User-defined values for the I/O rate thresholds were specified for the storage tiers. For each tier, the lower threshold value is reported, so the lowest tier is shown with a threshold of 0.0 I/O per second.

Action

No action is required.

HWN024067W Recommendations cannot be generated for *number_of_volumes* volumes because the volumes do not meet the tiering criteria for tier *current_tier_number* or for any lower tier.

Explanation

Based on the tiering criteria that was selected, one or more volumes should be moved to lower tiers. However, recommendations to move the volumes cannot be generated because the volumes do not match the tiering criteria that was selected for the lower tiers.

Action

No action is required.

HWN024068W Recommendations cannot be generated to move *number_of_volumes* volumes from *source_tier* to tier *target_tier_number* due to the pool activity limit value.

Explanation

One or more volumes could not be moved to the specified tier without causing one or more storage pools in the tier to be too active.

Action

No action is required.

HWN024069W Recommendations cannot be generated to move *number_of_volumes* volumes from tier *source_tier* to to tier *target_tier_number* because the destination storage pools do not have enough space.

Explanation

The volumes cannot be added to the destination storage pools that were selected because of insufficient available space.

Action

Reduce the allocated capacity in the destination pools or choose destination pools with sufficient available space when you run the Analyze Tiering wizard.

HWN024070I The analysis to optimize subsystem *storage_subsystem* was completed.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWN024071I The option that was selected was to restrict the placement of volumes in capacity pools to destination storage pools in the same capacity pool.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWN024072W No file age information for volume *volume name*.

Explanation

The file age threshold can not be applied to this volume as no file scan information exists.

Action

No action is required. To enable file age threshold analysis of this volume, run a file system scan for any filesystems contained on the volume and rerun the analysis.

HWN024073W Storage pool {0} in tier {1} needs at least one additional storage pool in the same tier for the Balance Analysis to run on this tier.

Explanation

Storage pools are balanced within their tier. An input storage pool can not be balanced if no other input storage pool is of the same tier.

Action

Ensure storage pool tier assignments are correct and that all necessary storage pools are selected as input for the Balance Analysis.

HWN024074W Storage pool {0} in tier {1} and capacity pool {2} needs at least one additional storage pool in the same tier and capacity pool for the Balance Analysis to run within this capacity pool and on this tier.

Explanation

Storage pools are balanced within their tier and capacity pool boundary. An input storage pool can not be balanced if no other input storage pool is of the same tier and capacity pool.

Action

Ensure storage pool tier and capacity pool assignments are correct and that all necessary storage pools are selected as input for the Balance Analysis.

HWN024075W *number_of_volumes* volumes from storage pool *pool* could not be moved to the destination storage pools because the destination storage pools do not have enough space.

Explanation

The volumes cannot be moved to the destination storage pools that were selected because of insufficient available space.

Action

Add more capacity to the destination storage pools or choose destination storage pools with sufficient available space. If there are other reasons why the volumes could not be moved to the destination storage pools, adding more capacity to the destination storage pools or choosing destination storage pools with sufficient available space may still not generate recommendations.

HWN024076W *number_of_volumes* volumes from storage pool *pool* could not be moved to the destination pools because the destination storage pools are not in the same capacity pool.

Explanation

The volumes cannot be moved to the destination storage pools that were selected because the destination storage pools are not in the same capacity pool as the source storage pool.

Action

Choose destination storage pools that are in the same capacity pool as the source storage pool. If there are other reasons why the volumes could not be moved to the destination storage pools, choosing destination storage pools in the same capacity pool as the source storage pool may still not generate recommendations.

HWN024077W *number_of_volumes* volumes from storage pool *pool* could not be moved to the destination storage pools because the destination storage pools would have exceeded the pool activity limit value.

Explanation

The volumes cannot be moved to the destination storage pools that were selected because moving the volumes would have caused the destination storage pools' activity to exceed the activity limit value.

Action

Choose destination storage pools with lower pool activity values. If there are other reasons why the volumes could not be moved to the destination storage pools, choosing destination storage pools with lower activity values may still not generate recommendations.

HWN024078W *number_of_volumes* volumes from storage pool *pool* could not be moved to the destination storage pools because the destination storage pools already have a volume copy.

Explanation

The volumes cannot be moved to the destination storage pools that were selected because a copy of the volume already exists on the destination storage pools.

Action

Choose destination storage pools with do not have volume copies. If there are other reasons why the volumes could not be moved to the destination storage pools, choosing destination storage pools without volume copies may still not generate recommendations.

HWN024079W Because of an internal error, the number of volumes in the *pool* storage pool that could not be moved to destination storage pools is *number_of_volumes*.

Explanation

The selected destination storage pools were not valid destinations for these volumes.

Action

Choose different destination storage pools.

HWN024080W Destination storage pool *pool* already contains a copy of storage volume *volume*.

Explanation

Moving the storage volume to the destination storage pool will result in both the storage volume and its copy being in the same storage pool.

Action

Choose a destination storage pool with no volume copies.

HWN024081W Because the destination storage pool does not have sufficient available space, the *volume* storage volume in the *source_pool* storage pool cannot be moved to the *destination_pool* destination storage pool.

Explanation

The destination storage pool that was selected does not have sufficient available space.

Action

Allocate more space to the destination storage pool or select a destination storage pool that has sufficient available space.

HWN024082W Because the destination storage pool contains a copy of the mirrored volume, the *volume* volume in the *source_pool* storage pool cannot be moved to the *destination_pool* destination storage pool.

Explanation

The primary volume and the secondary volume of a volume in a mirrored volume relationship cannot be placed in the same storage pool.

Action

Select a destination storage pool that does not contain a copy of the mirrored volume.

HWN024083W Because of an internal error, the *volume* storage volume in the *spool* storage pool could not be moved to the *destination_pool* destination storage pool.

Explanation

The storage pool is not a valid destination storage pool for the volume.

Action

Choose a different destination storage pool.

HWN024084W Because the destination storage pools contain one or more copies of the mirrored volumes, the number of volumes that could not be moved from tier *source_tier* to tier *target_tier* is *number_of_volumes*.

Explanation

The primary volume and the secondary volume of a volume in a mirrored volume relationship cannot be placed in the same storage pool.

Action

Ensure that one or more of the destination storage pools that are selected do not contain copies of the mirrored volumes.

HWN024085W The *pool_name* storage pool cannot be balanced because the tier level of the pool was reset to none.

Explanation

To balance storage pools, the tier level of each storage pool must be set.

Action

Set the tier level for the storage pool, and then rerun the task that was created to balance the pools.

HWN024086E Recommendations cannot be generated because the tier level of the *destination_pool_name* destination storage pool was reset to none.

Explanation

To analyze the tiering of the volumes, the tier level of both the source and the destination storage pools must be set.

Action

Set the tier level for the storage pool, and then rerun the task to analyze the tiering of the volumes.

HWN024087W Recommendations cannot be generated for one or more of the volumes because collocated volumes cannot be placed in the same destination storage pool.

Explanation

Based on the tiering criteria, the resources, and the options that were selected, all of the collocated volumes cannot be placed in the same destination pool.

Action

To determine whether further action can be taken, check the preceding messages in the log file. If, for example, one of the collocated volumes in the source pool was a mirrored volume, and the option to exclude mirrored volumes was selected, then recommendations to collocate the volumes are not generated. To resolve this particular issue, rerun the analysis and include mirrored volumes in the analysis.

HWN024088I The option to collocate volumes that are assigned to the same server or hypervisor was selected.

Explanation

If one or more of the volumes that are assigned to the same server or hypervisor and in the same source pool require optimization, then recommendations are only generated if all of the related volumes can be placed in the same destination pool.

Action

No action is required.

HWN024089I The option to collocate volumes that are assigned to the same server or hypervisor was not selected.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWN024090W Because the storage pools do not meet the service class requirements, the number of volumes that cannot be moved is *no_volumes*.

Explanation

Volumes that are assigned a service class must be placed in pools that meet the service class requirements of the volumes.

Action

Ensure that pools that meet the service class requirements of the volumes are selected when you run the Balance Pools analysis.

HWN024091W If the recommendation to move the *volume_name* volume to the *storage_pool_name* storage pool is implemented, the service class requirements of the *volume_name* volume cannot be met.

Explanation

Volumes that are assigned a service class should be placed in pools that meet the service class requirements of the volumes.

Action

Ensure that the destination pools that you select meet the service class requirements of the volumes in the source pools.

HWN024092W Recommendations cannot be generated to move *number_of_volumes* volumes from tier *source_tier* to tier *target_tier_number* because the destination storage pools do not meet the service class requirements of the volumes.

Explanation

The volumes cannot be added to the destination storage pools that were selected because the storage pools do not meet the service class requirements.

Action

Ensure that pools that meet the service class requirements of the volumes are selected.

HWN024093I The number of volumes on tier *tier_level* that were not analyzed because of the instruction to exclude mirrored volumes from the analysis is *number_of_volumes* volumes.

Explanation

The option to exclude mirrored volumes from the analysis was selected.

Action

No action is required.

HWN024094W Valid target pools were not selected for the *subsystem name* storage virtualizer.

Explanation

When volumes are optimized, they are moved to destination pools in the same storage virtualizer. The destination pool is chosen from the list of target pools that are selected when the analysis is run.

Action

Ensure that target pools for all of the resources that are being analyzed are selected.

HWN024095I The grain size for the thin-provisioned volumes was set to the default value of *grain_size* KiB.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWN024096W Volumes in the *pool_name* pool on tier *tier_level* cannot be moved to a higher tier to reduce the activity level of the pool to the user-defined level.

Explanation

No suitable target pools were found on higher tiers to relocate the most-active volumes.

Action

No action is required.

HWN024097W Volumes in the *pool_name* pool on tier *tier_level* cannot be moved to a lower tier to reduce the activity level of the pool to the user-defined level.

Explanation

No suitable target pools were found on lower tiers to relocate the most-active volumes.

Action

No action is required.

HWN024098W Cannot generate recommendations to tier volumes from the *storage_system_name* storage system because all of the source volumes are in the selected destination storage pools.

Explanation

To generate recommendations for tiering volumes, there must be at least one destination storage pool that does not include the volumes that are in the source storage pools.

Action

Select at least one destination storage pool that does not include the volumes that are in the source storage pools.

HWN024099I The number of volumes that were excluded from the analysis to plan the tiering of the *storage_system_name* storage system is *vols_count*. The volumes were excluded because performance data is not available for the volumes.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWN024100I The number of volumes that were excluded from the analysis to plan the tiering of the *storage_system_name* storage system is *vols_count*. The volumes were excluded from the analysis because the capacity of the volumes is zero.

Explanation

The volumes that were excluded from the analysis might be thin-provisioned volumes that are not being used and that have an initial capacity of zero.

Action

No action is required.

HWN024101I The number of volumes that were excluded from the analysis to plan the tiering of the *storage_system_name* storage system is *vols_count*. The volumes were excluded from the analysis because the volumes are not assigned to pools that are tiered or the thresholds were not defined for the tiers.

Explanation

To plan tiering, the volumes must belong to pools that are assigned a tier level with defined performance thresholds.

Action

Define the criteria for the tiers in your storage environment and ensure that the pools that you want to include in the analysis are assigned a tier level.

HWN024102W The recommendation to move the *storage_volume_name* volume from the *source_pool_name* storage pool to the *target_pool_name* storage pool was not generated because the status of the destination pool is offline or excluded.

Explanation

The recommendation was not generated and implemented because it would result in the volume becoming offline

Action

Select another destination storage pool or run a probe of the system that contains the destination storage pool. The status of the storage pool might have changed since the last probe.

HWN024103I Reclaiming volumes

Explanation

This message is for informational purposes only.

Action

No action is required.

HWN024104I Planning for tiering volumes

Explanation

This message is for informational purposes only.

Action

No action is required.

HWN024105W The recommendation to move the *storage_volume_name* volume from the *source_pool_name* storage pool to the *target_pool_name* storage pool will not be executed because the status of the destination pool is offline or excluded.

Explanation

The recommendation was not implemented because it would result in the volume becoming offline.

Action

No action is required.

HWN024106W The recommendation to move the *storage_volume_name* volume from the *source_pool_name* storage pool was not generated because the status of the volume is offline.

Explanation

An offline volume cannot be moved.

Action

Select another volume or run a probe of the system that contains the selected volume. The status of the volume might have changed since the last probe.

HWN024107W The recommendation to move the *storage_volume_name* volume from the *source_pool_name* storage pool to the *target_pool_name* storage pool will not be executed because the status of the volume is offline.

Explanation

An offline volume cannot be moved.

Action

No action is required.

HWN024108E The recommendations can't be shown because the analysis was not completed.

Explanation

The analysis to generate recommendations was not saved.

Action

Verify that the database is available and check the log files for the Data and the Device server. The default location of log files for the Data server is:

- Windows: TPC_installation_directory\data\log
- Linux and AIX: TPC_installation_directory/data/log

The default location of log files for the Device server is:

- Windows: TPC_installation_directory\device\log
- Linux and AIX: TPC_installation_directory/device/log

HWN024109W The data for the previous analysis of the *storage_subsystem* storage system was not deleted.

Explanation

Analysis data was not deleted.

Action

Verify that the database is available and check the log files for the Data and the Device server. The default location of log files for the Data server is:

- Windows: TPC_installation_directory\data\log
- Linux and AIX: TPC_installation_directory/data/log

The default location of log files for the Device server is:

- Windows: TPC_installation_directory\device\log
- Linux and AIX: TPC_installation_directory/device/log

HWN024110E Volumes reclamation analysis failed for *storage_subsystem* storage subsystem.

Explanation

Failed to work with database. Received SQL error instead.

Action

Ensure database server is up and running. Check device and data server logs to get error details.

HWN024111W Recommendations cannot be generated to move *number_of_volumes* volumes from tier *source_tier* to tier *target_tier_number* because there is no potential destination pool assigned to the recommended tier.

Explanation

There must be at least one potential destination pool assigned to the recommended tier in order to try a placement analysis.

Action

Select at least one pool assigned to this recommended tier, as potential destination, when you run the Analyze Tiering wizard.

HWN024112W Cannot generate recommendations to tier volumes from the *storage_system_name* storage system because the source storage pools and the selected destination storage pools are assigned to the same tier.

Explanation

To generate recommendations for tiering volumes, there must be at least one destination storage pool that is not assigned to the same tier as the source storage pools.

Action

Select at least one destination storage pool that does not belong to the same tier as the source storage pools.

HWN024200I The days of the week to include in the analysis: *days_of_week*.

Explanation

Only the performance data that was collected during the specified days of the week is used to analyze the volumes.

Action

No action is required.

HWN024201I The time window for the performance data to include in the analysis is set to *start time - end time*.

Explanation

Only the performance data that was collected during the specified time window is used to analyze the volumes.

Action

No action is required.

HWN024202I The time window for the performance data to include in the analysis is set to *start time - end time*. The end time occurs on the next day.

Explanation

Only the performance data that was collected during the specified time window is used to analyze the volumes.

Action

No action is required.

HWN024203W The volume *storage_volume_name* cannot be converted or moved because the target pools do not have sufficient available space or the target pool types are incorrect for the operation.

Explanation

The volumes cannot be converted or moved because there is not enough space in the target pools or the target pool types are not allowed for the operation.

Action

Add more capacity to the target pools or choose target pools with sufficient available space.

HWN025000I Storage pool *value* in storage system *value* has storage from different types of back-end storage systems. Back-end disk data cannot be determined.

Explanation

Since the back-end storage is from different types of storage systems, back-end disk data like the disk type, raid type and number of disks cannot be determined for the storage pool.

Action

Back-end storage details for the storage pool can be set by editing the data in the Back-end Storage tab of the storage pool properties panel in the IBM Spectrum Control Web-based GUI.

HWN025001I Storage pool *value* in storage system *value* has storage from unknown back-end storage system(s). Back-end disk data cannot be determined.

Explanation

Since the back-end storage is from storage system(s) unknown to IBM Spectrum Control, back-end disk data like the disk type, raid type and number of disks cannot be determined for the storage pool.

Action

Back-end storage details for the storage pool can be set by editing the data in the Back-end Storage tab of the storage pool properties panel in the IBM Spectrum Control Web-based GUI.

HWN025002I Storage pool value in storage system value has storage from multiple back-end storage systems or from multiple pools in a single storage system. Back-end disk data cannot be determined.

Explanation

Since the back-end storage is from multiple storage systems or multiple pools in a single storage system, back-end disk data like the disk type, raid type and number of disks cannot be determined for the storage pool.

Action

Back-end storage details for the storage pool can be set by editing the data in the Back-end Storage tab of the storage pool properties panel in the IBM Spectrum Control Web-based GUI.

HWN025003I Storage pool value in storage system value has storage from a back-end storage pool with multiple disk types. Back-end disk data cannot be determined.

Explanation

Since the back-end storage is from a storage pool with multiple disk types, back-end disk data like the raid type cannot be determined for the storage pool.

Action

Back-end storage details for the storage pool can be set by editing the data in the Back-end Storage tab of the storage pool properties panel in the IBM Spectrum Control Web-based GUI.

HWN025004I Storage pool value in storage system value has storage from a back-end storage pool with a mixed raid type. Back-end disk data cannot be determined.

Explanation

Since the back-end storage is from a storage pool with a mixed raid type, back-end disk data like the raid type cannot be determined for the storage pool.

Action

Back-end storage details for the storage pool can be set by editing the data in the Back-end Storage tab of the storage pool properties panel in the IBM Spectrum Control Web-based GUI.

HWN025005I Storage pool value in storage system value has storage from a back-end storage pool with multiple raid types. Back-end disk data cannot be determined.

Explanation

Since the back-end storage is from a storage pool with multiple raid types, back-end disk data like the raid type cannot be determined for the storage pool.

Action

Back-end storage details for the storage pool can be set by editing the data in the Back-end Storage tab of the storage pool properties panel in the IBM Spectrum Control Web-based GUI.

HWN025006I Storage pool value in storage system value has storage from back-end disks of unknown type. Back-end disk data cannot be determined.

Explanation

Since the back-end storage is from disks of unknown type, back-end disk data cannot be determined for the storage pool.

Action

Back-end storage details for the storage pool can be set by editing the data in the Back-end Storage tab of the storage pool properties panel in the IBM Spectrum Control Web-based GUI.

HWN025007I Storage pool value in storage system value has storage from unknown number of back-end disks. Back-end disk data cannot be determined.

Explanation

Since the back-end storage is from unknown number of disks, back-end disk data cannot be determined for the storage pool.

Action

Back-end storage details for the storage pool can be set by editing the data in the Back-end Storage tab of the storage pool properties panel in the IBM Spectrum Control Web-based GUI.

HWN025008I Storage pool value in storage system value has storage from back-end disks with unknown raid type. Back-end disk data cannot be determined.

Explanation

Since the back-end storage is from disks with unknown raid type, back-end disk data cannot be determined for the storage pool.

Action

Back-end storage details for the storage pool can be set by editing the data in the Back-end Storage tab of the storage pool properties panel in the IBM Spectrum Control Web-based GUI.

HWN025009E Connection to Data Server failed. Make sure Data Server is up.

Explanation

Connection to Data Server cannot be established.

Action

If Data Server is down, start the Data Server. If it is up, make sure you can connect to the Data Server through other operations. If the problem persists, please contact IBM Software Support.

-  [Getting support](#)

HWN025011W All of the target ports for the storage system are used for the provisioning request. The request might take a long amount of time.

Explanation

Target port information was not supplied and the Device Server attempted to limit provisioning to the target ports that are on the same fabric as the host. The Device Server cannot determine which target ports are on the same fabric with the host.

Action

The provisioning tasks can complete faster if the fabrics are managed by IBM Spectrum Control. Add the fabrics to IBM Spectrum Control. If the fabrics are already managed by IBM Spectrum Control, check that data collection for the fabrics completed successfully.

HWN025010I Collecting parent pool volumes for storage system: *storage system identification.*

Explanation

The probe is collecting data to gather the relationships of the parent pool volumes to the thin-provisioned volumes.

Action

No action is required.

HWN025011E The port *the target port ID* has a usage restriction which prevents it from being used as a target port for volume assignment.

Explanation

The target port has a usage restriction that does not allow it to be used for volume assignment to initiators. The usage restriction may be in place if the storage system is a virtualizer and the storage system port is dedicated to be used as an initiator for backend storage.

Action

Specify storage system ports that do not have usage restrictions.

HWN025012E The invocation of CIM method *ExposePaths* failed on SMI-S provider *Name of SMI-S provider* . The return code is *Return code of method*.

Explanation

The extrinsic CIM method that was invoked on the given SMI-S provider failed. The standard return codes are as follows:

- 1 - Not Supported
- 2 - Unspecified Error
- 3 - Timeout
- 4 - Failed
- 5 - Invalid Parameter
- 4097 - Invalid logical unit ID
- 4098 - Invalid initiator port ID
- 4099 - Invalid target port ID
- 4100 - Invalid permission
- 4101 - Target/initiator combination already exposed
- 4102 - Requested logical unit number in use
- 4103 - Maximum Map Count Exceeded

Action

Check the details of the request to ensure that there is no problematic input. Otherwise contact IBM support for more assistance.

HWN025017E A CLI command failed. Check the logs from *EP working dir*.

Explanation

A command issued to CLI failed.

Action

Check the logs from the specified location.

HWN025018E An error occurred when attempting to parse the file *File name*.

Explanation

An error occurred when attempting to parse the specified file.

Action

Verify the correct file was specified or the file is in the correct format.

HWN025019E The requested operation failed. Check the logs from *EP working dir*.

Explanation

The requested operation failed.

Action

Check the logs from the specified location.

HWN025020E The volume cannot be created. The volume of size *Size* in pool *Pool* on storage system *Subsystem* cannot be created. The pool might already have the maximum number of volumes allowed.

Explanation

The volume cannot be created. This pool might have already reached the maximum number of volumes allowed.

Action

Change the provisioning request to make use of pools that have not reached the maximum number of volumes allowed.

HWN025021E Unable to resolve the address for the device because the request was not processed by the data collector.

Explanation

The data collector did not respond to the server in the allotted time. The data collector might not be running or it might not be able to connect to the server.

Action

Verify that the data collector is running and that it can connect to the server.

HWN025022E The data collection detected storage system *New Subsystem* with serial number *new serial number* instead of expected serial number *expected serial number*.

Explanation

The data source reported data for a different storage system as expected, because the a new serial number of the device was returned.

This can happen when a storage system is replaced by a new one with same ip address and credentials.

The new storage system is added and the storage system that was managed previously is shown as undetectable.

Action

Please verify status and the data source information of the storage systems and update them accordingly.

For the new storage system create data collection and performance data collection scheules as needed.

HWN025025I Starting the task to send the report for schedule *Schedule Id* by email.

Explanation

The task to send the the report by email at the frequency configured in the report is being created.

HWN025026I The *report title* report is being created.

Explanation

Based on the settings that were configured, the report is being created.

HWN025027I The *report title* report with ID *report id* is being sent by email to the reports recipients.

Explanation

The report that was created is being sent to the recipients.

HWN025028I The *report title* report with ID *report id* was sent by email to the reports recipients.

Explanation

The task that was created to send the report by email was completed successfully.

HWN025029E Can't retrieve the configured settings of the report for schedule *Schedule Id* .

Explanation

The settings that were used to configure the report were deleted.

Action

To generate the report, a new report must be created and configured.

HWN025030E The report can't be sent because the email server was not configured.

Explanation

The email server was not set up or was not set up correctly.

Action

Set up the email server for sending reports and test the connection.

Related reference

HWN025031E Can't send the *report title* report with ID *report id* by email because of the following error: *reported_error*.

Explanation

The task failed because an error was generated.

Action

Check the logs for more details about the errors.

Related reference

- [Getting support](#)

HWN025031I To view the report, choose HTML as the message format or use an email application that supports HTML message formats.

Explanation

The report contained in the e-mail can only displayed if the e-mail application supports HTML and has HTML support enabled.

Action

Enable HTML support in your the e-mail client you are using to view this report.

HWN025032E Job failed during post processing of collected data from the data source.

Explanation

The probe returned as failure because of a fatal error during post processing.

Action

Check the logs for more details about the error.

HWN025033E Failed to send the *report name* report for schedule *Schedule Id*.

Explanation

Failed to send the report by e-mail.

HWN025034I Created *number_of_servers* agentless servers automatically.

Explanation

The probe of the storage system discovered one or more host connections for which no corresponding agentless server was defined. The agentless servers for those host connections were created automatically during probe post-processing.

Action

No action is required.

HWN025035I Removed *number_of_servers* agentless servers automatically.

Explanation

The probe of the storage system discovered that one or more agentless servers were no longer associated with any storage system host connections. These agentless servers are obsolete and were removed automatically during probe post-processing.

Action

No action is required.

HWN025036E Can't save the report in the directory.

Explanation

Write access is required to save reports in the directory.

Action

Check that the access permissions for the directory are set correctly .

HWN025037E Can't save the report because the path specifies a file name instead of a directory name.

Explanation

The path must specify the name of the directory that is to be used to save the reports.

Action

Enter the path to a valid directory.

HWN025038E Can't save the report, because the directory doesn't exist.

Explanation

The report can't be saved in the directory that was specified.

Action

Check that the correct path to the directory was specified and that the access permissions for all of the directories in the path are set correctly.

HWN025039E Can't save the report because the directory doesn't have enough disk space.

Explanation

The directory that was specified doesn't have enough available space for saving the report.

Action

Allocate more space to the directory or specify a directory with sufficient space to save the reports in.

HWN025040I *The report title report with ID report id is being saved as report file name in the full path directory.*

Explanation

The report is being saved in the directory that was specified by the user.

HWN025041I *The report title report with ID report id was saved as report file name in the full path directory.*

Explanation

The report was saved in the directory that was specified by the user.

HWN099990I *The method name of the Device Server method of the device server returned return value @(execution context information) .*

Explanation

This is a device server informational trace message, intended for IBM development and support purposes.

Action

No action is required.

HWN099991I *info trace message@(execution context information)*

Explanation

This is a device server informational trace message, intended for IBM development and support purposes.

Action

No action is required.

HWN099992W *warning trace message@(execution context information)*

Explanation

This is a device server warning trace message, intended for IBM development and support purposes.

Action

No action is required.

HWN099993E *error/exception trace message @(execution context information)*

Explanation

This is a device server error/exception trace message, intended for IBM development and support purposes.

Action

No action is required.

HWN099994I *An object of class name of the class has been instantiated @(execution context information).*

Explanation

This is a device server informational trace message, intended for IBM development and support purposes. It indicates the creation of a Java object.

Action

No action is required.

HWN099995I *|=== class name.method name entry, parameter(s): parameter value(s) @(execution context information).*

Explanation

This is a device server informational trace message, intended for IBM development and support purposes. It reports a Java method entry.

Action

No action is required.

HWN099996I *===| class name.method name exit, return value: method return value (execution time in milliseconds) @(execution context information).*

Explanation

This is a device server informational trace message, intended for IBM development and support purposes. It reports a Java method completion.

Action

No action is required.

HWN099997I *External service name of the (DM) external service will be invoked with parameter(s) parameter value(s)@(execution context information).*

Explanation

This is a device server informational trace message, intended for IBM development and support purposes. It reports invocation of an service outside of DM, for example a CIMClient call.

Action

No action is required.

HWN099998I *Invocation of external service name of the (DM) external service returned result invocation result@(execution context information).*

Explanation

This is a device server informational trace message, intended for IBM development and support purposes. It reports the result of the invocation of an service outside of DM, for example a CIMClient call.

Action

No action is required.

HWN099999I The method *name of the device server method* of the device server was invoked with parameters *invocation parameters@(execution context information)*.

Explanation

This is a device server informational trace message, intended for IBM development and support purposes.

Action

No action is required.

HWN200000I Probe of switch *switch_name* completed successfully.

Explanation

The probe of the switch completed successfully.

Action

No action is required.

HWN200001I Started post-processing tasks after data was collected for switch *switch_name*.

Explanation

Data for the switch was collected by using REST, and the probe is complete. Started post-processing tasks for the probe.

Action

No action is required.

HWN6001I Operation *operation* completed successfully.

Explanation

The operation completed successfully.

Action

No response is necessary. This message is informational only.

HWN6002I Unable to set up NLS message file processing.

Explanation

The system was unable to set up message file processing for other languages.

Action

No response is necessary. This message is informational only.

HWN6003E Unable to set up tracing.

Explanation

The agent was unable to set up tracing.

Action

Try the same operation again. If the problem persists, contact IBM service.

HWN6004E Operation operation failed.

Explanation

The operation specified failed.

Action

Try the same operation again. If the problem persists, enable high level tracing as explained in the Installation and Configuration Guide and contact IBM service.

HWN6005E Unknown operation operation.

Explanation

An unknown operation was attempted.

Action

Try the same operation again. If the problem persists, enable high level tracing as explained in the Installation and Configuration Guide and contact IBM service.

HWN6006E Could not initialize connection, rc is rc

Explanation

A connection could not be initialized. Return code from the subsystem was rc.

Action

Try the same operation again. Verify connectivity with the subsystem. If the problem persists, enable high level tracing as explained in the Installation and Configuration Guide and contact IBM service.

HWN6007E Could not parse command arguments: arg

Explanation

The command arguments were not parsed successfully.

Action

Try the same operation again. If the problem persists, enable high level tracing as explained in the Installation and Configuration Guide and contact IBM service.

HWN6008E Error processing command: command

Explanation

There was an error processing the command.

Action

Try the same operation again. If the problem persists, enable high level tracing as explained in the Installation and Configuration Guide and contact IBM service.

HWN6009E Missing 'operation' property in input file

Explanation

The input specified was missing an input property.

Action

Specify the missing property and try the same operation again. If the problem persists, enable high level tracing as explained in the Installation and Configuration Guide and contact IBM service.

HWN6010I Task *arg* completed successfully

Explanation

The specified task completed successfully.

Action

No response is necessary. This message is informational only.

HWN6011E Task *arg* failed

Explanation

The specified task failed.

Action

Try the same operation again. If the problem persists, enable high level tracing as explained in the Installation and Configuration Guide and contact IBM service.

HWN6012E Cannot connect to this IP, switching to *IP*

Explanation

The current IP did not allow connection. The task will switch to the one specified.

Action

Try the same operation again. If the problem persists, enable high level tracing as explained in the Installation and Configuration Guide and contact IBM service.

HWN6013E An IBM XIV CLI command failed. The error is *arg*.

Explanation

The command issued to the XIV CLI failed with the error specified.

Action

Try the same operation again. If the problem persists, look up the XIV error. Contact IBM service if the issue cannot be resolved.

HWN6014I Command *arg* completed successfully

Explanation

A method was called with wrong attributes.

Action

No response is necessary. This message is informational only.

HWN6015E Command *command* failed.

Explanation

The specified command failed.

Action

Try the same operation again. If the problem persists, enable high level tracing as explained in the Installation and Configuration Guide and contact IBM service.

HWN6016I Connected with IP address *IP*

Explanation

Connected with the XIV at the specified IP address

Action

No response is necessary. This message is informational only.

HWN6017I Started creation of volume with size *size* in pool *pool*.

Explanation

A method was called with wrong attributes.

Action

No response is necessary. This message is informational only.

HWN6018I Volume creation completed successfully. New volume *volume* created with size *size* in pool *pool*.

Explanation

A method was called with wrong attributes.

Action

No response is necessary. This message is informational only.

HWN6019I Started deletion of volume *volume* in pool *pool*.

Explanation

Deletion of the specified volume started.

Action

No response is necessary. This message is informational only.

HWN6020I Volume deletion completed successfully. Volume *wolume* deleted in pool *pool*

Explanation

Volume deletion completed successfully. The specified volume was deleted from the specified pool.

Action

No response is necessary. This message is informational only.

HWN6021I Started creation of host *host* with initiator ports *ports*

Explanation

Started host creation.

Action

No response is necessary. This message is informational only.

HWN6022I Finished creation of host *host* with initiator ports *ports*

Explanation

Finished host creation.

Action

No response is necessary. This message is informational only.

HWN6023I Started assignment of volume *volume* to host *host*.

Explanation

Started assignment of the volume to the host.

Action

No response is necessary. This message is informational only.

HWN6024I Finished assignment of volume *volume* to host *host*.

Explanation

Completed assignment of volume to host.

Action

No response is necessary. This message is informational only.

HWN6025I Started unassignment of volume *volume* from host *host*.

Explanation

Started removing volume from host.

Action

No response is necessary. This message is informational only.

HWN6026I Finished unassignment of volume *volume* from host *host*

Explanation

Volume removal completed.

Action

No response is necessary. This message is informational only.

HWNEP0001I Successfully persisted *number of count* instances.

Explanation

A Native API action has been executed successfully. No error condition has been encountered.

Action

No action is required.

HWNEP0002E The probe failed as the data collector couldn't write to its output file, *value*.

Explanation

Information couldn't be collected about the resource as the output file for the data collector was missing or couldn't be accessed.

Action

Try the following actions::

1. Verify that the file system is not full.
2. Verify that the output file exists and can be accessed. The default location for the output file is:
 - Windows: TPC_installation_directory\device\log
 - Linux and AIX: TPC_installation_directory/device/log
3. For more information about the error, check the log files for the device. The default location for the log files is:
 - Windows: TPC_installation_directory\device\log
 - Linux and AIX: TPC_installation_directory/device/log

HWNEP0003E A DS8000 ESSNI command failed. The error code is *error_code*.

Explanation

An ESSNI command failed. No subsequent ESSNI commands were issued, but any commands issued previously were successful. Please check the DS8000 Information Center for more information on the ESSNI error.

Action

Check the DS8000 Information Center for details on the cause and recommended response. Some additional detail may be available in the IBM Spectrum Control message and trace logs. Next, try running the IBM Spectrum Control operation again. Should the problem persist, contact IBM support.

HWNEP0004I Started creation of volume group *volume_group*.

Explanation

Volume Group creation has started. The log will provide information about the subsequent result.

Action

No action is required.

HWNEP0005I Finished creation of volume group *volume_group* with subsystem volume group number *number* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0006I Started adding volumes, with serial numbers *volume_list*, to subsystem volume group *volume_group_number* .

Explanation

Volumes specified will be added to the specified volume group. The log will provide information about the subsequent result.

Action

No action is required.

HWNEP0007I Finished adding volumes to volume group.

Explanation

The task succeeded.

Action

No action is required.

HWNEP0008I Started assignment of host *host* on subsystem *subsystem* to volume group *volume_group*.

Explanation

The host will be associated with the specified volume group, providing it with access to all volumes within the volume group.

Action

No action is required.

HWNEP0009I Finished assigning *host* on subsystem *subsystem* to volume group *volume_group*.

Explanation

The task succeeded.

Action

No action is required.

HWNEP0010I Started removing volumes, with serial numbers *volume_list*, from subsystem volume group *volume_group_number* .

Explanation

Volumes specified will be removed from the specified volume group. The log will provide information about the subsequent result.

Action

No action is required.

HWNEP0011I Finished removing volumes, with serial numbers *volume_list*, from subsystem volume group *volume_group_number* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0012I Increased virtual capacity of storage pool *storage_pool* on subsystem *subsystem* to size *size* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0013I Collecting pools for storage system *storage system identification*.

Explanation

The probe is currently querying the ESSNI server for the extent pools of the storage system.

Action

No action is required.

HWNEP0014I Collecting volumes for *lss* logical subsystems on storage system *storage system identification*.

Explanation

The probe is currently querying the ESSNI server for information regarding logical subsystems and their volumes.

Action

No action is required.

HWNEP0015I Collecting volume groups on storage system *storage system identification.*

Explanation

The probe is currently querying the ESSNI server for the subsystem's volume groups.

Action

No action is required.

HWNEP0016I Collecting hosts on storage system *storage system identification.*

Explanation

The probe is currently querying the ESSNI server for the subsystem's hosts and the volume group to which they are assigned.

Action

No action is required.

HWNEP0017I *value* Hosts Found.

Explanation

This status message is to inform you of the total number of hosts found for this storage system.

Action

No action is required.

HWNEP0018I Launching external process for devices *devices.*

Explanation

An external process has been started for the devices specified. The log will provide information about the subsequent result.

Action

No action is required.

HWNEP0019I External process for devices *devices* completed successfully.

Explanation

An external process has for the devices specified has completed successfully.

Action

No action required.

HWNEP0020E Could not create connection to NAPI *The IP for the NAPI..*

Explanation

No connection to the NAPI could be established.

Action

Check the External Process logs for further details.

HWNEP0021E ESSNI API query for Space Efficient Volume failed with ESSNI code *ESSNI Code*. Data from ESSNI is considered suspect.

Explanation

The ESSNI API was unable to successfully complete the requested query. This indicates a problem within the subsystem and thus the probe will terminate as any data received may be unreliable.

Action

This is usually due to an issue within the NI Services or the LPARs themselves. If the DS gives no indication as to the failure, try restarting one and then the other to see if the problem is resolved.

HWNEP0022I Started deletion of volume group with number *volume_group_number*.

Explanation

Volume group deletion was started. The log will provide information about the subsequent result.

Action

No action is required.

HWNEP0023I Finished deletion of volume group with number *volume_group_number*.

Explanation

The volume group was successfully deleted.

Action

No action is required.

HWNEP0100I Probing Volumes for Storage System: *value*

Explanation

The probe is finding the volumes (VDisks) for this storage system.

Action

No action is required.

HWNEP0101I Number of Volumes currently found: *value*. Continuing to probe Volumes.

Explanation

The probe is finding the volumes (VDisks). This status update is to inform of the number of volumes (VDisks) that have been processed at this point during the probe.

Action

No action is required.

HWNEP0102I *value* Volumes found.

Explanation

This is the total number of Volumes (VDisks) found on the storage system.

Action

No action is required.

HWNEP0103I Probing Configured Disks for Storage System: *value*.

Explanation

The probe is finding the configured disks (MDisks) for this storage system.

Action

No action is required.

HWNEP0104I Number of Configured Disks Found Currently: *value*. Continuing to Probe Disks.

Explanation

The probe is finding the configured disks (MDisks). This status update is to inform how many configured disks (MDisks) have been processed at this point during the probe.

Action

No action is required.

HWNEP0105I *value* Configured Disks Found.

Explanation

This status message to inform you of the total number of configured disks (MDisks) found for this storage system or storage pool.

Action

No action is required.

HWNEP0106I Probing Views of Host Initiator access to Volumes.

Explanation

The probe is finding the Host Initiator access to Volumes.

Action

Check logs for SQLExceptions logged for ServiceUtils.getConnection().

HWNEP0107I Finished probing Views.

Explanation

The probe for finding the Host Initiator access to Volumes is complete.

Action

Check logs for SQLExceptions logged for ServiceUtils.getConnection().

HWNEP0108I Initializing Probe for storage system *storage system identification*.

Explanation

Probe is being initialized.

Action

No Action is required

HWNEP0109I Probe for storage system *storage system identification* completed.

Explanation

Probe is completed.

Action

No action is required.

HWNEP0110I Collecting Nodes and fibre channel ports for storage system *storage system identification*.

Explanation

The probe is currently collection the Nodes and fibre channel ports of the storage system.

Action

No action is required.

HWNEP0111E The connection to the storage device failed. The error code is *error_code*.

Explanation

The External Process connection to the storage device failed with the specified error code. Please check the log details for more info.

Error codes :

- 0 : There is no connection for the specified device
- 2 : No SSH server found on the device
- 3 : Unsupported version
- 4 : The connection to the device failed
- 5 : Authentication failed
- 6 : Unknown host
- 7 : The passphrase is wrong
- 8 : The passphrase is missing
- 9 : Unknown error
- 10: ESSNI not available
- 11: Private key not found
- 12: Invalid format for the private key
- 49: Unable to establish a connection to the device through http port 80

Action

Verify the connection to the storage device and the user credentials. Check the message and trace logs to get to the root cause.

HWNEP0113E The cluster IP address is not specified in the configuration file.

Explanation

The cluster IP address is not specified in the configuration file.

Action

Run the job again. Should the problem persist, contact IBM support.

HWNEP0114E The trustore location is not specified in the configuration file.

Explanation

The trustore location is not specified in the configuration file.

Action

Run the job again. Should the problem persist, contact IBM support.

HWNEP0115E The IBM Spectrum Control data is out of synch with the device configuration and a re-probe is required for device *device name* .

Explanation

The IBM Spectrum Control data is out of synch with the device configuration and a re-probe is required for this device.

Action

Run the probe again. After probe has completed successful run the command again. Ensure that no other configuration changes are performed on the device. If the problem persists, please contact IBM support.

HWNEP0116E The user configured for the subsystem *subsystem name* is not permitted to perform the requested action.

Explanation

The user configured for the current subsystem is not permitted to perform the requested action.

Action

The user that is configured in IBM Spectrum Control to manage the subsystem or is authenticated using the keyfile does not have the proper rights to perform the requested action. This has to be corrected in the subsystem configuration.

HWNEP0117E The virtual disk (VDisk)-to-host mapping was not created because the volume *vdiskName* is already mapped to the *hostName* host for the Device *deviceName*

Explanation

The virtual disk (VDisk)-to-host mapping could not be created because this VDisk is already mapped to this host.

Action

Run the discovery or probe again. Check the message and trace logs to get to the root cause. If the problem persists, contact IBM support.

HWNEP0115I Starting Control Process for storage system *storage system identification*.

Explanation

The specified control process has been started.

Action

No Action is required

HWNEP0116I Started deletion of volume *VolumeID* on subsystem *Subsystem* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0117I Volume deletion completed successfully. Volume *VolumeID* on subsystem *Subsystem* was deleted.

Explanation

The task succeeded.

Action

No action is required.

HWNEP0118I Started adding Managed Disk(s) *Managed Disk ID* to Managed-disk group *Managed Disk group name* on subsystem *Subsystem*.

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0119I Finished adding Managed Disk(s) *Managed Disk ID* to Managed-disk group *Managed Disk group name* on subsystem *Subsystem*.

Explanation

The task succeeded.

Action

No action is required.

HWNEP0120I Started creation of volume with size *Size* in pool *Pool* on subsystem *Subsystem*

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0121I Volume creation completed successfully. New volume *VolumeID* created with size *Size* in pool *Pool* on subsystem *Subsystem* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0122I Started assignment of volume *VolumeID* on subsystem *Subsystem* to initiator port *Initiator Port* on host *Host* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0123I Finished assignment of volume *VolumeID* on subsystem *Subsystem* to initiator port *Initiator Port* on host *Host Name* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0124I Started unassignment of volume *VolumeID* on subsystem *Subsystem* from initiator port *Initiator Port* on host *Host Name* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0125I Finished unassignment of volume *VolumeID* on subsystem *Subsystem* from initiator port *Initiator Port* on host *Host Name* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0126I Started creation of host *host name* on subsystem *Subsystem* with initiator ports *WWPNs* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0127I Finished creation of host *host name* on subsystem *Subsystem* with initiator ports *WWPNs* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0128I Host name *hostName* already exists for the WWPNs *wwpns* on the device *Subsystem*

Explanation

The host name already exists on the device

Action

Run the discovery or probe again. Check the message and trace logs to get to the root cause. If the problem persists, contact IBM support.

HWNEP0129E The operation failed because the device returned unexpected values.

Explanation

Check configuration and connection to the device interface and make sure the device is up and running properly.

Action

An unexpected error occur in the communication with the storage device. Ensure that the device and connection to the device is working properly. Check the message and trace logs to get to the root cause. Run the operation again. If the problem persists, contact IBM support.

HWNEP0130E A IBM XIV CLI command failed. The error is *error_code*.

Explanation

A IBM XIV Command Line Interface command failed. None of the operations that are part of this request were processed successfully. Please check the detailed error messages..

Action

Check the message and trace logs to get to the root cause. Lookup the device specific error code in the device documentation. Run the operation again. Should the problem persist, contact IBM support.

HWNEP0131I The host definition for host *host name* on subsystem *Subsystem* contains additional Hostports *WWPNs* that will also be assigned to Volume *VolumeID* .

Explanation

The selected hostport is part of a host definition on the subsystem that contains additional hostports. These additional hostports will also be assigned to the volume and can access the volume.

Action

If the volume must not be accessible through the additional hostports use the subsystem element manager and change create separate host definitions for the hostports.

HWNEP0132E The unassignment of Volume *VolumeID* from hostport *WWPN* failed because the definition for host *host name* on subsystem *Subsystem* contains additional hostports *WWPNs* .

Explanation

The hostport is part of a host definition on the subsystem that contains additional hostports. Unassigning the additional hostports could cause access loss to the volume .

Action

Either specify all hostports of the host definition for unassignment command or change the host definition on the subsystem using the device's element manager.

HWNEP0133E Error invoking the external process for device *device name* .

Explanation

There was an error invoking the external process.

Action

Check the logs for errors and retry the operation.

HWNEP0134E Following exception occurred: *exception* .

Explanation

There was an unknown error occurred during processing of the function.

Action

Check the logs for errors and retry the operation.

HWNEP0135E External process failed with error code *error code* .

Explanation

The external process failed.

Action

Check the logs for errors and retry the operation.

HWNEP0136E Error connecting to *IP address* with user ID *user ID* .

Explanation

There was an unknown error connecting to a device like subsystem, server, switch, etc..

Action

Make sure the device is up and running.

HWNEP0137I Job *job ID* submitted for device *device name* .

Explanation

A new job was submitted for the device.

Action

None.

HWNEP0138I External process was successfully executed for device *device name* .

Explanation

A job was successfully executed.

Action

None.

HWNEP0139I An instruction was issued to add a copy of the *volume_name* *volume_size*-byte volume in the *pool_name* pool on the *storage_system_name* storage system.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNEP0140I The copy of the *volume_name* *volume_size*-byte volume with the copy ID of *VolumeID* in the *pool_name* pool on the *storage_system_name* storage system was added successfully.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNEP0141I Probing Internal Drives for Storage System: *value*.

Explanation

The probe is finding the internal drives for this storage system.

Action

No action is required.

HWNEP0142I Number of Internal Drives Found Currently: *value*. Continuing to Probe Internal Drives.

Explanation

The probe is finding the internal drives. This status update is to inform how many internal drives have been processed at this point during the probe.

Action

No action is required.

HWNEP0143I *value* Internal Drives Found.

Explanation

This status message to inform you of the total number of internal drives found for this storage system.

Action

No action is required.

HWNEP0144I Probing Pools for Storage System: *value*.

Explanation

The probe is finding the pools (MDisk groups) for this storage system.

Action

No action is required.

HWNEP0145I Number of Pools Found Currently: *value*. Continuing to Probe Pools.

Explanation

The probe is finding the pools (MDisk groups). This status update is to inform how many pools (MDisk groups) have been processed at this point during the probe.

Action

No action is required.

HWNEP0146I *value* Pools Found.

Explanation

This status message to inform you of the total number of pools (MDisk groups) found for this storage system.

Action

No action is required.

HWNEP0147I Collecting asset and status information about *storage_system_id* storage system.

Explanation

The data collection schedule is starting.

Action

No action is required.

HWNEP0148I Collecting cluster information for *storage_system_id* storage system.

Explanation

The data collection schedule is querying the storage system for information about clusters.

Action

No action is required.

HWNEP0149I Collecting file system exports for *storage_system_id* storage system.

Explanation

The data collection schedule is querying the storage system for information about file system exports.

Action

No action is required.

HWNEP0150I Collecting nodes for *storage_system_id* storage system.

Explanation

The data collection schedule is querying the storage system for information about nodes.

Action

No action is required.

HWNEP0151I Collecting file systems for *storage_system_id* storage system.

Explanation

The data collection schedule is querying the storage system for information about file systems.

Action

No action is required.

HWNEP0152I Collecting pools for *storage_system_id* storage system.

Explanation

The data collection schedule is querying the storage system for information about storage pools.

Action

No action is required.

HWNEP0153I Collecting file system storage for *storage_system_id* storage system.

Explanation

The data collection schedule is querying the storage system for information about file system storage.

Action

No action is required.

HWNEP0154I Collecting filesets for *storage_system_id* storage system.

Explanation

The data collection schedule is querying the storage system for information about filesets.

Action

No action is required.

HWNEP0155I Collecting links between file systems and nodes for *storage_system_id* storage system.

Explanation

The data collection schedule is querying the storage system for links between file systems and nodes.

Action

No action is required.

HWNEP0156I Collecting quotas for *storage_system_id* storage system.

Explanation

The data collection schedule is querying the storage system for information about quotas.

Action

No action is required.

HWNEP0157I Collecting file system snapshots for *storage_system_id* storage system.

Explanation

The data collection schedule is querying the storage system for information about file system snapshots.

Action

No action is required.

HWNEP0158I Collecting capacity for *file_system_id* file system.

Explanation

The data collection schedule is querying the storage system for information about file system capacity.

Action

No action is required.

HWNEP0159I Creating the export *export name* on cluster *cluster name* .

Explanation

The export is being created. Check the log file for status.

HWNEP0160I The export *export name* on cluster *cluster name* with path *export path* was created.

Explanation

The export was created.

HWNEP0161I The export *export name* on cluster *cluster name* is being changed.

Explanation

The export is being changed. Check the log file for status.

HWNEP0162I The export *export name* on cluster *cluster name* was changed.

Explanation

The export was changed.

HWNEP0163I Setting quota *quota type* - *quota name* on file system *file system name* .

Explanation

The set quota task has started. The log file will contain information on progress.

Action

No action is required.

HWNEP0164I Quota *quota type* - *quota name* on file system *file system name* has been created.

Explanation

The set quota task has completed.

Action

No action is required.

HWNEP0165I Checking quota on file system *file system name* .

Explanation

The check quota task has started. The log file will contain information on progress.

Action

No action is required.

HWNEP0166I Quota on file system *file system name* has been checked.

Explanation

The check quota task has completed.

Action

No action is required.

HWNEP0167I The export *export name* on cluster *cluster name* is being removed.

Explanation

The export is being removed. Check the log file for status.

HWNEP0168I The export *export name* on cluster *cluster name* was removed.

Explanation

The export was removed. Check the log file for status.

HWNEP0169E Command: *command* did not complete. *IBM SONAS CLI message*

Explanation

The IBM SONAS CLI command did not complete.

Action

Verify the IBM SONAS CLI command syntax is valid.

HWNEP0170I Creating fileset *fileset name* on file system *files system name* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0171I Successfully created fileset *fileset name* on file system *file system name* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0172I Removing fileset *fileset name* on file system *files system name* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0173I Successfully removed fileset *fileset name* on file system *file system name* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0174I Modifying fileset *fileset name* on file system *files system name* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0175I Successfully modified fileset *fileset name* on file system *file system name* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0176I Creating file system *file system* on cluster *cluster name* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0177I Successfully created file system *file system* on cluster *cluster name* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0178I Changing file system *file system* on cluster *cluster name* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0179I Successfully changed file system *file system* on cluster *cluster name* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0180I Removing file system *file system* on cluster *cluster name* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0181I Successfully removed file system *file system* on cluster *cluster name* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0182I Mounting file system *file system* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0183I Successfully mounted file system *file system* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0184I Unmounting file system *file system* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0185I Successfully unmounted file system *file system* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0186I Linking fileset *fileset* on file system *file system* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0187I Successfully linked fileset *fileset* on file system *file system* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0188I Unlinking fileset *fileset* on file system *file system* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0189I Successfully unlinked fileset *fileset* on file system *file system* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0190E The IBM Spectrum Control server could not connect to *IP address* using the SSH protocol.

Explanation

The IBM Spectrum Control server could not create a network connection to the specified IBM Storwize V7000 Unified/IBM SONAS device using the SSH protocol.

Action

Verify that the IBM Storwize V7000 Unified/IBM SONAS device is running and that the connection is not being blocked by a firewall.

HWNEP0191E The IBM Spectrum Control server could not authenticate with *IP address* using the SSH protocol.

Explanation

The IBM Spectrum Control server could not create an SSH connection to the specified IBM Storwize V7000 Unified/IBM SONAS device due to an authentication failure.

Action

Verify that the IBM Spectrum Control server is configured with the correct credentials for the IBM Storwize V7000 Unified/IBM SONAS device.

HWNEP0192E The IBM Spectrum Control server could not execute a command on the IBM Storwize V7000 Unified/IBM SONAS device at *IP address* .

Explanation

The IBM Spectrum Control server could not remotely execute a command on the specified IBM Storwize V7000 Unified/IBM SONAS device using the SSH protocol.

Action

Check the log files for additional details.

HWNEP0193E The *command name* command failed because the following command executed on the NAS device failed with the return code *return code* : *command* returned: *command output*

Explanation

The IBM Spectrum Control command failed because the command that was executed on the NAS device failed.

Action

Check the diagnostics section of the manpage of the failed command for additional details.

HWNEP0195I modify fileset

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0196I change export

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0197I create export

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0198I remove export

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0199I create fileset

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0200I link fileset

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0201I remove fileset

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0202I unlink fileset

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0203I change filesystem

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0204I create filesystem

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0205I mount filesystem

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0206I remove filesystem

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0207I unmount filesystem

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0208I check quota

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0209I set quota

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0210I probe

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0211W The *command name* command completed, however during post-processing the following command executed on the NAS device failed with the return code *return code* : *command* returned:

command output As a result, the IBM Spectrum Control database is now out of sync with the current state of the NAS device.

Explanation

The requested command completed, but during post-processing one of the commands executed on the NAS device failed. Post-processing commands are used to update the IBM Spectrum Control database so this failure has caused the IBM Spectrum Control database to be out of sync with the current state of the device.

Action

Probe the device to update the IBM Spectrum Control database and check the diagnostics section of the manpage of the failed command for additional details on why the post-processing command failed.

HWNEP0212I create disk in modifying file system

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0213I Started deletion of host *host name* on subsystem *Subsystem* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0214I Finished deletion of host *host name* on subsystem *Subsystem* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0215I Collecting cache information for *storage_system_id* storage system.

Explanation

The data collection schedule is querying the storage system for cache information.

Action

No action is required.

HWNEP0216I remove cached source

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0217I create cached node

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0218I remove cached node

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0219I create cache

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0220I remove cache

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0221I modify cache source

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0222I Creating cache source *cache_source_name* on cluster *file_system_name*.

Explanation

The task was started. Consult the log for details on the task's progress.

Action

No action is required.

HWNEP0223I Created cache source *cache_source_name* on cluster *file_system_name*.

Explanation

The task completed.

Action

No action is required.

HWNEP0224I Removing cache source *cache_source_name* on cluster *file_system_name*.

Explanation

The task was started. Consult the log for details on the task's progress.

Action

No action is required.

HWNEP0225I Removed cache source *cache_source_name* on cluster *file_system_name*.

Explanation

The task completed.

Action

No action is required.

HWNEP0226I Modifying cache source *cache_source_name* on cluster *file_system_name*.

Explanation

The task was started. Consult the log for details on the task's progress.

Action

No action is required.

HWNEP0227I Modified cache *cache_source_name* on cluster *file_system_name*.

Explanation

The task completed.

Action

No action is required.

HWNEP0228I Creating cache *cache_name* on file system *file_system_name*.

Explanation

The task was started. Consult the log for details on the task's progress.

Action

No action is required.

HWNEP0229I Created cache *cache_name* on file system *file_system_name*.

Explanation

The task completed.

Action

No action is required.

HWNEP0230I Removing cache *cache_name* on file system *file_system_name*.

Explanation

The task was started. Consult the log for details on the task's progress.

Action

No action is required.

HWNEP0231I Removed cache *cache_name* on file system *file_system_name*.

Explanation

The task completed.

Action

No action is required.

HWNEP0232I Modifying cache *cache_name* on file system
file_system_name.

Explanation

The task was started. Consult the log for details on the task's progress.

Action

No action is required.

HWNEP0233I Modified cache *cache_name* on file system
file_system_name.

Explanation

The task completed.

Action

No action is required.

HWNEP0234I modify cache

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0235I create cached source

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0236I Configuring nodes *node_names* as cached nodes.

Explanation

The task was started. Consult the log for details on the task's progress.

Action

No action is required.

HWNEP0237I Configured nodes *node_names* as cached nodes.

Explanation

The task completed.

Action

No action is required.

HWNEP0238I Unconfiguring cached nodes *node_names*.

Explanation

The task was started. Consult the log for details on the task's progress.

Action

No action is required.

HWNEP0239I Unconfigured cached nodes *node_names*.

Explanation

The task completed.

Action

No action is required.

HWNEP0240I Executed control operation on cache *cache_name* on filesystem *file_system_name* .

Explanation

The task completed.

Action

No action is required.

HWNEP0241I control cache

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0242I run prepop

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0243I list prepop

Explanation

Name of the command which will be used as an insert to messages HWNEP0193E and HWNEP0211W

Action

None.

HWNEP0244I Retrieving cache prepopulation status for file system *file system name* .

Explanation

The list prepop task has started. The log file will contain information on progress.

Action

No action is required.

HWNEP0245I Cache prepopulation status for file system *file system name* has been retrieved.

Explanation

The check list prepop has completed.

Action

No action is required.

HWNEP0246I Prepopulate cache data for fileset *fileset_name* on file system *file_system_name* using policy *policy_name*.

Explanation

The task was started. Consult the log for details on the task's progress.

Action

No action is required.

HWNEP0247I Command to pre populate cached data for fileset *fileset_name* was successful.

Explanation

The task completed.

Action

No action is required.

HWNEP0248W An error was encountered while parsing protocol options for export *export_name*. The options were not persisted, the probe will continue.

Explanation

Export protocol options are not in the expected format.

Action

Check the message and trace logs to get to the root cause.

HWNEP0249W The connection to the storage device failed. The error code is *error_code*.

Explanation

The External Process connection to the storage device failed with the specified error code. Please check the log details for more info.

Error codes :

- 0 : There is no connection for the specified device
- 2 : No SSH server found on the device
- 3 : Unsupported version
- 4 : The connection to the device failed
- 5 : Authentication failed
- 6 : Unknown host
- 7 : The passphrase is wrong
- 8 : The passphrase is missing
- 9 : Unknown error
- 10: ESSNI not available
- 11: Private key not found
- 12: Invalid format for the private key

Action

Verify the connection to the storage device and the user credentials. Check the message and trace logs to get to the root cause.

HWNEP0250I Started adding initiator port(s) *initiator ports* to host *host name* on subsystem *subsystem* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0251I Finished adding initiator port(s) *initiator ports* to host *host name* on subsystem *subsystem* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0252W A CLI command completed with warning. The warning message is : *warning_message*

Explanation

A Command Line Interface command completed with a warning message. Even if the operation completed, it might be possible to encounter problems when using the results of the operation. Please check the detailed warning message which can be shown in a different language since storage device might not be set to or support the same language as IBM Spectrum Control does.

Action

Check the warning message to see what the problem was.

HWNEP0253W Volume creation completed with warning. New volume *VolumeID* created with size *Size* in pool *Pool* on subsystem *Subsystem* .

Explanation

The operation completed with warning.

Action

Check the log files for details.

HWNEP0254W Volume deletion completed with warning. Volume *VolumeID* on subsystem *Subsystem* was deleted.

Explanation

The operation completed with warning.

Action

Check the log files for details.

HWNEP0255I The task to execute the recommendations for optimizing the volumes on the storage system with an ID of *storage_system_id* was paused.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNEP0256I The task for optimizing the volumes on the storage system with an ID of *storage_system_id* was canceled.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNEP0257I The task for optimizing the volumes on the storage system with an ID of *storage_system_id* was resumed.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNEP0258E The optimization task cannot be paused because the synchronization rate for the volume cannot be reset. The ID of the volume is *volume_id* and the ID of the storage system is *storage_system_id*.

Explanation

The command that was issued to the storage virtualizer to set the synchronization rate of the volume did not complete.

Action

See the log file in the device/log directory for more information about the problem.

HWNEP0259E The optimization task cannot be resumed because the synchronization rate for the volume cannot be reset. The ID of the volume is *volume_id* and the ID of the storage system is *storage_system_id*.

Explanation

The command that was issued to the storage virtualizer to set the synchronization rate of the volume did not complete.

Action

See the log file in the device/log directory for more information about the problem.

HWNEP0260I Started creation of host port *host port name* on storage system *Storage System* with initiator port *WWPN* .

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0261I Finished creation of host port *host port name* on storage system *Storage System* with initiator port *WWPN* .

Explanation

The task succeeded.

Action

No action is required.

HWNEP0262E The recommendation for the *volume_name* volume was not implemented because the command that was issued by the storage virtualizer returned the following error: *error_message*

Explanation

To determine the cause of the error, read the error message that was generated by the storage virtualizer. If the storage virtualizer does not support the same language that IBM Spectrum Control supports, the error message might be shown in a different language.

Action

Rerun the task to implement the recommendations. If an error is still generated, complete the following actions:

- To learn more about the error, check the documentation for the storage resource .
- To resolve the issue, complete the recommended actions.
- To generate new recommendations, probe the storage resource and rerun the wizard to optimize the volumes.

If you cannot resolve the issue, contact IBM Support.

HWNEP0263I The synchronization of the *volume_name* volume with the volume copy was successful.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNEP0264E The synchronization of the *volume_name* volume with the volume copy was unsuccessful.

Explanation

The instruction to synchronize the volume with the volume copy failed.

Action

Check the log messages and the status of the storage resource to resolve the issues that you identify. Manual cleanup might be required to restore the volume.

HWNEP0265E The CLI command that was issued for the *storage_system_name* storage system failed and generated the following error: *error_message*

Explanation

To determine the cause of the error, read the error message that was generated by the storage system. If the storage system does not support the same language that IBM Spectrum Control supports, the error message might be shown in a different language.

Action

Rerun the task to implement the recommendations. If an error is still generated, complete the following actions:

- To learn more about the error, check the documentation for the storage resource .
- To resolve the issue, complete the recommended actions.
- To generate new recommendations, probe the storage resource and rerun the wizard to optimize the volumes.

If you cannot resolve the issue, contact IBM Support.

HWNEP0266I Started expanding the capacity of volume *volume* on subsystem *subsystem* from *oldsize* to *newsize* bytes.

Explanation

The task was started. The log will contain information about the task progress.

Action

No action is required.

HWNEP0267I Finished expanding the capacity of volume *volume* on subsystem *subsystem* to *newsize* bytes.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNEP0268E The server operating system or version is not supported by IBM Spectrum Control for IBM Spectrum Scale.

Explanation

The server operating systems and versions that are supported by IBM Spectrum Control for IBM Spectrum Scale are listed in the interoperability matrix document.

Action

See the IBM Spectrum Control interoperability matrix at the following URL: <http://www.ibm.com/support/docview.wss?uid=swg21386446>. Go to the Storage section and search for IBM Spectrum Scale.

HWNEP0269E The IBM Spectrum Scale cluster information cannot be displayed. All the nodes in the cluster are down or cannot be contacted.

Explanation

An operation was attempted on a remote cluster node. However, none of the nodes in the cluster are reachable or IBM Spectrum Scale is not accepting commands on any of the nodes.

Action

Ensure that the cluster nodes are available and that the storage product user has sufficient authority to complete the required commands on the nodes. Try the operation again.

HWNEP0270E The switch cannot respond to SNMP queries because of an authentication error.

Explanation

The IBM Spectrum Control server could not create a connection to the switch because of an authentication failure.

Action

Make sure authentication info provided was correct and retry. If problem persists, check the log files for details.

HWNEP0271E The following password decryption exception occurred: *exception*

Explanation

The IBM Spectrum Control server could not decrypt the password.

Action

Resolve the issue that is indicated by the exception.

HWNEP0272E The switch cannot respond to SNMP queries because of the following exception: *exception*

Explanation

This exception might occur for any of the following reasons:

- SNMP is not enabled in the device.
- The given SNMP community string is incorrect.
- Access restrictions.

