Chapter 1. Introduction

Purpose of the Manual

This Manual presents all the entities, managed by the Specifications Dictionary Function, which describe the data used to build applications.

These entities are presented here in their character-mode display but you can also access them via the Developer workbench and via the VisualAge Pacbase WorkStation.

Before reading this Manual, you should be familiar with:

- The principles described in the 'VisualAge Pacbase Metamodel and Repository' Manual. These principles are supposed to be known here.
- All the possible operations on entities. These operations are detailed in the VisualAge Pacbase WorkStation User Interface Guide (formerly VisualAge Pacbase WorkStation Reference Manual) or in the Character-Mode User Interface Guide, depending on your interface.

(The operations performed with the Developer workbench are described in the Developer workbench on-line help).

Entities Managed by the System

The entities which describe data are the following ones:

- Data Elements,
- Data Structures,
- Segments,
- Database Blocks.

Moreover the Dictionary Function manages entities which are used to document applications:

- Texts, documented in the VA Pac WorkStation User Interface Guide or in the Character-Mode User Interface Guide, depending on your interface.
- Input Aids, documented in the Developer workbench or the Character-Mode User Interface Guide, depending on your interface.
- Keywords, documented in the Developer workbench or the Character-Mode User Interface Guide, depending on your interface.

DATA ELEMENTS

Data Elements (entity 'E') are used to create a dictionary of basic units of data. This entity is made up of a Definition screen and one or more Description screens. It may be commented and may include indications for the generation of error messages.

DATA STRUCTURES

The purpose of Data Structures (entity 'D') is to group Segments together in a logical manner.

This entity is made up of a Definition screen. It may be commented, may include generation elements and options. It may also include indications for the generation of on-line help.

SEGMENTS

Segments (entity 'S') are structured sets of Data Elements.

This entity is made of a Definition screen and one or more Description screens (Call of Elements). Both the Definition and each Description line may be commented.

Other pieces of information may be added, according to the future use of the segment (file record, database segment, table item, work area....).

A Segment may include generation options/and elements and include indications for the generation of error messages and on-line help.

DATABASE BLOCKS

Database Blocks (entity 'B') describe the relations between defined Segments. These relations can be structured hierarchically, in a network, or relationally.

This entity is made up of a Definition screen and one or more Description screens. Each can be commented.

Database Blocks are described according to types. One type of Description screen is used for hierarchical Blocks, a second type is used for Blocks organized relationally, and another for Blocks organized in networks.

Database Blocks can contain generation elements and/or options.

Principles of Description

This Manual describes some of the entities managed by VisualAge Pacbase. For each, you will find;

- An introduction which explains the purpose and the general characteristics of the entity,
- A detailed description of all the entity's input fields. These fields are assigned order numbers in the screen map. These numbers are also used in the screen description that follows.

>>>: If you use Developer workbench, refer to its on-line help.

Note: If you use the VisualAge Pacbase WorkStation, the graphical interface of the corresponding windows is described in the WorkStation User Interface Guide (formerly WorkStation Reference Manual).

Chapter 2. Data Elements

Data Elements: Introduction

The purpose of the Data Element entity is to identify and describe all pieces of information used by the applications of the company.

A Data Element is a unit of data, considered 'elementary' during at least one stage in the development of a project.

For example, during functional analysis, the user keeps track of a piece of information 'DATE OF MARRIAGE', which could, during implementation, be broken down into year, month and day of marriage.

Each one of these four basic units of data is defined as a Data Element:

.DATE OF MARRIAGE,

.YEAR OF MARRIAGE,

.MONTH OF MARRIAGE,

.DAY OF MARRIAGE.

GENERAL CHARACTERISTICS

The Data Element includes the following:

- A Definition screen, (required), for input of its general characteristics (name, formats, keywords, etc.);
- A Description screen, (optional), for input of all valid values, as well as labels which can be used by the Pacbench C/S, On-Line Systems Development, Pactables and DBD Functions;
- A Comments screen (see the 'Character Mode User Interface Guide', chapter 'Documentary Facilities').
- An Error Messages - Help screen (see chapter 'Common Screens' in this Manual).

RESULTS

Once defined, Data Elements appear in:

- Lists sorted by code or name,

- Cross-references to the Programs, Screens, Reports, Segments and Volumes in which they are used,
- Volumes for end-users; their descriptions are then adapted to the targeted readership.

Data Elements: Definition

A Data Element is defined by a mnemonic code, a name and three formats (input, internal and output, which are expressed in COBOL). Whenever the Data Element is used, it automatically takes on one of these three formats.

NOTE:

If you create a Data Element by duplication (code overwrite) and if the new code already exists in a lateral library, 'W' is displayed in the ACTION CODE. It inhibits the immediate update. To perform the actual update, press the ENTER key again.

PARENT DATA ELEMENT

Technical variants of Data Elements, on which the data element's characteristics are modified, may be created.

Each variant is defined as a 'CHILD' Data Element of the 'PARENT' Data Element. The characteristics of the parent may be modified on each child Data Element.

All Data Elements from the same 'family' are logically linked in the Database.

A child Element cannot be a parent Element as well.

NOTES:

On a list screen with an operation other than 'C1', (i.e. consultation of other than the selected library and all higher level libraries), the information concerning child Data Elements is not displayed unless it is different from that of the parent Data Element.

In a child Data Element Definition screen, data different from the parent Element are identified by an asterisk (*).

If the parent Element has description lines, it is indicated in the child Element Description screen by a special line marked by an asterisk (*) in its ACTION CODE field, and labeled "PARENT ELEMENT:". These description lines can be visualized with the value 'C2' entered in the OPERATION CODE field of the child Element's Description screen.

When a parent Data Element is consulted, the first 40 child Data Elements are also listed.

If there are more than 40 child Data Elements, the 40th line will display the value '*MORE.'. In this case, all child Data Elements may be viewed on the screens listing Data Elements by code and by name, 'LCE' and 'LNE' screens, respectively.

DATE PROCESSING

Data Elements used to represent dates are automatically managed by the system. A symbolic format can be assigned to these Data Elements, as follows:

- 'D' for a display type format (input):
X(6) (MMDDYY or DDMMYY according to the value of the DATE FORMAT IN GENERATED PROGRAMS entered on the Library Definition screen),
- 'I' for an internal type format:
X(6) (YYMMDD),
- 'E' for an output format (extended):
X(8) (MM/DD/YY or DD/MM/YY according to the value of the DATE FORMAT IN GENERATED PROGRAMS entered on the Library Definition screen),
- 'C' for a display type format with century (input):
X(8) (MMDDCCYY or DDMMCCYY according to the value of the DATE FORMAT IN GENERATED PROGRAMS entered on the Library Definition screen),
- 'S' for an internal type format with century:
X(8) (CCYYMMDD),
- 'M' for an output format with century (extended):
X(10) (MM/DD/CCYY or DD/MM/CCYY according to the value of the DATE FORMAT IN GENERATED PROGRAMS entered on the Library Definition screen).
- 'G' for a Gregorian format with century:
X(10) (CCYY-MM-DD),
- 'T' for a Time format:
X(8) (HH:MM:SS).

When using the On-line Systems Development or Pacbench C/S Function, date validation is automatically performed.

For the formats which include a separator (E, G, M and T), you can specify, after the character which represents the format, a separator if you do not want to use the separator included by default in the format.

Example: A 'G/' format will generate SSAA/MM/JJ instead of SSAA-MM-JJ (the default generated Gregorian format).

NUMERIC FIELDS PROCESSING

To enter a numeric Data Element format longer than 10 characters, omit the '9' that would normally be entered after the 'V'.

EXAMPLE: S9(10)V9(3) must be entered as S9(10)V(3).

This way of coding must not be used when the format is shorter than 10 characters.

AUTOMATIC CONVERSION OF INTERNAL USAGE

The USAGE clause of a COBOL numeric variable allows you to indicate the internal representation of its value. Different USAGES are available depending on the COBOL variants adapted to the different materials.

The INTERNAL USAGE characteristic of a Data Element corresponds to the COBOL USAGE clause. You should choose a Data Element INTERNAL USAGE according to the following elements:

- The type of COBOL to generate associated with the library where you define the Data Element.
- The internal representation you want.

For example, if you generate for IBM, C INTERNAL USAGE generates USAGE COMP and F generates USAGE COMP-1. For UNISYS 1100, H INTERNAL USAGE generates USAGE COMP.

You can use this Data Element in a lower level library whose type of COBOL to generate is different to the one of the higher library.

For example, you have defined the DELCO Data Element in the HIG library with C as INTERNAL USAGE and you use it in a LOW library with a type of COBOL to generate for UNISYS 1100.

When this happens, the System automatically replaces the Data Element INTERNAL USAGE with an equivalent which is compatible with the type of COBOL to generate.

So, when you visualize DELCO in LOW, the INTERNAL USAGE automatically displayed is H. This value will be used to generate.

If there is no equivalent, or if the provided one does not suit you, you can modify the INTERNAL USAGE of the Data Element in the lower library to obtain the result you want.

UNDEFINED DATA ELEMENTS

It is possible in limited occasions to use element codes which are not defined in the dictionary; for example groups with no functional meaning.

Cross-references and a specific list are also available for these Data Elements, so that the dictionary administrator is able to control their use.

ASSOCIATED LINES

Comments (-GC).

This screen enables you to insert additional explanatory text.

'Error messages - help' (-GE).

This screen enables you to describe error messages and help texts on the Data Element.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
1	6		DATA ELEMENT CODE (REQUIRED)
			Enter the mnemonic code which references the Data Element independently of any Data Structure, Report or Screen to which the Data Element might belong.
			There is no need to include a Report, Screen or Segment code in the Data Element code since the System does it automatically.
			This code consists of alphabetic or numeric characters only.
			Some Data Element codes are reserved by the System for use in Data Structures, Reports or Screens and cannot be defined in the Specifications Dictionary:
		'SUITE'	Prohibited. This code is reserved for the System for program generation.
		'FILLER'	Data Element that is used for the alignment of fields.
			Options of the BSD Function:
			Error Verification fields on transaction files:
		'ENPR' 'GRPR' 'ERUT'	Used for Data Element error verification. Used for Segment error verification. Used for user defined errors.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			For more information see DATA ELEMENT CODE on the Segment Call of Elements.
			For Reports:
		'LIGNE'	Reserved for the placement and alignment of the layout line. It is used only for a '00' structure.
		'LSKP'	Reserved usage only in the '00' Report Structure. See STRUCTURE NUMBER on the Report Call of Elements.
		'SAUT'	Reserved usage. This code is the counterpart of LSKP and used with the French version of the System.
			Options of the OLSD and Pacbench C/S (TUI Client) Functions:
		'ERMSG'	Data Element for the placement of the error message.
		'LIERR'	Reserved usage. This code is the counterpart of ERMSG and used with the French version of the System.
		'PFKEY'	Used to represent the programmable function keys.
		'*PASWD'	(IMS only): Used for passwords on a specific screen.
			For more information see DATA ELEMENT CODE OR SCREEN CODE TO CALL on the Call of Elements.
2	36		NAME OF DATA ELEMENT (REQUIRED IN CREAT)
			This name should be as explicit as possible. Words used here become implicit keywords (subject to limitations specified in the Character-Mode User Interface Guide, chapter 'Search for Instances', subchapter 'Searching by Keywords').
			This name appears in documentation and in Volumes each time the Data Element is used. It is also possible to list Data Elements sorted by name.
			In IMS: Use uppercase.
3	1		TYPE
		'P'	Property: Elementary piece of information defined at the conceptual level. Note: the FORMAT is optional.
		'R'	Real Data Element (Default value): elementary piece of information, defined at the Specifications Dictionary level.
			D.B.D. function: CODASYL elementary data, Relational column.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		'A'	ALIAS Data Element: This value is used in conjunction with the 'A*' value in the DATA STRUCTURE CODE IN GENER. DESCR. field with the 'DATA' PIA, causes the NAME OF DATA ELEMENT to be generated, rather than the standard element name.
		'L'	Large Object Data Element
4	10		Input format
			(Default option: INTERNAL FORMAT).
			This format is normally used with input transaction files (the conversion to internal format is done when updating master files).
			The user must ensure the compatibility between input and internal formats.
			The input format will automatically be used in segment descriptions.
			For batch programs, the user may select the format on the Call of Data Structures (-CD) screen.
			The input format must be coded like a COBOL picture (without print characters).
			USAGE is always DISPLAY.
			This format is not necessary for a property.
			For data elements representing a date, it is possible to assign a symbolic format:
			Display type formats (input):
		D	Without century (DDMMYY or MMDDYY)
		C	With century (DDMMCCYY or MMDDCCYY)
			Internal type formats:
		I	Without century (YYMMDD)
		S	With century (CCYYMMDD)
			Extended type formats (output) (with slashes):
		E	Without century (DD/MM/YY or MM/DD/YY)
		M	With century (DD/MM/CCYY or MM/DD/CCYY)
		G	Gregorian format (CCYY-MM-DD)
		T	TIME format (HH:MM:SS)
		TS	TIMESTAMP format.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			PACMODEL function: this field may be omitted for a property.
			For the formats which include a separator (E, G, M and T), you can specify, after the character which represents the format, a separator if you do not want to use the separator included by default in the format (for example, A 'G/' format will generate CCYY/MM/DD instead of CCYY-MM-DD, which is the default Gregorian format).
			For a complete list of the uses of formats with the various Database Block types, see the summary tables in Chapter "COLUMN: DATA ELEMENT" in the RELATIONAL/ SQL DATABASE DESCRIPTION reference manual.
5	10		Internal format
			Format normally used in system files (permanent, database and temporary files) and in screen input fields.
			Like the INPUT FORMAT, the INTERNAL FORMAT will be automatically used in the data Segment descriptions.
			For batch Programs, the user may select the format type on the Program Call of Data Structures (-CD) screen.
			It is also used (with the necessary transformations) in screen descriptions (input fields). (Refer to screen description in the 'On-Line Systems Development' Manual and 'Pacbench C/S: Business Logic and TUI Clients' (chapter 'TUI Clients')).
			The internal format must be coded like a COBOL picture (without print characters).
			The 'INTERNAL USAGE' clause is associated with this format.
			Data Elements that represent a date can be assigned a symbolic format:
			Display type formats (input):
		D	Without century (DDMMYY or MMDDYY).
		C	With century (DDMMCCYY or MMDDCCYY).
			Internal type formats:
		I	Without century (YYMMDD).
		S	With century (CCYYMMDD).
			Extended type formats (output) (with slashes):
		E	Without century (DD/MM/YY or MM/DD/YY).

