How to send your comments

Your feedback is important in helping to provide the most accurate and highest quality information.

- To send comments on articles in the WebSphere Application Server Information Center
 1. Display the article in your Web browser and scroll to the end of the article.
 2. Click on the **Feedback** link at the bottom of the article, and a separate window containing an email form appears.
 3. Fill out the email form as instructed, and submit your feedback.
- To send comments on PDF books, you can email your comments to: **wasdoc@us.ibm.com**.

Your comment should pertain to specific errors or omissions, accuracy, organization, subject matter, or completeness of this book. Be sure to include the document name and number, the WebSphere Application Server version you are using, and, if applicable, the specific page, table, or figure number on which you are commenting.

For technical questions and information about products and prices, please contact your IBM branch office, your IBM business partner, or your authorized remarketer. When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you. IBM or any other organizations will only use the personal information that you supply to contact you about your comments.

Using this PDF

Links

Because the content within this PDF is designed for an online information center deliverable, you might experience broken links. You can expect the following link behavior within this PDF:

- Links to Web addresses beginning with `http://` work.
- Links that refer to specific page numbers within the same PDF book work.
- The remaining links will *not* work. You receive an error message when you click them.

Print sections directly from the information center navigation

PDF books are provided as a convenience format for easy printing, reading, and offline use. The information center is the official delivery format for IBM WebSphere Application Server documentation. If you use the PDF books primarily for convenient printing, it is now easier to print various parts of the information center as needed, quickly and directly from the information center navigation tree.

To print a section of the information center navigation:

1. Hover your cursor over an entry in the information center navigation until the **Open Quick Menu** icon is displayed beside the entry.
2. Right-click the icon to display a menu for printing or searching your selected section of the navigation tree.
3. If you select **Print this topic and subtopics** from the menu, the selected section is launched in a separate browser window as one HTML file. The HTML file includes each of the topics in the section, with a table of contents at the top.
4. Print the HTML file.

For performance reasons, the number of topics you can print at one time is limited. You are notified if your selection contains too many topics. If the current limit is too restrictive, use the feedback link to suggest a preferable limit. The feedback link is available at the end of most information center pages.

Chapter 1. Migration, coexistence, and interoperability

The goal of migration is to reconstruct the environment of your previous version of WebSphere® Application Server in a Version 8.5 environment. Coexistence allows you to create a mixed-version environment that is not in conflict and allows the nodes of all versions to start and run at the same time. Coexistence also facilitates rollback and allows one or the other version to run at one time. Interoperating is exchanging data between two coexisting product installations or between products on different systems.

Overview of migration, coexistence, and interoperability

The goal of migration is to reconstruct your earlier version of WebSphere Application Server in a Version 8.5 environment. Coexistence allows you to create a mixed-version environment that is not in conflict and allows the nodes of all versions to start and run at the same time. Coexistence also facilitates rollback and allows one or the other version to run at one time. Interoperating is exchanging data between two coexisting product installations or between products on different systems.

Note: These tools are intended for use with the full WebSphere Application Server profile; they are not required or supported for use with the Liberty profile.

Introduction

WebSphere Application Server Version 8.5 can coexist with Version 6.1 and above. Depending on the previous version of WebSphere Application Server, port conflicts might exist that must be resolved. Read “Coexistence support” on page 101 and Chapter 14, “Configuring port settings,” on page 107 for more information.

WebSphere Application Server Version 8.5 migration leverages the existing configuration and applications and changes them to be compatible with the WebSphere Application Server Version 8.5 environment. Existing application components and configuration settings are applied to the Version 8.5 environment during the migration process.

If you use an earlier version of WebSphere Application Server, the system administrator might have fine-tuned various application and server settings for your environment. It is important to have a strategy for migrating these settings with maximum efficiency.

You can perform incremental migration of your WebSphere Application Server Version 6.1 or above configuration by running the migration tools multiple times, each time specifying a different set of profiles.

Incremental migration of your WebSphere Application Server usually involves operating your system in a mixed cell release environment. Migration in this environment involves node migrations at various times and as such, may result in mixed cells running for extended periods of time until migration is complete.

A cell can contain nodes from different WebSphere Application Server versions. A WebSphere Application Server Version 8.5 mixed cell can contain nodes that support WebSphere Application Server Version 8.5 and Version 6.1 or above. A mixed cell environment can exist in two ways:

1. You perform incremental node migration of your existing system.
 - a. You migrate the deployment manager to Version 8.5. The deployment manager has to be at the level of the highest node version. If you have nodes of the previous version, then this migration of the deployment manager creates a mixed cell at the highest version of WebSphere Application Server.
 - b. Then when you migrate one node at a time to this new highest version, the cell becomes a cell at the highest version of WebSphere Application Server.

Note: This cell cannot be at a higher version than the deployment manager.

2. You migrate the deployment manager to Version 8.5 and then federate older version nodes to the new version deployment manager. This form of migration is supported for only Version 6.1 and above nodes.
 - a. First, you migrate the deployment manager to Version 8.5. The deployment manager has to be at the level of the highest node version.
 - b. You then can federate nodes from Version 6.1 and above to the new highest deployment manager version.

gotcha: This method of incremental migration leaves your system in a mixed cell environment with nodes administered by a Version 8.5 deployment manager. Your migration planning should eventually include migrations of all nodes to the Version 8.5 level to ensure consistent administration of the nodes.

Existing functions continue to work in a mixed cell environment. You should be able to perform reasonable operations, such as run existing applications, perform management operations, such as addNode, create mixed cluster, configure the system, call Mbeans, and deploy applications. New function support in a mixed cell environment can be decided on a case by case basis - based on function, priority and available resources.

gotcha: **gotcha:** When running in a mixed-cell environment, clients might suddenly encounter a situation where the port information about the cluster members of the target cluster has become stale. This situation most commonly occurs when all of the cluster members have dynamic ports and are restarted during a time period when no requests are being sent. The client process in this state will eventually attempt to route to the node agent to receive the new port data for the cluster members, and then use that new port data to route back to the members of the cluster.

If any issues occur that prevent the client from communicating with the node agent, or that prevent the new port data being propagated between the cluster members and the node agent, request failures might occur on the client. In some cases, these failures are temporary. In other cases you need to restart one or more processes to resolve a failure.

To circumvent the client routing problems that might arise in these cases, you can configure static ports on the cluster members. With static ports, the port data does not change as a client process gets information about the cluster members. Even if the cluster members are restarted, or there are communication or data propagation issues between processes, the port data the client holds is still valid. This circumvention does not necessarily solve the underlying communication or data propagation issues, but removes the symptoms of unexpected or uneven client routing decisions.

Migration involves the following main steps:

1. Test your applications in a non-production WebSphere Application Server Version 8.5 environment, and make any changes to the applications that are necessary to ensure that they run in that environment.
2. Migrate those applications and your configuration to Version 8.5.

You can complete this task by using the migration tools that are included with the product.

Use the migration tools to migrate applications and configuration information to the new version as described in Chapter 4, "Migrating product configurations," on page 19. Read "Migrating product configurations with migration tools" on page 23 for more information.

The Migration wizard provides a graphical user interface to the migration tools. The Migration wizard can call the migration tools, or you can run them directly.

Important reference articles for this migration include the following articles:

- Creating profiles using the graphical user interface

- `manageprofiles` command.

If you neither migrate nor coexist with an earlier version of WebSphere Application Server, you are choosing to ignore the previous installation and you can run only one version at a time because of conflicting default port assignments. It is possible for both versions to run at the same time without conflict if you use non-default ports in one version. To set up coexistence with WebSphere Application ServerVersion 6.1 or above, ensure that unique ports are selected during profile creation for the Version 8.5 installation. To set up coexistence with an existing installation of Version 8.5, select the **Install a new copy of the V8.5 Application Server product** radio button during installation.

You can resolve conflicting port assignments by specifying port assignments for coexistence during profile creation, by `wsadmin` scripting, or by using the **Servers > Application Servers > server1 > Ports** administrative console page to ensure that WebSphere Application Server Version 8.5 can run with an earlier version. Read the "Wsadmin tool" article in the information center for more information on `wsadmin` scripting.

Coexistence processing changes the following configuration files:

- `virtualhosts.xml`
 - HTTP transport port
 - IBM® HTTP server port
 - HTTPS transport port
 - HTTP administrative console port
 - HTTPS administrative console secure port
- `serverindex.xml`
 - Bootstrap address
 - SOAP connector address
 - Secure Authentication Service (SAS) Secure Sockets Layer (SSL) ServerAuth listener address
 - Common Secure Interoperability Protocol Version 2 (CSIV2) SSL ServerAuth listener address
 - CSIV2 SSL MutualAuth listener address
 - Administrative console port
 - HTTP transport port
 - Distribution and Consistency Services (DCS) unicast address
 - Administrative console secure port
 - HTTP transport secure port
 - Service Integration Bus (SIB) endpoint address
 - SIB endpoint secure address
 - SIB MQ endpoint address
 - SIB MQ endpoint secure address

Read Port number settings in WebSphere(r) Application Server versions for more information.

Consider the following issues in a migration or coexistence scenario:

- Conflicting context roots when attempting to share the same Web server.
Follow the procedure in "Migrating web server configurations" on page 68 to learn how to configure a web server for sharing between WebSphere Application Server versions.
- If your node agent or application server has been configured to run as non-root, follow the instructions in "Migrating non-root configurations to root" on page 49 to change the ownership and file permissions of the node directories after running the **WASPostUpgrade** command.

This task must be completed before you start the WebSphere Application Server Version 8.5 node agent or application server.

Read “WASPostUpgrade command” on page 31 for more information.

Migrating and coexisting application servers

Migrating involves collecting the configuration information from a previous release of a WebSphere Application Server and merging it into a configuration for a new release. Coexisting involves running a new release of a WebSphere Application Server and an earlier release simultaneously on the same machine.

Before you begin

Read “Overview of migration, coexistence, and interoperability” on page 1 and “Premigration considerations” on page 5. For resources to help you plan and perform your migration, visit Knowledge Collection: Migration planning for WebSphere Application Server.

The migration tools basically save the existing WebSphere configurations and user applications in a backup directory and then process the contents of this backup directory to migrate the configurations and your applications from previous WebSphere Application Server releases to the latest release.

If you have a previous version of WebSphere Application Server, you must decide whether to migrate the configuration and applications of the previous version to the new version.

Migration does not uninstall the previous version.

If you run two different versions of the application server at the same time, the two versions are *coexisting*. For example, if Version 6.1 and 8.5 application servers are running on the same machine, they are coexisting.

To support coexistence, you must either use the `-portBlock` and `-replacePorts` options when you migrate a profile or you must resolve port conflicts manually so that the two releases do not attempt to use the same ports. Any ports bound when the first profile starts will prevent the second profile from starting because the port is in use. No port changes are required if only one release of the profile is active at any given time.

For help in troubleshooting problems when migrating, read “Troubleshooting migration” on page 71.

About this task

For information on migrating to Version 8.5, read Chapter 4, “Migrating product configurations,” on page 19. For more information on coexistence among releases, read “Coexistence support” on page 101.

Procedure

1. Update product prerequisites and corequisites to supported versions.
Refer to the IBM WebSphere Application Server supported hardware, software, and APIs site for current requirements.
2. Install the Version 8.5 product.
Read the "Installing the product and additional software" article in the information center for more information.
3. Migrate your WebSphere Application Server Version 6.1 or above product configuration to Version 8.5.
You have the choice between migrating your configuration automatically using the migration tools or manually.
 - Use the migration tools to automatically migrate your configuration.
Read “Migrating product configurations with migration tools” on page 23 for more information.
Consider the following points related to using the migration tools to automatically migrate your configuration:

- Advantages
 - You copy the old configuration automatically.
This includes all resource definitions, virtual host definitions, security settings, and so forth.
 - You recreate the same exact Version 6.1 or above configuration in Version 8.5, including the server definitions and deployed applications by default.
 - You can enable support for script compatibility.
Read “WASPostUpgrade command” on page 31 for more information.
 - Consideration

This approach will copy the configuration exactly. A different approach, such as the manual approach, is required if your existing configuration is different from that which you want for the new configuration.
 - Manually migrate your configuration.

Migrating your configuration manually involves the following activities:

 - You start with a clean slate and build up a new environment for Version 8.5.
 - Ideally, you would use an existing set of administration scripts to set up the complete Version 8.5 environment.
 - You move your applications to Version 8.5 as they are tested on Version 8.5.

Consider the following points related to manually migrating your configuration:

 - Advantages
 - You can reuse the scripts for maintenance, replication, and disaster recovery.
 - You can easily refactor the topology if you desire.
 - Considerations
 - A complete set of administration scripts is a significant investment.
 - You must address script incompatibilities and changes before you migrate.
4. Migrate web server plug-ins as described in “Migrating web server configurations” on page 68.
 5. Optional: Set up multiple versions of WebSphere Application Server to coexist.

No runtime conflicts can exist for multiple instances and versions of WebSphere Application Server if they are going to run at the same time on the same machine. Potential conflicts can occur with your port assignments. Read “Port number settings” on page 108 for more information.

 - Set up your system to run Version 6.1 or above and Version 8.5 together as described in “Setting up Version 6.1 or above and Version 8.5 coexistence” on page 102.
 - Set up your system to run two concurrent Version 8.5 profiles as described in “Setting up Version 8.5 coexistence” on page 104.
 - Create more than one Version 8.5 profile on the same machine as described in the “Managing profiles using the graphical user interface” article in the information center.

Premigration considerations

Before you begin the process of migrating to WebSphere Application Server Version 8.5, there are some considerations of which you need to be aware.

Considerations for AIX, HP-UX, IBM i, Linux, Solaris, and Windows operating systems

Consider the following information before you migrate Application Server:

- Before you perform the migration, evaluate the items deprecated in WebSphere Application Server Version 8.5.

For more information, read the “Deprecated and removed features” article in the information center.

- Before you migrate to Java Standard Edition (SE) Development Kit (JDK) 6 from JDK 5 or JDK 1.4 , review your applications for necessary changes based on the Java specification. IBM® WebSphere® SDK Java Technology Edition Version 6.0 is installed by default with WebSphere Application Server Version 8.5. Optionally, you can use the Installation Manager to install IBM WebSphere SDK Java Technology Edition Version 7.0.

Note: Do not enable SDK Java Technology Edition Version 7.0 unless all nodes are migrated to Version 8.5.

Read “Migrating API and specifications” on page 9 for more information.

- The migration articles in this information center assume that WebSphere Application Server Version 8.5 is being installed in an environment where it must coexist with previous versions of WebSphere Application Server.

Consider the following items when planning to enable coexistence:

- Update prerequisites to the levels required by WebSphere Application Server Version 8.5. Previous versions of WebSphere Application Server continue to run at the higher prerequisite levels.
- Review the ports that have been defined to ensure that the WebSphere Application Server Version 8.5 installation does not conflict.

Read “Port number settings” on page 108 for default port information.

Read Chapter 12, “Running multiple application server versions,” on page 101 for more information.

- WebSphere Application Server Version 8.5 migration converts HTTP transports to channel-framework web container transport chains.

For more information on WebSphere Application Server Version 8.5 transport support, read the following articles in the information center:

- Configuring transport chains
- HTTP transport channel settings
- Transport chains

- If you create a profile that does not meet the migration requirements such as naming requirements, you can remove the previous profile and create a new one rather than uninstalling and reinstalling the WebSphere Application Server Version 8.5 product.
- The migration tools create a migration backup directory containing a backup copy of the configuration from the previous version. The following guidelines might help you to determine the amount of file-system space that this directory might require:
 - If you are migrating from Version 6.1 or above, the space available for this directory must be at least the size of the configuration directory and applications from the previous profile.
- If you use the migration tools to create more than one Version 8.5 target profile on the same host or installation instance and you use the default port settings, there is a chance that the target profiles will share the same ports for some of the new Version 8.5 port definitions. This will cause startup problems if both of the migrated profiles are used.

If you are migrating two or more profiles that reside on the same host or installation instance, perform the following actions for each additional target profile:

1. Before using the migration tools, use the Profile Management tool or **manageprofiles** command to create the target profile and make sure that you select unique ports rather than using the default ports.
2. When you use the migration tools, select the target profile rather than letting the tools create it.

- The amount of storage that your system requires during migration to Version 8.5 depends on your environment as well as on the migration tool that you are using.

- **WASPreUpgrade storage requirements**

- **Location:** Backup directory specified as a parameter of the **WASPreUpgrade** command
- **Amount:** For an estimate of your storage requirements when using this command, add the following amounts.

- Size of the following items for all of the profiles in your previous configuration:
 - *profile_root*/installableApps directory
 - *profile_root*/installedApps directory
 - *profile_root*/config directory
 - *profile_root*/properties directory
 - Shared libraries referenced in the `libraries.xml` configuration files
 - Resource adapter archive (RAR) files referenced in the `resources.xml` configuration files
- If trace is enabled, which is the default, up to 200 MB (depending on the size and complexity of your configuration)

For more information about this command, read “WASPreUpgrade command” on page 28.

– WASPostUpgrade storage requirements

- For an estimate of your storage requirements when using this command, add the following amounts.

- **Location:** New configuration relative to the new *profile_root* directory
Size of the following items for the previous profile that you are migrating:
 - *profile_root*/installableApps directory
 - *profile_root*/installedApps directory
 - *profile_root*/config directory
 - *profile_root*/properties directory
 - Shared libraries referenced in the `libraries.xml` configuration files
 - RAR files referenced in the `resources.xml` configuration files
- **Location:** Backup directory specified as a parameter of the **WASPreUpgrade** and **WASPostUpgrade** commands
If trace is enabled, which is the default, up to 1 GB (depending on the size and complexity of your configuration)

For more information about this command, read “WASPostUpgrade command” on page 31.

- If you use isolated data repositories—specifically, nonshared data repositories such as transaction logs for SIB and IBM Cloudscape or Apache Derby databases—and you migrate from a previous release, your existing databases and transaction logs are saved when the WASPreUpgrade tool is run. Any database changes that you make after the WASPreUpgrade tool is run will not be reflected in the migrated environment.
 - If you have mission-critical information that is stored in these local data repositories, you should safely shut down all servers that interact with those repositories before attempting migration. Those servers should remain offline until the migration has been successfully completed or rolled back.
 - If you make multiple attempts at migration, either because of unexpected rollback or to apply fixes, rerun the WASPreUpgrade tool so that any changes to your isolated data repositories are reflected in the migrated environment.

After the migration is complete or you have rolled back to the previous version, you can restart the servers that interact with these isolated data repositories.

- Do not migrate a node with active servers if the SIB uses the file-store option for one or all of the messaging engines.
 - **Windows** The WASPreUpgrade tool fails with a file-locked exception when you try to copy the file stores on an active application server.
 - **AIX** **Linux** The WASPreUpgrade tool copies a locked file, which could compromise data consistency.

A data store for the messaging engine is an option for a hot migration; but if a file store must be used, the servers should not be running.

- **Windows** If you try to run the **WASPreUpgrade** command to migrate from Version 6.1 with the node and application server that own the SIB file store still running, you might get an error similar to the following:

```
C:\was80A\bin>WASPreUpgrade c:\bkupWAS6.1.0.17June30B C:\was61B
MIGR0385I: Starting to save profile AppSrv01.
MIGR0215W: The migration function cannot copy the file and open the destination file
c:\bkupWAS6.1.0.17June30B\migrated\C_\FSJune19\Log.
MIGR0272E: The migration function cannot complete the command.
```

If you then shut down the application server and node, the **WASPreUpgrade** command completes.

- Before you migrate an Apache Derby database, ensure that any application servers hosting applications that are using the Apache Derby database are closed. Otherwise, the Apache Derby migration fails.
- If you updated your java.security file in the previous version of WebSphere Application Server, ensure that your updates are located in the migrated java.security file, which is located in V85WAS_HOME/java/jre/lib/security/java.security.
- The process for disabling credential prompting has changed.
 To disable credential prompting in Version 8.5, configure the ipc.client.props to disable credential prompting before migrating from Version 6.1 to Version 8.5.
- During migration, some of your application metadata might be reset to the default and cause the application to function differently from what you expect.

If you installed an application in your old environment with **Use Metadata From Binaries** set to true and during that installation or a future update of the application you made a change to the application's metadata (such as JNDI resource references or database entries for example), the change might be lost when you migrate.

When **Use Metadata From Binaries** is set to true, the administrative code only updates the metadata in the binary EAR file. This option is not supported in a mixed cell; therefore, it is automatically turned to false as part of migration. When this happens, the expanded metadata in the configuration directories take precedence over the values in the binary EAR file. This causes the values from the original EAR file installation to take precedence over any updates that you might have made.

Perform one of the following actions to resolve this issue:

- Before migrating, update your applications in the old environment and set **Use Metadata From Binaries** to false. Ensure that the applications are functioning correctly with this new setting, and then run the migration.
- After migrating, update your applications and correct the metadata as required to allow the applications to function appropriately.
- After you use the migration tools to migrate to WebSphere Application Server Version 8.5, you might need to perform some actions that are not done automatically by the migration tools.
 - Examine any Lightweight Third-Party Authentication (LTPA) security settings that you might have used in WebSphere Application Server Version 6.1 or above, and verify that Version 8.5 security is set appropriately.
 Read the "Lightweight Third Party Authentication" article in the information center for more information.
 - Check the WASPostUpgrade.log file in the logs directory for details about any JavaServer Pages (JSP) objects that the migration tools did not migrate.
 If Version 8.5 does not support a level for which JSP objects are configured, the migration tools recognize the objects in the output and log them.
 - Review your Java Virtual Machine (JVM) settings to verify that you are using a heap size of at least 50 for improved startup performance.
 Read the "Java virtual machine settings" article in the information center for more information.
 If you have used a smaller heap size before, you can use the default heap size of 50.
 - Verify the results of the automatic Apache Derby database migration, and manually migrate any Apache Derby databases that are not automatically migrated by the tools.

Read “Migrating IBM Cloudscape or Apache Derby databases” on page 44 for more information.

- WebSphere Application Server Version 8.5 does not include the WebSphere Connect JDBC driver for SQL Server. The WebSphereConnectJDBCdriverConversion tool is provided to convert data sources from the WebSphere Connect JDBC driver to the DataDirect Connect JDBC driver or the Microsoft SQL Server JDBC driver.

Read “Migrating from the WebSphere Connect JDBC driver” on page 46 for more information.

Migrating API and specifications

Migrating application programming interfaces (APIs) and specifications involves moving to the current Java component level as well as to other technologies that WebSphere Application Server Version 8.5 supports. If your existing applications currently support different specification levels than are supported by this version of the product, it is likely that you must update at least some aspects of the applications to comply with the new specifications.

In many cases, IBM provides additional features and customization options that extend the specification level even further. If your existing applications use IBM extensions from earlier product versions, it might be necessary for you to perform mandatory or optional migration to use the same kinds of extensions in Version 8.5.

WebSphere Application Server Version 8.5 supports Java SE Development Kit (JDK) 7.

Notes on the use of Java SE Development Kit 6:

- WebSphere Application Server began supporting Java SE Development Kit (JDK) 6 in Version 8.0. Read JSR 270: Java SE 6 Release Contents and Java SE 6 for more information about JDK 6.
- In general, existing Version 6.x application binaries that were developed using JDK 1.4 and 5 are highly compatible and typically do not require modifications to run. However, recompilation of the JDK 1.4 or 5 applications at the JDK 6 level might necessitate modifications of the source code to conform to incompatible changes that are present in JDK 6. As part of your migration planning, you should review the JDK compatibility restrictions that are documented at Java SE 6 Release Notes: Compatibility.
- A mixed cell containing Version 6.x and Version 7.0 nodes requires that all application binaries deployed on Version 6.x remain at the lowest JDK level associated with the Version 6.x nodes. Although you can successfully migrate Version 6.x applications to Version 8.5, this is only meant to be a temporary state as you transition to Version 8.5. After you begin migration to Version 8.5, plan to complete the migration of the entire cell, update your tooling to Version 8.5, and update your applications to conform to JDK 6 requirements.

Complete this action before any further application changes. After you have completely migrated your cell to Version 8.5, upgrade your application binaries to the JDK 6 level the next time that you make application modifications that require recompiling. This action might require source code changes to your application to conform to the JDK 6 API changes as documented.

Note: The Java Virtual Machine Debug Interface (JVMDI) and the Java Virtual Machine Profiler Interface (JVMPPI) were deprecated in JDK 5 and removed in JDK 6. Read [Java SE 6 Release Deprecated API](#) for more information.

Read the "Specifications and API documentation" article in the information center for a summary of the specifications and API documentation supported in current and prior product releases.

For more information on the items deprecated in WebSphere Application Server Version 8.5, read the "Deprecated, stabilized, and removed features" article in the information center.

Chapter 2. How do I migrate, coexist, and interoperate?

Use the documentation provided to answer your questions about migration, coexistence, and interoperability.

Follow these shortcuts to get started quickly with popular tasks. When you visit a task, look for the **IBM Suggests** feature at the bottom of the page. Use it to find available tutorials, demonstrations, presentations, articles, IBM Redbooks, support documents, and more.

“Overview of migration, coexistence, and interoperability” on page 1

“Configuration mapping during product-configuration migration” on page 19

“Migrating product configurations with migration tools” on page 23

Chapter 4, “Migrating product configurations,” on page 19

Chapter 13, “Interoperating multiple application server versions,” on page 105

“Troubleshooting migration” on page 71

Chapter 3. Migrating applications to the Liberty profile

This section provides information on how to migrate applications to the Liberty profile.

Procedure

Migrate data access applications to the Liberty profile.

Migrating data access applications to the Liberty profile

For data access applications, you need to make configuration changes when you migrate a data source from the WebSphere Application Server full profile to the Liberty profile.

Procedure

- “Configuration differences between the full profile and Liberty profile: dataSource and jdbcDriver elements.”
- “Configuration differences between the full profile and Liberty profile: connectionManager element” on page 14.
- “Migrating a DB2 data source to the Liberty profile” on page 15.
- “Migrating a Derby embedded data source to the Liberty profile” on page 17.

Configuration differences between the full profile and Liberty profile: dataSource and jdbcDriver elements

This page identifies some differences in configuration between dataSource in the Liberty profile and data sources in the full profile.

- Data source properties with different names
 - `ifxIFX_LOCK_MODE_WAIT`, which is `informixLockModeWait` in the full profile.
 - `supplementalJDBCTrace`, which is `supplementalTrace` in the full profile.
- Data source properties with different values
 - `beginTranForResultSetScrollingAPIs`, which is true by default in the Liberty profile
 - `beginTranForVendorAPIs`, which is true by default in the Liberty profile
 - `connectionSharing`, which is `MatchOriginalRequest` by default in the Liberty profile
 - `statementCacheSize`, which is 10 by default in the Liberty profile
- `connectionSharing` property of data source
 - The Liberty profile allows `connectionSharing` to be configured to either `MatchOriginalRequest` or `MatchCurrentState`. By default, it is `MatchOriginalRequest`.
 - The full profile allows `connectionSharing` to be configured in a finer grained manner, where individual connection properties can be matched based on the original connection request or current state of the connection. In the full profile, `connectionSharing` is a combination of bits representing which connection properties to match based on the current state of the connection. In the full profile, a value of 0 means match all properties based on the original connection request, and a value of -1 means to match all properties based on the current state of the connection. The default value for the full profile is 1, which means that the isolation level is matched based on the current state of the connection and all other properties are matched based on the original connection request.
- Time duration properties of data source

Time duration properties can optionally be specified with units in the Liberty profile. For example,

```
<dataSource id="informix" jndiName="jdbc/informix" queryTimeout="5m" ...>
  <properties.informix ifxIFX_LOCK_MODE_WAIT="120s" .../>
</dataSource>
```

See Liberty profile: Configuration elements in the server.xml file for accepted time units and formats of dataSource element. Omitting the units in the Liberty profile is equivalent to the default units used in the full profile.

- Configuration for JDBC drivers
 - In the Liberty profile, you can take the same approach of configuring different jdbcDriver elements for XA capable and non-XA capable data source implementation classes, or you can use a single jdbcDriver element for both. Defining multiple jdbcDriver elements does not cause different class loaders to be used. In the Liberty profile, jdbcDriver elements always use the class loader of the shared library with which they are configured.
 - In the full profile, a JDBC provider is defined pointing to the JDBC driver JARs, compressed files and native files. Separate JDBC providers must be defined for XA capable and non-XA capable data source implementation classes.

For some of the commonly used JDBC drivers, the Liberty profile infers the data source implementation class names based on the names the driver JARs. In these cases it is possible to omit the implementation class names. For example:

```
<jdbcDriver id="Derby" libraryRef="DerbyLib"/>
<library id="DerbyLib">
  <fileset dir="C:/Drivers/derby" includes="derby.jar" />
</library>
```

If you want to override the default implementation classes such as javax.sql.DataSource, javax.sql.ConnectionPoolDataSource, and javax.sql.XADataSource, you can use their optional properties.

The following example overrides the default javax.sql.XADataSource and javax.sql.ConnectionPoolDataSource implementations that are selected by the Liberty profile:

```
<jdbcDriver id="Derby" libraryRef="DerbyLib"
  javax.sql.XADataSource="org.apache.derby.jdbc.EmbeddedXADataSource"
  javax.sql.ConnectionPoolDataSource="org.apache.derby.jdbc.EmbeddedConnectionPoolDataSource"/>
<library id="DerbyLib">
  <fileset dir="C:/Drivers/derby" includes="derby.jar" />
</library>
```

See Liberty profile: Configuration elements in the server.xml file for more information of jdbcDriver.

Configuration differences between the full profile and Liberty profile: connectionManager element

This page identifies some differences in configuration between connectionManager in the Liberty profile and connection pools in the full profile.

- Properties with different names
 - **maxConnectionsPerThread**, which is **maxNumberOfMCsAllowableInThread** in the full profile.
 - **maxIdleTime**, which is **unusedTimeout** in the full profile.
 - **maxPoolSize**, which is **maxConnections** in the full profile.
 - **minPoolSize**, which is **minConnections** in the full profile.
- Time duration properties

Time duration properties can optionally be specified with units in the Liberty profile. For example,

```
<connectionManager id="pool1" connectionTimeout="30s" reapTime="3m" maxIdleTime="30m"/>
```

See Liberty profile: Configuration elements in the server.xml file for accepted time units and formats for the connectionManager element. If you do not specify time units in the Liberty profile, the same units are used as in the full profile.

- Differences in timeout values for immediate and never

There are differences in the values used to represent immediate timeout and never (disabled) timeout.

- The Liberty profile uses a value of 0 to represent immediate, whereas the full profile often uses -1 for immediate.
- The Liberty profile uses a value of -1 to represent never (disabled), whereas the full profile often uses 0 for never (disabled).

Specifically this applies to:

- **agedTimeout**
- **connectionTimeout**
- **maxIdleTime**, which is **unusedTimeout** in the full profile
- **reapTime**
- Purge Policy changes

In the Liberty profile, there are three purge policy values: **EntirePool**, **FailingConnectionOnly**, and **ValidateAllConnections**.

In the full profile, there are two purge policy values: **EntirePool** and **FailingConnectionOnly**, with a second property, **defaultPretestOptimizationOverride**, determining the behavior of **FailingConnectionOnly**.

Purge policies in the Liberty profile, and their full profile equivalents, are as follows:

- `purgePolicy="EntirePool"`, which is the same for both.
- `purgePolicy="FailingConnectionOnly"`, which is equivalent to `purgePolicy="FailingConnectionOnly" with defaultPretestOptimizationOverride="false"` in the full profile.
- `purgePolicy="ValidateAllConnections"`, which is equivalent to `purgePolicy="FailingConnectionOnly" with defaultPretestOptimizationOverride="true"` in the full profile.

Migrating a DB2 data source to the Liberty profile

You can easily migrate a DB2[®] data source to the Liberty profile.

About this task

Refer to the following code examples to see the configurations for a DB2 data source in the full profile and Liberty profile.