Action

Resolve the issue that is indicated by the exception.

HWNEP0273E The following exception occurred because the OID format is incorrect: *exception*

Explanation

The OID string was sent in the wrong format.

Action

Resolve the issue that is indicated by the exception.

HWNEP0274E The switch cannot respond to SNMP queries because of a timeout problem.

Explanation

A timeout can occur as a result of throttling enhancements or incorrect authentication parameters.

Action

Ensure that the following conditions are true:

- SNMP is enabled on the switch./
- For SNMPv1, the community string is correct.
- For SNMPv3:
 - The username/password authentication and private protocols are correct.
 - The user is not set on the switch by using one of unsupported encryption types: Triple DES, AES 192 or AES 256.

- There are no network access restrictions.

HWNEP0270I Retrieved the file module address *file_module_address*.

Explanation

The file module address was retrieved from the device.

Action

No action is required.

HWNEP0271I No quota data was collected. Quota limits are not activated for the file systems that are associated with the IBM Spectrum Scale cluster.

Explanation

Information about inode and space usage is collected only for file systems on which quota limits are activated.

Action

No action is required.

HWNEP0272I Collecting file systems that are mounted on the nodes of storage system *storage_system_id*.

Explanation

The data collection schedule is querying the IBM Spectrum Scale cluster for information about file systems that are mounted at the nodes of the cluster.

Action

No action is required.

HWNEP0275W One or more operations failed for the CLI command that was issued for the storage system. The following error was generated: *errorMsg* .

Explanation

The CLI command completed but some errors occurred.

Action

Review the error message that was generated by the storage system. To learn more about the cause of the error and the recommended actions, search the IBM Knowledge Center using the storage system name and version. Check the message and trace logs for more information.

HWNEP0276E Command execution failed because *sudo* is not installed.

Explanation

For users other than root, 'sudo' must be installed and configured to allow command execution on behalf of root.

Action

Install and configure 'sudo' for the user that connects to the system.

HWNEP0277I Commands are executed through 'sudo'.

Explanation

A user other than root is used, so commands are executed through 'sudo' with root authority.

Action

No action is required.

HWNEP0278E User can not execute command through sudo.

Explanation

For users other than root, 'sudo' must be configured to allow command execution on behalf of root.

Action

Add the user to the sudoers list and allow all necessary commands to be executed through sudo.

HWNEP0279I Collecting remote file systems for *storage_system_id* storage system.

Explanation

The data collection schedule is querying the storage system for information about remote file systems.

Action

No action is required.

HWNEP0280I Collecting remote file systems that are mounted on the nodes of storage system *storage_system_id*.

Explanation

The data collection schedule is querying the IBM Spectrum Scale cluster for information about remote file systems that are mounted at the nodes of the cluster.

Action

No action is required.

HWNEP0281E The switch is returning corrupted data.

Explanation

The server could not use data from the switch.

Action

Review recent configuration changes and try to run the probe again.

HWNEP0282E Zoning data cannot be collected because there is a transaction in progress on the switch

Explanation

The server could not use data from the switch.

Action

None.

HWNEP0283E VSAN *vsan_name* was not found.

Explanation

The VSAN specified as a parameter can not be found in the switch.

Action

Retry the operation with other VSAN name.

HWNEP0284E No zoning data collected from the switch.

Explanation

Zoning data not retrieved from the switch.

Action

Review recent configuration changes and try to run the probe again.

HWNEP0285E Cannot authenticate to the object storage using the specified user credentials.

Explanation

The IBM Spectrum Control server failed to authenticate to the Keystone identity service using the specified user credentials.

Action

Check the user credentials. If the user credentials for the object storage are different from the user credentials for the GPFS cluster, you must enter both sets of user credentials. Try the operation again.

HWNEP0286E An object storage request failed on the GPFS cluster.

Explanation

The IBM Spectrum Control server cannot connect to the object storage on the GPFS cluster. This error might occur because the object service is disabled or stopped or because the user credentials are invalid.

Action

Verify that the object service is configured correctly and is enabled and started. For more information about configuring the object service for IBM Spectrum Scale, go to the IBM Knowledge Center (<http://www.ibm.com/support/knowledgecenter>).

Verify the user credentials and privileges.

Try the operation again. If the problem persists, contact IBM Software Support.

HWNEP0287E Error when collecting Accounts information from Object Storage Service using REST protocol.

Explanation

The probe failed for an IBM Spectrum Scale storage system that is configured for object storage. This issue might occur if the IBM Spectrum Control Server cannot connect to the OpenStack Swift and Keystone endpoints that are used to access object services.

Action

Complete the following steps to verify that the OpenStack Keystone and Swift services are running and correctly configured:

1. To list the URLs for the Keystone and Swift services, run the following commands as user root on one of the GPFS cluster nodes that are configured for object storage. `~/openrc openstack endpoint list`
2. Ensure that the IBM Spectrum Control server can connect to the IP addresses and host names that are included in the URLs for the Keystone and Swift services. For example, the URL for the Keystone service might be `http://gpfs420proto1:5000/v3`. In this case, the IBM Spectrum Control server must be able to connect to the `gpfs420proto1` host name.

If the problem persists, check the log files for the Device server for error messages that might help determine the problem. The default location of log files for the Device server is:

- Windows: `TPC_installation_directory\device\log`
- Linux and AIX: `TPC_installation_directory/device/log`

HWNEP0288E Error when collecting Containers information from Object Storage Service using REST protocol.

Explanation

Failed when attempting to retrieve Swift Containers from Object Storage service.

Action

Review error messages from External Probe log files of Device Server. Verify OpenStack Swift services are running and correctly configured.

HWNEP0281I Collecting object storage accounts for *storage_system_id* storage system.

Explanation

The data collection schedule is querying the GPFS cluster for information about object storage accounts.

Action

No action is required.

HWNEP0282I Collecting object storage containers for *storage_system_id* storage system.

Explanation

The data collection schedule is querying the GPFS cluster for information about object storage containers.

Action

No action is required.

HWNEP0289E Failed to retrieve container information because the number of containers now exceeds the maximum number of containers that can currently be collected for an account (*MAX Containers*).

Explanation

To prevent probes of GPFS clusters that are configured with object storage from taking an excessive amount of time, the number of containers which can be collected for each account during a probe is limited. This limit can be configured by adjusting the Probe.ObjectContainerMaxPages property.

Action

Use the "tpctool getdscfg" command to retrieve the current value for the Probe.ObjectContainerMaxPages property. Archive or delete any unused containers so that the number of containers for the account no longer exceeds the time limit. Try the operation again.

Alternatively, use the "tpctool setdscfg" command to increase the value for the Probe.ObjectContainerMaxPages property. Then, restart the Device server service and try the operation again.

For more information about using the tpctool command, go to the IBM Knowledge Center (<http://www.ibm.com/support/knowledgecenter>).

HWNEP0290E The probe failed to retrieve object storage account information from the storage system *storage_system_id* because the *userid* user does not have the required authority.

Explanation

The user that is configured to monitor the object storage system does not have authority to retrieve information about accounts.

Action

Check the credentials for the user that is configured to monitor the object storage system. In Keystone, the OpenStack identity service, ensure that the user is assigned the required role and has the authority to retrieve object storage account information. Try the operation again.

HWNEP0291E The probe failed to retrieve object storage container information from the storage system *storage_system_id* because the *userid* user does not have the required authority.

Explanation

The user that is configured to monitor the object storage system does not have authority to retrieve information about containers.

Action

Check the credentials for the user that is configured to monitor the object storage system. In Keystone, the OpenStack identity service, ensure that the user is assigned the required role and has the authority to retrieve object storage container information. Try the operation again.

HWNEP0292E Cannot query the object service for information about accounts and containers as the specified user does not have admin privileges.

Explanation

To query account and container information from the object service, the user must be assigned the admin role in Keystone, the OpenStack identity service. To monitor all accounts and containers, the user must also be assigned the role that is defined in the reseller_admin_role configuration option in the Swift proxy server. The default value for the reseller_admin_role option is ResellerAdmin.

Action

Check the credentials for the user. In Keystone, the OpenStack identity service, ensure that the user is assigned the required role and has the authority to retrieve object storage account and container information. Try the operation again.

HWNEP0293W The probe did not collect information about all the object accounts for the storage system *storage_system_id* as the *userid* user does not have sufficient authority on the storage system.

Explanation

The role assigned to the user that is configured to monitor the storage system does not have sufficient privileges to collect information about all accounts and their associated containers. To monitor all accounts on the object storage system, the user must be configured with the ResellerAdmin role.

Action

Check the role that is assigned to the user that is used to monitor the storage system. To monitor all accounts, assign the ResellerAdmin role to the user in Keystone, the OpenStack Identity service. Try the operation again.

HWNEP0294W An authentication error prevented the switch from responding to SNMP queries regarding the ability of the switch to perform zone control.

Explanation

The IBM Spectrum Control server could not create a connection to the switch when checking the ability to perform zone control because of an authentication failure.

Zone control during provisioning Tasks might not be possible until this is resolved.

Action

Make sure that the switch authentication information is correct and then try the action again. If problem persists, contact IBM Software Support.

HWNEP0295W A timeout prevented the switch from responding to SNMP queries regarding the ability of the switch to perform zone control.

Explanation

A timeout can occur as a result of throttling enhancements or incorrect authentication parameters.

Zone control during provisioning Tasks might not be possible until this is resolved.

Action

Using the switch management application, ensure that the following conditions are true:

- SNMP is enabled on the switch./
- For SNMPv1, the read and write community strings are correct.
- For SNMPv3:
 - The username/password authentication and private protocols are correct.
 - The user is not set on the switch by using one of unsupported encryption types: Triple DES, AES 192 or AES 256.
- There are no network access restrictions.

Try the action again.

HWNEP0296W The switch cannot respond to SNMP queries to check the ability of the switch to perform zone control because of the following exception: *exception*

Explanation

This exception might occur for any of the following reasons:

- SNMP is not enabled in the device.
- The SNMP read or write community strings are incorrect.
- Access restrictions.

Action

Use the switch management application to resolve the issue that is indicated by the exception and try the action again.

HWNEP0297W The switch cannot respond to SNMP queries to check the ability of the switch to perform zone control because of the following exception: *exception*

Explanation

This exception might occur for any of the following reasons:

- SNMP is not enabled in the device.
- The SNMP read or write community strings are incorrect.
- Access restrictions have been defined for the switch.

Action

Use the switch management application to resolve the issue that is indicated by the exception and try the action again.

HWNEP0298I Collecting IBM Cloud Object Storage configuration.

Explanation

The data collection schedule is querying IBM Cloud Object Storage for information about system configuration.

Action

No action is required.

HWNEP0299I Collecting IBM Cloud Object Storage vaults.

Explanation

The data collection schedule is querying IBM Cloud Object Storage for information about vaults.

Action

No action is required.

HWNEP0300I Collecting detailed IBM Cloud Object Storage status.

Explanation

The data collection schedule is querying IBM Cloud Object Storage for information about the health and status of its components.

Action

No action is required.

HWNEP0301W The IP address *ip_address* for the FlashSystem storage system is not the management IP address.

Explanation

The IP address for the FlashSystem storage system that you added is not the management IP address. If you do not use the management IP address, the storage system might be managed incorrectly.

Action

To change the current IP address to the management IP address, right-click the FlashSystem storage system on the Block Storage Systems page and select Connections > Modify Connection.

HWNEP0302I Collecting Transparent Cloud Tiering information for *storage_system_id* storage system.

Explanation

The data collection schedule is querying the storage system for information about its Transparent Cloud Tiering configuration.

Action

No action is required.

HWNEP0303I No Transparent Cloud Tiering configuration was detected on the IBM Spectrum Scale cluster.

Explanation

This problem might occur when Transparent Cloud Tiering is not configured on the IBM Spectrum Scale cluster, or the mmcloudgateway command is not installed on node that is used by IBM Spectrum Control to connect to the cluster.

Action

Verify that Transparent Cloud Tiering is configured on the IBM Spectrum Scale cluster. If Transparent Cloud Tiering is configured but is not detected by IBM Spectrum Control, ensure that the mmcloudgateway command is installed on the cluster node that is used to connect to IBM Spectrum Scale.

HWNEP0304E Cannot connect to IBM Cloud Object Storage.

Explanation

This error might occur because the object service is disabled or stopped or because the user credentials for logging in to IBM Cloud Object Storage are invalid.

Action

To resolve the issue, try the following actions:

- Verify that the object service is configured correctly and is enabled and started.
- Verify that the user credentials and privileges are valid.

Try the action again. If the problem persists, contact IBM Software Support.

HWNEP0305I Collecting disk controllers for storage system *storage system identification*.

Explanation

The probe is currently collecting data for the disk controllers of the storage system.

Action

No action is required.

HWNEP0306I Collecting disks for storage system *storage system identification*.

Explanation

The probe is currently collecting data for the disks of the storage system.

Action

No action is required.

HWNEP0307I Collecting CIFS shares for storage system *storage system identification*.

Explanation

The probe is currently collecting data for the CIFS shares of the storage system.

Action

No action is required.

HWNEP0308I Collecting NFS exports for storage system *storage system identification*.

Explanation

The probe is currently collecting data for the NFS exports of the storage system.

Action

No action is required.

HWNEP0309I The data is being collected by the data collector: *data collector host*.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNEP0310I Discovery found *number* storage systems.

Explanation

The discovery task completed and found the specified number of storage systems that are managed by the SMI-S provider.

Action

No action is required.

HWNEP0311I Probing nodes or directors for *storage system name* storage system.

Explanation

The probe is querying the SMI-S provider for information about nodes or directors on the storage system.

Action

No action is required.

HWNEP0312I Probe found *number* nodes or directors.

Explanation

The probe found the specified number of nodes or directors on the storage system.

Action

No action is required.

HWNEP0313I Probing pools for *storage system name* storage system.

Explanation

The probe is querying the SMI-S provider for information about pools on the storage system.

Action

No action is required.

HWNEP0314I Probe found *number* pools.

Explanation

The probe found the specified number of pools on the storage system.

Action

No action is required.

HWNEP0315I Probing disk groups for *storage system name* storage system.

Explanation

The probe is querying the SMI-S provider for information about disk groups on the storage system.

Action

No action is required.

HWNEP0316I Probe found *number* disk groups.

Explanation

The probe found the specified number of disk groups on the storage system.

Action

No action is required.

HWNEP0317I Probing disks for *storage system name* storage system.

Explanation

The probe is querying the SMI-S provider for information about disks on the storage system.

Action

No action is required.

HWNEP0318I Probe found *number* disks.

Explanation

The probe found the specified number of disks on the storage system.

Action

No action is required.

HWNEP0319I Probing host connections for *storage system name* storage system.

Explanation

The probe is querying the SMI-S provider for information about host connections on the storage system.

Action

No action is required.

HWNEP0320I Probing ports for *storage system name* storage system.

Explanation

The probe is querying the SMI-S provider for information about the fibre channel and ethernet ports on the storage system.

Action

No action is required.

HWNEP0321I Probing volumes for *storage system name* storage system.

Explanation

The probe is querying the SMI-S provider for information about volumes on the storage system.

Action

No action is required.

HWNEP0322I Probe found *number* volumes. Continuing to probe volumes.

Explanation

The probe is querying the SMI-S provider for information about volumes on the storage system. So far, the probe found the specified number of volumes.

Action

No action is required.

HWNEP0323I Probe found *number* volumes for *storage system name* storage system.

Explanation

The probe found the specified number of volumes on the storage system.

Action

No action is required.

HWNEP0324I Probing NAS nodes for *storage system name* storage system.

Explanation

The probe is querying the SMI-S provider for information about NAS nodes on the storage system.

Action

No action is required.

HWNEP0325I Probe found *number* NAS nodes.

Explanation

The probe found the specified number of NAS nodes on the storage system.

Action

No action is required.

HWNEP0326I Probing file systems that are mounted on the NAS nodes of *storage system name* storage system.

Explanation

The probe is querying the SMI-S provider for information about file systems that are mounted on the NAS nodes of the storage system.

Action

No action is required.

HWNEP0327I Probe found *number* file systems.

Explanation

The probe found the specified number of file systems on all of the NAS nodes on the storage system.

Action

No action is required.

HWNEP0328I Probing file system exports for *storage system name* storage system.

Explanation

The probe is querying the SMI-S provider for information about file system exports on the storage system.

Action

No action is required.

HWNEP0329W *profile name version version number* SMI-S Profile is not supported.

Explanation

The minimum required version for the specified SMI-S profile is not supported by the SMI-S provider used. The job now running might fail to collect some information.

Action

Upgrade the SMI-S provider to one that supports the minimum required version. See the IBM Spectrum Control interoperability matrix at the following URL: <a href=<http://www.ibm.com/support/docview.wss?uid=swg27047049>><http://www.ibm.com/support/docview.wss?uid=swg27047049>. Search for the supported agent or provider for your resource.

HWNEP0330E Unable to find minimum required SMI-S profile to proceed with requested task.

Explanation

The SMI-S provider does not support the minimum required version of at least one of the following SMI-S profiles: Array, NAS Head, or Storage Virtualizer.

Action

Upgrade the SMI-S provider to one that supports the minimum required version. See the IBM Spectrum Control interoperability matrix at the following URL: <a href=<http://www.ibm.com/support/docview.wss?uid=swg27047049>><http://www.ibm.com/support/docview.wss?uid=swg27047049>. Search for the supported agent or provider for your resource.

HWNEP0331I Probing copy pair relationships for *storage system name* storage system.

Explanation

The probe is querying the SMI-S provider for information about copy pair relationships on the storage system.

Action

No action is required.

HWNEP0332I Probe found *number* copy pairs.

Explanation

The probe found the specified number of copy pairs on the storage system.

Action

No action is required.

HWNEP1111E There is no connection for the specified device.

Explanation

The External Process connection to the storage device failed because there is no connection for the specified device.

Action

Verify the connection to the storage device and the user credentials. Check the message and trace logs to get to the root cause.

HWNEP1112E No SSH server found on the device.

Explanation

The External Process connection to the storage device failed because the SSH server was not found on the device

Action

Verify the ssh server on the storage device and the user credentials. Check the message and trace logs to get to the root cause.

HWNEP1113E Unsupported version.

Explanation

The External Process connection to the storage device failed because the SSH version is not supported.

Action

Verify the connection to the storage device and the user credentials. Check the message and trace logs to get to the root cause.

HWNEP1114E The connection to the device failed.

Explanation

The External Process connection to the storage device failed.

Action

Verify the connection to the storage device and the user credentials. Check the message and trace logs to get to the root cause.

HWNEP1115E Authentication failed.

Explanation

The External Process connection to the storage device failed because authentication failed.

Action

Verify the connection to the storage device and the user credentials. Check the message and trace logs to get to the root cause.

HWNEP1116E Unknown host.

Explanation

The External Process connection to the storage device failed due to unknown host.

Action

Verify the connection to the storage device and the user credentials. Check the message and trace logs to get to the root cause.

HWNEP1117E The passphrase is wrong.

Explanation

The External Process connection to the storage device failed because the passphrase used is wrong.

Action

Verify the connection to the storage device and the passphrase used. Check the message and trace logs to get to the root cause.

HWNEP1118E The passphrase is missing.

Explanation

The External Process connection to the storage device failed because the passphrase is missing.

Action

Verify the connection to the storage device and the passphrase used. Check the message and trace logs to get to the root cause.

HWNEP1119E Unknown error.

Explanation

The External Process connection to the storage device failed because an unknown error occurred.

Action

Verify the connection to the storage device and the user credentials. Check the message and trace logs to get to the root cause.

HWNEP1120E ESSNI not available.

Explanation

The External Process connection to the storage device failed because ESSNI not available.

Action

Verify the connection to the storage device and the user credentials. Check the message and trace logs to get to the root cause.

HWNEP1121E Private key not found.

Explanation

The External Process connection to the storage device failed because the private key used was not found.

Action

Verify the connection to the storage device and the private key used. Check the message and trace logs to get to the root cause.

HWNEP1122E Invalid format for the private key.

Explanation

The External Process connection to the storage device failed because the format for the private key is invalid.

Action

Verify the connection to the storage device and the private key used. Check the message and trace logs to get to the root cause.

HWNEP1123E Unable to establish a connection to the device through http port 80.

Explanation

The External Process connection to the storage device failed because we were unable to establish a connection to the device through http port 80.

Action

Verify the connection to the storage device . Check the message and trace logs to get to the root cause.

HWNEP1124I Log collection successfully started for *storage system name* storage system.

Explanation

The collection of support logs has successfully started for the storage system

Action

No action is required.

HWNEP1125E The activity requested is already in progress on *storage system name* storage system.

Explanation

The requested activity is already in progress on this subsystem.

Action

Wait until the currently running activity completes before making this request.

HWNEP1126I The support log activity has started successfully *storage system name* storage system.

Explanation

The requested activity has started successfully.

Action

No action is required.

HWNEP0112E The CLI command that was issued for the storage system failed and generated the following error: *error_message*

Explanation

To determine the cause of the error, read the error message that was generated by the storage system. If the storage system does not support the same language that IBM Spectrum Control supports, the error message might be shown in a different language.

Action

Rerun the task to implement the recommendations. If an error is still generated, complete the following actions:

- To learn more about the error, check the documentation for the storage resource .
- To resolve the issue, complete the recommended actions.
- To generate new recommendations, probe the storage resource and rerun the wizard to optimize the volumes.

If you cannot resolve the issue, contact IBM Support.

HWNEP1127I The probe failed to retrieve encryption information from the storage system *storage_system_id* because the *userid* user does not have the required authority.

Explanation

The user that is configured to monitor the HPE 3PAR storage system does not have authority to retrieve information about encryption.

Action

Check the credentials for the user that is configured to monitor the object storage system. Collection encryption information requires a user that has Super or Service permission. Try the operation again.

HWNEP1128E The process failed because it was unable to find the Export Tool. Expected location was *loc of tool*.

Explanation

The Hitachi Export Tool is required to collect Performance data for Hitachi systems. The tool was not found at the location specified.

Action

Check that the tool exists and confirm that the location is correct in the Data Collector setup.properties file. Try the operation again.

HWNEP1129E The process failed because the *userid* or password provided failed to connect to the Export Tool.

Explanation

Performance data collection for Hitachi systems requires a user name and password to be defined in the Hitachi Device Manager for the Export Tool. Connection with the provided user name or password failed.

Action

Check the credentials for the user that is configured to monitor the block storage system. To connect to the storage system for both probe and performance monitoring, ensure that the following credentials match:

- The user name and password that is defined in Hitachi Device Manager.
- The user name and password that is used for Hitachi Command Suite to connect to the device.

HWNEP1130E The process failed because the Hitachi SVP was busy and did not return data or timed out.

Explanation

The hitachi external process was unable to collect data because the Hitachi SVP is too busy.

Action

The Hitachi SVP seems to be too busy to return performance data. Collection will retry at the next performance interval.

HWNPM5412E Performance statistics collection is not enabled.

Explanation

Performance statistics collection is not enabled on either the SMI-S provider or the system it manages.

Action

Enable performance statistics collection on either the SMI-S provider or the system it manages.

HWNEP1131E The process failed because the Hitachi performance interval is set to something other than 1 or 5 minutes.

Explanation

The performance interval on the Hitachi Device Manager must be set to either 1 or 5 minutes.

Action

Using the Device Manager, set the performance interval to 1 or 5 minutes.

HWNEP1132W Can't collect further system information because the device returned unexpected values.

Explanation

All the DS8k CECs are in maintenance mode and can't collect further system information.

Action

Make sure the DS8k CECs aren't in maintenance mode when running probe on the storage.

NAD0001I Connecting to *hostname* using *protocol* protocol.

Explanation

The server is connecting to the Storage Resource Agent at the specified hostname using the specified communication protocol.

NAD0002W Connection to *hostname* failed using *protocol* protocol: *error*.

Explanation

The server failed to connect to the Storage Resource Agent at the specified hostname using the specified communication protocol.

NAD0003I Connected to *hostname* using *protocol* protocol.

Explanation

The server connected to the Storage Resource Agent at the specified hostname using the specified communication protocol.

NAD0005E Connection to *hostname* failed using *protocol* protocol: *error message*.

Explanation

The server failed to connect to the Storage Resource Agent at the specified hostname using the specified communication protocol.

NAD0006E Exception thrown for method *method name*: *error message*.

Explanation

An error occurred while processing the specified method.

NAD0007I Closing connection to *hostname*.

Explanation

Closing the connection to the Storage Resource Agent at the specified hostname.

NAD0008E Invalid protocol *protocol* passed to *method name*.

Explanation

The method does not support this protocol.

NAD0010E Invalid parameter(s) *parameter name* passed to *method name*.

Explanation

Invalid input to the specified method.

NAD0013I Installing GUID on remote machine: *hostname*.

Explanation

Installing the unique identifier on the specified machine.

NAD0014I GUID successfully installed on remote machine: *hostname*.

Explanation

Unique identifier installed on the specified machine.

NAD0018E Command on remote machine: *host name* failed. Error code = *value* executing command *value*.

Explanation

The installation on the remote machine failed.

NAD0019E Parameter *parameter* passed to *method* is null or 0 length.

Explanation

Invalid input to the specified method.

NAD0055E Failed to connect to remote host *host*.

Explanation

The specified host is down or not reachable via network.

NAD0097I Opening connection to *hostname*.

Explanation

Opening the connection to the Storage Resource Agent at the specified hostname.

NAD0180I Installing re-distributable package on .

Explanation

Updating remote machine with Visual Studio re-distributable dll package.

NAD0181I Install of re-distributable package on succeeded.

Explanation

Update of Visual studio 2008 DLL's on remote machine succeeded.

NAD0182E Failed to install re-distributable package on .

Explanation

Failed to update remote machine with Visual Studio dll's.

NAD0186I Trying to locate package TIVguid using pkginfo ...

Explanation

Trying to locate installation folder of package TIVguid using pkginfo.

NAD0187I Package TIVguid is not installed.

Explanation

Package TIVguid is not installed on the system.

NAD0188I Checking TIVguid default install path : *path* ...

Explanation

Trying to detect existing installation of package TIVguid using the default install path : /opt/tivoli/guid.

NAD0259W Unable to determine Storage Resource Agent version on host . Fabric Discovery will not be invoked.

Explanation

Storage Resource Agent version could not be obtained. Since Fabric Discovery is not supported on some early versions of Storage Resource Agent, it will not be invoked.

Action

Check if there are any connectivity issues with the Storage Resource Agent. Also, check the device server message and trace log for more detail. If the problem continues, contact IBM support.

NAD0145E Cannot get version information from agent on host .

Explanation

Storage Resource Agent version could not be obtained.

Action

Check if there are any connectivity issues with the Storage Resource Agent. If the problem continues, contact IBM support.

-  [Getting support](#)

NAD0146E The connection to *remote machine* failed because the Remote Execution and Access component was unable to create a temporary directory on the remote machine. Remove unneeded ~CSRI* directories in the remote machine's temporary directory.

Explanation

The connection to the remote machine failed.

Action

Remove unneeded ~CSRI* directories in the remote machine's temporary directory.

NAD0156E The server *host_address* cannot be reached because the host name or IP address is not recognized.

Explanation

The host cannot be contacted because the host is unreachable.

Action

Check the host name specified for the target host. Check if the host name can resolve to an IP address from a command line by using commands such as nslookup or ping.

NAD0157E The server *host_name* cannot be contacted. The server might be down, unreachable due to network problems, or the SSH credentials might be invalid.

Explanation

The server cannot be contacted. The server might be down or unreachable due to other connection failures or the server cannot be contacted using the credentials that are provided.

Action

Check the host name that is specified for the server. Check whether the host name can resolve to an IP address from a command line by using commands such as nslookup or ping. Check whether the user and password that are specified are valid. If SSH certificates are used for authentication, check whether the certificate and the passphrase are valid.

NAD0260I Agent is active.

Explanation

The check to ensure that communication with the agent has completed with success.

NAD0272W The connection to the Storage Resource Agent on *host name* was not established. Retrying using the IP address.

Explanation

The Storage Resource Agent specified on this computer could not be connected using the fully qualified computer name. Connection is retried using the ip address.

Action

Check if the fully qualified computer name can be resolved through the network using network commands.

NAD0274E An SSH certificate *certificate name* already exist.

Explanation

The SSH certificate could not be copied on IBM Spectrum Control server directory as there is another certificate with this name.

Action

Rename the SSH certificate name and try again.

NAD0275E Failed to connect to remote host *hostname and port*. Failed to establish a secure connection.

Explanation

The SSH connection failed due to an unknown SSL error.

Action

Verify the connection is not blocked by a firewall and retry the connection.

NAD0276E Failed to connect to remote host *hostname and port*. Failed to establish a secure connection because the SSL handshake failed.

Explanation

The SSL connection failed because the IBM Spectrum Control server and the storage resource agent could not negotiate the desired level of security. This could happen if the IBM Spectrum Control server or storage resource agent certificate is not trusted, not valid, or expired.

Action

If you have recently updated the certificate on the IBM Spectrum Control server then make sure you have also replaced the certificate on the storage resource agent. Make sure that the system date on both the IBM Spectrum Control server and storage resource agent machine is within validity date range of both certificates.

NAD0277E Failed to connect to remote host *hostname and port*. Failed to establish a secure connection because of an invalid SSL key.

Explanation

The SSL connection failed because of a bad SSL key. This is normally caused by a misconfiguration of the SSL certificate and private key.

Action

Verify that the certificates and private keys on the IBM Spectrum Control server and storage resource agent have been configured correctly.

NAD0278E Failed to connect to remote host *hostname and port*. Failed to establish a secure connection because the identity of the peer could not be verified.

Explanation

The SSL connection failed because the peer was not able to identify itself. This could happen if no certificate is available or the configured cipher suite does not support authorization.

Action

Verify that the certificates on the IBM Spectrum Control server and storage resource agent have been configured correctly. There is no need to investigate the cipher suite because IBM Spectrum Control does not allow this to be configured.

NAD0279E Failed to connect to remote host *hostname and port*. Failed to establish a secure connection because of an SSL protocol error.

Explanation

The SSL connection failed because of an error in the SSL protocol.

Action

Contact IBM support.

Related reference

- [Getting support](#)

NAD0281E The Storage Resource agent cannot be deployed because of insufficient space or other issues on the target system. The error is: *error message*.

Explanation

This problem might occur when there is insufficient space on the target system, or the target file is read-only or is being used by another application.

Action

Ensure that the target file is not open or in read-only mode, and that enough space is available on the target system. Try the action again.

BTAVM2272W Unsupported virtual disk backing info for disk "*Disk name*" of hypervisor *Hypervisor name*, virtual machine "*VM name*": *Virtual disk type*.

Explanation

Currently Spectrum Control supports only the following types of ESX virtual disks: VirtualDiskFlatVer2BackingInfo, VirtualDiskSparseVer2BackingInfo, and VirtualDiskRawDiskMappingVer1BackingInfo.

Action

Contact IBM support.

BTAVM2273W Unable to find file "*File name*" which is the backing device of the virtual disk "*Disk name*" of hypervisor *Hypervisor name*, virtual machine "*VM name*".

Explanation

The backing info of the virtual disk was not found by the ESX probe. This happens when either the virtual disk was created after the latest datastore scan or VM was probed while its snapshots were being deleted.

Because the virtual disk could not be correlated to its backing device, the capacity of the VM will be reported wrong in Spectrum Control.

Action

Rerun the hypervisor probe.

BTAVM2274W Probe of hypervisor *Name of the Hypervisor* completed with warnings.

Explanation

The probe of the hypervisor completed with warnings.

Action

Check the message log to find the warnings reason.

BTAEC - Event correlator messages

- [BTAEC1020W The Device Server cannot listen for Forwarded SNMP Traps on port {0}. Port {1} will be used instead.](#)

BTAEC1020W The Device Server cannot listen for Forwarded SNMP Traps on port {0}. Port {1} will be used instead.

Explanation

The port specified for Forwarded SNMP Traps was already in use, so a new one has been found.

BTAHM - Host manager messages

- [BTAHM2501E The service name Service failed to start due to condition.](#)
- [BTAHM2520E Agent agent name has been marked inactive.](#)
- [BTAHM2521E The agent returned an invalid name.](#)
- [BTAHM2522E agent name is not a known agent.](#)
- [BTAHM2524E The agent returned an invalid port number.](#)
- [BTAHM2525E Agent agent name cannot be removed because it is active.](#)
- [BTAHM2527E Unexpected error java error.](#)
- [BTAHM2528I Agent host name has been marked active.](#)
- [BTAHM2551I An inactive agent agent name has been removed.](#)
- [BTAHM2580I The service name service started.](#)
- [BTAHM2581I The service name service is shut down.](#)

BTAHM2501E The *service name* Service failed to start due to *condition*.

Explanation

An error condition prevented the service from starting.

Action

Correct the condition that prevented the service from starting.

BTAHM2520E Agent *agent name* has been marked inactive.

Explanation

The specified agent is not visible to the manager.

Action

Check to make sure that the SANAgentHostQuery service is up and running on the Managed Host.

BTAHM2521E The agent returned an invalid name.

Explanation

An agent name is not in the proper format, according to java.net.InetAddress.

Action

Make sure that the managed host name has a valid IP address and host name.

BTAHM2522E *agent name* is not a known agent.

Explanation

The specified agent is not known to the host manager.

Action

Run a Fabric discovery and then retry the operation.

BTAHM2524E The agent returned an invalid port number.

Explanation

The port number was non-numeric, or was not in the range 0-65535.

Action

Provide a valid port number in the range of 0-65535.

BTAHM2525E Agent *agent name* cannot be removed because it is active.

Explanation

The agent has not been removed.

Action

Remove the agent from the IP network and wait until the server detects that the agent is gone.

BTAHM2527E Unexpected error *java error*.

Explanation

An internal programming error caused an error.

Action

Save the error message and error log and contact your service representative for assistance in resolving the error.

BTAHM2528I Agent *host name* has been marked active.

Explanation

The specified agent is visible to the host manager.

BTAHM2551I An inactive agent *agent name* has been removed.

Explanation

The inactive agent has been removed.

BTAHM2580I The *service name* service started.

Explanation

The host manager started.

BTAHM2581I The *service name* service is shut down.

Explanation

The host manager is shut down.

BTAIC - Inband change agent messages

- [BTAIC1200E The InbandChangeAgent cannot contact the EventCorrelator.](#)
- [BTAIC1201E An error occurred while reading the InbandEvents file.](#)
- [BTAIC1202E The InbandChangeAgent thread has been interrupted.](#)
- [BTAIC1203E The InbandChangeAgent failed to execute the Event.exe command.](#)
- [BTAIC1204E The AIX protocol driver must be uninstalled to prevent it from interfering with the EventScanner.](#)
- [BTAIC1205E In-band event notification requires at least maintenance level 2 for AIX 5.2.](#)
- [BTAIC1206E In-band event notification requires at least maintenance level 1 for AIX 5.3.](#)
- [BTAIC1207E The version of AIX that is running on this managed host is not supported.](#)

BTAIC1200E The InbandChangeAgent cannot contact the EventCorrelator.

Explanation

An error condition prevented the InbandChangeAgent from contacting the EventCorrelator. One possible cause is that the EventCorrelator service is not active.

Action

Verify that all IBM Spectrum Control services are running. Restart the EventCorrelator service if necessary.

BTAIC1201E An error occurred while reading the InbandEvents file.

Explanation

IBM Spectrum Control encountered an error while reading the InbandEvents file.

Action

Contact IBM customer support if the problem persists.

Related reference

- [Getting support](#)

BTAIC1202E The InbandChangeAgent thread has been interrupted.

Explanation

An error condition interrupted the InbandChangeAgent thread. This might be caused by the InbandChangeAgent service shutting down.

Action

Verify that all IBM Spectrum Control services are running. Restart the InbandChangeAgent service if necessary.

BTAIC1203E The InbandChangeAgent failed to execute the Event.exe command.

Explanation

An error condition prevented the InbandChangeAgent from executing the Event.exe command.

Action

Verify that all IBM Spectrum Control services are running. Restart any services that are not running.

BTAIC1204E The AIX protocol driver must be uninstalled to prevent it from interfering with the EventScanner.

Explanation

The agent does not use the protocol driver for this version of AIX. The protocol driver can prevent the EventScanner from gathering in-band events on an AIX host.

Action

Please uninstall the protocol driver using the instructions in the Planning and Installation Guide. Restart the agent after uninstalling the protocol driver.

BTAIC1205E In-band event notification requires at least maintenance level 2 for AIX 5.2.

Explanation

In-band event notification functionality requires at least maintenance level 2 for AIX 5.2.

Action

Please apply maintenance level 2 or greater to the AIX host and restart the agent.

BTAIC1206E In-band event notification requires at least maintenance level 1 for AIX 5.3.

Explanation

In band event notification functionality requires at least maintenance level 1 for AIX 5.3.

Action

Please apply maintenance level 1 or greater to the AIX host and restart the agent.

BTAIC1207E The version of AIX that is running on this managed host is not supported.

Explanation

This AIX managed host is running an unsupported level of the operating system. The agent might not function properly.

Action

Please contact IBM customer support.

BTAMS0500I IBM Spectrum Control MessagingService started successfully.

Explanation

The Messaging Service has started successfully.

BTAMS0501I The Messaging Service has shutdown.

Explanation

The Messaging Service has been shutdown.

BTAMS0502I Service *service name* subscribed to topic *topic name*.

Explanation

The specified service has subscribed to events published to the specified topic.

BTAMS0503I Event published to topic *topic name*.

Explanation

An event has been published to the specified topic.

BTAMS0504E Messaging Service failed to get a proxy to the *service name* service.

Explanation

Messaging Service could not get a proxy to the service.

Action

Review the message log to determine why the proxy could not be obtained. If this problem persists, enable ServiceManager tracing to assist in determining why the proxy could not be obtained.

BTAMS0505E Messaging Service could not invoke the onMessage method on service *service name*.

Explanation

An exception occurred when invoking the onMessage method on the specified service. The service might not be running.

Action

Verify that the service is up and running.

BTAMS0001W Failed to load the configuration for the database exception handler.

Explanation

Failed to load an optional configuration file for the database exception handler. The default configuration will be used.

Action

No action is required.

BTAMS0002I Data server

Explanation

Identifier for the Data server.

Action

No action is required.

BTAMS0003I Device server

Explanation

Identifier for the Device server.

Action

No action is required.

BTAMS0004I Unknown

Explanation

Identifier that is used if the server type cannot be determined.

Action

No action is required.

BTAMS0005W Failed to update the database pool monitor handler *handler name.*

Explanation

Failed to update the specified database pool monitor.

Action

No action is required.

BTAMS0006W Failed to initialize the database pool monitor handler *handler name.*

Explanation

Failed to initialize the specified database pool monitor.

Action

No action is required.

BTAQE1100E Query Engine Event Generator can not start.

Explanation

The SAN Query Engine Event Generator was unable to start.

Action

Get the SANQueryEngine service trace information from the trace log, and contact IBM customer support.

BTAQE1101E Unable to open the database.

Explanation

IBM Spectrum Control was unable to open the database. There might be a problem with the database or the network connections to the database server.

Action

Make sure that the database is online and working properly and is connected to the network. Stop and restart the manager, which will allow the database to synchronize its data.

BTAQE1102E Unable to close the database.

Explanation

IBM Spectrum Control was unable to close the database. There might be a problem with the database or the network connections to the database server.

Action

Make sure that the database is online and working properly and is connected to the network. Stop and restart the manager, which will allow the database to synchronize its data.

BTAQE1104E The Query Engine check write authority failed.

Explanation

The IBM Spectrum Control query engine does not have the appropriate authority. There might be a problem with the product license file or with the license server, or the current license might have expired.

Action

Make sure the IBM Spectrum Control license has not expired. Contact IBM customer support to get a new license, if necessary.

Related reference

- [Getting support](#)

BTAQE1105E Check for QueryEngine Authentication failed.

Explanation

During a routine authorization check, IBM Spectrum Control encountered an error. There might be a problem with the license file or the license server, or the current license might have expired.

Action

Make sure the IBM Spectrum Control license has not expired. Contact IBM customer support to get a new license, if necessary.

Related reference

- [Getting support](#)

BTAQE1106E The SANQueryEngine thread has been interrupted.

Explanation

There is a problem with the SANQueryEngine service. This might be caused by the service shutting down.

Action

Make sure the SANQueryEngine service is active. If it is not running, you may need to stop and restart the manager to start the service again.

BTAQE1109E An error occurred while attempting to save the IP target to the database.

Explanation

There might be a problem with the database or with the network connections to the database.

Action

Make sure the database is running and is properly connected to the network. Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

Related reference

- [Getting support](#)
- [Default locations of log files](#)

BTAQE1110E An error occurred while attempting to delete an IP target from database.

Explanation

There might be a problem with the database or with the network connections to the database.

Action

Make sure the database is running and is properly connected to the network. Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

Related reference

- [Getting support](#)
- [Default locations of log files](#)

BTAQE1111E An error occurred while querying the IP target information from the database.

Explanation

There might be a problem with the database or with the network connections to the database.

Action

Make sure the database is running and is properly connected to the network. Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

Related reference

- [Getting support](#)
- [Default locations of log files](#)

BTAQE1116E Database errors occurred while performing queries on Tasks .

Explanation

There might be a problem with the database or the network connections to the database.

Action

Make sure the database is running and is properly connected to the network.

BTAQE117E Database errors occurred while saving the task.

Explanation

There might be a problem with the database or the network connections to the database.

Action

Make sure the database is running and is properly connected to the network.

BTAQE1118E Errors occurred while resolving InterconnectElement and Port relationship.

Explanation

Some of the data returned from the scanner could not be resolved.

Action

Get the SANQueryEngine service trace information from the trace log, and contact IBM customer support.

Related reference

- [Getting support](#)
- [Default locations of log files](#)

BTAQE1119E Errors in Topology XML generator.

Explanation

Some of the data generated by the scanner appears to have errors.

Action

Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

Related reference

- [Getting support](#)
- [Default locations of log files](#)

BTAQE1120E Errors in creating an entity.

Explanation

Errors occurred while attempting to create an entity from the results of a scan.

Action

Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

BTAQE1121E Invalid target host IP address.

Explanation

The IP address that was returned from the target host appears to be invalid.

Action

Verify the IP address of the target host. Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

Related reference

- [Getting support](#)
- [Default locations of log files](#)

BTAQE1122E Failed to get the SNMP Service proxy.

Explanation

The scanner was unable to get the SNMP Service proxy. This might be caused by network problems.

Action

Make sure the network is running properly. Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

Related reference

- [Getting support](#)
- [Default locations of log files](#)

BTAQE1123E Unable to close the event publisher.

Explanation

IBM Spectrum Control was unable to close the event publisher.

Action

Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

Related reference

- [Getting support](#)
- [Default locations of log files](#)

BTAQE1124E Unable to compress scanner result due to IOException: *exception*.

Explanation

An IOException occurred in the process of compressing the scanner result.

BTAQE1125E Unable to uncompress the scanner result due to IOException: *exception*.

Explanation

An IOException occurred in the process of uncompressing the scanner result.

BTAQE1126I An unidentified port was removed from the scan data.

Explanation

The outband AdvancedTopologyScanner scan data contained a port entity which did not have a port World Wide Name (WWN), or it had a port WWN of 0000000000000000. The port cannot be identified.

Action

This problem can be caused by a switch port being improperly configured. Check the switch port configurations. For more information on the unidentified port, get the SANQueryEngine service trace information from the trace log.

BTAQE1127E An outband scanner failed to capture the scan data.

Explanation

An error condition prevented the scanner from processing the outband scan data.

Action

If the problem continues, contact IBM customer support.

Related reference

- [Getting support](#)

BTAQE1128E An outband scanner failed to save the scan data for benchmark comparison.

Explanation

An outband scanner encountered an error while saving the scan data as a benchmark file. This file is created when the scanner is run for the first time. When the scanner is invoked again, the scan data is compared against the saved benchmark data from the previous scan for optimization processing. Benchmark comparison will not be performed for the next scan due to the encountered error.

Action

Check to see if the file system is full on the managed host system. If the problem continues, contact IBM customer support.

Related reference

-  [Getting support](#)

BTAQE1129E An outband scanner failed to read the benchmark file *benchmark file name* saved from the previous scan.

Explanation

An outband scanner encountered an error while reading the benchmark file. This file is created when the scanner is run for the first time. When the scanner is invoked again, the scan data is compared against the saved benchmark data from the previous scan for optimization processing. Benchmark comparison is not performed for the current scan due to the encountered error.

Action

Check to see if the benchmark file name exists in the specified path on the manager system. If the problem continues, contact IBM customer support.

Related reference

-  [Getting support](#)

BTAQE1130E An outband scanner failed to decrypt the password for target *target IP*.

Explanation

An outband scanner encountered an error decrypting an outband agent password to target address target IP . Either the encrypted password does not exist, or it has been corrupted.

Action

Restart the product. If the problem continues, contact IBM customer support.

Related reference

-  [Getting support](#)

BTAQE1134I The outband agent target address *TargetIP address* does not respond to Fibre Channel MIB (previously called the Fibre Alliance MIB) queries.

Explanation

A basic query to the Fibre Channel MIB at IP address TargetIP address did not respond. Either the device does not support the Fibre Channel MIB, or it is not enabled.

Action

If the problem continues, contact IBM customer support.

BTAQE1135E Unable to get the license state from the license server.

Explanation

Unable to get either the license state or the license state value from the license server.

Action

No operator response

BTAQE1136E The Query Engine cannot obtain a valid IP address for the host *target*.

Explanation

The host might have an invalid IP address.

Action

Verify the IP address of the host. Get the SANQueryEngine service trace information from the trace log and contact IBM customer support.

Related reference

- [Getting support](#)
- [Default locations of log files](#)

BTAQE1137E The Query Engine could not obtain the information for target host *target* from the database.

Explanation

An error occurred while attempting to obtain target host information. This could be caused by a network error, or there could be a problem with the database.

Action

Make sure the network is functioning properly. Check to see if the database is online and functioning properly. Retry the operation. If it continues to fail, contact IBM customer support.

Related reference

- [Getting support](#)

BTAQE1138E The Query Engine could not obtain the capability information for target host *target* from the database.

Explanation

An error occurred while attempting to obtain target host capability information. This could be caused by a network error, or there could be a problem with the database.

Action

Make sure the network is functioning properly. Check to see if the database is online and functioning properly. Retry the operation. If it continues to fail, contact IBM customer support.

Related reference

- [🔗 Getting support](#)

BTAQE1139E The Query Engine could not obtain the information for all known target hosts from the database.

Explanation

An error occurred while attempting to obtain target host information. This could be caused by a network error, or there could be a problem with the database.

Action

Make sure the network is functioning properly. Check to see if the database is online and functioning properly. Retry the operation. If it continues to fail, contact IBM customer support.

Related reference

- [🔗 Getting support](#)

BTAQE1140E Error creating an event subscriber.

Explanation

The Query Engine received an error while trying to create an event subscriber. This might have been caused by a service not starting properly. This will not affect system processing.

Action

If this message continues to appear, contact IBM customer support.

Related reference

- [🔗 Getting support](#)

BTAQE1141E The Query Engine could not obtain the scheduled scan information from the database.

Explanation

An error occurred while attempting to obtain scheduled scan information. This could be caused by a network error, or there could be a problem with the database.

Action

Make sure the network is functioning properly. Check to see if the database is online and functioning properly. Retry the operation. If it continues to fail, contact IBM customer support.

Related reference

- [🔗 Getting support](#)

BTAQE1142E The Query Engine could not obtain the list of active scanners from the database.

Explanation

An error occurred while attempting to obtain the list of active scanners. This could be caused by a network error, or there could be a problem with the database.

Action

Make sure the network is functioning properly. Check to see if the database is online and functioning properly. Retry the operation. If it continues to fail, contact IBM customer support.

Related reference

- [Getting support](#)

BTAQE1143E The Query Engine could not obtain the list of inactive scanners from the database.

Explanation

An error occurred while attempting to obtain the list of inactive scanners. This could be caused by a network error, or there could be a problem with the database.

Action

Make sure the network is functioning properly. Check to see if the database is online and functioning properly. Retry the operation. If it continues to fail, contact IBM customer support.

Related reference

- [Getting support](#)

BTAQE1144E An error occurred attempting to run the *scanner name* scanner on the IBM Spectrum Control managed host *target*.

Explanation

IBM Spectrum Control periodically scans each managed host to identify associated devices.

Action

Check the status of the managed hosts. Check the message log file on the managed host for any error information. Restart any hosts that are not running properly.

BTAQE1145E The *scanner name* scanner running on the IBM Spectrum Control managed host *target* found no SAN.

Explanation

An error occurred attempting to run a scan on one of the IBM Spectrum Control managed hosts. The scanner did not find a Storage Area Network (SAN).

Action

Check that the host-based adapter (HBA) is properly connected to the Storage Area Network.

BTAQE1146E The *scanner name* scanner running on IBM Spectrum Control managed host *target* found no host-based adapter (HBA) .

Explanation

An error occurred while attempting to run a scan on one of the IBM Spectrum Control managed hosts. The scanner could not communicate with the HBA.

Action

Check that an HBA is installed in the managed host and is properly connected to the SAN. Also check that the correct level of device drivers are installed.

BTAQE1147E The *scanner name* scanner running on IBM Spectrum Control managed host *target* found no SCSI host-based adapter (HBA) .

Explanation

An error occurred while attempting to run a scan on one of the IBM Spectrum Control managed hosts. The scanner could not communicate with the HBA.

Action

Check that an HBA is installed in the managed host and is properly connected to the SAN. Also check that the correct level of device drivers are installed.

BTAQE1149E A scanner overlap condition has occurred for the *scanner name* scanner on the IBM Spectrum Control managed host *target* .

Explanation

IBM Spectrum Control periodically scans each managed host to identify associated devices. In this case the managed host has determined that more than one scanner process of the same type attempted to run on the managed host at the same time. This condition is known as scanner overlap. The scanner overlap condition is not allowed on the managed host, and should be corrected.

Action

Check the status of the managed host. Check the message log file on the managed host for any error information. Terminate the scanner processes still running on the managed host. Restart the managed host if needed. If the problem continues, contact IBM customer support.

Related reference

- [Getting support](#)

BTAQE1150I The outband agent target address *TargetIP address* does not support topology discovery through SNMP Fibre Channel MIB (previously called the Fibre Alliance MIB), or Cisco VSAN MIB queries.

Explanation

A basic query to either the Fibre Channel Management MIB, or the Cisco VSAN MIB to IP address *TargetIP address* did not respond. Either the device does not support the Fibre Channel Management MIB, or the Cisco VSAN MIB, or one of those MIBs is not enabled.

Action

If the problem continues, contact IBM customer support.

BTAQE1151I The outband agent with target address *TargetIP address* has been added.

Explanation

An agent with IP address *TargetIP address* has been added.

Action

This event occurs as a result of adding an outband agent using the Add Fabric Agent panel.

BTAQE1152I The outband agent with target address *TargetIP address* has been removed.

Explanation

An agent with IP address *TargetIP address* has been removed.

Action

This event occurs as a result of removing an outband agent using the Fabric Agents panel.

BTASA1400E The SAN Agent Scanner failed to execute the inband scanner *scanner* with the command: *scan command*.

Explanation

An error condition prevented the scanner from executing the inband scan.

Action

Verify that the scanner executable scanner exists in the specified path on the managed host system. If the problem continues, contact IBM customer support.

Related reference

- [🔗 Getting support](#)

BTASA1401E The SAN Agent Scanner failed to capture the inband scan data.

Explanation

An error condition prevented the scanner from processing the inband scan data.

Action

If the problem continues, contact IBM customer support.

Related reference

- [🔗 Getting support](#)

BTASA1403E The SAN Agent Scanner failed to save the scan data for benchmark comparison.

Explanation

The scanner encountered an error while saving the scan data as a benchmark file. This file is created when the scanner is run for the first time. When the scanner is invoked again, the scan data is compared against the saved benchmark data from the previous scan for optimization processing. Benchmark comparison is not performed for the next scan due to the encountered error.

Action

Check to see if the file system is full on the managed host system. If the problem continues, contact IBM customer support.

BTASA1405E The SAN Agent Scanner failed to retrieve the global unique identifier from Host Query.

Explanation

The scanner encountered an error while retrieving the global unique identifier for the managed host agent from Host Query. This identifier is required for the service to initialize.

Action

Verify that the SAN Agent Host Query service is initialized. Try to restart the managed host agent if the SAN Agent Scanner is the only service that is not initialized. Otherwise, follow the instructions in the Install Guide to uninstall and reinstall the agent. If the problem continues, contact IBM customer support.

Related reference

- [Getting support](#)

BTASA1406I The SAN Agent Scanner Service has initialized successfully.

Explanation

The scanner service has initialized successfully.

BTASA1407I The Inband scanner *scanner* has started.

Explanation

The specified inband scanner has started on the managed host.

BTASA1408I The Inband scanner *scanner* has ended with return code *return code*.

Explanation

The specified inband scanner has ended on the managed host.

BTASA1409E A scanner overlap condition has occurred on the IBM Spectrum Control managed host.

Explanation

The managed host has determined that more than one scanner process of the same type attempted to run on the managed host at the same time. This condition is known as scanner overlap. The scanner overlap condition is not allowed on the managed host, and should be corrected.

Action

Check the status of the managed host. Check the message log file on the managed host for any error information. Terminate the scanner processes still running on the managed host. Restart the managed host if needed. If the problem continues, contact IBM customer support.

BTASD1922E An error occurred while getting the information from device services.

Explanation

The device service could not be contacted by the data service. Possible causes are device server is not running. Communication between the data server machine and the device server machine was not possible.

Action

Check to see if the device server is currently operational. Check to see if communication is possible between the data and device server. If it continues to fail, restart the device server then restart the data server.

BTASD1923E The agent *agent identifier* is currently *agent state*. It must be in order to remove it.

Explanation

Agent must be in inactive state in order to remove it.

Action

Stop the inband agent. Try to remove again.

BTASD1930E Unable to contact zone agent

Explanation

Zoning agent could not be found to conduct zoning on this fabric

Action

Determine whether Fabric has a zoneable agent.

Check the status of the device server.

Restart the device server.

BTASD1931E Unable to contact zoning agent. Token used for contacting zone agent is invalid.

Explanation

A token is used to ensure that only one agent can configure zoning at a time. This error can occur when the zoning agent is unable to contact the switch and the token times out.

Action

Try doing zoning operation again. Another agent may have completed its task allowing this one to gain a token.

Determine whether Fabric has a zoneable agent.

Check the status of the device server.

Restart the device server.

BTASD1932E Agent capable of configuring zoning could not be found on this Fabric

Explanation

Zoning a fabric requires an agent capable of zoning be available on the fabric. Typically this is an SRA or an inband fabric agent or a Brocade SMI Agent. A token is used to ensure that only one agent can configure zoning at a time. This error can occur when the zoning agent is unable to contact the switch and the token times out.

Action

Determine if fabric has zoning agent. SRA, Inband fabric, Brocade SMI Agent are typically required.

Check status of fabric agent. If inactive, activate it

Check the status of the device server.

Restart the device server.

BTASD1933E Zoning is already being configured on this Fabric. New zoning can not be done until agent is available again

Explanation

To avoid colliding zoning configurations, two agents can not zone the same fabric at the same time. This error occurs when two separate interfaces attempt to conduct zoning at the same time. The interfaces can be the IBM Spectrum Control GUI, the native switch UI or the IBM Spectrum Control CLI.

Action

Determine if another UI is attempting zoning. Wait for it to complete and try again.

Check the status of the device server.

Restart the device server.

BTASD1934E Unable to delete the selected entities.

Explanation

Action

Check status of fabric agent. If inactive, activate it

Check the status of the device server.

Restart the device server.

BTASD1935E The delete failed because an agent is still installed on the selected computer or configured in Data Agent or Inband Fabric Agent list.

Explanation

Action

Uninstall any Data Server or Device Server agents.

Check the status of the device server.

Restart the device server.

BTASD1936E Unexpected server response message_status= agent response.

Explanation

IBM Spectrum Control has received an unexpected response from the Agent

Action

Run the Check function on the Agent. If the response is successful then retry command.

Otherwise check the IBM Spectrum Control and Agent logs for Agent errors.

BTASD1937E A zone name cannot contain the characters '.',',',',','%','*' or '!' in its name. Brocade zone names also cannot contain '\$' nor '-'. The first character for a zone name must be alphanumeric. Enter a new name for this zone.

Explanation

One or more of the characters in the zone name string is not allowed by the Capabilities for the switch type you are trying to do zone configuration for.

Action

Remove the characters from the zone name that are not allowed for the switch type you are trying to configure.

BTASD1938E A zone set name cannot contain the characters '.',',',',','%','*' or '!' in its name. Brocade zone set names also cannot contain '\$' nor '-'. The first character for a zone set name must be alphanumeric. Enter a new name for this zone set.

Explanation

One or more of the characters in the zone set name string is not allowed for the switch type you are trying to do zone configuration for.

Action

Remove the characters from the zone set name that are not allowed for the switch type you are trying to configure.

BTASD1939E Zoning is already being configured by *lock owner* on this Fabric since *lock time*. New zoning can not be done until agent is available again.

Explanation

Another user has locked the fabric for zoning.

Action

Wait until the Fabric is available for zoning.

BTASD1940E Zoning is already being configured by *lock owner* on this Fabric since *lock time*. New zoning can not be done until agent is available again. Do you want to release the lock from user {0}?

Explanation

Another user has locked the fabric for zoning.

Action

Click YES to reset the lock on the Fabric and to continue.

BTASD1941E The lock for the zone control operations has been reset. Do you want to re-obtain the lock and continue zone operations?

Explanation

The lock on this fabric has been lost.

Action

Choose yes to re-obtain the lock for the Fabric and continue with the zoning operations. If the problem occurs frequently, contact IBM Support.

Related reference

-  [Getting support](#)

BTASD1942E Zoning changes cannot be made at this time. Zoning for this fabric is currently locked by *lock owner* since *date*.

Explanation

Another user is making zone operations and has acquired a lock for this Fabric preventing any other users from making changes at the same time.

Action

Contact the user that has acquired the lock.

BTASD1943E An alias with the same name already exists. Enter a new name for this alias.

Explanation

Fabrics can not have aliases with duplicate names. An alias with the name you entered already exists for this fabric.

Action

Enter a different name for this alias.

BTASD1944E The Alias name field must be filled in to create an alias.

Explanation

The name field in the alias wizard is empty. Every alias must have a name to be created.

Action

Enter a name for this alias.

BTASD1945E A alias name cannot contain the characters '.',',',',',%',',*', or '!' in its name. Brocade alias names also cannot contain '\$' nor '-'. The first character for an alias name must be alphanumeric. Enter a new name for this alias.

Explanation

One or more of the characters in the alias name string is not allowed by the Capabilities for the switch type you are trying to do zone configuration for.

Action

Remove the characters from the alias name that are not allowed for the switch type you are trying to configure. See the switch documentation for details.

BTASD1946E An alias name cannot begin with a number. Enter a new name for this alias.

Explanation

Alias names cannot start with a number.

Action

Change the name to not start with a number.

BTASD1947E An alias, zone and/or zone set in the same configuration can not have the same name. Enter a new name.

Explanation

The alias name entered matches the name for a zone or zone alias in this configuration. This fabric does not support that capability.

Action

Enter a unique name for the alias.

BTASD1948E This alias does not contain any members. Add a member to this alias.

Explanation

This fabric does not support empty aliases. The alias must have members assigned to it.

Action

Select members to be added to the alias and move them to the selected list.

BTASD1949E There are too many members selected. The maximum number of members allowed for this alias is *max members*. Member(s) must be removed before you can continue.

Explanation

Zone Aliases have a maximum number of members allowed. The current alias has reached that limitation.

Action

Remove members from the selected list until the number of members is equal to or less than the maximum number given in the error message.

BTASD1950E The zone configuration has the maximum number of aliases allowed. The maximum number of aliases is *max aliases*. An existing alias must be deleted before a new one can be created.

Explanation

This zone configuration has a maximum number of aliases allowed and has reached that limitation.

Action

Remove aliases from the aliases table so there are less than the maximum number supplied in the error message.

BTASD1951E Fabric *fabric name* has zone count zones with non-standard members: *zone names*. Zone and ZoneSet changes cannot be applied to zones with nonstandard members.

Explanation

This fabric has non-standard zones so IBM Spectrum Control can not perform zone configuration on this fabric.

Action

Remove the non-standard zones from the fabric before trying to manage its configuration with IBM Spectrum Control.

BTASD1952E Zone set *zoneset name* is active or in activation or deactivation pending status. Deletion of the zone set is not supported for this fabric. After committing the deactivation, this zone set can be deleted in the next zone control session.

Explanation

This fabric does not support the deletion of the active zone set.

Action

Deactivate the zone set before you delete it.

BTASD1953E Renaming of the active zone set is not supported for this fabric. Deactivate zone set *zoneset name* before attempting to rename it.

Explanation

This fabric does not support the renaming of the active zone set.

Action

Deactivate the zone set before attempting to rename it.

BTASD1954E Zoning cannot be done because there is no connection to the SMI-S provider. Reason: *reason*

Explanation

Ensure that there is a proper connection to the SMI-S provider.

Action

Determine the root cause for the failing SMI-S provider connection. Verify that you entered the correct credentials, restart the SMI-S provider or pass through a firewall.

Check the SMI-S provider connection status.

Restart the SMI-S provider.

BTASD2001W Zoning has changed on this fabric since the configuration panel was opened. You may need to run the Fabric discovery/probe again to get the zone information within IBM Spectrum Control synchronized with the fabric. Do you still want to make zoning changes?

Explanation

The current zone information stored by IBM Spectrum Control is outdated.

Action

In order to synchronize IBM Spectrum Control data with the zoning information from the fabric, you may need to run a Fabric Discovery/Probe for the specific switch associated with the Fabric experiencing this issue.

BTASD2002W This alias is not assigned to any zones. This could result in an error when the zone configuration is applied later. Do you want to continue?.

Explanation

The capabilities of this fabric does not support orphaned aliases. Therefore, creating an alias without a parent zone may result in errors if the zone configuration is applied with this zone still an orphan.

Action

It is recommended that you either add the alias to a zone in this alias wizard or add the alias to a zone using the add or edit zone functionalities.

BTASD2003W No exclusive fabric-wide lock is available on the switches for fabric *fabric name*. Other users might be modifying the zoning configuration from outside of IBM Spectrum Control during your zoning operations.

Explanation

The capabilities of this fabric does not support a fabric-wide lock. Therefore, other clients can change the zoning configuration before this transaction is committed.

Action

Ensure that no other user is modifying the zoning configuration while you make changes to the zoning operation.

BTASD2004W This Out Of Band Agent is already defined with the same parameters. Would you like to save it anyway?

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BTASD3001I A probe job for fabric *fabric name* has been submitted. The inactive Zone Definition for this fabric will have the old Zone Definition until the probe job is complete. Wait a few minutes before working with Zone Definition for this fabric.

Explanation

Changing the zone set data source causes the fabric to be probed again using the newly active zone set data source. Therefore, users should not try to edit the zone configuration for this fabric until the probe is done so that they are working with the most up-to-date zone definition.

Action

Wait a few minutes before working with this fabric so the probe on this fabric can complete.

BTATG0000E You must have root user authority to run this program.

Explanation

On a UNIX system, only a root user can run this program.

Action

Log in as root user to run the program.

BTATG0001E Invalid option '&1'.

Explanation

The specified option is not valid.