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		M	With century (DD/MM/CCYY or MM/DD/CCYY).
		G	Gregorian format (CCYY-MM-DD).
		T	TIME format (HH:MM:SS).
		TS	TIMESTAMP format
			METHODOLOGY function: This field may be left blank for a property.
			For the formats which include a separator (E, G, M and T), you can specify, after the character which represents the format, a separator if you do not want to use the separator included by default in the format (For example, A 'G/' format will generate CCYY/MM/DD instead of CCYY-MM-DD, which is the default Gregorian format).
			For details on the use of the formats with the various types of database blocks, see the summary tables in chapter "Columns: Data Elements" of the "Relational SQL Database Description" Manual.
6	1		INTERNAL USAGE
			Corresponds to the COBOL 'USAGE' clause.
		'D'	DISPLAY (default option), all hardware. Required for data elements indicating dates.
		'C'	COMPUTATIONAL (binary), IBM or equivalent; COMPUTATIONAL-4 (binary), IBM SYSTEM 38; COMPUTATIONAL-4 IBM 3-15D, COMPUTATIONAL-6 ICL 2900; BINARY, IBM and COBOL II variant.
		'R'	COMPUTATIONAL SYNCHRONIZED RIGHT, IBM or equivalent; This value is preferable to 'C' when binary data is aligned on even addresses, since corresponding COBOL statements are more efficient.
		'B'	COMPUTATIONAL-1 ICL 1900. BINARY-1 UNISYS 1100 associated with format 1(n).
		'S'	COMPUTATIONAL SYNCHRONIZED RIGHT ICL 1900.
		'N'	COMPUTATIONAL-4 aligned on a half-byte. You must add the complement if the length is uneven.
		'P'	COMPUTATIONAL-1 BULL 66, 6000 and DPS8.
		'L'	COMPUTATIONAL-1 SYNCHRONIZED RIGHT ICL 1900.
		'Q'	COMPUTATIONAL BULL 66, 6000 and DPS8.

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
	'F'	COMPUTATIONAL-1 IBM or equivalent. COMPUTATIONAL-9 BULL DPS7. COMPUTATIONAL-11 BULL 66 and DPS8. Relational DBD : floating point, simple precision.
	'T'	COMPUTATIONAL-3 PACKED SYNC. BULL 66 and DPS8.
	'X'	DISPLAY SIGN IS TRAILING SEPARATE CHARACTER.
	'G'	COMPUTATIONAL SYNCHRONIZED RIGHT ICL 2900 AND COMPUTATIONAL-5 MICROFOCUS.
	'7'	COMPUTATIONAL-5 ICL 2900.
	'K'	COMPUTATIONAL CDC. COMPUTATIONAL UNISYS 1100 (COBOL 85)
	'M'	COMPUTATIONAL-1 CDC.
	'N'	COMPUTATIONAL UNISYS-A
	'O'	COMPUTATIONAL-4 UNISYS 1100
	'U'	COMPUTATIONAL-1 UNISYS 1100.
	'W'	COMPUTATIONAL-2 UNISYS 1100. COMPUTATIONAL-12 BULL 66 and DPS8. RELATIONAL DBD : floating point, double precision.
	'H'	COMPUTATIONAL UNISYS 1100. BINARY UNISYS 1100 (COBOL 85)
	'8'	COMPUTATIONAL BULL 66 COBOL 74 and DPS8.
	'9'	COMPUTATIONAL-3 BULL 66 COBOL 74 DPS7 and DPS8.
	'J'	COMPUTATIONAL-6 BULL 66 COBOL 74 DPS7 and DPS8. REAL UNISYS-A.
	'Y'	DB-KEY BULL 66 DM4 and DPS8. POINTER IBM and MICROFOCUS.
	'I'	DISPLAY-1 Unisys 1100
	'5'	COMPUTATIONAL-1 BULL 64 66 MINI-6 COBOL 74 DPS7 DPS8
	'6'	COMPUTATIONAL-2 BULL 64 66 MINI-6 COBOL 74 DPS7 DPS8
	'3'	COMPUTATIONAL-3 IBM or equivalent. COMPUTATIONAL BULL 64 MINI-6 DPS7. COMPUTATIONAL-3 (packed decimal) IBM SYSTEM 38. PACKED-DECIMAL UNISYS 1100 (COBOL 85)
	'0'	COMPUTATIONAL-7 BULL 66 and DPS8.

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
	'1'	DISPLAY-1 NCR (signed extended decimal). DISPLAY SIGN LEADING SEPARATE - UNISYS 1100, DPS8, IBM, TANDEM, DPS7.
	'4'	DISPLAY-2 NCR (unsigned packed decimal).
	'2'	DISPLAY-2 BULL = DISPLAY, fields are compared in accordance with the "commercial collating sequence" and not in accordance with the standard BULL sequence.
	'Z'	In batch mode only: this option, which is only used with an output format, allows for the generation of a 'BLANK WHEN ZERO' clause with the Batch D.S. function.
		METHODOLOGY function: This field may be left blank for a property.
7	27	Output format
		(Default option: INTERNAL FORMAT)
		This is the format of a Data Element as it is used in a printed Report, or in a Screen as a display field. It can also be used in a segment description.
		It must be coded like a COBOL picture. USAGE is always DISPLAY.
		In previous versions, this field was used to generate the BLANK WHEN ZERO clause, which may be displayed in this field.
		When creating or updating a Data Element, the BLANK WHEN ZERO CLAUSE field must be used for this purpose.
		For Data Elements representing a date, it is possible to assign a symbolic format:
		Display type formats (input):
	D	Without century (DDMMYY or MMDDYY)
	C	With century (DDMMCCYY or MMDDCCYY)
		Internal type formats:
	I	Without century (YYMMDD)
	S	With century (CCYYMMDD)
		Extended type formats (output) (with slashes):
	E	Without century (DD/MM/YY or MM/DD/YY)
	M	With century (DD/MM/CCYY or MM/DD/CCYY)
	G	Gregorian format (CCYY-MM-DD)
	T	TIME format (HH:MM:SS)

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		TS	TIMESTAMP format
			PACMODEL function: This field may be omitted for a property.
			For the formats which include a separator (E, G, M and T), you can specify, after the character which represents the format, a separator if you do not want to use the separator included by default in the format (For example, A 'G/' format will generate CCYY/MM/DD instead of CCYY-MM-DD, which is the default gregorian format).
			For details on the use of the formats with the various types of database blocks, see the summary tables in chapter "COLUMNS: DATA ELEMENTS" of the "Relational SQL Database Description" Manual.
8	1		BLANK WHEN ZERO CLAUSE
			This field does not exist in batch mode: the USAGE field must be used instead.
			With OUTPUT FORMAT only:
		'Z'	Generates the 'BLANK WHEN ZERO' clause for a Data Element used in a Batch Program only.
			(For the generation of this clause with the O.L.S.D. and Pacbench C/S Functions, refer to the Data Element Description screen (-D).)
9	55		EXPLICIT KEYWORDS
			This field allows you to enter additional (explicit) keywords. By default, keywords are generated from the instance's name (implicit keywords).
			Keywords must be separated by at least one space. Keywords have a maximum length of 13 characters which must be alphanumeric. However, '=' and '*' are reserved for special usage and are therefore ignored in keywords.
			Keywords are not case-sensitive: uppercase and lower-case letters are equivalent.
			NOTE: Accented and special characters can be declared as equivalent to an internal value in order to optimize the search of instances by keywords (Administrator workbench, 'Window' menu, 'Parameters browser' choice, in 'Special Characters' tab).
			A maximum of ten explicit keywords can be assigned to one entity. For more details, refer to the 'Character Mode User Interface' guide, chapter 'Search for Instances', subchapter 'Searching by Keywords'.

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
10	6	PARENT ELEMENT CODE
		Allows Data Elements sharing the same characteristics to be defined under different codes.
		If a parent Data Element is indicated, the Data Element takes on the characteristics of the parent by default. These can be modified at the child level.
		The parent Data Element must have been defined previously.

List of Data Elements for Update

Data elements are the basic units of data managed by the system.

The initial building phase of the Database, or the massive input of new Data Elements, calls for a system facility which allows quick execution:

For this purpose, Data Elements may also be updated in a list format.

HOW IT WORKS

The screen used for Data Element input by list is obtained by the CHOICE 'LUE'. Depending on which code is entered in the OPERATION field, the 'LUE' screen allows input of:

- .'C1': the basic characteristics of the Data Elements (parent, name, internal format, usage),
- .'C2': the input and output formats.

The information to be entered here is the same as that found on the Definition Screen and thus undergoes the same validation operations.

Each line entered will appear as a Data Element Definition (E) screen.

NOTE: This screen does not allow for the specification of EXPLICIT KEYWORDS. These must be added as needed, on each individual Data Element Definition screen ('E.....').

O: C1 CH: LUE

Data Elements: Description

This screen is used to provide the full description of a Data Element by assigning explanatory text as well as values or ranges of possible values and their meaning.

It is also used to complement the description by providing specific information which will be exploited where the Data Element is used (screen labels and format, relational databases name..).

GENERAL CHARACTERISTICS

Each value or range of values is entered as a code and a label; this label will be used in user documentation. The values or ranges may be used in the Data Element validation process, if desired, in batch and on-line programs.

The description lines of the parent Data Element automatically attributed to its child Data Elements. These lines are identified by an asterisk (*) in the ACTION CODE field, and may be viewed in option C2.

They cannot be modified or deleted at the level of the child Data Element.

Description lines specific to the child Data Element are displayed following those of the parent Data Element.

It is not necessary to create blank lines, as the SKIP OR ACTION TYPE field provides for line or page skip, both being taken into account in user manuals and volumes.

CHARACTERISTICS SPECIFIC TO ON-LINE SYSTEMS DEVELOPMENT and PACBENCH C/S

When using a Data Element in a Screen, a Short Label, a Column Label, a sample value and possibly an on-line format can be defined at this level, if necessary.

Delimiters of Data Element labels may be parameterized. The delimiter default value may then be overridden if it is used in the given label. A delimiter is required for the column label but optional for the short label.

Conversational Formats: In on-line programs, the format used for unprotected (variable) Data Elements is calculated by the system, as an expanded version of the INTERNAL FORMAT. For protected fields, the system will use the OUTPUT FORMAT. However you may override these formats by specifying a conversational format.

For dates, the symbolic date formats may be used.

Operation and Action codes: their values and the corresponding internal values may be indicated here.

PREREQUISITE

The Data Element must have been previously defined.

OPERATION FIELD

C1: default value.

C2: displays the source of lines entered.

PURCHASING MANAGEMENT SYSTEM			SG000008.LILI.CIV.1583

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
1	6		DATA ELEMENT CODE (REQUIRED)
2	1		ACTION CODE (REQUIRED)
		'C'	Creation of the line
		M	Modification of the line
		D or 'A'	Deletion of the line
		T	Transfer of the line
		B	Beginning of multiple deletion
		G	Multiple transfer
		?	Request for HELP documentation
		E or '-'	Inhibit implicit update
		X	Implicit update without upper/lowercase processing
3	3		Line number
			Numeric.
			It is advisable to begin with line number '100' and then number in intervals of 20. This facilitates subsequent line insertions, as necessary. Alphanumeric if you generate a customized SQL access.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			It is possible to enter letters in the 'NLG' field in this case. You are allowed to create more than the '1000' limited lines.
4	1		Type of line
		'blank'	Value and/or description line.
			With a blank line type, descriptive text is assigned to the Data Element. This text includes all possible values and what they mean.
		'D'	DATA ELEMENT DEFAULT VALUE
			One of the values entered can be referenced as the default value. When the value 'D' is entered on the Segment Call of Elements (-CE) screen in the TYPE : VALIDATION, UPDATE, VALUES field, this value is assigned as the initial value.
			SPECIAL TYPES (OLSD, Pacbench C/S, Pactables Functions)
		'P'	DATA ELEMENT PRESENTATION VALUE:
			The sample value is entered in the SIGNIFICANCE - DESCRIPTION field. This value is used when simulating a screen for documentary purposes.
		'L'	DATA ELEMENT SHORT LABEL: Maximum length: 18 characters. NOTE: This length may be shortened by explicitly entering a delimiter (see description of the DATA ELEMENT VALUE field). Default delimiter is '£'.
		'C'	COLUMN LABEL:
			The Column Label is defined on a single line but may use up to three lines. A delimiter in the Column Label indicates a line skip. The Column Label length is that of its longest line. Maximum length = 18 characters, including delimiters. A Column Label must be delimited by at least one delimiter (default = '/'). NOTE: To change the default delimiter, enter its value left-justified in the DATA ELEMENT VALUE field (refer to the description of this field).
		F	CONVERSATIONAL FORMAT: Data Elements used in input and output on-line:
			For Date Data Elements, enter the one-character symbolic value that represents the desired format, in the DATA ELEMENT VALUE field. The system will display the format in the SIGNIFICANCE - DESCRIPTION field.
			For other Data Elements, enter the desired output format in the SIGNIFICANCE - DESCRIPTION field.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			For numeric Data Elements, a BLANK WHEN ZERO clause may be obtained by entering 'Z' following the format entered in the SIGNIFICANCE - DESCRIPTION field.
			T ... SIGNIFICANCE - DESCRIPTION
			F ... 9(4) Z
		'O'	Declaration of the OPERATION CODE values.
		'I'	Declaration of the ACTION CODE values.
			For values 'O' and 'I', see also the SKIP OR ACTION TYPE field, and refer to the 'On-Line Systems Development' Manual and to the 'Pacbench C/S: Business Logic and TUI Clients' Manual (chapter TUI Client).
			RELATIONAL DATABASES:
		R	This value generates the Data Element's relational name on 18 characters, which is entered in the SIGNIFICANCE - DESCRIPTION field.
			The relational name of a parent Data Element is not carried forward to the child Data Element.
			With TurboImage, this field generates an Item name different from the Data Element code. In this case only the first 16 characters are recognized.
		E	This value allows you to input non standard date format in the SIGNIFICANCE - DESCRIPTION field.
			The format indicated on the Data Element Definition screen must be X(n), with n < 28 (or n < 15 for an ORACLE Database for the automatic management of dates in ON-LINE SYSTEMS DEVELOPMENT and PACBENCH C/S).
			This format is taken into account: . in the SQL generation to generate DATE for ORACLE, SYBASE and SQL SERVER, and DATETIME for NONSTOP SQL. . in the OLSD and Pacbench C/S generation for the SQL accesses (e.g. by generating the TOCHAR and TODATE functions for ORACLE). Non-standard dates are not controlled in the generated programs; only standard dates (types C, D, E, G, I, M, S) are controlled. Furthermore, the date operator (AD) cannot be applied to this non-standard format.
			The system controls only the elements of the format, and not the way you put them together (ex: MD will be rejected but MMMMM and YY-DD/MM will be accepted).
			DATA ELEMENTS COMING FROM REVERSE ENGINEERING:

