Welcome	1
What's new	1
Change history	1
Discontinued features	9
Sponsor user program	10
Beta program	11
Collaborating with the team	11
Printable documentation	12
Product licenses	12
Definitions of licensing metrics	13
Names of equivalent licenses in previous releases	13
Actions that are available based on role	14
Licensing	15
How licensing values are calculated	18
Configuring license values for storage systems	19
Licensing examples	20
Getting started	21
Social media	22
Videos	22
Blogs	24
Product overview	26
Supported devices	27
Architecture	28
Interfaces for IBM Spectrum Control	29
Starting IBM Spectrum Control	29
Navigation	29
IBM Spectrum Storage Suite	32
IBM Virtual Storage Center	33
IBM Storage Insights	35
Replication products	36
Product updates and security fixes	37
Releases and downloads	37
Security	38
Subscribing to IBM announcements	39
End of support	39
Collaborating with the team	39
Reporting a problem	40
Key concepts	40
Data collection	41
Performance monitoring and troubleshooting	41
Applications, departments, and general groups	42
Storage optimization	43
Cloud configuration	43
Service classes	43
Capacity pools	45
Provisioning storage	46
Storage reclamation	47
Alerts and alert policies	48
Reporting	49
Rollup servers	49
Units of measurement for storage data	50
Role-based authorization	51
Fabrics and zones	51
Monitoring fabrics and zones in the GUI	52
Zones, zone aliases, and zone sets	52
Switch zoning capabilities	53
Zoning for Cisco MDS 9000 switches	53
Brocade switches in zones	53
Agents	53
SMI-S providers	53
Storage Resource agents	54
SNMP agents	54
REST APIs	54
Tutorials	55
Optimizing the performance of storage virtualizers	55
Tutorial: Analyzing and re-tiering volumes in pools on tier 1	56
Tutorial: Collocating volumes	58
Monitoring capacity usage at different levels of a business hierarchy	58
Tutorial: Comparing storage usage in each department	59
Using applications and subcomponents to monitor capacity and space usage	60

Tutorial: Viewing storage capacity and usage trends	61
Tutorial: Viewing NPIV connections between server ports and switch ports in a fabric	62
Tutorial: Exporting and uploading performance data for a SAN Volume Controller system	62
Tutorial: Comparing the performance of storage systems	64
Tutorial: Reviewing and updating your agentless servers	65
Tutorial: Troubleshooting performance	67
Tutorial: Monitoring IBM Spectrum Scale performance	68
Tutorial: Viewing the aggregated workload for an application	69
Tutorial: Identifying the source of slow drain problems caused by depletion of buffer credits	70
Tutorial: Identifying the locations of devices	72
Planning	72
Planning for installation	73
Planning to install IBM Spectrum Control in a Windows domain	75
Windows domain and local user accounts	76
Adding a computer to the Windows domain	76
Verifying that the Netlogon service is running	77
Installing Db2 by using a Windows domain user account	77
Creating a Windows domain common user account for IBM Spectrum Control	77
Granting Db2 SYSADM authority to a Windows domain user account	78
Required user privileges in installation scenarios	78
Planning for configuration	80
Planning for capacity	81
Planning for IBM Spectrum Control authentication and authorization	81
User names and passwords	82
User name and password requirements	82
Db2 user names and passwords	83
Required user roles for monitoring resources	83
Worksheet for user names and passwords	85
Ports used by IBM Spectrum Control	86
Planning for multipath subsystem device drivers	90
Planning for Storage Resource agents	90
Protocol support for Storage Resource agents	90
Planning for Internet Protocol Version 6	91
Planning to use LDAP	92
Planning for storage management	92
Planning for storage systems	93
Planning for monitoring storage systems	94
Planning for SMI-S providers	95
Planning for TagmaStore CIM agents	96
Planning for the native interface	97
Storage capacity of volumes	97
Planning for DS8000	98
Planning for SAN Volume Controller	98
Planning for IBM Spectrum Virtualize for Public Cloud	99
Planning for Storwize V7000	100
Planning for Storwize V7000 Unified	101
Planning for XIV storage systems	101
Planning for Dell EMC storage systems	102
Planning for Hitachi storage systems	103
Planning for NetApp device support	104
Planning for Pure Storage systems	106
Planning to monitor performance	108
Performance metrics	108
Performance configuration	109
Planning for switches and fabrics	110
Collecting data about fabrics	111
Planning for Brocade	111
Planning to use the BNA SMI agent	113
Support for Access Gateway switches and virtual fabrics	113
Planning for Cisco	113
Cisco SNMP agent	114
Configuration requirements for Cisco switches and directors	114
Migrating fabrics and switches	115
Planning for private switch networks	116
Planning for VMware	116
Configuring VMware in a IBM Spectrum Control environment	117
VMware capacity reports	117
Planning for files systems and volume managers	118
File systems	118
Networked file systems	118
Volume managers	118
Planning for PowerHASystemMirror for AIX	119
PowerHA SystemMirror for AIX environment	120
NAS support	120

Network-attached storage system requirements	120
Microsoft Cluster Server	121
Microsoft Cluster Server environment	121
Microsoft Cluster Server support	122
Planning for the Virtual I/O Server	122
Planning to monitor Db2	123
Sudo command privileges	124
Installing	124
IBM Spectrum Control components	124
Hardware requirements	125
Software requirements	125
Software requirements for operating systems	125
Software requirements for Storage Resource agents	125
Software requirements for the database repository	126
Web browser support	126
Software requirements for LDAP servers	126
Software requirements for CIM agents	126
Installing IBM Spectrum Control	126
Installation checklists for IBM Spectrum Control	127
Db2	128
Preparing to install Db2	129
Preparing to install Db2 on Windows	129
Preparing to install Db2 on UNIX or Linux	129
Installing Db2	130
Installing Db2 on Windows	130
Installing Db2 on AIX or Linux	131
Installing Db2 on AIX or Linux by using the command-line	132
Verifying that Db2 is installed correctly	133
Verifying Db2 installation using the command-line processor (CLP)	134
Verifying Db2 installation by using the First Steps tool	134
Licensing Db2	134
Starting the installation programs	135
Installing IBM Spectrum Control in a single-server environment	137
Installing IBM Spectrum Control in a single-server Windows environment	137
Installing IBM Spectrum Control in a single-server AIX or Linux environment	137
Installing IBM Spectrum Control in a single-server environment by using silent mode	138
Editing the response file	140
Installing IBM Spectrum Control in a multiple-server environment	142
Installing IBM Spectrum Control with a remote database by using the installation program	143
Installing IBM Spectrum Control with a remote database by using silent mode	144
Accessing IBM Spectrum Control server from a remote computer using Command Line Interface	147
Installing IBM Spectrum Control on a Windows domain	147
Verifying the connection to the domain controller computer by using the Dcdiag tool	149
Installing IBM Spectrum Control and associated products using minimal space on the Windows C: drive	150
Verifying the installation	150
Reviewing the log files to resolve installation issues	152
Changing languages	152
Changing the language of the IBM Spectrum Control GUI	152
Changing the operating system language for Windows	153
Changing the operating system language for AIX	153
Adding an installation license	153
Adding an installation license using the installation program	154
Adding an installation license using silent mode	154
Installing Storage Resource agents	154
Installing Storage Resource agents by using a command	155
Installing IBM Cognos Analytics	156
Installing Cognos Analytics in a single Windows environment	156
Installing Cognos Analytics in a single Linux environment	157
Installing Cognos Analytics in a single AIX environment	158
Configuring IBM Cognos Analytics	159
Copying JDBC files for Db2 on Windows	159
Copying Db2 files and linking the Db2 library on Linux and AIX	160
Creating a content store and starting Cognos Analytics on Windows	160
Creating a content store and starting Cognos Analytics on Linux or AIX	161
Creating Cognos Analytics data source for the IBM Spectrum Control database	162
Using Cognos Analytics with multiple remote IBM Spectrum Control databases	163
Importing IBM Spectrum Control pre-defined reports package	164
Configuring access to the Cognos Analytics reporting tool	165
Reinstalling the software if a failure occurs	165
Taking the first steps after installation	166
Uninstalling	166
Uninstalling IBM Spectrum Control in a single-server environment	167
Uninstalling IBM Spectrum Control in a multiple-server environment	167
Uninstalling IBM Spectrum Control by using silent mode	168
Manually uninstalling IBM Spectrum Control components on AIX or Linux	169

Manually uninstalling IBM Spectrum Control components on Windows	169
Uninstalling Storage Resource agents	170
Uninstalling Storage Resource agents manually	171
Deleting Storage Resource agent registry entries after a failed installation or uninstallation	171
Removing servers	172
Uninstalling Db2	172
Uninstalling Db2 on AIX or Linux	172
Uninstalling IBM Cognos Analytics	174
Upgrading and migrating	174
Preparing to upgrade	175
Backups	177
Example of upgrading Db2 in a Windows environment	177
Example of upgrading Db2 in a AIX or Linux environment	178
Upgrading IBM Spectrum Control in a single-server environment	179
Upgrading IBM Spectrum Control in a single-server Windows environment by using the installation program	180
Upgrading IBM Spectrum Control in a single-server AIX or Linux environment by using the installation program	180
Upgrading IBM Spectrum Control in a single-server environment by using silent mode	181
Editing the upgrade response file	182
Upgrading IBM Spectrum Control in a multiple-server environment	183
Upgrading to IBM Spectrum Control 5.3.0 or later with a remote database by using the installation program	183
Upgrading IBM Spectrum Control with a remote database by using silent mode	183
Upgrading Storage Resource agents	185
Starting agent upgrades	186
Scheduling agent upgrades	186
Upgrading Storage Resource agents by using a command	186
Upgrading SMI-S providers for storage systems	187
Upgrading CIM agents	187
Migrating alert definitions to alert policies	187
Scenario: Changing from LDAP and Local OS authentication to only LDAP or Local OS authentication after an upgrade	188
Configuring	188
Starting IBM Spectrum Control	189
Configuring history and data retention	190
Configuring user authentication	191
Authorizing users	191
Role-based authorization	192
Assigning a role to a group	192
Determining the groups to which a user belongs	193
Modifying the authentication mechanism	193
Actions that are available based on role	194
Managing authentication	195
Changing from operating system to LDAP authentication	196
Changing from LDAP to operating system authentication	198
Configuring user authentication alternatives	198
Enabling secure communication between IBM Spectrum Control and the LDAP repository	198
Disabling secure communication between IBM Spectrum Control and the LDAP repository	199
Exporting SSL certificate from the IBM Security Directory Server to a file	199
Exporting SSL certificate from the Microsoft Active Directory to a file	200
Adding the SSL certificate for the LDAP server to the web server keystore using the IKEYCMD command	200
Using the ldapEntityType element for advanced LDAP configuration	201
Adding customized text to the logon page	202
Managing a SAN without agents	202
Setting timeout values for the Device server	203
Configuring Service Location Protocol	204
Router configuration	204
SLP directory agent configuration	204
Environment configuration	204
SLP registration and the slptool command	205
SLP discovery	205
Configuring IP addressing	205
Configuring IBM Spectrum Control with multiple IP addresses	205
Changing the HOSTS file	206
Deploying Storage Resource agents	207
Deployment guidelines and limitations for Storage Resource agents	207
Creating a certificate for SSH protocol	210
Replacing default SSL certificates for the Data server and Storage Resource agents with custom SSL certificates	213
Configuration guidelines for 500 or more agents	215
Including a Storage Resource agent with a server golden image	216
Checking for a fully qualified host name	216
Checking for a fully qualified host name for AIX systems	216
Checking for a fully qualified host name for Linux systems	217
Checking for a fully qualified host name for Oracle Solaris	217
Checking for a fully qualified host name for Windows systems	217
Granting local administrative privileges to a domain account	218
Importing authentication information for a Storage Resource agent	218
Installing and configuring the IBM Spectrum Control server with multiple NIC cards	218
Replacing the default SSL certificate for the Device, Alert, or Web server with a self-signed certificate	219

Replacing the default SSL certificate for the Device, Alert, or Web server with a certificate from an external certificate authority	220
Updating IBM Spectrum Control data collector trusted certificates after replacing default SSL certificate for the Device server with a self-signed certificate OR an external certificate	221
Replacing the default SSL certificate for the Export server	222
Generating a new default self-signed SSL certificate for the Export server	222
Enabling TLS 1.0 and 1.1 for ports	223
Enabling TLS 1.1 and 1.0 for IBM Spectrum Control ports	223
Configuring Db2, AIX, and Linux for IPv6-only environment	224
Administering	225
Administering resources and data sources	225
Storage systems	226
Viewing information about storage systems	226
Updating the credentials for storage systems	226
Updating the credentials for a System Storage DS8000 storage system	227
Updating the credentials for an XIV or IBM Spectrum Accelerate	227
Updating the credentials for storage systems that run IBM Spectrum Virtualize	227
Updating the credentials for a Storwize V7000 Unified storage system	228
Updating the credentials for a storage system that is managed by a CIM agent	229
Testing the connection to a storage system	229
Collecting CIM agent logs	229
Removing storage systems	230
Hypervisors and VMware data sources	230
Checking permissions to browse data stores	230
Viewing information about hypervisors	230
Updating the credentials for a hypervisor	231
Removing hypervisors and VMware data sources	231
Switches and fabrics	231
Viewing information about switches and fabrics	231
Updating the connection information for switches and fabrics	232
Updating the connection information for a switch	232
Updating the connection information for a fabric	233
Testing the connection to a switch or fabric	233
Removing switches and fabrics	234
Servers and Storage Resource agents	234
Fixing deployments	235
Canceling deployments	236
Modifying deployment schedules	236
Viewing information about Storage Resource agents	236
Viewing Storage Resource agent log files	237
Disabling Storage Resource agents	237
Enabling Storage Resource agents	238
Testing the connection with a Storage Resource agent	238
Changing credentials for Storage Resource agents	238
Collecting service data	239
Enabling or disabling scripts for Storage Resource agents	239
Enabling or disabling the monitoring of fabrics by Storage Resource agents	240
Using the help command for Storage Resource agents	240
Removing servers	240
Registering a Storage Resource agent with a different IBM Spectrum Control server	241
Manually changing the Windows service logon	241
Deployment guidelines and limitations for Storage Resource agents	241
SMI-S providers	244
Verifying that an SMI agent is running	244
Replacing an SMI agent for block storage systems, fabrics, and switches	245
Interop namespaces for SMI-S providers for switches and storage systems	245
SNMP agents	246
Displaying information about an SNMP agent	246
Removing an SNMP agent	246
Starting and stopping the IBM Spectrum Control servers	247
Starting the servers by using the GUI	247
Starting the servers by using scripts	247
Stopping the servers by using the GUI	248
Stopping the servers by using scripts	249
Checking the version and license of IBM Spectrum Control	249
Checking IBM Spectrum Control status	250
Troubleshooting problems with the IBM Spectrum Control component and servers	250
Packaging and sending log files from the System Management page	250
Increasing the memory allocation for the Data server	251
Increasing the memory allocation for the Data server that is running on AIX	252
Increasing the memory allocation for the Data server that is running on Linux	252
Increasing memory allocation for Data server that is running on Windows	253
Changing passwords	253
Changing passwords by using the password tool	253
Single server installation where components use the same logon credentials	254

Single-server installation where components use different logon credentials	255
Multiple-server installation where Db2 is remote	256
Changing passwords on AIX and Linux systems using the Command Line Interface (CLI)	257
Changing passwords on Windows systems from the Command Line Interface (CLI)	258
Granting local administrative privileges to a domain account	258
Collecting diagnostic information about IBM Spectrum Control	259
Service tool overview	259
Packaging log files from the command line and sending them to IBM Support	260
Creating a compressed file for a Storage Resource agent	261
How to customize the service tool	261
Administering the IBM Spectrum Control database	263
Backing up the database	263
Comparison of database backup methods	264
Backing up the database offline using the command line	265
Backing up the database offline using IBM® Data Studio client	265
Backing up the database online using IBM® Data Studio client	266
Restoring the database	267
Restoring the database using the command line	267
Restoring the database using IBM Data Studio client	267
Disaster recovery	268
Maintaining and improving the performance of the database	268
Updating database statistics	268
Reorganizing database tables	269
Customizing the reorganization function of the database maintenance tool	269
Repository copy tool	270
Exporting repository data	270
Administering Db2	271
Using the command line on UNIX and Linux	271
Manually starting Db2 on Windows	272
Manually stopping Db2 on Windows	272
Starting the IBM Data Studio full client	272
Monitoring Db2	273
Managing resources	273
Resources that you can monitor	274
Adding resources	277
Required user roles for monitoring resources	277
Adding storage systems	279
Hitachi	281
Installing the Hitachi Export Tool	282
Adding and configuring NetApp resources	283
Configuring IBM Spectrum Virtualize for Public Cloud for monitoring	284
Monitoring IBM Spectrum Virtualize for Public Cloud with on-premises data collection (Site to Site VPN IPsec)	284
User roles for collecting performance metadata from IBM Spectrum Virtualize	285
Monitoring IBM Spectrum Scale without requiring root privileges	285
Verifying that probe data can be collected for object storage	286
Configuring the collection of performance data for IBM Spectrum Scale	286
Configuring OpenStack access to monitor the object storage system	287
Adding fabrics and switches	288
Data sources for switches and fabrics	289
Configuring Brocade switches for monitoring	289
Adding hypervisors	290
Adding ESX and ESXi hypervisors	290
Checking permissions to browse data stores	291
Adding vCenter Server systems	291
Adding servers	292
Agentless servers	292
Adding servers with Storage Resource agents	292
File List	293
Adding rollup servers	293
Restrictions for rollup servers	294
Removing resources	294
Collecting data	295
Collecting asset and status data	295
Creating probes	296
How automated probes are scheduled	296
Verifying that a probe is running for a resource	297
Modifying probes	297
Configuring alerts for probes	298
Starting probes	298
Viewing probes for a specific resource	299
Viewing probe logs	299
Collecting performance data	299
Creating performance monitors	300
Verifying that a performance monitor is running for a resource	301

Modifying performance monitors	301
Configuring alerts for performance monitors	302
Starting and stopping performance monitors	302
Viewing performance monitors	303
Viewing all performance monitors	303
Viewing performance monitors for specific resources	304
Viewing performance monitors logs	304
Collecting information about shares on storage systems	305
Collecting information about the sizes of snapshots in IBM Spectrum Scale	305
Alerting	305
How alerts work	306
Viewing and administering alerts	307
Viewing and administering alert definitions	308
Alert policies	308
Defining notification settings for alerts	309
Alert severities	310
Defining alerts	310
Defining alerts for resources	311
Defining alert definitions for general attributes and capacity changes	311
Defining alert definitions for performance changes	312
Defining custom alerts for resources	314
Scenarios for custom alerts	315
Defining alerts for applications	319
Defining application alerts for attribute and capacity changes	320
Defining application alerts for performance metrics	320
Defining custom alerts for applications	322
Defining alerts for general groups	323
Defining general group alerts for attribute and capacity changes	323
Defining general group alerts for performance metrics	324
Defining custom alerts for general groups	325
Configuring alert notifications	326
Configuring email alert notifications	327
Configuring SNMP alert notifications	327
Configuring Tivoli Netcool/OMNIBus alert notifications	328
Triggering conditions for alerts	328
Triggering conditions for storage system alerts	329
Triggering conditions for storage system internal resource alerts	332
Triggering conditions for hypervisor alerts	340
Triggering conditions for switch alerts	343
Triggering conditions for fabric alerts	344
Triggering conditions for server alerts	345
Alert notifications and actions	349
How scripts are run	350
Viewing information about resources	351
How information is organized	352
Dashboard view	353
Viewing information about top-level resources	355
Viewing information about internal, object, and related resources	355
Overview charts	356
Capacity by pool	358
Capacity by volume	359
Viewing information about enclosures	360
Monitoring the status and condition of resources	361
How the condition of a resource is determined	362
Viewing the overall condition of resources	364
Viewing the condition of specific types of resources	364
Viewing the status of resources	365
Acknowledging the condition and status of resources	365
Acknowledging the condition of top-level resources	365
Acknowledging the status of internal resources	366
Monitoring vaults in IBM Cloud Object Storage	367
Monitoring access to vaults in IBM Cloud Object Storage	367
Investigating vaults that cannot be accessed	367
Monitoring vaults that are at risk of access failure	368
Calculating the failure tolerance for vaults	369
Monitoring the performance of resources	369
Viewing performance information	370
How performance information is displayed	372
Controls	373
Resources in the chart legend	374
Saving URLs for performance views	375
Identifying performance issues for IBM Spectrum Virtualize storage systems	376
IBM Spectrum Virtualize guideline values for key performance indicators	376
Viewing performance alerts	378
Exporting performance data for storage systems and fabrics	378

Exporting performance data by using the GUI	379
Exporting performance data by using a script	379
Performance metrics	380
Performance metrics for DS8000	380
Performance metrics for resources that run IBM Spectrum Virtualize	385
Performance metrics for XIV, IBM Spectrum Accelerate, IBM FlashSystem A9000, and IBM FlashSystem A9000R	395
Performance metrics for IBM Spectrum Scale	397
Performance metrics for IBM FlashSystem 900	398
Performance metrics for Dell EMC storage systems	400
Performance metrics for Hitachi VSP storage systems	404
Performance metrics for NetApp storage systems	405
Performance metrics for Pure storage systems	407
Performance metrics for other storage systems	408
Performance metrics for switches	409
Monitoring the capacity of resources	411
Setting capacity limits	412
Tutorial: Investigating compliance with the capacity limit	413
Removing the capacity limit	414
Capacity limit metrics	414
Viewing capacity information	415
How capacity information is displayed	416
Controls for capacity views	417
Resources in the capacity chart legend	418
Investigating capacity trends for block storage systems	418
Investigating capacity trends for block storage pools	419
Investigating capacity trends for volumes	420
Investigating capacity trends for file systems	420
Investigating capacity trends for file system pools	421
Investigating capacity trends for filesets	422
Investigating capacity trends for containers	423
Investigating capacity trends for tiers	424
Investigating capacity trends for servers	424
Creating bookmarks for URLs of capacity views	424
Viewing the capacity of external storage	425
Identifying shortfall before data is recalled from external storage	426
Viewing capacity alerts and violations	426
Capacity metrics	426
Capacity metrics for block storage systems	427
Key capacity concepts	435
Key storage values for pools	441
Capacity metrics for file storage systems	441
Capacity metrics for object storage systems	442
Capacity metrics for tiers	443
Monitoring and administering applications, departments, and general groups	443
Applications	446
Creating an application hierarchy	447
Creating applications	447
Using filters to assign resources to applications	448
Adding subcomponents	449
Adding resources manually to applications	450
Adding resources with the command line interface	450
Viewing information about applications	450
Removing applications and subcomponents	451
Removing resources from applications	451
Departments	452
Creating a department hierarchy	453
Creating departments	453
Adding and creating subdepartments	454
Adding applications to departments	455
Viewing information about departments	455
Removing departments and subdepartments	455
Removing applications from a department	456
Application and department hierarchies	456
Exporting information about applications and departments	457
General groups	458
Creating a general group hierarchy	458
Creating general groups and adding resources	458
Adding general groups as subgroups	459
Adding resources to general groups	459
Viewing and administering general groups	460
Provisioning storage	462
Configuring IBM Spectrum Control for provisioning	462
Configuring service classes	463

Creating service classes	463
Viewing the details of service classes	464
Modifying service classes	464
Deleting service classes	465
Tagging resources to satisfy custom requirements	465
Configuring capacity pools	466
Adding resources to capacity pools	466
Viewing the details of capacity pools	467
Modifying capacity pools	468
Deleting capacity pools	468
Block storage: Calculating available capacity and determining the placement of volumes	468
File storage: Calculating available capacity and determining the placement of shares	470
Changing the default host definition for provisioned storage	471
Provisioning storage with the IBM Spectrum Control GUI	472
Provisioning volumes to servers	472
Provisioning volumes to hypervisors	473
Provisioning volumes to a server cluster	473
Provisioning volumes to a hypervisor cluster	473
Provisioning shares to servers	474
Provisioning shares to hypervisors	474
Provisioning shares to a server cluster	474
Provisioning shares to a hypervisor cluster	475
Provisioning with zone control	475
Optimizing storage tiering	475
Investigating the capacity of tiered storage	477
Setting the tier level of storage pools	478
Renaming tiers	478
Analyzing tiering by servers	478
Analyzing tiering by hypervisors	479
Analyzing tiering by storage virtualizers	479
Analyzing tiering by storage pools	479
Analyzing tiering by volumes	479
Tiering volumes by I/O density and I/O rate	479
Modifying the criteria for analyzing tiering	480
Optimizing storage pools	480
Balancing pools	481
Modifying the criteria for balancing pools	481
Criteria for identifying the pools that require balancing	482
Reclaiming storage	482
Viewing storage reclamation	483
Viewing storage reclamation by storage system	483
Excluding volumes from reclamation analysis	484
Transforming and migrating volumes	484
Modifying the period for analyzing performance data	485
Modifying the properties of resources	485
Properties of resources that can be modified	486
Opening the management GUI for a resource	487
Exporting information to a file	487
Customizing lists	488
Filtering lists	488
Sorting lists	489
Showing, hiding, and reordering columns in lists	489
Managing tasks	489
Viewing tasks	490
Viewing all tasks	490
Viewing pending tasks	491
Viewing tasks for a type of resource	491
Viewing tasks for a specific resource	491
Viewing task details	492
Viewing task logs	492
Setting the number of task runs that are displayed	493
Managing tasks for provisioning	493
Creating provisioning tasks	493
Running provisioning tasks	494
Exporting provisioning task information	494
Managing tasks for tiering storage, balancing pools, and transforming storage	494
Creating analysis tasks	495
Running analysis tasks	496
Implementing recommendations to optimize storage	496
Implementing recommendations immediately	496
Scheduling the implementation of recommendations	497
Pausing, resuming, and canceling the implementation of recommendations	498
Renaming tasks	498
Deleting tasks	499
Planning copy data resources	499

Monitoring copy data resources	499
REST APIs	500
Retrieve data by using a REST API command line utility	500
Retrieve data by using REST APIs with a web browser	502
Reporting	503
Creating predefined capacity reports	505

Introduction to messages	987
Message types	988
AGT - Storage Resource Agent messages	989
AGT0001E Cannot set working directory to directory	992
AGT0002E Invalid invocation: swtchusr.	993
AGT0003I Agent registered.	993
AGT0004I Agent started.	993
AGT0005I Waiting for swtchusr.	993
AGT0006E Process process number is already connected to the server.	993
AGT0007E Another process is already connected to the server.	994
AGT0008E Job-type should be job type, but it is job type.	994
AGT0009E Error writing to swtchusr.	994

AGT0010E Class not found: class name.	994
AGT0011E class name does not inherit from class name.	994
AGT0012E class name does not have appropriate constructor.	995
AGT0013E Error constructing class name.	995
AGT0014E Cannot close the log-file log file name	995
AGT0015E The process identified by the process number failed to start generating the error status number.	995
AGT0016E Read from pipe failed.	996
AGT0017E Write to pipe failed.	996
AGT0018E Close of pipe failed.	996
AGT0019W Problem reading GUID identified by the GUID number.	996
AGT0020E Unparseable class-loader string class loader.	997
AGT0021E Error stopping the bundle.	997
AGT0031E User user name does not exist.	997
AGT0032E Cannot exec user command shell shell -- errno = arguments error message.	997
AGT0033E initgroups command(shell) fails -- errno = arguments error message.	998
AGT0034E Cannot create log-file in directory -- errno = arguments error message.	998
AGT0035W Error reading logical volume.	998
AGT0036W Error deserializing from file name.	998
AGT0037W Premature end of file -- file name.	998
AGT0038W Class class name not found restoring from file name.	998
AGT0039W Object restored from file name is not class name, Object is class name.	999
AGT0040E Agent Shutting down.	999
AGT0041E Agent not registered.	999
AGT0042E Error writing file name.	999
AGT0043E Error serializing to file name.	999
AGT0044E Fatal error -- cannot connect to self port number.	1000
AGT0045E Error parsing configuration file on line line number.	1000
AGT0046W In agent.config, key name is not an integer -- default of default key number used.	1000
AGT0047E In agent.config, key name is not a valid port.	1000
AGT0048E In agent.config, no value supplied for key name.	1000
AGT0049E Too many unreported jobs.	1001
AGT0050E Error parsing configuration file.	1001
AGT0051W The configuration file had at least one bad value.	1001
AGT0052W Cannot create temporary file in directory.	1001
AGT0053W Tried to send signal process number to nonexistent PID process number.	1001
AGT0054W No running job (job name, job number).	1001
AGT0055E Jobs are not allowed to run as root.	1002
AGT0056I NOTICE: Server moved to computer name:port number.	1002
AGT0057E Unable to create message-queue from key value.	1002
AGT0058E Error waiting for job to start.	1002
AGT0059I Received request to shut down request type.	1002
AGT0060I Exiting normally.	1002
AGT0061I Exiting abnormally.	1003
AGT0062E Cannot fork job.	1003
AGT0063E Error terminating process.	1003
AGT0064E Putative SID has too few hyphens: security identifier.	1003
AGT0065E Error waiting for shutdown request with Queue ID.	1003
AGT0066E Error reaping.	1004
AGT0067E Error waiting for process process name.	1004
AGT0068E Cannot fork -- command: command name.	1004
AGT0069E open(/proc/uptime) fails.	1004
AGT0070E read(/proc/uptime) fails.	1005
AGT0071E /proc/uptime does not look right.	1005
AGT0072E Cannot determine system-boot time.	1005
AGT0073E Problem creating up-time poller.	1005
AGT0074E Unsupported Operating System.	1006
AGT0075E Cannot query key name key value.	1006
AGT0076E Performance title data title not found.	1006
AGT0077E <<System>> performance object not found.	1006
AGT0078E The <<system>> performance counter not found.	1006
AGT0079E Cannot create semaphore.	1007
AGT0080W Cannot retrieve process times.	1007
AGT0081W Cannot retrieve process exit code.	1007
AGT0082E Cannot log in user user name.	1007
AGT0083E Cannot obtain SID of local computer (computer name).	1008
AGT0084E Cannot get name of local computer.	1008
AGT0085E SID of local computer has unexpected type (security identifier type).	1008
AGT0086W The GetTokenInformation method failed to execute.	1008
AGT0087W The LookupAccountSid method failed to execute.	1008
AGT0088W Cannot find any domain controller for domain domain name.	1009
AGT0089W Cannot fetch the information for user domain\\user.	1009
AGT0090W Cannot load profile for user username.	1009

AGT0091W Cannot unload user profile.	1009
AGT0092E Unable to retrieve status of job with the job number.	1010
AGT0093E Cannot retrieve environment block.	1010
AGT0094E Cannot impersonate to create resource.	1010
AGT0095W Environment for user username not fully configured.	1010
AGT0096E Malformed command-line.	1011
AGT0097E Command not found: fdisk command.	1011
AGT0098E Command has unsupported extension.	1011
AGT0099E Cannot duplicate handle.	1011
AGT0101E Cannot determine whether this is a domain controller.	1011
AGT0102E Cannot determine name of own domain.	1012
AGT0103W Cannot make Windows Job Object.	1012
AGT0104E Wrong server.	1012
AGT0105W Ignoring server relocation in config file.	1012
AGT0106I Server has changed.	1013
AGT0110E Cannot open key key name key value.	1013
AGT0111I Rereading config file.	1013
AGT0112E This product is not fully installed. To try again, stop and restart this agent.	1013
AGT0113E Cannot create temporary file in directory error message.	1013
AGT0114E Cannot write to file file name error message.	1013
AGT0115E Fork failed.	1014
AGT0116E Cannot exec command name.	1014
AGT0117W Cannot open file for auto-delete.	1014
AGT0118E Upgrader is not okay.	1014
AGT0119I version, modification and release.	1015
AGT0120E Error transmitting shutdown request to agent.	1015
AGT0121E Unable to create socket.	1015
AGT0122I The agent is already down.	1015
AGT0123W Unable to determine if agent is active. Sending shutdown request.	1015
AGT0124E Unable to create restartable job directory: directory name.	1016
AGT0125E Unable to read directory directory name.	1016
AGT0126E Unable to restart job from file file name.	1016
AGT0127E Unable to restart job job name.name run number run number.	1016
AGT0128W Cannot retrieve global structure.	1017
AGT0129W A system call failed in the agent program.	1017
AGT0130E The upgrader program parameters are missing.	1017
AGT0131I Exit Status = exit message.	1017
AGT0132E Cannot find/create script <script name>.	1017
AGT0133I Running Command: script name script contents.	1017
AGT0134E Putative SID does not start correctly: security identifier.	1017
AGT0135E Component component name is not a number: component number.	1018
AGT0136E No INSTANCEn.DAT file found!	1018
AGT0137E Cannot determine working directory!	1018
AGT0138W product name is not licensed on this computer.	1018
AGT0139E An initial probe cannot be performed.	1019
AGT0140W Discovery will not be performed.	1019
AGT0141W A filesystem scan will not be performed.	1019
AGT0142E Cannot make handle inheritable.	1019
AGT0143I file_count files scanned	1019
AGT0144I file_count total files scanned	1019
AGT0145I Retrieving job definition from server	1019
AGT0146I Scan started	1020
AGT0147I Retrieving report partition partition_number	1020
AGT0148I Report data retrieved	1020
AGT0149I Retrieving history data	1020
AGT0150I Deleting temporary files	1020
AGT0151E Unable to retrieve report definition	1020
AGT0152I Job definition retrieved	1020
AGT0153E MSCSEventListener thread interrupted. Shutting down native MSCS event listener.	1021
AGT0154E No IP address could be found for the local host.	1021
AGT0155I Windows Scan Option : scan parameters.	1021
AGT0156W Error killing process process id.	1021
AGT0157E Interrupted (agent shutting down).	1021
AGT0159E A problem was encountered stopping IBM Spectrum Control subagent.	1022
AGT0160E Error enumerating keys under registry path.	1022
AGT0161W Error querying value root path\\subkey name\\library file.	1022
AGT0162E Library : HBA_RegisterLibrary returned value.	1022
AGT0163E Library : HBA_LoadLibrary returned value.	1023
AGT0164W Library : HBA_GetAdapterName(adapter number) returned adapter name.	1023
AGT0165W Library : HBA_OpenAdapter(adapter name) failed.	1023
AGT0166W The HBA API HBA_GetAdapterAttributes for adapter adapter name returned error error code.	1023
AGT0167W Library : HBA_GetAdapterPortAttributes(adapter number, port) returned status.	1024

AGT0168W HBA data cannot be collected because the adapter name> adapter on the server does not support the HBA_GetAdapterAttributes function.	1024
AGT0200E Error waiting for process.	1024
AGT0250E Error starting bundle: exception message.	1024
AGT0251E Failed to install language pack.	1024
AGT0252E Failed to install language pack: File not found archive	1025
AGT0253E Invalid file format: file name	1025
AGT0254E Failed to load language pack.	1025
AGT0256I Waiting for Common Agent services.	1025
AGT0259E Agent cannot upgrade, the required space of 50 meg was not met.	1025
AGT0260E Failed to create a session with Reliable Scalable Cluster Technology Error ID-Error type: Error Description	1026
AGT0261E Failed to end a session with Reliable Scalable Cluster Technology Error ID-Error type: Error Description	1026
AGT0262W Concurrent cluster resource groups are not supported. The cluster will not be probed.	1026
AGT0263E Failed to get resource data from the HACMP cluster using the RSCT RMC interface.	1026
AGT0264E Failed to determine if the local node is clustered using the following command: command line	1027
AGT0265E Failed to get the cluster name using the following command: command line	1027
AGT0266E Failed to get the cluster ID using the following command: command line	1027
AGT0267E Failed to get the names of all the resource groups in the cluster.	1027
AGT0268E Failed to get the list of all the resource groups.	1028
AGT0269E Failed to get the service IP label information for resource group cluster resource group.	1028
AGT0270E Failed to get the volume group resources associated with cluster resource group cluster resource group.	1028
AGT0271I query command command selected.	1028
AGT0271E Failed to get the export resources associated with cluster resource group cluster resource group.	1029
AGT0272E Failed to get state of all the resource groups in the cluster.	1029
AGT0273E Failed to query the ODM query command.	1029
AGT0274E Storage Resource Agent initialization failed, return code: return code.	1029
AGT0275E Failed to get the HACMP node name using the following command:\ \n command line	1030
AGT0276E Failed to get the physical volume information for the volume group volume group.	1030
AGT0277E Failed to get the logical volume information for the volume group volume group.	1030
AGT0278E Failed to get the SDD device information using the following command: Command	1030
AGT0279W The detected level of HACMP is not compatible. Please consult the user's guide for compatible versions.	1031
AGT0279I Registry entry added for installation location location.	1031
AGT0280W Failed to determine if the cluster is stable using the following command.	1031
AGT0281I Config file entry added for server server and port number number.	1031
AGT0281W The cluster is not ready to be probed. Waiting settle time seconds to retry (retry count/retries).	1031
AGT0282E Unable to probe the cluster.	1032
AGT0283I The cluster is ready and the probe will proceed.	1032
AGT0284E Agent host name does not accept scripts from server (scripts are "Disabled"). Script script name cannot run.	1032
AGT0285E The script script name has an incorrect Windows extension.The accepted Windows extensions are: extension list.	1032
AGT0301I Extracting file	1033
AGT0304E Failed to send agent registration for agent in server to server server.	1033
AGT0305I Successfully sent Agent, server, registration to server number	1033
AGT0306E Unable to send status to server.	1033
AGT0307I Successfully sent Probe complete status to server, server.	1033
AGT0314E Unable to stop all jobs for server server name	1034
AGT0383I Install completed successfully.	1034
AGT0389E Installation aborted. Communication method specified for this installation is communication method and does not match communication method, the communication method of the installed SRA.	1034

ALR0002I The amount of virtual memory on host server name has changed from current value to new value. _____	1057
ALR0003I A new disk drive has been detected on host server name. Disk manufacturer/serial Number: manufacturer/serial Number. _____	1057
ALR0004E A previously visible disk drive can no longer be found on host server name. Disk manufacturer/serial number: manufacturer/serial number. _____	1057
ALR0005I A new filesystem has been detected on host server name. Filesystem mount point: mount point. _____	1057
ALR0006E A previously visible filesystem can no longer be found on host server name. Filesystem mount point: mount point. _____	1057
ALR0007E A disk drive visible on host server name has predicted that a disk failure is imminent. Disk manufacturer/serial number: manufacturer/serial number. _____	1058
ALR0008I The physical space definition of filesystem filesystem name on host server name has been reconfigured. _____	1058
ALR0009W The free space on filesystem filesystem name on host server name has fallen below the threshold value of threshold. The free space is freespace or percent of the filesystem capacity. _____	1058
ALR0010W The number of free inodes on filesystem filesystem name on host server name has fallen below the threshold value of threshold. The number of free inodes is free inodes or percent of the filesystem's total inodes. _____	1058
ALR0011W A new grown defect has been detected on a disk visible to host server name. Disk manufacturer/serial Number: disk manufacturer/serial number, Current grown defects: current, Previous grown defects: previous. _____	1058
ALR0012W The number of grown disk defects has exceeded the threshold value of threshold. Host: server name, Disk manufacturer/serial number: disk manufacturer/serial number, Current grown defects: current, Previous grown defects: previous. _____	1058
ALR0013W A new monitored directory has been detected on host server name. Directory name: directory name, Directory Group: directory group. _____	1059
ALR0014E A monitored directory has been removed from host server name. Directory name: directory name, Directory group: directory group. _____	1059
ALR0015W Directory directory on host server name has exceeded its space usage quota of quota. The directory is currently consuming usage or percent of the filesystem capacity. _____	1059

ALR0016W Filesystem filesystem name on host server name has violated a filesystem constraint. number of files file(s) consuming space or percent of the filesystem capacity are in violation of the conditions defined in this constraint. The constraint threshold is threshold. User user name} has number of files} files consuming space} of storage. violating owners}.	1059
ALR0017E Host server name appears to be down. number of attempts attempt(s) to ping this host have failed.	1059
ALR0018W quota name user has exceeded a network storage usage quota of usage. This user is currently consuming amount of storage.	1059
ALR0019W quota name user on host server name has exceeded a server storage usage quota of usage. This user is currently consuming amount of storage.	1060
ALR0020W quota name user on host server name has exceeded a filesystem usage quota of <usage>valueon filesystem filesystem name. This user is currently consuming amount of storage.	1060
ALR0021W Run number number of job creator job name has failed on run number of total jobs total jobs.	1060
ALR0022I Server server name has been discovered.	1060
ALR0023W Run number run number of job creator job name has failed.	1060
ALR0024W User user name on host server name has exceeded a table space usage quota of usage on table space rdbms type, table space instance. This user is currently consuming amount of storage.	1060
ALR0025W User user name on host server name has exceeded an RDBMS instance usage quota of quota on rdbms type instance instance name. This user is currently consuming amount of storage.	1061
ALR0026W User user name has exceeded a network database storage usage quota of quota. This user is currently consuming amount of storage.	1061
ALR0027W The log directory file name archived log directory value on host server name has exceeded the threshold value of threshold. This directory currently contains number of logs archived logs consuming amount of storage.	1061
ALR0028I A new table space name has been discovered on rdbms type instance on host server name. rdbms instance: database.	1061
ALR0029E value value has been dropped. RDBMS: value value, Host: host name.	1061
ALR0030E value value has been taken offline. RDBMS: value value, Host: host name.	1061
ALR0031W The free space on value: value, RDBMS: value value, host: host name, has fallen below the threshold value of value. The free space is value or value of the value capacity.	1061
ALR0032W The free space on table space: table space name, RDBMS: rdbms type instance, database: database, host: server name, is fragmented across number of extents extents. This exceeds the threshold value of threshold extents. The largest contiguous free extent is largest extent.	1062
ALR0033W The largest free extent available on table space: table space name, RDBMS: rdbms type rdbms name, database: database name, host: server name, has fallen below the threshold value of threshold. The largest free extent is largest extent.	1062
ALR0034W Segment segment name of table/cluster table name on host: server name, RDBMS: rdbms type rdbms name, database: database name, is fragmented across number of extents extents. This exceeds the threshold value of threshold extents. This segment is a value type segment.	1062
ALR0035W Segment value of table/cluster value on host: host name, RDBMS: value value, database: value, is nearing the maximum number of extents available to it. This segment currently occupies value extents. The value additional extent(s) available to this segment falls below the defined threshold of value extent(s). The segment is a type type segment.	1062
ALR0036W Table/cluster table name on host: server name, RDBMS: rdbms type rdbms name, database: database name, has exceeded a space usage quota of usage quota. This table is currently consuming amount of storage.	1062
ALR0037W Table/cluster value on host: host name, RDBMS: value value, database: database name, has exceeded a chained row quota of value. Statistics indicate that value rows or value of the total rows are chained.	1063
ALR0038W Segment name of table/cluster table name on host: server name, RDBMS: rdbms type rdbms name, database: database name, has amount of unused, wasted space. This represents amount of the total space allocated to the segment, and exceeds the threshold value of threshold. This segment is a type type segment.	1063
ALR0039E Table/cluster table name on host: server name, RDBMS: rdbms type rdbms name, database: database name, has been dropped.	1063
ALR0040W Filer filer name has been discovered. Spectrum Control will not monitor this filer until it has been licensed.	1063
ALR0041W The amount of log freespace available on instance: database, RDBMS: rdbms type , <rdbms>host: server name, has fallen below the threshold value of threshold. The amount of log freespace available is amount or percent of the total capacity.	1063
ALR0042I A new device has been discovered on rdbms instance instance on host server name. Device: device name, Capacity: capacity, File Name: filename.	1063
ALR0043E Device device name has been dropped from rdbms instance instance on host server name. Capacity: capacity, File Name: filename.	1064
ALR0044W The amount of device freespace available on value instance value on host value has fallen below the threshold value of value. The amount of device freespace available is value or value of the current capacity of value.	1064
ALR0045W The amount of device freespace available on device instance instance on host server name has gone above the threshold value of threshold. The amount of device freespace available is freespace or percent of the current capacity of total capacity.	1064
ALR0046W Database database name has not been backed up in the last number of days days. Last backup for the database was on date. RDBMS: rdbms type rdbms name, Host: server name.	1064
ALR0047W filer name filer type is no longer accessible from host entity.	1064
ALR0048W Storage Subsystem subsystem name is no longer accessible from host server name.	1064
ALR0049W disk array name disk array type has been discovered from host server name. Spectrum Control will not monitor this disk array until it has been selected as for monitoring from within the Storage Subsystem Administration GUI.	1064
ALR0050W The amount of cache on storage subsystem subsystem name has changed from old value to new value.	1065
ALR0052W Filesystem filesystem name on host server name will be automatically extended because its free space has fallen below the threshold of threshold. Current free space: current free space; Current capacity: current capacity; Target capacity: target capacity}.	1065
ALR0053W Filesystem filesystem name on host server name needs extension but will not be because its current capacity of current capacity exceeds the specified limit of limit. Filesystem free space: freespace (current capacity of current capacity).	1065
ALR0055I Cluster resource group cluster resource group name was added to cluster cluster name on node node name .	1065
ALR0056I Cluster resource group cluster resource group name was removed from cluster cluster name on node node name .	1065
ALR0057I Cluster resource group cluster resource group name was moved in cluster cluster name from node node name to node node name.	1065
ALR0076W Performance monitor failure for device value.	1066
ALR0500E The Disk Utilization Percentage of array array name in storage system storage system name was measured to be measured value%. This violated the critical-stress boundary value of boundary value%.	1066
ALR0501W The Disk Utilization Percentage of array array name in storage system storage system name was measured to be measured value%. This violated the warning-stress boundary value of boundary value%.	1066
ALR0502W The Disk Utilization Percentage of array array name in storage system storage system name was measured to be measured value%. This violated the warning-idle boundary value of boundary value%.	1067
ALR0503E The Disk Utilization Percentage of array array name in storage system storage system name was measured to be measured value%. This violated the critical-idle boundary value of boundary value%.	1067
ALR0504E The Total Back-end I/O Rate of array, MDisk, or MDisk Group Array, MDisk, or MDisk Group name in storage system storage system name was measured to be measured value ops/s, which violated the defined critical-stress boundary value of boundary value ops/s.	1067

[illegible]

[illegible]

ALR0579E The Port to Local Node Send Response Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined critical-idle boundary value of boundary value ms/op. 1094

ALR0580E The Port to Local Node Receive Response Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined critical-stress boundary value of boundary value ms/op. Violation of this threshold boundary could mean that it is taking too long to send data between nodes on the fabric, which suggests either a problem with the nodes or congestion around the associated FC ports on the fabric. 1094

ALR0581W The Port to Local Node Receive Response Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined warning-stress boundary value of boundary value ms/op. Violation of this threshold boundary could mean that it is taking too long to send data between nodes on the fabric, which suggests either a problem with the nodes or congestion around the associated FC ports on the fabric. 1095

ALR0582W The Port to Local Node Receive Response Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined warning-idle boundary value of boundary value ms/op. 1095

ALR0583E The Port to Local Node Receive Response Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined critical-idle boundary value of boundary value ms/op. 1096

ALR0584E The Port to Local Node Send Queue Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined critical-stress boundary value of boundary value ms/op. Violation of this threshold boundary could mean that the node has to wait too long to send data to other nodes on the fabric, which suggests congestion around the associated FC ports on the fabric. 1096

ALR0585W The Port to Local Node Send Queue Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined warning-stress boundary value of boundary value ms/op. Violation of this threshold boundary could mean that the node has to wait too long to send data to other nodes on the fabric, which suggests congestion around the associated FC ports on the fabric. 1096

ALR0586W The Port to Local Node Send Queue Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined warning-idle boundary value of boundary value ms/op. 1097

ALR0587E The Port to Local Node Send Queue Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined critical-idle boundary value of boundary value ms/op. 1097

ALR0588E The Port to Local Node Receive Queue Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined critical-stress boundary value of boundary value ms/op. Violation of this threshold boundary could mean that the node has to wait too long to receive data to other nodes on the fabric, which suggests congestion around the associated FC ports on the fabric. 1097

ALR0589W The Port to Local Node Receive Queue Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined warning-stress boundary value of boundary value ms/op. Violation of this threshold boundary could mean that the node has to wait too long to receive data to other nodes on the fabric, which suggests congestion around the associated FC ports on the fabric. 1098

ALR0590W The Port to Local Node Receive Queue Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined warning-idle boundary value of boundary value ms/op. 1098

ALR0591E The Port to Local Node Receive Queue Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined critical-idle boundary value of boundary value ms/op. 1099

ALR0592E The Non-preferred Node Usage Percentage of I/O Group I/O Group name in device device name was measured to be measured value%, which violated the critical-stress boundary value of boundary value%. 1099

ALR0593W The Non-preferred Node Usage Percentage of I/O Group I/O Group name in device device name was measured to be measured value%, which violated the warning-stress boundary value of boundary value%. 1099

ALR0594W The Non-preferred Node Usage Percentage of I/O Group I/O Group name in device device name was measured to be measured value%, which violated the warning-idle boundary value of boundary value%. 1100

ALR0595E The Non-preferred Node Usage Percentage of I/O Group I/O Group name in device device name was measured to be measured value%, which violated the critical-idle boundary value of boundary value%. 1100

ALR0596E The Peak Back-end Write Response Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined critical-stress boundary value of boundary value ms/op. If writes to disk are too slow, and writes are being received faster than they can be destaged to disk, then the nodes write-cache will eventually fill up. In extreme cases, the node will stop caching write data, causing a significant performance degradation for the affected volumes. 1100

ALR0597W The Peak Back-end Write Response Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined warning-stress boundary value of boundary value ms/op. If writes to disk are too slow, and writes are being received faster than they can be destaged to disk, then the nodes write-cache will eventually fill up. In extreme cases, the node will stop caching write data, causing a significant performance degradation for the affected volumes. 1101

ALR0598W The Peak Back-end Write Response Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined warning-idle boundary value of boundary value ms/op. 1101

ALR0599E The Peak Back-end Write Response Time of node node name in storage system storage system name was measured to be measured value ms/op, which violated the defined critical-idle boundary value of boundary value ms/op. 1102

ALR0600E The Port Send Utilization Percentage of port port name in storage system storage system name was measured to be measured value%, which violated the critical-stress boundary value of boundary value%. 1102

ALR0601W The Port Send Utilization Percentage of port port name in storage system storage system name was measured to be measured value%, which violated the warning-stress boundary value of boundary value%. 1103

ALR0602W The Port Send Utilization Percentage of port port name in storage system storage system name was measured to be measured value%, which violated the warning-idle boundary value of boundary value%. 1103

ALR0603E The Port Send Utilization Percentage of port port name in storage system storage system name was measured to be measured value%, which violated the critical-idle boundary value of boundary value%. 1103

ALR0604E The Port Receive Utilization Percentage of port port name in storage system storage system name was measured to be measured value%, which violated the critical-stress boundary value of boundary value%. 1104

ALR0605W The Port Receive Utilization Percentage of port port name in storage system storage system name was measured to be measured value%, which violated the warning-stress boundary value of boundary value%. 1104

ALR0606W The Port Receive Utilization Percentage of port port name in storage system storage system name was measured to be measured value%, which violated the warning-idle boundary value of boundary value%. 1105

ALR0607E The Port Receive Utilization Percentage of port port name in storage system storage system name was measured to be measured value%, which violated the critical-idle boundary value of boundary value%. 1105

ALR0608E The Port Send Bandwidth Percentage of port port name in device device name was measured to be measured value%, which violated the critical-stress boundary value of boundary value%. 1105

ALR0609W The Port Send Bandwidth Percentage of port port name in device device name was measured to be measured value%, which violated the warning-stress boundary value of boundary value%. 1106

ALR0610W The Port Send Bandwidth Percentage of port port name in device device name was measured to be measured value%, which violated the warning-idle boundary value of boundary value%. 1106

ALR0611E The Port Send Bandwidth Percentage of port port name in device device name was measured to be measured value%, which violated the critical-idle boundary value of boundary value%. 1106

[illegible]

[illegible]

ALR0686W The Port Congestion Index of port port_name in device device_name was found to be measured_value Counts, which violated the defined warning-idle boundary value of boundary_value Counts.	1132
ALR0687E The Port Congestion Index of port port_name in device device_name was found to be measured_value Counts, which violated the defined critical-idle boundary value of boundary_value Counts.	1132
ALR0688E The Link Quality Percentage of port port_name in device device_name was found to be measured_value, which violated the defined critical-stress boundary value of boundary_value.	1133
ALR0689W The Link Quality Percentage of port port_name in device device_name was found to be measured_value, which violated the defined warning-stress boundary value of boundary_value.	1133
ALR0690W The Link Quality Percentage of port port_name in device device_name was found to be measured_value, which violated the defined warning-idle boundary value of boundary_value.	1133
ALR0691E The Link Quality Percentage of port port_name in device device_name was found to be measured_value, which violated the defined critical-idle boundary value of boundary_value.	1134
ALR0692E The Invalid Link Transmission Rate of port port_name in device device_name was found to be measured_value, which violated the defined critical-stress boundary value of boundary_value.	1134
ALR0693W The Invalid Link Transmission Rate of port port_name in device device_name was found to be measured_value, which violated the defined warning-stress boundary value of boundary_value.	1134
ALR0694W The Invalid Link Transmission Rate of port port_name in device device_name was found to be measured_value, which violated the defined warning-idle boundary value of boundary_value.	1135
ALR0695E The Invalid Link Transmission Rate of port port_name in device device_name was found to be measured_value, which violated the defined critical-idle boundary value of boundary_value.	1135
ALR0696E The Extreme I/O Concurrency Percentage of port port_name in storage system device_name was found to be measured value, which violated the defined critical-stress boundary value of boundary value.	1135
ALR0697W The Extreme I/O Concurrency Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined warning-stress boundary value of boundary_value.	1136
ALR0698W The Extreme I/O Concurrency Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined warning-idle boundary value of boundary_value.	1136
ALR0699E The Extreme I/O Concurrency Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined critical-idle boundary value of boundary_value.	1137
ALR0700E The I/O Busy Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined critical-stress boundary value of boundary_value.	1137
ALR0701W The I/O Busy Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined warning-stress boundary value of boundary_value.	1137
ALR0702W The I/O Busy Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined warning-idle boundary value of boundary_value.	1138
ALR0703E The I/O Busy Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined critical-idle boundary value of boundary_value.	1138
ALR0704E The I/O Overrun Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined critical-stress boundary value of boundary_value.	1139
ALR0705W The I/O Overrun Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined warning-stress boundary value of boundary_value.	1139
ALR0706W The I/O Overrun Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined warning-idle boundary value of boundary_value.	1139
ALR0707E The I/O Overrun Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined critical-idle boundary value of boundary_value.	1140
ALR0708E The Zero Send Buffer Credit Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined critical-stress boundary value of boundary_value.	1140
ALR0709W The Zero Send Buffer Credit Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined warning-stress boundary value of boundary_value.	1140
ALR0710W The Zero Send Buffer Credit Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined warning-idle boundary value of boundary_value.	1141
ALR0711E The Zero Send Buffer Credit Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined critical-idle boundary value of boundary_value.	1141
ALR0712E The Zero Receive Buffer Credit Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined critical-stress boundary value of boundary_value.	1142
ALR0713W The Zero Receive Buffer Credit Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined warning-stress boundary value of boundary_value.	1142
ALR0714W The Zero Receive Buffer Credit Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined warning-idle boundary value of boundary_value.	1142
ALR0715E The Zero Receive Buffer Credit Percentage of port port_name in storage system device_name was found to be measured_value, which violated the defined critical-idle boundary value of boundary_value.	1143
ALR0716E The number of bytes received on each of the client network interfaces of cluster cluster name in storage subsystem storage system name was measured to be measured valuebytes, which violated the defined critical-idle boundary value of boundary valuebytes.	1143
ALR1114I New Storage Subsystem discovered.	1143
ALR4000I Endpoint device endpoint device name has been discovered.	1143
ALR4001W Endpoint device endpoint device name is missing.	1144
ALR4002I Endpoint device endpoint device name has been rediscovered.	1144
ALR4015I subsystem/fabric/switch/server subsystem/fabric/switch/server name port port name or WWPN has been discovered.	1144
ALR4016W subsystem/fabric/switch/server subsystem/fabric/switch/server name port port name or WWPN is missing.	1144
ALR4017I subsystem/fabric/switch/server subsystem/fabric/switch/server name port port name or WWPN has been rediscovered.	1144
ALR4018W subsystem/fabric/switch/server subsystem/fabric/switch/server name port port name or WWPN has gone offline.	1145
ALR4019I subsystem/fabric/switch/server subsystem/fabric/switch/server name port port name or WWPN has gone online.	1145
ALR4020I Switch switch name or WWN has been discovered.	1145
ALR4021E Switch switch name or WWN is missing.	1145
ALR4022I Switch switch name or WWN has been rediscovered.	1145
ALR4023W The version for switch switch name or WWN has changed from previous firmware version to current firmware version .	1146

ALR4024W Status of switch switch name or WWN has degraded from previous status to current status .	1146
ALR4025I Status of switch switch name or WWN has improved from previous status to current status .	1146
ALR4026I Blade blade name or WWN on switch switch name or WWN has been discovered.	1146
ALR4027W Blade blade name or WWN on switch switch name or WWN is missing.	1146

ALR4029E Blade blade name or WWN on switch switch name or WWN has gone offline.	1147
ALR4030I Blade blade name or WWN on switch switch name or WWN has gone online.	1147
ALR4034W The driver version for HBA adapter name on server host name has changed from previous version to new version.	1147
ALR4035W The firmware version for HBA adapter name on server host name has changed from previous version to new version .	1147
ALR4046I Fabric fabric name or WWN is discovered.	1148
ALR4047E Fabric fabric name or WWN is missing.	1148
ALR4048I Fabric fabric name or WWN is rediscovered.	1148
ALR4051I Inactive zone zone name in fabric fabric name or WWN has been discovered.	1148
ALR4052W Inactive zone zone name in fabric fabric name or WWN is missing.	1148
ALR4053I Inactive zone zone name in fabric fabric name or WWN has been rediscovered.	1148
ALR4054I Inactive zoneset zoneset name in fabric fabric name or WWN has been discovered.	1149
ALR4055W Inactive zoneset zoneset name in fabric fabric name or WWN is missing.	1149
ALR4056I Inactive zoneset zoneset name in fabric fabric name or WWN has been rediscovered.	1149
ALR4063I The connection from switch or node switch name or WWN port port name or WWPN to switch or node switch name or WWN port port name or WWPN has been discovered.	1149
ALR4064W The connection from switch or node switch name or WWN port port name or WWPN to switch or node switch name or WWN port port name or WWPN is missing.	1149
ALR4065I The connection from switch or node switch name or WWN port port name or WWPN to switch or node switch name or WWN port port name or WWPN has been rediscovered.	1150
ALR4066I Switch switch name or WWN in fabric fabric name or WWN has been discovered.	1150
ALR4067W Switch switch name or WWN in fabric fabric name or WWN is missing.	1150
ALR4068I Switch switch name or WWN in fabric fabric name or WWN has been rediscovered.	1150
ALR4069I Port port name or WWPN in switch switch name or WWN has been discovered.	1150
ALR4070W Port port name or WWPN in switch switch name or WWN is missing.	1151
ALR4071I Port port name or WWPN in switch switch name or WWN has been rediscovered.	1151
ALR4078I Alias zone alias has been added to inactive zone zone name in fabric fabric name or WWN .	1151
ALR4079W Alias zone alias has been removed from inactive zone zone name in fabric fabric name or WWN .	1151
ALR4080I Alias zone alias has been readded to inactive zone zone name in fabric fabric name or WWN .	1151
ALR4081I Zone member zone member name has been added to inactive zone zone name in fabric fabric name or WWN .	1152
ALR4082I Zone member zone member name has been removed from inactive zone zone name in fabric fabric name or WWN .	1152
ALR4083I Zone member zone member name has been readded to inactive zone zone name in fabric fabric name or WWN .	1152
ALR4084I Zone zone name has been added to inactive zone set zone set name in fabric fabric name or WWN .	1152
ALR4085I Zone zone name has been removed from inactive zone set zone set name in fabric fabric name or WWN .	1152
ALR4086I Zone zone name has been readded to inactive zone set zone set name in fabric fabric name or WWN .	1153
ALR4089W ZoneSet zoneset name in fabric fabric name or WWN has been deactivated. ZoneSet zoneset name has been activated.	1153
ALR4090W Active zone zone name in fabric fabric name or WWN is missing.	1153
ALR4091I Active zone zone name in fabric fabric name or WWN has been discovered.	1153
ALR4092I Active zoneset zoneset name in fabric fabric name or WWN has been discovered.	1153
ALR4093E ZoneSet zoneset name in fabric fabric name or WWN has been deactivated. ZoneSet zoneset name has been activated.	1154
ALR4094I Active zone zone name in fabric fabric name or WWN has been rediscovered.	1154
ALR4095I Active zoneset zoneset name in fabric fabric name or WWN has been rediscovered.	1154
ALR4096I Zone member zone member name has been added to active zone zone name in fabric fabric name or WWN .	1154
ALR4097I Zone member zone member name has been removed from active zone zone name in fabric fabric name or WWN .	1154
ALR4098I Zone member zone member name has been readded to active zone zone name in fabric fabric name or WWN .	1155
ALR4099I Zone zone name has been added to active zone set zone set name in fabric fabric name or WWN .	1155
ALR4103W The performance monitor's primary process is experiencing a high memory utilization.	1155
ALR4104W A database used by the system is reporting an alarm: value.	1155
ALR4105W Device server configuration should be changed to improve performance: value.	1155
ALR4106W The IBM Spectrum Control server is receiving a high number of external type of events received, which is either CIM for CIM indications or SNMP for SNMP traps. events, which may cause temporary performance degradation.	1156
ALR4107I Zone zone name has been removed from active zone set zone set name in fabric fabric name or WWN .	1156
ALR4108I The server server name at host host name successfully connected to the database after previous attempts failed.	1156
ALR4112E The server server name at host host name failed to connect to the database.	1156
ALR4109I Alias zone alias has been added to active zone zone name in fabric fabric name or WWN .	1157
ALR4113E The IBM Spectrum Control server failed to connect to the database.	1157
ALR4110W Alias alias namehas been removed from active zone active zone name in fabric fabric name .	1157
ALR4111I Alias alias namehas been readded to active zone active zone name in fabric fabric name .	1157
ALR4197W A new connection is detected.	1157
ALR4198W The state for connection from initial state to final state has changed.	1158
ALR4199W The state for Fabric fabric name has changed.	1158
ALR4224W The state has changed for Node node name .	1158
ALR4225I Node node name has been discovered.	1158
ALR4226W Node node name has gone offline.	1158
ALR4227I Node node name has gone online.	1158
ALR4241E Subsystem storage subsystem name has gone offline.	1159
ALR4242I Subsystem storage subsystem name has gone online.	1159
ALR4243W The subsystem version has changed from initial version to new version on Subsystem storage subsystem name .	1159

