendor specific configuration details will be described in this document.

2.2 Alcatel NSS Gateway Overview

This section contains an overview of the Alcatel NSS Gateway and the network components, whose data the Gateway processes.

2.2.1 Network Details

The Alcatel NSS Gateway is design to transfer, parse, and further process data from Alcatel NSS components, for loading in the Tivoli performance management systems. The specific components of interest are the HLR/RCP, SSB/OCB and LM contained in the Alcatel NSS system.

This Alcatel NSS Gateway is specific to the French switch of the Alcatel NSS components.

2.2.2 HLR/RCP

The Gateway processes performance data from the Alcatel 900 and 1800 NSS format for the HLR Routing Core Platform (RCP) R5, R6 and R8 component.

2.2.3 OCB/SSP

The Alcatel OCB Service Switching Point (SSP) series of switches are used for PSTN and transit application and they have given the name S12 for their switches, which are being using in

wireless network mainly GSM. The Alcatel NSS Gateway processes performance data from the Alcatel OCB v24.

2.2.4 LM

The Alcatel NSS Gateway processes performance data from the LM switch for version 7 and version 9.

2.2.5 Data Version Support

This gateway supports data from the following Alcatel NSS switches.

- Alcatel NSS HLR/RCP R5, R6 and R8
- Alcatel NSS OCB/SSP R24
- Alcatel NSS LM R7 and R9, Flexible ADL Measurement

2.2.6 Data/File Formats

All data from HLR/RCP, SSP/OCB and LM are in binary format. Their respective layouts are described here.

2.2.6.1 Data Layout – RCP

The binary data contained in the RCP binary files is organized into blocks of data. Each block of data consists of a header record and multiple data records. The header record is described in table 1.

| Counter name | Size | Description |
|---------------------|----------------|----------------------------|
| Year | 1 byte integer | Date year; i.e. 04 |
| Month | 1 byte integer | Date month; i.e. 12 |
| Date | 1 byte integer | Date day of month; i.e. 29 |
| Hour | 1 byte integer | Date hour; i.e. 10 |
| Minute | 1 byte integer | Date minutes; i.e. 15 |
| Second | 1 byte integer | Date seconds; i.e. 00 |
| Hd_disp | 1 byte integer | |
| Hd_noofticket | 1 byte integer | Header number of ticket |
| Hd_ticketno | 1 byte integer | Header ticket number |

Table 1 – RCP Header Record fields description

RCP data records are either 10 or 12 bytes, depending on the size of the rank counter. This is determined by the value of the counter type integer (3rd byte). RCP records are described in table 2.

| Counter name | Size | Description |
|------------------------------|---|--|
| Observation Record family ID | 2 byte unsigned integer. | ID that determines the family group, the record belongs to. Used to generate the counter name. |
| Counter type | 1 byte | Determines rank ID size. 1,2 is a 2 byte rank. 3,4 is a 4 byte rank. |
| Rank ID within family | 2 or 4 byte hex string depending on counter type. | |
| Counter value | 4 byte big | |

| | | |
|--------------------------|----------------|--|
| | endian integer | |
| Counter validation value | 1 byte char | |

Table 2 – RCP Data Record field description

2.2.6.2 Data Layout – OCB

Each OCB file is composed of a series of block structures. Each block is identified by a block header entry, as described in table 3. The block header is followed by a series of data records, each starting with a record header. The header record is described in table 4.

| Counter name | Size | Description |
|--------------|-----------------------------|--------------|
| Block length | Two byte big endian integer | Block length |
| Reserved | Two bytes | |

Table 3 – OCB block header record fields description

| Counter name | Size | Description |
|-----------------|-----------------------------|--------------------------|
| Record length | Two byte big endian integer | Header record length |
| Reserved | Two bytes | |
| Record code | 1 byte integer | Header class ID |
| Year | Two byte big endian integer | Date year day; i.e. 0419 |
| Month | 1 byte integer | Date month; i.e. 12 |
| Hour | 1 byte integer | Date hour; i.e. 10 |
| Minute | 1 byte integer | Date minutes; i.e. 15 |
| Second | 1 byte integer | Date seconds; i.e. 00 |
| Exchange number | 1 byte integer | Exchange number |

Table 4 – OCB header record fields description

OCB data record byte allocation is dependent on the record class ID. Table 5 is an example of a byte allocation for a permanent observation class C record.

| Counter name | Size | Description |
|-----------------------------|------------------------------|-------------|
| CI (in tenths of an ERLANG) | Four byte big endian integer | |
| CD (in tenths of an ERLANG) | Four byte big endian integer | |
| CA (in tenths of an ERLANG) | Four byte big endian integer | |
| CT (in tenths of an ERLANG) | Four byte big endian integer | |

| | | |
|-----------------------------|------------------------------|--|
| CC (in tenths of an ERLANG) | Four byte big endian integer | |
| CV (in tenths of an ERLANG) | Four byte big endian integer | |

Table 5 – OCB class C record fields description

2.2.6.3 Data Layout – LM

The arrangement of data structure in LM record is illustrated as below:

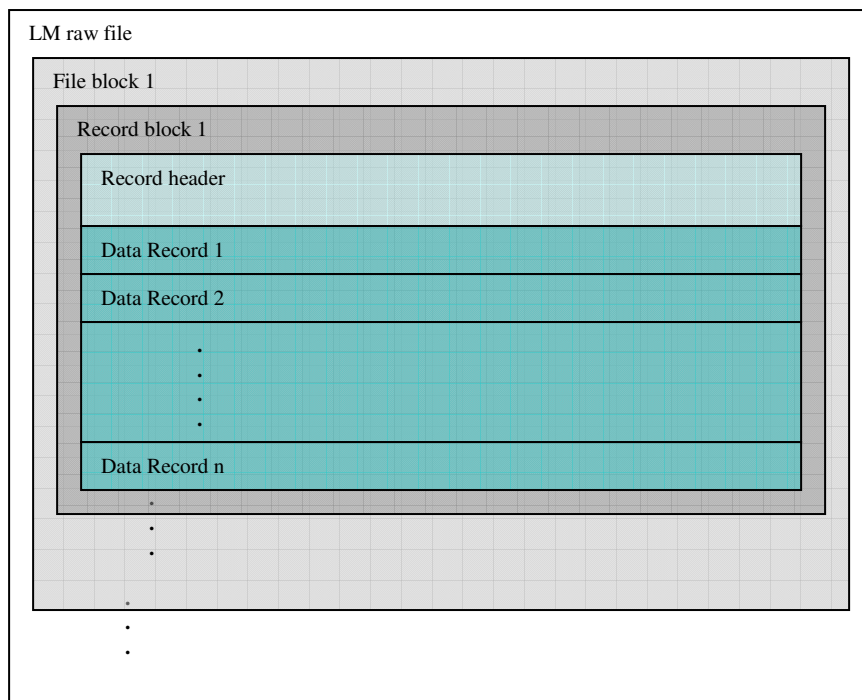

Diagram 1: LM raw data layout

An LM raw file must have one or more file blocks (with fixed length) in it. Multiple record blocks are sharing a single file block. Within a record block, there will be always a record header with at least one data record.