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		S	The COBOL data-name(s) of the associated REVERSE Elements are generated in the SIGNIFICANCE - DESCRIPTION field.
			COBOL COPYBOOKS:
		A	For COPYBOOKS, when a variant Data Element is being used as an alias-type Element, the SIGNIFICANCE - DESCRIPTION field contains the SEGMENT CODE of the Segment in which the parent is called.
			ADABAS DATABASE:
		A	For a Data Element used in an Adabas Database. This enables you to enter the values for the generation of the Format-Buffer.
			LIST OF TURBOIMAGE CLASSES:
		T	Values of the TurboImage class list.
5	1		ACTION TYPE, JUMP, CONTINUATION
			This field is used to specify:
			Line skip or page skip (only taken into account when printing User Manuals and Volumes).
			Continuation of a value range when a value does not fit on a single line.
			Operation or Action Code (also see the TYPE OF LINE field).
			SKIP:
		blank or 1	New line.
		2	1 blank line + 1 new line.
		3 to 9	2 to 8 blank lines + 1 new line.
		*	Only in User Manuals ('U' entity) : Page skip.
			CONTINUATION OF A VALUE RANGE:
		'+'	This value indicates a continuation of a value range if it cannot fit on a single line.
			ACTION (OLSD function and Pacbench C/S TUI Clients)
			Two categories of value according to the selected TYPE OF LINE:
			WITH TYPE OF LINE 'I':
		'C'	Creation.
		'M'	Modification.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		'D'	Deletion.
		'X'	Mod-4 (implicit update).
			WITH TYPE OF LINE 'O':
		'A'	Display.
		'M'	Update.
		'S'	Next screen.
		'E'	End of session.
		'P'	Same page.
		'O'	Call of another screen.
6	10		DATA ELEMENT VALUE
			This field is used to specify the authorized values of the data element.
			These values undergo automatic validation if they are entered as either numeric or alphanumeric literals (quotes for the latter),
			If the Data Element takes on a range of values, the range must be described as two values between parentheses and separated by at least a space. Inverted parentheses indicate that the given value is excluded from the range.
			EXAMPLES:
			('E' 'Z') : from E inclusive to Z inclusive,)0 100(: from 0 exclusive to 100 exclusive.
			If the description of a value calls for several lines, the value must be entered on the first line.
			The values assigned to a parent Data Elements are automatically assigned to each one of its child Data Elements.
			OLSD FUNCTION & PACBENCH C/S
		'*9'	Numeric Data Element. This causes a COBOL NOT NUMERIC check to be generated.
		'*B'	Numeric Data Element: LEADING blanks are replaced by zeros.
		'*Z'	Numeric Data Element: ALL blanks are replaced by zeros.
		'*A'	Alphabetic Data Element: checks that all characters are alphabetic.
		'*L'	Alphabetic Data Element: checks that all characters are lowercase alphabetic..

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
	'*U'	Alphabetic Data Element: checks that all characters are uppercase alphabetic.
		The system displays a decoded representation, in the SIGNIFICANCE - DESCRIPTION field.
		WITH TYPE OF LINE = 'F'
	I	Without century (picture x(6)): YYMMDD
	S	With century (picture x(8)): CCYYMMDD
	D	Without century (picture x(6)): MMDDYY or DDMMYY depending on the value entered in the DATE FORMAT IN GENERATED PROGRAMS field on the Library Def. screen.
	C	With century (picture x(8)): MMDDCCYY or DDMMCCYY depending on the value entered in the DATE FORMAT IN GENERATED PROGRAMS field on the Library Def. screen.
	G	With century (picture x(10)): CCYY-MM-DD in a Gregorian format.
		Date with slashes:
	E	Without century (picture x(8)): MM/DD/YY or DD/MM/YY.
	M	With century (picture x(10)): MM/DD/CCYY or DD/MM/CCYY
		WITH TYPE OF LINE = 'C':
		Enter the delimiter for the end of each Column label line (left-justified). Default value is '/ '.
		WITH TYPE OF LINE = 'L':
		Enter the delimiter for the end of the short label, (left-justified). Default value is 'E'.
		WITH TYPE OF LINE = 'O' OR 'I':
		When setting the value of the Operation and/or Action Codes via an element on the screen, enter the value that corresponds to the specific operation or action. NOTE: These values correspond to the internal operation and action codes as entered in the SKIP OR ACTION TYPE field.
	T	Time.
	TS	Timestamp.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			Concerning the use of the formats with the various types of database blocks, see the summary tables in chapter "Columns: Data Elements" of the "RELATIONAL/ SQL DATABASE DESCRIPTION" Reference Manual.
7	54		SIGNIFICANCE - DESCRIPTION
			The value entered here depends upon the value of the TYPE OF LINE field.
			With ' ', 'D', 'O', 'I': Enter a descriptive comment (optional).
			With 'L', 'C', or 'P': Enter the label (with delimiters as needed) or a presentation value.
			With 'A': Enter the SEGMENT CODE where the parent Data Element is called.
			With 'R': Enter the Relational Column name.
			With 'E': Enter the non-standard date format with one or several of the following elements:
			. YY : year (YYYY with the century)
			. MM : month
			. MON : month's 3 first characters
			. DD : day
			. HH : hour 00 to 23 save for SQL Oracle : 00 to 12
			. HHAM or HHPM: hour 00 to 12 + am/pm indicator
			. HH24 : hour (00 to 23) for SQL Oracle
			. MI : minute
			. SS : second
			. FF : millisecond
			. delimiters / . : - blank
			For more information, refer to the DBMS documentation. For NONSTOP SQL: input of start field and end field.
			With 'F' (for Data Elements other than dates): Enter the output format (using standard COBOL syntax). Note: To generate a BLANK WHEN ZERO clause with numeric Data Elements, follow the format with a blank and a 'Z' (Example: 9(4) Z).

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
	\$OFF \$ON	When the Data Element Description is to be printed in a Document (with print option EO), the left-justified \$OFF command allows you to exclude from this printing the following Description lines. The explicit exclusion end command is \$ON, also left- justified, to be entered just after the last line to exclude from printing. WARNING: This exclusion is not effective when the Data Element Description lines appear in a generated online help. Only lines bearing the \$OFF and \$ON commands are excluded. For more information about the \$OFF and \$ON commands, refer to the "Personalized Documentation Manager" Manual.

Data Elements: Generation-Print

Lists and description reports on Data Elements may be obtained by entering certain commands on the Generation and Print Commands (GP) screen.

LISTS

LCE: List of all Data Elements, sequenced by code.

C1 OPTION: Without explicit keywords,

C2 OPTION: With explicit keywords.

LKE: List of all Data Elements, by keywords.

After typing LKE, a selection field (SEL:) enables the user to choose implicit ('L') or explicit ('M') keywords, or both (' '). Keywords are entered on a continuation line.

C1 OPTION: Same as LCE.

LNE: List of all Data Elements, sequenced by name (sorted on the first 20 characters and the element codes).

C1 OPTION: Same as LCE.

LXE: List of defined Data Elements having Description lines, Comments lines or Keywords, but not used.

C1 OPTION: Same as LCE.

LAE: List of 'REVERSE' Data Elements by COBOL names.

C1 OPTION: Same as LCE.

DESCRIPTIONS

DCE: Definition, Description and Comments for the Data Element entered in the ENTITY CODE field. If no code is specified, the information on ALL data elements is printed.

C1 OPTION: Definition, description, general documentation without X-references. (Parent and Child Data Elements), C2 OPTION: With X-references.

DFE: Description, X-references of undefined data elements.

C1 OPTION: (Only).

Chapter 3. Data Structures

Data Structures: Introduction

All sets of data processed by applications are described via the Data Structure entity.

Data Structures are logical groups of segments, which may be :

- . Records of files,
- . Segments of databases,
- . Work areas of programs,
- . Inter-program common areas,
- . Table items...

A data structure is described logically, with no physical characteristics. This description may then be reused for different purposes : for example a given segment may be used in a database and in the programs which access the database.

Information of a physical nature (such as organization, block size, description type, etc.) is added when the data structure is used in programs or database blocks.

(See the 'Database Description' and 'Batch Applications' Manuals).

TRANSACTION FILE

Certain files are designed to undergo validation, and then update master (Principal) files or databases.

They are called Transaction Files.

For such files, validation and update procedures are described on the Segment Definition and Call of Elements (-CE) screens (see the 'Batch Applications' Manual).

TABLES

The Data Structures corresponding to Tables are described in the Pactables reference manual.

GENERAL CHARACTERISTICS

The Data Structure entity includes the following:

- A Definition screen (required), for entry of the general characteristics of the Data Structure (name, nature, keywords, etc.),
- A Comments screen (optional). (See chapter 'Documentary Facilities' in the 'Character-Mode User Interface Guide').
- A 'Generation Elements' screen (optional) where you can enter technical information concerning the Data Structure (according to the type of Data Structure, for example, frequency of backups, etc.). (See chapter 'Common Screens' in this Manual).
- An 'Error Messages - Help' screen (optional). (See chapter 'Common Screens' in this Manual).

RESULTS

Once the Data Structures are defined, you can obtain the following:

- A list of all Data Structures,
- Cross-references, listing all uses of the Data Structures in Programs or on-line Screens.

Data Structures: Definition

A Data Structure is defined by its code, name and type.

The 'type' is documentary (mostly used to provide list of Data Structures sorted by type), except for Pactables.

For the Batch Systems Development function, Programs containing the error messages to be used with the application are named in the COMPLEMENT field. For more information see the 'Batch Applications' Manual, Chapter 'Error Messages'.

ASSOCIATED LINES

Comments (-GC).

These lines allow you to insert additional explanatory text.

Generation Elements (-GG).

These lines allow you to indicate technical information about the Data Structure.

Error Messages - Help (-GE).

These lines allow you to specify on-line help on the Data Structure.

```

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
1	2		DATA STRUCTURE CODE (REQUIRED)
			This code is made up of two alphanumeric characters. This is a logical code internal to the Database and therefore independent of the names used in Database Blocks and Programs.
2	30		NAME OF DATA STRUCTURE (REQUIRED IN CREAT)
			This name should be as explicit as possible. Words used here become implicit keywords (subject to limitations specified in the Character-Mode User Interface Guide, chapter 'Search for Instances', subchapter 'Searching by Keywords').
3	44		COMPLEMENT OF DATA STRUCTURE NAME
			With the Batch Systems Development function only:
			Error messages corresponding to validation of a transaction file are coded in at most two programs. Those two program codes are indicated in this field, as follows: Blank in column 1, 'E' in column 2, then one or two program codes.
			Example: Eerrpg1errpg2

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			Note: The 'E' is entered in column 36, in batch mode.
			For more information, refer to the Batch Applications Manual, chapter 'Error Messages', subchapter 'Coding of Error Messages'.
4	1		TYPE OF DATA STRUCTURE
			The TYPE of Data Structure is used for documentary purposes, except the Pactables and Logical View types.
		'Z' 'G' 'T' 'M' 'N' 'V'	Data structure (Default value) Table (Historical) used with the Pactables function Table (without Historical account), Pactables function Once a Data Structure has been assigned the type 'G' or 'T', this type cannot be changed. Once a Data Structure has been assigned another type, this type cannot be changed to 'G' nor 'T'. Table with historical account, with century. Table without historical account, with century. Logical view (See the 'Business Logic' volume of the Developer's Documentation dedicated to eBusiness applications). this type cannot be changed. Once a Data Structure has been assigned another type, this type cannot be changed to 'V'.
5	55		EXPLICIT KEYWORDS
			This field allows you to enter additional (explicit) keywords. By default, keywords are generated from the instance's name (implicit keywords).
			Keywords must be separated by at least one space. Keywords have a maximum length of 13 characters which must be alphanumeric. However, '=' and '*' are reserved for special usage and are therefore ignored in keywords.
			Keywords are not case-sensitive: uppercase and lower-case letters are equivalent.
			NOTE: Accented and special characters can be declared as equivalent to an internal value in order to optimize the search of instances by keywords (Administrator workbench, 'Window' menu, 'Parameters browser' choice, in 'Special Characters' tab).
			A maximum of ten explicit keywords can be assigned to one entity. For more details, refer to the 'Character Mode User Interface' guide, chapter 'Search for Instances', subchapter 'Searching by Keywords'.

Data Structures: Generation-Print

Lists and description reports on Data Structures may be obtained by entering certain commands on the Generation and Print Commands (GP) screen.

LISTS

LCD: List of all data structures, sequenced by code.

C1 OPTION: Without explicit keywords,

C2 OPTION: With explicit keywords.

LKD: List of all data structures, by keywords.

After typing LKD, a selection field (SEL:) enables the user to choose implicit ('L') or explicit ('M') keywords, or both (' '). Keywords are entered on a continuation line.

C1 OPTION: Like LCD.

LPD: List of all data structures, sequenced by external name.

C1 OPTION: Like LCD.

LTD: List of all data structures, sequenced by type.

C1 OPTION: Like LCD.

LED: List of error messages, sequenced by Data Structure or Segment.

C1 OPTION: Like LCD.

DESCRIPTION

DCD: Definition, Description and Comments for the data structure entered in the ENTITY CODE field. If no code is entered, the information on ALL data structures will be printed.

C1 OPTION: Provides definition, description and comments, x-references, and a list of associated reports and segments,

C2 OPTION: With the assigned text.

GENERATION REQUESTS

A data structure may be generated to provide a COBOL description which is stored in a source library and may be copied into a program using the COBOL COPY clause.

This description may be used as many times as needed. For more information, see the 'Generation of Copy Books' in the 'Data Dictionary' Manual.

FLD: Specify the flow control for the generation of data structures. You may specify optional commands (CCF:_ and CCB:_ fields) and parameters (on continuation lines).

GCD: Generation and description of a data structure whose code you enter in the ENTITY field. You can indicate optional commands (CCF:_ and CCB:_ fields).

Note: Upon generation, a Segment can contain up to 9999 Data Elements. An error message is displayed in the generation report if this number is exceeded

C1 option: generation and description of the data structure without assigned text,

C2 option: generation and description of the data structure with assigned text,

C3 option: besides the generation and description of the data structure, generation of the Data Element and Segment description lines in the form of comments to be used by VAP Connector (an eBusiness tool).

The 'GCD' command also enables you to valorize the parameters of the DATA and/or DATASQ P.I.A. on continuation lines:

- in C4 option, the calls to the DATA and DATASQ P.I.As. will be ignored ;
- in C1, C2 or C3 option, the values entered here will override the values in all the calls to the DATA and DATASQ P.I.As.

Chapter 4. Segments

Segments: Introduction

A Segment entity is made of a structured collection of data elements (elementary or group).

It must belong to a Data Structure.

Each segment, described only once, can be called into any entity that uses segments (programs, screens, segments or database blocks).

A lot of information may be coded on the Segment definition and description lines. This information may be used according to the way the segment is used by other modules of the System (Pactables, BATCH, DBD..).

For information concerning the use of a Segment as a logical view, refer to the 'Business Logic' volume of the Developer's Documentation dedicated to eBusiness applications.

GENERAL CHARACTERISTICS

The Segment entity includes the following:

- A Definition screen (required) for entry of the general characteristics of a segment. Other information may be added if the segment is to be used in batch validation programs.
- A Description screen, to specify the data elements which make up the segment.

It is also possible to add validation and updating criteria to be used in batch programs or data useful in the description of database segments, or table items. This information will be added according to the future use of the Segment.

- Comments (optional). (See the 'Character-Mode User Interface Guide', chapter 'Documentary Facilities').
- Generation Options (optional). (See chapter 'Common Screens' in this Manual).
- Generation Elements (optional). (See chapter 'Common Screens' in this Manual).
- Error Messages (optional). (See chapter 'Common Screens' in this Manual).

RESULTS

- Cross-references indicating all the uses of the segment (in Screens, Programs, Segments, Database Blocks),
- Activity calculation, in order to optimize the logical model developed from the conceptual model, when using PACMODEL.

Segments: Definition

A Segment is defined by its code and name.

The Segment code is made of the Data Structure code and a number.

Depending on future needs, it is also possible to specify:

- the number of occurrences of the Segment (used in the activity calculation of the PACMODEL function),
- the maximum number of items of the table, if the Segment describes a table item.

If a library is defined with the protection of extracted entities or no modification of extracted lines, the creation of a Segment is authorized if its Data Structure exists in the same library and if the Segment does not exist in a protected library of the network.

STANDARD FILES

A standard file may have several types of records.

Nevertheless, the sort criteria and keys must be on all the records. This 'common part' is described once in the Segment number '00'.

The specific part of each record is described in a Segment number 'nn'.

In generated programs, a record description will be made of the concatenation of the '00' and the appropriate 'nn' segment descriptions.

A data element used to identify the specific record type has to be defined on the common part : the CODE OF RECORD TYPE.

This data element code is specified on the definition line of segment number '00'; the appropriate value is coded on the definition line of the specific part segment.

For a file that has only one type of record, a unique '00' segment is described.

TRANSACTION FILE (BATCH SYSTEMS DEVELOPMENT FUNCTION)

A transaction file is made of records that update a 'permanent' file.

A data element belonging to the common part of the file is used to identify the type of update being done (Creation, Modification, Deletion, or other cases). It is called the ACTION CODE.

This Data Element code and values are indicated on the Definition line of the '00' Segment, respectively in the 'CODE OF ACTION CODE' and 'VALUES OF TRANSACTION CODE' fields.

When each specific part Segment is defined, the rules concerning its presence or absence with each type of update are specified in the corresponding fields.

PREREQUISITE

The data structure must have been previously defined.

ASSOCIATED LINES

- Comments (-GC).
These lines are used for documentation purposes.
- 'Generation Elements' (-GG).
These lines are used to customize SQL accesses.
- 'Error Messages - Help' (-GE) where you specify error messages and on-line help on the Segment.
- 'Generation Options' (-GO) for the uppercase-lowercase management in customized SQL accesses.