Example

In the full profile:

```
<resources.jdbc:JDBCProvider xmi:id="JDBCProvider_1321914412932"
  providerType="DB2 Using IBM JCC Driver" isolatedClassLoader="false"
  implementationClassName="com.ibm.db2.jcc.DB2ConnectionPoolDataSource" xa="false">
  <classpath>${DB2_JCC_DRIVER_PATH}/db2jcc4.jar</classpath>
  <classpath>${DB2_JCC_DRIVER_PATH}/db2jcc_license_cu.jar</classpath>
  <classpath>${DB2_JCC_DRIVER_PATH}/db2jcc_license_cisuz.jar</classpath>
  <factories xmi:type="resources.jdbc:DataSource" xmi:id="DataSource_1321914498985"
    name="DefaultDB2Datasource" jndiName="jdbc/DefaultDB2Datasource"
    providerType="DB2 Using IBM JCC Driver" authMechanismPreference="BASIC_PASSWORD"
    authDataAlias="IBM-9NE5C7ONIG4Node01/dbuser2" relationalResourceAdapter="builtin_rra"
    statementCacheSize="10"
    datasourceHelperClassName="com.ibm.websphere.rsadapter.DB2UniversalDataStoreHelper">
  <propertySet xmi:id="J2EEResourcePropertySet_1321914499000">
    <resourceProperties xmi:id="J2EEResourceProperty_1321914499000" name="databaseName"
      type="java.lang.String" value="TESTDB" required="true" ignore="false"
      confidential="false" supportsDynamicUpdates="false"/>
    <resourceProperties xmi:id="J2EEResourceProperty_1321914499001" name="driverType"
      type="java.lang.Integer" value="4" required="true" ignore="false"
      confidential="false" supportsDynamicUpdates="false"/>
  </propertySet>
  </resources.jdbc:JDBCProvider>
```

```

<resourceProperties xmi:id="J2EEResourceProperty_1321914499002" name="serverName"
  type="java.lang.String" value="localhost" required="false" ignore="false"
  confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499003" name="portNumber"
  type="java.lang.Integer" value="50000" required="false" ignore="false"
  confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499010" name="currentLockTimeout"
  type="java.lang.Integer" value="10" required="false" ignore="false"
  confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499013" name="currentSchema"
  type="java.lang.String" value="DBUSER2" required="false" ignore="false"
  confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499015" name="cursorSensitivity"
  type="java.lang.Integer" value="0" required="false" ignore="false"
  confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499016" name="deferPrepares"
  type="java.lang.Boolean" value="true" required="false" ignore="false"
  confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499027" name="loginTimeout"
  type="java.lang.Integer" value="0" required="false" ignore="false"
  confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499032" name="resultSetHoldability"
  type="java.lang.Integer" value="1" required="false" ignore="false"
  confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499034"
  name="retrieveMessagesFromServerOnGetMessage" type="java.lang.Boolean" value="true"
  required="false" ignore="false" confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499041" name="traceLevel"
  type="java.lang.Integer" value="-1" required="false" ignore="false"
  confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499052"
  name="beginTranForResultSetScrollingAPIs" type="java.lang.Boolean" value="false"
  required="false" ignore="false" confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499053" name="beginTranForVendorAPIs"
  type="java.lang.Boolean" value="false" required="false" ignore="false"
  confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499054" name="connectionSharing"
  type="java.lang.Integer" value="-1" required="false" ignore="false"
  confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499060"
  name="nonTransactionalDataSource" type="java.lang.Boolean" value="false" required="false"
  ignore="false" confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499063"
  name="syncQueryTimeoutWithTransactionTimeout" type="java.lang.Boolean" value="false"
  required="false" ignore="false" confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499069"
  name="webSphereDefaultIsolationLevel" type="java.lang.Integer" value="2" required="false"
  ignore="false" confidential="false" supportsDynamicUpdates="false"/>
<resourceProperties xmi:id="J2EEResourceProperty_1321914499070"
  name="webSphereDefaultQueryTimeout" type="java.lang.Integer" value="10" required="false"
  ignore="false" confidential="false" supportsDynamicUpdates="false"/>
</propertySet>
<connectionPool xmi:id="ConnectionPool_1321914499012" connectionTimeout="180"
  maxConnections="10" minConnections="1" reapTime="180" unusedTimeout="1800"
  agedTimeout="7200" purgePolicy="EntirePool" />
<mapping xmi:id="MappingModule_1321914681786" mappingConfigAlias=""
  authDataAlias="IBM-9NE5C7ONIG4Node01/dbuser2"/>
</factories>
</resources.jdbc:JDBCProvider>
<systemLoginConfig xmi:id="JAASConfiguration_2">
  <authDataEntries xmi:id="auth1" alias="IBM-9NE5C7ONIG4Node01/dbuser2"
    userId="dbuser2" password="{xor}LDcflTo7Oz0=" />
</systemLoginConfig>

```

In the Liberty profile, the equivalent configuration is:

```
<variable name="DB2_JCC_DRIVER_PATH" value="C:/Drivers/DB2" />
<library id="db2Lib">
  <fileset dir="{DB2_JCC_DRIVER_PATH}" includes="db2jcc4.jar
    db2jcc_license_cu.jar db2jcc_license_cisuz.jar" />
</library>
<dataSource id="DefaultDB2Datasource" jndiName="jdbc/DefaultDB2Datasource"
  statementCacheSize="10"
  beginTranForResultSetScrollingAPIs="false"
  beginTranForVendorAPIs="false"
  connectionSharing="MatchCurrentState"
  transactional="false"
  syncQueryTimeoutWithTransactionTimeout="false"
  isolationLevel="TRANSACTION_READ_COMMITTED"
  queryTimeout="10"
  >
  <jdbcDriver libraryRef="db2Lib"
    javax.sql.ConnectionPoolDataSource="com.ibm.db2.jcc.DB2ConnectionPoolDataSource"/>
  <properties.db2.jcc
    databaseName="TESTDB"
    driverType="4"
    serverName="localhost"
    portNumber="50000"
    currentLockTimeout="10"
    currentSchema="DBUSER2"
    cursorSensitivity="0"
    deferPrepares="true"
    loginTimeout="0"
    resultSetHoldability="1"
    retrieveMessagesFromServerOnGetMessage="true"
    traceLevel="-1"
    user="dbuser2"
    password="{xor}LDcfLTo70z0="
  />
  <connectionManager connectionTimeout="180" maxPoolSize="10" minPoolSize="1" reapTime="180"
    maxIdleTime="1800" agedTimeout="7200" purgePolicy="EntirePool"/>
</dataSource>
```

Migrating a Derby embedded data source to the Liberty profile

You can easily migrate a Derby Embedded data source to the Liberty profile.

About this task

Refer to the following code examples to see the configurations for a Derby Embedded data source in the full profile and Liberty profile.

Example

In the full profile:

```
<resources.jdbc:JDBCProvider xmi:id="JDBCProvider_1183122153343"
  providerType="Derby JDBC Provider"
  implementationClassName="org.apache.derby.jdbc.EmbeddedConnectionPoolDataSource"
  xa="false">
  <classpath>${DERBY_JDBC_DRIVER_PATH}/derby.jar</classpath>
  <factories xmi:type="resources.jdbc:DataSource" xmi:id="DataSource_1183122153625"
    name="DefaultDerbyDatasource" jndiName="jdbc/DefaultDatasource"
    providerType="Derby JDBC Provider" authMechanismPreference="BASIC_PASSWORD"
    relationalResourceAdapter="builtin_rra" statementCacheSize="10"
    datasourceHelperClassName="com.ibm.websphere.rsadapter.DerbyDataStoreHelper">
  <propertySet xmi:id="J2EEResourcePropertySet_1183122153625">
```

```

    <resourceProperties xmi:id="J2EEResourceProperty_1183122153625" name="databaseName"
      type="java.lang.String" value="C:/myDerby/DefaultDB" required="true"/>
    <resourceProperties xmi:id="J2EEResourceProperty_1183122153626" name="shutdownDatabase"
      type="java.lang.String" value="false" required="false"/>
    <resourceProperties xmi:id="J2EEResourceProperty_1183122153629" name="connectionAttributes"
      type="java.lang.String" value="upgrade=true" required="false"/>
    <resourceProperties xmi:id="J2EEResourceProperty_1183122153630" name="createDatabase"
      type="java.lang.String" value="create" required="false"/>
  </propertySet>
  <connectionPool xmi:id="ConnectionPool_1183122153625" connectionTimeout="180"
    maxConnections="10" minConnections="1" reapTime="180" unusedTimeout="1800"
    agedTimeout="7200" purgePolicy="EntirePool"/>
</factories>
</resources.jdbc:JDBCProvider>

```

In the Liberty profile, the equivalent configuration is:

```

<variable name="DERBY_JDBC_DRIVER_PATH" value="C:/Drivers/derby" />
<library id="derbyLib">
  <fileset dir="{DERBY_JDBC_DRIVER_PATH}" includes="derby.jar" />
</library>
<dataSource id="DefaultDerbyDatasource" jndiName="jdbc/DefaultDerbyDatasource"
  statementCacheSize="10">
  <jdbcDriver libraryRef="derbyLib"
    javax.sql.ConnectionPoolDataSource="org.apache.derby.jdbc.EmbeddedConnectionPoolDataSource"/>
  <properties.derby.embedded
    databaseName="C:/myDerby/DefaultDB"
    shutdownDatabase="false"
    connectionAttributes="upgrade=true"
    createDatabase="create"
  />
  <connectionManager connectionTimeout="180" maxPoolSize="10" minPoolSize="1" reapTime="180"
    maxIdleTime="1800" agedTimeout="7200" purgePolicy="EntirePool" />
</dataSource>

```

Chapter 4. Migrating product configurations

Use the WebSphere Application Server Version 8.5 migration tools to migrate your product configurations. These migration tools support migration from Version 6.1 or above.

Before you begin

Read “Overview of migration, coexistence, and interoperability” on page 1 and “Premigration considerations” on page 5. For resources to help you plan and perform your migration, visit Knowledge Collection: Migration planning for WebSphere Application Server.

The following configuration upgrades of WebSphere Application Server versions and offerings are directly supported.

Table 1. Directly Supported Configuration Upgrades. The table lists supported configuration upgrades of WebSphere Application Server versions and offerings.

Migration Source (Version 6.1 or above)	WebSphere Application Server Version 8.5 Target
	Express Stand-alone Profile
WebSphere Application Server (base) stand-alone application server	Supported
WebSphere Application Server, Network Deployment stand-alone application server	Supported
WebSphere Application Server, Network Deployment federated application server	Not supported
WebSphere Application Server, Network Deployment deployment manager	Not supported
WebSphere Application Server Client	Not supported
WebSphere Application Server, Express stand-alone application server	Supported

* WebSphere Application Server Version 8.5 supports the migration of a subset of programming model extensions (PMEs) from WebSphere Business Integration Server Foundation.

You can migrate your product configurations using the WebSphere Application Server Version 8.5 Migration wizard or the command-line migration tools.

Before using the migration tools, consult the IBM WebSphere Application Server supported hardware, software, and APIs website to understand what fixes you must apply to earlier versions. Applying fixes to an earlier version might also apply fixes to files that have a role in the migration. Apply any fixes to ensure the most effective migration of configurations and applications.

Procedure

1. Run the **backupConfig** command for the deployment manager and each federated node before you begin. For more information, see the documentation about the **backupConfig** command.
2. Stop the nodeagent process before you migrate the nodes.
3. Stagger the start of the migration process for each node by 3 to 5 minutes.
4. Run the **restoreConfig** command on that node and rerun the migration process if a failure occurs. For more information, see the documentation about the **restoreConfig** command.

Configuration mapping during product-configuration migration

Various configurations are mapped during product-configuration migration.

Migration always involves migrating a single profile to another single profile on the same machine or a separate machine. Go to the information center for the WebSphere Application Server WebSphere Application Server, Network Deployment product to learn how the migration tools map models, clones, server groups, clusters, and Lightweight Third Party Authentication (LTPA) security settings.

Many migration scenarios are possible. The migration tools map objects and attributes existing in the version from which you are migrating to the corresponding objects and attributes in the Version 8.5 environment.

Bootstrap port

The migration tools carry the old release value into the Version 8.5 environment.

If a value for the `-portBlock` parameter is specified during the call to `WASPostUpgrade`, however, a new port value is given to each application server that is migrated to Version 8.5.

Command-line parameters

The migration tools convert appropriate command-line parameters to Java Virtual Machine (JVM) settings in the server process definition. Most settings are mapped directly. Some settings are not migrated because their roles in the WebSphere Application Server Version 8.5 configuration do not exist, have different meanings, or have different scopes.

For information on how to change the process-definition settings, read the "Process definition settings" article in the information center. For information on how to change the JVM settings, read the "Java virtual machine settings" article in the information center.

Generic server

In Version 6.1 and later, a generic server has its own type, called `GENERIC_SERVER`. Migration will perform this conversion, but migration cannot accurately migrate the external resources that the generic server references. After migration has completed migrating the generic server settings, you might need to perform additional tasks. If the old resource that the generic server was managing is located under the old WebSphere Application Server installation, perform the following tasks:

1. Copy any related files to the new installation.
2. Run any setup required to put the external application back into a valid and working state.

It is best that you reinstall the resource into the new WebSphere Application Server directory. Whatever you choose to do, the final step is to reset the reference to the new location of the application.

If the old resource that the generic server was managing is not installed under the old WebSphere Application Server installation, nothing further is required.

Java heap size for migrating EAR files

When migrating all WebSphere Application Server Version 6.1 or above EAR files to Version 8.5 using the `wsadmin` tool, the `WASPostUpgrade` tool uses the default maximum Java heap size value of 64 MB to install the EAR files.

If a Version 6.1 or above EAR file fails to install during migration because the Java heap size is not large enough, you see a message similar to the following message:

```
java.lang.OutOfMemoryError JVMXE006:OutOfMemoryError
```

Increase the maximum Java heap size, and follow the example below to install the application.

Example of installing the application on WebSphere Application Server Version 8.5

Assume that:

Installation root

```
C:\WebSphere\AppServer
```

EAR_file_name

Name of the EAR file

app_name

Name of the application

server_name

Name of the server on which the EAR file installs

node_name

Name of the node on which the server is configured

The command is displayed on more than one line for clarity.

```
wsadmin -conntype NONE
        -c "$AdminApp install
           C:\\WebSphere\\AppServer\\installableApps\\
           EAR_file_name
           {-nodeployejb
            -appname app_name
            -server server_name
            -node node_name}"
```

Policy files

WebSphere Application Server Version 8.5 migrates all the policy files that are installed with Version 6.1 or above by merging settings into the Version 8.5 policy files with the following characteristics:

- Any comments located in the Version 8.5 policy files will be preserved. Any comments contained in the Version 6.1 or above policy files will not be included in the Version 8.5 file.
- Migration will not attempt to merge permissions or grants; it is strictly an add-type migration. If the permission or grant is not located in the Version 8.5 file, the migration will bring it over.
- Security is a critical component; thus, the migration makes any additions at the end of the original .policy files right after the comment MIGR0372I: Migrated grant permissions follow. This is done to help administrators verify any policy-file changes that the migration has made.

Properties directories

Migration copies files from prior version directories into the WebSphere Application Server Version 8.5 configuration.

Property files

WebSphere Application Server Version 8.5 migrates all the property files that are installed with Version 6.1 or above by merging settings into the Version 8.5 property files.

Resource adapter archives (RARs) referenced by J2C resources

RARs that are referenced by J2C resources are migrated if those RARs are in the old WebSphere Application Server installation. In this case, the RARs are copied over to the corresponding location in the new WebSphere Application Server installation. Relational Resource Adapter RARs will not be migrated.

Samples

No migration of samples from previous versions is available. There are equivalent WebSphere Application Server Version 8.5 samples that you can install.

Security

Java 2 security is enabled by default when you enable security in WebSphere Application Server Version 8.5. Java 2 security requires you to grant security permissions explicitly.

There are several techniques that you can use to define different levels of Java 2 security in Version 8.5. One is to create a was.policy file as part of the application to enable all security

permissions. The migration tools call the `wsadmin` command to add an existing `was.policy` file in the Version 8.5 `properties` directory to enterprise applications as they are being migrated.

When migrating to WebSphere Application Server Version 8.5, your choice of whether or not to migrate to support script compatibility results in one of two different outcomes.

- If you choose to migrate to support script compatibility, your security configuration is brought over to Version 8.5 without any changes.

This is the default.

- If you choose not to migrate to support script compatibility, the security configuration is converted to the default configuration for WebSphere Application Server Version 8.5. The default security configuration for Version 6.1 and later acts almost the same as in the previous versions, but there are some changes.

For example, existing keyfiles and trustfiles are moved out of the `SSLConfig` repertoire and new keystore and truststore objects are created.

For more information on migrating your security configurations to Version 8.5, read the "Migrating, coexisting, and interoperating – Security considerations" article in the information center.

Stdin, stdout, stderr, passivation, and working directories

The location for these directories is typically within the installation directory of a previous version. The default location for `stdin`, `stdout`, and `stderr` is the `logs` directory of the WebSphere Application Server Version 8.5 installation root.

The migration tools attempt to migrate existing passivation and working directories. Otherwise, appropriate Version 8.5 defaults are used.

Note: In a coexistence scenario, using common directories between versions can create problems.

Transport ports

The migration tools migrate all ports. You must resolve any port conflicts before you can run servers at the same time.

Note: If ports are already defined in a configuration being migrated, the migration tools fix the port conflicts in the Version 8.5 configuration and log the changes for your verification.

If you specify the `-portBlock` parameter in the `WASPostUpgrade` command, a new value is assigned to each transport that is migrated.

If you specify `true` for the `-replacePorts` parameter in the `WASPostUpgrade` command, all port values from the old configuration are used in the new configuration. If you specify `false` for the `-replacePorts` parameter, the default port definitions in the new profile are not replaced with the values from the old configuration during migration.

For more information on the `WASPostUpgrade` command, read "WASPostUpgrade command" on page 31.

For further information on transport chains and channels, read the 'Transport chains' article in the information center.

You must manually add virtual host alias entries for each port. For more information, read the "Configuring virtual hosts" article in the information center.

Web modules

The specification level of the Java Platform, Enterprise Edition (Java EE) implemented in WebSphere Application Server Version 6.1 required behavior changes in the web container for setting the content type. If a default servlet writer does not set the content type, not only does the web container no longer default to it but the web container returns the call as "null." This situation

might cause some browsers to display resulting web container tags incorrectly. To prevent this problem from occurring, migration sets the `autoResponseEncoding` IBM extension to "true" for web modules as it migrates enterprise applications.

JVM system properties

If you migrate a Version 6.1 configuration that has feature packs installed, the migration tools might add one or two JVM system properties for each Java server in your configuration, including your administrative servers. Web servers are not affected. The properties are set to indicate to the JVM that the configuration should use a Java annotation scan policy other than the Version 8.5 default scan policy.

- If you migrate a Version 6.1 profile that has the Feature Pack for EJB 3.0 installed, the migration tools add the following system property to the JVM definitions for all Java servers defined on that node:

```
com.ibm.websphere.ejb.UseEJB61FEPScanPolicy = true
```

- If you migrate a Version 6.1 profile that has the Feature Pack for Web Services installed, the migration tools add the following system property to the JVM definitions for all Java servers defined on that node:

```
com.ibm.websphere.webservices.UseWSFEP61ScanPolicy = true
```

- If you migrate a Version 6.1 profile that has both the Feature Pack for EJB 3.0 and the Feature Pack for Web Services installed, the migration tools add both of the system properties to the JVM definitions for all Java servers defined on that node:

```
com.ibm.websphere.ejb.UseEJB61FEPScanPolicy = true
```

```
com.ibm.websphere.webservices.UseWSFEP61ScanPolicy = true
```

If these properties are set, the following two changes take place in the default Version 8.5 behavior:

- Application installation generates classes based on the annotation scan policy associated with the settings for those two properties.

This means that you can potentially use the following four annotation scan policies:

- Version 8 default behavior
 - Feature Pack for EJB 3.0 behavior
 - Feature Pack for Web Services behavior
 - Net behavior from having both the Feature Pack for EJB 3.0 and the Feature Pack for Web Services installed
- The servers use the generated annotation classes based on the properties set, resulting in four potential behaviors.

You can change the scan policy behavior by adding or removing the custom JVM system properties from your `server.xml` files. After changing the properties, you must reinstall or update your applications and then resynchronize the cell to implement the change.

Migrating product configurations with migration tools

Migration support consists of tools that are included with WebSphere Application Server. These tools primarily provide support for saving the configuration and applications from a previous version of the product into a migration-specific backup directory and then importing that configuration into the latest version of the application server.

Before you begin

Read “Overview of migration, coexistence, and interoperability” on page 1 and “Premigration considerations” on page 5. For resources to help you plan and perform your migration, visit Knowledge Collection: Migration planning for WebSphere Application Server.

Important: Use the migration tools for the version of WebSphere Application Server that you are installing. The tools change over time. If you use migration tools from an earlier release of WebSphere Application Server, you are likely to encounter a problem with the migration.

The migration scripts are located in the *app_server_root/bin* directory after installation.

You can use the **WASPreUpgrade** command to store the configuration of an existing release before installing the Version 8.5 product.

Procedure

Select the appropriate migration tools to migrate your product configurations.

Migration wizard

You use the Migration wizard to migrate an earlier supported version of WebSphere Application Server to Version 8.5.

The wizard is the graphical interface to the primary Version 8.5 migration tools, the **WASPreUpgrade** and the **WASPostUpgrade** commands.

The Migration wizard cannot run in a non-graphical environment. Examples of non-graphical environments include telnet sessions. If you want to run migration in a non-graphical environment, use the **WASPreUpgrade** and **WASPostUpgrade** commands.

WASPreUpgrade command

You use the **WASPreUpgrade** command to save the applications and configuration data from a previous installation of WebSphere Application Server to a backup directory.

The **WASPostUpgrade** command restores the configuration data from the directory to the new installation.

The Migration wizard calls the **WASPreUpgrade** command during migration. You can also use the command to perform a manual migration after installing the new version.

Read “WASPreUpgrade command” on page 28 for more information.

WASPostUpgrade command

You use the **WASPostUpgrade** command to restore the configuration data from a previous release.

The **WASPostUpgrade** command reads the data from the backup directory where the **WASPreUpgrade** command stored the data.

The Migration wizard calls the **WASPostUpgrade** command during migration. You can also use the command to perform a manual migration after installing the new version.

Read “WASPostUpgrade command” on page 31 for more information.

clientUpgrade tool

You can use the clientUpgrade tool to upgrade the client application to a new release level.

Read “clientUpgrade command” on page 25 for more information.

convertScriptCompatibility tool

Administrators use the **convertScriptCompatibility** tool to convert their configuration from a mode that supports backward compatibility of Version 6.1 or above administration scripts to a mode that is fully Version 8.5.

Read “convertScriptCompatibility command” on page 25 for more information.

convertSelfSignedCertificatesToChained task

Chained certificates are the default certificate type in WebSphere Application Server Version 8.5.

Administrators can use the **convertSelfSignedCertificatesToChained** task with the **wsadmin** tool to convert self-signed certificates to chained certificates.

Read the "SSLMigrationCommands command group for the AdminTask object" article for more information.

Tip: For help, read "Troubleshooting migration" on page 71.

What to do next

Use the selected tools to migrate your product configuration.

clientUpgrade command

Use the **clientUpgrade** command to migrate previous versions of client resources to Version 8 level resources.

Use the **clientUpgrade** command to migrate Version 6.x and Version 7 client resources to Version 8 level resources. In the process of migrating these resources, the `client-resources.xmi` file that is located in the client JAR files is migrated to the latest level. A backup of the `client-resources.xmi` file is also located in the client JAR file. If this command is not launched against the client EAR files before they are installed on Version 8, the client EAR files do not operate or install correctly.

Locate the command file in the `app_server_root/bin` directory.

AIX

Linux

HP-UX

Solaris

```
clientUpgrade.sh EAR_file [-clientJar client_jar ][-logFileLocation logFileLocation]
[-traceString trace_spec [-traceFile file_name ]]
```

Windows

```
clientUpgrade.bat EAR_file [-clientJar client_jar ][-logFileLocation logFileLocation]
[-traceString trace_spec [-traceFile file_name ]]
```

Parameters

Supported arguments include the following:

EAR_file

Use this parameter to specify the fully qualified path to the EAR file that contains client JAR files to process.

-clientJar

Use this optional parameter to specify a JAR file for processing. If not specified, the program transforms all client JAR files in the EAR file.

-logFileLocation log_file_location

Use this optional parameter to specify an alternate location to store the log output.

-traceString trace_spec -traceFile file_name

Use these optional parameters to gather trace information for IBM Service personnel. Specify a `trace_spec` of `"*=all=enabled"` (with quotation marks) to gather all trace information.

The following example demonstrates correct syntax:

```
clientUpgrade EAR_file -clientJar ejbJarFile
```

convertScriptCompatibility command

The **convertScriptCompatibility** command is used by administrators to convert their configurations from a mode that supports backward compatibility of WebSphere Application Server Version 6.x or Version 7.0.x administration scripts to a mode that is fully in the Version 8.0 configuration model.

The scope of the configuration changes depend on the type of profile that is being processed.

- For stand-alone configurations, the default is to convert all servers owned by the node in that configuration.

Use the `-serverName` parameter for more granular control.

Nodes are checked to verify that they are at a WebSphere Application Server Version 8.0 level before they are processed in order to support mixed-node configurations. Client environments are not processed.

The following conversions take place with this tool:

- `processDef` to `processDefs`
WCCM objects of type `processDef` from WebSphere Application Server Version 6.x are converted to use `processDefs` as defined in the Version 8.0 `server.xml` model. The existing `processDef` object remains in the configuration and is ignored by the runtime.
- `transports` to `channels`
Existing transport entries in the configuration from WebSphere Application Server Version 6.x are mapped to channel support. This affects `server.xml` and `serverindex.xml` files. The values of the transport settings are used to create new channel entries.
- SSL configuration
WebSphere Application Server Version 8.0 contains enhancements to SSL configuration that result in refactoring the existing SSL configuration model. Both the old and the new model are supported. The default is to map to the WebSphere Application Server Version 6.x or Version 7.x SSL configuration model.
- `bootstrapAddress` to `bootstrapAddresses`
Each single bootstrap address configuration is converted to a new bootstrap address list configuration containing that single bootstrap address.
- `ObjectRequestBroker` from not using the server thread pool to using it
For example, `<ObjectRequestBroker useServerThreadPool="false"...>` is changed to `<ObjectRequestBroker useServerThreadPool="true">`.

Location

The `convertScriptCompatibility` command is located in the following directory.

- `AIX` `HP-UX` `Linux` `Solaris` `profile_root/bin`
- `Windows` `profile_root\bin`

Syntax

The syntax is as follows:

```
AIX HP-UX Linux Solaris
convertScriptCompatibility.sh -help

convertScriptCompatibility.sh [-profileName profile_name]
                             [-backupConfig true | false]
                             [-nodeName node_name [-serverName server_name]]
                             [-traceString trace_spec [-traceFile file_name]]
```

```
Windows
convertScriptCompatibility.bat -help

convertScriptCompatibility.bat [-profileName profile_name]
                               [-backupConfig true | false]
                               [-nodeName node_name [-serverName server_name]]
                               [-traceString trace_spec [-traceFile file_name]]
```

Parameters

Supported arguments include the following parameters:

-help

This displays help for this command

-backupConfig

This is an optional parameter that is used to back up the existing configuration of the current profile. The default is true—that is, to use the **backupConfig** command to save a copy of the current configuration into the *profile_name/temp* directory.

Use the **restoreConfig** command to restore that configuration as required.

Read the "restoreConfig command" article in the information center for more information.

-profileName

This is an optional parameter that is used to specify the profile configuration in the Version 8.0 environment. If this is not specified, the default profile is used. If the default profile has not been set or cannot be found, the system returns an error.

-nodeName

This is an optional parameter that is used to specify a particular node name be processed rather than every node in the configuration. If this is not specified, all nodes in the configuration are converted.

-serverName

This is an optional parameter that is used to specify a particular server name to be processed rather than every server in the configuration. It can be used on all profile types and can be used in conjunction with the **-nodeName** parameter when processing WebSphere Application Server, Network Deployment configurations. If this parameter is not specified, all servers in the configuration are converted. If it is used in conjunction with the **-nodeName** parameter, all processing is limited to the specified node name.

-traceString

This is an optional parameter. The value *trace_spec* specifies the trace information that you want to collect. To gather all trace information, specify "**=all=enabled*" (with quotation marks). The default is to not gather trace information. If you specify this parameter, you must also specify the **-traceFile** parameter.

-traceFile

This is an optional parameter. The value *file_name* specifies the name of the output file for trace information. If you specify the **-traceString** parameter but do not specify the **-traceFile** parameter, the command does not generate a trace file.

Usage

Stand-alone application server profile

Example scenario

1. Run the **WASPostUpgrade** command and specify **-scriptCompatibility=true** or do not specify a value for the **-scriptCompatibility** parameter (which has a default value of true).
2. Follow these steps to convert all servers under this stand-alone profile:
 - a. Open a command window.
 - b. Change to the Version 8.0 profile's *profile_root/bin* directory.
 - c. Run the following command:

```
AIX      HP-UX    Linux   Solaris
./convertScriptCompatibility.sh
```

```
Windows
convertScriptCompatibility.bat
```

For more information about where to run this command, read the "Using command line tools" article in the information center.

WASPreUpgrade command

The **WASPreUpgrade** command for WebSphere Application Server Version 8.5 saves the configuration of a previously installed version of WebSphere Application Server into a migration-specific backup directory.

Location

The command file is located in and must be run from the Version 8.5 *app_server_root/bin* directory.

Syntax

```
AIX      HP-UX      Linux      Solaris
WASPreUpgrade.sh backupDirectory
                 currentWebSphereDirectory
                 [-traceString trace_spec [-traceFile file_name ]]
                 [-machineChange true | false]
                 [-oldProfile profile_name]
                 [-workspaceRoot profile1=user_workspace_folder_name_1;profile2=user_workspace_folder_name_2]
                 [-username < user name >]
                 [-password < password >]
                 [-javaoption < -Xms...m > -javaoption < -Xmx...m > ]
```

```
Windows
WASPreUpgrade.bat backupDirectory
                  currentWebSphereDirectory
                  [-traceString trace_spec [-traceFile file_name ]]
                  [-machineChange true | false]
                  [-oldProfile profile_name]
                  [-workspaceRoot profile1=user_workspace_folder_name_1;profile2=user_workspace_folder_name_2]
                  [-username < user name >]
                  [-password < password >]
                  [-javaoption < -Xms...m > -javaoption < -Xmx...m > ]
```

Parameters

The command has the following parameters:

backupDirectory

This is a required parameter and must be the first parameter that you specify. The value *backupDirectory* specifies the name of the directory where the command script stores the saved configuration.

Note: The `WAS_INSTALL` and `USER_INSTALL` root directories are invalid directories for the location of the WebSphere Application Server backup directory.

This is also the directory from which the **WASPostUpgrade** command reads the configuration.

If the directory does not exist, the **WASPreUpgrade** command script creates it.

currentWebSphereDirectory

This is a required parameter and must be the second parameter that you specify. This can be any edition of WebSphere Application Server Version 6.1 for which migration is supported.

The value *currentWebSphereDirectory* specifies the name of the installation root directory for the current WebSphere Application Server Version 6.1 installation.

-traceString

This is an optional parameter. The value *trace_spec* specifies the trace information that you want to collect.

To gather all trace information, specify "`*=all=enabled`" (with quotation marks).

If you do not specify the `-traceString` or `-traceFile` parameter, the command creates a trace file by default and places it in the `backupDirectory/logs` directory.

-traceFile

This is an optional parameter. The value `file_name` specifies the name of the output file for trace information.

If you do not specify the `-traceString` or `-traceFile` parameter, the command creates a trace file by default and places it in the `backupDirectory/logs` directory.

-machineChange

This is an optional parameter used for a migration involving cross operating-system and machine boundaries. If specified as true, this parameter provides support for changing physical hardware when migrating by backing up items that are stored outside the WebSphere Application Server installation or profile folder hierarchy. If specified as false, only files stored under the WebSphere Application Server installation folder or profile folders are copied to the backup directory during migration.

The default is false.

When this value is false, migration assumes that the new and old WebSphere Application Server installations are on the same physical machine with shared access to the file system. Therefore, any files located outside the WebSphere directories are communal and can be shared. Migration does not copy files outside the WebSphere Application Server tree into the backup directory when `-machineChange` is false. False is the only option when you use the Migration wizard. If you select `-machineChange=false`, you must run the **WASPostUpgrade** command on the same physical hardware.

If you intend to run the **WASPostUpgrade** command on a different machine or file system, you should run the **WASPreUpgrade** command with `-machineChange=true`. If you select `-machineChange=true`, migration creates an additional subdirectory (`/migrated/`) in the migration backup directory that contains any files referenced by the WebSphere Application Server configuration that reside outside the product or profile directories. When you run the **WASPostUpgrade** command, these files are returned to their original paths on the new machine.

Performance considerations:

If you migrate with Service Integration Bus (SIB) busses configured with file-system file-store repositories, you might require additional space in your migration heap and migration backup directory. Each bus has three file-store values—a log, a tempspace, and a repository. These three files vary in size, but they can be as much as 100-500 MB each. When migration is running, it backs up any file stores that are in the WebSphere Application Server tree during the pre-upgrade process. There needs to be sufficient space on the file system to permit this. If file stores exist at the destination location already during the post-upgrade process, migration backs up the file stores in memory to support rollback.