Table 6 shows the field descriptions of a file block header. Note that the Block length does not include the first 6 bytes of this file block header.

| Counter name | Size | Description |
|----------------|--------------------------------|-------------------------------|
| Block number | Two byte little endian integer | Block number |
| Reserved | Two bytes | Reserve byte and Spanned flag |
| Last used byte | Two byte little endian integer | Block length |

Table 6 – LM file block header field description

A record block always contains a record header, followed by multiple data records. Table 7 shows the example of a record header field description that belongs to record block type SCPHIST of file type SCCP.

| Counter name | Size | Description |
|---------------|--------------------------------|-----------------------|
| Record length | Two byte little endian integer | Header record length |
| MMC number | Two byte little endian integer | Record type |
| Reserved | 26 bytes | |
| Year | Two byte little endian integer | Date Year; i.e. 2004 |
| Month | 1 byte little endian integer | Date month; i.e. 12 |
| Day | 1 byte little endian integer | Date day; i.e. 25 |
| Hour | 1 byte little endian integer | Date hour; i.e. 10 |
| Minute | 1 byte little endian integer | Date minutes; i.e. 15 |
| Reserved | 6 bytes | |

Table 7 – Sample LM record header field description (SCCP SCPHIST header)

Each different MMC number (from record header) has its own unique data record byte allocation. It is possible to have multiple data records within a single record block. Table 8 is an example of data record for record block type SCPHIST.

| Counter name | Size | Description |
|-----------------|------------------|-------------|
| Reserved | 8 bytes | |
| SSN | One byte integer | |
| Threshold | One byte integer | |
| Hour | One byte integer | |
| Minute | One byte integer | |
| Second | One byte integer | |
| Tenth_of_second | One byte integer | |

Table 8 – SCPHIST data record byte allocation

2.2.7 File Naming Convention

2.2.7.1 HLR/RCP and OCB/SSP File Naming

For HLR/RCP and OCB/SSP Alcatel NSS raw files must follow the naming convention as below:

<OMC> . <NODE>

where,

<OMC> : 3 digit hexadecimal followed by the OMC.
<NODE> : this is the switch name who's generated the raw file.

2.2.7.2 LM File Naming

For LM Alcatel NSS raw files must follow the naming convention as below:

<MSCID> . <TYPE>

where,

<MSCID> : the MSC ID and name.
<TYPE> : this the type (file type) of the raw file.

2.2.8 Architectural extensions

There are no specific architectural extensions to the Alcatel NSS Gateway, such as XML parsing etc.

2.2.9 Log Messages

The log messages will be recorded in the log file as configured inside the properties. Basically there are 3 general types of log messages.

- a. Informative messages
 - General informative description about parser current state. Example: the information about current block read (byteReadCount, blockSize, recordLength)
- o Warning messages
 - Informing the abnormalities during parsing. The warning messages are not critical and can safely be ignore at point of existence. The messages mostly used during debugging process if there are problem arises during parsing activities.
Example: Warning: -get_pif_key - record_type missing from binary data.
(In this case, the record_type [MMC number] is missing when the gateway trying to use it as a PIF key record)
- o Error messages
 - Pointing out the problem during parsing. This is critical messages as it describes the reason of why the parser failed to parse the data. Most of the time the parser will the stop the processing and skip the raw data.
 - Example: Unexpected end of file or error reading file.

3 Engine Rules and Configuration

This section describes the Alcatel NSS engine rules and rule configurations.

3.1 ALCATEL_RCP

The binary parsing of the Alcatel RCP data is handled by the ALCATEL_RCP engine rule. The rule is designed to parse through each individual RCP performance data file and produce unique PIF files for each block of data.

The ALCATEL_RCP engine is designed to be a flexible tool, which can be used to map every byte in the binary RCP file. The header and record byte mappings for each block are contained in the configuration file entries HEADER_MAPPING and RECORD_MAPPING respectively. These two record mapping configurations are sufficient to map and parse the entire file. If a change in the record design occurs, the new mapping can be achieved by updating the configuration accordingly.

3.2 ALCATEL_OCB

This is the engine rule to parse Alcatel NSS OCB data. This is a one-to-many relationship where a single raw OCB file will generate many PIF files. PIF files will be generated whenever an OCB 'class_id' matches the configured OBSERVATION_RECORDS for the rule.

Note that the header information shall be shared among these records, if there is only one header available for multiple records (it can be multiple sections in the raw file, where each section has its own header information). For OCB, each record has its own vital information in the record header.

3.3 ALCATEL_LM

ALCATEL_LM parses LM data. Each input file will generate multiple PIF files depending on the record type it contains. Similar to ALCATEL_OCB, a PIF file will be generated whenever the LM 'class_id' matches one of the entries in OBSERVATION_RECORDS.

Some of the input files contain records that do not have a record header, for example MNEM record type. Only the first record block has a header. All subsequent record blocks will share the header information in the PIF output files.

3.4 Alcatel Engine Rule Configurations

The following details the Alcatel engine RCP, OCB and LM rule configurations. The configurations are divided up into entries common to all rules and individual rule specific entries.

Entries such as HEADER_MAPPINGS and RECORD_MAPPINGS are common to all rules, but the configured value structures are different, and so these entries are documented in both the Alcatel RCP, Alcatel OCB and Alcatel LM sections.

3.4.1 Common Rule Entries

The following details proprietary rule entries common to all ALCATEL_RCP, ALCATEL_OCB and ALCATEL_LM rules.

- **HEADER_FIELDS_FOR_PIF_NAME:** This is a mandatory entry with an array value. The values for the array of header counter names that are contained in the array shall be included in the output PIF filename. The values appear in the filename in accordance with the sequence of counter names configured.

HEADER_FIELDS_FOR_PIF_NAME =>

[qw(OMC NODE hd_ticketno StartDate StartTime)],

- **HEADER_FIELDS_FOR_UNIQUE_PIF:** This is a mandatory entry containing an array value. The header counter values for these counter name entries are used to create a key for the data records. This key serves the purpose of identifying uniqueness of each of the PIF records. If the key is always unique, then all raw data shall be processed and outputted. If it is duplicated, only the final record in the duplication will be retained.

HEADER_FIELDS_FOR_UNIQUE_PIF =>

[qw(OMC NODE hd_ticketno StartDate StartTime)],

- **PIF_OBJ_ID:** A mandatory entry containing an array value. The counter names specified here are used to configure what counter names in the current data record contain the observation record family object ID. This object ID is then used to search the configured group record ID's configured in the **OBSERVATION_RECORDS** entry to see if a match is found. IF a match is found the group name is used in the data output. If not the record is discarded.