```

Segments: On-Line Definition

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			DATA STRUCTURE / SEGMENT CODE
1	2		DATA STRUCTURE CODE (REQUIRED)
			This code is made up of two alphanumeric characters. This is a logical code internal to the Database and therefore independent of the names used in Database Blocks and Programs.
2	2		Segment number (REQUIRED)
			The first character must be numeric and the second either numeric or alphabetic. However the second character can be alphabetic only if the first character is other than zero.
		00	For standard files:
			Used to indicate the common part of records in a file, located at the beginning of each record (Default).
			The control break sort keys, the record type and the keys of indexed files are contained in this Segment.
			A file does not necessarily have a common part.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			Records on files with only one type of record should be coded as a '00' Segment.
			With the Pactables function, this value is not allowed.
		01-99	Designates a specific Segment. The common part Data Elements are automatically concatenated with each specific part Segment. Although a data element may not be used twice in the same Segment, it may be used in both the common part and in one or more specific Segments (except data structures used as Tables).
3	36		SEGMENT NAME (REQUIRED IN CREAT)
			This name must be as explicit as possible because it is used in the automatic building of keywords, Words used here become implicit keywords (subject to limitations specified in the Character-Mode User Interface Guide, chapter 'Search for Instances', subchapter 'Searching by Keywords').
4	4	NUMER.	Occurrences of segment in table
			PURE NUMERIC FIELD
			BATCH SYSTEMS DEVELOPMENT:
			This is the amount of space reserved for a Segment in memory (USAGE OF DATA STRUCTURE 'T' or 'X', or RECORD TYPE = 3, or 4.
			For tables (USAGE OF DATA STRUCTURE 'T' or 'X'), the default value at generation time is 100.
			Pactables:
			This field is strictly for documentation purposes.
			PACBENCH C/S:
			The value entered in this field indicates the repetitive read or update capacity of the server which calls the Logical View. This capacity is expressed by a maximum number of repetitions. The Logical View can then be used as a repeated structure.
			NOTE: The use of a Logical View in a card layout does not exclude its use in a row layout. It is therefore strongly recommended to systematically fill in this field. Moreover, the entered value must be high enough to limit the exchanges between the client and the server.
5	9	NUMER.	Estimated number of instances
			PURE NUMERIC FIELD

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		For the Batch Systems Development function, this field is used to specify the estimated number of occurrences for a segment in a database or in a standard file.
		For the METHODOLOGY function, this field is used for activity calculation on the record or set using the Segment (on-line only).
		For the DBD function, this field is used to specify the application number of an entity in a SOCRATE/CLIO Block.
6	10	Code/value of record elm. - table id
		For the Batch Systems Development function:
		CODE OF RECORD TYPE ELEM for the '00' segment:
		Enter the code of the data element used to identify the type of record (left-justified, six characters maximum).
		VALUE OF RECORD TYPE ELEM for the non-00 segments:
		Enter the value to differentiate the individual segments from one another.
		This information is required every time a variable1 file is used in a Segment.
		DL/1, SQL:
		Enter the external name of the segment or object 1 to 8 characters, between quotes).
		For Pactables table segments:
		Enter the END USER TABLE ID on 6 characters.
7	6	Code of action code element
		In the BATCH SYSTEMS DEVELOPMENT FUNCTION:
		Enter the DATA ELEMENT CODE for the element used to identify the transaction type. The System will generate validation logic appropriate for creation, modification, deletion and implicit action codes, as well as user-defined transaction types. Six values are associated with this code. Validation and updates are automatic for these six values:
		. transaction 1 creation, . transaction 2 modification, . transaction 3 deletion, . transaction 4 modification . transaction 5 modification, . transaction 6 modification.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			If there is no ACTION CODE ELEMENT, this field remains blank, and the transaction type is a modification. In this case, presence specifications for the segment are entered in the MOD-4 : ACTN CODE VALUE / SEG PRES. field, and for the elements, in the MOD-4 field on the Call of Elements (-CE) screen.
			The CODE OF ACTION CODE ELEMENT and the values must be entered on only one segment of the data structure, preferably on the common part '00'.
8	5		Create: Actn code value / Seg pres.
			(Specific to the Batch Systems Development function).
			ACTION CODE VALUE:
			On the '00' segment, enter the value that stands for "create" for this file: Example: 'ADD'. Note: for alphabetic characters use quotes.
			SEGMENT PRESENCE:
			On the non-00 segments, enter the presence specifications for the individual segment.
		'O'	Obligatory: the segment must be present on a "create"
		'I'	Invalid: the segment must not be present on a "create"
		'F'	Optional (default).
9	5		Modify: action code value/ Seg pres.
			(Specific to the Batch Systems Development function).
			ACTION CODE VALUE:
			On the '00' segment, enter the value that stands for "modify" for this file: Example: 'CHG'. Note: for alphabetic characters use quotes.
			SEGMENT PRESENCE:
			On the non-00 segments, enter the presence specifications for the individual segment.
		'O'	Obligatory: the segment must be present on a "modify"
		'I'	Invalid: the segment must not be present on a "mofify"
		'F'	Optional (default)
10	5		Delete: actn code value / Seg pres.
			(Specific to the Batch Systems Development function).
			ACTION CODE VALUE:

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		On the '00' segment, enter the value that stands for "delete" for this file: Example: 'DEL'. Note: for alphabetic characters use quotes.
		SEGMENT PRESENCE:
		On the non-00 segments, enter the presence specifications for the individual segment.
	'O'	Obligatory: the segment must be present on a "delete"
	'I'	Invalid: the segment must not be present on a "delete"
	'F'	Optional (default).
11	5	Mod-4: actn code value / Seg pres.
		(Specific to the Batch Systems Development function).
		ACTION CODE VALUE:
		On the '00' segment, enter the value that stands for implicit action codes - (creates or modifications). Note: for alphabetic characters use quotes.
		SEGMENT PRESENCE:
		On the non-00 segments, enter the presence specifications for the individual segment.
	'O'	Obligatory: the segment must be present.
	'I'	Invalid: the segment must not be present.
	'F'	Optional (default).
12	5	Mod-5: actn code value / Seg pres.
		(Specific to the Batch Systems Development function).
		ACTION CODE VALUE:
		On the '00' segment, enter the value that stands for this user-defined action. Note: for alphabetic characters use quotes.
		SEGMENT PRESENCE:
		On the non-00 segments, enter the presence specifications for the individual segment.
	'O'	Obligatory: the segment must be present.
	'I'	Invalid: the segment must not be present.
	'F'	Optional (default).
13	5	Mod-6: actn code value / Seg pres.
		(Specific to the Batch Systems Development function).

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			ACTION CODE VALUE:
			On the '00' segment, enter the value that stands for this user-defined action. Note: for alphabetic characters use quotes.
			SEGMENT PRESENCE:
			On the non-00 segments, enter the presence specifications for the individual segment.
		'O'	Obligatory: the segment must be present.
		'I'	Invalid: the segment must not be present.
		'F'	Optional (default)
14	55		EXPLICIT KEYWORDS
			This field allows you to enter additional (explicit) keywords. By default, keywords are generated from the instance's name (implicit keywords).
			Keywords must be separated by at least one space. Keywords have a maximum length of 13 characters which must be alphanumeric. However, '=' and '*' are reserved for special usage and are therefore ignored in keywords.
			Keywords are not case-sensitive: uppercase and lower-case letters are equivalent.
			NOTE: Accented and special characters can be declared as equivalent to an internal value in order to optimize the search of instances by keywords (Administrator workbench, 'Window' menu, 'Parameters browser' choice, in 'Special Characters' tab).
			A maximum of ten explicit keywords can be assigned to one entity. For more details, refer to the 'Character Mode User Interface' guide, chapter 'Search for Instances', subchapter 'Searching by Keywords'.

Segments: Description

A Segment is described by listing (calling) the Data Elements it contains. This is done by the -CE screen.

Additional information may be coded, according to the future use of the Segment (validation and update for transaction files, keys for database Segments, Pactables information..).

It is highly recommended to dedicate a Segment to only one type of future use.

OPERATION CODE

C1: default value (Update).

C2: display of the internal format of the Data Elements.
display of Elements of a called "data aggregate"
(see below).
display of names of Elements defined at the
Segment level.

C3: display of the input format of each Data Element
called in the Segment.

précédent.

GENERAL CHARACTERISTICS

A Segment is described by an ordered sequence of Data Elements. This sequence may include group Data Elements, or repetitions of elementary or group Data Elements.

Redefinitions are possible within a Segment.

For files and databases, access and control break sort keys are indicated. Initial values can be defined for work areas.

A segment is described by Data Elements defined in the Specifications Dictionary. As a result, the clear name of the Data Element, its formats and USAGE clauses are channeled down to the Segment level.

It is not possible to modify those characteristics at the Segment level.

It is possible to use Data Element codes which are not defined in the Specifications Dictionary, only when they do not have a real functional meaning (group Elements, fillers, error tables, etc.) In this case, a name and/or a format are required.

It is also possible to describe a Segment containing different aggregates of previously defined data, such as Segments or entities described with the PACMODEL function (Objects and Relationships).

It is not possible to modify the description of the called entity at the Segment level.

PREREQUISITE

The Segment and the Data Elements (except some technical Data Elements which can be defined in the Segment description lines) must have been previously defined.

ASSOCIATED SCREENS

There are additional screens associated (via the LINE NUMBER) with each of the entities called onto the Segment Call of Elements (-CE) screen:

- the S...CEnnnGC screen for comments on the line,
- the S...CEnnnGG screen for additional information about the generation of Database Blocks,
- the S...CEnnnGE screen for additional documentation concerning error messages (Batch Systems Development function).

GROUP ELEMENTS

A Group Element is identified in the list by the number of elementary Data Elements it contains. These Elements are listed after the group element.

A group may include other groups. All elementary Elements are then counted to define the group.

If a dictionary Data Element is used as a group, its length is recalculated (sum of the lengths of the elementary data elements), regardless of its dictionary format.

REDEFINITION

Redefinition is possible within a Segment (generating the COBOL 'REDEFINES' clause). The following is entered in the UPDATE TARGET field:

- . 'R*' in the UPDATE TARGET / FIRST PART,
- . Blank in the rest of the UPDATE TARGET field.

The Data Element containing this option redefines the Data Element of the same COBOL level which precedes it in the Segment description. (See UPDATE TARGET / FIRST PART.)

If a Data Element which redefines another Data Element is contained in a group, it is considered to be an elementary Data Element. It must be taken into account in the calculation of the number of Data Elements contained in a group (except for DL1 database Segments).

NOTE: When Data Elements are redefined, the system does not take their respective lengths into account. This is the user's responsibility.

In the calculation of address length (Segment Level, Address and Length Description (-LAL)), the redefined Data Element length is used for the address calculation.

DATA AGGREGATES

Segments, Model Objects and Relationships (PACMODEL) are also called "data aggregates". They may be called into other segments.

The data aggregate code is indicated instead of the data element code in the list, and it is specified as a special group (see NO. OF ELEMENTARY ELEMENTS IN A GROUP). It may be occurred (See OCCURRENCES (COBOL 'Occurs' clause)).

The description (list of elements) will be included, but it cannot be modified at this level.