Action

Check the command syntax and retry the command. Use the -HELP option to see usage and syntax information.

BTATG0003E The format of the GUID is invalid.

Explanation

The GUID value specified is not valid.

Action

Check the GUID value and retry the command. Use the -HELP option to see usage and syntax information.

BTATG0004I A GUID already exists on this host. A new GUID will not be created.

Explanation

There is already a GUID on this host. Use the -WRITE -NEW options to create a new GUID.

Action

Check the command syntax and retry the command. Use the -HELP option to see usage and syntax information.

BTATG0005I A GUID entry was not found. The program is generating a new one.

Explanation

There is no GUID on this system. A new one will be created.

BTATG0006I A GUID entry was not found.

Explanation

There is no GUID on this host.

Action

Create a new GUID or use a known GUID to write it on this host.

BTATG0007E A GUID entry was not created.

Explanation

Creation of the GUID failed.

Action

Contact a Tivoli service representative

BTATG0008E The GUID entry could not be written.

Explanation

Creation of the GUID failed.

Action

Contact a Tivoli service representative.

BTATG0009E The GUID entry can not be read.

Explanation

The attempt to read the GUID failed.

Action

Contact a Tivoli service representative.

BTATG0011E When using '&1' you must enter '&3' or use '&3'.

Explanation

The use of -WRITE was not valid.

Action

Check the command syntax and retry the command. Use the -HELP option to see usage and syntax information.

BTATG0012E The tivguid program encountered an internal error.

Explanation

An internal error occurred.

Action

Contact a Tivoli service representative.

BTATG0013E '&1' return status is '&2'.

Explanation

An error occurred.

Action

Contact a Tivoli service representative.

BTAVM

- [BTVMW4001I Connection test to VMware VI Data Source VMware VI Data Source host name FAILED due to VMWareConnectionStatus](#)
- [BTVMW2013E The addition of the data source Name of the data source failed.](#)
- [BTVMW2014W This VMWare VI Data Source is already defined with the same parameters. Would you like to save it anyway?](#)

BTVMW4001I Connection test to VMware VI Data Source *VMware VI Data Source host name* FAILED due to *VMWareConnectionStatus*

Explanation

The connection test to the named VMware VI Data Source failed.

Action

Check the trace logs to find the error reason. The log files reside in the installation subdirectory device/log. If possible correct the error and rerun the connection test to the VMware VI Data Source. If the problem persists, contact IBM Technical Support.

BTVMW2013E The addition of the data source *Name of the data source* failed.

Explanation

The data source may already exist. To modify an existing data source click on the details button.

Action

Make sure the data source name is not already used. If then the problem persists, contact IBM Technical Support.

BTVMW2014W This VMWare VI Data Source is already defined with the same parameters. Would you like to save it anyway?

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BTAZC0313E CIM native error: No Transaction

Explanation

The SMI agent reported that there was no open transaction with the SMI agent or fibre channel switch. If the fabric is a Brocade fabric, this may happen if the Zone Control session was open too long before the changes were applied or if a separate Zone Control session completed while this one was in progress.

Action

Get the Zone Control service trace information from the trace log and contact IBM customer support. If this is a Brocade fabric, check Network Advisor logs or check the switch logs to see if another Zone Control session occurred around the same time. IBM customer support may instruct you to increase the Zone Control session timeout setting.

BTAZC5000I Started Zone Control layer.

Explanation

The Zone Control layer has been started.

BTAZC5001I reserve: SAN=*SAN_name*, Agent=*agent_name*, Client=*client_name*, Token=*token_ID*.

Explanation

The Zone Control reserve API is used to reserve access of the zone control commands for a particular SAN.

BTAZC5002I startTransaction: SAN=*SAN_name*, Client=*client_name*, Token=*token_ID*, result=*return_code*.

Explanation

The Zone Control startTransaction API is used to begin a zone control transaction on the specified SAN.

BTAZC5003I commitTransaction: SAN=*SAN_name*, Client=*client_name*, Token=*token_ID*. result=*return_code*.

Explanation

The Zone Control commitTransaction API is used to apply zone control changes for this transaction on the specified SAN.

BTAZC5004I rollbackTransaction: SAN=*SAN_name*, Client=*client_name*, Token=*token_ID*. result=*return_code*.

Explanation

The Zone Control rollbackTransaction API is used to remove zone control changes for this transaction that were started on the specified SAN.

BTAZC5005I setZoneInfo: SAN=*SAN_name*, Client=*client_name*,
Token=*token_ID*. result=*return_code*.

Explanation

The Zone Control setZoneInfo API is used to apply zone control changes for this transaction on the specified SAN.

BTAZC5006I sendCommandArray: SAN=*SAN_name*, Client=*client_name*,
Token=*token_ID*. result=*return_code*.

Explanation

The Zone Control sendCommandArray API is used to make zone configuration changes on the specified SAN.

BTAZC5007I release: SAN=*SAN_name*, Client=*client_name*,
Token=*token_ID*. result=*return_code*.

Explanation

The Zone Control release API is used to release access of the zone control commands for a particular SAN.

BTAZC5008I createZoneSet: zoneSetName=*zone_set_name*, SAN=*SAN_name*,
Client=*client_name*, Token=*token_ID*. result=*return_code*.

Explanation

The Zone Control createZoneSet API is used to create a zone set with the specified name.

BTAZC5009I createZone: zoneName=*zone_name*, zoneType=*zone_type*,
zoneSubType=*zone_subtype*, SAN=*SAN_name*, Client=*client_name*,
Token=*token_ID*. result=*return_code*.

Explanation

The Zone Control createZone API is used to create a zone with the specified name, type, and subtype.

BTAZC5010I createZoneAlias: zoneAliasName=*zone_alias_name*,
SAN=*SAN_name*, Client=*client_name*, Token=*token_ID*.
result=*return_code*.

Explanation

The Zone Control createZoneAlias API is used to create a zone alias with the specified name.

BTAZC5011I createZoneMemberSettingData:
zoneMemberID=*zone_member_id*, zoneMemberType=*zone_member_type*,
targetType=*target_type*, targetName=*target_name*, SAN=*SAN_name*,
Client=*client_name*, Token=*token_ID*. result=*return_code*.

Explanation

The Zone Control createZoneMemberSettingData API is used to create a zone member with the specified name and type, and add it to the specified zone or zone alias.

BTAZC5012I addZoneToZoneSet: zoneSetName=zone_set_name,
zoneName=zone_name, SAN=SAN_name, Client=client_name,
Token=token_ID. result=return_code.

Explanation

The Zone Control addZoneToZoneSet API is used to add the zone to the specified zone set.

BTAZC5013I addZoneMemberToZone: zoneName=zone_name,
zoneMemberID=zone_member_id, zoneMemberType=zone_member_type,
SAN=SAN_name, Client=client_name, Token=token_ID.
result=return_code.

Explanation

The Zone Control addZoneMemberToZone API is used to add the zone member to the specified zone.

BTAZC5014I addZoneAliasToZone: zoneName=zone_name,
zoneAliasName=zone_alias_name, SAN=SAN_name, Client=client_name,
Token=token_ID. result=return_code.

Explanation

The Zone Control addZoneAliasToZone API is used to add the zone alias to the specified zone.

BTAZC5015I addZoneMemberToZoneAlias: zoneAliasName=zone_alias_name,
zoneMemberID=zone_member_id, zoneMemberType=zone_member_type,
SAN=SAN_name, Client=client_name, Token=token_ID.
result=return_code.

Explanation

The Zone Control addZoneMemberToZoneAlias API is used to add the zone member to the specified zone alias.

BTAZC5016I removeZoneFromZoneSet: zoneSetName=zone_set_name,
zoneName=zone_name, SAN=SAN_name, Client=client_name,
Token=token_ID. result=return_code.

Explanation

The Zone Control removeZoneFromZoneSet API is used to remove the zone from the specified zone set.

BTAZC5017I removeZoneAliasFromZone: zoneName=zone_name,
zoneAliasName=zone_alias_name, SAN=SAN_name, Client=client_name,
Token=token_ID. result=return_code.

Explanation

The Zone Control removeZoneAliasFromZone API is used to remove the zone alias from the specified zone.

BTZC5018I removeZoneMemberFromZone: zoneName=zone_name,
zoneMemberID=zone_member_id, zoneMemberType=zone_member_type,
SAN=SAN_name, Client=client_name, Token=token_ID.
result=return_code.

Explanation

The Zone Control removeZoneMemberFromZone API is used to remove the zone member from the specified zone.

BTZC5019I removeZoneMemberFromZoneAlias:
zoneAliasName=zone_alias_name, zoneMemberID=zone_member_id,
zoneMemberType=zone_member_type, SAN=SAN_name, Client=client_name,
Token=token_ID. result=return_code.

Explanation

The Zone Control removeZoneMemberFromZoneAlias API is used to remove the zone member from the specified zone alias.

BTZC5020I deleteZoneMember: zoneMemberID=zone_member_id,
zoneMemberType=zone_member_type, SAN=SAN_name, Client=client_name,
Token=token_ID. result=return_code.

Explanation

The Zone Control deleteZoneMember API is used to delete the specified zone member.

BTZC5021I deleteZone: zoneName=zone_name, SAN=SAN_name,
Client=client_name, Token=token_ID. result=return_code.

Explanation

The Zone Control deleteZone API is used to delete the specified zone.

BTZC5022I deleteZoneSet: zoneSetName=zone_set_name, SAN=SAN_name,
Client=client_name, Token=token_ID. result=return_code.

Explanation

The Zone Control deleteZoneSet API is used to delete the specified zone set.

BTZC5023I deleteZoneAlias: zoneAliasName=zone_alias_name,
SAN=SAN_name, Client=client_name, Token=token_ID.
result=return_code.

Explanation

The Zone Control deleteZoneAlias API is used to delete the specified zone alias.

BTZC5024I activateZoneSet: zoneSetName=zone_set_name,
SAN=SAN_name, Client=client_name, Token=token_ID.

`result=return_code.`

Explanation

The Zone Control activateZoneSet API is used to make the specified zone set the currently active zone set.

BTAZC5025I deactivateZoneSet: zoneSetName=zone_set_name,
SAN=SAN_name, Client=client_name, Token=token_ID.
result=return_code.

Explanation

The Zone Control deactivateZoneSet API is used to deactivate the specified active zone set.

BTAZC5026I ping: SAN=SAN_name, Agent=agent_name,

Explanation

The Zone Control ping API is used to find an agent to send zone control commands to for the specified SAN, and to gather zone capabilities information about the SAN.

BTAZC5027I readCurrentZoneDefinition: SAN=SAN_name,
Client=client_name, Token=token_ID result=return_code.

Explanation

The Zone Control readCurrentZoneDefinition API is used to gather the current zone information directly from the SAN.

Related reference

- [Getting support](#)

BTM0098E Unable to retrieve CIM Object Path for Storage System: *storage system* from the SMI-S provider.

Explanation

The storage system that previously was discovered by an SMI-S provider can no longer be found. This could be due to the following conditions:

- The storage system was removed from the SMI-S provider where it had been discovered.
- The storage system was removed from the SMI-S provider where it had been discovered, but it was added to another SMI-S provider that is defined.

Action

One of the following actions can be taken:

- If the storage system should not have been removed from the SMI-S provider where it had been discovered, add the storage system to the SMI-S provider.
- If the storage system does not need to be monitored by IBM Spectrum Control, but the storage system information is to be retained, this error will occur when the storage system is probed until the storage system is added back to the SMI-S provider where it had been discovered.
- If the storage system does not need to be monitored and other storage system information is to be retained, uncheck Monitored against the storage system as it is listed in the Storage Subsystem Administration Panel.
- If the storage system should be removed, remove from the SMI-S provider Logins Panel the SMI-S provider where the storage system had been previously discovered. Add back the SMI-S provider, and discover the storage systems again. Check Monitored against all the storage systems that are to be monitored in the Storage Subsystem Administration Panel.
- If the storage system was defined to another SMI-S provider defined to Spectrum Control, remove from the SMI-S provider Logins Panel the SMI-S provider where the storage system had been previously discovered, and the SMI-S provider where the storage system is defined. Add back the SMI-S provider where the storage system was added and the SMI-S provider where the storage system had been previously discovered. Discover the storage systems again. Check Monitored against all the storage systems that are to be monitored in the Storage Subsystem Administration Panel.

BTM0443E Error calling extrinsic method *name* rc = *value*: The requested logical subsystem already contains the maximum number of volumes allowed.

Explanation

Error calling the specified extrinsic method. The requested logical subsystem already contains the maximum number of volumes allowed. This problem occurs when there is enough volume addresses within the logical subsystem to satisfy the request, but the requested volume size is beyond the capacity allowed by the logical subsystem.

Action

If the model LUNs used to provision a file system were all exhausted, create a policy where the model LUNs outside the volume group are used. If that is still not sufficient, assign a model LUN to the host from a logical subsystem with sufficient space. If that does not resolve the problem, contact IBM customer technical support.

Related reference

- [Getting support](#)

BTM0444E Error calling extrinsic method *value* rc = *value*: The requested amount of volume addresses exceeds the maximum number of volumes allowed in the given logical subsystems.

Explanation

Error calling the specified extrinsic method. The requested amount of volume addresses exceeds the maximum number of volumes allowed in the given logical subsystems. This problem occurs when there are not enough volume addresses within the logical subsystem to satisfy the request. If the volume being created will be the last available volume address within the logical subsystem, it must be the same size of the remaining free space within the logical subsystem. Otherwise, this error occurs.

Action

If the model LUNs used to provision a file system were all exhausted, create a policy where the model LUNs outside the volume group are used. If that is still not sufficient, assign a model LUN to the host from a logical subsystem with sufficient space and available volume addresses. If that does not resolve the problem, contact IBM customer technical support.

Explanation

The probe is finding the managed disks for this backend controller that has its storage virtualized by the SAN Volume Controller cluster.

BTM0710E Unable to retrieve data for Managed Disk: *value*

Explanation

The probe was not able to retrieve data for this managed disk.

Action

Contact IBM customer technical support.

Related reference

- [Getting support](#)

BTM0711E Unable to retrieve data for Managed Disk Group: *value*

Explanation

The probe was not able to retrieve data for this managed disk group.

Related reference

BWN000000E An object must be selected.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000200E The minimum size of the volume cannot be less than *minimum volume size*.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000201E The volume *volume name* cannot be deleted because there are host ports assigned to it.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000202E The volume *volume name* cannot be deleted, because volume deletion is not supported by this storage subsystem.

Explanation

ESS 2105 volumes cannot be deleted.

Action

BWN000203E No storage pool is available.

Explanation

Either no storage pool has been selected, or there is no storage pool available for the specified RAID level.

Action

Make sure that a storage pool is selected. The storage pool must have available capacity to create volumes.

BWN000204E The maximum size of the volume cannot be greater than *maximum volume size*.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000205E The maximum size of the XIV volume cannot be greater than *maximum volume size*. The size of the volume must be changed.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000206E The number of volumes must be reduced so that volume(s) with selected size can be created.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000207E The volume deletion failed. Please check job log for detailed information about the error.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000208E Invalid characters in volume name. Volume name can only contain: A-Z, a-z, 0-9, _, -, ~, . and space.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000300E A valid quantity must be selected. It must be between 1 and *max quantity*.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000301E A valid size must be selected. It must be between 0 and *max size*.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000302E The maximum virtual disk size must be less than or equal to the available capacity (*available capacity*) for one virtual disk in the managed-disk group. If multiple virtual disks are to be created, the virtual-disk size must be less than or equal to the available capacity divided by the number of virtual disks.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000303E The number of virtual disks is invalid. The maximum number of virtual disks that can be created is (*available quantity*).

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000304E At least one managed disk must be selected.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000305E The virtual disk *vdisk name* cannot be deleted because there are host ports assigned to it.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000306E The virtual disk name is not valid.

Explanation

The name must adhere to the following conventions:

- One to 15 characters in length
- Permissible characters include upper-case letters (A-Z), lower-case letters (a-z), numerals (0-9), a hyphen (-), and an underscore (_).
- The first character cannot be a numeral.
- The name cannot begin with an abbreviation commonly used to specify the object type, for example, the name cannot begin with VDisk, VDISK, or vdisk.

Action

Retype the name and try again.

BWN000307E Sequential virtual disks and multiple managed disks are selected, but round-robin assignment is not specified.

Explanation

To create sequential virtual disks without using round-robin assignment, you must select only one managed disk. To use multiple managed disks, select round-robin assignment.

Action

Reselect the virtual-disk creation properties and try again.

BWN000308E The number of selected mdisks must be equal to the number of vdisks to be created - *vdisk no.*

Explanation

To create sequential virtual disks using robin-robin assignment, the number of virtual disks must equal the number of managed disks.

Action

Reselect the virtual-disk creation properties and try again.

BWN000309E The selected managed disks could not be added to the managed-disk group.

Explanation

The selected managed disks could not be added to the managed-disk group. This might be due to one or more of the following conditions:

- The cluster that contains the managed disks is not stable.
- A managed disk already is part of a managed-disk group.
- A selected managed disk does not exist.
- Too few or too many managed disks were selected.
- A selected managed disk is in managed or image mode.
- A managed disk was destroyed.

Action

Select different managed disks and try again.

BWN000310E The selected host type does not match the host type of the selected host ports to be assigned.

Explanation

The host type of selected host ports is not same as the host type selected. Assigning volumes to selected host port will result in error.

Action

All the host ports that do not match the selected host types should be unselected by moving these back to Available Ports list.

BWN000311E The selected host ports have identical WWPNs. Select the host ports with different WWPNs.

Explanation

The selected host ports have identical WWPNs. Assigning more than 1 host port with same WWPN will result in error.

Action

Host ports with identical WWPNs should be unselected by moving these back to Available Ports list.

BWN000312E The maximum virtual-disk real size must be less than or equal to the available capacity (*available capacity*) in the managed-disk group. If multiple virtual disks are to be created, the virtual-disk real size must be less than or equal to the available capacity divided by the number of virtual disks.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000313E When creating Space Efficient virtual-disks, the maximum virtual-disk size must not exceed *maximum size*.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000314E The virtual-disk warning size must be greater than 0 and cannot exceed 100 percent.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000315W This SMI-S provider is already defined with the same parameters. Would you like to save it anyway?

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000316W This IBM Spectrum Control Server is already defined with the same parameters. Would you like to save it anyway?

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000317W Testing SMI-S provider connectivity can take up to several minutes in case of an incorrectly entered port number, network problems or an unpassed firewall. Would you like to continue anyway?

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000318E No managed disk is found for the selected mdisk group.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

BWN000319E The length of the generated virtual disk name (*virtual disk*) exceeds the maximum permitted length (*maximum length of characters*).

Explanation

For multiple virtual disk, a number is added to the end of the virtual disk name. This number increases the virtual disk name length and could exceed the maximum permitted length.

Action

Retype the name and try again.

BWN000600E Some of the selected host ports do not have a host connection configured on the subsystem\ and require a host type to be specified. Select the appropriate host type to be used.

Explanation

Since the selected host ports are not known to the subsystem yet, the subsystem requires a host type to be specified in order to create a new host connection and establish a functional communication between host and host port. With no or unapplicable host type selected, the connection is likely to be non-functional.

Action

A host type must be selected that matches the characteristics of all host ports to be assigned.

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9040E [21]Number of entries (VALUE_0) is exceeded for the "-VALUE_1" flag.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9041E [21]Entry "VALUE_0" exceeds the length limit (VALUE_1) for one item for the "-VALUE_2" flag.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9042E [21]Value for -VALUE_0 must be VALUE_1 the current setting of VALUE_2.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9043E [21]Unrecognized syntax error in command "VALUE_0"

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9044E Cannot run ''VALUE_0'' as a command within the VALUE_1 application.Tip: Enter "help VALUE_2" for more information.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9900E User access to CIMOM server denied.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9901E User access to command "VALUE_0" denied.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9902E Invalid key in truststore.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9903E The IBM CIM Object Manager has encountered an internal error.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9904E Truststore access failure.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9905E Namespace not found in the CIMOM server: "VALUE_0".

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9906E Host url unspecified to CIMOM server.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9907E Invalid host specified to CIMOM server: "VALUE_0".

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9908E Could not connect to CIMOM server.

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9909E Invalid port address for CIMOM server: "VALUE_0".

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CMMUI9910E An unexpected CIMOM based error occurred: "VALUE_0".

Explanation

No additional information is available for this message.

Action

Consult the Maintenance and Problem Determination Guide for suggestions for assessing system health.

CNFG00001E The Prefix can not be blank, or contain any of the following characters: \\/:*?><|."

Explanation

A unique prefix is required.

Action

Enter a unique prefix.

CNFG00002E The prefix {0} can not be used because {1} duplicate names have been found. For example: {2}

Explanation

A probe or an alert using the prefix has been found in the database.

Action

Enter a unique prefix.

CNFG00003E Invalid HMC Address .

Explanation

The entry for HMC Address is not valid.

Action

Enter a valid HMC Address.

CNFG00004E Invalid Username for subsystem {0}.

Explanation

The entry for Username is not valid.

Action

Enter a valid Username.

CNFG00005E Invalid Password for subsystem {0}.

Explanation

The entry for Password is not valid.

Action

Enter a valid Password.

CNFG00006E Invalid IP Address for subsystem {0}.

Explanation

The entry for IP Address is not valid.

Action

Enter a valid IP Address.

CNFG00007E Invalid Admin Username for subsystem {0}.

Explanation

The entry for Admin Username is not valid.

Action

Enter a valid Admin Username.

CNFG00008E Invalid Admin Password for subsystem {0}.

Explanation

The entry for Admin Password is not valid.

Action

Enter a valid Admin Password.

CNFG00009E Invalid Username for subsystem {0}.

Explanation

The entry for Key Username is not valid.

Action

Enter a valid Key Username.

CNFG00010E Invalid Public SSH Key for subsystem {0}.

Explanation

The entry for Public SSH Key is not valid.

Action

Enter a valid Public SSH Key.

CNFG00011E Invalid Private SSH Key for subsystem {0}.

Explanation

The entry for Private SSH Key is not valid.

Action

Enter a valid Private SSH Key.

CNFG00012E Invalid SMI-S provider Host.

Explanation

The entry for Private SMI-S provider Host is not valid.

Action

Enter a valid SMI-S provider Host.

CNFG00013E Invalid SMI-S provider Namespace.

Explanation

The entry for SMI-S provider Namespace is not valid.

Action

Enter a valid SMI-S provider Namespace.

CNFG00014E Invalid SMI-S provider Port Number.

Explanation

The entry for SMI-S provider Port Number is not valid.

Action

Enter a valid SMI-S provider Port Number.

CNFG00015E Invalid Out of Band Agent Host name.

Explanation

Invalid Out of Band Agent Host Name.

Action

Enter a valid Out of Band Agent Host name.

CNFG00016W You will need to update the credentials for {0}. Do you want to update the credentials now?

Explanation

The credentials for this subsystem need to be updated.

Action

Update credentials of the subsystem.

CNFG00017E Connection test failed with status: {0}

Explanation

The connection test performed to test the system data entered did not pass for the reason specified.

Action

Double check the values entered on the device connection panel are correct. Also verify the system is running properly and configured for the port and credentials you are specifying.

CNFG00018E Connection test to SMI-S provider {0} failed with status: {1}. {2}

Explanation

The connection test performed to test the SMI-S provider data entered did not pass for the reason specified.

Action

Double check the values entered on the SMI-S provider connection panel are correct. Also verify the SMI-S provider is running properly and configured for the port and credentials you are specifying.

CNFG00019E The server was unable to contact out of band fabric agent at address {0} for the following reason: {1}

Explanation

The connection test performed to test the agent data entered did not pass for the reason specified.

Action

Double check the values entered on the agent connection panel are correct. Also verify the device is running properly and configured for the port and credentials you are specifying.

CNFG00020E The filter text [{0}] contains invalid characters. Click the help button for allowable characters

Explanation

An invalid character was input into the filter field.

Action

Double check that the values entered in the filter field are valid. For a list of allowable characters click the help button associated with the filter field.

CNFG00021E Only {0} log files may be opened at any one time. Please reduce the number of selected log files and try again.

Explanation

The maximum number of log files that can be opened at a time has been exceeded.

Action

Please reduce the number of selected log files and try again.

CNFG00022E Unable to retrieve job data due to an internal error. Please check Data server logs.

Explanation

An unexpected error occurred when attempting to retrieve job data from the server.

Action

Refer to the Data server logs and contact Customer Support

CNFG00023E Invalid Public SSH Key for Storwize V7000U File Module {0}.

Explanation

The entry for Public SSH Key for Storwize V7000U File Module is not valid.

Action

Enter a valid Public SSH Key.

CNFG00024E Invalid Username for Storwize V7000U File Module {0}.

Explanation

The entry for Storwize V7000U File Module Username is not valid.

Action

Enter a valid Key Username for Storwize V7000U File Module.

CNFG00025E Invalid Password for Storwize V7000U File Module {0}.

Explanation

The entry for Storwize V7000U File Module Password is not valid.

Action

Enter a valid Password for Storwize V7000U File Module.

CNFG00026E Invalid Passphrase for Storwize V7000U File Module {0}.

Explanation

The entry for Storwize V7000U File Module Passphrase is not valid.

Action

Enter a valid Passphrase that matches the SSH certificate for Storwize V7000U File Module.

CNFG00027E Connection failed for Storwize V7000U File Module. Check Management Console {0}.

Explanation

Connection failed for the Storwize V7000U Management Console.

Action

Storwize V7000U File Module may not be configured. Use Management Console to check the status of the Storwize V7000U File Module.

CNFG00028E Invalid Public SSH Key for IBM IBM SONAS Device {0}.

Explanation

The entry for Public SSH Key for IBM IBM SONAS Device is not valid.

Action

Enter a valid Public SSH Key.

CNFG00029E Invalid Username for IBM SONAS Device {0}.

Explanation

The entry for IBM SONAS Device Username is not valid.

Action

Enter a valid Key Username for IBM SONAS Device.

CNFG00030E Invalid Password for IBM SONAS Device {0}.

Explanation

The entry for IBM SONAS Device Password is not valid.

Action

Enter a valid Password for IBM SoNAS Device.

CNFG00031E Invalid Passphrase for IBM SONAS Device {0}.

Explanation

The entry for IBM SONAS Device Passphrase is not valid.

Action

Enter a valid Passphrase that matches the SSH certificate for IBM SONAS Device.

EMSG0001E The DS8000 Element Managers view is not accessible because the Device Server is down.

Explanation

The DS8000 Element Managers view is hosted on the Device Server.

Action

EMSG0002E The embedded browser widget was unexpectedly destroyed. Click OK to reset display.

Explanation

The panel needs to be reset because the widget containing the element manager GUI was destroyed.

Action

EMSG0003I The element manager is about to be removed. Once removed the element manager will not be accessible from IBM Spectrum Control. Do you wish to continue?

Explanation

Removes the reference to the element manager from the IBM Spectrum Control. Once the deletion is completed the element manager will not be accessible from IBM Spectrum Control. If access to the element manager is required in future then the element manager needs to be readded.

Action

Click cancel to take no further action and maintain access to the element manager. Click OK to proceed with the removal of the element manager.

EMSG0004I Connection test to the element manager *element manager* passed.

Explanation

A connection test was successfully performed on the specified element manager with the displayed result.

Action

The connection test passed and no further action is required.

EMSG0005E Connection test to the element manager *element manager* failed.

Explanation

A connection could not be established to the specified element manager.

Action

There could be a number of reasons for the failure, including, but not restricted to the element manager's machine being down, network problems or the element manager settings in IBM Spectrum Control.

EMSG0006I SMI-S provider connection was removed from element manager.

Explanation

The SMI-S provider connection was successfully removed.

Action

No action necessary.

EMSG0007E A problem occurred removing the SMI-S provider from the element manager.

Explanation

Action

This is an internal error. Contact IBM support.

Related reference

EMSG0040I The SMI-S provider Connection is about to be removed. Do you wish to continue?

Explanation

Removes SMI-S provider Connection to the element manager from the IBM Spectrum Control.

Action

Click cancel to take no further action and retain SMI-S provider Connection. Click OK to proceed with the removal of the SMI-S provider Connection.

MSG0041E The DS8000 Network server is unavailable.

Explanation

The connection to the DS8000 Network server is established immediately after the user login to the GUI application. The DS8000 Network server cannot be reached over the TCP/IP network or over a local connection. The DS8000 Network server might not be enabled, a network problem might exist, or the DS8000 Network server might be refusing connections because too many clients are connected.

Action

Ensure that the network is functioning properly and the DS8000 network server is enabled. If too many clients are connected, wait until the DS8000 Network server has fewer clients. Resubmit the task. If the problem persists, log out of the GUI application and log in again and resubmit the task.

MSG0042E You are not authorized to perform this action through the management console.

Explanation

You are attempting to perform an action for which you have no authorization.

Action

Contact your system administrator to change your authorization level. Resubmit the task.

MSG0043E You cannot add an element manager for this DS8K as its software version is too low.

Explanation

The DS8K must be release 3 or later to add using Add Element Manager.

Action

Upgrade the DS8K to a more software version greater than R5.3.

MSG0044E You cannot update the element manager for this DS8K as its software version is too low.

Explanation

The DS8K must be release 3 or later to update using Update Element Manager.

Action

Upgrade the DS8K to a more software version greater than R5.3.

-

GEN0401I Probe completed successfully.

Explanation

The probe completed successfully.

Action

No action is required. If you want, you can examine the job log for further details.

GEN0402W Probe completed with warnings.

Explanation

The probe completed with warnings.

Action

Check the job and server logs for details about the warnings.

GEN0403E Unable to retrieve probe definition.

Explanation

The server was unable to retrieve the probe definition from the repository.

Action

Examine the job and server logs and determine what caused the error. If unable to determine the cause of the error, contact IBM customer technical support.

Related reference

- [Getting support](#)

GEN0404I Probe started.

Explanation

The probe has been started.

GEN0405E No computers or storage subsystems to probe.

Explanation

The probe definition did not specify any valid element to be probed.

Action

Specify at least one valid element to be probed.

GEN0406E A probe of the computer or hypervisor *computer name* is already in progress.

Explanation

Another probe of the same computer or hypervisor is already in progress, so the new probe cannot be started.

Action

Ensure that the previous probe has completed before starting a new probe for the same computer or hypervisor.

GEN0407E Probe of storage subsystem *subsystem name (subsystem alias)* already in progress.

Explanation

Another probe of the same storage subsystem is already in progress, so the new probe cannot be started.

Action

Ensure that the previous probe has completed before starting a new probe for the same storage subsystem.

GEN0408W Probe of fabric *fabric WWN* already in progress.

Explanation

Another probe of the same fabric is already in progress, so the new probe cannot be started.

Action

Ensure that the previous probe has completed before starting a new probe for the same fabric.

GEN0409E Batch Report job *report name* already in progress.

Explanation

Another job for the same batch report is already in progress, so the new one cannot be started.

Action

Ensure that the previous job has completed before starting a new one for the same batch report.

GEN0410E Probe of switch *switch WWN* already in progress.

Explanation

Another probe of the same switch is already in progress, so the new probe cannot be started.

Action

Ensure that the previous probe has completed before starting a new probe for the same switch.

GEN5001W Not all statistics could be saved due to unlicensed computer(s). See TPCD log for details.

Explanation

Not all statistics could be saved due to unlicensed computers.

GEN7111E Unable to retrieve data from the repository database.

Explanation

IBM Spectrum Control cannot retrieve data from the repository database. The repository database contains information that was collected about the storage resource.

Action

Ensure that the repository database, Data server, and Device server are running. Verify that the local area network is available. Check the product log files for error messages that might help determine the problem. See the product information center to view the locations of these log files. Try the action again. If the problem persists, contact IBM Software Support.

Related reference

- [Getting support](#)

GEN7112E Failed to retrieve e-mail report from (*report URL*).

Explanation

The report could not be downloaded from the specified URL.

Action

Check that the URL is accessible. If necessary, start the web server and retry.

GEN7113E Failed to retrieve e-mail report from the web server.

Explanation

The report could not be downloaded from the web server due to an unknown error.

Action

Check that the web server is up. If necessary, start the web server and retry.

If this does not resolve the issue then contact IBM support.

Related reference

- [Getting support](#)

GEN7114E The user and password combination for the outgoing e-mail server is invalid.

Explanation

Failed to authenticate with the outgoing e-mail server..

Action

Update the user and password in the e-mail server configuration panel.

If this does not resolve the issue then contact IBM support.

Related reference

- [Getting support](#)

GEN7115E Can't send the attached "*reportName*" report with the ID *reportId*. The size of the attachment (*totalSize* KB) exceeds the maximum size for attachments that was set on your email server. [Learn More link](#)

Explanation

The size of the message exceeds the physical limit or the administrative limit that is set for messages on the email server.

Action

Change the size limit on the email server that you configured to send reports.

GEN7116E The email address that was configured for replies to alert notifications and reports, *reply_to_address_value*, was not accepted by the email server, *server*.

Explanation

The email address that was configured for replies to alert notifications and reports was rejected.

Action

Check the documentation for the email server that you use to send emails. For example, your email server might expect that the user name that you configure in IBM Spectrum Control to authenticate with your email server is an email address and that you must use the same address for the user name and the reply-to address.

GPC000001E One or more of the selected profiles is a system-defined profile and cannot be deleted. Deselect *profile* and try again.

Explanation

Action

GPC000002E The selected profile *profile* is a system-defined profile and cannot be updated.

Explanation

Action

GPC000003E There is no performance data collected for any of the storage subsystems, create workload profile Wizard can not continue.

Explanation

Action

GPC000150W Analyzing all the volume performance data may take a long time to complete.

Explanation

Action

GPC000200E Based on the current choices, no devices can be included in the analysis.

Explanation

After excluding the subsystems with missing host ports, there are no devices available for analysis. A new selection of subsystems and host port combinations is required.

Action

GPC000201E There is no ESS performance data collected, Volume Performance Advisor Wizard can not continue.

Explanation

Action

GPC000350I Volume size may round up to multiple of 100 MB.

Explanation

Action

GPC00400E Subsystem type for *type identifier* does not match the subsystem type in selected list.

Explanation

The device selected in the source list does not have the same subsystem type in the selected list.

Action

GPC00401E Duration value is not specified.

Explanation

Duration value is not specified. Please specify a value.

Action

GPC00800E The value entered for the number of rows is incorrect.

Explanation

The user entered a non-integer value for the number of rows.

Action

GPC00801E The selected metrics do not have same unit type. Charts only display metrics with the same unit type.

Explanation

The charts display a single Y-Axis listing the metric unit types, hence the charts only display the metrics of the same unit type.

Action

GPC00802E The selected charting metrics do not have same chart type. Chart and History Chart options cannot be mixed.

Explanation

There is a choice to display batch chart or batch history chart reports, options for both chart types cannot be mixed.

Action

GPC00803E Performance reports can only be saved with 300 or less explicitly specified components. To save the report either select all components or select no more than 300.

Explanation

The database is limited in the number of components a saved report can contain. The limit is either 300 user-specified components or all components. All components can be saved in the report since a flag is used to indicate the condition rather than an entry for each component.

Action

GPC00804E Please enter a relative time higher than zero.

Explanation

The relative time in days to display the historic performance data should be higher than zero.

Action

GPC00950I There is no data to be charted.

Explanation

There is no data available for the requested chart.

Action

GPC00951I No metrics were selected.

Explanation

No metrics were selected when this report was generated.

Action

GPC00952I No drill-up available for this component.

Explanation

Drill-up is not available for this component.

Action

GPC00953I None of the selected metrics apply for all the report components.

Explanation

A metric can be charted only if it applies to each component in the report.

Action

GPC00954I None of the selected metrics apply for all selected components.

Explanation

A metric can be charted only if it applies to each selected component.

Action

GPC00955I None of the selected metrics apply for all the report components or for all selected components.

Explanation

A metric can be charted only if it applies for each component in the report or for each selected component.

Action

GPC00956I Subsystem port constraint violations do not support the affected volumes report.

Explanation

Affected volumes reports are not generated for metrics associated with the subsystem port component.

Action

GPC00957I The maximum limit of *max no of rows* displayable rows for a performance report has been reached. If a larger report is required rerun the report as a batch report, alternatively redefine the report to return less data. The amount of report data can be reduced by using a smaller time window, working with less components, applying filters when defining the report or using the aggregated hourly or daily report data rather than the sample data.

Explanation

The IBM Spectrum Control GUI has to limit the number of rows in a performance report to avoid heapdumps caused by large reports.

Action

If the user wants to view more data than the default 100000 rows in the GUI, the user can modify data server's TPCD.config parameter, pmReportRowLimit. To avoid the GUI running out of memory the GUI's max heapsize should also be increased.

GPC00958I No drill-down available for this component.

Explanation

Drill-down is not available for this component.

Action

GPC50000E Fabric type for *fabric type identifier* does not match the fabric type in selected list.

Explanation

The device selected in the source list does not have the same subsystem type in the selected list.

Action

HWNAS - Agentless Server messages

- [HWNAS0001I Successfully created server server.](#)
- [HWNAS0002I Successfully deleted server server.](#)
- [HWNAS0003E The host name or IP address {0} is not valid.](#)
- [HWNAS0004E Cannot add port portWWPN because it belongs to server serverName.](#)
- [HWNAS0005E Cannot add port portWWPN because it belongs to switch switchName.](#)
- [HWNAS0006E Cannot add port portWWPN because it belongs to storage system storageSystemName.](#)
- [HWNAS0007W Server serverName was not created because it exists already.](#)
- [HWNAS0008I Successfully created mergeServerName server by merging numberOfServers servers.](#)
- [HWNAS0009I Successfully separated serverName server into numberOfServers individual servers.](#)
- [HWNAS0010E The serverId agentless server that you selected does not exist.](#)
- [HWNAS0011I You cannot separate the serverName agentless server because it is not based on storage system host connections.](#)
- [HWNAS0012I You cannot separate the serverName agentless server because it is already defined on the smallest possible separation boundary.](#)
- [HWNAS0013I You cannot merge the selected agentless servers into the serverName agentless server because they are not all based on storage system host connections.](#)

HWNAS0001I Successfully created server server.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNAS0002I Successfully deleted server server.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNAS0003E The host name or IP address {0} is not valid.

Explanation

The IP address or host name that was entered for the device is not valid.

Action

Make sure that the IP address and host name are valid for the device that is being added. Reenter the IP address or host name and click Add again.

HWNAS0004E Cannot add port portWWPN because it belongs to server serverName.

Explanation

The specified port WWPN belongs to another server and cannot be added to the server.

Action

Enter a port WWPN that does not belong to another server.

HWNAS0005E Cannot add port *portWWPN* because it belongs to switch *switchName*.

Explanation

The specified port WWPN is a switch port and cannot be added to the server.

Action

Enter a port WWPN that does not belong to a switch.

HWNAS0006E Cannot add port *portWWPN* because it belongs to storage system *storageSystemName*.

Explanation

The specified port WWPN is a storage system port and cannot be added to the server.

Action

Enter a port WWPN that does not belong to a storage system.

HWNAS0007W Server *serverName* was not created because it exists already.

Explanation

The server was not created because a server with the same host name or IP address exists already.

Action

Enter a host name or IP address for a server that is not already monitored.

HWNAS0008I Successfully created *mergeServerName* server by merging *numberOfServers* servers.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNAS0009I Successfully separated *serverName* server into *numberOfServers* individual servers.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNAS0010E The *serverId* agentless server that you selected does not exist.

Explanation

Either the server ID is invalid or it refers to a resource that is not an agentless server. For example the server might be a server with a Storage Resource agent deployed.

Action

Select a valid agentless server.

HWNAS0011I You cannot separate the *serverName* agentless server because it is not based on storage system host connections.

Explanation

The agentless server has no assigned WWPNs, or the assigned WWPNs are not associated with any storage system host connections. For example, the agentless server might represent a virtual machine that was discovered during a hypervisor probe. You cannot separate these agentless servers into multiple individual servers.

Action

Select an agentless server that represents two or more storage system host connections.

HWNAS0012I You cannot separate the *serverName* agentless server because it is already defined on the smallest possible separation boundary.

Explanation

The separation of an agentless server occurs on boundaries that are identified by storage system host connections that have sets of WWPNs that do not overlap. The agentless server that you selected is either based on a single host connection and therefore cannot be further subdivided, or the agentless server is based on multiple host connections that all have overlapping sets of WWPNs assigned.

Action

If the agentless server is based on multiple host connections and you want to separate it, use the GUI or CLI for the storage system to modify the host connection definitions. Remove any unintended overlap between sets of WWPNs for the storage system host connections. After you remove the overlap, rerun the probe on those storage systems. After the probes complete, try to separate the agentless server again.

You cannot eliminate any overlap that is caused by HBAs. HBAs are discovered during the fabric probe, and identify which WWPNs cannot be separated. That is, the HBAs identify which WWPNs are known to belong to the same interface card in a server computer.

HWNAS0013I You cannot merge the selected agentless servers into the *serverName* agentless server because they are not all based on storage system host connections.

Explanation

One or more of the agentless servers is not associated with any storage system host connections. For example, the agentless server might represent a virtual machine that was discovered during a hypervisor probe. You cannot merge these agentless servers into a single server.

Action

Select agentless servers that are based on storage system host connections.

HWNAL - Single sign-on service messages

- [HWNAL0001E A connection with the IBM Spectrum Control Device Server, \(Device Server IP, could not be established for authentication.](#)

To proceed enter a local OS username with administrative privileges and password.](#)
- [HWNAU0019E An unknown error occurred while authenticating with Web server.](#)

HWNAU0001E A connection with the IBM Spectrum Control Device Server, (Device Server IP, could not be established for authentication.

Explanation

A connection to the IBM Spectrum Control Device server could not be established for the authentication request.

Action

Make sure the IBM Spectrum Control Device Server is active and has IP connectivity with the IBM Spectrum Control server.

HWNAU0002E A connection with the LDAP or Active Directory server, (LDAP or Active Directory Server IP) , could not be made for authentication.

Explanation

A connection to the LDAP or Active Directory server could not be made for the authentication request.

Action

Make sure the LDAP or Active Directory server is active and has IP connectivity with the IBM Spectrum Control Device Server.

HWNAU0003E Authentication of the Single Sign-On token failed. Provide your username and password to attempt a re-authentication.

Explanation

Authentication of the Single Sign-On token failed.

Action

Make sure the Single Sign-On token was created within the same domain as the IBM Spectrum Control server.

HWNAU0004E The Single Sign-On token has expired. To re-authenticate the token, please enter your user name / password.

Explanation

The Single Sign-On token expired. Enter your password to resume the Single Sign-On login session.

Action

Provide the Single Sign-On token's password in order for it to reauthenticate.

HWNAU0005E Creation of the Single Sign-On token failed due to an username that is not valid. Enter your username and password and try again.

Explanation

Creation of the Single Sign-On token failed due to an username that is not valid.

Action

Either make sure the username and password are valid or the user is configured to the LDAP or Active Directory server.

HWNAU0006E Creation of the Single Sign-On token failed due to a password that is not valid. Enter your username and password and try again.

Explanation

Creation of the Single Sign-On token failed due to a password that is not valid.

Action

Make sure the password of the user is valid.

HWNAU0007E Authentication failed due to an username or password that is not valid. Enter your username and password and try again.

Explanation

Authentication failed due to an username or password that is not valid.

Action

Make sure the username and password are valid.

HWNAU0008I Single Sign On Service started successfully.

Explanation

The Single Sign On Service has started successfully.

HWNAU0009I The Single Sign On Service has shutdown.

Explanation

The Single Sign On Service has been shutdown.

HWNAU0010E An error occurred retrieving the Single Sign-On token from the private credentials.

Explanation

An error occurred retrieving the Single Sign-On token from the private credentials.

HWNAU0011E An error occurred retrieving the Single Sign-On token from the public credentials.

Explanation

An error occurred retrieving the Single Sign-On token from the public credentials.

HWNAU0012E An error occurred when attempting to decode the authentication token.

Explanation

An error occurred when attempting to decode the authentication token.

HWNAU0013E An error occurred when attempting to encode the authentication token.

Explanation

An error occurred when attempting to encode the authentication token.

HWNAU0014E An error occurred while translating the user's credentials into a Single Sign-On token.

Explanation

An error occurred while translating the user's credentials into a Single Sign-On token.

HWNAU0015E An unknown error occurred while authenticating to the WebSphere login module.

Explanation

An unknown error occurred while authenticating to the WebSphere login module.

HWNAU0016E An error occurred while registering SsoConfigChangeListener with TIP.

Explanation

An error occurred while registering SsoConfigChangeListener with TIP.

HWNAU0017E An error occurred while unregistering SsoConfigChangeListener from TIP.

Explanation

An error occurred while unregistering SsoConfigChangeListener from TIP.

HWNAU0018E The Web server appears to be down and cannot be used for authentication. It is still possible to perform OS user authentication against the device server, however since the Web server is down the IBM Spectrum Control functionality will be limited. Among the limitations is the inability to perform SSO to other applications that rely on the presence of a lightweight third party authentication token. To proceed enter a local OS username with administrative privileges and password.

Explanation

Authentication and Single Sign On (SSO) functionality is primarily obtained through the Web server. Without the Web server, IBM Spectrum Control can only authenticate the user with no SSO capability.

Action

Make sure the Web Server is active and has IP connectivity with the IBM Spectrum Control server.

HWNAU0019E An unknown error occurred while authenticating with Web server.

Explanation

An unknown error occurred while authenticating with Web Server.

- [HWNCA0070E The expansion of the capacity is not supported for the delivery unit with ID delivery_unit_id.](#)
- [HWNCA0071E The reduction of the capacity is not supported for the delivery unit with ID delivery_unit_id.](#)

HWNCA0001E The required *parameter_name* parameter is missing.

Explanation

A required parameter was not specified.

Action

Try the command again, specifying all parameters.

HWNCA0002E The delivery unit type *delivery_unit_type* is not supported.

Explanation

The specified delivery unit type is not supported by the Storage Management API for Cloud.

Action

HWNCA0003E The delivery unit type, *delivery_unit_type*, does not match the capacity pool type, *capacity_pool_type*.

Explanation

The specified delivery unit type does not match the type of the capacity pool that is in use.

Action

Specify a different delivery unit type or use a different capacity pool to allocate the delivery unit.

HWNCA0004E The service class *service_class_name* is not supported by the capacity pool.

Explanation

The capacity pool contains no resources that support the requested service class.

Action

Add resources to this capacity pool that support the service class, or specify a different capacity pool for this service class.

HWNCA0005E IBM Spectrum Control cannot provide the requested *delivery_unit_size* GiB of capacity that also satisfies the requirements of the service class.

Explanation

There is not enough storage available that also satisfies the requirements of the specified service class. If the provisioning request is constrained to a capacity pool, the capacity pool does not contain enough storage that also satisfies the requirements of the specified service class.

Action

Review the service class properties to determine if the service class requirements are too restrictive, or if additional storage should be added. Depending on your findings, complete one of the following steps:

- Specify a different service class or modify the properties of the service class.
- Change the provisioning constraints. If you are limiting provisioning to a capacity pool, specify a different capacity pool or allow provisioning from any available storage.
- Add storage that satisfies the requirements of the service class.
- Check the msgPlanner.log from <IBM Spectrum Control folder>/device/log for more information about the provisioning task.

HWNCA0006E A delivery unit *delivery_unit_name* and service instance ID *service_instance_ID* already exists.

Explanation

The delivery unit already exists.

Action

Choose a different name for the delivery unit or assign the delivery unit to a different service instance.

HWNCA0007I Normal isolated file storage.

Explanation

Normal isolation allows the shared use of storage resources for NAS exports.

Action

HWNCA0008I Enhanced isolated file storage.

Explanation

Enhanced isolation enforces the use of dedicated storage resources for NAS exports.

Action

HWNCA0009E The capacity pool with ID *capacity_pool_id* is still in use and cannot be deleted.

Explanation

At least one delivery unit allocates storage from the capacity pool. The capacity pool cannot be deleted until all delivery units that allocate storage from it have been deleted.

Action

Delete all delivery units that allocate storage from this capacity pool. Try to delete the capacity pool again.

HWNCA0010E The service class *service_class_name* has no recipe for deleting delivery unit *delivery_unit_name*.

Explanation

The delivery unit could not be deleted because the recipe for this device type was not found.

Action

Add a recipe for this service class that supports the device type that the delivery unit was created on.

HWNCA0011E The service class *service_class_name* cannot modify the delivery unit *delivery_unit_name*.

Explanation

The delivery unit could not be modified because no recipe for this device type was found.

Action

Add a recipe for this service class that supports the device type that the delivery unit was created on.

HWNCA0012E The capacity of the delivery unit with ID *delivery_unit_id* cannot be modified after delivery unit is created.

Explanation

IBM Spectrum Control was unable to modify the delivery unit's capacity, because the corresponding recipe does not support this operation.

Action

Replace the existing delivery unit with a new one that has the needed capacity. Alternatively, create an additional delivery unit to extend the available capacity of this delivery unit.

HWNCA0013E Delivery unit with ID *delivery_unit_id* cannot be modified or deleted because it is in the processing state.

Explanation

The creation process of this delivery unit is not complete. You cannot delete or modify a delivery unit that is in a processing state.

Action

Wait until the creation process is complete. Check the attributes of the delivery unit to see the status of the creation process.

HWNCA0014E Delivery unit with ID *delivery_unit_id* cannot be modified because it has a completion state error.

Explanation

An error occurred during the creation of this delivery unit. You cannot modify a delivery unit that has creation errors.

Action

Delete and then create the delivery unit again.

HWNCA0015E The principal *principal_name* was used in multiple CIFS access control list (ACL) entries.

Explanation

CIFS ACLs do not support the specification of the same principal in multiple entries.

Action

Remove duplicate ACL entries.

HWNCA0016I A standard object can handle object-type delivery units, such as CDMI containers.

Explanation

This service class allows the creation, modification, and deletion of object-type delivery units, such as CDMI containers.

Action

No further action is required.

HWNCA0017I You can use the StandardBlock service class to create, modify, and delete delivery units that are block based, such as volume containers.

Explanation

This message is for informational purposes only.

Action

No further action is required.

HWNCA0018I High Availability, Sequential.

Explanation

This service class allows the creation, modification, and deletion of block-type delivery units, such as volume containers using a default RAID5 provisioning profile.

Action

No further action is required.

HWNCA0019I High Availability, Short response time, Transactional.

Explanation

This service class allows the creation, modification, and deletion of block-type delivery units, such as volume containers with a default RAID10 provisioning profile.

Action

No further action is required.

HWNCA0020E No provisioning profile was found for *recipe name*.

Explanation

No provisioning profile was found for the PlannerEnabledBlockRecipe.

Action

Specify a provisioning profile and try again.

HWNCA0021E The WWPN *WWPN* does not belong to a server or hypervisor managed by IBM Spectrum Control.

Explanation

The Host ports/WWPNs must belong to a server or hypervisor managed by IBM Spectrum Control.

Action

Probe the server or select another WWPN and try again.

HWNCA0022E Device Selection failed with the following error: *Planner Message*

Explanation

The Device Selection failed.

Action

Perform the actions specified by the Planner and try again.

HWNCA0023E Creation of DeliveryUnit failed with the following error: *Planner Message*

Explanation

Creation of DeliveryUnit failed.

Action

Perform the actions specified by the Planner and try again.

HWNCA0025I Remote Caching allows the data written to one delivery unit to be pushed to another remote located delivery unit.

Explanation

Delivery units created with this service class can be configured so that data written to them is automatically pushed to another, potentially offsite, storage location.

Action

HWNCA0026E Deletion of DeliveryUnit failed with the following error: *Planner Message*

Explanation

Deletion of DeliveryUnit failed.

Action

HWNCA0027I Highest-performing storage for mission-critical applications.

Explanation

Storage volumes that are associated with this service class are placed on storage resources that provide the highest performance characteristics.

Action

HWNCA0028I High-performing storage for applications in production.

Explanation

Storage volumes that are associated with this service class are placed on storage resources that provide high performance characteristics.

Action

HWNCA0029I Standard storage for non-mission-critical applications.

Explanation

Storage volumes that are associated with this service class are placed on storage resources that provide standard performance characteristics.

Action

HWNCA0030E No host port WWPNs were found for server *host name*.

Explanation

To contain World Wide Port Names (WWPNs), a server must be managed by a Storage Resource agent or an ESX server.

Action

Ensure that the server is managed by a Storage Resource agent or an ESX server. After the server is managed, run a probe to collect data about its WWPNs. Try to create or modify the Delivery Unit again.

HWNCA0031I The standard root object class enforces the use of dedicated filesets for associated object-type delivery units, such as CDMI containers.

Explanation

You can use this service class to create, modify and delete isolated object-type delivery units, such as CDMI containers. On creation, a dedicated fileset uses available free storage resources as needed.

Action

No further action is required.

HWNCA0032E A Storage Resource agent is not up and running for the *host name server*.

Explanation

To assign World Wide Port Names (WWPNs), the Storage Resource agent that is managing a server must be up and running.

Action

Ensure that the server is managed by a Storage Resource agent and start the agent. Try to create or modify the Delivery Unit again.

HWNCA0033E A service class with name *service_class_name* does not exist for the specified delivery unit type.

Explanation

The service class could not be found.

Action

Ensure that such a service class exists and check that its name was spelled correctly.

HWNCA0034E IBM Spectrum Control is unable to create or modify the service class because one or more of the capacity pools to which it was restricted were removed.

Explanation

The service class that you attempted to create or modify defines storage constraints that restrict future provisioning to a specific set of capacity pools. While the service class creation or modification was in progress, one or more of the specified capacity pools were removed. Because one or more of the specified capacity pools no longer exist, IBM Spectrum Control cannot create or modify the service class.

Action

In the Create Service Class wizard or service class properties notebook, go to the list of capacity pools. The capacity pools that were deleted are no longer listed. Define the storage constraints from the new list of capacity pools.

HWNCA0035E Delivery unit with ID *delivery_unit_id* cannot be modified or deleted because it has a completion status of planned or change_planned.

Explanation

You cannot modify or delete a delivery unit that in planned or change planned state.

Action

Execute or delete the existing plan to allow delivery unit modification or deletion.

HWNCA0036E More than *numResults* results found. Modify your search pattern.

Explanation

The number of users that were found with the provided search pattern exceeds the limit.

Action

Modify your search pattern and try again.

HWNCA0037I Start the creation of an object container with name *containerName*.

Explanation

The operation to start the creation of object container is started.

Action

No further action is required.

HWNCA0038I The creation of the object container with name *containerName* is finished.

Explanation

The operation to start the creation of object container is completed.

Action

No further action is required.

HWNCA0039I Start the deletion of an object container with name *containerName*.

Explanation

The operation to delete the object container is started.

Action

No further action is required.

HWNCA0040I The deletion of the object container with name *containerName* is finished.

Explanation

The operation to delete the object container is completed.

Action

No further action is required.

HWNCA0041I Start the modification of an object container with name *containerName*.

Explanation

The operation to modify the object container is started.

Action

No further action is required.

HWNCA0042I The modification of the object container with name *containerName* is finished.

Explanation

The operation to modify the object container is completed.

Action

No further action is required.

HWNCA0043I This task was already deleted.

Explanation

You are attempting to execute, schedule, or delete a task that was already deleted. The task was possibly deleted by another user.

Action

No action is required.

HWNCA0044E The requested operation requires SMAC API client version *version* or later.

Explanation

Some SMAC API operations require the most recent version of the SMAC client. This prevents unexpected behavior by older SMAC API clients.

Action

Update the SMAC API client to the version specified in this message, or to a more recent version. For best results, the SMAC API client should be at the same version level as the IBM Spectrum Control server.

HWNCA0045E The plan with scheduleID *scheduleID* can not be deleted because the delivery unit creation is already processing state.

Explanation

You cannot delete or modify a delivery unit that is in a processing state, so its associated plan can not be deleted.

Action

Wait until the associated creation process is complete then try to delete the plan again.

HWNCA0046E The specified value *deletionType* is not a valid plan deletion type.

Explanation

You cannot delete a plan with a invalid deletion type.

Action

Pick a valid deletion type and then try to delete the plan again.

HWNCA0047E Host with host name *host* is not known by IBM Spectrum Control.

Explanation

No host with the specified name exists.

Action

HWNCA0048E Filer Storage ID *filerId* for given fileSystem is not found.

Explanation

Filer Id for a given fileSystem is either not found or not specified.

Action

HWNCA0049W IBM Spectrum Control did not change any Fibre Channel zones. After the provisioning operation completes, verify the Fibre Channel connectivity between any involved host and the storage subsystem that contains the storage volume. If necessary, change the zoning configuration.

Explanation

IBM Spectrum Control reassigned volumes to hosts and host ports, but did not change the fabric zoning to ensure the connectivity between the storage subsystem and the hosts.

Action

After the provisioning operation completes, configure the zones and zone sets, if necessary, using the appropriate external applications.

HWNCA0050W IBM Spectrum Control did not enable the multipath policy for the host or hosts to which the volume was reassigned. You must enable the multipath policy after the provisioning operation completes.

Explanation

IBM Spectrum Control reassigned volumes to hosts and host ports, but did not enable the multipath policy for the involved hosts.

Action

After the provisioning operation completes, log in to the operating system on each involved host to enable the multipath policy.

HWNCA0051E Incorrect volume name *volumeName*. The name can contain letters, numbers, dashes (-) and underscores (_). However, the name cannot start with a number, dash, or the reserved words *vdisk* or *volume*.

Explanation

The volume name is incorrect.

Action

Choose a valid volume name.

HWNCA0052E One or more of the requested volume names are too long for the following storage systems: *StorageSubsystemsList*. The maximum volume name length that is allowed is *MaxAllowedNameLength* characters, and a volume name of *LargestNameLength* characters was requested.

Explanation

Restrictions on volume name length vary by storage system type. When you request volumes, IBM Spectrum Control uses criteria such as the service class requirements, available space and performance data to identify the best location for the volumes. It does not consider the allowed length for volume names on particular storage systems. Sometimes a storage pool that is recommended for volume placement is on a storage system that does not support the volume name length.

Action

Either specify volume names within the allowed length, or select a capacity pool that contains only storage pools from storage subsystems that allow longer volume names.

HWNCA0053E The service class *scName* does not support provisioning from any available storage.

Explanation

This service class is restricted to a certain set of capacity pools, and therefore does not support provisioning from any available storage.

Action

Specify a capacity pool that can be used with this service class.

HWNCA0054E The volume *volumeName* already exists on the storage system *storageSystemName*. Request a different volume name.

Explanation

The best location for the requested volume already has a volume of that name. Because volume names must be unique on a storage system, the new volume cannot be created.

Action

Specify a different name for the volume.

HWNCA0055E The share *shareName* already exists on the storage system *storageSystemName*. Request a different share name.

Explanation

The best location for the requested NAS share already has a share of that name. Because share names must be unique on a storage system, the new share cannot be created.

Action

Specify a different name for the share.

HWNCA0056W Zoning cannot be configured because the connected fabrics are not monitored.

Explanation

Typically, you cannot provision volumes to servers and hypervisors that do not have fabric connectivity. However, because the selected hosts have Fibre Channel Port WWPNs and do not appear to have fabric connectivity, it is possible that the related fabrics were not probed by IBM Spectrum Control.

In this case, you can still provision the volumes, but because no fabric information is available, all fabric-related options are ignored and the fabric is not configured. Fabric-related options include number of paths, redundant fabrics, and automatic zoning.

Action

Ensure that the hosts are connected to the recommended storage system before you run the task. After the provisioning operation completes, you must manually configure the fabric.

HWNCA0057W The multipath policy cannot be set on the following hypervisors: *HostList*.

Explanation

IBM Spectrum Control cannot enable the multipath policy for hypervisors.

Action

After the provisioning operation completes, log in to the hypervisor or use VMware tools to enable the multipath policy on the hypervisor.

HWNCA0058W The multipath policy cannot be set on the following agentless servers: *HostList*.

Explanation

IBM Spectrum Control cannot enable the multipath policy for servers that are not managed by a Storage Resource agent.

Action

After the provisioning operation completes, log in to the operating system on the agentless server to enable the multipath policy.

HWNCA0059W The multipath policy cannot be set on the following hosts: *HostList*.

Explanation

IBM Spectrum Control cannot enable the multipath policy for hypervisors or servers that are not managed by a Storage Resource agent.

Action

For each hypervisor: After the provisioning operation completes, log in to the hypervisor or use VMware tools to enable the multipath policy on the hypervisor.

For each agentless server: After the provisioning operation completes, log in to the operating system on the agentless server to enable the multipath policy.

HWNCA0060E Storage volume can not be assigned to servers that are running different operating systems.

Explanation

A storage volume can be assigned to multiple servers only if the servers use the same operating systems.

Action

Ensure that the specified servers are running the same operating system, and try to create or modify the volume again.

HWNCA0061E The required resources cannot be reserved because too many provisioning tasks are currently being created. Try again in a few minutes.

Explanation

When a task for provisioning volumes is created, pool space is reserved for allocating the volumes. Because too many provisioning tasks are being created at the same time, pool space cannot be reserved and this provisioning task cannot be created.

Action

Wait a few minutes for the other provisioning tasks to be created.

HWNCA0062E The operation did not complete because the specified service class or capacity pool no longer exists.

Explanation

The service class or capacity pool that was specified in the provisioning request was deleted before IBM Spectrum Control could determine the recommended placement for a new volume or share. If either the service class or capacity pool no longer exists, the operation to create the provisioning task fails.

Action

Resubmit your provisioning request. Make sure that any service class or capacity pool that is specified in the provisioning request still exists.

HWNCA0063E The service class *ScName* that is specified by this provisioning task does not exist.

Explanation

The service class that was specified in the provisioning task was deleted before IBM Spectrum Control could complete the provisioning of the new volume or share. The provisioning task failed because the service class no longer exists.

Action

Recreate the provisioning task. Ensure that you specify an existing service class.

HWNCA0064E The current SMAC API client is version *current_version*. The requested operation requires SMAC API client version *required_version* or later.

Explanation

Some SMAC API operations require the most recent version of the SMAC client. This prevents unexpected behavior by older SMAC API clients.

Action

Update the SMAC API client to the version specified in this message, or to a more recent version. For best results, the SMAC API client should be at the same version level as the IBM Spectrum Control server.

HWNCA0065E The delivery unit specified has snapshots and could not be deleted.

Explanation

A delivery unit cannot be deleted if it has snapshots.

Action

Delete the delivery unit snapshots and try the deletion of the delivery unit again.

HWNCA0066E The WWPN *WWPN* already belongs to a server or hypervisor managed by IBM Spectrum Control. Was expected an unknown WWPN based on previous Hosts or WWPNS passed in.

Explanation

The WWPNS specified in the provisioning task was sent part of a group of WWPNS or Hosts that are not of same type. All specified WWPNS or Hosts should be either known or unknown. The provisioning task failed because the of this.

Action

Recreate the provisioning task. Ensure that you all wwpns and hosts of same type (known or unknown to IBM Spectrum Control). In case unknown wwpns are sent specify maximum one unknown host. If one unknown host is specified make sure at least one unknown wwpn is specified also.

HWNCA0067E The host *host* already belongs to a server or hypervisor managed by IBM Spectrum Control. Was expected an unknown Host based on previous Hosts or WWPNS passed in.

Explanation

The host specified in the provisioning task was sent part of a group of WWPNS or Hosts that are not of same type. All specified WWPNS or Hosts should be either known or unknown. The provisioning task failed because the of this.

Action

Recreate the provisioning task. Ensure that you all wwps and hosts of same type (known or unknown to IBM Spectrum Control). In case unknown wwps are sent specify maximum one unknown host. If one unknown host is specified make sure at least one unknown wwpn is specified also.