(RCP) PIF_OBJ_ID => ['COUNTER_FID']

(OCB) PIF_OBJ_ID => ['class_id'],

(LM) PIF_OBJ_ID => ['class_id'],

- **PIF_RECORD_ID:** A mandatory entry containing an array value. The counter names specified here are used to configure what counter values in the current data record are used as the current PIF record key.

(RCP) PIF_RECORD_ID => ['rank']

(OCB) PIF_RECORD_ID =>

['class_id', 'rec_num', 'routeid', 'rank', 'intrecno', 'index'],

(LM) PIF_RECORD_ID => ['class_id'],

ENABLE_FILENAME_TIMESTAMP: An optional entry with a 'True' or 'False/0' value (True – to turn it on and False/0 to turn it off). This entry allows the pif filename to be appended with a binary file processing timestamp. Enabling this entry will ensure the uniqueness of the pif filename during pif creation.

3.4.2 Alcatel RCP Rule Configuration

The section details rule entries specific to the Alcatel RCP rule.

- **OBSERVATION_RECORDS:** A mandatory entry containing a hash value. Each hash key entry is the name of a family of objects ID's. Each object family name key points to another hash, which contains the ID's, either as discrete numbers, or regular expression number ranges. If the record **COUNTER_FID** (record object ID) in each data record does not match any of the values specified in the **OBSERVATION_RECORDS COUNTER_GROUPS**, it shall be ignored.

OBSERVATION_RECORDS => {

```
VLR_SS => {  
    COUNTER_GROUPS => ['2300[1,2]'],  
},  
VLR_E212 => {  
    COUNTER_GROUPS => ['20454'],  
},  
VLR_E164 => {  
    COUNTER_GROUPS => ['20606'],  
},  
VLR_GLOBAL => {  
    COUNTER_GROUPS => ['2030[1-8]',  
                        '20402',  
                        '2040[4-9]'],  
},  
}
```

- **HEADER_MAPPING:** This is a mandatory entry containing an array of hashes. The array will contain a sequence of entries, each of which represents a byte (or bytes) mapping for a field of the header record. Each hash in the array shall contain a mandatory key called **COUNTER_TYPE**. The value of **COUNTER_TYPE** decides the byte(s) description and byte(s) allocation. The codes used to describe the byte data are those defined in the Perl template for the pack/unpack function. These codes determine how the byte(s) are translated, or unpacked. For example, “C” represents an unsigned character, whereas “N” represents a 4 byte big-endian integer. There are two optional keys in the hash entry. They are **ATTR** and **COUNTER_NAME**.
 - **ATTR** is used to describe the function of the data, and this is currently only used to describe if the byte is part of a date definition. The ALCATEL_RCP collects all “Date” bytes and further processes into a suitable date format.
 - If the **COUNTER_NAME** is included in the hash entry for each byte(s) allocation, then the entity will be outputted as a full counter name/value in the PIF record. The absence of the **COUNTER_NAME** suggests that the byte(s) entity will be further processed elsewhere, or else is of no interest and is ignored.

```
HEADER_MAPPING => [  
    { COUNTER_TYPE => 'C', ATTR => "Date" }, # year  
    { COUNTER_TYPE => 'C', ATTR => "Date" }, # month  
    { COUNTER_TYPE => 'C', ATTR => "Date" }, # day  
    { COUNTER_TYPE => 'C', ATTR => "Date" }, # hour  
    { COUNTER_TYPE => 'C', ATTR => "Date" }, # min  
    { COUNTER_TYPE => 'C', ATTR => "Date" }, # sec  
    { COUNTER_TYPE => 'C', COUNTER_NAME => 'hd_disp' },  
    { COUNTER_TYPE => 'C', COUNTER_NAME => 'hd_noofticket' },  
    { COUNTER_TYPE => 'C', COUNTER_NAME => 'hd_ticketno' },  
],
```

- **RECORD_MAPPING:** This is a mandatory entry, containing an array of hashes, and works in the same way as header mapping for records in terms of a sequence of byte(s) allocation using **COUNTER_TYPE**, and optionally **COUNTER_NAME** to describe a complete counter name/value pair. **RECORD_MAPPING** includes an extra feature for **COUNTER_TYPE**, as it allows for dynamic

allocation of bytes for a single entity in the RECORD_MAPPING array sequence, based on counter values. This is done by configuring the COUNTER_TYPE value as a hash entry with the following entries:

- Default: This hash entry describes the default mapping of byte(s) for the current hash entry in terms of counter type mapping and counter name, and is used for initial sizing of the record when parsing the binary data.
- Index: The value of Index contains the parsed record array subscript, whose value contains the integer that will determine the current entities dynamic counter type and byte allocation. This integer must exist in the COUNTER_TYPE hash for a successful mapping.
- 1,2,3,4 etc.: These hash entries describe the mapping of byte(s) for the current RECORD_MAPPING hash entry, which the counter value retrieved by Index, will output, in terms of counter type mapping and counter name, and is used for the final sizing of the record when parsing the binary data.

This dynamic mapping is designed to handle the fact that the rank counter, as described in table 2, is either a 2 byte or a 4 byte integer, depending on the value of the counter type record field.

```
RECORD_MAPPING => [  
  { COUNTER_TYPE => 'S', COUNTER_NAME => 'COUNTER_FID' },  
  { COUNTER_TYPE => 'C' },  
  { COUNTER_TYPE => {  
    Index => 1,  
    Default => {COUNTER_TYPE => 'H16', COUNTER_NAME => 'rank'},  
    1 => {COUNTER_TYPE => 'H16', COUNTER_NAME => 'rank'},  
    2 => {COUNTER_TYPE => 'H16', COUNTER_NAME => 'rank'},  
    3 => {COUNTER_TYPE => 'H32', COUNTER_NAME => 'rank'},  
    4 => {COUNTER_TYPE => 'H32', COUNTER_NAME => 'rank'},  
  },  
  { COUNTER_TYPE => 'N' },  
  { COUNTER_TYPE => 'C' },  
]
```

- **HEADER_RECORD_PROCESSING:** An optional entry whose value points to a configured Perl subroutine. The purpose of this entry is to add custom processing for a deployment, such as add a new counter. But it could be any processing on the header record. This entry only deals with counter name/value pairs in the current header record and is invoked for each header record encountered.