ALR4244W The allocated capacity has changed from initial capacity to new capacity on Subsystem storage subsystem name .	1159
ALR4245W The available capacity has changed from initial capacity to new capacity on Subsystem storage subsystem name .	1159
ALR4246W Back-end capacity has changed from initial capacity to new capacity on Subsystem storage subsystem name .	1160
ALR4247W Back-end controller back-end controller name for owning storage subsystem name has gone offline.	1160
ALR4248I Back-end controller back-end controller name for owning storage subsystem name has gone online.	1160
ALR4249W Volume volume name on storage subsystem name has gone offline.	1160
ALR4250I Volume volume name on storage subsystem name has gone online.	1160
ALR4251W The capacity has changed from initial capacity to new capacity for Volume volume name on Subsystem storage subsystem name .	1161
ALR4252W The state for Pool pool name on Subsystem storage subsystem name has changed to not detectable .	1161
ALR4253I Pool pool name on Subsystem storage subsystem name has been discovered.	1161
ALR4254W Pool pool name on Subsystem storage subsystem name has gone offline.	1161
ALR4255I Pool pool name on Subsystem storage subsystem name has gone online.	1161
ALR4256W The pool capacity has changed from initial capacity to new capacity for Pool pool name on Subsystem storage subsystem name .	1162
ALR4257W The pool available space has changed from initial capacity to new capacity for Pool pool name on Subsystem storage subsystem name .	1162
ALR4273E Server server name has gone offline.	1162
ALR4274I Server server name has gone online.	1162
ALR4278W The property for Subsystem storage subsystem name has changed.	1162
ALR4300W The use count for Disk Drive disk drive name on Subsystem subsystem name has changed from initial use count to final use count.	1163
ALR4301W Disk Drive disk drive name on Subsystem subsystem name has gone offline.	1163
ALR4304W The state for Back-end Controller back-end controller for subsystem has changed from initial state to final state .	1163
ALR4305W The WWPN path count for Back-end Controller back-end controller for system name has changed from initial state to final state .	1163
ALR4312W Notification has received from external device device name	1163
ALR4313W The endpoint version has changed from initial state to final state on Endpoint	1164
ALR4314W Entity entity name has been discovered.	1164
ALR4315I Hypervisor hypervisor name has been discovered.	1164
ALR4316I Virtual machine vm name was added to hypervisor hypervisor name .	1164
ALR4317W Virtual machine vm name was removed from hypervisor hypervisor name .	1164
ALR4318W New unmanaged hypervisor discovered.	1164
ALR4319W Virtual machine added.	1165
ALR4320W Virtual machine removed.	1165
ALR4321W Hypervisor hypervisor missing.	1165
ALR4322W Hypervisor missing.	1165
ALR4323I New disk disk name discovered for system system name .	1165
ALR4324W Disk disk not found for system system .	1166
ALR4325W New volume volume name discovered for system system name .	1166
ALR4326W Volume volume not found for system system.	1166
ALR4327W Zone Alias to Member Change	1166
ALR4328W The association between Zone Alias zone alias and Member member has changed.	1166
ALR4329I Zone member zone member has been added to zone alias zone alias in fabric fabric .	1167
ALR4330W Zone member zone member has been removed from zone alias zone alias in fabric fabric .	1167
ALR4331I Zone member zone member has been read added to zone alias zone alias in fabric fabric .	1167
ALR4332W Storage Resource Agent Deployment Failed	1167
ALR4333W Replication Session State Change alert received.	1167
ALR4334W Replication Configuration Change alert received.	1168
ALR4335W Replication Suspending Event Notification alert received.	1168
ALR4336W Replication Communication Failure alert received.	1168
ALR4337W Replication Management Server State Change alert received	1168
ALR4338W Replication PPRC Path State Change alert received.	1168
ALR4339W The IBM Spectrum Control for Replication resource resource name triggered an alert with the following message: message text	1168
ALR4353W number of affected datapaths Data Paths from Host host name to Volume volume name on Subsystem subsystem name are no longer available.	1169
ALR4354I number of affected datapaths Data Paths from Host host name to Volume volume name on Subsystem subsystem name have been discovered..	1169
ALR4356E The mount state of specified file system changed to error level.	1169
ALR4358I The mount state of specified file system changed to normal level.	1169
ALR4359E The CPU usage reached the error level.	1170
ALR4360W The CPU usage reached the warning level.	1170
ALR4361I The CPU usage reached the normal level.	1170
ALR4362E The memory usage reached the error level.	1170
ALR4364I The memory usage reached the normal level.	1170
ALR4365I The clustered CIFS is active.	1170
ALR4366W The clustered CIFS is disabled.	1171
ALR4367E The clustered CIFS status reached the error level.	1171
ALR4368I The IBM Spectrum Scale is active.	1171
ALR4369W The IBM Spectrum Scale status reached the warning level.	1171
ALR4370E The IBM Spectrum Scale is down.	1171
ALR4427I The file system file system has been detected on device type device device display name.	1172
ALR4429I The capacity of file system file system has changed from previous capacity to current capacity on device type device NAS display name.	1172
ALR4433W The free space on file system file system has fallen below the threshold value of threshold on device type device nas display name. The free space is current free space value or relative free space value of the file system capacity.	1172
ALR4440W The state of the device type node type node node name changed from old state to new state on device display name.	1172
ALR4441I The state of the device type node type node node name changed from old state to new state on device display name.	1172
ALR4442W The IBM Spectrum Scale status of device type node node name changed from old state to new state on device display name.	1173
ALR4443I The IBM Spectrum Scale status of device type node node name changed from old state to new state on device display name.	1173

ALR4447I The fileset fileset was detected on device type device device name.	1173
ALR4448I The fileset fileset was linked to path for device type device device name.	1173
ALR4455I The fileset fileset was unlinked on device type device device name.	1173
ALR4458W The number of free inodes on file system path has fallen below the threshold value of threshold on device type device device name. There are current value free inodes or current value relative to maximum of the maximum inodes.	1174
ALR4460I Export export name detected on device type device device name with path path.	1174
ALR4461W The state of export export name changed from previous state to current state on device type device device name.	1174
ALR4462W Export export name was reconfigured on device type device device name. Path changed from previous path to current path.	1174
ALR4463W Export export name was reconfigured on device type device device name. Protocols changed from previous list of protocols to current list of protocols.	1174
ALR4470W Export export name is missing from device type device device name..	1175
ALR4471I Export export name was rediscovered on device type device device name..	1175
ALR4474W Fileset fileset name is missing from device type device device name..	1175
ALR4475I Fileset fileset name was rediscovered on device type device device name..	1175
ALR4478W File system File system name is missing from device type device device name..	1175
ALR4479I File system File system name was rediscovered on device type device device name..	1176
ALR4482W A Quota type Quota limit type quota was violated for the path file system on the device device name device type system. Quota type resource name is consuming usage and the Quota limit type limit is threshold.	1176
ALR4496I New quota detected on file system path of Device type device Device name.	1176
ALR4385E The status of NSD NSD name reached error level.	1176
ALR4386W The status of NSD NSD name reached warning level.	1176
ALR4387I The status of NSD NSD name was set back to normal level.	1177
ALR4503I New NSD NSD name has been detected on device type device device display name.	1177
ALR4505W NSD NSD name is missing from device type device device name.	1177
ALR4507W The state of NSD NSD name changed from previous state to current state on device type device device name.	1177
ALR4511E Alert condition for nodes has been selected. Select only nodes.	1177
ALR4512E Alert condition for clusters has been selected. Select only clusters.	1178
ALR4513E Alert condition for NSD has been selected. Select only NSD.	1178
ALR4514E Alert condition for File set has been selected. Select only File set.	1178
ALR1022M A new unmanaged server or cluster discovered.	1178
ALR1294W The server or cluster has gone offline.	1178
ALR1295W The server or cluster has gone online.	1178
ALR1296W The server or cluster property has changed.	1179
ALR1245W A node state has changed.	1179
ALR1246W A node was discovered.	1179
ALR4528I Cluster was discovered.	1179
ALR4529I Cluster was removed.	1179
ALR4530I Cluster was rediscovered.	1180
ALR0078W =Performance monitor for device value failed to collect new data using data source value.	1180
ALR4391I Node node name is selected as cache gateway node.	1180
ALR4392I Node node name is unselected as cache gateway node.	1180
ALR4393I Home system home system name detected on device type device device name with path path.	1180
ALR4394I Home system has been removed from fileset fileset name on device type device device name.	1180
ALR4395W Home system home system name is missing from device type device device name.	1181
ALR4396I Home system home system name was rediscovered on device type device device name..	1181
ALR4397I Cache fileset cache fileset name detected on device type device device name.	1181
ALR4398W Cache fileset cache fileset name is missing from device type device device name.	1181
ALR4399I Cache fileset cache fileset name was rediscovered on device type device device name.	1181
ALR4400I Cache fileset name has changed from cache fileset name to cache fileset name on device type device device name.	1182
ALR4401I Cache fileset cache fileset name state has changed from old value to new value on device type device device name.	1182
ALR4402I Cache fileset cache fileset name mode has changed from old value to new value on device type device device name.	1182
ALR4403I Cache client cluster name is added to home system home system name on device type device device name.	1182
ALR4404I Cache client cluster name has been removed from home system home system name on device type device device name.	1182
ALR4541E The available space is too low for pool pool name on storage system storage system name. The measured value pool available space violates the critical boundary of user defined threshold value.	1183
ALR4542W The available space is too low for pool pool name on storage system storage system name. The measured value pool available space violates the warning boundary of user defined threshold value.	1183
ALR4543E The allocation is too high for pool pool name on storage system storage system name. The measured value pool virtual allocation violates the critical boundary of user defined threshold value.	1183
ALR4544W The allocation is too high for pool pool name on storage system storage system name. The measured value pool virtual allocation violates the warning boundary of user defined threshold value.	1183
ALR4545E The shortfall percentage is too high for pool pool name on storage system storage system name. The measured value pool shortfall percentage violates the critical boundary of user defined threshold value.	1184
ALR4546W The shortfall percentage is too high for pool pool name on storage system storage system name. The measured value pool shortfall percentage violates the warning boundary of user defined threshold value.	1184
ALR4547I VMWare Cluster cluster name discovered on hypervisor hypervisor name.	1184
ALR4548W VMWare Cluster cluster name removed from hypervisor hypervisor name.	1184
ALR4549I New cluster hypervisor relationship discovered.	1184
ALR4550W Cluster hypervisor relationship removed.	1185
ALR4551I Hypervisor hypervisor name was moved from VMWare Cluster old cluster nameto VMWare Cluster new cluster name.	1185
ALR4552I Cluster hypervisor relationship moved.	1185
ALR4600I Fabric Name fabric WWN changed to fabric WWN .	1185
ALR1349I A new path path name was discovered for disk disk name on host host name.	1185

ALR1350W The path path name was not found for disk disk name on host host name.	1186
ALR1351W The path path name for disk disk name on host host name is disconnected.	1186
ALR4604I The home system home system was linked to path on resource type resource resource name.	1186
ALR4605I The home system home system was unlinked from a path on resource type resource resource name.	1186
ALR1352E The status of disk disk name on server server name has degraded to Error from former status.	1186
ALR1353W The status of disk disk name on server server name has degraded to Warning from former status.	1187
ALR1354I The status of disk disk name on server server name has improved to Normal from former status.	1187
ALR4625I New entity type, entity name, added to system type system name .	1187
BPCCA - Data collector installation messages	1187
BPCCA0001I The data collector started, connected to the storage management service, and is ready to process requests from the storage management service.	1188
BPCCA0002E The data collector failed to connect to the storage management service at server_url.	1188
BPCCA0003E The data collector started but detected a problem with the directory directory_name and must stop.	1188
BPCCA0004E The data collector cannot run because it is not configured correctly.	1188
BPCCA0005E The data collector failed to connect to the storage management service at server_url because the host name could not be resolved.	1189
BPCCA0006E The data collector failed to connect to the storage management service at server_url because of an unknown error.	1189
BPCCA0007E The data collector failed to connect to a service from the storage management system.	1189
BPCCA0008E The data collector failed to connect to the storage management service because of invalid credentials.	1189
BPCCA0009I The data collector connected to the storage management service. The data collector had failed to connect since date_and_time.	1190
BPCCA0010E The data collector in the directory_name directory of the host host_name was running and an attempt was made to start a second instance of the same data collector. The second instance of the data collector stopped.	1190
BPCCA0011I The data collector stopped because a user requested it to shut down.	1190
BPCCA0012I The data collector stopped to enable the installation of an upgraded version of the data collector.	1190
BPCCA0013E The storage management service did not allow the data collector to connect because another data collector was already connected to the service.	1190
BPCCA0100I The updateCollector utility started.	1191
BPCCA0101E The collector directory was not specified in the collectorDirectory.properties file.	1191
BPCCA0102E The collector directory directory_name that was specified in the collectorDirectory.properties file is invalid. The collector directory is the directory to which the updateCollector utility must copy the upgrade image files.	1191
BPCCA0103E The collector directory directory_name that was specified in the collectorDirectory.properties file cannot be used as the collector directory.	1191
BPCCA0104E The updateCollector utility started but there was a problem with the upgrade image directory current_directory.	1191
BPCCA0105E The collector directory directory_name that was specified in the collectorDirectory.properties file is a subdirectory of the upgrade image directory upgrade_image_directory_name.	1192
BPCCA0106E Cannot upgrade the data collector in the collector_directory directory because the directory contains the following locked files: locked_files_list	1192
BPCCA0107I The content of the directory collector_directory will be deleted and replaced with subdirectories and files from the upgrade_image_directory directory. Some configuration files, the log directory, and the contents of the log directory will not be deleted.	1192
BPCCA0108E The data collector service cannot be uninstalled from the operating system. The upgrade process cannot be completed.	1192
BPCCA0109E The updateCollector utility could not upgrade the data collector. The data collector service is now in an inconsistent state.	1193
BPCCA0110E The contents of the collector_directory directory could not be deleted. The upgrade process cannot be completed. The data collector might be in an inconsistent state.	1193
BPCCA0111E The files and directories of the data collector from the directory upgrade_image_directory could not be copied into the directory collector_directory. The upgrade process cannot be continued. The data collector might be in an inconsistent state.	1193
BPCCA0112I The data collector in the directory collector_directory was upgraded successfully to version downloaded_version.	1193
BPCCA0113E The data collector in the directory collector_directory could not be upgraded.	1194
BPCCA0114I The data collector was upgraded to the new version and will start automatically.	1194
BPCCA0115I The attempt to upgrade the data collector failed. The existing data collector will start automatically.	1194
BPCCA0116E The attempt to upgrade the data collector failed. You must download and install the latest version of the data collector.	1194
BPCCA0117E The upgraded data collector could not be installed as a service on the operating system. You must install the new data collector service manually.	1194
BPCCA0118I The data collector was upgraded to the new version and started successfully.	1195
BPCCA0119I The data collector could not be upgraded, but was not modified. The existing data collector was restarted successfully.	1195
BPCCA0120E The upgraded data collector did not start.	1195
BPCCA0121E The existing data collector did not restart.	1195
BPCCA0122E The data collector cannot authenticate to the HTTPS proxy server proxy_server_hostname.	1195
BPCIN - Spectrum Control installation messages	1196
BPCIN0001I The system is installing IBM Spectrum Control.	1201
BPCIN0002I The system completed the installation of IBM Spectrum Control.	1201
BPCIN0003E The installation program could not find the file file_name in the installation image. For more information, go to the IBM Knowledge Center and search on the message code.	1201
BPCIN0004E An error occurred during the installation of the component_name component. Review the log files in the log_file_directory_name directory for additional information.	1201
BPCIN0005E Invalid characters "characters" were found in the installation path "path".	1202
BPCIN0006E The location "location" that was specified for the installation is not empty. It might contain hidden items.	1202
BPCIN0007E Directory directory is not writable.	1202
BPCIN0008E The installation location specified is blank. Enter an installation location.	1203
BPCIN0009E The host name or IP address is not valid for name_with_spaces.	1203
BPCIN0010E The port number field is blank. Enter a valid port number.	1203
BPCIN0011E Enter a fully qualified host name or IP address.	1203
BPCIN0012E Enter a valid port number.	1203
BPCIN0013E Enter a port number from 1 to 65535.	1203
BPCIN0014E The user name cannot be blank or contain spaces. Enter a valid user name.	1204
BPCIN0015E The location for the license key file is blank. Enter a file location.	1204
BPCIN0016E The file that was specified does not exist. Enter a valid license key file.	1204
BPCIN0017E The file that was specified is not a valid license key file.	1204
BPCIN0018E The installation path cannot end with the characters "endCharacter".	1204
BPCIN0019I The system is installing the component component.	1205

BPCIN0020I The system completed the installation of the component component.	1205
BPCIN0021E An unexpected error occurred during the prevalidation of the component.	1205
BPCIN0022E The port range port_start - port_end is not available because the port or ports port are already used by other applications. The next available port range is available_start_port - available_end_port.	1205
BPCIN0023E The password is incorrect. It cannot be blank or contain spaces. Enter a valid password.	1206
BPCIN0024E The user name userID cannot contain the following special characters: characters.	1206
BPCIN0025E The password password cannot contain spaces or any of the following special characters: characters.	1206
BPCIN0026E The installation location selected does not have enough space.	1206
BPCIN0027E The user name userID is not in the administrative group adminGroup.	1206
BPCIN0028E The validation for user name userID has failed. Check to see if this user name exists.	1207
BPCIN0029E The password that was entered does not match the password for user user_name on the system. Please try again.	1207
BPCIN0031E The configuration of component failed. Review the installation log file.	1207
BPCIN0032E The host name field is empty. Enter the fully qualified host name or IP address.	1207
BPCIN0033E The specified host name or IP address cannot be identified.	1207
BPCIN0034E The installation location is not an absolute path. Enter an absolute path.	1208
BPCIN0035W The installation program cannot validate the host name because the fully qualified domain name (FQDN) cannot be retrieved for the host.	1208
BPCIN0043E The last port number must be a port number from 1 to 65535.	1208
BPCIN0044E The installation location that was specified uses a Windows reserved name. Enter a different installation location.	1208
BPCIN0045E The installation location cannot contain special shell characters special_characters in the installation path path.	1209
BPCIN0046E The installation location contains special characters special_characters that are not supported by the operating system in the installation path path.	1209
BPCIN0047E The IBM Db2 database manager must be active to continue the installation process.	1209
BPCIN0048E IBM Spectrum Control cannot be installed because Db2 is not installed on the system or the Db2 configuration is not valid.	1209
BPCIN0049E The Db2 db2Version is not supported. The minimum supported Db2 versions are minDB2Version.	1209
BPCIN0050E An error occurred when the installation program tried to verify that the Db2 database manager is running. The error message is: error_message.	1210
BPCIN0051E An error occurred when the installation program tried to find an available database named dbName.	1210
BPCIN0052I The name of the database to be created is dbName.	1210
BPCIN0053E An error occurred when creating the database dbName. Review the log files for more information.	1210
BPCIN0055E Db2 is not installed or the Db2 profile was not sourced before installing IBM Spectrum Control.	1211
BPCIN0056E The user name userID does not have write permission on the default database path configuration parameter DFTDBPATH: dftdbpath.	1211
BPCIN0057E The user name userID is not in an operating system group that has Db2 SYSADM authority. Before you run your DB2 installation, validate that the Windows Server Hostname is 15 characters or less in length.	1211
BPCIN0059W There are long file names in the IBM Spectrum Control installation images.	1211
BPCIN0060E An error occurred during the uninstallation of component. Review the log files for more information.	1212
BPCIN0061E An invalid host name or IP address was specified for the Data server.	1212
BPCIN0062E The IPv6 internet protocol is not enabled on the specified host computer.	1212
BPCIN0063E The Data server is not running. For more information, go to the IBM Knowledge Center and search on the message code.	1212
BPCIN0064E The Data Server is not running at the specified host address or port: host host_address, port port. For more information, go to the IBM Knowledge Center and search for the message code.	1213
BPCIN0066E Errors occurred during the installation of the IBM Spectrum Control GUI. Review the log files for more information.	1213
BPCIN0068E Errors occurred during the uninstallation of the IBM Spectrum Control GUI. Review the log files for more information.	1213
BPCIN0069E Errors occurred during the configuration of Tivoli Common Reporting for IBM Spectrum Control. Review the log files for more information.	1214
BPCIN0070E Errors occurred during the configuration of the IBM Spectrum Control data model in Tivoli Common Reporting. Review the log files for more information.	1214
BPCIN0071E An error occurred because the installation program could not find the Db2 DFTDBPATH variable. For more information, go to the IBM Knowledge Center and search for the message code.	1215
BPCIN0072E The validation for user name userID has failed. Check to see if this user name exists or if Db2 is running.	1215
BPCIN0074E The port range validation failed because the port value is not numeric.	1215
BPCIN0075E An invalid GUID 0xFFFFFFFFFFFFFFFFFFFFFFFF was found. Update or uninstall the GUID.	1215
BPCIN0076E IBM Spectrum Control could not read the GUID. See the GUID installation log for an explanation of the error.	1215
BPCIN0077E The name specified for the database is not valid because it contains a space or is blank.	1216
BPCIN0078E The database name database_name is not valid. The name can only contain the following characters: a-z, A-Z or 0-9.	1216
BPCIN0079E The first character or characters in the database name are not valid. The name must not begin with a number or the letters: SYS, DBM, or IBM.	1216
BPCIN0080E The database name specified is not valid because an existing database has the same name: database_name.	1217
BPCIN0081E The database name database_name is too long. The name can be 1 - 8 characters in length with no spaces.	1217
BPCIN0082E The specified host name or IP address is not a remote host. Enter a remote host name or IP address.	1217
BPCIN0083E The server could not connect to the remote database. Verify that the port is correct and that the database is running on the remote server. Also verify that the internet protocol connection between the server and remote database is compatible.	1217
BPCIN0084E The database name is not valid because there is no database on the specified server with this name.	1217
BPCIN0085E The installation program was unable to connect to the remote database. Check the remote server to verify that you can connect to Db2. For more information about Db2 connection issues, go to the IBM Knowledge Center at http://www-01.ibm.com/support/knowledgecenter/SSEPGG/welcome .	1218
BPCIN0086E The connection to the remote database failed because the user name or password is not valid.	1218
BPCIN0087E The remote host name or IP address is not valid.	1218
BPCIN0088E The database repository was not found on the remote server.	1218
BPCIN0089E The version "retrivedVersion" of the remote database repository is not at the correct level. Upgrade the remote database repository to version "requiredVersion", then upgrade the remaining components.	1219
BPCIN0090E The name specified for the database is not valid because it contains a space.	1219
BPCIN0091E The file path file_path specified is not an absolute path or is not a directory or the partition does not exists.	1219
BPCIN0092E The first directory directory_name specified is not valid.	1219
BPCIN0093E The path string path_string is too long. The path string cannot be longer than 242 bytes.	1219
BPCIN0094E The user name user_name does not have write permission on the specified database path: database_path.	1220
BPCIN0095E The user name user_name does not have write permission on the specified log location: log_location.	1220
BPCIN0096E The database path cannot be blank. Enter a valid database path.	1220

BPCIN0097E The log location cannot be blank. Enter a valid log location.	1220
BPCIN0098E Enter 10 or fewer paths.	1220
BPCIN0099E You have entered pathNumber directories. A maximum of 10 directories can be specified.	1221
BPCIN0100W The database log files and database are in the same location. Click Yes to change the database log files or database location. Click No to ignore this message.	1221
BPCIN0101E The location "location" that was specified contains Db2 logs or log files.	1221
BPCIN0102E The Db2 profile for the "db2_instance" instance was not run before installing IBM Spectrum Control.	1221
BPCIN0103E The user name userID is not in the system group adminGroup.	1221
BPCIN0104I Resuming a failed install and installing the remaining components.	1222
BPCIN0105E A reboot must be done before continuing with the installation.	1222
BPCIN0106E There are invalid header files in the installation images. You may might be using the AIX tar program instead of the GNU tar program to extract files from the installation images. For more information, see IBM Knowledge Center and search by the error message code.	1222
BPCIN0107E The database path exists in the database path list. You must specify a unique database path.	1222
BPCIN0108E An error occurred during the upgrade of the component. Review the log files in the following directory for an explanation of the error: location.	1223
BPCIN0109E An unexpected error occurred. IBM Spectrum Control cannot resolve this error. For more information, review the log files and go to the IBM Knowledge Center.	1223
BPCIN0112I Upgrading the components:upgrade_components.	1223
BPCIN0116I The system is upgrading the component component.	1224
BPCIN0117I The system completed the upgrade of the component component.	1224
BPCIN0120E The validation of user name and password could not be completed	1224
BPCIN0121E The installation type entered is not supported.	1224
BPCIN0122E The TPCCCommon.dll or libTPCCCommon.so library could not be found or loaded.	1224
BPCIN0123E The user has no administrative rights to install or uninstall IBM Spectrum Control.	1225
BPCIN0124E The operating system cannot find the Db2 Service name.	1225
BPCIN0125E The installation program cannot find the Db2 instance name. Check the Db2 instance configuration.	1225
BPCIN0126E Unable to find Db2 installation path. Check your Db2 configuration.	1225
BPCIN0127E The service name configuration parameter cannot be queried from the Db2 Database Manager.	1225
BPCIN0129E The version that is installed cannot be upgraded because it does not meet the minimum build version for the database repository. The minimum build version supported is build_version.	1226
BPCIN0130E The database administrator password in IBM Spectrum Control does not match the database administrator password for Db2. Run the changepasswords tool to update the database administrator password.	1226
BPCIN0131E An invalid host name or IP address was specified for the Device Server.	1226
BPCIN0132E The Device Server is not running at the specified host address or port: host host_address, port port.	1227
BPCIN0134E The installation program could not stop the . Please manually stop the .	1227
BPCIN0135E Tivoli Storage Productivity Center version is installed. Before you can upgrade to version 5, you must upgrade Tivoli Storage Productivity Center to version 4.	1227
BPCIN0136E The version "retrivedVersion" of the remote database repository is not at the correct build level. Upgrade the remote database repository to the correct build level, then upgrade the remaining version "requiredVersion" components.	1227
BPCIN0137E The version "retrivedVersion" of the remote database repository is not at the correct build level. Ensure that the installation image for the remaining version "requiredVersion" components is at the same build level as the remote database repository, then upgrade the remaining components.	1228
BPCIN0138E The common user name password does not match the password for the existing user name user_name on the system. Run the changepasswords tool to change the common user name password for IBM Spectrum Control.	1228
BPCIN0139I The User Migration Tool completed successfully.	1228
BPCIN0140E The User Migration Tool could not be started. Start the User Migration Tool from the graphical user interface after the upgrade is finished.	1228
BPCIN0143E Errors occurred during the upgrade of the GUI. Review the log files for more information.	1229
BPCIN0146E The installation language specified is not a supported language.	1229
BPCIN0148E IBM Spectrum Control cannot be installed, because the physical memory size on this computer is too small. The minimum memory size is minMemoryProduction. Increase the physical memory on this computer and run the installation program again.	1229
BPCIN0149W The physical memory size on this computer is below the minimum requirements that are specified for a production system. The minimum memory size for a production system is minMemoryProduction. You must increase the physical memory on this computer and run the installation program again. If you install IBM Spectrum Control with lower memory, you can only use it in an evaluation environment.	1230
BPCIN0150E The installation program cannot determine the amount of physical memory on the system.	1230
BPCIN0151E You tried to install IBM Spectrum Control on an unsupported operating system. For more information on the supported operating systems, go to following link.	1230
BPCIN0152E IBM Spectrum Control cannot determine if the operating system is supported.	1230
BPCIN0153E The installation program could not rename the jre folder. To continue the installation, stop all Java processes that access the jre directory: jre_folder	1231
BPCIN0159E The web server data source creation failed.	1231
BPCIN0163E The service name configuration parameter cannot be queried from the Db2 Database Manager. Reboot the machine after Db2 installation. SQL Error Message is sqlerrmsg	1231
BPCIN0164E The service name configuration parameter cannot be queried from the Db2 Database Manager. SQL Error Message is sqlerrmsg	1232
BPCIN0165E The password for user name has expired. You must change the password, or select another user name, to install IBM Spectrum Control.	1232
BPCIN0166W The password for user name cannot be checked for expiration. Please ensure that it is not expired.	1232
BPCIN0167E You cannot upgrade the license to the same or lower level.	1232
BPCIN0168E An error occurred while checking the user name and password. Review the log files for more information.	1232
BPCIN0169E The location "location" that should be specified for the license is not correct.	1233
BPCIN0170E IBM Spectrum Control cannot upgrade the license because the upgrade must be done on the server system.	1233
BPCIN0173E An error occurred during the deployment of the file_name file.	1233
BPCIN0176E An error occurred during Db2 catalog creation, and the catalog was not created.	1234
BPCIN0177E You cannot upgrade IBM Spectrum Control with a license key file that is at a lower level than the installed license key file.	1234
BPCIN0178E The provided license key file_name is invalid.	1234
BPCIN0179E An error occurred during Db2 catalog deletion, and the catalog was not removed.	1234
BPCIN0181E The web server data source testing has failed.	1235
BPCIN0182E TPC-GUI.war data source testing failed.	1235

BPCIN0184E The remote database repository already contains data. Install a new IBM Spectrum Control remote database repository first, then install the remaining IBM Spectrum Control components.	1235
BPCIN0185E The remote database repository for version oldVersion is incompatible with IBM Spectrum Control Version requiredVersion. Upgrade remote database repository to Version requiredVersion first, and then install the remaining IBM Spectrum Control components.	1235
BPCIN0190E You cannot use non-standard characters, such as a space between characters or an underscore, in a host name. You must enter a host name with standard characters and try again.	1235
BPCIN0191E You cannot install Db2 in a directory that starts with the letter a.	1236
BPCIN0193E The version "retrivedVersion" of the remote database repository is not at the correct level. Install a new Version "requiredVersion" remote database repository at the correct level, then install the remaining IBM Spectrum Control components.	1236
BPCIN0195E The version "retrivedVersion" of the database repository dbHost is not at the correct build level. Install a new Version "requiredVersion" database repository at the correct build level, then install the remaining IBM Spectrum Control components.	1236
BPCIN0198E The path to installation image "installDirectory" contains the invalid character "unallowedCharater". You must change the directory name so that it contains valid characters.	1236
BPCIN0199E The installation program cannot validate the host name because the fully qualified domain name (FQDN) cannot be retrieved for the host.	1237
BPCIN0200E The installation program does not allow host name specified as IP address. Please ensure that a fully qualified domain name (FQDN) is provided.	1237
BPCIN0202E Runtime errors have occurred during the IBM Spectrum Control preinstallation process. The installation program cannot recover from this error.	1237
BPCIN0203E The installation program does not support backslash character in the user name. In case it is a Windows domain account, please specify just the user name without using the "Domain_name\\" prefix.	1237
BPCIN0205E The IBM Spectrum Control installation program could not find the directory "installDirectory" on the installation image. For more information, go to the IBM Knowledge Center and search on the message code.	1238
BPCIN0206E The IBM Spectrum Control installation program was unable to retrieve a fully qualified domain name (FQDN) for the host. You must configure the host system with an FQDN.	1238
BPCIN0207E You cannot upgrade when the stand-alone GUI is running. Stop the stand-alone GUI and click OK to continue the upgrade or click Quit to exit the installation program.	1238
BPCIN0208E The fully qualified domain name(FQDN) retrieved for the host contains non-standard characters, such as a space between characters or an underscore. You must configure the host system with an FQDN that contains standard characters.	1238
BPCIN0209E The installation program does not allow a user that is present in both the Windows Domain and the local Operating System repositories. Install with a user name that is only present in one of these repositories.	1239
BPCIN0210E The Db2 "sourcedb2profile" profile has not been loaded in the .profile file for user commonUser. This profile must be loaded before you install IBM Spectrum Control.	1239
BPCIN0211E The technology level or the service pack level of this operating system is not supported and must be upgraded to a supported level. The detected operating system version is os_version	1239
BPCIN0214E Cannot complete a fresh install without a valid license.	1239
BPCIN0215E The path extractorDirectory where IBM Spectrum Control is extracted has extractorDirLength characters and the maximum number of characters allowed is 260. You must shorten this path.	1240
BPCIN0217E The Windows registry check indicates that .NET 3.5 or higher is not available on this Windows server. You must install .NET 3.5 or higher to continue. To install .NET 3.5 type the following commands in a 64 bit windows powershell: Import-Module ServerManager Add-WindowsFeature as-net-framework	1240
BPCIN0219E The domain configuration is invalid. To resolve the issue, complete the following steps: Disable the Windows Firewall service. Start or restart the Computer Browser service on this domain member computer and on the domain controller computer. If the service has a Stopped or Disabled status on the domain controller computer, you must restart Computer Browser service on the domain member computer after you start the service on the domain controller computer. In a Windows command window, run the net view command and verify that there are no errors. Reinstall IBM Spectrum Control.	1240
BPCIN0220E The current login user loginuser is not an administrator or a member of the domain administrator group. The installation program cannot start.	1240
BPCIN0221E The user name userID is not a part of the local administrator group.	1241
BPCIN0222E The current login user loginuser is not an administrator or a member of the local administrator group. The installation program cannot continue.	1241
BPCIN0223E The current login user loginuser is not a member of the local Db2 administrator group. The installation program cannot start.	1241
BPCIN0224E The user userID is a domain account and cannot be used to log in to Db2. You must enter a separate user name for Db2.	1241
BPCIN0225E The current logged in user loginuser does not have Db2 SYSADM authority. To provide the user with Db2 SYSADM authority, log in by using a user name with SYSADM authority and run the following commands: db2cmd db2set -g DB2_GRP_LOOKUP=local,TOKENLOCAL db2 force application all db2stop db2start	1242
BPCIN0226E Login as a windows domain user in order to install IBM Spectrum Control using a windows domain account.	1242
BPCIN0229E The Monitoring Agent for Windows OS - Watchdog and Monitoring Agent for Windows OS - Primary services must be stopped before you can continue. After you upgrade, you must restart these services.	1242
BPCIN0230E The Monitoring Agent for Windows OS - Watchdog and Monitoring Agent for Windows OS - Primary services must be stopped before you can continue. After you uninstall IBM Spectrum Control, you must restart these services if the required reboot is postponed.	1242
BPCIN0231E Tivoli Common Reporting is not installed on your system. You must install it to continue with the IBM Spectrum Control installation.	1243
BPCIN0233E Jazz for Service Management is not installed in the specified location. Reenter the correct installation location for Jazz for Service Management.	1243
BPCIN0234E The Jazz for Service Management user credentials that you entered were incorrect. Check the user credentials and try again.	1243
BPCIN0235W The Jazz for Service Management and Tivoli Common Reporting servers are not running. To start the servers, run the following command: file It takes a few minutes for these servers to start up and initialize. Wait for a few minutes before resuming the installation.	1243
BPCIN0236W The Tivoli Common Reporting server is not running. If you have already started the server , wait for a few more minutes. It takes a while for the server to start up and initialize. Otherwise, you can start the server by running this command: file	1244
BPCIN0238E The Tivoli Common Reporting server at tcrllocation cannot be reached. If the Jazz for Service Management server has not completed startup, wait for a few more minutes and then click OK. It takes a while for the server to start and initialize. Otherwise, if the Jazz for Service Management server is started but Tivoli Common Reporting still cannot be reached, restart the Jazz for Service Management server using the following commands: stopServer -username username -password password startServer	1244
BPCIN0239E The Tivoli Common Reporting server configuration cannot be exported.	1244
BPCIN0240E The Tivoli Common Reporting server configuration file "configuration file" was not created.	1244
BPCIN0241E The Tivoli Common Reporting configuration cannot be upgraded.	1245
BPCIN0242E The Windows registry check indicates that .NET 3.5 is not available on this Windows 2012 server. You must install .NET 3.5 to continue. To install .NET 3.5 type the following commands in a 64 bit windows powershell: Import-Module ServerManager Add-WindowsFeature as-net-framework	1245
BPCIN0244E An error occurred while enumerating the local administrator group membership. On the current computer, on the Properties page of this group, remove the user names that are displayed with a security ID (SID). An example of a SID is S-1-5-21-337177553-1671989427-887411491-500 and is used instead of a user name.	1245
BPCIN0245E An error occurred while enumerating the local Db2 administrator group membership. On the current computer, on the Properties page of this group, remove the user names that are displayed with a security ID (SID). An example of a SID is S-1-5-21-337177553-1671989427-887411491-500 and is used	1245

instead of a user name.	1245
BPCIN0246E Tivoli Storage Productivity Center version is installed. Before you can upgrade to version 5, you must upgrade Tivoli Storage Productivity Center to version 4.	1246
BPCIN0247E An error occurred during the domain check prevalidation process. Verify that the domain controller computer is available and then restart this domain member machine.	1246
BPCIN0248E The IBM Spectrum Control installation program supports only fully qualified user names on Windows domain member machines. Specify the user name userID by using the "Domain_name\\" or the "Machine_name\\" prefix. The detected domain name is "domainName".	1246
BPCIN0250W Before you can upgrade the database repository, you must first stop the Data server, Device server, Alert server, Export server, and Web GUI server on the remote server. For more information about stopping IBM Spectrum Control servers use the following link.	1246
BPCIN0252E Db2 has been installed by using a domain user account. The IBM Spectrum Control installation software does not allow the Db2 user name userID because this user name exists in both the Windows domain and the local operating system repositories. Specify a Db2 user name that exists only in the Windows Domain registry.	1247
BPCIN0253W All IBM Spectrum Control components are installed. GUIErrorMessage	1247
BPCIN0254W IBM Spectrum Control servers are installed on remoteHost.	1247
BPCIN0255E The database dbName must be upgraded to the current version. For more information about upgrading Db2, go to the IBM Knowledge Center and search for "Upgrading Db2"	1247
BPCIN0256W If you continue upgrading to IBM Spectrum Control, the reports you have from Tivoli Storage Productivity Center Version oldVersion will be deleted. When you uninstall Tivoli Integrated Portal, the Authentication Services Server is also uninstalled. If you have storage subsystems that are configured to use LDAP authentication through the Authentication Services Server, before you upgrade the product and uninstall Tivoli Integrated Portal, reconfigure the storage subsystems so that these subsystems do not use LDAP authentication. Click OK to continue or Cancel to select another option.	1247
BPCIN0257E The Db2 database installation on dbPath path was made when the creation of 8.3 filenames was disabled on this server. The IBM Spectrum Control installation will fail when Db2 is installed to a path with spaces and 8.3 filenames were not enabled when it was installed.	1248
BPCIN0258E The LDAP configuration export did not succeed. For more information, review the log files, and in the LDAP export command output, search for "exportLDAPRepositories".	1248
BPCIN0260E The connection to the local database failed because the user name or password is not valid.	1248
BPCIN0261E The installation program was unable to connect to the local database. Check the server to verify that you can connect to Db2. For more information about Db2 connection issues, go to the IBM Knowledge Center at http://www-01.ibm.com/support/knowledgecenter/SSEPGG/welcome .	1248
BPCIN0262E The IBM Spectrum Control upgrade process has stopped because Jazz for Service Management and Tivoli Integrated Portal are using the same ports. To continue, you must install Jazz for Service Management and Tivoli Common Reporting again and use ports that are different from the ports that are used by Tivoli Integrated Portal.	1249
BPCIN0264E The version of the database repository component cannot be queried from the Db2 Database Manager. SQL Error Message is sqlerrmsg	1249
BPCIN0265E An error occurred during the prevalidation of the component because the file_name is missing.	1249
BPCIN0266E Db2 has been installed by using a domain user name. The user name dbuser is not a member of the domain Db2 administrator group domainDB2AdminGroup, so the IBM Spectrum Control installation program cannot start.	1249
BPCIN0267E The password password cannot start with the following special characters: characters.	1250
BPCIN0268E The installation program could not stop the .You must manually stop the by running the script.	1250
BPCIN0269E The Jazz(tm) for Service Management installation image Version "retrivedVersion" is not at the correct build level.	1250
BPCIN0272E "installDirectory" cannot be found where the Jazz(tm) for Service Management installation files are extracted. Extract the Jazz(tm) for Service Management installation files to a local directory before you start the Jazz(tm) for Service Management installation program.	1250
BPCIN0275E A 32-bit version of Db2 has been detected. IBM Spectrum Control can only be installed with a 64-bit version of Db2. Install a supported 64-bit version of Db2, and install IBM Spectrum Control again.	1251
BPCIN0276E A required system library could not be loaded. Review the log files for more information about this error.	1251
BPCIN0277W The Jazz(tm) for Service Management installation image that you selected is not the latest version. Click Yes to continue with the current version and not install or upgrade reports. Click No to install or upgrade to Jazz(tm) for Service Management Version "latest_JazzSM_available_version" and Tivoli Common Reporting Version "latest_TCR_available_version".	1251
BPCIN0279W IBM Spectrum Control does not support the version of Jazz(tm) for Service Management that is installed on this computer. You must upgrade to Jazz(tm) for Service Management minJazzSMVersion before you can continue.	1251
BPCIN0281E The current version of the Tivoli Common Reporting installation image is not at the correct level.	1252
BPCIN0282E The installation package for Tivoli Common Reporting Version 3.1.0.1 cannot be found on your computer. To continue installing IBM Spectrum Control, download the installation package for Tivoli Common Reporting Version 3.1.0.1 in the same directory where you downloaded the installation package for Tivoli Common Reporting Version 3.1.0.2.	1252
BPCIN0283E You cannot upgrade "latest_version" to the lower version "lower_version".	1252
BPCIN0284E The Jazz for Service Management installation directory does not have execution rights. You can add execution rights to the directory by running the following command:chmod -R u+x "JazzSM_build_folder"	1252
BPCIN0285E The getDB2Inst.sh "user_name" command is displaying a "null" result because the Db2 profile was not sourced for user "user_name" or the environment for "user_name" has been corrupted.	1253
BPCIN0286W The operation of the storage resource agent is limited on the operating system of the local server. Total Disk Space and Available Disk Space on this server cannot be determined.	1253
BPCIN0287E Directory directory is located on a memory based file system (RAM disk) and cannot be used for installing IBM Spectrum Control.	1253
BPCIN0288E The upgrade process detected an error with the previously installed version of the product. The installation directory of the previously installed version of the product contains corrupted files. Remove or fix the corrupted files and run the upgrade process again. See the lax*-out.txt and lax*-err.txt log files in the system temporary directory for details of the error.	1253
BPCIN0289E You must install Db2 before you can install Cognos BI Reports. Ensure that Db2 is already installed on the system and the db2profile is sourced.	1254
BPCIN0290E The IBM Spectrum Control installation image is corrupted. Extract the IBM Spectrum Control installation image again into an empty directory.	1254
BPCIN0291E You need to define 'localhost' in the 'hosts' file that is used by Jazz for Service Management and restart the host system.	1254
BPCIN0293E The IBM Spectrum Control installation program cannot find the license folder. Ensure the license folder is extracted into "extractorDir".	1254
BPCIN0295E Tivoli Storage Productivity Center old_version is installed. Before you upgrade to IBM Spectrum Control version new_version, you must upgrade to Tivoli Storage Productivity Center version 5.2.7.	1255
BPCIN0296E The installation program could not rename the short_name directory because the folder is in use by other processes. Quit the installation program and stop all processes that access the directory full_path.	1255
BPCIN0297E The user_name user does not have the full control permission for the folder_path folder.	1255
BPCIN0298E The user_name fenced user does not have full permissions for the directory_path database directory.	1255
BPCIN0299E The installation location "install_location" has a naming conflict with a file or folder named folder_path. Rename the folder_path file or folder.	1255
BPCIN0300E The value db2_variable_existing_value is not allowed for the Db2 variable DB2_LIMIT_FENCED_GROUP. Use the db2set -g DB2_LIMIT_FENCED_GROUP=OFF command to change the value of the variable to OFF.	1256

BPCIN0301E The versionFile file is empty. Extract IBM Spectrum Control again and make sure the version.txt file contains a valid build string.	1256
BPCIN0302E Db2 Advanced Enterprise Server Edition is not supported. Install Db2 Enterprise Server Edition and then proceed with your installation.	1256
BPCIN0303W Your storage environment has switches with obsolete data sources. Configure up-to-date data sources after you upgrade.	1256
BPCIN0304E You cannot upgrade from a Basic Edition license.	1257
BPCIN0306W The Storage Resource agent registered successfully with the Data server but some problems occurred after the registration. Review the log files in the SRA_log_name directory for additional information.	1257
BPCIN0307W You are currently connected to devices using a CIM interface. This upgrade might require new certificates to be generated on your CIM managed devices to continue monitoring them. To resolve this issue, go to http://www.ibm.com/support/docview.wss?uid=swg21976237	1257
BPCIN0307E The security certificates for the Web server have expired. Renew the security certificates and run the installation program again. See the lax*-out.txt and lax*-err.txt log files in the system temporary directory for details of the error and how to resolve the issue.	1257
BPCIN0308W Brocade switches that use SNMP services were detected. SNMP data sources are no longer used to manage Brocade fabrics and switches. Instead, you must use the embedded SMI agent in Brocade Network Advisor.	1258
BPCIN0309E The port configuration export did not succeed. For more information, review the log files, and in the port export command output, search for "exportCurrentPorts".	1258
BPCIN0310E Spectrum Control installation requires that the Administrators group in Windows is assigned "Debug programs" privilege. Check this setting, log out of and back into Windows, and try again.	1258
BPCIN0311E Spectrum Control installation requires the wmic command to work. Check this command, ensure the service "Windows Management Instrumentation" is running and try again.	1259
BPCIN0312E Spectrum Control installation requires that wmic command to work. Check this command, ensure service "Windows Management Instrumentation" is working, disable any antivirus and try again.	1259
BPCIN0313E Spectrum Control installation requires that wmic command to work. Check this command and the PATH environment variable and try again.	1259
BPCIN0314E Spectrum Control installation requires that wmic command to work. Check this command and try again.	1259
BPCIN0315E Spectrum Control installation requires that chcp command to work. Check this command and try again.	1260
BPCIN0316E The IBM Spectrum Control upgrade process does not support custom materialized query tables (MQTs). Remove any MQTs from the database and run the upgrade process again.	1260
BPCIN0317E The IBM Spectrum Control upgrade process does not support missing vendor information from the .com.zerog.registry.xml file. Add the missing information and run the upgrade process again. See the lax*-out.txt and lax*-err.txt log files to resolve the issue.	1260
BPCIN0318E The IBM Spectrum Control upgrade process does not support duplicated users user in IBM WebSphere Application Server related to the Web server. Remove the duplicate user from a federated repository other than the localOS default repository; run the upgrade process again.	1260
BPCIN0319E The currently installed version of AIX XL C/C++ RUNTIME is not supported. You must upgrade to a supported level. The version that was detected is version.	1260
BPCIN0320E PAM (Pluggable Authentication Modules) isn't installed on your system. Installing PAM would resolve the issue.	1261
BPCIN0321E An error occurred when restoring authorities before creating the database dbName. Review the log files for more information.	1261
BPCIN0323E The Data Server port has different values in the configuration files. Verify that the port value is correct in the installDir/data/config/server.config file, and the installDir/config/InstallVariable.properties file. Also, verify that the PORT_NUMBER column where SERVER_TYPE is serverType is correct in the T_RES_Server database table.	1261
BPCIN0324W The current certificate used to secure the connection of the IBM Spectrum Control Data server and the Storage Resource agents cannot be replaced with the latest certificate that provides higher security. After you complete the upgrade, you can create new certificates by following the information in the following link.	1262
BPCIN0325E IBM Tivoli Storage Productivity Center old_version is installed. Before you can upgrade to IBM Spectrum Control new_version, you must upgrade to IBM Spectrum Control 5.3.0 or later. For more information about upgrading to IBM Spectrum Control 5.4.0 or later, go to the following link:	1262
BPCIN0328E The IBM Spectrum Control installation requires the LD_LIBRARY_PATH environment variable be set. Set this environment variable and try the installation again. If you ran setup.bin from the IBM Spectrum Control installation directory with sudo and the LD_LIBRARY_PATH variable was properly set, then try the sudo -E LD_LIBRARY_PATH=\$LD_LIBRARY_PATH ./setup.bin command.	1262
BPCIN0329E The IBM Spectrum Control installation requires that the LIBPATH environment variable be set. Set this environment variable and try the installation again.	1263
BPCIN0330E An SQL exception was created when querying the Db2 Database Manager. The SQL error message is: sqlerrmsg.	1263
BPCIN0331E The tpcregFile file is not valid because it contains a failed or partial upgrade to a previous IBM Spectrum Control Version newTPCVersion. Continue with the incomplete upgrade before you try to upgrade to the new IBM Spectrum Control Version varNewUpgradeVersion.	1263
BPCIN0335E The IBM Spectrum Control installation requires you install the libstdc++ package on the AIX operating system. Download and install the libstdc++ package and start the installation again. You can download the package here: https://www.ibm.com/developerworks/aix/library/aix-toolbox/alpha.html .	1263
BPCIN0336E The version of the libstdc++ package you installed is lower than the minimum required Version minVersion. Download and upgrade the libstdc++ package and start the installation again. You can download the package here: https://www.ibm.com/developerworks/aix/library/aix-toolbox/alpha.html .	1264
BPCIN0337E The componentServer password failed to validate. Check that you entered the password correctly and try again.	1264
BPCIN0338E The componentServers passwords failed to validate. Check that you entered the passwords correctly and try again.	1264
BPCIN0339W Your current Db2 instance is using a trial license. The license will expire on expireDate. Once your trial expires Db2 will not start. If you want to upgrade your Db2 license now, use the information in the following link.	1264
BPCIN0340W Your current Db2 instance is using a trial license. The license will expire on expireDate. Once your trial expires Db2 will not start. If you want to upgrade your Db2 license now, goto link.	1264
BPCIN0343W There are new certificate requirements that are strictly enforced for macOS Catalina users which might affect their ability to access the IBM Spectrum Control GUI. During an upgrade of IBM Spectrum Control, certificates self-signed by IBM Spectrum Control will be made compliant automatically. However, if one or more of your certificates are not self-signed by IBM Spectrum Control, see the following links for more information. Validate that your certificates are compliant.	1265
BPCIN0344E Your current Db2 instance trial license has expired. If you want to upgrade your Db2 license now, goto the following link.	1265
BPCIN0345E The user user is part of the "Deny access to this computer from the network" security policy setting on your computer. Either contact your administrator to have the user removed from the security policy or enter a different user. BPCCM0001I Data collection is being performed by hostname.	1270
BPCDP - Data processor messages	1271
BPCDP0000I Performance data for natural key resource at date and time timestamp was collected and processed successfully.	1271
BPCDP0001E Error while collecting and processing performance data for natural key resource at date and time timestamp. Performance data was not collected and processed.	1271
BPCDP0002E The processing of performance data for the resource could not be completed.	1271
BPCDP0003E No performance data is available at the current time for this resource.	1272
BPCDP0004I Performance data was retrieved and persisted but aggregation of data to higher-level components didn't complete because the relationship to the higher-level components couldn't be determined.	1272
BPCDP0005E Could not save the performance data that was collected from the resource.	1272
BPCDP0006I Performance data at date and time timestamp was processed and saved successfully for the resource.	1272
BPCDP0007E The resource is missing. The resource is required.	1272
BPCDP0008E Identifying information for the resource is missing. This information is required.	1272
BPCDP0009E Information identifying the resource type is invalid: system type .	1273
BPCDP0010E Information uniquely identifying the resource is missing. This information is required.	1273
BPCDP0011E Information uniquely identifying the resource is invalid.	1273
BPCDP0012E The UUID for the tenant's resource is invalid.	1273
BPCDP0013E The start time for the performance data is invalid: start time	1273
BPCDP0014E The end time for the performance data is invalid: end time	1274
BPCDP0015I Performance data at date and time timestamp was processed and saved successfully for the resource, but the data processing raised warnings.	1274
BPCDP0016W Performance data for natural key resource at date and time timestamp was collected and processed successfully, but the data processing raised warnings.	1274
BPCCS - Scheduler messages	1274
BPCCS0000E An error occurred while collecting performance data from the device. The collection is being attempted by a different collector.	1275
BPCCS0001W The data collection is taking longer than expected.	1276
BPCCS0002E Currently, there is no data collector available for this device.	1276
BPCCS0005I Performance monitor is starting at an interval of interval interval units. This action was requested by user name.	1276
BPCCS0008I Collection can no longer continue due to invalid credentials. Use the 'Modify Connection' dialog to fix the storage system credentials and resume collection.	1276
BPCCS0009E Failed to save the performance monitor schedule.	1276
BPCCS0010E A job cannot be run for resource resourceName because there is a job already running for the resource.	1277
BPCCS0011W The schedule change was saved but the update to the active collection did not happen.	1277
BPCCS0012I Performance monitor is stopped. This action was requested by user name.	1277
BPCCS0013I Performance monitor is stopped.	1277
BPCCS0014I Performance monitor is starting at an interval of interval interval units.	1278
BPCCS0015I Performance monitor collection interval was updated to interval interval units. This action was requested by user name.	1278
BPCCS0016I Performance monitor collection interval was updated to interval interval units.	1278
BPCCS0017I Performance monitor is enabled. This action was requested by user name.	1278
BPCCS0018I Performance monitor is enabled.	1278
BPCCS0019I Performance monitor is disabled. This action was requested by user name.	1278
BPCCS0020I Performance monitor is disabled.	1278
BPCCS0021W Performance monitor is starting. The initial attempt to start collection failed so it is retried. This action was requested by user name.	1278
BPCCS0022W Performance monitor is starting. The initial attempt to start collection failed so it is retried.	1279
BPCCS0023I Performance monitor collection interval is enabled and updated to interval interval units. This action was requested by user name.	1279
BPCCS0024I Performance monitor collection interval is enabled and updated to interval interval units.	1279
BPCCS0025E Access to the agent or device is denied. Ensure that valid credentials are specified for agent agent name.	1279
BPCCS0026E New performance data is not yet available for the device. Statistics with time stamps later than time stamp could not be found.	1279
BPCCS0027E The performance monitor failed due to an internal error.	1280
BPCCS0028E The value that is specified as parameter (value) is invalid.	1280
BPCCS0029E Cannot connect to the device with the address IP address.	1280
BPCCS0030E Cannot connect to the SNMP data source IP address.	1281

BPCSS0031E Cannot authenticate with the provided user credentials.	1281
BPCSS0032E Passphrase is incorrect for subsystem param1.	1281
BPCSS0033E Passphrase is required. Specify one for subsystem param1.	1281
BPCSS0034E Verify that they private key that was provided for subsystem param1 was in the OpenSSH file format. If it is in another format, it needs to be converted before it can be used.	1281
BPCSS0035E The user does not have the required authority to complete the task or command.	1282
BPCSS0036E Cannot connect to the storage system or cluster.	1282
BPCSS0037W The device cannot be reached.	1282
BPCSS0038E The device or device agent did not respond within the allotted time.	1282
BPCSS0039E The host name or IP address {0} is not valid.	1283
BPCSS0040E The host name or IP address is not valid.	1283
BPCSS0041E Cannot connect to the device.	1283
BPCSS0042E Cannot connect to the SNMP data source.	1283
BPCSS0043E Passphrase is incorrect.	1284
BPCSS0044E Passphrase is required.	1284
BPCSS0045E Access to the device is denied. Ensure that valid credentials are specified.	1284
BPCSS0046E Verify that they private key that was provided was in the OpenSSH file format. If it is in another format, it needs to be converted before it can be used.	1284
BPCSS0047E New performance data is not yet available for the device.	1284
BPCSS0048E The parameter for the Performance Manager API is invalid.	1285
BPCSS0049E Schedule is not enabled for the resource resource.	1285
BPCSS0050W Performance data could not be collected for device device name because the device or data source cannot be reached (reason reason code). The current samples are skipped.	1285
BPCSS0051E The device or device agent did not respond within the allotted time (timeout valuesseconds).	1286
BPCSS0052W Performance data continuity is broken. The device might have been reset or rebooted. record count performance data records were discarded.	1286
BPCSS0053W No valid performance data was provided by the monitored resource. Zero performance data records were inserted into the database.	1287
BPCSS0054E A timeout occurred while polling the performance statistics for this device: device name	1287
BPCSS0055E Performance data was not collected for device device name due to error error trace. The current samples are skipped.	1287
BPCSS0056E The last performance Data Collection was not readable for device device name, the collection failed with error error trace.	1287
BPCSS0057E Cannot connect to the switch with the provided IP address, host name, protocol, and port.	1287
BPCSS0058E Cannot authenticate to the switch with the provided user name and password.	1288
BPCSS0059E The specified user name does not have the required permissions for the switch.	1288
BPCSS0112I The probe was stopped. This action was requested by user name.	1288
BPCSS0113I The probe is stopped.	1288
BPCSS0114I The probe is starting at an interval of interval interval units.	1289
BPCSS0115I The probe interval was updated to interval. This change was requested by user name.	1289
BPCSS0116I The probe interval was updated to interval.	1289
BPCSS0117I The probe is enabled. This action was requested by user name.	1289
BPCSS0118I The probe is enabled.	1289
BPCSS0119I The probe is disabled. This action was requested by user name.	1289
BPCSS0120I The probe is disabled.	1289
BPCSS0123I The Probe collection interval is enabled and updated to interval. This action was requested by user name.	1289
BPCSS0124I Probe interval is enabled and updated to interval.	1290
BPCSS0105I Probe is starting at an interval of interval interval units. This action was requested by user name.	1290
BPCUI - User Interface messages	1290
BPCUI0000E The action can't be completed because the following error occurred: Error message text.	1297
BPCUI0001E An action could not be completed and the following error message was generated: TPCRemoteException message	1297
BPCUI0002E Failed to retrieve the requested data because the service is unavailable.	1298
BPCUI0003E The NAPI with the IP address Napi IP was not added because of an Internal Error	1298
BPCUI0004E The SSH private key for the NAPI Napi IP could not be uploaded	1298
BPCUI0005E The action cannot be completed because the following internal error has occurred: message.	1298
BPCUI0007E The discovery job failed to complete.	1298
BPCUI0009E The SSH key could not be loaded for the following reason:IOException message	1299
BPCUI0010E The host name or IP address that you entered is a resource_type, but you selected to add a different type of storage system.	1299
BPCUI0011E The Device Server did not discover any device	1299
BPCUI0012E Cannot connect to the device with the address Ip Address.	1299
BPCUI0019E No data is available for this selection.	1299
BPCUI0025E Probe job job Id failed.	1299
BPCUI0029E Invalid parameter param passed.	1300
BPCUI0030I This task was already executed.	1300
BPCUI0032E An unexpected response was received from the server.	1300
BPCUI0034E Invalid number of runs to keep for each schedule. The number should be between param1 and param2.	1300
BPCUI0035E Invalid number of days' worth of log-files to keep. The number should be between param1 and param2.	1300
BPCUI0036E The schedule id scheduleID associated with this job is no longer valid. It might have been deleted. Refresh the view and try again.	1301
BPCUI0037E The replication server is not installed or is unavailable.	1301
BPCUI0038E Invalid number of days to retain alerts. The number should be between param1 and param2.	1301
BPCUI0039E A Storage Resource agent cannot be found.	1301
BPCUI0040E Parsing results from a call to the Data server failed with the following error message: param1.	1301
BPCUI0042E Communication with the Data Server failed with the following error: param1	1302
BPCUI0043E Cannot connect to the Data server.	1302
BPCUI0044E The entity was not found in the database.	1302
BPCUI0045E Host name length exceeds the 255 character limit	1302