If you run the **WASPreUpgrade** command with `-machineChange=true`, resulting in a backup directory that contains shared file-store objects, you might find that the post-upgrade process suffers from out-of-memory exceptions because the default maximum heap is too small to contain the file-store backups in support of rollback. To resolve this issue, perform one of the following three tasks:

- If the file stores at the system location are valid, delete the copies from the backup directory before running the **WASPostUpgrade** command.

By deleting the entire `/migrated/` subdirectory from the migration backup directory before running the **WASPostUpgrade** command, you essentially convert your pre-upgrade backup from `-machineChange=true` to `-machineChange=false`.

- If the copies of the file stores in the backup directory are valid, delete the versions at the destination location.

This changes the rollback support so that the destination files do not exist and will not occupy space in memory during the migration.

- If you require rollback support and you need both the files in the backup directory as well as the files on the file system, increase your maximum heap size for the post-upgrade process to some value great enough to support all of the SIB files that conflict.

-oldProfile

This is an optional parameter used for migrating a specific instance or profile from a previous version of WebSphere Application Server.

-workspaceRoot

This is an optional parameter. The value `user_workspace_folder_name_x` specifies the location of the administrative console customized "My tasks" settings for one or more profiles.

-username

This is an optional parameter. The value `user name` specifies the administrative user name of the current WebSphere Application Server installation.

This is a required parameter if the following conditions are true:

- You are migrating a deployment manager.
- Administrative or global security is enabled in the source installation.
- The WebSphere Application Server installation you are migrating from is Version 8.0 or above.

-password

This is an optional parameter. The value `password` specifies the administrative password of the current WebSphere Application Server installation.

This is a required parameter if the following conditions are true:

- You are migrating a deployment manager.
- Administrative or global security is enabled in the source installation.
- The WebSphere Application Server installation you are migrating from is Version 8.0 or above.

-javaoption

This is an optional parameter. Use this parameter to specify memory sizes for the Java heap used by the **WASPostUpgrade** command.

The value `"-Xms...m"` is the parameter specified to indicate the starting heap size. Replace the `"..."` with the size in Megabytes that you intended to use. For example, if the starting heap size is to be 128 MB, specify the parameter as: `-javaoption -Xms128m`

The value `"-Xmx...m"` is the parameter specified to indicate the maximum heap size. Replace the `"..."` with the size in Megabytes that you intend to use. For example, if the maximum heap size is to be 1024 MB, specify the parameter as: `-javaoption -Xmx1024m`

Logging

The **WASPreUpgrade** tool displays status to the screen while it runs. The tool also saves a more extensive set of logging information in the `WASPreUpgrade.time_stamp.log` file written to the `backupDirectory` directory, where `backupDirectory` is the value specified for the `backupDirectory` parameter. You can view the `WASPreUpgrade.time_stamp.log` file with a text editor.

Migrated resources

WASPreUpgrade saves all of your resources, but it does not migrate entities in your `classes` directory.

Migration saves the following files in the `backupDirectory` directory.

- `classes`
- `config`
- `properties`

WASPostUpgrade command

The **WASPostUpgrade** command for WebSphere Application Server retrieves the saved configuration that was created by the **WASPreUpgrade** command from the `backupDirectory` that you specified. The **WASPostUpgrade** script for WebSphere Application Server reads the configuration from this directory to migrate to WebSphere Application Server Version 8.5 and adds all migrated applications into the `app_server_root/installedApps` directory for the Version 8.5 installation.

Location

The command file is located in and must be run from the `app_server_root/bin` directory.

Syntax

```
AIX      HP-UX      Linux      Solaris
WASPostUpgrade.sh backupDirectory
    [-username userID]
    [-password password]
    [-oldProfile profile_name]
    [-profileName profile_name]
    [-scriptCompatibility true | false]
    [-portBlock port_starting_number]
    [-backupConfig true | false]
    [-replacePorts true | false]
    [-includeApps true | false | script]
[-requestTimeout seconds]
[-javaoption -Xms...m -javaoption -Xmx...m]
    [[-appInstallDirectory user_specified_directory] | [-keepAppDirectory true | false]]
    [-traceString trace_spec [-traceFile file_name]]
```

```
Windows
WASPostUpgrade.bat backupDirectory
    [-username userID]
    [-password password]
    [-oldProfile profile_name]
    [-profileName profile_name]
    [-scriptCompatibility true | false]
    [-portBlock port_starting_number]
    [-backupConfig true | false]
    [-replacePorts true | false]
    [-includeApps true | false | script]
[-requestTimeout seconds]
[-javaoption -Xms...m -javaoption -Xmx...m]
    [[-appInstallDirectory user_specified_directory] | [-keepAppDirectory true | false]]
    [-traceString trace_spec [-traceFile file_name]]
```

Use these parameters when migrating a registered application server with security enabled for both the target and source administrative agent:

```
AIX      HP-UX      Linux      Solaris
WASPostUpgrade.sh backupDirectory
    [-oldAdminAgentProfilePath path to old admin agent]
    [-oldAdminAgentSoapPort soap port of old admin agent]
```

```

[-oldAdminAgentHostname hostname of old admin agent, defaults to localhost ]
[-oldAdminAgentUsername login username for old admin agent, if admin security is enabled ]
[-oldAdminAgentPassword login password for old admin agent, if admin security is enabled ]
[-newAdminAgentProfilePath path to new admin agent ]
[-newAdminAgentSoapPort soap port of new admin agent ]
[-newAdminAgentHostname hostname of new admin agent, defaults to localhost ]
[-newAdminAgentUsername login username for new admin agent, if admin security is enabled ]
[-newAdminAgentPassword login password for new admin agent, if admin security is enabled ]

```

Windows

WASPostUpgrade.bat *backupDirectory*

```

[-oldAdminAgentProfilePath path to old admin agent]
[-oldAdminAgentSoapPort soap port of old admin agent]
[-oldAdminAgentHostname hostname of old admin agent, defaults to localhost ]
[-oldAdminAgentUsername login username for old admin agent, if admin security is enabled ]
[-oldAdminAgentPassword login password for old admin agent, if admin security is enabled ]
[-newAdminAgentProfilePath path to new admin agent ]
[-newAdminAgentSoapPort soap port of new admin agent ]
[-newAdminAgentHostname hostname of new admin agent, defaults to localhost ]
[-newAdminAgentUsername login username for new admin agent, if admin security is enabled ]
[-newAdminAgentPassword login password for new admin agent, if admin security is enabled ]

```

Parameters

The command has the following parameters:

backupDirectory

This is a required parameter. The value *backupDirectory* specifies the name of the directory in which the **WASPreUpgrade** tool stores the saved configuration and files and from which the **WASPostUpgrade** tool reads the configuration and files.

-username

This is an optional parameter. The value *userID* specifies the administrative user name of the current WebSphere Application Server Version 6.x or 7.x installation.

-password

This is an optional parameter. The value *password* specifies the password for the administrative user name of the current WebSphere Application Server Version 6.x or 7.x installation.

Tip: When you need to specify a password in the Migration wizard or when you use the **WASPostUpgrade** command with the `-password` parameter on the command line, you can type the password in plain text or use the xor-ciphered value. To use the xor-ciphered value, type the entire cipher including the `{xor}` prefix as the value for the parameter. This xor-ciphered value can be specified in any one of several WebSphere Application Server configuration files for your previous configuration, including the `soap.client.props`, `ssl.client.props`, and `security.xml` files.

Tip: When you use the **WASPostUpgrade** command with the `-password` parameter on the command line, you can type the password in plain text or use the xor-ciphered value. To use the xor-ciphered value, type the entire cipher including the `{xor}` prefix as the value for the parameter. This xor-ciphered value can be specified in any one of several WebSphere Application Server configuration files for your previous configuration, including the `soap.client.props`, `ssl.client.props`, and `security.xml` files.

-oldProfile

This is an optional parameter for migrating instances or profiles from previous WebSphere Application Server versions. The instance or profile must already exist in the migration backup directory before running this command.

If the `-oldProfile` parameter is not specified, the default profile is used. If no default profile is found, the system reports an error.

gotcha: If you do not specify the specific profile name on `-oldProfile`, then whatever is the designated "default" profile will be migrated. You might have to migrate each profile in the backup taken on pre-migration, using the `WASPostUpgrade` post-migration command specifying the `-oldProfile` and `-profileName` parameters for each and every profile that the client wants in the new Version 8.5 environment. If the old profile contains installed applications (`installedApps`) in addition to the sample application and system applications, then the migration process automatically migrates those applications.

-profileName

This is an optional parameter for migrating to specific profiles in WebSphere Application Server Version 8.5. The value `profile_name` specifies the name of the Version 8.5 profile to which the script migrates your configuration. You must have already created this profile before calling the `WASPostUpgrade` command.

If the `-profileName` parameter is not specified, the default profile is used. If no default profile is found, the system reports an error.

gotcha: If you do not specify the specific profile name on `-profileName`, then whatever is the designated "default" profile will be migrated. You might have to migrate each profile in the backup taken on pre-migration, using the `WASPostUpgrade` post-migration command specifying the `-oldProfile` and `-profileName` parameters for each and every profile that the client wants in the new environment. If the old profile contains installed applications (`installedApps`) in addition to the sample application and system applications, then the migration process automatically migrates those applications.

Note: When migrating a stand-alone application server from Version 8.5, you can choose a stand-alone application server node that has already been registered with an administrative agent as the target of the migration.

-scriptCompatibility

This is an optional parameter used to specify whether or not migration should create the following Version 6.x or 7.x configuration definitions:

- Transport
- ProcessDef
- Version 6.x SSL

instead of the following Version 8.5 configuration definitions:

- Channels
- ProcessDefs
- Version 8.5 SSL

The default value is `true`.

Specify `true` for this parameter in order to minimize impacts to existing administration scripts. If you have existing `wsadmin` scripts or programs that use third-party configuration APIs to create or modify the Version 6.x or 7.x configuration definitions, for example, you might want to specify `true` for this option during migration.

If you want to use a cell that contains Version 6.x or 7.x nodes, you must specify `true` for this variable.

Note: This is meant to provide a temporary transition until all of the nodes in the environment are at the Version 8.5 level. When they are all at the Version 8.5 level, you should perform the following actions:

1. Modify your administration scripts to use all of the Version 8.5 settings.
2. Use the `convertScriptCompatibility` command to convert your configurations to match all of the Version 8.5 settings.

-backupConfig

This is an optional parameter used to specify whether the existing WebSphere Application Server Version 8.5 configuration is saved before any changes are made by the **WASPostUpgrade** tool. The default is true—that is, to use the **backupConfig** command to save a copy of the current configuration into the *profile_name/temp* directory.

Use the **restoreConfig** command to restore that configuration as required. Read the "restoreConfig command" article in the information center for more information.

-portBlock

This is an optional parameter. The *port_starting_number* value specifies the starting value of a block of consecutive port numbers to assign when creating new ports.

By default, this parameter is not set.

If a value is specified for this parameter, any new ports that are assigned are set based on this value. Every time a new port value is required, the port is created based on this value and the seed value is incremented for the next usage. No duplicate ports are assigned.

-replacePorts

This optional parameter is used to specify how to map port values.

- True

Use all port values from the old configuration in the new configuration. All ports from the old configuration supersede the settings for the same ports in the new configuration.

- If the **-portBlock** parameter is not set, a conflicting port is renumbered incrementally from its original value until a nonconflicting port is identified.
- If the **-portBlock** parameter is set, a conflicting port is renumbered incrementally from the port block number until a nonconflicting port is identified.

This value is the default.

- False

Do not replace the default port definitions in the new profile with the values from the old configuration during migration. All ports values from the new configuration supersede the settings for the same ports in the old configuration

- If the **-portBlock** parameter is not set, a conflicting port is renumbered incrementally from its original value until a nonconflicting port is identified.
- If the **-portBlock** parameter is set, a conflicting port is renumbered incrementally from the port block number until a nonconflicting port is identified.

-includeApps

You can include business level applications, assets, and composition units as part of the migration. You can optionally migrate these items using the **-IncludeApps** parameter on the **WASPostUpgrade** command. This is an optional parameter that can be specified in the following ways:

- True

Include user enterprise applications, business level applications, assets, and composition units as part of the migration.

This value is the default.

- False

Do nothing with user enterprise applications, business level applications, assets, and composition units during **WASPostUpgrade** processing.

- Script

- Enterprise applications

Prepare user enterprise applications for installation in the WebSphere Application Server Version 8.5 *installableApps* directory without installing them during **WASPostUpgrade** processing.

Scripts that can be used to install these applications are generated and saved in the *backupDirectory* directory. You can then run these files at any point and in any combination after the **WASPostUpgrade** command has completed. You can also reorganize and combine these files to enhance the efficiency of application installation.

- Business level applications, assets, and composition units

The `install_all_BLAs.jy` script is generated and placed in the backup directory. This script can migrate all business level applications, assets, and composition units located in the backup directory to your target profile. The `WASPostUpgradeBLAHelper.bat/sh` script, located in the `<WAS_PROFILE_ROOT>/bin` directory, is used to migrate the business level applications, assets and composition units in the `install_all_BLAs.txt` file.

Note: To migrate business level applications, assets, and composition units, you must first create their dependencies.

WebSphere Application Server system applications migrate regardless of the value set by this parameter.

-keepAppDirectory

This is an optional parameter used to specify whether to install all applications to the same directories in which they are currently located. The default is false.

If this parameter is specified as true, each individual application retains its location.

If you specify this parameter, you cannot specify the `-appInstallDirectory` parameter.

Restrictions: If this parameter is specified as true, the location is shared by the existing WebSphere Application Server Version 6.x or 7.x installation and the Version 8.5 installation. If you keep the migrated applications in the same locations as those of the previous version, the following restrictions apply:

- The WebSphere Application Server Version 8.5 mixed-node support limitations must be followed. This means that the following support cannot be used when evoking the **wsadmin** command:
 - Precompile JSP
 - Use Binary Configuration
 - Deploy EJB
- You risk losing the migrated applications unintentionally if you later delete applications from these locations when administering (uninstalling for example) your Version 6.x or 7.x installation.

-appInstallDirectory

This is an optional parameter that is used to pass the directory name to use when installing all applications during migration. The default of `profile_name\installedApps` is used if this parameter is not specified.

If you specify this parameter, you cannot specify the `-keepAppDirectory` parameter.

Quotes must be used around the directory name if one or more spaces are in the name.

If you use this parameter, the migration tools investigate the node-level variables for the node being migrated both in the backup directory (variables for the old release) and in the destination profile (variables from the new release). If the path is part of any of the following variables in either of these releases, the tools contract the path information to use the related variable:

- APP_INSTALL_ROOT
- USER_INSTALL_ROOT
- WAS_INSTALL_ROOT

When the contraction takes place, you receive the following warning message that tells you that the tools changed your specified value and what that contracted value is:

MIGR0341W: Application install directory has been updated to {0}.

For example:

MIGR0341W: Application install directory has been updated to \${USER_INSTALL_ROOT}\customAppDirectory.

or

MIGR0341W: Application install directory has been updated to \${APP_INSTALL_ROOT}\
cellName\customAppDirectory\.

-traceString

This is an optional parameter. The value *trace_spec* specifies the trace information that you want to collect.

To gather all trace information, specify `"*=all=enabled"` (with quotation marks).

If you do not specify the `-traceString` or `-traceFile` parameter, the command creates a trace file by default and places it in the *backupDirectory/logs* directory.

-traceFile

This is an optional parameter. The value *file_name* specifies the name of the output file for trace information.

If you do not specify the `-traceString` or `-traceFile` parameter, the command creates a trace file by default and places it in the *backupDirectory/logs* directory.

-requestTimeout

This is an optional parameter. The value *seconds* refers to the number of seconds that migration will wait before failing attempted wsadmin connections.

This value is also used as the timeout parameter during application migration.

-oldAdminAgentProfilePath

This is an optional parameter. The value *path to old admin agent* refers to the file system path of the profile directory for the original administrative agent.

This parameter is only required if the application server being migrated is managed by an administrative agent.

-oldAdminAgentSoapPort

This is an optional parameter. The value *soap port of old admin agent* refers to the SOAP port used by the original administrative agent for administrative connections.

This parameter is required only if the application server being migrated is managed by an administrative agent.

-oldAdminAgentHostname

This is an optional parameter. The value *hostname of old admin agent* refers to the hostname location of the original administrative agent. If the parameter is not specified, the value is set by default to "localhost".

This parameter is required only if the application server being migrated is managed by an administrative agent.

-oldAdminAgentUsername

This is an optional parameter. The value *login username for old admin agent* refers to the username for the original administrative agent.

This parameter is required only if the application server being migrated is managed by an administrative agent that has administrative security enabled.

-newAdminAgentProfilePath

This is an optional parameter. The value *path to new admin agent* refers to the file system path of the profile directory for the newly migrated Administrative Agent.

This parameter is required only if the application server being migrated is managed by an administrative agent.

-newAdminAgentSoapPort

This is an optional parameter. The value *soap port of old admin agent* refers to the SOAP port used by the newly migrated Administrative Agent for administrative connections.

This parameter is required only if the application server being migrated is managed by an administrative agent.

-newAdminAgentHostname

This is an optional parameter. The value *hostname of old admin agent* refers to the hostname location of the new Administrative Agent. If the parameter is not specified, the value is set by default to "localhost".

This parameter is required only if the application server being migrated is managed by an administrative agent.

-newAdminAgentUsername

This is an optional parameter. The value *login username for old admin agent* refers to the username for the new Administrative Agent.

This parameter is required only if the application server being migrated is managed by an administrative agent that has administrative security enabled.

-newAdminAgentPassword

This is an optional parameter. The value *login password for old admin agent* refers to the password for the new Administrative Agent.

This parameter is required only if the application server being migrated is managed by an administrative agent that has administrative security enabled.

-javaoption < -Xms...m > -javaoption < -Xmx...m >

This is an optional parameter. Use this parameter to specify memory sizes for the Java heap used by WASPostUpgrade.

The value "-Xms...m" specifies the starting heap size. Replace the "..." with the size in Megabytes that you need. For example, if the starting heap size is to be 128 MB, specify the parameter as:

`-javaoption -Xms128m`

The value "-Xmx...m" specifies the maximum heap size. Replace the "..." with the size in Megabytes that you need. For example, if the maximum heap size is to be 1024 MB, specify the parameter as:

`-javaoption -Xmx1024m`

Logging

The **WASPostUpgrade** tool displays status to the screen while running. This tool also saves a more extensive set of logging information in the `WASPostUpgrade.time_stamp.log` file located in the `backupDirectory/logs` directory. You can view the `WASPostUpgrade.time_stamp.log` file with a text editor.

Security considerations

The target system must have security disabled before migration. If you migrate from a source configuration that has security enabled, the **WASPostUpgrade** command automatically enables security for the Version 8.5 target configuration during the migration.

java.security file

During WASPostUpgrade, a copy of the `java.security` file is made in the target WAS installation before migrating the file. The presence of this copy, named `java.security.premigration`, indicates to future

migrations that the file has already been migrated. Also, the copy gives you a chance to reference the default Version 8.0 settings and determine if you want to make changes to the migrated java.security file.

The following properties are migrated in the java.security file, all other properties and comments are not migrated:

```
?security.provider.* - prepend the source provider list before the target provider list and renumber the target provider list
?networkaddress.cache.ttl
?networkaddress.cache.negative.ttl
?ocsp.enable
?ocsp.responderURL
?ocsp.responderCertSubjectName
?ocsp.responderCertIssuerName
?ocsp.responderCertSerialNumber
```

The following situations might cause the migration of the java.security file to fail. If you must use any of the following settings, then manually migrate the java.security file.

- If the **WASPreUpgrade** command is run with the machineChange=true option, the source and target operating systems will be checked before migrating the java.security file. If the source operating system is HP or Sun, and the target operating system is not the same, the file will not be migrated. If the target operating system is HP or Sun, and the source operating system is not the same, the file will not be migrated. This is because the contents of the java.security file are not compatible between the different operating systems.
- If the copy of the java.security file to java.security.premigration cannot be made, the file will not be migrated.
- If the java.security file is not writeable, the file will not be migrated.
- If the java.security file is not found in the backup directory, the file will not be migrated. If you use an old backup directory, or if something there is a problem with the old installation, then this problem might occur.

Migrating stand-alone application servers for distributed operating systems

Use the migration tools to migrate from a WebSphere Application Server Version 6.1 or above stand-alone application server to a Version 8.5 stand-alone application server.

Before you begin

Read “Overview of migration, coexistence, and interoperability” on page 1 and “Premigration considerations” on page 5.

Procedure

Select the appropriate migration scenario for information on how to migrate from a WebSphere Application Server Version 6.1 or above stand-alone application server to a Version 8.5 stand-alone application server.

- “Migrating to a Version 8.5 stand-alone application server” on page 39
This article contains instructions for migrating a WebSphere Application Server Version 6.1 or above stand-alone application server profile to a Version 8.5 stand-alone application server.
- “Migrating to a Version 8.5 stand-alone application server on a remote machine” on page 41
This article contains instructions for migrating a WebSphere Application Server (base) Version 6.1 or above stand-alone application server profile to a Version 8.5 stand-alone application server on a remote machine.
- “Migrating stand-alone application servers from unsupported operating systems” on page 42
This article contains instructions for migrating from a WebSphere Application Server Version 6.1 or above configuration that is running on an operating system that Version 8.5 does not support.

Tip: For help, read “Troubleshooting migration” on page 71.

Migrating to a Version 8.5 stand-alone application server

Use the migration tools to migrate from a WebSphere Application Server Application Server Version 6.1 or above stand-alone application server profile to a Version 8.5 stand-alone application server.

Before you begin

Read “Overview of migration, coexistence, and interoperability” on page 1 and “Premigration considerations” on page 5.

For help, read “Troubleshooting migration” on page 71.

If your scenario includes migrating a WebSphere Application Server Application Server Version 6.1 or above configuration on one machine to Version 8.5 on another machine, use the alternate procedure described in “Migrating to a Version 8.5 stand-alone application server on a remote machine” on page 41.

Tip: Before migrating a WebSphere Application Server Version 6.1 or above stand-alone application server, use the **backupConfig** command or your own preferred backup utility to back up your existing configuration if you want to be able to restore it to its previous state after migration. Read the “backupConfig command” article in the information center for more information. Make sure that you note the exact name and location of this backed-up configuration.

Decide whether you want to migrate from WebSphere Application Server Application Server Version 6.1 or above to Version 8.5 using the Migration wizard or using the command-line migration tools.

Procedure

- Migrate from WebSphere Application Server Application Server Version 6.1 or above to Version 8.5 using the Migration wizard.

1. Stop all of the WebSphere Application Server Version 6.1 or above application servers that are running on the node.

Use the **stopServer** command from the *app_server_root/bin* directory. Read the “stopServer command” article in the information center for more information.

Linux For example, issue the following commands to stop server1 and server2 on the Linux operating system:

```
./stopServer.sh server1  
./stopServer.sh server2
```

If security is enabled, specify the **-user** and **-password** parameters on the **stopServer** command.

You can migrate a WebSphere Application Server Application Server Version 6.1 or above node without stopping it; however, you must stop the node before you can start the Version 8.5 node that you are installing. It is not necessary to have the node running to migrate its configuration. The migration tools can retrieve all the configuration data while the node is stopped.

2. Install WebSphere Application Server Version 8.5.
Read the “Installing the product and additional software” article in the information center for more information.
3. Optional: Use the Profile Management tool or the **manageprofiles** command to create a WebSphere Application Server Version 8.5 profile.

Restriction: You cannot use the Profile Management Tool to create profiles for WebSphere Application Server installations on 64-bit architectures except on the Linux for zSeries platform. However, you can use the Profile Management Tool on other 64-bit architectures if you use a WebSphere Application Server 32-bit installation.

Read the "Creating profiles using the graphical user interface" article or the "manageprofiles command" article in the information center for more information.

4. Use the Migration wizard to transfer configuration settings from Version 6.1 or above to the Version 8.5 stand-alone application server.

Perform one of the following actions to access the Migration wizard:

- Go to **Start > Programs > IBM WebSphere > IBM WebSphere Application Server V8.5 > Tools**, and click **Configuration Migration tool**.
- Run the following command:

```
- AIX HP-UX Linux Solaris app_server_root/bin/migration.sh  
- Windows app_server_root\bin\migration.bat
```

This step transfers applications and configuration information for the Version 6.1 or above server resources, security, variables, and virtual hosts to the Version 8.5 stand-alone application server. All stored information is in XML files in the *app_server_root/config/cells* directory of each product.

The Migration wizard uses the **WASPreUpgrade** command and **WASPostUpgrade** command to migrate the data and applications from Version 6.1 or above to Version 8.5.

The **WASPreUpgrade** tool saves selected files from the */bin* directory to a backup directory that you specify on a wizard panel. Migration saves files from the following directories to the backup directory:

- classes
- config
- installableApps
- installedApps (or an alternate directory specified by the user)
- properties

Later, the Migration wizard uses the **WASPostUpgrade** tool to copy the environment in the backup directory to the Version 8.5 stand-alone application server installation.

- Migrate from WebSphere Application Server Version 6.1 or above to Version 8.5 using the command-line migration tools.

1. Stop all of the WebSphere Application Server Version 6.1 or above application servers that are running on the node.

Use the **stopServer** command from the *app_server_root/bin* directory. Read the "stopServer command" article in the information center for more information.

Linux For example, issue the following commands to stop server1 and server2 on the Linux operating system:

```
./stopServer.sh server1  
./stopServer.sh server2
```

If security is enabled, specify the **-user** and **-password** parameters on the **stopServer** command.

You can migrate a WebSphere Application Server Application Server Version 6.1 or above node without stopping it; however, you must stop the node before you can start the Version 8.5 node that you are installing. It is not necessary to have the node running to migrate its configuration. The migration tools can retrieve all the configuration data while the node is stopped.

2. Install WebSphere Application Server Version 8.5.

Read the "Installing the product and additional software" article in the information center for more information.

3. Use the Profile Management tool or the **manageprofiles** command to create a WebSphere Application Server Application Server Version 8.5 profile.

Read the "Creating profiles using the graphical user interface" article or the "manageprofiles command" article in the information center for more information.

4. Run the **WASPreUpgrade** command, specifying the migration backup directory name and the existing WebSphere Application Server Application Server directory name.

Read “WASPreUpgrade command” on page 28 for more information.

The **WASPreUpgrade** tool saves selected files from the /bin directory to a backup directory you specify on a wizard panel. Migration saves files from the following directories to the backup directory:

- classes
- config
- installableApps
- installedApps (or an alternate directory specified by the user)
- properties

5. Run the **WASPostUpgrade** command, specifying the migration backup directory.

Read “WASPostUpgrade command” on page 31 for more information.

The **WASPostUpgrade** tool copies the environment in the backup directory to the WebSphere Application Server Application Server Version 8.5 stand-alone application server installation.

Note: When migrating a stand-alone application server from Version 6.1 or above to Version 8.5, you can choose a stand-alone application server node that has already been registered with an administrative agent as the target of the migration.

Migrating to a Version 8.5 stand-alone application server on a remote machine

Use the migration tools to migrate from a Version 6.1 or above to a Version 8.5 stand-alone application server on a remote machine.

Before you begin

Read “Overview of migration, coexistence, and interoperability” on page 1 and “Premigration considerations” on page 5.

Typically, you can use the **WASPreUpgrade** and the **WASPostUpgrade** migration tools to upgrade from Version 6.1 or above to Version 8.5 on the same machine. However, some scenarios require that you migrate the Version 6.1 or above configuration on one machine to Version 8.5 on a different machine. One of these scenarios is when you install new machines for your Version 8.5 environment but need to migrate your existing Version 6.1 or above configuration from other machines.

To ensure that your operating system is supported by WebSphere Application Server Version 8.5, visit the following site for the most current list of supported hardware and software: WebSphere Application Server system requirements.

If you find that your operating system is not supported for migration to Version 8.5, read “Migrating stand-alone application servers from unsupported operating systems” on page 42.

The **WASPreUpgrade** command saves the existing Version 6.1 or above configuration into a migration-specific backup directory. The **WASPostUpgrade** command uses this directory to add the old configuration settings to the new Version 8.5 environment.

Tip: Before migrating a WebSphere Application Server Version 6.1 or above stand-alone application server on a remote machine, use the **backupConfig** command or your own preferred backup utility to back up your existing configuration if you want to be able to restore it to its previous state after migration. Read the “backupConfig command” article in the information center for more information. Make sure that you note the exact name and location of this backed-up configuration.

For help in troubleshooting problems when migrating, read “Troubleshooting migration” on page 71.

Procedure

1. Create the migration jar. See Migrating cells across operating systems using the command-line tools, step 3.
2. Copy the *migration_specific_backup* directory from the WebSphere Application Server Version 6.1 or above machine to the Version 8.5 machine.
Use the **ftp** command, shared storage, or some other mechanism to copy the directory to the new machine.
3. Install WebSphere Application Server Version 8.5 on the new machine.
Read the "Installing the product and additional software" article in the information center for more information.
Install the same features as the earlier release.
4. Use the Profile Management tool or the **manageprofiles** command to create a WebSphere Application Server Version 8.5 profile.

Restriction: You cannot use the Profile Management Tool to create profiles for WebSphere Application Server installations on 64-bit architectures except on the Linux for zSeries platform. However, you can use the Profile Management Tool on other 64-bit architectures if you use a WebSphere Application Server 32-bit installation.

Read the "Creating profiles using the graphical user interface" article or the "manageprofiles command" article in the information center for more information.

5. Add the WebSphere Application Server Version 6.1 or above configuration to the Version 8.5 configuration.
Read "WASPostUpgrade command" on page 31 for more information.
Use the **WASPostUpgrade** command in the *app_server_root/bin* directory of the Version 8.5 installation to add the Version 6.1 or above configuration to the Version 8.5 configuration.

AIX

HP-UX

Linux

Solaris

```
./WASPostUpgrade.sh /filepath/migration_specific_backup
```

Windows

```
WASPostUpgrade C:\filepath\migration_specific_backup
```

The **WASPostUpgrade** tool records information specific to each enterprise bean it deploys in the *migration_specific_backup/WASPostUpgrade.log* file.

6. Modify the configuration using the WebSphere Application Server Version 8.5 administrative console.
 - a. Change user IDs and passwords to match security requirements.
You might have to change user IDs and passwords if they are not identical to those in use on the Version 6.1 or above machine.
 - b. Change other machine-specific information.
The configuration might refer to other software products or configurations that do not exist on the new machine. For example, the old machine might have a database. Modify the data source to point to the database on the old machine.

Results

You have migrated WebSphere Application Server from Version 6.1 or above to a remote Version 8.5 machine.

Migrating stand-alone application servers from unsupported operating systems

Use the migration tools to migrate an earlier WebSphere Application Server Version 6.1 or above stand-alone application server that is running on an operating system that Version 8.5 does not support.

Before you begin

Read “Overview of migration, coexistence, and interoperability” on page 1 and “Premigration considerations” on page 5.

Tip: Before migrating from WebSphere Application Server Version 6.1 or above, use the **backupConfig** command or your own preferred backup utility to back up your existing configuration if you want to be able to restore it to its previous state after migration. Read the “backupConfig command” article in the information center for more information. Make sure that you note the exact name and location of this backed-up configuration.

For help, read “Troubleshooting migration” on page 71.

Procedure

1. Obtain the WebSphere Application Server Version 8.5 utilities disk.
This disk contains the `migration/bin` directory. This directory contains a special environment that you can use to run the **WASPreUpgrade** command without installing Version 8.5.

2. Save the current configuration using the **WASPreUpgrade** script from the `migration/bin` directory of the WebSphere Application Server Version 8.5 utilities disk.

Read “WASPreUpgrade command” on page 28 for more information.

Save the configuration in the `migration_specific_backup` directory. If the **WASPreUpgrade** command fails because the Java Development Kit (JDK) on the Version 8.5 utilities disk is not supported on the operating system that you are attempting to migrate, perform the following actions:

- a. Create a migration directory on your local system.
- b. Install an IBM certified JDK that is at the highest level that will run on your operating system.

Important: Your JDK must be version 1.6 or later if you want to use the migration tools.