The ALCATEL_RCP default rule configuration uses the HEADER_RECORD_PROCESSING to perform the following tasks on the header record:

- Hard code the duration time in seconds for the measurement period.
- Insert the FILE_START_DATE counter, if not already present.
- Insert the FILE_START_TIME counter, if not already present.

```
HEADER_RECORD_PROCESSING => sub {  
  my ($rec_ref, $op_hash_ref) = @_;  
  my @time = split (/:/, $op_hash_ref->{StartTime} );
```

```
if (!exists($op_hash_ref->{FILE_START_DATE})) {  
    $op_hash_ref->{FILE_START_DATE} =  
        $op_hash_ref->{StartDate};  
    $op_hash_ref->{FILE_START_TIME} = $time[0].":00";  
}  
$op_hash_ref->{Duration} = 60;  
return 0;  
},
```

- **DATA_RECORD_PROCESSING:** An optional entry whose value points to a configured Perl subroutine. The purpose of this entry is to add custom processing for a deployment, such as add a new counter. But it could be any processing on the data record. This entry only deals with counter name/value pairs in the current data record and is invoked for each data record.

The ALCATEL_RCP default rule configuration uses the DATA_RECORD_PROCESSING to perform the following tasks on each data record:

- Creates a new counter name by concatenating "C" and the record FID_COUNTER field value.
- Assign the new counter name to the counter value contained in the record.
- Creates a new counter name by concatenating "VAL_C" and the record counter, validation field value.
- Assign the new counter name to the validation counter field value contained in the record.

```
DATA_RECORD_PROCESSING => sub {  
    my ($rec_ref, $op_hash_ref) = @_;  
    $op_hash_ref->{"C$rec_ref->[0]"} = $rec_ref->[3];  
    $op_hash_ref->{"VAL_C".$rec_ref->[0]} = $rec_ref->[4];  
    return 0;  
},
```

- **HEADER_DATA_TO_REMOVE:** An optional entry whose value points to a configured Perl subroutine. The purpose of this entry is to add custom processing for a deployment such as stripping off extra header. FIELD_TERMINATOR is used to identify the field to be stripped off.

```
HEADER_DATA_TO_REMOVE => [  
    { FIELD_NAME => 'ERROR_CODE', FIELD_TERMINATOR => "\n", },  
    { FIELD_NAME => 'SYSTEM_NAME', FIELD_TERMINATOR => "\n", },  
    { FIELD_NAME => 'LENGTH', FIELD_TERMINATOR => "\n",  
      RECURRING => 'True',  
      BLOCK_LENGTH => 'True',  
    },  
],
```

3.4.3 Alcatel OCB Rule Configuration

The section details rule entries specific to the Alcatel OCB rule.

- **OBSERVATION_RECORDS:** A mandatory entry containing a hash value. This has the same role as the ALCATEL_RCP OBSERVATION_RECORDS, but with an added feature. Erroneous raw data block can be detected earlier by using two optional entries, HEADER_LENGTH, and RECORD_LENGTH.

When a block of raw data is read, it should contain the length of the block. To check whether this block is correct, the formula below should give a result of 0:

$(\text{raw_data_block_length} - \text{HEADER_LENGTH}) \bmod \text{RECORD_LENGTH}$

Related to CONSOLIDATE_FILES, an optional entry RECORD_GROUP is introduced here. This entry notifies the engine as to how many records should be expected for a certain record type.

```
OBSERVATION_RECORDS => {
  PERM_OBS_CLASS_R => { COUNTER_GROUPS => ['7'],
    HEADER_LENGTH => 25,
    RECORD_LENGTH => 16,
  },
  PERM_OBS_CLASS_T => { COUNTER_GROUPS => ['8'],
    HEADER_LENGTH => 13,
    RECORD_LENGTH => 16,
    RECORD_GROUP => 64,
  },
}
```

- **HEADER_MAPPING:** This is a mandatory entry, containing an array of hashes, and works in the same way as header mapping in the ALCATEL_RCP rule in terms of a sequence of byte(s) allocation using COUNTER_TYPE, and optionally COUNTER_NAME to describe a complete counter name/value pair. ALCATEL_OCB also includes dynamic byte allocation for the header record, based on the value of a particular counter in the current header, which is used to index into the HEADER_MAPPING COUNTER_TYPE hash to fetch the correct byte mapping for the current header record. This is done by configuring the COUNTER_TYPE value as a hash entry with the following entries:
 - **Default:** This hash entry describes the default mapping of byte(s) for the current hash entry in terms of counter type mapping and counter name, and is used for initial sizing of the record when parsing the binary data.
 - **Index:** The value of Index contains the parsed record array subscript entry, whose value contains the integer that will determine the current entities dynamic counter type and byte allocation. This integer must exist in the COUNTER_TYPE hash keys for a successful mapping.
 - **1,4,5,6,7 etc.:** The numeric record codes contained in the current header record are actually OCB class ID's and are configured here as hash keys. The corresponding hash values are arrays of hashes, reflecting the variable nature of OCB headers. Some of these mappings will be single entity hash mappings, where others will have multiple hash entities in the array.

```
HEADER_MAPPING => [
  { COUNTER_TYPE => 'n', RECORD_LENGTH => 'True', },
  { COUNTER_TYPE => 'n' },
  { COUNTER_TYPE => 'C', COUNTER_NAME => 'record_code' },
  { COUNTER_TYPE => 'n', ATTR => 'Date' }, # year day
  { COUNTER_TYPE => 'C', ATTR => 'Date' }, # hour
  { COUNTER_TYPE => 'C', ATTR => 'Date' }, # minute
  { COUNTER_TYPE => 'C', ATTR => 'Date' }, # second
  # Permanent Observation Measurement Mappings (OBS)
  { COUNTER_TYPE => {
```

```

Default => { COUNTER_TYPE => 'C' },
Index => 2,
# PERM_OBS_START
1 => [{ COUNTER_TYPE => 'C', COUNTER_NAME => 'xchg_num' }, ],

# PERM_OBS_CLASS_A
6 => [ { COUNTER_TYPE => 'C', COUNTER_NAME => 'xchg_num' },
      { COUNTER_TYPE => 'n' },
      { COUNTER_TYPE => 'n' },
      { COUNTER_TYPE => 'n' },
    ],

# PERM_OBS_CLASS_C
4 => [{ COUNTER_TYPE => 'C', COUNTER_NAME => 'xchg_num' }, ],

```

- **RECORD_MAPPING:** This is a mandatory array entry. Similar to ALCATEL_RCP but with an extra feature. A new key named COUNTER_OPERATION is introduced. This entry will tell the engine to generate a sequence number for each record of a particular record type. However, this entry only accepts two values, i.e. '+' and '++'. When '+' is used, the sequence number shall be reset back to 1 whenever a single raw data block is processed, whereas '++' is reset after the raw file is processed.

```

RECORD_MAPPING=> [
  { COUNTER_TYPE =>
    {
      Default => { COUNTER_TYPE => 'C' },
      33 => [
        { COUNTER_TYPE => 'C', COUNTER_NAME => 'rank' },
        { COUNTER_TYPE => 'C' },
        { COUNTER_TYPE => 'n' },
        { COUNTER_TYPE => 'N', COUNTER_NAME => 'ine_i' },
        { COUNTER_TYPE => 'N', COUNTER_NAME => 'inr_i' },
        { COUNTER_OPERATION => '+',
          COUNTER_NAME => 'intreco' },
      ],
      8 => [
        { COUNTER_TYPE => 'N', COUNTER_NAME => 'ta' },
        { COUNTER_TYPE => 'N', COUNTER_NAME => 'tt' },
        { COUNTER_TYPE => 'N', COUNTER_NAME => 'td' },
        { COUNTER_TYPE => 'N', COUNTER_NAME => 'ti' },
        { COUNTER_OPERATION => '++',
          COUNTER_NAME => 'index' },
      ],
    },
  ],
]