HWNCA0068E The list of hosts was expected to contain just one or no element because the WWPNS passed in were all unknown. The size of the host list is size.

Explanation

The host specified in the provisioning task was sent part of a group of WWPNS that are all Unknown to IBM Spectrum Control Server. Therefore only a maximum of one host (also unknown to IBM Spectrum Control) can be specified.

Action

Recreate the provisioning task. Ensure that you all wwps and hosts of same type (known or unknown to IBM Spectrum Control). In case unknown wwps are sent specify maximum one unknown host. If one unknown host is specified make sure at least one unknown wwpn is specified also.

HWNCA0069E No unknown WWPNS were specified for this provisioning operation but an unknown Host was specified.

Explanation

The unknown host specified in the provisioning task was not sent part of a group of unknown WWPNS.

Action

Recreate the provisioning task. Ensure that you all wwps and hosts of same type (known or unknown to IBM Spectrum Control). In case unknown wwps are sent specify maximum one unknown host. If one unknown host is specified make sure at least one unknown wwpn is specified also.

HWNCA0070E The expansion of the capacity is not supported for the delivery unit with ID *delivery_unit_id*.

Explanation

The storage subsystem containing the delivery unit does not support to expand the capacity.

Action

HWNCA0071E The reduction of the capacity is not supported for the delivery unit with ID *delivery_unit_id*.

Explanation

The storage subsystem containing the delivery unit does not support to reduce the capacity.

Action

HWNDA0001I *Operation Name of the operation processed successfully.*

Explanation

A request was run successfully. No error condition was encountered.

Action

No action is required.

HWNDA0002E *Mandatory parameter Name of the mandatory parameter which is missing missing*

Explanation

Mandatory parameter {0} is missing.

Action

Contact IBM Support.

Related reference

- [Getting support](#)

HWNDA0003E *Invalid parameter Name of the parameter which was invalid*

Explanation

Invalid parameter {0} was encountered while processing an API request.

Action

Contact IBM Support.

Related reference

- [Getting support](#)

HWNDA0004E *An internal error occurred.*

Explanation

An internal error occurred during execution.

Action

Check the logs for an indication of an error or exception and contact IBM customer support.

Related reference

- [Getting support](#)

HWNDA0005E *The server encountered an error when it was accessing the database.*

Explanation

The server cannot access data that is stored in the database.

Action

Check the status of the database. Also, check the logs for an indication of an error or exception and contact IBM customer support.

Related reference

- [Getting support](#)

HWNDA0006E The name provided while creating a new group is already in use.

Explanation

The name of a new group must be unique.

Action

Choose a unique name for the group and try again.

HWNDA0007E An external key could not be identified for the provided type *The constant integer type of the Group element* and id *The unique integer database ID of the Group element*.

Explanation

The element that is a member of a Group could not be found in the database and indicates some form of database inconsistency.

Action

Contact IBM customer support.

Related reference

- [Getting support](#)

HWNDA0008E The specified attribute *invalid attribute name* is not a valid attribute.

Explanation

The attribute that is specified is not in the list of usable attributes for the method that is being invoked.

Action

Contact IBM customer support.

Related reference

- [Getting support](#)

HWNDA0009E An internal ID could not be identified for the provided type *The constant integer type of the Group element* and external key *The unique external key of the Group element*.

Explanation

The provided external key could not be translated into an internal database ID.

Action

Verify the validity of the external key.

HWNDA0010I The following elements are already members of the group
The group: The keys of the elements.

Explanation

The groups cannot contain the same member more than once.

Action

Verify the current contents of the group.

HWNDA0011I The following elements are not members of the *The group*
Group and cannot be removed: *The element key.*

Explanation

The element that was requested to be removed is not currently a member of the Group.

Action

Verify that the current contents of the Group are correct.

HWNDA0012E Adding a Group with the name *Name of the proposed new member* to the *Name of the parent group* Group would create a circular relationship that is not allowed.

Explanation

A Group may not be a member of its children.

Action

Verify that the Group is not being added to any of its children groups.

HWNDA0013E The input parameter value *input parameter value* for
input *input parameter name* exceeds the maximum allowable length of
number of allowable characters characters.

Explanation

The provided input is too long.

Action

Shorten the provided input and try again.

HWNDA0014E The provided Group attribute value *Group attribute value* for the *Group attribute name* Group attribute contains

invalid characters. The following characters are not allowed, \\/:*?><|."

Explanation

The proposed Group attribute contained an invalid character.

Action

Remove the invalid character or characters and try the action again.

HWNDA0015E You are not the original creator of the provided Group name *Group name*.

Explanation

You must be the original creator of the Group in order to update its properties.

Action

None.

HWNDA0016E The provided Tiering Policy name *Tiering Policy name* is not unique.

Explanation

The proposed Tiering Policy name is already in use.

Action

Either specify a new name or delete the current Tiering Policy with this name and rerun this command.

HWNDA0017E The provided Group *Group name or ID* does not exist.

Explanation

The Data server could not find a Group with the specified name or ID.

Action

Verify that the required Group exists. If it does not, specify a different Group.

HWNDA0018E The provided Tiering Policy name *Tiering Policy name* does not exist.

Explanation

The Data server could not find a Tiering Policy with the name specified.

Action

Verify that the required Tiering Policy exists. If it does not, create a Tiering Policy with the required name or specify a different Tiering Policy.

HWNDA0019E The provided candidate and destination Group names, *Group name*, cannot be the same.

Explanation

The Tiering Policy cannot have the same Group for both its candidate and destination.

Action

Choose a different Group for either the candidate or destination for this Tiering Policy.

HWNDA0020E The provided condition *condition* type is not valid.

Explanation

Only valid condition types may be specified when adding a new condition to a tiering policy.

Action

Specify a valid condition type to add to the tiering policy.

HWNDA0021E The provided operand *operand type* is not valid.

Explanation

Only valid operands may be specified when adding a new condition to a tiering policy.

Action

Specify a valid operand for the condition being added to the tiering policy.

HWNDA0022E The provided condition *condition type* is either already applied to this tiering policy or conflicts with an existing condition, *existing condition type*.

Explanation

Tiering policies may only contain one condition. The exception is that an AGE and an IODENSITY conditions may exist for the same tiering policy.

Action

Remove the existing condition from the tiering policy before adding the new condition.

HWNDA0023E The requested priority value *priority value* is invalid.

Explanation

Tiering policy priorities range from 1 (highest priority) to the current number of policies.

Action

Try the command again, specifying a valid priority value.

HWNDA0024E The specified Group name *Group name* is not unique.

Explanation

The specified Group name is not unique and none of these Groups are owned by the current user.

Action

Try the command again, specifying the full Group name in "user"."name" format.

HWNDA0025E Cannot add the specified resource because the resource type, *element type*, is not supported as a child of the group.

Explanation

The specified resource type is not supported as a child of the group.

Action

Check the resource types that you are allowed to add as a child for this group. Try the operation again, using a supported resource type.

HWNDA0026E Cannot add the specified group, *Group name*, because the group type, *type*, is not supported as a child of the application.

Explanation

The specified group is not supported as a child of an application.

Action

Check the group types that you are allowed to add as a child of an application. Try the operation again, using a supported group type.

HWNDA0027E The first option specified in the file must be -*appgroupname*.

Explanation

The first option specified in the file must be -*appgroupname*.

Action

Edit the file appropriately.

HWNDA0028E The argument of the option *option* is missing at or before line *Line Number* : *Line*

Explanation

The option argument was not specified.

Action

Edit the file appropriately.

HWNDA0029E Both *option1* and *option2* were specified at or before line *Line Number* : *Line*

Explanation

Both options were specified.

Action

Edit the file appropriately.

HWNDA0030E The option *option* is missing at or before line *Line Number : Line*

Explanation

An option was not specified.

Action

Edit the file appropriately.

HWNDA0031E Neither *option1* nor *option2* was specified at or before line *Line Number : Line*

Explanation

Action

Edit the file appropriately.

HWNDA0032E Invalid number of parameters for option *option* at or before line *Line Number : Line*

Explanation

An Invalid number of parameters were specified for an option.

Action

Edit the file appropriately.

HWNDA0033E Incomplete options sequence before end of file.

Explanation

An incomplete options sequence was detected.

Action

Edit the file appropriately.

HWNDA0034E Invalid option *option* at line *Line Number : Line*

Explanation

An Invalid option was specified.

Action

Edit the file appropriately.

HWNDA0035E Invalid resource type *type* at line *Line Number* : *Line*

Explanation

An invalid resource type was specified.

Action

Edit the file appropriately.

HWNDA0036E Invalid sequence of options at or before line *Line Number* : *Line*

Explanation

An invalid sequence of options was specified.

Action

Edit the file appropriately.

HWNDA0037E Syntax error, quote sequence not properly closed at line *Line Number* : *Line*

Explanation

The quote sequence was not properly closed.

Action

Edit the file appropriately.

HWNDA0038E Option *option* is not allowed for resource type *type* at or before line *Line Number* : *Line*

Explanation

The option and the resource type are not compatible.

Action

Edit the file appropriately.

HWNDA0039E The input data for modifying the application groups is missing.

Explanation

No input data was specified to modify the application groups.

Action

Specify the necessary input data.

HWNDA0040E An invalid element was encountered in the input data.

Explanation

An invalid element was encountered while processing an API request for modifying the application groups.

Action

Specify a correct element.

HWNDA0041E The application group name is missing from the input data.

Explanation

An application group name was not specified.

Action

Specify a correct application group name.

HWNDA0042E The operation is missing from the input data.

Explanation

An operation was not specified.

Action

Specify a correct operation.

HWNDA0043E The resource type is missing from the input data.

Explanation

A resource type was not specified.

Action

Specify a correct resource type.

HWNDA0044E The server name is missing from the input data.

Explanation

A server name was missing while processing an API for modifying the application groups.

Action

Specify a correct server name.

HWNDA0045E The device name is missing from the input data.

Explanation

A device name was missing while processing an API for modifying the application groups.

Action

Specify a correct device name.

HWNDA0046E Invalid values were specified for the server, device or cluster names in the input data.

Explanation

Invalid values were specified for the server, device or cluster names in the input data that is used to modify the applications.

Action

Specify valid values for the server, device and cluster names.

HWNDA0047E Member names and the tags were specified for the same operation.

Explanation

Both the member names and tags were specified for the same operation.

Action

Specify either member names or tags for an operation.

HWNDA0048W The following entities were not found: *Entities*.

Explanation

The entities were not found in the database.

Action

Try the command again and specify the correct names for the entities.

HWNDA0049W No entities were found for the tags: *Tags*

Explanation

The entities were not found in the database.

Action

Try the command again and specify the correct tag keys and values.

HWNDA0050E The member names or tags were not specified for the operation.

Explanation

The members need to be specified using the individual names or the tag pairs.

Action

Specify either member names or tags for an operation.

HWNDA0051W The group *Name of the proposed new member* cannot be added to itself.

Explanation

You cannot add a group to itself. Your request to add a group to itself is ignored.

Action

Verify the user defined properties of the group.

HWNDA0052W The group *Name of the proposed new member* cannot be added to the *Name of the parent group* group because it creates a circular relationship that is not allowed.

Explanation

Groups cannot be used in a circular relationship with their parent and child groups.

Action

Verify the current contents of the group are correct.

HWNDA0053W The group *Name of the group* contains child groups and cannot be deleted. The child groups must be deleted before the parent group can be deleted.

Explanation

A Storage Resource Group, Reporting Group or Application Group that has child groups cannot be deleted.

Action

Delete the child groups before you delete any parent group.

HWNDA0054E The filter mask that was used to create or edit a group filter is currently being used.

Explanation

The filter mask must be unique for each group.

Action

Use a unique filter mask for the group filter and try to create or edit the group again.

HWNDA0055E The argument *argument* for the parameter *parameter* on line *Line Number* : *Line* is invalid.

Explanation

The argument for the parameter is not valid.

Action

Refer to the command help for valid arguments for the parameter and edit the input file to specify a valid argument.

HWNDA0056E The first option specified in the file must be *-id*.

Explanation

The first option specified in the file must be -id.

Action

Edit the file appropriately.

HWNDA0057E The specified Group *Group name* is not of type *type*.

Explanation

The specified Group is not of the specified type.

Action

Try the command again, specifying the correct type.

HWNDA0058W These groups have same names as existing members of the group *The group: The keys of the elements*. They were not added to the group.

Explanation

The group members must have unique names in order to be added to the group.

Action

Rename the group member you are trying to add or remove the group member with the same name that already exists.

HWNDA0059E The specified tag key *Tag key* is not valid.

Explanation

The tag key that you specified does not exist.

Action

Specify a valid tag key or use the -key parameter when you modify an application group, or the -memberid parameter when you modify a department group.

HWNDA0060W These group members are also members of another group: *The groups*. They are not deleted.

Explanation

Even though you specified the -rmchildren parameter, the group members are not deleted because they also belong to another group.

Action

Remove the group member from each group that it belongs to using the modifydeptgroup command.

HWNDA0061W These group members cannot be moved up one level in hierarchy due to name conflicts: *The groups*. The group is not deleted.

Explanation

When you do not specify the `--rmchildren` parameter, the group members are moved up one level in hierarchy. The specified group members have the same name as the existing groups in the higher hierarchical level.

Action

Rename the specified groups and try the command again.

HWNDA0062E The specified Group *Group name* is not a department group.

Explanation

The specified group is not of type department.

Action

Specify a valid department group and try the command again.

HWNDA0063W These group members cannot be moved as top level groups in hierarchy due to name conflicts: *The groups*. No group members were removed from the group.

Explanation

When you remove group members from a group of the same type, and that group is their only single parent, the group members must become the top level groups in the hierarchy. The specified group members have the same name as the existing top level groups in hierarchy.

Action

Rename the specified groups and try the command again.

HWNDA0064E An application with the same name already exists.

Explanation

The specified application name already exists and cannot be duplicated.

Action

Enter a unique name for the application.

HWNDA0065E A department with the same name already exists.

Explanation

The specified department name already exists and cannot be duplicated.

Action

Enter a unique name for the department.

HWNDA0066E Invalid values were specified for the device, cluster or file system names in the input data.

Explanation

Invalid values were specified for the device, cluster or file system names in the input data that is used to modify the applications.

Action

Specify valid values for the device, cluster and file system names.

HWNDA0067E Resources of type *Type of resource* cannot be added to an application or removed from an application using tags.

Explanation

Resources of this type can only be added to an application or removed from an application by specifying the resource key.

Action

Retry adding or removing the resource by specifying the resource key.

HWNDA0068E The application cannot be added because the number of levels in the group hierarchy exceeds the maximum of five levels.

Explanation

When you added a new subcomponent for the application, the maximum number of levels that are allowed in the hierarchy was exceeded.

Action

Review the application hierarchy. Add the application as a child of an application that is at a higher level in the hierarchy. Alternatively, add the application as a top-level application.

HWNDA0069E The department cannot be added because the number of levels in the group hierarchy exceeds the maximum of five levels.

Explanation

When you created a new subdepartment for the department, the maximum number of levels that are allowed in the hierarchy was exceeded.

Action

Review the department hierarchy. Add the department as a child of a department that is at a higher level in the hierarchy. Alternatively, add the department as a top-level department.

HWNDA0070W The File Systems: {0} were not added to the application {1} because they are NAS file systems.

Explanation

A NAS file system is not a supported type to add to an application. Only server file systems are supported.

Action

Add a supported type of file system to the application.

HWNDA0071E Member IDs and the tags were specified for the same operation.

Explanation

Both the member IDs and tags were specified for the same operation.

Action

Specify either member IDs or tags for an operation.

HWNDA0072E Member IDs should be specified in the input data for resources of type appgroup.

Explanation

Member IDs of the resources of type appgroup were not specified in the input data that is used to modify the applications.

Action

Specify valid member IDs.

HWNDA0073E A general group with the same name already exists.

Explanation

The specified general group name already exists and cannot be duplicated.

Action

Enter a unique name for the general group.

HWNDA0074E The general group cannot be added because the number of levels in the group hierarchy exceeds the maximum of five levels.

Explanation

When you added a new subcomponent for the general group, the maximum number of levels that are allowed in the hierarchy was exceeded.

Action

Review the general group hierarchy. Add the general group as a child of a group that is at a higher level in the hierarchy. Alternatively, add the general group as a top-level group.

HWNDA0075E A dashboard with the same name already exists.

Explanation

The specified dashboard name already exists and cannot be duplicated.

Action

Enter a unique name for the dashboard.

HWNDA0076E The dashboard group cannot be added because the number of levels in the group hierarchy exceeds the maximum of five levels.

Explanation

When you added a new subcomponent for the dashboard group, the maximum number of levels that are allowed in the hierarchy was exceeded.

Action

Review the dashboard group hierarchy. Add the dashboard group as a child of a group that is at a higher level in the hierarchy. Alternatively, add the dashboard group as a top-level group.

HWNDA0077E A policy group with the same name already exists.

Explanation

The specified policy group name already exists and cannot be duplicated.

Action

Enter a unique name for the policy group.

HWNDA0078I The *Name of the policy group* policy group was removed.

Explanation

This message is for informational purposes only.

Action

No further action is required.

HWNEM0001E The element manager management service failed to obtain a database connection.

Explanation

The element manager management service failed to obtain a database connection.

Action

Verify that the database is up and running. Check the Device Server logs for error messages that might help figure out what is going on. If such has not already been done, consider turning on the maximum level of tracing to aid in resolution of the issue. Should the problem persist, contact IBM support.

HWNEM0002E An error occurred while attempting to add element manager information to the database.

Explanation

A SQLException was thrown while attempting to insert element manager information into the database. The exception was caught. In response, the transaction was terminated and rolled back. Element manager information was not successfully added to the database.

Action

Verify that the database is up and running. Check the Device Server logs for error messages that might help figure out what is going on. If such has not already been done, consider turning on the maximum level of tracing to aid in resolution of the issue. Should the problem persist, contact IBM support.

HWNEM0003E An error occurred while attempting to update element manager information in the database.

Explanation

A SQLException was thrown while attempting to update element manager information in the database. The exception was caught. In response, the transaction was terminated and rolled back. Element manager information was not successfully updated in the database.

Action

Verify that the database is up and running. Check the Device Server logs for error messages that might help figure out what is going on. If such has not already been done, consider turning on the maximum level of tracing to aid in resolution of the issue. Should the problem persist, contact IBM support.

HWNEM0004E An error occurred while attempting to remove element manager information from the database.

Explanation

A SQLException was thrown while attempting to remove element manager information from the database. The exception was caught. In response, the transaction was terminated and rolled back. Element manager information was not successfully removed from the database.

Action

Verify that the database is up and running. Check the Device Server logs for error messages that might help figure out what is going on. If such has not already been done, consider turning on the maximum level of tracing to aid in resolution of the issue. Should the problem persist, contact IBM support.

HWNEM0005E An error occurred while attempting to obtain element manager information from the database.

Explanation

A SQLException was thrown while attempting to obtain element manager information from the database. The exception was caught. Element manager information was not successfully retrieved from the database.

Action

Verify that the database is up and running. Check the Device Server logs for error messages that might help figure out what is going on. If such has not already been done, consider turning on the maximum level of tracing to aid in resolution of the issue. Should the problem persist, contact IBM support.

Related reference

- [Getting support](#)

HWNEM0006E Failed to transmit request to Data Server to initiate SMI-S provider discovery job.

Explanation

An error occurred while attempting to kick off an SMI-S provider discovery job on the Data Server. The request was not successful. An SMI-S provider discovery job was neither scheduled nor initiated on the Data Server.

Action

Verify that the Data Server is up and running. Check the both the Data Server and Device Server log files for error messages that might help figure out what is going on. If such has not already done, consider turning on the maximum level of tracing to aid in resolution of the issue. Should the problem persist, contact IBM support.

Related reference

- [Getting support](#)

HWNEM0007E An error occurred while attempting to obtain Data Server information from the database.

Explanation

A SQLException was thrown while attempting to obtain Data Server information from the database. The exception was caught. Data Server information was not successfully retrieved from the database.

Action

Verify that the database is up and running. Check the Device Server logs for error messages that might help figure out what is going on. If such has not already been done, consider turning on the maximum level of tracing to aid in resolution of the issue. Should the problem persist, contact IBM support.

Related reference

- [Getting support](#)

HWNEM0008E Data Server information was not found in the database. SMI-S provider discovery could not be scheduled.

Explanation

An attempt was made to retrieve Data Server information from the database. However, no such information was found. Communication with the Data Server is required to schedule SMI-S provider discovery. Given that information about a Data Server was not available, SMI-S provider discovery was not initiated successfully.

Action

Data Server information is stored in T_RES_SERVER. Check that table for a row in which the value in the SERVER_TYPE column is set to 0. If no such row exists, restart the Data Server. Doing so should result in the creation of an appropriate entry in T_RES_SERVER. If, however, the problem persists, contact IBM support.

Related reference

- [Getting support](#)

HWNEM0009E An error occurred while attempting to obtain the SMI-S provider URL associated with an element manager from the database.

Explanation

An SQLException was thrown while attempting to obtain the service URL of the SMI-S provider associated with an element manager. The exception was caught. The SMI-S provider service URL was not successfully retrieved from the database.

Action

Verify that the database is up and running. Check the Device Server logs for error messages that might help figure out what is going on. If such has not already been done, consider turning on the maximum level of tracing to aid in resolution of the issue. Should the problem persist, contact IBM support.

Related reference

- [Getting support](#)

HWNEM0010E An error occurred while attempting to obtain element manager credentials from the database.

Explanation

An SQLException was thrown while attempting to obtain the set of credentials associated with an element manager. The exception was caught. The element manager credentials were not successfully retrieved from the database.

Action

Verify that the database is up and running. Check the Device Server logs for error messages that might help figure out what is going on. If such has not already been done, consider turning on the maximum level of tracing to aid in resolution of the issue. Should the problem persist, contact IBM support.

Related reference

- [Getting support](#)

HWNEM0011E An error occurred while attempting to remove element manager credentials from the database.

Explanation

An SQLException was thrown while attempting to remove element manager credentials from the database. The exception was caught. In response, the transaction was terminated and rolled back. The element manager credentials were not successfully removed from the database.

Action

Verify that the database is up and running. Check the Device Server logs for error messages that might help figure out what is going on. If such has not already been done, consider turning on the maximum level of tracing to aid in resolution of the issue. Should the problem persist, contact IBM support.

Related reference

HWNEM0012E An error occurred while attempting to store element manager credentials in the database.

Explanation

An SQLException was thrown while attempting to store element manager credentials in the database. The exception was caught. In response, the transaction was terminated and rolled back. The element manager credentials were not successfully stored in the database.

Action

Verify that the database is up and running. Check the Device Server logs for error messages that might help figure out what is going on. If such has not already been done, consider turning on the maximum level of tracing to aid in resolution of the issue. Should the problem persist, contact IBM support.

Related reference

- [Getting support](#)

HWNEM0013E Encountered element manager with malformed URL (URL).

Explanation

The URL associated with an element manager was invalid. Processing involving the element manager was not able to proceed.

Action

Look for the URL specified in the error message in the URL column of the T_RES_REGISTERED_EM table in the database. Attempt to update the URL so that it is no longer invalid. Should the problem persist, contact IBM support.

Related reference

- [Getting support](#)

HWNEM0014E Encountered element manager with URL containing hostname that could not be resolved by DNS (URL).

Explanation

The hostname associated with the element manager could not be resolved in DNS. Processing involving the element manager was not able to proceed.

Action

Verify that the hostname specified in the error message looks correct and that it can be pinged from the Device Server machine. If it cannot be reached from the Device Server machine, check the DNS configuration of the Device Server machine and its surrounding environment. Should everything look good, and the problem persist, contact IBM support.

HWNEM0018E Failed to send request to Data Server (*dataServerHost:dataServerPort*) .

Explanation

An error occurred while attempting to send a request to the Data Server.

Action

Verify that the Data Server is up and running. Check the both the Data Server and Device Server log files for error messages that might help figure out what is going on. If such has not already done, consider turning on the maximum level of tracing to aid in resolution of the issue. Should the problem persist, contact IBM support.

HWNEM0117E A problem occurred testing the connection to the element manager.

Explanation

Some unexpected error occurred when attempting to test the connection to the element manager.

Action

This is an internal error. Contact IBM support.

Related reference

- [Getting support](#)

HWNEM0118I Connection test to the element manager *element manager* passed.

Explanation

A connection test was successfully performed on the specified element manager with the displayed result.

Action

The connection test passed and no further action is required.

HWNEM0119E Connection test to the element manager *element manager* failed.

Explanation

A connection could not be established to the specified element manager.

Action

There could be a number of reasons for the failure, including, but not restricted to the element manager's machine being down, network problems or the element manager settings in IBM Spectrum Control.

HWNEM0120E IBM Spectrum Control is unable to communicate with the element manager, the problem could be the element manager is not running, a network communication error or user credentials stored in IBM Spectrum Control are incorrect.

Explanation

A token is required to be exchanged for launching the element manager. No valid token is available. This could be for a number of reasons such as: the element manager might not be running, the network connection might be broken or the element manager user credentials might be wrong.

Action

Verify that the element manager is running at the specified location and that the network connection is good. Check user credentials.

HWNEM0121I Connection test to the SMI-S provider *SMI-S provider* passed.

Explanation

A connection test was successfully performed on the specified SMI-S provider with the published result.

Action

The connection test passed no further action is required.

HWNEM0122I Connection test to the SMI-S provider *SMI-S provider* failed.

Explanation

A connection could not be established to the specified SMI-S provider.

Action

There could be a number of reasons for the failure, including, but not restricted to the SMI-S provider's machine being down, network problems or the SMI-S provider settings in IBM Spectrum Control.

HWNEM0123E Before executing the action the user must select an element manager from the table.

Explanation

The action requires an element manager to execute the action.

Action

Select an element manager from the table.

HWNEM0124E There is no SMI-S provider associated with the selected element manager.

Explanation

The action requires that an element manager has an associated SMI-S provider.

Action

No action necessary since the action is not relevant at this time.

HWNEM0125I The element manager is about to be removed. Once removed the element manager will not be accessible from IBM Spectrum Control. Do you wish to continue.

Explanation

Removes the reference to the element manager from the IBM Spectrum Control. Once the deletion is completed the element manager will not be accessible from IBM Spectrum Control. If access to the element manager is required in future then the element manager needs to be readded.

Action

Click cancel to take no further action and maintain access to the element manager. Click OK to proceed with the removal of the element manager.

HWNEM0126I The element manager is about to be removed. Once removed the element manager will not be accessible from IBM Spectrum Control. Do you wish to continue.

Explanation

Removes the reference to the element manager from the IBM Spectrum Control. Once the deletion is completed the element manager will not be accessible from IBM Spectrum Control. If access to the element manager is required in future, the element manager will need to be re-added.

Action

Click cancel to take no further action and maintain access to the element manager. Click OK to proceed with the removal of the element manager.

HWNEM0127E An internal processing error occurred while servicing the last request.

Explanation

- [Getting support](#)

HWNEM0131I The DS8000 SMI-S provider has been added successfully. IBM Spectrum Control has started the discovery job for the DS8000 storage subsystem managed by this SMI-S provider. To check the status of the jobs, go to the IBM Spectrum Control perspective and check the following navigation tree nodes: Administrative Services -> Discovery -> CIMOM

Explanation

The SMI-S provider connection was successfully added and the SMI-S provider discovery job was launched.

Action

No action necessary.

HWNEM0132I SMI-S provider connection was removed from element manager.

Explanation

The SMI-S provider connection was successfully removed.

Action

No action necessary.

HWNEM0133E Internal error occurred, the element manager info for launching the element manager could not be located in the IBM Spectrum Control DB.

Explanation

An unexpected error occurred because expected information was missing from the database.

Action

This is an internal error. Contact IBM support.

Related reference

- [Getting support](#)

HWNEM0134E The user session data is no longer available. To continue restart the IBM Spectrum Control GUI.

Explanation

Some unexpected error occurred that resulted in the required user information being lost.

Action

This is an internal error. Contact IBM support.

Related reference

- [Getting support](#)

HWNEM0135E Unable to contact the device server. It appears to be down.

Explanation

IBM Spectrum Control device server is down.

Action

Restart the device server.

HWNEM0136I The DS8000 Element Manager at *IP Address* has been added successfully.

Explanation

Successfully added the element manager.

Action

None.

HWNEM0137I *service.method* IBM Spectrum Control User *IBM Spectrum Control user* launched DS8000 Element Manager *IP Address* under the alias of *DS8000 user name*.

Explanation

Successfully launched the element manager.

Action

None.

HWNEM0138I The DS8000 SMI-S provider has been modified successfully. IBM Spectrum Control has started the discovery job for the DS8000 storage subsystem managed by this SMI-S provider. To check the status of the jobs, go to the IBM Spectrum Control perspective and check the following navigation tree nodes: Administrative Services -> Data Sources -> Discovery -> CIMOM

Explanation

SMI-S provider connection successfully modified and the SMI-S provider discovery job launched.

Action

No action necessary.

HWNEM0139I The DS8000 SMI-S provider has been modified successfully.

Explanation

SMI-S provider connection successfully modified.

Action

No action necessary.

HWNEM0140W The element manager GUI cannot be accessed because no username and password have been specified by the currently logged-in IBM Spectrum Control user. Element manager credentials are managed on a per-IBM Spectrum Control user basis. The element manager GUI will appear after you provide the correct username and password information.

Explanation

SMI-S provider discovery does not provide the element manager username and password. The message will be displayed if the user attempts to launch the element manager GUI after SMI-S provider discovery without manually updating the element manager's user credentials.

Action

Dismiss the popup dialog. The edit element manager dialog appears. Complete the user name and password fields. On successful update of the fields the element manager is automatically launched.

HWNEM0141E The length of the SMI-S provider's text description is too long. The description should be 255 characters or less.

Explanation

The description length is limited to 255 characters.

Action

Re-enter the text description in 255 or less characters

HWNEM0142E An element manager named *manager.name* already exists.

Explanation

The name of an element manager must be unique across the element managers defined in IBM Spectrum Control. The user has attempted to name an element manager with a name that has already been used.

Action

Choose a new name for the element manager.

HWNEM0143E The DS8000 Element Manager Console is only accessible from IBM Spectrum Control. To access it, open IBM Spectrum Control and switch to the DS8000 Element Manager perspective.

Explanation

The user has attempted to access the DMC perspective panels from an external browser session external to IBM Spectrum Control. The panel is only accessible from within IBM Spectrum Control.

Action

HWNFS - File system monitor messages

- [HWNFS0001E The file system monitor tool does not recognize the command: command.](#)
- [HWNFS0002E The file system monitor tool is unable to read its property file.](#)
- [HWNFS0003W The FileSystems property value property_value has an invalid format.](#)
- [HWNFS0004E The file system monitor tool was unable to initialize access to the IBM Spectrum Control database repository.](#)
- [HWNFS0005E The probe of device_name ended with the error_code error code.](#)
- [HWNFS0006E The FileSystems property is missing in the fsmon.properties file.](#)
- [HWNFS0007E Data cannot be retrieved from the database repository.](#)
- [HWNFS0008E Data about IBM SONAS devices or file systems cannot be retrieved from the database repository.](#)
- [HWNFS0009W Capacity data cannot be collected for the file_system file system.](#)
- [HWNFS0010W No matching file system found in the database repository for file_system.](#)

HWNFS0001E The file system monitor tool does not recognize the command: *command*.

Explanation

The specified command is not supported by the file system monitor tool.

Action

The list of supported commands is displayed with the following command: fsmon help.

HWNFS0002E The file system monitor tool is unable to read its property file.

Explanation

The file system monitor tool encountered an error when trying to read the property file fsmon.properties.

Action

The property file fsmon.properties must exist in the configuration directory of the Device server with appropriate access permissions and it must contain the FileSystems property.

HWNFS0003W The FileSystems property value *property_value* has an invalid format.

Explanation

The FileSystems property value includes a file system specification that cannot be parsed. The file system specification is skipped.

Action

Specify a list of file systems using the correct format. The format for the FileSystems property value is the following:
FileSystems=Device1:FileSystems1,Device2,FileSystem1,...

HWNFS0004E The file system monitor tool was unable to initialize access to the IBM Spectrum Control database repository.

Explanation

The file system monitor tool is unable to retrieve the list of IBM SONAS file systems to monitor from the database repository.

Action

Verify that the database connection property file, tsnmdbparms.properties, exists in the configuration directory for the Device server and that the database repository is running and available.

HWNFS0005E The probe of *device_name* ended with the *error_code* error code.

Explanation

The probe schedule for collecting capacity data about file systems from a IBM SONAS device did not complete.

Action

Verify that the IBM SONAS device can be reached from the Device server using an SSH client. If unable to resolve the problem, contact IBM Software Support.

Related reference

- [Getting support](#)

HWNFS0006E The *FileSystems* property is missing in the *fsmon.properties* file.

Explanation

The file system monitor tool requires the *FileSystems* property to determine which file systems to monitor.

Action

Add the *FileSystems* property to the *fsmon.properties* property file located in the configuration directory for the Device server. If you add the *FileSystems* property but do not define a value for it, all the file systems from all IBM SONAS devices are monitored.

HWNFS0007E Data cannot be retrieved from the database repository.

Explanation

The file system monitor was unable to retrieve file system information from the database repository.

Action

Verify that the IBM Spectrum Control database repository is running and available. If unable to resolve the problem, contact IBM Software Support.

Related reference

- [Getting support](#)

HWNFS0008E Data about IBM SONAS devices or file systems cannot be retrieved from the database repository.

Explanation

There is no data available for IBM SONAS devices or file systems in the database repository.

Action

The file system monitor tool requires that a IBM SONAS device be added to IBM Spectrum Control and probed by a data collection schedule. See the Information Center for information about how to add devices for monitoring and run probes to collect data about those devices.

HWNFS0009W Capacity data cannot be collected for the *file_system* file system.

Explanation

The IBM SONAS device did not report any data for the specified file system. This occurs when the file system is deleted from the IBM SONAS device and that device was not probed after the deletion.

Action

Use the IBM SONAS CLI command lsfs to verify that the file system still exists on the IBM SONAS device.

HWNFS0010W No matching file system found in the database repository for *file_system*.

Explanation

The FileSystems property in the fsmon.properties file specifies a file system that is not found in the IBM Spectrum Control database repository.

Action

Update the FileSystems property in the fsmon.properties file to specify file systems that exist in the database repository. The fsmon.properties file is located in the configuration directory for the Device server.

HWNLM0700E Storage pool recommendations cannot be given because a storage subsystem is not selected as input.

Explanation

In order to recommend storage pools, a storage subsystem must first be selected as input.

Action

Select a storage subsystem and try again.

HWNLM0701E The selected planner cannot occur because a storage subsystem is not selected as input.

Explanation

In order to continue, a storage subsystem must first be selected as input.

Action

Select a storage subsystem and try again.

HWNLM0702E The selected planner cannot occur because a computer is not selected as input.

Explanation

In order to continue, a computer must first be selected as input.

Action

Select a computer and try again.

HWNLM0703E The selected planner(s) cannot occur because a computer and/or volume is not selected as input.

Explanation

In order to continue, a computer and/or storage volume must first be selected as input.

Action

Select a computer and/or storage volume and try again.

HWNLM0704E The selected planner cannot occur because a volume is not selected as input.

Explanation

In order to continue, a storage volume must first be selected as input.

Action

Select a storage volume and try again.

HWNLM0705E Storage pool recommendation can not be done because there is already a storage volume selected as input.

Explanation

In order to recommend storage pools, a storage volume must not be selected as input.

Action

Unselect the storage volume as input and try again.

HWNLM0706E The selected planner cannot occur because there is already a volume selected as input.

Explanation

In order to continue, a storage volume must not be selected as input.

Action

Unselect the storage volume as input and try again.

HWNLM0707E The selected planner(s) cannot occur because a subsystem or computer is not selected as input.

Explanation

In order to continue, a computer and/or storage subsystem must first be selected as input.

Action

Select a computer and/or storage subsystem and try again.

HWNLMO708E The total required space (*total space* MB) exceeds the total available space (*total space* MB) considering all planner inputs. This could be due to insufficient space in the selected storage subsystem's controller(s) or pool(s), or the selected RAID level does not have enough free space or in case of SVC there is insufficient IO group memory configuration.

Explanation

Based on the Planner input, there is not enough free space for the request.

Action

Either reduce the required space or select another storage subsystem or pool with enough free space. It is also possible that there were not enough volumes available in the LSS(es) of the ESS subsystem(s) selected. If this is the case, then ensure that there are enough volumes available in the ESS subsystem LSS(es) to accommodate the request.

HWNLMO709E The storage cannot be assigned to the specified hosts due to insufficient LUN addresses.

Explanation

The number of LUN addresses on the host is at its maximum.

Action

Select another host to assign the storage to and try again.

HWNLMO710E The specified total size to be allocated (*total space* MB) is invalid. It must be positive and an integral multiple of 100.

Explanation

The total size specified is an invalid number.

Action

Correct the total size value and try again.

HWNLMO711E The specified minimum volume size (*minimum size* MB) is invalid. It must be positive and an integral multiple of 100.

Explanation

The minimum volume size specified is an invalid number.

Action

Correct the minimum size value and try again.

HWNLMO712E The specified maximum volume size (*maximum size* MB) is invalid. It must be positive and an integral multiple of 100.

Explanation

The maximum volume size specified is an invalid number.

Action

Correct the maximum size value and try again.

HWNLMO713E The total capacity requested cannot be obtained. The allowed minimum size is {0} GB and the allowed maximum size is {1} GB for the given subsystem(s). The total size is {2} GB.

Explanation

The specified total size is invalid for the given storage subsystem(s).

Action

Correct the invalid volume size for the given subsystem(s).

HWNLMO714E Host *Host* does not have multipath support because it only has one Fibre Channel port.

Explanation

In order for the host to have multipath support, there needs to be at least two Fibre Channel ports on the host.

Action

Select a host capable of multipath support and try again.

HWNLMO715E There are no common fabrics that have the minimum number of required paths between the selected servers and the managed storage systems.

Explanation

In order for the SAN Planner action to proceed, there needs to be at least one common fabric between the hosts and storage subsystems. If multipath planning is specified, at least two data paths between each host and storage subsystem is required. For virtual disks, an I/O group requires two nodes to be connected to a common fabric. If only one node of the I/O group has a working connection to the fabric, then the I/O group cannot be used for path planning.

Action

Select one or more hosts and storage subsystems within the same fabric, then try the SAN Planner action again. For virtual disks, check the status of the connectivity of the nodes of the I/O groups on the SVC. Ensure both nodes of each I/O group have a working connection to the same fabrics as the selected hosts, then probe the SVC and fabrics again. Once the probes complete, try the SAN Planner action again.

HWNLMO716E There needs to be at least two common fabrics between host *Host* and storage subsystem *Subsystem* in order to use the redundant fabric option.

Explanation

In order to use the redundant fabric option, there needs to be at least two common fabrics between the host and storage subsystem. For virtual disks, an I/O group requires two nodes to be connected to at least two common fabrics. If only one node of the I/O group has a working connection to the fabric, then the I/O group cannot be used for path planning.

Action

Either clear the redundant fabric option or select a host and storage subsystem that have two fabrics common between them and try again. For virtual disks, check the status of the connectivity of the nodes of the I/O groups on the SVC. Ensure both nodes of each I/O group have a working connection to at least two common fabric(s) as the selected host(s) and then reprobe the SVC and the fabric(s). Once the probes complete, try again.

HWNLM0718E The number of paths specified was *Paths*, but the redundant fabric option requires the number of paths to be an even number of paths.

Explanation

The redundant fabric option requires the number of paths to be an even number of paths.

Action

Alter the number of paths so that the number of paths is even or clear the redundant fabric option. Once the alteration has been completed, the plan can be submitted again.

HWNLM0719E Host *host* does not have a Host Bus Adapter (HBA) installed. Please select a host with a HBA installed and try again.

Explanation

The Path Planner requires Fibre Channel connectivity between the host and the storage subsystem. Without a Host Bus Adapter installed this connectivity cannot be made and storage subsystem volumes cannot be assigned to the host.

Action

Select another host or install a Host Bus Adapter on this host and try again.

HWNLM0720E The Plan failed to generate due to storage subsystem *Subsystem* not having any volumes identified for Planning use. Please select another storage subsystem and try again.

Explanation

Host volume assignment requires at least one volume to be identified for use by the SAN Planner.

Action

Modify the planner input and try again.

HWNLM0721E A supported multipath driver is not installed on host *Host*.

Explanation

The selected host does not have a supported multipath driver installed. Currently, the only supported multipath driver is IBM SDD.

Action

Select a host with a supported multipath driver and try again.

HWNLM0722E There is an insufficient number of Fibre Channel paths between host *Host* and storage subsystem *Subsystem*. Requested *Paths*

paths were requested but there are only *Possible Paths* paths available.

Explanation

The number of Fibre Channel paths available is less than the user requested number of paths.

Action

Either add more Fibre Channel paths or decrease the number of required paths and try again.

HWNLM0723E The number of paths specified was *Paths*, but the redundant fabric option requires the minimum number of paths for virtual disks to be four paths or more.

Explanation

The redundant fabric option requires the minimum number of paths for virtual disks to be four paths or more.

Action

Alter the number of paths for virtual disks so that the number of paths is even and equal or greater than four paths or uncheck the redundant fabric option. Once the alteration has been completed, the plan can be submitted again.

HWNLM0724E The number of zones in fabric *fabric* will be *number of zones*. This is larger than the *max zones* maximum number of zones specified.

Explanation

If this Planner action would continue, the resulting number of zones would exceed the user specified maximum number of zones.

Action

Either increase the maximum number of zones or change the Planner inputs and try again.

HWNLM0725E Storage pool data does not exist for storage subsystem *subsystem*. This is either due to not running a storage subsystem probe or not having any fixed block formatted storage pools on the subsystem.

Explanation

In order for the Volume Planner to continue, it requires the selected storage subsystem to have a valid storage pool.

Action

First verify the storage subsystem has been probed. If it has been probed, verify the storage subsystem's storage pools are fixed block formatted and not CKD formatted.

HWNLM0726E Performance data does not exist for input storage subsystem(s) for the given date range. Either run an IBM Spectrum Control Performance Monitor against the given storage subsystem(s) or under the Capacity Planner, select the 'Space Only' Workload Profile option.

Explanation

The Capacity Planner requires performance data in order to determine what the best plan of action will be for the selected storage subsystem and Planner options. Without performance data, you can still proceed by selecting the 'Space Only' Workload Profile option. With this option selected, the Capacity Planner will make all decisions based solely on the storage capacity levels. For SVC storage subsystem, it is required that the performance data is collected for all the back-end storage subsystems of the SVC as well as the performance data collected for the SVC itself.

Action

Either run an IBM Spectrum Control Performance Monitor against this storage subsystem or select the 'Space Only' Workload Profile option under the Capacity Planner and try again.

HWNLM0728E An unexpected internal error occurred. Please contact IBM customer technical support.

Explanation

The SAN Planner job failed due to an unexpected error.

Action

Contact IBM customer technical support with all related errors.

Related reference

- [Getting support](#)

HWNLM0729E The resulting SAN Planner actions include creating a zoneset on McData fabric *fabric WWN*. Since there is already an active zone set, please select the 'Use active zone set' option under the Zone Planner and try again.

Explanation

Since IBM Spectrum Control 3.3 supports only inband fabric agents for McData, there is a current limitation that only one zoneset can be defined for the fabric. An existing zone set must be deleted before a new one can be created, otherwise newly created zone set will replace the current active zone set.

Action

Select the 'Use active zone set' option under the zone planner and try again, so SAN Planner will add the recommended zone(s) into current active zone set.

HWNLM0730E SDD version 1.6.2.3 installed on HP host *host* is not supported by IBM Spectrum Control.

Explanation

HP SDD version 1.6.2.3 has a problem which will cause the SAN Planner action to fail.

Action

A problem with the SDD 'cfgvpath -r' command causes a failure. This is specific to SDD version 1.6.2.3 on HP-UX only. Please upgrade to a different SDD version and try again.

HWNLM0731E The computer probe for computer *host* was incomplete. Please attempt another computer probe and try again.

Explanation

The SAN Planners were unable to obtain multipath driver information obtained from a computer probe.

Action

An unknown problem caused the computer probe to be incomplete. Check the computer probe's job log to determine the problem and try again.

HWNLM0732E DM-Multipath installed on Linux host *host* does not support the selected Multipath mode.

Explanation

The selected host has DM-Multipath installed which only supports the round-robin mode.

Action

DM-Multipath only supports the round-robin mode. Please select this multipath option.

HWNLM0734E The total required IO Group mirroring memory (*total memory* KB) for vdisk mirroring creation exceeds total available mirroring memory (*total memory* KB) available.

Explanation

Based on the Planner input, there is not enough free IO Group mirroring memory for the request.

Action

Either reduce the required space or select another IBM SAN Volume Controller with enough free IO Group mirroring memory.

HWNLM0735E Could not find any subsystem for planning. It is possible that the given subsystems are not detectable.

Explanation

Based on the Planner input, the subsystems provide are not detectable in IBM Spectrum Control, possibly in missing state, hence planner can not use them.

Action

Run the probe again and check the status of the subsystem in IBM Spectrum Control.

HWNLM0736E The primary, secondary or tertiary storage subsystem *subsystem* that you specified is not registered with the IBM Spectrum Control-R server.

Explanation

The storage subsystem that you specified as a primary, secondary or tertiary candidate is not registered with the IBM Spectrum Control for Replication server. Depending on the replication session type that you specified, there must be at least one primary, one secondary, and and one tertiary storage subsystem registered with the IBM Spectrum Control for Replication server to generate a recommendation.

Action

Depending on the replication session type that you specified, ensure that the primary, secondary and tertiary storage subsystem candidates exist and then register the primary, secondary and tertiary storage subsystem with the IBM Spectrum Control for Replication server. After the storage subsystems have been added, refresh the IBM Spectrum Control for Replication configuration.

HWNLM0737E Storage Subsystem *subsystem* is not a supported type for replication operations.

Explanation

Storage Subsystem(s) are not supported for replication operations.

Action

Check the types of supported subsystems for replication operation.

HWNL0738E Replication session with a combination of virtualized and non-virtualized storage volumes in not supported.

Explanation

Input contains a mix of virtualized and non-virtualized storage volumes. Replication session with a combination of virtualized and non-virtualized storage volumes in not supported.

Action

Avoid mixing virtualized and non-virtualized storage volumes in one replication session.

HWNL0739E Replication session type *session* is not allowed for the supplied subsystem *subsystem* of type *subsystemtype*.

Explanation

Planner input contains type of subsystems that does not support specified replication session type.

Action

Planner input contains type of subsystems that does not support specified replication session type.

HWNL0740E Limit reached : Number of copy pairs for Replication session type *session* for the supplied subsystem *subsystem*.

Explanation

Limit reached for number of copy pairs of particular session type of supplied storage subsystem.

Action

Limit reached for number of copy pairs of particular session type of supplied storage subsystem.

HWNL0741E Replication session type *session* is not supported.

Explanation

Input replication session type is not supported.

Action

Input replication session type is not supported.

HWNL0742E Format of LSS Property File *filepath* is invalid.

Explanation

Format of LSS Property File is invalid.

Action

Format of LSS Property File is invalid.

HWNLM0743E Namespace in specified LSS is not available.

Explanation

Namespace in specified LSS is not available. Check the LSS Property File.

Action

Namespace in specified LSS is not available. Check the LSS Property File.

HWNLM0744E Unable to find suitable placement for replication storage volumes. *plannermsg*

Explanation

Unable to find suitable placement for replication storage volumes. Readjust input requirements and(or) candidate entities. This may happen because of various reasons like: There was no subsystem provided for secondary/tertiary volumes, or The target subsystem is not eligible for planning based on the input provided in the planner (for example Thin Provisioning, Solid State Drives etc), or No eligible pools were found on the target subsystem, or The subsystem is not added to IBM Spectrum Control for Replication, or In case of San Volume Controller, there is no connectivity established between the source and the target subsystems, or The input contains a number of SAN Volume Controller subsystems and some of which have connectivity established, but some of them do not have the connectivity established between themselves, etc.

Action

Unable to find suitable placement for replication storage volumes. Readjust input requirements and(or) candidate entities.

HWNLM0745E Secondary SRG *secsrg* is either empty or does not contain any valid elements for replication related resource provisioning.

Explanation

Secondary SRG is either empty or does not contain any valid elements for replication related resource provisioning.

Action

Check secondary SRG contents to validate the requirements.

HWNLM0746E Tertiary SRG *tersrg* is either empty or does not contain any valid elements for replication related resource provisioning.

Explanation

Tertiary SRG is either empty or does not contain any valid elements for replication related resource provisioning.

Action

Check tertiary SRG contents to validate the requirements.

HWNLM0747I Please ensure that proper Replication license and device feature codes are enabled, otherwise the plan execution will fail.

Explanation

The SAN Planner does not check for license on IBM Spectrum Control for Replication and the feature codes on the storage subsystems. Please ensure that proper Replication license and device feature codes are enabled, otherwise the plan execution will fail.

Action

The SAN Planner does not check for license on IBM Spectrum Control for Replication and the feature codes on the storage subsystems. Please ensure that proper Replication license and device feature codes are enabled, otherwise the plan execution will fail.

HWNLMO748E Replication Manager is not installed.

Explanation

Replication Manager is not installed.

Action

Install Replication Manager.

HWNLMO749E Replication Planner Internal Error.

Explanation

Replication Planner Internal Error. Unable to retrieve information from Replication Manager.

Action

Replication Planner Internal Error. Unable to retrieve information from Replication Manager.

HWNLMO750E Replication session with the specified name (*sesname*) already exists. Please use a different name.

Explanation

Replication session with the specified name already exists. Please use a different name.

Action

Replication session with the specified name already exists. Please use a different name.

HWNLMO751E No storage system resource can satisfy the provisioning requirements.

Explanation

No storage system resource can satisfy the requested storage capacity and the requirements of the service class.

Action

Try again, specifying different requirements. If you are provisioning from a capacity pool, consider adding storage systems to the capacity pool, selecting a different capacity pool, or allowing provisioning from any capacity pool or any available storage. Consider selecting a different service class.

HWNLMO752E The subsystem(s) provided in the input do not satisfy the given Thin Provisioning criteria.

Explanation

The given subsystem(s) do not support Thin Provisioning or the given Thin Provisioning method.

Action

Try again with different subsystem(s) or with changed input parameters. The SAN Planner log may provide more information.

HWNLM0753E The subsystem(s) provided in the input do not allow provisioning on volumes or no subsystems were selected.

Explanation

The selection to provision volumes will not work against selected the subsystem(s) because the selected subsystem(s) do not allow the provisioning of volumes or there were no subsystem(s) selected in the plan.

Action

Either change the provisioning request to virtual disks or add subsystem(s) that allow volume provisioning.

HWNLM0754E The subsystem(s) provided in the input do not allow provisioning on virtual disks or no subsystems were selected.

Explanation

The selection to provision virtual disks will not work against selected the subsystem(s) because the selected subsystem(s) do not allow the provisioning of virtual disks or there were no subsystem(s) selected in the plan.

Action

Either change the provisioning request to volumes or add subsystem(s) that allow virtual disk provisioning.

HWNLM0755E The selected virtual disk(s) cannot be added in a plan for volumes.

Explanation

The selection to plan for volumes will not work against the selected virtual disk(s).

Action

Either remove the selected virtual disk(s) or remove the selected volume(s) and submit the plan for virtual disks.

HWNLM0756E The selected volume(s) cannot be added in a plan for virtual disks.

Explanation

The selection to plan for virtual disks will not work against the selected volume(s).

Action

Either remove the selected volume(s) or remove the selected virtual disk(s) and submit the plan for volumes.

HWNLM0757I The volume size has been slightly adjusted to meet subsystem requirement.

Explanation

The subsystem allows creation of volumes in multiples of a specific number, which varies for different subsystems. The individual volume size is therefore adjusted by the SAN Planner for the given subsystem(s).

Action

HWNLM0758I If a FlashCopy source has multiple targets, an IncrementalFlashCopy relationship can be established with one and only one target.

Explanation

An incremental flashCopy relationship can be established with one and only one target.

Action

HWNLM0759I IncrementalFlashCopy is not available with FlashCopy SE.

Explanation

Action

HWNLM0760W Input Volume is already in source role for 12 Flash Copy Sessions, ID = *volumeID*, Volume Name = *volumeName*.

Explanation

Action

HWNLM0761W Input Volume is already in a target role of Flash Copy Session(s), ID = *volumeID*, Volume Name = *volumeName*.

Explanation

Action

HWNLM0762W Input Volume is already in a target role of Continuous Copy Session(s), ID = *volumeID*, Volume Name = *volumeName*.

Explanation

Action

HWNLM0763W Input Volume is already in a target role of Flash Copy Session(s).

Explanation

Action

HWNLMO764I Ensure connectivity between source and target (direct or through fabric).

Explanation

Action

HWNLMO765W For TSE volumes, please ensure that the Repository Capacity is configured and available on the pool *poolName*.

Explanation

Action

HWNLMO766W The storage subsystem *ssName* is unacceptable due to -- *reason*.

Explanation

Action

HWNLMO767I The storage subsystem *ssName* is a valid candidate subsystem, thus it is considered during planning.

Explanation

Action

HWNLMO768W The storage pool *poolName* is unacceptable due to -- *reason*.

Explanation

Action

HWNLMO769I The storage pool *poolName* is a valid candidate storage pool, thus it is considered during planning.

Explanation

Action

HWNLMO770W The SVC *ssName* is unacceptable due to -- *reason*.

Explanation

Action

HWNLM0771I The SVC *ssName* is a valid candidate subsystem, thus it is considered during planning.

Explanation

Action

HWNLM0772W The mdiskgroup *mdiskGroupName* is unacceptable due to -
- *reason*.

Explanation

Action

HWNLM0773I The mdiskgroup *mdiskGroupName* is a valid candidate mdiskgroup, thus it is considered during planning.

Explanation

Action

HWNLM0774W The iogroup *ioGroupName* is unacceptable due to --
reason.

Explanation

Action

HWNLM0775I The iogroup *ioGroupName* is a valid candidate iogroup, thus it is considered during planning.

Explanation

Action

HWNLM0776E Unable to plan for *volumeName* due to reaching the maximum limit of volumes on the LSS(es) within storage pool *storagePool* on storage subsystem *subsystem*.

Explanation

The maximum number of volumes on each LSS within a storage pool is 256. The plan recommendation found that of the eligible storage pools, there are no longer LSS(es) available to create a storage volume on the storage subsystem since creating a volume on such a storage pool will result in exceeding the maximum number of volumes on

the LSS(es) within the storage pool.

Action

Either change the provisioning request to select storage pool(s) where the LSS(es) have not reached the maximum number of volumes or select storage subsystem(s) where the maximum number volumes on the LSS(es) within the storage pools has yet to be reached. Also note that the LSS range for the volume role may be changed in the LSSRange.properties file located in the device/conf directory where the product was installed. Increasing the range may help depending on the type of DS8000 storage volume being created.

HWNLM0777E Replication session with the specified name (*sesname*) associated with SRG (*srgname*) has required replication and does not require extension.

Explanation

SRG and associated session has required replication. It does not require extension.

Action

SRG and associated session has required replication. It does not require extension.

HWNLM0778I The volume/vdisk name may be different during plan execution based on the name availability and/or subsystem limitation.

Explanation

SAN Planner gives the volume name recommendation, but it is possible that at the time of execution of the plan, the volume name was already taken or the subsystem does not allow user specific names, so the resulting volume name will be different.

Action

HWNLM0779E Unable to recommend plan due to reaching the maximum limit of volumes on the LSS(es) within storage pool(s) *storagePool* on storage subsystem(s) *subsystem*.

Explanation

The maximum number of volumes on each LSS within a storage pool is 256. The plan recommendation found that of the eligible storage pools, there are no longer LSS(es) available to create a storage volume on the storage subsystem since creating a volume on such a storage pool will result in exceeding the maximum number of volumes on the LSS(es) within the storage pool.

Action

Either change the provisioning request to select storage pool(s) where the LSS(es) have not reached the maximum number of volumes or select storage subsystem(s) where the maximum number volumes on the LSS(es) within the storage pools has yet to be reached.

HWNLM0780E Unable to recommend plan since the LSS range specified in the LSSRange.properties file is not valid for *volumeName* on storage subsystem *subsystem*.

Explanation

The LSSRange.properties file is required to process storage volumes on DS8000. This file is located under the device/conf directory where the product is installed and identifies the LSS range for each type of volume that is to be created by the plan. The plan encountered an error accessing this file.

Action

Ensure the LSSRange.properties file exists and the entries inside the file are in the proper format for the DS8000 volumes to be created. The range of eligible LSS(es) is in the format of 0Xnn-0Xmm where nn and mm represent the hexadecimal digit of the LSS lower and upper boundaries. The lower bound nn must be less than or equal to the upper bound mm. A full explanation of valid entries exist within the LSSRange.properties file.

HWNLMO781E No cluster partnership exists between source subsystem *srcSS* and target subsystem *targetSS*.

Explanation

No cluster partnership exists between source subsystem and target subsystem.

Action

HWNLMO782E No connectivity path exists between source subsystem *srcSS* and target subsystem *targetSS*.

Explanation

No connectivity path exists between source subsystem and target subsystem.

Action

HWNLMO783E The selected input volume *volumeName* is missing from the storage subsystem.

Explanation

The selected input volume is missing from the storage subsystem and is required to complete the requested plan. The volume may have been deleted from the storage subsystem or the volume may have not been discovered after a scheduled storage subsystem probe.

Action

Remove the selected input volume from the plan or choose to ignore the selected input volume so that it is not considered in the plan recommendation. If the selected input volume exists in a storage resource group, remove the volume from the storage resource group or choose to ignore the selected input volume in the storage resource group.

HWNLMO784E The selected input virtual disk *virtualDiskName* is missing from the SVC.

Explanation

The selected input virtual disk is missing from the SVC and is required to complete the requested plan. The virtual disk may have been deleted from the SVC or the virtual disk may have not been discovered after a scheduled SVC probe.

Action

Remove the selected input virtual disk from the plan or choose to ignore the selected input virtual disk so that it is not considered in the plan recommendation. If the selected input virtual disk exists in a storage resource group, remove the virtual disk from the storage resource group or choose to ignore the selected input virtual disk in the storage resource group.

HWNLMO785E Provisioning with replication can not be achieved with Extent Space Efficient(ESE) or Track Space Efficient(TSE) volumes. Extent Space Efficient volumes are not allowed in copy sets and Track Space Efficient volumes are valid only in the target role of

a FlashCopy session or the Journal role of a Global Mirror or Metro Global Mirror session.

Explanation

Extent Space Efficient volumes are not allowed in copy sets, Track Space Efficient volumes are valid only in the target role of a FlashCopy session or the Journal role of a Global Mirror or Metro Global Mirror session.

Action

Please use standard volumes or use a thin provisioning profile which meets this limitation.

HWNLMO786E Replication can not be extended to Extent Space Efficient(ESE) or Track Space Efficient(TSE) source volumes. Extent Space Efficient volumes are not allowed in copy sets and Track Space Efficient volumes are valid only in the target role of a FlashCopy session or the Journal role of a Global Mirror or Metro Global Mirror session. One or more selected input volumes are either ESE or TSE : *volumes*.

Explanation

Extent Space Efficient volumes are not allowed in copy sets, Track Space Efficient volumes are valid only in the target role of a FlashCopy session or the Journal role of a Global Mirror or Metro Global Mirror session.

Action

Please use standard volumes or use thin provisioned volumes that meets this limitation.

HWNLMO787E vDisk Mirroring is already enabled for the input vdisk *volumes*.

Explanation

vDisk mirroring is already enabled for the input vDisk.

Action

vDisk mirroring is already enabled for the input vDisk.

HWNLMO788I Fabric selection is based on planner selection of the host port(s) and the subsystem port(s) and not by the fabric(s) selected by the user.

Explanation

SAN Planner will ignore the fabrics selected by the user and select the fabric(s) based on the port(s) that are selected when SAN planner finds the best single or multiple paths from the host port(s) to the subsystem port(s). The zone changes for the fabric(s) are then based on the fabric(s) of the ports that have been selected by the SAN Planner.

Action

HWNLMO789E The IO group *IO Group* for virtual disk *virtual disk* does not have appropriate connectivity to the host(s) selected in the plan.

Explanation

The IO group that connects the virtual disk to the fabric does not have enough fabrics or enough paths to satisfy the request to assign the virtual disks to the host(s) specified in the plan.

Action

If redundant fabrics have not been selected, reduce the number of paths to at least two paths or ensure the IO group nodes have connectivity to the same fabric as the host(s). If redundant fabrics have been selected, reduce the number of paths to at least four paths or ensure the specified IO group has two nodes connected to different fabrics shared by the host(s).

HWNLMO790E Not considering Subsystem(s): *Subsystem* because not all of its back-end subsystems are configured into this IBM Spectrum Control or some are currently undetectable. This is unacceptable when an input RAID level is specified or a workload profile other than space-only is selected.

Explanation

Not considering the current subsystem(s) because not all of its back-end subsystems are configured into this IBM Spectrum Control or some are currently undetectable. This is unacceptable when an input RAID level is specified or a workload profile other than space-only is selected.

Action

HWNLMO791E The input volume you specified is already defined as a snapshot copy volume of a snapshot copy session, volume ID = *volume_id*, volume name = *volume_name*.

Explanation

A volume cannot be the source volume of a replication session if it is already defined as a snapshot copy volume.

Action

Select a different volume to use as the source volume.

HWNLMO792E The input volume you specified cannot be defined as a source volume in a replication session, ID = *volume_id*, volume name = *volume_name*.

Explanation

A volume cannot be the source volume of a replication session if it is already defined as a snapshot copy volume or if it is not defined to the Replication Manager.

Action

Select a different volume to use as the source volume.

HWNLMO793I Replication Manager is used to manage snapshot copy sessions.

Explanation

The Planner recommends the source volumes for the snapshot copy session, but it does not control the creation of snapshots. Management of snapshot copies is performed using Replication Manager.

Action

Use Replication Manager to manage snapshot copy sessions.

HWNLMO794E The total space requirement (*total space* MB) cannot be met within a single storage pool for the replication session. This could be due to insufficient space in the selected storage subsystem's pool(s), or because the storage subsystem's pool(s) do not meet the requirements of the Planner input.

Explanation

Based on the Planner input, there is not enough space in a single storage pool for the replication session request.

Action

Either reduce the required space or select another storage subsystem or pool with enough free space to meet the requirements of the Planner input.

HWNLMO796E The input volumes you specified must be within a single storage pool for the replication session.

Explanation

The input volumes for a replication session must reside within the same storage pool to generate a valid replication session.

Action

Create a plan for a replication session that will only specify volumes within the same storage pool.

HWNLMO797E Volumes could not be created or used in the source pool of the existing snapshot copy session.

Explanation

The required volumes could not be created or used in the source pool of the existing snapshot copy session.

Action

Create a plan for an existing snapshot copy session that will satisfy the request in the source pool of the existing snapshot copy session.

HWNLMO798E The total space requirement (*total space* MB) cannot be met within the storage pool of the existing replication session. This could be due to insufficient space in the storage pool of the existing replication session, or because the input volumes you specified are not within the storage pool of the existing replication session.

Explanation

Based on the Planner input, there is not enough space in the storage pool of the existing replication session or the input volumes specified are not within the storage pool of the existing replication session.