The JDK directory should be in the same directory as the migration directory that you created on your local system in the last step, or you should have a working symlink that allows Java to be invoked from that path.

```
<directory>
- migration directory
- JDK/jre.pak/repository/package.java.jre/java/jre/bin/java
```

- c. Copy the `WASPreUpgrade.bat` (or `WASPreUpgrade.sh`) and the `setupCmdLine.bat` (or `setupCmdLine.sh`) files from the `migration/bin` directory of the WebSphere Application Server Version 8.5 utilities disk to the migration directory that you created on your local system.
 - d. Edit the `setupCmdLine.bat` or `setupCmdLine.sh` file in your new migration directory.
 - Change **WAS_HOME** to point to the fully qualified path to the migration directory that you created
 - Change **JAVA_HOME** to point to the fully qualified path to your IBM Developer Kit or Java directory.
 - e. Ensure that the executable bit is on for the `setupCmdLine.sh` and `WASPreUpgrade.sh` files in the migration directory that you created.
 - f. Run the command from the migration directory that you created.
Identify the backup directory and the location of the configuration files.

```
migration_directory\WASPreUpgrade migration_specific_backup_directory
file_path\WebSphere\AppServer node_name
```
3. Shut down the WebSphere Application Server Version 6.1 or above release by stopping all server nodes in the configuration.
 4. Tar or zip the `migration_specific_backup` directory, and FTP it to another system.
 5. Install the new operating system, keeping the same host name.

If possible, keep the system name and passwords the same as on the old system. Place any database files related to applications that you are migrating in the same path as on the previous system. In general, try to keep paths the same. If you do change paths and names, refer to “Migrating to a Version 8.5 stand-alone application server on a remote machine” on page 41. Make any changes before running the **WASPostUpgrade** command as described in a later step.

6. FTP the *migration_specific_backup* directory from the other system, and extract it.
7. Install WebSphere Application Server Version 8.5.
Read the "Installing the product and additional software" article in the information center for more information.
8. Use the Profile Management tool or the **manageprofiles** command to create a WebSphere Application Server Version 8.5 profile.
Read the "Creating profiles using the graphical user interface" article or the "manageprofiles command" article in the information center for more information.
9. Run the **WASPostUpgrade** command from the Version 8.5 *app_server_root/bin* directory.
Specify the *migration_specific_backup* directory that you extracted in an earlier step.
Read “WASPostUpgrade command” on page 31 for the proper command syntax.

Migrating IBM Cloudscape or Apache Derby databases

The migration tools migrate any IBM Cloudscape database instances to Apache Derby instances in the new configuration, and they copy any Apache Derby instances that are stored in the previous release's WebSphere Application Server configuration tree to the new release's configuration tree. After you use the migration tools, you should verify the results of the database migration and manually migrate any Cloudscape database instances or copy any Derby database instances that are not automatically migrated or copied by the tools.

Before you begin

Read “Overview of migration, coexistence, and interoperability” on page 1 and “Premigration considerations” on page 5. For resources to help you plan and perform your migration, visit Knowledge Collection: Migration planning for WebSphere Application Server.

Tips:

- Before you run the migration tools, ensure that any application servers hosting applications that are using a Cloudscape or a Derby database are closed.
Otherwise, the database migration will fail.
- Before you run the migration tools, ensure that the *debug migration trace* is active.
By default, this trace function is enabled. To reactivate the debug migration trace if it is disabled, set one of the following trace options:
 - `all traces*=all`
 - `com.ibm.ws.migration.WASUpgrade=all`

About this task

WebSphere Application Server Version 8.5 requires Apache Derby Version 10.3 or later. Apache Derby Version 10.3 is a pure Java database server that combines the Derby runtime with the opportunity to use the full services of IBM Software Support. For comprehensive information about Apache Derby Version 10.3, read the Apache Derby website.

For help, read “Troubleshooting migration” on page 71.

Important: Derby-to-Derby migration performs a file-system copy of the data at a given point in time. This snapshot will not remain in sync with the database in the previous installation. If you roll back to the previous release, any updates to the database that you made after migration will not be reflected in the previous installation.

Procedure

1. Migrate the configuration to Version 8.5.
2. Verify the automatic migration of Cloudscape database instances or copying of Derby database instances.

When you migrate from WebSphere Application Server Version 6.1 or above to Version 8.5, the migration tools automatically upgrade Cloudscape or Derby database instances that are accessed through the embedded framework by some internal components such as the UDDI registry. The tools also attempt to upgrade Cloudscape or Derby instances that your applications access through the embedded framework. You must verify these migration results after running the migration tools.

- To distinguish between a partially and a completely successful Cloudscape-to-Derby migration, verify the automatic-migration results by performing the following tasks:

- a. Check the general migration post-upgrade log for database error messages.

These exceptions indicate database migration failures. The migration tool references all database exceptions with the prefix DSRA.

- b. Check the individual database migration logs.

These logs have the same timestamp as that of the general migration post-upgrade log. The individual logs display more detail about errors that are listed in the general post-upgrade log as well as expose errors that are not documented by the general log.

The path name of each database log is `app_server_root/profiles/profileName/logs/myFullDbPathName_migrationLogtimestamp.log`.

- c. Look at the debug log that corresponds with the database migration log.

The WebSphere Application Server migration utility triggers a *debug migration trace* by default; this trace function generates the database debug logs.

The full path name of each debug log is `app_server_root/profiles/profileName/logs/myFullDbPathName_migrationDebugtimestamp.log`.

Performing these tasks gives you vital diagnostic data to troubleshoot the partially migrated databases as well as those that fail automatic migration completely. Ultimately, you must migrate databases that were not completely migrated automatically through a manual process. The log messages contain the exact old and new database path names that you must use to run the manual migration. Note these new path names precisely.

Read the "Verifying the Cloudscape automatic migration" article in the information center for more information.

- Verify that any Derby database instances that are stored in the previous release's WebSphere Application Server configuration tree were copied to the new release's configuration tree

Check the general migration post-upgrade log for database error messages. These exceptions indicate database migration failures. The migration tool references all database exceptions with the prefix DSRA..

3. Manually migrate Cloudscape database instances or copy Derby database instances where necessary.

- The Version 8.5 migration tools do not attempt to migrate database instances that transact with applications through the Cloudscape Network Server or the Apache Derby Network Server framework. This exclusion eliminates the risk of corrupting third-party applications that access the same database instances as those accessed by WebSphere Application Server.

To minimize the risk of migration errors for databases that were only partially upgraded during the automatic migration process, delete the new database. Troubleshoot the original database according to the log diagnostic data, then perform manual migration of the original database.

Read the "Upgrading Cloudscape manually" article in the information center for more information.

- The Version 8.5 migration tools do not copy any Derby database instances outside the WebSphere Application Server configuration tree.

If migration does not copy a Derby database instance automatically, copy the database instance manually.

4. Manually migrate your UDDI registry if it uses a database on the Cloudscape Network Server or the Apache Derby Network Server framework.

Read the "Migrating the UDDI registry" article in the information center for more information.

What to do next

Service integration bus-enabled web services use a Service Data Objects (SDO) repository for storing and serving WSDL definitions. If you migrate a configuration that uses a Cloudscape database as the SDO repository, the SDO application will still be configured to use Cloudscape in the new configuration. Migration converts the Cloudscape database to Derby, but you must still update any SDO application's backend ID to use the new database. After you migrate all of the nodes on a server with an SDO repository application that uses Cloudscape, perform the following actions to reset the database type used by the SDO application on the new configuration to Derby:

1. Read about the basic usage for the `installSdoRepository.jacl` script inside the script file.
2. Run the `installSdoRepository.jacl` script by changing to the `app_server_root/bin/` directory and running the following command:

```
wsadmin.extension -f app_server_root/bin/installSdoRepository.jacl -editBackendId DERBY_V10
```

Read the "Installing and configuring the SDO repository" article in the information center for more information on upgrading the SDO repository application to Version 8.5 .

Migrating from the WebSphere Connect JDBC driver

WebSphere Application Server Version 8.5 does not include the WebSphere Connect JDBC driver for SQL Server. Use the `WebSphereConnectJDBCDriverConversion` command to convert data sources from the WebSphere Connect JDBC driver to the DataDirect Connect JDBC driver or the Microsoft SQL Server JDBC driver. The `WebSphereConnectJDBCDriverConversion` command processes `resources.xml` files, and there are many options that can be specified to indicate which `resources.xml` files to process.

Before you begin

Read "Overview of migration, coexistence, and interoperability" on page 1 and "Premigration considerations" on page 5.

About this task

gotcha: If you are running in a mixed node environment, you must issue this command for each node, specifying a specific cell name for the `cellName` parameter, and a specific node name for the `nodeName` parameter. If you do not issue these commands, you will get the following exception for your back-level nodes:

```
IGR0480E: The node node-name specified for the -nodeName parameter
is not at the current release. Migrate this node to the current release and rerun the tool.
```

Syntax

AIX
HP-UX
Linux
Solaris

```
./WebSphereConnectJDBCDriverConversion.sh
  [-profileName profile_name]
  [-driverType MS | DD]
  [-classPath class_path]
  [-nativePath native_path]
```

```

[-pathSeparator separator]
[[-cellName ALL | cell_name [-clusterName ALL | cluster_name] |
  [-applicationName ALL | application_name] |
  [-nodeName ALL | node_name] [-serverName ALL | server_name]]]
[-backupConfig true | false]
[-username userID]
[-password password]
[[-traceString trace_spec [-traceFile file_name]]]

```

Windows

```

WebSphereConnectJDBCdriverConversion.bat
[-profileName profile_name]
[-driverType MS | DD]
[-classPath class_path]
[-nativePath native_path]
[-pathSeparator separator]
[[-cellName ALL | cell_name [-clusterName ALL | cluster_name] |
  [-applicationName ALL | application_name] |
  [-nodeName ALL | node_name] [-serverName ALL | server_name]]]
[-backupConfig true | false]
[-username userID]
[-password password]
[[-traceString trace_spec [-traceFile file_name]]]

```

Parameters

-profileName *profile_name*

This optional parameter is used to specify a specific profile configuration in the Version 8.5 environment.

If this parameter is not specified, the default profile is used. If the default is not set or cannot be found, an error is returned.

If the command is run from within the *profile_name/bin* directory, it is implicit that the *profile_name* profile should be migrated and this parameter is not needed.

-driverType MS | DD

This required parameter is used to indicate the type of conversion that you want to perform.

Specifying MS converts to the Microsoft SQL Server JDBC Driver, and specifying DD converts to the DataDirect Connect JDBC driver.

-classPath *class_path*

This required parameter is used to specify the class path for the new JDBC driver.

-nativePath *native_path*

This optional parameter is used to specify the native path for the new JDBC driver.

-pathSeparator *separator*

This optional parameter is used to specify a path separator other than the default.

The default is operating-system dependant and is listed in the command-line help.

-cellName ALL | *cell_name*

This optional parameter is used to specify the specific name of the cell to process or to specify all cells.

The default is ALL. If ALL is specified, the values specified for the nodeName, serverName, applicationName, and clusterName parameters are ignored, and the settings for these parameters revert to their default values of ALL.

-clusterName ALL | *cluster_name*

This optional parameter is used to specify the specific name of the cluster to process or to specify all clusters.

The default is ALL

-application nameName ALL | *application_name*

This optional parameter is used to specify applications to process. (Some resource.xml files might exist in applications if enhanced EAR file support is used.)

The default is ALL

-nodeName ALL | *node_name*

This optional parameter is used to specify the specific name of the node to process or to specify all node names in the configuration. If you specify a specific nodeName, you must also specify a specific cell name on the cellName parameter. If a specific cell name is not specified, the default value of ALL is used for this parameter.

If ALL is specified for this parameter, the value specified for the serverName parameter is ignored, and the setting for the serverName parameter reverts to its default value of ALL.

-serverName ALL | *server_name*

This optional parameter is used to specify the specific name of a server or to specify all server names in a node.

The default is ALL.

-backupConfig true | false

This parameter is used to specify whether (true) or not (false) to back up the existing configuration before the command makes changes to the configuration.

The default is true.

-username *userID*

This optional parameter is used to specify the user name to be used by this command.

-password *password*

This optional parameter is used to specify the password to be used by this command.

-traceString *trace_spec*

This optional parameter is used with -traceFile to gather trace information for use by IBM service personnel.

The value of traceString is "**=all=enabled*" and must be specified with quotation marks to be processed correctly.

-traceFile *file_name*

This optional parameter is used with -traceString to gather trace information for use by IBM service personnel.

Migrating root configurations to non-root

On Linux and UNIX operating systems, you can run WebSphere Application Server Version 8.5 as a non-root user when you previously used a root user ID in Version 6.1 or above.

Before you begin

About this task

Previous releases of WebSphere Application Server required root access to the system. The default migration paths to Version 8.5 carry forward that requirement unless you modify the standard migration process.

Procedure

1. Collect related information.
 - Collect user and group information on the non-root user profile (referred to here as *nonroot_user*) that will run Version 8.5.

- Collect user and group information on any files outside the WebSphere Application Server tree that are referenced by your current configuration and applications.
 - Library files (.jar files)
 - Resource Adapter Files (.rar files)
 - Keyfiles (.jks and .p12files for example)
 - Other files (database driver files and application helper files or services for example)
 - Does your configuration use Run As User on the servers?
If it does, include that in your plans. Ideally, they should use RunAsUser *nonroot_user*.
 - Do your applications or your application-server configurations use system services with user-restricted access?
2. Provide access to all necessary files, including files in the the WebSphere Application Server configuration directories and all files outside the WebSphere Application Server tree that you identified in the first step.
 - a. Perform one of the following actions:
 - Change the ownership of the previous version's installation.

```
chown -R nonroot_user WAS_HOME
chown -R nonroot_user USER_HOME
```
 - Change the restrictions of the previous version's installation.

```
chmod -R 0777 WAS_HOME
chmod -R 0777 USER_HOME
```
 - b. Change ownership or group access for all the files outside the WebSphere Application Server tree that you identified in the first step.
 3. Install Version 8.5 using *nonroot_user*.
 4. Create a migration backup directory accessible by *nonroot_user*.
 5. Use the migration tools to migrate your previous configuration to Version 8.5.

Migrating non-root configurations to root

You can run either a deployment manager or application server as root in WebSphere Application Server Version 8.5 when you previously used a non-root user ID on Linux and UNIX platforms in Version 6.1 or above.

Before you begin

Read “Overview of migration, coexistence, and interoperability” on page 1 and “Premigration considerations” on page 5.

Procedure

Set the ownership of the profile or deployment manager directory to be the same as the user under which WebSphere Application Server is to run.

This must be done for the deployment manager or application servers to run correctly.

As a root user, run the following commands:

```
cd $WASROOT/profiles/
chown -R wasadmin dmgr/
chgrp -R wasndgrp dmgr/
chmod -R 755 dmgr/
...
cd $WASROOT/profiles/dmgr/bin
./startManager.sh
```

where the profile name is dmgr run as a user in wasadmin with the primary group wasndgrp.

Tip: For help, read “Troubleshooting migration” on page 71.

Results

You can now run either a deployment manager or application server as root.

Rolling back environments

After migrating to a WebSphere Application Server Version 8.5 environment, you can roll back to a Version 6.1 or above environment. This returns the configuration to the state that it was in before migration. After rolling back the environment, you can restart the migration process.

Before you begin

About this task

Generally, migration does not modify anything in the configuration of the prior release; however, there are cases where minimal changes are made that are reversible.

Procedure

To roll back a Version 8.5 stand-alone application server to Version 6.1 or above, follow the instructions in “Rolling back stand-alone application servers” on page 52.

Results

The configuration should now be returned to the state that it was in before migration.

What to do next

You can now restart the migration process if you want to do so.

Rolling back a federated node

You can use the **restoreConfig** and **wsadmin** commands to roll back a migrated WebSphere Application Server Version 8.5 federated node to the state that it was in before migration. For each federated node that you want to roll back, you must roll back the federated node itself and the corresponding changes made to the primary repository located on the deployment manager.

Before you begin

Best practice: When migrating a Version 6.1 or above federated node, the best practice is to perform the following actions if you want to be able to roll it back to its previous state after migration:

1. Back up your existing configuration.
 - a. Run the **backupConfig** command or your own preferred utility to back up the Version 8.5 deployment manager configuration.

Important: Make sure that you note the exact name and location of this backed-up configuration.

Read the “backupConfig command” article in the information center for more information.

- b. Run the **backupConfig** command or your own preferred utility to back up the Version 6.1 or above federated node configuration.

Important: Make sure that you note the exact name and location of this backed-up configuration.

Read the "backupConfig command" article in the information center for more information.

2. Migrate the federated node.
3. If necessary, you can now roll back the federated node that you just migrated.

Important: If you do not have a backup copy of your Version 8.5 deployment manager configuration as it was before you migrated the Version 6.1 or above federated node that you want to roll back, you cannot use the procedure described in this article and you must roll back your whole cell.

About this task

You must perform all of the backup and rollback actions for each migrated federated node before you proceed to migrate another federated node.

Procedure

1. Run the **backupConfig** command or your own preferred utility to back up the Version 8.5 deployment manager configuration at the current state.

Important: Make sure that you note the exact name and location of this backed-up configuration.

Read the "backupConfig command" article in the information center for more information.

2. Stop all servers and the node agent on the Version 8.5 federated node that you want to roll back.
3. Restore your previous configuration.
 - a. Run the **restoreConfig** command or your own preferred utility to restore the previous Version 8.5 deployment manager configuration.

Important:

- Make sure that you restore the same backed-up configuration that you created just before you migrated the federated node.
- If you have made changes to your environment (application or configuration changes for example), these changes are rolled back at the same time and cause the other nodes to force synchronization with the deployment manager.

Read the "restoreConfig command" article in the information center for more information.

- b. Perform one of the following actions to restore the Version 6.1 or above configuration for the federated node.
 - Run the **restoreConfig** command or your own preferred utility to restore the Version 6.1 or above configuration.

Important: Make sure that you restore the same backed-up configuration that you created just before you migrated this federated node.

Read the "restoreConfig command" article in the information center for more information.

- Use the **wsadmin** command to run the `migrationDisablementReversal.jacl` script from the Version 6.1 or above `profile_root/bin` directory of the federated node.

Linux

In a Linux environment, for example, use the following parameters:

```
./wsadmin.sh -f migrationDisablementReversal.jacl -conntype NONE
```

Tip: If you have trouble running the `migrationDisablementReversal.jacl` script, try to manually perform the steps in the script.

- 1) Go to the following directory:

```
profile_root/config/cells/cell_name/nodes/node_name
```

where *node_name* is the name of the federated node that you want to roll back.

- 2) If you see a `serverindex.xml_disabled` file in this directory, perform the following actions:
 - a) Delete or rename the `serverindex.xml` file.
 - b) Rename the `serverindex.xml_disabled` file to `serverindex.xml`.
4. Start the Version 8.5 deployment manager.
5. Perform any application maintenance that is required.
6. Synchronize the Version 6.1 or above federated node with the deployment manager.
Read the "Synchronizing nodes with the wsadmin tool" article in the information center for more information.
7. If you chose to keep the installed applications in the same location as the prior release during migration to Version 8.5 and any of the Version 8.5 applications are not compatible with the prior release, install applications that are compatible.
8. Start the rolled-back Version 6.1 or above federated node and servers.
9. Validate that the configuration is satisfactory.
This is the last chance to undo the rollback action by restoring the deployment-manager configuration that you backed up in the first step.
10. Delete the Version 8.5 profile for the federated node that you rolled back to Version 6.1 or above.
Read the "Deleting a profile" article in the information center for more information.

Results

The configuration should now be returned to the state that it was in before migration.

What to do next

You can now restart the migration process if you want to do so.

Rolling back stand-alone application servers

You can use the `restoreConfig` and `wsadmin` commands to roll back a migrated WebSphere Application Server Version 8.5 stand-alone application server to the state that it was in before migration.

Before you begin

Best practice: When migrating a Version 6.x or 7.x stand-alone application server, the best practice is to perform the following actions if you want to be able to roll it back to its previous state after migration:

1. Run the `backupConfig` command or your own preferred utility to back up the Version 6.x or 7.x stand-alone application server configuration.

Important: Make sure that you note the exact name and location of this backed-up configuration.

Read the "backupConfig command" article in the information center for more information.

2. Migrate the stand-alone application server.
3. If necessary, you can now roll back the stand-alone application server that you just migrated.

Procedure

1. Stop all of the servers that are currently running in the Version 8.5 environment.

2. Perform one of the following actions to restore the Version 6.x or 7.x configuration for the stand-alone application server.
 - Run the **restoreConfig** command or your own preferred utility to restore the Version 6.x or 7.x configuration.

Important: Make sure that you restore the same backed-up configuration that you created just before you migrated this stand-alone application server.

Read the "restoreConfig command" article in the information center for more information.

- Use the **wsadmin** command to run the `migrationDisablementReversal.jacl` script from the Version 6.x or 7.x `profile_root/bin` directory of the stand-alone application server.

Linux

In a Linux environment, for example, use the following parameters:

```
./wsadmin.sh -f migrationDisablementReversal.jacl -conntype NONE
```

3. If you chose to keep the installed applications in the same location as the prior release during migration to Version 8.5 and any of the Version 8.5 applications are not compatible with the prior release, install applications that are compatible.
4. Delete the Version 8.5 profile for the stand-alone application server.

Read the "Deleting a profile" article in the information center for more information.
5. Start the rolled-back stand-alone application server in the Version 8.5 environment.

Results

The configuration should now be returned to the state that it was in before migration.

What to do next

You can now restart the migration process if you want to do so.

Chapter 5. Scenario 1: Migrating a cell using the command line tools

Before you begin

Review the migration planning information. See Knowledge Collection: Migration planning for WebSphere Application Server.

This scenario covers migrating cells on the same host. If you intend to migrate cells to a different host, see Scenario 2: Migrating cells across operating systems using the command-line tools.

About this task

This task describes how to use the command line tools to migrate a cell from a previous version of WebSphere Application Server to Version 8.5. The cell configuration consists of a deployment manager with one or more nodes, a web server, and an application client. All ports are migrated forward into the new configuration. This procedure assumes that the previous configuration is running. For more information, see `clientUpgrade` command.

Note: Ensure that your setting for the maximum number of open files is 10000 or greater. If the number of open files is too low, this can cause a variety of migration failures.

Procedure

1. Run the `backupConfig` command on the deployment manager and all old nodes. In case of failure during the migration, save the current deployment manager and node configuration to a file that you can use later for recovery purposes.
 - a. Change to the `<deployment manager profile root>/bin` directory.
 - b. Run the `backupConfig` command with the appropriate parameters and save the current profile configuration to a file. For example:

```
/opt/WebSphereV70/profiles/v70dmgr01/bin/backupConfig.sh /mybackupdir/v70dmgr01backupBeforeV85migration.zip -username myuser -password mypass -nostop
```
 - c. For each node in the configuration, change to the `<node profile root >/bin` directory.
 - d. Run the `backupConfig` command with the appropriate parameters, and save the current profile configuration to a file. For example:

```
/opt/WebSphereV70/profiles/v70node01/bin/backupConfig.sh /mybackupdir/v70node01backupBeforeV85migration.zip -username myuser -password mypass -nostop
```
2. Install WebSphere Application Server Version 8.5. Install WebSphere Application Server Version 8.5 onto each target host in a new directory. For more information, see [How do I install an application serving environment?](#)
3. Create the target deployment manager profile. The target deployment manager profile is a new deployment manager profile that will be the target of the migration.

Note: The Version 8.5 profile `nodeName` and `cellName` must match the previous Version 7.0 or above `nodeName` and `cellName`. If the Version 8.5 deployment manager `cellName` or `nodeName` are different, the migration will fail.

- a. Run the `manageprofiles` command with the appropriate parameters to create a new deployment manager profile. For example:

```
/opt/WebSphereV85/bin/manageprofiles.sh -create -profileName v70tov85dmgr01 -templatePath /opt/WebSphereV85/profileTemplates/management -serverType DEPLOYMENT_MANAGER -nodeName currentDmgrNodeName -cellName currentCellName -hostName mydmgrhost.company.com
```
4. Run the `WASPreUpgrade` command from the new deployment manager profile `bin` directory. Save the current deployment manager configuration to the migration backup directory. The `WASPreUpgrade` command does not make any changes to the Version 7.0 or above configuration. If you are migrating

from Version 8.0 to Version 8.5 and your profile is a deployment manager, the Version 8.0 profile is stopped during WASPreUpgrade and then restarted.

- a. Run the WASPreUpgrade command to save the current deployment manager configuration information to a migration backup directory. For example:

```
/opt/WebSphereV85/bin/WASPreUpgrade.sh /mybackup/v70tov85dmgr01
/opt/WebSphereV70 -oldProfile 70dmgr01
```

5. Verify the console output and the WASPreUpgrade logs for success, warnings, or failure After the WASPreUpgrade command is complete, check the console output and logs for any warnings or errors. If there are errors, all errors must be fixed and then WASPreUpgrade must be run again. Also check the warnings to see if they will impact any other migration or runtime activities on Version 8.5. If the command completed successfully, then it is not necessary to check the logs for errors or warnings.
 - a. Check the WASPreUpgrade console output for "Failed with errors" or "Completed with warnings".
 - b. Look in the following logs for warnings or errors:
 - WASPreUpgrade.< oldProfile >.< timestamp >.log
 - WASPreUpgrade.trace
6. Run the WASPostUpgrade command from the new deployment manager profile bin directory Use the WASPostUpgrade command to restore the previous deployment manager configuration that you saved in the migration backup directory. If you use the options shown in the example, all the ports will be carried forward, the old deployment manager will be shutdown and disabled, and all applications will be installed.
 - a. Run the WASPostUpgrade command to restore the saved deployment manager configuration into the new Version 8.5 deployment manager profile. For example:

```
/opt/WebSphereV85/bin/WASPostUpgrade.sh /mybackup/v70tov85dmgr01 -profileName
v70tov85dmgr01 -oldProfile 70dmgr01 -replacePorts TRUE -backupConfig TRUE
-includeApps TRUE -scriptCompatibility TRUE -keepDmgrEnabled FALSE
-username myuser -password mypass
```

When creating profiles, only one profile is considered the default per installation.

The WASPostUpgrade command migrates the default profile for the source and the target installations if the -oldProfile or the -profileName parameters are not specified, respectively.

The default profiles can be identified by looking in the profileRegistry.xml file found in the WAS_HOME/properties directory. The source profileRegistry.xml is copied to the migration backup directory as part of the WASPreUpgrade command.

gotcha:

- The -oldProfile and -profileName parameters should always be specified when running the WASPostUpgrade command.
 - The script compatibility flag on your deployment manager must be the same as the flag that you use on your nodes. Save the value of the script compatibility flag for later use.
7. Verify the logs for success Once the WASPostUpgrade command is completed, check the console output and logs for any warnings or errors. If there are errors, check the error codes against the Version 8.5 Information Center for more information. Check the warnings to see if they will impact any node migration or runtime activities once the Version 8.5 deployment manager is started. If the command completed successfully, then it is not necessary to check the logs for errors or warnings.
 - a. Check the WASPostUpgrade console output for "Failed with errors" or "Completed with warnings".
 - b. Look in the following logs for warnings or errors:
 - <migration backupdir>/logs/WASPostUpgrade.<target profile name>.< timestamp >.log
 - <migration backupdir>/logs/WASPostUpgrade.<target profile name>.trace
 8. Run the backupConfig command on the Version 8.5 deployment manager Save the Version 8.5 migrated deployment manager configuration to a file.

Note: This is an important step in the cell migration plan. If there are any node migration failures, the cell configuration can be restored to the point prior to the failure, remedial actions can be applied, and the node migration can be attempted again.

- a. Change to the `<deployment manager profile root>/bin` directory
- b. Run the `backupConfig` command with the appropriate parameters and save the Version 8.5 profile configuration to a file. For example:

```
/opt/WebSphereV85/profiles/v70tov85dmgr01/bin/backupConfig.sh /mybackupdir/  
v70tov85dmgr01backupMigratedDmgrOnly.zip -username myuser -password mypass
```

9. Start the Version 8.5 deployment manager Ensure that the previous version of the deployment manager is not running.
 - a. Change to the new Version 8.5 deployment manager profile bin directory.
 - b. Run the `startManager` command.
 - c. While the deployment manager is running, check the `SystemOut.log` file for warnings or errors.

Note: This topic references one or more of the application server log files. As a recommended alternative, you can configure the server to use the High Performance Extensible Logging (HPEL) log and trace infrastructure instead of using `SystemOut.log`, `SystemErr.log`, `trace.log`, and `activity.log` files on distributed and IBM i systems. You can also use HPEL in conjunction with your native z/OS logging facilities. If you are using HPEL, you can access all of your log and trace information using the LogViewer command-line tool from your server profile bin directory. See the information about using HPEL to troubleshoot applications for more information on using HPEL.

- d. Check all of the node's `nodeagent` and application server logs for new warnings or errors. If "Automatic synchronization" is enabled, then allow the node to synchronize, allow the applications to restart, and then check the logs for new warnings or errors.
10. Migrate plug-ins for web servers
 - a. Ensure that the Version 8.5 deployment manager is running.
 - b. Upgrade the version of the web server plugin that is used in the cell.
 - c. See the supporting information that is applicable to your web server type and version.
 11. Run a migration on application client installations Migrate client resources to Version 8.5 level resources.
 - a. Install the WebSphere Version 8.5 Application client.
 - b. Run the `clientUpgrade` command on your application client ear files. For more information, see `clientUpgrade` command.
 - c. Run the Version 8.5 `WASPreUpgrade` command to save the Application client security settings to a migration backup directory. For example:

```
/opt/AppClientV85/bin/WASPreUpgrade.sh /mybackup/v70clientTov85 /opt/AppClientV70
```
 - d. Run the Version 8.5 `WASPostUpgrade` command to restore the Application client security settings to the new Version 8.5 client. For example:

```
/opt/AppClientV85/bin/WASPostUpgrade.sh /mybackup/v70clientToV85
```
 12. Migrate nodes Ensure that the Version 8.5 deployment manager is running. Use the migration tooling to migrate the previous versions of the nodes in the configuration to Version 8.5. For each node that you plan to migrate to Version 8.5, perform the following steps:

Note: For the migration to be successful, you must use the same source node name and cell name for each node that you migrate to Version 8.5.

- a. Create the target node profile. Run the `manageprofiles` command with the appropriate parameters to create a new managed profile. For example:

```
/opt/WebSphereV85/manageprofiles.sh -create -profileName node1 -templatePath  
/opt/WebSphereV85/profileTemplates/managed -nodeName currentNode1Name -cellName  
currentCellName -hostName mynode1host.company.com
```

- b. Run the WASPreUpgrade command to save the current node X configuration information to a migration backup directory. Choose a new directory for the backup files. For example:

```
/opt/WebSphereV85/bin/WASPreUpgrade.sh /mybackup/v70tov85node1  
/opt/WebSphereV70 -oldProfile 70node1
```

- c. If the WASPreUpgrade command completed with Success, then checking the logs for errors or warnings is not necessary.
- d. Check the WASPreUpgrade console output for the following messages: "Failed with errors" or "Completed with warnings".
- e. Look in the following logs for warnings or errors:
- <migration backupdir>/logs/WASPreUpgrade.< oldProfile >< timestamp >.log
 - <migration backupdir>/logs/WASPreUpgrade.trace
- f. Stop the node agent. If you have Version 7.0 or above nodes running during a migration to Version 8.5, you must stop the node agent on the node being migrated. If you do not stop the node agent, you might encounter corruption problems.
- g. Run the WASPostUpgrade command to restore the saved node X configuration into the new Version 8.5 managed profile. For example:

```
/opt/WebSphereV85/bin/WASPostUpgrade.sh /mybackup/v70tov85node1 -profileName  
v70tov85node1 -oldProfile 70node1 -replacePorts TRUE -backupConfig TRUE  
-scriptCompatibility TRUE -username myuser -password mypass
```

Note: The script compatibility flag on your deployment manager must be the same as the flag that you use on your nodes.

- h. If the command completed with Success, then checking the logs for errors or warnings is not necessary.
- i. Check the WASPostUpgrade console output for the following messages: "Failed with errors" or "Completed with warnings".
- j. Look in the following logs for errors or warnings:
- <migration backupdir>/logs/WASPostUpgrade.<target profile>.< timestamp >.log
 - <migration backupdir>/logs/WASPostUpgrade.< target profile name >.trace

Note: If the WASPostUpgrade command fails, you may have to restore the Version 8.5 deployment manager from the backupConfig file. If the WASPostUpgrade processing executed the syncNode command, then the deployment manager is aware that the node X has been migrated. The node X cannot be migrated again until the deployment manager has been restored to the state before the node X migration.

- k. Check the Version 8.5 deployment manager SystemOut.log for warnings or errors.