BPCUI0046E Report 'configurationId' not found	1302
BPCUI0047E Parameter 'parameterName' is not defined in report configurationId'	1302
BPCUI0048E No property is not defined for report configurationId'	1303
BPCUI0049E No such property propertyName for report configurationId'	1303
BPCUI0050E variableName can not be overridden	1303
BPCUI0051E variableName not valid report output format.	1303
BPCUI0052E variableName not reachable	1303
BPCUI0053E Cannot authenticate with the provided user credentials.	1303
BPCUI0054E The host name or IP address {0} is not valid.	1304
BPCUI0055E Cannot connect to the storage system.	1304
BPCUI0056E Cannot connect to the storage system or cluster.	1304
BPCUI0058I No supported resources were discovered on the data source data_Source_Address.	1304
BPCUI0060I File param was successfully uploaded to the Data Server.	1304
BPCUI0061E Upload file type param is not supported.	1305
BPCUI0062E The requested action failed with the following error message: error message	1305
BPCUI0063E Cannot find jobs for scheduleId param and deviceId param. No logs are displayed.	1305
BPCUI0064E A log file cannot be displayed for the job.	1305
BPCUI0065E The job log file cannot be accessed. The log file may have been manually removed or may have been deleted because it was older than retain_days days or it exceeded the maximum number of no_of_lofs runs.	1305
BPCUI0067E The schedule for collecting status and asset data cannot be created.	1306
BPCUI0068E A proposed schedule for collecting status and asset data cannot be created.	1306
BPCUI0069E The proposed schedule for collecting status and asset data cannot be deleted.	1306
BPCUI0071E The task task_name could not be completed.	1306
BPCUI0072E Cannot connect to the Device server. Verify that the database service and Device server are running, and that the Device server is accessible.	1307
BPCUI0073E Can't make a connection to the storage_resource storage resource.	1307
BPCUI0074E The wizard could not set an attribute for the storage resource.	1307
BPCUI0075E The certificate wasn't saved on the server.	1307
BPCUI0076W The initial job to collect status and asset data did not start.	1307
BPCUI0077E A failure occurred loading the certificate.	1308
BPCUI0078I The certificate was loaded successfully.	1308
BPCUI0079E The SSL certificate is not in the expected format.	1308
BPCUI0084W The wizard could not retrieve the default interval information for performance monitoring.	1308
BPCUI0085E The user name or password for the hypervisor or vCenter hypervisor or vCenter Server is invalid.	1308
BPCUI0086E The SSL certificate is invalid for the hypervisor or vCenter hypervisor or vCenter Server, or the firewall is blocking access to it.	1309
BPCUI0087E The version of the hypervisor or vCenter hypervisor or vCenter Server is not supported.	1309
BPCUI0088E The host name, protocol, or port for the hypervisor or vCenter hypervisor or vCenter Server is invalid, or the hypervisor or vCenter Server is unreachable.	1309
BPCUI0089W Cannot retrieve a valid set of data collection intervals for performance monitoring.	1310
BPCUI0090I All alerts were removed.	1310
BPCUI0091W error_count of total_count alerts were not removed.	1310
BPCUI0093I No data path is available for deviceNameVariable.	1310
BPCUI0094E Authorization failed due to an internal error.	1310
BPCUI0097E Authorization failed due to an invalid request context.	1311
BPCUI0098E The current user is not authorized to perform the requested function.	1311
BPCUI0099E The storage resource is not available.	1311
BPCUI0100I success_count alerts were marked as acknowledged.	1311
BPCUI0101I The alert was marked as acknowledged.	1312
BPCUI0102E None of the alerts were marked as acknowledged.	1312

BPCUI0108I All informational alerts were marked as acknowledged.	1312
BPCUI0110W Some informational alerts were not marked as acknowledged.	1312
BPCUI0111I All alerts were marked as acknowledged.	1313
BPCUI0112I success_count alerts were removed.	1313
BPCUI0113I The alert was removed.	1313
BPCUI0114I All acknowledged alerts were removed.	1313
BPCUI0116W Some acknowledged alerts were not removed.	1313
BPCUI0120W Some acknowledged alerts were not marked as unacknowledged.	1314
BPCUI0121E Unable to communicate with the product server. Make sure that the server is running properly.	1314
BPCUI0122E No job log file was created for this job run.	1314
BPCUI0123E The action cannot be completed.	1314
BPCUI0124E An unexpected error occurred during the execution of the action.	1315
BPCUI0125E The alert is not available.	1315
BPCUI0126E The status of the Performance Monitors could not be retrieved.	1315
BPCUI0127E The currently installed version of the product does not have the required product license for the function that you requested.	1315
BPCUI0128E An undefined capacity chart metric was requested.	1315
BPCUI0129I Alerts that were migrated from a previous version of the product are not shown on this page.	1316
BPCUI0130E The alerts cannot be acknowledged because they were deleted.	1316
BPCUI0131E The alerts cannot be unacknowledged because they were deleted.	1316
BPCUI0132W success_count alerts were marked as acknowledged. unsuccess_count alerts cannot be marked as acknowledged because they were deleted.	1316
BPCUI0133W success_count alerts were marked as unacknowledged. unsuccess_count alerts cannot be marked as unacknowledged because they were deleted.	1316
BPCUI0134E The alert cannot be acknowledged because it was deleted.	1317

BPCUI0135E The alert cannot be unacknowledged because it was deleted.	1317
BPCUI0136E The device was not removed because the action is not supported for devices of type devType.	1317
BPCUI0137E Input text provided has invalid character(s): characters. Input text: text	1317
BPCUI0141E Host name or IP address hostname specified on line line of file file is not valid.	1318
BPCUI0143E Host port WWPN wwpn specified on line line of file file is not valid.	1318
BPCUI0144E Duplicate server name specified on lines line1 and line2 of file file.	1318
BPCUI0145E Could not parse file file.	1318
BPCUI0146E Could not parse file file. Invalid entry on line line.	1318
BPCUI0148I Successfully deleted server server_name.	1318
BPCUI0149I Successfully modified ports of server server_name.	1319
BPCUI0150I The server was created.	1319
BPCUI0151E The host name or IP address is associated with another resource.	1319
BPCUI0152I The data source data_Source_Address was successfully added as a data source for monitoring. The following new resources were detected:	1319
BPCUI0155W You cannot provision volumes because there is no Fibre Channel host port information for at least one server.	1319
BPCUI0156W You cannot provision volumes to servers that use different operating systems.	1320
BPCUI0157W You cannot provision volumes to servers and virtual machines at the same time. To provision volumes, ensure that you select either only servers or only virtual machines.	1320
BPCUI0158I Volumes are assigned to the hypervisors that host virtual machines. Volumes are not assigned directly to virtual machines.	1320
BPCUI0159W You cannot provision volumes because at least one of the hypervisors that host the virtual machines is not being monitored. Ensure that all the hypervisors that are hosting the virtual machines that were selected for provisioning were probed.	1320
BPCUI0160E Duplicate port WWPN wwpn specified on lines line1 and line2 of file file.	1321
BPCUI0162W File file does not contain any servers to create.	1321
BPCUI0166W Optimization cannot be done in place to the subsystem since storage subsystem param1 and/or its pools belong to more than one capacity pool. Following are capacity pools the subsystem is associated with: param2	1321
BPCUI0167W Optimization cannot be done in place to the subsystem since storage subsystem param1 and/or its pools are not part of any capacity pool.	1321
BPCUI0168W Optimization cannot be done in place to the server param1 since storage subsystems or storage pools associated with luns assigned to the server belong to more than one capacity pool. Following are associated capacity pools: param2	1321
BPCUI0169W Optimization cannot be done in place to the server param1 since storage subsystems or storage pools associated with luns assigned to the server are not part of any capacity pool.	1322
BPCUI0170W Optimization cannot be done in place to the storage entity param1 since storage subsystems or storage pools associated with it belong to more than one capacity pool. Following are associated capacity pools: param2	1322
BPCUI0171W Optimization cannot be done in place to the storage entity param1 since storage subsystems or storage pools associated with it are not part of any capacity pool.	1322
BPCUI0172E The operation timed out while waiting for a response from the server.	1322
BPCUI0173E File file does not exist or is empty.	1323
BPCUI0174E The device does not support the credential mechanism used.	1323
BPCUI0175E A required parameter is missing.	1323
BPCUI0176E The highlighted field contains an invalid value.	1323
BPCUI0177E The highlighted field contains a value that is outside of the allowed range. The value must be between minVal and maxVal.	1323
BPCUI0178E A service class with the same name and type already exists.	1323
BPCUI0179I The service class was created.	1324
BPCUI0180I Based on the known configuration of storage system host connections, fabric zone aliases, and HBA ports, additional ports may have been added to the selection below.	1324
BPCUI0181I You selected to add a expectedDevice resource, but a foundDevice resource was detected and will be added.	1324
BPCUI0182I The data source data_Source_Address was added as a data source for monitoring. No new resources were detected.	1324
BPCUI0183E The text in the highlighted field exceeds the maxLength character limit.	1325
BPCUI0185W Unable to lookup the IP Address for Host Name hostName. Enter the IP Address manually.	1325
BPCUI0189I Configuration of SRA deployment and probe schedules were done successfully.	1325
BPCUI0190W Configuration of SRA finished with some warnings or errors. Check the detail messages.	1325
BPCUI0191E An internal error occurred while testing connecton to param1.	1325
BPCUI0192E The supplied service class type is invalid.	1326
BPCUI0193E The specified SMI-S provider was not found. Make sure that the protocol, SMI-S provider host name or IP address, and port are specified correctly and that the SMI-S provider is properly configured at that location.	1326
BPCUI0194E An unknown error has occurred. Please review all values entered.	1326
BPCUI0195E The Interop Namespace is not correct. Please correct this entry.	1326
BPCUI0196E A timeout ocured while processing the request. Please retry request.	1326
BPCUI0197E A connection was not established. Make sure that the protocol, SMI-S provider host name or IP address, and port are specified correctly.	1326
BPCUI0198E The authentication to the SMI-S provider failed.	1327
BPCUI0199E An SSLHandshakeException or SSLProtocolException has occurred. This exception might be due to an invalid SLP registration, e.g. 'http' instead of 'https'.	1327
BPCUI0201E There is a pending delete in process for this SMI-S provider.	1327
BPCUI0202I Success	1327
BPCUI0203E The selected resources were not removed.	1327
BPCUI0204W successfulDeletes of attemptedDeletes of the selected resources were removed.	1327
BPCUI0205W successfulDeletes selected resources were removed, however warnings did occur.	1327
BPCUI0209E A database operation cannot be completed.	1328
BPCUI0210I Device param1 supports performance monitoring.	1328
BPCUI0211E No performance data is available for a resource.	1328
BPCUI0212E There is no Secure Shell running at this host/IP.	1328
BPCUI0213E Unsupported Secure Shell protocol was used.	1328
BPCUI0214E Invalid public key location for subsystem param1.	1329
BPCUI0215E Invalid public key format for subsystem param1.	1329
BPCUI0216E Passphrase was incorrect for subsystem param1.	1329

BPCUI0217E Unable to transfer the key(s) to the server param1.	1329
BPCUI0218E The specified private key file format is not supported. Please convert it to Open SSH (.pem) key file format for subsystem param1.	1329
BPCUI0219E The specified key file or key file name is already linked to another user.	1329
BPCUI0220E The IP address that was entered was the address of the management console for the storage system. You must enter the valid IP address of the block component of the storage system.	1329
BPCUI0221E The IP address you entered is the address of another device's management console.	1330
BPCUI0222E The IP address you entered points to a device of another type.	1330
BPCUI0223E Passphrase is required. Specify one for subsystem param1.	1330
BPCUI0224E Cannot connect to a resource because of an SSL certificate error. Troubleshooting information: http://www.ibm.com/support/docview.wss?uid=swg21976237	1330
BPCUI0225I The agent log files for server_Name have been collected and copied to log_Location.	1331
BPCUI0226I Discovery of data_source is taking longer than expected. Click Close to run the discovery in the background.	1331
BPCUI0227E Thin provisioning must be enabled when compression is enabled.	1331
BPCUI0229I 1 resource was added to name.	1331
BPCUI0231I count resources were added to name.	1331
BPCUI0233E The specified host name is already associated with an existing server.	1331
BPCUI0234E The specified IP address is already associated with an existing server.	1332
BPCUI0235E The specified host name and IP address are already associated with an existing server.	1332
BPCUI0236E The disabling of the agents failed.	1332
BPCUI0237E Errors occurred when attempting to disable some of the agents.	1332
BPCUI0238W Warnings occurred when attempting to disable warningCount of the agents.	1332
BPCUI0239I attemptedCount of the selectedCount selected agents were disabled.	1333
BPCUI0240E The agents were not enabled.	1333
BPCUI0241E Errors occurred when attempting to enable some of the agents.	1333
BPCUI0242W Warnings occurred when attempting to enable warningCount of the agents.	1333
BPCUI0243I attemptedCount of the selectedCount selected agents were enabled.	1333
BPCUI0244I The credentials of an agent were updated.	1334
BPCUI0245I The credentials of updateCount agents were updated.	1334
BPCUI0246E Cannot authenticate to the file module with the provided user credentials.	1334
BPCUI0247E Unknown file module key user.	1334
BPCUI0248E The SSH key could not be loaded for the following reason:IOException message	1334
BPCUI0249E Passphrase is incorrect.	1334
BPCUI0250E Passphrase is required.	1335
BPCUI0251E Cannot connect to the storage system or cluster.	1335
BPCUI0252E The host name or IP address {0} is not valid.	1335
BPCUI0253E Cannot connect to the data source for the resource with the address ip_address.	1335
BPCUI0254E Invalid private key location.	1335
BPCUI0255W The following resources are already assigned to a capacity pool. Are you sure you want to move these resources to a different capacity pool?	1335
BPCUI0256W The following resources are already assigned to a capacity pool. Are you sure you want to move these resources to a different capacity pool?	1336
BPCUI0257W The following resources are already assigned to a capacity pool. Are you sure you want to move these resources to a different capacity pool?	1336
BPCUI0258W The following internal resources of a storage system you are attempting to add are already assigned to a capacity pool. Are you sure you want to move these resources to a different capacity pool?	1336
BPCUI0259W The following storage systems and storage-system internal resources are already assigned to a capacity pool. Are you sure you want to move these resources to a different capacity pool?	1336
BPCUI0260E The specified private key file format for the file module is not supported. Please convert it to Open SSH (.pem) key file.	1336
BPCUI0261E The service class was not found in the database.	1337
BPCUI0262E The capacity pool was not found in the database.	1337
BPCUI0263E The scheduling of the agent upgrade jobs failed.	1337
BPCUI0264E Errors occurred when attempting to schedule the upgrade jobs of some of the agents.	1337
BPCUI0265W Warnings occurred when scheduling the upgrade of warningCount of the agents.	1337
BPCUI0266I attemptedCount of the selected agents were scheduled for upgrade.	1337
BPCUI0267I The upgrade agent job was successfully scheduled for hostName.	1338
BPCUI0268W Deleting a capacity pool does not affect any volumes or shares that were provisioned from the capacity pool. However, the volumes or shares are no longer associated with the capacity pool. Associations with the following volumes or shares will be removed:	1338
BPCUI0269W The following volumes are associated with the service class scName. When the volumes were created, they satisfied the requirements of the service class. If you modify the service class, the volumes are still associated with the service class, but might not satisfy the new requirements of the service class. Depending on your changes to the service class, users might incorrectly assume that the volumes have properties that they do not possess.	1338
BPCUI0270W The following shares are associated with the service class scName. When the shares were created, they satisfied the requirements of the service class. If you modify the service class, the shares are still associated with the service class, but might not satisfy the new requirements of the service class. Depending on your changes to the service class, users might incorrectly assume that the shares have properties that they do not possess.	1338
BPCUI0271W The following volumes are associated with the service class scName. If you delete the service class, the volumes are no longer associated with any service class.	1339
BPCUI0272W The following shares are associated with the service class scName. If you delete the service class, the shares are no longer associated with any service class.	1339
BPCUI0273E The action does not support the specified type of device.	1339
BPCUI0274I The connection test to resource data_Source_Name was successful.	1339
BPCUI0275I To collect data about zoning or complete zoning actions during provisioning, you must deploy Storage Resource agents to one or more servers that are on the fabric.	1339
BPCUI0276I Agent agentName was disabled.	1339
BPCUI0277I Agent agentName was enabled.	1340
BPCUI0278I The credentials for agentName were updated.	1340
BPCUI0279I There is no job defined for the device Name. Please create a job first before running it again.	1340
BPCUI0280I No switches are managed by the data_Source_Address data source.	1340

BPCUI0282I The resources that are managed by data_Source_Address are already known. One or more resources were added.	1340
BPCUI0284I No fabrics are managed by the data_Source_Address data source.	1340
BPCUI0286I The fabrics that are managed by data_Source_Address are already being monitored.	1341
BPCUI0289W The following network shared disks (NSDs) are already assigned to a capacity pool. Are you sure you want to move these NSDs to a different capacity pool?	1341
BPCUI0290W The following file systems and network shared disks (NSDs) are already assigned to a capacity pool. Are you sure you want to move these resources to a different capacity pool?	1341
BPCUI0291W The following network shared disks (NSDs) are already assigned to a capacity pool. Are you sure you want to move these NSDs to a different capacity pool?	1341
BPCUI0292E The host name or IP address ip_address_or_hostname cannot be reached.	1341
BPCUI0293I A probe is started for deviceName.	1342
BPCUI0294I A performance monitor is started for deviceName.	1342
BPCUI0295I The performance monitor is stopped for deviceName.	1342
BPCUI0297W One resource was added to capacity_pool_name. One resource could not be added because it could not be found.	1342
BPCUI0298W count resources were added to capacity_pool_name. One resource could not be added because it could not be found.	1342
BPCUI0299W One resource was added to capacity_pool_name. count_Not_Found resources could not be added because they could not be found.	1342
BPCUI0300W count resources were added to capacity_pool_name. count_Not_Found resources could not be added because they could not be found.	1343
BPCUI0301E Failed to assign the role name role.	1343
BPCUI0302E Failed to retrieve the existing role assignments.	1343
BPCUI0303E Failed to remove all role assignments from the specified groups.	1343
BPCUI0304W An error occurred when saving the user-defined properties of the resourcesType.	1343
BPCUI0305E A capacity pool with the same name already exists.	1344
BPCUI0306W The selected resource was removed, however warnings did occur.	1344
BPCUI0307E The schedule could not be deleted.	1344
BPCUI0308I The resource does not have a connection configured. To add a connection to the resource, click Add Storage System.	1344
BPCUI0309I A probe schedule is defined for deviceName.	1344
BPCUI0310I A performance monitor schedule is defined for deviceName.	1344
BPCUI0311I Probe and performance monitor schedules are defined for deviceName.	1345
BPCUI0312I SNMP Discovery of switches is taking longer than expected. Click Close to run the discovery in the background.	1345
BPCUI0313I An upgrade is started for server deviceName.	1345
BPCUI0314E Failed to retrieve the list of user groups from the WebSphere user repository.	1345
BPCUI0315E Failed to retrieve the list of user groups from user repository due to an invalid search string.	1345
BPCUI0316W Failed to update the role cache maintained by the Device server.	1345
BPCUI0317E Access can not be removed, because at least one Administrator user must remain in the system.	1346
BPCUI0318E The group mapping can not be modified, because at least one Administrator user must remain in the system.	1346
BPCUI0319I A task is started for resource resourceName.	1346
BPCUI0320I Probe and performance monitor schedules are defined for deviceName. A performance monitor is scheduled to collect performance data after the probe is done.	1346
BPCUI0321I A task is paused for resource resourceName.	1346
BPCUI0322E A task could not be paused for resource resourceName.	1346
BPCUI0323I A task is resumed for resource resourceName.	1346
BPCUI0324E A task could not be resumed for resource resourceName.	1347
BPCUI0325E Failed to retrieve the list of users from the WebSphere user repository.	1347
BPCUI0326E Failed to retrieve the list of users from user repository due to an invalid search string.	1347
BPCUI0327E Failed to get the roles associated with the current user.	1347
BPCUI0328I A task is saved.	1347
BPCUI0329I A task was successfully deleted.	1347
BPCUI0330E The user user is not authorized to access the product.	1347
BPCUI0331I A task is cancelled for resource resourceName.	1348
BPCUI0332E An unexpected error occurred. The task for schedule schedule name could not be paused or resumed.	1348
BPCUI0333E An unexpected error occurred. The task for schedule schedule name could not be paused.	1348
BPCUI0334E An unexpected error occurred. The task for schedule schedule name could not be resumed.	1348
BPCUI0335E The volumes cannot be converted or moved because the target pools do not have sufficient available space.	1348
BPCUI0336I The ability to provision with block storage devices is only available with the advanced license.	1349
BPCUI0338E Insufficient user privileges to service the REST request.	1349
BPCUI0339E An unexpected error occurred while authorizing the REST request.	1349
BPCUI0340I A task was successfully renamed.	1349
BPCUI0341E The task could not be renamed.	1349
BPCUI0342E The task could not be renamed because the specified name already exists.	1349
BPCUI0343I Performance monitoring is unavailable for resource resource name because the resource was not probed.	1350
BPCUI0344W The following service classes allow provisioning only from the capacity pool capacity pool: service classes. If you delete this capacity pool, the service classes will allow provisioning from any available storage.	1350
BPCUI0346I The Storage Resource agent that is deployed on the server cannot be uninstalled.	1350
BPCUI0347I All servers were removed except for the product server. Entries for the product server resources might still be displayed in the GUI until all the associated removals are complete.	1350
BPCUI0348W You cannot provision volumes because at least one of the selected hosts was not found in the database. Ensure that all hosts that are selected for provisioning are being monitored.	1350
BPCUI0349W You cannot provision volumes because not all of the selected hosts appear to have Fibre Channel connectivity.	1351
BPCUI0350W You cannot provision volumes because the hypervisors that host the virtual machines use different operating systems.	1351
BPCUI0351W You cannot provision volumes because there is no Fibre Channel host port information for at least one hypervisor.	1351
BPCUI0352W You cannot provision volumes because not all of the hypervisors that host the virtual machines appear to have Fibre Channel connectivity.	1351
BPCUI0355W You cannot provision volumes because no block-storage service class exists.	1352

BPCUI0356W You cannot provision shares because no file-storage service class exists.	1352
BPCUI0357W You cannot provision volumes because you do not have permission to provision by using any block-storage service class.	1352
BPCUI0358W You cannot provision shares because you do not have permission to provision by using any file-storage service class.	1352
BPCUI0359E The credentials for the servers were not updated.	1352
BPCUI0360W The credentials for successfulUpdates of attemptedUpdates of the selected servers were updated.	1353
BPCUI0361W The credentials for the selected server was updated, however warnings did occur.	1353
BPCUI0362W The credentials for successfulUpdates selected servers were updated, however warnings did occur.	1353
BPCUI0363E Cannot connect to the SNMP data source IP_Address.	1353
BPCUI0364I The performance monitor schedule was updated for deviceName.	1353
BPCUI0366W The server serverName was not updated because it does not support the action.	1353
BPCUI0367W You cannot provision volumes to virtual machines with NPIV ports and virtual machines without NPIV ports at the same time. To provision volumes to virtual machines, ensure that you select either only virtual machines with NPIV ports or only virtual machines without NPIV ports.	1354
BPCUI0368W You cannot provision volumes because none of the selected hosts appear to have Fibre Channel connectivity and the automatic zoning option is enabled. Disable the automatic zoning option in your zoning policy.	1354
BPCUI0369W You cannot provision volumes because none of the hypervisors that manage the selected virtual machines appear to have Fibre Channel connectivity and the automatic zoning option is enabled. Disable the automatic zoning option in your zoning policy.	1354
BPCUI0370E The display name displayName is already assigned to resource resource Name.	1354
BPCUI0372I The selected hosts do not appear to have Fibre Channel connectivity. In the resulting provisioning task, ensure that the recommended storage system is connected to the hosts before you run the task. Also, be aware that all fabric-related options will be ignored.	1355
BPCUI0373I Volumes are assigned to the hypervisors that host virtual machines. Volumes are not assigned directly to virtual machines that do not have NPIV ports. None of the hypervisors that manage the virtual machines appear to have Fibre Channel connectivity. In the resulting provisioning task, ensure that the recommended storage system is connected to the hypervisors before you run the task. Also, be aware that all fabric-related options will be ignored.	1355
BPCUI0374E Schedule is not enabled for the resource resource.	1355
BPCUI0375E Performance data is not available.	1356
BPCUI0376E Invalid number of days to keep configuration history. The number should be between minimum value and maximum value.	1356
BPCUI0377E Invalid number of days to keep data for removed resources. The number should be between minimum value and maximum value.	1356
BPCUI0378E Invalid number of days to keep sample performance data. The number should be between minimum value and maximum value.	1356
BPCUI0379E Invalid number of days to keep hourly performance data. The number should be between minimum value and maximum value.	1356
BPCUI0380E Invalid number of days to keep daily performance data. The number should be between minimum value and maximum value.	1357
BPCUI0381E Failed to update the performance data retention settings.	1357
BPCUI0382E Performance monitoring is unavailable for resource resource name.	1357
BPCUI0383E Failed to update the history retention settings.	1357
BPCUI0384E Failed to retrieve the history retention settings.	1357
BPCUI0385E Invalid number of runs to keep log files for each schedule. The number should be between minimum value and maximum value.	1358
BPCUI0386E A job cannot be run for resource resourceName because there is a job already running for the resource. Wait for the job to finish and try again.	1358
BPCUI0387I The selected resources support different performance monitor intervals. If you select multiple resources, intervals that are common to all resources are displayed in the interval list.	1358
BPCUI0388E The probe schedule cannot be created for resource {0} because not all the information was provided. If you are configuring a probe for a resource for the first time, you must enter values for the probe status, time, and frequency fields.	1358
BPCUI0389E The performance monitor schedule cannot be created because not all the information was provided. If you are configuring a performance monitor for a resource for the first time, you must enter values for the performance monitor status and interval fields.	1359
BPCUI0390I The service logs were successfully created.	1359
BPCUI0391I The connection test to data source data source was successful. A probe is running. The health status is unknown until the probe is finished.	1359
BPCUI0392I The connection test to the data source data source was successful.	1359
BPCUI0393E The user user_name does not have sufficient privileges to deploy the vSphere Web Client extensionr.	1360
BPCUI0394E The user user_name does not have permission to log in to the vCenter Server system.	1360
BPCUI0395E This version of the vCenter Server server_name does not support the deployment of the vSphere Web Client extension for the product.	1360
BPCUI0396E The user user_ID does not have the required role. The role associated with this user must be Administrator, Monitor, or External Application.	1360
BPCUI0397E The vCenter Server user name or password is invalid.	1360
BPCUI0398E The user name or password is invalid.	1361
BPCUI0399I The server was started.	1361
BPCUI0400E Failed to retrieve the system management information from the Data server.	1361
BPCUI0402E Failed to retrieve the server status of the Data server.	1361
BPCUI0403E The SMI-S provider service is not available.	1361
BPCUI0404E An error occurred while updating the trace log configuration file. The original file file was deleted and could not be restored. A backup of this file may be available at backup file.	1361
BPCUI0405E Failed to set the trace settings from the Data server.	1362
BPCUI0406E Cannot start the server. The start script reported the following error: error	1362
BPCUI0407E Cannot start the server. Unable to locate the start script path to script.	1362
BPCUI0408E Cannot start the server. Unable to execute the start script path to script.	1362
BPCUI0409W The server is taking a long time to start. If the server status continues to show an error status after a reasonable interval, try to start the server again.	1363
BPCUI0410E Cannot stop the server. The stop script reported the following error: error	1363
BPCUI0411W The server is taking a long time to stop. If the server status continues to show that it is still running try to stop the server again after a reasonable interval.	1363
BPCUI0412E Cannot stop the server. Unable to locate the stop script path to script.	1363
BPCUI0413E Cannot stop the server. Unable to execute the stop script path to script.	1363
BPCUI0414W It is taking a long time for the services to start. If the server status continues to show an error status after a reasonable interval, try to start the services again. If the problem persists then restart the server.	1364
BPCUI0415E Failed to start the service service name.	1364
BPCUI0416I The server was stopped.	1364
BPCUI0417I The services of the server were started.	1364
BPCUI0418E The action cannot be completed because the data source that is managing this resource cannot be reached.	1364

BPCUI0419E A Storage Resource agent is already deployed for this server and has a status of Pending deployment or Failed deployment. Use the Servers page to resolve the deployment errors or modify the deployment schedule.	1365
BPCUI0420E A file access error occurred when the system attempted to back up or modify the tracing configuration file configuration file.	1365
BPCUI0421E There is a log collection operation already running. A new one cannot be submitted until the current one completes.	1365
BPCUI0422E Cannot start the log collecting job. Unable to locate the required script path to script.	1365
BPCUI0423E Cannot start the log collecting job. Unable to run the log collection script path_to_script.	1365
BPCUI0424E Storage cannot be provisioned from capacity pool capacity pool using service class service class for the following reason:	1366
BPCUI0425W The task task name cannot be scheduled because it is already running.	1366
BPCUI0426E Storage cannot be provisioned by using service class service class for the following reason:	1366
BPCUI0427W The selected group action is complete for all tasks, but warnings were reported.	1366
BPCUI0428I The selected group action is complete for all tasks. Some informational messages were returned.	1366
BPCUI0429E The validation process cannot contact the server. The server might be down or unreachable due to network problems.	1367
BPCUI0430I Some tasks were not deleted because they were already run.	1367
BPCUI0431E Failed to retrieve the list of managed devices.	1367
BPCUI0432E Failed to retrieve the performance monitoring granularity from the Device server. Check the connection to the Device server and retry the operation.	1367
BPCUI0433E OS type osType specified on line line of file file is not valid.	1367
BPCUI0434E Data source data_Source_Key could not be found.	1368
BPCUI0435E Required host name or IP address and OS type were not specified on line line of file file.	1368
BPCUI0436E The alert notification settings cannot be displayed.	1368
BPCUI0437E The alert notification settings cannot be saved.	1368
BPCUI0438E File file does not exist or is empty.	1369
BPCUI0439E The file file could not be uploaded.	1369
BPCUI0440E The text location specified on line line of file file has invalid character(s): characters	1369
BPCUI0441E The alert definitions cannot be displayed.	1369
BPCUI0442E The alert definitions cannot be saved.	1369
BPCUI0443E Select at least one managed server that is deployed for which alert notification settings need to be displayed.	1370
BPCUI0444E Select at least one managed server that is deployed for which alert definitions need to be displayed.	1370
BPCUI0445W The discovery job completed with errors. Some available devices were not discovered.	1370
BPCUI0446E Unable to test the connection to the device because the request was not processed by the data collector.	1370
BPCUI0447E Select at least one managed storage subsystem for which alert notification settings need to be displayed.	1370
BPCUI0448E Select at least one managed storage subsystem for which alert definitions need to be displayed.	1371
BPCUI0449E The user does not have the required authority to complete the task or command.	1371
BPCUI0451E One or more applications from provided list: names do not exist.	1371
BPCUI0452E entity name is not supporting data collection actions.	1371
BPCUI0453E One or more departments from provided list: names do not exist.	1371
BPCUI0455I No performance data is available for the selected resources.	1372
BPCUI0456E You cannot complete the action because the service is temporarily unavailable.	1372
BPCUI0457W The applications listOfApplications cannot be deleted because they contain subcomponents subcomponent, which cannot be moved up a level in the applications hierarchy due to name conflicts with existing applications in that higher level.	1372
BPCUI0458W The departments listOfDepartments cannot be deleted because they contain subdepartments or applications subdepartment, which cannot be moved up a level in the departments hierarchy due to name conflicts with departments in that higher level.	1372
BPCUI0459W The selected subcomponents cannot be removed from the application because they cannot be moved up a level in the application hierarchy due to name conflicts with the existing applications or subcomponents at the higher level.	1373
BPCUI0460W The selected applications or subdepartments cannot be removed from the department because they cannot be moved up a level in the department hierarchy due to name conflicts with the existing applications or subdepartments at the higher level.	1373
BPCUI0461W There are no task details to display. The analysis-execution task could not be run.	1373
BPCUI0462E Failed to add the device because the data collector is not responding.	1373
BPCUI0463E The discovery failed because the data collector is not responding.	1373
BPCUI0464E The connection test failed because the data collector is not responding.	1374
BPCUI0465E The requested action failed because the data collector is not responding.	1374
BPCUI0466I The servers were created.	1374
BPCUI0467W successCount of totalCount servers were created.	1374
BPCUI0468E The creation of the servers failed.	1374
BPCUI0469E Schedule job does not exist for entity name.	1374
BPCUI0470E Invalid file file size of size GB. Maximum allowed file size is max size GB.	1375
BPCUI0471E Failed to set the trace settings from the Alert server.	1375
BPCUI0472E Failed to retrieve the system management information from the Alert server.	1375
BPCUI0474E Failed to retrieve the server status of the Alert server.	1375
BPCUI0475I The volumes have been excluded from the reclamation analysis.	1375
BPCUI0476I The volumes will be included in future analyses to reclaim storage.	1376
BPCUI0477E An unexpected error occurred when modifying the optimization characteristics of the volumes.	1376
BPCUI0478E The scheduled agent upgrade time is in the past.	1376
BPCUI0479E The object storage credentials are incorrect. Enter the correct credentials. Alternatively, clear the object credentials check box and do not specify the authentication credentials for object storage now. You can use the Modify Connection action to add the object storage later.	1376
BPCUI0480E An object storage request failed on the GPFS cluster.	1377
BPCUI0481W No resources were removed.	1377
BPCUI0482E No resources were updated.	1377
BPCUI0483E The connection information cannot be updated because it points to another device.	1377
BPCUI0484I The connection information for device name was updated.	1377
BPCUI0485E The connection information cannot be updated.	1377
BPCUI0486E Cannot query the object service for information about accounts and containers as the specified user does not have admin privileges.	1378

BPCUI0487I The connection information of the selected device was successfully updated. Other devices were detected as being managed by the same data source. Would you like to update the connection information of all of them?	1378
BPCUI0488I The connection information of all devices connecting through this data source was updated.	1378
BPCUI0489W Some of the devices connecting through this data source failed to be updated.	1378
BPCUI0490I The vCenter vCenter Server was removed.	1379
BPCUI0491E The vCenter vCenter Server was not found in the database.	1379
BPCUI0492E The selected vCenter Servers were not found in the database.	1379
BPCUI0493I The vCenter vCenter Server and all number of monitored hypervisors hypervisors monitored by it were successfully removed.	1379
BPCUI0494I The number of vCenters selected vCenter Servers and all number of monitored hypervisors hypervisors monitored by them were successfully removed.	1379
BPCUI0495W Only number of removed vCenters of number of selected vCenters of the selected vCenter Servers and number of removed monitored hypervisors of number of monitored hypervisors of the hypervisors monitored by them were successfully removed.	1380
BPCUI0496I The following fabrics were detected as being managed by the same data source: comma separated fabrics list. This action applies to all fabrics that are managed by the current data source. Would you like to update the connection information of all of them?	1380
BPCUI0497E The following fabrics cannot be monitored through the SMI agent: comma separated fabrics list. The data source connection information will not be updated.	1380
BPCUI0498E The fabric cannot cannot be monitored through the SMI agent.	1380
BPCUI0499I Other switches were detected as being managed by the same data source. This action applies to all switches that are managed by the current data source. Would you like to update the connection information of all of them?	1381
BPCUI0500E One or more switches cannot be monitored through the SMI agent. The data source connection information will not be updated.	1381
BPCUI0501E The information cannot be displayed. Log out of the GUI, log in, and try the action again.	1381
BPCUI0502E The device is already managed by this data source. The data source connection information will not be updated.	1381
BPCUI0503I The connection information of the selected switches was updated.	1382
BPCUI0504I The detected versions of the resources discovered on the data source data_Source_Address are unsupported.	1382
BPCUI0505E The resource does not have a connection configured.	1382
BPCUI0506E Cannot connect to the Alert server.	1382
BPCUI0507E The version of the tpc_server IBM Spectrum Control Server is not supported.	1382
BPCUI0508E Cannot connect to the rollup server rollup_server on port host_port.	1383
BPCUI0509E Cannot authenticate with the rollup server using the provided credentials.	1383
BPCUI0510E You entered an invalid time range. The start date and time must be before the end date and time.	1383
BPCUI0511E The following alert name(s) are not unique: names.	1383
BPCUI0512E Custom alerts already exist for other resources with the following alert name(s): names.	1383
BPCUI0513E Unable to connect from rollup server rollup_server to the repository database.	1384
BPCUI0514E The specified secondary server secondary_server is the primary server.	1384
BPCUI0515E The duration of the automated probe run window must be at least minimum_hours hours.	1384
BPCUI0516W The selected subgroups cannot be removed from the general group because they cannot be moved up a level in the groups hierarchy due to name conflicts with the general groups at the higher level.	1384
BPCUI0519E Authorization has failed because the private key is not valid for the user name that you have specified.	1384
BPCUI0520E The IP address ip_address for the FlashSystem storage system is not the management IP address.	1385
BPCUI0521E The configuration for the report can't be saved.	1385
BPCUI0522E Failed to delete a report configuration.	1385
BPCUI0523E Alerts cannot be defined for this storage system.	1385
BPCUI0524E The changes to the report configuration can't be saved.	1385
BPCUI0525E The configuration for the report can't be saved because the report title isn't unique.	1386
BPCUI0527E The action cannot be completed because of an invalid request.	1386
BPCUI0528E The action cannot be completed because of an invalid file upload request.	1386
BPCUI0526I The connection test to data source data source was successful. A probe is running.	1386
BPCUI0529I The data source data_Source_Address is already being managed as a data source for monitoring. No new resources were detected.	1386
BPCUI0530I The data source data_Source_Address is already being managed as a data source for monitoring. The following new resources were detected:	1387
BPCUI0531E The action cannot be completed because LDAP registry file failed to upload.	1387
BPCUI0532E The action failed because of a missing resource.	1387
BPCUI0533E The LDAP configuration test failed.	1387
BPCUI0534E There was an error executing the collect log process. If this problem persists, you can try collecting and uploading the service logs manually. Learn More.	1388
BPCUI0535E An FTP connection can not be established. If your organization requires the use of a proxy server, consult the following documentation: Troubleshooting FTP Transfers.	1388
BPCUI0536E The support data collection failed due to an invalid PMR number format.	1388
BPCUI0537E The support package could not be created because file system permissions prevent the creation of temporary files.	1388
BPCUI0538E The support data collection completed creating a support package, but the package could not be uploaded to IBM.	1388
BPCUI0539E The support data collection failed with an internal error	1389
BPCUI0540E The support data collection failed due to an invalid email address format.	1389
BPCUI0541E The specified SMI agent was not found. Make sure that the protocol, SMI agent host name or IP address, and port are specified correctly and that the SMI agent is properly configured at that location.	1389
BPCUI0542E A connection was not established. Make sure that the protocol, SMI agent host name or IP address, and port are specified correctly.	1389
BPCUI0543E The authentication to the SMI agent failed.	1389
BPCUI0544E There is a pending delete in process for this SMI agent.	1390
BPCUI0545E The SMI agent service is not available.	1390
BPCUI0546E The action cannot be completed because the LDAP registry file could not be updated.	1390
BPCUI0547E Connection failed. The server might be down or unreachable due to network problems.	1390
BPCUI0548E The add SSL certificate action failed.	1390
BPCUI0549E The add SSL certificate action failed because of a wrong password.	1390
BPCUI0550E The specified storage resource is not valid for the REST API service request.	1391
BPCUI0551E The file cannot be used because it is not a valid SSL certificate. Select a valid certificate file and try again.	1391

BPCUI0554E The SSL certificate download process failed.	1391
BPCUI0555E The test connection to the LDAP server failed. Verify that your XML file contains the correct syntax and values and that the LDAP server is running.	1391
BPCUI0556E An unexpected error occurred creating or updating a support ticket.	1391
BPCUI0557E An invalid request was made when creating or updating a support ticket.	1392
BPCUI0558E This tier name is already in use. Enter a different name.	1392
BPCUI0559E The custom dashboard was removed by another user. Cancel the action and refresh the page manually.	1392
BPCUI0600W Can't save the scheduling information for the report because the Data server is offline.	1392
BPCUI0601I The resource does not have a connection configured. To add a connection to the resource, click Add Switch or Add Fabric.	1392
BPCUI0602E The osAuthentication script does not start. The script reported the following error: script_error.	1393
BPCUI0603E The connection test to data source data source was not successful.	1393
BPCUI0604E Can't stop data collection for entity name.	1393
BPCUI0605E Can't restart data collection for entity name.	1393
BPCUI0606E The action cannot be completed because there was a failure to create or write into the pending configuration file.	1394
BPCUI0607E The action cannot be completed because there was a failure to read the pending LDAP registry file.	1394
BPCUI0608E The action cannot be completed because there was a failure to get the list of LDAP groups.	1394
BPCUI0609E The Local OS authentication configuration test failed.	1394
BPCUI0610E Failed to update modified username for IBMid unique ID.	1394
BPCUI0611E Failed to update IBMid unique ID for IBMid username.	1395
BPCUI0612E The action was not performed due to invalid device credentials for entity name.	1395
BPCUI0613E A switch with this host name or IP address is already being monitored.	1395
BTACD - Database verifier messages for SAN database service	1395
BTACD0010I IBM Spectrum Control (Configuration Service) initialized successfully.	1395
BTACD0011E An error occurred while reading properties from file file name	1395
BTACD0012I Properties were successfully read from file file name	1396
BTACD0013E Exception occurred while saving the properties file file name.	1396
BTACD0014E An error was received while attempting to remove a callback key.	1396
BTACD0015E An error was received while attempting to get the database driver driver name.	1396
BTACD0016E An error was received while decrypting the database password.	1397
BTACD0017E There was an error in setting the WAS Admin password.	1397
BTACE - SAN event services messages	1397
BTACE0030I IBM Spectrum Control (Event Service) initialized successfully.	1397
BTACE0031I A SAN Event message was received from: publisher name.	1397
BTACE0032E Missing SNMP destination address. SNMP trap was not sent.	1398
BTACE0033E An error occurred when trying to send an event to the Tivoli Enterprise Console server.	1398
BTACE0034E The Tivoli Enterprise Console server location has not been specified.	1398
BTACE0035E JMSEException: exception	1398
BTACE0037E An error occurred during the process of forwarding an SNMP trap or sending a Tivoli Enterprise Console event.	1398
BTACE0039E Unable to save the SnmpAddress entry to the properties file properties file.	1399
BTACE0040E Unable to remove the SnmpAddress entry from the properties file properties file.	1399
BTACE0041E Unable to save the SAN Domain ID to the properties file properties file.	1399
BTACE0042E Unable to read the SNMP and Tivoli Enterprise Console server address entries from the properties file properties file.	1399
BTACE0507E Messaging Service is not running and cannot be used to subscribe or publish events.	1399
BTACE0508E A proxy to the Messaging Service could not be obtained.	1400
BTACE0509E The proxy to the Messaging Service might not be valid. Cannot publish or subscribe to events.	1400
BTACE0510E Unable to create topic topic name.	1400
BTACE0511E Unable to create a publisher for topic topic name.	1400
BTACE0512E Unable to create a subscriber for topic topic name.	1400
BTACE0513E Unable to create a message.	1401
BTACE0514E Service service name failed to subscribe to topic topic name.	1401
BTACE0515E Publish failed for topic topic name.	1401
BTACS - Service manager messages	1401
BTACS0001I IBM Spectrum Control command line interface initialized successfully.	1402
BTACS0002E The -url requires a host:port argument.	1402
BTACS0003E Required parameters are not present.	1402

BTADS/BTAFM/BTAVM/HWN - Job logging messages	1415
BTADS0000I Starting Discover Process value , with Device Server RUN ID value , and Job ID value .	1431
BTADS0001I Discover Process with Device Server run ID value and job ID value is complete.	1432
BTADS0002I Starting Child Discover Process value with Job ID= value .	1432
BTADS0003I The Child Discover Process with Job ID value has completed with Status= value and Return Code= value .	1432
BTADS0004W The child discovery request with job ID job_id completed with status status_number and return code value.	1432
BTADS0005E The child discovery request with job ID job_id completed with status status_number and return code value.	1432
BTADS0010I Invoking outband scanner value on agent value .	1433
BTADS0011I Outband scanner value on agent value completed successfully.	1433
BTADS0012E Outband Scanner value on agent value failed with return code value .	1433
BTADS0019E An outband scanner failed to capture the scan data.	1433
BTADS0020I Processing value data from agent value .	1433

BTADS0021W Warning encountered while parsing Fabric XML for job: RUN ID= value , and Job ID= value . value .	1434
BTADS0022E Exception encountered while parsing Fabric XML for job: RUN ID= value , and Job ID= value . value .	1434
BTADS0023E Fatal error encountered while parsing Fabric XML for job: RUN ID= value , and Job ID= value . value .	1434
BTADS0024E Error encountered processing scanner value data from agent value . value .	1434
BTADS0025I Running job to discover SMI-S providers through Service Location Protocol: RUN ID= value , Job ID= value .	1435
BTADS0026I Service Location Protocol has found value SMI-S providers.	1435
BTADS0027E Error encountered by a Service Location Protocol job: RUN ID= value , and Job ID= value . value .	1435
BTADS0028W The Device Server Job with RUN ID=: value , Job ID= value , Discover Request= value has been cancelled since it is long running.	1435
BTADS0029I Scanner value data from agent value has not changed since last scan.	1435
BTADS0030I Invoking inband Scanner value on agent value .	1436
BTADS0031I Inband Scanner value on Agent value completed successfully.	1436
BTADS0032E Inband Scanner value failed on agent value with Return Code value .	1436
BTADS0033E Error invoking value on host value .	1436
BTADS0034E Fatal error encountered while persisting the data for job: RUN ID= value , and Job ID= value . value .	1436
BTADS0035E The execution of the job failed with: value .	1437
BTADS0036I Found SNMP Target at value .	1437
BTADS0037E Found SNMP Target at value but it is not persisted in the database. Will NOT perform discovery of information using the address.	1437
BTADS0038I Starting scan of SNMP agents from value to value .	1437
BTADS0039I Starting probe of detected agents.	1437
BTADS0040I Processing of Scanner value data from Agent value completed successfully.	1438
BTADS0041I Discover Process with Device Server RUN ID value and Job ID value completed successfully.	1438
BTADS0042E Discover Process with Device Server RUN ID value and Job ID value failed with return code value .	1438
BTADS0043I Invoking value scanner value on target value .	1438
BTADS0044I value scanner value on target value completed succesfully.	1438
BTADS0045E value Scanner value on target value failed with return code value .	1439
BTADS0046I Processing value data from agent value .	1439
BTADS0047W The value parser encountered a warning while parsing XML for job with RUN ID= value , and Job ID value . The return code from the parser job is value .	1439
BTADS0048E The value parser encountered an exception while parsing XML from job with RUN ID= value , and Job ID= value .The return code from the parser is value .	1439
BTADS0049E The value parser for Device Server job with RUN ID= value , and Job ID= value failed. The return code from the parser is value .	1440
BTADS0050I Service Location Protocol has found SMI-S provider, value , at address value .	1440
BTADS0051I Service Location Protocol has found SMI-S provider, value , at address value , which requires security information to be configured.	1440
BTADS0052W Warning encountered while parsing value data from agent value. value.	1440
BTADS0053E Exception encountered while parsing value data from agent value. value.	1440
BTADS0054E Fatal error encountered while parsing value data from agent value. value.	1441
BTADS0055E Outband Scanner value on agent value encountered the presence of a McData i10k. These devices do not report correctly via SNMP and can only be used with SMI-S provider.	1441
BTADS0056E Errors in Topology XML generator.	1441
BTADS0057E Errors occurred while resolving InterconnectElement and Port relationship.	1441
BTADS0058E Errors in creating an entity.	1442
BTADS0059E The outband agent target address IP address is not a Cisco device or is invalid.	1442
BTADS0060E Outband Scanner value is not responding.	1442
BTADS0062E Encountered SQL error value while persisting some data.	1442
BTADS0063E The execution of the PM BSP invocation failed with: value .	1443
BTADS0063W The performance data collection for the current device is not enabled.	1443
BTADS0064I Starting scan of Storage Subsystems from value to value .	1443
BTADS0065I Outband and inband agents for fabric(s) specified in probe are value	1443
BTADS0066I Could not find scanners for agent value	1443
BTADS0067I Agent value is configured for no SAN calls and so no scanners will be invoked for this particular agent	1444
BTADS0068I Could not retrieve connection information for agent value. Will not be able to invoke scanners for this particular agent	1444
BTADS0069I Added inband scanner job with id value discover request value for agent value.	1444
BTADS0070I Agent value has not discovered any fabrics and will not be used during the probe.	1444
BTADS0071I Invoked inband Scanner value on agent value .	1444
BTADS0072I Successfully received response from agent for job value with request id value .	1445
BTADS0073E Received error response from agent for job value with request id value. Return code is value.	1445
BTADS0074E IP Scan Discovery was canceled due to a hung socket/thread detected. Partial result of the scan will be persisted.	1445
BTADS0075E IP Scan Discovery was canceled due to a hung socket/thread detected.	1445
BTADS0076I IP Scan Discovery has started for DS, XIV, and IBM SONAS subsystems.	1445
BTADS0077I Scanning value out of value IP addresses.	1446
BTADS0078I IP Scan Discovery has started for SVC subsystems.	1446
BTADS0079I IP Scan Discovery for DS and XIV was done.	1446
BTADS0080I IP Scan Discovery for SVC was done	1446
BTADS0081I Inband Scanner value for agent address value is not required for probing switches and will not be used.	1446
BTADS0082W A first run of a switch probe failed. Additional agents will be used.	1446
BTADS0083I The available agents provide a subset of possible features for the probed switch: value	1447
BTADS0084I There are no limitations for probing switch value based on the mix of agents that are configured.	1447
BTADS0085W A problem was encountered when agent assignments were being determined for the probe. All available agents will be used to collect information about the switch.	1447
BTADS0086I The following storage systems were discovered value	1447
BTADS0087I IP Scan Discovery did not find any DS8000, SVC, XIV, and IBM SONAS storage systems in the given IP range.	1447
BTADS0088I IP Scan Discovery finished.	1448

BTADS0089E The Device server is not registered with agent manager. Scanners cannot be used for agent value. value. _____	1448
BTADS0090E There are no agents currently available to probe switch value. _____	1448
BTADS0091I Inband Scanner value for agent address value is currently not running and will not be used. _____	1448
BTADS0092I Inband Scanner value for agent address value is currently disabled from performing fabric functions and will not be used. _____	1449
BTADS0093I Inband Scanner value for agent address value is currently not reachable and will not be used. _____	1449
BTADS0094W The probe for switch value has some limitations. _____	1449
BTADS0095W For switch value some information will not be collected. _____	1449
BTADS0096I The probe limitation can be overcome by configuring an SMI agent to manage fabric value. _____	1449
BTADS0097I The probe limitation can be overcome by configuring SNMP agents to manage switches in fabric value. _____	1450
BTADS0098I The probe limitation can be overcome by configuring a Storage Resource agent to manage fabric value. _____	1450
BTADS0099W The following WWN is not recognized as belonging to a known vendor: value. _____	1450
BTADS0100W Invalid relationships between switches and fabrics were identified. If possible, these relationships will be fixed automatically for the following switches: value. _____	1450
BTADS0101W The discover process that has the Device server run ID value and job ID value completed with one or more warnings. _____	1451
BTADS0102E The probe with the run ID value completed with errors. _____	1451
BTADS0103E No data source is available to probe switch switch_name. _____	1451
BTADS0104E A timeout occurred while processing the request. Try the request again. _____	1451
BTADS0105E A response from the data collector was not received within the specified time. _____	1452
BTADS0106E The requested action on agent agent_name did not complete because the data collector stopped or is not responding. The request failed with error code error_code. _____	1452
BTADS0107W Outband Scanner outband_scanner_name on agent agent_name failed because of another transaction in progress on the switch. _____	1452
BTADS0108E Outband Scanner outband_scanner_name on agent agent_name failed because unexpected data was returned by the switch. Check the trace file for more details. _____	1452
BTADS0109I Outband Scanner outband_scanner_name on agent agent_name did not collect zoning data. _____	1452
BTADS0110I Outband Scanner outband_scanner_name on agent agent_name did not pass write capabilities check. _____	1453
BTADS0111E The probe was unable to collect some details of the switch. _____	1453
BTADS0112E Error encountered while persisting some data. value _____	1453
BTADS0113E Error encountered while processing a probe job. value _____	1453
BTADS0114E The information cannot be saved to the database repository. _____	1454
BTADS0115E The probe failed when collecting information about the resource. The data collector returned the following error status: value. _____	1454
BTAfM0000I Operation op_name processed successfully. _____	1454
BTAfM0100I Initializing Collection. _____	1454
BTAfM0110I Querying the SMI-S provider. _____	1454
BTAfM0113I Collecting for db_table, current_obj of num_objs. _____	1455
BTAfM0114I Probing data for switch switch_name. _____	1455
BTAfM0115I Probing data for port port_name. _____	1455
BTAfM0150I Storing Information. _____	1455
BTAfM0151I The db_table of current_obj num_objs stored. _____	1455
BTAfM0200I Traversing fabric topology. _____	1456
BTAfM0500I The IBM Spectrum Control Device Server service has started successfully. _____	1456
BTAfM0501I The IBM Spectrum Control Device Server service was shut down successfully. _____	1456
BTAfM0502I The IBM Spectrum Control Device Server service provides methods to collect, report and configure the fabric hardware. _____	1456
BTAfM0505I The delete missing function has started. _____	1456
BTAfM0506I The delete missing method was processed in milliseconds milliseconds. _____	1456
BTAfM0723W No blades were discovered for the slot slot. _____	1457
BTAfM2000W Operation op_Name partially processed. _____	1457
BTAfM2501W Unable to shut down Device Server Service smoothly. _____	1457
BTAfM4000E Operation op_Name failed. _____	1457
BTAfM4001E An internal error occurred. _____	1457
BTAfM4002E Could not get requested information due to an internal error - errorMessage _____	1458
BTAfM4100E Mandatory parameter parameter_Name is missing. _____	1458
BTAfM4101E Invalid parameter parameter_name. _____	1458
BTAfM4103E Entity entity_name was not found. _____	1458
BTAfM4104E Attribute attribute_name was not found. _____	1458
BTAfM4105E Computer computer_name was not found. _____	1459
BTAfM4106E Fabric fabric_name was not found. _____	1459
BTAfM4107E Switch switch_name was not found. _____	1459
BTAfM4108E Port port_name was not found. _____	1459
BTAfM4109E Zone set zoneset_name was not found. _____	1459
BTAfM4110E Zone zone_name was not found. _____	1459
BTAfM4111E Zone alias zone_alias_name was not found. _____	1460
BTAfM4112E Zone member zone_member_name was not found. _____	1460
BTAfM4113E Subsystem subsystem_name was not found. _____	1460
BTAfM4114E Host Bus Adapter HBA_name was not found. _____	1460
BTAfM4115E Node node_name was not found. _____	1460
BTAfM4116E Link from port from_port_name to port to_port_name was not found. _____	1460
BTAfM4117E Hub hub_name was not found. _____	1461
BTAfM4118E Router router_name was not found. _____	1461
BTAfM4119E Bridge bridge_name was not found. _____	1461
BTAfM4120E LUN LUN_name was not found. _____	1461
BTAfM4140E Agent Agent_name was not found. _____	1461
BTAfM4141E Scanner scanner_name on agent agent_name was not found. _____	1461

BTAFM4142W Agent agent_name was ignored because the switch switch_name was probed by agent agent1_name.	1462
BTAFM4150E Indexed properties property_name don't match.	1462
BTAFM4180E Agent to gather sensor and event data is not available for the switch switch_name.	1462
BTAFM4200E Credentials not found.	1462
BTAFM4300E The connection to the SMI agent for switch switch_name could not be made.	1462
BTAFM4301E The invocation of CIM method method_name failed on SMI-S provider SMI-S provider name. The return code is return_code.	1463
BTAFM4302E The invocation of CIM method method_name failed on SMI-S provider SMI-S provider name with the following exception text: exception_text.	1463
BTAFM4303E Received unexpected values from SMI-S provider SMI-S provider name .	1463
BTAFM4304E SMI agent SMI agent name can not contact switch switch_name.	1463
BTAFM4305E The CIM method method_name is not supported on the switch switch_name.	1464
BTAFM4306E Could not create connection to SMI-S provider SMI-S provider name . Reason: reason.	1464
BTAFM4307E The username user_name or password is wrong on SMI-S provider SMI-S provider name.	1464
BTAFM4308I Could not create connection to SMI-S provider SMI-S provider name . Reason: reason. An alternate SMI-S provider will be used.	1464
BTAFM4501E No agent is available to configure the zoning on the fabric with ID fabric_name.	1465
BTAFM4502E The fabric with ID fabric_name is currently locked by another client of IBM Spectrum Control.	1465
BTAFM4503E A token for fabric fabric_name has expired for client client_name.	1465
BTAFM4504E The transaction for fabric fabric_name has expired.	1465
BTAFM4505E Another transaction is in progress for fabric fabric_name.	1465
BTAFM4506E Zone set zoneset_name already exists.	1465
BTAFM4507E Zone zone_name already exists.	1466
BTAFM4508E Zone alias zone_alias_name already exists.	1466
BTAFM4509E Zone member zone_member_name already exists.	1466
BTAFM4510E Another job is in progress for fabric fabric_name.	1466
BTAFM4550E The Device Server encountered an error accessing the database.	1466
BTAFM4600E Unable to start the Device Server service.	1467
BTAFM5000E Step failed after collecting Count of collected entities entities for switch switch where entities exist. Continuing with next step.	1467
BTAFM5001E No set of fabrics or switches was defined for this probe.	1467
BTAFM5002E The SMI agents SMIURL returned an error or can no longer contact the switches.	1467
BTAFM5003E Requests to an SMI agent did not correctly collect a set of switches for fabric fabric identity.	1468
BTAFM5004E No switch retrieved from the SMI agent for fabric fabric identity.	1468
BTAFM5005E No switch found for fabric fabric identity.	1468
BTAFM5006E No switch retrieved from database.	1468
BTAFM5007E Failed to get CIM entity for fabric fabric_name.	1469
BTAFM5008E Failed to get CIM entity for switch switch_name.	1469
BTAFM5009E Failed to enumerate CIM entity Entity class name.	1469
BTAFM5010E SMI-S provider is not available.	1469
BTAFM5011E Failed to get blade for switch Switch name.	1470
BTAFM5012E Failed to get physicalpackage for blade with slot number Blade slot name.	1470
BTAFM5013E Blade serial number is NULL.	1470
BTAFM5014E Step failed after collecting Count of collected entities entities for fabric fabric where entities exist. Continuing with next step.	1470
BTAFM5015E Data source could not be retrieved from the IBM Spectrum Control database for fabric fabric where data source exists.	1471
BTAFM5016E The selected data source could not be contacted for fabric fabric where data source exists.	1471
BTAFM5017E Failed to get fabric for switch Switch name.	1471
BTAFM5018E Failed to get CIM entity for port port_name.	1471
BTAFM5019E Failed to get switch for port port_name.	1472
BTAFM5020E Failed to get blade for port port_name.	1472
BTAFM5021E Failed to get CIM entity for blade blade_name.	1472
BTAFM5022E Failed to get switch for blade blade_name.	1472
BTAFM5023E Failed to discover Fabric and Switch.	1472
BTAFM5024E The data source for switch switch_name was not retrieved from the database repository.	1473
BTAFM0600I Count of collected entities blades collected for switch switch where entities exist.	1473
BTAFM0601I Starting collection of switch blades for switch switch identifier.	1473
BTAFM0602I Collection of switch blades completed. Count of collected entities entities collected in total for switch switch identifier.	1473
BTAFM0603I Starting collection of switch fcports for switch switch identifier.	1474
BTAFM0604I Collection of switch fcports completed. count of collected entities entities collected in total for switch switch identifier.	1474
BTAFM0605I Start probing switch entities switches.	1474
BTAFM0606I Start topology probing for fabric fabric entity.	1474
BTAFM0609I Count of entities fcports collected for switch switch where entities exist.	1474
BTAFM0614I The probe task is to probe topology and zone. The probe algorithm is CIM association.	1475
BTAFM0616I The probe policy involves discovering segmented or merged fabrics.	1475
BTAFM0617I The probe policy doesn't involve discovering segmented or merged fabrics.	1475
BTAFM0618I The probe task is to probe topology. The probe algorithm is CIM association.	1475
BTAFM0620I Start zone probing for fabric fabric entity.	1475
BTAFM0621I Starting collection of zone set for switch switch entity.	1476
BTAFM0622I Starting collection of zone for switch switch entity.	1476
BTAFM0623I Starting collection of zone alias for switch switch entity.	1476
BTAFM0624I Starting collection of zone member from zone alias for switch switch entity.	1476
BTAFM0625I Starting collection of zone member and zone alias from zone for switch switch entity.	1476
BTAFM0626I Starting collection of zone member from zone for switch switch entity.	1477
BTAFM0627I Starting collection of zone set for fabric fabric entity.	1477
BTAFM0628I Count of collected entities zone sets collected.	1477
BTAFM0629I Collection of zone set completed. Count of collected entities entities collected in total for fabric fabric entity.	1477

