

## IBM System z10™ Enterprise Class Launch Virtualization Flash Animation Transcript

Has your business hit an IT wall?

Do you have racks and racks of physical servers that are expensive to manage, require too much energy, and take days to add new capacity?

Outside, your business needs to deploy new innovations without being held up by IT bottlenecks.

Inside, the IBM System z10™ Enterprise Class uses advanced virtualization technology to help break through restrictions of distributed IT.

Virtual servers on the z10 EC, created and managed with z/VM, dynamically share resources to help business applications get what they need when they need it.

The z10 EC is also designed to reduce management costs and can use less energy than a distributed infrastructure.

Best of all, when your business needs more IT capacity – you simply switch it on.

Don't put an IT wall around your business growth.

Think beyond limits - The Future Runs on System z.