Note: This topic references one or more of the application server log files. As a recommended alternative, you can configure the server to use the High Performance Extensible Logging (HPEL) log and trace infrastructure instead of using SystemOut.log, SystemErr.log, trace.log, and activity.log files on distributed and IBM i systems. You can also use HPEL in conjunction with your native z/OS logging facilities. If you are using HPEL, you can access all of your log and trace information using the LogViewer command-line tool from your server profile bin directory. See the information about using HPEL to troubleshoot applications for more information on using HPEL.

- l. Start the migrated Version 8.5 node X agent.
- m. Check the Version 8.5 deployment manager and node X SystemOut.log for warnings or errors.
- n. Synchronize the cell.
- o. Stop all the application servers on the Version 8.5 migrated node X.
- p. Start the appropriate application servers on the Version 8.5 migrated node X.
- q. Run the backupConfig command with the appropriate parameters and save the Version 8.5 profile configuration to a file. For example:

```
/opt/WebSphereV85/profiles/v70tov85node1/bin/backupConfig.sh /mybackupdir/  
v70tov85node1.zip -username myuser -password mypass -nostop
```

Each time you run the backupConfig command, use a new backup file name.

- r. Save the Deployment Manager configuration using the backupConfig command. On the Version 8.5 Deployment Manager host, change to the *<deployment manager profile root>/bin* directory. Run the backupConfig command with the appropriate parameters and save the Version 8.5 profile configuration to a file. For example:

```
/opt/WebSphereV85/profiles/v70tov85dmgr01/bin/backupConfig.sh /mybackupdir/  
v70tov85dmgr01backupMigratedDmgrPlusNodeX.zip -username myuser -password mypass
```

Note: If you are migrating a node to a different host, refer to these steps in Scenario 2: Migrating cells across operating systems using the command-line tools.

Note: For each node migrated, backup the Version 8.5 Deployment Manager configuration to a new backup file.

13. Troubleshooting See the information center documentation on troubleshooting migration.

Results

You have migrated from a previous version to WebSphere Application Server Version 8.5 using the migration tools.

Chapter 6. Scenario 2: Migrating cells across operating systems using the command-line tools

Before you begin

Review the migration planning information. See Knowledge Collection: Migration planning for WebSphere Application Server.

This information describes migrating cells to a different machine. For information on migrating cells on the same machine, see Scenario 1: Migrating a cell using the command line tools.

About this task

This task describes how to use the command-line tools to migrate cell topologies across operating systems from a previous version of WebSphere Application Server to Version 8.5. WebSphere Application Server Version 8.5 only needs to be installed on the target host. A remote migration jar will be created and extracted on the source WebSphere Application Server host. The cell configuration consists of a deployment manager with one or more nodes, a web server, and an application client. All ports are migrated forward into the new configuration. This procedure assumes that the previous configuration is running and that you are migrating all profiles to a new host.

Note: Ensure that your setting for the maximum number of open files is 10000 or greater. If the number of open files is too low, this can cause a variety of migration failures.

Procedure

1. Run the **backupConfig** command on the deployment manager and all old nodes. If the process fails, save the current deployment manager and node configuration to a file that you can use later for recovery purposes.
 - a. Change to the *deployment_manager_profile_root/bin* directory.
 - b. Run the **backupConfig** command with the appropriate parameters and save the current profile configuration to a file. For example:

```
Windows
previous_version_app_server_root\v70dmgr01\bin\
backupConfig.bat \mybackup_old_host\v70dmgr01\backupBeforeV85migration.zip
-username myuser -password mypass -nostop
```

```
AIX      HP-UX    Linux    Solaris
previous_version_app_server_root/v70dmgr01/bin/backupConfig.sh
/mybackup_old_host/v70dmgr01/backupBeforeV85migration.zip -username
myuser -password mypass -nostop
```

where *mybackup_old_host* is the location where the configuration restore points are stored.

- c. For each node in the configuration, change to the *node_profile_root/bin* directory.
- d. Run the **backupConfig** command with the appropriate parameters and save the current profile configuration to a file. For example:

```
Windows
previous_version_app_server_root\v70node01\bin\backupConfig.bat
\mybackup_old_host\v70node01\backupBeforeV85migration.zip -username
myuser -password mypass -nostop
```

```
AIX      HP-UX    Linux    Solaris
previous_version_app_server_root/v70node01
/bin/backupConfig.sh /mybackup_old_host/v70node01\backupBeforeV85migration.zip
-username myuser -password mypass -nostop
```

2. Install WebSphere Application Server Version 8.5. Install WebSphere Application Server Version 8.5 onto each target host in a new directory.

- a. Install the correct version of WebSphere Application Server Network Deployment, Base, or Express onto each target host. For more information, see How do I install an application serving environment?
3. Create the remote migration .jar file This .jar file contains the files necessary to run the WASPreUpgrade command on a system which does not have WebSphere Application Server installed.

Note: The generated archive contains operating system specific code, and will only execute on the same architecture the archive was created on.

- a. Identify the operating system and architecture of the source profile. If the operating system and architecture of the source profile is different from the operation system or the architecture of the target profile, then you must install WebSphere Application Server Version 8.5 on a system that matches the source profile before creating the remote migration jar. Once you have generated the remote migration jar, it will work on any system which matches the operating system and architecture.
- b. Create the remote migration .jar.
 - 1) In the command prompt, enter: `cd $WAS_HOME/bin/migration/bin`
 - 2) To create the .jar file, run: `createRemoteMigrJar.bat(sh) -targetDir <dir for the remote migration jar> .` This creates the following file:
 WAS_V85_<OS>.<arch>_RemoteMigrSupport.zip. For example:
 WAS_V85_windows.x86_RemoteMigrSupport.zip
- c. Prepare the remote system for the WasPreUpgrade command.
 - 1) Send the .jar file to the system where your source profile resides.
 - 2) Extract the file to a temporary location.
 - 3) Cd to the bin directory in the temporary location.
 - 4) Run the WASPreUpgrade command against the source profile to be migrated using the `-machineChange true` parameter. For more information, see the article WASPreUpgrade command.
4. Create the target deployment manager profile The target deployment manager profile is a new deployment manager profile that is the target of the migration.

Note: The Version 8.5 cell and node names must match the cell and node names in the previous configuration. If you create cells and nodes with new cell and node names, then the migration will fail.

- a. Run the **manageprofiles** command with the appropriate parameters to create a deployment manager profile. For example:

Windows

```
version 8.5_install_root\bin\manageprofiles.bat -create
-profileName v70tov85dmgr01 -templatePath \opt\WebSphereV85\profileTemplates\
management -serverType DEPLOYMENT_MANAGER -nodeName currentDmgrNodeName
-cellName currentCellName -hostName mydmgrhost.company.com
```

AIX **HP-UX** **Linux** **Solaris**

```
version 8.5_install_root/bin/manageprofiles.sh -create
-profileName v70tov85dmgr01 -templatePath /opt/WebSphereV85/profileTemplates/
management -serverType DEPLOYMENT_MANAGER -nodeName currentDmgrNodeName
-cellName currentCellName -hostName mydmgrhost.company.com
```

5. Run the **WASPreUpgrade** command. Save the current deployment manager configuration to the migration backup directory. The **WASPreUpgrade** command does not change the old configuration.
 - a. Run the **WASPreUpgrade** command to save the current deployment manager configuration information to a migration backup directory. For example:

Windows

```
<path to remote migration jar>\migration\bin\WASPreUpgrade.bat \mybackup_old_host\v70tov85dmgr01
\opt\WebSphereV70 -oldProfile 70dmgr01 -machineChange true
```

AIX**HP-UX****Linux****Solaris**

```
<path to remote migration jar>/migration/bin/WASPreUpgrade.sh /mybackup_old_host/v70tov85dmgr01
/opt/WebSphereV70 -oldProfile 70dmgr01 -machineChange true
```

where *mybackup_old_host* is the directory from which you are migrating your files to the new host.

If you are migrating from Version 8.0 to Version 8.5 and your profile is a deployment manager, the Version 8.0 profile is stopped during WASPreUpgrade and then restarted.

Note: If you specify **-machineChange true**, you must update the job manager URL for all resources (such as other deployment managers or application servers) that are managed by the job manager function of the Version 8.0 deployment manager after the migration.

6. Verify the console output and the **WASPreUpgrade** logs for success, warnings, or failure. After the **WASPreUpgrade** command is complete, check the console output and logs for any warnings or errors. If there are errors, fix all the errors and then rerun the **WASPreUpgrade** command. Also, check the warnings to see if they affect any other migration or runtime activities on Version 8.5. If the command completed successfully, then it is not necessary to check the logs for errors or warnings.
 - a. Check the **WASPreUpgrade** console output for "Failed with errors" or "Completed with warnings".
 - b. Look in the following logs for warnings or errors:
 - *mybackup_old_host/v70tov85dmgr01/logs/WASPreMigrationSummary.log*
 - *mybackup_old_host/v70tov85dmgr01/logs/WASPreUpgrade.< timestamp >.log*
 - *mybackup_old_host/v70tov85dmgr01/logs/WASPreUpgrade.trace*
7. Archive the backup directory created by the **WASPreUpgrade** command

Note: Do not use the Windows archive tool because it is not compatible with a WebSphere Application Server migration.

- a. Use the archive tool of your choice to create a compressed file of the backup directory. For example:

```
cd /mybackup_old_host
/opt/WebSphereV70/java/bin/jar -cf v70tov85dmgr01.jar v70tov85dmgr01/
```

- b. Move the archived file to the target machine.
- c. Create a directory on the target machine and extract the archived file to the new directory. For example:

```
mkdir /mybackup_new_host
cd /mybackup_new_host
/opt/WebSphereV85/java/bin/jar -xf v70tov85dmgr01.jar
```

where *mybackup_new_host* is the directory to which you are migrating your files.

8. Run the **WASPostUpgrade** command from the new deployment manager profile bin directory. Use the **WASPostUpgrade** command to restore the previous deployment manager configuration that you saved in the migration backup directory. If you use the options shown in the example, all the ports are carried forward, and all applications are installed.
 - a. Run the **WASPostUpgrade** command to restore the saved deployment manager configuration into the new Version 8.5 deployment manager profile. For example:

Windows

```
version_8.5_install_root\bin\WASPostUpgrade.bat \
mybackup_new_host\v70tov85dmgr01 -profileName v70tov85dmgr01 -oldProfile
70dmgr01 -replacePorts TRUE -backupConfig TRUE -scriptCompatibility TRUE
-keepDmgrEnabled TRUE -username myuser -password mypass
```

AIX**HP-UX****Linux****Solaris**

```
version_8.5_install_root/bin/WASPostUpgrade.sh /
mybackup_new_host/v70tov85dmgr01 -profileName v70tov85dmgr01 -oldProfile
70dmgr01 -replacePorts TRUE -backupConfig TRUE -scriptCompatibility TRUE
-keepDmgrEnabled TRUE -username myuser -password mypass
```

where *mybackup_new_host* is the directory to which you are migrating your files.

Note:

- The script compatibility flag on your deployment manager must be the same as the flag that you use on your nodes. Save the value of the script compatibility flag for later use.
 - After the **WASPostUpgrade** command completes successfully, do not start the new deployment manager. You must complete a few more steps before starting the new deployment manager.
9. Verify the logs for success After the **WASPostUpgrade** command completes, check the console output and logs for any warnings or errors. If there are errors, check the error codes against the Version 8.5 Information Center for more information.
 - a. Check the **WASPostUpgrade** console output for "Failed with errors" or "Completed with warnings".
 - b. Look in the following logs for warnings or errors:
 - *mybackup_new_host/v70tov85dmgr01/logs/WASPostMigrationSummary.log*
 - *mybackup_new_host/v70tov85dmgr01/logs/WASPostUpgrade.<target profile name>.<timestamp >.log*
 - *mybackup_new_host/v70tov85dmgr01/logs/WASPostUpgrade.<target profile name>.trace*
 10. Run the **backupConfig** command on the Version 8.5 deployment manager Save the Version 8.5 migrated deployment manager configuration to a file.

Note: If you encounter a node migration failure, you can restore the cell configuration to the point before the failure. You can apply remedial actions and the attempt the node migration again.

- a. Change to the *deployment_manager_profile_root/bin* directory
- b. Run the **backupConfig** command with the appropriate parameters and save the Version 8.5 profile configuration to a file. For example:

```
Windows
version_8.5_profile_root\profiles\v70tov85dmgr01\
bin\backupConfig.bat \mybackup_new_host\v70tov85dmgr01backupMigratedDmgrOnly.zip
-username myuser -password mypass

AIX      HP-UX    Linux    Solaris
version_8.5_profile_root/profiles/v70tov85dmgr01/bin/backupConfig.sh /
mybackup_new_host/v70tov85dmgr01backupMigratedDmgrOnly.zip -username
myuser -password mypass
```

where *mybackup_new_host* is the location where the configuration restore points are stored.

11. Stop and disable the deployment manager on the old host Ensure that you do not use the deployment manager on the old host. For more information , see clientUpgrade command.
 - a. Stop the deployment manager on the old host.
 - b. Disable the deployment manager on the old host To disable this deployment manager, you must rename the associated serverindex.xml file as indicated in the following information:
Old name
\$PROFILE_ROOT/config/cells/cell_name/nodes/deployment_manager_node_name/
serverindex.xml
New name
\$PROFILE_ROOT/config/cells/cell_name/nodes/deployment_manager_node_name/
serverindex.xml_disabled
12. Start the Version 8.5 deployment manager Start the deployment manager on the new host.
 - a. Change to the new Version 8.5 *deployment_manager_profile_root/bin* directory.
 - b. Run the **startManager** command.
 - c. While the deployment manager is running, check the SystemOut.log file for warnings or errors.

Note: This topic references one or more of the application server log files. As a recommended alternative, you can configure the server to use the High Performance Extensible Logging (HPEL) log and trace infrastructure instead of using `SystemOut.log`, `SystemErr.log`, `trace.log`, and `activity.log` files on distributed and IBM i systems. You can also use HPEL in conjunction with your native z/OS logging facilities. If you are using HPEL, you can access all of your log and trace information using the LogViewer command-line tool from your server profile bin directory. See the information about using HPEL to troubleshoot applications for more information on using HPEL.

Check the warnings to see if they affect any node migration or runtime activities when the Version 8.5 deployment manager is started.

- d. Ensure that the Version 8.5 deployment manager starts successfully.
13. Manually synchronize all nodes You must synchronize the old nodes to the new Version 8.5 deployment manager. Ensure that the Version 8.5 deployment manager on the new host is running. You must log into the machine that contains the old nodes and run the **syncNode** command.
 - a. Stop the node agent.
 - b. Obtain the deployment manager host and port number and update the `node_agent_profile_root/properties/wsadmin.properties` file. Change the `com.ibm.ws.scripting.host` value to the new host. Change the `com.ibm.ws.scripting.port` value to the new port.
 - c. Run the **syncNode** command from the bin directory. For example:

```

Windows
node_agent_install_root\bin\syncNode.bat myV85DmgrHost.mycompany.com 8879 -username myuser -password mypass

AIX   HP-UX   Linux   Solaris
node_agent_install_root/bin/syncNode.sh myV85DmgrHost.mycompany.com 8879 -username myuser -password mypass
  
```

- d. Start the node agent if synchronization is successful.
14. Migrate plug-ins for web servers
 - a. Ensure that the Version 8.5 deployment manager is running.
 - b. Upgrade the version of the web server plug-in that is used in the cell.
 - c. See the supporting information that is applicable to your web server type and version.
15. Run a migration on application client installations Migrate client resources to Version 8.5 level resources. If the source WebSphere Application client is Version 6.1, you also must run the **WASPreUpgrade** and **WASPostUpgrade** commands to migrate the existing security settings.

Note: The **clientUpgrade** command is not supported for cross operating system migrations. This step applies to WebSphere Application client host machines only. On any of your client host machines, you must run the same host migration.

- a. Identify all client hosts that you must migrate.
- b. Install the WebSphere Version 8.5 Application client.
- c. Run the **clientUpgrade** command on your application client enterprise archive (EAR) files.
- d. Run the Version 8.5 **WASPreUpgrade** command to save the Application client security settings to a migration backup directory. For example:

```
/opt/AppClientV85/bin/WASPreUpgrade.sh /mybackup_client/v70clientToV85 /opt/AppClientV70
```

- e. Run the Version 8.5 **WASPostUpgrade** command to restore the Application client security settings to the new Version 8.5 client. For example:

```
/opt/AppClientV85/bin/WASPostUpgrade.sh /mybackup_client/v6clientToV85
```

Note: The script compatibility flag on your deployment manager must be the same as the flag that you use on your nodes.

16. Migrate nodes These steps apply to cross operating system migrations only. If you are not completing a cross operating system migration of a node, see Scenario 1: Migrating a cell using the command-line tools. Ensure that the Version 8.5 deployment manager is running. For each node that you plan to migrate to Version 8.5, perform the following steps:

Note: For the migration to be successful, you must use the same source node name and cell name for each node that you migrate to Version 8.5 or later.

- a. Install WebSphere Application Server Version 8.5. Install the correct version of WebSphere Application Server Network Deployment, Base, or Express onto each target host. For more information, see *How do I install an application serving environment?*
- b. Create the target node profile. Run the **manageprofiles** command with the appropriate parameters to create a new managed profile. For example:

Windows

```
version_8.5_install_root\bin\manageprofiles.bat
-create -profileName node1 -templatePath \opt\
WebSphereV85\profileTemplates\managed -nodeName currentNode1Name
-cellName currentCellName -hostName mynode1host.company.com
```

AIX

HP-UX

Linux

Solaris

```
version_8.5_install_root/bin/manageprofiles.sh
-create -profileName node1 -templatePath
/opt/WebSphereV85/profileTemplates/managed -nodeName currentNode1Name
-cellName currentCellName -hostName mynode1host.company.com
```

- c. Use the updated supplemental CD you created to run the **WASPreUpgrade** command. For more information, see Step 3 of the overall scenario on upgrading the WebSphere Application Server Version 8.5 supplemental CD to the desired fix pack level.
- d. Run the **WASPreUpgrade** command to save the current node X configuration information to a migration backup directory. Choose a new directory for the backup files. For example:

Windows

```
\supplemental\migration\bin\WASPreUpgrade.bat \mybackup_old_host\v70tov85node1
\opt\WebSphereV70 -oldProfile 70node1 -machineChange true
```

AIX

HP-UX

Linux

Solaris

```
<path to remote migration jar>/migration/bin/WASPreUpgrade.sh /mybackup_old_host/v70tov85node1
/opt/WebSphereV70 -oldProfile 70node1 -machineChange true
```

- e. Check the **WASPreUpgrade** console output for error and warning messages. You might find the following messages: "Failed with errors" or "Completed with warnings". Also, look in the following log files for error or warning messages:

- *myback_old_host/v70tov85node1/logs/WASPreMigrationSummary.log*
- *myback_old_host/v70tov85node1/logs/WASPreUpgrade.< timestamp >.log*
- *myback_old_host/v70tov85node1/logs/WASPreUpgrade.trace*

If the **WASPreUpgrade** command is successful, you do not need to check the log files for error or warning messages.

- f. Use the archive tool of your choice to create a compressed file of the backup directory that was created by the **WASPreUpgrade** command. For example:

```
cd /mybackup_old_host
/opt/WebSphereV70/java/bin/jar -cf v70tov85node1.jar v70tov85node1/
```

- g. Move the archived file to the target machine.
- h. Create a directory on the target machine and extract the archived file to the new directory. For example:

```
mkdir /mybackup_new_host
cd /mybackup_new_host
/opt/WebSphereV85/java/bin/jar -xf v70tov85dmgr01.jar
```

where *mybackup_new_host* is the directory to which you are migrating your files.

- i. Stop the application servers on the old node, then stop the node agent on the old node.
- j. Stop and disable the deployment manager on the old host. Ensure that you do not use the deployment manager on the old host. To disable this deployment manager, you must rename the associated *serverindex.xml* file as indicated in the following information:

Old name

```
$PROFILE_ROOT/config/cells/cell_name/nodes/node_X/serverindex.xml
```

New name

```
$PROFILE_ROOT/config/cells/cell_name/nodes/node_X/serverindex.xml_disabled
```

- k. Run the **WASPostUpgrade** command to restore the saved node X configuration into the new Version 8.5 managed profile. For example:

Windows

```
version_8.5_install_root\bin\WASPostUpgrade.bat \
mybackup_new_host\v70tov85node1 -profileName v70tov85node1
-oldProfile 70node1 -replacePorts TRUE
-backupConfig TRUE -includeApps TRUE -scriptCompatibility
TRUE -username myuser -password mypass
```

AIX**HP-UX****Linux****Solaris**

```
version_8.5_install_root/bin/WASPostUpgrade.sh /
mybackup_new_host\v70tov85node1 -profileName v70tov85node1
-oldProfile 70node1 -replacePorts TRUE -backupConfig
TRUE -includeApps TRUE -scriptCompatibility TRUE
-username myuser -password mypass
```

- l. Check the **WASPostUpgrade** console output for the following messages. You might find the following messages: "Failed with errors" or "Completed with warnings". Also, look in the following log files for errors or warning messages:

- *mybackup_new_host/v70tov85node1/logs/WASPostMigrationSummary.log*
- *mybackup_new_host/v70tov85node1/logs/WASPostUpgrade.<target profile>.< timestamp >.log*
- *mybackup_new_host/v70tov85node1/logs/WASPostUpgrade.< target profile name >.trace*

Note: If the **WASPostUpgrade** command fails, you might need to restore the Version 8.5 deployment manager from the backup configuration file. If the **WASPostUpgrade** command processing ran the **syncNode** command, then the deployment manager is aware that the node X has been migrated. The node X cannot be migrated again until the deployment manager has been restored to the state before the node X migration.

- m. Check the Version 8.5 deployment manager *SystemOut.log* file for error or warning messages.

Note: This topic references one or more of the application server log files. As a recommended alternative, you can configure the server to use the High Performance Extensible Logging (HPEL) log and trace infrastructure instead of using *SystemOut.log*, *SystemErr.log*, *trace.log*, and *activity.log* files on distributed and IBM i systems. You can also use HPEL in conjunction with your native z/OS logging facilities. If you are using HPEL, you can access all of your log and trace information using the LogViewer command-line tool from your server profile bin directory. See the information about using HPEL to troubleshoot applications for more information on using HPEL.

- n. Start the migrated Version 8.5 node X agent.
- o. Check the Version 8.5 deployment manager and node X *SystemOut.log* for error or warning messages.
- p. Optional: Synchronize the cell if the auto synchronization process is not enabled.
- q. Optional: Start the appropriate application servers on Version 8.5 migrated node X.
- r. Run the **backupConfig** command and save the Version 8.5 profile configuration to a file. For example:

Windows

```
version_8.5_profile_root\v70tov85node1\bin\backupConfig.bat
\mybackup_new_host\v70tov85node1.zip -username myuser
-password mypass -nostop
```

AIX**HP-UX****Linux****Solaris**

```
version_8.5_profile_root/v70tov85node1/bin/backupConfig.sh
/mybackup_new_host/v70tov85node1.zip -username myuser
-password mypass -nostop
```

Each time you run the **backupConfig** command on a specific node, use a new backup file name.

- s. Save the deployment manager configuration using the **backupConfig** command. On the Version 8.5 deployment manager host, change to the *deployment_manager_profile_root/bin* directory. Run the **backupConfig** command and save the Version 8.5 profile configuration to a file. For example:

Windows

```
version_8.5_profile_root\v70tov85dmgr01\bin\backupConfig.bat
\mybackup_new_host\v70tov85dmgr01\backupMigratedDmgrPlusNodeX.zip
-username myuser -password mypass
```

AIX

HP-UX

Linux

Solaris

```
version_8.5_profile_root/v70tov85dmgr01/bin/backupConfig.sh
/mybackup_new_host/v70tov85dmgr01/backupMigratedDmgrPlusNodeX.zip
-username myuser -password mypass
```

Note: For each node that you migrate, backup the Version 8.5 Deployment Manager configuration to a new backup file.

- t. Repeat the previous steps for additional nodes.
17. Troubleshoot See the information center documentation on troubleshooting migration.

Results

You have migrated from a previous version to WebSphere Application Server Version 8.5 or later using the migration tools.

Step 15

Migrating web server configurations

You can migrate a web server so that it supports the latest version of WebSphere Application Server.

Before you begin

Procedure

1. Install the IBM HTTP Server Version 8.5 and its plug-in or a plug-in for another supported web server. Install the HTTP Server and its plug-in on a different machine with the following procedure:
 - a. Insert the product disk into the machine.
 - b. Close the launchpad if it starts automatically.
 - c. Change directories to the IHS directory on the product disk.
 - d. Install the IBM HTTP Server.

Run the appropriate installation script for your platform.

- **AIX** **HP-UX** **Linux** **Solaris** InstallIHS.sh
- **Windows** InstallIHS.bat

This script installs the plug-in that you need and makes the necessary configuration changes for the supported web server.

IBM HTTP Server Version 8.5 can coexist with earlier versions, or you can upgrade earlier versions to Version 8.5. Install Version 8.5 into the same directory structure as the earlier version to upgrade that version.

Note: The IHS ISMP installer will not allow installing into the previous directory. The target directory MUST be empty.

If you install the HTTP Server into a different directory, Version 8.5 coexists with the previous version. By default, the administration server and the web server use the same ports as the previous version, which causes a conflict. However, you can change the port assignments on the port assignment panel of the WebSphere Application Server Installation wizard or the Profile Management tool. Read the "Installing the product and additional software" article in the information center for more information.

- Change the port number assignments for the new installation if you install into a separate directory. You can change port numbers on the coexistence panel. You can back track through the Installation wizard and change the port settings if you have not already done so. Or, you can change the port settings after installation in the `httpd.conf` file in the HTTP Server directory.
- Update the IBM HTTP Server `httpd.conf` configuration entries to remove entries for earlier WebSphere Application Server versions if you install into the same directory as an earlier version. WebSphere Application Server Version 6.1 or above use the same HTTP transport plug-in binary module. If the Web server configuration file contains WebSphere Application Server Version 6.1 or above plug-in information, you must manually remove it. Otherwise, when the HTTP Server attempts to start the second Version 8.5 plug-in binary module, there is an error. The error indicates that the module is already loaded.

The configuration file might contain duplicate entries for accessing WebSphere Application Server samples. Remove any aliases for previous versions and retain the Version 8.5 entries:

Version 6.x installation:

```
Alias /WSsamples "c:\Program Files\WebSphere\AppServer\WSsamples"  
Alias /IBMWebAS/ "c:\Program Files\WebSphere\AppServer\web\"
```

Version 8.0 installation:

```
Alias /WSsamples "c:\Program Files\WebSphere\AppServer\WSsamples"  
Alias /IBMWebAS/ "c:\Program Files\WebSphere\AppServer\web\"
```

2. Migrate plug-ins to work with WebSphere Application Server Version 8.5.

Starting with WebSphere Application Server Version 6.0, the following are true:

- Web servers can be represented in the administrative console.
- The web server plug-in configuration file (`plugin-cfg.xml`) is associated with every web server definition instead of one cell-wide plug-in configuration file.
- The settings in the generated plug-in configuration file are based on the list of applications that are deployed on the hosting web server.

Use the following steps to generate a web server plug-in configuration file that is based on topology. This method was used for generated plug-in configuration files in previous releases.

- a. Use the **GenPluginCfg** command to generate the plug-in configuration file.
Read the "GenPluginCfg command" article in the information center for more information.
- b. Manually propagate the generated plug-in configuration file from the machine on which the WebSphere Application Server resides to the remote web server.
- c. Use the Plug-ins installation wizard to configure the web server. Instead of using the default plug-in configuration file location, specify the new location of the plug-in configuration file that was propagated in the previous step.

Read the "Installing web server plug-ins" article in the information center for more information.

You should migrate to the application-centric approach that uses the Plug-ins installation wizard. The Plug-ins installation wizard generates scripts that can be used to create the web server definition for that web server and to map all of the applications that are currently deployed to the newly created web server definition.

What to do next

Migrating from WebSphere Application Server Version 6.1 or above:

- Only web servers defined on managed nodes are migrated to WebSphere Application Server Version 8.5.
- If you are migrating a web server and plug-ins from WebSphere Application Server Version 6.1 or above to Version 8.5 and the web server is defined on an unmanaged node, the web server creation and application mapping must be done manually.

To create the web server definition manually, perform one of the following actions:

- Use the administration console wizard.

To generate mapping to all applications that are installed at web server creation, use the mapping ALL option in the wizard.

- Use the **wsadmin** command.

```
$AdminTask createWebServer -interactive
```

and reply ALL to the mapping applications prompt.

- Use the `configureWebserverDefinition.jacl` script.

This script maps all installed applications to the web server. The script updates all of the information related to the web server plug-in such as the locations of the plug-in installation root, log file, configuration file, and key stores on the web server system. However, the script does not update other properties related to the web server if the web server definition already exists.

- The Web server might have migrated with the application server. After migrating, Verify that your web server is functioning correctly. If not, delete the web server definition and follow the instructions in this topic to redefine it.

Step 16

clientUpgrade command

Use the **clientUpgrade** command to migrate previous versions of client resources to Version 8 level resources.

Use the **clientUpgrade** command to migrate Version 6.x and Version 7 client resources to Version 8 level resources. In the process of migrating these resources, the `client-resources.xmi` file that is located in the client JAR files is migrated to the latest level. A backup of the `client-resources.xmi` file is also located in the client JAR file. If this command is not launched against the client EAR files before they are installed on Version 8, the client EAR files do not operate or install correctly.

Locate the command file in the `app_server_root/bin` directory.

AIX

Linux

HP-UX

Solaris

```
clientUpgrade.sh EAR_file [-clientJar client_jar ][-logFileLocation logFileLocation]
[-traceString trace_spec [-traceFile file_name ]]
```

Windows

```
clientUpgrade.bat EAR_file [-clientJar client_jar ][-logFileLocation logFileLocation]
[-traceString trace_spec [-traceFile file_name ]]
```

Parameters

Supported arguments include the following:

EAR_file

Use this parameter to specify the fully qualified path to the EAR file that contains client JAR files to process.

-clientJar

Use this optional parameter to specify a JAR file for processing. If not specified, the program transforms all client JAR files in the EAR file.

-logFileLocation *log_file_location*

Use this optional parameter to specify an alternate location to store the log output.

-traceString *trace_spec* **-traceFile** *file_name*

Use these optional parameters to gather trace information for IBM Service personnel. Specify a *trace_spec* of `"*=all=enabled"` (with quotation marks) to gather all trace information.

The following example demonstrates correct syntax:

```
clientUpgrade EAR_file -clientJar ejbJarFile
```

Step 17

Step 18

Troubleshooting migration

You might encounter problems while migrating from an older version of WebSphere Application Server.

Before you begin

Procedure

- While you are using the Version 8.5 Migration wizard to create a profile before migrating a configuration, you might see the following profile-creation error messages.

```
profileName: profileName cannot be empty
profilePath: Insufficient disk space
```

These error messages might be displayed if you enter a profile name that contains an invalid character such as a space. Rerun the Migration wizard, and verify that there are no invalid characters in the profile name such as a space, quotes, or any other special characters.

- If you encounter a problem when you are migrating from a previous version of WebSphere Application Server to Version 8.5, check your log files and other available information.

1. Look for the log files, and browse them for clues.

- *migration_backup_dir*/logs/WASPreUpgrade.time_stamp.log
- *migration_backup_dir*/logs/WASPostUpgrade.time_stamp.log
- *app_server_root*/logs/clientupgrade.time_stamp.log

2. Look for MIGR0259I: The migration has successfully completed or MIGR0271W: The migration completed with warnings in one of the log files.

- *migration_backup_dir*/logs/WASPreUpgrade.time_stamp.log
- *migration_backup_dir*/logs/WASPostUpgrade.time_stamp.log
- *app_server_root*/logs/clientupgrade.time_stamp.log

If MIGR0286E: The migration failed to complete is displayed, attempt to correct any problems based on the error messages that appear in the log file. After correcting any errors, rerun the command from the bin directory of the product installation root.

3. Open the service log of the server that is hosting the resource that you are trying to access, and browse error and warning messages.
4. With WebSphere Application Server running, run the **dumpNameSpace** command and pipe, redirect, or “more” the output so that it can be easily viewed.

This command results in a display of all objects in WebSphere Application Server's namespace, including the directory path and object name.

5. If the object that a client needs to access does not appear, use the administrative console to verify the following conditions.
 - The server hosting the target resource is started.
 - The web module or enterprise Java bean container hosting the target resource is running.
 - The JNDI name of the target resource is properly specified.
6. Enable tracing when you run the migration tools; then, analyze the trace data or forward it to the appropriate organization for analysis.

You can enable trace when you use the **WASPreUpgrade** command or the **WASPostUpgrade** command by specifying the following parameters:

-traceString

This is an optional parameter. The value *trace_spec* specifies the trace information that you want to collect.