BTAFM0630I Starting collection of zone for fabric fabric entity.	1477
BTAFM0631I Count of collected entities zones collected.	1477
BTAFM0632I Collection of zone completed. Count of collected entities entities collected in total for fabric fabric entity.	1478
BTAFM0633I Starting collection of zone alias for fabric fabric entity.	1478
BTAFM0634I Count of collected entities zone aliases collected.	1478
BTAFM0635I Collection of zone alias completed. Count of collected entities entities collected in total for fabric fabric entity.	1478
BTAFM0636I Starting collection of zone member from zone alias for fabric fabric entity.	1478
BTAFM0637I Starting collection of zone member and zone alias from zone for fabric fabric entity.	1479
BTAFM0638I Starting collection of zone member from zone for fabric fabric entity.	1479
BTAFM0639I Collection of zone member completed. Count of collected entities entities collected in total for fabric fabric entity.	1479
BTAFM0640I Zone probe will discover both active and inactive zone definitions at selected data source datasource name for zone probe.	1479
BTAFM0641I Zone probe will discover only active zone sets at data source datasource name for zone probe.	1479
BTAFM0654I The port is not switch port.	1480
BTAFM0655I The switch profile doesn't support this switch switch_name. No further process to probe this switch.	1480
BTAFM0656I Start enumerating entity of association between fabric and zone set at selected data source Url entity.	1480
BTAFM0657I Start enumerating entity of association between fabric and zone at selected data source Url entity.	1480
BTAFM0658I Start enumerating entity of association between fabric and zone alias at selected data source Url entity.	1480
BTAFM0659I Start enumerating entity of association between switch and zone set at selected data source Url entity.	1481
BTAFM0660I Start enumerating entity of association between switch and zone at selected data source Url entity.	1481
BTAFM0661I Start enumerating entity of association between switch and zone alias at selected data source Url entity.	1481
BTAFM0662I Start enumerating associations between virtual fabric and zoning entities at selected data source Url entity.	1481
BTAFM0663I Starting collection of switch control processor blades for switch switch identifier.	1481
BTAFM0664I Count of collected entities control processor blades collected for switch switch where entities exist.	1482
BTAFM0665I Collection of switch control processor blades completed. Count of collected entities entities collected in total for switch switch identifier.	1482
BTAFM0666I Checksums for the active and defined Zone Database could not be updated for fabric entity.	1482
BTAFM0667E Job id or request id is missing for a SRA job that is been processed.	1482
BTAFM0668E Command and/or job timestamp is missing for job id with request id .	1482
BTAFM0669I job id with request id was is not found. Device server may have been restarted after job was created.	1483
BTAFM0670E could not retrieve output file for job id with request id .	1483
BTAFM0671E Another probe of fabric The Name+Nameformat of the fabric is already in progress.	1483
BTAFM0672E Device server is not registered with agent manager. Will not be able to invoke scanner on host .	1483
BTAFM0673E There are no agents that are currently available to probe fabric .	1483
BTAFM0674W No fabric found for event source that is associated with switch with IP address .	1484
BTAFM0675E Unable to start parsing of SRA fabric probe data for SRA job id request id file name .	1484
BTAFM0676E Error parsing SRA fabric probe data for SRA job id request id file name .	1484
BTAFM0677E Unable to connect to SNMP port (another application may already be connected and forwarding messages).	1484
BTAFM0678I The Name of the switch switch was removed.	1484
BTAFM0679I The The Name+Nameformat of the fabric fabric was removed.	1485
BTAFM0680E The Name of the switch switch was not removed because it is not missing.	1485
BTAFM0681E The The Name+Nameformat of the fabric fabric was not removed because it is not missing.	1485
BTAFM0682E An error occurred while checking for access to the database to save new zoning information for fabric to the database.	1485
BTAFM0683E Unable to access the database to save zoning information for fabric . Another job is currently saving new zoning information to the database for the same fabric.	1485
BTAFM0684I The job is waiting to access the database to save new zoning information for fabric . Another job is currently saving zoning information to the database for the same fabric.	1486
BTAFM0685W Host/IP Address is not a switch.	1486
BTAFM0686W Switch is not a supported switch.	1486
BTAFM0687W The switch does not respond to SNMP queries.	1486
BTAFM0688W Cannot communicate with host or IP address .	1487
BTAFM0689W No ports were discovered for the switch .	1487
BTAFM0690I Collection of data from trunks is completed. Data was collected from count of collected entities trunks.	1487
BTAFM0691I Starting collection of data from trunks for switch switch identifier.	1487
BTAFM0692I Count of entities trunks collected for switch switch where entities exist.	1487
BTAFM0692E A response from the data collector was not received within the specified time.	1487
BTAFM0693E A response from the data collector was not received. The request failed with return code return_code	1488
BTAFM0694W Zoning data cannot be collected because there is a transaction in progress on the switch key	1488
BTAFM0695E The switch key is returning unexpected data.	1488
BTAFM0696E Zone set zoneset_name is already active.	1488
BTAFM0697E Zone set zoneset_name is already inactive.	1488
BTAFM0698E On the switch switch_name VSAN vsan_name was not found.	1489
BTAFM0699E The switch key did not return zoning data.	1489
BTAFM0700E Duplicate entries for the same switch: switch.	1489
BTAFM0701E Current active full zone configuration is not synchronized with the zone configuration on the switch switch_name for VSAN vsan_name .	1489
BTAFM0702E You cannot monitor Brocade Access Gateway switches without Network Advisor.	1489
BTAFM0703I Waiting for probes of other Access Gateway switches to complete.	1490
BTAFM0704W Distributing zone configuration across all the switches for VSAN vsan_name did not succeed on the switch switch_name .	1490
BTAFM0705W Zone data collection after zone changes were made failed on the switch switch_name .	1490
BTAFM0706E The fabric probe was unable to collect some details of the blades on the switches.	1490
BTAFM0707I You cannot use IBM Spectrum Control to make zoning changes for provisioning on switch switch_name.	1490
BTAFM0708E The probe was unable to collect some details of the switches.	1491
BTAFM0709I Started to process information for fabric fabric_name.	1491
BTAFM0710I Started to process information for switch switch_name.	1491

BTAFM0711I Started to process information for discovered switches.	1491
BTAFM0712I Started to process information for a switch blade.	1492
BTAFM0713I Started to process information for a switch zone set.	1492
BTAFM0714I Started to process information for switch ports.	1492
BTAFM0715E Error occurred while processing information for fabric fabric_name.	1492
BTAFM0716E Error occurred while processing information for virtual fabric virtual_fabric_name.	1492
BTAFM0717E Error occurred while processing information for switch switch_name.	1492
BTAFM0718E Error occurred while processing information for discovered switches.	1493
BTAFM0719E Error occurred while processing information for logical switches.	1493
BTAFM0720E Error occurred while processing information for active zone set active_zone_set_name.	1493
BTAFM0721E Error occurred while processing information for inactive zone set inactive_zone_set_name.	1493
BTAFM0722E Error occurred while processing information for port port_name.	1493
BTAQE1107E InbandScanHandler failed to start InbandScanner scanner name on managed host target.	1494
BTAQE1108E InbandScanHandler failed to get callback information for InbandScanner scanner name on managed host target.	1494
BTAQE1112E During an outband scan, the scanner scanner name was unable to identify the target host target.	1494
BTAQE1113E Unable to invoke an Outband scan scanner name on target target.	1494
BTAQE114E OutbandScannerHandler received invalid callback information for Outband scanner scanner name on target target.	1495
BTAQE1115E The outband scanner scanner name did not return the SAN ID on target target.	1495
BTAVM0001I The operation Name of the operation processed successfully.	1495
BTAVM0002I The Web service call Name of the operation processed successfully.	1495
BTAVM0003I Data source Name of the datasource successfully added.	1496
BTAVM0004I Data source Name of the datasource successfully deleted.	1496
BTAVM0005I Data source Name of the datasource successfully modified.	1496
BTAVM0006I Discovery on data source Name of the datasource has started.	1496
BTAVM0007I Discovery on data source Name of the datasource completed successfully.	1496
BTAVM0008I Probe of hypervisor Name of the Hypervisor has started.	1497
BTAVM0009I Probe of hypervisor Name of the Hypervisor completed successfully.	1497
BTAVM0010I A connection test to data source Name of the data source has started.	1497
BTAVM0011I The Connection test to data source Name of the data source completed successfully.	1497
BTAVM0012I Hypervisor Name of the Hypervisor discovered/rediscovered.	1497
BTAVM0013I Discovery: Hypervisor Name of the hypervisor will not be discovered as it is managed by another data source.	1498
BTAVM0014I Discovery: Hypervisor Name of the hypervisor will not be discovered as it itself is registered as a data source.	1498
BTAVM0015I Collection of the physical storage configuration for hypervisor Name of the hypervisor has started.	1498
BTAVM0016I Collection of the physical storage configuration for hypervisor Name of the hypervisor completed successfully.	1498
BTAVM0017I Collection of the logical storage configuration for hypervisor Name of the hypervisor has started.	1498
BTAVM0018I Collection of the logical storage configuration for hypervisor Name of the hypervisor completed successfully.	1499
BTAVM0019I Collection of the virtual machines configuration for hypervisor Name of the hypervisor has started.	1499
BTAVM0020I Collection of the virtual machines configuration for hypervisor Name of the hypervisor completed successfully.	1499
BTAVM0021I The probe of name of the hypervisor found number of physical disks physical disks.	1499
BTAVM0022I The probe of name of the hypervisor found number of logical volumes logical volumes.	1499
BTAVM0023I The probe of name of the hypervisor found number of virtual machines virtual machines.	1500
BTAVM0024I The Name of the hypervisor hypervisor was removed.	1500
BTAVM0025I VMWare Cluster Name of the Cluster discovered/rediscovered.	1500
BTAVM1301I The probe of name of the hypervisor could collect partial information only for the disk with the device name Device name of the disk.	1500
BTAVM1302I LUN correlation is not supported for disk with device name Device name of the disk, vendor: Vendor name, model: model name, for hypervisor hypervisor name.	1500
BTAVM1503E An internal error occurred: Text describing the internal error.	1501
BTAVM2001E The mandatory parameter Name of the mandatory parameter which is missing is missing.	1501
BTAVM2002E Invalid parameter Name of the parameter which was invalid.	1501
BTAVM2003E A database error was encountered during database query or insert.	1501
BTAVM2004E Cannot connect to the database repository.	1501
BTAVM2006E The operation Name of the operation that failed failed for the following reason: Reason of the failure.	1502
BTAVM2007E The Web service call Name of the operation failed for the following reason: Reason of the failure.	1502
BTAVM2008E The product Name of the unsupported product is not supported.	1502
BTAVM2010E The user name or password is invalid for Address of the host	1502
BTAVM2011E The operation Name of the timed out operation could not complete within the time limit of Timeout threshold in milliseconds milliseconds.	1503
BTAVM2012E An error occurred while trying to establish secure communication over SSL.	1503
BTAVM2013E The Add Device wizard could not add the Name of the data source data source.	1503
BTAVM2014E The deletion of data source Name of the data source failed.	1503
BTAVM2015E The modification of data source Name of the data source failed.	1504
BTAVM2016E Discovery on data source Name of the datasource failed.	1504
BTAVM2017E Probe of the hypervisor Name of the Hypervisor failed.	1504
BTAVM2018E IBM Spectrum Control can't connect to the data source Name of the datasource.	1504
BTAVM2201E Probe: An error occurred during the collection of the physical storage configuration.	1505
BTAVM2202E Probe: An error occurred during the collection of the logical storage configuration.	1505
BTAVM2204E Probe: An error occurred during the collection of the virtual machine configuration.	1505
BTAVM2206E Discovery: the hypervisor Name of the hypervisor will not be discovered because its version is not supported.	1505
BTAVM2207E Calculation of the summary data for the hypervisor Name of the hypervisor failed.	1506
BTAVM2208E Unable to obtain the hypervisor version(s) from the datasource Name of the datasource.	1506
BTAVM2209E Unable to obtain information about other Virtual Centers managing the hypervisor(s) of datasource Name of the datasource.	1506
BTAVM2210W Error getting LUN definition data for the disk with the device name Device name of the disk, storage subsystem vendor: Vendor name, model: model name, for hypervisor hypervisor name.	1506

BTAVM2211E Probe: Virtualization Manager failed to get the VMWare VI data source for the hypervisor Name of the hypervisor from the database.	1507
BTAVM2212E Probe: The hypervisor Name of the hypervisor is not available on the VMWare VI datasource Name of the datasource.	1507
BTAVM2213E Data source Name of the datasource is disconnected from Virtual Center.	1507
BTAVM2214E The probe job encountered an NFS file system while probing ESX server {0}. IBM Spectrum Control currently does not support probes of ESX servers with NFS file systems. The probe job for this ESX server has been stopped. Probes of other ESX servers that are included in this probe job will continue.	1507
BTAVM2215W Unsupported storage subsystem disk with device name Device name of the disk, vendor: Vendor name, model: model name, for hypervisor hypervisor name with hypervisor version less than 3.5.0.	1507
BTAVM2216E Unable to get keystore instance.	1508

BTAVM2226E Certificate already exists in keystore.	1510
BTAVM2227E host_address hypervisor is already being monitored and could not be added.	1510
BTAVM2228E Missing host name.	1510
BTAVM2229E Missing certificate.	1510
BTAVM2230E Cannot create keystore directory.	1510
BTAVM2231E Cannot download the certificate from Data Source Name of the data source.	1511
BTAVM2232E Cannot connect to the Name of the data source data source.	1511
BTAVM2233E Cannot download the certificate from the port.	1511
BTAVM2234E The hypervisor name hypervisor was not removed because IBM Spectrum Control is running other actions on the device.	1511
BTAVM2235E Unable to obtain the cluster(s) from the datasource Name of the datasource.	1511
BTAVM2236W Subsequent steps of probe process may not be able to collect data for the hypervisor Name of the hypervisor because the hypervisor is in critical state.	1512
BTAVM2237E Datastore Browser Task failed for hypervisor Name of the hypervisor, datastore Name of the datastore with error: Error	1512
BTAVM2238E The registration of the vSphere Web Client extension for IBM Spectrum Control has started on Name of the vCenter server.	1512
BTAVM2239E The registration of the vSphere Web Client extension for IBM Spectrum Control did not extract the extension package.	1512
BTAVM2240E The registration of the vSphere Web Client extension for IBM Spectrum Control did not complete while updating the VASA web archive file, vasa.war, with the IBM Spectrum Control server configuration.	1513
BTAVM2241E The registration of the vSphere Web Client extension for IBM Spectrum Control completed.	1513
BTAVM2242E Unable to register IBM Spectrum Control as an extension on the vCenter server Name of the vCenter server. The validation of input values did not complete.	1513
BTAVM2243E Unable to register IBM Spectrum Control as an extension on the vCenter server Name of the vCenter server. Could not authenticate with the vCenter server.	1513
BTAVM2244E The registration of the vSphere Web Client extension for IBM Spectrum Control did not complete.	1514
BTAVM2245E Unable to connect to the vCenter Server Name of the datasource.	1514
BTAVM2246E Unable to configure the vCenter Server.	1514
BTAVM2247E The registration of the vSphere Web Client extension for IBM Spectrum Control did not delete the temporary directory Name of the directory.	1514
BTAVM2248E The registration of IBM Spectrum Control as a VASA provider did not complete.	1515
BTAVM2249E Automatic registration of IBM Spectrum Control as a VASA provider is not supported for vCenter Server version 5.0 and earlier.	1515
BTAVM2250E IBM Spectrum Control is already registered as a VASA provider for vCenter Server server_name. Register IBM Spectrum Control as a VASA provider manually in the vSphere Web Client to update the credentials.	1515
BTAVM2251E One or more third-party VASA providers are already registered with the vCenter Server. IBM Spectrum Control VASA provider was not registered. Register IBM Spectrum Control as a VASA provider manually.	1515
BTAVM2252E The registration of IBM Spectrum Control as a VASA provider has started on Name of the vCenter server.	1516
BTAVM2253E The registration of IBM Spectrum Control as a VASA provider has completed.	1516
BTAVM2254E The registration of the vSphere Web Client extension for IBM Spectrum Control did not complete. The current session is invalid.	1516
BTAVM2255E The registration of IBM Spectrum Control as a VASA provider did not complete. The current session is invalid.	1516
BTAVM2256W Could not determine the host for VM with ID: host id and Name: Vendor name. Check if the same mac address is used on other computers.	1516
BTAVM2257I Found number of files files on name of datastore of name of the hypervisor.	1517
BTAVM2258I The probe of name of the hypervisor found number of controllers controllers.	1517
BTAVM2259I Collecting file system details for hypervisor Name of the hypervisor.	1517
BTAVM2260I Collecting list of files for hypervisor Name of the hypervisor.	1517
BTAVM2261I Collecting logical volumes for hypervisor Name of the hypervisor.	1517
BTAVM2262I Collecting disk partition for hypervisor Name of the hypervisor.	1518
BTAVM2263I Files details for Name of the datastore being collected by id of the Hypervisor.	1518
BTAVM2264I Files details for Name of the datastore were collected by id of the Hypervisor on timestamp.	1518
BTAVM2265E Invalid host name or IP address.	1518
BTAVM2266E The connection information cannot be updated because it points to another device.	1518
BTAVM2268E The connection information cannot be updated because IBM Spectrum Control cannot determine if the hypervisor is managed by the Name of the data source data source.	1519
BTAVM2269E The connection information cannot be updated because a data source with this host name or IP address is already present.	1519
BTAVM2270E The connection information cannot be updated because it doesn't point to a data source of the same type (vCenter/ESX).	1519
BTAVM2271W The hypervisor Name of the Hypervisor cannot be discovered because its connection state is "Connection State".	1519
BTAVM2272E The user User Name does not have the privilege to browse the datastore Name of the Datastore.	1519
HWN020001I Operation Name of the operation processed successfully.	1520
HWN020002E Mandatory parameter Name of the mandatory parameter which is missing missing	1520
HWN020003E Invalid parameter Name of the parameter which was invalid	1520

HWN020101E The external process terminated unexpectedly.	1520
HWN020102W The external process was canceled per users request.	1520
HWN020103E The external process exceeded the timeout limit and was canceled.	1521
HWN020104E The external process could not be started.	1521
HWN020105E The data collector is not responding to the server.	1521
HWN020106E An external process was cancelled by the data collector.	1521
HWN021503E The action cannot be completed	1521
HWN021504E Entity The ID of the entity was not found.	1522
HWN021508E Credentials not found	1522
HWN021514E The invocation of CIM method Name of method failed on SMI-S provider Name of SMI-S provider . The return code is Return code of method	1522
HWN021515E The invocation of CIM method Name of method failed on SMI-S provider Name of SMI-S provider with the following exception text: Exception text	1522
HWN021516E The LSS specified LSS name on subsystem Name of subsystem is already at the maximum volume number (255). Volume creation can not be done on this LSS, please select a different one.	1523
HWN021517E The connection to SMI-S provider for storage system VPD of the storage system could not be made.	1523
HWN021520E The attribute Name of the attribute was not found.	1523
HWN021522E Host port The WWPN of the host port not assigned to Volume The PK of the volume	1523
HWN021524E Indexed Properties Names don't match	1523
HWN021529E An SMI-S provider has reported unexpected values: IP and port of SMI-S provider.	1524
HWN021530E The Volume - Port mapping can not be created. There are existing mappings that prevent this combination. VolumeCOP: The ID of the volume , Port: The WWPN of the port that should be mapped to the volume	1524
HWN021531E SMI-S provider The IP and port of the SMI-S provider can not reach storage system The VPD of the storage system	1524
HWN021535E There is not enough space left in the storage pool The primary key of the Pool on storage system The VPD of the storage system to create a volume of The requested volume size bytes.	1524
HWN021536E The CIM method The CIM method that is not supported. is not supported on the storage system The VPD of the storage system	1525
HWN021537E Could not create connection to SMI-S provider The IP and port for the SMI-S provider..Reason: The exception returned by the SMI-S provider.	1525
HWN021538E The username The username that was used to connect to the SMI-S provider. or password is wrong on SMI-S provider The IP and port for the SMI-S provider.	1525
HWN021539E The SVC with IP The IP of the SVC. which is managed by SMI-S provider The IP and port for the SMI-S provider. can not be discovered. The status is The status of the SVC. .	1525
HWN021540E The invocation of CIM method Name of method failed on SMI-S provider Name of SMI-S provider . The return code is Return code of method. Details provided by the SMI-S provider : Description of Returncode	1525
HWN021600W Operation Name of the operation. partially processed.	1526
HWN021601E The operation(s) Operation_names failed.	1526
HWN021602E It is necessary to specify target ports for storage device VPD of the storage subsystem	1526
HWN021603W More storage volumes and ports than specified will loose access	1526
HWN021604E WWPNs and storage volumes to be unassigned not completely specified. Assigned WWPNs: All WWPNs that are assigned to the volumes in the host port collection , missing WWPNs: The WWPNs that are assigned but were not specified in the input parameter in the method unassign . Storage volumes to be unassigned not completely specified. Assigned storage volumes: Lists all storage volumes that are really assigned to the WWPNs. }, missing storage volumes: The storage volumes that are really assigned but were not specified in the input parameter in the method unassign	1526
HWN021605I More storage volumes and ports than specified will gain access.	1527
HWN021606E WWPNs and storage volumes to be assigned not completely specified. Missing WWPNs: The WWPNs that need to be assigned but were not specified in the input parameter. . Storage volumes to be assigned not completely specified. Missing storage volumes: The storage volumes that need to be assigned but were not specified in the input parameter.	1527
HWN021607E The client type the client type with description the client description is not supported on SMI-S provider the SMI-S provider IP and port for storage subsystem the subsystem ID of volumes the volumeIDs of the subsystem which were passed in	1527
HWN021608E The target port the target port ID does not belong to storage subsystem the subsystem ID of volumes the volumeIDs of the subsystem which were passed in	1528
HWN021609E There is not enough space left in the storage pool The primary key of the Pool on storage system The VPD of the storage system to create The number of volumes to create volumes of The total size needed bytes total.	1528
HWN021610E The specified size The size of the volume to create is not supported on pool The storage pool ID Size has to be dividable by Divisor returned by getSupportedSizeRange and in between Minimum returned by getSupportedSizeRange and Maximum returned by getSupportedSizeRange	1528
HWN021611E Volume The volume ID has mappings, it can not be deleted.	1528
HWN021612E The mapping between volume The volume ID and port The initiator port wwpn exists already	1528
HWN021613E The WWPN The WWPN not found can not be found on subsystem The subsystem	1529
HWN021614E The WWPNs The WWPNs without mappings have no mappings on storage system The storage system	1529
HWN021615E WWPNs WWPNs that can not share mappings can not share mappings on storage system Storage system}. There are existing mappings that prevent this.	1529
HWN021616E Volumes VolumeIDs can not share mappings on storage system Storage system }. There are existing mappings that prevent this.	1529
HWN021617E The stored data for storage system The storage system is not in sync with the environment. Rerun data collection.	1530
HWN021618E Modifying target ports is not supported by subsystem the subsystem .	1530
HWN021619E Modifying the target ports for mapping of initiator port initiator port WWPN and volume volume name will also modify the target ports of the following mappings: port - volume list	1530
HWN021620I Modifying the target ports for mapping of initiator port initiator port WWPN and volume volume name will modify the target ports of more mappings than specified.	1530
HWN021621E It is not supported to modify the target ports of existing mappings and create new mappings in one step. Modify the existing mappings first and then create the new mappings. Existing mappings: port - volume list	1530
HWN021622I Started modification of the assignment of volume VolumeID on subsystem Subsystem to initiator port WWPN . Target ports to add: target ports to add Target ports to remove: target ports to remove	1531
HWN021623I Finished modification of the assignment of volume VolumeID on subsystem Subsystem to initiator port WWPN . Target ports to add: target ports added Target ports to remove: target ports removed	1531
HWN021624E The modification of the assignment of volume VolumeID on subsystem Subsystem to initiator port WWPN failed. Target ports to add: target ports to add Target ports to remove: target ports to remove	1531
HWN021650E A timeout occurred while connecting to SMI-S provider SMI-S provider IP and port.	1531

HWN021651E Job on SMI-S provider SMI-S provider IP and Port in format IP:Port failed. Job Status: Job status . Error code is Error code , error description: Error description . Check IBM Spectrum Control and SMI-S provider logs.	1532
HWN021652E The process has timed out. Check the IBM Spectrum Control log files for more information.	1532
HWN021653E The attribute Name of the attribute was not found.	1532
HWN021654E Pool ID was not found.	1532
HWN021655E Volume ID The ID of the volume was not found.	1532
HWN021656E Port ID The ID of the port was not found.	1533
HWN021657E Subsystem ID The ID of the subsystem was not found.	1533
HWN021658E Managed Disk ID The ID of the MDisk was not found.	1533
HWN021659E SMI-S provider The ID of the SMI-S provider was not found	1533
HWN021660E IO Group The SVC IO Group was not found.	1533
HWN021661E Extent The storage extent external key was not found.	1533
HWN021662E Physical volume The physical volume external key was not found.	1534
HWN021670E The client type the client type with description the client description is not unique on SMI-S provider the SMI-S provider IP and port } for storage subsystem the subsystem ID of volumes the volumeIDs of the subsystem which were passed in	1534
HWN021671I The storage system The storage system was deleted from the database	1534
HWN021672E The storage system name storage system was not removed because other monitoring actions are running on the device.	1534
HWN021673E The probe job on SMI-S provider SMI-S provider IP and Port in format IP:Port did not complete within the time limit of Microseconds microseconds. The job is Percent complete percent complete. Check the SMI-S provider log for job status. Job information: JobCOP . Run the probe job again after the current job has completed.	1534
HWN021674E Job on SMI-S provider SMI-S provider IP and Port in format IP:Port returned unexpected results. Job information: JobCOP Job status: JobState , status description: JobStatus Check SMI-S provider log. Redo probe if the job completed.	1535
HWN021675I Started creation of volume with size Size in pool Pool on subsystem Subsystem	1535
HWN021676I Volume creation completed successfully. New volume VolumeID created with size Size in pool Pool on subsystem Subsystem .	1535
HWN021677E Volume creation failed. The volume of size Size in pool Pool on subsystem Subsystem could not be created.	1535
HWN021678I Started assignment of volume VolumeID on subsystem Subsystem to initiator port WWPN .	1536
HWN021679I Finished assignment of volume VolumeID on subsystem Subsystem to initiator port WWPN .	1536
HWN021680E The assignment of volume VolumeID on subsystem Subsystem to initiator port WWPN failed.	1536
HWN021681I Started unassignment of volume VolumeID on subsystem Subsystem to initiator port WWPN .	1536
HWN021682I Finished unassignment of volume VolumeID on subsystem Subsystem to initiator port WWPN .	1536
HWN021683E The unassignment of volume VolumeID on subsystem Subsystem to initiator port WWPN failed.	1537
HWN021684I Started deletion of volume VolumeID on subsystem Subsystem .	1537
HWN021685I Volume deletion completed successfully. Volume VolumeID on subsystem Subsystem was deleted.	1537
HWN021686E Volume deletion failed. Volume VolumeID on subsystem Subsystem could not be deleted.	1537
HWN021687I Started modification of Pool Pool display name on subsystem Subsystem display name .	1537
HWN021688I Pool modification completed successfully. Pool Pool display name on subsystem Subsystem display name was modified.	1538
HWN021689E Pool modification failed. Pool Pool display name on subsystem Subsystem display name could not be modified.	1538
HWN021690I Started creation of number volumes volumes with size Size in pool Pool on subsystem Subsystem	1538
HWN021691I Created number volumes out of total number volumes volumes with size Size in pool Pool on subsystem Subsystem	1538
HWN021692E Volume creation failed. Created number volumes out of total number volumes volumes with size Size in pool Pool on subsystem Subsystem	1538

HWN023010I Virtual disk vdisk name was successfully migrated from storage pool source pool name to storage pool target pool name.	1558
HWN023011W The recommendation for virtual disk vdisk name contains a virtual disk that does not exist in the source storage pool source pool name or the target storage pool target pool name.	1558
HWN023012W The recommendation for virtual disk vdisk name contains a non-mirrored virtual disk that is now a mirrored virtual disk.	1558
HWN023013W The recommendation for virtual disk vdisk name contains a mirrored virtual disk that is now a non-mirrored virtual disk.	1558
HWN023014I The recommendation for virtual disk vdisk name requires more space on target pool target pool name to be processed.	1559
HWN023015I Virtual disk vdisk name will now be migrated from storage pool source pool name to storage pool target pool name.	1559
HWN023016I Successfully added virtual disk copy to virtual disk vdisk name.	1559
HWN023017I Synchronization for virtual disk vdisk name has completed synchronization percent% and requires about seconds to complete seconds to complete.	1559
HWN023018I Synchronization for virtual disk vdisk name has completed.	1559
HWN023019I Successfully removed a virtual disk copy from virtual disk vdisk name.	1560
HWN023020I Successfully changed the synchronization rate of virtual disk vdisk name to syncrate%.	1560
HWN023021I Successfully changed the primary copy of virtual disk vdisk name.	1560
HWN023022E There is no space available on target pool target pool name to migrate the virtual disk vdisk name.	1560
HWN023023E Unable to submit request to add vdisk copy command for virtual disk vdisk name due to rc (rc).	1560
HWN023024E Unable to complete request to add vdisk copy command for virtual disk vdisk name due to rc (rc).	1561
HWN023025E Unable to submit request to get vdisk synchronization progress for virtual disk vdisk name due to rc (rc).	1561
HWN023026E Unable to complete request to get vdisk synchronization progress for virtual disk vdisk name due to rc (rc).	1561
HWN023027E Unable to submit request to remove vdisk copy command for virtual disk vdisk name due to rc (rc).	1561
HWN023028E Unable to complete request to remove vdisk copy command for virtual disk vdisk name due to rc (rc).	1562
HWN023029E Unable to submit request to change the synchronization rate for virtual disk vdisk name due to rc (rc).	1562
HWN023030E Unable to complete request to change the synchronization rate for virtual disk vdisk name due to rc (rc).	1562
HWN023031E Unable to submit request to change the primary copy for virtual disk vdisk name due to rc (rc).	1562
HWN023032E Unable to complete request to change the primary copy for virtual disk vdisk name due to rc (rc).	1563
HWN023033E The request failed. Message from failed request: message.	1563
HWN023034E The Optimization Automation job completed with errors in the recommendations.	1563
HWN023035W The Optimization Execution task completed with warnings.	1563
HWN023036E The request failed because there were not enough extents in the storage pool.	1564
HWN023037E The request failed because the number of copies of this volume would exceed the limit.	1564
HWN023038E The request failed because the copy specified does not exist.	1564
HWN023039E The following exception occurred during a migration request: exception	1564
HWN023040E The migration request for volume vdisk name is already being processed.	1565
HWN023041W The request to migrate the mirrored volume vdisk name is suspended because the secondary volume is offline.	1565
HWN023042E The secondary copy needed for migration does not exist.	1565
HWN023043I The mirrored volume migration for volume vdisk name will be ignored.	1565
HWN023044I The mirrored volume migration for volume vdisk name will result in the current secondary volume becoming the primary volume.	1565
HWN023045I The mirrored volume migration for volume vdisk name will result in the primary volume being migrated to the target pool.	1566
HWN023046I The Migration of the previously abandoned Optimization Automation job has started.	1566
HWN023047I The Migration of the previously abandoned Optimization Automation job has completed.	1566
HWN023048I The Optimization Automation cancellation job jobname has started.	1566
HWN023049E The Optimization Automation cancellation job completed with errors.	1566
HWN023050I The Optimization Automation cancellation job jobname has completed.	1567
HWN023051I The Optimization Automation job jobname will be canceled.	1567
HWN023052W The Optimization Automation job is not in progress.	1567
HWN023053I The migration of volume vdisk name has been canceled.	1567
HWN023054W The Optimization Automation job was canceled.	1567
HWN023055I The volume that was chosen for transformation, vdisk name, is a secondary volume in a mirrored volume relationship. The secondary volume will be migrated to the specified target pool or converted as specified.	1568
HWN024000I An optimization analysis task was started.	1568
HWN024001I The analysis is completed.	1568
HWN024002W Unable to retrieve any policy for Tier value.	1568
HWN024003I Analyzed number_of_volumes volumes on tier tier_number for storage virtualizer subsystem_name.	1568
HWN024006W No target pools in subsystem value were selected.	1568
HWN024011W Destination storage pool value in subsystem value was not considered. Reason: value.	1569
HWN024012I It is recommended that number_of_volumes volumes on tier source_tier_number are moved to tier target_tier_number.	1569
HWN024015I The optimization analysis of the value subsystem was started.	1569
HWN024016W Volume value is already in the destination storage pool value. No recommendations will be generated for the volume.	1569
HWN024018W No destination storage pools in Tier value have been specified for subsystem value.	1569
HWN024019W The following pools on tier tier_number on the storage_system storage system cannot be balanced by redistributing or re-tiering volumes: pool_names.	1570
HWN024020I Started analysis to balance pools on tier value.	1570
HWN024021W The pool_name pool on tier tier_number on the storage_system storage system cannot be balanced by redistributing the volumes.	1570
HWN024027I Storage Pool pool name has insufficient available space for volume volume name in storage pool pool name.	1570
HWN024030W One or more entities specified as input for the analysis could not be found or pools or volumes in some input entities could not be found.	1571
HWN024031W One or more entities specified as candidate destinations for the analysis could not be found.	1571
HWN024032W For one or more mirrored volumes, both the primary and the secondary volume copies were chosen for transformation. You cannot transform both volume copies in the same transform task. Only the primary volume copies are included for transformation. You can transform the secondary volume copies in a separate transformation.	1571
HWN024033W The volume volume name cannot be analyzed because it is not in a capacity pool.	1571
HWN024034W The pool pool name cannot be analyzed because the pool is not in a capacity pool.	1572
HWN024035W The storage virtualizer system name cannot be analyzed because the storage virtualizer is not in a capacity pool.	1572

HWN024036W The operation to transform the volumes on the subsystem name storage virtualizer cannot be completed because the destination pools were not available.	1572
HWN024037E An unexpected error occurred. The operation to transform the volumes on the subsystem name storage virtualizer cannot be completed because the destination pools were not identified.	1572
HWN024043I The capacity pools of the source volumes were selected as the target pools.	1572
HWN024046I The option that was selected to handle volumes with mirrored volumes is: After optimization, set the copy of the secondary volume in the destination pool as the primary volume. The original secondary volume remains the secondary volume.	1573
HWN024047I The number of days for collecting performance data to analyze the volumes is set to performance_data_collection_period.	1573
HWN024050I Automatic tiering was selected to tier the volumes.	1573
HWN024051I The tiering analysis is starting.	1573
HWN024052I Tier tier# has an I/O density threshold value of value per second per GiB.	1573
HWN024053I Tier tier#, has a file age threshold value of value percent of files last accessed within time_unit.	1574
HWN024054I The real capacity for the thin-provisioned volumes is set to value unit.	1574
HWN024055I The auto expand property of the thin-provisioned volumes is set to yes/no.	1574
HWN024056I The warning level for thin-provisioned volumes is set to value %.	1574
HWN024057I The grain size that was specified for the thin-provisioned volumes is grain_size KiB.	1574
HWN024058I The real capacity for the compressed volumes is set to value unit.	1575
HWN024059I The auto expand property for the compressed volumes is set to yes/no.	1575
HWN024060I The warning level for the compressed volumes is set to value.	1575
HWN024061I The option that was selected to handle volumes with mirrored volumes is: After optimization, set the secondary volume as the primary volume. The volume in the destination pool is the secondary volume.	1575
HWN024062I The option that was selected for mirrored volumes is: Do not optimize volumes with mirrored volumes.	1575
HWN024066I Tier tier# has an I/O rate threshold value of value I/O per second.	1576
HWN024067W Recommendations cannot be generated for number_of_volumes volumes because the volumes do not meet the tiering criteria for tier current_tier_number or for any lower tier.	1576
HWN024068W Recommendations cannot be generated to move number_of_volumes volumes from source_tier to tier target_tier_number due to the pool activity limit value.	1576
HWN024069W Recommendations cannot be generated to move number_of_volumes volumes from tier source_tier to tier target_tier_number because the destination storage pools do not have enough space.	1576
HWN024070I The analysis to optimize subsystem storage_subsystem was completed.	1577
HWN024071I The option that was selected was to restrict the placement of volumes in capacity pools to destination storage pools in the same capacity pool.	1577
HWN024072W No file age information for volume volume name.	1577
HWN024073W Storage pool {0} in tier {1} needs at least one additional storage pool in the same tier for the Balance Analysis to run on this tier.	1577
HWN024074W Storage pool {0} in tier {1} and capacity pool {2} needs at least one additional storage pool in the same tier and capacity pool for the Balance Analysis to run within this capacity pool and on this tier.	1577
HWN024075W number_of_volumes volumes from storage pool pool could not be moved to the destination storage pools because the destination storage pools do not have enough space.	1578
HWN024076W number_of_volumes volumes from storage pool pool could not be moved to the destination pools because the destination storage pools are not in the same capacity pool.	1578
HWN024077W number_of_volumes volumes from storage pool pool could not be moved to the destination storage pools because the destination storage pools would have exceeded the pool activity limit value.	1578
HWN024078W number_of_volumes volumes from storage pool pool could not be moved to the destination storage pools because the destination storage pools already have a volume copy.	1578
HWN024079W Because of an internal error, the number of volumes in the pool storage pool that could not be moved to destination storage pools is number_of_volumes.	1579
HWN024080W Destination storage pool pool already contains a copy of storage volume volume.	1579
HWN024081W Because the destination storage pool does not have sufficient available space, the volume storage volume in the source_pool storage pool cannot be moved to the destination_pool destination storage pool.	1579
HWN024082W Because the destination storage pool contains a copy of the mirrored volume, the volume volume in the source_pool storage pool cannot be moved to the destination_pool destination storage pool.	1579
HWN024083W Because of an internal error, the volume storage volume in the spool storage pool could not be moved to the destination_pool destination storage pool.	1579
HWN024084W Because the destination storage pools contain one or more copies of the mirrored volumes, the number of volumes that could not be moved from tier source_tier to tier target_tier is number_of_volumes.	1580
HWN024085W The pool_name storage pool cannot be balanced because the tier level of the pool was reset to none.	1580
HWN024086E Recommendations cannot be generated because the tier level of the destination_pool_name destination storage pool was reset to none.	1580
HWN024087W Recommendations cannot be generated for one or more of the volumes because collocated volumes cannot be placed in the same destination storage pool.	1580
HWN024088I The option to collocate volumes that are assigned to the same server or hypervisor was selected.	1581
HWN024089I The option to collocate volumes that are assigned to the same server or hypervisor was not selected.	1581
HWN024090W Because the storage pools do not meet the service class requirements, the number of volumes that cannot be moved is no_volumes.	1581
HWN024091W If the recommendation to move the volume_name volume to the storage_pool_name storage pool is implemented, the service class requirements of the volume_name volume cannot be met.	1581
HWN024092W Recommendations cannot be generated to move number_of_volumes volumes from tier source_tier to tier target_tier_number because the destination storage pools do not meet the service class requirements of the volumes.	1581
HWN024093I The number of volumes on tier tier_level that were not analyzed because of the instruction to exclude mirrored volumes from the analysis is number_of_volumes volumes.	1582
HWN024094W Valid target pools were not selected for the subsystem name storage virtualizer.	1582
HWN024095I The grain size for the thin-provisioned volumes was set to the default value of grain_size KiB.	1582
HWN024096W Volumes in the pool_name pool on tier tier_level cannot be moved to a higher tier to reduce the activity level of the pool to the user-defined level.	1582
HWN024097W Volumes in the pool_name pool on tier tier_level cannot be moved to a lower tier to reduce the activity level of the pool to the user-defined level.	1582
HWN024098W Cannot generate recommendations to tier volumes from the storage_system_name storage system because all of the source volumes are in the selected destination storage pools.	1583

HWN024099I The number of volumes that were excluded from the analysis to plan the tiering of the storage_system_name storage system is vols_count. The volumes were excluded because performance data is not available for the volumes.	1583
HWN024100I The number of volumes that were excluded from the analysis to plan the tiering of the storage_system_name storage system is vols_count. The volumes were excluded from the analysis because the capacity of the volumes is zero.	1583
HWN024101I The number of volumes that were excluded from the analysis to plan the tiering of the storage_system_name storage system is vols_count. The volumes were excluded from the analysis because the volumes are not assigned to pools that are tiered or the thresholds were not defined for the tiers.	1583
HWN024102W The recommendation to move the storage_volume_name volume from the source_pool_name storage pool to the target_pool_name storage pool was not generated because the status of the destination pool is offline or excluded.	1584
HWN024103I Reclaiming volumes	1584
HWN024104I Planning for tiering volumes	1584
HWN024105W The recommendation to move the storage_volume_name volume from the source_pool_name storage pool to the target_pool_name storage pool will not be executed because the status of the destination pool is offline or excluded.	1584
HWN024106W The recommendation to move the storage_volume_name volume from the source_pool_name storage pool was not generated because the status of the volume is offline.	1584
HWN024107W The recommendation to move the storage_volume_name volume from the source_pool_name storage pool to the target_pool_name storage pool will not be executed because the status of the volume is offline.	1585
HWN024108E The recommendations can't be shown because the analysis was not completed.	1585
HWN024109W The data for the previous analysis of the storage_subsystem storage system was not deleted.	1585
HWN024110E Volumes reclamation analysis failed for storage_subsystem storage subsystem.	1586
HWN024111W Recommendations cannot be generated to move number_of_volumes volumes from tier source_tier to tier target_tier_number because there is no potential destination pool assigned to the recommended tier.	1586
HWN024112W Cannot generate recommendations to tier volumes from the storage_system_name storage system because the source storage pools and the selected destination storage pools are assigned to the same tier.	1586
HWN024200I The days of the week to include in the analysis: days_of_week.	1586
HWN024201I The time window for the performance data to include in the analysis is set to start time - end time.	1586
HWN024202I The time window for the performance data to include in the analysis is set to start time - end time. The end time occurs on the next day.	1587
HWN024203W The volume storage_volume_name cannot be converted or moved because the target pools do not have sufficient available space or the target pool types are incorrect for the operation.	1587
HWN025000I Storage pool value in storage system value has storage from different types of back-end storage systems. Back-end disk data cannot be determined.	1587
HWN025001I Storage pool value in storage system value has storage from unknown back-end storage system(s). Back-end disk data cannot be determined.	1587
HWN025002I Storage pool value in storage system value has storage from multiple back-end storage systems or from multiple pools in a single storage system. Back-end disk data cannot be determined.	1588
HWN025003I Storage pool value in storage system value has storage from a back-end storage pool with multiple disk types. Back-end disk data cannot be determined.	1588
HWN025004I Storage pool value in storage system value has storage from a back-end storage pool with a mixed raid type. Back-end disk data cannot be determined.	1588
HWN025005I Storage pool value in storage system value has storage from a back-end storage pool with multiple raid types. Back-end disk data cannot be determined.	1588
HWN025006I Storage pool value in storage system value has storage from back-end disks of unknown type. Back-end disk data cannot be determined.	1588
HWN025007I Storage pool value in storage system value has storage from unknown number of back-end disks. Back-end disk data cannot be determined.	1589
HWN025008I Storage pool value in storage system value has storage from back-end disks with unknown raid type. Back-end disk data cannot be determined.	1589
HWN025009E Connection to Data Server failed. Make sure Data Server is up.	1589
HWN025011W All of the target ports for the storage system are used for the provisioning request. The request might take a long amount of time.	1589
HWN025010I Collecting parent pool volumes for storage system: storage system identification.	1590
HWN025011E The port the target port ID has a usage restriction which prevents it from being used as a target port for volume assignment.	1590
HWN025012E The invocation of CIM method ExposePaths failed on SMI-S provider Name of SMI-S provider . The return code is Return code of method.	1590
HWN025013E The invocation of CIM method HidePaths failed on SMI-S provider Name of SMI-S provider . The return code is Return code of method.	1591
HWN025014E The invocation of CIM method CreateOrModifyElementFromStoragePool failed on SMI-S provider Name of SMI-S provider . The return code is Return code of method.	1591
HWN025015E The invocation of CIM method ReturnToStoragePool failed on SMI-S provider Name of SMI-S provider . The return code is Return code of method.	1592
HWN025016E The invocation of CIM method DeleteStorageHardwareID failed on SMI-S provider Name of SMI-S provider . The return code is Return code of method.	1592
HWN025017E A CLI command failed. Check the logs from EP working dir.	1592
HWN025018E An error occurred when attempting to parse the file File name.	1593
HWN025019E The requested operation failed. Check the logs from EP working dir.	1593
HWN025020E The volume cannot be created. The volume of size Size in pool Pool on storage system Subsystem cannot be created. The pool might already have the maximum number of volumes allowed.	1593
HWN025021E Unable to resolve the address for the device because the request was not processed by the data collector.	1593
HWN025022E The data collection detected storage system New Subsystem with serial number new serial number instead of expected serial number expected serial number.	1593
HWN025025I Starting the task to send the report for schedule Schedule Id by email.	1594
HWN025026I The report title report is being created.	1594
HWN025027I The report title report with ID report id is being sent by email to the reports recipients.	1594
HWN025028I The report title report with ID report id was sent by email to the reports recipients.	1594
HWN025029E Can't retrieve the configured settings of the report for schedule Schedule Id .	1594
HWN025030E The report can't be sent because the email server was not configured.	1594
HWN025031E Can't send the report title report with ID report id by email because of the following error: reported_error.	1595
HWN025031I To view the report, choose HTML as the message format or use an email application that supports HTML message formats.	1595
HWN025032E Job failed during post processing of collected data from the data source.	1595
HWN025033E Failed to send the report name report for schedule Schedule Id.	1595
HWN025034I Created number_of_servers agentless servers automatically.	1595
HWN025035I Removed number_of_servers agentless servers automatically.	1596
HWN025036E Can't save the report in the directory.	1596

HWN025037E Can't save the report because the path specifies a file name instead of a directory name.	1596
HWN025038E Can't save the report, because the directory doesn't exist.	1596
HWN025039E Can't save the report because the directory doesn't have enough disk space.	1596
HWN025040I The report title report with ID report id is being saved as report file name in the full path directory.	1597
HWN025041I The report title report with ID report id was saved as report file name in the full path directory.	1597
HWN099990I The method name of the Device Server method of the device server returned return value @(execution context information).	1597

HWN200000I Probe of switch switch_name completed successfully.	1599
HWN200001I Started post-processing tasks after data was collected for switch switch_name.	1599
HWN6001I Operation operation completed successfully.	1599
HWN6002I Unable to set up NLS message file processing.	1599
HWN6003E Unable to set up tracing.	1600
HWN6004E Operation operation failed.	1600
HWN6005E Unknown operation operation.	1600
HWN6006E Could not initialize connection, rc is rc	1600
HWN6007E Could not parse command arguments: arg	1600
HWN6008E Error processing command: command	1600
HWN6009E Missing 'operation' property in input file	1601
HWN6010I Task arg completed successfully	1601
HWN6011E Task arg failed	1601
HWN6012E Cannot connect to this IP, switching to IP	1601
HWN6013E An IBM XIV CLI command failed. The error is arg.	1601
HWN6014I Command arg completed successfully	1602
HWN6015E Command command failed.	1602
HWN6016I Connected with IP address IP	1602
HWN6017I Started creation of volume with size size in pool pool.	1602
HWN6018I Volume creation completed successfully. New volume volume created with size size in pool pool.	1602
HWN6019I Started deletion of volume volume in pool pool.	1602
HWN6020I Volume deletion completed successfully. Volume wolume deleted in pool pool	1603
HWN6021I Started creation of host host with initiator ports ports	1603
HWN6022I Finished creation of host host with initiator ports ports	1603
HWN6023I Started assignment of volume volume to host host.	1603
HWN6024I Finished assignment of volume volume to host host.	1603
HWN6025I Started unassignment of volume volume from host host.	1603
HWN6026I Finished unassignment of volume volume from host host	1604
HWNEP0001I Successfully persisted number of count instances.	1604
HWNEP0002E The probe failed as the data collector couldn't write to its output file, value.	1604
HWNEP0003E A DS8000 ESSNI command failed. The error code is error_code.	1604
HWNEP0004I Started creation of volume group volume_group.	1605
HWNEP0005I Finished creation of volume group volume_group with subsystem volume group number number .	1605
HWNEP0006I Started adding volumes, with serial numbers volume_list, to subsystem volume group volume_group_number .	1605
HWNEP0007I Finished adding volumes to volume group.	1605
HWNEP0008I Started assignment of host host on subsystem subsystem to volume group volume_group.	1605
HWNEP0009I Finished assigning host on subsystem subsystem to volume group volume_group.	1605
HWNEP0010I Started removing volumes, with serial numbers volume_list, from subsystem volume group volume_group_number .	1606
HWNEP0011I Finished removing volumes, with serial numbers volume_list, from subsystem volume group volume_group_number .	1606
HWNEP0012I Increased virtual capacity of storage pool storage_pool on subsystem subsystem to size size .	1606
HWNEP0013I Collecting pools for storage system storage system identification.	1606
HWNEP0014I Collecting volumes for lss logical subsystems on storage system storage system identification.	1606
HWNEP0015I Collecting volume groups on storage system storage system identification.	1607
HWNEP0016I Collecting hosts on storage system storage system identification.	1607
HWNEP0017I value Hosts Found.	1607
HWNEP0018I Launching external process for devices devices.	1607
HWNEP0019I External process for devices devices completed successfully.	1607
HWNEP0020E Could not create connection to NAPI The IP for the NAPI..	1608
HWNEP0021E ESSNI API query for Space Efficient Volume failed with ESSNI code ESSNI Code. Data from ESSNI is considered suspect.	1608
HWNEP0022I Started deletion of volume group with number volume_group_number.	1608
HWNEP0023I Finished deletion of volume group with number volume_group_number.	1608
HWNEP0100I Probing Volumes for Storage System: value	1608
HWNEP0101I Number of Volumes currently found: value. Continuing to probe Volumes.	1609
HWNEP0102I value Volumes found.	1609
HWNEP0103I Probing Configured Disks for Storage System: value.	1609
HWNEP0104I Number of Configured Disks Found Currently: value. Continuing to Probe Disks.	1609

HWNEP0105I value Configured Disks Found.	1609
HWNEP0106I Probing Views of Host Initiator access to Volumes.	1609
HWNEP0107I Finished probing Views.	1610
HWNEP0108I Initializing Probe for storage system storage system identification.	1610
HWNEP0109I Probe for storage system storage system identification completed.	1610
HWNEP0110I Collecting Nodes and fibre channel ports for storage system storage system identification.	1610
HWNEP0111E The connection to the storage device failed. The error code is error_code.	1610
HWNEP0113E The cluster IP address is not specified in the configuration file.	1611
HWNEP0114E The trustore location is not specified in the configuration file.	1611
HWNEP0115E The IBM Spectrum Control data is out of synch with the device configuration and a re-probe is required for device device name .	1611
HWNEP0116E The user configured for the subsystem subsystem name is not permitted to perform the requested action.	1611
HWNEP0117E The virtual disk (Vdisk)-to-host mapping was not created because the volume vdiskName is already mapped to the hostName host for the Device deviceName	1612
HWNEP0115I Starting Control Process for storage system storage system identification.	1612
HWNEP0116I Started deletion of volume VolumeID on subsystem Subsystem .	1612
HWNEP0117I Volume deletion completed successfully. Volume VolumeID on subsystem Subsystem was deleted.	1612
HWNEP0118I Started adding Managed Disk(s) Managed Disk ID to Managed-disk group Managed Disk group name on subsystem Subsystem.	1612
HWNEP0119I Finished adding Managed Disk(s) Managed Disk ID to Managed-disk group Managed Disk group name on subsystem Subsystem.	1613
HWNEP0120I Started creation of volume with size Size in pool Pool on subsystem Subsystem	1613
HWNEP0121I Volume creation completed successfully. New volume VolumeID created with size Size in pool Pool on subsystem Subsystem .	1613
HWNEP0122I Started assignment of volume VolumeID on subsystem Subsystem to initiator port Initiator Port on host Host .	1613
HWNEP0123I Finished assignment of volume VolumeID on subsystem Subsystem to initiator port Initiator Port on host Host Name .	1613
HWNEP0124I Started unassignment of volume VolumeID on subsystem Subsystem from initiator port Initiator Port on host Host Name .	1614
HWNEP0125I Finished unassignment of volume VolumeID on subsystem Subsystem from initiator port Initiator Port on host Host Name .	1614
HWNEP0126I Started creation of host host name on subsystem Subsystem with initiator ports WWPNs .	1614
HWNEP0127I Finished creation of host host name on subsystem Subsystem with initiator ports WWPNs .	1614
HWNEP0128I Host name hostName already exists for the WWPNs wwpns on the device Subsystem	1614
HWNEP0129E The operation failed because the device returned unexpected values.	1615
HWNEP0130E A IBM XIV CLI command failed. The error is error_code.	1615
HWNEP0131I The host definition for host host name on subsystem Subsystem contains additional Hostports WWPNs that will also be assigned to Volume VolumeID .	1615
HWNEP0132E The unassignment of Volume VolumeID from hostport WWPN failed because the definition for host host name on subsystem Subsystem contains additional hostports WWPNs .	1615
HWNEP0133E Error invoking the external process for device device name .	1615
HWNEP0134E Following exception occurred: exception .	1616
HWNEP0135E External process failed with error code error code .	1616
HWNEP0136E Error connecting to IP address with user ID user ID .	1616
HWNEP0137I Job job ID submitted for device device name .	1616
HWNEP0138I External process was successfully executed for device device name .	1616
HWNEP0139I An instruction was issued to add a copy of the volume_name volume_size-byte volume in the pool_name pool on the storage_system_name storage system.	1617
HWNEP0140I The copy of the volume_name volume_size-byte volume with the copy ID of VolumeID in the pool_name pool on the storage_system_name storage system was added successfully.	1617
HWNEP0141I Probing Internal Drives for Storage System: value.	1617
HWNEP0142I Number of Internal Drives Found Currently: value. Continuing to Probe Internal Drives.	1617
HWNEP0143I value Internal Drives Found.	1617
HWNEP0144I Probing Pools for Storage System: value.	1618
HWNEP0145I Number of Pools Found Currently: value. Continuing to Probe Pools.	1618
HWNEP0146I value Pools Found.	1618
HWNEP0147I Collecting asset and status information about storage_system_id storage system.	1618
HWNEP0148I Collecting cluster information for storage_system_id storage system.	1618
HWNEP0149I Collecting file system exports for storage_system_id storage system.	1618
HWNEP0150I Collecting nodes for storage_system_id storage system.	1619
HWNEP0151I Collecting file systems for storage_system_id storage system.	1619
HWNEP0152I Collecting pools for storage_system_id storage system.	1619
HWNEP0153I Collecting file system storage for storage_system_id storage system.	1619
HWNEP0154I Collecting filesets for storage_system_id storage system.	1619
HWNEP0155I Collecting links between file systems and nodes for storage_system_id storage system.	1620
HWNEP0156I Collecting quotas for storage_system_id storage system.	1620
HWNEP0157I Collecting file system snapshots for storage_system_id storage system.	1620
HWNEP0158I Collecting capacity for file_system_id file system.	1620
HWNEP0159I Creating the export export name on cluster cluster name .	1620
HWNEP0160I The export export name on cluster cluster name with path export path was created.	1620
HWNEP0161I The export export name on cluster cluster name is being changed.	1621
HWNEP0162I The export export name on cluster cluster name was changed.	1621
HWNEP0163I Setting quota quota type - quota name on file system file system name .	1621
HWNEP0164I Quota quota type - quota name on file system file system name has been created.	1621
HWNEP0165I Checking quota on file system file system name .	1621
HWNEP0166I Quota on file system file system name has been checked.	1621
HWNEP0167I The export export name on cluster cluster name is being removed.	1622
HWNEP0168I The export export name on cluster cluster name was removed.	1622
HWNEP0169E Command: command did not complete. IBM SONAS CLI message	1622

HWNEP0170I Creating fileset fileset name on file system files system name .	1622
HWNEP0171I Successfully created fileset fileset name on file system file system name .	1622
HWNEP0172I Removing fileset fileset name on file system files system name .	1622
HWNEP0173I Successfully removed fileset fileset name on file system file system name .	1623
HWNEP0174I Modifying fileset fileset name on file system files system name .	1623
HWNEP0175I Successfully modified fileset fileset name on file system file system name .	1623
HWNEP0176I Creating file system file system on cluster cluster name .	1623
HWNEP0177I Successfully created file system file system on cluster cluster name .	1623
HWNEP0178I Changing file system file system on cluster cluster name .	1624
HWNEP0179I Successfully changed file system file system on cluster cluster name .	1624
HWNEP0180I Removing file system file system on cluster cluster name .	1624
HWNEP0181I Successfully removed file system file system on cluster cluster name .	1624
HWNEP0182I Mounting file system file system .	1624
HWNEP0183I Successfully mounted file system file system .	1625
HWNEP0184I Unmounting file system file system .	1625
HWNEP0185I Successfully unmounted file system file system .	1625
HWNEP0186I Linking fileset fileset on file system file system .	1625
HWNEP0187I Successfully linked fileset fileset on file system file system .	1625
HWNEP0188I Unlinking fileset fileset on file system file system .	1625
HWNEP0189I Successfully unlinked fileset fileset on file system file system .	1626
HWNEP0190E The IBM Spectrum Control server could not connect to IP address using the SSH protocol.	1626
HWNEP0191E The IBM Spectrum Control server could not authenticate with IP address using the SSH protocol.	1626
HWNEP0192E The IBM Spectrum Control server could not execute a command on the IBM Storwize V7000 Unified/IBM SONAS device at IP address .	1626
HWNEP0193E The command name command failed because the following command executed on the NAS device failed with the return code return code : command returned: command output	1626
HWNEP0195I modify fileset	1627
HWNEP0196I change export	1627
HWNEP0197I create export	1627
HWNEP0198I remove export	1627
HWNEP0199I create fileset	1627
HWNEP0200I link fileset	1628
HWNEP0201I remove fileset	1628
HWNEP0202I unlink fileset	1628
HWNEP0203I change filesystem	1628
HWNEP0204I create filesystem	1628
HWNEP0205I mount filesystem	1628
HWNEP0206I remove filesystem	1629
HWNEP0207I unmount filesystem	1629
HWNEP0208I check quota	1629
HWNEP0209I set quota	1629
HWNEP0210I probe	1629
HWNEP0211W The command name command completed, however during post-processing the following command executed on the NAS device failed with the return code return code : command returned: command output As a result, the IBM Spectrum Control database is now out of sync with the current state of the NAS device.	1629
HWNEP0212I create disk in modifying file system	1630
HWNEP0213I Started deletion of host host name on subsystem Subsystem .	1630
HWNEP0214I Finished deletion of host host name on subsystem Subsystem .	1630
HWNEP0215I Collecting cache information for storage_system_id storage system.	1630
HWNEP0216I remove cached source	1630
HWNEP0217I create cached node	1631
HWNEP0218I remove cached node	1631
HWNEP0219I create cache	1631
HWNEP0220I remove cache	1631
HWNEP0221I modify cache source	1631
HWNEP0222I Creating cache source cache_source_name on cluster file_system_name.	1632
HWNEP0223I Created cache source cache_source_name on cluster file_system_name.	1632
HWNEP0224I Removing cache source cache_source_name on cluster file_system_name.	1632
HWNEP0225I Removed cache source cache_source_name on cluster file_system_name.	1632
HWNEP0226I Modifying cache source cache_source_name on cluster file_system_name.	1632
HWNEP0227I Modified cache source cache_source_name on cluster file_system_name.	1633
HWNEP0228I Creating cache cache_name on file system file_system_name.	1633
HWNEP0229I Created cache cache_name on file system file_system_name.	1633
HWNEP0230I Removing cache cache_name on file system file_system_name.	1633
HWNEP0231I Removed cache cache_name on file system file_system_name.	1633
HWNEP0232I Modifying cache cache_name on file system file_system_name.	1634
HWNEP0233I Modified cache cache_name on file system file_system_name.	1634
HWNEP0234I modify cache	1634
HWNEP0235I create cached source	1634
HWNEP0236I Configuring nodes node_names as cached nodes.	1634
HWNEP0237I Configured nodes node_names as cached nodes.	1634
HWNEP0238I Unconfiguring cached nodes node_names.	1635
HWNEP0239I Unconfigured cached nodes node_names.	1635