NOTE: On the -CE screen, the list of Data Elements of a called aggregate is only viewed in O: C2. When a Segment description is printed (DCS), only the SEGMENT CODE will appear. The expanded view of the Segment may be seen on the Segment Level, Address and Length (-LAL) screen.

LIMITATION

Called Segments may also contain segments. This 'nesting' may occur up to three times.

EXAMPLE:

	ELEM.	GR	01 level: Segment BL00
	ELEM.		01 level: Segment BL00
S BL00 CE	DELCO1		05 level: Delco1
	CL10	**	Segment CL10
S CL10 CE	DELCO2		10 level: Delco2
	DL20	**	Segment DL20
S DL20 CE	DELCO3		15 level: Delco3
	DELCO4		Delco4
			Segment AA30
S AA30 CE	DELCO5	**	20 level: Delco5

DATABASES SEGMENT DESCRIPTION

- Existing DL/1 segments

DL/1 Segments defined prior to the installation of the System may have used Data Element codes that are eight characters in length. This does not conform to the System standards.

In that case, it is possible to define the Elements in the Dictionary to ensure future management in the System, and associate them with the old codes, to maintain compatibility with the existing applications.

- SQL external names

SQL Data element codes are used also by the end-user, so they must be significant. In some cases, a Data Element must be given a code other than its System code.

In these cases, the two codes can be managed as follows:

On the Segment Call of Elements (-CE) screen, enter:

- The data element code in the DATA ELEMENT CODE field,
- 'A*' in the UPDATE TARGET / FIRST PART field,
- The former code (up to 8 characters) in the UPDATE TARGET / SECOND and LAST PARTs.

For DL/1, the 'old' code will be not only used in the Database Block description, but also in generated SSAs for on-line or batch programs.

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		With the Pactable function, this value is not allowed.
	01-99	Designates a specific Segment. The common part Data Elements are automatically concatenated with each specific part Segment. Although a data element may not be used twice in the same Segment, it may be used in both the common part and in one or more specific Segments (except data structures used as Tables).
3	1	ACTION CODE (REQUIRED)
	'C'	Creation of the line
	M	Modification of the line
	D or 'A'	Deletion of the line
	T	Transfer of the line
	B	Beginning of multiple deletion
	G	Multiple transfer
	?	Request for HELP documentation
	E or '-'	Inhibit implicit update
	X	Implicit update without upper/lowercase processing
4	3	Line number
		Numeric.
		It is advisable to begin with line number '100' and then number in intervals of 20. This facilitates subsequent line insertions, as necessary. Alphanumeric if you generate a customized SQL access.
		It is possible to enter letters in the 'NLG' field in this case. You are allowed to create more than the '1000' limited lines.
5	6	DATA ELEMENT CODE
		ELEMENTARY DATA ELEMENT DEFINED IN THE DICTIONARY
		The Data Element automatically assumes the characteristics defined at the Specifications Dictionary level.
		If the Data Element is used as a group, its format depends on the characteristics of the elementary Elements that make up the group.
		If the group is used as a key (sort or access key), the composite format of the elementary Elements must be compatible with the format specified for the group.
		DATA ELEMENT NOT DEFINED IN THE DICTIONARY

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		The name and/or format of undefined Data Elements must be indicated at the segment level.
		RESERVED DATA ELEMENT CODES
	SUITE	Prohibited. This code is reserved for the System for program generation.
	FILLER	Data Element that is used for the alignment of fields.
		OPTIONS OF THE BATCH SYSTEMS DEVELOPMENT FUNCTION
		These codes (when used) precede other entries made in this field, in the sequence described below.
	ENPR	Used to store Element error verifications in a transaction file. The length is $n + 1$ where n = either the total number of elementary Elements in the file, or the number of elementary Elements in the '00' Segment added to the largest non-00 Segment. ("Largest" here means the most elementary Elements.) This depends upon the value entered in the RESERVED ERROR CODES IN TRANS FILE field on the Call of Data Structures (-CD) screen.
	GRPR	Used to store Segment error verifications. Its length is $n + 1$ where n = the number of records.
	ERUT	Used to store error verifications for users.
		Normally, these last three Data Elements are used in transaction files for error verification fields. When used in other types of files as "optional" Data Elements, they may be used as group fields whose generation may be invoked or suppressed according to the option selected in the RESERVED ERROR CODES IN TRANS. FILE field. (Note: this will affect the elementary Elements within the group as well.)
		CALLING DATA AGGREGATES
		A SEGMENT CODE or a Model Entity code (Relationship or Object in the METHODOLOGY function) can be entered in this field. The called data aggregate will be interpreted as if the individual Elements that make it up had been entered.
		The NO. OF ELEMENTARY ELEMENTS IN GROUP field is used to identify data aggregate calls.
		Enter the code at the location the elements are to be included in the Segment description.
		In O:C2, the level of 'nesting' is displayed in the Action Code (up to four levels).

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			The number of authorized nesting levels varies according to the type of generator. Up to 4 nesting levels are authorized for data generation and PAF use.
			CONTINUATION LINES
			It is possible to create continuation lines. This may be necessary if there are many validations on a Data Element. In this case, leave the DATA ELEMENT CODE field blank, and use a LINE NUMBER value that sequentially follows that of the line where the Data Element code was entered.
			The continuation lines are taken into account if the Data Element code is blank or if the Data Element code is the same as the previous one.
6	18		NAME OF DATA ELEMENT
			It is not required for a Data Element which is not defined in the Data Dictionary.
			However, it is optional for a data aggregate or a FILLER.
			NOTE: For on-line entry of Data Elements that are not declared in the Dictionary, this field cannot be used to input more than one Data Element at a time. There is actually only one available field on this screen, whether for input or for display.
			To define an Element at the Segment level :
			- Enter the Element code (and possibly the format) on the -CE, line nnn,
			- On the 'name' line, repeat the line number (nnn), and indicate the name (18 characters maximum),
			- Use the C2 option to view the name and format.
			NOTE: If several undefined Data Elements have been defined in the Dictionary, only the name of the first Data Element will be displayed if the Choice 'CH:S.....CE' is used.
			To view the name of the Data Element CODEL, on line 130, for example, use the choice 'O: C2 CH: Ssss-CE130'. This will display the Data Elements called in the Segment 'ssss' from the line 130 on.
7	10		Data element internal format
			It is required only in the following cases :
			- For an elementary Data Element not defined in the Dictionary (COBOL format),

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		- For a group Data Element that is or belongs to a key; its length must be the sum of the lengths of its elementary Data Elements,
		- For a FILLER-type field.
		It is the internal format; input and output formats will be the same (but with usage Display). It is defined as on a Data Element Definition screen.
8	1	INTERNAL USE
		For Data Elements not defined in the Specifications Dictionary when the INTERNAL FORMAT OF DATA ELEMENT field has been given a value, enter the appropriate USAGE (default : 'D' for DISPLAY).
		For valid values, see the USAGE field on the Data Element Definition Screen.
9	3	OCCURRENCES (COBOL "OCCURS" CLAUSE)
		PURE NUMERIC FIELD
		This field represents the 'OCCURS' clause at an elementary Data Element level, or at a group level (Maximum of 3 levels).
		It can be changed into an 'OCCURS DEPENDING ON' clause by entering '***' in the UPDATE TARGET field, followed by the counter's Segment and Data Element codes.
		The COBOL restrictions on the OCCURS clause apply.
10	2	No. of elementary elements in group
		PSEUDO NUMERIC FIELD
	'1 to 99'	For group Data Elements, enter the number of elementary Elements that belong to the group (A Segment call is considered as an elementary Data Element).
		Groups may contain up to 99 elementary Elements. Group Elements may contain embedded groups however the total number of elementary Elements cannot exceed 99. (The group Data Element codes are not counted). The maximum number of levels of 'nesting' is 9.
		This field is also used to identify the entity called in the DATA ELEMENT CODE field as Methodology entities or previously defined Segments.
	'*M' '***'	Call of an Object or a Relationship. Call of a Segment.
	'***'	SQL DBD function: Call of a Segment into a view.
11	1	Access or sort key

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			This field identifies all data elements that might be used as control break sort keys, or as access keys to a file, a database or a Pactable table.
			Note: It is highly recommended to dedicate a Segment to only one type of use.
			Each data element that may belong to a sort key must be referenced by a unique alphabetic or numeric character. It is recommended to reference the indicators by a series (1, 2, 3 ...).
			The actual sort sequence will be chosen at the program level (on the Call of Data Structures (-CD) screen) by sequencing the characters in the appropriate order.
			Reminder:
			The format of key group data elements must have been entered in the Dictionary or at the segment level.
			PACTABLES:
		'U'	References the access key for a VisualAge Pacbase table. This value must be indicated on the group data element if it is a group key.
		'S'	Indicates that the data element belongs to at least one sub-system.
			DL1 DBD (See the DL/1 DATABASE DESCRIPTION Reference Manual)
		'U'	References a unique key for an DL/1 database.
		'M'	References a multiple key for an DL/1 database.
		1 to 9	Secondary index
			All other values designate a search field.
			DBD AS400 physical file (See the corresponding DBD Reference Manual)
		0 to 9	AS400 physical file key.
			Relational databases (See the corresponding DBD Reference Manual)
		'V'	Variable length column
		'Blank'	Fixed length column
		'W'	For DB2 SQL, SQL/DS and ORACLE, generation of a variable length column (VARCHAR).
		'L'	For DB2 SQL, SQL/DS and ORACLE, generation of a LONG VARCHAR.

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		NOTE: Sort keys are not allowed on data elements redefining other data elements (see VALIDATION and UPDATE FIELDS, below).
12	30	VALIDATION AND UPDATE FIELDS
		This field is made of four main fields :
		- 'CMD456' reserved to presence validation - 'CONT' reserved to class and value validation - 'VALUE/FCT' complementary to the previous one - 'UPD/TRGET' reserved to batch update
		Those fields are mostly used in batch validation and update programs; their detailed description is to be found in the 'Batch Applications' Manual.
		Nevertheless, they may be used for other purposes:
		DEFINITION OF AN INITIAL VALUE
		. 'T' column of the 'CONT' field :
		- 'V' definition of an initial value, which is specified as a litteral in the 'VALUE/FCT' field or on the element description (type 'D' line) (10 characters).
		- 'W' same as 'V', but the litteral may continue in the 'UPD/TRGT' field (10 more characters).
		. The initial value will be taken into account in programs and also in the generation of COPY BOOKS (COBOL value clause), if needed.
		REDEFINITION
		. 'UPD/TRG' field : enter R*, left justified. The remaining part of the field should be blank. It means the data element redefines the preceding data element of the same level.
		Pactables function:
		In the 'T' column of the 'CONT' field :
	'S'	Indicates that the element belongs to one or more sub-schemas. Sub-schemas are indicated by entering the letter 'O' positionally in the VALUES/FCT field as illustrated below:
		Example:
		ELEM. CONT VALUE/SFC
		delco S O OOO
		The data element 'delco' belongs to sub-schemas 1,3,4 and 5.

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		SQL RELATIONAL DBD: .'C' column of the 'CMS456' field :
		Indicates the presence of a Table Column.
		.In the 'T' column of the CONT field :
	'S'	Indicates that the Data Element belongs to one or more sub-schema(s).
		.VALUES/FCT field :
		Indicates to which sub-schema(s) the Data Element belongs.
		.UPD/TRG field :
		The relational name of a Column may be entered in this field.
		For more information, refer to Subchapter "Table or View Description" in the "Relational / SQL Database Description" manual.
13	1	DOCUMENTATION INDICATOR
		This field is used in on-line mode only. It is a read-only field.
	'*'	A Comment, a Generation Element or an Error Message has been assigned to the element called on this line.
		Access to line nnn: -CEnnn, or -Dxn timer for a Database Block (with x = C, H or R depending on the Block type)
		To access the Comment, Generation Element or Error Message assigned to the called element, enter the access to line nnn followed (without blank) by GC (for Comment), GG (for Generation Element) or GE (for Error Message).

Segments: Generation-Print

Lists and description reports on data structures may be obtained by entering certain commands on the Generation and Print Commands (GP) screen.

LISTS

LCS: List of Segments sequenced by code.

C1 OPTION: Without explicit keywords,

C2 OPTION: With explicit keywords.

LKS: List of Segments sequenced by keyword.

After typing LKS, a selection field (SEL:) enables the user to choose implicit ('L') or explicit ('M') keywords, or both (' '). Keywords are entered on a continuation line or

DESCRIPTION

DCS : Segment description On the GP screen, enter the Data Structure code in the ENTITY field. The segment selection is made by listing the 2-character numbers (00,10,20..) on the continuation line. To get the continuation line, put an '*' in the 'S' field.

The format of the Elements may be selected. After typing 'DCS', a FORMAT: field appears.

The valid values are :

.I = internal,

.E = input,

.S = output.

.R = internal format but if there is a relational name, it replaces the Data Element label.

Regardless of the selected Library code, the print option for this entity can only be '1' or '2' (C1, U1, etc., C2, U2, etc.).

Option '1' generates the printing of:

- The definition line of the data structure:
Associated keywords and general comments lines,
Cross-references to programs and screens,
The list of segments belonging to the data structure,
- The definition line of each segment:
Associated keywords and comments lines,
Cross-references to all other entities,
- Description lines of each segment:
The list of sub-schemas and sub-systems (Pactables only)
The call of elements (including the comments),
The statistics of the segment (number of elementary elements and record length).

NOTE: For table segments, see the Pactables Reference Manual.

Option '2' provides the same listings as above, but adds a listing of the texts assigned to the data structure and the segment.

Chapter 5. Database Blocks

Database Blocks: Introduction

The purpose of the Database Block entity is to:

- Describe, at the logical level, hierarchical, relational or network databases,
- Describe, at the physical level, hierarchical, relational, or network databases, taking into account the characteristics of certain DBMSs.

GENERAL CHARACTERISTICS

The definition and description of logical or physical segments is ensured by the Segment entity.

The definition and description of logical or physical relationships between segments is ensured by the Database Block entity.

The Database Block entity includes the following:

- A Definition (required), for entry of the general characteristics (clear name, type, external name, keywords, etc.),
- Descriptions, which vary according to the type of block,
- Comments (optional). (See the 'Character-Mode User Interface Guide', chapter 'Documentary Facilities').
- Generation options (optional). (See chapter 'Common Screens' in this Manual).
- Generation elements (optional). (See chapter 'Common Screens' in this Manual).

NOTE

The actual generation of these descriptions is not accomplished by the Specifications Dictionary function.

The Database Description function actually generates these descriptions according to the syntax required by the DBMS.

The Database Block may be linked to a data model built with the PACMODEL function.

Database Blocks: Definition

A database block is defined by a code, a name and a type.

The Definition is done on a 'B' screen.