- Specify `"*=all=enabled"` (with quotation marks) to gather all possible trace information. This produces a very large trace file; for example, it can exceed 1 GB for the **WASPostUpgrade** command.
- Specify `"Migration.*=all"` to gather only the migration information
- Specify `"Migration.Flow=all:Migration.*=finer"` to gather most of the migration information.
- Specify `"Migration.Flow=finer:Migration.*=fine"` to gather the minimum amount of migration data needed by support teams.

This is the default.

If you do not specify the `-traceString` or `-traceFile` parameter, the command creates a trace file by default and places it in the *backupDirectory/logs* directory.

If you specify this parameter, you must also specify the `-traceFile` parameter.

-traceFile

This is an optional parameter. The value *file_name* specifies the name of the output file for trace information.

If you do not specify the `-traceString` or `-traceFile` parameter, the command creates a trace file by default and places it in the *backupDirectory/logs* directory.

If you specify the `-traceString` parameter but do not specify the `-traceFile` parameter, the script does not generate a trace file.

See the “Tracing and logging configuration” article for information on configuring your tracing and logging settings to help diagnose problems.

For current information available from IBM Support on known problems and their resolution, read the IBM Support page. IBM Support also has documents that can save you time gathering information needed to resolve this problem. Before opening a PMR, read the IBM Support page.

- During the migration process, problems might occur while you are using the **WASPreUpgrade** tool or the **WASPostUpgrade** tool.
 - Problems can occur when you are using the **WASPreUpgrade** tool.
 - A “Not found” or “No such file or directory” message is returned.

This problem can occur if you are trying to run the **WASPreUpgrade** tool from a directory other than the Version 8.5 *app_server_root\bin*. Verify that the **WASPreUpgrade** script resides in the Version 8.5 *app_server_root\bin* directory, and launch the file from that location.
 - The DB2 JDBC driver and DB2 JDBC driver (XA) cannot be found in the drop-down list of supported JDBC providers in the administrative console.

The administrative console no longer displays deprecated JDBC provider names. The new JDBC provider names used in the administrative console are more descriptive and less confusing. The new providers will differ only by name from the deprecated ones.

The deprecated names will continue to exist in the `jdbc-resource-provider-templates.xml` file for migration reasons (for existing JACL scripts for example); however, you are encouraged to use the new JDBC provider names in your JACL scripts.

- You receive the following message:

```
MIGR0108E: The specified WebSphere directory does not contain a WebSphere version that can be upgraded.
```

The following possible reasons for this error exist:

- If WebSphere Application Server Version 6.1 is installed, you might not have run the **WASPreUpgrade** tool from the `bin` directory of the Version 8.5 installation root.
 1. Look for something like the following message to display when the **WASPreUpgrade** tool runs:
IBM WebSphere Application Server, Release 6.x.
This message indicates that you are running the WebSphere Application Server Version 6.1 migration utility, not the Version 8.5 migration utility.
 2. Alter your environment path or change the current directory so that you can launch the Version 8.5 **WASPreUpgrade** tool.
 - An invalid directory might have been specified when launching the **WASPreUpgrade** tool.
- The **WASPreUpgrade** tool might exit without backing up your previous environment.

The tool might appear to run successfully as in the following example:

```
MIGR0201I: The migration function initialized log file WASPreUpgrade.log.  
MIGR0300I: The migration function is starting to save the existing Application Server environment.  
MIGR0302I: The existing files are being saved.  
MIGR0303I: The existing Application Server environment is saved.  
MIGR0420I: The first step of migration completed successfully.
```

You might also see a message similar to the following example in the migration trace file:

```
[10/9/08 18:26:40:363 CDT] 00000000 Save 1  
Skipped instance dmgr01 because user root /opt/migration_backup/profiles/dmgr01 does not exist.
```

The **WASPreUpgrade** tool writes out a copy of a `profileList.ser` file that contains pointers to the backup directory to be used by the **WASPostUpgrade** tool. If that file is not subsequently deleted by migration for any reason, the old paths are used instead of the real paths when you run the **WASPreUpgrade** tool in later migrations. To resolve this issue, you can safely delete the `profileList.ser` file and rerun the **WASPreUpgrade** tool.

For more information, read “WASPreUpgrade command” on page 28.

Note: When migrating a Version 6.1 federated node to Version 8.5, the **WASPreUpgrade** command might fail. You might receive an error similar to the following example:

```
[07/16/2011 11:07:10:357 CDT] MIGR0344I: Processing configuration file  
/opt/WAS61fep/profiles/v6109node74_01/config/cells/ndcell/clusters/Station1EJBCluster  
/resources.xml.  
[07/16/2011 11:07:10:436 CDT] org.eclipse.emf.ecore.resource.Resource$IOWrappedExcept  
ion: Unresolved reference 'DataSource_1310769433958'.  
(file:/opt/WAS61fep/profiles/v6109node74_01/config/cells/ndcell/clusters/Station1EJBC  
luster/resources.xml, 9, 323)  
java.lang.Exception: org.eclipse.emf.ecore.resource.Resource$IOWrappedException:  
Unresolved reference 'DataSource_1310769433958'.  
(file:/opt/WAS61fep/profiles/v6109node74_01/config/cells/ndcell/clusters/Station1EJBC  
luster/resources.xml, 9, 323)  
at com.ibm.wsspi.migration.document.wccm.WCCMDocument.setInputStream(WCCMDocument.ja  
va:162)
```

You might encounter this problem on a WebSphere Version 6.1 node when a DB2 database using IBM JCC Provider Driver has been created, and the WebSphere Version 6.1 node is synchronized to the Version 8.5 deployment manager. The Version 6.1 node does not support the Version 7.0 or above driver level. The node synchronization process is failing to remove all of the driver definitions.

To resolve this problem, backup any resources.xml files that are to be modified. Stop the Version 6.1 node agent process. Edit the WebSphere Version 6.1 node resources.xml files and remove the orphaned resources.jdbc:CMPCConnectorFactory entries prior to running the WASPreUpgrade command. Do not edit the deployment manager copy.

– Problems can occur when you are using the **WASPostUpgrade** tool.

- A “Not found” or “No such file or directory” message is returned.

This problem can occur if you are trying to run the **WASPostUpgrade** tool from a directory other than the Version 8.5 *app_server_root*\bin. Verify that the **WASPostUpgrade** script resides in the Version 8.5 *app_server_root*\bin directory, and launch the file from that location.

- You receive the following message:

```
MIGR0102E: Invalid Command Line. MIGR0105E: You must specify the primary node name.
```

The most likely cause of this error is that WebSphere Application Server Version 6.1 is installed and the **WASPostUpgrade** tool was not run from the bin directory of the Version 8.5 installation root.

To correct this problem, run the **WASPostUpgrade** command from the bin directory of the Version 8.5 installation root.

- You receive the “Unable to copy document to temp file” error message. Here is an example:

```
MIGR0304I: The previous WebSphere environment is being restored.  
com.ibm.websphere.management.exception.DocumentIOException: Unable to copy document to temp file:  
cells/sunblade1Network/applications/LARGEApp.ear/LARGEApp.ear
```

Your file system might be full. If your file system is full, clear some space and rerun the **WASPostUpgrade** command.

- You receive the following message:

```
MIGR0108E: The specified WebSphere directory does not contain WebSphere version that can be upgraded.
```

The following possible reasons for this error exist:

- If WebSphere Application Server Version 6.1 is installed, you might not have run the **WASPostUpgrade** tool from the bin directory of the Version 8.5 installation root.
 1. Look for something like the following message to display when the **WASPostUpgrade** tool runs: IBM WebSphere Application Server, Release 6.x.
This message indicates that you are running the WebSphere Application Server Release 6.1 migration utility, not the Version 8.5 migration utility.
 2. Alter your environment path or change the current directory so that you can launch the Version 8.5 **WASPostUpgrade** tool.
- An invalid directory might have been specified when launching the **WASPreUpgrade** tool or the **WASPostUpgrade**.
- The **WASPreUpgrade** tool was not run.

- You receive the following error message:

```
MIGR0253E: The backup directory migration_backup_directory does not exist.
```

The following possible reasons for this error exist:

- The **WASPreUpgrade** tool was not run before the **WASPostUpgrade** tool.
 1. Check to see if the backup directory specified in the error message exists.
 2. If not, run the **WASPreUpgrade** tool.
Read “WASPreUpgrade command” on page 28 for more information.
 3. Retry the **WASPostUpgrade** tool.
- An invalid backup directory might be specified.
For example, the directory might have been a subdirectory of the Version 6.1 tree that was deleted after the **WASPreUpgrade** tool was run and the older version of the product was uninstalled but before the **WASPostUpgrade** tool was run.
 1. Determine whether or not the full directory structure specified in the error message exists.

2. If possible, rerun the **WASPreUpgrade** tool, specifying the correct full migration backup directory.
 3. If the backup directory does not exist and the older version it came from is gone, rebuild the older version from a backup repository or XML configuration file.
 4. Rerun the **WASPreUpgrade** tool.
- Version 8.5 applications fail to install.

Manually install the applications using the **wsadmin** command after **WASPostUpgrade** has completed.

To manually install an application that failed to install during migration, use the **wsadmin** command to run the `install_application_name.jacl` script that the migration tools created in the backup directory.

In a Linux environment, for example, use the following parameters:

```
./wsadmin.sh -f migration_backup_directory/install_application_name.jacl -conntype NONE
```

Read “WASPostUpgrade command” on page 31 for more information.

- The trace file exceeds its 400 megabytes allocation, but WASPostUpgrade is still running. If additional disk space is not available, the migration will fail.

If you think you might encounter this problem during your migration, complete the following actions:

1. Stop the Migration wizard before the WASPostUpgrade command is issued.
2. Run the WASPostUpgrade command from the command line for each profile you are migrating.

When you run the WASPostUpgrade command from the command line:

- Include the **-oldProfile** and **-profileName** parameters to indicate the profile you want to migrate.
- Add the **com.ibm.ejs.ras.TraceNLS*** parameter to the trace string to reduce the size of your trace log. For example you might want to specify the following trace setting:

```
com.ibm.ejs.ras.TraceNLS*=info
```

- **Solaris** When you use the Migration wizard to migrate a profile from WebSphere Application Server Version 6.0.2 to Version 8.5 on a Solaris x64 processor-based system, the migration might fail during the WASPostUpgrade step.

You might see messages similar to the following in `migration_backup_dir/logs/WASPostUpgrade.time_stamp.log`:

```
MIGR0327E: A failure occurred with stopNode.  
MIGR0272E: The migration function cannot complete the command.
```

WebSphere Application Server Version 6.0.2 uses a Java Virtual Machine (JVM) in 32-bit mode. The Migration wizard for Version 8.5 calls the `WASPostUpgrade.sh` script, which attempts to run the JVM for Version 6.0.2 in the 64-bit mode when the server stops the Version 6.0.2 node.

Complete the following actions to remove the incomplete profile and enable WebSphere Application Server to correctly migrate the Version 6.0.2 profile:

1. From a command line, change to the `app_server_root/bin` directory.
For example, type the following command:

```
cd /opt/IBM/WebSphere/AppServer/bin
```
2. Locate the `WASPostUpgrade.sh` script in the `app_server_root/bin` directory, and make a backup copy.
3. Open the `WASPostUpgrade.sh` script in an editor, and perform the following actions:
 - a. Locate the following line of code:

```
."$binDir" /setupCmdLine.sh
```
 - b. Insert the following line of code after the code that was identified in the previous step:

```
JVM_EXTRA_CMD_ARGS=""
```
 - c. Save the changes.
4. Use the following command to delete the incomplete Version 8.5 profile that was created during the migration process:

```
app_server_root/bin/manageprofiles.sh -delete -profileName profile_name
```

5. Delete the *profile_root* directory of the Version 8.5 profile that was removed in the previous step.
 6. Rerun the Migration wizard.
- If you select the option for the migration process to install the enterprise applications that exist in the Version 6.1 configuration into the new Version 8.5 configuration, you might encounter some error messages during the application-installation phase of migration.

The applications that exist in the Version 6.1 configuration might have incorrect deployment information—typically, invalid XML documents that were not validated sufficiently in previous WebSphere Application Server runtimes. The runtime now has an improved application-installation validation process and will fail to install these malformed EAR files. This results in a failure during the application-installation phase of **WASPostUpgrade** and produces an “E” error message. This is considered a “fatal” migration error.

If migration fails in this way during application installation, you can do one of the following:

- Fix the problems in the Version 6.1 applications, and then remigrate.
- Proceed with the migration and ignore these errors.

In this case, the migration process does not install the failing applications but does complete all of the other migration steps.

Later, you can fix the problems in the applications and then manually install them in the new Version 8.5 configuration using the administrative console or an install script.

- Because of the inclusion of the `javax.ejb.Remote` annotation in the EJB 3.0 specification, certain EJB 2.1 beans might fail to compile if Enterprise Java Beans are written to import the entire `javax.ejb` and `java.rmi` packages. Compilation errors similar to those in the following example might occur:

```
ejbModule/com/ibm/websphere/samples/trade/ejb/QuoteHome.java(17): The type Remote is ambiguous
```

What to do next

If you did not find your problem listed, contact IBM support.

Chapter 7. Scenario 3: Flexible Management: Migrating an administrative agent profile and its registered set of managed base application servers

Administrative agent profiles manage multiple base application servers in environments such as development, unit test or that portion of a server farm that resides on a single machine. Before you can migrate managed base application servers from Version 7.0 or above to Version 8.5, you must first migrate the administrative agent.

Before you begin

Review the migration planning information. See Knowledge Collection: Migration planning for WebSphere Application Server.

You can migrate administrative agent profiles and the registered set of managed base application servers from Version 7.0 or above to Version 8.5.

About this task

This task describes how to use the command line tools to migrate an administrative agent and its associated set of managed base application servers from WebSphere Application Server Version 7.0 or above to Version 8.5. A base application server becomes managed when it is registered with a single administrative agent. An administrative agent may manage one or more base application servers and must be at the same release level and on the same machine as the base application servers it is managing. Because of this restriction, the administrative agents on both the old and new release run simultaneously until all managed base application servers are migrated. The migration of an administrative agent does not bring forward its old port values, however, all other configuration data is migrated. Access the Version 8.5 admin agent console using the WC_ adminhost or WC_ adminhost_ secure ports as defined in the new Version 8.5 admin agent's serverindex.xml file. Additionally, the Version 7.0 or above administrative agent must not be shut down or disabled during this procedure. For migrating the managed base application server in a flexible management environment, ensure that the node names are the same on Version 8.5 and previous releases.

For migrating the managed base application server in a flexible management environment, ensure that the node names are the same on Version 8.5 and previous releases.

Note: Ensure that your setting for the maximum number of open files is 10000 or greater. If the number of open files is too low, this can cause a variety of migration failures.

Procedure

1. Install WebSphere Application Server Version 8.5 Install WebSphere Application Server Version 8.5 onto the target host in a new directory.
 - a. Install the Network Deployment or Base version of WebSphere Application Server onto the target host. For more information, see How do I install an application serving environment?
2. Create the target administrative agent profile The target administrative agent profile is a new administrative agent profile that will be the target of the administrative agent migration.
 - a. Run the manageprofiles command with the appropriate parameters to create a new administrative agent profile. For example:

```
C:\WebSphere\AppServer85\bin>manageprofiles.bat -create -profileName AdminAgent01 -profilePath
c:\WebSphere\AppServer85\profiles\AdminAgent01 -templatePath c:\WebSphere\AppServer85\profileTemplates\management
-serverType ADMIN_AGENT -nodeName AdminAgentNode01 -cellName AdminAgentCell01 -hostName <myhostname>
```

3. Ensure that all the "In Progress" jobs are completed on the managed profiles Before running WASPreUpgrade on a managed application server or deployment manager, all in progress jobs must be complete.
4. Stop polling the job manager To avoid problems, stop polling the job manager before running the WASPreUpgrade on profiles that are getting jobs from the job manager. Before you start polling for jobs, complete WASPreUpgrade and WASPostUpgrade for the managed profile. For more information, see ManagedNodeAgent command group for the AdminTask object using wsadmin scripting.
5. Run the WASPreUpgrade command from the new WebSphere Application Server install root bin directory Save the current administrative agent configuration to the migration backup directory. The WASPreUpgrade command does not make any changes to the old configuration.
 - a. Run the WASPreUpgrade command to save the current administrative agent configuration information to a migration backup directory. For example:

```
C:\WebSphere\AppServer85\bin>WASPreUpgrade.bat C:\WAS70AdminAgentbackup C:\WebSphere\AppServer70 -oldProfile AdminAgent01 -traceString *=all=enabled -tracefile C:\WAS70AdminAgentbackup\logs\WASPreMigrationSummary.log
```
6. Verify the console output and the WASPreUpgrade logs for success, warnings, or failure After the WASPreUpgrade command is complete, check the console output and logs for any warnings or errors. If there are errors, all errors must be fixed and then WASPreUpgrade must be run again. Also check the warnings to see if they will impact any other migration or runtime activities on Version 8.5. If the command completed successfully, then it is not necessary to check the logs for errors or warnings.
 - a. Check the WASPreUpgrade console output for "Failed with errors" or "Completed with warnings".
 - b. Look in the following logs for warnings or errors:
 - <migration backupdir>/logs/WASPreMigrationSummary.log
 - WASPreUpgrade.< timestamp >.log
 - WASPreUpgrade.trace
7. Run the WASPostUpgrade command from the new WebSphere Application Server install root bin directory Use the WASPostUpgrade command to restore the previous administrative agent configuration that you saved in the migration backup directory.
 - a. Run the WASPostUpgrade command to restore the saved administrative agent configuration into the new Version 8.5 administrative agent profile. For example:

```
C:\IBM\WebSphere\AppServer85\bin>WASPostUpgrade.bat C:\WAS70AdminAgentbackup -oldProfile AdminAgent01 -profileName AdminAgent01 -traceString *=all=enabled -tracefile C:\WAS70AdminAgentbackup\logs\WASPostMigrationSummary.log -username myuser -password mypass
```
8. Verify the logs for success Once the WASPostUpgrade command is completed, check the console output and logs for any warnings or errors. If there are errors, check the error codes against the Version 8.5 Information Center for more information. If the command completed successfully, then it is not necessary to check the logs for errors or warnings.
 - a. Check the WASPostUpgrade console output for "Failed with errors" or "Completed with warnings".
 - b. Look in the following logs for warnings or errors:
 - <migration backupdir>/logs/WASPostMigrationSummary.log
 - WASPostUpgrade.<target profile name>.< timestamp >.log
 - WASPostUpgrade.<target profile name>.trace
9. Start the Version 8.5 administrative agent Ensure that both Version 7.0 or above and Version 8.5 administrative agents are running.
 - a. Change to the new Version 8.5 administrative agent profile bin directory.
 - b. Run the startServer adminagent command.
 - c. Check the SystemOut.log file for warnings or errors.

Note: This topic references one or more of the application server log files. As a recommended alternative, you can configure the server to use the High Performance Extensible Logging (HPEL) log and trace infrastructure instead of using SystemOut.log , SystemErr.log,

trace.log, and activity.log files on distributed and IBM i systems. You can also use HPEL in conjunction with your native z/OS logging facilities. If you are using HPEL, you can access all of your log and trace information using the LogViewer command-line tool from your server profile bin directory. See the information about using HPEL to troubleshoot applications for more information on using HPEL.

10. Migrate managed base application servers Ensure that the Version 8.5 administrative agent is running. For each managed base application server that you plan to migrate to Version 8.5, perform the following steps:

Note: For the migration to be successful:

- Managed base application servers must be located on the same machine as the associated administrative agent.
 - The node names must be the same on the Version 8.5 and previous releases.
 - **Windows** Stop the *AppSrv* server before running a migration if you have a Windows platform and plan to migrate a SIB component.
- a. Create the target base application server profile. Run the manageprofiles command with the appropriate parameters to create a new managed profile. For example:

```
C:\WebSphere\AppServer85\bin>manageprofiles.bat -create -profileName AppSrv01
-profilePath C:\WebSphere\AppServer85\profiles\AppSrv01
-templatePath C:\WebSphere\AppServer85\profileTemplates\default
-serverType APPLICATION_SERVER -nodeName AppSrv01Node01
-cellName AppSrv01Cell01 -hostName <myhostname>
```
 - b. Run the WASPreUpgrade command to save the current managed base application server information to a migration backup directory. Choose a new directory for the backup files. For example:

```
C:\WebSphere\AppServer85\bin>WASPreUpgrade.bat C:\WAS70Appserver01backup
C:\WebSphere\AppServer70 -oldProfile Appserver01 -traceString *=all=enabled
-summaryLogName C:\WAS70Appserver01backup\logs\WASPreMigrationSummary.log
```
 - c. If the WASPreUpgrade command completed with Success, then checking the logs for errors or warnings is not necessary.
 - d. Check the WASPreUpgrade console output for the following messages: "Failed with errors" or "Completed with warnings".
 - e. Look in the following logs for warnings or errors:
 - <migration backupdir>/logs/WASPreMigrationSummary.log
 - WASPreUpgrade.< timestamp >.log
 - WASPreUpgrade.trace
 - f. Run the WASPostUpgrade command to restore the saved managed application server profile configuration into the new Version 8.5 base application server profile.

Note: This command requires additional parameters and the following example assumes that security is enabled on both administrative agents.

For example:

```
C:\IBM\WebSphere\AppServer85\bin>WASPostUpgrade.bat C:\WAS70Appserver01backup
-oldProfile AppSrv01 -profileName AppSrv01 -traceString *=all=enabled
-summaryLogName C:\WAS70Appserver01backup\logs\WASPostMigrationSummary.log
-oldAdminAgentProfilePath C:\WebSphere\Appserver70\profiles\AdminAgent01
-oldAdminAgentHostname myhostname -oldAdminAgentSoapPort 8879 -oldAdminAgentUsername
myusername -oldAdminAgentPassword mypassword -newAdminAgentProfilePath
C:\WebSphere\AppServer85\profiles\AdminAgent01 -newAdminAgentHostname
myhostname -newAdminAgentSoapPort 8887 -newAdminAgentUsername
myusername1 -newAdminAgentPassword mypassword1
```

- g. If the command completed with Success, then checking the logs for errors or warnings is not necessary.
- h. Check the WASPostUpgrade console output for the following messages: "Failed with errors" or "Completed with warnings".
- i. Look in the following logs for errors or warnings:

- <migration backupdir>/logs/WASPostMigrationSummary.log
 - WASPostUpgrade.<target profile>.< timestamp >.log
 - WASPostUpgrade.< target profile name >.trace
- j. Start the migrated Version 8.5 managed application server.
 - k. Check the Version 8.5 managed application server SystemOut.log for warnings or errors.

Note: This topic references one or more of the application server log files. As a recommended alternative, you can configure the server to use the High Performance Extensible Logging (HPEL) log and trace infrastructure instead of using SystemOut.log , SystemErr.log, trace.log, and activity.log files on distributed and IBM i systems. You can also use HPEL in conjunction with your native z/OS logging facilities. If you are using HPEL, you can access all of your log and trace information using the LogViewer command-line tool from your server profile bin directory. See the information about using HPEL to troubleshoot applications for more information on using HPEL.

11. Troubleshooting See the information center documentation on troubleshooting migration.

Results

You have migrated an administrative agent profile and its associated managed base application servers from WebSphere Application Server Version 7.0 or above to Version 8.5 using the migration tools. You can stop the Version 7.0 or above administrative agent and you can assign the Version 7.0 or above ports to the Version 8.5 administrative agent.

Chapter 8. Scenario 4: Flexible Management: Migrating a job manager profile and its registered set of servers

You can migrate a job manager profile and its registered set of servers from Version 7.0 or above to Version 8.5.

Before you begin

Review the migration planning information. See Knowledge Collection: Migration planning for WebSphere Application Server.

About this task

Job manager profiles can have one or more of the following server types registered:

- Deployment manager servers
- Managed base application servers (which are also registered to an administrative agent)

Note:

1. Managed base application servers and deployment manager servers cannot accept jobs from a job manager that is of a previous version. To avoid problems, migrate your job manager profiles to Version 8.5 before you migrate managed base application servers and deployment manager servers to Version 8.5.
2. When migrating the managed base application server or managed deployment manager in a flexible management environment, the node names must be the same in Version 8.5 and previous releases.

This task outlines the steps needed to migrate the job manager and the set of registered servers.

You can migrate job manager profiles and the registered set of servers from Version 7.0 or above to Version 8.5.

Note: Ensure that your setting for the maximum number of open files is 10000 or greater. If the number of open files is too low, this can cause a variety of migration failures.

Procedure

1. Install WebSphere Application Server Version 8.5 Install WebSphere Application Server Network Deployment Version 8.5 onto the target host in a new directory. For more information, see How do I install an application serving environment?
2. Create the target job manager profile The target job manager profile is a new job manager profile that is located on the target of the job manager migration.
 - a. Run the `manageprofiles` command with the appropriate parameters to create a new job manager profile. For example:

```
C:\WebSphere\AppServer85\bin>manageprofiles.bat -create -profileName JobMgr01 -profilePath \WebSphere\AppServer85\profiles\JobMgr01 -templatePath \WebSphere\AppServer85\profileTemplates\management -serverType JOB_MANAGER -nodeName JobMgr01Node01 -cellName JobMgr01Cell01 -hostName localhost
```
3. Stop the old job manager Any jobs that exist within the old job manager database will be migrated as part of the migration.
4. Run the `WASPreUpgrade` command from the new WebSphere Application Server install root bin directory Save the current job manager configuration to the migration backup directory. The `WASPreUpgrade` command does not make any changes to the old configuration.
 - a. Run the `WASPreUpgrade` command to save the current job manager configuration information to a migration backup directory. For example:

```
C:\WebSphere\AppServer85\bin>WASPreUpgrade.bat C:\WAS70JobMgrbackup C:\WebSphere\AppServer70 -oldProfile JobMgr01
-traceString *=all=enabled -tracefile C:\WAS70JobMgrbackup\logs\WASPreMigrationSummary.log
```

5. Verify the console output and the WASPreUpgrade logs for success, warnings, or failure After the WASPreUpgrade command is complete, check the console output and logs for any warnings or errors. If there are errors, all errors must be fixed and then WASPreUpgrade must be run again. Also check the warnings to see if they will impact any other migration or runtime activities on Version 8.5. If the command completed successfully, then it is not necessary to check the logs for errors or warnings.
 - a. Check the WASPreUpgrade console output for "Failed with errors" or "Completed with warnings".
 - b. Look in the following logs for warnings or errors:
 - <migration backupdir>/logs/WASPreMigrationSummary.log
 - WASPreUpgrade.< timestamp >.log
 - WASPreUpgrade.trace

6. Run the WASPostUpgrade command from the new WebSphere Application Server install root bin directory Use the WASPostUpgrade command to restore the previous job manager configuration that you saved in the migration backup directory.

Note: To avoid database inconsistencies, run WASPostUpgrade immediately after completing WASPreUpgrade. As part of WASPreUpgrade, a backup of the database is created. If you restart the old job manager before running WASPostUpgrade, the database in the backup and the database in the old job manager will be out of sync.

- a. Run the WASPostUpgrade command to restore the saved job manager configuration into the new Version 8.5 administrative agent profile. For example:

```
C:\IBM\WebSphere\AppServer85\bin>WASPostUpgrade.bat C:\WAS70JobMgrbackup -oldProfile JobMgr01 -profileName JobMgr01
-traceString *=all=enabled -tracefile C:\WAS70JobMgrbackup\logs\WASPostMigrationSummary.log -username myuser -password mypass
```

7. Verify the logs for success Once the WASPostUpgrade command is completed, check the console output and logs for any warnings or errors. If there are errors, check the error codes against the Version 8.5 Information Center for more information. If the command completed successfully, then it is not necessary to check the logs for errors or warnings.
 - a. Check the WASPostUpgrade console output for "Failed with errors" or "Completed with warnings".
 - b. Look in the following logs for warnings or errors:
 - <migration backupdir>/logs/WASPostMigrationSummary.log
 - WASPostUpgrade.<target profile name>.< timestamp >.log
 - WASPostUpgrade.<target profile name>.trace
8. Start the Version 8.5 job manager Ensure that both Version 7.0 or above and Version 8.5 of the job manager are running.
 - a. Change to the new Version 8.5 job manager profile bin directory.
 - b. Run the startServer jobmgr command.
 - c. Check the SystemOut.log file for warnings or errors.

Note: This topic references one or more of the application server log files. As a recommended alternative, you can configure the server to use the High Performance Extensible Logging (HPEL) log and trace infrastructure instead of using SystemOut.log , SystemErr.log, trace.log, and activity.log files on distributed and IBM i systems. You can also use HPEL in conjunction with your native z/OS logging facilities. If you are using HPEL, you can access all of your log and trace information using the LogViewer command-line tool from your server profile bin directory. See the information about using HPEL to troubleshoot applications for more information on using HPEL.

9. Migrate the registered servers The Version 8.5 job manager can manage Version 7.0 or above registered servers. For the Version 7.0 or above topology to function with the Version 8.5 job manager, you are not required to migrate the registered servers. For each registered server that you plan to migrate to Version 8.5, perform the following steps:

- If the registered server you wish to migrate is of type deployment manager, see Scenario 1: Migrating a cell using the command line tools
- If the registered server you wish to migrate is of type managed base application server, see Flexible Management Scenario 1: Migrating an administrative agent profile and its registered set of managed base application servers

10. Troubleshooting See the information center documentation on troubleshooting migration.

Results

You have migrated a job manager profile and its associated managed base application servers from WebSphere Application Server Version 7.0 or above to Version 8.5 using the migration tools.

Chapter 9. Migrating Compute Grid or Feature Pack for Modern Batch on distributed operating systems

This section documents the migration of WebSphere Extended Deployment Compute Grid Version 6.1.1 on WebSphere Application Server Version 6.x, 7.x or 8.0 to WebSphere Application Server Version 8.5. You can also use these steps to migrate the Feature Pack for Modern Batch 1.0.0.x.

Migration overview

Migrate WebSphere Extended Deployment Compute Grid Version 6.1.1 and above on WebSphere Application Server Version 6.x, 7.x or 8.0 to WebSphere Application Server Version 8.5. You can also use these steps to migrate the Feature Pack for Modern Batch 1.0.0.x.

Before you begin

To migrate WebSphere Extended Deployment Compute Grid Version 6.1.1 and above to Version 8.5, you must have WebSphere Extended Deployment Compute Grid Fixpack 3 and cumulative interim fix PM39203 installed. Migration from any version of the Feature Pack for Modern Batch 1.0.0.x is supported.

About this task

The following list is an overview of the steps required to migrate from WebSphere Extended Deployment Compute Grid Version 6.1.1 and above or the Feature Pack for Modern Batch Version 1.0.0.x to Version 8.5. Depending on your specific configuration, you might not follow the migration steps in the order of this overview.

If your migration involves WebSphere Application Server Version 8.5, see Special considerations for migrating to WebSphere Application Server Version 8.5.

Procedure

- Migrate the nodes. Migrate the nodes in the following order:

1. Migrate the deployment manager.

Note: You must always migrate the deployment manager first.

2. Migrate the databases.
3. Migrate the schedulers one at a time.
4. Migrate the endpoints one at a time.

- Migrate your environment.

Perform the following steps to migrate the deployment manager:

1. Run the backup script.
2. Stop the deployment manager.
3. Unaugment WebSphere Extended Deployment Compute Grid Version 6.1.1.3 and above or the Feature Pack for Modern Batch Version 1.0.0.x.
4. Uninstall WebSphere Extended Deployment Compute Grid Version 6.1.1.3 and above or the Feature Pack for Modern Batch Version 1.0.0.x.
5. Install WebSphere Application Server Version 8.5.
6. Augment the deployment manager using the deployment manager profile.
7. Start the deployment manager.
8. Run the restore script.

Perform the following steps to migrate the scheduler and endpoint nodes:

1. Stop the server and node.
2. Unaugment the profile.
3. Uninstall WebSphere Extended Deployment Compute Grid Version 6.1.1.3 and above or the Feature Pack for Modern Batch Version 1.0.0.x.
4. Install WebSphere Application Server Version 8.5.
5. Augment the scheduler node.
6. Run the restore script.
7. Start the server.

Preparing cells for migration to Version 8.5

Before migrating to Version 8.5, you must perform prerequisite steps to prepare Feature Pack for Modern Batch or WebSphere Extended Deployment Compute Grid Version 6.1.1 cells for migration to WebSphere Application Server Version 8.5 cells.