HWNEP0240I Executed control operation on cache cache_name on filesystem file_system_name .	1635
HWNEP0241I control cache	1635
HWNEP0242I run prepop	1635
HWNEP0243I list prepop	1636
HWNEP0244I Retrieving cache prepopulation status for file system file system name .	1636
HWNEP0245I Cache prepopulation status for file system file system name has been retrieved.	1636
HWNEP0246I Prepopulate cache data for fileset fileset_name on file system file_system_name using policy policy_name.	1636
HWNEP0247I Command to pre populate cached data for fileset fileset_name was successful.	1636
HWNEP0248W An error was encountered while parsing protocol options for export export_name. The options were not persisted, the probe will continue.	1637
HWNEP0249W The connection to the storage device failed. The error code is error_code.	1637
HWNEP0250I Started adding initiator port(s) initiator ports to host host name on subsystem subsystem .	1637
HWNEP0251I Finished adding initiator port(s) initiator ports to host host name on subsystem subsystem .	1637
HWNEP0252W A CLI command completed with warning. The warning message is : warning_message	1638
HWNEP0253W Volume creation completed with warning. New volume VolumeID created with size Size in pool Pool on subsystem Subsystem .	1638
HWNEP0254W Volume deletion completed with warning. Volume VolumeID on subsystem Subsystem was deleted.	1638
HWNEP0255I The task to execute the recommendations for optimizing the volumes on the storage system with an ID of storage_system_id was paused.	1638
HWNEP0256I The task for optimizing the volumes on the storage system with an ID of storage_system_id was canceled.	1638
HWNEP0257I The task for optimizing the volumes on the storage system with an ID of storage_system_id was resumed.	1639
HWNEP0258E The optimization task cannot be paused because the synchronization rate for the volume cannot be reset. The ID of the volume is volume_id and the ID of the storage system is storage_system_id.	1639
HWNEP0259E The optimization task cannot be resumed because the synchronization rate for the volume cannot be reset. The ID of the volume is volume_id and the ID of the storage system is storage_system_id.	1639
HWNEP0260I Started creation of host port host port name on storage system Storage System with initiator port WWPN .	1639
HWNEP0261I Finished creation of host port host port name on storage system Storage System with initiator port WWPN .	1639
HWNEP0262E The recommendation for the volume_name volume was not implemented because the command that was issued by the storage virtualizer returned the following error: error_message	1640
HWNEP0263I The synchronization of the volume_name volume with the volume copy was successful.	1640
HWNEP0264E The synchronization of the volume_name volume with the volume copy was unsuccessful.	1640
HWNEP0265E The CLI command that was issued for the storage_system_name storage system failed and generated the following error: error_message	1640
HWNEP0266I Started expanding the capacity of volume volume on subsystem subsystem from oldsize to newsize bytes.	1641
HWNEP0267I Finished expanding the capacity of volume volume on subsystem subsystem to newsize bytes.	1641
HWNEP0268E The server operating system or version is not supported by IBM Spectrum Control for IBM Spectrum Scale.	1641
HWNEP0269E The IBM Spectrum Scale cluster information cannot be displayed. All the nodes in the cluster are down or cannot be contacted.	1641
HWNEP0270E The switch cannot respond to SNMP queries because of an authentication error.	1641
HWNEP0271E The following password decryption exception occurred: exception	1642
HWNEP0272E The switch cannot respond to SNMP queries because of the following exception: exception	1642
HWNEP0273E The following exception occurred because the OID format is incorrect: exception	1642
HWNEP0274E The switch cannot respond to SNMP queries because of a timeout problem.	1642
HWNEP0270I Retrieved the file module address file_module_address.	1643
HWNEP0271I No quota data was collected. Quota limits are not activated for the file systems that are associated with the IBM Spectrum Scale cluster.	1643
HWNEP0272I Collecting file systems that are mounted on the nodes of storage system storage_system_id.	1643
HWNEP0275W One or more operations failed for the CLI command that was issued for the storage system. The following error was generated: errorMsg .	1643
HWNEP0276E Command execution failed because sudo is not installed.	1643
HWNEP0277I Commands are executed through 'sudo'.	1644
HWNEP0278E User can not execute command through sudo.	1644
HWNEP0279I Collecting remote file systems for storage_system_id storage system.	1644
HWNEP0280I Collecting remote file systems that are mounted on the nodes of storage system storage_system_id.	1644
HWNEP0281E The switch is returning corrupted data.	1644
HWNEP0282E Zoning data cannot be collected because there is a transaction in progress on the switch	1644
HWNEP0283E VSAN vsan_name was not found.	1645
HWNEP0284E No zoning data collected from the switch.	1645
HWNEP0285E Cannot authenticate to the object storage using the specified user credentials.	1645
HWNEP0286E An object storage request failed on the GPFS cluster.	1645
HWNEP0287E Error when collecting Accounts information from Object Storage Service using REST protocol.	1645
HWNEP0288E Error when collecting Containers information from Object Storage Service using REST protocol.	1646
HWNEP0281I Collecting object storage accounts for storage_system_id storage system.	1646
HWNEP0282I Collecting object storage containers for storage_system_id storage system.	1646
HWNEP0289E Failed to retrieve container information because the number of containers now exceeds the maximum number of containers that can currently be collected for an account (MAX Containers).	1646
HWNEP0290E The probe failed to retrieve object storage account information from the storage system storage_system_id because the userid user does not have the required authority.	1647
HWNEP0291E The probe failed to retrieve object storage container information from the storage system storage_system_id because the userid user does not have the required authority.	1647
HWNEP0292E Cannot query the object service for information about accounts and containers as the specified user does not have admin privileges.	1647
HWNEP0293W The probe did not collect information about all the object accounts for the storage system storage_system_id as the userid user does not have sufficient authority on the storage system.	1647
HWNEP0294W An authentication error prevented the switch from responding to SNMP queries regarding the ability of the switch to perform zone control.	1648
HWNEP0295W A timeout prevented the switch from responding to SNMP queries regarding the ability of the switch to perform zone control.	1648
HWNEP0296W The switch cannot respond to SNMP queries to check the ability of the switch to perform zone control because of the following exception: exception	1648
HWNEP0297W The switch cannot respond to SNMP queries to check the ability of the switch to perform zone control because of the following exception: exception	1649
HWNEP0298I Collecting IBM Cloud Object Storage configuration.	1649

HWNEP0299I Collecting IBM Cloud Object Storage vaults.	1649
HWNEP0300I Collecting detailed IBM Cloud Object Storage status.	1649
HWNEP0301W The IP address ip_address for the FlashSystem storage system is not the management IP address.	1649
HWNEP0302I Collecting Transparent Cloud Tiering information for storage_system_id storage system.	1650

BTASA1400E The SAN Agent Scanner failed to execute the inband scanner scanner with the command: scan command.	1703
BTASA1401E The SAN Agent Scanner failed to capture the inband scan data.	1703
BTASA1403E The SAN Agent Scanner failed to save the scan data for benchmark comparison.	1703
BTASA1404E The SAN Agent Scanner failed to read the benchmark file benchmark file saved from the previous scan.	1704
BTASA1405E The SAN Agent Scanner failed to retrieve the global unique identifier from Host Query.	1704
BTASA1406I The SAN Agent Scanner Service has initialized successfully.	1704
BTASA1407I The Inband scanner scanner has started.	1704
BTASA1408I The Inband scanner scanner has ended with return code return code.	1704
BTASA1409E A scanner overlap condition has occurred on the IBM Spectrum Control managed host.	1705
BTASA1420E The GS-3 Zone Control DLL could not be loaded.	1705
BTASD - Fabric User Interface messages	1705
BTASD1922E An error occurred while getting the information from device services.	1706
BTASD1923E The agent agent identifier is currently agent state. It must be in order to remove it.	1706
BTASD1930E Unable to contact zone agent	1706
BTASD1931E Unable to contact zoning agent. Token used for contacting zone agent is invalid.	1706
BTASD1932E Agent capable of configuring zoning could not be found on this Fabric	1707
BTASD1933E Zoning is already being configured on this Fabric. New zoning can not be done until agent is available again	1707
BTASD1934E Unable to delete the selected entities.	1707
BTASD1935E The delete failed because an agent is still installed on the selected computer or configured in Data Agent or Inband Fabric Agent list.	1707
BTASD1936E Unexpected server response message_status= agent response.	1708
BTASD1937E A zone name cannot contain the characters '!', '%', '*' or '!' in its name. Brocade zone names also cannot contain '\$' nor '-'. The first character for a zone name must be alphanumeric. Enter a new name for this zone.	1708
BTASD1938E A zone set name cannot contain the characters '!', '%', '*' or '!' in its name. Brocade zone set names also cannot contain '\$' nor '-'. The first character for a zone set name must be alphanumeric. Enter a new name for this zone set.	1708
BTASD1939E Zoning is already being configured by lock owner on this Fabric since lock time. New zoning can not be done until agent is available again.	1708
BTASD1940E Zoning is already being configured by lock owner on this Fabric since lock time. New zoning can not be done until agent is available again. Do you want to release the lock from user {0}?	1708
BTASD1941E The lock for the zone control operations has been reset. Do you want to re-obtain the lock and continue zone operations?	1709

BTASD1942E Zoning changes cannot be made at this time. Zoning for this fabric is currently locked by lock owner since date.	1709
BTASD1943E An alias with the same name already exists. Enter a new name for this alias.	1709
BTASD1944E The Alias name field must be filled in to create an alias.	1709
BTASD1945E A alias name cannot contain the characters ':' ','%' or '!' in its name. Brocade alias names also cannot contain '\$' nor '-'. The first character for an alias name must be alphanumeric. Enter a new name for this alias.	1710
BTASD1946E An alias name cannot begin with a number. Enter a new name for this alias.	1710
BTASD1947E An alias, zone and/or zone set in the same configuration can not have the same name. Enter a new name.	1710
BTASD1948E This alias does not contain any members. Add a member to this alias.	1710
BTASD1949E There are too many members selected. The maximum number of members allowed for this alias is max members. Member(s) must be removed before you can continue.	1710
BTASD1950E The zone configuration has the maximum number of aliases allowed. The maximum number of aliases is max aliases. An existing alias must be deleted before a new one can be created.	1711
BTASD1951E Fabric fabric name has zone count zones with non-standard members: zone names. Zone and ZoneSet changes cannot be applied to zones with nonstandard members.	1711
BTASD1952E Zone set zoneset name is active or in activation or deactivation pending status. Deletion of the zone set is not supported for this fabric. After committing the deactivation, this zone set can be deleted in the next zone control session.	1711
BTASD1953E Renaming of the active zone set is not supported for this fabric. Deactivate zone set zoneset name before attempting to rename it.	1711
BTASD1954E Zoning cannot be done because there is no connection to the SMI-S provider. Reason: reason	1711
BTASD2001W Zoning has changed on this fabric since the configuration panel was opened. You may need to run the Fabric discovery/probe again to get the zone information within IBM Spectrum Control synchronized with the fabric. Do you still want to make zoning changes?	1712
BTASD2002W This alias is not assigned to any zones. This could result in an error when the zone configuration is applied later. Do you want to continue?.	1712
BTASD2003W No exclusive fabric-wide lock is available on the switches for fabric fabric name. Other users might be modifying the zoning configuration from outside of IBM Spectrum Control during your zoning operations.	1712
BTASD2004W This Out Of Band Agent is already defined with the same parameters. Would you like to save it anyway?	1712
BTASD3001I A probe job for fabric fabric name has been submitted. The inactive Zone Definition for this fabric will have the old Zone Definition until the probe job is complete. Wait a few minutes before working with Zone Definition for this fabric.	1713

BTAZC0025E An error occurred while adding a member to a zone.	1725
BTAZC0026E An error occurred while adding an alias to a zone.	1725
BTAZC0027E An error occurred while adding a member to an alias.	1725
BTAZC0028E An error occurred while removing a zone from zone set.	1725

BTAZC0029E An error occurred while removing an alias from a zone.	1726
BTAZC0030E An error occurred while removing a member from a zone.	1726
BTAZC0031E An error occurred while removing a member from an alias.	1726
BTAZC0032E An error occurred while deleting a zone member	1726
BTAZC0033E An error occurred while deleting a zone.	1727
BTAZC0034E An error occurred while deleting a zone set.	1727
BTAZC0035E An error occurred while deleting an alias.	1727
BTAZC0036E An error occurred while activating a zone set.	1727
BTAZC0037E An error occurred while deactivating a zone set.	1728
BTAZC0038E An error occurred while pinging the Zoning Agent.	1728
BTAZC0039E An error occurred during transaction commit action.	1728
BTAZC0040E An error occurred while closing a session.	1728
BTAZC0041E An error occurred while saving the zone information.	1729
BTAZC0042E An error occurred during the Get Capabilities command	1729
BTAZC0043E An error occurred sending the zone control command array.	1729
BTAZC0044E An error occurred while sending commands to Switch.	1729
BTAZC0045E An error occurred: n unsupported zone database.	1730
BTAZC0046E A native error occurred: invalid field length.	1730
BTAZC0047E A native error occurred: invalid number of members.	1730
BTAZC0048E A native error occurred: invalid arguments.	1730
BTAZC0049E A native error occurred: null fabric handle.	1731
BTAZC0050E An unknown error occurred during Zone control.	1731
BTAZC0051E An XML parse error occurred during Zone Control operations.	1731
BTAZC0052E Unable to create logical zone definition.	1731
BTAZC0053E An error occurred during Zone Control: library not opened.	1732
BTAZC0054E Non standard members in the current zone definition.	1732
BTAZC0055E A native error occurred: function not supported.	1732
BTAZC0056E An error occurred: not connected to the SAN.	1732
BTAZC0057E A native error occurred: invalid buffer index.	1733
BTAZC0058E A native error occurred during an HBA API call.	1733
BTAZC0059E A native error occurred: no memory available.	1733
BTAZC0060E A native error occurred: error loading the HBA API.	1733
BTAZC0270E An error occurred during an HBA API call.	1734
BTAZC0271E An error occurred during an HBA API call: not supported.	1734
BTAZC0272E An error occurred during an HBA API call: invalid handle.	1734
BTAZC0273E Bad argument with the HBA API.	1734
BTAZC0274E An error occurred during an HBA API call: illegal WWN.	1735
BTAZC0275E An error occurred during an HBA API call: illegal index.	1735
BTAZC0276E Larger buffer required with the HBA API.	1735
BTAZC0277E Information has changed since the last call to HBA_RefreshInformation.	1735
BTAZC0278E SCSI check condition reported with the HBA API.	1736
BTAZC0279E HBA error: adapter may be busy or reserved. Retry may be effective.	1736
BTAZC0280E HBA API request timed out. Retry may be effective.	1736
BTAZC0281E Referenced HBA has been removed or deactivated.	1736
BTAZC0282E Extended Link Service reject with the HBA API.	1737
BTAZC0283E An error occurred during an HBA API call: invalid LUN.	1737
BTAZC0284E An error occurred during an HBA API call: incompatible.	1737
BTAZC0285E Ambiguous WWN with HBA API call.	1737
BTAZC0286E Local bus error with the HBA API.	1738
BTAZC0287E Local target error with the HBA API.	1738
BTAZC0288E Local LUN error with the HBA API.	1738
BTAZC0289E HBA API error: local SCSI bound.	1738
BTAZC0290E HBA API error on FCID target.	1739
BTAZC0291E Target node WWN error with the HBA API.	1739
BTAZC0292E Target port WWN error with the HBA API.	1739
BTAZC0293E Target LUN error with the HBA API.	1739
BTAZC0294E Target LUN ID error with the HBA API.	1740
BTAZC0295E An HBA API error occurred: no such binding.	1740
BTAZC0296E An HBA API error occurred: not a target.	1740
BTAZC0297E Unsupported FC4 with HBA API.	1740
BTAZC0298E Incapable error with the HBA API.	1741
BTAZC0299E An HBA API error occurred: target busy.	1741
BTAZC0301E An error occurred during a zoning command.	1741
BTAZC0302E An error occurred during zone control operation.	1741

BWN - Disk User Interface messages	1842
BWN000000E An object must be selected.	1843
BWN000200E The minimum size of the volume cannot be less than minimum volume size.	1843
BWN000201E The volume volume name cannot be deleted because there are host ports assigned to it.	1843
BWN000202E The volume volume name cannot be deleted, because volume deletion is not supported by this storage subsystem.	1843
BWN000203E No storage pool is available.	1844
BWN000204E The maximum size of the volume cannot be greater than maximum volume size.	1844
BWN000205E The maximum size of the XIV volume cannot be greater than maximum volume size. The size of the volume must be changed.	1844
BWN000206E The number of volumes must be reduced so that volume(s) with selected size can be created.	1844
BWN000207E The volume deletion failed. Please check job log for detailed information about the error.	1844
BWN000208E Invalid characters in volume name. Volume name can only contain: A-Z, a-z, 0-9, _, -, . and space.	1845
BWN000300E A valid quantity must be selected. It must be between 1 and max quantity.	1845
BWN000301E A valid size must be selected. It must be between 0 and max size.	1845
BWN000302E The maximum virtual disk size must be less than or equal to the available capacity (available capacity) for one virtual disk in the managed-disk group. If multiple virtual disks are to be created, the virtual-disk size must be less than or equal to the available capacity divided by the number of virtual disks	1845

BWN000303E The number of virtual disks is invalid. The maximum number of virtual disks that can be created is (available quantity).	1845
BWN000304E At least one managed disk must be selected.	1846
BWN000305E The virtual disk vdisk name cannot be deleted because there are host ports assigned to it.	1846
BWN000306E The virtual disk name is not valid.	1846
BWN000307E Sequential virtual disks and multiple managed disks are selected, but round-robin assignment is not specified.	1846
BWN000308E The number of selected mdisks must be equal to the number of vdisks to be created - vdisk no..	1846
BWN000309E The selected managed disks could not be added to the managed-disk group.	1847
BWN000310E The selected host type does not match the host type of the selected host ports to be assigned.	1847
BWN000311E The selected host ports have identical WWPNs. Select the host ports with different WWPNs.	1847
BWN000312E The maximum virtual-disk real size must be less than or equal to the available capacity (available capacity) in the managed-disk group. If multiple virtual disks are to be created, the virtual-disk real size must be less than or equal to the available capacity divided by the number of virtual disks.	1847
BWN000313E When creating Space Efficient virtual-disks, the maximum virtual-disk size must not exceed maximum size.	1848
BWN000314E The virtual-disk warning size must be greater than 0 and cannot exceed 100 percent.	1848
BWN000315W This SMI-S provider is already defined with the same parameters. Would you like to save it anyway?	1848
BWN000316W This IBM Spectrum Control Server is already defined with the same parameters. Would you like to save it anyway?	1848
BWN000317W Testing SMI-S provider connectivity can take up to several minutes in case of an incorrectly entered port number, network problems or an unpassed firewall. Would you like to continue anyway?	1848
BWN000318E No managed disk is found for the selected mdisk group.	1849
BWN000319E The length of the generated virtual disk name (virtual disk) exceeds the maximum permitted length (maximum length of characters).	1849
BWN000600E Some of the selected host ports do not have a host connection configured on the subsystem\and require a host type to be specified. Select the appropriate host type to be used.	1849

EMSG - DS8000 management console messages	1870
EMSG0001E The DS8000 Element Managers view is not accessible because the Device Server is down.	1870
EMSG0002E The embedded browser widget was unexpectedly destroyed. Click OK to reset display.	1870
EMSG0003I The element manager is about to be removed. Once removed the element manager will not be accessible from IBM Spectrum Control. Do you wish to continue?	1871
EMSG0004I Connection test to the element manager element manager passed.	1871
EMSG0005E Connection test to the element manager element manager failed.	1871
EMSG0006I SMI-S provider connection was removed from element manager.	1871
EMSG0007E A problem occurred removing the SMI-S provider from the element manager.	1871
EMSG0008I The SMI-S provider has been added successfully. IBM Spectrum Control has started the discovery job for the device managed by this SMI-S provider. To check the status of the jobs, go to the IBM Spectrum Control perspective and check the following navigation tree nodes: Administrative Services -> Discovery -> CIMOM	1872
EMSG0009E The element manager already exists.	1872
EMSG0010E A problem occurred adding the element manager to IBM Spectrum Control.	1872
EMSG0011E Connection test to Element Manager failed.	1872
EMSG0012E Unable to establish an https connection to the element manager.	1872
EMSG0013E SMI-S provider connection was added to the element manager, however the SMI-S provider discovery job failed to launch.	1873
EMSG0014E An element manager named manager.name already exists.	1873
EMSG0015E A problem occurred updating the element manager to IBM Spectrum Control.	1873

EMSG0016E Connection test to SMI-S provider FAILED due to status code.	1873
EMSG0017E The element manager's URL is not in the correct format.	1874
EMSG0018E A problem occurred locating the element manager in IBM Spectrum Control.	1874
EMSG0019E A problem occurred locating the SMI-S provider associated with the element manager.	1874
EMSG0020E Unable to reset DS8000 Element Manager password.	1874
EMSG0021E To be added to IBM Spectrum Control, all DS8000 Element Manager software is prior to release 4.2 need Username and password.	1875
EMSG0022E User credentials provided for DS8000 Element Manager are not valid. Provide valid credentials.	1875
EMSG0023E Unable to Add or Modify DS8000 Element manager for unknown reasons.	1875
EMSG0024E Unable to Add or Modify DS8000 Element manager. Provide right password.	1875
EMSG0025E Unable to Add or Modify DS8000 Element manager. Account does not exist.	1876
EMSG0026E Unable to Add or Modify DS8000 Element manager. User Account is locked.	1876
EMSG0027E Unable to Add/Modify DS8000 Element manager. Storage Authentication Service (SAS) database cannot be accessed.	1876
EMSG0028E Unable to Add or Modify DS8000 Element manager. Parameters passed are not valid.	1876
EMSG0029E Unable to Add or Modify DS8000 Element manager. Storage Authentication Service(SAS) database login task has failed. Username or password is Incorrect.	1877
EMSG0030E Unable to Add or Modify DS8000 Element manager. The external user account or user group is not mapped to a DS series user role.	1877
EMSG0031E Unable to Add or Modify DS8000 Element manager. Token submitted to Authentication policy is not supported.	1877
EMSG0032E Unable to Add or Modify DS8000 Element manager. Token submitted for authentication has expired. Re-authenticate to continue.	1877
EMSG0033E Unable to Add or Modify DS8000 Element manager. No URL provided for Storage Authentication Service (SAS) policy.	1878
EMSG0034E Unable to Add or Modify DS8000 Element manager. The host specified in the URL is not a known host or is not reachable.	1878
EMSG0035E Unable to Add or Modify DS8000 Element manager. The specified truststore does not have a valid certificate for the Storage Authentication Service (SAS).	1878
EMSG0036E Unable to Add or Modify DS8000 Element manager. Connection request to the Storage Authentication Service (SAS) is refused.	1878
EMSG0037E Unable to Add or Modify DS8000 Element manager. Connection request to the Storage Authentication Service (SAS) has failed due to socket timeout.	1879
EMSG0038E Unable to Add or Modify DS8000 Element manager. Failed to login to DS8000 Element manager. Please enter valid Username and password.	1879
EMSG0039E Unable to Add or Modify DS8000 Element manager. The type of token submitted is not supported by the Storage Authentication Service.	1879
EMSG0040I The SMI-S provider Connection is about to be removed. Do you wish to continue?	1879
EMSG0041E The DS8000 Network server is unavailable.	1880
EMSG0042E You are not authorized to perform this action through the management console.	1880
EMSG0043E You cannot add an element manager for this DS8K as its software version is too low.	1880
EMSG0044E You cannot update the element manager for this DS8K as its software version is too low.	1880

GPC00952I No drill-up available for this component.	1926
GPC00953I None of the selected metrics apply for all the report components.	1926
GPC00954I None of the selected metrics apply for all selected components.	1926
GPC00955I None of the selected metrics apply for all the report components or for all selected components.	1927
GPC00956I Subsystem port constraint violations do not support the affected volumes report.	1927
GPC00957I The maximum limit of max no of rows displayable rows for a performance report has been reached. If a larger report is required rerun the report as a batch report, alternatively redefine the report to return less data. The amount of report data can be reduced by using a smaller time window, working with less components, applying filters when defining the report or using the aggregated hourly or daily report data rather than the sample data.	1927
GPC00958I No drill-down available for this component.	1927
GPC50000E Fabric type for fabric type identifier does not match the fabric type in selected list.	1927
HWNAS - Agentless Server messages	1928
HWNAS0001I Successfully created server server.	1928
HWNAS0002I Successfully deleted server server.	1928
HWNAS0003E The host name or IP address {0} is not valid.	1928
HWNAS0004E Cannot add port portWWPN because it belongs to server serverName.	1928
HWNAS0005E Cannot add port portWWPN because it belongs to switch switchName.	1929
HWNAS0006E Cannot add port portWWPN because it belongs to storage system storageSystemName.	1929
HWNAS0007W Server serverName was not created because it exists already.	1929
HWNAS0008I Successfully created mergeServerName server by merging numberOfServers servers.	1929
HWNAS0009I Successfully separated serverName server into numberOfServers individual servers.	1929
HWNAS0010E The serverId agentless server that you selected does not exist.	1930
HWNAS0011I You cannot separate the serverName agentless server because it is not based on storage system host connections.	1930
HWNAS0012I You cannot separate the serverName agentless server because it is already defined on the smallest possible separation boundary.	1930
HWNAS0013I You cannot merge the selected agentless servers into the serverName agentless server because they are not all based on storage system host connections.	1930
HWNAU - Single sign-on service messages	1930
HWNAU0001E A connection with the IBM Spectrum Control Device Server, (Device Server IP, could not be established for authentication.	1931
HWNAU0002E A connection with the LDAP or Active Directory server, (LDAP or Active Directory Server IP) , could not be made for authentication.	1931
HWNAU0003E Authentication of the Single Sign-On token failed. Provide your username and password to attempt a re-authentication.	1931
HWNAU0004E The Single Sign-On token has expired. To re-authenticate the token, please enter your user name / password.	1931
HWNAU0005E Creation of the Single Sign-On token failed due to an username that is not valid. Enter your username and password and try again.	1932
HWNAU0006E Creation of the Single Sign-On token failed due to a password that is not valid. Enter your username and password and try again.	1932
HWNAU0007E Authentication failed due to an username or password that is not valid. Enter your username and password and try again.	1932
HWNAU0008I Single Sign On Service started successfully.	1932
HWNAU0009I The Single Sign On Service has shutdown.	1932
HWNAU0010E An error occurred retrieving the Single Sign-On token from the private credentials.	1933
HWNAU0011E An error occurred retrieving the Single Sign-On token from the public credentials.	1933
HWNAU0012E An error occurred when attempting to decode the authentication token.	1933
HWNAU0013E An error occurred when attempting to encode the authentication token.	1933
HWNAU0014E An error occurred while translating the user's credentials into a Single Sign-On token.	1933
HWNAU0015E An unknown error occurred while authenticating to the WebSphere login module.	1933
HWNAU0016E An error occurred while registering SsoConfigChangeListener with TIP.	1933
HWNAU0017E An error occurred while unregistering SsoConfigChangeListener from TIP.	1934
HWNAU0018E The Web server appears to be down and cannot be used for authentication. It is still possible to perform OS user authentication against the device server, however since the Web server is down the IBM Spectrum Control functionality will be limited. Among the limitations is the inability to perform SSO to other applications that rely on the presence of a lightweight third party authentication token. To proceed enter a local OS username with administrative privileges and password.	1934
HWNAU0019E An unknown error occurred while authenticating with Web server.	1934
HWNCA - Storage multiple access control messages	1934

HWNCA0001E The required parameter_name parameter is missing.	1935
HWNCA0002E The delivery unit type delivery_unit_type is not supported.	1935
HWNCA0003E The delivery unit type, delivery_unit_type, does not match the capacity pool type, capacity_pool_type.	1936
HWNCA0004E The service class service_class_name is not supported by the capacity pool.	1936
HWNCA0005E IBM Spectrum Control cannot provide the requested delivery_unit_size GiB of capacity that also satisfies the requirements of the service class.	1936
HWNCA0006E A delivery unit delivery_unit_name and service instance ID service_instance_ID already exists.	1936
HWNCA0007I Normal isolated file storage.	1936
HWNCA0008I Enhanced isolated file storage.	1937
HWNCA0009E The capacity pool with ID capacity_pool_id is still in use and cannot be deleted.	1937
HWNCA0010E The service class service_class_name has no recipe for deleting delivery unit delivery_unit_name.	1937
HWNCA0011E The service class service_class_name cannot modify the delivery unit delivery_unit_name.	1937
HWNCA0012E The capacity of the delivery unit with ID delivery_unit_id cannot be modified after delivery unit is created.	1937
HWNCA0013E Delivery unit with ID delivery_unit_id cannot be modified or deleted because it is in the processing state.	1938
HWNCA0014E Delivery unit with ID delivery_unit_id cannot be modified because it has a completion state error.	1938
HWNCA0015E The principal principal_name was used in multiple CIFS access control list (ACL) entries.	1938
HWNCA0016I A standard object can handle object-type delivery units, such as CDMI containers.	1938
HWNCA0017I You can use the StandardBlock service class to create, modify, and delete delivery units that are block based, such as volume containers.	1938
HWNCA0018I High Availability, Sequential.	1939
HWNCA0019I High Availability, Short response time, Transactional.	1939
HWNCA0020E No provisioning profile was found for recipe name.	1939
HWNCA0021E The WWPN WWPN does not belong to a server or hypervisor managed by IBM Spectrum Control.	1939
HWNCA0022E Device Selection failed with the following error: Planner Message	1939
HWNCA0023E Creation of DeliveryUnit failed with the following error: Planner Message	1939
HWNCA0025I Remote Caching allows the data written to one delivery unit to be pushed to another remote located delivery unit.	1940
HWNCA0026E Deletion of DeliveryUnit failed with the following error: Planner Message	1940
HWNCA0027I Highest-performing storage for mission-critical applications.	1940
HWNCA0028I High-performing storage for applications in production.	1940
HWNCA0029I Standard storage for non-mission-critical applications.	1940
HWNCA0030E No host port WWPNs were found for server host name.	1940
HWNCA0031I The standard root object class enforces the use of dedicated filesets for associated object-type delivery units, such as CDMI containers.	1941
HWNCA0032E A Storage Resource agent is not up and running for the host name server.	1941
HWNCA0033E A service class with name service_class_name does not exist for the specified delivery unit type.	1941
HWNCA0034E IBM Spectrum Control is unable to create or modify the service class because one or more of the capacity pools to which it was restricted were removed.	1941
HWNCA0035E Delivery unit with ID delivery_unit_id cannot be modified or deleted because it has a completion status of planned or change_planned.	1942
HWNCA0036E More than numResults results found. Modify your search pattern.	1942
HWNCA0037I Start the creation of an object container with name containerName.	1942
HWNCA0038I The creation of the object container with name containerName is finished.	1942
HWNCA0039I Start the deletion of an object container with name containerName.	1942
HWNCA0040I The deletion of the object container with name containerName is finished.	1943
HWNCA0041I Start the modification of an object container with name containerName.	1943
HWNCA0042I The modification of the object container with name containerName is finished.	1943
HWNCA0043I This task was already deleted.	1943
HWNCA0044E The requested operation requires SMAC API client version version or later.	1943
HWNCA0045E The plan with scheduleID scheduleID can not be deleted because the delivery unit creation is already processing state.	1944
HWNCA0046E The specified value deletionType is not a valid plan deletion type.	1944
HWNCA0047E Host with host name host is not known by IBM Spectrum Control.	1944
HWNCA0048E Filer Storage ID filerId for given fileSystem is not found.	1944
HWNCA0049W IBM Spectrum Control did not change any Fibre Channel zones. After the provisioning operation completes, verify the Fibre Channel connectivity between any involved host and the storage subsystem that contains the storage volume. If necessary, change the zoning configuration.	1944
HWNCA0050W IBM Spectrum Control did not enable the multipath policy for the host or hosts to which the volume was reassigned. You must enable the multipath policy after the provisioning operation completes.	1945
HWNCA0051E Incorrect volume name volumeName. The name can contain letters, numbers, dashes (-) and underscores (_). However, the name cannot start with a number, dash, or the reserved words vdisk or volume.	1945
HWNCA0052E One or more of the requested volume names are too long for the following storage systems: StorageSubsystemsList. The maximum volume name length that is allowed is MaxAllowedNameLength characters, and a volume name of LargestNameLength characters was requested.	1945
HWNCA0053E The service class scName does not support provisioning from any available storage.	1945
HWNCA0054E The volume volumeName already exists on the storage system storageSystemName. Request a different volume name.	1946
HWNCA0055E The share shareName already exists on the storage system storageSystemName. Request a different share name.	1946
HWNCA0056W Zoning cannot be configured because the connected fabrics are not monitored.	1946
HWNCA0057W The multipath policy cannot be set on the following hypervisors: HostList.	1946
HWNCA0058W The multipath policy cannot be set on the following agentless servers: HostList.	1946
HWNCA0059W The multipath policy cannot be set on the following hosts: HostList.	1947
HWNCA0060E Storage volume can not be assigned to servers that are running different operating systems.	1947
HWNCA0061E The required resources cannot be reserved because too many provisioning tasks are currently being created. Try again in a few minutes.	1947
HWNCA0062E The operation did not complete because the specified service class or capacity pool no longer exists.	1947
HWNCA0063E The service class ScName that is specified by this provisioning task does not exist.	1947
HWNCA0064E The current SMAC API client is version current_version. The requested operation requires SMAC API client version required_version or later.	1948
HWNCA0065E The delivery unit specified has snapshots and could not be deleted.	1948
HWNCA0066E The WWPN WWPN already belongs to a server or hypervisor managed by IBM Spectrum Control. Was expected an unknown WWPN based on previous Hosts or WWPNs passed in.	1948

HWNCA0067E The host host already belongs to a server or hypervisor managed by IBM Spectrum Control. Was expected an unknown Host based on previous Hosts or WWPNS passed in.	1948
HWNCA0068E The list of hosts was expected to contain just one or no element because the WWPNS passed in were all unknown. The size of the host list is size	1949
HWNCA0069E No unknown WWPNS were specified for this provisioning operation but an unknown Host was specified.	1949
HWNCA0070E The expansion of the capacity is not supported for the delivery unit with ID delivery_unit_id.	1949
HWNCA0071E The reduction of the capacity is not supported for the delivery unit with ID delivery_unit_id.	1949
HWNDA - Data Manager API messages	1949
HWNDA0001I Operation Name of the operation processed successfully.	1951
HWNDA0002E Mandatory parameter Name of the mandatory parameter which is missing missing	1951
HWNDA0003E Invalid parameter Name of the parameter which was invalid	1951
HWNDA0004E An internal error occurred.	1951
HWNDA0005E The server encountered an error when it was accessing the database.	1951
HWNDA0006E The name provided while creating a new group is already in use.	1952
HWNDA0007E An external key could not be identified for the provided type The constant integer type of the Group element and id The unique integer database ID of the Group element.	1952
HWNDA0008E The specified attribute invalid attribute name is not a valid attribute.	1952
HWNDA0009E An internal ID could not be identified for the provided type The constant integer type of the Group element and external key The unique external key of the Group element.	1952
HWNDA0010I The following elements are already members of the group The group: The keys of the elements.	1953
HWNDA0011I The following elements are not members of the The group Group and cannot be removed: The element key.	1953
HWNDA0012E Adding a Group with the name Name of the proposed new member to the Name of the parent group Group would create a circular relationship that is not allowed.	1953
HWNDA0013E The input parameter value input parameter value for input input parameter name exceeds the maximum allowable length of number of allowable characters characters.	1953
HWNDA0014E The provided Group attribute value Group attribute value for the Group attribute name Group attribute contains invalid characters. The following characters are not allowed, \\\\:.*?>< ."	1953
HWNDA0015E You are not the original creator of the provided Group name Group name.	1954
HWNDA0016E The provided Tiering Policy name Tiering Policy name is not unique.	1954
HWNDA0017E The provided Group Group name or ID does not exist.	1954
HWNDA0018E The provided Tiering Policy name Tiering Policy name does not exist.	1954
HWNDA0019E The provided candidate and destination Group names, Group name, cannot be the same.	1954
HWNDA0020E The provided condition condition type is not valid.	1955
HWNDA0021E The provided operand operand type is not valid.	1955
HWNDA0022E The provided condition condition type is either already applied to this tiering policy or conflicts with an existing condition, existing condition type	1955
HWNDA0023E The requested priority value priority value is invalid.	1955
HWNDA0024E The specified Group name Group name is not unique.	1955
HWNDA0025E Cannot add the specified resource because the resource type, element type, is not supported as a child of the group.	1956
HWNDA0026E Cannot add the specified group, Group name, because the group type, type, is not supported as a child of the application.	1956
HWNDA0027E The first option specified in the file must be -appgroupname.	1956
HWNDA0028E The argument of the option option is missing at or before line Line Number : Line	1956
HWNDA0029E Both option1 and option2 were specified at or before line Line Number : Line	1956
HWNDA0030E The option option is missing at or before line Line Number : Line	1957
HWNDA0031E Neither option1 nor option2 was specified at or before line Line Number : Line	1957
HWNDA0032E Invalid number of parameters for option option at or before line Line Number : Line	1957
HWNDA0033E Incomplete options sequence before end of file.	1957
HWNDA0034E Invalid option option at line Line Number : Line	1957
HWNDA0035E Invalid resource type type at line Line Number : Line	1958
HWNDA0036E Invalid sequence of options at or before line Line Number : Line	1958
HWNDA0037E Syntax error, quote sequence not properly closed at line Line Number : Line	1958
HWNDA0038E Option option is not allowed for resource type type at or before line Line Number : Line	1958
HWNDA0039E The input data for modifying the application groups is missing.	1958
HWNDA0040E An invalid element was encountered in the input data.	1958
HWNDA0041E The application group name is missing from the input data.	1959
HWNDA0042E The operation is missing from the input data.	1959
HWNDA0043E The resource type is missing from the input data.	1959
HWNDA0044E The server name is missing from the input data.	1959
HWNDA0045E The device name is missing from the input data.	1959
HWNDA0046E Invalid values were specified for the server, device or cluster names in the input data.	1960
HWNDA0047E Member names and the tags were specified for the same operation.	1960
HWNDA0048W The following entities were not found: Entities.	1960
HWNDA0049W No entities were found for the tags: Tags	1960
HWNDA0050E The member names or tags were not specified for the operation.	1960
HWNDA0051W The group Name of the proposed new member cannot be added to itself.	1960
HWNDA0052W The group Name of the proposed new member cannot be added to the Name of the parent group group because it creates a circular relationship that is not allowed.	1961
HWNDA0053W The group Name of the group contains child groups and cannot be deleted. The child groups must be deleted before the parent group can be deleted.	1961
HWNDA0054E The filter mask that was used to create or edit a group filter is currently being used.	1961
HWNDA0055E The argument argument for the parameter parameter on line Line Number : Line is invalid.	1961
HWNDA0056E The first option specified in the file must be -id.	1961
HWNDA0057E The specified Group Group name is not of type type.	1962
HWNDA0058W These groups have same names as existing members of the group The group: The keys of the elements. They were not added to the group.	1962
HWNDA0059E The specified tag key Tag key is not valid.	1962

HWNDA0060W These group members are also members of another group: The groups. They are not deleted.	1962
HWNDA0061W These group members cannot be moved up one level in hierarchy due to name conflicts: The groups. The group is not deleted.	1962
HWNDA0062E The specified Group Group name is not a department group.	1963
HWNDA0063W These group members cannot be moved as top level groups in hierarchy due to name conflicts: The groups. No group members were removed from the group.	1963
HWNDA0064E An application with the same name already exists.	1963
HWNDA0065E A department with the same name already exists.	1963
HWNDA0066E Invalid values were specified for the device, cluster or file system names in the input data.	1963
HWNDA0067E Resources of type Type of resource cannot be added to an application or removed from an application using tags.	1964
HWNDA0068E The application cannot be added because the number of levels in the group hierarchy exceeds the maximum of five levels.	1964
HWNDA0069E The department cannot be added because the number of levels in the group hierarchy exceeds the maximum of five levels.	1964
HWNDA0070W The File Systems: {0} were not added to the application {1} because they are NAS file systems.	1964
HWNDA0071E Member IDs and the tags were specified for the same operation.	1964
HWNDA0072E Member IDs should be specified in the input data for resources of type appgroup.	1965
HWNDA0073E A general group with the same name already exists.	1965
HWNDA0074E The general group cannot be added because the number of levels in the group hierarchy exceeds the maximum of five levels.	1965
HWNDA0075E A dashboard with the same name already exists.	1965
HWNDA0076E The dashboard group cannot be added because the number of levels in the group hierarchy exceeds the maximum of five levels.	1965
HWNDA0077E A policy group with the same name already exists.	1966
HWNDA0078I The Name of the policy group policy group was removed.	1966
HWNEM - Element manager messages	1966
HWNEM0001E The element manager management service failed to obtain a database connection.	1967
HWNEM0002E An error occurred while attempting to add element manager information to the database.	1967
HWNEM0003E An error occurred while attempting to update element manager information in the database.	1968
HWNEM0004E An error occurred while attempting to remove element manager information from the database.	1968
HWNEM0005E An error occurred while attempting to obtain element manager information from the database.	1968
HWNEM0006E Failed to transmit request to Data Server to initiate SMI-S provider discovery job.	1968
HWNEM0007E An error occurred while attempting to obtain Data Server information from the database.	1969
HWNEM0008E Data Server information was not found in the database. SMI-S provider discovery could not be scheduled.	1969
HWNEM0009E An error occurred while attempting to obtain the SMI-S provider URL associated with an element manager from the database.	1969
HWNEM0010E An error occurred while attempting to obtain element manager credentials from the database.	1970
HWNEM0011E An error occurred while attempting to remove element manager credentials from the database.	1970
HWNEM0012E An error occurred while attempting to store element manager credentials in the database.	1970
HWNEM0013E Encountered element manager with malformed URL (URL).	1970
HWNEM0014E Encountered element manager with URL containing hostname that could not be resolved by DNS (URL).	1971
HWNEM0015E Failed to clone element manager.	1971
HWNEM0016E Failed to encrypt element manager password.	1971
HWNEM0017E Failed to decrypt element manager password.	1971
HWNEM0018E Failed to send request to Data Server (dataServerHost:dataServerPort).	1972
HWNEM0019I Attempting to schedule discovery on Data Server for number SMI-S provider(s) (SMI-S provider URLs)...	1972
HWNEM0020I Successfully scheduled discovery on Data Server for number SMI-S provider(s).	1972
HWNEM0021I SMI-S provider discovery was not scheduled on Data Server. No SMI-S providers are associated with the specified set of element managers.	1972
HWNEM0022E Failed to authenticate with ESSNI server associated with element manager at URL using ESSNI user ID ESSNI user ID.	1973
HWNEM0023E The ESSNI server associated with the element manager at URL is not available.	1973
HWNEM0026E An error occurred while attempting to retrieve version information from the ESSNI server associated with the element manager at URL.	1973
HWNEM0029E Failed to set element manager credentials. Specified Element manager does not exist.	1973
HWNEM0100E The element manager's URL is not in the correct format.	1974
HWNEM0101E Change the default administrator password now to avoid security conflicts.	1974
HWNEM0102E The element manager already exists.	1974
HWNEM0103E A problem occurred adding the element manager to IBM Spectrum Control.	1974
HWNEM0104E Login to the element manager failed. Check the user credentials.	1975
HWNEM0105E The request contained data in an unexpected format	1975
HWNEM0106E The request did not contain the expected information.	1975
HWNEM0107E The request contained an unsupported action.	1975
HWNEM0108E Connection test to SMI-S provider URL FAILED due to status code.	1975
HWNEM0109E Connection test to Element Manager failed.	1976
HWNEM0111E A problem occurred locating the element manager in IBM Spectrum Control.	1976
HWNEM0112E A problem occurred updating the element manager to IBM Spectrum Control.	1976
HWNEM0113E A problem occurred removing the SMI-S provider from the element manager.	1976
HWNEM0114E A problem occurred locating the SMI-S provider associated with the element manager.	1977
HWNEM0115E Unable to establish an https connection to the element manager.	1977
HWNEM0116E A problem occurred removing the element manager from IBM Spectrum Control.	1977
HWNEM0117E A problem occurred testing the connection to the element manager.	1977
HWNEM0118I Connection test to the element manager element manager passed.	1978
HWNEM0119E Connection test to the element manager element manager failed.	1978
HWNEM0120E IBM Spectrum Control is unable to communicate with the element manager, the problem could be the element manager is not running, a network communication error or user credentials stored in IBM Spectrum Control are incorrect.	1978
HWNEM0121I Connection test to the SMI-S provider SMI-S provider passed.	1978
HWNEM0122I Connection test to the SMI-S provider SMI-S provider failed.	1979
HWNEM0123E Before executing the action the user must select an element manager from the table.	1979
HWNEM0124E There is no SMI-S provider associated with the selected element manager.	1979

HWNEM0125I The element manager is about to be removed. Once removed the element manager will not be accessible from IBM Spectrum Control. Do you wish to continue.	1979
HWNEM0126I The element manager is about to be removed. Once removed the element manager will not be accessible from IBM Spectrum Control. Do you wish to continue.	1979
HWNEM0127E An internal processing error occurred while servicing the last request.	1980
HWNEM0128E The element manager is not available. Ensure that the element manager's credentials are defined and up to date.	1980
HWNEM0129E An unexpected error occurred changing the element manager's default password.	1980
HWNEM0130E SMI-S provider connection was added to the element manager, however the SMI-S provider discovery job failed to launch.	1980
HWNEM0131I The DS8000 SMI-S provider has been added successfully. IBM Spectrum Control has started the discovery job for the DS8000 storage subsystem managed by this SMI-S provider. To check the status of the jobs, go to the IBM Spectrum Control perspective and check the following navigation tree nodes: Administrative Services -> Discovery -> CIMOM	1981
HWNEM0132I SMI-S provider connection was removed from element manager.	1981
HWNEM0133E Internal error occurred, the element manager info for launching the element manager could not be located in the IBM Spectrum Control DB.	1981
HWNEM0134E The user session data is no longer available. To continue restart the IBM Spectrum Control GUI.	1981
HWNEM0135E Unable to contact the device server. It appears to be down.	1982
HWNEM0136I The DS8000 Element Manager at IP Address has been added successfully.	1982
HWNEM0137I service.method IBM Spectrum Control User IBM Spectrum Control user launched DS8000 Element Manager IP Address under the alias of DS8000 user name.	1982
HWNEM0138I The DS8000 SMI-S provider has been modified successfully. IBM Spectrum Control has started the discovery job for the DS8000 storage subsystem managed by this SMI-S provider. To check the status of the jobs, go to the IBM Spectrum Control perspective and check the following navigation tree nodes: Administrative Services -> Data Sources -> Discovery -> CIMOM	1982
HWNEM0139I The DS8000 SMI-S provider has been modified successfully.	1982
HWNEM0140W The element manager GUI cannot be accessed because no username and password have been specified by the currently logged-in IBM Spectrum Control user. Element manager credentials are managed on a per-IBM Spectrum Control user basis. The element manager GUI will appear after you provide the correct username and password information.	1983
HWNEM0141E The length of the SMI-S provider's text description is too long. The description should be 255 characters or less.	1983
HWNEM0142E An element manager named manager.name already exists.	1983
HWNEM0143E The DS8000 Element Manager Console is only accessible from IBM Spectrum Control. To access it, open IBM Spectrum Control and switch to the DS8000 Element Manager perspective.	1983
HWNFNS - File system monitor messages	1984
HWNFNS0001E The file system monitor tool does not recognize the command: command.	1984
HWNFNS0002E The file system monitor tool is unable to read its property file.	1984
HWNFNS0003W The FileSystems property value property_value has an invalid format.	1984
HWNFNS0004E The file system monitor tool was unable to initialize access to the IBM Spectrum Control database repository.	1984
HWNFNS0005E The probe of device_name ended with the error_code error code.	1985
HWNFNS0006E The FileSystems property is missing in the fsmon.properties file.	1985
HWNFNS0007E Data cannot be retrieved from the database repository.	1985
HWNFNS0008E Data about IBM SONAS devices or file systems cannot be retrieved from the database repository.	1985
HWNFNS0009W Capacity data cannot be collected for the file_system file system.	1985
HWNFNS0010W No matching file system found in the database repository for file_system.	1986
HWNLML - Planner manager messages	1986
HWNLML0700E Storage pool recommendations cannot be given because a storage subsystem is not selected as input.	1990
HWNLML0701E The selected planner cannot occur because a storage subsystem is not selected as input.	1990
HWNLML0702E The selected planner cannot occur because a computer is not selected as input.	1990
HWNLML0703E The selected planner(s) cannot occur because a computer and/or volume is not selected as input.	1991
HWNLML0704E The selected planner cannot occur because a volume is not selected as input.	1991
HWNLML0705E Storage pool recommendation can not be done because there is already a storage volume selected as input.	1991
HWNLML0706E The selected planner cannot occur because there is already a volume selected as input.	1991
HWNLML0707E The selected planner(s) cannot occur because a subsystem or computer is not selected as input.	1991
HWNLML0708E The total required space (total space MB) exceeds the total available space (total space MB) considering all planner inputs. This could be due to insufficient space in the selected storage subsystem's controller(s) or pool(s), or the selected RAID level does not have enough free space or in case of SVC there is insufficient IO group memory configuration.	1992
HWNLML0709E The storage cannot be assigned to the specified hosts due to insufficient LUN addresses.	1992
HWNLML0710E The specified total size to be allocated (total space MB) is invalid. It must be positive and an integral multiple of 100.	1992
HWNLML0711E The specified minimum volume size (minimum size MB) is invalid. It must be positive and an integral multiple of 100.	1992
HWNLML0712E The specified maximum volume size (maximum size MB) is invalid. It must be positive and an integral multiple of 100.	1992
HWNLML0713E The total capacity requested cannot be obtained. The allowed minimum size is {0} GB and the allowed maximum size is {1} GB for the given subsystem(s). The total size is {2} GB.	1993
HWNLML0714E Host Host does not have multipath support because it only has one Fibre Channel port.	1993
HWNLML0715E There are no common fabrics that have the minimum number of required paths between the selected servers and the managed storage systems.	1993
HWNLML0716E There needs to be at least two common fabrics between host Host and storage subsystem Subsystem in order to use the redundant fabric option.	1993
HWNLML0718E The number of paths specified was Paths, but the redundant fabric option requires the number of paths to be an even number of paths.	1994
HWNLML0719E Host host does not have a Host Bus Adapter (HBA) installed. Please select a host with a HBA installed and try again.	1994
HWNLML0720E The Plan failed to generate due to storage subsystem Subsystem not having any volumes identified for Planning use. Please select another storage subsystem and try again.	1994
HWNLML0721E A supported multipath driver is not installed on host Host.	1994
HWNLML0722E There is an insufficient number of Fibre Channel paths between host Host and storage subsystem Subsystem. Requested Paths paths were requested but there are only Possible Paths paths available.	1994
HWNLML0723E The number of paths specified was Paths, but the redundant fabric option requires the minimum number of paths for virtual disks to be four paths or more.	1995
HWNLML0724E The number of zones in fabric fabric will be number of zones. This is larger than the max zones maximum number of zones specified.	1995
HWNLML0725E Storage pool data does not exist for storage subsystem subsystem. This is either due to not running a storage subsystem probe or not having any fixed block formatted storage pools on the subsystem.	1995

HWNLM0726E Performance data does not exist for input storage subsystem(s) for the given date range. Either run an IBM Spectrum Control Performance Monitor against the given storage subsystem(s) or under the Capacity Planner, select the 'Space Only' Workload Profile option.	1995
HWNLM0728E An unexpected internal error occurred. Please contact IBM customer technical support.	1996
HWNLM0729E The resulting SAN Planner actions include creating a zoned set on McData fabric fabric WWN. Since there is already an active zone set, please select the 'Use active zone set' option under the Zone Planner and try again.	1996
HWNLM0730E SDD version 1.6.2.3 installed on HP host host is not supported by IBM Spectrum Control.	1996
HWNLM0731E The computer probe for computer host was incomplete. Please attempt another computer probe and try again.	1996
HWNLM0732E DM-Multipath installed on Linux host host does not support the selected Multipath mode.	1997
HWNLM0734E The total required IO Group mirroring memory (total memory KB) for vdisk mirroring creation exceeds total available mirroring memory (total memory KB) available.	1997
HWNLM0735E Could not find any subsystem for planning. It is possible that the given subsystems are not detectable.	1997
HWNLM0736E The primary, secondary or tertiary storage subsystem subsystem that you specified is not registered with the IBM Spectrum Control-R server.	1997
HWNLM0737E Storage Subsystem subsystem is not a supported type for replication operations.	1997
HWNLM0738E Replication session with a combination of virtualized and non-virtualized storage volumes in not supported.	1998
HWNLM0739E Replication session type session is not allowed for the supplied subsystem subsystem of typesubsystemtype.	1998
HWNLM0740E Limit reached : Number of copy pairs for Replication session type session for the supplied subsystem subsystem.	1998
HWNLM0741E Replication session type session is not supported.	1998
HWNLM0742E Format of LSS Property File filepath is invalid.	1998
HWNLM0743E Namespace in specified LSS is not available.	1999
HWNLM0744E Unable to find suitable placement for replication storage volumes. plannermsg	1999
HWNLM0745E Secondary SRG secsrc is either empty or does not contain any valid elements for replication related resource provisioning.	1999
HWNLM0746E Tertiary SRG tersrc is either empty or does not contain any valid elements for replication related resource provisioning.	1999
HWNLM0747I Please ensure that proper Replication license and device feature codes are enabled, otherwise the plan execution will fail.	1999
HWNLM0748E Replication Manager is not installed.	2000
HWNLM0749E Replication Planner Internal Error.	2000
HWNLM0750E Replication session with the specified name (sesname) already exists. Please use a different name.	2000
HWNLM0751E No storage system resource can satisfy the provisioning requirements.	2000
HWNLM0752E The subsystem(s) provided in the input do not satisfy the given Thin Provisioning criteria.	2000
HWNLM0753E The subsystem(s) provided in the input do not allow provisioning on volumes or no subsystems were selected.	2001
HWNLM0754E The subsystem(s) provided in the input do not allow provisioning on virtual disks or no subsystems were selected.	2001
HWNLM0755E The selected virtual disk(s) cannot be added in a plan for volumes.	2001
HWNLM0756E The selected volume(s) cannot be added in a plan for virtual disks.	2001
HWNLM0757I The volume size has been slightly adjusted to meet subsystem requirement.	2001
HWNLM0758I If a FlashCopy source has multiple targets, an IncrementalFlashCopy relationship can be established with one and only one target.	2002
HWNLM0759I IncrementalFlashCopy is not available with FlashCopy SE.	2002
HWNLM0760W Input Volume is already in source role for 12 Flash Copy Sessions, ID = volumeID, Volume Name = volumeName.	2002
HWNLM0761W Input Volume is already in a target role of Flash Copy Session(s), ID = volumeID, Volume Name = volumeName.	2002
HWNLM0762W Input Volume is already in a target role of Continuous Copy Session(s), ID = volumeID, Volume Name = volumeName.	2002
HWNLM0763W Input Volume is already in a target role of Flash Copy Session(s).	2002
HWNLM0764I Ensure connectivity between source and target (direct or through fabric).	2003
HWNLM0765W For TSE volumes, please ensure that the Repository Capacity is configured and available on the pool poolName.	2003
HWNLM0766W The storage subsystem ssName is unacceptable due to -- reason.	2003
HWNLM0767I The storage subsystem ssName is a valid candidate subsystem, thus it is considered during planning.	2003
HWNLM0768W The storage pool poolName is unacceptable due to -- reason.	2003
HWNLM0769I The storage pool poolName is a valid candidate storage pool, thus it is considered during planning.	2003
HWNLM0770W The SVC ssName is unacceptable due to -- reason.	2003
HWNLM0771I The SVC ssName is a valid candidate subsystem, thus it is considered during planning.	2004
HWNLM0772W The mdiskgroup mdiskGroupName is unacceptable due to -- reason.	2004
HWNLM0773I The mdiskgroup mdiskGroupName is a valid candidate mdiskgroup, thus it is considered during planning.	2004
HWNLM0774W The iogroup ioGroupName is unacceptable due to -- reason.	2004
HWNLM0775I The iogroup ioGroupName is a valid candidate iogroup, thus it is considered during planning.	2004
HWNLM0776E Unable to plan for volumeName due to reaching the maximum limit of volumes on the LSS(es) within storage pool storagePool on storage subsystem subsystem.	2004
HWNLM0777E Replication session with the specified name (sesname) associated with SRG (srgrname) has required replication and does not require extension.	2005
HWNLM0778I The volume/vdisk name may be different during plan execution based on the name availability and/or subsystem limitation.	2005
HWNLM0779E Unable to recommend plan due to reaching the maximum limit of volumes on the LSS(es) within storage pool(s) storagePool on storage subsystem(s) subsystem.	2005
HWNLM0780E Unable to recommend plan since the LSS range specified in the LSSRange.properties file is not valid for volumeName on storage subsystem subsystem.	2005
HWNLM0781E No cluster partnership exists between source subsystem srcSS and target subsystem targetSS.	2006
HWNLM0782E No connectivity path exists between source subsystem srcSS and target subsystem targetSS.	2006
HWNLM0783E The selected input volume volumeName is missing from the storage subsystem.	2006
HWNLM0784E The selected input virtual disk virtualDiskName is missing from the SVC.	2006
HWNLM0785E Provisioning with replication can not be achieved with Extent Space Efficient(ESE) or Track Space Efficient(TSE) volumes. Extent Space Efficient volumes are not allowed in copy sets and Track Space Efficient volumes are valid only in the target role of a FlashCopy session or the Journal role of a Global Mirror or Metro Global Mirror session.	2006
HWNLM0786E Replication can not be extended to Extent Space Efficient(ESE) or Track Space Efficient(TSE) source volumes. Extent Space Efficient volumes are not allowed in copy sets and Track Space Efficient volumes are valid only in the target role of a FlashCopy session or the Journal role of a Global Mirror or Metro Global Mirror session. One or more selected input volumes are either ESE or TSE : volumes.	2007
HWNLM0787E vDisk Mirroring is already enabled for the input vdisk volumes.	2007
HWNLM0788I Fabric selection is based on planner selection of the host port(s) and the subsystem port(s) and not by the fabric(s) selected by the user.	2007
HWNLM0789E The IO group IO Group for virtual disk virtual disk does not have appropriate connectivity to the host(s) selected in the plan.	2007