Action

Create a plan for a replication session that will only specify volumes with the same storage pool as the existing replication session or reduce the required space.

HWNLM0799E The input volumes you specified are already defined in an existing snapshot copy session.

Explanation

The input volumes for a snapshot copy session must not already be defined in an existing snapshot copy session.

Action

Create a plan for a snapshot copy session that will specify volumes not already defined in an existing snapshot copy session.

HWNLM0800W The input volume you specified is already defined as a snapshot copy volume of a snapshot copy session, volume ID = *volume_id*, volume name = *volume_name*.

Explanation

The input volume for a continuous copy session are already defined as a snapshot copy volume of a snapshot copy session.

Action

Select a different volume to use as the source volume.

HWNLM0801E The input volumes you specified are not within the storage pool of the existing replication session.

Explanation

The input volumes specified are not within the storage pool of the existing replication session.

Action

Create a plan for a replication session that will only specify volumes with the same storage pool as the existing replication session.

HWNLM0802E For a Metro Global Mirror session, you must specify at least three DS8000 subsystems with sufficient capacity.

Explanation

Based on the Planner input, there are not enough DS8000 subsystems with sufficient capacity to create all source and target volumes required for Metro Global Mirror.

Action

Select at least three DS8000 subsystems with sufficient capacity.

HWNLM0803E The selected input volume *volume_name* is already in a copy set used by this copy session.

Explanation

An input volume is already in use by a copy set that is part of this copy session. A volume may not be added to the same session more than once.

Action

Remove this volume from either the planner input or from the existing copy session.

HWNLMO804E Subsystem cannot be considered. Please check both the candidate SVC and its back-end subsystems for available space and performance data for the specified time interval.

Explanation

Either candidate SVC or its back-end subsystems (or both) do not have either space or performance data for the specified time interval.

Action

Make sure that both candidate SVC and its back-end subsystems (or both) have space and performance data for the specified time interval.

HWNLMO804I The storage pool(s) provided do not satisfy the criteria for an acceptable destination pool.

Explanation

The reason the storage pool(s) is not considered acceptable is logged in the log file.

Action

Try again with different storage pool(s) or with changed input parameters. The log file may provide more information.

HWNLMO805E Host *Host* is a virtual machine without any Fibre Channel host port and a storage volume cannot be assigned directly to it.

Explanation

A storage volume cannot be assigned directly to a virtual machine if the virtual machine has no Fibre Channel host port. Instead, it must be assigned to the hypervisor that contains the virtual machine.

Action

Specify the hypervisor for the provisioning operation. If the provisioning operation succeeds, use VMware tools to assign the hypervisor disk to the virtual machine.

HWNLMO806W Host *Host* is a hypervisor. IBM Spectrum Control is unable to set the multipath policy on the hypervisor.

Explanation

IBM Spectrum Control can create volumes, complete fabric zoning, and assign volumes for the hypervisor. However, IBM Spectrum Control cannot enable the multipath policy for the hypervisor.

Action

After the provisioning operation completes, log in to the hypervisor or use VMware tools to enable the multipath policy on the hypervisor.

HWNLMO807W Host *Host* is a server that is not managed by an SRA. IBM Spectrum Control is unable to set the multipath policy on the host.

Explanation

IBM Spectrum Control can create volumes, complete fabric zoning, and assign volumes for the agentless server. However, IBM Spectrum Control cannot enable the multipath policy for the agentless server.

Action

After the provisioning operation completes, log in to the operating system on the agentless server to enable the multipath policy.

HWNLM0808E Ports of host *Host* are not connected to any fabric that is known to IBM Spectrum Control.

Explanation

The host that you are attempting to provision volumes to does not appear to IBM Spectrum Control to have fabric connectivity. It is likely that the host ports are connected to a fabric, but that the fabric has not been probed.

Action

Probe the fabrics to which the host is connected, and repeat the provisioning operation.

HWNLM0809E Ports of host *Host* are not connected to fabrics that allow automatic zoning.

Explanation

Automatic zoning is enabled, but the fabrics to which the host is connected do not allow the automatic zoning operations. For example, this error is returned if the host is connected only to a Brocade fabric that is controlled only by an inband agent.

Action

If the host already has fabric connectivity to the storage system through existing zones, disable automatic zoning and repeat the provisioning operation.

HWNLM0810E The total capacity requested is {0} GB for {1} number of volumes. The individual volume size comes out to be {2} GB, which is invalid. The allowed minimum size is {3} GB and the allowed maximum size is {4} GB per volume for the given subsystem(s).

Explanation

The specified total volume size is invalid for the given number of volumes.

Action

Correct the invalid volume size or the number of volumes and try again.

HWNLM0811W No fabric information is available. All fabric-related options are ignored and no fabric configuration operation is performed.

Explanation

Typically, you cannot provision volumes to servers or hypervisors that do not have fabric connectivity. However, because all of the selected hosts have Fibre Channel Port WWPNs and none appear to IBM Spectrum Control to have fabric connectivity, it is possible that the fabrics were not probed. For this reason, you can provision volumes even though the hosts appear to have no fabric connectivity. However, because no fabric information is available, all of the fabric-related options (number of paths, redundant fabrics, and automatic zoning) are ignored and no fabric configuration operation is performed.

Action

Ensure that the hosts are connected to the recommended storage system before you run the task. After the provisioning operation completes, you must manually configure the fabric.

HWNLM0812E Unable to plan virtualizer provisioning task due to reaching the maximum vdisks limitation in all candidate iogroups.

Explanation

All iogroups on the predefined for the provisioning task virtualizer storage have exceeded the allowed number of vdisk per iogroup.

Action

Please ensure that the predefined for the provisioning task virtualizer storage has any iogroups with less than maximum allowed volumes

HWNLM0001I An integrated SAN Planner job started with schedule *creator. schedule name*

Explanation

HWNL00017W The command to discover volumes on host *host id* failed with status *status*.

Explanation

The discovery of volumes on the host failed due to an unexpected error.

Action

Contact IBM customer technical support with all related errors.

HWNL00018W Unable to set the multipath policy on host *host id* due to host failure *status*.

Explanation

Setting the multipath policy on the host failed due to a variety of reasons. Detail of the failure is logged by the host. The host must be installed with a multipath device driver fully supported by IBM Spectrum Control, but may fail due to the following reasons:

- A multipath driver fully supported by IBM Spectrum Control is not installed on the host.
- A multipath driver fully supported by IBM Spectrum Control does not support the requested multipath policy.
- A multipath driver fully supported by IBM Spectrum Control does not support the assigned subsystem volumes.
- The host failed to fully complete the request on a multipath driver fully supported by IBM Spectrum Control.

Action

Check that you are using a supported multipath driver. For information on driver support, search the IBM Knowledge Center for "multipath subsystem device drivers".

If the multipath driver fully supported by IBM Spectrum Control is installed on the host and meets the conditions, then it will be necessary to investigate messages issued by the host for more details. If the multipath driver fully supported by the IBM Tivoli Storage Productivity Center is not installed on the host, then the multipath policy will need to be set on the host with a multipath driver that supports changing the multipath policy.

Activating the zone set failed due to an unexpected error.

Action

Contact IBM customer technical support with all related errors.

Related reference

- [Getting support](#)

HWNL0027E The `commitTransaction` command on fabric *fabric wwn* failed with return code *return code*.

Explanation

Provisioning was not successful because of an unexpected error. This problem might occur when a provisioning job is run at the same time as other zone control sessions are in progress for a fabric.

Action

Ensure that no other zone control sessions for the fabric are in progress when the Provisioning job is run. Other zone control sessions might be run from another installation of IBM Spectrum Control, from the command-line interface for a switch, or from the element manager for a switch.

If the fabric is a Brocade fabric and you have a licensed version of Network Advisor, check the Network Advisor event logs for a history of other zone control sessions.

If the fabric is a Cisco fabric, you might need to distribute the full zone database from one of the logical switches to the other logical switches in the VSAN.

If this problem persists, contact IBM Software Support.

HWNL0028I Starting volume discovery on host *host*.

Explanation

None.

Action

None.

HWNL0029I Finished volume discovery on host *host*.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNL0030I Assignment(s) between Volume *volume id* and Host Port(s) *host ports* already exist, no assignment actions will happen for these paths.

Explanation

None.

Action

None.

HWNL0031W Since multiple Storage Resource Groups were provided as input to the plan, the newly created volumes will not be added to any Storage Resource Groups.

Explanation

Newly created volumes will automatically be added to a Storage Resource Group only if a single Storage Resource Group is provided as input to the plan.

Action

If you want newly created volumes to automatically be placed into the Storage Resource Group, then use only one Storage Resource Group as input to the SAN Planner.

HWNL0032W IBM Spectrum Control is unable to set the multipath policy on host *host id* because it is an ESX hypervisor. After the provisioning operation completes, log in to the hypervisor or use VMware tools to set the multipath policy on the hypervisor.

Explanation

IBM Spectrum Control can create volumes, complete fabric zoning, and assign volumes for the hypervisor. However, IBM Spectrum Control cannot enable the multipath policy for the hypervisor.

Action

After the provisioning operation completes, log in to the hypervisor or use VMware tools to enable the multipath policy on the hypervisor.

HWNLM0033W IBM Spectrum Control is unable to set the multipath policy on host *host id* because it is not managed by an SRA. After the volume or volumes are provisioning, log in to the operating system on the agentless server to set the multipath policy.

Explanation

IBM Spectrum Control can create volumes, complete fabric zoning, and assign volumes for the agentless server. However, IBM Spectrum Control cannot enable the multipath policy for the agentless server.

Action

After the provisioning operation completes, log in to the operating system on the agentless server to enable the multipath policy.

HWNLM0034I Started updating agentless server configuration with disk information.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNLM0035I Completed updating agentless server information with disk information.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNLM0036W The volume discovery operation failed for one or more agentless servers.

Explanation

IBM Spectrum Control was unable to update the database with information about the volume or volumes that were provisioned to agentless servers.

Action

Run storage system probes for the storage systems on which the volumes are located. Running the probes updates the data for the agentless servers that have volumes that are assigned from the storage systems.

HWNL00037I Disks mappings detected for volume *volume* by the discovery on host *host* on the following paths: *path*.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNL00038W No disks were detected for volume *volume* by the discovery on host *host*.

Explanation

The volume was assigned to the host, but SRA discovered no disks corresponding to this volume on the host.

Action

A disk might be detected by the host later, so a probe that runs later might discover the disk that is related to the volume.

Check for other causes that would prevent the host from detecting the disk. For example, make sure that the driver is configured correctly and that the host has connectivity with the storage system.

HWNL00039I After unassigning volume *volume* from host *host*, no disks were detected anymore for it by the discovery on that host.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNL00040W After unassigning volume *volume* from host *host*, disks mappings were still detected for it by the discovery on that host on the following paths: *path*.

Explanation

The volume was unassigned from the host, but SRA still discovered disks corresponding to this volume on the host.

Action

You can try to run the SRA probe for the host again.

HWNL00041I Started to copy storage volumes.

Explanation

No further information is available.

Action

No further action is required.

HWNLMO042E The copy of storage volumes could not be completed.

Explanation

The copy of storage volumes failed with errors.

Action

Check the log files for the external process and contact IBM Software Support.

HWNLMO043I Completed copy of storage volumes.

Explanation

No further information is available.

Action

No further action is required.

Action

None.

HWNLMO109I Considering user selected virtual disk: {0} of storage virtualized controller: {1} as candidate since it is of the right size, is unassigned and not in a known replication relationship (or these requirements were over-ridden by user).

Explanation

None.

Action

None.

HWNLMO110I Considering user selected volume: {0} of subsystem: {1} as candidate since it is of the right size, is unassigned and not in a known replication relationship (or these requirements were over-ridden by user).

Explanation

None.

Action

None.

HWNLMO111I The algorithm used to identify the best location for the volumes will ignore the co-location criterion.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNLMO300I A Path Planner job started with multipath policy (*multipath*), redundant fabric policy (*rFabric*), multipath mode (*mode*), and (*paths*) number of paths.

Explanation

None.

Action

None.

HWNLMO301I The Path Planner job completed.

Explanation

None.

Action

None.

HWNL0302E Multiple paths are not supported on host *host name* as it has only one port.

Explanation

The host requires two or more HBA ports in order for multiple paths to be support

Action

Modify the planner input and try again.

HWNL0303E No common fabrics between *Host* and *Subsystem*

Explanation

There are no common fabrics connecting the host and subsystem.

Action

Modify the planner input and try again.

HWNL0304E There is an insufficient number of possible paths between *Host* and *Subsystem*. The number of possible paths *possiblePaths* are less than the required number of paths *paths*.

Explanation

The total number of possible paths is less than the required number of paths.

Action

Modify the planner input and try again.

HWNL0305E Cannot create redundant paths using the specified *paths* number of paths.

Explanation

Redundant fabrics requires an even number of paths.

Action

Modify the planner input and try again.

HWNL0306E There are less than two fabrics in common between host *Host* and storage subsystem *Subsystem*.

Explanation

Redundant fabrics requires 2 or more fabrics linking each host with each subsystem.

Action

Modify the planner input and try again.

HWNLMO307W No supported multipath driver was found on host *host id*.

Explanation

No supported multipath driver is installed on this system.

Action

Make sure that fully supported multipath driver is available on this system for Path Planner configurations and try again.

HWNLMO308W No corresponding multipath device was found on host *host id* in case of one or more volumes.

Explanation

For one or more volumes, no matching SDD device has been identified on the host.

Action

Make sure that the volumes have been assigned and they are visible to the host.

HWNLMO309W Multipath policy configuration is not supported for multipath driver on host *host id*.

Explanation

Multipath policy configuration is not supported for multipath driver this host.

Action

Make sure that the multipath driver supports the requested multipath policy.

HWNLMO310W Failed to set the multipath policy on host *host id* because for Multipath DM driver only Round Robin policy is available.

Explanation

For Multipath DM driver only Round Robin policy is available.

Action

If different multipath policy is required, then a supported multipath driver that supports this policy is required.

HWNLMO311W The command for setting the multipath policy on host *host id* has failed to execute.

Explanation

The command for configuring the multipath policy on the host has failed to execute.

Action

Refer to the agent log file for more details.

HWNL0312I Please check the agent log file for more details.

Explanation

The agent log file located on the agent host may contain more details about the problem.

Action

Refer to the agent log file for more details.

HWNL0313W iSCSI ports were not mapped to the storage volume because storage subsystem *Subsystem* does not support iSCSI connectivity.

Explanation

iSCSI ports were not mapped to the storage volume because the storage subsystem does not support iSCSI connectivity..

Action

Access the storage volume using Fibre Channel connectivity. If iSCSI access is required, the volume should be moved to a storage subsystem supporting iSCSI connectivity.

HWNL0314W iSCSI ports were not mapped to the storage volume because storage subsystem *Subsystem* does not have iSCSI connectivity configured.

Explanation

The storage subsystem does not have any target iSCSI ports configured.

Action

Configure the storage subsystem to add iSCSI target ports.

HWNL0315E No common connectivity exists between *Host* and *Subsystem*.

Explanation

The host is configured only for iSCSI connectivity and the subsystem either does not support iSCSI connectivity or does not have iSCSI connectivity configured.

Action

If the subsystem supports iSCSI connectivity configure the storage subsystem for iSCSI connectivity and try again. If the subsystem does not support iSCSI connectivity, either add HBA cards to the host for Fibre Channel access or move the volume to a storage system which is capable of iSCSI connectivity.

HWNL0316I Started to set the multipath policy on host *host id*.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNLM0317I The multipath policy has been successfully set on host *host id*.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNLM0500I The user specified maximum number of zones is *user zones* however the current number of zones is *current zones*.

Explanation

None.

Action

None.

HWNLM0501E The maximum number of zones in a fabric policy was violated.

Explanation

The number of zones the Zone Planner generated are more than the maximum number of zones that the user specified.

Action

Modify the planner input and try again.

HWNLM0502E The zone per host policy was violated.

Explanation

The Zone Planner cannot satisfy the zone per host guidance policy.

Action

Modify the planner input and try again.

HWNLM0503E The zone per HBA policy was violated.

Explanation

The Zone Planner cannot satisfy the zone per HBA guidance policy.

Action

Modify the planner input and try again.

HWNLM0504E The zone per cluster policy was violated.

Explanation

The Zone Planner cannot satisfy the zone per cluster guidance policy.

Action

Modify the planner input and try again.

HWNLM0505E The zone per controller policy was violated.

Explanation

The Zone Planner cannot satisfy the zone per controller guidance policy.

Action

Modify the planner input and try again.

HWNLM0506E The zone per controller type policy was violated.

Explanation

The Zone Planner cannot satisfy the zone per controller type guidance policy.

Action

Modify the planner input and try again.

HWNLM0507E The zone per fabric policy was violated.

Explanation

The Zone Planner cannot satisfy the zone per fabric guidance policy.

Action

Modify the planner input and try again.

HWNLM0508I Zone Set *zone set name* was created.

Explanation

None.

Action

None.

HWNLM0509I Zone *zone name* was created.

Action

None.

HWNL0537I Not considering Pool: {0} of Subsystem: {1} because its backend storage is not configured into this IBM Spectrum Control or is currently undetectable and input requires a specific backend RAID level

Explanation

None.

Action

None.

HWNL0538I Not considering IO Group: {0} of Subsystem: {1} because it does not have two nodes associated with it

Explanation

None.

Action

None.

HWNL0539I Not considering IO Group: {0} of Subsystem: {1} because it has more than or equal to 2048 vdisks

Explanation

None.

Action

None.

HWNL0540I Not considering IO Group: {0} of Subsystem: {1} because it does not have enough available mirroring memory

Explanation

None.

Action

None.

HWNLM0541I Not considering Volume: {0} of Subsystem: {1} because its subsystem was found to be unacceptable based on inputs

Explanation

None.

Action

None.

HWNLM0542I Not considering Volume: {0} of Subsystem: {1} because its pool was found to be unacceptable based on inputs

Explanation

None.

Action

None.

HWNLM0543I Not considering Volume: {0} of Subsystem: {1} because its IO group was found to be unacceptable based on inputs

Explanation

None.

Action

None.

HWNLM0544I Not considering Volume: {0} of Subsystem: {1} because its size does not match the input

Explanation

None.

Action

None.

HWNLM0545I Not considering Subsystem: {0} because not all of its backend subsystems are configured into this IBM Spectrum Control or some are currently undetectable. This is unacceptable when an input RAID level is specified or a workload profile other than space-only is selected

Explanation

None.

Action

None.

HWNLMO546I Not considering Subsystem: {0} because IBM Spectrum Control does not have adequate performance data for it and/or some of its backend subsystems. For planning with workload profiles other than space-only, this subsystem and all of its backend subsystems need to have daily performance data

Explanation

None.

Action

None.

HWNLMO547I Not considering Subsystem: {0} since none of its IO groups have enough available mirroring memory to support vdisk mirroring input

Explanation

None.

Action

None.

HWNLMO548I Not considering Subsystem: {0} since it does not support vdisk mirroring (code level is below v4.3)

Explanation

None.

Action

None.

HWNLMO549I Not considering Subsystem: {0} since it does not support space-efficient vdisks (code level is below v4.3)

Explanation

None.

Action

None.

HWNLMO550I Not considering IO Group: {0} of Subsystem: {1} because it does not appropriate connectivity to hosts selected in the

input

Explanation

None.

Action

None.

HWNLM0551I Not considering Subsystem: {0} since none of its IO groups have appropriate connectivity to hosts selected in the input

Explanation

None.

Action

None.

HWNLM0552I Not considering Volume: {0} of Subsystem {1} since it does not match input on thin-provisioning characteristics

Explanation

None.

Action

None.

HWNLM0553I Volume size too small {0} MB. Minimum size should be {1} MB for the pool {2}. Not considering this pool.

Explanation

None.

Action

None.

HWNLM0554I Volume size too big {0} MB. Maximum size should be {1} MB for the pool {2}. Not considering this pool.

Explanation

None.

Action

None.

HWNLMO555I Not considering Volume: {0} of Subsystem: {1} because it is in a known replication relationship.

Explanation

None.

Action

None.

HWNLMO556I Volume {0} can not be moved to the following candidate pool(s) due to insufficient allocatable space: {1}.

Explanation

None.

Action

None.

HWNLMO557I The max theoretical I/O capability of storage pool {0} on subsystem {1} has not been set. Using default value {2}.

Explanation

Because insufficient information was available to calculate the maximum I/O capability of the pool, a default value was set.

Action

If the I/O capability of the storage pool cannot be determined, the user-defined value for theoretical I/O capability is used. If this value has not been set, the default value is used and the informational message HWNLMO557I is generated. To add the information, go to the Pools page, right-click the pool, and then click View Properties. On the Back-End Storage tab, click Edit.

HWNLMO558W The subsystem pool {0} does not have performance data for the specified time interval.

Explanation

None.

Action

None.

HWNLMO559I Not considering IO Group: {0} of Subsystem: {1} because compression was specified, but the IO Group does not have compression active.

Explanation

Compression was specified, but the IO group could not satisfy the request because there are no active compressed volumes in the IO group.

Action

If no IO groups have compression active, then create a compressed volume in the IO group to make compression active.

HWNLM0560I Not considering Volume: {0} of Subsystem {1} since it is not compressed when compression was specified.

Explanation

Compression was specified, but the volume could not satisfy the request because it is not compressed.

Action

Select volumes that are compressed.

HWNLM0560W Fabric agent not available to perform the zoning operation on the fabric {0}.

Explanation

None.

Action

None.

HWNLM0561I Fabric agent available to perform the zoning operation on the fabric {0}.

Explanation

None.

Action

None.

HWNLM0562E Fabric service exception occurred trying to check for zone control on the fabric {0}.

Explanation

None.

Action

None.

HWNLM0563W A zone *unnecessary_zone* was not created, because the host already has connectivity to the storage system using *existing_zone*.

Explanation

When automatic zoning is enabled, new zones might be created during provisioning to connect the server or hypervisor to the storage system. New zones are created only if the server or hypervisor does not have connectivity with the storage system. In this case, a new zone was not needed because another zone between the same ports already exists in the active zone set.

Action

No action is required.

HWNLM0564W There is already a zone named *zone_name*. A zone named *new_zone_name* was created instead.

Explanation

The planned zone name was not used because a zone with that name exists. Although the zone was created with a different name, the provisioning task shows the original planned name.

Action

No action is required.

HWNLM0565W There is already a volume named *vol_name*. A volume named *new_vol_name* will be created instead.

Explanation

The planned volume name was not used because a volume with that name exists. Although the volume will be created with a different name, the provisioning task shows the original planned name.

Action

No action is required.

HWNLM0566I Not considering Pool: {0} of Subsystem: {1} because it is mixed pool.

Explanation

None.

Action

None.

HWNLM0567I Not considering Subsystem: {0} for vdisk mirroring since it does not have at least two acceptable mdiskgroups from different backend subsystems.

Explanation

None.

Action

None.

HWNLM0568I Not considering I/O group {0} of subsystem {1} because it already reached the limit of 200 compressed vdisks.

Explanation

An I/O group can contain a maximum of 200 compressed vdisks, and the I/O group already reached this limit.

Action

No action is required.

HWNLM0569I Not considering subsystem {0} because none of its I/O groups can be used for compressed vdisks.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNLM0570I Not considering I/O group {0} of subsystem {1} because host definition {2} has access restrictions.

Explanation

The host definition has access restrictions and can can not connect to the I/O group.

Action

No action is required.

HWNLM0571I Not considering storage system {0} because none of its I/O groups allow restricted access to all hosts.

Explanation

The host definition has access restrictions and can can not connect to any of the I/O groups of the storage system.

Action

No action is required.

HWNLM801I Synchronous Refresh Configuration of the Storage Subsystem was completed Successfully for Subsystem *subsystem*.

Explanation

None.

Action

None.

HWNLM802E Synchronous Refresh Configuration of the Storage Subsystem did not complete successfully for Subsystem *subsystem*.

Explanation

None.

Action

None.

HWNL803I Replication Session was created successfully *session*.

Explanation

None.

Action

None.

HWNL804E Replication Session creation failed. ReplicationManager [*session*].

Explanation

None.

Action

None.

HWNL805I Successful check for existence of session *session*.

Explanation

None.

Action

None.

HWNL806E No Such session exists with name *session*.

Explanation

None.

Action

None.

HWNL807I CopySets Added to Session successfully *session*.

Explanation

None.

Action

None.

HWNL808E CopySets addition to session failed. ReplicationManager [*session*].

Explanation

None.

Action

None.

HWNLM809E CopySets creation failed. ReplicationManager [session].

Explanation

None.

Action

None.

HWNLM810I Storage Subsystem Configuration refreshed successfully in Replication Manager ss.

Explanation

None.

Action

None.

HWNLM811E Storage Subsystem Configuration refresh operation failed in Replication Manager [ss].

Explanation

None.

Action

None.

HWNLM812E Fabric agent not available to perform the zoning operation on the fabric {0}.

Explanation

None.

Action

None.

HWNLM813I Replication Session was started successfully session.

Explanation

None.

Action

None.

HWNL814W Replication Session start failed. ReplicationManager [session] .

Explanation

None.

Action

None.

HWNL815W Not considering the Storage Subsystem {0} because it is not registered in TPC-R.

Explanation

None.

Action

None.

HWNL816I Please use Replication Manager console to schedule point-in-time copy creation.

Explanation

None.

Action

None.

HWNL817W No cluster partnership exists between source subsystem [srcss] and target subsystem [tgtss].

Explanation

Cluster partnership needs to established between source and target storage subsystems

Action

Cluster partnership needs to established between source and target storage subsystems

HWNL818W No path exists between source subsystem [srcss] and target subsystem [tgtss].

Explanation

Connectivity path needs to established between source and target storage subsystems

Action

Connectivity path needs to established between source and target storage subsystems

HWNLM820I Copysets can not be added to a session when it's in Prepared/Suspend/Recover/Flash state. Please try again later after some time. State of session can be checked from Replication Manager console.

Explanation

Copysets can not be added to a session when it's in Prepared/Suspend/Recover/Flash state. Please try again later after some time. State of session can be checked from Replication Manager console.

Action

Copysets can not be added to a session when it's in Prepared/Suspend/Recover/Flash state. Please try again later after some time. State of session can be checked from Replication Manager console.

HWNLM0821W IBM Spectrum Control had no information about the Fibre Channel configuration, so it did not verify fabric connectivity or change the zoning configuration.

Explanation

Because IBM Spectrum Control did not have any information about the Fibre Channel configuration, it did not verify fabric connectivity and did not change the zoning configuration.

Action

After the provisioning operation completes, ensure that the involved storage subsystems and hosts are connected through Fibre Channel and create and activate the necessary zones and zone sets in order to make the connection possible.

HWNPM0001E The specified summarization level (*level*) is invalid. It must be an integer value between *minimum* and *maximum*, inclusive.

Explanation

The summarization level that was passed as argument on the Performance Manager API call is invalid. The method that was called returns this error indicator.

Action

Modify the caller of this method to pass a valid summarization level as parameter. The valid levels are enumerated via the `summtpe_*` constants in the `com.ibm.tpc.perf.api.ApiConstants` interface.

HWNPM0002E The specified device category (*category*) is invalid. It must be an integer value between *minimum* and *maximum*, inclusive.

Explanation

The device category that was passed as argument on the Performance Manager API call is invalid. The method that was called returns this error indicator.

Action

Modify the caller of this method to pass a valid device category as parameter. The valid categories are enumerated via the `devcat_*` constants in the `com.ibm.tpc.perf.api.ApiConstants` interface.

HWNPM0003E The specified device type (*type*) is invalid. It must be an integer value between *minimum* and *maximum*, inclusive.

Explanation

The device type that was passed as argument on the Performance Manager API call is invalid. The method that was called returns this error indicator.

Action

Modify the caller of this method to pass a valid device type as parameter. The valid types are enumerated via the `devtype_*` constants in the `com.ibm.tpc.perf.api.ApiConstants` interface.

HWNPM0004E The specified component type (*type*) is invalid. It must be an integer value between *minimum* and *maximum*, inclusive.

Explanation

The component type that was passed as argument on the Performance Manager API call is invalid. The method that was called returns this error indicator.

Action

Modify the caller of this method to pass a valid component type as parameter. The valid types are enumerated via the `comtype_*` constants in the `com.ibm.tpc.perf.api.ApiConstants` interface.

HWNPM0006E The string specified as parameter (*string*) exceeded its allowed length (*maximum length*).

Explanation

The string parameter that was passed as argument on the Performance Manager API call is too long. The method that was called returns this error indicator.

Action

Length limitations usually arise due to the need for saving the given string into a fixed length database column. Modify the caller of this method to pass a shorter string as parameter.

HWNPM0007E The value specified as parameter (*value*) is invalid.

Explanation

The parameter value that was passed as argument on the Performance Manager API call is invalid. The method that was called returns this error indicator.

Action

Refer to the method or class documentation to determine the allowed values for the particular parameter. Modify the caller of this method to pass a valid value to the API.

HWNPM0008E A required parameter is missing (*null*).

Explanation

The parameter value that was passed as argument on the Performance Manager API call is NULL, but the parameter is required. The method that was called returns this error indicator.

Action

Refer to the method or class documentation to determine the allowed values for the particular parameter. Modify the caller of this method to pass a valid value to the API.

HWNPM0010E The specified device ID (*device ID*) is invalid. It must conform to the pattern '*name+nameFormat*'.

Explanation

The device identifier string that was passed as argument on the Performance Manager API call is invalid. The method that was called returns this error indicator.

Action

Modify the caller of this method to pass a valid device ID as parameter.

HWNPM0011E The specified component ID (*component ID*) is invalid. It must be a simple WWN (16 hexadecimal characters).

Explanation

The component identifier string that was passed as argument on the Performance Manager API call is invalid. The method that was called returns this error indicator.

Action

Modify the caller of this method to pass a valid component ID as parameter.

HWNPM0012E The specified component ID (*component ID*) was not found or is not unique in the IBM Spectrum Control database.

Explanation

The component identifier string that was passed as argument on the Performance Manager API call does not correspond to a device known to IBM Spectrum Control. The method that was called returns this error indicator.

Action

Modify the caller of this method to pass a valid component ID as parameter. The parameter string must uniquely identify the required component.

HWNPM0013E The specified component ID (*component ID*) is invalid.

Explanation

The component identifier string that was passed as argument on the Performance Manager API call is invalid. It must conform to the pattern 'compName+deviceName+deviceNameFormat'. The method that was called returns this error indicator.

Action

Modify the caller of this method to pass a valid component ID as parameter.

HWNPM0015E Failed to retrieve the requested data because the service is unavailable.

Explanation

The Device server is unable to connect to the database. The API call cannot be completed.

Action

To resolve the problem, check the following and then try the action again:

- Verify that the database manager is operational.
- Stop and start the product servers.

HWNPM0021E The device identifier specified as parameter (*device ID*) is invalid.

Explanation

The device identifier that was passed as an argument for the product API is invalid. The device identifier was either not found or is not unique in the database.

Action

Modify the caller of this method to pass a valid device identifier as a parameter. The parameter must uniquely identify the required device.

HWNPM0090E Failed to retrieve the requested data because the service is unavailable.

Explanation

The Device server was unable to complete a database operation. This might have caused the requested operation to fail.

Action

To resolve the problem, check the following and then try the action again:

- Verify that the database manager is operational.
- Stop and start the product servers.

HWNPM0099E The requested operation failed because of an internal error.

Explanation

An internal error occurred during the requested operation. Internal errors can be caused by a database inconsistency or corruption, or can be caused by a programming error.

Action

Try the operation again. Check for error messages in the log files for the Device server. If the problem continues, contact IBM Software Support.

- [Getting support](#)

HWNPM0101E Unable to create the specified performance service instance ({0}).

Explanation

The Performance Manager failed trying to create a service instance (performance collection, performance threshold, or performance reporting service). The accompanying exception object should give more clues as to the exact problem.

Action

If you have made changes to the PM configuration file, reverse those changes. Try to restart the IBM Spectrum Control Device Server service.

If you are overriding the default instantiation class by specifying the associated property as argument to the factory class, ensure that the specified instantiation class exists and is accessible by the JVM.

HWNPM0200I This operation (*operation name*) on Performance Manager was successful.

Explanation

None.

Action

None.

HWNPM0201E The device (*device_id*) that was passed to the method is invalid.

Explanation

The device is null or is not supported.

Action

Provide the correct device to the method.

HWNPM0202E The device category (*device_category*) that was passed to the method is invalid.

Explanation

The device category is null or not supported.

Action

Provide the correct device category to the method.

HWNPM0203E The device type received (*device_type*) is invalid.

Explanation

The device type is null or not supported.

Action

Provide the correct device type to the method.

HWNPM0204E The device type - HOST - that was passed to the method is not supported.

Explanation

The HOST device type is not supported for performance data collection.

Action

None.

HWNPM0205E The specified performance collection policy is invalid.

Explanation

The specified policy is invalid and could not be successfully set into effect. The previous performance collection policy remains in effect for the associated device(s).

Action

Please ensure that all performance collection rules were followed when the new policy was created.

HWNPM0209I The device type and device category are valid.

Explanation

None.

Action

None.

HWNPM0210E Collector failed to start due to system failure.

Explanation

A system failure caused a collector not to start.

Action

None.

HWNPM0220E Collector failed to stop due to system failure.

Explanation

A system failure caused a running collector to fail.

Action

None.

HWNPM0230E One or more of the specified performance collection policies are invalid.

Explanation

A performance collection policy object that was specified as an argument for the product API call is invalid. The called method could not process the policy object.

Action

Modify the caller of this method to pass valid performance collection policy objects as arguments. One common cause of problems is the specification of an invalid device identifier for custom policies. Ensure that the policy device ID field corresponds to a device that is valid and known to the product.

HWNPM0231W The specified performance collection policy is ignored because it conflicts with another policy in the same parameter list.

Explanation

The performance collection policy object that was specified as argument on the Performance Manager API call is ignored, because another policy specified in the same call is effectively equivalent to this policy. Equivalent policies have the same device type and device ID. The other policy has been used for the purpose of this call, and this policy has been ignored.

Action

Modify the caller of this method to remove any conflicting or duplicate policy objects.

HWNPM0232E The specified performance collection policy contains an unsupported interval length.

Explanation

The performance collection policy object that was specified as argument on the Performance Manager API call is invalid because it contains an unsupported interval length attribute. The supported interval lengths can vary for individual devices, and for individual device types.

Action

Consult the performance collection rules to determine the supported interval lengths for devices of the desired type, and/or the particular device in question. Then modify the caller of this method to specify a valid interval length attribute in the passed policy object.

HWNPM0233E The specified performance collection policy contains an unsupported frequency.

Explanation

The performance collection policy object that was specified as argument on the Performance Manager API call is invalid because it contains an unsupported frequency attribute. The supported frequencies can vary for individual devices, and for individual device types.

Action

Consult the performance collection rules to determine the supported frequencies for devices of the desired type, and/or the particular device in question. Then modify the caller of this method to specify a valid frequency attribute in the passed policy object.

HWNPM0234E The specified performance collection policy contains an unsupported duration.

Explanation

The performance collection policy object that was specified as argument on the Performance Manager API call is invalid because it contains an unsupported duration attribute. The supported durations can vary for individual devices, and for individual device types.

Action

Consult the performance collection rules to determine the supported durations for devices of the desired type, and/or the particular device in question. Then modify the caller of this method to specify a valid duration attribute in the passed policy object.

HWNPM0240E The attempt to update the specified performance collection policies has failed.

Explanation

An internal error occurred while performing the requested IBM Spectrum Control Performance Manager API operation. Internal errors can be caused by a database inconsistency or corruption, or can be due to a programming error.

Action

Please retry the failing operation. If the failure persists, please contact IBM software support. More details about the exact failure will be available in the Performance Manager trace logs in the device server log directory.

Related reference

- [Getting support](#)

HWNPM0241E The attempt to reset the specified performance collection policies has failed.

Explanation

An internal error occurred while performing the requested IBM Spectrum Control Performance Manager API operation. Internal errors can be caused by a database inconsistency or corruption, or can be due to a programming error.

Action

Please retry the failing operation. If the failure persists, please contact IBM software support. More details about the exact failure will be available in the Performance Manager trace logs in the device server log directory.

Related reference

- [Getting support](#)

HWNPM0242E The attempt to remove the specified performance collection policies has failed.

Explanation

An internal error occurred while performing the requested IBM Spectrum Control Performance Manager API operation. Internal errors can be caused by a database inconsistency or corruption, or can be due to a programming error.

Action

Please retry the failing operation. If the failure persists, please contact IBM software support. More details about the exact failure will be available in the Performance Manager trace logs in the device server log directory.

Related reference

- [Getting support](#)

HWNPM0249W An attempt to dynamically update one or more running performance collectors with a new performance collection policy has failed.

Explanation

When a new performance collection policy is set into effect, any running performance collectors using that policy must be dynamically updated, for the new settings to take effect. This dynamic update failed for one or more of the running collectors associated with a particular policy.

Action

The policy has been successfully saved in the database, so the operation does not need to be repeated. However the running performance collector needs to be manually stopped and restarted for the new settings to take effect.

HWNPM0250E One or more default performance collection policies are missing from the database.

Explanation

One default performance collection policy must exist in the database for each supported device type. The IBM Spectrum Control Performance Manager will not function properly without these default policies. The fact that they are missing from the database indicates a database corruption of some kind.

Action

Please retry the failing operation. If the failure persists, please contact IBM software support. If a database corruption seems plausible, and you have a recent backup of the IBM Spectrum Control database, you can also try shutting down IBM Spectrum Control and restoring the old database. However remember that you will lose all information that has been added to the database since the backup was made.

- [Getting support](#)

HWNPM0281I Performance monitoring is unavailable for resource *resource_name* because an agent for monitoring the resource was not defined. For IBM Spectrum Scale, the problem might occur because the data collection service cannot connect to port 9084 on the node where the collector component of the IBM Spectrum Scale performance monitoring tool is running.

Explanation

For the product to collect performance statistics and other necessary information to monitor a resource, an agent that manages the resource must be defined. An agent can be an SMI-S provider, ZIMon agent for IBM Spectrum Scale, or a native API for a resource.

Action

Define a data source for the resource, such as an SMI-S provider, a ZIMon agent for IBM Spectrum Scale, or a resource-specific service.

Before you can collect performance data for IBM Spectrum Scale, the IBM Spectrum Control server must be able to connect to port 9084 on the node where the collector component of the IBM Spectrum Scale performance monitoring tool is running.

To ensure that the IBM Spectrum Control server can connect to the collector node, complete the following steps:

1. Determine the node that is configured as the collector node by viewing the `/opt/IBM/zimon/ZIMonSensors.cfg` file on one of the sensor nodes. The collector node is set in the host property of the collectors section in this file. For example, `collectors = {host = "node3" port = "4739"}`
2. Ensure that the host property is set to one of the following options:
 - An IP address that can be reached by the IBM Spectrum Control server
 - A host name that can be resolved to a reachable IP address by the IBM Spectrum Control server

Related reference

- [🔗 Configuring the collection of performance data for IBM Spectrum Scale](#)

HWNPM0282I Performance monitoring is unavailable for resource *resource_name* because the associated data sources are unable to collect performance data from the resource.

Explanation

One or more data sources for the resource are defined, but the particular types of data sources cannot collect performance data. The data sources might be able to complete other tasks for the resource.

Action

Add the resource using a data source that can retrieve performance data from the resource, if such a data source is available.

HWNPM0283I Performance monitoring is unavailable for *resource_name* because this resource does not support performance monitoring.

Explanation

One or more agents for the resource are defined in the product, but these agents cannot retrieve performance statistics for the resource. The agents might be able to perform other tasks for the resource.

Action

Upgrade or reinstall the firmware for the device.

HWNPM0284I Performance monitoring is unavailable for resource *resource_name* because the associated agent does not have the required level of software *agent_level*.

Explanation

The product does not support performance monitoring of the device at its current agent software level. In most cases, the current agent level is earlier than the required level, in which case an upgrade of the agent software is necessary. In rare cases, the agent software level is a later level that is not supported.

Action

Upgrade or reinstall the agent software for the device.

HWNP0285I Performance monitoring is unavailable for resource *resource name* because the associated agent is unable to fully monitor the resource.

Explanation

A device agent (an SMI-S provider, SMI agent, or a proprietary service API, etc.) must exist for IBM Spectrum Control to be able to retrieve the performance statistics and other necessary information to monitor the device. The currently defined agent(s) for the device will not allow IBM Spectrum Control to perform performance monitoring on the device. This can happen primarily for FC switches in mixed fabrics if there is a mismatch between the SMI agent and device, in other words if one switch vendor's SMI agent was able to discover a different vendor's switch. The mismatching agent will not be able to fully manage the other vendor's switches, and in particular, will not be able to retrieve performance statistics for those switches.

Action

Please define a "matching" agent for the particular vendor's device, for example for Brocade switches ensure that there is a Brocade SMI agent defined to manage the switch, for McData switches a McData SMI agent, and so forth. Switches with embedded SMI agents can only be managed using that embedded agent.

HWNP0286I Performance monitoring is unavailable for resource *resource name* because the associated SMI-S provider does not have the required SMI-S support.

Explanation

An SMI-S provider has been defined in IBM Spectrum Control to manage the device, but unfortunately that agent does not have the necessary SMI-S support to allow retrieval of performance statistics for the device. For FC switches, the SMI-S provider needs to support the SMI-S "Switch" profile, and must support the SMI-S level 1.0.2 at minimum. For storage subsystems, the SMI-S provider needs to support the "Array" profile and the "Block Server Performance" (BSP) sub-profile.

Action

Install an SMI-S provider with the necessary SMI-S support, and configure it to manage the device in question. Define the agent to IBM Spectrum Control using the IBM Spectrum Control GUI Administrative Services, Data Sources. Note that some vendors require purchase of a separate feature to enable this support.

HWNP0287I Performance monitoring is unavailable for resource *resource name* because the resource or the associated agent does not support performance monitoring.

Explanation

This can happen primarily for virtual devices, for example a logical FC switch. IBM Spectrum Control does not support performance data collection for virtual devices.

Action

Run the performance monitor on the physical device rather than on the individual virtual devices configured for the physical device.

HWNP0288I Performance monitoring is unavailable for resource *resource name* because the resource was not probed.

Explanation

To monitor the performance of a resource, you must first run a probe to collect asset and configuration information about that resource. Probes are data collection jobs that you schedule or start immediately.

Action

Define and run a probe for the resource. To run a probe, go the resource list page for the resource, right-click the resource, and select Data Collection > Start Probe. For example, to probe a storage system, go to Storage Systems page, right-click the storage system, and select Data Collection > Start Probe. After the probe completes successfully, run the performance monitor again.

To monitor the performance of a switch, the following conditions must be met:

- The switch must be probed through a SMI or SNMP agent. Probing a switch through a Storage Resource agent does not provide sufficient performance information.
- The probe of a SMI agent must complete successfully and discover at least one port on the switch. If the probe does not discover one or more ports, the switch is not eligible for performance monitoring using that SMI agent. If multiple agents are used for a probe, it is possible that an SNMP or Storage Resource agent discovers switch ports but a SMI agent does not. If you suspect that this situation occurred, stop and restart the SMI agent and rerun the fabric probe.

HWNPM0289W Performance monitoring is unavailable for resource *resource_name* because no agents are available.

Explanation

One or more of the agents that monitor the resource are not available. If multiple agents are monitoring the resource, the product tries to use each agent to collect performance data. If none of the agents are up and running, no data can be collected.

Action

To resolve the problem, try the following actions:

- Ensure that the agent for the resource is up and running.
- Verify that the local area network is available.
- Verify that the product can communicate with the agent.
- Restart the performance monitor that collects data about the resource.
- Check for error messages in the log files for the Device server.

HWNPM0290E Performance monitoring is unavailable for resource *resource_name* because the associated agent was could not be selected.

Explanation

This is due to an internal failure in the device server.

Action

Try to delete and then recreate the performance monitor job definition. If the problem continues, contact IBM Software Support.

Related reference

- [Getting support](#)

HWNPM0291I Performance monitoring is unavailable for switch *resource_name* because the switch has no ports.

Explanation

All performance data for FC switches is associated with the individual switch ports. If the switch has no ports, no performance data can be collected for it.

Action

If the switch does have ports but the ports were not discovered, run the probe for the switch again. To run a probe, go to the resource list page for switches, right-click the switch, and select Data Collection > Start Probe. After the probe completes successfully, run the performance monitor again.

HWNPM0292I Performance monitoring is unavailable for switch *resource_name* because the switch was not probed using the correct agent.

Explanation

To monitor the performance of a resource, you must first run a probe to collect asset and configuration information about that resource. Probes are data collection jobs that you schedule or start immediately. In addition, to successfully collect performance data for FC switches using SMI agents, it is necessary to have probed the switch

using that exact SMI agent. If the switch was probed using a Storage Resource agent or SNMP agent, it is not possible to collect performance data using a SMI agent. If the switch is managed by multiple SMI agents, only those SMI agents that have been previously used to probe the switch can be used to collect performance data for it.

Action

If a probe is not yet defined for the switch, define and run a probe for the resource. To run a probe, go to the resource list page for switches, right-click the switch, and select Data Collection > Start Probe. After the probe completes successfully, run the performance monitor again. If the Data Collection -> Start Probe action is not available, a probe is not yet defined. Right-click the switch and select Data Collection -> Schedule to define and save the probe parameters, and then select Data collection -> Start Probe to run it.

Even if a probe has successfully completed in the past, it may be necessary to run the probe again. When new agents have been added for managing the switch, or old agents have become unreachable, running a new probe will ensure that all the data needed for successful performance monitoring was collected.

If running a new probe does not resolve the error, it may be necessary to reset the SMI agent. It may not be obvious when a SMI agent is returning incorrect or incomplete data, especially when using multiple, different types of agents to probe the switch. Stop and restart the SMI agent and run the probe again.

HWNPM0293I Performance monitoring is unavailable for FlashSystem resource_name because its SNMP agent is disabled. You can enable SNMP for FlashSystem storage systems in the FlashSystem GUI<a>.

Explanation

Collection of performance data from a FlashSystem 840 or FlashSystem 900 requires the use of an SNMP data source. If the FlashSystem SNMP agent is not enabled, the performance monitor for that system fails with this message.

Action

Go to the management GUI of the FlashSystem storage system, then go to the SNMP Settings page, set the SNMP v1 Read Community name, and enable the SNMP agent. The SNMP agent for the FlashSystem storage system supports only SNMPv1 for authentication. If using SNMPv1 for authentication is unacceptable in your environment due to security reasons, do not enable the SNMP agent. If the SNMP agent is not enabled you cannot collect performance data from your FlashSystem storage system.

If IBM Spectrum Control is already monitoring the FlashSystem storage system, run another probe after you enable the SNMP Agent. To run a probe, go the Storage Systems page, right-click the storage system, and click Data Collection > Start Probe. After the probe completes successfully, run the performance monitor again.

HWNPM0300E There is an exception for each device processed in a multiple devices call.

Explanation

Because each device got an exception during the process, the method call will throw the first exception in the result array as the general exception for multiple devices.

Action

None.

HWNPM0390E A system failure occurred.

Explanation

A system failure occurred, which caused the operation to fail.

Action

None.

HWNPM0400I This operation (operation name) on Threshold Service was successful.

Explanation

None.

Action

None.

HWNPM0401E The device (*device_id*) that was passed to the method is invalid.

Explanation

The device is null or is not supported.

Action

Provide the correct device to the method.

HWNPM0410E The Performance threshold policy that was passed to the method (*threshold policy*) is null.

Explanation

The specified policy is invalid and could not be successfully set into effect. The previous performance threshold policy remains in effect for the associated device(s).

Action

Please ensure that all applicable rules were followed when the new policy was created.

HWNPM0411E The Performance threshold that was passed to the method (*threshold*) is null.

Explanation

The performance threshold is null.

Action

Provide a valid performance threshold to the method.

HWNPM0412E The Performance threshold filter that was passed to the method (*filter*) is null.

Explanation

The performance threshold filter is null.

Action

Provide a valid performance threshold filter to the method.

HWNPM0420E The device type received (*device_type*) is invalid.

Explanation

A device type is null or not supported by the IBM Spectrum Control system.

Action

Provide the correct device type to the method.

HWNPM0421E There is no default performance threshold policy or default threshold filter for this device.

Explanation

A default performance threshold policy and threshold filter should exist. These values are shipped with the product.

Action

Re-install the database.

HWNPM0425E There is an exception for each device processed in a multiple devices threshold call.

Explanation

Because each device received an exception during the process, the method call will throw the first exception in the result array as the general exception for multiple devices.

Action

None.

HWNPM0590E Performance Manager failed due to system failure.

Explanation

A system failure occurred which caused the failure of the operation.

Action

None.

HWNPM0600E Parameter number *a number* of the call made to the IBM Spectrum Control Performance Manager reporting API *method name of the api* is invalid. The invalid value is the invalid value of parameter *descriptive name of the parameter*.

Explanation

The caller of a Performance Manager reporting API receives a TPCMessage object containing this message if an API call fails with an InvalidParameterException. The message states what the invalid parameter is.

Action

The InvalidParameterException indicates the caller of the API passed an invalid value in one of the parameters. Usually this indicates an error in the implementation of the calling function. You will need to report the failure to the personnel supporting that function.

HWNPM0601E A request to continue the data retrieval can not be performed. Information for continuing the data retrieval does not exist.

Explanation

The caller of a Performance Manager reporting API receives a TPCMessage object containing this message, as part of an InvalidParameterException. The message states what the invalid parameter is.

Action

The exception might have occurred because the continuation state information has been deleted. The information might have been deleted by an explicit close request, or because a time limit exceeded because the previously initiated request, or because the continuation parameter was set incorrectly by the application.

HWNP0602E Support for the device type *device type name* is not available in the Performance Manager reporting API function *method name*.

Explanation

A caller invoked the specified Performance Manager reporting API function. Device-type specific support needed by that function is not currently available in IBM Spectrum Control.

Action

Report the problem to IBM support.

Related reference

- [Getting support](#)

HWNP0603E The performance reporting API *method_name* failed at *time_of_failure* as a result of an internal processing exception. The Performance Manager logs contain message *message_ID* that describes the internal processing exception.

Explanation

The caller of the reporting API receives a TPCMessage object containing this message if an API call fails with a TPCTServerException.

Action

The TPCTServerException indicates a condition beyond the control of the caller of the API. In some cases, retrying the API call might succeed. In other cases, you must report the failure to the personnel supporting your product. Include the information contained in this message in your report.

HWNP0604E The sort order parameter of a call to the performance reporting API *method_name* contains a value not included in the report columns list, at position *list_item* in the sort order list.

Explanation

The caller of a product reporting API receives a TPCMessage object containing this message if an API call fails with an InvalidParameterException. A value in the sort order list does not appear in the report columns list as is required.

Action

The metrics identified to be sorted on must be included in the list of report column metrics.

HWNP0605E Performance metadata cannot be displayed.

Explanation

This problem might occur when metadata is not available for the selected time range or device, or when the cache, cookies, and history in your web browser need to be cleared to refresh the GUI with the latest metadata.

Action

In some cases, you can clear the cache, cookies, and history in your web browser to resolve the problem.

In Mozilla Firefox:

1. Click Tools > Options and select Privacy and Security.
2. Under Cookies and Site Data, click Clear Data.
3. Under History, click Clear History.

In Google Chrome:

1. Click Settings and select Privacy and security.
2. Click Clear browsing data, accept the default choices, and click Clear data.

After the cache, cookies, and history is cleared, click the browser refresh button to update the product GUI.

For more detailed and up-to-date instructions about how to clear the cache, cookies, and history in different types and versions of web browsers, refer to the documentation for those browsers.

HWNPM0606E Unable to instantiate performance reporting service service class name.

Explanation

A failure occurred trying to instantiate the performance reporting service of Performance Manager. This usually indicates an internal error.

Action

If you have made changes to the PM configuration file, reverse those changes. Try to restart the IBM Spectrum Control Device Server service. If the problem persists, contact your IBM support representative.

Related reference

-  [Getting support](#)

HWNPM0607E An error occurred while the performance data was being retrieved.

Explanation

An error occurred that caused a delay in presenting the performance data that was being retrieved for the storage system and its resources.

Action

Wait a few minutes and try again. If you still can't see the performance data, go to the IBM Support page (<https://www.ibm.com/mysupport/>) where you can chat with an expert, browse troubleshooting topics and forums, open support cases, and access IBM Documentation.

HWNPM0630E An invalid operator (*operator identifier*) was specified for the filter expression.

Explanation

The caller of the performance reporting filter related constructor or method specified an invalid operator identifier.

Action

The application should use a valid operator identifier as described in the documentation of the method or constructor.

HWNPM0631E An invalid first operand (*operand class*) was specified for the filter expression. It must be a *operand class* class.

Explanation

The caller of the performance reporting filter related constructor or method specified an invalid first operand. The operand should be of the indicated type.

Action

The application should use a valid operand type as described in the documentation of the method or constructor.

HWNPM0632E An invalid first operand was specified for the filter expression. The data type of the operand (*data type*) is invalid or unsupported.

Explanation

The caller of the performance reporting filter related constructor or method specified an invalid first operand. The operand, usually an ICounter, should have a valid data type.

Action

The application should use a valid data type as described in the documentation of the method or constructor.

HWNPM0633E An invalid second operand (*operand class*) was specified for the filter expression. It must be a *operand class* class.

Explanation

The caller of the performance reporting filter related constructor or method specified an invalid second operand. The operand should be of the indicated type.

Action

The application should use a valid operand type as described in the documentation of the method or constructor.

HWNPM0650E The IBM Spectrum Control Performance Manager reporting API *method name* failed as a result of exception *the related exception* from a call to method *method name*, of the *lower-level service name* internal service.

Explanation

The Performance Manager reporting API received an exception from a call to an internal processing function. The exception resulted in failure of the reporting API call.

Action

Examine the log entries from the specified internal service for aid in determining the cause of the received exception.

HWNPM0651E The configuration data needed to generate the affected volumes and hosts report for the device *device name* was not found in the IBM Spectrum Control database.

Explanation

The configuration data of the device at the time the threshold or constraint violation occurred is not present in the database. The affected volumes and hosts report cannot be generated in absence of the device configuration data.

Action

Contact your IBM support representative.

HWNPM0652E The requested performance metrics are no longer available. Clear your browser cache to proceed.

Explanation

The performance metrics are not available.

Action

Clear your web browser cache and cookies. To learn how, see your web browser documentation .

HWNPM2000I Performance monitoring is enabled.

Explanation

The ability to monitor the performance of resources is enabled.

Action

To monitor the performance of a storage system or switch, schedule a performance monitor for that resource. Performance monitors can collect performance data daily and enable you to track trends and identify performance bottlenecks.

HWNPM2001E The IBM Spectrum Control Performance Manager is not operational.

Explanation

The Performance Manager component of IBM Spectrum Control is not running or has been stopped.

Action

Restart the Performance Manager Service and try again.

HWNPM2002E An initialization error occurred.

Explanation

A failure occurred during the initialization of a service of the Device server.

Action

Stop and restart the Device server and try the action again.

HWNPM2003E Initialization of the Device server event service failed. No performance threshold exception alerts will be generated.

Explanation

A failure occurred initializing the Device server event service. This means that no internal performance monitoring events can be externalized, including any threshold exception events that would normally cause the configured alerts to be generated. However, threshold exceptions are still logged and can be displayed using constraints

violation reports.

Action

Restart the Device Server service. If the problem continues, contact IBM Software Support.

Related reference

- [Getting support](#)

HWNPM2004E Initialization of the product scheduler status service failed. The status of performance monitors will not be updated in the GUI.

Explanation

A failure occurred initializing the Device Server scheduler status service. This means that the Device server cannot update the status of any performance monitor jobs to be visible in the GUI. However, the monitors will continue to run normally, collecting performance data for their associated devices.

Action

Restart the Device Server service. If the problem continues, contact IBM Software Support.

Related reference

- [Getting support](#)

HWNPM2005E Initialization of the product configuration data service failed. Performance monitors cannot be started without this service.

Explanation

A failure occurred while initializing the configuration data service. No new performance monitors can be started, and restarting prior monitors will fail.

Action

Restart the Device Server service. If the problem continues, contact IBM Software Support.

Related reference

- [Getting support](#)

HWNPM2006E Initialization of the product configuration data service failed. Performance monitors cannot be started without this service.

Explanation

A failure occurred while initializing the performance data service. No new performance data collected from the devices can be saved in the database. Normally, performance monitors will terminate under these circumstances.

Action

Restart the Device server service. If the problem continues, contact IBM Software Support.

Related reference

- [Getting support](#)

HWNPM2007E Initialization of the product counter data service failed for device type using agent type. Performance monitors will not be able to collect performance data from devices of this type.

Explanation

A failure occurred while initializing the counter data service. No new performance data can be collected from the devices of this type. This might be a transient failure due to the state of the product environment.

Action

Retry the operation. If the problem continues, contact IBM Software Support.

Related reference

- [Getting support](#)

HWNPM2008E Initialization of the product metadata service failed. Performance monitors cannot be started without this service.

Explanation

A failure occurred while initializing the metadata service. No new performance monitors can be started, and restarting prior monitors will fail.

Action

Restart the Device server service. If the problem continues, contact IBM Software Support.

Related reference

- [Getting support](#)

HWNPM2009E Unable to instantiate lower level service *service_class_name*.

Explanation

A failure occurred while trying to instantiate a particular lower level product service. This usually indicates an internal error.

Action

If you have made changes to the [TPC_installation_directory]\device\conf\pm.conf configuration file, reverse those changes. Restart the Device server service. If the problem continues, contact IBM Software Support.

Related reference

- [Getting support](#)

HWNPM2010E Unable to instantiate the collection logic *implementation service class name*.

Explanation

A failure occurred trying to instantiate a particular implementation class in the Performance Manager. This usually indicates an internal error.

Action

Contact your IBM support representative.

Related reference

- [Getting support](#)

HWNPM2011E Unable to instantiate the performance statistics data class *class name*.

Explanation

A failure occurred trying to instantiate a particular data class in the Performance Manager. This usually indicates an internal error.

Action

Contact your IBM support representative.

Related reference

- [Getting support](#)

HWNPM2012I The product is using trace log directory log directory name .

Explanation

The specified log directory is in use.

Action

No action is required.

HWNPM2020W The performance monitor for device *device name* is not currently active, so a dynamic update of its monitor policy is not necessary.

Explanation

An attempt was made to dynamically update the monitor policy for a particular device, but the performance monitor for that device was not active. Policies have to be dynamically updated only for running monitors; for all other monitors updates are static, and take effect when the monitor for that device is started again.

Action

The policy updates are saved in the database, and will take effect when the performance monitor for the device is started. There is no effect on any other running monitors.

HWNPM2021W The performance monitor for device *device name* is not currently active, so a dynamic update of its threshold policy is not necessary.

Explanation

An attempt was made to dynamically update the threshold policy for a particular device, but the performance monitor for that device was not active. Policies have to be dynamically updated only for running monitors; for all other monitors updates are static, and take effect when the monitor for that device is started again.

Action

The policy updates are saved in the database, and will take effect when the performance monitor for the device is started. There is no effect on any other running monitors.

HWNPM2022E A performance monitor for device *device name* is already active. A new monitor for the same device cannot be started until the previous monitor completes or is cancelled.

Explanation

An attempt was made to start a new performance monitor for the specific device. There can be only a single performance monitor active within the IBM Spectrum Control environment for an individual device. Attempts to start a new monitor while a previous one is still running will fail.

Action

Cancel the previous monitor for the device before starting a new one, if so desired.

HWNPM2023W The performance monitor for device *device_name* is not currently active.

Explanation

An attempt was made to stop an existing performance monitor for the device. However, the performance monitor for that device was not active.

Action

No action is required.

HWNPM2024E Unable to find a monitor policy applicable to resource *resource name*.

Explanation

While starting a performance monitor for the specific resource, the monitor policy for the resource could not be determined. This error usually indicates a database access problem, because a policy is always in effect for every resource, even if it is only the default policy. However, a new performance monitor cannot be started for the resource until the problem is resolved.

Action

Try the following actions:

- Verify that the local area network is available.
- Verify that that the database repository is up and running
- Verify that the related database service is active.
- Start the performance monitor again.

HWNPM2025E Unable to find a threshold policy applicable to resource *resource_name*.

Explanation

While starting a performance monitor for the specific resource, the threshold policy for the resource could not be determined. This error usually indicates a database access problem, because a policy is always in effect for every resource, even if it is only the default policy. However, a new performance monitor cannot be started for the resource until the problem is resolved.

Action

Try the following actions:

- Verify that the local area network is available.
- Verify that that the database repository is up and running
- Verify that the related database service is active.
- Start the performance monitor again.

HWNPM2026I The performance monitor's primary process has failed unexpectedly. Attempting to recover from the failure.

Explanation

During the operation of the performance monitor a failure occurred which caused the monitor's primary process to be terminated. The Performance Manager will attempt to automatically recover from the failure by restarting the failed process. Performance data collection will be interrupted temporarily until the process has been successfully restarted.

Action

No action is required. To view information about the failure, view the trace logs. Additional messages will be issued to indicate the success or failure of the restart attempt.

HWNPM2027I The performance monitor threshold checker has failed unexpectedly. Attempting to recover from the failure.

Explanation

During the operation of the performance monitor a failure occurred which caused the monitor's threshold checker to be terminated. The Performance Manager engine will attempt to automatically recover from the failure by restarting the failed threshold checker. No thresholds will be generated for the performance data collected in the current interval.

Action

No action is required. For additional information, check the trace logs. Additional messages will be issued to indicate the success or failure of the attempt to restart the threshold checker.

HWNPM2028I The performance monitor purge process has failed unexpectedly. Attempting to recover from the failure.

Explanation

During the operation of the performance monitor a failure occurred which caused the monitor's purge processor to be terminated. The Performance Manager engine will attempt to automatically recover from the failure by restarting the failed purge processor. The purging of expired performance data will be interrupted temporarily until the process has been successfully restarted.

Action

No action required. For additional information, see the trace logs. Additional messages will be issued to indicate the success or failure of the recovery attempt.

HWNPM2029I Successfully recovered from the performance monitor failure.

Explanation

The automatic recovery attempt of the earlier failure was successful. The subject process has been restarted, and the performance monitor will continue to operate.

Action

None.

HWNPM2030E Unable to recover from the performance monitor failure. The performance monitor for the storage resource will be shut down.

Explanation

The attempt to restart the performance monitor failed.

Action

Restart the performance monitor. For additional information regarding the cause of the original failure, or the failure to restart the performance monitor, see the trace logs. If the problem persists, contact IBM Support.

Related reference

- [Getting support](#)

HWNPM2031E The performance monitor failed due to an internal error.

Explanation

If the error is recoverable, the performance manager will attempt to restart. This failure might be temporary, and will result in a temporary disruption of performance data collection for the device.

Action

Restart the performance monitor if it does not restart automatically. For additional information regarding the cause of the original failure, or the failure to restart the performance monitor, see the trace logs. If the problem persists, contact IBM Support.

Related reference

- [Getting support](#)

HWNPM2032W The performance monitor for device *device name* is not currently using the default monitor policy, so a dynamic update of the policy is not necessary.

Explanation

An attempt was made to dynamically update the default monitor policy for a particular device, but the performance monitor for that device is using an already customized monitor policy rather than the default policy. The update is ignored for this device.