Before you begin

To Migrate WebSphere Extended Deployment Compute Grid Version 6.1.1 to Version 8.5, you must have WebSphere Extended Deployment Compute Grid Fixpack 3 and cumulative interim fix PM39203 installed. Migration from any version of the Feature Pack for Modern Batch 1.0.0.x is supported.

About this task

Use the following steps to prepare your batch Version 6.1.1 cells for migration to WebSphere Application Server Version 8.5 cells.

Procedure

1. Run the prerequisite wsadmin script.
 - a. On the Deployment Manager node, run the addCGSystemAppVariables.py script; for example:

```
<WASHOME>/bin>wsadmin.sh -lang jython -f addCGSystemAppVariables.py
```

Note: [-level wcg/wcg8/was8/fep/ default is wcg]

 - wcg if you are migrating from Compute Grid 6.1
 - wcg8 if you are migrating from Compute Grid 8.0
 - was8 if you are migrating from WebSphere Application Server 8.0
 - fep if you are migrating a Feature Pack for Modern Batch node
 - b. Restart all the servers after running the script.
2. Back up the existing Version 6.1.1.3 configuration. From the <WASHOME>/bin directory of the deployment manager, run the .wsadmin.[shlbat] -lang jython -f migrateWCGConfigTo8.py --backup script.
Optional parameters:
 - -configBackupDir: Use this optional parameter to change the location where the product configuration is backed up. The default is <WASHOME>/temp.
 - -profileName: Use this optional parameter to change the Deployment Manager profile name. The default is Dmgr01.

Migrating the deployment manager

After you have prepared your cells for migration and ensured that you have met all prerequisites, migrate the deployment manager.

Before you begin

To Migrate WebSphere Extended Deployment Compute Grid Version 6.1.1 to Version 8.5, you must have WebSphere Extended Deployment Compute Grid Fixpack 3 and cumulative interim fix PM39203 installed. Migration from any version of the Feature Pack for Modern Batch 1.0.0.x is supported.

About this task

You must migrate the deployment manager first. To migrate the deployment manager, perform the following steps:

Procedure

1. Stop the deployment manager. Run the `<WAS_INSTALL_ROOT>/profiles/<profileName>/bin/stopManager.sh` command.
2. Install WebSphere Application Server Version 8.5.
3. Migrate your old Deployment Manager. Use the migration tools to migrate the old deployment manager to WebSphere Application Server Version 8.5.

- a. Perform `--wasmigrate` on your migrated deployment manager from its `WAS_HOME/bin` dir. For example:

```
wsadmin.sh -conntype NONE -lang jython -f .migrateConfigTo85.py --wasmigrate -oldWASHome <oldWASHome> -newWASHome <newWASHome> -cellName <cell> -nameOfProfile <profile> -configBackupDir <PathToBackupLocation> -level <level>
```

4. Restore your saved configurations on the deployment manager. To restore a configuration, run the following script from the `<WASHOME>/bin` directory of the deployment manager:

-  `./wsadmin.sh -lang jython -f migrateWCGConfigTo85.py --restore`
-    `(wsadmin.bat -lang jython -f migrateWCGConfigTo85.py --restore`

Optional parameters:

- `-configBackupDir` : Use this parameter to change the location where the batch configuration is backed up. The default is `<WASHOME>/temp`
- `-lreeJNDIName`: Use this parameter to change the default JNDI name used by the batch endpoints. The default is `jdbc/lree`
- `-lreeSchema`: Use this parameter to change the default database schema used by the batch endpoints. The default is `LREESHEMA`
- `-profileName`: Use this parameter to change the default profile name. The default is `Dmgr01`

Migrating databases

You can migrate your WebSphere Extended Deployment Compute Grid or Feature Pack for Modern Batch databases to Version 8.5.

Before you begin

- To Migrate WebSphere Extended Deployment Compute Grid Version 6.1.1 to Version 8.5, you must have WebSphere Extended Deployment Compute Grid Fixpack 3 and cumulative interim fix PK35389 installed.
- You can also use these steps to migrate the Feature Pack for Modern Batch 1.0.0.x.
- Migrate the deployment manager before performing the following tasks.

About this task

To migrate the databases, run the migration DDL corresponding to the database type.

Procedure

- WebSphere Extended Deployment Compute Grid
 1. For DB2: Run the following commands:
 - db2 –tvf MigrateLRSCHEDTablesDB2v6TOv85.ddl
 - db2 –tvf MigrateLREETablesDB2.ddl
 2. For Derby: Run the following commands:
 - >java -Djava.ext.dirs=<WAS_INSTALL_ROOT> /derby/lib -Dij.protocol=jdbc:derby:org.apache.derby.tools.ij MigrateLRSCHEDTablesDerbyv6Tov85.ddl
 - >java -Djava.ext.dirs=<WAS_INSTALL_ROOT> /derby/lib -Dij.protocol=jdbc:derby:org.apache.derby.tools.ij MigrateLREETablesDerby.ddl
 3. For Oracle: Run the following scripts:
 - MigrateLRSCHEDTablesOraclev6TOv85.ddl
 - MigrateLREETablesOracle.ddl
- Feature Pack for Modern Batch
 1. For DB2: Run the following command:
 - db2 –tvf MigrateLRSCHEDTablesDB2FePTOv85.ddl
 2. For Derby: Run the following command:
 - >java -Djava.ext.dirs=<WAS_INSTALL_ROOT> /derby/lib -Dij.protocol=jdbc:derby:org.apache.derby.tools.ij MigrateLRSCHEDTablesDerbyFePTov85.ddl
 3. For Oracle: Run the following script:
 - MigrateLRSCHEDTablesOraclevFePTOv85.ddl

Migrating servers

You can migrate your WebSphere Extended Deployment Compute Grid or Feature Pack for Modern Batch servers to Version 8.5.

Before you begin

To Migrate WebSphere Extended Deployment Compute Grid Version 6.1.1.3 to Version 8.5, you must have WebSphere Extended Deployment Compute Grid Fixpack 3 and cumulative interim fix PM39203 installed.

About this task

Migrate the schedulers one at a time and then migrate the endpoints. Repeat the following steps for each Compute Grid or batch server:

Procedure

1. Stop the server. You can stop the server either by using the administration console or by running the following commands from the <USER_INSTALL_ROOT>/bin directory:
 -  ./stopServer.bat <serverName>
 -     ./stopServer.sh <serverName>
2. Install WebSphere Application Server Version 8.5.
3. Migrate your old server. Use the migration tools to migrate the old server to WebSphere Application Server Version 8.5.
4. Augment the deployment manager with the Compute Grid or batch deployment manager profile. To augment a profile, use the manageprofiles utility. In the <WAS_INSTALL_ROOT>/bin directory, run the following commands: 
bin/manageprofiles.bat -augment -profileName <profileName> -templatePath <templatePath>

► AIX ► HP-UX ► Solaris ► Linux

bin/manageprofiles.sh -augment -profileName <profileName> -templatePath <templatePath>

5. Restore your saved configurations. Start the node by running the <USER_INSTALL_ROOT>/bin/startNode.bat command. To restore a configuration, run the following script from the <WASHOME>/bin directory:

- **Windows** (wsadmin.bat -lang jython -f migrateWCGConfigTo85.py --restore
- **AIX** ► **HP-UX** ► **Solaris** ► **Linux** ./wsadmin.sh -lang jython -f migrateWCGConfigTo85.py --restore

Required parameter:

- -node: The name of the WebSphere Application Server node of the current server.
6. Start the server. Run the following command from the <USER_INSTALL_ROOT> directory:
 - **Windows** startServer.bat <servername>
 - **AIX** ► **HP-UX** ► **Solaris** ► **Linux** startServer.sh <servername>

Chapter 10. Migrating web server configurations

You can migrate a web server so that it supports the latest version of WebSphere Application Server.

Before you begin

Procedure

1. Install the IBM HTTP Server Version 8.5 and its plug-in or a plug-in for another supported web server. Install the HTTP Server and its plug-in on a different machine with the following procedure:

- a. Insert the product disk into the machine.
- b. Close the launchpad if it starts automatically.
- c. Change directories to the IHS directory on the product disk.
- d. Install the IBM HTTP Server.

Run the appropriate installation script for your platform.

- **AIX** **HP-UX** **Linux** **Solaris** `InstallIHS.sh`
- **Windows** `InstallIHS.bat`

This script installs the plug-in that you need and makes the necessary configuration changes for the supported web server.

IBM HTTP Server Version 8.5 can coexist with earlier versions, or you can upgrade earlier versions to Version 8.5. Install Version 8.5 into the same directory structure as the earlier version to upgrade that version.

Note: The IHS ISMP installer will not allow installing into the previous directory. The target directory **MUST** be empty.

If you install the HTTP Server into a different directory, Version 8.5 coexists with the previous version. By default, the administration server and the web server use the same ports as the previous version, which causes a conflict. However, you can change the port assignments on the port assignment panel of the WebSphere Application Server Installation wizard or the Profile Management tool. Read the "Installing the product and additional software" article in the information center for more information.

- Change the port number assignments for the new installation if you install into a separate directory. You can change port numbers on the coexistence panel. You can back track through the Installation wizard and change the port settings if you have not already done so. Or, you can change the port settings after installation in the `httpd.conf` file in the HTTP Server directory.
- Update the IBM HTTP Server `httpd.conf` configuration entries to remove entries for earlier WebSphere Application Server versions if you install into the same directory as an earlier version. WebSphere Application Server Version 6.1 or above use the same HTTP transport plug-in binary module. If the Web server configuration file contains WebSphere Application Server Version 6.1 or above plug-in information, you must manually remove it. Otherwise, when the HTTP Server attempts to start the second Version 8.5 plug-in binary module, there is an error. The error indicates that the module is already loaded.

The configuration file might contain duplicate entries for accessing WebSphere Application Server samples. Remove any aliases for previous versions and retain the Version 8.5 entries:

```
Version 6.x installation:  
Alias /WSsamples "c:\Program Files\WebSphere\AppServer\WSsamples"  
Alias /IBMWebAS/ "c:\Program Files\WebSphere\AppServer\web\"
```

```
Version 8.0 installation:  
Alias /WSsamples "c:\Program Files\WebSphere\AppServer\WSsamples"  
Alias /IBMWebAS/ "c:\Program Files\WebSphere\AppServer\web\"
```

2. Migrate plug-ins to work with WebSphere Application Server Version 8.5.

Starting with WebSphere Application Server Version 6.0, the following are true:

- Web servers can be represented in the administrative console.
- The web server plug-in configuration file (`plugin-cfg.xml`) is associated with every web server definition instead of one cell-wide plug-in configuration file.
- The settings in the generated plug-in configuration file are based on the list of applications that are deployed on the hosting web server.

Use the following steps to generate a web server plug-in configuration file that is based on topology. This method was used for generated plug-in configuration files in previous releases.

- a. Use the **GenPluginCfg** command to generate the plug-in configuration file.
Read the "GenPluginCfg command" article in the information center for more information.
- b. Manually propagate the generated plug-in configuration file from the machine on which the WebSphere Application Server resides to the remote web server.
- c. Use the Plug-ins installation wizard to configure the web server. Instead of using the default plug-in configuration file location, specify the new location of the plug-in configuration file that was propagated in the previous step.

Read the "Installing web server plug-ins" article in the information center for more information.

You should migrate to the application-centric approach that uses the Plug-ins installation wizard. The Plug-ins installation wizard generates scripts that can be used to create the web server definition for that web server and to map all of the applications that are currently deployed to the newly created web server definition.

What to do next

Migrating from WebSphere Application Server Version 6.1 or above:

- Only web servers defined on managed nodes are migrated to WebSphere Application Server Version 8.5.
- If you are migrating a web server and plug-ins from WebSphere Application Server Version 6.1 or above to Version 8.5 and the web server is defined on an unmanaged node, the web server creation and application mapping must be done manually.

To create the web server definition manually, perform one of the following actions:

- Use the administration console wizard.

To generate mapping to all applications that are installed at web server creation, use the mapping ALL option in the wizard.

- Use the **wsadmin** command.

```
$AdminTask createWebServer -interactive
```

and reply ALL to the mapping applications prompt.

- Use the `configureWebserverDefinition.jacl` script.

This script maps all installed applications to the web server. The script updates all of the information related to the web server plug-in such as the locations of the plug-in installation root, log file, configuration file, and key stores on the web server system. However, the script does not update other properties related to the web server if the web server definition already exists.

- The Web server might have migrated with the application server. After migrating, Verify that your web server is functioning correctly. If not, delete the web server definition and follow the instructions in this topic to redefine it.

Chapter 11. Migrating administrative scripts

You can migrate administrative scripts using scripting and the wsadmin tool.

Before you begin

About this task

WebSphere Application Server Version 8.5 supports migrating administrative scripts from Version 6.1 or above.

Procedure

If you are migrating administrative scripts from Version 6.1 or above, see: “Migrating administrative scripts from Version 6.1 or above to 8.5” on page 97

Migrating administrative scripts from a previously Version 5.1.x application server

There are some changes you should be aware of when migrating from a version of WebSphere Application Server that was previously Version 5.1.x.

Before you begin

About this task

There are a few changes to be aware of that are required for your existing scripts when moving to WebSphere Application Server Version 8.5. In general, the administration model has changed very little. However, there are some changes required when moving from a previously Version 5.1.x to Version 8.5.

Procedure

- Be aware of the implications of migrating JMS applications from the embedded messaging in WebSphere Application Server Version 5.1.x to the default messaging provider in WebSphere Application Server Version 8.5.
- A new version of Jacl (1.3.2) was shipped beginning with WebSphere Application Server Version 6.1. With this Jacl version, **regexp** command supports only Tcl 8.0 **regexp** command syntax. If your existing Version 5.1.x Jacl script uses the **regexp** command syntax that is supported in Jacl 1.2.6 but not anymore in Jacl 1.3.2, you might not get a match anymore or you might get a compile error for your **regexp** command similar to the following:

```
com.ibm.bsf.BSFException: error while eval'ing Jacl expression:
couldn't compile regular expression pattern: ?+* follows nothing
    while executing
"regexp {(?x)
    ...
    ("if" test expression)
    invoked from within
"if {[regexp {(?x)
    ...
    (file testregexp.jacl line 2)
    (file line 2)
    invoked from within
"source testregexp.jacl"
```

There is no workaround for this regression problem. Jacl has indicated that this is by design and there is no simple patch to fix this design decision.

- For WSADMIN \$AdminConfig: The PME CacheInstanceService type is no longer used. If your scripts contain code to set the **enable** attribute on the CacheInstanceService type, remove the code. It is not needed in Version 8.5.
- There are a few changes to be aware of that are required for your existing Version 5.1.x scripts when moving to WebSphere Application Server Version 8.5. These types of changes can be evolved directly without the assistance of script compatibility support. The data can be accessed from multiple locations, including the old and new locations. As long as the new location is not updated, the data is accessed from the old location. Once the new location is updated, it becomes the current data and is used for further accesses and updates. Warning messages are logged when the old location is still being used. Read “Example: Migrating - Changing transaction log directory using wsadmin scripting” on page 95 for more information.
- There are a few changes to be aware of that are required for your existing scripts when moving from Version 5.1.x to WebSphere Application Server Version 8.5. These changes are assisted by the compatibility mode provided by “WASPostUpgrade command” on page 31. During migration, the default is to migrate using compatibility mode. If this option is taken, then the old object types are migrated into the new configuration; all existing scripts will run unchanged.

See the “Example: Migrating - Changing process definitions using scripting” on page 96 article for more information.

- Be aware of removed features that might have an impact on administration scripts.

These might include the following:

- Support for the Secure Authentication Service (SAS) IIOIP security protocol
- Support for the Common Connector Framework (CCF)
- Support for the IBM Cloudscape Version 5.1.x database
- Support for the following Java Database Connectivity (JDBC) drivers:
 - WebSphere Connect JDBC driver
 - Microsoft SQL Server 2000 Driver for JDBC
 - WebSphere SequeLink JDBC driver for Microsoft SQL Server

Read “Migrating from the WebSphere Connect JDBC driver” on page 46 for information on using the WebSphereConnectJDBCDriverConversion command to convert data sources from the WebSphere Connect JDBC driver to the DataDirect Connect JDBC driver or the Microsoft SQL Server JDBC driver.

For more information, see the "Deprecated and removed features" article in the information center.

Example: Migrating - Allowing configuration overwrite when saving configurations

These examples demonstrate how to enable configuration overwrite in network deployment for WebSphere Application Server Version 6.x.

Use the following examples:

- wsadmin Version 6.x
 1. Enable configuration repository to allow configuration overwrite:

depfeat: Using Jacl:

```
set s1AdminService [$AdminConfig getid /Server:dmgr/AdminService:/]

set configRepository [$AdminConfig showAttribute $s1AdminService configRepository]
set props [$AdminConfig showAttribute $configRepository properties]
set foundAllowConfigOverwrites ""
if {$props != "{}"} {
  foreach prop $props {
    if {[AdminConfig showAttribute $prop name] == "allowConfigOverwrites"} {
      set foundAllowConfigOverwrites $prop
      break
    }
  }
}
```

```

    }
  }
}

if {$foundAllowConfigOverwrites == ""} {
  $AdminConfig create Property $configRepository {{name allowConfigOverwrites} {value true}}
} else {
  $AdminConfig modify $foundAllowConfigOverwrites {{value true}}
}

$AdminConfig save

```

Using Jython:

```

s1AdminService = AdminConfig.getid('/Server:dmgr/AdminService:/')
configRepository = AdminConfig.showAttribute(s1AdminService, 'configRepository')
props = AdminConfig.showAttribute(configRepository, 'properties')
foundAllowConfigOverwrites = ''
if props != '[]':
  properties = props[1:len(props)-1].split(' ')
  for prop in properties:
    name = AdminConfig.showAttribute(prop, 'name')
    if name == 'allowConfigOverwrites':
      foundAllowConfigOverwrites = prop
      break

if len(foundAllowConfigOverwrites) != 0:
  AdminConfig.modify(foundAllowConfigOverwrites, [['value', 'true']])
else:
  AdminConfig.create('Property', configRepository, [['name', 'allowConfigOverwrites'], ['value', 'true']])

AdminConfig.save()

```

- Restart the deployment manager. From the bin directory of the deployment manager profile, run the following:

```

Windows
stopManager
startManager

AIX HP-UX Solaris
./stopManager.sh
./startManager.sh

```

- Allow configuration overwrite, for example:

depfat: Using Jacl:

```
$AdminConfig setSaveMode overwriteOnConflict
```

Using Jython:

```
AdminConfig.setSaveMode('overwriteOnConflict')
```

Example: Migrating - Changing transaction log directory using wsadmin scripting

Prepare for evolutionary changes without script compatibility support.

The location of the transaction logs directory attribute has changed from the ApplicationServer::TransactionService to the ServerEntry::recoveryLogs. As long as the new location is not used, the value from the old location will continue to be used. Scripts that modify the old location can still be used; that value will take effect until a value in the new location is set. The change to scripts to use the new location is as follows:

Old location:

- Using Jacl:

```
set transService [$AdminConfig list TransactionService $server1]
$AdminConfig showAttribute $transService transactionLogDirectory
```

New Location:

- Using Jython:

```
AdminConfig.list("ServerEntry")

# Select one entry from the list, e.g the entry for server1:
serverEntryId = AdminConfig.getid("/ServerEntry:server1")
serverEntry = AdminConfig.list("ServerEntry", serverEntryId)

recoveryLog = AdminConfig.showAttribute(serverEntry, "recoveryLog")
AdminConfig.showAttribute(recoveryLog, "transactionLogDirectory")
```

- Using Jacl:

```
$AdminConfig list ServerEntry $node
set serverEntry <select one of the ServerEntry from output of above command>
set recoveryLog [$AdminConfig showAttribute $serverEntry recoveryLog]
$AdminConfig showAttribute $recoveryLog transactionLogDirectory
```

Example: Migrating - Changing process definitions using scripting

Prepare for evolutionary changes with script compatibility support.

The following changes can be made with **with** script compatibility support.

- **HTTP transports:** the architecture uses the new channel framework. HTTP definitions are mapped on top of this support. When compatibility mode is chosen, the old HTTPTransport objects are migrated and mapped onto the channel architecture. Existing scripts can modify these objects and will run unchanged.
- **Process definition:** The name of this object is changed from processDef to processDefs. You can mitigate this change by using the compatibility mode mapping provided by the migration tools. The change to scripts to use the new location is as follows:

- Old example using Jython:

```
processDef = AdminConfig.list('JavaProcessDef', server1)
print processDef
```

- New example using Jython. Identify the process definition belonging to this server and assign it to the processDefs variable:

```
processDefs = AdminConfig.list('JavaProcessDef', server1)
print processDefs
```

Example: Migrating - Modifying web container port numbers

These examples demonstrate how to modify web container HTTP transport ports for WebSphere Application Server Version 6.x.

Use the following examples:

- wsadmin Version 5.1.x

depfeat: Using Jacl:

```
set httpPort 7575
set server [$AdminConfig getid /Cell:myCell/Node:myNode/Server:server1/]
set transports [$AdminConfig list HTTPTransport $server]
set transport [lindex $transports 0]
set endPoint [$AdminConfig showAttribute $transport address]
$AdminConfig modify $endPoint [list [list port $httpPort]]
$AdminConfig save
```

Using Jython:

```
httpPort = 7575
server = AdminConfig.getid("/Cell:myCell/Node:myNode/Server:server1/")
transports = AdminConfig.list("HTTPTransport", server).split(java.lang.System.getProperty("line.separator"))
```

```

transport = transports[0]
endPoint = AdminConfig.showAttribute(transport, "address")
AdminConfig.modify(endPoint, [{"port", httpPort}])
AdminConfig.save()

```

- wsadmin Version 6.x

defeat: Using Jacl:

```

set serverNm server1
set newPort 7575
set node [AdminConfig getid /Cell:myCell/Node:myNode/]
set TCS [AdminConfig getid /Cell:myCell/Node:myNode/Server:server1/TransportChannelService:/]
set chains [AdminTask listChains $TCS {-acceptorFilter WebContainerInboundChannel}]

foreach chain $chains {
  set channels [lindex [AdminConfig showAttribute $chain transportChannels] 0]
  foreach channel $channels {
    if {[catch {set channelEndPointName [AdminConfig showAttribute $channel endPointName]} result]} {
      # ignore the error as not all channel has endPointName attribute
    } else {
      set serverEntries [AdminConfig list ServerEntry $node]
      foreach serverEntry $serverEntries {
        set sName [AdminConfig showAttribute $serverEntry serverName]
        if {$sName == $serverNm} {
          set specialEndPoints [lindex [AdminConfig showAttribute $serverEntry specialEndpoints] 0]
          foreach specialEndPoint $specialEndPoints {
            set endPointNm [AdminConfig showAttribute $specialEndPoint endPointName]
            if {$endPointNm == $channelEndPointName} {
              set ePoint [AdminConfig showAttribute $specialEndPoint endPoint]
              AdminConfig modify $ePoint [list [list port $newPort]]
              break
            }
          }
        }
      }
    }
  }
}

AdminConfig save

```

Using Jython:

```

serverNm = "server1"
newPort = "7575"
node = AdminConfig.getid("/Cell:myCell/Node:myNode/")
TCS = AdminConfig.getid("/Cell:myCell/Node:myNode/Server:server1/TransportChannelService:/")
chains = AdminTask.listChains(TCS, ["-acceptorFilter WebContainerInboundChannel"]).split(java.lang.System.getProperty("line.separator"))

for chain in chains:
    channelString = AdminConfig.showAttribute(chain, "transportChannels")
    channelList = channelString[1:len(channelString)-1].split(" ")
    for channel in channelList:
        try:
            channelEndPointName = AdminConfig.showAttribute(channel, "endPointName")
            serverEntries = AdminConfig.list("ServerEntry", node).split(java.lang.System.getProperty("line.separator"))
            for serverEntry in serverEntries:
                sName = AdminConfig.showAttribute(serverEntry, "serverName")
                if sName == serverNm:
                    sepString = AdminConfig.showAttribute(serverEntry, "specialEndpoints")
                    sepList = sepString[1:len(sepString)-1].split(" ")
                    for specialEndPoint in sepList:
                        endPointNm = AdminConfig.showAttribute(specialEndPoint, "endPointName")
                        if endPointNm == channelEndPointName:
                            ePoint = AdminConfig.showAttribute(specialEndPoint, "endPoint")
                            AdminConfig.modify(ePoint, [{"port", newPort}])
                            break
        except:
            # ignore the error as not all channel has endPointName attribute
            pass

AdminConfig.save()

```

Migrating administrative scripts from Version 6.1 or above to 8.5

There are some changes you should be aware of when migrating your administrative scripts from WebSphere Application Server Version 6.1 or above to Version 8.5.

Before you begin

Procedure

- Be aware of removed features that might have an impact on administration scripts.

These might include the following:

- Support for the Secure Authentication Service (SAS) IIOIP security protocol
- Support for the Common Connector Framework (CCF)
- Support for the IBM Cloudscape Version 5.1.x database
- Support for the following Java Database Connectivity (JDBC) drivers:
 - WebSphere Connect JDBC driver
 - Microsoft SQL Server 2000 Driver for JDBC
 - WebSphere SequeLink JDBC driver for Microsoft SQL Server

Read “Migrating from the WebSphere Connect JDBC driver” on page 46 for information on using the `WebSphereConnectJDBCdriverConversion` command to convert data sources from the WebSphere Connect JDBC driver to the DataDirect Connect JDBC driver or the Microsoft SQL Server 2005 JDBC driver.

For more information, see the “Deprecated and removed features” article in the information center.

- Be aware of the change required when creating Service Integration Bus (SIB) objects.

For more information about the `createSIBus` command, see the “createSIBus command” article in the information center.

Updating SSL configurations to Version 8.5 configuration definitions after migration

When migrating to Version 8.5, you can update the format for SSL configuration or you can continue to use the format of the earlier version. If you encounter errors with your existing administration scripts for SSL configurations, use this task to manually convert your SSL configuration to the Version 8.5 format.

Before you begin

Note:

About this task

When migrating to Version 8.5, you can use the “WASPreUpgrade command” on page 28 to save the configuration of your previously installed version into a migration-specific backup directory. When migration is complete, you can use the “WASPostUpgrade command” on page 31 to retrieve the saved configuration and WASPostUpgrade script to migrate your previous configuration. The **-scriptCompatibility** parameter for the WASPostUpgrade command is used to specify whether to maintain the 6.1 or above configuration definitions or to upgrade the format to Version 8.5 configuration definitions. If you used the default value, or `-scriptCompatibility true` when migrating, you do not need to perform this task. If you set the `scriptCompatibility` parameter to `false` during migration, you may notice that your existing administration scripts for SSL configurations do not work correctly. If this occurs, use this task to convert your 6.1 or above SSL configuration definitions to Version 8.5. This process creates a new SSL configuration based on the existing configuration.

Follow the steps below to modify the existing SSL configuration:

```
<repertoire xmi:id="SSLConfig_1" alias="Node02/DefaultSSLSettings">
<setting xmi:id="SecureSocketLayer_1" keyFileName="$install_root/etc/MyServerKeyFile.jks"
keyFilePassword="password" keyFileFormat="JKS" trustFileName="$install_root/etc/MyServerTrustFile.jks"
trustFilePassword="password" trustFileFormat="JKS" clientAuthentication="false" securityLevel="HIGH"
enableCryptoHardwareSupport="false">
<cryptoHardware xmi:id="CryptoHardwareToken_1" tokenType="" libraryFile="" password="{custom}"/>
```

```
<properties xmi:id="Property_6" name="com.ibm.ssl.protocol" value="SSL"/>
<properties xmi:id="Property_7" name="com.ibm.ssl.contextProvider" value="IBMJSSE2"/>
</setting>
</repertoire>
```

Procedure

1. Create a key store that references the key store attributes in the old configuration.

- a. In the existing configuration, find the **keyFileName**, **keyFilePassword**, and **keyFileFormat** attributes.

```
keyFileName="${install_root}/etc/MyServerKeyFile.jks" keyFilePassword="password" keyFileFormat="JKS"
```

- b. Use the **keyFileName**, **keyFilePassword**, and **keyFileFormat** attributes to create a new KeyStore object. For this example, set the name as "DefaultSSLSettings_KeyStore".

depfat: Using Jacl:

```
$AdminTask createKeyStore {-keyStoreName DefaultSSLSettings_KeyStore -keyStoreLocation
${install_root}/etc/MyServerKeyFile.jks -keyStoreType JKS -keyStorePassword
password -keyStorePasswordVerify password }
```

The resulting configuration object in the security.xml file is:

```
<keyStores xmi:id="KeyStore_1" name="DefaultSSLSettings_KeyStore" password="password"
provider="IBMJCE" location="${install_root}/etc/MyServerKeyFile.jks" type="JKS" fileBased="true"
managementScope="ManagementScope_1"/>
```

Note: If you specify the cryptoHardware values in your configuration, create the KeyStore object using these values instead. Associate the -keyStoreLocation parameter with the libraryFile attribute, the -keyStoreType parameter with the tokenType attribute, and the -keyStorePassword parameter with the password attribute.

```
<cryptoHardware xmi:id="CryptoHardwareToken_1" tokenType="" libraryFile="" password=""/>
```

2. Create a trust store that references the trust store attributes from the existing configuration.

- a. Find the **trustFileName**, **trustFilePassword**, and **trustFileFormat** attributes in the existing configuration.

```
trustFileName="${install_root}/etc/MyServerTrustFile.jks" trustFilePassword="password"
trustFileFormat="JKS"
```

- b. Use the **trustFileName**, **trustFilePassword**, and **trustFileFormat** attributes to create a new KeyStore object. For this example, set the name as "DefaultSSLSettings_TrustStore".

depfat: Using Jacl:

```
$AdminTask createKeyStore {-keyStoreName DefaultSSLSettings_TrustStore -keyStoreLocation
${install_root}/etc/MyServerTrustFile.jks -keyStoreType JKS -keyStorePassword password
-keyStorePasswordVerify password }
```

The resulting configuration object in the security.xml file is:

```
<keyStores xmi:id="KeyStore_2" name="DefaultSSLSettings_TrustStore" password="password"
provider="IBMJCE" location="${install_root}/etc/MyServerTrustFile.jks" type="JKS" fileBased="true"
managementScope="ManagementScope_1"/>
```

3. Create a new SSL configuration using the new key store and trust store. Include any other attributes from the existing configuration which are still valid.

Use a new alias for your updated SSL configuration. You can not create an SSL configuration with the same name as your existing configuration.

depfat: Using Jacl:

```
$AdminTask createSSLConfig {-alias DefaultSSLSettings -trustStoreName DefaultSSLSettings_TrustStore
-keyStoreName DefaultSSLSettings_KeyStore -keyManagerName IbmX509 -trustManagerName IbmX509
-clientAuthentication true -securityLevel HIGH -jsseProvider IBMJSSE2 -sslProtocol SSL }
```

Results

The new SSL configuration is:

```
<repertoire xmi:id="SSLConfig_1" alias="DefaultSSLSettings" managementScope="ManagementScope_1">  
<setting xmi:id="SecureSocketLayer_1" clientAuthentication="true" securityLevel="HIGH" enabledCiphers=""  
jsseProvider="IBMJSSE2" sslProtocol="SSL" keyStore="KeyStore_1" trustStore="KeyStore_2"  
trustManager="TrustManager_1" keyManager="KeyManager_1"/>  
</repertoire>
```

Note: The default management scope is used if it is not specified.

Chapter 12. Running multiple application server versions

You can create an environment in which multiple versions of WebSphere Application Server can run independently on the same system at the same time. A major consideration in coexistence is the avoidance of port conflicts.

Before you begin

Coexisting, as it applies to WebSphere Application Server products, is running a new release of a WebSphere Application Server product on the same machine at the same time as you run an earlier release or running two installations of the same release of a WebSphere Application Server product on the same machine at the same time.

Procedure

- Read “Coexistence support.”

This article discusses which coexistence scenarios are supported.

- Read “Setting up Version 6.1 or above and Version 8.5 coexistence” on page 102.

This article describes how to install a WebSphere Application Server Version 8.5 product to coexist with another installation instance of Version 6.1 or above.

- Read “Setting up Version 8.5 coexistence” on page 104.

This article describes how to install a WebSphere Application Server Version 8.5 product to coexist with another installation instance of Version 8.5.

Coexistence support

Coexistence is a state in which multiple installations and multiple nodes from different versions of WebSphere Application Server run independently in the same environment at the same time.

As it applies to WebSphere Application Server products, coexistence primarily refers to the ability of multiple installations of WebSphere Application Server to run independently on the same machine at the same time. Multiple installations include multiple versions and multiple instances of one version. Coexistence also implies various combinations of web server interaction.