HWNLM0790E Not considering Subsystem(s): Subsystem because not all of its back-end subsystems are configured into this IBM Spectrum Control or some are currently undetectable. This is unacceptable when an input RAID level is specified or a workload profile other than space-only is selected.	2008
HWNLM0791E The input volume you specified is already defined as a snapshot copy volume of a snapshot copy session, volume ID = volume_id, volume name = volume_name.	2008
HWNLM0792E The input volume you specified cannot be defined as a source volume in a replication session, ID = volume_id, volume name = volume_name.	2008
HWNLM0793I Replication Manager is used to manage snapshot copy sessions.	2008
HWNLM0794E The total space requirement (total space MB) cannot be met within a single storage pool for the replication session. This could be due to insufficient space in the selected storage subsystem's pool(s), or because the storage subsystem's pool(s) do not meet the requirements of the Planner input.	2009
HWNLM0796E The input volumes you specified must be within a single storage pool for the replication session.	2009
HWNLM0797E Volumes could not be created or used in the source pool of the existing snapshot copy session.	2009
HWNLM0798E The total space requirement (total space MB) cannot be met within the storage pool of the existing replication session. This could be due to insufficient space in the storage pool of the existing replication session, or because the input volumes you specified are not within the storage pool of the existing replication session.	2009
HWNLM0799E The input volumes you specified are already defined in an existing snapshot copy session.	2010
HWNLM0800W The input volume you specified is already defined as a snapshot copy volume of a snapshot copy session, volume ID = volume_id, volume name = volume_name.	2010
HWNLM0801E The input volumes you specified are not within the storage pool of the existing replication session.	2010
HWNLM0802E For a Metro Global Mirror session, you must specify at least three DS8000 subsystems with sufficient capacity.	2010
HWNLM0803E The selected input volume volume_name is already in a copy set used by this copy session.	2010
HWNLM0804E Subsystem cannot be considered. Please check both the candidate SVC and its back-end subsystems for available space and performance data for the specified time interval.	2011
HWNLM0804I The storage pool(s) provided do not satisfy the criteria for an acceptable destination pool.	2011
HWNLM0805E Host Host is a virtual machine without any Fibre Channel host port and a storage volume cannot be assigned directly to it.	2011
HWNLM0806W Host Host is a hypervisor. IBM Spectrum Control is unable to set the multipath policy on the hypervisor.	2011
HWNLM0807W Host Host is a server that is not managed by an SRA. IBM Spectrum Control is unable to set the multipath policy on the host.	2011
HWNLM0808E Ports of host Host are not connected to any fabric that is known to IBM Spectrum Control.	2012
HWNLM0809E Ports of host Host are not connected to fabrics that allow automatic zoning.	2012
HWNLM0810E The total capacity requested is {0} GB for {1} number of volumes. The individual volume size comes out to be {2} GB, which is invalid. The allowed minimum size is {3} GB and the allowed maximum size is {4} GB per volume for the given subsystem(s).	2012
HWNLM0811W No fabric information is available. All fabric-related options are ignored and no fabric configuration operation is performed.	2012
HWNLM0812E Unable to plan virtualizer provisioning task due to reaching the maximum vdisks limitation in all candidate iogroups.	2013
HWNLM0001I An integrated SAN Planner job started with schedule creator. schedule name	2013
HWNLM0002E The integrated SAN Planner job completed with errors. Message from exception: message.	2013
HWNLM0003I The integrated SAN Planner job completed.	2013
HWNLM0004W The integrated SAN Planner job completed with warnings.	2013
HWNLM0005E The integrated SAN Planner job completed with errors.	2014
HWNLM0006I Zone set zone set name created on fabric fabric wwn.	2014
HWNLM0007I Zone zone name created on fabric fabric wwn.	2014
HWNLM0008I Zone zone name added to zone set zone set name on fabric fabric wwn.	2014
HWNLM0009I A list of ports added to zone zone name for zone set zone set name on fabric fabric wwn.	2014
HWNLM0010I Activated zone set zone set name on fabric zone set name.	2015
HWNLM0011I Started to create storage volumes.	2015
HWNLM0012E The creation of storage volumes completed with errors.	2015
HWNLM0013I Completed creating storage volumes.	2015
HWNLM0014I Started to assign storage volumes to WWPNs.	2015
HWNLM0015E The assignment of storage volumes to WWPNs completed with errors.	2015
HWNLM0016I Completed assigning storage volumes to WWPNs.	2016
HWNLM0017W The command to discover volumes on host host id failed with status status.	2016
HWNLM0018W Unable to set the multipath policy on host host id due to host failure status.	2016
HWNLM0019I Completed startTransaction command on fabric fabric wwn.	2016
HWNLM0020I Completed commitTransaction command on fabric fabric wwn.	2017
HWNLM0021E The startTransaction command on fabric fabric wwn failed with return code return code.	2017
HWNLM0022E Creation for Zone set zone set name on fabric fabric wwn failed with return code return code.	2017
HWNLM0023E Creation for Zone zone name created on fabric fabric wwn failed with return code return code.	2017
HWNLM0024E Adding Zone zone name to zone set zone set name on fabric fabric wwn failed with return code return code.	2018
HWNLM0025E Adding ports to zone zone name for zone set zone set name on fabric fabric wwn failed with return code return code.	2018
HWNLM0026E Activated zone set zone set name on fabric zone set name failed with return code return code.	2018
HWNLM0027E The commitTransaction command on fabric fabric wwn failed with return code return code.	2018
HWNLM0028I Starting volume discovery on host host.	2019
HWNLM0029I Finished volume discovery on host host.	2019
HWNLM0030I Assignment(s) between Volume volume id and Host Port(s) host ports already exist, no assignment actions will happen for these paths.	2019
HWNLM0031W Since multiple Storage Resource Groups were provided as input to the plan, the newly created volumes will not be added to any Storage Resource Groups.	2019
HWNLM0032W IBM Spectrum Control is unable to set the multipath policy on host host id because it is an ESX hypervisor. After the provisioning operation completes, log in to the hypervisor or use VMware tools to set the multipath policy on the hypervisor.	2019
HWNLM0033W IBM Spectrum Control is unable to set the multipath policy on host host id because it is not managed by an SRA. After the volume or volumes are provisioning, log in to the operating system on the agentless server to set the multipath policy.	2020
HWNLM0034I Started updating agentless server configuration with disk information.	2020
HWNLM0035I Completed updating agentless server information with disk information.	2020
HWNLM0036W The volume discovery operation failed for one or more agentless servers.	2020
HWNLM0037I Disks mappings detected for volume volume by the discovery on host host on the following paths: path.	2021
HWNLM0038W No disks were detected for volume volume by the discovery on host host.	2021
HWNLM0039I After unassigning volume volume from host host, no disks were detected anymore for it by the discovery on that host.	2021

HWNLM0040W After unassigning volume volume from host host, disks mappings were still detected for it by the discovery on that host on the following paths: path.	2021
HWNLM0041I Started to copy storage volumes.	2021
HWNLM0042E The copy of storage volumes could not be completed.	2022
HWNLM0043I Completed copy of storage volumes.	2022
HWNLM0100E No Storage Subsystem(s) passed to SAN Planner.	2022
HWNLM0101E No Storage Virtualized Controller(s) passed to SAN Planner.	2022
HWNLM0102E Virtual disk(s) were selected in a plan for volumes.	2022
HWNLM0103E Volume(s) were selected in a plan for virtual disks.	2022
HWNLM0104I Not considering subsystem {0} for new storage because the user indicated so.	2023
HWNLM0105I Not considering storage pool {0} for new storage because the user indicated so.	2023
HWNLM0106I Not considering storage virtualized controller {0} for new storage because the user indicated so.	2023
HWNLM0107I Not considering managed disk group {0} for new storage because the user indicated so.	2023
HWNLM0108I Considering virtual disk: {0} of storage virtualized controller: {1} as candidate since it is of the right size, is unassigned and not in a known replication relationship (or these requirements were over-ridden by user).	2023
HWNLM0109I Considering user selected virtual disk: {0} of storage virtualized controller: {1} as candidate since it is of the right size, is unassigned and not in a known replication relationship (or these requirements were over-ridden by user).	2024
HWNLM0110I Considering user selected volume: {0} of subsystem: {1} as candidate since it is of the right size, is unassigned and not in a known replication relationship (or these requirements were over-ridden by user).	2024
HWNLM0111I The algorithm used to identify the best location for the volumes will ignore the co-location criterion.	2024
HWNLM0300I A Path Planner job started with multipath policy (multipath), redundant fabric policy (rFabric), multipath mode (mode), and (paths) number of paths.	2024
HWNLM0301I The Path Planner job completed.	2024
HWNLM0302E Multiple paths are not supported on host host name as it has only one port.	2025
HWNLM0303E No common fabrics between Host and Subsystem	2025
HWNLM0304E There is an insufficient number of possible paths between Host and Subsystem. The number of possible paths possiblePaths are less than the required number of paths paths.	2025
HWNLM0305E Cannot create redundant paths using the specified paths number of paths.	2025
HWNLM0306E There are less than two fabrics in common between host Host and storage subsystem Subsystem.	2025
HWNLM0307W No supported multipath driver was found on host host id.	2026
HWNLM0308W No corresponding multipath device was found on host host id in case of one or more volumes.	2026
HWNLM0309W Multipath policy configuration is not supported for multipath driver on host host id.	2026
HWNLM0310W Failed to set the multipath policy on host host id because for Multipath DM driver only Round Robin policy is available.	2026
HWNLM0311W The command for setting the multipath policy on host host id has failed to execute.	2026
HWNLM0312I Please check the agent log file for more details.	2027
HWNLM0313W iSCSI ports were not mapped to the storage volume because storage subsystem Subsystem does not support iSCSI connectivity.	2027
HWNLM0314W iSCSI ports were not mapped to the storage volume because storage subsystem Subsystem does not have iSCSI connectivity configured.	2027
HWNLM0315E No common connectivity exists between Host and Subsystem.	2027
HWNLM0316I Started to set the multipath policy on host host id.	2027
HWNLM0317I The multipath policy has been successfully set on host host id.	2028
HWNLM0500I The user specified maximum number of zones is user zones however the current number of zones is current zones.	2028
HWNLM0501E The maximum number of zones in a fabric policy was violated.	2028
HWNLM0502E The zone per host policy was violated.	2028
HWNLM0503E The zone per HBA policy was violated.	2028
HWNLM0504E The zone per cluster policy was violated.	2029
HWNLM0505E The zone per controller policy was violated.	2029
HWNLM0506E The zone per controller type policy was violated.	2029
HWNLM0507E The zone per fabric policy was violated.	2029
HWNLM0508I Zone Set zone set name was created.	2029
HWNLM0509I Zone zone name was created.	2029
HWNLM0510I Zone zone name was added to Zone Set zone set name.	2030
HWNLM0511I Host port port id was added to Zone zone name.	2030
HWNLM0512I Subsystem port port id was added to Zone zone name.	2030
HWNLM0513I SAN Planner started with guidance Policy (guidance), validation policies (validation), fabric WWN (fabricWWN), and using active zone set (zone set name).	2030
HWNLM0514I The Zone Planner completed.	2030
HWNLM0515W Not considering Subsystem {0} since Planner could not obtain its information from database (it could be undetectable).	2030
HWNLM0516E Could not find any subsystem with the given input. The subsystem(s) may be undetectable.	2031
HWNLM0517W Invalid candidate subsystem {0} for performance data for SAN Planner.	2031
HWNLM0518I Not considering Pool: {0} of Subsystem: {1} since it does not have enough allocatable space.	2031
HWNLM0519W Not considering Pool: {0} of Subsystem: {1} since it is not online.	2031
HWNLM0520I Not considering Pool: {0} of Subsystem: {1} because it is not Fixed Block pool.	2031
HWNLM0521I Not considering Pool: {0} of Subsystem: {1} because it is Solid State Disk pool.	2032
HWNLM0522I Not considering Pool: {0} of Subsystem: {1} because it is not a Solid State Disk pool.	2032
HWNLM0523I Not considering Pool: {0} of Subsystem: {1} because its Encryption Group is not matching with the input.	2032
HWNLM0524I Not considering Pool: {0} of Subsystem: {1} because it is not thin-provisioning enabled.	2032
HWNLM0525I Not considering Pool: {0} of Subsystem: {1} because its lock behavior is not matching with the input.	2032
HWNLM0526I Not considering Pool: {0} of Subsystem: {1} because it is not in the selected input pools list or it is already filtered out.	2033
HWNLM0527I Not considering Pool: {0} of Subsystem: {1} because its RAID level does not match with the input RAID level.	2033
HWNLM0528I Considering volume: {0} of Subsystem: {1} as candidate since it is of the right size, is unassigned and not in a known replication relationship (or these requirements were over-ridden by user).	2033
HWNLM0529W The subsystem {0} does not have performance data for the specified time interval.	2033

HWNLM0530I Not considering volume {0} for new storage because the user indicated so.	2033
HWNLM0531I Not considering the subsystem {0} because it does not support Extent Space Efficient volumes.	2034
HWNLM0532I Not considering the Subsystem: {0} because it does not support Track Space Efficient volumes.	2034
HWNLM0533I Not considering Pool: {0} of Subsystem: {1} because it does not have repository capacity available/defined for Track Space Efficient volumes.	2034
HWNLM0534I New Capacity Planning Advice Task Started....	2034
HWNLM0535I Capacity Planning Advice Task Completed.	2034
HWNLM0536I Not considering Pool: {0} of Subsystem: {1} because its backend storage RAID level does not match the input RAID level	2035
HWNLM0537I Not considering Pool: {0} of Subsystem: {1} because its backend storage is not configured into this IBM Spectrum Control or is currently undetectable and input requires a specific backend RAID level	2035
HWNLM0538I Not considering IO Group: {0} of Subsystem: {1} because it does not have two nodes associated with it	2035
HWNLM0539I Not considering IO Group: {0} of Subsystem: {1} because it has more than or equal to 2048 vdisks	2035
HWNLM0540I Not considering IO Group: {0} of Subsystem: {1} because it does not have enough available mirroring memory	2035
HWNLM0541I Not considering Volume: {0} of Subsystem: {1} because its subsystem was found to be unacceptable based on inputs	2036
HWNLM0542I Not considering Volume: {0} of Subsystem: {1} because its pool was found to be unacceptable based on inputs	2036
HWNLM0543I Not considering Volume: {0} of Subsystem: {1} because its IO group was found to be unacceptable based on inputs	2036
HWNLM0544I Not considering Volume: {0} of Subsystem: {1} because its size does not match the input	2036
HWNLM0545I Not considering Subsystem: {0} because not all of its backend subsystems are configured into this IBM Spectrum Control or some are currently undetectable. This is unacceptable when an input RAID level is specified or a workload profile other than space-only is selected	2036
HWNLM0546I Not considering Subsystem: {0} because IBM Spectrum Control does not have adequate performance data for it and/or some of its backend subsystems. For planning with workload profiles other than space-only, this subsystem and all of its backend subsystems need to have daily performance data	2037
HWNLM0547I Not considering Subsystem: {0} since none of its IO groups have enough available mirroring memory to support vdisk mirroring input	2037
HWNLM0548I Not considering Subsystem: {0} since it does not support vdisk mirroring (code level is below v4.3)	2037
HWNLM0549I Not considering Subsystem: {0} since it does not support space-efficient vdisks (code level is below v4.3)	2037
HWNLM0550I Not considering IO Group: {0} of Subsystem: {1} because it does not appropriate connectivity to hosts selected in the input	2037
HWNLM0551I Not considering Subsystem: {0} since none of its IO groups have appropriate connectivity to hosts selected in the input	2038
HWNLM0552I Not considering Volume: {0} of Subsystem {1} since it does not match input on thin-provisioning characteristics	2038
HWNLM0553I Volume size too small {0} MB. Minimum size should be {1} MB for the pool {2}. Not considering this pool.	2038
HWNLM0554I Volume size too big {0} MB. Maximum size should be {1} MB for the pool {2}. Not considering this pool.	2038
HWNLM0555I Not considering Volume: {0} of Subsystem: {1} because it is in a known replication relationship.	2039
HWNLM0556I Volume {0} can not be moved to the following candidate pool(s) due to insufficient allocatable space: {1}.	2039
HWNLM0557I The max theoretical I/O capability of storage pool {0} on subsystem {1} has not been set. Using default value {2}.	2039
HWNLM0558W The subsystem pool {0} does not have performance data for the specified time interval.	2039
HWNLM0559I Not considering IO Group: {0} of Subsystem: {1} because compression was specified, but the IO Group does not have compression active.	2039
HWNLM0560I Not considering Volume: {0} of Subsystem {1} since it is not compressed when compression was specified.	2040
HWNLM0560W Fabric agent not available to perform the zoning operation on the fabric {0}.	2040
HWNLM0561I Fabric agent available to perform the zoning operation on the fabric {0}.	2040
HWNLM0562E Fabric service exception occurred trying to check for zone control on the fabric {0}.	2040
HWNLM0563W A zone unnecessary_zone was not created, because the host already has connectivity to the storage system using existing_zone.	2040
HWNLM0564W There is already a zone named zone_name. A zone named new_zone_name was created instead.	2041
HWNLM0565W There is already a volume named vol_name. A volume named new_vol_name will be created instead.	2041
HWNLM0566I Not considering Pool: {0} of Subsystem: {1} because it is mixed pool.	2041
HWNLM0567I Not considering Subsystem: {0} for vdisk mirroring since it does not have at least two acceptable mdiskgroups from different backend subsystems	2041
HWNLM0568I Not considering I/O group {0} of subsystem {1} because it already reached the limit of 200 compressed vdisks.	2041
HWNLM0569I Not considering subsystem {0} because none of its I/O groups can be used for compressed vdisks.	2042
HWNLM0570I Not considering I/O group {0} of subsystem {1} because host definition {2} has access restrictions.	2042
HWNLM0571I Not considering storage system {0} because none of its I/O groups allow restricted access to all hosts.	2042
HWNLM801I Synchronous Refresh Configuration of the Storage Subsystem was completed Successfully for Subsystem subsystem.	2042
HWNLM802E Synchronous Refresh Configuration of the Storage Subsystem did not complete successfully for Subsystem subsystem.	2042
HWNLM803I Replication Session was created successfully session.	2043
HWNLM804E Replication Session creation failed. ReplicationManager [session].	2043
HWNLM805I Successful check for existence of session session.	2043
HWNLM806E No Such session exists with name session.	2043
HWNLM807I CopySets Added to Session successfully session.	2043
HWNLM808E CopySets addition to session failed. ReplicationManager [session].	2043
HWNLM809E CopySets creation failed. ReplicationManager [session].	2044
HWNLM810I Storage Subsystem Configuration refreshed successfully in Replication Manager ss.	2044
HWNLM811E Storage Subsystem Configuration refresh operation failed in Replication Manager [ss].	2044
HWNLM812E Fabric agent not available to perform the zoning operation on the fabric {0}.	2044
HWNLM813I Replication Session was started successfully session.	2044
HWNLM814W Replication Session start failed. ReplicationManager [session].	2045
HWNLM815W Not considering the Storage Subsystem {0} because it is not registered in TPC-R.	2045
HWNLM816I Please use Replication Manager console to schedule point-in-time copy creation.	2045
HWNLM817W No cluster partnership exists between source subsystem [srcss] and target subsystem [tgtss].	2045
HWNLM818W No path exists between source subsystem [srcss] and target subsystem [tgtss].	2045
HWNLM820I Copysets can not be added to a session when it's in Prepared/Suspend/Recover/Flash state. Please try again later after some time. State of session can be checked from Replication Manager console.	2046
HWNLM8021W IBM Spectrum Control had no information about the Fibre Channel configuration, so it did not verify fabric connectivity or change the zoning configuration.	2046
HWNOP - Storage optimizer messages	2046
HWNOP0001I The Collection phase of the integrated Storage Optimizer job jobname has started.	2047
HWNOP0002E The Collection phase of the integrated Storage Optimizer job jobname has failed with errors. Message from exception: message.	2047
HWNOP0003I The Collection phase of the integrated Storage Optimizer job jobname has completed.	2047

HWNOP0004W The Collection phase of the integrated Storage Optimizer job jobname has completed with warnings.	2047
HWNOP0005E The Collection phase of the integrated Storage Optimizer job jobname has completed with errors.	2047
HWNOP0006I Zone set zoneset created on fabric fabric .	2048
HWNOP0007I The Collection phase has started Collecion for the Analysis job jobname, on Subsystem: subsystem , Start Date: startdate , End Date: enddate	2048
HWNOP0008I The Collection phase has started Collection for the Optimization job creator, Analysis Job ID: analysisjob , on Subsystem: subsystem	2048
HWNOP0009W The subsystem subsystem does not exist in the internal database.	2048
HWNOP0010W The Performance data summary level is unknown for subsystem subsystem.	2048
HWNOP0011I Collecting Performance Data for Subsystem subsystem Storage Pool pool with summary level level for time range range	2049
HWNOP0012E Failed to bind to Performance Manager Service	2049
HWNOP0013E Database operation failed error	2049
HWNOP0014I Optimizer Service Started	2049
HWNOP0015I Optimizer Collector called for Job job with inputs input	2050
HWNOP0016I Collecting Configuration Data for Subsystem subsystem	2050
HWNOP0017I Updating Aggregated Workload Profile Data Table in Database for Subsystem subsystem	2050
HWNOP0018I The collection of configuration and performance data is finished. Now starting Analysis...	2050
HWNOP0019I The Analyzer is computing utilizations for storage subsystem subsystem.	2050
HWNOP0020I The Analyzer is updating the database with utilizations for storage subsystem subsystem.	2051
HWNOP0021I The Analyzer is reading analysis data from the database.	2051
HWNOP0022I The Analyzer queued the job on the planner.	2051
HWNOP0023I The Analyzer is done for the job.	2051
HWNOP0024I The Planner is starting the planning operation.	2051
HWNOP0025I The Planner generated number recommendations	2051
HWNOP0026I The Planner queued the job on the effector.	2052
HWNOP0027I The Effector is adding the plans in the database.	2052
HWNOP0028I The Effector is done. The Optimization job is complete.	2052
HWNOP0029I Starting Planning phase.	2052
HWNOP0030I Starting Consolidation Plan.	2052
HWNOP0031I The Storage Optimizer cannot migrate or consolidate volume volume from source pool pool on subsystem subsystem because of space or utilization threshold constraints.	2053
HWNOP0032I The Optimizer consolidated volume volume to Storage Pool pool. The Storage Pool size is size. The Max Size is maxsize.	2053
HWNOP0033I There were duration day(s) in the selected interval for subsystem subsystem. numData of these had performance data available.	2053
HWNOP0034E No data performance data is available for the subsystem subsystem and the time interval that you have selected. Please choose a new start and end date interval to analyze.	2053
HWNOP0035I volume volumes out of maxvolume volumes were not consolidated.	2053
HWNOP0036E The Optimizer job failed with the following error: error	2054
HWNOP0037I Performance Data for Subsystem subsystem Storage Pool pool will not be collected as it is of mixed pool type.	2054
HWNOP0038I The Storage Optimizer job has been queued for processing.	2054
HWNPM - Performance manager messages	2054
HWNPM0001E The specified summarization level (level) is invalid. It must be an integer value between minimum and maximum, inclusive.	2060
HWNPM0002E The specified device category (category) is invalid. It must be an integer value between minimum and maximum, inclusive.	2060
HWNPM0003E The specified device type (type) is invalid. It must be an integer value between minimum and maximum, inclusive.	2060
HWNPM0004E The specified component type (type) is invalid. It must be an integer value between minimum and maximum, inclusive.	2060
HWNPM0006E The string specified as parameter (string) exceeded its allowed length (maximum length).	2061
HWNPM0007E The value specified as parameter (value) is invalid.	2061
HWNPM0008E A required parameter is missing (null).	2061
HWNPM0010E The specified device ID (device ID) is invalid. It must conform to the pattern 'name+nameFormat'.	2061
HWNPM0011E The specified component ID (component ID) is invalid. It must be a simple WWN (16 hexadecimal characters).	2061
HWNPM0012E The specified component ID (component ID) was not found or is not unique in the IBM Spectrum Control database.	2062
HWNPM0013E The specified component ID (component ID) is invalid.	2062
HWNPM0015E Failed to retrieve the requested data because the service is unavailable.	2062
HWNPM0021E The device identifier specified as parameter (device ID) is invalid.	2062
HWNPM0090E Failed to retrieve the requested data because the service is unavailable.	2062
HWNPM0099E The requested operation failed because of an internal error.	2063
HWNPM0101E Unable to create the specified performance service instance {{0}}.	2063
HWNPM0200I This operation (operation name)on Performance Manager was successful.	2063
HWNPM0201E The device (device_id) that was passed to the method is invalid.	2063
HWNPM0202E The device category (device_category) that was passed to the method is invalid.	2064
HWNPM0203E The device type received (device_type) is invalid.	2064
HWNPM0204E The device type - HOST - that was passed to the method is not supported.	2064
HWNPM0205E The specified performance collection policy is invalid.	2064
HWNPM0209I The device type and device category are valid.	2064
HWNPM0210E Collector failed to start due to system failure.	2064
HWNPM0220E Collector failed to stop due to system failure.	2065
HWNPM0230E One or more of the specified performance collection policies are invalid.	2065
HWNPM0231W The specified performance collection policy is ignored because it conflicts with another policy in the same parameter list.	2065
HWNPM0232E The specified performance collection policy contains an unsupported interval length.	2065
HWNPM0233E The specified performance collection policy contains an unsupported frequency.	2066
HWNPM0234E The specified performance collection policy contains an unsupported duration.	2066
HWNPM0240E The attempt to update the specified performance collection policies has failed.	2066
HWNPM0241E The attempt to reset the specified performance collection policies has failed.	2066
HWNPM0242E The attempt to remove the specified performance collection policies has failed.	2067
HWNPM0249W An attempt to dynamically update one or more running performance collectors with a new performance collection policy has failed.	2067

HWNPM0250E One or more default performance collection policies are missing from the database.	2067
HWNPM0281I Performance monitoring is unavailable for resource resource_name because an agent for monitoring the resource was not defined. For IBM Spectrum Scale, the problem might occur because the data collection service cannot connect to port 9084 on the node where the collector component of the IBM Spectrum Scale performance monitoring tool is running.	2067
HWNPM0282I Performance monitoring is unavailable for resource resource_name because the associated data sources are unable to collect performance data from the resource.	2068
HWNPM0283I Performance monitoring is unavailable for resource_name because this resource does not support performance monitoring.	2068
HWNPM0284I Performance monitoring is unavailable for resource resource_name because the associated agent does not have the required level of software agent_level.	2068
HWNPM0285I Performance monitoring is unavailable for resource resource name because the associated agent is unable to fully monitor the resource.	2069
HWNPM0286I Performance monitoring is unavailable for resource resource name because the associated SMI-S provider does not have the required SMI-S support.	2069
HWNPM0287I Performance monitoring is unavailable for resource resource name because the resource or the associated agent does not support performance monitoring.	2069
HWNPM0288I Performance monitoring is unavailable for resource resource name because the resource was not probed.	2069
HWNPM0289W Performance monitoring is unavailable for resource resource_name because no agents are available.	2070
HWNPM0290E Performance monitoring is unavailable for resource resource_name because the associated agent was could not be selected.	2070
HWNPM0291I Performance monitoring is unavailable for switch resource_name because the switch has no ports.	2070
HWNPM0292I Performance monitoring is unavailable for flash resource_name because the switch was not probed using the correct agent.	2070
HWNPM0293I Performance monitoring is unavailable for FlashSystem resource_name because its SNMP agent is disabled. You can enable SNMP for FlashSystem storage systems in the FlashSystem GUI<a>.	2071
HWNPM0300E There is an exception for each device processed in a multiple devices call.	2071
HWNPM0390E A system failure occurred.	2071
HWNPM0400I This operation (operation name)on Threshold Service was successful.	2071
HWNPM0401E The device (device_id) that was passed to the method is invalid.	2072
HWNPM0410E The Performance threshold policy that was passed to the method (threshold policy)is null.	2072
HWNPM0411E The Performance threshold that was passed to the method (threshold)is null.	2072
HWNPM0412E The Performance threshold filter that was passed to the method (filter)is null.	2072
HWNPM0420E The device type received (device_type) is invalid.	2072
HWNPM0421E There is no default performance threshold policy or default threshold filter for this device.	2073
HWNPM0425E There is an exception for each device processed in a multiple devices threshold call.	2073
HWNPM0590E Performance Manager failed due to system failure.	2073
HWNPM0600E Parameter number a number of the call made to the IBM Spectrum Control Performance Manager reporting API method name of the api is invalid. The invalid value is the invalid value of parameter descriptive name of the parameter.	2073
HWNPM0601E A request to continue the data retrieval can not be performed. Information for continuing the data retrieval does not exist.	2073
HWNPM0602E Support for the device type device type name is not available in the Performance Manager reporting API function method name.	2074
HWNPM0603E The performance reporting API method_name failed at time_of_failure as a result of an internal processing exception. The Performance Manager logs contain message message_ID that describes the internal processing exception.	2074
HWNPM0604E The sort order parameter of a call to the performance reporting API method_name contains a value not included in the report columns list, at position list_item in the sort order list.	2074
HWNPM0605E Performance metadata cannot be displayed.	2074
HWNPM0606E Unable to instantiate performance reporting service service class name.	2075
HWNPM0607E An error occurred while the performance data was being retrieved.	2075
HWNPM0630E An invalid operator (operator identifier) was specified for the filter expression.	2075
HWNPM0631E An invalid first operand (operand class) was specified for the filter expression. It must be a operand class class.	2075
HWNPM0632E An invalid first operand was specified for the filter expression. The data type of the operand (data type) is invalid or unsupported.	2076
HWNPM0633E An invalid second operand (operand class) was specified for the filter expression. It must be a operand class class.	2076
HWNPM0650E The IBM Spectrum Control Performance Manager reporting API method name failed as a result of exception the related exception from a call to method method name, of the lower-level service name internal service.	2076
HWNPM0651E The configuration data needed to generate the affected volumes and hosts report for the device device name was not found in the IBM Spectrum Control database.	2076
HWNPM0652E The requested performance metrics are no longer available. Clear your browser cache to proceed.	2077
HWNPM2000I Performance monitoring is enabled.	2077
HWNPM2001E The IBM Spectrum Control Performance Manager is not operational.	2077
HWNPM2002E An initialization error occurred.	2077
HWNPM2003E Initialization of the Device server event service failed. No performance threshold exception alerts will be generated.	2077
HWNPM2004E Initialization of the product scheduler status service failed. The status of performance monitors will not be updated in the GUI.	2078
HWNPM2005E Initialization of the product configuration data service failed. Performance monitors cannot be started without this service.	2078
HWNPM2006E Initialization of the product configuration data service failed. Performance monitors cannot be started without this service.	2078
HWNPM2007E Initialization of the product counter data service failed for device type using agent type. Performance monitors will not be able to collect performance data from devices of this type.	2079
HWNPM2008E Initialization of the product metadata service failed. Performance monitors cannot be started without this service.	2079
HWNPM2009E Unable to instantiate lower level service service_class_name.	2079
HWNPM2010E Unable to instantiate the collection logic implementation service class name.	2079
HWNPM2011E Unable to instantiate the performance statistics data class class name.	2080
HWNPM2012I The product is using trace log directory log directory name.	2080
HWNPM2020W The performance monitor for device device name is not currently active, so a dynamic update of its monitor policy is not necessary.	2080
HWNPM2021W The performance monitor for device device name is not currently active, so a dynamic update of its threshold policy is not necessary.	2080
HWNPM2022E A performance monitor for device device name is already active. A new monitor for the same device cannot be started until the previous monitor completes or is cancelled.	2081
HWNPM2023W The performance monitor for device device_name is not currently active.	2081
HWNPM2024E Unable to find a monitor policy applicable to resource resource name.	2081
HWNPM2025E Unable to find a threshold policy applicable to resource resource_name.	2081

HWNPM2026I The performance monitor's primary process has failed unexpectedly. Attempting to recover from the failure.	2082
HWNPM2027I The performance monitor threshold checker has failed unexpectedly. Attempting to recover from the failure.	2082
HWNPM2028I The performance monitor purge process has failed unexpectedly. Attempting to recover from the failure.	2082
HWNPM2029I Successfully recovered from the performance monitor failure.	2082
HWNPM2030E Unable to recover from the performance monitor failure. The performance monitor for the storage resource will be shut down.	2082
HWNPM2031E The performance monitor failed due to an internal error.	2083
HWNPM2032W The performance monitor for device device name is not currently using the default monitor policy, so a dynamic update of the policy is not necessary.	2083
HWNPM2033W The performance monitor for device device name is not currently using the default threshold policy, so a dynamic update of the policy is not necessary.	2083
HWNPM2040E The device key specified for the snapshot vote (key) was not found in the database. The device does not exist.	2083
HWNPM2050E Failed to get the latest configuration data for device device_name.	2084
HWNPM2051E No performance data was collected from device device_name for the current collection interval (time_stamp) because the performance monitor was stopped.	2084
HWNPM2052E No performance data was collected from device device_name for the current collection interval due to an error. Data was last collected at time_stamp.	2084
HWNPM2053E The new performance data collected from device device_name could not be saved in the database. Increase the size of the transaction log.	2084
HWNPM2054E The new performance data collected from device device_name could not be saved in the database. Increase the size of the database lock list.	2085
HWNPM2055E The new performance data collected from resource device name could not be saved.	2085
HWNPM2056E No performance data was collected from device device name for the current performance monitor job duration. The performance monitor job status is set to 'failed'.	2085
HWNPM2057E No performance data was collected from device device_name for the current collection interval because the performance monitor was stopped.	2085
HWNPM2058E No performance data was collected from device device_name for the current collection interval due to an error.	2086
HWNPM2060W The device does not support performance management for segment pool pool ID. Only incomplete performance data can be collected for array array ID.	2086
HWNPM2061W The device does not support performance management for segment pool pool ID. Only incomplete performance data can be collected for device adapter DA ID.	2086
HWNPM2062W Invalid error message saved in database	2086
HWNPM2100E The performance monitor for resource device name cannot be started because configuration data for the resource is not available.	2087
HWNPM2101E All agents that can collect performance data for resource device name are currently non-operational.	2087
HWNPM2102E The performance monitor for resource device name cannot be started because the resource might not support the collection of performance data.	2087
HWNPM2103W Agent agent name is non-operational. Attempting to find an alternative agent.	2087
HWNPM2104I The performance monitor policy was adjusted due to agent limitations. Current values in effect are: interval-length=interval-length, frequency=frequency.	2088
HWNPM2105E The performance monitor for resource resource name failed because the resource for enabling performance data collection cannot be reached.	2088
HWNPM2106E The performance monitor for device device name failed because of errors trying to enable performance data collection on the device or device agent: error description	2088
HWNPM2107E The performance monitor for device device name failed because of unrecognized errors trying to enable performance data collection on the device or device agent: error description	2088
HWNPM2108E The performance monitor for resource resource name failed during shutdown because the resource cannot be reached for terminating data collection.	2089
HWNPM2109E The performance monitor for resource resource name failed during shutdown because of errors during termination of performance data collection: error description	2089
HWNPM2110E The performance monitor for resource resource name failed during shutdown because of unrecognized errors during termination of performance data collection: error description	2089
HWNPM2111E The performance monitor for resource resource name failed because of errors retrieving the most recent configuration data for the resource.	2090
HWNPM2112I Agent agent name was selected for performance data collection from resource resource name.	2090
HWNPM2113I The performance monitor for resource resource name is starting in an active state.	2090
HWNPM2114I The performance monitor for resource resource name is starting in a dormant state.	2090
HWNPM2115I Monitor Policy: name="policy name", creator="policy creator", description="policy description"	2091
HWNPM2116I Monitor Policy: retention period: sample data=length in days days, hourly data=length in days days, daily data=length in days days.	2091
HWNPM2117I Monitor Policy: interval length=length in seconds secs, frequency=length in seconds secs, duration=length in hours hours.	2091
HWNPM2118I Threshold Policy: name="policy name", creator="policy creator", description="policy description"	2091
HWNPM2119I Threshold Policy: retention period: exception data=length in days days.	2091
HWNPM2120I Threshold Policy: threshold name=name, component=component type, enabled=Yes or No, boundaries=critical stress boundary,warning stress boundary,warning idle boundary,critical idle boundary units.	2092
HWNPM2121I Monitor Policy: interval length=length in seconds secs, frequency=length in seconds secs, duration=continue indefinitely.	2092
HWNPM2122W No valid performance data was provided by the monitored resource. No performance data records were inserted into the database.	2092
HWNPM2123I Performance data for resource timestamp date and time was collected and processed successfully. record count performance data records were inserted into the database repository.	2092
HWNPM2124W Performance data continuity is broken. The device was possibly reset or rebooted. record count performance data records were discarded.	2093
HWNPM2125W Aggregated performance values have been computed from the remaining data records, but their accuracy cannot be guaranteed.	2093
HWNPM2126I The performance monitor for device device name is stopping because its intended duration has elapsed.	2093
HWNPM2127I The performance monitor for device device name is stopping due to a user request.	2094
HWNPM2128E The performance monitor for device device name is stopping due to an unexpected failure.	2094
HWNPM2129I The performance monitor for device device name is stopping because of a shutdown request.	2094
HWNPM2130W Failed to retrieve the latest configuration data for device device name.	2094
HWNPM2131W Performance data could not be collected for device device name, because the device or data source cannot be reached (reason reason code). The current samples are skipped.	2095
HWNPM2132W Performance data could not be collected for device device name. The current samples are skipped. (error description)	2095
HWNPM2133W Performance data could not be collected for device device name due to an unknown error. The current samples are skipped.	2095
HWNPM2134W The state of the performance monitor for resource resource name started, but the status of the performance monitor was not updated.	2096
HWNPM2135W The state of the performance monitor for device device name has changed to 'active', but could not be recorded appropriately.	2096

HWNPM2136W The performance monitor for the resource resource name generated a warning, but the status of the performance monitor was not updated.	2096
HWNPM2137W The performance monitor for the resource resource name stopped, but the status of the performance monitor was not updated.	2096
HWNPM2138W The performance monitor for the resource resource name completed the collection of data, but the status of the performance monitor was not updated.	2096
HWNPM2139W The performance monitor for the resource resource name failed, but the status of the performance monitor was not updated.	2097
HWNPM2140W The status of the performance monitor for the resource resource name was not updated.	2097
HWNPM2141E The service is unavailable because an unexpected error occurred.	2097
HWNPM2142E Performance data can't be collected for the resource resource name because the performance monitor was disabled.	2097
HWNPM2143E The performance monitor for the resource resource name was started, but the status of the performance monitor was not updated and might not be shown in the GUI.	2098
HWNPM2144W The performance data cannot be checked against the alert conditions, so no alerts can be generated.	2098
HWNPM2145I The data is being collected by the data collector: data collector host.	2098
HWNPM2146W Performance data could not be collected for device device name, the exact reason for the failure could not be determined. The current samples are skipped.	2098
HWNPM2147W Performance data could not be collected for device device name, because of a bad target (device or agent) address. The current samples are skipped.	2099
HWNPM2148W Performance data could not be collected for device device name, because of an unknown target address. The current samples are skipped.	2099
HWNPM2149W Performance data could not be collected for device device name, because of an unreachable target address. The current samples are skipped.	2099
HWNPM2150W Performance data could not be collected for device device name, because of an unresponsive target. The current samples are skipped.	2100
HWNPM2151W Performance data could not be collected for device device name, because a communication time-out for communication that uses UDP rather than TCP. The current samples are skipped.	2100
HWNPM2200I The performance monitor successfully collected the configuration data for the storage system with the following internal resources: number_of_pools pools, number_of_controllers controllers, number_of_device_adapters device adapters, number_of_ports ports, number_of_host_connections host connections, number_of_ranks ranks, number_of_arrays arrays, and number_of_volumes volumes.	2100
HWNPM2201I The performance monitor successfully collected the configuration data for the storage system with the following internal resources: number_of_io_groups I/O Groups, number_of_nodes nodes, number_of_ports ports, number_of_host_connections host connections, number_of_pools pools, number_of_managed_disks managed disks, number_of_local_disks local disks, number_of_volumes volumes, and number_of_volume_copies volume copies.	2100
HWNPM2202I The performance monitor successfully retrieved the configuration data for the switch. The following internal resources were found: number_of_trunks trunks, and number_of_ports ports.	2101
HWNPM2203I The performance monitor successfully retrieved the configuration data for the storage system. The following internal resources were found: number_of_host_connections host connections, number_of_modules modules, number_of_ports ports, number_of_pools pools, and number_of_volumes volumes.	2101
HWNPM2204I The performance monitor successfully retrieved the configuration data for the storage system. The following internal resources were found: number_of_nodes nodes, number_of_ports ports, and number_of_modules flash modules.	2102
HWNPM2205I The performance monitor successfully retrieved the configuration data for the storage system. The following internal resources were found: number_of_ports ports, number_of_controllers controllers, number_of_volumes volumes, and number_of_disks disks.	2102
HWNPM3000E There was a problem establishing the database connection.	2102
HWNPM3001E An unexpected null row was returned from a database cursor.	2102
HWNPM3002E An unexpected database exception occurred.	2103
HWNPM3003E An unexpected database exception occurred on the snapshot database tables.	2103
HWNPM3004E The snapshot ID could not be found.	2103
HWNPM3500E The current transaction has been rolled back because of a deadlock.	2103
HWNPM3501E The current transaction has been rolled back because of a timeout.	2104
HWNPM3502E The current transaction has been rolled back because the database transaction log has been exhausted.	2104
HWNPM3503E The current transaction has been rolled back because the database disk space has been exhausted.	2104
HWNPM3600E The threshold identifier parameter value : threshold ID is not valid.	2104
HWNPM3601E The target component type parameter value : component type is not valid for the threshold identifier : threshold ID passed to the affected volumes and hosts reporting function.	2104
HWNPM3602E There was a problem retrieving the performance data needed to generate the affected volumes and hosts report for the device device name.	2105
HWNPM3603E The sample volume performance data needed to generate the affected volumes and hosts report for the device device name was not found in the IBM Spectrum Control database.	2105
HWNPM3604E There are no volumes associated with the specified target component, component name, in the IBM Spectrum Control database. Therefore, the resulting Affected Volumes and Hosts report will be empty.	2105
HWNPM4000E Unable to retrieve the device agent that managed this device: device identifier.	2106
HWNPM4001E Timeout while starting performance data collection for this device: device identifier.	2106
HWNPM4002E Unable to start performance data collection for this device: device identifier.	2106
HWNPM4003E Performance data collection has already been enabled for this device: device identifier.	2106
HWNPM4004E Failed to enable performance data collection for this device: device identifier.	2107
HWNPM4005I Successfully enabled performance data collection on the storage subsystem, using device access point SMI-S provider address.	2107
HWNPM4006E An exception occurred while starting performance data collection for this device: device identifier.	2107
HWNPM4007E A timeout occurred while stopping performance data collection for this device: device identifier.	2107
HWNPM4008E Unable to stop performance data collection for this device: device identifier.	2108
HWNPM4009E Performance data collection is not enabled for this device: device identifier.	2108
HWNPM4010E Failed to disable performance data collection for this device: device identifier.	2108
HWNPM4011I Successfully disabled performance data collection on the storage subsystem, using device access point SMI-S provider address.	2108
HWNPM4012E An exception occurred while stopping performance data collection for this device: device identifier.	2109
HWNPM4013E A timeout occurred while retrieving the status of the performance data collection for this device: device identifier.	2109
HWNPM4014E Unable to retrieve the status of the performance data collection for this device: device identifier.	2109
HWNPM4015I Performance data collection is not enabled for this device: device identifier.	2109
HWNPM4016I Performance data collection is enabled for this device: device identifier.	2110
HWNPM4017E Unable to determine the status of the performance data collection for this device: device identifier.	2110
HWNPM4018E Failed to retrieve the status of the performance data collection for this device: device identifier.	2110
HWNPM4019E A timeout occurred while polling the performance statistics for this device: device identifier.	2110
HWNPM4020E Unable to retrieve the performance statistics for this device: device identifier.	2111

HWNPM4021E No performance statistics available at the current time for this device: device identifier.	2111
HWNPM4022E Failed to disable performance data collection for this device: device identifier.	2111
HWNPM4023W A set of performance statistics data was empty for this device: device identifier.	2111
HWNPM4024E An exception occurred while stopping performance data collection for this device: device identifier.	2112
HWNPM4025E Unable to retrieve storage subsystem for this device: device identifier.	2112
HWNPM4026E Failed to retrieve storage subsystem for this device: device identifier.	2112
HWNPM4027E Failed to properly initialize counter data service for this device: device identifier.	2112
HWNPM4028W Performance data cannot be collected because the security role authority of the user account user name for accessing device identifier is not sufficient.	2112
HWNPM4029W Performance data cannot be collected because the collection of performance statistics is stopped on device identifier. The security role authority of the user account user name for accessing the storage system is not sufficient to start the collection of performance statistics.	2113
HWNPM4030W Performance data cannot be collected. The performance interval device interval on device identifier is greater than the sample interval and the set security role authority of the user account user name is not sufficient to update the interval value on device identifier .	2113
HWNPM4051E Failed to obtain a reference to the Performance Manager Configuration Data Service for this device: device name.	2114
HWNPM4052E Error occurred in trying to retrieve a device agent for this device: device name.	2114
HWNPM4053E Unable to locate or retrieve the device agent that manages this device: device name.	2114
HWNPM4054E Error occurred in trying to construct the poll state information for this device: device name.	2114
HWNPM4055E Unable to construct the poll state information for this device: device name.	2115
HWNPM4056E SMI-S provider operation triggered a timeout (step timeout= step timeout value seconds, operation timeout= total timeout value seconds,).	2115
HWNPM4057E Mismatch in device identifier for this device: device name.	2115
HWNPM4058E Failed to build the parameter Map for this device: device name.	2115
HWNPM4059I Performance data collection has already been enabled for this device: device name.	2116
HWNPM4060I Performance data collection was successfully started for this device: device name.	2116
HWNPM4061E Performance data collection could not be started for this device: device name.	2116
HWNPM4062I Performance data collection successfully stopped for this device: device name.	2116
HWNPM4063W Parse exception in performance data collected this device: device name.	2116
HWNPM4064E Wrong format in performance data collected for this device: device name.	2117
HWNPM4065W number of null time stamps null time stamp(s)for performance data collected from the device were substituted by server time stamp(s).	2117
HWNPM4066W count of null operational status null Port Operational Status value(s) for performance data collected from the device was/were substituted by default value(s).	2117
HWNPM4081E A database cursor operation failed.	2117
HWNPM4082E A database connect operation failed.	2118
HWNPM4083E A database retrieve operation failed.	2118
HWNPM4084E A database operation failed.	2118
HWNPM4085E A database query operation failed.	2118
HWNPM4086W A database query gave no result rows.	2118
HWNPM4087W Missing or invalid association between SMI-S provider SMI-S provider URL and device device name. The configured SMI-S provider is inoperative, or may no longer be managing the specified device.	2119
HWNPM4091E Encountered an error during execution of a discover service process.	2119
HWNPM4092E Encountered exception during execution of a discover service process.	2119
HWNPM4093E An input business object could not be converted to a CIMInstance.	2120
HWNPM4100E Failed to initialize SVC counter data service discover service reference.	2120
HWNPM4101E Failed to initialize SVC counter data service configuration service reference.	2120
HWNPM4102E Failed to parse performance data file time stamp suffix: filename.	2120
HWNPM4103E SMI-S provider operation timeout (timeout value seconds) expired.	2121
HWNPM4104E Failed to retrieve SMI-S provider password for SVC counter data service access point: access point.	2121
HWNPM4105E Encountered an error when communicating with the device agent.	2121
HWNPM4106E Encountered invalid SVC component type: component type.	2121
HWNPM4107E Failed to create performance data object: performance data object class.	2122
HWNPM4108E TimeZone property is not defined for SVC cluster: cluster identifier.	2122
HWNPM4109E SVC cluster TimeZone property is set to unrecognized value: timezone id and name.	2122
HWNPM4110E StatisticsStatus property is not defined for SVC cluster: cluster identifier.	2122
HWNPM4111E Failed to retrieve dump filename dump from SVC node node identifier (return code = return code).	2123
HWNPM4112E IsConfigNode property is not defined for SVC node: node identifier.	2123
HWNPM4113E Caught exception while processing SVC XML performance data.	2123
HWNPM4114E SVC cluster cluster identifier has more than one configuration node.	2123
HWNPM4115E SVC cluster cluster identifier does not have a configuration node.	2124
HWNPM4116W Failed to associate SVC performance data from non-configuration node with SVC performance data from configuration node.	2124
HWNPM4117W Encountered incomplete SVC performance data sample.	2124
HWNPM4118E Firmware version information is not available for storage subsystem subsystem name. Performance data collection cannot proceed.	2124
HWNPM4119E The firmware installed on storage subsystem subsystem name (firmware version) is not supported for performance data collection. The minimum level of firmware supported for performance data collection is firmware version.	2125
HWNPM4150E Unable to retrieve storage subsystem for this device: device identifier.	2125
HWNPM4151E Unable to determine the status of any performance data collection for this device: device identifier.	2125
HWNPM4152E Performance data collection has already been enabled for this device: device identifier.	2125
HWNPM4153E Performance data collection is not enabled for this device: device identifier.	2126
HWNPM4154E Unable to start performance data collection for this device: device identifier.	2126
HWNPM4155E Failed to enable performance data collection for this device: device identifier.	2126
HWNPM4156E Unable to stop performance data collection for this device: device identifier.	2126
HWNPM4157E Failed to disable performance data collection for this device: device identifier.	2127
HWNPM4158E Unable to complete start performance data collection task for this device: device identifier.	2127
HWNPM4159E Unable to complete stop performance data collection task for this device: device identifier.	2127

HWNPM4160E Unable to complete performance data collection status query task for this device: device identifier.	2127
HWNPM4161E Performance data collection is not enabled for this device: device identifier.	2128
HWNPM4162E Unable to retrieve port performance statistics data for this device: device identifier.	2128
HWNPM4163E Unable to retrieve volume performance statistics data for this device: device identifier.	2128
HWNPM4164E Unable to retrieve rank performance statistics data for this device: device identifier.	2128
HWNPM4165E Unable to retrieve performance statistics data for this device: device identifier.	2129
HWNPM4166E Unable to complete polling for performance data collection task for this device: device identifier.	2129
HWNPM4167E Unable to retrieve a device agent for this device: device identifier.	2129
HWNPM4168E Failed attempt to use device device identifier counter data service with device different device identifier.	2129
HWNPM4169E An invalid access point of device agent URL was used to acquire the agent for this device: device identifier.	2130
HWNPM4170E The device agent's configuration for device identifier has changed from the given access point, device agent URL.	2130
HWNPM4171E Performance data collection start task timed out after time seconds for device: device identifier.	2130
HWNPM4172E Performance data collection stop task timed out after time seconds for device: device identifier.	2130
HWNPM4173E Performance data collection check status task timed out after time seconds for device: device identifier.	2131
HWNPM4174E Performance data collection poll task timed out after time seconds for device: device identifier.	2131
HWNPM4175W An error occurred while parsing statistics for port port identifier. Its statistics will be excluded.	2131
HWNPM4176W An error occurred while parsing statistics for volume volume identifier. Its statistics will be excluded.	2131
HWNPM4177W An error occurred while parsing statistics for rank rank identifier. Its statistics will be excluded.	2132
HWNPM4178E Failed to decrypt the device agent's password for device device identifier.	2132
HWNPM4179W Performance data collection is currently enabled with errors for device device identifier.	2132
HWNPM4180E Unable to retrieve key identifier value from the internal discover process.	2132
HWNPM4181W number of ports of the port statistics from the device agent were unrecognized and were not included in this sample interval.	2133
HWNPM4182W number of volumes of the volume statistics from the device agent were unrecognized and were not included in this sample interval.	2133
HWNPM4183W number of ranks of the rank statistics from the device agent were unrecognized and were not included in this sample interval.	2133
HWNPM4184E The device agent configured for this storage subsystem is not supported for this task. The current version, version number, is downlevel from from the minimum required, version number.	2133
HWNPM4185W The device agent did not return all performance statistics data for this time interval. The incomplete data is being processed.	2134
HWNPM4186W The ESS SMI-S provider did not return performance statistics data for both clusters for this time interval. The incomplete data is being processed.	2134
HWNPM4187W The device does not support performance management for pool pool ID because it contains Space Efficient Volumes. Only incomplete performance data can be collected for array array ID.	2134
HWNPM4188W The performance monitor was unable to collect performance statistics data from the device agent for the following component types: component list.	2134
HWNPM4189W number of MDisks of the MDisk statistics from the device agent were unrecognized and were not included in this data collection interval.	2135
HWNPM4190W number of nodes of the node statistics from the resource agent were unrecognized and were not included in this data collection interval.	2135
HWNPM4191W number of modules out of total number of modules module statistics could not be retrieved from the device agent due to errors, and were not included in this data collection interval.	2135
HWNPM4192W number of Drives of the drive statistics from the device agent were unrecognized and were not included in this data collection interval.	2136
HWNPM4193W number of Volume-copies of the volume-copy statistics from the device agent were unrecognized and were not included in this data collection interval.	2136
HWNPM4194W number of partitions of the partition statistics from the device agent were unrecognized and were not included in this data collection interval.	2136
HWNPM4195W number of file systems of the file system statistics from the device agent were unrecognized and were not included in this data collection interval.	2137
HWNPM4250E Failed to start the discover service for the SMI-S counter data service.	2137
HWNPM4251E Failed to start the configuration service for the SMI-S counter data service.	2137
HWNPM4252I Successfully returned access point device name for device device name.	2137
HWNPM4253I Successfully stopped SMI-S counter data service on access point access point for device device name.	2138
HWNPM4254I The SMI-S counter data service is active on access point access point for device device name.	2138
HWNPM4255I The SMI-S counter data service is inactive on access point access point for device device name.	2138
HWNPM4256I Performance statistics successfully returned on access point access point for device device name.	2138
HWNPM4257W Performance statistics not returned on access point access point for device device name.	2138
HWNPM4258E No SMI-S providers found for device device name.	2139
HWNPM4259E No storage subsystem found for device device name.	2139
HWNPM4260E Failed to initialize the polling context for device device name.	2139
HWNPM4261E Failed to retrieve the device capabilities for device device name.	2139
HWNPM4262E A database exception occurred trying to retrieve the device capabilities for device device name.	2140
HWNPM4263E A database exception occurred trying to retrieve the storage subsystem for device device name.	2140
HWNPM4264W Failed to retrieve manifest for component type.	2140
HWNPM4265E A database exception occurred trying to retrieve the Manifests for device device name.	2140
HWNPM4266E No manifests found for device device name.	2140
HWNPM4267E A database exception occurred trying to retrieve the discovery parameters for device device name.	2141
HWNPM4268E Statistics record not correctly formatted due to exception local exception string.	2141
HWNPM4269E Statistics record not correctly parsed due to exception local exception string.	2141
HWNPM4270W The block storage statistics is not formatted for device device name.	2141
HWNPM4271E The SMI-S provider found for device device name is not valid.	2142
HWNPM4272E The storage subsystem found for device device name is not valid.	2142
HWNPM4273W Discarding the stale performance statistics returned on access point access point for device device name.	2142
HWNPM4274E The SMI-S provider found for this device has changed. Please re-run SMI-S provider discovery and probe.	2142
HWNPM4300E Access to the agent or device has been denied. Ensure that valid credentials have been specified for agent agent name.	2143
HWNPM4301E The device or device agent did not respond within the allotted time (timeout value seconds).	2143
HWNPM4302E New performance data is not yet available for the device. Statistics with time stamps later than time_stamp could not be found.	2143
HWNPM4303E An agent API call (API name) failed while attempting to retrieve performance data for the device.	2143
HWNPM4304E The request for performance data could not be retrieved from the queue by the data collector.	2144
HWNPM4305W No samples were received from the data collector in the expected time. The data might still arrive automatically after connection is recovered.	2144

HWNPM4306E The data collector failed to connect to the storage management service because of invalid credentials. No performance manager data can be collected from device name until valid credentials are available.	2144
HWNPM4502E Attempt to delete a default policy.	2144
HWNPM4503E A database update operation failed.	2145
HWNPM4504E A database insert operation failed.	2145
HWNPM4505E A database delete operation failed.	2145
HWNPM4506E A database cursor operation failed.	2145
HWNPM4507E A database connect operation failed.	2145
HWNPM4508E A database retrieve operation failed.	2145
HWNPM4509E A database operation failed.	2146
HWNPM4510E A database query operation failed.	2146
HWNPM4511E A database commit operation failed.	2146
HWNPM5200E The performance manager failed to publish event even name due to exception exception.	2146
HWNPM5210E The performance manager failed to receive event from other modules.	2146
HWNPM5211E The first parameter passed to this method is null.	2147
HWNPM5212E The second parameter passed to this method is invalid.	2147
HWNPM5400E The performance data collection identifiers are not valid integers: schedule ID {0}, schedule run number {1}, job run number {2}.	2147
HWNPM5401E There was a problem establishing the database connection: {0}.	2147
HWNPM5402E There was a problem creating the new run job entry: {0}.	2147
HWNPM5403E There was a problem updating the run job entry {0}: {1}.	2148
HWNPM5404E There was a problem closing the database connection: {0}.	2148
HWNPM5405E There was a problem inserting a new run job into the database: {0}.	2148
HWNPM5406E There was a problem executing an update for run job number {0} in the database.	2148
HWNPM5407E There was a problem executing an update for run job number {0} in the database.	2149
HWNPM5408E There was a problem executing an update for run number {0} in the database.	2149
HWNPM5409I Successfully retrieved the configuration data for the elastic device. Found number of nodes Nodes and number of file systems File systems.	2149
HWNPM5410W The performance monitor could not collect performance data for the following cluster nodes: nodes names.	2149
HWNPM5411W The performance monitor could not collect performance data for the following filesystems: filesystem names.	2150
HWNPM5412E Performance statistics collection is not enabled.	1659
HWNPM5413E The process failed because the userid or password provided failed to connect to the Export Tool.	2150
HWNPM5414E The process failed because the Hitachi SVP was busy and did not return data or timed out.	2150
HWNPM5415E The process failed because the performance interval is set to 0.	2151
HWNPM5416E The process failed because the performance interval for the storage system is not supported.	2151
HWNPM5417E The process failed because the Hitachi VSP Model being monitored is not known. A Hitachi Export Tool to match it cannot be found.	2151
HWNPM5418E The process failed because the data collected is out of range.	2151
HWNPM5419E Performance data can't be collected.	2152

HWNSS - Single sign-on User Interface messages	2158
HWNSS0001E The IBM Spectrum Control device server is down and cannot perform OS user authentication. It is still possible to perform OS user authentication against the data server, however since the device server is down the IBM Spectrum Control functionality will be limited. Among the limitations is the inability to perform SSO to other applications that rely on the presence of a lightweight third party authentication token. To proceed enter a local OS username and password.	2159
HWNSS0002E The IBM Spectrum Control device server is down and cannot perform LDAP user authentication.	2159
HWNSS0003E The single sign-on (SSO) token is missing or incorrect. Enter a valid user name and password.	2159

HWNSS0004E The web server is unavailable and cannot be used for authentication. The Device server can be used for some authentication, but IBM Spectrum Control functions will be limited. To proceed, enter either the common user name that was used to install IBM Spectrum Control or the tpcFileRegistryUser user name and password.	2159

IBM Spectrum Control documentation for V5.4.9

IBM Spectrum® Control centralizes, automates, and simplifies the management of complex and heterogeneous storage environments. Use the IBM Spectrum Control documentation to help you with your storage management tasks.

What's new for IBM Spectrum Control 5.4.9

Learn about the latest changes that are available in IBM Spectrum® Control 5.4.9.

Product fixes and security updates

In every release of IBM Spectrum Control, IBM fixes issues that are reported by our internal teams and by our customers. Along with fixes, improving the operation and security of the product is also a priority. See what's been updated and fixed in this release:

- [Fixes that are included in this release](#)
- [Security bulletins for IBM Spectrum Control](#)

Limitations and known issues

For information about limitations and known issues that might occur when you use IBM Spectrum Control 5.4.9, see [Limitations and known issues for IBM Spectrum Control](#).

Changes in 5.4.9

The following updates are available in IBM Spectrum Control 5.4.9:

Product fixes and security updates

- [Fixes that are included in 5.4.9](#)
- [Security bulletins for IBM Spectrum Control](#)
- [Limitations and known issues](#)

Changes in 5.4.8

The following updates are available in IBM Spectrum Control 5.4.8:

More security when you want it

Security is an important part of protecting an organization's assets and data. To provide another level of security when you want it, you can now enter a password for the SSH User that IBM Spectrum Control uses to connect with IBM Spectrum Virtualize storage systems that run firmware levels 8.5.0.0 or later.

Product fixes and security updates

See the fixes and updates in this release:

- [Fixes that are included in 5.4.8](#)
- [Security bulletins for IBM Spectrum Control](#)
- [Limitations and known issues](#)

Changes in 5.4.7

The following updates are available in IBM Spectrum Control 5.4.7:

Product fixes and security updates

See the fixes and updates in this release:

- [Fixes that are included in 5.4.7](#)
- [Security bulletins for IBM Spectrum Control](#)
- [Limitations and known issues](#)

Db2® 11.1 is no longer supported

Db2 11.1 is out of service and no longer supported by IBM Spectrum Control:

- For information about how to upgrade Db2 to Db2 11.5 or later, see [Example of upgrading Db2 in a Windows environment](#).
- For a complete list of supported Db2 versions, go to <http://www.ibm.com/support/pages/node/6249361#DB>.