```

- **PARTIAL_FILE_DIR:** This is an optional entry containing a directory entry. In some cases the records for a group are not within a single raw file. When this happens, the partial PIF cannot be processed to LIF yet. It is being stored in the directory path specified by this entry.

```

PARTIAL_FILE_DIR => '../..../partial',

```

- **CONSOLIDATE_FILES:** This is an optional scalar entry. As mentioned above, when a partial PIF is generated, and this entry is set to 'true', the engine shall go to match the other portion of PIF in **PARTIAL_FILE_DIR**. If there are matching partial PIF, they will be joined together and consolidates counters if necessary.

```
CONSOLIDATE_FILES => 'True'
```

- **INDEX_HOLDER:** This is an optional array entry. When **COSOLIDATE_FILES** is set to 'true', there is an option to consolidate any sequence number within the PIFs. This array holds all possible counter names contain sequence number.

```
INDEX_HOLDER => [ qw( rank rec_num intrecno index) ]
```

- **CHARACTER_MAP:** This is an optional entry. This is used to map the character in the raw file to a specific character map, i.e. from EBCDIC to ASCII. It points to an array of characters.

```
CHARACTER_MAP => char_map()
```

3.4.4 Alcatel LM Rule Configuration

The section details rule entries specific to the Alcatel LM rule.

Mandatory Entries

- **OBSERVATION_RECORDS:** A mandatory entry containing a hash value. This entry is similar to Alcatel RCP. The extra configuration for Alcatel LM is the **UNIQUE_HEADER_KEY**. Some of the record types have different sets of header/record structure, depending on the indicator in the raw data itself. This has to be determined at runtime. This optional entry (**UNIQUE_HEADER_KEY**) tells the engine where to find the value of the indicator. The indicator tells which header/record structure to take from the configuration. Below shows the example of the MTP record type. Note that the counter 'repetitions' is defined in the **HEADER_MAPPING** for the MTP record type.

```
OBSERVATION_RECORDS => {  
  N7T1 => {  
    COUNTER_GROUPS => ['1565'],  
    UNIQUE_HEADER_KEY => 'repetitions',  
  },  
  N7T2 => {  
    COUNTER_GROUPS => ['1566'],  
    UNIQUE_HEADER_KEY => 'repetitions',  
  },  
  N7T3 => {  
    COUNTER_GROUPS => ['1567'],  
    UNIQUE_HEADER_KEY => 'repetitions',  
  },  
  N7T4a => {  
    COUNTER_GROUPS => ['1568'],  
    UNIQUE_HEADER_KEY => 'repetitions',  
  },  
  N7T4b => {  
    COUNTER_GROUPS => ['1589'],  
  },  
}
```

```
    },
    N7T5 => {
        COUNTER_GROUPS => ['1569'],
    },
    N7T6 => {
        COUNTER_GROUPS => ['1570'],
    },
},
```

- **HEADER_MAPPING:** This is a mandatory entry containing an array of hashes. The usage is exactly the same as for the Alcatel OCB rule. Below shows the example mapping for the CPU record type:

```
HEADER_MAPPING => [
  { COUNTER_TYPE => 'v', RECORD_LENGTH => 'True' }, # rec len
  { COUNTER_TYPE => 'v', COUNTER_NAME => 'record_type' },
  { COUNTER_TYPE => {
    Index => 1,
    Default => {COUNTER_TYPE => 'C'},

    1560 => [ # CPU
      { COUNTER_TYPE => 'a16', }, # unused
      { COUNTER_TYPE => 'v', ATTR => "Date", }, #year
      { COUNTER_TYPE => 'C', ATTR => "Date" }, # month
      { COUNTER_TYPE => 'C', ATTR => "Date" }, # day
      { COUNTER_TYPE => 'C', ATTR => "Date" }, # hour
      { COUNTER_TYPE => 'C', ATTR => "Date" }, # min
      { COUNTER_TYPE => 'C', COUNTER_NAME => "end_hour" },
      { COUNTER_TYPE => 'C', COUNTER_NAME => "end_min" },
      { COUNTER_TYPE => 'a6', }, # unused
    ],
  },
],
```

Below shows the example mapping for the TRUNKGROUP record type for Flexible ADL. Gateway will do counter name mapping from counter id given in the data file.

```
7403 => [ # TRUNKGROUP
  { COUNTER_TYPE => 'a12', }, # unused
  { COUNTER_TYPE => 'v', ATTR => "Date", }, #year
  { COUNTER_TYPE => 'C', ATTR => "Date" }, # month
  { COUNTER_TYPE => 'C', ATTR => "Date" }, # day
  { COUNTER_TYPE => 'a4', }, # unused
  { COUNTER_TYPE => 'C', ATTR => "Date" }, # hour
  { COUNTER_TYPE => 'C', ATTR => "Date" }, # min
  { COUNTER_TYPE => 'C', COUNTER_NAME => "end_hour" },
  { COUNTER_TYPE => 'C', COUNTER_NAME => "end_min" },
  { COUNTER_TYPE => 'a2', }, # unused
  { COUNTER_TYPE => 'C', COUNTER_NAME => 'ind' },
  { COUNTER_TYPE => 'a5' }, # unused
  { COUNTER_TYPE => 'v', NAME_REF => 'COUNTERNAME1' },
  { COUNTER_TYPE => 'v', NAME_REF => 'COUNTERNAME2' },
  { COUNTER_TYPE => 'v', NAME_REF => 'COUNTERNAME3' },
  { COUNTER_TYPE => 'v', NAME_REF => 'COUNTERNAME4' },
```

```

        { COUNTER_TYPE => 'v', NAME_REF => 'COUNTERNAME5' },
        { COUNTER_TYPE => 'v', NAME_REF => 'COUNTERNAME6' },
        { COUNTER_TYPE => 'v', NAME_REF => 'COUNTERNAME7' },
        { COUNTER_TYPE => 'v', NAME_REF => 'COUNTERNAME8' },
        { COUNTER_TYPE => 'v', NAME_REF => 'COUNTERNAME9' },
        { COUNTER_TYPE => 'v', NAME_REF => 'COUNTERNAME10' },
        { COUNTER_TYPE => 'a40', }, # unused
    ],