Action

The new default monitor policy may have an affect on the running performance monitors of other devices, but it will not affect the running performance monitor of this device. To modify the behavior of the performance monitor of this device, please update the custom monitor policy in effect for this device.

HWNPM2033W The performance monitor for device *device name* is not currently using the default threshold policy, so a dynamic update of the policy is not necessary.

Explanation

An attempt was made to dynamically update the default threshold policy for a particular device, but the performance monitor for that device is using an already customized threshold policy rather than the default policy. The update is ignored for this device.

Action

The new default threshold policy may have an affect on the running performance monitors of other devices, but it will not affect the running performance monitor of this device. To modify the behavior of the performance monitor of this device, please update the custom threshold policy in effect for this device.

HWNPM2040E The device key specified for the snapshot vote (*key*) was not found in the database. The device does not exist.

Explanation

During the internal operation of the product, an invalid device ID was used.

Action

This issue resolves without user action. If these error messages persist, contact your IBM support representative. If this error message persists, contact IBM Software Support.

- [Getting support](#)

HWNPM2050E Failed to get the latest configuration data for device *device_name*.

Explanation

There was an error either in getting a reference for the Device server configuration data service, or in retrieving the latest configuration data for the device using the reference to the configuration data service.

Action

Try to run a probe for the device. If the problem continues, contact IBM Software Support.

Related reference

- [Getting support](#)

HWNPM2051E No performance data was collected from device *device_name* for the current collection interval (*time_stamp*) because the performance monitor was stopped.

Explanation

The performance monitor was stopped while it was collecting data from the device.

Action

No action is required.

HWNPM2052E No performance data was collected from device *device_name* for the current collection interval due to an error. Data was last collected at *time_stamp*.

Explanation

No performance data was received from the device for the current collection interval. This could be due to an internal error, or a problem communicating with the device or device agent.

Action

No action is required. The current performance monitor is not affected and will continue to try to collect performance data for the device.

HWNPM2053E The new performance data collected from device *device_name* could not be saved in the database. Increase the size of the transaction log.

Explanation

The transaction log size of the database is too low. This is preventing large transactions such as performance data collections from being saved to the database. The current set of performance data could not be saved.

Action

Increase the size of your database transaction log and try the operation again.

HWNPM2054E The new performance data collected from device *device_name* could not be saved in the database. Increase the size of the database lock list.

Explanation

The lock list size of the database is too low. This is preventing large transactions such as performance data collections from being saved to the database. The current set of performance data could not be saved.

Action

Increase the size of your database lock list and try the operation again.

HWNPM2055E The new performance data collected from resource *device name* could not be saved.

Explanation

An error occurred when the product attempted to save performance data about the resource.

Action

Try the following actions:

- Verify that the local area network is available.
- Check the status of the Device server on the Home > System Management page.
- Check for error messages in the log file of the Device server.
- Verify that the database repository is up and running.
- Verify that the related database service is active.
- Try the action again.

For more information about troubleshooting, go to IBM Documentation at <https://www.ibm.com/docs/en/spectrum-control>.

HWNPM2056E No performance data was collected from device *device name* for the current performance monitor job duration. The performance monitor job status is set to 'failed'.

Explanation

No performance data was received from the device for the current job duration. This could be due to the fact that there are no IOs on the device.

Action

None. The running performance monitor is not affected, and will continue to try to collect performance data for the device until the duration has elapsed.

HWNPM2057E No performance data was collected from device *device_name* for the current collection interval because the performance monitor was stopped.

Explanation

The performance monitor was stopped while it was collecting data from the device.

Action

No action is required.

HWNPM2058E No performance data was collected from device *device_name* for the current collection interval due to an error.

Explanation

No performance data was received from the device for the current collection interval. This could be due to an internal error, or a problem communicating with the device or device agent.

Action

No action is required. The current performance monitor is not affected and will continue to try to collect performance data for the device.

HWNPM2060W The device does not support performance management for segment pool *pool ID*. Only incomplete performance data can be collected for array *array ID*.

Explanation

The specified segment pool contains multiple ranks, which makes it impossible to accurately manage the performance for those ranks, the arrays associated with those ranks, and the device adapters associated with those arrays.

For DS6000 and DS8000 devices whenever a segment pool contains multiple ranks, any volumes allocated in that segment pool might be spread across those ranks in an unpredictable manner. This makes it impossible to determine the performance impact of the volumes on the individual ranks. To avoid presenting the user with inaccurate or misleading performance data, the Performance Manager does not attempt to compute the performance metrics for the affected arrays and device adapters.

Action

None.

HWNPM2061W The device does not support performance management for segment pool *pool ID*. Only incomplete performance data can be collected for device adapter *DA ID*.

Explanation

The specified segment pool contains multiple ranks, which makes it impossible to accurately manage the performance for those ranks, the arrays associated with those ranks, and the device adapters associated with those arrays.

For DS6000 and DS8000 devices whenever a segment pool contains multiple ranks, any volumes allocated in that segment pool might be spread across those ranks in an unpredictable manner. This makes it impossible to determine the performance impact of the volumes on the individual ranks. To avoid presenting the user with inaccurate or misleading performance data, the Performance Manager does not attempt to compute the performance metrics for the affected arrays and device adapters.

Action

None.

HWNPM2062W Invalid error message saved in database

Explanation

The program tried to save an error message in the database, but that message was invalid.

Action

None.

HWNPM2100E The performance monitor for resource *device name* cannot be started because configuration data for the resource is not available.

Explanation

When a performance monitor was started for the resource, configuration data for the resource could not be retrieved, or configuration data for historical purposes could not be copied.

Action

Try the following actions:

- Verify that the local area network is available.
- Check the status of the Device server on the Home > System Management page.
- Check for error messages in the log file of the Device server.
- Verify that that the database repository is up and running.
- Verify that the related database service is active.
- Try the action again.

For more information about troubleshooting, go to IBM Documentation at <https://www.ibm.com/docs/en/spectrum-control>.

HWNPM2101E All agents that can collect performance data for resource *device name* are currently non-operational.

Explanation

A performance monitor could not collect performance data with the agents that are configured for the resource. When this error occurs, the performance monitor will be stopped or it will retry the agents periodically until an operational agent is found. You can determine which action is taken by selecting an option for the Sampling Failed alert in the definition of the performance monitor.

Action

To resolve the problem, try the following actions:

- Verify that the local area network is available.
- Verify that that the agents for the resource are up and available.
- Verify that the product can communicate with at least one of the agents.
- Verify that the resource is up and available.
- Start the performance monitor again.

HWNPM2102E The performance monitor for resource *device name* cannot be started because the resource might not support the collection of performance data.

Explanation

When a performance monitor starts, the product verifies that the monitored resource supports the collection of performance data. If performance support cannot be verified, the following problems might exist: the resource does not support performance data collection, older microcode exists on the resource, or the associated SMI-S provider is an older version.

Action

If you believe that the resource does support performance data collection, ensure that the proper microcode levels are installed on that resource and the associated SMI-S provider is up to date. If the problem persists, contact the vendor of the resource.

HWNPM2103W Agent *agent name* is non-operational. Attempting to find an alternative agent.

Explanation

The agent that has been used to retrieve performance statistics from the resource is no longer returning statistics. Contact with a different agent will be attempted, if one is defined. There will be additional messages issued to notify you whether the attempted change in agents was successful.

Action

Ensure that the specified agent is up and running. Respond to any further messages.

HWNPM2104I The performance monitor policy was adjusted due to agent limitations. Current values in effect are: *interval-length=interval-length, frequency=frequency*.

Explanation

After switching to an alternative agent, it may be necessary to adjust the performance manager policy because different types of agents may have different capabilities. If the new agent does not support as low an interval-length or frequency as the previous agent, this message is issued, and the policy that is in effect is temporarily adjusted as indicated in the message.

Action

None. The policy in effect will return to the original user-specified values after the original agent is reestablished for performance data collection for the monitor.

HWNPM2105E The performance monitor for resource *resource name* failed because the resource for enabling performance data collection cannot be reached.

Explanation

When starting a performance monitor for the resource, a connection to the resource or associated agent could not be established. This problem might occur when there is a network problem, or there is an undiscovered change in the network attributes of the resource or associated agent, such as a change to an IP address or port number. It might also occur when the resource or associated agent is down or not available.

Action

If the networking attributes of the resource or associated agent have changed, run a probe. Ensure that the proper user name and password is being used, and (if applicable) certificate files were specified for communication with the resource or agent.

Ensure that a network path exists to resource or agent, including appropriate pass-through of any firewalls between the two network end-points. If you suspect network connectivity problems, contact your network administrator.

Ensure that the resource or agent is operational. Check the log files to verify that no errors exist that would prevent it from accepting connection requests.

HWNPM2106E The performance monitor for device *device name* failed because of errors trying to enable performance data collection on the device or device agent: *error description*

Explanation

While starting a performance monitor for the specific device, the Performance Manager was able to establish a connection to the device or device agent, but was unable to initiate performance data collection on the device and/or device agent.

Action

Ensure that the device and/or device agent are fully operational. Check for error condition in the logs of the device or device agent.

HWNPM2107E The performance monitor for device *device name* failed because of unrecognized errors trying to enable performance data collection on the device or device agent: *error description*

Explanation

While starting a performance monitor for the specific device, the Performance Manager was able to establish a connection to the device or device agent, but was unable to initiate performance data collection on the device and/or device agent. This might be due to an internal error in the IBM Spectrum Control Performance Manager.

Action

Ensure that the device and/or device agent are fully operational. Retry the operation. If the problem persists, contact your IBM support representative.

Related reference

- [Getting support](#)

HWNPM2108E The performance monitor for resource *resource name* failed during shutdown because the resource cannot be reached for terminating data collection.

Explanation

When stopping a performance monitor for the resource, a connection to the resource or associated agent could not be established. This problem might occur when there is a network problem, or there is an undiscovered change in the network attributes of the resource or associated agent, such as a change to an IP address or port number. It might also occur when the resource or associated agent is down or not available.

Action

If the networking attributes of the resource or associated agent have changed, run a probe. Ensure that the proper user name and password is being used, and (if applicable) certificate files were specified for communication with the resource or agent.

Ensure that a network path exists to resource or agent, including appropriate pass-through of any firewalls between the two network end-points. If you suspect network connectivity problems, contact your network administrator.

Ensure that the resource or agent is operational. Check the log files to verify that no errors exist that would prevent it from accepting connection requests.

Because the performance monitor is shutting down anyway, there is no immediate affect on operations. However, some resources or agents might not allow a subsequent restart of performance data collection, unless the previous collection was terminated properly. For some resources, leaving performance data collection activated can cause additional burden when processing their related resources. In either case, you can also try to manually stop the performance data collection on the resource by using the interface for that resource.

HWNPM2109E The performance monitor for resource *resource name* failed during shutdown because of errors during termination of performance data collection: *error description*

Explanation

When stopping a performance monitor for the resource, a connection was established, but the process for collecting performance data could not be terminated. This problem might occur when there is a network problem, or there is an undiscovered change in the network attributes of the resource or associated agent, such as a change to an IP address or port number. It might also occur when the resource or associated agent is down or not available.

Action

Because the performance monitor is shutting down anyway, there is no immediate affect on operations. However, some resources or agents might not allow a subsequent restart of performance data collection, unless the previous collection was terminated properly. For some resources, leaving performance data collection activated can cause additional burden when processing their related resources. In either case, ensure that the resource or agent are fully operational. Check for error condition in the logs of the resource or agent. You can also try to manually stop the performance data collection on the resource using the interface for that resource.

HWNPM2110E The performance monitor for resource *resource name* failed during shutdown because of unrecognized errors during termination of performance data collection: *error description*

Explanation

When stopping a performance monitor for the resource, a connection was established, but the process for collecting performance data could not be terminated. This might be due to an internal error in the product.

Action

Because the performance monitor is shutting down anyway, there is no immediate affect on operations. However, some resources or agents might not allow a subsequent restart of performance data collection, unless the previous collection was terminated properly. For some resources, leaving performance data collection activated can cause additional burden when processing their related resources. In either case, try to manually stop the performance data collection on the resource by using the interface for that resource. If the problem persists, contact IBM Software Support.

HWNPM2111E The performance monitor for resource *resource name* failed because of errors retrieving the most recent configuration data for the resource.

Explanation

When starting a performance monitor for the resource, its configuration data could not be retrieved and processed. This problem might occur when there is corrupt or invalid configuration data in the database repository.

Action

Try running a probe job for the resource and starting the performance monitor again. If the problem persists, contact IBM Software Support.

Related reference

- [Getting support](#)

HWNPM2112I Agent *agent name* was selected for performance data collection from resource *resource name*.

Explanation

This message shows how performance data was collected for the resource. Performance data can be collected either through an SMI-S provider or a direct connection. This message is useful in environments where there are multiple agents that manage the same resource.

Action

No further action is required.

HWNPM2113I The performance monitor for resource *resource name* is starting in an active state.

Explanation

Performance monitors start in an active state when initiated due to a user or a scheduled action, or due to a server restart when the monitor was previously active and has not reached its intended duration. The monitor will collect performance data from the resource when its initialization has completed.

Action

No further action is required.

HWNPM2114I The performance monitor for resource *resource name* is starting in a dormant state.

Explanation

Performance monitors start in a dormant state due to a server restart, if the monitor was previously dormant or if it was previously active and has reached its intended duration. A dormant monitor does not collect new performance data from its associated resource, but only performs basic maintenance functions such as summarization and purge processing.

Action

No further action is required. If you want to reactivate the performance monitor, schedule or run it immediately.

HWNPM2115I Monitor Policy: name=*policy name*, creator=*policy creator*, description=*policy description*

Explanation

This message provides information regarding a particular performance monitor policy that is in effect for a particular device.

Action

None.

HWNPM2116I Monitor Policy: retention period: sample data=*length in days* days, hourly data=*length in days* days, daily data=*length in days* days.

Explanation

This message provides information about a performance monitor policy that is in effect for a resource.

Action

No further action is required.

HWNPM2117I Monitor Policy: interval length=*length in seconds* secs, frequency=*length in seconds* secs, duration=*length in hours* hours.

Explanation

This message provides information about a performance monitor policy that is in effect for a resource.

Action

No further action is required.

HWNPM2118I Threshold Policy: name=*policy name*, creator=*policy creator*, description=*policy description*

Explanation

This message provides information about a performance monitor threshold policy that is in effect for a resource.

Action

No further action is required.

HWNPM2119I Threshold Policy: retention period: exception data=*length in days* days.

Explanation

This message provides information about a performance monitor threshold policy that is in effect for a resource.

Action

No further action is required.

HWNP2120I Threshold Policy: *threshold name=name, component=component type, enabled=Yes or No, boundaries=critical stress boundary,warning stress boundary,warning idle boundary,critical idle boundary units.*

Explanation

This message provides information about a performance monitor threshold policy that is in effect for a resource.

Action

No further action is required.

HWNP2121I Monitor Policy: *interval length=length in seconds secs, frequency=length in seconds secs, duration=continue indefinitely.*

Explanation

This message provides information about a performance monitor policy that is in effect for a resource.

Action

No further action is required.

HWNP2122W No valid performance data was provided by the monitored resource. No performance data records were inserted into the database.

Explanation

The performance monitor contacted the resource and tried to collect data. However, the resource did not provide valid performance counter information.

If message HWNP2124W is also displayed, the resource was able to provide performance data, but it was determined to be invalid and discarded.

Action

The operation of the performance monitor is not affected, and it will attempt to retrieve performance data again for the next sample interval. If the monitored resource continues to provide no performance data, ensure that it is fully operational. If appropriate, also ensure that performance functionality is enabled for the resource.

HWNP2123I Performance data for resource *timestamp date and time* was collected and processed successfully. *record count* performance data records were inserted into the database repository.

Explanation

This message provides information for an active performance monitor. The performance data was collected at the indicated resource time in the server timezone. The indicated number of performance statistics records were saved in the database repository. The saved information was either received from the resource, or was computed based on the information received from the resource.

Action

None.

HWNPM2124W Performance data continuity is broken. The device was possibly reset or rebooted. record count performance data records were discarded.

Explanation

The message indicates that invalid performance information was received from the device.

In general, performance information is represented as a set of ever-increasing counters, and actual statistics are computed by taking the difference between two consecutive sets of such counters.

However, if a counter appears to decrease rather than increase between consecutive sets, the information is unusable and is discarded.

Counters can be expected to decrease if they are reset to zeros, which might happen normally when a device is reset or rebooted. For example, when new firmware is loaded, or in some cases when a device agent (such as an SMI-S provider) is reset or rebooted. In those situations, this warning message can be safely ignored.

If this warning is displayed when no reset or restart happened, the device or device agent might be generating incorrect performance statistics. You might have to contact your device vendor for further instructions.

Action

Determine whether the device or device agent was reset or rebooted.

Those situations include loading of new firmware, or fail-over and fail-back scenarios for Enterprise Storage Server, DS6000, and DS8000 storage subsystems.

In any of these cases, the reset of performance counters is expected behavior, and this warning message can be safely ignored. If it is not one of these cases, the device might be generating incorrect performance data, which might or might not lead to inaccurate performance reports.

Contact your device vendor for further instructions in those cases.

HWNPM2125W Aggregated performance values have been computed from the remaining data records, but their accuracy cannot be guaranteed.

Explanation

This message only appears in combination with message HWNPM2124W. See the description of this message for background information on the condition that has occurred. Configuration parameter PM.LimitCheckLenient controls whether or not any data will be saved in the IBM Spectrum Control database when HWNPM2124W occurs. If set to true, then only those performance records where invalid counters were specifically detected are discarded (indicated with message HWNPM2124W), but all other data for that sample interval is saved (indicated with message HWNPM2123I). However because a number of records had to be discarded, any performance statistics derived from the remaining data (for example the aggregated statistics for the entire subsystem) will be inaccurate because they will not include the activity represented by that discarded data.

Action

Use any performance data saved for this sample interval cautiously, due to its inherent inaccuracy. To avoid such potentially inaccurate values from being saved in the IBM Spectrum Control database, you can set the PM.LimitCheckLenient configuration parameter back to false by running the following command:

```
setdscfg -property PM.LimitCheckLenient -context PerformanceManager false
```

However this will mean that no performance data will be saved in the database for any sample intervals where invalid counters are detected.

HWNPM2126I The performance monitor for device *device name* is stopping because its intended duration has elapsed.

Explanation

Performance monitors with a preset duration end when that duration has elapsed. The monitor job might show normal completion or failure, depending on the success or failure of the data collection process during its life.

Action

None. If you want to reactivate the monitor, start another monitor job for the device.

HWNPM2127I The performance monitor for device *device name* is stopping due to a user request.

Explanation

The performance monitor is ending because a user requested the monitor to stop. A user request can be submitted either from the IBM Spectrum Control graphical user interface, or the IBM Spectrum Control command line interface.

Action

None. If you want to reactivate the monitor, start another monitor job for the device.

HWNPM2128E The performance monitor for device *device name* is stopping due to an unexpected failure.

Explanation

The performance monitor is ending due to an environmental condition or due to an internal error. Additional messages prior to this message indicate the cause of the failure.

Action

In case of an environmental condition, such as a network problem, correct the problem and restart the monitor. In case of an internal error, contact your service representative. For additional details regarding the cause of the failure, see the trace logs.

Related reference

HWNPM2129I The performance monitor for device *device name* is stopping because of a shutdown request.

Explanation

The performance monitor is ending because the IBM Spectrum Control Performance Manager Service is shutting down, usually due to the IBM Spectrum Control device server being stopped.

Action

None. When the Performance Manager Service is restarted, the previously running monitors will be automatically restarted, as long as their originally intended duration has not been exceeded.

HWNPM2130W Failed to retrieve the latest configuration data for device *device name*.

Explanation

During the normal operation of a performance monitor, it will periodically attempt to retrieve the latest configuration data for its associated device. This attempt failed for the monitor of the specified device.

The immediate operation of the running performance monitor is unaffected. However if the failure persists for prolonged periods of time, it is possible that a discrepancy between the saved performance data collected from the device and the configuration data of that device could develop. In that case, the performance reports or any advanced analysis of the performance data might yield misleading results.

Action

Try running a probe job for the specific device, and retry starting the performance monitor. If the problem persists, contact your IBM support representative.

HWNPM2131W Performance data could not be collected for device *device name*, because the device or data source cannot be reached (reason reason code). The current samples are skipped.

Explanation

The current attempt to retrieve a set of performance data from the device failed. No performance data will be inserted for the device in this time period. The next performance data sample recorded into the database might represent an average over more than the configured interval length.

The immediate operation of the running performance monitor is unaffected. The reason code can be used to help identify the exact cause of the problem encountered:

1. Reason Code 0 indicates that the exact reason for the failure could not be determined. This should be a rare occurrence.
2. Reason Code 1 indicates a bad target (device or data source) address. This condition can occur when the user-specified host name or IP address, or the target port number are invalid such that they would cause the formation of an invalid URL or IP Address. This type of failure is rare and can usually also be identified via a `java.net.MalformedURLException` printed in the trace logs.
3. Reason Code 2 indicates the problem to be an unknown target address. This condition can occur when a hostname rather than an IP address was specified as target address, and:
 - either the network is down,
 - the specified hostname cannot be resolved (i.e. the nameserver cannot be contacted, or the nameserver is down, or the specified hostname is not known to the nameserver), or
 - the specified hostname can be resolved by the nameserver but no longer exists on the network.This type of failure can usually also be identified via a `java.net.UnknownHostException` printed in the trace logs.
4. Reason Code 3 indicates the problem to be an unreachable target address. This condition can occur when an IP address rather than a hostname was specified as target address, and either the network or a part of the network is down or is blocked by a firewall (the host cannot be contacted), or the specified IP address does not exist on the network. This type of failure can usually also be identified via a `java.net.NoRouteToHostException` in the trace logs.
5. Reason Code 4 indicates the problem to be an unresponsive target. This condition can occur when the target server is powered off, or when the server is not listening on the port which is the target of the communication (for example if the web server or SMI-S provider is not operational). This type of failure can usually also be identified via a `java.net.ConnectException` printed in the trace logs.
6. Reason Code 5 indicates a communication time-out for communication that uses UDP rather than TCP, for example when using SNMP data sources. This condition can occur when the target server cannot be reached, or when the SNMP data source is disabled on the target server, or when the SNMP port (161) is blocked by a firewall.

Action

If the problem persists for an hour or longer, ensure that your device and data source (if applicable) are operational. Also ensure that a network path exists between the IBM Spectrum Control server and the device or data source, including any appropriate firewall pass-throughs. If there is nothing wrong with the device or device agent, or with the network path, try cancelling and restarting the performance monitor job. If the problem is still not resolved, contact your IBM support representative.

HWNPM2132W Performance data could not be collected for device *device name*. The current samples are skipped. (error description)

Explanation

The current attempt to retrieve a set of performance data from the device failed. No performance data will be inserted for the device in this time period. The immediate operation of the running performance monitor is unaffected. However the next performance data sample recorded into the database might represent an average over more than the configured interval length.

Action

If the problem persists for an hour or longer, ensure that your device and device agent (if applicable) are operational, and that performance data collection is still enabled. Try cancelling and restarting the performance monitor job. If the problem is still not resolved, contact your IBM support representative.

For a NetApp device it is recommended to put all the NetApp volumes online before collecting performance data.

HWNPM2133W Performance data could not be collected for device *device name* due to an unknown error. The current samples are skipped.

Explanation

The current attempt to retrieve a set of performance data from the device failed. No performance data will be inserted for the device in this time period. The immediate operation of the running performance monitor is unaffected. However the next performance data sample recorded into the database might represent an average over more than the configured interval length.

Action

If the problem persists for an hour or longer, ensure that your device and device agent (if applicable) are operational, and that performance data collection is still enabled. Try cancelling and restarting the performance monitor job. If the problem is still not resolved, contact your IBM support representative.

HWNPM2134W The state of the performance monitor for resource *resource name* started, but the status of the performance monitor was not updated.

Explanation

The status of the performance monitor was not updated and won't be shown in the GUI.

Action

Ensure that the product database is up and running. If the problem persists, contact IBM Software Support.

HWNPM2135W The state of the performance monitor for device *device name* has changed to 'active', but could not be recorded appropriately.

Explanation

The state of the specified monitor has changed to 'active'. However the IBM Spectrum Control user interfaces might not be able to display this fact due to a failure in updating the monitor's state record in the database.

Action

This error is usually indicative of a database problem. Ensure that the IBM Spectrum Control database is operational. If the problem persists, contact your IBM support representative.

HWNPM2136W The performance monitor for the resource *resource name* generated a warning, but the status of the performance monitor was not updated.

Explanation

The status of the performance monitor was not updated and won't be shown in the GUI.

Action

Ensure that the product database is up and running. If the problem persists, contact IBM Software Support.

HWNPM2137W The performance monitor for the resource *resource name* stopped, but the status of the performance monitor was not updated.

Explanation

The status of the performance monitor was not updated and won't be shown in the GUI.

Action

Ensure that the product database is up and running. If the problem persists, contact IBM Software Support.

HWNPM2138W The performance monitor for the resource *resource name* completed the collection of data, but the status of the

performance monitor was not updated.

Explanation

The status of the performance monitor was not updated and won't be shown in the GUI.

Action

Ensure that the product database is up and running. If the problem persists, contact IBM Software Support.

HWNPM2139W The performance monitor for the resource *resource name* failed, but the status of the performance monitor was not updated.

Explanation

The status of the performance monitor was not updated and won't be shown in the GUI.

Action

Ensure that the product database is up and running. If the problem persists, contact IBM Software Support.

HWNPM2140W The status of the performance monitor for the resource *resource name* was not updated.

Explanation

The status of the performance monitor was not updated and won't be shown in the GUI.

Action

Ensure that the product database is up and running. If the problem persists, contact IBM Software Support.

HWNPM2141E The service is unavailable because an unexpected error occurred.

Explanation

The request for the performance service wasn't accepted.

Action

Contact IBM Software Support.

- [Getting support](#)

HWNPM2142E Performance data can't be collected for the resource *resource name* because the performance monitor was disabled.

Explanation

The performance monitor must remain enabled until the scheduled collection of the data can be completed. If the performance monitor is disabled by a user, application, or external entity while the performance monitor is running, the collection of performance data can't be completed.

Action

Determine whether another application or user has disabled the collection of performance data for the storage resource and restart the performance monitor.

If the resource or the agent for the resource, such as the SMI-S provider, is shut down or restarted, the performance monitor can be disabled. In such cases, the performance monitor can be restarted after the resource or its agent is restarted.

HWNPM2143E The performance monitor for the resource *resource name* was started, but the status of the performance monitor was not updated and might not be shown in the GUI.

Explanation

The current status of the performance monitor might not be shown in the GUI.

Action

Ensure that the product database is up and running. If the problem persists, contact IBM Software Support.

Related reference

- [Getting support](#)

HWNPM2144W The performance data cannot be checked against the alert conditions, so no alerts can be generated.

Explanation

After every new set of performance data is collected by the performance monitor, the data is checked to determine whether it violates any alert conditions. When violations are detected, the appropriate alerts are generated and any necessary user notifications are sent.

This message indicates that the normal checking against the new data cannot be done. Because the checking cannot be done, violations are not detected, alerts are not generated, and no notifications are sent.

Action

Go to Home > System Management to verify that the Alert Server component and the Database component are up and running. If these components are not operational, restart them. If the problem persists, contact IBM Software Support.

HWNPM2145I The data is being collected by the data collector: *data collector host*.

Explanation

This message is for informational purposes only.

Action

No action is required.

HWNPM2146W Performance data could not be collected for device *device name*, the exact reason for the failure could not be determined. The current samples are skipped.

Explanation

The current attempt to retrieve a set of performance data from the device failed. No performance data will be inserted for the device in this time period. The next performance data sample recorded into the database might represent an average over more than the configured interval length.

The immediate operation of the running performance monitor is unaffected.

Action

If the problem persists for an hour or longer, ensure that your device and device agent (if applicable) are operational. Also ensure that a network path exists between the TPC server and the device or device agent, including any appropriate firewall pass-throughs. If there is nothing wrong with the device or device agent, or with the network path, try cancelling and restarting the performance monitor job. If the problem is still not resolved, contact your IBM support representative.

HWNPM2147W Performance data could not be collected for device *device name*, because of a bad target (device or agent) address. The current samples are skipped.

Explanation

The current attempt to retrieve a set of performance data from the device failed. No performance data will be inserted for the device in this time period. The next performance data sample recorded into the database might represent an average over more than the configured interval length. This condition can occur when the user-specified host name or IP address, or the target port number are invalid such that they would cause the formation of an invalid URL or IP Address. This type of failure is rare and can usually also be identified via a `java.net.MalformedURLException` printed in the trace logs.

The immediate operation of the running performance monitor is unaffected.

Action

If the problem persists for an hour or longer, ensure that your device and device agent (if applicable) are operational. Also ensure that a network path exists between the TPC server and the device or device agent, including any appropriate firewall pass-throughs. If there is nothing wrong with the device or device agent, or with the network path, try cancelling and restarting the performance monitor job. If the problem is still not resolved, contact your IBM support representative.

HWNPM2148W Performance data could not be collected for device *device name*, because of an unknown target address. The current samples are skipped.

Explanation

The current attempt to retrieve a set of performance data from the device failed. No performance data will be inserted for the device in this time period. The next performance data sample recorded into the database might represent an average over more than the configured interval length. This condition can occur when a hostname rather than an IP address was specified as target address, and either the network is down, the specified hostname cannot be resolved (i.e. the nameserver cannot be contacted, or the nameserver is down, or the specified hostname is not known to the nameserver), or the specified hostname can be resolved by the nameserver but no longer exists on the network. This type of failure can usually also be identified via a `java.net.UnknownHostException` printed in the trace logs.

The immediate operation of the running performance monitor is unaffected.

Action

If the problem persists for an hour or longer, ensure that your device and device agent (if applicable) are operational. Also ensure that a network path exists between the TPC server and the device or device agent, including any appropriate firewall pass-throughs. If there is nothing wrong with the device or device agent, or with the network path, try cancelling and restarting the performance monitor job. If the problem is still not resolved, contact your IBM support representative.

HWNPM2149W Performance data could not be collected for device *device name*, because of an unreachable target address. The current samples are skipped.

Explanation

The current attempt to retrieve a set of performance data from the device failed. No performance data will be inserted for the device in this time period. The next performance data sample recorded into the database might represent an average over more than the configured interval length. This condition can occur when an IP address rather than a hostname was specified as target address, and either the network or a part of the network is down or is blocked by a firewall (the host cannot be contacted), or the specified IP address does not exist on the network. This type of failure can usually also be identified via a `java.net.NoRouteToHostException` in the trace logs.

The immediate operation of the running performance monitor is unaffected.

Action

If the problem persists for an hour or longer, ensure that your device and device agent (if applicable) are operational. Also ensure that a network path exists between the TPC server and the device or device agent, including any appropriate firewall pass-throughs. If there is nothing wrong with the device or device agent, or with the network path, try cancelling and restarting the performance monitor job. If the problem is still not resolved, contact your IBM support representative.

HWNPM2150W Performance data could not be collected for device *device name*, because of an unresponsive target. The current samples are skipped.

Explanation

The current attempt to retrieve a set of performance data from the device failed. No performance data will be inserted for the device in this time period. The next performance data sample recorded into the database might represent an average over more than the configured interval length. The problem is an unresponsive target. This condition can occur when the target server is powered off, or when the server is not listening on the port which is the target of the communication (for example if the web server or CIMOM is not operational). This type of failure can usually also be identified via a `java.net.ConnectException` printed in the trace logs.

The immediate operation of the running performance monitor is unaffected.

Action

If the problem persists for an hour or longer, ensure that your device and device agent (if applicable) are operational. Also ensure that a network path exists between the TPC server and the device or device agent, including any appropriate firewall pass-throughs. If there is nothing wrong with the device or device agent, or with the network path, try cancelling and restarting the performance monitor job. If the problem is still not resolved, contact your IBM support representative.

HWNPM2151W Performance data could not be collected for device *device name*, because a communication time-out for communication that uses UDP rather than TCP. The current samples are skipped.

Explanation

The current attempt to retrieve a set of performance data from the device failed. No performance data will be inserted for the device in this time period. The next performance data sample recorded into the database might represent an average over more than the configured interval length. This condition can occur when the target server cannot be reached, or when the SNMP data source is disabled on the target server, or when the SNMP port (161) is blocked by a firewall.

The immediate operation of the running performance monitor is unaffected.

Action

If the problem persists for an hour or longer, ensure that your device and device agent (if applicable) are operational. Also ensure that a network path exists between the TPC server and the device or device agent, including any appropriate firewall pass-throughs. If there is nothing wrong with the device or device agent, or with the network path, try cancelling and restarting the performance monitor job. If the problem is still not resolved, contact your IBM support representative.

HWNPM2200I The performance monitor successfully collected the configuration data for the storage system with the following internal resources: *number_of_pools* pools, *number_of_controllers* controllers, *number_of_device_adapters* device adapters, *number_of_ports* ports, *number_of_host_connections* host connections, *number_of_ranks* ranks, *number_of_arrays* arrays, and *number_of_volumes* volumes.

Explanation

The configuration data for the monitored storage system and its internal resources were collected.

The number of host connections that is shown here and in the log file might vary because only host connections with one or more assigned volumes are counted. To see the total number of host connections, go to the Overview page for the storage system.

Host connections with the same name and the same volume group are considered identical and are not double counted.

Action

No further action is required.

HWNPM2201I The performance monitor successfully collected the configuration data for the storage system with the following

internal resources: *number_of_io_groups* I/O Groups, *number_of_nodes* nodes, *number_of_ports* ports, *number_of_host_connections* host connections, *number_of_pools* pools, *number_of_managed_disks* managed disks, *number_of_local_disks* local disks, *number_of_volumes* volumes, and *number_of_volume_copies* volume copies.

Explanation

The configuration data for the monitored storage system and its internal resources were collected.

The number of host connections that is shown here and in the log file might vary because only host connections with one or more assigned volumes are counted. To see the total number of host connections, go to the Overview page for the storage system.

Host connections with the same name and the same volume group are considered identical and are not double counted.

The number of volume copies includes both the primary and secondary volume copies for all of the volumes.

Action

If the number of internal resources shown in the message doesn't match the number of actual internal resources for the storage system, run a probe on the storage system.

HWNPM2202I The performance monitor successfully retrieved the configuration data for the switch. The following internal resources were found: *number_of_trunks* trunks, and *number_of_ports* ports.

Explanation

The running performance monitor has updated its internal state with the latest configuration data from the switch. The specified internal resources were found.

Trunks are ISL Trunks, ICL Trunks, or port channels configured for the switch.

Action

None.

HWNPM2203I The performance monitor successfully retrieved the configuration data for the storage system. The following internal resources were found: *number_of_host_connections* host connections, *number_of_modules* modules, *number_of_ports* ports, *number_of_pools* pools, and *number_of_volumes* volumes.

Explanation

The running performance monitor has updated its internal state with the latest configuration data from the storage system. The specified internal resources were found.

Note: The number of host connections reflects only the host connections that have at least one volume assigned. Host connections with 0 volumes have no associated performance data.

In some cases, the number of host connections that is shown in a log file is less than the number of host connections that is shown on the Storage System details page in the web-based GUI. This difference might occur because log files do not count host connections that have no volumes assigned. However, the Storage System details page does count host connections with 0 volumes.

Action

None.

HWNP2204I The performance monitor successfully retrieved the configuration data for the storage system. The following internal resources were found: *number_of_nodes* nodes, *number_of_ports* ports, and *number_of_modules* flash modules.

Explanation

The running performance monitor has updated its internal state with the latest configuration data from the storage system. The specified internal resources were found.

Action

No action is required.

HWNP2205I The performance monitor successfully retrieved the configuration data for the storage system. The following internal resources were found: *number_of_ports* ports, *number_of_controllers* controllers, *number_of_volumes* volumes, and *number_of_disks* disks.

Explanation

The running performance monitor has updated its internal state with the latest configuration data from the storage system. The specified internal resources were found.

Action

No action is required.

HWNP3000E There was a problem establishing the database connection.

Explanation

An exception occurred when trying to retrieve the database connection from the connection pool.

Action

Make sure your database is working correctly. If you cannot find anything wrong with the database, contact your IBM support representative.

- [Getting support](#)

HWNPM3603E The sample volume performance data needed to generate the affected volumes and hosts report for the device *device name* was not found in the IBM Spectrum Control database.

Explanation

The sample volume performance statistics data collected during the time the threshold or constraint was violated is no longer present in the IBM Spectrum Control database. The affected volumes and hosts report cannot be generated in absence of this data.

Action

Contact your IBM support representative.

Related reference

- [Getting support](#)

HWNPM3604E There are no volumes associated with the specified target component, *component name*, in the IBM Spectrum Control database. Therefore, the resulting Affected Volumes and Hosts report will be empty.

Explanation

A constraint violation is always associated with a particular component (array, controller, I/O group, MDisk, etc.), which is the component that actually violated the constraint. In this case, the component associated with the constraint violation that was selected as the target for the Affected Volumes and Hosts report, currently has no volumes configured or assigned to it. This means that there are neither volumes nor hosts affected by this particular constraint violation, and the resulting report will be empty.

Action

It is possible that the IBM Spectrum Control database has outdated information for the corresponding device. If you believe that there are one or more volumes configured or assigned to the constraint violation's component, run a new probe of the device, to ensure that the latest configuration information is present in the IBM Spectrum Control database. Future constraint violations for this component (and for all other components of the device) will use this updated information, and should generate an accurate Affected Volumes and Hosts report.

HWNPM4000E Unable to retrieve the device agent that managed this device: *device identifier*.

Explanation

Unable to retrieve the device agent, such as an SMI-S provider, that controls this device. An invalid user ID, password, or namespace might be configured in IBM Spectrum Control for this device.

Action

Confirm that this device is registered with a device agent, and that the device agent is known to IBM Spectrum Control with correct user ID, password and namespace. If the device agent is correct, contact your IBM support representative.

Related reference

HWNPM4026E Failed to retrieve storage subsystem for this device: *device identifier*.

Explanation

An Exception occurred when retrieving the subsystem information from the database.

Action

Re-probe the storage subsystem.

HWNPM4027E Failed to properly initialize counter data service for this device: *device identifier*.

Explanation

An Exception occurred when retrieving the subsystem information from the database.

Action

Check if the database contains the storage subsystem for this device.

HWNPM4028W Performance data cannot be collected because the *security role* authority of the user account *user name* for accessing *device identifier* is not sufficient.

Explanation

The user account that is used to log on to the storage system does not have the required authority for collecting performance data. For versions of IBM Spectrum Virtualize earlier than 8.3.1.2, the user must have the Administrator or SecurityAdmin role.

Action

If the resource is a Spectrum Virtualize storage system, complete one of the following tasks:

- Open the management GUI for the storage system and change the role of the user account to either 'Administrator' or 'SecurityAdmin'.
- In the IBM Spectrum Control GUI, go to the Block Storage Systems page, right-click the resource, and select Connections -> Modify Connection. Enter a different user name that has sufficient authority for collecting performance data. You might need to stop and restart the performance monitor to have these changes take effect. Right-click the resource again and select the appropriate Data Collection options.

HWNPM4029W Performance data cannot be collected because the collection of performance statistics is stopped on *device identifier*. The *security role* authority of the user account *user name* for accessing the storage system is not sufficient to start the collection of performance statistics.

Explanation

The user does not have sufficient authority to run the following command to start the collection:

```
svctask startstats -interval "time in minutes"
```

You might see this message if a user with a role other than Administrator, or SecurityAdmin is used to access the storage system.

Action

Complete one of the following tasks:

- Run the following command on the storage system to start the collection of performance statistics. You must be logged on as a user with the Administrator, or SecurityAdmin role.

```
svctask startstats -interval "time in minutes"
```

For example, `svctask startstats -interval 5`

The specified interval must be less than or equal to the performance monitor interval for the storage system in IBM Spectrum Control. To check the value, in the IBM Spectrum Control GUI, go to the Block Storage Systems page and view the value for Performance Monitor Interval for the storage system.

- Change the authority of the user that is used to log on to the storage system. Open the management GUI for the storage system and change the role of the user account to the Administrator, or SecurityAdmin role.

HWNPM4030W Performance data cannot be collected. The performance interval *device interval* on *device identifier* is greater than the sample interval and the set *security role* authority of the user account *user name* is not sufficient to update the interval value on *device identifier* .

Explanation

The interval that is specified on the storage system for the collection of performance statistics must be less than or equal to the performance monitor interval for the storage system in IBM Spectrum Control. The user that is used to access the storage system does not have sufficient authority to run the following command to change the interval:

```
svctask startstats -interval "time in minutes"
```

You might see this message if a user with a role other than Administrator, or SecurityAdmin is used to access the storage system.

Action

Complete one of the following tasks:

- Run the following command on the storage system to start the collection of performance statistics. You must be logged on as a user with the Administrator, or SecurityAdmin role.

```
svctask startstats -interval "time in minutes"
```

For example, `svctask startstats -interval 5`

The specified interval must be less than or equal to the performance monitor interval for the storage system in IBM Spectrum Control. To check the value, in the IBM Spectrum Control GUI, go to the Block Storage Systems page and view the value for Performance Monitor Interval for the storage system.

- Change the authority of the user that is used to log on to the storage system. Open the management GUI for the storage system and change the role of the user account to the Administrator, or SecurityAdmin role.

HWNPM4051E Failed to obtain a reference to the Performance Manager Configuration Data Service for this device: *device name*.

- [Getting support](#)

HWNPM4062I Performance data collection successfully stopped for this device: *device name*.

Explanation

Performance data collection successfully stopped for this device.

Action

None.

HWNPM4063W Parse exception in performance data collected this device: *device name*.

Explanation

A parse error occurred while processing performance data collected for this device. An exception was caught while trying to extract an SMI-S provider Property from the data returned by the collector. The data is ignored.

Action

Contact your IBM support representative.

HWNPM4064E *wrong format in performance data collected for this device: device name.*

Explanation

The performance data object representing the performance statistics for a port of this device does not have the expected format. This is an internal error.

Action

Contact your IBM support representative.

Related reference

- [Getting support](#)

HWNPM4065W *number of null time stamps null time stamp(s) for performance data collected from the device were substituted by server time stamp(s).*

Explanation

The switch device did not report the required SMI-S provider StatisticTime time stamp property for the reported number of statistics instances reported. These were substituted by IBM Spectrum Control server time stamps. If this is an intermittent problem, it might cause inconsistencies in performance reports. This is a device provider error.

Action

Contact your IBM support representative, and switch vendor.

HWNPM4066W *count of null operational status null Port Operational Status value(s) for performance data collected from the device was/were substituted by default value(s).*

Explanation

The switch device did not report the required SMI-S provider OperationalStatus property for the reported number of statistics instances reported. These were substituted by a default value of port operational status ('unknown'). This can be caused either because an assembled FCPort CIMInstance was used by Fabric Data collection code, or by an error in the provider for the device.

Action

If this warning occurred when collecting performance statistics for all the ports of a switch, contact your IBM support representative, and switch vendor.

HWNPM4081E *A database cursor operation failed.*

Explanation

A failure occurred when IBM Spectrum Control attempted to obtain or use a database cursor.

Action

Verify that the database is operational and online.

HWNPM4082E A database connect operation failed.

Explanation

A failure occurred when IBM Spectrum Control attempted to connect to the database.

Action

Verify that the database is operational and online.

HWNPM4083E A database retrieve operation failed.

Explanation

A failure occurred when IBM Spectrum Control attempted to retrieve a row from a database table. This is an internal error, that can occur either because of a problem with the database, or because an attempt was made to retrieve a non-existent row from the database.

Action

Verify that the database is operational and online. If it is verified to be so, contact your IBM support representative.

Related reference

-  [Getting support](#)

HWNPM4085E A database query operation failed.

Explanation

A failure occurred when IBM Spectrum Control attempted a database query operation. This is an internal error, that can occur either because of a problem with the database, or because an attempt was made to retrieve a non-existent row from the database.

Action

Verify that database is operational and online. If it is verified to be so, contact your IBM support representative.

Related reference

-  [Getting support](#)

HWNPM4086W A database query gave no result rows.

Explanation

IBM Spectrum Control executed a query operation that generated no result rows. This might be because the parameters to the query were valid, but there is no underlying data, or the parameters to the query were incorrect. This might result in the failure of a higher level operation.

Action

Check the trace log for more information.

HWNPM4087W Missing or invalid association between SMI-S provider *SMI-S provider URL* and device *device name*. The configured SMI-S provider is inoperative, or may no longer be managing the specified device.

Explanation

The IBM Spectrum Control database no longer carries the association between the indicated SMI-S provider and device. This could be because a previous IBM Spectrum Control discovery job detected that the device was removed from the SMI-S provider configuration, or it could be because the SMI-S provider was not operational at the time of the last IBM Spectrum Control discovery job, causing the SMI-S provider-to-device association to be deleted from the IBM Spectrum Control database.

Action

There are several common causes for this problem:

1. If the device was moved to a different SMI-S provider, ensure that the most recent IBM Spectrum Control SMI-S provider discovery job detected the new SMI-S provider and its association to the device. If necessary, run a new SMI-S provider discovery job to detect this association. Then manually stop and restart the IBM Spectrum Control performance monitor for the device, to force the use of the new SMI-S provider by the monitor.
2. If the device is intended to still be managed by the indicated SMI-S provider, check the SMI-S provider configuration. If the device was accidentally removed from the configuration, add it back, or if the SMI-S provider is not currently operational, restart the SMI-S provider. Then run a new IBM Spectrum Control SMI-S provider discovery job to allow IBM Spectrum Control to rediscover the SMI-S provider-to-device association. The existing IBM Spectrum Control performance monitor for the device should start working again automatically, once the SMI-S provider-to-device association is added back to the IBM Spectrum Control database by the discovery job.

HWNPM4091E Encountered an error during execution of a discover service process.

Explanation

An unexpected error occurred during discover process execution for the fiber channel switch.

Action

HWNPM4093E An input business object could not be converted to a CIMInstance.

Explanation

An input business object (such as a Switch or a Port object) could not be converted to the CIMInstance form (required by an executing discover service process) because its CIM Keys were not found in the IBM Spectrum Control database. This could be because the input object was erroneous, hence no record for its keys exists in the database, or because the top level discovery is incomplete or erroneous (for example, the CIM keys of the Switch exist in the database, but not the keys of its constituent ports). This is an internal error.

HWNPM4181W *number of ports of the port statistics from the device agent were unrecognized and were not included in this sample interval.*

Explanation

The port statistics data received from the device agent included data for a number of unknown ports. This could be due to one of the following conditions:

- The subsystem contains some ports which are not fibre-channel ports. IBM Spectrum Control as well as some device agents (mostly SMI-S providers) currently only support fibre-channel ports, so other types of ports (parallel SCSI-3, or ESCON ports for example) will be treated as unrecognized. If this is the case, this warning message can be safely ignored.
- The probe of the subsystem did not complete successfully, and failed to record information for all ports of the subsystem.
- The subsystem was recently upgraded and more ports were added which were not yet discovered by IBM Spectrum Control.

Action

If your subsystem contains unsupported ports, this message is expected but you can safely ignore it. Otherwise, run a probe for the subsystem to ensure that any unrecognized ports are discovered and properly recorded in the IBM Spectrum Control database. If this message persists for subsequent performance data collection intervals, even after successful completion of a probe, contact your IBM service representative.

HWNPM4182W *number of volumes of the volume statistics from the device agent were unrecognized and were not included in this sample interval.*

Explanation

The volume statistics data received from the device agent included data for a number of unknown volumes. This could be due to one of the following conditions:

- The probe of the subsystem did not complete successfully, and failed to record information for all volumes of the subsystem.
- The subsystem configuration was recently changed to add more volumes. These new volumes have not yet been discovered by IBM Spectrum Control.

Action

Rerun a probe for the subsystem to ensure that any unrecognized volumes are discovered and properly recorded in the IBM Spectrum Control database. If this message persists for subsequent performance data collection intervals, even after successful completion of a probe, contact your IBM service representative.

HWNPM4183W *number of ranks of the rank statistics from the device agent were unrecognized and were not included in this sample interval.*

Explanation

The rank statistics data received from the device agent included data for a number of unknown ranks. This could be due to one of the following conditions:

- The probe of the subsystem did not complete successfully, and failed to record information for all storage extents of the subsystem.
- The subsystem configuration was recently changed to add more ranks. These new storage extents have not yet been discovered by IBM Spectrum Control.

Action

Rerun a probe for the subsystem to ensure that any unrecognized ranks are discovered and properly recorded in the IBM Spectrum Control database. If this message persists for subsequent performance data collection intervals, even after successful completion of a probe, contact your IBM service representative.

HWNPM4184E *The device agent configured for this storage subsystem is not supported for this task. The current version, version number, is downlevel from from the minimum required, version number.*

Explanation

Performance data cannot be collected from the subsystem through this particular device agent (usually an SMI-S provider), because the version of the agent is not supported by the IBM Spectrum Control Performance Manager.

Action

Use another device agent, or upgrade the version of the existing device agent to the minimum required level indicated in the message.

HWNPM4185W The device agent did not return all performance statistics data for this time interval. The incomplete data is being processed.

Explanation

IBM Spectrum Control expects to receive performance data for ports, ranks, and volumes from the device and device agent. One or two of these types of data was not received as expected. This usually indicates that there is a problem with the device itself, the native device interfaces, or the device agent.

In the rare case that there are no ranks or no volumes defined on the device, this message can safely be ignored because then no rank or volume statistics will be sent by the device. However, in that case it is not necessary to run a performance monitor for the device because there is no performance to be measured.

Action

Ensure that the device and the native device interfaces are operating normally. Ensure that the device agent is operating normally. It might be necessary to view error and/or trace logs for your device and/or device agent. Contact your IBM service representative for help, if necessary.

HWNPM4186W The ESS SMI-S provider did not return performance statistics data for both clusters for this time interval. The incomplete data is being processed.

Explanation

IBM Spectrum Control expects to receive performance data for ports, ranks, and volumes from ESS SMI-S provider for both clusters. The data for one cluster was not received as expected. This usually indicates that there is a problem with the device itself, the native device interfaces, or the device agent.

Action

Ensure that the device and the native device interfaces are operating normally. Ensure that the ESS SMI-S provider is operating normally. It might be necessary to view error and/or trace logs for your device and/or device agent. Contact your IBM service representative for help, if necessary.

HWNPM4187W The device does not support performance management for pool *pool ID* because it contains Space Efficient Volumes. Only incomplete performance data can be collected for array *array ID*.

Explanation

The specified pool contains space efficient volumes, which makes it impossible to accurately manage the performance for those ranks, the arrays associated with those ranks, and the device adapters associated with those arrays.

For DS8000 devices whenever a pool consisting of multiple ranks contains space efficient volumes that are not yet fully allocated, the performance impact of those volumes on their associated ranks cannot be measured. As a result, to avoid presenting the user with potentially inaccurate or misleading performance data, the Performance Manager does not attempt to compute the performance metrics for the affected arrays and device adapters

Action

None.

HWNPM4188W The performance monitor was unable to collect performance statistics data from the device agent for the following component types: *component list*.

Explanation

The request for performance statistics from the agent resulted in no statistic data being received for either the ports, ranks, and/or volumes.

The performance monitor will attempt to retrieve statistics for all components until the next polling interval. If the components statistics continue to be missing for the next polling interval, the statistics that are available will be processed. This may result in the loss of some performance data.

Action

Confirm that both the subsystem and the subsystem's agent are working properly. Contact your IBM support representative for further assistance.

HWNPM4189W *number of MDisks of the MDisk statistics from the device agent were unrecognized and were not included in this data collection interval.*

Explanation

The MDisk statistics data received from the device agent included data for a number of unknown MDisks. This could be due to one of the following conditions:

- The probe of the subsystem did not complete successfully, and failed to record information for all storage extents of the subsystem.
- The subsystem configuration was recently changed to add more MDisks. These new storage extents have not yet been discovered by IBM Spectrum Control.

Action

Rerun a probe for the subsystem to ensure that any unrecognized MDisks are discovered and properly recorded in the IBM Spectrum Control database. If this message persists for subsequent performance data collection intervals, even after successful completion of a probe, contact your IBM service representative.

Related reference

-  [Getting support](#)

HWNPM4190W *number of nodes of the node statistics from the resource agent were unrecognized and were not included in this data collection interval.*

Explanation

The node statistics data that were received from the data source included data for a number of unknown nodes. This problem might be caused by the following conditions:

- The probe of the storage system did not complete successfully, and failed to record information for all nodes of the storage system.
- The storage system configuration was recently changed to add more nodes. These new nodes were not discovered.
- If the storage system is an IBM Spectrum Scale cluster, the OS host names and the cluster host names of the Spectrum Scale nodes might conflict. Similarly the cluster host names and the Zimon sensor or collector configuration files might conflict.

Action

If the storage system is an IBM Spectrum Scale cluster, check the OS host name and the IBM Spectrum Scale cluster host name of each of the nodes. Correct any mismatches, for example use the `hostnamectl` command to change the OS host name to the one shown by `mmlscluster`, which is the host name that is recognized by the cluster.

If the storage system is an IBM Spectrum Scale cluster, check the Zimon sensor configuration files on each of the nodes and the Zimon collector configuration file on the collector node. Correct any mismatches in the node host names that are used in those configuration files.

Otherwise, rerun a probe for the storage system to ensure that any unrecognized nodes are discovered and properly recorded in the database repository. If this message persists for subsequent performance data collection intervals, even after successful completion of a probe, contact IBM Software Support.

HWNPM4191W *number of modules out of total number of modules module statistics could not be retrieved from the device agent due to errors, and were not included in this data collection interval.*

Explanation

Each interface module in an XIV device is responsible for tracking performance statistics of the I/O flowing through it. In this case, one or more of the interface modules did not return its statistics data to IBM Spectrum Control. This is usually caused by the particular modules being inoperative.

Action

Check the health status of your XIV interface modules, and correct any errors. If this message persists for subsequent performance data collection intervals, even if all XIV interface modules are fully operational, contact your IBM service representative.

HWNPM4192W *number of Drives of the drive statistics from the device agent were unrecognized and were not included in this data collection interval.*

Explanation

The performance data gathered for local disks or flash modules from the data source included data for a number of unknown drives.

This warning can appear if one of the following conditions occurs:

- The probe of the storage system did not complete successfully, and failed to record information for all local disks or flash modules of the storage system.
- The storage system configuration was recently changed to add more drives. The new drives were not yet discovered when the previous probe was run.

Action

Run another probe for the storage system to ensure that any unrecognized local disks and flash modules are discovered and properly recorded in the database repository. If this message continues after a probe completes successfully, contact IBM Software Support.

HWNPM4193W *number of Volume-copies of the volume-copy statistics from the device agent were unrecognized and were not included in this data collection interval.*

Explanation

The volume-copy statistics data received from the device agent included data for a number of unknown copies. This could be due to one of the following conditions:

- The probe of the subsystem did not complete successfully, and failed to record information for all volume-copies of the subsystem.
- The subsystem configuration was recently changed to add more volumes or volume-copies. These new volumes or volume-copies have not yet been discovered by IBM Spectrum Control.

Action

Rerun a probe for the subsystem to ensure that any unrecognized volume-copies are discovered and properly recorded in the IBM Spectrum Control database. If this message persists for subsequent performance data collection intervals, even after successful completion of a probe, contact your IBM service representative.

HWNPM4194W *number of partitions of the partition statistics from the device agent were unrecognized and were not included in this data collection interval.*

Explanation

The partition statistics data received from the device agent included data for a number of unknown pools. This could be due to one of the following conditions:

- The probe of the subsystem did not complete successfully, and failed to record information for all pools of the subsystem.
- The subsystem configuration was recently changed to add more pools. These new pools have not yet been discovered by IBM Spectrum Control.

Action

Rerun a probe for the subsystem to ensure that any unrecognized pools are discovered and properly recorded in the IBM Spectrum Control database. If this message persists for subsequent performance data collection intervals, even after successful completion of a probe, contact your IBM service representative.

Related reference

-  [Getting support](#)

HWNPM4195W *number of file systems* of the file system statistics from the device agent were unrecognized and were not included in this data collection interval.

Explanation

The file system statistics data received from the device agent included data for a number of unknown file systems. This could be due to one of the following conditions:

- The probe of the storage system did not complete successfully, and failed to record information for all file systems of the storage system.
- The storage system configuration was recently changed to add more file systems. These new file systems have not yet been discovered by IBM Spectrum Control.

Action

Rerun a probe for the storage system to ensure that any unrecognized file systems are discovered and properly recorded in the IBM Spectrum Control database. If this message persists for subsequent performance data collection intervals, even after successful completion of a probe, contact your IBM service representative.

HWNPM4270W The block storage statistics is not formatted for device *device name*.

Explanation

The block storage statistics is not correctly formatted for the device.

Action

If block storage statistics are supported for this device, contact your IBM support representative.

HWNPM4271E The SMI-S provider found for device *device name* is not valid.

Explanation

The SMI-S provider found for the device is not valid. The SMI-S provider is required to retrieve performance statistics for the SMI-S counter data service.

Action

Check if an SMI-S provider found for the device is valid. If the SMI-S provider is valid, then contact your IBM support representative.

Related reference

- [Getting support](#)

HWNPM4272E The storage subsystem found for device *device name* is not valid.

Explanation

The storage subsystem found for the device is not valid. The storage subsystem must have a serial number, and a storage subsystem is required to retrieve performance statistics for the SMI-S counter data service.

Action

Check if a storage subsystem has a defined serial number. If the storage subsystem has a defined serial number, then contact your IBM support representative.

Related reference

- [Getting support](#)

HWNPM4273W Discarding the stale performance statistics returned on access point *access point* for device *device name*.

Explanation

Some of the performance statistics counters were not updated on the SMI-S provider for the device. IBM Spectrum Control will discard all the performance data retrieved from the SMI-S provider during this sample interval. IBM Spectrum Control will automatically try to retrieve the performance statistics after a short timeout.

Action

None

HWNPM4274E The SMI-S provider found for this device has changed. Please re-run SMI-S provider discovery and probe.

Explanation

The SMI-S provider may have been migrated from the Brocade SMI Agent to the SMI Agent that is integrated in Brocade Data Center Fabric Manager, or vice versa.

Action

If SMI-S provider discovery and probe are executed after SMI-S provider migration and the problem still exists, contact your IBM support representative.

Related reference

- [Getting support](#)

HWNPM4300E Access to the agent or device has been denied. Ensure that valid credentials have been specified for agent *agent name*.

Explanation

When attempting to retrieve performance statistics for the device, access was denied by the device or the device agent. Therefore no performance statistics could be retrieved. No performance data will be inserted for the device in this time period. The next performance data sample recorded into the database might represent an average over more than the configured interval length.

Action

Ensure that the correct agent address has been specified, and that the specified credentials are valid and will allow access to the device or agent for performance data collection. The credentials usually consist of a username and password, but can also encompass other security related parameters such as ssh keys or authentication tokens, depending on the type of device or agent being accessed and, where applicable, the access method selected.

HWNPM4301E The device or device agent did not respond within the allotted time (*timeout value seconds*).

Explanation

When attempting to retrieve performance statistics for the device, the requested performance data was not returned before the timeout expired. Either the device or agent is completely unresponsive, or is much slower than expected by IBM Spectrum Control. No performance data will be inserted for the device in this time period. The next performance data sample recorded into the database might represent an average over more than the configured interval length.

Action

Ensure that the device and device agent are fully operational. It may be necessary to reboot either device or agent, if it is in a hung state. If you have reason to believe that the device and agent are operational but are simply slower than expected, you can also attempt to increase the timeout value used by the performance manager, which is set in configuration file `device/conf/pm.conf`.

HWNPM4302E New performance data is not yet available for the device. Statistics with time stamps later than *time_stamp* could not be found.

Explanation

If the time stamp in the message is "null", then no statistics were previously retrieved, and the performance manager is unable to get ANY statistics for the device.

In case performance data is cached by the device or device agent, the performance manager ensures that the most recently retrieved performance statistics are indeed newer than the previously retrieved statistics. If not, the performance manager waits for a short time and tries retrieving the statistics again. If after several tries no new statistics were retrieved, this message is issued.

No performance data is inserted for the device in this time period. The next performance data sample that is recorded into the database might represent an average over more than the configured interval length.

Action

Ensure that the device and device agent are fully operational. It might be necessary to restart either device or agent, if it is in a hung state. Ensure that if the device has multiple clocks (for example for multiple nodes or controllers), that the clocks are synchronized to within a few minutes.

HWNPM4303E An agent API call (*API name*) failed while attempting to retrieve performance data for the device.

Explanation

The current attempt to retrieve a set of performance data from the device failed. No performance data will be inserted for the device in this time period. The immediate operation of the running performance monitor is unaffected. However the next performance data sample recorded into the database might represent an average over more than the configured interval length.

The API name indicated in the message is the function or method which caused the error. If a null name is indicated, the exact function or method is unknown.

Action

Ensure that the device agent is fully operational. It may be necessary to reboot the agent if it is not working properly. If the problem persists, contact the vendor of the device and agent for problem diagnosis and resolution.

HWNPM4304E The request for performance data could not be retrieved from the queue by the data collector.

Explanation

The data collector may be down, or the connection may be unavailable or congested.

Action

Verify the connection between the data collector and the server. Then, verify that the data collector is running and if not, restart the data collector process.

HWNPM4305W No samples were received from the data collector in the expected time. The data might still arrive automatically after connection is recovered.

Explanation

The data collector might be down, or the connection might not be available or congested. The data might still arrive automatically after connection is recovered.

Action

Verify the connection between the data collector and the server. Then, verify that the data collector is running and if not, restart the data collector process. If the data collector is running, restart data collection. The data might still arrive automatically after connection is recovered.

HWNPM4306E The data collector failed to connect to the storage management service because of invalid credentials. No performance manager data can be collected from *device name* until valid credentials are available.

Explanation

The credentials of the data collector were not authenticated by the storage management service. No further automated attempts to connect to the storage management service can be made until the valid credentials are available.

Action

Update the credentials and restart the data collector. To restart the data collector, log in to the computer that the data collector and its file are on. On a UNIX system, run the dataCollector.sh script to start the data collector. On a Windows system, start the service from the Services tab on the Windows Task Manager. For more information, see Resolving Connections Issues topic in the Knowledge Center.

HWNPM4502E Attempt to delete a default policy.

Explanation

An IBM default policy or current default policy cannot be deleted.

Action

None.

HWNPM4503E A database update operation failed.

Explanation

A failure occurred when IBM Spectrum Control attempted to make an update to the database.

Action

Verify that database is operational and online.

Explanation

A failure occurred when IBM Spectrum Control attempted to insert a new row into the database.

Action

Verify that database is operational and online.

HWNPM4505E A database delete operation failed.

Explanation

A failure occurred when IBM Spectrum Control attempted to delete one or more rows from a database table.

Action

Verify that database is operational and online.

HWNPM4506E A database cursor operation failed.

Explanation

A failure occurred when IBM Spectrum Control attempted to obtain or use a database cursor.

Action

Verify that database is operational and online.

HWNPM4507E A database connect operation failed.

Explanation

A failure occurred when IBM Spectrum Control attempted to connect to the database.

Action

Verify that database is operational and online.

HWNPM4508E A database retrieve operation failed.

Explanation

A failure occurred when IBM Spectrum Control attempted to retrieve a row from a database table.

Action

Verify that database is operational and online.

HWNPM4509E A database operation failed.

Explanation

A generalized database failure occurred.

Action

Verify that database is operational and online.

HWNPM4510E A database query operation failed.