There are three categories of Database Blocks:

- Hierarchical blocks used to describe tree-like structured hierarchical databases (for example, DL/1).
- Network blocks used to describe the relationships in network databases (for example, CODASYL).
This category also allows for the description of TANDEM or DB2 databases.
- Relational blocks used to describe the links in relational databases in the SQL language (for example, DB2).

To each one of these block categories corresponds a specific Description.

A Database Block is classified into one of these categories according to the TYPE OF BLOCK. A change in the block type is allowed only when it does not imply a change in the block's category.

ASSOCIATED LINES

Comments lines.

The definition and description lines of a Database Block support all of the logical information necessary for the generation of the block in source language.

The physical level information is entered on the 'Generation Elements' (-GG) screen associated with the definition and description lines of the Database block.

Options are entered on the 'Generation Options' (-GO) screen.

This can be facilitated by the use of pre-defined Parameterized Input Aids (P.I.A.'s).

BLOCK DEFINITION.....: 1 ORDRDB

NAME.....: 2 ORDER DATABASE

TYPE.....: 3 D1 SCHEMA (DDL)

VERSION.....: 4

EXTERNAL NAME.....: 5 ORDRDB00

EXT. NAME OF SCHEMA : 6

CONTROL CARDS..... FRONT: 7 L BACK: 8 L

EXPLICIT KEYWORDS..: 9 IMS

SESSION NUMBER.....: 0059

LIBRARY.....: CIV

LOCK.....:

O: C1 CH: Bdbordb

ACTION:

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
1	6	BLOCK CODE (REQUIRED) One to six alphanumeric characters.
2	36	NAME OF THE BLOCK (REQUIRED IN CREAT) This clear name should be as explicit as possible. Words used here become implicit keywords (subject to limitations specified in Subchapter "HOW TO BUILD THE THESAURUS", Chapter "KEYWORDS" in the SPECIFICATIONS DICTIONARY Reference Manual).
3	2	TYPE OF BLOCK (REQUIRED IN CREAT) For hierarchical or network databases, it is not required, when creating a database block, to enter the definitive block type. The selection of a network or hierarchical structure is sufficient at this point. A specific "physical" type must be entered when generating the Data Description Language (DDL).
	'TR' 'SE'	Tree-like structure (hierarchical block). Group of sets (network block).
		HIERARCHICAL DATABASES - IMS/DL1
	'DP'	Physical Database Description.

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
	'DR'	Physical Database Description (same as 'DP', but only the data elements referenced as access keys in the segment description are generated in the 'FIELD.....' statements).
	'DL'	Logical Database Description.
	'PC'	PCB.
	'IP'	Primary Index.
	'IS'	Secondary Index.
	'PS'	PSB (Assigned at creation. Cannot be modified at a later stage).
		RELATIONAL DATABASES
	Q2	DB2 SQL
	Q3	SQL SERVER
	QB	DB2/2 and DB2/6000
	QC	DATACOM/DB
	QN	NONSTOP SQL
	QO	ORACLE (releases earlier than V6)
	QP	ORACLE (from release V6 on)
	QR	RDMS
	QS	SQL/DS
	QT	INTEREL RDBC
	QU	INTEREL RFM
	QY	SYBASE
	DB	DB2 (It is recommended to use the Q2 type)
		NETWORK DATABASES
		.CODASYL-DM4 (BULL 66 or DPS8):
	'M1'	DDL schema, only elementary fields are generated,
	'M4'	DDL schema, only group fields are generated,
	'M2'	DMCL schema,
	'M3'	Sub-schema.
		.CODASYL-IDS2 (BULL 64 or DPS7):
	'I1'	DDL schema,
	'I2'	DMCL schema,
	'I3'	SDDL sub-schema.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			.CODASYL-IDMS:
		'D0'	DDL schema (Release 10.0),
		'D1'	DDL schema,
		'D2'	DMCL schema,
		'D3'	Sub-schema,
		'D4'	Sub-schema (Release 5.7).
			.CODASYL-DMS (UNISYS 1100):
		'S1'	DDL Schema,
		'S3'	Sub-schema.
			DDL TANDEM
		TD	TANDEM
			AS/400 PHYSICAL FILE
		PF	AS/400 Physical file (IBM SYS. 38)
		LF	AS/400 Logical file (IBM SYS. 38).
			DMSII DATABASE
		20	DMSII Database (DASDL)
4	4		VERSION NUMBER
			Version number of the database system.
		3000	NONSTOP SQL: Version C30
		5000	RDMS 1100 : Version 5RA4
		7000	ORACLE : V7
		Blank	Other systems, all versions.
5	8		DATABASE BLOCK EXTERNAL NAME
			Necessary at generation time.
			This is the physical name of the System-generated DDL (Data Description Language) module.
			To obtain a list of blocks sorted by this external name, enter 'LEB' in the CHOICE field.
			For TurboImage, only the first six characters are processed.
6	8		EXTERNAL NAME OF THE SCHEMA
			This field is only used for SE-type blocks (Group of Sets) and for CODASYL Blocks. Otherwise, it is not displayed.
			This is necessary at generation time if the block is a SUB-SCHEMA or a DMCL.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			This is the physical name of the schema to which the given block is attached.
			This field is not used if the block is a schema.
7	1		CONTROL CARDS IN FRONT OF BLOCK
			Necessary at generation time.
			Enter the one-character code that identifies the job control card to be inserted before the generated block.
8	1		CONTROL CARDS IN BACK OF BLOCK
			Necessary at generation time.
			Enter the one-character code that identifies the job control card to be inserted after the generated block.
9	55		EXPLICIT KEYWORDS
			This field allows you to enter additional (explicit) keywords. By default, keywords are generated from the instance's name (implicit keywords).
			Keywords must be separated by at least one space. Keywords have a maximum length of 13 characters which must be alphanumeric. However, '=' and '*' are reserved for special usage and are therefore ignored in keywords.
			Keywords are not case-sensitive: uppercase and lower-case letters are equivalent.
			NOTE: Accented and special characters can be declared as equivalent to an internal value in order to optimize the search of instances by keywords (Administrator workbench, 'Window' menu, 'Parameters browser' choice, in 'Special Characters' tab).
			A maximum of ten explicit keywords can be assigned to one entity. For more details, refer to the 'Character Mode User Interface' guide, chapter 'Search for Instances', subchapter 'Searching by Keywords'.

Hierarchical Database Blocks: Description

The -DH screen is used to describe the relationships between segments in a hierarchical database (example: DL/1).

GENERAL CHARACTERISTICS

Each line designates a segment and its parent (except for the line referring to the root segment). The exact position of the segment within the hierarchical structure is indicated according to normal DL/1 standards, that is top to bottom, left to right.

PREREQUISITE

The hierarchical block must be defined as well as all the entities called.

ASSOCIATED SCREEN

The 'Comments' screen (-GC) to document each description line.

The 'Generation Elements' screen (-GG) is used to provide the physical information necessary in order to generate the block. This screen is associated with each description line and is accessed by the choice '-DHnnnGG' (where 'nnn' represents the description LINE NUMBER of the entity concerned).

OPERATION FIELD

C1: default value.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			It is advisable to begin with line number '100' and then number in intervals of 20. This facilitates subsequent line insertions, as necessary. Alphanumeric if you generate a customized SQL access.
			It is possible to enter letters in the 'NLG' field in this case. You are allowed to create more than the '1000' limited lines.
4	4		SEGMENT CODE (REQUIRED IN CREAT)
			This is the Segment Code as defined in the database.
5	4		PARENT SEGMENT CODE
			This is the code of the segment upon which the given segment is hierarchically dependent.
6	6		MODEL ENTITY RELATIONSHIP CODE
			With the PACMODEL function only:
			Enter the code of the MODEL ENTITY RELATIONSHIP that defines the link between the segment and its parent.
			The System will automatically create a cross-reference for these relationships.
			NOTE: The relationships are described via the PAC-MODEL function.
7	1		KEY INDICATOR
			Used for a symbolic reference of the key data element of a given segment in a given DBD. The character indicated in this field must also appear on the Segment Call of Elements (-CE) screen in the KEY INDICATOR FOR ACCESS OR SORT field, on the key data element line.
		'U'	References a unique key.
		'M'	References a multiple key.
		1 to 9	DL/1 Secondary index.
		\$	In a PCB or a physical or logical DBD (Block type PC, DB, or DL), generates a non-qualified SSA (used in OLSD).
			All other values designate a search field.
			NOTE: Sort keys are not permitted on data elements redefining other data elements (see the Segment Call of Elements (-CE)).
8	1		DOCUMENTATION INDICATOR
			This field is used in on-line mode only. It is a read-only field.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		'**'	A Comment, a Generation Element or an Error Message has been assigned to the element called on this line.
			Access to line nnn: -CEnnn, or -Dxn timer for a Database Block (with x = C, H or R depending on the Block type)
			To access the Comment, Generation Element or Error Message assigned to the called element, enter the access to line nnn followed (without blank) by GC (for Comment), GG (for Generation Element) or GE (for Error Message).
9	5		EST. NUMBER OF CHILD / PARENT LINK
			PURE NUMERIC FIELD
			This gives the average number of occurrences of child segments that are linked to an occurrence of a parent segment. This number is used for activity calculation (see the PACMODEL Reference Manual).
10	36		COMMENT/RELATIONSHIP/KEYLENGTH
			Documentary purpose mostly : it allows to document the defined parent/child link.
			It is also used to indicate the concatenated key length (cc=...).

Relational/SQL Database Blocks: Description

The -DR screen allows the description of a Database Block's physical model (i.e. table spaces, tables, table views, index or key) used to generate an SQL database description.

On each description line, a special ACTION CODE indicates the type of SQL command to generate for the block's object.

Description lines which are assigned Comments (-GC) or Generation Elements (-GG) are displayed with a '**'.

PREREQUISITE

The Database Block, as well as all called entities, must have been previously defined.

OPERATION FIELD

C1: only value.

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		It is advisable to begin with line number '100' and then number in intervals of 20. This facilitates subsequent line insertions, as necessary. Alphanumeric if you generate a customized SQL access.
		It is possible to enter letters in the 'NLG' field in this case. You are allowed to create more than the '1000' limited lines.
4	1	SQL record type
	'P'	Tablespace (except for Interrel RDBC, Interrel RFM, Nonstop SQL, Sybase and SQL Server)
	'T'	Table
	'V'	View
	'I'	Index
	'A'	Alter Table: Column updating
	'K'	RDMS 1100: Primary Key (Processed with the generation of the table that precedes it.)
		DB2, Datacom/DB, SQL/DS, Oracle V6 and V7, DB2/2, DB2/6000, Sybase and SQL Server: Primary key (Processed with the generation through an ALTER TABLE command.)
	'J'	DB2, Datacom/DB, SQL/DS, Oracle V6 and V7, Sybase and SQL Server: Foreign key (Processed with the generation through an ALTER TABLE command.)
	'C'	Package (Oracle V7 only)
	'E'	Function (Oracle V7 only)
	'Q'	Procedure (Oracle V7, Sybase, SQL Server)
	'R'	Oracle V7, Sybase and SQL Server: Trigger
5	27	DATABASE OBJECT EXTERNAL NAME
		It is the name used by the end-user.
		It is prohibited for a Primary Key (K-type line, DB2, DB2/2, DB2/6000 or DATACOM/DB).
		It is required for a Tablespace (P-type line).
		For all other objects, this name may be defined at several levels.
		The priority, at generation time, will be as follows:
		- the external name defined here (-DR),
		- or the one defined in the CODE OF RECORD TYPE ELEMENT field on the Segment Definition screen, defining the corresponding object.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			- or the code of the Segment defining the corresponding object.
			For a Foreign Key (J-type line), two separate codes are required: the constraint name (8 char. maxi) and the Segment code of the reference Table.
6	4		TABLE OR VIEW CODE
			On a T, V or A-type line, this field contains the code of the Segment which represents the Columns of the Table or View.
			On an I, K or J-type line, this field contains the code of the Segment which supports the key.
			On a P-type line, this field must be left blank.
7	1		KEY TYPE
		U	On an I-type line: This value is entered in order to generate the UNIQUE command.
		0-9	On a V-type line: View of the sub-schema Data Element selection in the Segment. Value 0 corresponds to the sub-schema 10.
		*	All Data Elements of the Segment are included in the View.
		R C S	On a J-type line: Restrict (default value for DB2-type Databases only) Cascade (DB2, SQL/DS, DB2/2, DB2/6000 and ORACLE V7 only) S: Set null (DB2, SQL/DS, DB2/2 and DB2/6000 only)
		B BLANK	On a C-type line (ORACLE V7): Indicates the package type. BODY package standard package
		A B	On a R-type line: Indicates where the trigger or the rule starts to operate: After Before
8	1		TYPE OF GENERATED TRANSACTION
			This field is entered in order to generate the following SQL commands: CREATE, ALTER, and DROP.
		C	CREATE Default value when the corresponding line is created. (No other value may be entered on A-type lines).
		M	Modification This choice is possible on Table-type lines only, on all Database types, except SQL/400. It generates an ALTER statement.
		D	Cancellation: generation of a DROP command. For J (Foreign Key) and K (Primary Key) lines, a DROP PRIMARY KEY or DROP FOREIGN KEY command is generated in an ALTER TABLE command.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		Blank	No generation (-GN); no generation through the GPRT procedure with option 'C2'.

CODASYL, TANDEM And DB2 Blocks: Description

The -DC screen is used to logically describe a CODASYL schema or sub-schema, i.e.:

- declare areas,
- call records and distribute them among areas,
- define and describe sets (code, name, owner record, member record).

By default, a record is mono-area. Should a record be described as multi-area, its description must be overridden by a Comment line (-DCnnnGC, where nnn is the line number).

DESCRIPTION OF A DB2 OR TANDEM DATABASE BLOCK

PRELIMINARY NOTE: The 'Q2'-type Database Block - used to generate the SQL description of relational databases - is to be used.

The 'DB'-type block corresponds to the first version of the DBD DB2 module.

On the Description screen of a DB2 or TANDEM Database Block, the user calls table views, tables or table spaces.

'Q2'-type blocks are described in the previous subchapter 'Description of a relational block.'

PREREQUISITE

The Database Block, as well as all the called entities, must have been previously defined.

OPERATION FIELD

C1: default value.