```

- **RECORD_MAPPING:** This is a mandatory entry containing an array of hashes. The usage is similar to **HEADER_MAPPING** described above, but it is for data record field mappings. Below shows the example mapping for the CPU record type:

```

RECORD_MAPPING => [
    { COUNTER_TYPE => {
        Default => {COUNTER_TYPE => 'C'},

        1560 => [ # CPU
            { COUNTER_TYPE => 'a2', }, # unused
            { COUNTER_TYPE => 'v', COUNTER_NAME => 'CE_ID' },
            { COUNTER_TYPE => 'V', COUNTER_NAME => 'INTERRUPTS' },
            { COUNTER_TYPE => 'V', COUNTER_NAME => 'EVENTS' },
            { COUNTER_TYPE => 'V', COUNTER_NAME => 'PROC_SE' },
            { COUNTER_TYPE => 'V', COUNTER_NAME => 'IDLE' },
            { COUNTER_TYPE => 'v', COUNTER_NAME => 'CPU_LOAD' },
        ],
    },
],

```

Below shows the example mapping for the TRUNKGROUP record type for Flexible ADL. Gateway will do counter name mapping from counter id given in the data file.

```

'7403_IN' => [ # TRUNKGROUP
    { COUNTER_TYPE => 'v', COUNTER_NAME=> 'OBJECTINDEX' },
    { COUNTER_TYPE => 'a2' },
    { COUNTER_TYPE => 'N', NAME_REF => 'COUNTERVALUE1' },
    { COUNTER_TYPE => 'N', NAME_REF => 'COUNTERVALUE2' },
    { COUNTER_TYPE => 'N', NAME_REF => 'COUNTERVALUE3' },
    { COUNTER_TYPE => 'N', NAME_REF => 'COUNTERVALUE4' },
    { COUNTER_TYPE => 'N', NAME_REF => 'COUNTERVALUE5' },
    { COUNTER_TYPE => 'N', NAME_REF => 'COUNTERVALUE6' },
    { COUNTER_TYPE => 'N', NAME_REF => 'COUNTERVALUE7' },
    { COUNTER_TYPE => 'N', NAME_REF => 'COUNTERVALUE8' },
    { COUNTER_TYPE => 'N', NAME_REF => 'COUNTERVALUE9' },
    { COUNTER_TYPE => 'N', NAME_REF => 'COUNTERVALUE10' },
],

```

- **FILE_BLOCK_SIZE:** this is a scalar entry. It tells the engine the size of a single file block (refer Diagram 1) in bytes. The vendor engine will read the amount of bytes from the raw file specified by this entry for each iteration, until the whole raw file is processed.

```

FILE_BLOCK_SIZE => 2048,

```

Optional Entries

- **SKIP_UNKNOWN_RECORD:** This is a scalar entry. It is an entry that decide whether to skip the unknown block when the parser already reach at the end of the record as describe in the record header. The calculation on the number of bytes to skip is based on block data size and current record length. The trigger for the skipping is based on errors when parsing the next record block. Without this entry or setting it to false, the parser will assume that the raw data file is corrupted.

```
SKIP_UNKNOWN_RECORD => 'TRUE',
```

- **RECORD_BLOCK_LENGTH_BYTE_SIZE:** This is a scalar entry. In 'overflow' cases, where a single 2KB file block is not sufficient to contain all data records, these data records will overflow to the next file block. The first record block in the next file block will not contain any record header, but only record length information (the length of the overflowed data record). The engine needs to skip these bytes in order to continue reading the data record. This entry tells the engine how many bytes to skip for the length information. It is defaulted to 2 bytes if this entry is not set.

```
RECORD_BLOCK_LENGTH_BYTE_SIZE => 2,
```

- **ADD_RUNNING_SEQUENCE:** This is a scalar entry. Most of the LM data records do not contain any unique key. This entry, if set to true, will result in a counter name called 'OBJECT', with a numeric value incremented for each record, in the output PIF data records.

```
ADD_RUNNING_SEQUENCE => 'True',
```

- **CONFIG_FILE:** This is a hash entry. An external file is required when the indicator of a dynamic header/record structure is not within the raw file. These indicators are stored within an external file. The Alcatel LM rule provides this facility where the data (content of external file) is read into its internal data structures. This information will be read at the beginning of the rule execution and updated back to the file at the end of the execution. Any new entry added during execution shall be added to these external files. The key of this hash is string containing the directory path and filename of the external configuration file.

Within the hash, **DELIMITER** and **KEY_INDEX** are optional. If they do not exist, the engine defaults the value of **DELIMITER** to ' ' (space) and the **KEY_INDEX** to 0 (first index of array). Note that the **DELIMITER** value is a Perl regular expression.

COLUMN_NAMES is a mandatory array entry. It lists out the sequence of column names in the external configuration file. Note that there is always a 'key' in this array. The index of its position must match with **KEY_INDEX** (or defaults at index 0).

```
CONFIG_FILE => {  
  './GSconfigfile' => {  
    DELIMITER => ', ',  
    KEY_INDEX => 0,  
    COLUMN_NAMES => ['key', 'num_objs', 'is_nsta'],  
  },  
  './attrfile' => {  
    DELIMITER => '\s+',  
    KEY_INDEX => 0,  
    COLUMN_NAMES => ['key', 'name', 'group'],  
  },  
}
```

```
    },  
  },
```

- **COMMON_HEADER_COUNTERS:** This is an array entry. As some of the record header types (MNEM file type) do not have date time information, it needs to take that information from another record header, i.e. only the very first record header has the information. This entry tells the engine to copy these common header counters to the remaining record headers that require it.

```
COMMON_HEADER_COUNTERS => [ qw(StartDate StartTime) ],
```

- **HEADER_RECORD_PROCESSING:** This is the same entry as described in the Alcatel RCP rule. The only difference for Alcatel LM is that there are three parameters passed into this subroutine instead of the two in the Alcatel RCP rule. The added parameter is the reference to the object parent. This gives the subroutine access to some of the information needed from the engine code for processing.

```
HEADER_RECORD_PROCESSING => sub {  
  my ($parent_ref, $rec_ref, $op_hash_ref) = @_;  
  
  # format end time  
  if ( exists($op_hash_ref->{end_hour}) &&  
        exists($op_hash_ref->{end_min}) ) {  
    $op_hash_ref->{'end_time'} =  
      sprintf("%02d:%02d",  
              $op_hash_ref->{end_hour},  
              $op_hash_ref->{end_min});  
    delete $op_hash_ref->{end_hour};  
    delete $op_hash_ref->{end_min};  
  }  
  
  # Handover (4684), header byte 13 to determine blocks  
  if ( $op_hash_ref->{class_id} eq '4684' ) {  
    $parent_ref->{HOD_Ind} = $op_hash_ref->{indicator};  
    $parent_ref->{HOD_cnt1} = $op_hash_ref->{cnt1};  
    $parent_ref->{HOD_rec_count} = 0;  
  }  
  
  return 0;  
},
```