Explanation

A failure occurred when IBM Spectrum Control attempted a database query operation.

Action

Verify that database is operational and online.

HWNPM4511E A database commit operation failed.

Explanation

A failure occurred when IBM Spectrum Control attempted a database commit operation.

Action

Verify that database is operational and online.

HWNPM5200E The performance manager failed to publish event even name due to exception exception.

Explanation

The performance manager failed to publish event to other modules.

Action

Restart device server and try again.

HWNPM5210E The performance manager failed to receive event from other modules.

Explanation

The performance manager failed to receive event from other modules.

Action

Restart device server and try again.

HWNPM5211E The first parameter passed to this method is null.

Explanation

The subscriber can not be null when calling this method.

Action

Make sure the first parameter passed to this method is not null.

HWNPM5212E The second parameter passed to this method is invalid.

Explanation

The event array can not be null or empty.

Action

Make sure the second parameter passed to this method is valid.

HWNPM5400E The performance data collection identifiers are not valid integers: schedule ID {0}, schedule run number {1}, job run number {2}.

Explanation

Each performance data collection job is identified by three integers. The scheduler service did not receive three integers when asked to update the job status, and so could not identify the correct job.

Action

Contact your IBM support representative.

HWNPM5409I Successfully retrieved the configuration data for the elastic device. Found *number of nodes* Nodes and *number of file systems* File systems,

Explanation

The running performance monitor has updated its internal state with the latest configuration data from the storage subsystem. The indicated device components were found.

Action

None.

HWNPM5410W The performance monitor could not collect performance data for the following cluster nodes: *nodes names*.

Explanation

The IBM Spectrum Scale performance monitoring tool on the GPFS cluster could not collect performance data for the nodes and related resources such as file systems.

Action

Check that the collector component of the performance monitoring tool is started on a single GPFS cluster node.

Check that the sensor component of the performance monitoring tool is started on the nodes.

Check the sensor and collector components are configured correctly on the nodes. For information about how to configure the performance monitoring tool, see <https://www.ibm.com/docs/en/spectrum-scale/5.1.4?topic=tool-configuring-performance-monitoring>.

Try the operation again.

HWNPM5411W The performance monitor could not collect performance data for the following filesystems: *filesystem names*.

Explanation

The IBM Spectrum Scale performance monitoring tool on the GPFS cluster could not collect performance data for the file systems. This problem might occur because the performance monitoring tool is not started or is not configured correctly on the nodes that the file system is mounted on.

Action

Check that the collector component of the performance monitoring tool is started on a single GPFS cluster node.

Check that the sensor component of the performance monitoring tool is started on the nodes that the file system is mounted on.

Check the sensor and collector components are configured correctly on the nodes. To learn more about configuring the performance monitoring tool, see http://www.ibm.com/support/knowledgecenter/STXKQY_4.1.1/com.ibm.spectrum.scale.v4r11.adv.doc/bl1adv_PMToverview.htm

Try the operation again.

HWNPM5412E Performance statistics collection is not enabled.

Explanation

Performance statistics collection is not enabled on either the SMI-S provider or the system it manages.

Action

Enable performance statistics collection on either the SMI-S provider or the system it manages.

HWNPM5413E The process failed because the userid or password provided failed to connect to the Export Tool.

Explanation

Performance data collection for Hitachi systems requires a user name and password to be defined in the Hitachi Device Manager for the Export Tool. Connection with the provided user name or password failed.

Action

Check the credentials for the user that is configured to monitor the block storage system. To connect to the storage system for both probe and performance monitoring, ensure that the following credentials match:

- The user name and password that is defined in Hitachi Device Manager.
- The user name and password that is used for Hitachi Command Suite to connect to the device.

HWNPM5414E The process failed because the Hitachi SVP was busy and did not return data or timed out.

Explanation

The Hitachi external process was unable to collect data because the Hitachi SVP is too busy.

Action

The Hitachi SVP seems to be too busy to return performance data. Collection will retry at the next performance interval.

HWNPM5415E The process failed because the performance interval is set to 0.

Explanation

Incorrect data can cause IBM Spectrum Control to set the performance interval to 0.

Action

Collect service logs for the product. IBM Software Support can use these logs to help troubleshoot the issue. Open a support case at <https://www.ibm.com/mysupport/> for help with determining what might be causing this error. Don't forget to include the version, release, modification, and service level number of IBM Spectrum Control that you're using.

For information about how to collect service logs, go to the documentation at <https://www.ibm.com/docs/en/spectrum-control/5.4.4?topic=overview-collecting-service-logs-software-support-troubleshooting>.

HWNPM5416E The process failed because the performance interval for the storage system is not supported.

Explanation

For Hitachi Virtual Storage Platform (VSP) F and G Series storage systems, you can select performance intervals of 1 minute and 5 minutes. Other performance intervals are not supported.

Action

For the storage system, set the performance interval to 1 minute or 5 minutes. To set the interval, go to Storage > Block Storage Systems, right-click the storage system, and select Data Collection > Schedule.

If performance monitoring is already enabled at an unsupported interval and you want to keep the previous monitoring data, first export the data by using the Hitachi Export Tool and then restart monitoring.

HWNPM5417E The process failed because the Hitachi VSP Model being monitored is not known. A Hitachi Export Tool to match it cannot be found.

Explanation

This problem might occur when the appropriate version of the Hitachi Export Tool is not installed for the model of the storage system. The Hitachi Export Tool is used to collect performance metadata about the storage system and is located on the server or virtual machine where the data collector is installed.

Action

Ensure that the configured Export Tool matches the model of the Hitachi VSP storage system. If the appropriate Export Tool is not being used, log in with your Hitachi account to download the correct version from the following location:
https://knowledge.hitachivantara.com/Knowledge/Storage/How_to_Download_the_Appropriate_Export_Tool_Version_Specific_to_Array_Microcode.

For information about installing the Hitachi Export Tool, go to the documentation at <https://www.ibm.com/docs/en/storage-insights?topic=pro-installing-hitachi-export-tool>.

HWNPM5418E The process failed because the data collected is out of range.

Explanation

Performance data that is returned from the device is out of range and not valid.

Action

If the problem persists, open a support case at <https://www.ibm.com/mysupport/>. Don't forget to include the version, release, modification, and service level number of IBM Spectrum Control that you're using.

HWNPM5419E Performance data can't be collected.

Explanation

No other information is available.

Action

If this problem persists, open a support case at <https://www.ibm.com/mysupport/>. Don't forget to include the version, release, modification, and service level number of IBM Spectrum Control that you're using.

HWNRM0000I Connection to Replication Manager Server successful.

Explanation

IBM Spectrum Control can successfully communicate with the Replication Manager server.

Action

None.

HWNRM0001E Communication with Replication Manager server failed.

Explanation

IBM Spectrum Control can not communicate with the Replication Manager server.

Action

Verify correct port is used for Replication Manager server and that the Replication Manager server is up and running.

HWNRM0002E The specified port number {0} is invalid.

Explanation

The port number specified is not correct.

Action

Use numeric port number.

HWNRM0003E Invalid host or port specified.

Explanation

The hostname and/or the port number for the Replication Manager server is invalid.

Action

Provide a valid hostname/port number for the Replication Manager server. If only port number can be changed, provide valid port number.

HWNRM0004E Unknown host error.

Explanation

Can not resolve host for the Replication Manager server.

Action

If hostname doesn't work, try providing the IP address.

HWNRM0005E Failed to connect to the Replication Manager server.

Explanation

The most likely cause of this error is that wrong port number is given for the Replication Manager Server. Another possible cause of this error is the internal authentication failure between IBM Spectrum Control and the Replication Manager Server.

Action

Make sure that the port number entered is correct. The correct port number can be found from the config file repcli.properties located at {replication manager install directory}/replication/CLI/. The default port is 5110. Contact IBM customer technical support with all related errors.

Related reference

- [Getting support](#)

HWNRM0006E Status update failed in database.

Explanation

Could not update the status of Replication Manager connection test in the IBM Spectrum Control database.

Action

Make sure IBM Spectrum Control is able to communicate with the database. If the problem persists, contact IBM customer technical support with all related errors.

Related reference

- [Getting support](#)

HWNRM0007E Unable to read status from database.

Explanation

Could not read the previous status of Replication Manager connection test in the IBM Spectrum Control database.

Action

Make sure IBM Spectrum Control is able to communicate with the database, if problem persists, contact IBM service.

Related reference

- [Getting support](#)

HWNRM0008E Certificate file for authentication with Replication Manager not found.

Explanation

IBM Spectrum Control could not locate the certificate file to connect to the Replication Manager server.

Action

This could be due to failed installation of Replication Manager server, or deleting some files from the IBM Spectrum Control installation directory.

HWNRM0009E Replication Manager certificate error.

Explanation

IBM Spectrum Control found an invalid/corrupted certificate file which is needed to communicate with the Replication Manager server.

Action

Contact IBM customer technical support with all related errors.

Related reference

- [Getting support](#)

HWNRM0010E Unable to read Replication Manager authentication certificate.

Explanation

IBM Spectrum Control found an invalid/corrupted certificate file which is needed to communicate with the Replication Manager server.

Action

Contact IBM customer technical support with all related errors.

Related reference

- [Getting support](#)

HWNRM0100E The delete action failed because the session check with the Replication Manager server failed. {0}

Explanation

A storage subsystem or volume can not be deleted without successfully checking if it is in an active Replication session.

Action

Make sure Replication Server is up and running and do a connectivity test to it from the IBM Spectrum Control.

Related reference

- [Getting support](#)

HWNRM0101E One or more storage systems cannot be deleted because they contain volumes that are defined in an active replication session. {0}

Explanation

You cannot delete storage systems if they contain volumes that are defined in active replication sessions. In IBM Spectrum Control for Replication, a replication session is used to perform a specific type of data replication against a specific set of volumes.

Action

Go to Replication Manager and remove all the volumes of the storage systems from the associated replication sessions. To access Replication Manager from the IBM Spectrum Control GUI, go to Replication Manager > Replication Management in the navigation tree and click Replication Sessions Overview. When the volumes are removed from the active replication sessions, try to delete the storage systems again.

HWNRM0102W The volume is in active replication session. {0}

Explanation

A storage subsystem volume can not be deleted if it is in an active Replication session.

Action

Go to Replication Manager and remove the storage subsystem volume from the Replication session.

HWNRM0103W Error getting storage subsystems.

Explanation

Not able to retrieve storage subsystems from Replication Manager server.

Action

Make sure Replication Manager server is up and running and that the IBM Spectrum Control is able to communicate with the Replication Manager server.

HWNRM0104E Error getting storage subsystem information.

Explanation

Not able to retrieve storage subsystem details from Replication Manager server.

Action

Make sure Replication Manager server is up and running and that IBM Spectrum Control is able to communicate with the Replication Manager server.

HWNRM0105E Storage subsystem not found in IBM Spectrum Control database.

Explanation

Not able to retrieve storage subsystem details from the IBM Spectrum Control database.

Action

Make sure IBM Spectrum Control is able to communicate with the database. If problem persists, contact IBM customer technical support with all related errors.

Related reference

- [Getting support](#)

HWNRM0106E Storage subsystem type is not supported for Replication.

Explanation

The given storage subsystem type is not supported by Replication Manager.

Action

Contact IBM customer technical support with all related errors.

Related reference

- [Getting support](#)

HWNRM0107E Volume not found in the IBM Spectrum Control database.

Explanation

Volume not found in the IBM Spectrum Control database.

Action

Related reference

- [Getting support](#)

HWNRM0011E Replication Manager server is not installed.

Explanation

IBM Spectrum Control has not detected Replication Manager server installation.

Action

If Replication Manager functionality is required, make sure it is installed and running. Replication Manager server should be installed using the IBM Spectrum Control installer.

HWNRM0012E Adding the connection to the specified storage device failed on the Replication server

Explanation

Adding the connection to the specified storage device failed

Action

HWNRM0013E The connection specified to be added to the Replication server is not a valid one. Please check the parameters again

Explanation

The connection specified is not a valid one

Action

HWNRM0014E A problem with the following message *Exception message* appeared when modifying the connection on the Replication server

Explanation

A problem appeared when modifying the connection

Action

HWNRM0015E The connection to be modified does not exist on the Replication server

Explanation

The connection to be modified does not exist on the Replication server

Action

HWNSS - Single sign-on User Interface messages

- [HWNSS0001E The IBM Spectrum Control device server is down and cannot perform OS user authentication. It is still possible to perform OS user authentication against the data server, however since the device server is down the IBM Spectrum Control functionality will be limited. Among the](#)

limitations is the inability to perform SSO to other applications that rely on the presence of a lightweight third party authentication token. To proceed enter a local OS username and password.

- HWNSS0002E The IBM Spectrum Control device server is down and cannot perform LDAP user authentication.
- HWNSS0003E The single sign-on (SSO) token is missing or incorrect. Enter a valid user name and password.
- HWNSS0004E The web server is unavailable and cannot be used for authentication. The Device server can be used for some authentication, but IBM Spectrum Control functions will be limited. To proceed, enter either the common user name that was used to install IBM Spectrum Control or the tpcFileRegistryUser user name and password.

HWNSS0001E The IBM Spectrum Control device server is down and cannot perform OS user authentication. It is still possible to perform OS user authentication against the data server, however since the device server is down the IBM Spectrum Control functionality will be limited. Among the limitations is the inability to perform SSO to other applications that rely on the presence of a lightweight third party authentication token. To proceed enter a local OS username and password.

Explanation

Authentication and Single Sign On (SSO) functionality is primarily obtained through the IBM Spectrum Control Device Server. With only the IBM Spectrum Control Data Server running, IBM Spectrum Control can only authenticate the user with no SSO capability.

Action

Restart the IBM Spectrum Control Device Server and re-login to IBM Spectrum Control.

HWNSS0002E The IBM Spectrum Control device server is down and cannot perform LDAP user authentication.

Explanation

LDAP authentication is only available through the IBM Spectrum Control Device Server.

Action

Restart the IBM Spectrum Control Device Server and re-login to IBM Spectrum Control.

HWNSS0003E The single sign-on (SSO) token is missing or incorrect. Enter a valid user name and password.

Explanation

The SSO token is missing. The token might be missing because of incorrect domain information

Action

Ensure that the application from which you are starting IBM Spectrum Control is in the same TCP/IP domain as the IBM Spectrum Control server. If the application from which you are starting IBM Spectrum Control is in a different TCP/IP domain than the IBM Spectrum Control server, a fully qualified domain name (FQDN) is required for the server. If a FQDN was not provided for the server during installation, you can change the domain name using the web server administrative console.

HWNSS0004E The web server is unavailable and cannot be used for authentication. The Device server can be used for some authentication, but IBM Spectrum Control functions will be limited. To proceed, enter either the common user name that was used to install IBM Spectrum Control or the tpcFileRegistryUser user name and password.

Explanation

The web server provides authentication and single sign-on. If the web server is unavailable, IBM Spectrum Control can only authenticate user names that do not use single sign-on.

Action

Restart the web server and log in to IBM Spectrum Control again.

JSS0021E Unable to process returned job number *job number* The job completed with an exit code of *exit code*.

Explanation

This may or may not be an error.

Action

Examine the exit code. If greater than four rerun the job.

JSS0022E Unknown request type passed to completed job handler.

Explanation

An internal error has occurred.

Action

Contact IBM customer technical support.

JSS0023E SQL error querying identifier table in *class name.method name*.

Explanation

An SQL error occurred while querying the identifier table in the specified Java program and routine.

Action

Examine the associated error text and determine what caused the error. If unable to determine the cause of the error contact IBM customer technical support.

JSS0051E A system error occurred.

Explanation

An error occurred contacting the agent

Action

Verify that the agent exists, is running and can be contacted.

JSS0052E The agent did not respond.

Explanation

A response was not received from the agent.

Action

Verify that the agent is running and can be contacted.

JSS0062W The value for the config file keyword *keyword* must be a number between *number* and *number*. The default (*value*) will be used.

Explanation

The value for the specified keyword is out of range. The specified default will be used.

Action

Change the value if the default is not desired.

JSS0063E Unable to connect to repository database while attempting to delete job log rows from t_run_jobs.

Explanation

Unable to connect to repository database while attempting to delete job log rows from t_run_jobs.

Action

Examine the associated error text and determine what caused the error. If unable to determine the cause of the error contact IBM customer technical support.

JSS0074E The Scheduler service repository connection has failed and it is in auto-restart mode. It will restart automatically when the repository becomes available.

Explanation

The Scheduler service repository connection has failed and it is in auto-restart mode. It will restart automatically when the repository becomes available.

JSS0075W The repository connection has been lost. The Scheduler service is terminating and will automatically restart when the repository again becomes available.

Explanation

The repository connection has been lost. The Scheduler service is terminating and will automatically restart when the repository again becomes available.

JSS0076I The Scheduler service is automatically restarting after recovering its repository connection.

Explanation

The Scheduler service is automatically restarting after recovering its repository connection.

JSS0094W The *job type* job named *creator.name* is scheduled to run once at a time in the past and will not run.

Explanation

A job is scheduled to run once but the time the job is expected to run has passed. If the message is seen when saving a job there is most likely a time difference between the server and the GUI where the job was saved.

JSS2003L The Storage Resource Agent version is not compatible with the server.

Explanation

The version of the Storage Resource Agent on this machine is not compatible with the version of IBM Spectrum Control running on the server.

Action

Upgrade the Storage Resource Agent on this machine.

JSS2006L The agent is disabled.

Explanation

The Storage Resource Agent on this computer is disabled and will not accept any request from the IBM Spectrum Control server.

Action

Enable the Storage Resource Agent on this computer using the 'Enable' option available for this agent in IBM Spectrum Control Web GUI.

JSS2007W The job for computer *computer name* in run *run number* of job type *job creator.job name* was not started because the Storage Resource Agent is disabled..

Explanation

The specified job was not submitted because the Storage Resource Agent is disabled.

Action

Enable the Storage Resource Agent on this computer using the 'Enable' option available for this agent in IBM Spectrum Control Web GUI and run the job again.

NAD0001I Connecting to *hostname* using *protocol* protocol.

Explanation

The server is connecting to the Storage Resource Agent at the specified hostname using the specified communication protocol.

NAD0002W Connection to *hostname* failed using *protocol* protocol: *error*.

Explanation

The server failed to connect to the Storage Resource Agent at the specified hostname using the specified communication protocol.

NAD0003I Connected to *hostname* using *protocol* protocol.

Explanation

The server connected to the Storage Resource Agent at the specified hostname using the specified communication protocol.

NAD0004W Possible cause: provided login information is incorrect.

Explanation

The login information might not be entered correctly.

Action

Check if the login information is correct and that the specified user has enough access privileges. You need to check user id and password information entered. If SSH protocol is used and certificate/passphrase is used, then make sure those are valid.

NAD0005E Connection to *hostname* failed using *protocol* protocol: *error message*.

Explanation

The server failed to connect to the Storage Resource Agent at the specified hostname using the specified communication protocol.

NAD0006E Exception thrown for method *method name*: *error message*.

Explanation

An error occurred while processing the specified method.

NAD0007I Closing connection to *hostname*.

Explanation

Closing the connection to the Storage Resource Agent at the specified hostname.

NAD0008E Invalid protocol *protocol* passed to *method name*.

Explanation

The method does not support this protocol.

NAD0009E Cannot connect to *host name*. Remote host is running in a non-global application container.

Explanation

The connection to the specified host cannot be established because the remote host container does not have enough privileges to accept incoming connections.

Action

Please check remote host to which IBM Spectrum Control Server is trying to connect for installation or communication with Storage Resource Agent. You need to start host in global application container mode.

NAD0010E Invalid parameter(s) *parameter name* passed to *method name*.

Explanation

Invalid input to the specified method.

NAD0011I Validating GUID on remote machine: *host name*.

Explanation

The GUID validation process on a host on which Storage Resource Agent is going to be installed is starting. This will check if GUID exists on that host.

NAD0012I GUID *value* validated on remote machine: *host name*.

Explanation

The GUID is pre-installed on remote machine and returns a valid ID. The GUID of the remote machine was successfully validated.

NAD0013I Installing GUID on remote machine: *hostname*.

Explanation

Installing the unique identifier on the specified machine.

NAD0014I GUID successfully installed on remote machine: *hostname*.

Explanation

Unique identifier installed on the specified machine.

NAD0015I GUID not found on remote machine: *host name*.

Explanation

The GUID was not found on the remote machine and will be installed.

NAD0016E Could not copy GUID package to remote host: *host name*.

Explanation

The GUID installation package could not be sent to the remote machine.

Action

Please check if host on which GUID is being installed has sufficient space or enough privileges for user connecting to target host. Other reason could be guid.zip file on IBM Spectrum Control server machine may be corrupt. Please check guid.zip file in <IBM Spectrum Control Server>/data/sra/<OS> directory.

NAD0017E The GUID on remote machine: *host_name* could not be validated.

Explanation

The GUID value could not be validated on the remote host. This could be because the GUID is not installed on the target system or GUID binaries are corrupted.

Action

Check by running "tivguid -show" on the target system, and determine if it returns valid output with the GUID.

NAD0018E Command on remote machine: *host name* failed. Error code = *value* executing command *value*.

Explanation

The installation on the remote machine failed.

NAD0019E Parameter *parameter* passed to *method* is null or 0 length.

Explanation

Invalid input to the specified method.

NAD0020I Host validation succeeded.

Explanation

The host validation process of the host on which Storage Resource Agent is to be installed has completed with success.

NAD0021E Host validation failed.

Explanation

The host validation process of the host on which Storage Resource Agent is to be installed has failed.

Action

Please check Storage Resource Agent deployment logs for more details. You can fix problem specified in error log and re-attempt deployment of Storage Resource Agent (possibly with Force option) to avoid other issues such as non-empty installation directory. Please keep in mind, if force option is used and port is used by other running process then deployment will fail due to port usage.

NAD0022E Cannot contact remote host due to invalid credentials, check logs for additional information. Host validation failed.

Explanation

The remote host validation has failed due to invalid credentials.

Action

Check if the login information is correct and that the specified user has enough access privileges. You need to check user id and password information entered. If SSH protocol is used and certificate/passphrase is used, then make sure those are valid.

NAD0023E There is not enough space on the remote machine. Host validation failed.

Explanation

The remote host validation has failed due insufficient space on the target host of the Storage Resource Agent installation.

Action

Check that the remote host has enough space for the installation of the Storage Resource Agent.

NAD0024E It was not possible to determine the available space on the remote machine. Host validation failed.

Explanation

The remote host validation has failed due to the fact that free space on the host could not be computed.

Action

Check privileges of user used to connect to the target system on which Storage Resource Agent is going to be installed.

NAD0025E The specified directory could not be accessed. Host validation failed.

Explanation

The remote host validation has failed due to the fact that the agent install directory could not be accessed.

Action

Check privileges of the user used to connect to the target system on which the Storage Resource Agent is going to be installed. Check any permissions set on the directory in which the Storage Resource Agent will be installed.

NAD0036E Failed to copy *package name* to remote machine.

Explanation

The specified file could not be copied/extracted to the remote host in specified location.

Action

Please check if target system has enough space, user had sufficient privileges or file to be sent/copied is not corrupt.

NAD0037E Cannot cleanup remote machine directory: *directory path*.

Explanation

For some reasons installation of Storage Resource Agent has failed. At the end of failure it tries to clean up directory on remote host, but it failed to delete it.

Action

First fix the problem reported in failure while attempting to deploy Storage Resource Agent. If you want to re-run the deployment job, try deleting the directory on the target machine . If you cannot delete directory due to some access issues, then attempt to deploy Storage Resource Agent with "Force" option by editing the job definition and selecting the "Force" option.

NAD0038E Failed to install agent on *host name*.

Explanation

The Storage Resource Agent failed to install on specified host.

Action

Please check deployment logs and address issues. Once you address issues, you can re-deploy this job. For any reason, if you cannot delete target directory or any residue exists on target host system, then use "Force" option to re-deploy Storage Resource Agent.

NAD0039I Agent successfully installed at *install location*.

Explanation

The Storage Resource Agent installation has completed successfully.

NAD0040E Agent install exited with an error code: *value*.

Explanation

The Storage Resource Agent installation has failed with the provided error code number.

Action

Most of the time reason for failure is given along with error codes. For additional information, please check installation/user guide for explanation of error codes.

NAD0041E Failed to get agent bundle locations.

Explanation

The Storage Resource Agent source location cannot be found.

Action

Please check <TPCServerLocation>/data/sra/<OS> directory. It should have all deployment packages for Storage Resource Agent. If packages are missing, please copy from CD to that directory.

NAD0042E Exception occurred while retrieving IPs for Data Server machine : *host name*.

Explanation

The internet addresses of the Data Server machine cannot be retrieved.

Action

Contact IBM customer technical support.

NAD0043I Installing agent at *install location*.

Explanation

The Storage Resource Agent will start installing at the specified location on target system.

NAD0044I Agent registration to Data Server completed successfully.

Explanation

The Storage Resource Agent has registered successfully with the Data Server.

NAD0045I Validation of *host name* has started.

Explanation

The validation process for the host is starting.

NAD0046E GUID cannot be null value for registration of agent.

Explanation

The Storage Resource Agent could not be registered since the GUID value is null.

Action

Check the GUID on the target machine. Check by running "tivguid -show" on the target system and verifying that it gives valid output with the GUID. If there are issues with the GUID and no other application is using the GUID on the target system, clean up the GUID and redeploy the Storage Resource Agent on it.

NAD0047E Exception while reading authentication information.

Explanation

Error occurred while reading registration information from host on which Storage Resource Agent is being installed.

Action

Contact IBM customer technical support.

NAD0048E Probe did not start successfully on agent *host address*, error code returned = *value*.

Explanation

The probing process did not start on the host and returned the specified error code.

Action

There may be issue such as missing operating system library. You can extract agent.zip and probe.zip from the CD or <Data Server>/data/sra/<OS> to target system, and run bin/Probe and check log or system out error message.

NAD0049I Running probe on agent *host address*.

Explanation

The probe on the agent is running.

NAD0050E Exception occurred while running probe on agent *host name* : *exception message*.

Explanation

The probe on the host has failed with the provided error message.

Action

Please check probe logs on Storage Resource Agent and Server logs in IBM Spectrum Control Data Server directory.

NAD0051I Successfully started probe on agent *host address*.

Explanation

The probe was started successfully on the Storage Resource Agent.

NAD0052E Error in receiving *remote file name* from *host address*.

Explanation

The remote data file from the host could not be received.

Action

Please check firewall or any other security issues for file access problem.

NAD0053E Exception occurred while receiving *remote file name* from *host address: exception message*.

Explanation

The remote data file from the host could not be received.

Action

Please check firewall or any other security issues for file access problem, please check logs for more information.

NAD0054E The directory *install_location* is not empty on the remote machine. Host validation failed.

Explanation

The target directory for installation of Storage Resource Agent must be empty.

Action

Verify that the install directory for the agent is empty. If you cannot delete/clean-up the installation directory for Storage Resource Agent, use the "force" option, which will bypass checking any residue remaining from an earlier installation.

NAD0055E Failed to connect to remote host *host*.

Explanation

The specified host is down or not reachable via network.

NAD0056E Error uninstalling agent at *host address:install location*.

Explanation

The Storage Resource Agent could not be uninstalled because the connection to the agent could not be made.

Action

If this is daemon based agent, then check if its up and running. If its non-daemon based agent, then please check if authentication information is still valid. You need to check subnet firewall, or firewall on IBM Spectrum Control Server and host on which SRA is being installed. There may be network issue, please check if ping is working.

NAD0057E Error uninstalling agent at *host address:install location error message*.

Explanation

The agent could not be uninstalled due to the reason specified in error message.

Action

Try to address error from specified message. You may need to clean up target host system manually. If you intend to re-install the agent, you can edit the existing deployment job and select the "Force" option.

NAD0058I Performing agent upgrade on remote machine *host address*.

Explanation

The Storage Resource Agent upgrade process has started.

NAD0059I Upgrade on *host address* succeeded.

Explanation

The upgrade of the Storage Resource Agent has succeeded on the host.

NAD0059E Upgrade on *host address* failed: *error message*.

Explanation

The upgrade for the Storage Resource Agent has failed with the specified error message.

Action

Please check error logs on Storage Resource Agent and on Data Server machine. Address errors pointed in logs.

NAD0070I Updating Langpacks on remote machine *host address*.

Explanation

The localized messages on Storage Resource Agents are being upgraded.

NAD0071W Requested Langpack *language pack name* not found on local machine.

Explanation

The package corresponding to localized messages that was requested can not be found on the IBM Spectrum Control Data Server.

Action

Please verify if localized messages (language pack) for IBM Spectrum Control Data Server has been installed. Localized message package for Storage Resource Agent are copied on IBM Spectrum Control Server machine when localized messages for IBM Spectrum Control Data Server gets installed. These localized message packages are used to copy from Data Server to Storage Resource Agent in upgrade of Storage Resource Agent if corresponding localized message is used in upgrade job definition of Storage Resource Agent.

NAD0072I Langpacks updated on remote machine *host address*.

Explanation

The language pack upgrade has succeeded on the remote host.

NAD0073E Error updating LangPacks on remote machine *host name* : *error message*.

Explanation

Error occurred while upgrading localized messages on Storage Resource Agent as indicated in error message.

Action

Please check error logs and address issue.

NAD0074W No langpacks found on local machine, update not performed.

Explanation

The update of the language pack was not performed because there were no previously installed language packs.

Action

Please verify if localized messages (language pack) for IBM Spectrum Control Data Server has been installed. Localized message package for Storage Resource Agent are copied on IBM Spectrum Control Server machine when localized messages for IBM Spectrum Control Data Server gets installed. These localized message packages are used to copy from Data Server to Storage Resource Agent in upgrade of Storage Resource Agent if corresponding localized message is used in upgrade job definition of Storage Resource Agent.

NAD0075E The Agent is already installed on host *host_name*. Host validation failed.

Explanation

IBM Spectrum Control Server has Storage Resource Agent information in its registry.

Action

You cannot install another Agent on the same system. If the Storage Resource Agent on the target host was removed, delete the agent from the IBM Spectrum Control Server. If you want to preserve historical information, you can re-deploy the Agent using the "force" option.

NAD0076E Failed to configure Auto-upgrade feature.

Explanation

The Auto-upgrade feature could not be configured due to an error regarding the schedule file.

Action

Please check existence of the file SCHEDULED_UPGRADES in <TPC>/data directory. This file should be deleted if AutoUpgrade needs to be enabled and vice-versa.

NAD0077E *Schedule file name* file cannot be created because the *schedule file* is a directory.

Explanation

The directory with the same name as the schedule file already exists, so the schedule file cannot be created. This disables AutoUpgrade.

Action

Rename directory which conflicts with schedule file name in <TPC>/data directory and then disable AutoUpgrade.

NAD0078E Cannot create *file name*.

Explanation

The schedule file could not be created as specified in error logs.

Action

Please check logs and take appropriate actions. Please check existence of file SCHEDULED_UPGRADES in <TPC>/data directory. This file should be created if AutoUpgrade needs to be disabled and vice-versa.

NAD0079E Cannot delete *file name*.

Explanation

The schedule file could not be deleted as specified in error logs.

Action

Please check logs and take appropriate actions. Please check existence of file SCHEDULED_UPGRADES in <TPC>/data directory. This file should be deleted if AutoUpgrade needs to be enabled and vice-versa.

NAD0080W Auto-upgrade feature was already enabled.

Explanation

The Auto-upgrade feature cannot be enabled because it is already enabled.

Action

No response needed.

NAD0081W Auto-upgrade feature was already disabled.

Explanation

Cannot disable the Auto-upgrade feature because it is already disabled.

Action

No response needed.

NAD0082E Exception has been encountered: *exception trace*.

Explanation

An exception has been encountered by the program as specified in message.

Action

Please take appropriate action based on error message.

NAD0083W Following Storage Resource Agent information is invalid *agent information*.

Explanation

The specified information about the agent is invalid. This is not expected to cause any problem.

Action

NAD0084W *Host location has no match from IBM Spectrum Control cached non-daemon based Storage Resource Agent list. Agent might not be non-Daemon based Storage Resource Agent.*

Explanation

The non-Daemon Storage Resource Agent could not be found in IBM Spectrum Control Data Server internal cache list while performing upgrade job on those agents.

Action

Restart Data Server and try to run upgrade job again.

NAD0085I *Current non-Daemon based Storage Resource Agents in IBM Spectrum Control cache are agents list .*

Explanation

The agent list of the non-Daemon based SRA currently in the IBM Spectrum Control cache.

NAD0086E *Unable to connect to Windows Domain Controller host name .*

Explanation

Cannot connect to Windows Domain Controller which is used to get list of domains and host list under domain.

Action

Please check network or IBM Spectrum Control Server or Windows Domain controller firewall. Check authentication information used to connect to Windows Domain controller. Make sure "File and Printer Sharing for Microsoft Network" under "Network properties" is enabled. You need to make sure to choose "Network Properties" of a connection which is used to communicate between IBM Spectrum Control Server and Storage Resource Agent.

NAD0087E *Unable to determine source package home directory.*

Explanation

The source package directory required for the domain controller tool cannot be determined.

Action

Please restart IBM Spectrum Control Data Server and check if problem goes away.

NAD0088E *Error deploying package zip file.Error message.*

Explanation

A error has occurred during the deployment of the zip file containing the domain controller tool.

Action

Please check space, access, firewall or any other blocking issues while copying tool to Domain controller.

NAD0089E *Error deleting binary executable file.Error message.*

Explanation

An error has occurred during the removal of the domain controller tool executable.

Action

Please check error logs. You can delete this file manually as well.

NAD0090E No connection exists to remote machine.

Explanation

There are no valid connections to the remote machine.

Action

Please check logs if connection had any issues. You can re-attempt to do what you were doing earlier.

NAD0091E Error executing binary *executable file*.Error message.

Explanation

A error has occurred during the invocation of the domain controller tool executable.

Action

Please check access privileges of user used to connect to domain controller.

NAD0092E Unable to retrieve remote temporary directory location.

Explanation

The temporary directory on domain controller cannot be determined.

Action

Please check access privileges of user used to connect to domain controller.

NAD0093E Unable to retrieve domains from *host name*.

Explanation

The domain list from domain controller cannot be retrieved.

Action

Please check access privileges of user used to connect to domain controller. You may need to contact Domain Controller administrator for more information.

NAD0094E Unable to retrieve host list for *domain name*.

Explanation

The domain list from domain controller cannot be retrieved.

Action

Please check access privileges of user used to connect to domain controller. You may need to contact Domain Controller administrator for more information.

NAD0095E The platform *OS_name* is not supported for Storage Resource Agents.

Explanation

The Storage Resource Agent cannot be installed on the specified platform as it is not one of the supported platforms for Storage Resource Agent.

Action

Check the IBM Spectrum Control support matrix for a list of operating systems on which Storage Resource Agent is supported.

NAD0096E Authentication failed due to invalid credentials or insufficient access privileges.

Explanation

The agent authentication failed due to invalid credentials.

Action

Check user ID and password used for connection between IBM Spectrum Control Server and Storage Resource Agent. If you have used SSH as a connection protocol, and provided a certificate and passphrase, make sure that information is correct.

NAD0097I Opening connection to *hostname*.

Explanation

Opening the connection to the Storage Resource Agent at the specified hostname.

NAD0098I Copying agent files on remote machine...

Explanation

The agent files are currently being copied to the remote host where Storage Resource Agent will get installed.

NAD0099I Installing agent on host *host name*, in *install location* directory with force option.

Explanation

The Storage Resource Agent installation at the specified path will proceed with the force parameter enabled. That means most of the validation will not be performed. If agent is being installed as a daemon (service) and some other running service is using same port as this agent, then installation will fail, as validations are skipped in "Force" option.

NAD0100E Agent command did not run successfully on agent *host name*, error code returned = *value*.

Explanation

The agent on the remote host failed to process the command.

Action

Please check error code in installation/user's guide for more information.

NAD0101I Running agent command on agent *host name*.

Explanation

The agent is now processing the command.

NAD0102E Exception occurred while running command on agent *host name* : *error message*.

Explanation

During the command processing the agent has encountered an error.

Action

Please check error message and take an appropriate action.

NAD0103E Error in deleting file *remote data file* from host *host address*.

Explanation

The data file on the Storage Resource Agent machine cannot be deleted.

Action

Please check access privileges or if any other process is using this file.

NAD0104E Exception occurred while deleting file *remote data file* from host *host address*: *exception trace*.

Explanation

An exception occurred during the deletion of the remote data file on the host.

Action

Please check access privileges or if any other process is using this file.

NAD0105E Failed to lock Agent file.

Explanation

While installing Storage Resource Agent, agent file on remote host cannot be locked.

Action

Please check deployment logs to understand problem. If logs are deleted then re-deploy with "Force" option to leave logs and other files behind.

NAD0106E Failed to stop Probe.

Explanation

The probe cannot be stopped.

Action

Please check deployment logs to understand problem. If logs are deleted then re-deploy with "Force" option to leave logs and other files behind.

NAD0107E Failed to stop Agent.

Explanation

The agent cannot be stopped.

Action

Please check deployment logs to understand problem. If logs are deleted then re-deploy with "Force" option to leave logs and other files behind.

NAD0108E Failed to create registry entry on Agent machine.

Explanation

The registry entry for the agent cannot be created on the agent machine.

Action

It is possible that some registry entries residue exists on target system from an earlier failed installation. Try re-deploying Storage Resource Agent with "Force" option.

NAD0109E Failed to extract file.

Explanation

Installation package files used for deployment of Storage Resource Agent cannot be extracted.

Action

Please check installation package on CD or on IBM Spectrum Control Server at <IBM Spectrum Control Server>/data/sra/<OS> location.

NAD0110E Failed to create configuration.

Explanation

The configuration of Storage Resource Agent has failed in deployment process.

Action

Please check logs and take corrective actions.

NAD0111E Failed to stop Agent service.

Explanation

The agent service did not stop properly.

Action

Please check if there is any issues with service on target machine.

NAD0112E Agent service already exist.

Explanation

The agent service cannot be installed because it already exists.

Action

On target machine service used for Storage Resource Agent already exists. You can cleanup machine manually or try to deploy Storage Resource Agent with "Force" option.

NAD0113E Failed to create Agent service.

Explanation

The agent service could not be created.

Action

Please check agent logs for more information and take corrective action.

NAD0114E Failed to start Agent service.

Explanation

The agent service cannot be started.

Action

Please check agent logs for more information and take corrective action.

NAD0115E Failed to start Probe.

Explanation

The probe could not be started.

Action

Please check agent logs for more information and take corrective action.

NAD0116E Failed to create Agent service.

Explanation

The agent service could not be created.

Action

Please check agent logs for more information and take corrective action.

NAD0117E File extraction needs more space.

Explanation

There is not enough space for the archive to be extracted.

Action

Increase available space on target system in installation directory of Storage Resource Agent and re-attempt installation of Storage Resource Agent.

NAD0118E Failed to open archive file.

Explanation

The archive could not be opened.

Action

Please check for valid archive file by opening it with any zip utility. If file is corrupted then it needs to be replaced from CD or IBM Spectrum Control Server <IBM Spectrum Control Server>/data/sra/<OS> location.

NAD0119E Missing upgrade files.

Explanation

Upgrade of Storage Resource Agent cannot be continued as upgrade files are missing during the upgrade process.

Action

Please check agent logs for more information.

NAD0120E Failed to extract files.

Explanation

Upgrade package files used for deployment of Storage Resource Agent cannot be extracted.

Action

Please check installation package on CD or on IBM Spectrum Control Server at <IBM Spectrum Control Server>/data/sra/<OS> location.

NAD0121E Failed to stop probe in upgrade process.

Explanation

The agent upgrade failed because the running probe could not be stopped.

Action

Please check if there is long running Probe which cannot be stopped for any reason. You can manually stop Probe and then re-attempt the upgrade.

NAD0122E Failed to stop Agent in upgrade process.

Explanation

The agent upgrade failed because the agent could not be stopped.

Action

Please check agent logs for more information.

NAD0123E Failed to start Agent in upgrade process.

Explanation

The agent upgrade failed because the agent could not be started.

Action

Please check agent logs for more information.

NAD0124E Failed to register Agent to Server.

Explanation

The agent could not register with the server.

Action

Please check agent and IBM Spectrum Control Server logs for more information.

NAD0125E Extraction needs more space.

Explanation

The archived files cannot be extracted because there is not enough space.

Action

Please increase space on target directory and re-attempt the failed action.

NAD0126E Failed to open archive file.

Explanation

The archive cannot be opened.

Action

Please check for valid archive file by opening it with any zip utility. If file is corrupted then it needs to be replaced from CD or IBM Spectrum Control Server <IBM Spectrum Control Server>/data/sra/<OS> location.

NAD0127I Uninstalling agent from host *host address* at location *path*.

Explanation

The Storage Resource Agent is being uninstalled.

NAD0128E Failed to start process.

Explanation

The agent process failed to start.

Action

Please check agent logs for more information.

NAD0129E Error in opening catalog file.

Explanation

The catalog file could not be opened.

Action

Please check agent logs for more information. Catalog file is located in <SRA>/nls directory. You can replace it from CD or IBM Spectrum Control Server location. It is in agent.zip file.

NAD0130E Probe failed.

Explanation

The probe failed.

Action

Please check agent logs for more information.

NAD0131E The installation process could not write files to the directory *install_location*. Host validation failed.

Explanation

The host validation failed because files cannot be written to the agent install directory.

Action

Check access privileges for the user account used to deploy Storage Resource Agent.

NAD0135E The certificate file *file_name* was not found on *host_name*.

Explanation

The certificate file could not be found on the host.

Action

Check that the installation package certs.zip has certificate files on CD(if installed locally) or on IBM Spectrum Control Server if deployed remotely.

NAD0136E The port number of the agent is invalid.

Explanation

The valid port range for an agent is between 0 and 65535.

Action

Specify a port number within the valid port range.

NAD0137E The port number *port_number* is in use on the remote machine.

Explanation

The port is already being used by another process on the remote machine.

Action

Either specify a different port which is not being used by any other process or terminate the application that is using it. Use the following commands to determine what process is using the port. In any instance, replace the generic "port_number" with the specific port value.

Windows: netstat -nao | findstr port_number The last column shows the process ID information.

Linux: netstat -nap | grep port_number The last column shows the process ID/Program name information.

AIX: 1. netstat -Aan | grep port_number The hex number in the first column is the address of the protocol control block (PCB) 2. rmsock "addr of PCB" tcpcb This command shows the process that is holding the socket. Note that this command must be run as root.

Solaris: for pid in `ps -ef|grep -v UID|awk '{ print \$2 }'`; do pfiles \$pid 2>/dev/null|awk '/^[0-9]/ {pid_line=\$0} /port: port_number/ {print pid_line; print}'; done The first line shows the process ID information.

HP-UX: for pid in `ps -ef|grep -v UID|awk '{ print \$2 }'`; do pfiles \$pid 2>/dev/null|awk '/^[0-9]/ {pid_line=\$0} /localaddr\port =.*port_number.*remaddr\port =/ {print pid_line; print substr(\$0,0,index(\$0,"remaddr")-1); exit}'; done The first line shows the process ID information.

NAD0138E Invalid character "*invalid_character*" found in *install_location*.

Explanation

The agent install location path contains an invalid character.

Action

Use only supported characters in the directory name. Check the operating system help for supported characters in a directory name.

NAD0139E The User *userID* does not have sufficient administrator privileges.

Explanation

The specified user ID does not have sufficient administrator privileges.

Action

The user needs to have root privileges required for this action on a remote host.

NAD0140I Cannot ping to host *host name*.

Explanation

The host cannot be reached by issuing the ping command.

Action

Please check network or IBM Spectrum Control Server or Storage Resource Agent host machine firewall. Please check if you can run ping successfully from command line.

NAD0141E Either the remote host could not be contacted due to invalid credentials or the machine is not reachable. Check logs for more information. Host validation failed.

Explanation

The host validation failed because the entered credentials are incorrect or the machine cannot be reached.

Action

Use the ping command to check if the machine can be reached. Verify credential information such as user id and password. If you have used SSH as a connection protocol, and provided a certificate and passphrase, make sure that information is correct.

NAD0142E Deployment of Agent failed, error creating startup scripts.

Explanation

The startup scripts for Storage Resource Agent running as daemon on Unix and Linux could not be created.

Action

There could be issue with privileges or scripts with similar name already exist. Please check agent logs for more information.

NAD0143E Cannot change agent from Daemon based type to non-Daemon based type with force installation, host validation failed.

Explanation

The host validation failed because the agent cannot be changed from Daemon to non-Daemon or vice versa.

Action

If you have installed daemon Storage Resource Agent and are trying to convert it to non-daemon agent, it is not possible. Even with the force option, installation will fail. This is true while converting from non-daemon agent to daemon agent as well. If you want to convert from one type to another you need to uninstall and install it again.

NAD0144E Agent type can not be changed between non-daemon-based and daemon-based with force installation. Host validation failed.

Explanation

The host validation failed because the agent cannot be changed between non-daemon and daemon.

Action

It is not possible to change agent type between daemon and non-daemon. Even with the force option, installation will fail. If you want to convert from one type to another you need to uninstall and re-install the Storage Resource Agent.

NAD0145E Cannot get version information from agent on host .

Explanation

Storage Resource Agent version could not be obtained.

Action

Check if there are any connectivity issues with the Storage Resource Agent. If the problem continues, contact IBM support.

Related reference

- [Getting support](#)

NAD0146E The connection to *remote machine* failed because the Remote Execution and Access component was unable to create a temporary directory on the remote machine. Remove unneeded ~CSRI* directories in the remote machine's temporary directory.

Explanation

The connection to the remote machine failed.

Action

Remove unneeded ~CSRI* directories in the remote machine's temporary directory.

NAD0147E The daemon-based agent on *host_address* could not be stopped.

Explanation

The daemon based Storage Resource Agent on the host cannot be stopped.

Action

Check the agent logs and IBM Spectrum Control Server logs for more information.

NAD0148E Daemon based agent on *host address* failed to start.

Explanation

The daemon based Storage Resource Agent on the host cannot be started.

Action

Please check agent logs for more information.

NAD0149E Runtime files of agent *host address* are missing or corrupted.

Explanation

The Storage Resource Agent runtime files on the host are either missing or not behaving as expected.

Action

Restart Storage Resource Agent and check status through GUI. If problem still exists, then re-install Agent with Force option.

NAD0150E Agent is defected.

Explanation

The agent state indicates that it is defected. This may be due to any files missing or corrupted.

Action

Restart Storage Resource Agent and check status through GUI. If the problem still exists, then re-install Agent with Force option.

NAD0151E The original install location *path* cannot be changed.

Explanation

Once the Storage Resource Agent is installed, you cannot change its location.

Action

If you want to change the Storage Resource Agent location, then you must uninstall and re-install the Agent at a new location.

NAD0152E Initialization of TCP/IP failed while creating socket.

Explanation

While creating sockets for the agent the IBM Spectrum Control/IP initialization failed.

Action

Please check available resources on target machine where Storage Resource Agent is being installed. You can see error code in agent logs.

NAD0153E Agent service could not be stopped at uninstallation time.

Explanation

The uninstallation failed because the agent service could not be stopped.

Action

Please check logs for additional information. You can manually stop service and do local uninstallation of Agent. If uninstallation still fails, you can delete agent from IBM Spectrum Control GUI and manually clean up agent files, registry information on target host.

NAD0154E Invalid server name passed at uninstallation time.

Explanation

The uninstallation failed because the server name specified at uninstallation time is not correct.

Action

Please provide proper IBM Spectrum Control server name at uninstallation time. You can see server names in configuration file Agent.config in the <Storage Resource Agent>/config directory.

NAD0155E Port passed at installation time for agent service is in use.

Explanation

The port specified for the Storage Resource Agent is in use by another process.

Action

Please use a port which is not used by any other process on the host.

NAD0156E The server *host_address* cannot be reached because the host name or IP address is not recognized.

Explanation

The host cannot be contacted because the host is unreachable.

Action

Check the host name specified for the target host. Check if the host name can resolve to an IP address from a command line by using commands such as nslookup or ping.

NAD0157E The server *host_name* cannot be contacted. The server might be down, unreachable due to network problems, or the SSH credentials might be invalid.

Explanation

The server cannot be contacted. The server might be down or unreachable due to other connection failures or the server cannot be contacted using the credentials that are provided.

Action

Check the host name that is specified for the server. Check whether the host name can resolve to an IP address from a command line by using commands such as nslookup or ping. Check whether the user and password that are specified are valid. If SSH certificates are used for authentication, check whether the certificate and the passphrase are valid.

NAD0158E GUID *value* of machine *host_name* duplicates GUID on agent machine *host_address*.

Explanation

The GUID value is already in use by another machine.

Action

Regenerate the GUID on one of the machines with the duplicate GUID by running "tivguid -Write -New". You might need to reinstall the Storage Resource Agent after regenerating the GUID.

NAD0160E Agent is already registered with Server on machine *host_name* location *path*.

Explanation

The Storage Resource Agent cannot be registered with the server as another Storage Resource Agent pointing to this IBM Spectrum Control server is already installed at another location on same host.

Action

You can uninstall Storage Resource Agent from other location and then try to install at this new location.

NAD0161E The *install location* is not an absolute path.

Explanation

The specified install location path is not fully qualified.

Action

Provide a fully qualified path for the installation of Storage Resource Agent.

NAD0162E Services script did not run on the *host_address* server : *exception_message*.

Explanation

The script that collects service data about a Storage Resource Agent failed to run on the associated server.

Action

Review the additional error message that was included in the text of this message. Take any actions based on the details of that message. Check the logs of the IBM Spectrum Control server and the Storage Resource agent for more information about the problem.

NAD0163I Services files collected from *host address* machine can be found in *local service file* archive.

Explanation

The service files for the host have been collected and stored in archive file.

NAD0164E Cannot collect service data from the *host_address* server.

Explanation

Service archive files can not be collected from the server on which the Storage Resource agent is installed.

Action

Verify that the server is up and running and that the network is available. Check the logs of the IBM Spectrum Control server and the Storage Resource agent for more information about the problem.

NAD0165E Cannot copy the *services_file* service archive file from the *host_address* server.

Explanation

The service archive file cannot be transferred from the server on which the Storage Resource agent is installed to the IBM Spectrum Control server.

Action

Verify that the Storage Resource agent is up and running and that the network is available. Retry the copy. If the copy fails again, use a command line tool or GUI file manager to locate the directory where the service archive file is located and copy it manually.

NAD0166E Cannot create the *local_service* directory for storing service archive file.

Explanation

The local directory for the service archive file cannot be created.

Action

Check the logs of the Storage Resource agent for more information about why the directory was not created. Use this information to resolve the problem.

NAD0167I Running scan on agent *host address*.

Explanation

The scan of host system has started.

NAD0168E Exception occurred while running scan on agent *host address* : *exception message*.

Explanation

The scan for the host completed with a error message.

Action

Please check agent and IBM Spectrum Control Server logs for more detail.

NAD0169I Successfully started scan on agent *host address*.

Explanation

The scan for the host has successfully started.

NAD0170E Scan did not start successfully on agent *host address*, error code returned = *value*.

Explanation

The scan did not start on the host and returned the provided error code.

Action

Please check the agent logs for more messages and, if necessary, contact IBM Software Support for more information. The default location for the Storage Resource Agent log files is: TPC_installation_directory/agent/log/name_of_server_SRA_communicates_with

NAD0171E Failed to copy *remote file name* file to *host name* machine.

Explanation

Cannot copy input data file from IBM Spectrum Control Server to Storage Resource Agent.

Action

Please check IBM Spectrum Control Data Server and agent logs for more information.

NAD0172E Failed to extract *remote file name* file.

Explanation

Extraction of archive file on Storage Resource Agent machine failed.

Action

Please check installation package on CD or on IBM Spectrum Control Server at <IBM Spectrum Control Server>/data/sra/<OS> location.

NAD0173I Running NetAppImportQuota on agent *host address*.

Explanation

The NetAppImportQuota is running on the Storage Resource Agent.

NAD0174E Exception occurred while running NetAppImportQuota on agent *host address* : *error message*.

Explanation

The NetAppImportQuota command generated an exception as provided in message.

Action

Please check error message on Storage Resource Agent or IBM Spectrum Control Server machine for more information.

NAD0175I Successfully started NetAppImportQuota on agent *host address*.

Explanation

The NetAppImportQuota command has started on the agent.

NAD0176E NetAppImportQuota did not start successfully on agent *host address*, error code returned = *value*.

Explanation

The NetAppImportQuota command could not be started on the agent host generating an exception message.

Action

Please check error message on Storage Resource Agent or IBM Spectrum Control Server machine for more information.

NAD0180I Installing re-distributable package on .

Explanation

Updating remote machine with Visual Studio re-distributable dll package.

NAD0181I Install of re-distributable package on succeeded.

Explanation

Update of Visual studio 2008 Dll's on remote machine succeeded.

NAD0182E Failed to install re-distributable package on .

Explanation

Failed to update remote machine with Visual Studio dll's.

NAD0183I Validating re-distributable package on *host name*.

Explanation

The redistributable package installation is being validated on the Storage Resource Agent host.

NAD0184I Validation of re-distributable package succeeded.

Explanation

The redistributable package installation has been successfully validated on Storage Resource Agent host.

NAD0185E Validation of re-distributable package failed.

Explanation

The redistributable package installation has failed to validate on Storage Resource Agent host.

Action

You can install reinstallation package on Storage Resource Agent machine by using redistrib.zip on CD or from IBM Spectrum Control Server machine from <TPCServer>/data/sra/windows directory. You need to unzip redistrib.zip file and use TivReDist.msi file for installing redistribution package.

NAD0186I Trying to locate package TIVguid using pkginfo ...

Explanation

Trying to locate installation folder of package TIVguid using pkginfo.

NAD0187I Package TIVguid is not installed.

Explanation

Package TIVguid is not installed on the system.

NAD0188I Checking TIVguid default install path : *path* ...

Explanation

Trying to detect existing installation of package TIVguid using the default install path : /opt/tivoli/guid.

NAD0189E Command is not valid.

Explanation

The specified command is not a valid command.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0190E Provided option is not valid.

Explanation

The specified agent option is not valid.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0191E Arguments are not valid.

Explanation

The specified agent command arguments are not valid.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0192E Value for one of the arguments is missing.

Explanation

The value for one of the provided arguments is missing.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0193E Localized string missing in message file.

Explanation

The language specific string is missing from the appropriate message file.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0194E Probe process is already running.

Explanation

Cannot start another probe because an earlier probe process is still running.

Action

You need to wait until earlier probe finishes. If you think this is invalid case, you can restart Storage Resource Agent and try to run probe again. If you still see similar situation, you can restart IBM Spectrum Control Data Server and run probe again.

NAD0195E Failed to open file for writing.

Explanation

The file could not be opened for writing.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0196E Failed to close file.

Explanation

The file could not be closed.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0197E Logfile was not specified.

Explanation

The file in which the log messages should be stored was not specified.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0198E Tracing failed.

Explanation

The trace messages could not be written.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0199E Cannot start a new Probe process because another one is already running.

Explanation

Cannot start a probe because another probe is already running.

Action

You need to wait until earlier probe finishes. If you think this is invalid case, you can restart Storage Resource Agent and try to run probe again. If you still see similar situation, you can restart IBM Spectrum Control Data Server and run probe again.

NAD0200I Validating user on remote machine *host name*.

Explanation

The user credentials for the Storage Resource Agent host are being validated.

NAD0201I Validation of user *user* succeeded.

Explanation

The user credentials of user for the Storage Resource Agent host have been successfully validated.

NAD0202E The validation of user credentials for *user* failed.

Explanation

The user credentials used to access the Storage Resource Agent host are not valid.

Action

Check the user id and password used for connecting to the host. If you used SSH as a connection option, and provided a certificate and passphrase, make sure that the information is correct.

NAD0203E No tracing.

Explanation

There is no tracing possible for the current action.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0204E An internal error occurred in the agent process.

Explanation

The agent process has failed with an internal error.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0205E The provided socket is invalid.

Explanation

The provided socket could not be used.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0206E Failed to start the service.

Explanation

The service could not be started.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information. Once you address problem, please retry starting agent.

NAD0207E The file was not found.

Explanation

The specified file was not found.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0208E Not enough memory to run agent.

Explanation

The host does not have sufficient memory to run the agent.

Action

Please look at the system hardware configuration of Storage Resource Agent, applications running on it and memory usage of different applications on it.

NAD0209E The agent process did not start after the upgrade was finished.

Explanation

The agent process did not start after the upgrade was finished.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information. Please start agent to check if it can be started.

NAD0210E The installation directory was not valid when trying to upgrade.

Explanation

The installation directory was not valid when trying to upgrade.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0211E The Probe is currently busy.

Explanation

The probe process is currently busy and cannot be accessed.

Action

Wait for few minutes for Probe to be responsive. If probe is not responding, try to shut down agent or forcefully stop probe process and restart agent.

NAD0212E The data file was not found.

Explanation

The data file was not found.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0213E The exit code is not in the output file.

Explanation

The exit code is not in the output file.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0214E Failed to send the job status.

Explanation

Failed to send the job status.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information. Communication between IBM Spectrum Control Server and Storage Resource Agent has failed. Please check if IBM Spectrum Control Data Server is up and running.

NAD0215E Failed to copy the certificate files.

Explanation

Failed to copy the certificate files.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information. You need to check network IBM Spectrum Control Server or Storage Resource Agent firewall or any connection issues.

NAD0216E Failed to create directory.

Explanation

Failed to create directory.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information. There may be access privileges issue which needs to be addressed.

NAD0217E Failed to remove directory.

Explanation

Failed to remove directory.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information. There may be access privileges issue which needs to be addressed. You need to check network IBM Spectrum Control Server or Storage Resource Agent firewall or any connection issues.

NAD0218E Failed to execute the command.

Explanation

Failed to execute the command.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0219E Failed to convert wide characters.

Explanation

Failed to convert wide characters.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information. There may be an issue with operating system localization installation for particular language on Storage Resource Agent.

NAD0220E The installation directory is not valid.

Explanation

The installation directory is not valid.

Action

Please make sure valid installation directory has been provided for installation of Storage Resource Agent.

NAD0221E No server name was provided.

Explanation

No server name was provided.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0222E An error occurred while trying to remove entries from the configuration file.

Explanation

An error occurred while trying to remove entries from the configuration file.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0223E Failed to stop Probe process at uninstallation time.

Explanation

Failed to stop Probe process at uninstallation time.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information. Probe process may be busy and could not respond in timely manner. You can forcefully stop probe process and try to uninstall Storage Resource Agent if its not already uninstalled.

NAD0224E Failed to remove registry entry at uninstallation time.

Explanation

Failed to remove registry entry at uninstallation time.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0225E Failed to remove service entry at uninstallation time.

Explanation

Failed to remove service entry at uninstallation time.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information. If Storage Resource Agent has been uninstalled then you need to manually clean up service from host.

NAD0226E The agent files are corrupted.

Explanation

The installed agent files are corrupted.

Action

You can re-install Storage Resource Agent on host with "Force" option. It will just overlay files on top of what was installed.

NAD0227E Failed to install the GUID.

Explanation

The GUID could not be installed.

Action

Please check guid logs for error message and take an appropriate action.

NAD0228E A storage resource agent with a different runtime operation mode, daemon / non-daemon, is already installed at the specified location.

Explanation

The runtime operation mode of a storage resource agent cannot be changed

Action

To deploy a storage resource agent at the same location using a different runtime operation mode, un-install the agent and re-install it with the desired runtime operation mode.

NAD0229E Not enough disk space available for installation.

Explanation

Not enough disk space available for installation.

Action

Please increase available space on Storage Resource Agent host and then re-try installation of agent.

NAD0230E An installation is already in progress.

Explanation

An installation is already in progress.

Action

Please wait until earlier installation process gets completed.

NAD0231E Cannot get the server name from the server.

Explanation

Cannot get the server name from the server.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0232E The installation directory is not empty.

Explanation

The installation directory is not empty.

Action

Please delete installation directory or try to install with "Force" option.

NAD0233E The parameter server name is missing.

Explanation

The parameter server name is missing.

Action

Contact IBM customer technical support.

NAD0234E The parameter server port is missing.

Explanation

The parameter server port is missing.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0235E The parameter server ip is missing.

Explanation

The parameter server ip is missing.

Action

Please provide Server IP address while installing Storage Resource Agent.

NAD0236E The parameter agent port is missing.

Explanation

The parameter agent port is missing.

Action

If you are installing Storage Resource Agent as daemon agent then you need to provide Agent port. Please check usage of Agent.

NAD0237E The parameter installation directory is missing.

Explanation

The parameter installation directory is missing.

Action

Please provide installation directory for installation of Storage Resource Agent.

NAD0238E Failed to send the Probe results.

Explanation

Failed to send the Probe results.

Action

Please check network or IBM Spectrum Control Server or Storage Resource Agent host machine firewall. Please check if you can run ping successfully from command line to IBM Spectrum Control Server and telnet to IBM Spectrum Control Data Server port. Please check IBM Spectrum Control Data Server or Storage Resource Agent logs for additional information.

NAD0239E Failed to initialize the agent.

Explanation

Failed to initialize the agent.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0240E The service port number is missing.

Explanation

The service port number is missing.

Action

If you are installing Storage Resource Agent as daemon agent then you need to provide Agent port. Please check usage of Agent.

NAD0241E Get data file statistics failed.

Explanation

Get data file statistics failed.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0242E Get data file read failed.

Explanation

Get data file read failed.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0243E Failed to send the data to the server.

Explanation

Failed to send the data to the server.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0244E Failed to receive the data from the server.

Explanation

Failed to receive the data from the server.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0245E The full path was not specified. (copy file function)

Explanation

The full path for copying of the file was not specified.

Action

Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0246E Create file failed. (copy file function)

Explanation

During copying of the file the creation of the copy file failed.

Action

There may be access privileges or directory space issue. Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0247E Write file failed. (copy file function)

Explanation

During copying of the file the data could not be written.

Action

There may be access privileges or directory space issue. Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0248E Open file failed. (copy file function)

Explanation

During copying of the file the copied file could not be opened.

Action

There may be access privileges issue. Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0249E Read file failed. (copy file function)

Explanation

During copying of the file the data could not be read.

Action

There may be access privileges issue. Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0250E The UCS conversion failed.

Explanation

The Unicode conversion failed.

Action

Contact IBM customer technical support.

There may be operating system language installation issue. Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0251E The server connection failed.

Explanation

The server connection failed.

Action

Please check network or IBM Spectrum Control Server or Storage Resource Agent host machine firewall. Please check if you can run ping successfully from command line to IBM Spectrum Control Server and telnet to IBM Spectrum Control Data Server port. Please check IBM Spectrum Control Data Server or Storage Resource Agent logs for additional information.

NAD0252E Please check the OS level.

Explanation

The OS level is not correct.

Action

Operating system level is not the one supported for Storage Resource Agent, you cannot use this operating system to install Storage Resource Agent on.

NAD0253W No error message defined for error code: *value*.

Explanation

The specified error code has no associated error message attached.

Action

Please check installation or user's guide for more information.

NAD0254E Registry entry not found.

Explanation

The searched registry entry was not found.

Action

Registry entry used for Storage Resource Agent identification is missing from host. You may need to reinstall agent with force option on host to recover from situation.

NAD0255E Insufficient space to copy file *file name* on remote machine *host name* in location *location*.

Explanation

There is not enough space on the remote host at the specified location path for the file to be copied.

Action

Increase available space on target system and retry failed action.

NAD0256E Cannot get the available space on remote machine *host name* : *error message*.