C2: source display.

```

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
1	6	BLOCK CODE (REQUIRED)
		One to six alphanumeric characters.
2	1	ACTION CODE
	'C'	Creation of the line
	M	Modification of the line
	D or 'A'	Deletion of the line
	T	Transfer of the line
	B	Beginning of multiple deletion
	G	Multiple transfer
	?	Request for HELP documentation
	E or '-'	Inhibit implicit update
	X	Implicit update without upper/lowercase processing
3	3	Line number
		Numeric.

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		It is advisable to begin with line number '100' and then number in intervals of 20. This facilitates subsequent line insertions, as necessary. Alphanumeric if you generate a customized SQL access.
		It is possible to enter letters in the 'NLG' field in this case. You are allowed to create more than the '1000' limited lines.
4	1	TYPE (REQUIRED)
	'S'	Set.
	'**'	Continuation of a set.
		For a set with multiple members, the first MEMBER Segment is indicated on an 'S'-type line, the others on '**'-type lines.
	'R'	Record.
	'A'	Area.
5	6	AREA OR SET CODE (REQUIRED)
		CODASYL:
		In this field, the user enters the code which corresponds to the selected description line type.
		Type 'S': Set code (6 characters), Type 'A': Area code (6 characters), Type 'R': Code of area to which the record belongs.
6	4	OWNER SEGMENT CODE
		With TYPE = 'A': Not used.
		With TYPE = 'R': Enter the code of the segment.
		With TYPE = 'S': Enter the parent segment code (OWNER).
7	4	MEMBER SEGMENT CODE
		With TYPE = 'S' , enter the child segment code (MEMBER).
8	6	MODEL RELATIONSHIP CODE
		SCHEMA
		Used only with TYPE = 'S'.
		With the Methodology function only:
		Enter the Relationship code from which the set is derived. VA Pac will automatically create a cross-reference for these relationships.
		NOTE: The relationships are described via the Methodology Function.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			SUB-SCHEMA
			Only used for IDMS ('D3', 'D4' types), DM4 ('M3' type) and DMS ('S3' type) sub-schemas.
			for 'R'-type lines :
			It is possible to change the description of the selected record. The user must indicate the code of the segment redefining the selected segment, as follows : '=FFnn'.
			EXAMPLE:
			T AREA OWNER MEM METHOD OCC NAME OF AREA, SET SEG SEG CODE SET OR COMMENT R AREA1 FF10 =FF20
			In this example record FF10 is generated with the elements belonging to FF20.
			NOTE: Segment FF20 must have been previously defined and described.
9	5	NUMER.	NUMBER OF OCCURRENCES OF SETS
			PURE NUMERIC FIELD
			Used only with TYPE = 'S':
			This is the average number of occurrences of MEMBER segments that are linked to an occurrence of an OWNER segment. This number is used for Activity Calculation (see the PACMODEL Reference Manual).
10	36		NAME OF AREA, SET, OR COMMENT
			With TYPE = 'S': Set name, With TYPE = 'A': Area name, With TYPE = 'R': Comment.
			SUB-SCHEMA IDMS (D4) OR DMS (S3):
			There are four different ways to select a record sub- set, as illustrated in the following example:
			LIN : T AREA OWNER MEM MODEL OCC NAME OF AREA, SET SEG SEG CODE SET OR COMMENT 001 : R AREA1 FF10 002 : R AREA1 FF10 =FF20 003 : R AREA1 FF10 SS=n 004 : R AREA1 FF10 =FF20 SS=n
			LINE 001: Record FF10 of the sub-schema is made up of all the data elements of Segment FF10.
			LINE 002: Record FF10 of the sub-schema is made up of all the data elements of Segment FF20.
			LINE 003: Record FF10 of the sub-schema is made up of the data elements of Sub-schema n.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			LINE 004: Record FF10 of the sub-schema is made up of the data elements of Sub-schema n of Segment FF20.
			IDS2 (I3) sub-schema:
			It is possible to call an object (area, record, set) without re-describing it, by specifying: INCLUSION.

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		It is advisable to begin with line number '100' and then number in intervals of 20. This facilitates subsequent line insertions, as necessary. Alphanumeric if you generate a customized SQL access.
		It is possible to enter letters in the 'NLG' field in this case. You are allowed to create more than the '1000' limited lines.
4	1	TYPE OF DESCRIPTION LINE (REQUIRED)
	R	Record call line.
5	4	TABLE OR VIEW (REQUIRED)
		This field contains the Segment code which corresponds to the called record.
		When the Database Block is generated, this code appears after the 'RECORD' clause.
6	36	FILE NAME (REQUIRED)
		This field contains the name of the physical file which supports the data.
		When the Database Block is generated, this name appears after the 'FILE IS' clause.

Database Blocks: Generation-Print

Lists and description reports on Database Blocks may be obtained by entering certain commands on-line on the Generation and Print Commands (GP) screen. The COMMANDS FOR PRINT REQUEST are listed below.

LISTS

LCB: List of all database blocks, sequenced by their codes.

C1 OPTION: Without explicit printed keywords,

C2 OPTION: With explicit printed keywords.

LEB: List of database blocks, sequenced by external names, without explicit printed keywords.

LTB: List of database blocks, sequenced by their types.

C1 OPTION: Without explicit printed keywords,

C2 OPTION: With explicit printed keywords.

LKB: List of all database blocks, by keywords.

After typing LKB, a selection field (SEL:) enables the user to choose implicit ('L') or explicit ('M') keywords, or both (' ').

Keywords are entered on a continuation line.

LTS: List of SQL objects by codes,

LES: List of SQL objects by external names.

DESCRIPTION

DTB: Definition, description and general documentation for the database block entered in the ENTITY CODE field. If no code is specified, ALL occurrences of the Database Block entity type are listed.

A Type selection is requested by entering the desired TYPE CODE field.

C1 OPTION: Provides definition, description, general documentation, and X-references,

C2 OPTION: With assigned text.

GENERATION OPTION

The Database Description Generation function is used to generate the specific DBMS source language according to the Database Block descriptions.

Chapter 6. Common Screens

Introduction

The screens presented in this chapter are common to several entities.

You will not find here detailed explanations specific to the input on each entity.

To find them, please consult the references to other Manuals located in each introduction text.

Error Messages - Help (-GE)

This screen enables you to describe error messages and help texts for Data Elements, Segments, Data Structures and Screens.

Refer to the 'OLSD' or 'Pacbench C/S - Business Logic and TUI Clients' manual, chapter 'Error Messages - Help Function', or to the 'Batch Applications' manual, chapter 'Error Messages'.

These manuals can be consulted from our VisualAge Pacbase internet page. The internet address is noted at the beginning of the manual, after the title page.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
3	1		LINE TYPE - MESSAGES GENERATION
		'T'	Call of a Text section.
			PACBENCH C/S AND ON-LINE SYSTEMS DEVELOPMENT FUNCTIONS
		'S'	Segment call.
		'F'	Data Element call.
		'U'	Error message.
		'C'	Comment. See the 'Pacbench C/S Business Logic and TUI Clients' manual or the 'OLSD' manual, chapter 'Error Messages'.
			BATCH SYSTEMS DEVELOPMENT FUNCTION
		'S'	Replacement of an automatic error message
		'D'	Documentary messages. See the 'Batch Applications' manual, chapter 'Error Messages'.
4	60		DESCRIPTION
			BATCH SYSTEMS DEVELOPMENT FUNCTION
			DOCUMENTARY MESSAGE: 'D'-type line.
			Position 1:
			'0': Message before Element Description.
			'1': Message after Element Description.
			'2-5': Message after an error message of type 2 to 5.
			Position 2:
			blank.
			Position 3:
			'blank': Message entered on the line.
			'T': Call of a Text instance.
			Position 5-...Documentary message, or Text & Paragraph codes (**: ALL paragraphs).
			OVERRIDING A STANDARD ERROR MESSAGE: 'S'-type line.
			Position 1:
			'2-5': Error type.
			Position 2: Blank.
			Position 3: Error gravity (E, C or W).

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		Position 4: Blank.
		Position 5-...: Error message.
		PACBENCH C/S AND ON-LINE SYSTEMS DEVELOPMENT FUNCTIONS
		SCREEN-RELATED DOCUMENTATION: 'C'- or 'T'-type line.
		Position 1-5: Blank.
		Position 6-...: Message on 'C'-type line or Text & Paragraph codes on 'T'-type line.
		OVERRIDING A DATA ELEMENT-RELATED STANDARD ERROR MESSAGE OR CREATING A DATA ELEMENT-RELATED USER-DEFINED ERROR MESSAGE:
		NOTE: Two lines need be coded.
		1. 'F'-type line:
		Position 1-6: Data Element instance code.
		2. 'U'-type line:
		Position 1-3: Blank.
		Position 4:
		'2-5': Standard error type.
		'N' : Code of manual error (save '0' and '1')
		Position 5: Blank.
		Position 6-...: Error message.
		OVERRIDING STANDARD SEGMENT-RELATED ERROR MESSAGES: NOTE: Two lines need be coded.
		1. 'S'-type line:
		Position 1-4: Segment instance code.
		Position 5: Blank.
		Position 6: Category:
		'A' Heading,
		'R' Repetitive,
		'Z' Bottom.
		Position 7: Segment's rank in the category (if used several times in the category).
		2. 'U'-type line:
		Position 1:

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			'F': Segment used in reception.
			'G': Segment used in display.
			Position 2-3: Blank.
			Position 4:
			'8': Invalid segment creation.
			'9': Segment not found.
			Position 5: Blank.
			Position 6-...: Error message.
			USER-DEFINED DIALOGUE-RELATED ERROR MESSAGE: 'U'-type line.
			Position 1-4: Error code.
			Position 5: Blank.
			Position 6-...: Error message.
			DOCUMENTATION OF A DATA ELEMENT:
			Position 1-3: Blank.
			Position 4: '0'(zero).
			Position 5: Blank.
			Position 6-...: Documentation lines, or Text and Paragraph codes after a 'T'-type line.
			DOCUMENTATION OF A DIALOGUE-RELATED ERROR MESSAGE:
			Position 1-4: Error code. 'blank' If following a 'U'-, 'C'-, or 'T'-type line.
			Position 5: Blank.
			Position 6-...: Documentation lines, or Text and Paragraph codes after a 'T'-type line.
			DOCUMENTATION OF A STANDARD ERROR MESSAGE AND OF A USER-DEFINED DATA ELEMENT-RELATED ERROR MESSAGE:
			COL. VALUE DESCRIPTION
			Position 1-3: Error code.
			'blank' If following an 'F'-, 'U'-, 'C'-, or 'T'-type line.
			Position 4: Type of error whose message is to be documented.
			Position 5: Blank.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
			Position 6-...: Documentation lines, or Text and Paragraph codes after a 'T'-type line.
5	40		DESCRIPTION / SECOND PART
			You can tabulate directly to this field. However, it has not any special use in this screen.

Generation Elements (-GG)

You use this screen for different purposes, depending on the entity:

- on a Database Block Definition, you specify the physical characteristics of the Block.
See the Manual which corresponds to your Database Block Description manager.
- on the Database Block Description, you can complement the generation information.
See the Manual which corresponds to your Database Block Description manager.
- on a Data Structure, you enter technical information (frequency of backups...).
- on a Segment, you customize SQL accesses.
See the 'Relational Databases' Manual.
- on the Segment Call of Elements, you indicate additional description elements for the generation of Database Blocks.
See the 'Relational Databases' Manual.
- on a Screen or TUI Client Definition, you modify the generated constants (which depend on the hardware in use).
- for a TUI client only, you can generate one PSB per sub-monitor (as opposed to a general PSB for the whole dialogue). You must indicate, on the -GG screen of each sub-monitor, on a G-type line, in C2 option:
 - PSB= left-justified in the DESCRIPTION field
 - PSB code, at the next tabulation position.

This line must be the first -GG line.

NOTE: Each client component must belong to only ONE sub-monitor.

See the 'OLSD' and 'Pacbench C/S - Business Logic and TUI Clients' manuals.

The lines indicated in this screen are taken into account when the instance is generated.

These manuals can be consulted from our VisualAge Pacbase internet page. The internet address is noted at the beginning of the manual, after the title page.

CALLING A P.I.A.

The use of the Parameterized Input Aid entity (P.I.A.) may facilitate and standardize data entry on this screen.

An Input Aid is a group of parameterized lines. Each line contains a fixed label and a variable part which will be filled in the calling instance.

You call a P.I.A. by entering the value 'T' in the 'Type of Line' field and the P.I.A. code in the 'Description' field. VA Pac responds by displaying the P.I.A. lines field. Enter the parameters values on these formatted lines.

NOTE: The 'C2' option (O: C2) enables you to tab to the variable part of the P.I.A. line.

Additional lines cannot be inserted between called lines.

PREREQUISITES

The instance must be defined prior to being documented.

The called P.I.As must also exist.

LINES COPY

You may overwrite the instance code with another instance code (belonging to the same entity). This will not affect the original lines, but it will replicate them for the other instance.

NOTE: If the original lines include the lines of a called P.I.A., they will also be duplicated, except for user input on the variable parts of the P.I.A. lines.

>>>> For more details, refer to the 'Character Mode User Guide', chapter 'Documentary Facilities', subchapter 'Parameterized Input Aids'.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
3	1		LINE TYPE - GENERATION ELEMENTS
		'G'	You use a 'G' line to:
			. generate, from a Segment, a customized SQL access with a delimiter.
			. indicate the physical characteristics of a Block on the Block Definition.
			. add generation data on the Block Description.
			. override generated constants in a Screen or TUI Client.
		'V'	Generate, from a Segment, a customized SQL access without a delimiter.
		'T'	Call of a P.I.A.
			You can only call a P.I.A. with a 'G' type.
			The lines from the called P.I.A. have a 'Line generation option' set to 'blank' or 'G' in the P.I.A. Description.
			The call line is then replaced by the called P.I.A.
			Socrate Databases
		'V'	Line taken into account at generation.
		'P'	Line taken into account at generation.
		'Z'	Line taken into account at generation.
4	60		DESCRIPTION / FIRST PART
			If no P.I.A. is called, you can use the whole field.
			The contents of this field vary according to the type of line and to the current entity.
			See the corresponding manuals.
5	40		DESCRIPTION / SECOND PART
			This field is specific to a P.I.A. call.
			With value 'C2' in the OPERATION CODE field, the cursor automatically tabs to the first position of this field.
			This field is initialized with blanks (default value) or with the value specified in the INITIAL VALUE field for a Standard PIA description line (Type = 'blank').
			If symbolic parameters have been defined on the P.I.A. Description (-D), they may be entered in this field. They will be replaced by their corresponding value, and will remain displayed on the right of the screen.

Generation Options (-GO)

You use this screen for different purposes, depending on the entity:

- on an SQL Database Block, you specify options such as the prefixing, the transformation of lowercase into uppercase, the complete description, in the Working Storage Section, of the Segments which constitute DB2 Tables...
See the 'SQL Databases' Manual.
- on a Segment, you can inhibit the conversion of lowercase letters into uppercase letters on customized SQL accesses (with the UPPER=NO option).