Changes in 5.4.6

The following updates are available in IBM Spectrum Control 5.4.6:

Product fixes and security updates

See the fixes and updates in this release:

- [Fixes that are included in 5.4.6](#)
- [Security bulletins for IBM Spectrum Control](#)
- [Limitations and known issues](#)

Changes in 5.4.5

The following updates are available in IBM Spectrum Control 5.4.5:

Enhanced OS support

You can now install IBM Spectrum Control and Storage Resource agents on servers that run AIX® 7.3 (64 bit). This enhanced support is available in IBM Spectrum Control 5.4.5.2 or later. For more information, see the following pages:

- [Release information for 5.4.5](#)
- [Installing IBM Spectrum Control in a single-server AIX or Linux® environment](#)
- [OS support for IBM Spectrum Control](#)

Product fixes and security updates

See the fixes and updates in this release:

- [Fixes that are included in 5.4.5](#)
- [Security bulletins for IBM Spectrum Control](#)
- [Limitations and known issues](#)

Changes in 5.4.4

The following feature was available in IBM Spectrum Control 5.4.4:

A new subscription option is available for IBM Virtual Storage Center

New customers can now subscribe to IBM Virtual Storage Center. With a subscription, you can pay for your license on a monthly basis with a flexible term length and an initial lower cost. You also receive IBM's Software Subscription and Support. To sign up and manage the subscription contract, you can use the familiar Passport Advantage® (PA) system. For more information about subscription licenses with IBM, see <https://www.ibm.com/software/passportadvantage/subscriptionlicenses.html>.

[View more information about the changes in 5.4.4](#)

Changes in 5.4.3

The following feature was available in IBM Spectrum Control 5.4.3:

IBM Spectrum Control now comes with IBM Spectrum Protect™ Snapshot

Protecting the application and data that drives your business and is critical to your operations is important to us. That's why IBM Spectrum Control includes a license for IBM Spectrum Protect Snapshot, which provides fast, application-aware backups and restores, leveraging advanced snapshot technologies to help improve your cyber resiliency.

IBM Spectrum Protect Snapshot is available with the following editions of IBM Spectrum Control:

- IBM Spectrum Control and IBM Spectrum Control Select Edition
- IBM Virtual Storage Center and IBM Virtual Storage Center Entry

[View more information about the changes in 5.4.3](#)

Changes in 5.4.2

The following feature was available in IBM Spectrum Control 5.4.2

Update for IBM Virtual Storage Center

The edition "IBM Virtual Storage Center Entry Edition" was renamed to "IBM Virtual Storage Center Starter Edition"

Along with the renaming, capacity limits in IBM Virtual Storage Center Starter Edition were increased to better meet your needs. Now, you can use the IBM Virtual Storage Center Starter Edition to manage up to 1,500 TiBs of usable capacity. That's an increase of 1,000 TiBs over the previous limit! Speaking of limits, the previous limit of 4 I/O groups was removed, so you're no longer restricted by the number of I/O groups in your environment.

[View more information about the changes in 5.4.2](#)

Changes in 5.4.1

The following features and enhancements were available in IBM Spectrum Control 5.4.1

Monitoring snapshot information for volumes that are protected by Safeguarded Copy

With Safeguarded Copy in DS8000® 8.5.0 or later, you can improve cyber resiliency by frequently creating protected, point-in-time backups of critical data, with minimum impact and effective resource utilization.

You can now view snapshot information for volumes that are backed up using the Safeguarded Copy feature across all your monitored DS8000 storage systems. Use this information to monitor the volume capacity that is protected and the capacity that is used to store volume backups for Safeguarded Copy.

Viewing topology and location information for DS8000 Fibre Channel (FC) ports

You use IBM Spectrum Control to monitor DS8000 storage systems, and you need to understand the port topology and the location of the ports in the hardware hierarchy? Not a problem. From the Resources menu, click Block Storage Systems, double-click a DS8000 storage system, and click FC Ports.

You can now check whether an FC port uses the FICON® or the SCSI FCP protocol and view the frame, I/O enclosure, and host adapter for the port.

Enhanced platform support

The following platforms are now supported:

- Db2 11.5.4
- IBM Cognos® Analytics 11.1.7
- Red Hat® Enterprise Linux 8 and Windows 2019 are now supported for all components of IBM Spectrum Control.

[View more information about the changes in 5.4.1](#)

Changes in 5.4.0

The following features and enhancements were available in IBM Spectrum Control 5.4.0:

Connecting directly to Brocade switches and fabrics

You can now connect directly to Brocade switches that run Fabric OS 8.2.1 or later. You no longer need Brocade Network Advisor (BNA) or extra servers to monitor your switches and fabrics. Connect directly to the switch by using the Fabric OS REST API and get the same key inventory and performance information that you got when you used BNA.

Monitoring performance for Hitachi Virtual Storage Platform F and G Series

You can now monitor the performance of Hitachi Virtual Storage Platform F and G Series storage systems. You can also define performance alerts so that you're notified of bandwidth, latency, and other issues before they impact your storage environment.

Viewing the name and VOLSER properties for DS8000 CKD volumes

For DS8000, you can now view both the volume name and the volume serial number (VOLSER) for your count-key-data (CKD) volumes.

User roles for monitoring IBM Spectrum Virtualize

You can now use a role with a lower level of authority on storage systems that run IBM Spectrum Virtualize 8.3.1.2 or later to collect performance metadata. When you add these storage systems, users with a lower level of authority than Administrator, such as users with the Monitor role, can collect performance metadata.

Name updates for licenses

The following licenses were renamed:

Names of IBM Spectrum Control 5.3 licenses	Names of IBM Spectrum Control 5.4.0 licenses
IBM Spectrum Control Standard Edition	IBM Spectrum Control
IBM Spectrum Control Standard Select Edition	IBM Spectrum Control Select Edition

Standard Edition bonus: If you owned a *Standard* license in a previous release, you now have access to the following features:

- Chargeback, consumer, and rollup reports
- Storage reclamation

Advanced Edition: If you own the Advanced Edition, you are not impacted by the renaming of product licenses.

Enhancements to the Licensing page

The Licensing page (Settings > Licensing) was updated to make it easier for you to understand your licensing and determine how much storage you can add before exceeding your license.

The following updates were made:

- The automatic assignment of storage category for most storage systems. Fewer manual assignments are now required.
- Improved notifications to make you aware of actions that you must complete.
- The names of column headings were changed and the hover help was revised to help you complete your compliance check.
- The capacity to be licensed is now shown in tebibytes (TiB) for consistency with the other capacity values on the page.

[View more information about the changes in 5.4.0](#)

Changes in 5.3.7

The following features and enhancements were available in IBM Spectrum Control 5.3.7:

Setting capacity limits

Set capacity limits for storage systems and pools. You want to know how much capacity you have left before your storage systems or pools are 80% full? Just set a capacity limit and you'll know how close you are to reaching your capacity limit. Then, check the Capacity-to-Limit (GiB) value and see how much capacity you can use before you reach your limit.

Support for Pure Storage devices

Monitor Pure FlashArray//M and FlashArray//X. View information about the capacity, space usage, and performance of this non-IBM storage. Other features, such as alerting, health monitoring, advanced analytics, and reporting are also supported.

More support for IBM FlashSystem® devices

You can now view information about the capacity, space usage, and performance of the FlashSystem 5000, FlashSystem 5100, FlashSystem 7200, and FlashSystem 9200 storage systems.

Monitoring DS8000 capacity on flash drives

Monitor the volume capacity that Easy Tier® places on Tier 1 and Tier 2 flash, high-capacity drives on DS8000 storage systems. View the capacity and available capacity of Tier 1 and Tier 2 flash drives in a pool and the distribution of volume extents across each of the Easy Tier drive classes.

Monitoring compliance with your license

For storage systems that use the capacity license model, view the capacity breakdown of the storage environment by the categories of drives that are used. In this release, Category 1 was added for Storage Class Memory (SCM) drives and managed disks on Spectrum Virtualize for Public Cloud.

[View more information about the changes in 5.3.7](#)

Changes in 5.3.6

The following features and enhancements were available in IBM Spectrum Control 5.3.6:

Monitoring performance for Dell EMC Unity and NetApp storage systems running ONTAP 9

Support for monitoring and alerting on performance is now added for the following non-IBM storage systems:

- Dell EMC Unity
- NetApp storage systems that are running ONTAP 9

Monitoring Hitachi Virtual Storage Platform F Series and G Series

Add Hitachi Virtual Storage Platform (VSP) F Series and G Series to the list of non-IBM storage systems that you can monitor and report on directly in IBM Spectrum Control.

More support for IBM FlashSystem devices

You can now view information about the capacity, space usage, and performance of the FlashSystem 5000, FlashSystem 5100, FlashSystem 7200, and FlashSystem 9200 storage systems.

Gaining insights into capacity usage and capacity growth

When you log in to IBM Spectrum Control, you want to know how much capacity you have, how much capacity you've used, and how much usable capacity is still available. To make this information more consumable, the overview charts have got a makeover. But, that's not all. Now, with a click, you can access key capacity metrics for each pool and volume in your storage systems. And, to help you plan capacity, two new metrics were added:

- Recent Fill Rate (%)
- Recent Growth (GiB)

Aligning capacity terms

To enhance your experience of our products and to provide a unified and simplified view of capacity concepts, IBM Storage is aligning the capacity terms across all IBM Storage products. To ensure that we use the same capacity term for the same capacity concept across our products, IBM Spectrum Control has changed 47 of the capacity terms that it uses, removed 4 terms that are no longer needed, and added 1 new term. [Learn more about the capacity terminology changes.](#)

Viewing capacity savings for devices that support hardware compression

You can now view the amount and percentage of capacity that is saved for devices that use inline data compression technology, such as IBM FlashSystem 9100 and IBM Storwize® V7000 Gen3.

Monitoring the cache fullness of pools on IBM Spectrum Virtualize

See how full your cache is by adding new cache fullness metrics to the performance charts when you view the performance of pools in your storage systems. Add and track cache fullness metrics to identify the pools that are experiencing heavy cache usage. You can also use the metrics to help investigate problems with volumes in a pool and to determine whether to move a volume to a different I/O group where the pool's cache partition does not have a cache fullness problem.

Monitoring the aggregated cache fullness of nodes at storage system level on IBM Spectrum Virtualize

See how full your nodes cache is at storage system level by adding new cache fullness metrics to the performance charts when you view the performance of storage systems. Add and track cache fullness metrics to identify the nodes that are experiencing heavy cache usage. You can also use the metrics to help investigate problems for volumes in a pool and to determine whether to move a volume to a different I/O group where the pool's cache partition does not have a cache fullness problem.

Monitoring unmap operations at host connection level on IBM Spectrum Virtualize

Track the workload of unmap operations that each host contributes to the system. To do this, you can measure the performance of unmap volume operations at host connection level. Metrics, such as the average number of MiBs that are unmapped from volumes, I/O rates, data rates, and response times for unmap operations, are collected and shown.

Monitoring Storage Class Memory (SCM) on IBM Spectrum Virtualize

You can now monitor the volume capacity that Easy Tier places on SCM drives on IBM Spectrum Virtualize systems, such as IBM FlashSystem 9100, IBM FlashSystem 7200, and the IBM Storwize family.

Creating inventory reports about IP ports

You can now create and schedule predefined reports about the IP ports on the nodes in IBM Spectrum Virtualize systems, such as SAN Volume Controller, IBM FlashSystem 9100, FlashSystem V9000, and the IBM Storwize family.

Adding IP ports to general groups

You can now add IP ports to general groups so that you can receive alert notifications about changes in the configuration or attributes of the IP ports in a general group.

Monitoring disk utilization for RAID arrays on DS8000 storage systems

For RAID arrays on DS8000 8.5.0 or later, the disk utilization values were updated in performance charts and reports. You can now more accurately check how busy the disks in the array are over a period and identify arrays that are underutilized and overutilized.

Support for IBM Cognos Analytics

IBM Spectrum Control now supports IBM Cognos Analytics Version 11.1.4. Note that IBM Cognos Analytics *does not* run on Windows Server 2019 and Red Hat Enterprise Linux 8.

[View more information about the changes in 5.3.6](#)

Changes in 5.3.5

The following features and enhancements were available in IBM Spectrum Control 5.3.5:

Important capacity updates

Capacity values were updated to better reflect capacity usage in devices that support hardware compression. Capacity, such as pool capacity and allocated space, is now measured based on the physical capacity of the device, rather than the effective capacity.

The devices affected by this update are:

- Storage systems such as FlashSystem 9100, FlashSystem 900, and Storwize V7000 Gen3, which contain IBM FlashCore® Modules with hardware compression.
- Storage virtualizers such as SAN Volume Controller and Storwize family that use back-end storage systems with hardware compression.

The effective capacity information is still available. Additional columns were added to the Block Storage Systems and Pools pages to show the effective capacity based on the data reduction savings that are achieved with hardware compression. Check the column names that begin with "Effective", for example, Effective Capacity (GiB) and Effective Used Capacity (%).

This update also affects alert thresholds and historical charting for storage systems and pools. In historical capacity charts, you'll see a sharp drop in the values for capacity and used space.

[Learn more about the capacity updates.](#)

Product fixes and security updates

In every release of IBM Spectrum Control, IBM fixes issues that are reported by our internal teams and by our customers. Along with fixes, improving the operation and security of the product is also a priority. See what's been updated and fixed in this release:

- [Fixes that are included in this release](#)
- [Security bulletins for IBM Spectrum Control](#)

[View more information about the changes in 5.3.5](#)

Changes in 5.3.4

The following features and enhancements were available in IBM Spectrum Control 5.3.4:

Monitoring unmap operations on IBM Spectrum Virtualize

You can now measure the performance of unmap volume commands and define alerts so that you are notified when unmap operations values fall outside thresholds you specify. Metrics, such as the average number of MiBs that are unmapped from volumes, I/O rates, data rates, and response times for unmap operations, are collected and shown:

- At the pool level
- At the node level
- At the I/O group level

For more information, see [Performance metrics for resources that run IBM Spectrum Virtualize](#).

Enhanced OS support

You can now install IBM Spectrum Control and Storage Resource agents on servers that run Windows Server 2019 and Red Hat Enterprise Linux 8.

Product fixes and security updates

In every release of IBM Spectrum Control, IBM fixes issues that are reported by our internal teams and by our customers. Along with fixes, improving the operation and security of the product is also a priority. See what's been updated and fixed in this release:

- [Fixes that are included in this release](#)
- [Security bulletins for IBM Spectrum Control](#)

[View more information about the changes in 5.3.4](#)

Changes in 5.3.3

The following features and enhancements were available in IBM Spectrum Control 5.3.3:

IBM Storage Insights for IBM Spectrum Control

IBM Storage Insights for IBM Spectrum Control is an IBM Cloud® service that can help you predict and prevent storage problems before they impact your business. It is complementary to IBM Spectrum Control and is available at no additional cost if you have an active license with a current subscription and support agreement for IBM Virtual Storage Center, IBM Spectrum Storage Suite, or any edition of IBM Spectrum Control.

For more information, see [IBM Storage Insights for IBM Spectrum Control](#).

Monitoring IBM Storwize V5000E storage systems

You can now monitor Storwize V5000E storage systems. You can view information about the capacity, space usage, and performance of the storage systems. Other features, such as alerting, health monitoring, advanced analytics, and reporting are also supported.

Viewing application performance

You can now view the total workload of an application that is consuming storage resources. Previously, to investigate the workload of an application, you had to review the workloads of the individual volumes. Now you can select an application from the Applications page and click View Performance to see the Total I/O Rate and the Total Data Rate for the application. On the applications details page, you can view the Aggregated Workload charts.

Faster ways to view and acknowledge your alerts

Now it's easier and faster to view and acknowledge your alerts. On the Alerts dashboard, just double-click an alert to see details of the alert on the same screen, including a performance chart for performance alerts. You can view summary details of several alerts at the same time, and acknowledge them all with a single click.

To filter alerts, you can now click one of the alert category tags. For example, to show critical and warning unacknowledged alerts, click Critical and Warning. To show your acknowledged alerts, click Acknowledged.

Automate changing the password for Spectrum Control on Windows

You can now run the `changepassword.bat` script from Windows Command Line Interface, or from an automated script, to change the passwords for the Spectrum Control user ID or for the database user ID.

Improved support for special characters in Spectrum Control and Db2 passwords

IBM Spectrum Control has improved the support for special characters in passwords, giving you the flexibility that you need based on your security requirements.

IBM Spectrum Control ports have TLS 1.1 and 1.0 disabled by default to increase security

Prior to 5.3.3, IBM Spectrum Control ports had TLS 1.1 and 1.0 enabled by default. To increase security IBM Spectrum Control ports have TLS 1.1 and 1.0 disabled by default. Therefore, IBM Spectrum Control won't be able to communicate with devices that do not support TLS 1.2. If you want to upgrade your devices to a version that supports TLS 1.2, contact your vendor.

[View more information about the changes in 5.3.3](#)

Changes in 5.3.2

The following features and enhancements were available in IBM Spectrum Control 5.3.2:

Configuring alerts using alert policies

Configuring alerts is now easier! You can now use alert policies to configure alerts for groups of resources rather than just for individual resources.

Simply create an alert policy and specify the alerts that you want, and those alerts are automatically applied to all the resources that you include in the policy.

Modifying alerts for resources is also a snap because the changes that you make are automatically applied to all the resources in the policy at the same time.

For more information about alerts and alert policies, see [How alerts work](#).

Reporting

- Create and schedule predefined reports about the capacity that is assigned to hypervisors.
- Create an inventory report about your servers' ports showing information about the ports that your servers are connected to.
- Easily generate predefined capacity reports about the resources that you are interested in. It just takes a click to select managed disks by storage systems, pools by storage systems, servers by applications, volumes by servers.
- Send custom and predefined reports as CSV and HTML attachments. Recipients can then download and open the report in a tool of their choice.
- Can't wait for the next run of a monthly report? Just click and run the report now to share the information with your colleagues!

For more information about reporting, see [Reporting](#).

Monitoring compression savings for RAID arrays in IBM FlashSystem 900, model AE3 storage system

For FlashSystem 900, model AE3 with firmware 1.6, you can now view the amount of capacity that is saved when the flash modules in the RAID array use inline data compression.

Identifying mirrored volume relationships on storage systems that run IBM Spectrum Virtualize

To help you identify the primary and secondary copies in mirrored volume relationships, the following properties for volumes were renamed:

- Target is now named Mirror Role and shows the value "Primary" or "Secondary".
- Mirror is now named Copy ID.

Tip: The name changes for these columns are also reflected in the volume information that is retrieved by using the REST API for IBM Spectrum Control. Ensure that you update any 3rd-party tools or reports that you use to show information from the REST API.

[View more information about the changes in 5.3.2](#)

Changes in 5.3.1

The following features and enhancements were available in IBM Spectrum Control 5.3.1:

- Reporting enhancements:
 - From a single page, create predefined capacity reports that you can schedule, send by email and save to your file system.
 - Create predefined inventory reports for your storage systems and for the storage resources that they use, such as nodes.
 - Add filters to custom reports. For example, you want to create a report that shows whether your file systems have enough capacity.
- You can now monitor Storwize V7000 Gen3 storage systems. You can view information about the capacity, space usage, and performance of the storage systems. You can also view the savings that are achieved when data is reduced, compressed, and deduplicated.

[View more information about the changes in 5.3.1](#)

Changes in 5.3.0

The following features and enhancements were available in IBM Spectrum Control 5.3.0:

- Create custom reports. From any table view, create reports to share information with your colleagues and managers about the capacity, configuration, and health status and the performance of the resources that you monitor in your storage environment.
- Monitor IBM FlashSystem 9100 storage systems.
- Prevent your FlashSystem 900 from running out of capacity by monitoring the physical capacity and receiving alerts when the physical capacity is low. View information about pool capacity and the used and available capacity in the RAID array.
- Add multiple storage systems for monitoring at the same time.

[View more information about the changes in 5.3.0](#)

Changes in 5.2.17

The following features and enhancements were available in IBM Spectrum Control 5.2.17:

- View detailed information about the enclosures for block storage systems that run IBM Spectrum Virtualize, such as FlashSystem V9000, FlashSystem 900, SAN Volume Controller, and the IBM Storwize family.
- Use new overview charts for storage systems to answer key physical capacity, volume capacity, and capacity savings questions:
 - How much space is available.
 - How much of your thin-provisioned volume space is used.
 - How much space you are saving by using compression, deduplication, and thin provisioning.
- For storage systems that run IBM Spectrum Virtualize 8.1.1 or later, use the Pool Attributes column to distinguish data reduction pools from standard pools and identify if the data in the pool is encrypted. For storage systems that run IBM Spectrum Virtualize 8.1.3 or later, you can also view the capacity savings that are made when you use data reduction pools.
- For storage systems that run IBM Spectrum Virtualize 8.1.3 or later, you can see the amount and percentage of capacity that is saved when data is deduplicated. The capacity savings for deduplication are shown at the storage systems, pools, and volumes levels.
- For storage systems that run IBM Spectrum Virtualize, you can track the historical capacity and the capacity savings that were achieved when volumes are compressed. This allows you to monitor the efficiency of compression over time.
- Use the Compressed and Deduplicated filters to show only volumes with the selected filter value.

[View more information about the changes in 5.2.17](#)

Changes in 5.2.16

The following features and enhancements were available in IBM Spectrum Control 5.2.16:

- Monitor the availability of clusters by checking which nodes have spare nodes. You can also check the status of the spare nodes, such as which nodes are online and which nodes are on standby.
- Monitor the workload of compressed volumes on storage systems that run IBM Spectrum Virtualize™. You can view I/O rate, data rate, and response time metrics for compressed volumes and uncompressed volumes. See [Compression metrics for volumes](#).
- In previous releases, IBM Cognos Business Intelligence reports was installed with and could be accessed directly from IBM Spectrum Control. In this release, IBM Cognos Analytics is installed as a separate product. See [View more information about the changes in 5.2.16](#).
- The integration with external LDAP repositories in IBM Spectrum Control is improved.

[View more information about the changes in 5.2.16](#)

Changes in 5.2.15

The following features and enhancements were available in IBM Spectrum Control 5.2.15:

- Creating agentless servers used to be a manual process, and automating it was a frequently requested enhancement. IBM Spectrum Control now automatically generates agentless servers for the physical servers and virtual machines in your SAN environment, so that you can easily see how they are consuming storage.
 - Change the default names of the tiers that are shown in the GUI.
 - Add or change properties, such as the location or custom tags, for multiple servers, storage systems, hypervisors, switches, or fabrics. You can use the properties to filter or sort the resources in the GUI or in an external application if the data is shared or exported.
 - Define more than 30 new alerts for volumes in block storage systems, including alerts for capacity values such as Compression Savings, Data Deduplication Savings, Data Reduction Savings, and Unallocated Volume Space. Use these alerts to detect and monitor potential configuration and capacity issues in your environment.
 - Find volumes with the same attributes. Use the new filters, such as Easy Tier and Mirror, to show only volumes with the selected filtered value. You can also sort the volumes by allocated and unallocated space, and much more.
 - Add and monitor IBM Spectrum Virtualize software-only clusters.
 - IBM Db2 Version 11.1 is now included with IBM Spectrum Control.
 - Use the Representational State Transfer (REST) API to automatically export the data that you need to generate custom reports or share with external applications.
- The following information is now available:
- How much capacity is used by applications, departments, hypervisors, and physical servers.
 - How much block capacity is used by a specific application, department, hypervisor, or physical server.

[View more information about the changes in 5.2.15](#)

Changes in 5.2.14

The following features and enhancements were available in IBM Spectrum Control 5.2.14:

- Enhancements for IBM Cloud Object Storage:
 - Add COS Vaults to applications and general groups so you can track how much space is being consumed by logically related vaults and how that consumption trends over time.
 - Use the enhanced Vaults by Accessers chart, and the new Vaults by Drives and SliceStors by Drives charts, to monitor the availability of all your COS Vaults and COS SliceStor® nodes.
 - View the number of failed drives in the COS SliceStor nodes and the tolerance of the nodes to more drive failures.
 - View the tolerance of COS Vaults to drive failures across all the COS SliceStor nodes in the storage pool.
 - View the COS Vaults, access pools, and storage pools that are used by IBM Spectrum Scale storage systems.

- The user experience is enhanced within the GUI for integration with an external LDAP repository. IBM Spectrum Control is now available to a larger set of users and groups and you are able to log in to IBM Spectrum Control with one set of credentials.
- IBM Spectrum Control ensures, when it sends alert notifications and reports by email to your email server, that it complies with the security standards that you configure on your email server.
- You can now choose the unit of measurement for a capacity metric when you create or edit chargeback and consumer reports. So, you can generate reports that show storage consumption in the unit of measurement of your choice whether it is PB or PiB, TB or TiB, or GB or GiB.
- View the following port delay metrics for storage systems that run IBM Spectrum Virtualize: Port Delay Time, Port Delay I/O Percentage
- DS8000 storage systems, you can now see the hosts and host clusters that host connections belong to.
- View a list of all the primary volumes that are not protected by a copy data relationship.
- View which Managed Disks are active Quorum disks.
- View the site name of each node in a stretched cluster.
- For Storwize storage systems, 7.8 or later, you can now view information about flash drives by tier in storage pools and volumes. For storage pools, you can view the capacity and available capacity for solid-state drives (Tier 0) and for read-intensive flash storage (Tier 1). For volumes, you can view the capacity for solid-state drives (Tier 0) and for read-intensive flash storage (Tier 1).
- Upload logs automatically to IBM Software Support to help resolve problems quickly.

[View more information about the changes in 5.2.14](#)

Changes in 5.2.13

The following features and enhancements were available in IBM Spectrum Control 5.2.13:

- View more information about the capacity, space usage, and performance of Dell EMC. Support for versions of Dell EMC SMI-S Provider or Dell EMC Solutions Enabler that are compliant with SMI-S 1.6 provides a more representative view of Dell EMC VMAX, Dell EMC VNX, and Dell EMC VNXe storage systems.
- Gain insights into the external storage that is used by IBM Spectrum Scale:
 - View capacity values for the external storage that clusters and file systems use. This view provides insight into the total amount of data that is migrated from all file systems in a storage system, or the amount of data that is migrated from specific file systems.
 - Check whether you have enough internal space to recall data that was migrated to external storage.
- For storage systems that run IBM Spectrum Virtualize, you can now see the cluster that host connections belong to.
- Enhancements for IBM Cloud Object Storage:
 - View information about the hard disk drives, solid-state drives, and flash modules in COS Slicestor nodes.
 - In the Vaults by Accessers chart, view the vaults that cannot be accessed and the vaults that are at risk of access failure.
- On the new VDisk Mirrors and HyperSwap® pages in the Copy Data panel, you can analyze storage device relationships across your block storage environment in IBM Spectrum Control to identify how redundancy is affecting available capacity.
- You exclude the cost of storage in chargeback and consumer reports when you want to highlight storage consumption and not storage cost.

[View more information about the changes in 5.2.13](#)

Changes in 5.2.12

The following features and enhancements were available in IBM Spectrum Control 5.2.12:

- Monitor the capacity, space usage, and performance of FlashSystem A9000 and FlashSystem A9000R storage systems.
- Create consumer reports that show the capacity and the cost of the block storage that an application, department, hypervisor, or physical server uses.
- Report on allocated versus assigned capacity in chargeback and consumer reports.
- Analyze replication and FlashCopy® relationships across your block storage environment
- View the amount of external storage from cloud services and other storage providers that is being used by the file systems in a IBM Spectrum Scale cluster. For external storage that is provided by IBM Cloud Object Storage, you can also view capacity information, including the percentage of space that is being used.
- Monitor sites, mirrors, and vault quotas for IBM Cloud Object Storage. For example, you can:
 - Monitor the capacity and space usage of sites. See which COS Slicestor and COS Accesser® nodes are located at each site and which sites cannot tolerate COS Accesser node failures.
 - View the space quotas that are configured for vaults and see whether any vaults are violating the soft or hard quota limits.
 - View information about mirrors, such as the pair of vaults in each of the mirrors, and the number of COS Accesser nodes that are configured to access the mirrors. You can also see the storage pools and sites for the vaults in the mirror.
- Define alerts that notify you of status changes on the IBM Spectrum Scale nodes that are configured as cloud gateways.
- Customize the analysis period for analyzing tiering and balancing pools to the days of the week and hours of the day of your choice.
- Access information about your resources by using the Representational State Transfer (REST) API for IBM Spectrum Control. You can use this information to generate custom configuration and performance reports.

[View more information about the changes in 5.2.12](#)

Changes in 5.2.11

The following features and enhancements were available in IBM Spectrum Control 5.2.11:

- Changes to alerts:
 - Create alerts for a set of storage resources that are assigned to an application.
 - Define alerts for a set of resources in custom groups that you create.
 - Combine multiple alert conditions from multiple resources in a single, custom alert.
- Create, schedule, and send chargeback reports by email to make the owners and managers aware of the cost of the capacity and the amount of capacity that is used by their applications, departments, hypervisors, and servers.
- View key performance metrics for IBM® FlashSystem 900 storage systems:
 - Response times
 - I/O rates and data rates
 - The condition of the storage system
- Review new capacity charts to detect capacity shortages and investigate trends in storage growth for your tiers.
- Analyze replication relationships across your block storage environment.
- Monitor the status, capacity, and space usage of IBM Cloud Object Storage.
- Identify which file systems in a Spectrum Scale cluster use external storage that is provided by cloud services or other storage providers.

- Enable automated probe scheduling to simplify the process of scheduling probes and help avoid excessive load on the product server.
- Determine whether the total capacity of the storage systems that IBM Spectrum Control manages exceeds your product license entitlement.
- When you complete a fresh installation of the product, the number of random listening ports is reduced. Information about the ports is documented and you can change the Device server ports after you complete the installation or perform an upgrade.
- Manually uninstall IBM Tivoli® Storage Productivity Center for Replication from IBM Spectrum Control servers on your computer.
- IBM Db2® Version 10.5 Fix Pack 7 is now included with IBM Spectrum Control.

[View more information about the changes in 5.2.11](#)

Changes in 5.2.10

The following features and enhancements were available in IBM Spectrum Control 5.2.10:

- Identify key performance metrics that are outside of a standard range on IBM System Storage® SAN Volume Controller and IBM Storwize® storage systems.
- Export performance data for a resource to a compressed file.
- Review new capacity charts to detect capacity shortages and investigate trends in storage growth for your block, file, and object storage resources.
- Review the capacity and space usage that the tiered storage in your environment consumes. You can see when your tiered storage will run out of space and the weekly growth rate in storage usage for each tier.
- View the values for the capacity of virtualized storage and non-virtualized storage to understand how capacity is used when storage virtualization is implemented in your storage environment.
- Use rollup reporting to combine capacity and status information from multiple instances of IBM Spectrum Control™. You can use this information to gain a network-wide perspective of storage usage in your environment when you have multiple IBM Spectrum Control servers deployed.
- Group resources, such as the storage systems with lease agreements that end in the current year, so that you can view information about the resources at one location.
- IBM Spectrum Control V5.2.10 now supports only Storage Management Initiative (SMI) data sources, also called CIM agents, for managing switches from Brocade Communications Systems, Inc.
- View the resource types that were explicitly added to an application or subcomponent.

[View more information about the changes in 5.2.10](#)

Changes in 5.2.9

The following features and enhancements were available in IBM Spectrum Control 5.2.9:

- Reclaim unused storage capacity and more effectively allocate volume space on your block storage systems.
- View the amount of storage that can be reclaimed in each of the storage systems that are monitored.
- Use the volume reclamation recommendations to reclaim unused storage space and use your storage more efficiently. By reclaiming the volumes, you can reduce costs by recycling existing storage space instead of purchasing new storage media.
- IBM Spectrum Control™ now displays the switch blade number, port number, and blade names just as they were defined in other tools, such as Brocade Network Advisor.
- IBM Db2® Version 10.5 Fix Pack 6 is now included with IBM Spectrum Control.

[View more information about the changes in 5.2.9](#)

Changes in 5.2.8

The following features and enhancements were available in IBM Spectrum Control 5.2.8:

- The name of the product was changed from IBM Tivoli Storage Productivity Center to IBM Spectrum Control.
- Comprehensive improvements to alerting capabilities:
 - You can now define alerts for all the key attributes of a resource, including attributes for status, configuration, capacity, and performance.
 - To avoid receiving too many emails and disruptive notifications for some alerts, you can now choose a new suppression option where only one notification is sent.
 - If you want to define more than one alert for the same attribute but with different criteria and settings, you can duplicate that alert.
- View the performance of clusters, nodes, and file systems in IBM Spectrum Scale.
- Monitor object storage systems on IBM Spectrum Scale.
- Monitor the capacity and space usage of IBM FlashSystem 900 storage systems.
- View charts that show the current and historical capacity of your block storage pools.
- IBM Spectrum Control is now a native, 64-bit application for all server operating systems.
- Simple Network Management Protocol (SNMP) Version 3 is now the preferred protocol for the management of switches and fabrics from Cisco Systems, Inc., and is an optional protocol for devices from Brocade Communications Systems, Inc. and other vendors.
- View information about the performance of inter-switch connections.
- View information about Brocade switches that are in Access Gateway mode. You can also view information about the routes from ports that are connected to a hypervisor, server, or storage system to ports that are connected to fabrics.
- View information about Brocade F_port trunks and about NPV links.
- You can now more easily identify the internal resources that are encountering problems in your environment.
- Compare how much capacity is managed by IBM Spectrum Control with the total amount of capacity that you are entitled to manage.
- View information about the capacity for each of the class drives (SSD, Nearline HDD, and Enterprise HDD), that Easy Tier can use to tier or distribute volume extents.
- To consolidate the functions of IBM Spectrum Control into a single GUI, the stand-alone GUI was removed.

[View more information about the changes in 5.2.8](#)

Capacity terminology changes

IBM Storage is making the capacity terminology that is used in IBM Storage products consistent. In Q1 2020, the capacity terminology was made clearer and simpler across IBM Storage products, including IBM Spectrum Control.

Discontinued features in IBM Spectrum Control

View a list of the features that were discontinued in different releases of IBM Spectrum® Control.

What is a discontinued feature?: Discontinued features are features that are no longer supported in IBM Spectrum Control. In some cases, these features were removed from the GUI and are no longer available. In other cases, these features might still appear in the GUI, but they are no longer supported and might not work as intended. For both cases, it's recommended that you use another feature or product offering to complete the same actions, when possible.

Discontinued feature	Discontinued in version	Resolution
Db2® 11.1 is no longer supported as the database repository for storing metadata about your monitored devices.	5.4.7	Upgrade Db2 to Db2 11.5 or later. For information out how to upgrade Db2, see Example of upgrading Db2 in a Windows environment .
Operating systems where you can install Storage Resource agents: <ul style="list-style-type: none"> HP-UX 11i v3 Oracle Solaris 10 and 11 	5.4.0	Install your Storage Resource agents on different servers with supported operating systems. For a list of supported operating systems, see https://www.ibm.com/support/pages/node/6249361#Agents .
Storage systems: <ul style="list-style-type: none"> DS3000, DS4000®, DS5000, or DS6000™ Non-IBM storage systems that are monitored with SMI-S 1.1 providers. NetApp devices that run ONTAP 8. Huawei devices 	5.4.0	No future support is planned for monitoring these storage systems. For a complete list of storage systems that are supported in 5.4.0 and later, see IBM Spectrum Control interoperability matrix for storage systems .
Provisioning of block and file storage systems, which includes: <ul style="list-style-type: none"> Cloud configuration concepts, such as service classes and capacity pools Reserved capacity concept External Application role 	5.4.0	No other feature in IBM Spectrum Control currently replaces this feature. For your future provisioning and automation needs with IBM storage, consider using another product, such as Ansible® by Red Hat®. For more information about Ansible, see https://www.ansible.com/integrations/infrastructure/ibm-storage .
Optimization: <ul style="list-style-type: none"> Tiering Balancing Volume transformation 	5.4.0	No other feature in IBM Spectrum Control currently replaces this feature. It's recommended that you use a different product to optimize tiering, balance storage, and transform volumes. Pro tip: With the increasing use of all flash storage and environments with a few large pools rather than many smaller pools, optimization and balancing functions are becoming less critical.
Snapshot-based protection that is provided by IBM Spectrum Protect™ Snapshot for the applications and databases that IBM Spectrum Control uses.	5.4.0	This feature is still available in the IBM Storage Virtual Center storage solution.
STAR data is no longer available in the following: <ul style="list-style-type: none"> Cognos® Analytics reporting tool CLI (tpctool) commands IBM Spectrum Control GUI 	5.4.0	<ul style="list-style-type: none"> For your reclamation needs, go to Advanced Analytics > Reclamation. For tier-related capacity management, go to Groups > Tiers. For other uses of your STAR data, it's recommended that you use a different product.
Tivoli® Storage Productivity Center for Replication	5.3.0	Use IBM Copy Services Manager. See IBM Copy Services Manager .
IBM Spectrum Control workflows for storage provisioning with IBM Tivoli Provisioning Manager	5.3.0	No other feature in IBM Spectrum Control currently replaces this feature.
The agent for integrating IBM Spectrum Control alerting with IBM Tivoli Monitoring	5.3.0	No other feature in IBM Spectrum Control currently replaces this feature.
OpenStack Cinder driver that uses the provisioning feature in IBM Spectrum Control	5.3.0	Use the Cinder driver that is associated with your storage system.
Database views for custom reporting with SQL	5.3.0	Use the Representational State Transfer (REST) API to access information about resources and to generate custom configuration and performance reports. See IBM Spectrum Control REST API .
The tpctool CLI commands for provisioning that don't use the service-class concepts of IBM Spectrum Control	5.3.0	No other feature in IBM Spectrum Control currently replaces this feature.
Using IBM Spectrum Control components to enable IBM DS8000® storage systems to work with external authentication servers, such as LDAP	5.3.0	No other feature in IBM Spectrum Control currently replaces this feature.
vSphere Web Client extension for IBM Spectrum Control and VASA 1.0 provider	5.3.0	No other feature in IBM Spectrum Control currently replaces this feature. However, IBM Spectrum Connect provides IBM Storage Enhancements for VMware vSphere Web Client and an IBM Storage Provider for VMware VASA. For more information, see the IBM Spectrum Connect Knowledge documentation .
Graphical view of the data path between storage resources, SAN components, and servers (Data Path Explorer)	5.3.0	To view the relationships between resources: <ol style="list-style-type: none"> Go to a resource list page, such as the Block Storage Systems page. Right-click a resource and select View Details. On the details page, view the Related Resources section. Click a related resource to view more information about it. Related resources that you can view include servers, file systems, fabrics, switches, object storage systems, and back-end storage systems for storage virtualizers.

Sponsor user program

Sponsor users interact directly with designers and developers to improve the user experience and to help shape the future of the overall storage portfolio.

IBM® needs your experience and expertise as an active participant to work with our designers and developers to create new features for the future and help improve the overall look and feel of our IBM Storage products.

Are you ready to align us with your reality of what a product should do?

Are you a real user or a potential user of an IBM Storage software product?

IBM wants you to be excited about being an active participant and establishing a collaborative and fluid relationship between your company and our design and development teams.

Express® your thoughts and get your ideas heard! Then, as the discussion moves forward, we will integrate your insights and feedback into our decision making process and make them action items. In addition, as an active program user you get a peek into upcoming storage releases and gain beta access to new products.

Note: If you are interested in joining the IBM Storage Sponsor User Program or just want to get additional information, complete the following form: [IBM Storage Sponsor User](#).

Important: Always remember your information is kept confidential and is only used by the IBM Design and Development for product development purposes.

Beta program

The IBM Spectrum® Control Beta is a continuous program. It gives you a first look at upcoming features, a chance to influence design, an opportunity to test the new features in your own environment, and a direct voice into the product development process.

There are many reasons why new and existing customers, IBM® Business Partners, and even current members of IBM become part of the Beta program as a tester.

Customer quote: Bob Oesterlin, Sr. Principal Storage Engineer at Nuance: "If you're a IBM Spectrum Control user, definitely participate in IBM's Beta program. It gives you access to the latest features early on, direct access to developers and a great community of other early adopters. I've been a part of the IBM Spectrum Control Beta program for years, and the IBM team has been fantastic and responsive."

Benefits

Some benefits of IBM's Beta program include:

Gain access to early code and evaluate new product features and enhancements

You get access to the Beta code before general availability of the product release to determine whether the new features and enhancements are a good fit for your business organization. Once the code is downloaded, you are able to validate and test the new software directly in your environment. You can then identify and then fix any concerns before the code is available saving you precious time and preventing any production issues later on. When the code is made available, you are ready for installation, implementation and to take advantage of the new capabilities.

Interact with design and development

The product designers, architects, developers, and testers are integrated into the Beta program to help support the participants. They can assist you with any issues that you might encounter. You can also request an advocate to work with you during the process and post questions on the Beta forum.

Collaborate with other Beta customers

The Beta program includes group meetings that provide you with an opportunity to interact with other program participants about your configuration and testing experiences with the beta features. Participants are encouraged to share their experiences with the development team.

Participate in product education

The Beta program provides the participants with education on the new features and functions that are available in a Beta. The education is usually done in presentation form on a web conference where you can get a head start in learning about the capabilities.

Become an IBM reference customer

After your positive Beta experience, IBM invites you to participate in the reference program. The IBM Marketing team helps you craft a message to let other potential Beta testers know about your success when you adopt and use beta features.

Get enrolled!

To enroll in the Beta program, complete the [IBM Spectrum Control Beta Sign up form](#).

Collaborating with the team

Collaborate with the IBM Spectrum® Control team to help improve the product.

About this task

Got a great idea for making IBM Spectrum Control even better? Do you want to vote for an enhancement that was requested by another user? The IBM® System Storage® Ideas Portal is a place where you can collaborate with the development team for IBM Spectrum Control and other users through your ability to search, view, comment on, submit and track product requests. Help shape the future of IBM!

Procedure

1. Go to the IBM System Storage Ideas Portal at <https://ibm-sys-storage.ideas.ibm.com/ideas?project=SPCO>.
2. To submit an enhancement request, click Add A New Idea.
3. Log in with your IBMid.

4. In the Choose a workspace for this idea drop-down menu, select IBM Spectrum Control .
5. Complete the form and click Add Idea.

Printable documentation

The documentation for IBM Spectrum® Control is available in PDF format.

Viewing PDF files

Click one of the following links to view the corresponding PDF within your browser.

- [IBM Spectrum Control Quick Installation Guide](#) (about 1200 KB)
- [IBM Spectrum Control Installation Guide](#) (about 3100 KB)
- [IBM Spectrum Control Administrator's Guide](#) (about 2200 KB)
- [IBM Spectrum Control User's Guide](#) (about 10200 KB)

Downloading Adobe Acrobat Reader

To view or print these PDF files, you need Adobe Acrobat Reader. You can download a free copy from the [Adobe website](https://get.adobe.com/reader/)  (<https://get.adobe.com/reader/>).

Product licenses

Learn about the product licenses that are available for IBM Spectrum® Control. Current licenses are IBM Spectrum Control and IBM Spectrum Control Select Edition. The IBM Spectrum Control Advanced Edition license is still applied, if you owned it in a previous release.

IBM Spectrum Control offers two licenses based on the type of metric that you use:

- The IBM Spectrum Control license is based on the total number of storage capacity units (SCUs) that are required so that all of your capacity is licensed for all of your storage systems. This license applies if you currently have the IBM Spectrum Control or IBM® Virtual Storage Center license.
- The IBM Spectrum Control Select Edition license (and the IBM Virtual Storage Center for Storwize® license) is based on the total number of licenses that you need for your storage systems that use enclosures.

Note: Only one difference exists between the IBM Spectrum Control and IBM Spectrum Control Select Edition licenses: the license metric (SCUs versus enclosures). The features are otherwise identical in both solutions. To view the features, see [Product overview](#).

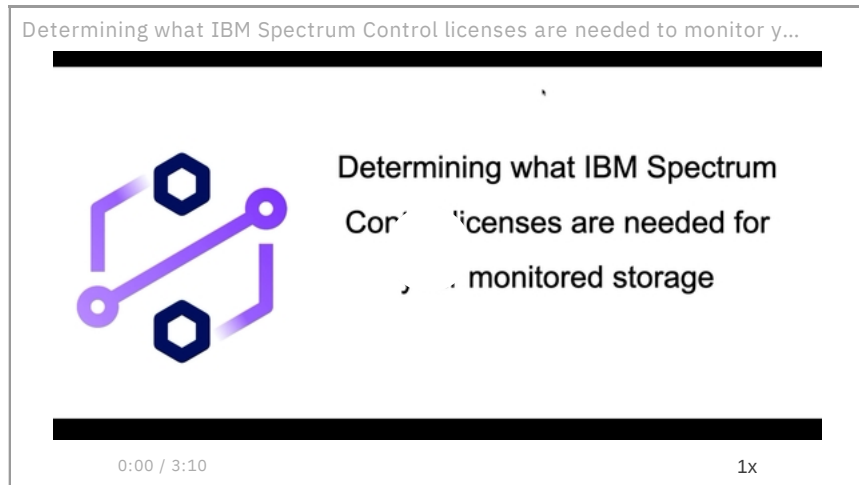

To view a complete list of devices that can be used with IBM Spectrum Control, go to <https://www.ibm.com/support/pages/node/388393>.

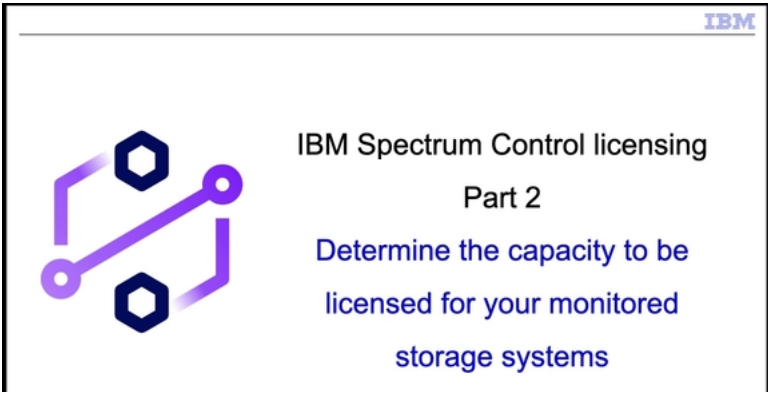

IBM Storage Insights for IBM Spectrum Control: IBM Storage Insights for IBM Spectrum Control is an IBM Cloud® service that can help you predict and prevent storage problems before they impact your business. It is complementary to IBM Spectrum Control and is available at no additional cost if you have an active license with a current subscription and support agreement for IBM Virtual Storage Center, IBM Spectrum Storage Suite, or any edition of IBM Spectrum Control.

For more information and to view a list of features in the service, see [IBM Storage Insights for IBM Spectrum Control](#).

Determining which licenses are needed for your monitored storage

Watch two short videos about how to view the capacity of the storage systems that IBM Spectrum Control monitors in your environment. Then, check the records of the licenses that you purchased to determine how much additional storage can be monitored before you're no longer covered.

IBM Spectrum Control licensing
Part 2
Determine the capacity to be licensed for your monitored storage systems

0:00 / 3:52 1x

- [Names of equivalent licenses in previous releases](#)
IBM Spectrum Control licenses were known by different names in previous releases. Use this table to determine the names.
- [Actions that are available based on role](#)
Your IBM Spectrum Control role and product license determine the actions that are available in the product.
- [Licensing](#)
View the capacity of the storage systems that IBM Spectrum Control monitors in your environment. Then, check the records of the licenses that you purchased to determine how much additional storage can be monitored before you're no longer covered.

Definitions of licensing metrics

Learn more about the licensing metrics that are available for IBM Spectrum® Control.

About this task

Three different license metrics are available for IBM Spectrum Control:

SCUs

Licenses are priced by the number of storage capacity units (SCUs) that you need for the capacity to be licensed for the storage system. The number of SCUs is based on the capacity and categories of drives that are used by the storage system. This metric is available for the IBM Spectrum Control and IBM® Virtual Storage Center perpetual licenses.

Total TiB

Licenses are priced by the total usable capacity in tebibytes (TiB) for all storage systems that use the capacity license model. This metric is available for the IBM Virtual Storage Center subscription license.

Total TiB (with limits)

Licenses are priced by the total usable capacity in tebibytes (TiB) for all storage systems that use the capacity license model, with the following limits:

- Up to 1,500 TiBs of usable capacity
- No limit I/O groups

This metric is available for the IBM Virtual Storage Center Entry and IBM Spectrum Storage Suite licenses.

Enclosures

Licenses are priced by the number of drive slots and capacity in the storage enclosures. This metric is available for the IBM Spectrum Control Select Edition and IBM Virtual Storage Center for Storwize® licenses.

For each enclosure, the number of licenses is calculated by using the following rules. Calculations are rounded up to the nearest whole number.

1. The number of slots in the enclosure divided by 25.
2. The sum of the physical capacity of the disks in the enclosure divided by 500 TiB.
3. The higher number from rule 1 and rule 2 is the number of licenses that are needed for the enclosure.

For examples of using the enclosure pricing model, see [Calculating the number of enclosure licenses for your storage systems](#).

To learn about the licensing of IBM Spectrum Control, click the Announcement in [Table 1](#). Information about licenses is available in the section *Charge Metrics*.

Table 1. Product announcements for IBM Spectrum Control licenses

License	Announcement	Revised Announcement
IBM Spectrum Control - Storage Capacity Unit	5.3.0	5.3.6.0
IBM Spectrum Control - Select/Enclosure license	5.3.0	5.3.7.0
IBM Virtual Storage Center (subscription license)	5.4.3	

Names of equivalent licenses in previous releases

IBM Spectrum® Control licenses were known by different names in previous releases. Use this table to determine the names.

Table 1. IBM Spectrum Control licenses and their previous names

Names of IBM Spectrum Control 5.4.0 licenses	Names of IBM Spectrum Control 5.3 licenses
IBM Spectrum Control	IBM Spectrum Control Standard Edition
IBM Spectrum Control Select Edition	IBM Spectrum Control Standard Select Edition

Actions that are available based on role

Your IBM Spectrum® Control role and product license determine the actions that are available in the product.

Users who are assigned the Administrator role or the Monitor role can use product functions. The actions that are available for each function depend on the role that is assigned to the user:

Administrator role

Users who are assigned the Administrator role have access to all monitoring and administrative actions.

Monitor role

Users who are assigned the Monitor role can view information about monitored resources and other objects such as tasks, alerts, and service classes. They can acknowledge alerts and resource statuses, open logs, and open management GUIs.

The following table outlines the actions that are available only for the Administrators role. All other actions are available to the Monitor and Administrator roles. In addition to the restrictions listed in this table, users who are assigned the Monitor role do not have access to user management functions.

Table 1. Product actions that are available only to users with the Administrator role

Function	Actions that require the Administrator role
Single dashboard view of the storage environment that you can use to manage storage systems, hypervisors, servers, and Fibre Channel fabrics.	<ul style="list-style-type: none"> • Adding and removing resources • Administering connections • Scheduling data collection • Changing and viewing the automated probe schedule • Viewing and editing history retention settings • Modifying license settings
Performance monitoring for storage systems and Fibre Channel networks.	<ul style="list-style-type: none"> • Scheduling performance monitors • Starting or stopping performance monitors
Capacity and usage monitoring of resources.	<ul style="list-style-type: none"> • Scheduling probes • Starting or stopping probes • Modifying Storage Resource agents • Enabling automatic zoning
Health and alerting for hypervisors, networks, servers, and storage systems.	<ul style="list-style-type: none"> • Creating, modifying, and deleting alert policies • Setting which alert policy manages a resource • Adding and modifying resources for management by an alert policy • Defining and modifying alert definitions • Editing alert notification settings
Capacity and performance of the storage that applications, departments, and general groups use.	<ul style="list-style-type: none"> • Creating applications, departments, and general groups • Creating, modifying, and removing filters to add resources to applications • Adding and removing resources in applications and general groups, directly • Adding applications as members of other applications • Adding departments to other departments • Adding applications to departments
Storage reclamation	Viewing volumes that can be reclaimed

Function	Actions that require the Administrator role
Roll-up reporting, in which capacity data is combined from multiple instances of IBM Spectrum Control for reporting purposes.	<ul style="list-style-type: none"> Adding and removing subordinate servers Starting a probe for a subordinate server Modifying the connection information for a subordinate server
Predefined Reports <ul style="list-style-type: none"> Predefined capacity reports allow users to quickly create reports about capacity anomalies and shortfalls, which can be scheduled and sent by email or saved to the user's file system, or both. Predefined inventory reports allow users to quickly create reports about their storage resources, which can be scheduled and sent by email or saved to the user's file system, or both. 	<ul style="list-style-type: none"> Creating, deleting, and editing reports Configuring the email server Emailing reports Saving reports to the file system
Custom reports From any table view in the GUI, custom reports can be created, which can be scheduled and sent by email or saved to the user's file system, or both, about capacity of storage resources, the configuration and attributes of storage resources, and the performance of storage resources.	<ul style="list-style-type: none"> Creating, deleting, and editing reports Configuring the email server Emailing reports Saving reports to the file system
Chargeback and consumer reports <ul style="list-style-type: none"> Chargeback reports show the capacity and the cost of the storage that is used by applications, departments, hypervisors, and physical servers. Consumer reports show the capacity and the cost of the block storage that is used by an application, department, hypervisor, and physical server. 	<ul style="list-style-type: none"> Creating, deleting, and editing reports Configuring the email server Emailing reports
Capacity limits for block storage systems and pools If your company has a policy to set a limit on the capacity that is used, you can set a capacity limit. When the capacity limit is set, you can then monitor the amount of capacity that is available before the capacity limit is reached.	<ul style="list-style-type: none"> Setting capacity limits Defining alerts for capacity limits Removing capacity limits

Licensing

View the capacity of the storage systems that IBM Spectrum® Control monitors in your environment. Then, check the records of the licenses that you purchased to determine how much additional storage can be monitored before you're no longer covered.

To determine how many licenses are needed for the capacity and enclosures that you monitor, complete these steps on the Settings > Licensing page:

1. [Know your licenses.](#)
2. [Understand the licensing models.](#)
3. [Select the license model for each storage system.](#)
4. [Update any settings that were not automatically updated or correctly identified for each storage system.](#)
5. [Determine if you're covered.](#)

1. Know your licenses

To get a list of the licenses that you purchased, complete one or more of these actions:

- Contact the person within your organization who originally purchased the licenses.
- Contact your IBM® seller or IBM Business Partner.
- Go to [Passport Advantage® Online](#).

2. Understand the licensing models

The licenses that you purchased determine which license models and values on the Licensing page are used to determine if you're covered. In some cases, a combination of values is used. For example, if you have some storage systems that are licensed by capacity and some that are licensed by enclosure, both the Total SCU and the Total Enclosure License values might be used.

License	License model
IBM Spectrum Control	Measured by the number of storage capacity units (SCUs) that are needed to cover the total usable capacity of the storage systems that IBM Spectrum Control monitors. For more information, see the description of the SCU value on the Licensing page .
IBM Virtual Storage Center (perpetual license)	
IBM Virtual Storage Center (subscription license)	Measured by the total usable capacity in terabytes (TiB) of your storage. For more information about the subscription option, see IBM Virtual Storage Center .
IBM Spectrum Control Select Edition	Measured by the number of licenses that are needed for the storage enclosures, modules, or expansions that IBM Spectrum Control monitors. See Calculating the number of enclosure licenses for your storage systems .
IBM Virtual Storage Center for Storwize®	

License	License model
IBM Virtual Storage Center Entry	Measured by the total capacity in terabytes (TiB) that IBM Spectrum Control monitors.
IBM Spectrum Storage Suite	

3. Select the license model for each storage system

You must specify the license model for each of your storage systems. The license model, capacity or enclosure, is the type of IBM license that you purchased for the storage system.

License model	Description
Capacity	The category of storage that is used by the storage system is needed to calculate the SCU usage. The category is based on the drive classes of the RAID array and is automatically assigned following a probe. For IBM Spectrum Scale and virtual nodes in IBM Cloud Object Storage, you must specify the storage category.
Enclosure	A probe automatically detects the number of enclosures that the storage system manages and determines the number of enclosure licenses that are required. You can manually update the number of enclosure licenses. After you modify the number of enclosure licenses, that number will not change unless you manually update it again. Probes that detect a different number of enclosure licenses do not modify a number that was manually updated.

Tip: For IBM System Storage® DS8000®, the license model is automatically assigned after a probe.

4. Update settings for each storage system

Update any settings that were not automatically updated or correctly identified for your storage systems. Examples of these settings include the number of enclosures in a storage system that were not identified or the drives in a storage system that were not categorized.

Learn more about configuring license settings: For more information about how to update the license settings for your storage systems, see [Configuring license values for storage systems](#).

5. Determine if you're covered

To verify that your purchased licenses cover the capacity and enclosures that are monitored by IBM Spectrum Control, compare the values in your purchased licenses to the values at the top of the page.

- Look at Total TiB for these licenses: IBM Virtual Storage Center Entry Edition and IBM Spectrum Storage Suite.
- Look at Total SCU for these licenses: IBM Spectrum Control, IBM Virtual Storage Center, and older IBM Spectrum Control licenses that are based on SCU.
- Look at Total Enclosure Licenses for these licenses: IBM Spectrum Control Select Edition, IBM Virtual Storage Center for Storwize, and older IBM Spectrum Control licenses that are based on enclosure.

Learn more about license values: For more information about how capacity and enclosure values are calculated for storage systems and storage virtualization systems (such as IBM SAN Volume Controller), see [How licensing values are calculated](#).

What's next

If the Total TiB, Total SCU, and Total Enclosure Licenses values are less than the value of your purchased licenses, you're covered.

If these values are more than the value of your licenses, you can reduce the amount of storage that you're monitoring or contact your IBM seller or IBM Business Partner to purchase additional storage.

Information about the summary values

The following, summary information is shown at the top of the Licensing page:

Capacity License Model

The number in parentheses shows the total number of storage systems that are licensed by storage capacity.

Total TiB

The sum of the capacity to be licensed for all storage systems that use the capacity license model. This value applies if you have the IBM Virtual Storage Center Entry or IBM Spectrum Storage Suite license.

Total SCU

The total number of storage capacity units that you need for the capacity to be licensed for all storage systems that use the capacity license model. This value applies if you have the IBM Spectrum Control or IBM Virtual Storage Center license.

Category 1, 2, 3, or 4

The capacity breakdown of the storage environment by the categories of drives that are used by the storage systems. The breakdown is shown both as a bar chart and as terabytes (TiB).

Category Info

For storage systems that are licensed by capacity rather than enclosure, a link that describes the categories of drives that are used by RAID arrays.

Enclosure License Model

The number in parentheses shows the total number of storage systems that are licensed by the enclosures that IBM Spectrum Control monitors.

Total Enclosure Licenses

The total number of licenses that are required for storage systems that use the enclosure license model. This value applies if you have the IBM Spectrum Control Select Edition or IBM Virtual Storage Center for Storwize license.

Information about storage system values

The following information is shown for each storage system on the Licensing page:

License Model

The type of IBM Spectrum Control license that was purchased for the storage system. Systems that use the capacity model are charged by the capacity to be licensed or the SCUs. Systems that use the enclosure model are charged by the number of enclosure licenses.

SCU

The number of storage capacity units that the license must cover for the storage system.

An SCU is the measure of capacity by which the license for a storage system is charged. The number of SCUs is based on the drive classes that are used by the storage system and the capacity that is assigned to each category. The following table shows the SCU categories, drive classes, and ratios that are supported by IBM Spectrum Control.

Table 1. Supported SCU licenses, drive classes, and ratios

Category	Drive Classes	Ratio of usable storage to SCU
1	Storage Class Memory (SCM) drives and managed disks on IBM Spectrum Virtualize for Public Cloud	1 TiB to 1 SCU
2	Flash and Solid-State Drives (SSDs)	1 TiB to 0.847 SCU 1.18 TiB to 1 SCU
3	10K Serial Attached SCSI (SAS) Drives, 15K Fibre Channel Drives, and storage systems that use Category 4 drives with advanced architectures	1 TiB to 0.5 SCU 2 TiB to 1 SCU
4	Near Line SAS (NL-SAS), Serial ATA (SATA) Drives, and Safeguarded Copy (SGC) Target Capacity	1 TiB to 0.25 SCU 4 TiB to 1 SCU
Tips: <ul style="list-style-type: none">Any storage capacity that uses drive classes that are not listed in the table is classified as Category 1.Calculations are rounded up to the nearest whole number.		

The following table provides examples that you can use when you want to determine your SCU usage.

Table 2. Examples of SCU usage

Storage category	TiB usable	SCU ratio	Total SCUs
1	42	1	42
2	400*	1.18	339
3	800	2	400
4	1600	4	400
Totals	2842		1181

Category

For capacity license models, the breakdown of the storage environment by the four categories of drives that are used by the storage system. The breakdown is shown as tebibytes (TiB).

For most storage systems, the storage category is set automatically. However, you must set the category for IBM Spectrum Scale and virtual appliances in IBM Cloud Object Storage. If the storage category is not set, IBM Spectrum Control assumes, for the calculations of SCU usage, that Category 1 drives are used.

For enclosure license models, the number of licenses that you need for the storage enclosures that the storage system manages. You can modify the number of enclosure licenses. For example, a probe might detect that two enclosure licenses are needed for a storage system, but you're aware of two external enclosures that were not detected. You calculate that these enclosures need one license each. In that case, you can change the probe-detected value (2) to the more accurate number of enclosure licenses (4).