Explanation

The amount of available space on the remote host could not be obtained.

Action

There may be access privileges issue. Please check Storage Resource Agent and IBM Spectrum Control Server logs for more information.

NAD0257E OS configuration error encountered. Please do a local install with debug set to MAX.

Explanation

The OS is not configured correctly.

Action

Make sure the operating system on this machine has the required software packages installed. Check the software requirements for the operating system and install any missing packages, then try the installation again.

NAD0258E Port *number* is in use on remote machine. Stop process manually or select another port number.

Explanation

The port is already being used by another process on the remote machine.

Action

Process needs to be stopped manually or select another port number.

NAD0259W Unable to determine Storage Resource Agent version on host . Fabric Discovery will not be invoked.

Explanation

Storage Resource Agent version could not be obtained. Since Fabric Discovery is not supported on some early versions of Storage Resource Agent, it will not be invoked.

Action

Check if there are any connectivity issues with the Storage Resource Agent. Also, check the device server message and trace log for more detail. If the problem continues, contact IBM support.

NAD0260I Agent is active.

Explanation

The check to ensure that communication with the agent has completed with success.

NAD0261I Agent shutdown successfully.

Explanation

The agent service was shutdown.

NAD0262I Successfully started agent

Explanation

The agent service was started.

NAD0263W The probe of the agent on *host name* did not complete in the allocated amount of time.

Explanation

The probe did not complete in the allocated amount of time that Server was configured to wait. Probe process continues on agent until completion.

Action

In order to verify that probe completed successfully, please check later the probe log file on the agent host.

NAD0264I The agent on *host name* is being probed.

Explanation

The probe continues on the specified host until completion.

NAD0265I After the probe has completed, the new volumes on the host will display in the IBM Spectrum Control GUI.

Explanation

New volumes might not display immediately in the GUI. This is caused by probes that take longer than expected to complete

Action

Make sure the probe completed successfully. Wait for the new volumes to display.

NAD0266I The probe of the agent on *host name* completed.

Explanation

The probe completed.

NAD0267W The probe of the agent on *host name* completed with return code *value*.

Explanation

The probe of the agent completed with a return code. The Storage Resource agent return codes are documented in the Reference section of the IBM Spectrum Control Information Center: For information about Storage Resource agent return codes, visit <http://pic.dhe.ibm.com/infocenter/tivihelp/v59r1/index.jsp> and search for Storage Resource agent return codes.

Action

Check the probe log file on the agent host to determine the cause of the return code and resolve the problem. Try the operation again.

NAD0268I To display newly assigned volumes in the IBM Spectrum Control GUI, start a new probe after the currently running probe completes. Make sure the new probe completes without errors.

Explanation

A manual probe is necessary in order to cause the new volumes to display in the IBM Spectrum Control GUI.

Action

If the currently running probe started before the new volumes were assigned to the host, you must start a new probe to display the new volumes in the IBM Spectrum Control GUI. Manually start a new probe and make sure the probe completes successfully.

NAD0269I To display newly assigned volumes in the IBM Spectrum Control GUI, you must start a new probe. Make sure the new probe completes without errors.

Explanation

A manual probe is necessary in order to cause the new volumes to display in the IBM Spectrum Control GUI.

Action

You must start a new probe to display the new volumes in the IBM Spectrum Control GUI. Manually start a new probe and make sure the probe completes successfully.

NAD0270W The Storage Resource Agent on *host name* is disabled and will not process any requests.

Explanation

The Storage Resource Agent specified on this computer is disabled and will not accept any requests from the IBM Spectrum Control server.

Action

Enable the Storage Resource Agent on this computer using the 'Enable' option available for this agent in IBM Spectrum Control Web GUI and submit the request again.

NAD0271W The connection to the Storage Resource Agent on *host name* was not established because the agent is disabled.

Explanation

The Storage Resource Agent specified on this computer is disabled and will not accept any connections from the IBM Spectrum Control server.

Action

Enable the Storage Resource Agent on this computer using the 'Enable' option available for this agent in IBM Spectrum Control Web GUI and submit the request again.

NAD0272W The connection to the Storage Resource Agent on *host name* was not established. Retrying using the IP address.

Explanation

The Storage Resource Agent specified on this computer could not be connected using the fully qualified computer name. Connection is retried using the ip address.

Action

Check if the fully qualified computer name can be resolved through the network using network commands.

NAD0273E The connection to *remote machine* failed because the Remote Execution and Access component was unable to create a temporary directory on the remote machine. Remove unneeded ~CSRI* directories in the remote machine's temporary directory.

Explanation

The connection to the remote machine failed.

Action

Remove unneeded ~CSRI* directories in the remote machine's temporary directory.

NAD0274E An SSH certificate *certificate name* already exist.

Explanation

The SSH certificate could not be copied on IBM Spectrum Control server directory as there is another certificate with this name.

Action

Rename the SSH certificate name and try again.

NAD0275E Failed to connect to remote host *hostname* and *port*. Failed to establish a secure connection.

Explanation

The SSH connection failed due to an unknown SSL error.

Action

Verify the connection is not blocked by a firewall and retry the connection.

NAD0276E Failed to connect to remote host *hostname and port*.
Failed to establish a secure connection because the SSL handshake failed.

Explanation

The SSL connection failed because the IBM Spectrum Control server and the storage resource agent could not negotiate the desired level of security. This could happen if the IBM Spectrum Control server or storage resource agent certificate is not trusted, not valid, or expired.

Action

If you have recently updated the certificate on the IBM Spectrum Control server then make sure you have also replaced the certificate on the storage resource agent. Make sure that the system date on both the IBM Spectrum Control server and storage resource agent machine is within validity date range of both certificates.

NAD0277E Failed to connect to remote host *hostname and port*.
Failed to establish a secure connection because of an invalid SSL key.

Explanation

The SSL connection failed because of a bad SSL key. This is normally caused by a misconfiguration of the SSL certificate and private key.

Action

Verify that the certificates and private keys on the IBM Spectrum Control server and storage resource agent have been configured correctly.

NAD0278E Failed to connect to remote host *hostname and port*.
Failed to establish a secure connection because the identity of the peer could not be verified.

Explanation

The SSL connection failed because the peer was not able to identify itself. This could happen if no certificate is available or the configured cipher suite does not support authorization.

Action

Verify that the certificates on the IBM Spectrum Control server and storage resource agent have been configured correctly. There is no need to investigate the cipher suite because IBM Spectrum Control does not allow this to be configured.

NAD0279E Failed to connect to remote host *hostname and port*.
Failed to establish a secure connection because of an SSL protocol error.

Explanation

The SSL connection failed because of an error in the SSL protocol.

Action

Contact IBM support.

Related reference

- [Getting support](#)

NAD0280E The installation failed for the Microsoft VC++ Redistributable package on *host*. The return code is *value*.

Explanation

The Microsoft VC++ Redistributable package did not install successfully on the remote host.

Action

The return code comes from the Windows operating system. Run the 'net helpmsg' command followed by the return code from a command prompt window to get additional information about the error.

NAD0281E The Storage Resource agent cannot be deployed because of insufficient space or other issues on the target system. The error is: *error message*.

Explanation

This problem might occur when there is insufficient space on the target system, or the target file is read-only or is being used by another application.

Action

Ensure that the target file is not open or in read-only mode, and that enough space is available on the target system. Try the action again.

NAG0008E Please enter a user with administrative privileges for the tree.

Explanation

A user has not been entered.

Action

Enter a user with administrative privileges for the tree.

NAG0009E The user password is required.

Explanation

The user password is required.

Action

Enter a valid password.

NAG0030E Please enter a user with administrative privileges on the filer.

Explanation

A user has not been entered.

Action

Enter a user with administrative privileges on the filer.

NAG0108E The Server Name is required.

Explanation

A server name is required to manually register a NAS/Netware server.

Action

A server name is required to manually register a NAS/Netware server.

NAG0119E No NDS trees have been located in your installation or they have not yet been assigned a login and password.

Explanation

No NDS trees have been assigned user IDs or passwords.

Action

You must go to Netware Tree Logins screen under Configuration to enter a user ID and password for any discovered NDS trees.

NAS0003E Unable to contact the agent on host *host address*.

Explanation

Unable to contact the specified agent.

Action

Examine the associated error messages and determine what caused the error. If unable to determine the cause of the error contact IBM customer technical support.

NAS0004E NetApp quotas: Error gathering list of agents.

Explanation

NetApp quotas: Error gathering list of agents.

Action

Examine the associated error messages and determine what caused the error. If unable to determine the cause of the error contact IBM customer technical support.

NAS0005I No filers.

Explanation

No filers need to be processed.

NAS0006W No agents available to retrieve quotas from *filer*.

Explanation

No agents were found that can be used to process the specified filer.

NAS0008I Gathering quotas through agent *host address*.

Explanation

The quotas will be processed by the specified agent.

NAS0009E No agents available.

Explanation

No agents were found that can be used to process the current filer.

Action

Contact IBM customer technical support.

NAS0010E Bad requestData.

Explanation

An internal error has occurred.

Action

Contact IBM customer technical support.

NAS0011E Not all agents reported back within allotted time.

Explanation

Not all agents reported back within allotted time.

Action

NAS0012W Filer *filer* : No quotas retrieved.

Explanation

No quotas were retrieved from the specified filer.

NAS0013E DB error saving/checking quotas.

Explanation

An SQL error saving/checking quotas.

Action

Examine the associated error messages and determine what caused the error. If unable to determine the cause of the error contact IBM customer technical support.

NAS0014E *** INTERNAL ERROR ***.

Explanation

An internal error has occurred.

Action

Contact IBM customer technical support.

NAS0015I Filer *filer* : Quota defined for volume *volume* but we have no record of that volume.

Explanation

The specified volume will be ignored.

NAS0016W Quota *quota creator.quota name* has no consumers.

Explanation

An internal error has occurred.

Action

Contact IBM customer technical support.

NAS0017E DB error saving/checking quotas (*filer* = *filer*).

Explanation

DB error saving/checking quotas for the specified filer.

Action

Follow the administrator response associated with the associated error messages.

NAS0018I NetApp Quota job completed successfully.

Explanation

NetApp Quota job completed successfully.

NAS0019I NetApp Quota job completed with WARNINGS.

Explanation

NetApp Quota job completed with WARNINGS.

NAS0020I NetApp Quota job completed with ERRORS.

Explanation

The NetApp Quota job completed with ERRORS.

Action

Follow the administrator response associated with the associated error messages.

NAS0021I Processed quotas for filer *filer*.

Explanation

Processed quotas for filer.

NAS0022E NetApp Quota is still associated with a schedule, unable to delete.

Explanation

NetApp Quota is still associated with a schedule, unable to delete.

Action

Follow the administrator response associated with the associated error messages.

NAS0023E NAS server *server name* is already manually registered to a windows domain.

Explanation

The listed server has already been registered from a windows domain.

Action

Each NAS filer can only be registered from one windows computer or domain.

NAS0024E Netware server *server name* is already manually registered.

Explanation

The listed Network server has already been manually registered.

Action

Each Network server can only be manually registered once.

NAS0025E An agent is already installed on *server name*. It cannot be manually entered.

Explanation

An IBM Spectrum Control agent is already running on the entered NAS server.

Action

A NAS server cannot be manually registered if an IBM Spectrum Control agent is already running on it.

NAS0028E Network name of filer could not be determined.

Explanation

The agent assigned to probe the NAS filer could not resolve the network name of the filer.

Action

Check the DNS configuration of the probing agent to ensure it can resolve the network name of the NAS filer.

SAA0001E SYMAPI error error code -- error text.

Explanation

The specified SYMAPI error occurred.

Action

Follow the administrator response associated with the associated error messages.

SAA0002E Error connecting to SYMAPI database (mode = *mode*) .

Explanation

Error connecting to SYMAPI database.

Action

Follow the administrator response associated with the associated error messages.

SAA0003E Error synching *Symmetrix ID*.

Explanation

There was an error synchronizing the specified Symmetrix volume.

Action

Follow the administrator response associated with the associated error messages.

SAA0004E *Symmetrix Symmetrix ID*: Unexpected volume name: *volume name* .

Explanation

The specified Symmetrix volume has an unexpected volume name. The volume cannot be processed.

Action

Follow the administrator response associated with the associated error messages.

SAA0005E *SymDevList(Symmetrix ID)* failed.

Explanation

SymDevList failed for the specified Symmetrix volume. The volume cannot be processed.

Action

Follow the administrator response associated with the associated error messages.

SAA0006E *SymDiskList(Symmetrix ID)* failed.

Explanation

SymDiskList failed for the specified Symmetrix volume. The volume cannot be processed.

Action

Follow the administrator response associated with the associated error messages.

SAA0007W *Symmetrix Symmetrix ID: SymDiskShow(Symmetrix volume) failed.*

Explanation

SymDevShow failed for the specified Symmetrix volume. The volume cannot be processed.

SAA0008I *(Disk disk , Hyper hyper) .*

Explanation

The specified hyper was not found.

SAA0009W *No parity hyper found for RAID group 0xRAID group.*

Explanation

No parity hyper was found for the specified RAID group.

SAA0010W *Symmetrix Symmetrix ID: SymDevShow(Symmetrix volume) failed.*

Explanation

SymDevShow failed for the specified Symmetrix volume.

SAA0011I *(Meta-component number of volume volume) .*

Explanation

The specified meta-component was not found.

SAA0012W *Symmetrix Symmetrix ID: Volume <Symmetrix volume> not found or already used.*

Explanation

The specified volume was not found or already used for the specified Symmetrix volume.

SAA0013W *Symmetrix Symmetrix ID: Hyper not found, volume remote sequence number (instance, bus number, target, partition) .*

Explanation

The specified hyper was not found for the specified Symmetrix volume.

SAA0014W *Symmetrix Symmetrix ID: SymDevShow(Symmetrix number) failed.*

Explanation

SymDevShow failed for the specified Symmetrix volume.

Action

Follow the administrator response associated with the associated error messages.

SAA0015W *Symmetrix Symmetrix ID: Volume Symmetrix volume does not contain hyper (device name, device number, disk ID, hyper number).*

Explanation

The specified Symmetrix volume does not contain the specified hyper.

SAA0016W *Symmetrix Symmetrix ID: Volume Symmetrix name is actually a meta-component of Symmetrix volume.*

Explanation

The specified Symmetrix volume has already been processed.

SAA0017W *Symmetrix Symmetrix ID: Volume Symmetrix name has no hypers.*

Explanation

The specified Symmetrix volume has no hypers.

SAA0018I *SYMAPI version: ID.*

Explanation

The specified SYMAPI version is being used.

SAA0019E *SymShow (Symmetrix ID) failed.*

Explanation

Processing for the specified device has failed.

Action

Follow the administrator response associated with the associated error messages.

SAA0020E *SymDiscover failed.*

Explanation

An internal error has occurred.

Action

Contact IBM customer technical support.

Related reference

- [Getting support](#)

SAA0021E SymList failed.

Explanation

An internal error has occurred.

Action

Contact IBM customer technical support.

Related reference

- [Getting support](#)

SAA0022I Storage Subsystem *subsystem name (subsystem alias)* will be probed.

Explanation

The specified storage subsystem will be probed.

SAA0023W Unsupported storage subsystem type: *subsystem type*.

Explanation

The specified storage subsystem type cannot be processed.

Action

Follow the administrator response associated with the associated error messages.

SAA0024E Failed to load SYMAPI.

Explanation

An internal error has occurred.

Action

Contact IBM customer technical support.

Related reference

- [Getting support](#)

SAA0025W Symmetrix ID: Remote Symmetrix *remote ID*: Unexpected volume name: *name*.

Explanation

The specified Symmetrix volume cannot be processed.

SAA0026W Symmetrix ID: Volume number (*volume number*) exceeds array capacity (*length*).

Explanation

The specified Symmetrix volume exceeds the product array capacity and cannot be processed.

- [VPLUG0041E An error was encountered while checking administrator privilege. The current session is invalid.](#)

VPLUG0001E The connection was refused because the IBM Spectrum Control server is not available at the specified host and port.

Explanation

The IBM Spectrum Control server is not responding. If the specified host and port are correct, the server might not be running properly or there might be problems with the network connections.

Action

Verify that the IBM Spectrum Control server is running at the specified host and port and that the network is not experiencing connection problems.

VPLUG0002E Unable to find the IBM Spectrum Control server configuration information.

Explanation

The configuration information has not been saved.

Action

Use the Administrator interface of the IBM Spectrum Control action to create the IBM Spectrum Control server configuration information.

VPLUG0003E Unable to access the IBM Spectrum Control server configuration information.

Explanation

The configuration file may be corrupted.

Action

Contact the system administrator for further assistance.

VPLUG0004E The service class *service_class_name* does not exist.

Explanation

IBM Spectrum Control cannot find the specified service class. The service class might have been deleted.

Action

Verify that the service class exists in IBM Spectrum Control or select a different service class.

VPLUG0005E An error was received from the IBM Spectrum Control server: *Key:message_key; Message:message_text; Status code: status_code*

Explanation

An error was received from the server.

Action

No action is required.

VPLUG0006E An error was received from the IBM Spectrum Control server: *message*

Explanation

An error was received from the server.

Action

No action is required.

VPLUG0007E An error was encountered while retrieving the list of capacity pools.

Explanation

An unknown error was encountered while the server was retrieving the list of capacity pools.

Action

No action is required.

VPLUG0008E Authentication to the IBM Spectrum Control server failed.

Explanation

Authentication to the server failed. This might be caused by an incorrect user name or password.

Action

Verify that the user name and password are entered correctly in the Configuration panel.

VPLUG0009E The specified host is not known.

Explanation

The specified host cannot be contacted. This might be caused by an incorrect host name in the Configuration panel, or by network connection problems.

Action

Verify that the host name is correct in the Configuration panel. Verify that the network is not experiencing problems.

VPLUG0010E The specified host cannot establish a secure connection.

Explanation

The server encountered an error while trying to establish a secure connection. This might be caused by an incorrect port specification in the Configuration panel, or by network connection problems.

Action

Verify that the port is correct in Configuration panel. Verify that the network is not experiencing problems.

VPLUG0011E An error was encountered when retrieving the list of service classes.

Explanation

An unknown error was encountered when retrieving the list of service classes.

Action

No action required.

VPLUG0012E An error was encountered while provisioning block storage.

Explanation

The provisioning block storage task failed due to unknown error.

Action

No action required.

VPLUG0013E An error was encountered while provisioning file storage.

Explanation

The provisioning file storage task failed due to unknown error.

Action

No action required.

VPLUG0014E The provisioning task timed out.

Explanation

The provisioning task did not complete in the specified timeout period.

Action

Increase the time out period in the Configuration panel and try the operation again.

VPLUG0015E An error was encountered while retrieving the status of the provisioning task.

Explanation

An unknown error occurred while retrieving the status of the provisioning task.

Action

No action is required.

VPLUG0016E An error was encountered while retrieving the list of WWPNS .

Explanation

An unknown error occurred while retrieving the list of WWPNS.

Action

No action is required.

VPLUG0017E An error was encountered when retrieving the file storage NFS options.

Explanation

An unknown error was encountered when retrieving the file storage NFS options.

Action

No action required.

VPLUG0018E An error was encountered while checking administrator privilege.

Explanation

An unknown error was encountered while checking administrator privilege.

Action

No action required.

VPLUG0019E An error was encountered while retrieving fabric port information.

Explanation

An unknown error was encountered while retrieving fabric port information.

Action

No action required.

VPLUG0020E An error was encountered while retrieving the IBM Spectrum Control port.

Explanation

An unknown error was encountered while retrieving the IBM Spectrum Control port.

Action

No action required.

VPLUG0021E An error occurred while retrieving virtual disk information from IBM Spectrum Control.

Explanation

An unknown error was encountered while retrieving virtual disk information from IBM Spectrum Control.

Action

Check IBM Spectrum Control logs for related error messages.

VPLUG0022E An error was encountered while retrieving volume performance information from IBM Spectrum Control.

Explanation

Retrieving volume performance information from IBM Spectrum Control could not be completed.

Action

Check IBM Spectrum Control logs for related error messages.

VPLUG0023E An error was encountered while retrieving storage devices list from vCenter.

Explanation

Retrieving volume performance information from vCenter could not be completed.

Action

Check vCenter logs for related error messages.

VPLUG0024E An error occurred while retrieving virtual machine virtual disk information from vCenter.

Explanation

Retrieval of virtual disk information from vCenter could not be completed.

Action

Check vCenter logs for related error messages.

VPLUG0025E An error was encountered while retrieving available datastore names from vCenter.

Explanation

Retrieving datastore names from vCenter could not be completed.

Action

Check vCenter logs for related error messages.

VPLUG0026E An error was encountered while retrieving the Lun WWN.

Explanation

An unknown error occurred while retrieving the Lun WWN.

Action

Check vCenter logs for related error messages.

VPLUG0027E An error was received from the IBM Spectrum Control server.

Explanation

An unknown error was received from the server.

Action

No action is required.

VPLUG0028E An error was received from the IBM Spectrum Control server: *Key:message_key; Message:message_text*

Explanation

An error was received from the server.

Action

No action is required.

VPLUG0029E An error was encountered while retrieving roles for current user.

Explanation

An unknown error was encountered while retrieving roles for current user.

Action

Check IBM Spectrum Control logs for related error messages.

VPLUG0030E The user {0} does not have the minimum role (Administrator, Monitor or External application) needed to access IBM Spectrum Control.

Explanation

A user should have one of the following roles: Administrator, Monitor or External application to be able to access the Plugin and VASA functionality.

Action

Login as a user with atleast the minimal role in IBM Spectrum Control.

VPLUG0031E Registration of the IBM Spectrum Control VASA provider could not be completed.

Explanation

An unexpected error occurred while attempting to register the IBM Spectrum Control VASA provider.

Action

Check IBM Spectrum Control logs for related error messages.

VPLUG0032E The IBM Spectrum Control VASA provider is already registered for server *server_name*. Register IBM Spectrum Control VASA provider manually to update credentials.

Explanation

Automatic update of IBM Spectrum Control VASA provider is not supported if the provider is already registered for this server.

Action

Remove the IBM Spectrum Control VASA provider and register it again manually to update the user name or password. For more information visit: <http://pic.dhe.ibm.com/infocenter/tivihelp/v59r1/index.jsp> and search for "Registering VASA provider".

VPLUG0033E One or more third party VASA provider(s) are already registered with the vCenter. IBM Spectrum Control VASA provider was not registered. Register IBM Spectrum Control VASA provider manually.

Explanation

If one or more third party VASA provider(s) are already registered with the vCenter, you must register IBM Spectrum Control VASA provider manually.

Action

Register IBM Spectrum Control VASA provider manually. For more information visit: <http://pic.dhe.ibm.com/infocenter/tivihelp/v59r1/index.jsp> and search for "Registering VASA provider".

VPLUG0034E Automatic registration of IBM Spectrum Control VASA provider is not supported for vCenter server version 5.0 and previous.

Explanation

vCenter server version 5.1 or later is required to automatically register IBM Spectrum Control VASA provider.

Action

Register the IBM Spectrum Control VASA provider manually. For more information visit: <http://pic.dhe.ibm.com/infocenter/tivihelp/v59r1/index.jsp> and search for "Registering VASA provider".

VPLUG0035E Error encountered while saving IBM Spectrum Control server configuration. Incorrect value for user name or password.

Explanation

Error encountered while saving IBM Spectrum Control server configuration.

Action

Save the IBM Spectrum Control server configuration using correct user name and/or password.

VPLUG0036E Error encountered while saving IBM Spectrum Control server configuration. Invalid host name *message*.

Explanation

Error encountered while saving IBM Spectrum Control server configuration.

Action

Save the IBM Spectrum Control server configuration using valid host name.

VPLUG0037E Error encountered while saving IBM Spectrum Control server configuration. Invalid port *message*.

Explanation

Error encountered while saving IBM Spectrum Control server configuration.

Action

Save the IBM Spectrum Control server configuration using valid port. Default value is 9569.

VPLUG0038E Error encountered while loading IBM Spectrum Control server configuration. Incorrect value for user name or password.

Explanation

Error encountered while loading IBM Spectrum Control server configuration.

Action

Save the IBM Spectrum Control server configuration using correct user name and/or password.

VPLUG0039E Error encountered while loading IBM Spectrum Control server configuration. Invalid port *message*.

Explanation

Error encountered while loading IBM Spectrum Control server configuration.

Action

Save the IBM Spectrum Control server configuration using valid port. Default value is 9569.

VPLUG0040E An error was encountered while the server configuration information for IBM Spectrum Control was saved. The current session is invalid.

Explanation

The current session is invalid.

Action

Log out of the vSphere Web Client and then log back in.

VPLUG0041E An error was encountered while checking administrator privilege. The current session is invalid.

Explanation

The current session is invalid.

Action

Log out of the vSphere Web Client and then log back in.

Publications

A number of publications are provided with IBM Spectrum® Control.

The following section describes how to access these publications online.

- **Accessing publications online**
Information about installing, configuring, using, upgrading, and uninstalling IBM Spectrum Control and related products is available online.
- **IBM Redbooks**
The IBM® Redbooks® are publications about specialized topics.
- **Languages**
Non-English publications are available from IBM Documentation, which is available in certain non-English languages. It is displayed in the language that is appropriate for the browser locale setting.
- **Providing feedback about publications**
Your feedback is important to help IBM provide the highest quality information.

Accessing publications online

Information about installing, configuring, using, upgrading, and uninstalling IBM Spectrum® Control and related products is available online.

Use [Table 1](#) to view and download these publications. Translated documents are available for some products.

Table 1. Locations of publications for IBM Spectrum Control and related products

IBM Redbooks

The IBM® Redbooks® are publications about specialized topics.

You can order publications through your IBM representative or the IBM branch office serving your locality. You can also search for and order books of interest to you by visiting the IBM Redbooks home page at <http://www.redbooks.ibm.com>.

Languages

Non-English publications are available from IBM® Documentation, which is available in certain non-English languages. It is displayed in the language that is appropriate for the browser locale setting.

When a locale does not have a non-English version, the information is displayed in English, which is the default language. Non-English PDFs are available when the information is translated.

Providing feedback about publications

Your feedback is important to help IBM® provide the highest quality information.

To provide comments or suggestions about the product documentation, go to the IBM Knowledge Center for IBM Spectrum® Control: <https://www.ibm.com/docs/en/spectrum-control>. Click Feedback at the bottom of any page and complete the form.

Legal notices

This information was developed for products and services offered in the U.S.A. This material may be available from IBM® in other languages. However, you may be required to own a copy of the product or product version in that language in order to access it.

About this task

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

*IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
U.S.A.*

For license inquiries regarding double-byte character set (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

*Intellectual Property Licensing
Legal and Intellectual Property Law
IBM Japan, Ltd.
19-21, Nihonbashi-Hakozakicho, Chuo-ku
Tokyo 103-8510, Japan*

The following paragraph does not apply to the United Kingdom or any other country where such provisions are inconsistent with local law: INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM Web sites are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this IBM product and use of those Web sites is at your own risk.

IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

*IBM Corporation
224A/101
11400 Burnet Road
Austin, TX 78758
U.S.A*

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

COPYRIGHT LICENSE: This information contains sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs. The sample programs are provided "AS IS", without warranty of any kind. IBM shall not be liable for any damages arising out of your use of the sample programs.

If you are viewing this information softcopy, the photographs and color illustrations may not appear.

Trademarks

IBM®, the IBM logo, and ibm.com® are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the Web on the Copyright and trademark information page at <http://www.ibm.com/legal/copytrade.shtml>.

Adobe is a registered trademark of Adobe Systems Incorporated in the United States, and/or other countries.

Intel and Itanium are trademarks or registered trademarks of Intel Corporation or its subsidiaries in the United States and other countries.

Java™ and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

The registered trademark Linux® is used pursuant to a sublicense from the Linux Foundation, the exclusive licensee of Linus Torvalds, owner of the mark on a worldwide basis.

Microsoft is a trademark of Microsoft Corporation in the United States, other countries, or both.

UNIX is a registered trademark of The Open Group in the United States and other countries.

VMware, the VMware logo, VMware Cloud Foundation, VMware Cloud Foundation Service, VMware vCenter Server, and VMware vSphere are registered trademarks or trademarks of VMware, Inc. or its subsidiaries in the United States and/or other jurisdictions.

Privacy policy considerations

For information about privacy policy considerations, see IBM®'s Privacy Policy at <https://www.ibm.com/privacy>.

Glossary

This glossary provides terms and definitions for IBM Spectrum® Control.

The following cross-references are used in this glossary:

- *See* refers you from a nonpreferred term to the preferred term or from an abbreviation to the spelled-out form.
- *See also* refers you to a related or contrasting term.

[A](#) [B](#) [C](#) [D](#) [E](#) [F](#) [G](#) [H](#) [I](#) [J](#) [K](#) [L](#) [M](#) [N](#) [O](#) [P](#) [R](#) [S](#) [T](#) [U](#) [V](#) [W](#) [Z](#)

A

activation key

See [license key](#).

active management server

A management server from which the storage environment can be monitored and managed. The active management server replicates its database to the standby server.

advisory lock

A type of lock that a process holds on a region of a file that signals any other process to not use or lock the region or an overlapping region. Other processes are not forced to comply.

allocatable extent limit

A maximum total capacity for the system. The allocatable extent limit is calculated from pool extent sizes.

application key

See [license key](#).

array

An ordered collection, or group, of physical devices (disk drive modules) that are used to define logical volumes or devices. An array is a group of drives designated to be managed with a Redundant Array of Independent Disks (RAID).

asynchronous replication

A type of replication in which control is given back to the application as soon as the write operation is made to the source volume. Some time later, the write operation is made to the target volume. See also [synchronous replication](#).

audit log

An unalterable record of all commands or user interactions that are issued to the system.

authenticated user

A user who has logged in to the system with a valid account (user ID and password).

authentication

The mechanism by which a system determines what permissions a particular authenticated user has to access specific resources or actions. See also [authorization](#).

authorization

The mechanism by which a system determines what permissions a particular authenticated user has to access specific resources or actions. See also [authentication](#).

authorization code

An alphanumeric code generated for administrative functions, such as password resets or two-factor authentication bypass.

available capacity

The amount of usable capacity that is not yet used in a system, pool, array, or MDisk.

B

block storage

A unit of data storage on a device.

business continuity

The capability of a business to withstand outages and to operate mission-critical services normally and without interruption in accordance with predefined service-level agreements.

C

cache

Storage or memory that is used to improve access times to instructions, data, or both. For example, data that resides in cache memory is normally a copy of data that resides elsewhere in slower, less expensive storage, such as on a disk or on another network node.

cache eviction

A process by which data associated with a file is removed from the cache system. The data is removed either by using a Least Recently Used (LRU) algorithm when configured General Parallel File System (GPFS) hard or soft quota limits are exceeded or by issuing a command. When referenced again in the cache system, the data that is associated with the file is retrieved from the home system.

caching I/O group

The I/O group in the system that performs the cache function for a volume.

call home

A communication link established between a product and a service provider. The product can use this link to place a call to a service provider when it requires service. With access to the machine, service personnel can perform service tasks, such as viewing error and problem logs or initiating trace and dump retrievals.

capacity

The amount of data that can be contained on a storage medium.

capacity recycling

The amount of provisioned capacity that can be recovered without causing stress or performance degradation. This capacity identifies the amount of resources that can be reclaimed and provisioned to other objects in an environment.

capacity threshold

The percent of total usable physical capacity that used capacity must exceed before a notification is sent. See also [total usable physical capacity](#).

certificate

A digital document that binds a public key to the identity of the certificate owner, thereby enabling the certificate owner to be authenticated. A certificate is issued by a certificate authority and is digitally signed by that authority.

change volume

A volume that is used in Global Mirror that holds earlier consistent revisions of data when changes are made.

child pool

A user-defined capacity that is formed from capacity that is defined either in another pool or a system. See also [parent pool](#).

CIFS

See [Common Internet File System](#).

CIM

See [Common Information Model](#).

CIM agent

The code that consists of common building blocks that can be used instead of proprietary software or device-specific programming interfaces to manage devices that are compliant with the Common Information Model (CIM).

CIM object manager (CIMOM)

The common conceptual framework for data management that receives, validates, and authenticates the CIM requests from the client application. It then directs the requests to the appropriate component or service provider.

CIMOM

See [CIM object manager](#).

CKD

See [count key data](#).

CKD record

See [count-key-data record](#).

CLI

See [command-line interface](#).

client

A software program or computer that requests services from a server. See also [host, server](#).

cloud account

An agreement with a cloud service provider to use storage or other services at that service provider. Access to the cloud account is granted by presenting valid credentials.

cluster

1. A collection of complete systems that work together to provide a single, unified computing capability.
2. A group of computers and other resources that operate together as a single system.
3. A loosely coupled collection of independent systems (or nodes) organized into a network for the purpose of sharing resources and communicating with each other.
4. In IBM® System Storage DS8000®, a partition capable of performing all DS8000 series functions. With two clusters in the DS8000 storage unit, any operational cluster can take over the processing of a failing cluster.
5. In Storwize® V7000, a pair of nodes that provides a single configuration and service interface.

command-line interface (CLI)

A computer interface in which the input and output are text based.

Common Information Model (CIM)

An implementation-neutral, object-oriented schema for describing network management or systems management information. The Distributed Management Task Force (DMTF) develops and maintains CIM specifications.

Common Internet File System (CIFS)

A protocol that manages shared, remote file access for applications to files, printers, serial ports, and so on over a TCP/IP network.

community name

The part of an SNMP message that represents a password-like name and that is used to authenticate the SNMP message.

compression

A function that removes repetitive characters, spaces, strings of characters, or binary data from the data being processed and replaces characters with control characters. Compression reduces the amount of storage space that is required for data.

compute node

An independent machine that contains one or more microprocessors, memory, storage, and network controllers and runs its own operating system and applications.

concurrent copy

A function of the DFSMSdss component that is used to back up any collection of data at a point in time with minimum down time for the database or application that uses the collection of data.

consistency group

A group of copy relationships between virtual volumes or data sets that are maintained with the same time reference so that all copies are consistent in time.

copyback

A process that moves data back to its expected or preferred location to maintain an array in a more efficient configuration after a failed drive is replaced.

copy set

The set of source volumes or target volumes involved in a FlashCopy® operation.

count key data

1. An architecture for a direct access storage device (DASD) device or logical device that specifies the access mechanisms for the logical data units on the device through a specific set of supported channel commands. Extensions to the CKD command set form the basis of Extended CKD.
2. A data recording format that uses self-defining record formats in which each record on a volume is represented by up to three fields: a count field identifying the record and specifying its format, an optional key field that can be used to identify the data area contents, and an optional data field that typically contains the user data. See also [data record](#), [storage architecture type](#).

count-key-data record (CKD record)

See [data record](#).

CRU

See [customer-replaceable unit](#).

customer-replaceable unit (CRU)

An assembly or part that can be replaced in its entirety by a user when any one of its components fails.

cylinder

A unit of storage on a count-key-data (CKD) device with a fixed number of tracks.

D

data collection

The process of obtaining performance and availability monitoring data and providing that data to a metric evaluator. Examples of data collectors include Domain Name System (DNS) probes, web page analyzers, or database analyzers. See also [discovery](#).

data consistency

A characteristic of the data at the target site where dependent write order is maintained to guarantee the recoverability of applications.

data record

A basic unit of data recording format. See also [count key data](#), [fixed-block architecture](#).

data reduction

A set of techniques that can be used to reduce the amount of usable capacity that is required to store data. Examples of data reduction include data deduplication and compression. See also [data reduction savings](#), [stored capacity](#).

data reduction savings

The total amount of usable capacity that is saved in a system, pool, or volume through the application of an algorithm such as compression or deduplication on the written data. This saved capacity is the difference between the written capacity and the used capacity. See also [data reduction](#).

data source

A storage resource or agent that provides data about a storage environment.

destage

To move data from cache to a nonvolatile storage medium.

discovery

The process of finding resources within an enterprise, including finding the new location of monitored resources that were moved. See also [data collection](#).

distributed RAID

An alternative RAID scheme where the number of drives that are used to store the array can be greater than the equivalent, typical RAID scheme. The same data stripes are distributed across a greater number of drives, which increases the opportunity for parallel I/O and hence improves overall array performance. See also [rebuild area](#).

DNS

See [Domain Name System](#).

Domain Name System (DNS)

The distributed database system that maps domain names to IP addresses.

drive

A data storage device. A drive can be either a magnetic disk drive or a solid-state drive (SSD).

drive class

A combination of drive technology and speed, which uniquely defines a class of drives that have approximately the same performance characteristics.

drive technology

A category of a drive that pertains to the method and reliability of the data storage techniques being used on the drive. Possible values include enterprise (ENT) drive, nearline (NL) drive, or solid-state drive (SSD).

E

ECKD

See [extended count key data](#).

effective capacity

The amount of provisioned capacity that can be created in a system or pool without running out of usable capacity given the current data reduction savings being achieved. This capacity equals the usable capacity divided by the data reduction savings percentage.

enclosure

The metal structure in which various electronic components are mounted.

encryption deadlock

The inability to access encryption keys to decrypt data. See also [encryption recovery key](#).

encryption key label

The list of encryption key labels used by the storage system to identify keys that will be used on the key server.

encryption key manager

See [encryption key server](#).

encryption key server

An internal or external system that runs a key manager that receives and then serves existing encryption keys or certificates to a storage system.

encryption recovery key

An encryption key that allows a method to recover from an encryption deadlock situation where the normal encryption key servers are not available. See also [encryption deadlock](#).

enterprise

Pertaining to a type of data storage device that has higher error recovery limits, vibration tolerance, and end-to-end error detection than standard desktop hard drives.

enterprise repository

A component of the data server that records and stores all information about the monitored computers' storage assets and their usage over time. The repository is organized into relational database tables and is accessed by the data server using Java™ Database Connectivity (JDBC).

event

An occurrence of significance to a task or system. Events can include completion or failure of an operation, a user action, or the change in state of a process.

extended count key data (ECKD)

An extension of the count-key-data (CKD) architecture. It includes additional commands that can be used to improve performance.

extent type

See [storage architecture type](#).

F

failback

The restoration of an appliance to its initial configuration after detection and repair of a failed network or component.

failover

An automatic operation that switches to a redundant or standby system or node in the event of a software, hardware, or network interruption.

FB

See [fixed block](#).

FBA

See [fixed-block architecture](#).

FC

See [Fibre Channel](#).

FC-AL

See [Fibre Channel Arbitrated Loop](#).

FCIP

See [Fibre Channel over IP](#).

FCP

See [Fibre Channel Protocol](#).

feature activation code

See [license key](#).

Fibre Channel (FC)

A technology for transmitting data between computer devices. It is especially suited for attaching computer servers to shared storage devices and for interconnecting storage controllers and drives. See also [zoning](#).

Fibre Channel Arbitrated Loop (FC-AL)

An implementation of the Fibre Channel standards that uses a ring topology for the communication fabric; refer to American National Standards Institute (ANSI) INCITS 272-1996, (R2001). In this topology, two or more Fibre Channel end points are interconnected through a looped interface.

Fibre Channel connection (FICON®)

A Fibre Channel communication protocol designed for IBM mainframe computers and peripherals.

Fibre Channel extender

A device used to extend a Fibre Channel link over a greater distance than is supported by the standard, usually a number of miles or kilometers. Devices must be deployed in pairs at each end of a link.

Fibre Channel over IP (FCIP)

A network storage technology that combines the features of the Fibre Channel Protocol and the Internet Protocol (IP) to connect distributed SANs over large distances.

Fibre Channel Protocol (FCP)

The serial SCSI command protocol used on Fibre Channel networks. See also [open system](#).

FICON

See [Fibre Channel connection](#).

field-replaceable unit (FRU)

An assembly that is replaced in its entirety when any one of its components fails.

file module

A component that provides file systems to network users. A file module must be provided with storage for the file systems.

fileset

See [file set](#).

file set

1. A subset of a file system that provides granularity of functions such as snapshots or quotas within the file system.
2. A hierarchical grouping of files managed as a unit for balancing workload across a cluster.

file system (FS)

A collection of files and certain attributes associated with those files.

file system storage

Data storage that is organized into files and directories.

fixed block (FB)

See [fixed-block architecture](#).

fixed-block architecture (FBA)

An architecture for a virtual device that specifies the format of and access mechanisms for the virtual data units on the device. The virtual data unit is a block. All blocks on the device are the same size (fixed size). The system can access them independently. See also [data record](#), [storage architecture type](#).

FlashCopy

1. Pertaining to a point-in-time copy where a virtual copy of a volume is created. The target volume maintains the contents of the volume at the point in time when the copy was established. Any subsequent write operations to the source volume are not reflected on the target volume.
2. An optional feature of the Storage System DS family that can make an instant copy of data, that is, a point-in-time copy of a volume.

flash drive

A data storage device, which is typically removable and rewritable, that uses solid-state memory to store persistent data. See also [flash module](#).

flash module

A modular hardware unit containing flash memory, one or more flash controllers, and associated electronics. See also [flash drive](#).

flush-through mode

See [write-through mode](#).

form factor

The industry-standard physical dimensions of a storage system drive enclosure. Possible values include “3.5 inch”, “2.5 inch”, and “1.8 inch.”

frame

The hardware support structure, covers, and all electrical parts mounted therein that are packaged as one entity for shipping.

freeze

An operation in which a storage system blocks I/O from the host system to the affected volumes on the primary site. A freeze operation stops mirroring between the primary and secondary volumes to ensure data consistency at the secondary site. See also [thaw](#).

FRU

See [field-replaceable unit](#).

FS

See [file system](#).

full restore operation

A copy operation where a local volume is created by reading an entire a volume snapshot from cloud storage.

full snapshot

A type of volume snapshot that contains all the volume data. When a full snapshot is created, an entire copy of the volume data is transmitted to the cloud.

G

General Parallel File System (GPFS)

A high-performance shared-disk file system that can provide data access from nodes in a clustered system environment.

Global Copy

A non-synchronous long-distance copy option for data migration and backup. See also [remote mirror and copy](#).

globally unique identifier (GUID)

An algorithmically determined number that uniquely identifies an entity within a system.

Global Mirror

A method of an asynchronous replication that maintains data consistency across multiple volumes within or across multiple systems. Global Mirror is generally used where distances between the source site and target site cause increased latency beyond what the application can accept.

GPFS

See [General Parallel File System](#).

grain size

The unit size for allocating space on thin-provisioned volumes, such as 32, 64, 128, and 256 kibibyte. The grain size is defined when a volume is created.

GUID

See [globally unique identifier](#).

H

Hardware Management Console (HMC)

1. In a system storage environment, a system that acts as the focal point for configuration, management of Copy Services functions, and maintenance.
2. A system that controls managed systems, including the management of logical partitions and use of Capacity Upgrade on Demand. Using service applications, the HMC communicates with managed systems to detect and consolidate information, which can then be sent for analysis.

heat map

An overlay that shows where the user performed actions on a web page. The data is summarized and shown as a colored marker at the location of the user action over a snapshot of the web page. The overlay lets the user see where and how the web page user interacted with the web page.

HMC

See [Hardware Management Console](#).

host

A physical or virtual computer system that hosts computer applications, with the host and the applications using storage. See also [client](#), [host](#), [server](#).

host cluster

A configured set of physical or virtual hosts that share one or more storage volumes in order to increase scalability or availability of computer applications.

host interface card

See [interface card](#).

host object

A logical representation of a host within a storage system that is used to represent the host for configuration tasks.

host volume

A volume that represents the volume functional role from an application point of view. The host volume can be connected to a host or server. It receives read, write, and update application I/O, depending on the site to which the application is writing.

hot-spare

Pertaining to redundant hardware (such as an adapter, a disk, a drive, or a server) that is installed and available in the event of a hardware failure.

HyperSwap®

Pertaining to a function that provides continuous, transparent availability against storage errors and site failures, and is based on synchronous replication.

hypervisor

Software or a physical device that enables multiple instances of operating systems to run simultaneously on the same hardware.

I

incremental restore operation

A copy operation where a local volume is modified to match a volume snapshot by reading from cloud storage only the parts of the volume snapshot that differ from the local volume.

incremental snapshot

A type of volume snapshot where the changes to a local volume relative to the volume's previous snapshot are stored on cloud storage.

input/output (I/O)

Pertaining to a device, process, channel, or communication path involved in data input, data output, or both.

interface card

An optional part of a node canister that provides the system with additional host and storage connectivity options.

interface node

A node that connects a system to an Internet Protocol (IP) network for file-serving capabilities by using service protocols.

Internet Small Computer System Interface (iSCSI)

An IP-based standard for linking data storage devices over a network and transferring data by carrying SCSI commands over IP networks. See also [Small Computer System Interface](#).

I/O

See [input/output](#).

I/O enclosure

A hardware unit in a storage system where data is transferred into and out of the system.

iSCSI

See [Internet Small Computer System Interface](#).

J

journal volume

A volume that holds a consistent copy of data until a new consistent copy is formed. The journal volume restores the last consistent point during a recovery.

K

key server

1. A server that negotiates the values that determine the characteristics of a dynamic virtual private network (VPN) connection that is established between two endpoints.
2. See [encryption key server](#).

L

launch-in-context

An operation in which a user starts a secondary application from a primary application to perform a specific task. Using the parameters, navigation instructions, and user credentials that are supplied by the primary application, the secondary application opens to the specific place in which to complete the task.

licensed capacity

The amount of capacity on a storage system that a user is entitled to configure.

license key

An alphanumeric code that activates a licensed function on a product.

license key file

A file that contains one or more licensed keys.

logical unit number (LUN)

In the Small Computer System Interface (SCSI) standard, a unique identifier used to differentiate devices, each of which is a logical unit (LU).

LUN

See [logical unit number](#).

M

machine signature

A string of characters that identifies a system. A machine signature might be required to obtain a license key.

Management Information Base (MIB)

In the Simple Network Management Protocol (SNMP), a database of objects that can be queried or set by a network management system.

management node

A node that is used for configuring, administering, and monitoring a system.

management server

A system that provides a central point of control for managing data replication.

management server relationship

A connection between two replication servers, where one server acts as the active server and replicates the data that is necessary for the standby server to take control of the replication environment.

maximum replication delay

The number of seconds that Metro Mirror or Global Mirror replication can delay a write operation to a volume.

Metro Global Mirror

1. A cascaded solution where Metro Mirror synchronously copies data to the target site. This Metro Mirror target is the source volume for Global Mirror that asynchronously copies data to a third site. This solution has the potential to provide a disaster recovery with no data loss at Global Mirror distances when the intermediate site does not participate in the disaster that occurs at the production site.
2. A three-site, high availability, disaster recovery solution. Metro Global Mirror uses synchronous replication to mirror data between a local site and an intermediate site, and asynchronous replication to mirror data from an intermediate site to a remote site.

Metro Mirror

A method of synchronous replication that maintains data consistency across multiple volumes within the system. Metro Mirror is generally used when the write latency caused by the distance between the source site and target site is acceptable to application performance.

MIB

See [Management Information Base](#).

N

namespace

The scope within which a Common Information Model (CIM) schema applies.

native interface

An interface that is specific to a system or subsystem.

nearline

Pertaining to a type of storage in which data is available in a short amount of time, but not instantly.

nearline SAS drive

A drive that combines the high capacity data storage technology of a Serial Advanced Technology Attachment (SATA) drive with the benefits of a serial-attached SCSI (SAS) interface for improved connectivity.

node

A single processing unit within a system. For redundancy, multiple nodes are typically deployed to make up a system.

O

open system

A system that complies with industry-defined interoperability standards. An open system can be connected to other systems complying with the same standards.

See also [Fibre Channel Protocol](#), [Small Computer System Interface](#).

order confirmation code

See [authorization code](#).

overhead capacity

An amount of usable capacity that is occupied by metadata in a system or pool and other data that is used for system operations.

overprovisioned ratio

The ratio of provisioned capacity to usable capacity in a system or pool.

overprovisioning

The result of creating more provisioned capacity in a storage system or pool than there is usable capacity. Overprovisioning occurs when thin provisioning or data reduction techniques ensure that the used capacity of the provisioned volumes is less than their provisioned capacity.

P

parent pool

A storage pool that receives its capacity from MDisk and has, or will have, some of its capacity allocated to child pools. See also [child pool](#).

performance group

A collection of volumes that is assigned the same performance characteristics. See also [performance policy](#).

performance policy

A policy that specifies performance characteristics, for example quality of service (QoS). See also [performance group](#).

PFC

See [priority flow control](#).

ping

1. The command that sends an Internet Control Message Protocol (ICMP) echo-request packet to a gateway, router, or host with the expectation of receiving a reply.
2. A job that tracks the availability of assets and that is performed by an agent. Several ping jobs can be used to monitor the availability of any computer or subset of computers in the network.

pool

1. See [storage pool](#).
2. A grouping of storage space that consists of volumes, logical unit numbers (LUNs), or addresses that share a common set of administrative characteristics.

pool pair

Two storage pools that are required to balance workload. Each storage pool is controlled by a separate node.

port

The physical entity within a host, system, or storage system that performs the data communication (transmitting and receiving) over the Fibre Channel.

practice volume

A volume that can be used to test disaster-recovery actions while maintaining disaster-recovery capability.

primary site

A physical or virtual site that is made up of hardware, network, and storage resources. Typically, production operations run at the primary site. Data can be replicated to a secondary site for disaster recovery and failover operations. See also [secondary site](#).

primordial pool

Storage capacity that is unallocated on a storage device. Storage pools are created by allocating storage capacity from primordial pools.

priority flow control (PFC)

A link-level flow control mechanism, IEEE standard 802.1Qbb. PFC operates on individual priorities. Instead of pausing all traffic on a link, PFC is used to selectively pause traffic according to its class.

probe

A data collection job that itemizes and creates an inventory of assets, such as computers, controllers, disk drives, file systems, and logical units.

projected capacity

The estimated volume capacity that is available for volume creation, given the current average performance of any data compression, excluding thin-provisioning savings. See also [thin-provisioning savings](#).

protocol

A set of rules controlling the communication and transfer of data between two or more devices or systems in a communication network.

provisioned capacity

The total capacity of all volumes and volume copies in a system or pool.

R

- rack
 - A free-standing structure that can hold multiple servers, storage systems, chassis, switches, and other devices.
- RAID
 - See [Redundant Array of Independent Disks](#).
- RAID 0
 - A data striping technique, which is commonly called RAID Level 0 or RAID 0 because of its similarity to common, RAID, data-mapping techniques. It includes no data protection, however, so, strictly speaking, the appellation RAID is a misnomer. RAID 0 is also known as data striping.
- RAID 1
 - A form of storage array in which two or more identical copies of data are maintained on separate media.
- RAID 10
 - A collection of two or more physical drives that present to the host an image of one or more drives. In the event of a physical device failure, the data can be read or regenerated from the other drives in the RAID due to data redundancy.
- RAID 5
 - A form of parity RAID in which the disks operate independently, the data stripe size is no smaller than the exported block size, and parity check data is distributed across the array's disks.
- RAID 6
 - A form of RAID that can continue to process read and write requests to all of an array's virtual disks in the presence of two concurrent disk failures.
- RAID level
 - The level of protection provided by the specific techniques of striping, mirroring, or parity used by a Redundant Array of Independent Disks (RAID).
- RAID type
 - See [RAID level](#).
- raw capacity
 - The reported capacity of the drives in the system before formatting or RAID (Redundant Array of Independent Disks) is applied.
- rebuild area
 - Reserved capacity that is distributed across all drives in a redundant array of drives. If a drive in the array fails, the lost array data is systematically restored into the reserved capacity, returning redundancy to the array. The duration of the restoration process is minimized because all drive members simultaneously participate in restoring the data. See also [distributed RAID](#).
- reclaimable capacity
 - The amount of provisioned capacity that can be recovered without causing stress or performance degradation. This capacity identifies the amount of resources that can be reclaimed and provisioned to other objects in an environment.
- reclaimed capacity
 - See [reclaimable capacity](#).
- recovery key
 - See [encryption recovery key](#).
- recovery point objective
 - The maximum amount of data loss that can be tolerated during a service interruption.
- Redundant Array of Independent Disks (RAID)
 - A collection of two or more physical disk drives that present to the host an image of one or more logical disk drives. In the event of a physical device failure, the data can be read or regenerated from the other disk drives in the array due to data redundancy.
- remote mirror and copy
 - A feature of a storage server that constantly updates a secondary copy of a logical volume to match changes made to a primary logical volume. The primary and secondary volumes can be on the same storage server or on separate storage servers. See also [Global Copy](#).
- repo
 - See [repository](#).
- repository (repo)
 - A persistent storage area for data and other application resources.
- reserved capacity
 - The amount of used capacity that is made up of capacity reserved for system use. See also [total usable physical capacity](#).
- resource
 - In a storage environment, an entity that is monitored. Resources can include fabrics, switches, computers, and storage systems.
- role
 - A job function that identifies the tasks that a user can perform and the resources to which a user has access. A user can be assigned one or more roles.
- role pair
 - The association of two volume roles in a session that take part in a copy relationship. For example, in a Metro Mirror session, the role pair can be the association between host volumes at the primary site and host volumes at the secondary site (H1-H2).

S

- scan
 - A data collection job that monitors storage usage and file statistics on the resources in an environment.
- SCSI
 - See [Small Computer System Interface](#).
- SCSI device
 - A product, such as a drive or adapter, connected to a host through an I/O interface using the Small Computer System Interface (SCSI) protocol. A SCSI device is either an initiator, target, or both. See also [Small Computer System Interface](#).
- SCSI-FCP
 - See [SCSI Fibre Channel Protocol](#).
- SCSI Fibre Channel Protocol (SCSI-FCP)
 - A standard that defines the protocol used to transfer Small Computer System Interface (SCSI) commands over the transport physical layer of the Fibre-Channel interface. This standard is published by ANSI as X3.269-1996.
- SCSI initiator
 - The system component that initiates communications with attached targets.
- SCSI target
 -

A device that acts as a subordinate to a SCSI initiator and consists of a set of one or more logical units (LUs), each with an assigned logical unit number (LUN). The LUs on the SCSI target are typically I/O devices.

secondary site
A physical or virtual site that is made up of the hardware, network, and storage resources that support the recovery needs of the primary site. When a failure occurs at the primary site, operations can continue at the secondary site. See also [primary site](#).

server
A computer program or a device that provides functions for other programs or devices, called clients. See also [client](#), [host](#).

Server Message Block (SMB)
A protocol that manages requests and responses in a client/server environment so that clients on a network can share files, directories, and devices. See also [Server Message Block 2.0](#).

Server Message Block 2.0
A higher performing, more scalable version of Server Message Block (SMB). This protocol can send multiple commands in the same packet and uses larger buffer sizes. See also [Server Message Block](#).

session
A collection of source and target volumes that are managed to create consistent copies of data. The type of data replication that is associated with the session determines the actions that can be conducted for the volumes.

site awareness
The association of a location with each storage system in a session. Site awareness ensures that a volume can only be selected for a session if it matches the location of the site. Site awareness helps to prevent both reversing a hardware relationship and selecting volumes at the wrong location.

Small Computer System Interface (SCSI)
An ANSI-standard electronic interface that allows personal computers to communicate with peripheral hardware, such as disk drives, tape drives, CD-ROM drives, printers, and scanners faster and more flexibly than previous interfaces. See also [Internet Small Computer System Interface](#), [open system](#), [SCSI device](#).

SMB
See [Server Message Block](#).

SMI-S
See [Storage Management Initiative Specification](#).

solid-state drive (SSD)

1. A storage device that contains nonvolatile flash memory. A solid-state drive (SSD) has no moving mechanical components.
2. See [flash drive](#).

space
See [capacity](#).

space efficient
See [thin provisioning](#).

spare drive
A drive reserved in an array for rebuilding a failed drive in a RAID. Should a drive fail in a RAID, a spare drive from within that device adapter (DA) pair will be selected to rebuild it.

SSD
See [solid-state drive](#).

standard-provisioned volume
A volume that completely uses storage at creation.

standard provisioning
The ability to completely use a volume's capacity for that specific volume.

standby management server
A management server that is a backup for the active server. The replication environment cannot be monitored or managed from the standby server.

storage architecture type (storage type)
The type of storage architecture, either count key data (CKD) or fixed block (FB), for which an array, pool, or volume is provisioned. See also [count key data](#), [fixed-block architecture](#).

storage enclosure
A specialized chassis that is designed to hold and power drives while providing a mechanism to allow them to communicate to one or more separate computers.

Storage Management Initiative Specification (SMI-S)
A design specification developed by the Storage Networking Industry Association (SNIA) that specifies a secure and reliable interface with which storage management systems (SMSs) can identify, classify, monitor, and control physical and logical resources in a storage area network (SAN). The interface integrates the various devices to be managed in a SAN and the tools used to manage them.

storage node
A component of a storage system that provides internal storage or a connection to one or more external storage systems.

storage pod

1. A subcomponent of a network-attached storage (NAS) system that consists of two or more storage nodes and one or more supported storage systems.
2. A logical entity of components of a system consisting of two storage nodes, and one or two storage subsystems directly connected with these storage nodes.

storage pool (pool)
A collection of storage that identifies an underlying set of resources. These resources provide the capacity and management requirements for a volume or set of volumes.

storage resource group
A named collection of logically related resources that are monitored by Tivoli® Storage Productivity Center. Monitored resources can include fabrics, switches, computers, storage systems, and other storage resource groups.

storage system
A system that provides persistent storage within a network. A storage system can include facilities for host attachment, user role authentication, a command-line interface (CLI), a graphical user interface (GUI), and storage devices that most often include Redundant Array of Independent Disks (RAID) controllers. It might also include agents for enabling third-party management software to monitor or manage the storage devices.

storage type
See [storage architecture type](#).

stored capacity
The amount of capacity that is used to store data that is written by a host after data reduction. See also [data reduction](#), [total usable physical capacity](#).

support assistance
A function that is used to provide support personnel access to the system to complete troubleshooting and maintenance tasks.

synchronous replication
A type of replication in which the application write operation is made to both the source volume and target volume before control is given back to the application. See also [asynchronous replication](#).

syslog

A standard for transmitting and storing log messages from many sources to a centralized location to enhance system management.

T

target volume

A volume that receives data from a host volume or another intermediate volume.

thaw

An operation in which a storage system releases the block of the I/O from the host system to the affected volumes on the primary site. A thaw operation can occur after a freeze operation ends and consistency is formed on the secondary site. See also [freeze](#).

thin-provisioned volume

A volume that allocates storage when data is written to it.

thin provisioning

1. The ability to defer capacity allocation on a storage resource until data is actually written to it.
2. A mechanism that provides the ability to define logical volume sizes that are larger than the physical capacity installed on the system.

thin-provisioning savings

The total amount of usable capacity that is saved in a system, pool, or volume by consuming usable capacity only when needed as a result of write operations. The capacity that is saved is the difference between the provisioned capacity minus the written capacity. See also [projected capacity](#), [volume capacity](#), [written capacity](#).

total capacity savings

The total amount of usable capacity that is saved in a system, pool, or volume through thin provisioning and data reduction techniques. This saved capacity is the difference between the used usable capacity and the provisioned capacity.

total usable physical capacity

The amount of physical configured storage space that is available for stored capacity or reserved capacity. This capacity can consist of both internal storage through arrays and external storage through MDisk. See also [capacity threshold](#), [reserved capacity](#), [stored capacity](#).

track space-efficient volume (TSE volume)

A volume in which storage space is allocated on an as-needed basis by using space on the target volume only when tracks are copied from the source volume to the target volume.

transparent cloud tiering

The functions that use cloud storage as an extension of on-premises storage.

trial license

A temporary entitlement to use a licensed function.

TSE for FlashCopy

A thin-provisioning method in which storage space is allocated from a TSE repository on an as needed basis. See also [TSE repository](#).

TSE repository

The amount of capacity in a storage pool reserved for volumes that use a thin-provisioning method of TSE for FlashCopy. See also [TSE for FlashCopy](#).

TSE volume

See [track space-efficient volume](#).

U

unmapped volume capacity

The amount of volume capacity that is not mapped to a host. See also [volume capacity](#).

update

1. To apply fixes to a system.
2. Software maintenance such as a manufacturing refresh, refresh pack, or fix pack that changes the modification level of a product.
3. To modify a file or data set with current information.

upgrade

1. Any hardware or software change to a later release, or any hardware addition or software addition.
2. To install a new version or release of a product to replace an earlier version or release of the same product.

usable capacity

The amount of capacity that is provided for storing data on a system, pool, array, or MDisk after formatting and RAID techniques are applied.

used capacity

The amount of usable capacity that is taken up by data or overhead capacity in a system, pool, array, or MDisk after data reduction techniques have been applied.

user role

An identifier that is assigned to a user that defines the set of permissions that are granted to that user.

V

virtual capacity

See [provisioned capacity](#).

virtualization

The substitution of virtual resources for actual resources, where the virtual resources have the same functions and external interfaces as their counterparts, but differ in attributes, such as size, performance, and cost. Virtualization is commonly applied to physical hardware resources by combining multiple physical resources into shared pools from which users receive virtual resources.

virtualized capacity

The amount of capacity that is contributed to a storage pool by a given provisioning group.

virtual machine (VM)

An emulation of a particular computer system. Virtual machines operate based on the computer architecture and functions of a real or hypothetical computer. Their implementations might involve specialized hardware, software, or a combination of both.

virtual storage area network (VSAN)

A fabric within the storage area network (SAN).

VM

See [virtual machine](#).

volume

A fixed amount of physical or virtual storage on a data storage medium.

volume access set

The set of I/O groups that allows host access to a volume. This set can optionally include the caching I/O group.

volume capacity

The total capacity for all volumes in a system or storage pool. Volume capacity is defined by the client when a volume is created and surfaced to the host. See also [thin-provisioning savings](#), [unmapped volume capacity](#).

volume snapshot

A collection of objects on a cloud storage account that represents the data of a volume at a particular time.

VSAN

See [virtual storage area network](#).

W

worldwide ID (WWID)

A name identifier that is unique worldwide and that is represented by a 64-bit value that includes the IEEE-assigned organizationally unique identifier (OUI).

worldwide name (WWN)

A 64-bit, unsigned name identifier that is unique.

worldwide node name (WWNN)

A unique 64-bit identifier for a host containing a Fibre Channel port. See also [worldwide port name](#).

worldwide port name (WWPN)

A unique 64-bit identifier associated with a Fibre Channel adapter port. The WWPN is assigned in an implementation-independent and protocol-independent manner. See also [worldwide node name](#).

write-through mode

A process in which data is written to a storage device at the same time as the data is cached.

written capacity

The amount of usable capacity that would have been used to store written data in a system or pool if data reduction was not applied. See also [thin-provisioning savings](#).

written capacity limit

The largest amount of capacity that can be written to a drive, array, or MDisk. The limit can be reached even when usable capacity is still available.

WWID

See [worldwide ID](#).

WWN

See [worldwide name](#).

WWNN

See [worldwide node name](#).

WWPN

See [worldwide port name](#).

Z

z Global Mirror

A method of an asynchronous replication function that maintains data consistency across multiple volumes that are attached to a z/OS® system. Time-based data consistency is maintained through the Data Facility Storage Management Subsystem (DFSMS) system data mover (SDM) component.

zone

A logical grouping of switches, switch ports, and their attached devices in a fabric.

zone alias

A name that is given to a collection of one or more zone members to be managed together.

zone set

A group of zones that function together on a fabric.

zoning

The grouping of multiple ports to form a virtual, private, storage network. Ports that are members of a zone can communicate with each other, but are isolated from ports in other zones. See also [Fibre Channel](#).