WebSphere Application Server Version 8.5 products can coexist with the following supported versions:

- WebSphere Application Server Version 6.1 or above
- WebSphere Application Server, Network Deployment Version 6.1 or above

All combinations of Version 6.1 or above and Version 8.5 products can coexist so long as there are no port conflicts.

WebSphere Application Server Version 6.1 and above clients can coexist with Version 8.5 clients.

Table 2. WebSphere Application Server Version 6.1, 7.0, 8.0, and Version 8.5 clients multiversion coexistence scenarios. The table lists the installed products and specifies if the products support WebSphere Application Server Version 8.5 clients.

Installed product	WebSphere Application Server Version 8.5 clients
WebSphere Application Server Version 6.1	Supported
WebSphere Application Server WebSphere Application Server, Network Deployment Version 6.1	Supported
WebSphere Application Server Version 7.0	Supported

Table 2. WebSphere Application Server Version 6.1, 7.0, 8.0, and Version 8.5 clients multiversion coexistence scenarios (continued). The table lists the installed products and specifies if the products support WebSphere Application Server Version 8.5 clients.

Installed product	WebSphere Application Server Version 8.5 clients
WebSphere Application Server WebSphere Application Server, Network Deployment Version 7.0	Supported
WebSphere Application Server Version 8.0	Supported
WebSphere Application Server WebSphere Application Server, Network Deployment Version 8.0	Supported

WebSphere Application Server Version 6.1, 7.0, and 8.0 products can coexist with Version 8.5 products.

Table 3. WebSphere Application Server Version 6.1, 7.0, 8.0 and Version 8.5 multiversion coexistence support. The table lists the installed products and specifies if coexistence with other products and versions is supported.

Installed product	WebSphere Application Server Version 6.1, 7.0, and 8.0			WebSphere Application Server Version 8.5		
	Application Server	WebSphere Application Server, Network Deployment	WebSphere Application Server, Express	Application Server	WebSphere Application Server, Network Deployment	WebSphere Application Server, Express
WebSphere Application Server Version 6.1	Supported	Supported	Supported	Supported	Supported	Supported
WebSphere Application Server, Network Deployment Version 6.1	Supported	Supported	Supported	Supported	Supported	Supported
WebSphere Application Server Version 7.0	Supported	Supported	Supported	Supported	Supported	Supported
WebSphere Application Server, Network Deployment Version 7.0	Supported	Supported	Supported	Supported	Supported	Supported
WebSphere Application Server Version 8.0	Supported	Supported	Supported	Supported	Supported	Supported
WebSphere Application Server, Network Deployment Version 8.0	Supported	Supported	Supported	Supported	Supported	Supported

In addition to multiversion coexistence, WebSphere Application Server also lets you install multiple times on one machine (multiple installation instances) or install once and have multiple profiles. Multiple Version 8.5 installation instances on one machine include the following combinations:

- Multiple application server profiles from multiple installations of the WebSphere Application Server product
- Multiple application server profiles from a single installation of the WebSphere Application Server product

Setting up Version 6.1 or above and Version 8.5 coexistence

You can install Version 8.5 to coexist with another installation instance of Version 6.1 or above.

Before you begin

Read "Overview of migration, coexistence, and interoperability" on page 1 and "Premigration considerations" on page 5.

Procedure

1. Be aware of the basic rules of WebSphere Application Server coexistence.

Each installation of the base product is a stand-alone application server with its own set of unique configuration files.

Be aware of the following multiple-instance limitations:

- If you install more than one instance, the most recent installation is the only one in the operating system registry.
- To uninstall a registered product instance, always use the operating-system removal program, such as the Add/Remove Program utility on Windows platforms. To uninstall an unregistered instance, use `Uninstall.exe` or the `uninstall` command in the `app_server_root/_uninstall` directory that matches the instance that you intend to remove.

Reasons to use multiple installation instances include the following items:

- You can achieve complete isolation between each WebSphere Application Server instance. You can uninstall one instance independently of the others.
- You can install the WebSphere Application Server (base) more than once on the same machine.
- You can install the base Version 6.1 or above product and the Version 8.5 product on the same machine.

Reasons you should not use multiple installation instances include the following items:

- The machine might have a hard-disk space constraint.
- You can use the operating system registry to locate the last installed instance of a WebSphere Application Server only.

When you install any product a second time, the last installation is the one that is displayed in the registry.

- Uninstalling the last instance removes any record of the product in the registry.

Suppose you have installed three instances of the WebSphere Application Server (base). You use the remove program function of the operating system to uninstall the registered third copy of the base product. A registry record no longer exists that indicates the existence of the other two installation instances. Other applications cannot use a query of the operating system registry to detect the presence of either WebSphere Application Server (base) product instance.

The "Creating profiles using the graphical user interface" article in the information center describes installing the WebSphere Application Server once and creating multiple profiles.

2. Use the Installation wizard to install another instance.

Read the "Installing the product and additional software" article in the information center for more information.

If you intend to share a single web server among installations, install the appropriate Version 8.5 web server plug-in using the stand-alone Web server Plug-in installation wizard that is provided on the WebSphere Application Server disk.

3. Share a web server among multiple installation instances.
 - a. Use the Plug-in installation wizard to select a Web server plug-in.
 - b. Use the administrative console to generate the plug-in configuration files for every installation instance and merge them into one primary configuration.
 - c. Use the administrative console to replace the original `plugin-cfg.xml` file with the primary file on the web server.

You can access samples from only one of the installation instances.

4. Change the port assignments in the configuration files if you have a node that you cannot start because of port conflicts.

Read “Port number settings” on page 108 for more information.

Note: If ports are already defined in a configuration being migrated, the migration tools fix the port conflicts in the Version 8.5 configuration and log the changes for your verification .

What to do next

After migrating a Version 6.1 or above deployment manager to a Version 8.5 deployment manager, you can migrate the Version 6.1 federated nodes incrementally. Read Migrating a Version 6.1 or above federated node for more information.

Setting up Version 8.5 coexistence

After installing the WebSphere Application Server product, you can install it again on the same machine.

Before you begin

Read “Overview of migration, coexistence, and interoperability” on page 1 and “Premigration considerations” on page 5.

About this task

This is not a typical scenario. One of the main goals of multiple-profile support is to minimize the need for scenarios like this. One reason that you might want to install two or more instances of WebSphere Application Server Version 8.5 on the same machine might be a need to have different fix levels of the product on a machine for some reason.

Procedure

1. Use the Installation wizard to install another set of the core product files as described in the "Installing the product and additional software" article in the information center.

Select the new installation option from the Installation wizard panel to install a new instance instead of adding features to the last installation and to install into a separate profile directory.

2. Use the Profile Management tool or the `manageprofiles` command to create multiple application-server processes.

During profile creation using the Profile Management tool, you can specify your port settings. Read the "Creating profiles using the graphical user interface" article in the information center for more information.

During profile creation, the `manageprofiles` command can use port values that you specify instead of the default port values. You can use a port file, specify a starting port, or accept the default port values. Read the "manageprofiles command" article in the information center for more information.

3. If you have a node that you cannot start because of port conflicts, change port assignments to nonconflicting ports in configuration files.

Use one of the following methods:

- Use the `updatePorts` tool to change port settings.
Read the "Updating ports in an existing profile" article in the information center for more information.
- Edit the `profile_root/config/cells/cell_name/nodes/node_name/serverindex.xml` file to change the port settings, or use scripting to change the values.

Chapter 13. Interoperating multiple application server versions

WebSphere Application Server Version 8.5 is interoperable with other versions of the product under certain conditions.

Before you begin

Read “Overview of migration, coexistence, and interoperability” on page 1 and “Premigration considerations” on page 5. For resources to help you plan and perform your migration, visit Knowledge Collection: Migration planning for WebSphere Application Server.

Interoperability applies to WebSphere administrative actions, administrative communication and to application client requests. WebSphere Application Server Version 8.5 is generally interoperable with WebSphere Application Server Version 6.1 and above. However, there are specific requirements to address for each version. In general, you should apply the latest fix level to support interoperability. If this is not possible, then the following interim fixes can be used to support your environment.

You can upgrade a portion of the nodes in a cell to WebSphere Application Server Version 8.5 while leaving others at the older release level. This means that, for a period of time, you might be administering servers that are at the current release and servers that are running the newer release in the same cell.

For web application clients, interoperability is provided by employing the HTTP server plug-in at the highest version of all of the application servers in the cell. For example, a cell comprised of WebSphere Application Server Version 7.0 and Version 6.1 application servers would use a supported HTTP server with a Version 7.0 plug-in. Refer to the TechnoteWeb server plug-in policy for WebSphere Application Server for more information.

Procedure

1. Apply required interim fixes.
All fixes are available on the Support site for WebSphere Application Server products.
2. Upgrade the Software Development Kit (SDK) used to one supported by Version 8.5.
Read Recommended fixes for WebSphere Application Server for more information.

What to do next

This information is dynamic and might be augmented by information in technical articles that are available on the IBM DeveloperWorks WebSphere site. Check the site for the latest information.

Chapter 14. Configuring port settings

When you configure WebSphere Application Server resources or assign port numbers to other applications, you must avoid conflicts with other assigned ports. In addition, you must explicitly enable access to particular port numbers when you configure a firewall.

Before you begin

Tip: Port conflicts might occur if you install WebSphere Application Server on multiple systems with deployment managers managing servers or clusters on different systems. The configuration-service port-resolution mechanism does not support cross profiles on different host machines.

- **Example 1:**

1. On system A, create a cell profile that includes Dmgr and AppSrv01 (Node1).
2. On system B, create AppSrv01 and federate AppSrv01 (Node2) to Dmgr on system A.
3. Create server1 on Node1 and server2 on Node2.
4. The server1 server and server2 server might contain duplicate server endpoint ports in the `serverindex.xml` file because Node1 and Node2 are located on different host systems.

- **Example 2:**

1. On system A, create a cell profile that includes Dmgr and AppSrv01 (Node1).
2. On system B, create AppSrv01 and federate AppSrv01 (Node2) to Dmgr on system A.
3. On system B, create JobManager.
4. Create a cluster and add two servers, server1 on Node1 and server2 on Node2.
5. The server2 server and the JobManager server might contain duplicate server endpoint ports in the `serverindex.xml` file because server2 and JobManager are in cross profiles. The server2 server is under Dmgr, JobManager is under the JobManager profile. and the Dmgr and JobManager profiles are located on different machines.

Procedure

1. Review the port number settings, especially when you are planning to coexist.
2. Optional: Change the port number settings.

You can set port numbers when configuring the product after installation.

- During profile creation using the `manageprofiles` command, you can accept the default port values or you can specify your port settings. If you want to specify ports, you can do so in any of the following ways:

- Specify the use of a port file that contains the port values.
- Specify the use of a starting port value.
- Specify the use of the default port values.

Read the *manageprofiles command* article in the information center for more information.

- During profile creation using the Profile Management tool, you can accept the port settings recommended by the tool or you can specify your port settings.

Read the *Creating profiles using the graphical user interface* article in the information center for more information.

You can perform one of the following actions to change port settings after installation:

- Use the `updatePorts` tool to change port settings.

Read the *Updating ports in an existing profile* article in the information center for more information.

Read the *Port number settings in WebSphere Application Server versions* article in the information center for more information.

- Edit the `profile_root/config/cells/cell_name/nodes/node_name/serverindex.xml` file to change the port settings, or use scripting to change the values.

Port number settings

You should be able to identify the default port numbers used in the various versions of WebSphere Application Server so that you can avoid port conflicts if you plan for an earlier version to coexist or interoperate with Version 8.5.

When you configure WebSphere Application Server resources or assign port numbers to other applications, you must avoid conflicts with other assigned ports. In addition, when you configure a firewall, you must explicitly enable access to particular port numbers.

If ports are already defined in a configuration being migrated, the migration tools fix the port conflicts in the Version 8.5 configuration and log the changes for your verification .

Version 8.5 port numbers

Table 4. Port definitions for WebSphere Application Server Version 8.5. The table lists port names and the default values of the port numbers.

Port Name	Default Value				Files
	Application Server	Administrative Agent	Job Manager	Administrative Subsystem	
Administrative Console Port (WC_adminhost)	9060	9060	9960	----	serverindex.xml and virtualhosts.xml
Administrative Console Secure Port (WC_adminhost_secure)	9043	9043	9943	----	
HTTP Transport Port (WC_defaulthost)	9080	----	----	----	
HTTPS Transport Secure Port (WC_defaulthost_secure)	9443	----	----	----	

Table 4. Port definitions for WebSphere Application Server Version 8.5 (continued). The table lists port names and the default values of the port numbers.

Port Name	Default Value				Files
	Application Server	Administrative Agent	Job Manager	Administrative Subsystem	
Bootstrap Port (BOOTSTRAP_ADDRESS)	2809	9807	9808	----	serverindex.xml
Cell Discovery Address (CELL_DISCOVERY_ADDRESS)	----	----	----	----	
CSIV2 Client Authentication Listener Port (CSIV2_SSL_MUTUALAUTH_LISTENER_ADDRESS)	9402	9402	9402	----	
CSIV2 Server Authentication Listener Port (CSIV2_SSL_SERVERAUTH_LISTENER_ADDRESS)	9403	9403	9403	----	
High Availability Manager Communication Port (DCS_UNICAST_ADDRESS)	9353	----	----	----	
Internal JMS Server Port (JMSSERVER_SECURITY_PORT)	5557	----	----	----	
IPC Connector Port (IPC_CONNECTOR_ADDRESS)	9633	9630	9631	9634	
MQ Transport Port (SIB_MQ_ENDPOINT_ADDRESS)	5558	----	----	----	
MQ Transport Secure Port (SIB_MQ_ENDPOINT_SECURE_ADDRESS)	5578	----	----	----	

Table 4. Port definitions for WebSphere Application Server Version 8.5 (continued). The table lists port names and the default values of the port numbers.

Port Name	Default Value				Files
	Application Server	Administrative Agent	Job Manager	Administrative Subsystem	
ORB Listener Port (ORB_LISTENER_ADDRESS)	9100	9098	9099	----	serverindex.xml
Status Update Listener Port (STATUS_LISTENER_ADDRESS)	----	----	9425	----	
RMI Connector Port (RMI_CONNECTOR_ADDRESS)	----	----	----	9810	
JSR 160 RMI Connector Port (JSR160RMI_CONNECTOR_ADDRESS)	----	----	----	9811	
SAS_SSL_SERVERAUTH_LISTENER_ADDRESS (Deprecated)	9401	9401	9401	----	
Service Integration Port (SIB_ENDPOINT_ADDRESS)	7276	----	----	----	
Service Integration Secure Port (SIB_ENDPOINT_SECURE_ADDRESS)	7286	----	----	----	
SIP Container Port (SIP_DEFAULTHOST)	5060	----	----	----	
SIP Container Secure Port (SIP_DEFAULTHOST_SECURE)	5061	----	----	----	
SOAP Connector Port (SOAP_CONNECTOR_ADDRESS)	8880	8877	8876	8881	
IBM HTTP Server Port	80	----	----	----	virtualhosts.xml, plugin-cfg.xml, and web_server_root/conf/httpd.conf
IBM HTTPS Server Administration Port	8008	----	----	----	web_server_root/conf/admin.conf

Version 7.0 and Version 8.0 port numbers

Table 5. Port definitions for WebSphere Application Server Version 7.0 and Version 8.0. The table lists port names and the default values of the port numbers.

Port Name	Default Value				Files
	Application Server	Administrative Agent	Job Manager	Administrative Subsystem	
Administrative Console Port (WC_adminhost)	9060	9060	9960	----	serverindex.xml and virtualhosts.xml
Administrative Console Secure Port (WC_adminhost_secure)	9043	9043	9943	----	
HTTP Transport Port (WC_defaulthost)	9080	----	----	----	
HTTPS Transport Secure Port (WC_defaulthost_secure)	9443	----	----	----	

Table 5. Port definitions for WebSphere Application Server Version 7.0 and Version 8.0 (continued). The table lists port names and the default values of the port numbers.

Port Name	Default Value				Files
	Application Server	Administrative Agent	Job Manager	Administrative Subsystem	
Bootstrap Port (BOOTSTRAP_ADDRESS)	2809	9807	9808	----	serverindex.xml
Cell Discovery Address (CELL_DISCOVERY_ADDRESS)	----	----	----	----	
CSIV2 Client Authentication Listener Port (CSIV2_SSL_MUTUALAUTH_LISTENER_ADDRESS)	9402	9402	9402	----	
CSIV2 Server Authentication Listener Port (CSIV2_SSL_SERVERAUTH_LISTENER_ADDRESS)	9403	9403	9403	----	
High Availability Manager Communication Port (DCS_UNICAST_ADDRESS)	9353	----	----	----	
Internal JMS Server Port (JMSSERVER_SECURITY_PORT)	5557	----	----	----	
IPC Connector Port (IPC_CONNECTOR_ADDRESS)	9633	9630	9631	9634

					web_server_root/conf/ admin.conf

Chapter 15. Troubleshooting migration

You might encounter problems while migrating from an older version of WebSphere Application Server.

Before you begin

Procedure

- While you are using the Version 8.5 Migration wizard to create a profile before migrating a configuration, you might see the following profile-creation error messages.

```
profileName: profileName cannot be empty
profilePath: Insufficient disk space
```

These error messages might be displayed if you enter a profile name that contains an invalid character such as a space. Rerun the Migration wizard, and verify that there are no invalid characters in the profile name such as a space, quotes, or any other special characters.

- If you encounter a problem when you are migrating from a previous version of WebSphere Application Server to Version 8.5, check your log files and other available information.

1. Look for the log files, and browse them for clues.

- *migration_backup_dir/logs/WASPreUpgrade.time_stamp.log*
- *migration_backup_dir/logs/WASPostUpgrade.time_stamp.log*
- *app_server_root/logs/clientupgrade.time_stamp.log*

2. Look for MIGR0259I: The migration has successfully completed or MIGR0271W: The migration completed with warnings in one of the log files.

- *migration_backup_dir/logs/WASPreUpgrade.time_stamp.log*
- *migration_backup_dir/logs/WASPostUpgrade.time_stamp.log*
- *app_server_root/logs/clientupgrade.time_stamp.log*

If MIGR0286E: The migration failed to complete is displayed, attempt to correct any problems based on the error messages that appear in the log file. After correcting any errors, rerun the command from the bin directory of the product installation root.

3. Open the service log of the server that is hosting the resource that you are trying to access, and browse error and warning messages.

4. With WebSphere Application Server running, run the **dumpNameSpace** command and pipe, redirect, or “more” the output so that it can be easily viewed.

This command results in a display of all objects in WebSphere Application Server's namespace, including the directory path and object name.

5. If the object that a client needs to access does not appear, use the administrative console to verify the following conditions.

- The server hosting the target resource is started.
- The web module or enterprise Java bean container hosting the target resource is running.
- The JNDI name of the target resource is properly specified.

6. Enable tracing when you run the migration tools; then, analyze the trace data or forward it to the appropriate organization for analysis.

You can enable trace when you use the **WASPreUpgrade** command or the **WASPostUpgrade** command by specifying the following parameters:

-traceString

This is an optional parameter. The value *trace_spec* specifies the trace information that you want to collect.

- Specify “*=all=enabled” (with quotation marks) to gather all possible trace information.

This produces a very large trace file; for example, it can exceed 1 GB for the **WASPostUpgrade** command.

- Specify "Migration.*=all" to gather only the migration information
- Specify "Migration.Flow=all:Migration.*=finer" to gather most of the migration information.
- Specify "Migration.Flow=finer:Migration.*=fine" to gather the minimum amount of migration data needed by support teams.

This is the default.

If you do not specify the `-traceString` or `-traceFile` parameter, the command creates a trace file by default and places it in the `backupDirectory/logs` directory.

If you specify this parameter, you must also specify the `-traceFile` parameter.

-traceFile

This is an optional parameter. The value `file_name` specifies the name of the output file for trace information.

If you do not specify the `-traceString` or `-traceFile` parameter, the command creates a trace file by default and places it in the `backupDirectory/logs` directory.

If you specify the `-traceString` parameter but do not specify the `-traceFile` parameter, the script does not generate a trace file.

See the "Tracing and logging configuration" article for information on configuring your tracing and logging settings to help diagnose problems.

For current information available from IBM Support on known problems and their resolution, read the IBM Support page. IBM Support also has documents that can save you time gathering information needed to resolve this problem. Before opening a PMR, read the IBM Support page.

- During the migration process, problems might occur while you are using the **WASPreUpgrade** tool or the **WASPostUpgrade** tool.

- Problems can occur when you are using the **WASPreUpgrade** tool.

- A "Not found" or "No such file or directory" message is returned.

This problem can occur if you are trying to run the **WASPreUpgrade** tool from a directory other than the Version 8.5 `app_server_root\bin`. Verify that the **WASPreUpgrade** script resides in the Version 8.5 `app_server_root\bin` directory, and launch the file from that location.

- The DB2 JDBC driver and DB2 JDBC driver (XA) cannot be found in the drop-down list of supported JDBC providers in the administrative console.

The administrative console no longer displays deprecated JDBC provider names. The new JDBC provider names used in the administrative console are more descriptive and less confusing. The new providers will differ only by name from the deprecated ones.

The deprecated names will continue to exist in the `jdbc-resource-provider-templates.xml` file for migration reasons (for existing JACL scripts for example); however, you are encouraged to use the new JDBC provider names in your JACL scripts.

- You receive the following message:

MIGR0108E: The specified WebSphere directory does not contain a WebSphere version that can be upgraded.

The following possible reasons for this error exist:

- If WebSphere Application Server Version 6.1 is installed, you might not have run the **WASPreUpgrade** tool from the `bin` directory of the Version 8.5 installation root.
 1. Look for something like the following message to display when the **WASPreUpgrade** tool runs:
IBM WebSphere Application Server, Release 6.x.
This message indicates that you are running the WebSphere Application Server Version 6.1 migration utility, not the Version 8.5 migration utility.
 2. Alter your environment path or change the current directory so that you can launch the Version 8.5 **WASPreUpgrade** tool.

- An invalid directory might have been specified when launching the **WASPreUpgrade** tool.
- The **WASPreUpgrade** tool might exit without backing up your previous environment.

The tool might appear to run successfully as in the following example:

```
MIGR0201I: The migration function initialized log file WASPreUpgrade.log.
MIGR0300I: The migration function is starting to save the existing Application Server environment.
MIGR0302I: The existing files are being saved.
MIGR0303I: The existing Application Server environment is saved.
MIGR0420I: The first step of migration completed successfully.
```

You might also see a message similar to the following example in the migration trace file:

```
[10/9/08 18:26:40:363 CDT] 00000000 Save      1
Skipped instance dmgr01 because user root /opt/migration_backup/profiles/dmgr01 does not exist.
```

The **WASPreUpgrade** tool writes out a copy of a `profileList.ser` file that contains pointers to the backup directory to be used by the **WASPostUpgrade** tool. If that file is not subsequently deleted by migration for any reason, the old paths are used instead of the real paths when you run the **WASPreUpgrade** tool in later migrations. To resolve this issue, you can safely delete the `profileList.ser` file and rerun the **WASPreUpgrade** tool.

For more information, read “WASPreUpgrade command” on page 28.

Note: When migrating a Version 6.1 federated node to Version 8.5, the **WASPreUpgrade** command might fail. You might receive an error similar to the following example:

```
[07/16/2011 11:07:10:357 CDT] MIGR0344I: Processing configuration file
/opt/WAS61fep/profiles/v6109node74_01/config/cells/ndcell/clusters/Station1EJBCluster
/resources.xml.
[07/16/2011 11:07:10:436 CDT] org.eclipse.emf.ecore.resource.Resource$IOWrappedExcept
ion: Unresolved reference 'DataSource_1310769433958'.
(file:/opt/WAS61fep/profiles/v6109node74_01/config/cells/ndcell/clusters/Station1EJBC
luster/resources.xml, 9, 323)
java.lang.Exception: org.eclipse.emf.ecore.resource.Resource$IOWrappedException:
Unresolved reference 'DataSource_1310769433958'.
(file:/opt/WAS61fep/profiles/v6109node74_01/config/cells/ndcell/clusters/Station1EJBC
luster/resources.xml, 9, 323)
at com.ibm.wsspi.migration.document.wccm.WCCMDocument.setInputStream(WCCMDocument.ja
va:162)
```

You might encounter this problem on a WebSphere Version 6.1 node when a DB2 database using IBM JCC Provider Driver has been created, and the WebSphere Version 6.1 node is synchronized to the Version 8.5 deployment manager. The Version 6.1 node does not support the Version 7.0 or above driver level. The node synchronization process is failing to remove all of the driver definitions.

To resolve this problem, backup any `resources.xml` files that are to be modified. Stop the Version 6.1 node agent process. Edit the WebSphere Version 6.1 node `resources.xml` files and remove the orphaned `resources.jdbc:CMPCConnectorFactory` entries prior to running the **WASPreUpgrade** command. Do not edit the deployment manager copy.

- Problems can occur when you are using the **WASPostUpgrade** tool.
 - A “Not found” or “No such file or directory” message is returned.

This problem can occur if you are trying to run the **WASPostUpgrade** tool from a directory other than the Version 8.5 `app_server_root\bin`. Verify that the **WASPostUpgrade** script resides in the Version 8.5 `app_server_root\bin` directory, and launch the file from that location.
 - You receive the following message:

```
MIGR0102E: Invalid Command Line. MIGR0105E: You must specify the primary node name.
```

The most likely cause of this error is that WebSphere Application Server Version 6.1 is installed and the **WASPostUpgrade** tool was not run from the `bin` directory of the Version 8.5 installation root. To correct this problem, run the **WASPostUpgrade** command from the `bin` directory of the Version 8.5 installation root.

- You receive the “Unable to copy document to temp file” error message. Here is an example:

```
MIGR0304I: The previous WebSphere environment is being restored.  
com.ibm.websphere.management.exception.DocumentIOException: Unable to copy document to temp file:  
cells/sunblade1Network/applications/LARGEApp.ear/LARGEApp.ear
```

Your file system might be full. If your file system is full, clear some space and rerun the **WASPostUpgrade** command.

- You receive the following message:

```
MIGR0108E: The specified WebSphere directory does not contain WebSphere version that can be upgraded.  
The following possible reasons for this error exist:
```

- If WebSphere Application Server Version 6.1 is installed, you might not have run the **WASPostUpgrade** tool from the bin directory of the Version 8.5 installation root.
 1. Look for something like the following message to display when the **WASPostUpgrade** tool runs: IBM WebSphere Application Server, Release 6.x.
This message indicates that you are running the WebSphere Application Server Release 6.1 migration utility, not the Version 8.5 migration utility.
 2. Alter your environment path or change the current directory so that you can launch the Version 8.5 **WASPostUpgrade** tool.
- An invalid directory might have been specified when launching the **WASPreUpgrade** tool or the **WASPostUpgrade**.
- The **WASPreUpgrade** tool was not run.

- You receive the following error message:

```
MIGR0253E: The backup directory migration_backup_directory does not exist.
```

The following possible reasons for this error exist:

- The **WASPreUpgrade** tool was not run before the **WASPostUpgrade** tool.
 1. Check to see if the backup directory specified in the error message exists.
 2. If not, run the **WASPreUpgrade** tool.
Read “WASPreUpgrade command” on page 28 for more information.
 3. Retry the **WASPostUpgrade** tool.
- An invalid backup directory might be specified.
For example, the directory might have been a subdirectory of the Version 6.1 tree that was deleted after the **WASPreUpgrade** tool was run and the older version of the product was uninstalled but before the **WASPostUpgrade** tool was run.
 1. Determine whether or not the full directory structure specified in the error message exists.
 2. If possible, rerun the **WASPreUpgrade** tool, specifying the correct full migration backup directory.
 3. If the backup directory does not exist and the older version it came from is gone, rebuild the older version from a backup repository or XML configuration file.
 4. Rerun the **WASPreUpgrade** tool.

- Version 8.5 applications fail to install.

Manually install the applications using the **wsadmin** command after **WASPostUpgrade** has completed.

To manually install an application that failed to install during migration, use the **wsadmin** command to run the `install_application_name.jacl` script that the migration tools created in the backup directory.

In a Linux environment, for example, use the following parameters:

```
./wsadmin.sh -f migration_backup_directory/install_application_name.jacl -conntype NONE
```

Read “WASPostUpgrade command” on page 31 for more information.

- The trace file exceeds its 400 megabytes allocation, but **WASPostUpgrade** is still running. If additional disk space is not available, the migration will fail.

If you think you might encounter this problem during your migration, complete the following actions:

1. Stop the Migration wizard before the WASPostUpgrade command is issued.
2. Run the WASPostUpgrade command from the command line for each profile you are migrating.

When you run the WASPostUpgrade command from the command line:

- Include the **-oldProfile** and **-profileName** parameters to indicate the profile you want to migrate.
- Add the **com.ibm.ejs.ras.TraceNLS*** parameter to the trace string to reduce the size of your trace log. For example you might want to specify the following trace setting:

```
com.ibm.ejs.ras.TraceNLS*=info
```

- **Solaris** When you use the Migration wizard to migrate a profile from WebSphere Application Server Version 6.0.2 to Version 8.5 on a Solaris x64 processor-based system, the migration might fail during the WASPostUpgrade step.

You might see messages similar to the following in *migration_backup_dir/logs/WASPostUpgrade.time_stamp.log*:

```
MIGR0327E: A failure occurred with stopNode.
```

```
MIGR0272E: The migration function cannot complete the command.
```

WebSphere Application Server Version 6.0.2 uses a Java Virtual Machine (JVM) in 32-bit mode. The Migration wizard for Version 8.5 calls the WASPostUpgrade.sh script, which attempts to run the JVM for Version 6.0.2 in the 64-bit mode when the server stops the Version 6.0.2 node.

Complete the following actions to remove the incomplete profile and enable WebSphere Application Server to correctly migrate the Version 6.0.2 profile:

1. From a command line, change to the *app_server_root/bin* directory.

For example, type the following command:

```
cd /opt/IBM/WebSphere/AppServer/bin
```

2. Locate the WASPostUpgrade.sh script in the *app_server_root/bin* directory, and make a backup copy.

3. Open the WASPostUpgrade.sh script in an editor, and perform the following actions:

- a. Locate the following line of code:

```
. "$binDir" /setupCmdLine.sh
```

- b. Insert the following line of code after the code that was identified in the previous step:

```
JVM_EXTRA_CMD_ARGS=""
```

- c. Save the changes.

4. Use the following command to delete the incomplete Version 8.5 profile that was created during the migration process:

```
app_server_root/bin/manageprofiles.sh -delete -profileName profile_name
```

5. Delete the *profile_root* directory of the Version 8.5 profile that was removed in the previous step.

6. Rerun the Migration wizard.

- If you select the option for the migration process to install the enterprise applications that exist in the Version 6.1 configuration into the new Version 8.5 configuration, you might encounter some error messages during the application-installation phase of migration.

The applications that exist in the Version 6.1 configuration might have incorrect deployment information—typically, invalid XML documents that were not validated sufficiently in previous WebSphere Application Server runtimes. The runtime now has an improved application-installation validation process and will fail to install these malformed EAR files. This results in a failure during the application-installation phase of **WASPostUpgrade** and produces an “E” error message. This is considered a “fatal” migration error.

If migration fails in this way during application installation, you can do one of the following:

- Fix the problems in the Version 6.1 applications, and then remigrate.
- Proceed with the migration and ignore these errors.

In this case, the migration process does not install the failing applications but does complete all of the other migration steps.

Later, you can fix the problems in the applications and then manually install them in the new Version 8.5 configuration using the administrative console or an install script.

- Because of the inclusion of the `javax.ejb.Remote` annotation in the EJB 3.0 specification, certain EJB 2.1 beans might fail to compile if Enterprise Java Beans are written to import the entire `javax.ejb` and `java.rmi` packages. Compilation errors similar to those in the following example might occur:

```
ejbModule/com/ibm/websphere/samples/trade/ejb/QuoteHome.java(17): The type Remote is ambiguous
```

What to do next

If you did not find your problem listed, contact IBM support.

Chapter 16. IBM Suggests

Most of the following links will take you to information that is not part of the formal product documentation and is provided "as is." Some of these links go to non-IBM Web sites and are provided for your convenience only and do not in any manner serve as an endorsement by IBM of those Web sites, the material thereon, or the owner thereof.

Chapter 17. Migrating, coexisting, and interoperating

This section covers all aspects of migration, coexistence, and interoperability. Migrating is copying the configuration from a previous release of this product into a new release. Coexisting is running a new release of WebSphere Application Server on the same machine at the same time as you run an earlier release or running two installations of the same release of WebSphere Application Server on the same machine at the same time. Interoperating is exchanging data between two different systems, such as coexisting product installations.