See the 'SQL Databases' Manual.
- on a Program, you can change the function/subfunction number of the date transformation function (F9520 by default) or request the breakdown of generated dates into elementary fields.
See the 'Batch Applications' Manual.
- on a Library, you can request the non-overriding of the date processing function (F9520 by default), enter the format of the generated indices or request the breakdown of generated dates into elementary fields, or indicate the SCM import environment and application code.
See the 'Character-Mode User Interface' guide.
- on a Dialogue, you can indicate various generation options.
See the 'On-Line Systems Development' Manual.
- For all the entities managed by the Pacbench C/S Function, except blank-type or MW-type entities, you can indicate various generation options.
See the 'Business Logic' Volume of the Developer Documentation dedicated to eBusiness applications.
These manuals can be consulted from our VisualAge Pacbase internet page. The internet address is noted at the beginning of the manuel, after the title page.

CALLING A P.I.A.

The use of the Parameterized Input Aid entity (P.I.A.) may facilitate and standardize data entry on this screen.

An Input Aid is a group of parameterized lines. Each line contains a fixed label and a variable part which will be filled in the calling instance.

You call a P.I.A. by entering the value 'I' in the 'Type of Line' field and the P.I.A. code in the 'Description' field. VA Pac responds by displaying the P.I.A. lines field. Enter the parameters values on these formatted lines.

NOTE: The 'C2' option (O: C2) enables you to tab to the variable part of the P.I.A. line.

Additional lines cannot be inserted between called lines.

PREREQUISITES

The instance must be defined prior to being documented.

The called P.I.As must also exist.

LINES COPY

You may overwrite the instance code with another instance code (belonging to the same entity). This will not affect the original lines, but it will replicate them for the other instance.

NOTE: If the original lines include the lines of a called P.I.A., they will also be duplicated, except for user input on the variable parts of the P.I.A. lines.

>>>> For more details, refer to the 'Character Mode User Guide', chapter 'Documentary Facilities', subchapter 'Parameterized Input Aids'.

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
3	1		LINE TYPE - GENERATION OPTIONS
		I	Call of a P.I.A. You can only call a P.I.A with an 'O' type. The lines from the called P.I.A. have a 'Line generation option' set to 'blank' or 'O' in the P.I.A. Description. The call line is then replaced by the called P.I.A.
			For the Pacbench C/S, OLSD, DBD and Batch Functions:
		O	Generation options
4	60		DESCRIPTION
			If no P.I.A. is called, you can use the whole field.
			On an O-type line, Enter the option followed by an equal sign and the value (with no space).
5	40		DESCRIPTION / SECOND PART
			This field is specific to a P.I.A. call.
			With value 'C2' in the OPERATION CODE field, the cursor automatically tabs to the first position of this field.
			This field is initialized with blanks (default value) or with the value specified in the INITIAL VALUE field for a Standard PIA description line (Type = 'blank').
			If symbolic parameters have been defined on the P.I.A. Description (-D), they may be entered in this field. They will be replaced by their corresponding value, and will remain displayed on the right of the screen.

Chapter 7. Generation of Copy Books

Principles

The Specifications Dictionary includes a generator component. This component is used to obtain descriptions of Data Structures or SQL Database Blocks in COBOL source language, using the data structure descriptions implemented in the System.

Each description thus obtained is stored in a COBOL source library and can be incorporated into programs using the COPY clause.

A single data structure can be used to generate several different descriptions, each one adapted to a particular need in the programs. (i.e. in FILE SECTION or WORKING-STORAGE SECTION, taking the internal and input formats into account).

USAGE OF THE 'DATA' AND 'DATASQ' P.I.As.

The preliminary definition and description of the reserved P.I.A. called 'DATA' or 'DATASQ' is necessary for the generation of a data structure description.

At the data structure level, you can call the 'DATA' P.I.A. as often as necessary. Each time 'DATA' is called, you must specify the values in the parameters and the variants required for each description.

When you call the 'DATASQ' P.I.A., you request the description of an SQL Database Block. Two COPY clauses are generated for each Block: one for the host variables and one for the presence indicators.

The 'DATA' and 'DATASQ' P.I.As. are of Comment type ('C'). So they can be called only in the Comments screens (-GC) of a data structure.

The 'DATA' and 'DATASQ' P.I.As. are presented on the following pages.

There is one field per description line. The description must be scrupulously respected, be it the number, order or length of the parameters. No comment line is allowed.

Description of 'DATA' PIA

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
1	2		DATA STRUCTURE CODE IN GENER. DESCR.
		'A*'	Used to associate this P.I.A to a COPY book in order to regenerate the COPY book in its initial format. See the TYPE field with value 'A' on the Data Element Definition screen, Data Element Description screen, and the General Documentation screen of the segment.
			default value : D.S. code
2	8		EXTERNAL NAME
			It is the file name in the program and in the COPY instruction.
3	1		DESCRIPTION LOCATION
		'F'	FILE SECTION
			The different structures of a record will not contain a REDEFINES clause, since VA Pac automatically generates all REDEFINES.
		'W'	WORKING-STORAGE SECTION or LINKAGE SECTION. The different record structures are redefined explicitly. (default value)
		'V'	Generation of a variable file.
4	1		TYPE OF COBOL TO GENERATE (REQUIRED)
			Specify the language variant to which the generated description must be adapted. This adaptation does not concern the USAGE clauses.
		'0'	Adaptation to ANSI COBOL: IBM MVS
		'1'	Adaptation to ANSI COBOL: IBM DOS
		'3'	Adaptation to COBOL : PC/MICROFOCUS
		'4'	Adaptation to COBOL : BULL DPS7
		'5'	Adaptation to ANSI COBOL: (74) BULL DPS8
		'7'	Adaptation to COBOL: HP-3000
		'8'	Adaptation to COBOL: A Serie UNISYS
		'F'	Adaptation to COBOL: TANDEM
		'I'	Adaptation to COBOL: DEC/VAX
		'K'	Adaptation to ANSI COBOL: ICL 2900
		'M'	Adaptation to COBOL: DPS6

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		'O'	Adaptation to COBOL: AS 400
		'U'	Adaptation to ANSI COBOL: (74) UNISYS 1100 Series
		'W'	Adaptation to COBOL: DPPX IBM 8100
		'X'	Adaptation to ANSI COBOL: IBM MVS VS COBOL II
5	1		FORMAT TYPE
		'E'	Description using input formats.
		'I'	Description using internal formats with their associated 'usages'. (Default value).
		'S'	Description using output formats.
6	1		RECORD TYPE / USE WITHIN D.S.
			This option allows records of a data structure coming from the same description in a library to be arranged in several different ways:
		'blank'	Implicit or explicit redefinition of records. (Default value).
		'1'	Continuous sequence of records ('common part' segment followed by the different 'specific part' segments) without initial values or repetitions of records. If the data structure description appears in the COBOL FILE SECTION, the level number must be '2'.
		'2'	Continuous sequence of records that include initial values filled in on the description lines of the segments, or, by default, initial values of blank or zero according to the format (this option is reserved for descriptions in WORKING-STORAGE SECTION).
		'3'	Continuous sequence of records taking into account the number of repetitions specified on the Segment Definition screen. If the data structure description appears in the COBOL FILE SECTION, the level number must be '2'.
			This type of description can only be used for a data structure having a number of repetitions on the common part segment.
		'4'	Continuous sequence of records taking into account the number of repetitions specified on the Segment Definition screen. The associated level number must be '3'.
			The level '2' allows access to the table created by the repetition of a given record (FFEET).
			The level '1' consolidates all the information in the data structure (whether or not the common part and specific parts are repeated).

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
		This type of description can only be used for a data structure having a number of repetitions on the common part segment.
7	1	LEVEL NUMBER (COBOL) OF THE RECORD
		This option, used in relation with the preceding one, defines the level number of the descriptions of data structures, records, or data elements.
		In the following descriptions, the field 'FF00' is used to define the data structure level.
	'1'	Level '01' for data structures and records (default option). If the data structure description appears in the COBOL FILE SECTION, the records must be redefined. If the data structure has no 'common part' with a RECORD TYPE / USE WITHIN D.S. other than 'blank', the file level does not appear.
	'2'	Level '01' for data structures and '02' for records, the '01' level does not appear if the RECORD TYPE is 'blank'.
	'3'	Level '02' for data structures and '03' for records, when associated with RECORD TYPES 1, 2 or 3. Level '01' for data structures and '03' for records, when associated with RECORD TYPE 4. Level '03' for data structures and records when associated with RECORD TYPE 'blank'.
8	2	CONTROL CARDS FRONT/BACK COPY BOOK
		This field represents the two options of Job Control Cards which are used to ensure that the generated description is catalogued in the source library:
		.the option code to be inserted into the control cards in front of a generated description,
		.the option code to be inserted into the control cards in back of each generated description.
9	40	SEGMENT SELECTION
		If there is no selection, all the segments making up a data structure are selected.
		When a specific selection is made, the sequence of the chosen record codes, (which may or may not be sorted) is called for.
		The selection of a 'common part' segment of a multi-record file must be explicitly specified.

Description of 'DATASQ' PIA

NUM	LEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
1	2		DATA STRUCTURE CODE IN GENER. DESCR.
		'A*'	Used to associate this P.I.A to a COPY book in order to regenerate the COPY book in its initial format. See the TYPE field with value 'A' on the Data Element Definition screen, Data Element Description screen, and the General Documentation screen of the segment.
			default value : D.S. code
2	8		EXTERNAL NAME
			It is the file name in the program and in the COPY instruction.
3	6		BLOCK CODE
			One to six alphanumeric characters.
4	1		TYPE OF COBOL TO GENERATE (REQUIRED)
			Specify the language variant to which the generated description must be adapted. This adaptation does not concern the USAGE clauses.
		'0'	Adaptation to ANSI COBOL: IBM MVS
		'1'	Adaptation to ANSI COBOL: IBM DOS
		'3'	Adaptation to COBOL : PC/MICROFOCUS
		'4'	Adaptation to COBOL : BULL DPS7
		'5'	Adaptation to ANSI COBOL: (74) BULL DPS8
		'7'	Adaptation to COBOL: HP-3000
		'8'	Adaptation to COBOL: A Serie UNISYS
		'F'	Adaptation to COBOL: TANDEM
		'T'	Adaptation to COBOL: DEC/VAX
		'K'	Adaptation to ANSI COBOL: ICL 2900
		'M'	Adaptation to COBOL: DPS6
		'O'	Adaptation to COBOL: AS 400
		'U'	Adaptation to ANSI COBOL: (74) UNISYS 1100 Series
		'W'	Adaptation to COBOL: DPPX IBM 8100
		'X'	Adaptation to ANSI COBOL: IBM MVS VS COBOL II
5	1		GENERATION OF PRESENCE INDICATORS
		Y	Presence indicators will be generated.

NUMLEN	CLASS VALUE	DESCRIPTION OF FIELDS AND FILLING MODE
	N	Presence indicators will not be generated.
6	2	CONTROL CARDS FRONT/BACK COPY BOOK
		This field represents the two options of Job Control Cards which are used to ensure that the generated description is catalogued in the source library:
		.the option code to be inserted into the control cards in front of a generated description,
		.the option code to be inserted into the control cards in back of each generated description.
7	40	SEGMENT SELECTION
		If there is no selection, all the segments making up a data structure are selected.
		When a specific selection is made, the sequence of the chosen record codes, (which may or may not be sorted) is called for.
		The selection of a 'common part' segment of a multi- record file must be explicitly specified.

Data Generation and/or Printing

To generate data descriptions from a Data Structure, you must:

- call the 'DATA' or 'DATASQ' P.I.A. in the Comments screen (-GC) of the Data Structure,
- valorize the parameters,
- request the generation on the generation and printing screen (CH: GP).

You request it via the 'GCD' Command, followed by the Data Structure code. You can also enter optional commands (CCF:_ and CCB:_ fields).

Note: Upon generation, a Segment can contain up to 9999 Data Elements. An error message is displayed in the generation report if this number is exceeded.

General 'Flow' generation information (such as name of the source library..) may be coded on a 'FLD' Command.

With the C3 option, the 'GCD' command enables you to generate, besides the Segment Cobol source, Data Element and Segment description lines in the form of comments which will be used by VAP Connector.

The 'GCD' command also enables you to valorize the parameters of the DATA and DATASQ P.I.As. on continuation lines:

- In C1, C2 or C3 option, these parameters' values entered on continuation lines override the values entered in ALL the calls to the DATA and DATASQ P.I.As.
- In C4 option, the P.I.A. calls, if any, are ignored. The parameters entered on continuation lines are optional (because they all have a default value), except the SQLBLO parameter which is mandatory if the PIATYP parameter equals DSQC1 or DSQC2.

The following table presents the parameters you enter on continuation lines in order to override the values indicated in the DATA P.I.A. and/or the DATASQ P.I.A..

Param code	Meaning	Length	Default value	DATA	DATASQ
PIATYP ^o	P.I.A. type	3 or 5	DC1 for DATA C1 ^{oo}	X	X
DSCODE	Data Structure code	2	code of generated DS	X	X
EXTNAM	External name	8	code of generated DS	X	X
DESLOC	Description location	1	W	X	
COBTYP	Variant	1	space	X	
			0		X
FORTYP	format	1	I	X	
RECTYP	Description type	1	space	X	
LEVNUM	Description level	1	1	X	
SEGSEL	Record selection	40	space	X	X
SQLBLO	Block code, MANDATORY if PIATYP=DSQC1 or DSQC2	6	block code		X
PREIND	Presence indicator	1	Y		X

^o: only for the C4 option.

^{oo}: Other values are possible (DC2 for DATA C2, DC3 for DATA C3, DSQC1 for DATASQ C1 and DSQC2 for DATASQ C2).

Example of Generated 'DATA' in the FILE SECTION

```
01          TR00.
05          TR00-00.
10          TR00-KEYCD.
11          TR00-COCARA PICTURE X.
11          TR00-NUCOM PICTURE 9(5).
11          TR00-FOURNI PICTURE X(3).
05          TR00-SUITE.
15          FILLER          PICTURE X(00157).
01          TR05.
10          FILLER          PICTURE X(00009).
10          TR05-NUCLIE PICTURE 9(8).
10          TR05-DATE PICTURE X(6).
10          TR05-RELEA PICTURE X(3).
10          TR05-REFCLI PICTURE X(30).
10          TR05-RUE PICTURE X(40).
10          TR05-COPOS PICTURE X(5).
10          TR05-VILLE PICTURE X(20).
10          TR05-CORRES PICTURE X(25).
10          TR05-REMIS PICTURE S9(4)V99.
10          TR05-MATE PICTURE X(8).