- **DATA_RECORD_PROCESSING:** This is same as described above, but it is for the data record part. The example subroutine is as below:

```
DATA_RECORD_PROCESSING => sub {  
  my ($parent_ref, $rec_ref, $op_hash_ref) = @_;  
  
  # change record block when cnt1 is hit  
  if ($parent_ref->{HOD_rec_count}==$parent_ref->{HOD_cnt1}) {  
    if ( $parent_ref->{current_class_id} eq '4684' ) {  
      if ( $parent_ref->{HOD_Ind} == 0 ||  
            $parent_ref->{HOD_Ind} == 1 ) {  
        $parent_ref->{current_class_id} = '4684_block';  
      }  
    }  
    else {
```

```
        $parent_ref->{current_class_id} = '4684_notused';
    }
}

# increase record count
if (exists($parent_ref->{HOD_rec_count})) {
    $parent_ref->{HOD_rec_count}++;
}

return 0;
},
```

4 Post Parser Rules and Configuration

In order to produce the LIF that matches the requirement for SSP/OCB, two vendor specific, post parser rules are created. They are HEADER_2_RECORD_TRANSFER and ROTATE.

4.1 HEADER_2_RECORD_TRANSFER

This rule transfers the selective values of header/record from an existing PIF to a new PIF. Maximum value of a counter is populated into the new PIF if specify. Hard coded value is also made available by specifying it in the rule.

4.1.1 Rule Configuration

- **FILENAME_PREFIX:** This is an optional scalar entry. When this is specified, it will become the prefix of the new PIF filename.

FILENAME_PREFIX => 'MAX'

- **OUTPUT_BLOCK_NAME:** This is an optional scalar entry. If this is not specified, the block name of the existing PIF shall be used in the new PIF.

OUTPUT_BLOCK_NAME => 'PERM_OBS_CLASS_R_MAX'

- **HEADER_DATA_FOR_TRANSFER:** This is a mandatory array entry. This array contains the header counter name of the existing PIF. Values of these counters shall be copied to the new PIF's record part.

HEADER_DATA_FOR_TRANSFER => []

- **RECORD_DATA_FOR_TRANSFER:** This is a mandatory array entry. This array contains the record counter name of the existing PIF. Values of these counters shall be copied to the new PIF's record part.

RECORD_DATA_FOR_TRANSFER => ['rpa_i', 'rra_i', 'rec_num', 'NODEID']

- **MAX_SEQUENCE_COUNTER:** This is an optional scalar entry. This is the counter name in the existing PIF that holds the running sequence number. When this is specified, all other records in the existing PIF are ignored except the record with maximum running number. This will only happens if SET_MAX_COUNTER is specified.

MAX_SEQUENCE_COUNTER => 'rec_num'

- **SET_MAX_COUNTER:** This is an optional hash entry. This hash contains the new counter names (to new PIF) and the existing counter name (from existing PIF). If the value specify in this hash cannot be found (i.e. no such counter name in existing PIF), it shall be treated as hard coded value.

```
SET_MAX_COUNTERS => { rpx => 'rpa_i',  
                      rrx => 'rra_i',  
                      NODEID => 'NODEID',  
                      REFER_TO => 'PERM_OBS_CLASS_R',  
                      },
```

A full sample configuration is included below:

```
{  
  RULE_TYPE                => 'HEADER_2_RECORD_TRANSFER',  
  RULE_DESC                => 'Get summary info for CLASS_R',  
  INPUT_FILE_DESCRIPTION   => '^ (PERM_OBS_CLASS_R-#-.*-#-I)\\.pif',  
  PRODUCE_PIF              => 'True',  
  FILENAME_PREFIX          => 'MAX',  
  OUTPUT_BLOCK_NAME        => 'PERM_OBS_CLASS_R_MAX',  
  HEADER_DATA_FOR_TRANSFER => [],  
  RECORD_DATA_FOR_TRANSFER => ['rpa_i', 'rra_i', 'rec_num', 'NODEID'],  
  MAX_SEQUENCE_COUNTER     => 'rec_num',  
  SET_MAX_COUNTERS         => { rpx => 'rpa_i',  
                                rrx => 'rra_i',  
                                NODEID => 'NODEID',  
                                REFER_TO => 'PERM_OBS_CLASS_R',  
                                },  
}
```

4.1.2 Sample Usage

Given the following PIF:

```
## Parser Intermediate File  
##START|HEADER  
OMC|record_code|StartTime|class_id|NODE|Date|StartDate|xchg_num  
760BTS0|7|22:00|7|SSP01|13722025|2004May16|1  
##END|HEADER  
##START|PERM_OBS_CLASS_R  
NODEID|OBJ_GROUP_NAME|rpa_i|rrd_i|class_id|rra_i|rpd_i|rec_num  
SSP01|PERM_OBS_CLASS_R|109|0|7|0|3304192244|1  
SSP01|PERM_OBS_CLASS_R|0|0|7|3253860597|0|2  
SSP01|PERM_OBS_CLASS_R|3304192245|3879747648|7|121|0|3  
SSP01|PERM_OBS_CLASS_R|550172|0|7|0|0|4  
##END|PERM_OBS_CLASS_R
```

Using the sample configuration, the outputted data is as below:

```
## Parser Intermediate File  
##START|HEADER
```

```
OMC|record_code|StartTime|class_id|NODE|Date|StartDate|xchg_num
760BTS0|7|22:00|7|SSP01|13722025|2004May16|1
##END|HEADER
##START|PERM_OBS_CLASS_R_MAX
max_seq|rpx|NODEID|rrx|REFER_TO
4|550172|SSP01|0|PERM_OBS_CLASS_R
##END|PERM_OBS_CLASS_R_MAX
```

4.2 TRANSPOSE

The objective of this rule is to transpose the data matrix by exchanging the rows from PIF data block to columns. The counter names for the header and value will be defined in the configuration.

4.2.1 Rule Configuration

- NEW_NAME_FOR_COUNTER_NAMES: This is a mandatory scalar entry. This shall be the counter name that will be use to group counter names which will come in rows.

NEW_NAME_FOR_COUNTER_NAMES => 'HEADERS',

- COUNTER_NAME_FOR_DATA_ROWS: This is a mandatory scalar entry. This shall be the counter name that will be use to group all the counter values which map according its counter name.

COUNTER_NAME_FOR_DATA_ROWS => 'VALUE',

- COLUMN_DATA_TO_REPLACE_CTRS: This is an optional scalar entry. The value/data for the named counter will be promote as a counter name to group all the counter value.

COLUMN_DATA_TO_REPLACE_CTRS => 'OBJ_GROUP_NAME',

- REDUNDANT_COLUMNS: This is an optional array entry. The named columns will be removed from the data block before transposing the data matrix. The features similar to REDUNDANT_DATA_COUNTERS entry in other post parser rule.

REDUNDANT_COLUMNS => 'CA_OR',

A full sample configuration is included below:

```
{
  RULE_TYPE => 'TRANSPOSE',
  RULE_DESC => 'Transpose the ADL result to produce counter/value pair',
  INPUT_FILE_DESCRIPTION => [
    '^\\w+-#-\\w+_A900_ADL-#-\\w+-#-\\d{2}\\w{3}\\d{4}-#-\\d{2}:\\d{2}-#-\\d{2}:\\d{2}-#-\\d+-#-I.pif',
  ],
  NEW_NAME_FOR_COUNTER_NAMES => 'HEADERS',
  COUNTER_NAME_FOR_DATA_ROWS => 'VALUE',
  COLUMN_DATA_TO_REPLACE_CTRS => 'OBJ_GROUP_NAME',
  REDUNDANT_COLUMNS => ['CA_OR'],
  PRODUCE_PIF => 'True',
  PRODUCE_LIF => 0,
```

```
OUTPUT_FORMAT      => 0,  
    },
```

4.2.2 Sample Usage

Given the following PIF record (there are 20 columns):

```
## Parser Intermediate File  
##START|HEADER  
StartTime|record_type|MSC_AREA|end_time|class_id|TYPE|StartDate|duration|MSCID  
23:00|8362|ASTRAKHAN|00:00|8362|VFS_A900_ADL|28Feb2007|60|ASTRAKHAN  
##END|HEADER  
##START|STUNDLICHE  
ORIGIN_TERM_TRF|OBJ_GROUP_NAME|SEQUENCE|ORIGINATING_OUTGOING_TRF|INCOMING_TERM|CC_OG|CALL_ATTEMPTS|class_id|MOB_MOB_TRF|CA_MORTR_MSC|INCOMING_TERM_MOBILE_TRF|CA_OR|CA_MICTR_MSC|INCOMING_OUTGOING_TRF|CA_TERM|ORIG_TRF_MOBILE_TERM_TRF|MS_OUTGOING_TRF|BEHAVIOUR_INDICATOR|PA_START|MOBILE_TERM_TRF  
0|STUNDLICHE|0|0|0|55608|34654|8362|36630|52826|32026|0|19232|43012|0|0|52759|83|44078|0  
##END|STUNDLICHE
```

Using the sample configuration, new PIFs is generated according to the configuration.

```
## Parser Intermediate File  
##START|HEADER  
end_time|MSC_AREA|record_type|duration|MSCID|StartTime|class_id|TYPE|StartDate  
00:00|ASTRAKHAN|8362|60|ASTRAKHAN|23:00|8362|VFS_A900_ADL|28Feb2007  
##END|HEADER  
##START|STUNDLICHE  
HEADERS|STUNDLICHE  
ORIGIN_TERM_TRF|0  
SEQUENCE|0  
ORIGINATING_OUTGOING_TRF|0  
INCOMING_TERM|0  
INCOMING_TERM_MOBILE_TRF|32026  
CC_OG|55608  
CA_OR|0  
CALL_ATTEMPTS|34654  
CA_MICTR_MSC|19232  
class_id|8362  
INCOMING_OUTGOING_TRF|43012  
MOB_MOB_TRF|36630  
CA_TERM|0  
CA_MORTR_MSC|52826  
ORIG_TRF_MOBILE_TERM_TRF|0

BEHAVIOUR_INDICATOR|83  
PA_START|44078  
MOBILE_TERM_TRF|0
```

##END|STUNDLICHE

4.3 ROTATE

As the name suggested, this rule turns the row of records of a PIF into columns. The counter names of the new PIF shall be suffix with running number. The FILENAME_PREFIXES shall be populated into the new PIF as 'prefix'.

4.3.1 Rule Configuration

- **FILENAME_PREFIXES:** This is a mandatory array entry. It consists the prefix of each new PIFs that are going to be generated.

FILENAME_PREFIXES => ['ALINCT','ALORGO','ALTRA','ALINT']

- **COLUMNS_TO_ROTATE:** This is a mandatory array entry. This array contains the counter names in the existing PIF that is going to be rotated. Note that the sequence of the counter name must match the one specified in FILENAME_PREFIXES.

COLUMNS_TO_ROTATE => ['td', 'tt', 'ti', 'ta']

- **NEW_COLUMN_PREFIXES:** This is a mandatory array entry. This shall be the prefix of the counters in new PIF. Again, the sequence of this array must match the one specified in FILENAME_PREFIXES and COLUMNS_TO_ROTATE.

NEW_COLUMN_PREFIXES => ['t', 't', 't', 't']

- **SEQUENCE:** This is an optional scalar entry. This is the counter name in the existing PIF that holds the running number of records. When this is specified, the value of this counter shall be combined with the NEW_COLUMN_PREFIXES to form the complete counter name. If this is not specified, an internal running number is used to make the counter name in new PIF unique.

SEQUENCE => 'index',

A full sample configuration is included below:

```
{
  RULE_TYPE      => 'ROTATE',
  RULE_DESC      => 'Turn rows of rec in CLASS T to columns',
  INPUT_FILE_DESCRIPTION => '^PERM_OBS_CLASS_T-#-.*-#-1.pif',
  PRODUCE_PIF    => 'True',
  PRODUCE_LIF    => '0',
  FILENAME_PREFIXES => ['ALINCT','ALORGO','ALTRA','ALINT'],
  COLUMNS_TO_ROTATE => ['td', 'tt', 'ti', 'ta' ],
  NEW_COLUMN_PREFIXES => ['t', 't', 't', 't' ],
  SEQUENCE      => 'index',
},
```

4.3.2 Sample Usage

Given the following PIF record (there are 64 rows):

```
## Parser Intermediate File
##START|HEADER
OMC|record_code|Start Time|class_id|NODE|Date|Start Date|xchg_num

Appendix A Notices and Trademarks

This appendix contains the following:

- Notices
- Trademarks

2.2.6.4 Notices

This information was developed for products and services offered in the U.S.A.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk NY 10504-1785
U.S.A.

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

IBM World Trade Asia Corporation
Licensing
2-31 Roppongi 3-chome
Minato-ku
Tokyo 106-0032
Japan.

The following paragraph does not apply to the United Kingdom or any other country where such provisions are inconsistent with local law: INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER

EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM Web sites are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this IBM product and use of those Web sites is at your own risk.

IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

IBM Corporation
5300 Cork Airport Business Park
Kinsale Road
Cork
Ireland.

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement or any equivalent agreement between us.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

All statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

If you are viewing this information softcopy, the photographs and color illustrations may not appear.

2.2.6.5 Trademarks

IBM, IBM logo, Tivoli, and Netcool are trademarks of International Business Machines Corporation in the United States, other countries or both.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Intel and Pentium are trademarks or registered trademarks of Intel Corporation or its subsidiaries in the United States and other countries.

Other company, product or service names may be trademarks or service marks of others.