Keep in mind the following restrictions before you modify the number of enclosure licenses:

- You cannot reduce the number of enclosure licenses to be less than the number that was detected by a probe.
- After you modify the number of enclosure licenses, that number will not change unless you manually update it again. Probes that detect a different number of enclosure licenses do not modify a number that was manually updated.

Restriction:

- For SAN Volume Controller, if a probe doesn't detect any enclosures, 1 is displayed automatically.
- For XIV® systems and IBM Spectrum Accelerate, the number of enclosures can't be edited.

Capacity to be Licensed (TiB)

The capacity that must be licensed for the storage system. Capacity that is reserved for formatting or RAID management is not included. For storage virtualizers and IBM Spectrum Scale, this value includes the capacity that is provided by back-end storage systems that are not being monitored by IBM Spectrum Control.

Capacity from back-end storage systems that are monitored by IBM Spectrum Control is recorded separately on the Licensing page and is not included in this value.

Monitored Back-end Capacity (TiB)

For storage virtualizers and IBM Spectrum Scale, the capacity that is provided by back-end storage systems that are being monitored by IBM Spectrum Control.

This capacity is not included in the capacity to be licensed of the virtualizer or IBM Spectrum Scale. Each monitored back-end storage system has a separate record on the Licensing page.

Unmonitored Back-end Capacity (TiB)

For storage virtualizers, the capacity that is provided by back-end storage systems that are not being monitored by IBM Spectrum Control. This capacity is included in the capacity to be licensed of the virtualizer. Unmonitored storage systems do not have their own record on the Licensing page.

Total Capacity (TiB)

The total capacity of the storage system, including all monitored and unmonitored back-end storage.

$$\text{Total Capacity} = \text{Capacity to be Licensed} + \text{Monitored Back-end Capacity}$$

Uncategorized Capacity (TiB)

The total capacity that is not categorized for the storage system. Capacity that is not categorized is also included in the Capacity to be Licensed value.

For most storage systems, IBM Spectrum Control automatically assigns the storage category for the pools on the storage system, based on the technology type of the drives in the pool. However, for IBM Spectrum Scale and virtual appliances on IBM Cloud Object Storage, IBM Spectrum Control cannot determine the storage category.

To ensure that the correct storage category is used, assign the storage category on the Licensing page. If the storage category is not set, IBM Spectrum Control assumes, for the calculations of SCU usage, that Category 1 drives are used.

Enclosure Licenses

The number of enclosure licenses that you need for the storage system.

- [How licensing values are calculated](#)
Learn about how the capacity to be licensed and the number of enclosure licenses that are needed for your storage systems are calculated.
- [Configuring license values for storage systems](#)
Discover the capacity that IBM Spectrum Control monitors so that you can determine whether you are in compliance with your license.
- [Licensing examples](#)
See how the capacity to be licensed and other values on the Licensing page are calculated for different storage systems and configurations.

How licensing values are calculated

Learn about how the capacity to be licensed and the number of enclosure licenses that are needed for your storage systems are calculated.

Calculating the number of enclosure licenses for your storage systems

For each enclosure, the number of licenses that are needed is calculated by using the following rules. Calculations are rounded up to the nearest whole number.

1. The number of slots in the enclosure divided by 25.
2. The sum of the physical capacity of the disks in the enclosure divided by 500 TiB.
3. The higher number from rule 1 and rule 2 is the number of licenses that are needed for the enclosure.

Examples of the enclosure licensing calculations.

Rule 1 - Number of slots in the storage enclosures (or modules or expansions) that are managed:

- Enclosure with 12 slots requires 1 license.
- Enclosure with 92 slots requires 4 licenses.

Rule 2 - Sum of the physical capacity of the disks in the enclosure:

- Enclosure with 200 TiB requires 1 license.
- Enclosure with 1,250 TiB requires 3 licenses.

Example of a storage system with 4 enclosures:

Enclosure	Slots	Rule 1 - Licenses required	Capacity (TiB)	Rule 2 - Licenses required	Licenses required
Enclosure 1	28	2	400*	1	2
Enclosure 2	92	4	3,700	8	8
Enclosure 3	60	3	1,750	4	4
Enclosure 4	16	1	225	1	1
Total enclosure licenses required					15

Calculating the capacity to be licensed for your storage systems

Capacity to be licensed is the usable capacity of the storage systems that are being monitored and that is made available for storage consumption. Apart from IBM Spectrum Scale and IBM® Cloud Object Storage, the capacity to be licensed is based on the usable capacity of the RAID arrays on the storage system.

Information about the calculation of capacity to be licensed:

- Capacity that is reserved for overheads, such as RAID management is not included.
- Data reductions savings at the storage system level, such as compression and deduplication, are not included. For storage systems that use data reduction technologies, the capacity to be licensed is the usable capacity, not the effective capacity.
- Capacity to be licensed is the total capacity of the storage system after RAID is applied and spare disks and capacity are deducted. So, capacity to be licensed is the capacity that can be provisioned to servers, when no over-provisioning is used. Any form of cache, for example, DRAM, SSD, or flash storage is not included, and the capacity to be licensed is less than the raw capacity of the storage system.

Refer to the following information for details about how capacity to be licensed is calculated for different storage systems:

Storage virtualization systems

Capacity to be licensed is calculated for the following storage virtualizers:

- Storage systems that run IBM Spectrum Virtualize, such as IBM SAN Volume Controller and IBM FlashSystem® 9100.
- Non-IBM storage systems such as Hitachi VSP.

A storage virtualizer includes capacity from other storage systems. Capacity from back-end storage systems that are not monitored by IBM Spectrum® Control is counted in the capacity to be licensed of the virtualizer. Capacity from back-end storage systems that are monitored by IBM Spectrum Control is not counted. The

license for the monitored back-end storage is recorded separately and has its own record on the Licensing page.

For storage virtualizers that have internal capacity, such as IBM Storwize® V7000, FlashSystem 7200, and IBM FlashSystem 9100, the capacity to be licensed is calculated as:

**sum of the physical capacity of the internal RAID arrays +
sum of the capacity of the external MDisks from unmonitored back-end systems**

For storage virtualizers that do not have internal capacity, such as some models of IBM SAN Volume Controller, the capacity to be licensed is calculated as:

sum of the capacity of the external MDisks from unmonitored back-end systems

Block and file storage systems

The capacity to be licensed is the sum of the physical capacity of the RAID arrays on the storage system.

Exception: For FlashSystem A9000, FlashSystem A9000R, and IBM XIV® Storage System, the capacity to be licensed is the overall physical capacity of the storage system.

For the following storage systems, the capacity and enclosure license information is not calculated because IBM Spectrum Control does not collect the RAID array information from the device. The value **Unavailable** is shown in the SCU and Capacity to be Licensed columns on the Licensing page.

- Block and file storage systems that are managed by SMI-S providers. For example:
 - NetApp Data ONTAP 8.1
 - Dell EMC VMAX, VNX, and VNXe
 - Hitachi VSP F series

To get a complete picture of your licensing requirements, complete the following tasks for these storage systems:

- If the storage system is licensed by enclosure, you must manually enter the number of enclosure licenses. The value is then automatically included in the Total Enclosure Licenses value in the summary area at the top of the page.
- If the storage system is licensed by capacity, you must manually calculate the SCUs that you need for the storage system. Then, add that value to the Total SCU value in the summary area.

IBM Spectrum Scale storage systems

The capacity to be licensed is the sum of the capacity of the Network Shared Disks (NSDs) that are assigned to the file system pools.

NSD capacity from back-end storage systems that are not monitored by IBM Spectrum Control is included.

The following capacity is not included in the capacity to be licensed:

- NSDs that are not assigned to a pool.
- NSD capacity from back-end storage systems that are monitored by IBM Spectrum Control. The license for the monitored back-end storage is recorded separately and has its own record on the Licensing page.
- NSD capacity on external pools.

For IBM Spectrum Scale storage systems that are configured for file and object storage, the capacity to be licensed for the object storage is included in the file system pool capacity and is not counted separately.

Don't forget to assign the storage category for your file system pools: The storage category is based on the technology type of the drives in the pool, for example, Storage Class Memory and Flash, and is used in the calculation of SCU usage. To ensure that the correct storage category is used, assign the storage category on the Licensing page.

If the storage category is not set, IBM Spectrum Control assumes, for the calculations of SCU usage, that Category 1 drives are used.

Calculating enclosure licenses for IBM Spectrum Scale: For IBM Spectrum Scale storage systems that are licensed by enclosure, you need one enclosure license for each NSD server node that is connected to NSDs.

IBM Cloud Object Storage systems

The capacity to be licensed is the sum of the capacity of the COS Slicestor® nodes in IBM Cloud Object Storage.

Don't forget to assign the storage category for your virtual COS Slicestor nodes: The storage category is based on the technology type of the drives in the node, for example, Storage Class Memory and Flash, and is used in the calculation of SCU usage. A COS Slicestor node can be a server or a virtual appliance. For the server nodes, IBM Spectrum Control automatically assigns the Near-Line drive category. For virtual appliances, IBM Spectrum Control cannot determine the storage category of the drives in the node.

For the calculation of SCU usage for the node, IBM Spectrum Control assumes that Category 1 drives are used in the virtual appliance. To ensure that the correct storage category is used in the calculations, assign the storage category on the Licensing page for each virtual node.

Calculating enclosure licenses for IBM Cloud Object Storage

To calculate the number of enclosure licenses, the same rules that are specified in [Calculating the number of enclosure licenses for your storage systems](#) are used.

For the calculation:

- Each COS Slicestor node is treated as an enclosure.
- Instead of enclosure slots, the calculation uses the number of drives in the node.
- The capacity is based on the total capacity of the drives in the node.

Example of IBM Cloud Object Storage with 3 COS Slicestor nodes:

Nodes	Drives	Rule 1 - Licenses required	Capacity (TiB)	Rule 2 - Licenses required	Licenses required
Node 1	16	1	400	1	1
Node 2	64	3	2,400	5	5
Node 3	32	2	350	1	2
Total enclosure licenses required					8

Configuring license values for storage systems

Discover the capacity that IBM Spectrum® Control monitors so that you can determine whether you are in compliance with your license.

About this task

To determine the storage capacity that IBM Spectrum Control monitors, you must confirm the type of IBM license that you purchased for each storage system (known as the *license model*).

If you do not know the type of IBM Spectrum Control license that you purchased for each storage system, you can skip the process and return to complete the configuration later.

Whether you log on to IBM Spectrum Control for the first time or after an upgrade, the procedure for configuring license compliance is similar.

Procedure

1. Click Settings > Licensing.
 - If you are logging on to IBM Spectrum Control for the first time, the Set License Model page is displayed, with no selections made in the License Model column. Go to step 2.
 - If you are logging on to IBM Spectrum Control after an upgrade, the Licensing page is displayed, with the selections from the previous release in the License Model column. If some of your storage systems were not classified by license model and pool category in the last release, you must classify them by clicking Assign licenses.
Important: For some storage systems that support the IBM® Easy Tier® IBM feature, the capacity is not calculated when you upgrade from IBM Spectrum Control. In that case, it is necessary to probe the storage systems again. Following an upgrade and before you open the Licensing page for the first time, be sure to run a probe of all of your monitored storage systems.
2. Choose the type of license model. For storage systems that are licensed by enclosure, enter the number of enclosure licenses that you need for the storage system.
Tip: A storage enclosure that is managed by IBM Spectrum Control is an independently powered, channel-attached device that stores data on magnetic disks or solid-state drives. An example is a disk controller and its expansion units. Each expansion unit is a separate enclosure. It can be the main controller that houses disk or solid-state drives, or the expansion chassis that houses extra disk or solid-state drives to expand the total capacity of the storage system.
3. The IBM Spectrum Control software automatically assigns the category of disk for the pools:
 - If all automatic assignments are correct, click Finish.
 - If one or more assignments are incorrect, click the correct category for each pool and click Finish.

When you finish entering information, the Licensing page is displayed. The page presents data about the storage in your environment. If the page shows uncategorized storage systems, you can click the Assign licenses link to enter its license model and drive category. The page also indicates the total tebibytes (TiB) of capacity that IBM Spectrum Control manages. Values are shown as tebibytes (TiB). 1 TiB is equal to 2^{40} (1,099,511,627,776) bytes. To determine license compliance, compare the total TiB with your proof of entitlement that you received when you purchased your licenses.

Licensing examples

See how the capacity to be licensed and other values on the Licensing page are calculated for different storage systems and configurations.

In these examples, SVC-1 is an IBM® SAN Volume Controller and is monitored by IBM Spectrum® Control.

Example 1: Back-end capacity is not monitored

This example uses the following configuration:

- SVC-1 has no internal storage and does not receive capacity from storage systems other than the ones used in this example.
- Flash-1 is a Storwize® V5000, which manages one enclosure with a drive capacity of 750 TiB. The drive capacity is configured as a 600 TiB RAID array.

Here's the situation:

- Flash-1 is not monitored by IBM Spectrum Control.
- Flash-1 provides 300 TiB of capacity to SVC-1.

The following values are shown on the Licensing page:

Storage System	Enclosure Licenses	Capacity to be Licensed (TiB)	Monitored Back-end Capacity (TiB)	Unmonitored Back-end Capacity (TiB)	Total Capacity (TiB)
SVC-1	0	300	0	300	300

Explanation:

The 300 TiB Flash-1 capacity that is provided to SVC-1 is shown as unmonitored back-end capacity and is included in the capacity to be licensed for SVC-1.

The remaining 300 TiB capacity on Flash-1 is not provided to storage systems that are monitored by IBM Spectrum Control and does not need to be licensed.

Example 2: Back-end capacity is monitored

Configuration:

- SVC-1 has no internal storage and does not receive capacity from storage systems other than the ones used in this example.
- Flash-1 is a Storwize V5000, which manages one enclosure with a drive capacity of 750 TiB. The drive capacity is configured as a 600 TiB RAID array.

Situation:

- Flash-1 is monitored by IBM Spectrum Control and is licensed by capacity.
- Flash-1 provides 300 TiB of capacity to SVC-1.
- SVC-1 receives an additional 800 TiB of capacity from other storage systems that are not monitored by IBM Spectrum Control.

The following values are shown on the Licensing page:

Storage System	Enclosure Licenses	Capacity to be Licensed (TiB)	Monitored Back-end Capacity (TiB)	Unmonitored Back-end Capacity (TiB)	Total Capacity (TiB)
Flash-1	0	600	0	0	600

Storage System	Enclosure Licenses	Capacity to be Licensed (TiB)	Monitored Back-end Capacity (TiB)	Unmonitored Back-end Capacity (TiB)	Total Capacity (TiB)
SVC-1	0	800	300	800	1100

Example 3: Back-end capacity is monitored and the storage system is licensed by enclosure

Configuration:

- SVC-1 has no internal storage and does not receive capacity from storage systems other than the ones used in this example.
- Flash-1 is a Storwize V5000, which manages one enclosure with a drive capacity of 750 TiB. The drive capacity is configured as a 600 TiB RAID array.

Situation:

- Flash-1 is monitored by IBM Spectrum Control and is license by enclosure.
- Flash-1 provides 300 TiB of capacity to SVC-1.

The following values are shown on the Licensing page:

Storage System	Enclosure Licenses	Capacity to be Licensed (TiB)	Monitored Back-end Capacity (TiB)	Unmonitored Back-end Capacity (TiB)	Total Capacity (TiB)
Flash-1	2	600	0	0	600
SVC-1	0	0	300	0	300

Explanation:

- There is no capacity to be licensed for SVC-1. The back-end capacity that is provided to SVC-1 is licensed on Flash-1.
- To calculate the number of enclosure licenses, the Flash-1 drive capacity (750 TiB) is used, rather than the RAID array capacity (600 TiB).

Calculation of Enclosure Licenses for Flash-1

The higher number from rule 1 and rule 2 is used.

- Rule 1: 24 slots in the enclosure, which requires 1 enclosure license
- Rule 2: 750 TiB drive capacity, which requires 2 enclosure licenses (750 / 500, rounding up to the nearest whole number)

For more information, see [Calculating the number of enclosure licenses for your storage systems](#).

- Because Flash-1 is licensed by enclosure, the capacity to be licensed is not included in the Total SCU and Total TiB values at the top of the Licensing page.

Getting started with IBM Spectrum Control

Learn about the key tasks for setting up, installing, and monitoring IBM Spectrum Control to manage the resources and infrastructure in your storage environment.

Tip: Click items in the image to view information about installing, configuring, upgrading, and troubleshooting IBM Spectrum Control.

 Preparing	Understand licensing	Review release information	Explore social media
	Plan for installation	Review installable components	Install Db2
	Install IBM Spectrum Control in a single-server environment	Install IBM Spectrum Control in a multiple-server environment	Install IBM Cognos Analytics
 Installing	Open IBM Spectrum Control GUI	Add resources	Configure alert notifications
	Define alerts and alert policies	Authorize users	Configure history and data retention
	Prepare for an upgrade	Upgrade in a single-server environment	Upgrade in a multiple-server environment
 Upgrading	Migrate reports to IBM Cognos Analytics		
	Start and stop IBM Spectrum Control servers	Troubleshoot installing, uninstalling, and upgrading IBM Spectrum Control	Troubleshoot IBM Spectrum Control GUI
	Resolve problems		
 Troubleshooting

Product overview

IBM Spectrum® Control provides a set of tools for managing storage capacity, availability, alerts, events, performance, and resources. It can reduce the complexity of managing a storage environment by centralizing, simplifying, and optimizing storage tasks that are associated with storage systems, storage networks, performance troubleshooting, and capacity management.

IBM Spectrum Control can help you detect potential problems on your storage devices. For example, it can notify you when a server or storage system is running out of disk space or warn you of impending storage hardware failure so that you can prevent unnecessary system and application downtime.

IBM Spectrum Control provides the following benefits and functions:

- Simplifies the management of storage infrastructures
- Manages, administers, and provisions SAN-attached storage
- Monitors and tracks performance of SAN-attached resources
- Monitors, manages, and controls (through zones) SAN fabric components
- Manages the capacity utilization and availability of file systems

Get a quick overview of the storage monitoring features that are available in IBM Spectrum Control:

Table 1. Overview of features in IBM Spectrum Control

Features	Description
Understanding your environment	A single dashboard view of your storage environment to help you manage storage devices.
	Monitor IBM and non-IBM block storage, file storage, object storage, hypervisors, fabrics, switches.
	Capacity monitoring of storage systems, pools, volumes, file systems, and file sets.
	Performance monitoring of storage systems, Fibre Channel networks, applications, and departments.
	Drill down performance workflows to troubleshoot bottlenecks.
	Define groups of resources that represent applications or departments.
	Explore storage and server virtualization relationships.
Health and alerting	Explore replication relationships.
	Show health status of hypervisors, networks, servers, and storage systems, and selected internal entities.
	Alert on status changes and thresholds of capacity, performance, and error metrics.
Reporting	Customizable, multi-conditional alerting and the ability to create alert policies for many devices.
	Inventory, capacity, and performance reports.
	Reports that you can create from the information in the user-interface tables. You can configure, schedule, and save this information to your file systems. Or you can specify to send it to another user or person by mail.
	Chargeback reports for showing the capacity and the cost of the storage that is used by applications, departments, hypervisors, and physical servers.
	Consumer reports for showing the capacity and the cost of the block storage that is used by an application, department, hypervisor, and physical server.
	Roll up reports in which capacity data is combined from multiple instances of IBM Spectrum Control for reporting purposes.
	Reports that use REST API and Cognos®.
Analytics	For storage systems that run IBM Spectrum Virtualize, the transform storage feature moves volumes, and configures compression and the properties of the volumes.
	Storage reclamation that you can realize when the block storage systems in your data center are analyzed, and you determine and reclaim volumes that aren't used for storing data. You can replace the existing storage space instead of purchasing new storage media.
	Business impact analysis (applications, departments, and groups).
General	Active directory and LDAP integration for managing users.
	Customization options, including the ability to define the history retention of performance and capacity metadata, define how you are notified of alerts and notifications, and schedule when capacity and configuration metadata is automatically collected.
	Inclusion of the license for IBM® Copy Services Manager to manage 2-site replication, 3-site replication, and advanced copy services. Learn more about how to download and install Copy Services Manager at https://www.ibm.com/docs/en/csm .
	Snapshot-based protection that is provided by IBM Spectrum Protect™ Snapshot for the applications and databases that IBM Spectrum Control uses.

Restriction: IBM Spectrum Control doesn't support monitoring non-IBM software-defined storage devices. However, it can monitor IBM software-defined storage devices, such as IBM SAN Volume Controller. For a list of storage devices that can be monitored, check out <https://www.ibm.com/support/pages/node/6249369>.

Tips:

- To monitor the performance of a Storwize V7000 Unified storage system, you must add it as a block storage system.
- To monitor an IBM Spectrum Virtualize for Public Cloud storage system, you must configure it for communication with IBM Spectrum Control. For more information, see [Configuring IBM Spectrum Virtualize for Public Cloud](#).

Switches and fabrics

You can monitor the following types of switches and fabrics with IBM Spectrum Control:

- Brocade
- Cisco

For a complete list of the supported switches, see <https://www.ibm.com/support/pages/node/6249365>.

Hypervisors

You can monitor the following hypervisors with IBM Spectrum Control:

- Virtual machines on KVM 2.0
- Virtual machines on VMware ESX, ESXi, and vCenter Server

For a complete list of supported hypervisors, see <https://www.ibm.com/support/pages/node/6249425#hypervisor>.

Servers

You can deploy Storage Resource agents to monitor the following servers with IBM Spectrum Control:

IBM AIX®

- AIX 7.3
- AIX 7.2
- AIX 7.1

Linux®

- Red Hat® Enterprise Linux 8
- Red Hat Enterprise Linux 7
- SuSE Linux Enterprise Server 11

Microsoft Windows

- Windows Server 2019
- Windows Server 2016
- Windows Server 2012 R2
- Windows Server 2012

For a complete list of supported servers, see <https://www.ibm.com/support/pages/node/6249425>.

Architecture

The IBM Spectrum® Control consists of several components that form the infrastructure of its storage-management functions.

Data server

This component is the control point for product scheduling functions, configuration, and event information. It also includes functions that schedule data collection and discovery for the Device server.

Device server

This component discovers, gathers information from, analyzes performance of, and controls storage subsystems and SAN fabrics. It coordinates communication with and data collection from agents that scan SAN fabrics and storage devices.

Web server

IBM Spectrum Control uses WebSphere® Application Server Liberty as the web application server to host its GUI, and storage management API for cloud.

Alert server

This component manages the complex event processing that is related to alerting on the condition of resources and their attributes. The ability to detect and be notified about configuration, capacity, and performance changes within a storage environment is important to helping you maintain and administer storage resources.

Export server

This component enables the export of data from the tables in the GUI to HTML format and the creation of custom reports that show information about capacity, configuration, and health status of the resources in your storage environment. It runs in the Node.js environment and you can produce custom reports for storage systems, back-end storage systems, and their internal resources such as disks, pools, and volumes.

IBM® Cognos® Analytics (optional)

If you plan to use the optional Cognos Analytics reports, you must install IBM Cognos Analytics. You can use Cognos Analytics to create reports and view predefined reports to analyze multiple storage systems, switches, servers, and hypervisors. You can install Cognos Analytics on the same computer with IBM Spectrum Control or you can install Cognos Analytics on a separate computer.

Database

A single database instance serves as the repository for all IBM Spectrum Control components.

Agents

Storage Resource agent, CIM agents, and SNMP agents gather host, application, storage system, and SAN fabric information and send that information to the Data server or Device server.

- GUI
Use the IBM Spectrum Control GUI to manage the storage infrastructure in an enterprise environment.
- CLI
Use the command-line interface (CLI) to issue commands for key IBM Spectrum Control functions.

Interfaces for IBM Spectrum Control

IBM Spectrum® Control provides multiple user interfaces for managing the storage infrastructure in an enterprise environment.

IBM Spectrum Control GUI

This interface runs in a web browser and includes the ability to monitor, manage, and troubleshoot storage resources. You can access this interface from anywhere that you have a web browser and connectivity to a network.

IBM® Cognos® Analytics (optional)

This interface runs in a web browser. Use this interface to view predefined reports and create custom reports about the storage systems managed by IBM Spectrum Control. For more information, see <https://www.ibm.com/docs/en/cognos-analytics/11.1.0>.

Command-line interface

Use this interface to run IBM Spectrum Control commands from a command prompt. For more information about CLI commands, see [Command-line interface](#).

Related concepts

- [Managing resources](#)

Starting IBM Spectrum Control

You can start IBM Spectrum® Control by opening a web browser and entering a web address for the IBM Spectrum Control logon page. For example, you might enter `https://storage.example.com:9569/srm`.

Before you begin

Before you start IBM Spectrum Control, ensure that you are using a supported web browser. For a list of web browsers that you can use with IBM Spectrum Control, see [IBM Spectrum Control - Platform Support: Servers, Agents, and Browsers - Web Browsers](#).

About this task

Start the IBM Spectrum Control GUI to administer and monitor the condition, capacity, and relationships of the resources within your storage environment.

Procedure

1. On a server running the Windows operating system, start IBM Spectrum Control GUI. For information about how to start the GUI on Windows operating systems, see [Opening IBM Spectrum Control GUIs and CLIs](#). If you are not on a server running the Windows operating system, start a web browser and enter the following address in the address field:

`https://host_name:port/srm`

In the preceding address, specify the following values:

host_name

The IBM Spectrum Control server. You can specify the host name as an IP address or a Domain Name System (DNS) name.

port

The port number for IBM Spectrum Control. The default port number for connecting to IBM Spectrum Control by using the HTTPS protocol is 9569. However, this port number might be different for your site. For example, the port number might be different if the default port range was not accepted during installation. If the default port number does not work, ask your IBM Spectrum Control administrator for the correct port number.

Tip: If you have a non-default port, check the value of the `WC_defaulthost_secure` property in `installation_dir/web/conf/portdef.props` file.

2. From the IBM Spectrum Control logon page, type your user name and password and click **Log in**.
The GUI opens in the browser.
Tip: If you want to log on to the GUI with Windows Domain credentials, use this form: `domain_name\user`.

Navigation

IBM Spectrum® Control provides many of the functions for managing a storage environment. To access the functions in its GUI, use the menu bar at the top of the main window.

GUI element	Description

This information includes component server and database status, certain server alerts and database connection alerts, server file-system capacity information, and remote volume-performance information.</p>
Storage	<p>Add storage systems for monitoring and view asset, status, and performance information about their internal and related resources. You can also complete the following actions to manage and administer storage systems:</p> <ul style="list-style-type: none"> Modify the schedules for data collection. Place volumes on the tiers that match the workload requirements of the volume. Move or convert volumes. Move volumes from overutilized pools to pools that are less used. Add resources to a capacity pool. Open the management GUIs for storage systems. Update login credentials. Acknowledge conditions and statuses.
Servers	<p>Add servers and hypervisors for monitoring and view asset and status information about their internal and related resources. You can also complete the following actions to manage and administer these resources:</p> <ul style="list-style-type: none"> Deploy Storage Resource agents to servers for full monitoring. Modify the schedules for data collection. Modify and upgrade Storage Resource agents. Acknowledge conditions and statuses.
Network	<p>Add switches and fabrics for monitoring and view asset, status, and performance information about their internal and related resources. You can also complete the following actions to manage and administer these resources:</p> <ul style="list-style-type: none"> Modify the schedules for data collection. Setting or modifying the zoning policy. Open the management GUI for a switch. Acknowledge conditions and statuses.

GUI element	Description
Groups	<p>Add applications and departments to combine resources that are grouped by applications and departments. Applications and departments are used to monitor and view status, capacity, and performance information, and view details about their related resources. You can also complete the following actions to manage and administer applications and departments:</p> <ul style="list-style-type: none"> • Create applications and departments to model data for storage resources, allowing for enhanced capacity trending and performance troubleshooting. • View the status of resources that make up the applications and departments. • Create resource filters to automatically add resources to applications. • Add resources directly to applications and add applications to existing applications and departments. • Add departments to existing departments. • View subcomponent (member application) information to support hierarchal levels of storage grouping. • Remove applications and departments. <p>Review the distribution of capacity in your storage environment to determine whether you have sufficient capacity to meet the demands of your tiered storage.</p>
Advanced Analytics	<p>Configure IBM Spectrum Control for reclaiming storage that is not being used.</p> <p>Discontinued support: Other advanced analytics features, such as cloud configuration, provisioning, and optimization, are no longer supported in IBM Spectrum Control. While these features might still work in this release, it's recommended that you use another tool for your provisioning and optimization needs, when possible. For a complete list of discontinued features, see Discontinued features in IBM Spectrum Control.</p>
Reports	<p>Use the Reports option to create, configure, schedule, and send chargeback reports for applications, departments, hypervisors, and servers.</p> <p>Use IBM Spectrum Control when you want to individually view details about resources, for example when you want to troubleshoot a resource.</p> <p>Use the IBM® Cognos® Analytics reporting tool to analyze multiple storage systems, switches, servers, and hypervisors. For example, you can compare performance metrics across multiple storage systems. You can also view a report about the aggregate volume load that is on a server or hypervisor.</p> <p>Use the IBM Cognos Analytics reporting tool to schedule reports to run on different systems and with different options. You can specify schedules and output formats for the reports, and different ways to share the reports.</p> <p>For information about how to get started with the IBM Cognos Analytics reporting tool, see http://www.ibm.com/support/knowledgecenter/en/SSEP7J_11.0.0.</p>
Settings	<p>Complete the following actions to customize IBM Spectrum Control for your environment:</p> <ul style="list-style-type: none"> • Configure IBM Spectrum Control to send alert notifications by email, using SNMP traps, or using a Tivoli® Netcool®/OMNIBus server. An alert notification is sent when an alert condition is detected on the monitored resources in your environment. • Create and modify alert policies to manage the alert definitions and notification settings that apply to different sets of resources. • Modify the authentication repository and assign IBM Spectrum Control roles to user groups. Roles determine the product functions that are available to users. • Specify how long to retain the data that is collected about resources and the log files that are generated by IBM Spectrum Control. • Add and configure rollup servers so you can view capacity and status information about resources that are managed by your IBM Spectrum Control servers.

Keyboard navigation

Most of the features of the IBM Spectrum Control GUI are accessible by using the keyboard. For those features that are not accessible, equivalent function is available by using the command-line interface (CLI), except as noted in the product release notes.

You can use keys or key combinations to perform operations and initiate many menu actions that can also be done through mouse actions. The following sections describe the keys or key combinations for different parts of the GUI:

For navigating in the GUI and the context-sensitive help system:

- To navigate to the next link, button, or topic within a panel, press Tab.
- To move to the previous link, button, or topic within a panel, press Shift+Tab.
- To select an object, when the object is in focus, press Enter.

For actions menus:

- To navigate to the grid header, press Tab.
- To reach the drop-down field, press the Left Arrow or Right Arrow key.
- To open the drop-down menu, press Enter.
- To select the menu items, press the Up Arrow or Down Arrow key.
- To start the action, press Enter.

For filters:

To specify a filter option and text:

1. Press Tab to navigate to the magnifying glass icon.
2. Press the Up Arrow or Down Arrow key to navigate the filtering list.
3. Press Enter to select a filtering option.
4. When a filtering option is selected, the cursor moves to the filter text box. Type the filter text and press Enter. To reset a filter, press Enter.

For text fields:

- To navigate to text fields, press Tab.
- To navigate to the fields that are available for editing, press Tab.
- To navigate to the next field or to the Submit button, press Tab.

For tables or lists:

- To navigate between column headers, focus on a column header and use the Left Arrow and Right Arrow keys to move to other column headers.
- To navigate between data cells, focus on a data cell and use the Left, Right, Up, Down, Pageup, and Pagedown Arrow keys.
- To sort a column, focus on a column header and press Enter. The focus remains on the column header after the sort occurs.
- To change the size of a column, focus on the column header, hold Shift+Control, and press the Left or Right Arrow keys.
- To follow a link in a data cell, focus on a data cell and press Shift+F9.
- To open a menu for a table row, focus on the row and press Shift+F10.
- To select consecutive rows, select the first row and hold Shift, press the Up or Down Arrow keys to go to the last row in the range, and press the Space bar to add the new rows to the selection.
- To select non-consecutive rows, select a row and hold Control, press the Up or Down Arrow keys, and press the Space bar to add the new row to the selection.

Restriction: For Chinese languages, the keyboard combination Control+Space bar is not enabled for selecting multiple rows at the same time.

Keyboard navigation with Firefox for Mac users: If you're using Firefox on a Mac with IBM Spectrum Control and want to use keyboard navigation, complete the following steps:

1. In Firefox, go to Preferences, > Advanced, > General and clear the check mark for Always use the cursor keys to navigate within pages. This step enables the use of Tab key to navigate between GUI elements.
2. In the URL address bar of Firefox, type about:config and press Enter.
Tip: If a warning prompt is displayed, click the button to accept the risk of changing browser settings. Existing settings won't be changed; instead, you'll be adding a preference setting for accessibility.
3. To add an accessibility preference for tab focus, right-click on the configuration page and select New, > Integer.
4. In the New integer value window, type accessibility.tabfocus and click OK.
5. Type 7 to set the integer value and click OK.
6. Open your Mac's System Preferences app, go to Keyboard, > Shortcuts, and select All Controls.

IBM Spectrum Storage Suite

IBM Spectrum Control provides monitoring, automation and analytics for multiple-vendor storage environments and is a member of IBM Spectrum Storage™ Suite.

Licensing options

IBM Spectrum Storage Suite gives you unlimited access to the IBM® Software Defined Storage product portfolio with licensing on a flat, cost-per-TB basis to make pricing easy to understand and predictable as storage capacity grows. You can save up to 40 percent compared with licensing the products separately. Non-production use of the software in test environments is included.

Learn more: Go to [IBM Spectrum Storage Suite at IBM Marketplace](#).

Which products are included with IBM Spectrum Storage Suite?

Besides the aforementioned IBM Spectrum Control, the following products are included in the IBM Spectrum Storage Suite:

Table 1. Products that are members of IBM Spectrum Storage Suite

Product	Key benefits	Links
IBM® Spectrum Protect™	Protects your data with multi-site replication and flexible restore capacity, and reduces your backup costs up to 53 percent. It can simplify data protection where data is hosted in physical, virtual, software-defined or cloud environments.	<ul style="list-style-type: none"> • Learn more and buy • Product documentation
IBM® Spectrum Protect™ Plus	Provides a data protection and availability solution for virtual environments that can be deployed in minutes and protect your environment within an hour. You can either implement it as a stand-alone solution, or integrate the solution with the IBM Spectrum Protect™ environment to offload copies for long-term storage and governance with scale and efficiency. IBM Spectrum Protect Plus on IBM Cloud® is a data protection and availability solution for virtual environments that can be deployed in minutes and protect your environment within an hour. IBM Spectrum Protect Plus on IBM Cloud can be provisioned with push-button simplicity to an existing or new VMware environment from the IBM Cloud console.	<ul style="list-style-type: none"> • Learn more and buy • Product documentation
IBM® Spectrum Scale™	Supports big data analytics and clustered applications with high-performance, scalable storage that enables global collaboration, simplifies workflows and lowers costs with cloud tiering.	<ul style="list-style-type: none"> • Learn more and buy • Product documentation
IBM® Spectrum Virtualize™	Provides an ideal way to manage and protect the huge volumes of data organizations use for big-data analytics and new cognitive workloads.	<ul style="list-style-type: none"> • Learn more and buy • Product documentation

Product	Key benefits	Links
IBM Spectrum Virtualize for Public Cloud	Provides a way to transition existing IT architecture to a hybrid-cloud or cloud-based model, where servers, storage, and network infrastructure are delivered in a public cloud environment.	<ul style="list-style-type: none"> Learn more and buy Product documentation
IBM® Spectrum Archive™	Provides a direct, intuitive and graphical access to data stored in IBM tape drives and libraries by incorporating the Linear Tape File System™ (LTFS) format standard for reading, writing and exchanging descriptive metadata on formatted tape cartridges.	<ul style="list-style-type: none"> Learn more and buy Product documentation
IBM® Spectrum Accelerate™	Provides a software-defined block storage solution that is designed for rapid and flexible deployment across heterogeneous infrastructure on and off premises. It can be deployed on your choice of servers: x86 commodity-choice hardware, integrated appliances (including IBM XIV® Storage System Gen3 and pre-validated third party appliances), and IBM public cloud.	<ul style="list-style-type: none"> Learn more and buy Product documentation
IBM® Cloud Object Storage	Provides highly scalable software-defined on-premises storage system designed to store, protect and easily access unstructured data. Deploy in your own data centers using IBM appliances or IBM software running on industry-standard, certified hardware.	<ul style="list-style-type: none"> Learn more and buy Product documentation
IBM Spectrum™ Discover	Modern metadata management software that provides data insight for petabyte-scale unstructured storage. The software easily connects to IBM Cloud Object Storage and IBM Spectrum Scale to rapidly ingest, consolidate and index metadata for billions of files and objects. It provides a rich metadata layer that enables storage administrators, data stewards and data scientists to efficiently manage, classify and gain insights from massive amounts of unstructured data.	<ul style="list-style-type: none"> Learn more and buy Product documentation

Table 2. Other products of interest

Product	Key benefits	Links
IBM Storage Insights	An IBM Cloud based product that provides capabilities to help optimize your infrastructure with features, such as capacity planning, reclamation and data tier planning, and performance troubleshooting at a low monthly subscription price. Its enhanced dashboard enables you to quickly monitor and assess the basic health, status, and performance of block storage systems. If a problem is detected, you can get help to investigate and troubleshoot the problem and minimize the impact of hardware and software issues before they impact the performance of your critical business applications.	<ul style="list-style-type: none"> Learn more and buy Product documentation
IBM Spectrum™ Copy Data Management	Makes copies available to data consumers when and where they need them, without creating unnecessary copies or leaving unused copies on valuable storage. It catalogs copy data from across your local and hybrid cloud and off-site cloud infrastructure, identifies duplicates, and compares copy requests to existing copies.	<ul style="list-style-type: none"> Learn more and buy Product documentation

IBM Virtual Storage Center

IBM® Virtual Storage Center is a storage solution that provides efficient management, data protection, and virtualization for heterogeneous storage environments. It helps enhance storage efficiency, provides greater mobility, and delivers stronger control over storage performance and management.

Under a single license, IBM Virtual Storage Center includes the following products:

- IBM Spectrum® Control
- IBM Copy Services Manager
- IBM Spectrum Protect™ Snapshot
- IBM Spectrum Virtualize for IBM SAN Volume Controller, including all the functions available with storage virtualization, data reduction pools, HyperSwap® high availability, hybrid cloud and container support, and remote mirroring and FlashCopy® (snapshot).

The following key benefits are available with IBM Virtual Storage Center:

- Simplified storage management and reporting
- Virtualized physical storage resources for improved asset utilization
- Snapshot-based protection for the databases and applications that are used by IBM Spectrum Control
- Easy data mobility across pools and tiers of storage systems that use IBM Spectrum Virtualize
- Ability to change storage and move data without taking applications down
- Centralized management for visibility, control, and automation

- Helps improve the efficiency and productivity for storage management staff

For more details on what IBM Virtual Storage Center can do for your business, see <https://www.ibm.com/products/virtual-storage-center>

Licensing options

IBM Virtual Storage Center is available in three editions, each with different license options to best fit your needs:

Table 1. Licensing options for each of the IBM Virtual Storage Center editions

Product	Licensing	Why Choose This Edition
IBM Virtual Storage Center (perpetual license)	Measured by the number of storage capacity units (SCUs) that are needed to cover the total usable capacity in terabytes (TiB) of your storage.	<ul style="list-style-type: none"> • You use an IBM SAN Volume Controller as your storage virtualization engine and your total usable capacity is more than 1,500 TiBs. • You want to sign up for a perpetual license.
IBM Virtual Storage Center (subscription license)	Measured by the total usable capacity in terabytes (TiB) of your storage.	<ul style="list-style-type: none"> • You use an IBM SAN Volume Controller as your storage virtualization engine and your total usable capacity is more than 1,500 TiBs. • You want to pay for your license on a monthly basis with a flexible term length, have an initial lower cost, and use the familiar Passport Advantage® (PA) system to manage your contract.
IBM Virtual Storage Center Entry (formerly known as IBM Virtual Storage Center Entry Edition)	Measured by the total usable capacity in terabytes (TiB) of your storage, with the following limits: <ul style="list-style-type: none"> • Up to 1,500 TiBs of usable capacity • No limit I/O groups 	You use an IBM SAN Volume Controller as your storage virtualization engine and your total usable capacity is less than 1,500 TiBs.
IBM Virtual Storage Center for IBM Storwize®	Measured by the number of licenses that are needed for the storage enclosures, modules, or expansions of your storage.	You use an IBM Storwize or FlashSystem 5100 storage system in your environment.

When you subscribe to the IBM Virtual Storage Center license, you also receive IBM's Software Subscription and Support, which includes the following support options for the length of the subscription:

- Download access to the latest versions, releases, and fixes of the solutions in the IBM Virtual Storage Center license.
- IBM support for routine installation, deployment, migration, usage, and code-related technical support questions.
- 24x7 assistance for Severity 1 issues 7 days a week, 52 weeks a year. Simply open a case from the web, chat, or phone.

For the perpetual IBM Virtual Storage Center license, an SCU is the measure of capacity by which the license is charged. The number of SCUs is based on the drive classes that are used by your storage systems and the capacity that is assigned to each category. The following table shows the SCU categories, drive classes, and ratios:

Table 2. Supported SCU licenses, drive classes, and ratios

Category	Drive Classes	Ratio of usable storage to SCU
1	Storage Class Memory (SCM) drives and managed disks on IBM Spectrum Virtualize for Public Cloud	1 TiB to 1 SCU
2	Flash and Solid-State Drives (SSDs)	1 TiB to 0.847 SCU 1.18 TiB to 1 SCU
3	10K Serial Attached SCSI (SAS) Drives, 15K Fibre Channel Drives, and storage systems that use Category 4 drives with advanced architectures	1 TiB to 0.5 SCU 2 TiB to 1 SCU
4	Near Line SAS (NL-SAS), Serial ATA (SATA) Drives, and Safeguarded Copy (SGC) Target Capacity	1 TiB to 0.25 SCU 4 TiB to 1 SCU
Tips: <ul style="list-style-type: none"> • Any storage capacity that uses drive classes that are not listed in the table is classified as Category 1. • Calculations are rounded up to the nearest whole number. 		

What's included in IBM Virtual Storage Center

The following features are available in all editions of IBM Virtual Storage Center:

- Storage monitoring, reporting, and optimization for storage systems, hypervisors, servers, fabrics, and switches. Available on-premises or from IBM Cloud®.
- 3-site replication management
- Application-aware backup and restore operations with snapshot technologies of advanced storage systems
- External storage virtualization
- Easy Tier®
- FlashCopy
- Metro Mirror and Global Mirror

The following features are not included in any edition of IBM Virtual Storage Center:

- IBM Spectrum Virtualize Software for IBM SAN Volume Controller Real-time Compression Software V8
- IBM Spectrum Virtualize Software for IBM SAN Volume Controller Encryption Software

How to get IBM Virtual Storage Center

No matter which edition that you choose, IBM Virtual Storage Center can help save you time and money. It brings together storage management, monitoring, reporting, replication, and virtualization capabilities in one, comprehensive storage solution. You don't need to worry about shopping on your own for the best storage products to help meet your needs -- IBM has already done for that for you with IBM Virtual Storage Center.

To find out more about your purchasing options for IBM Virtual Storage Center, contact your IBM Business Partner or local IBM representative. In the US, to identify your IBM Business Partner or local IBM representative, you can call 800-IBM-4YOU (426-4968).

IBM Storage Insights for IBM Spectrum Control

IBM® Storage Insights for IBM Spectrum Control is an IBM Cloud® service that can help you predict and prevent storage problems before they impact your business. It is complementary to IBM Spectrum® Control and is available at no additional cost if you have an active license with a current subscription and support agreement for IBM Virtual Storage Center, IBM Spectrum Storage Suite, or any edition of IBM Spectrum Control.

As an on-premises application, IBM Spectrum Control doesn't send the metadata about monitored devices offsite, which is ideal for dark shops and sites that don't want to open ports to the cloud. However, if your organization allows for communication between its network and the cloud, you can use IBM Storage Insights for IBM Spectrum Control to transform your support experience for IBM block storage.

Why use IBM Storage Insights for IBM Spectrum Control

IBM Storage Insights for IBM Spectrum Control and IBM Spectrum Control work hand in hand to monitor your storage environment. Here's how IBM Storage Insights for IBM Spectrum Control can transform your monitoring and support experience:

- Open, update, and track IBM Support tickets easily for your IBM block storage devices.
- Get hassle-free log collection by allowing IBM Support to collect diagnostic packages for devices so you don't have to.
- Use Call Home to monitor devices, get best practice recommendations, and filter events to quickly isolate trouble spots.
- Leverage IBM Support's ability to view the current and historical performance of your storage systems and help reduce the time-to-resolution of problems.

To compare the features of **IBM Spectrum Control** and **IBM Storage Insights for IBM Spectrum Control**, check out the [Feature comparison](#).

Important: To monitor the devices that you already monitor in IBM Spectrum Control, you must add them separately to IBM Storage Insights for IBM Spectrum Control. You must also deploy a data collector in IBM Storage Insights for IBM Spectrum Control to collect advanced metadata about devices.

Alerting tip: Alerts are a good way to be notified of conditions and potential problems that are detected on your storage. If you use **IBM Spectrum Control** and **IBM Storage Insights for IBM Spectrum Control** together to enhance your monitoring capabilities, it's recommended that you define alerts in one of the offerings and not both. By defining all your alerts in one offering, you can avoid receiving duplicate or conflicting notifications when alert conditions are detected.

How to get IBM Storage Insights for IBM Spectrum Control

To register for IBM Storage Insights for IBM Spectrum Control, go to <https://www.ibm.com/it-infrastructure/storage/storage-insights/registration> and follow the directions for current IBM Spectrum Control customers.

To see how easy it is to sign up and deploy a data collector, check out [Before you begin checklist for IBM Storage Insights](#).

Questions and answers

Find answers to other questions about IBM Storage Insights for IBM Spectrum Control.

What's the difference between IBM Storage Insights, IBM Storage Insights Pro, and IBM Storage Insights for IBM Spectrum Control?

- **IBM Storage Insights** is an off-premises, IBM Cloud service that is available free of charge if you own IBM block storage systems. It provides a unified dashboard for IBM block storage systems with a diagnostic events feed, a streamlined support experience, and key capacity and performance information.
- **IBM Storage Insights Pro** is an off-premises, IBM Cloud service that is available on subscription and expands the capabilities of IBM Storage Insights. You can monitor IBM file, object, and software-defined storage (SDS) systems, and non-IBM block and file storage systems such as Dell EMC storage systems. It also includes configurable alerts and predictive analytics that help you to reduce costs, plan capacity, and detect and investigate performance issues. You get recommendations for reclaiming unused storage, recommendations for optimizing the placement of tiered data, capacity planning analytics, and performance troubleshooting tools.
- **IBM Storage Insights for IBM Spectrum Control** is similar to IBM Storage Insights Pro in capability and is available for no additional cost if you have an active license with a current subscription and support agreement for IBM Virtual Storage Center, IBM Spectrum Storage Suite, or any edition of IBM Spectrum Control.

I already have a paid subscription to IBM Storage Insights Pro, does this service apply to me?

Yes! When your next renewal date for IBM Storage Insights Pro approaches, contact your IBM Sales representative to see if a move to IBM Storage Insights for IBM Spectrum Control is right for you.

Tip: If you want to cancel your subscription to IBM Storage Insights Pro and switch to IBM Storage Insights for IBM Spectrum Control, check out the IBM Cloud Service Agreement at <https://www.ibm.com/support/customer/csol/contractexplorer/cloud/csa/us-en/9> for cancellation information.

If I already have IBM Storage Insights (the free service), can I upgrade it to IBM Storage Insights for IBM Spectrum Control?

Yes, if you have an active license for IBM Spectrum Control, you can upgrade IBM Storage Insights to IBM Storage Insights for IBM Spectrum Control. Just go to <https://www.ibm.com/it-infrastructure/storage/storage-insights/registration>, choose the option for IBM Spectrum Control, and follow the prompts.

Because IBM Storage Insights for IBM Spectrum Control is similar to IBM Storage Insights Pro in capability, does it use the same Service Level Agreement (SLA)?

No, IBM Storage Insights for IBM Spectrum Control doesn't include the service level agreement for IBM Storage Insights Pro. Terms and conditions for IBM Storage Insights for IBM Spectrum Control are available at <http://www.ibm.com/software/sla/sladb.nsf/sla/sd-8410-01>.

Do IBM Spectrum Control and IBM Storage Insights for IBM Spectrum Control share the metadata that they collect about storage?

No, metadata cannot be shared between the offerings or exported from one offering to the other.

Are the devices that I monitor in IBM Spectrum Control automatically monitored by IBM Storage Insights for IBM Spectrum Control?

To monitor the devices that you already monitor in IBM Spectrum Control, you must also add them to IBM Storage Insights for IBM Spectrum Control.

To collect advanced metadata about devices, you must also deploy a data collector in IBM Storage Insights for IBM Spectrum Control. Storage Resource agents and device connections that are defined in IBM Spectrum Control aren't used in IBM Storage Insights for IBM Spectrum Control.

To see which devices that you can monitor in IBM Storage Insights for IBM Spectrum Control, check out the list for IBM Storage Insights Pro in [Supported resources](#).

If I use IBM Storage Insights Pro or IBM Storage Insights and switch to IBM Storage Insights for IBM Spectrum Control, is my existing metadata migrated?

Yes, the metadata that you collected in IBM Storage Insights Pro and IBM Storage Insights is automatically available in IBM Storage Insights for IBM Spectrum Control.

How is licensing handled?

IBM Storage Insights for IBM Spectrum Control uses the same licensing that you already have in place for IBM Spectrum Control. IBM Spectrum Control can be licensed by capacity, by storage capacity units (SCU), or by number of slots in enclosures.

How long can I use IBM Storage Insights for IBM Spectrum Control?

You can use IBM Storage Insights for IBM Spectrum Control for as long as you have an active license with a current subscription and support agreement for IBM Spectrum Control license. If your subscription and support lapses, you're no longer eligible for IBM Storage Insights for IBM Spectrum Control.

If your subscription and support lapses, don't worry. To continue using IBM Storage Insights for IBM Spectrum Control, simply renew your IBM Spectrum Control license.

You can also choose to subscribe to IBM Storage Insights Pro. For information about how to subscribe, see [Want to try or buy IBM Storage Insights Pro?](#)

Because IBM Storage Insights for IBM Spectrum Control is a cloud service, I'm concerned about security. Where can I find out more information about its security measures?

IBM Storage Insights for IBM Spectrum Control runs in IBM Cloud and adheres to IBM's rigorous security standards. For more information, check out the [\[PDF\] IBM Storage Insights Security Guide](#).

Where can I learn more about IBM Storage Insights?

Explore these links for more detailed information about IBM Storage Insights:

- [IBM Storage Insights Knowledge documentation](#)
- [IBM Storage Insights FAQ](#)

How do I get support for IBM Storage Insights for IBM Spectrum Control?

To contact IBM Support for help and report issues that you encounter in IBM Storage Insights for IBM Spectrum Control, follow these steps:

1. [Open a support case](#) against IBM Storage Insights.
2. Describe the problem. To help us troubleshoot, include the URL of your IBM Storage Insights for IBM Spectrum Control instance.
3. Submit the case.

Pricing		On-premises licensing	No charge for IBM Spectrum Control customers

Replication products

IBM Spectrum® Control no longer supports Tivoli® Storage Productivity Center for Replication. IBM® Copy Services Manager is the replacement product for replication to use with IBM Spectrum Control.

Information about Copy Services Manager

It is strongly recommended that you back up your replication environment before you proceed with any upgrade.

See "Backing up a replication environment" and verify that your replication backup file location is outside of the IBM Spectrum Control installation directory structure or the replication backup file is deleted during the uninstall of replication.

Copy Services Manager provides automation for 2-site replication, 3-site replication, and advanced copy services from a single point of control across multiple platforms. To learn more about how to download and install Copy Services Manager, see [IBM Copy Services Manager](#).

Downloading the software code and the license for Copy Services Manager

Before you migrate to Copy Services Manager, obtain the software code and the license.

To download the software code for Copy Services Manager, go to IBM Fix Central at <https://www.ibm.com/support/fixcentral>.

To download the license for Copy Services Manager, follow these steps to access the IBM Passport Advantage® Online download portal. The license is part of the IBM Spectrum Control eAssembly in IBM Passport Advantage.

Note: You need an IBM ID and password to access Passport Advantage Online for customers.

1. Click [Downloading IBM Spectrum Control](#).
2. Scroll to **Download Package**.
3. Click **Downloading IBM Spectrum Control Vvrm using Passport Advantage Online** (where *vrm*=the version, release, and modification of the software).
4. Scroll to the **Optional parts**, and locate the part number for Copy Services Manager. Make a note of the part number.
5. Enter <https://www.ibm.com/software/passportadvantage/pacustomers.html> to go to Passport Advantage Online for customers.
6. Click **Customer sign in** to enter your IBM ID and password. If you are not an authorized user, follow the steps on the page to request access.
7. On the **Software and services online** page, click **Software download & media access**.
8. Use the **Find by part number** search option, and enter the part number that you copied in Step 4 to download the license.

Migrating to Copy Services Manager

Before you migrate to Copy Services Manager, be sure to back up your configuration of Tivoli Storage Productivity Center for Replication. Then, install Copy Services Manager and uninstall Tivoli Storage Productivity Center for Replication.

To perform the migration, follow these steps:

1. Back up your Tivoli Storage Productivity Center for Replication configuration by using the steps in the topic "Backing up a replication environment." The topic is located in the IBM Spectrum Control 5.3.3 Knowledge documentation or in the IBM Spectrum Control 5.3.3 Installation Guide. You can find and download the guide from the "Printable documentation" topic in the IBM Spectrum Control 5.3.3 Knowledge documentation.
2. Download the software code for Copy Services Manager (go to IBM Fix Central at <https://www.ibm.com/support/fixcentral> and follow the steps).
3. Download the license for Copy Services Manager (see the preceding section **Downloading the software code and the license for Copy Services Manager**).
4. Install Copy Services Manager. For instructions, see [Installing on distributed systems](#).
Note: During the installation, you will be asked to choose whether to "Migrate or restore by using existing backup." For details, see [Migrating on distributed systems](#).
5. Uninstall Tivoli Storage Productivity Center for Replication by using the steps in the topic "Manually uninstalling Tivoli Storage Productivity Center for Replication." The topic is located in the IBM Spectrum Control 5.2.12 Knowledge documentation or in the IBM Spectrum Control 5.2.12 Installation Guide. You can find and download the guide in the "Printable documentation" topic in the IBM Spectrum Control 5.2.12 Knowledge documentation.

Product updates and security fixes

Report problems that you encounter in IBM Spectrum Control.

Releases and downloads

IBM Spectrum® Control provides regular maintenance updates that can include code fixes, security fixes, new features, and enhancements.

Three types of maintenance packages are available for IBM Spectrum Control:

- Releases represent a significant update to the product, which includes, but is not limited to, new features, enhancements to existing features, code fixes, and security fixes.
- Refresh packs are quarterly deliverables that update the modification level of a release, and include new features, enhancements to existing features, code fixes, and security fixes.
- Fix packs update the fix level of a release, and primarily include code and security fixes.

All types of maintenance packages are cumulative: a fix pack includes all previous fix packs; a refresh pack includes all the previous fix packs and refresh packs; a release includes all previous fix packs, refresh packs, and releases.

With each new maintenance package that is delivered, the product number changes. The following table provides example of product number changes when you install a package.

Maintenance packages	Product version change examples
Release	5.4
Refresh pack (modification level)	5.4.1
Fix pack	5.4.1.1

A fix pack is installed on top of a specific modification level and release. If you install a fix pack that belongs to a newer level than your current fix pack, then your environment is automatically upgraded to the newer fix pack. For example,:

- If you are on fix pack 1 (5.4.1.1) and you apply fix pack 2, then the version is changed to 5.4.1.2.
- If you are on fix pack 1 (5.4.1.1) and you apply fix pack 3, then your environment is automatically updated to fix pack 3 and your version is changed to 5.4.1.3.

Tip: When you install a release, the modification level and fix pack number are reset to 0.

Downloading IBM Spectrum Control

If you have an IBM® ID and have purchased IBM Spectrum Control, you can download packages for a new installation or download packages that you can apply as an upgrade or fix to your existing installation.

- To download the package for a new installation of IBM Spectrum Control, go to [Passport Advantage Online](#).
- To download the package for upgrading or applying the latest fixes to your existing installation of IBM Spectrum Control, go to [Fix Central](#).

Tips:

- If you are downloading the package for a new installation, a license is required and is included on Passport Advantage® Online.
- If you are downloading the package for an upgrade, your existing license is transferred.
- Fix Central is the recommended site for retrieving fixes for most IBM products. Fix Central enables you to search, select, and download appropriate fixes for their situation.

Security

In IBM Spectrum® Control, the security of your data is critical. At IBM®, we're serious about keeping that data safe and constantly strive to address vulnerabilities before they impact your business.

Maintenance and security fixes are regularly provided for the IBM Spectrum Control base product. The base product includes core technology and components such as WebSphere® Application Server Liberty profile and the Java™ Runtime Environment.

When security issues or vulnerabilities are discovered in IBM Spectrum Control or its core components, IBM analyzes the product and distributes a fix or mitigation instructions, as appropriate. These issues are communicated through security bulletins on ibm.com® and through discrete communication when necessary.

To find security bulletins, go to the following pages on ibm.com:

- [Security bulletins for IBM Spectrum Control](#)
- [IBM Support portal](#)
- [Supported storage products](#)

More information about security: For more information about security in IBM Spectrum Control, check out this topics:

- [List of fixes that were included in releases of IBM Spectrum Control](#)
- [Ports used by IBM Spectrum Control](#)
- [Required user roles for monitoring resources](#)
- [User names and passwords](#)
- [Planning for IBM Spectrum Control authentication and authorization](#)
- [Planning to use LDAP for IBM Spectrum Control authentication](#)

Managing security for related software

An IBM Spectrum Control installation also includes other products, such as Db2®. You can monitor fixes for these related products in the same way that you do for IBM Spectrum Control on ibm.com:

- IBM support portal for Db2: https://www.ibm.com/support/entry/myportal/product/information_management/db2_for_linux_unix_and_windows
- IBM support portal for IBM WebSphere Application Server: https://www.ibm.com/support/entry/myportal/product/websphere/websphere_application_server
- IBM Product Security Response Team blog at <https://www.ibm.com/blogs/psirt/>

Each product team is responsible for publishing their own security bulletins. Review any published security bulletins to identify affected versions and follow the remediation or fix information. If these products are affected, they might provide a maintenance fix. It is acceptable to apply a fix pack to these products to resolve security vulnerabilities or other problems.

Important: Upgrading to a new version or release of these products is not typically supported by IBM Spectrum Control and might result in compatibility issues. Even with fix pack updates, read the security bulletins carefully for any compatibility concerns. For example, if a common protocol is disabled, both the related product and IBM

Spectrum Control must also accommodate a new protocol.

Subscribing to IBM announcements

Subscribe to My Notifications to be notified automatically of IBM® announcements such as security bulletins and flashes for IBM Spectrum® Control.

About this task

With My Notifications, you can specify that you want to receive daily or weekly email announcements. You can specify what type of information you want to receive (such as publications, hints and tips, product flashes (also known as alerts), downloads, and drivers). You can also customize and categorize the products about which you want to be informed and the delivery methods that best suit your needs.

Procedure

1. Go to <http://www.ibm.com/software/support/einfo.html>.
2. Click Subscribe now!.
3. Log in with your IBMid.
4. In Product lookup, type IBM Spectrum Control.
5. Click Subscribe for the edition of IBM Spectrum Control that you use.
6. Select the types of documents for which you want to receive notifications and click Submit.

End of support

End of Support (EOS) marks the official withdrawal of technical support for specific versions and releases of IBM Spectrum® Control and other IBM® software products.

What does End of Support mean to you

Important:

The following releases have reached end of support:

- Tivoli® Storage Productivity Center 5.2.0 - 5.2.8, 5.2.8 - 5.2.17
- IBM Spectrum Control 5.2.8 - 5.2.17
- IBM Spectrum Control 5.3.0 - 5.3.7

When a specific version or release of IBM Spectrum Control reaches end of support (sometimes called end of life), you might find that access to entitled severity 1 technical support is no longer available. The documentation for each product version is still available in PDF format when you access [IBM Documentation](#).

What can you do to monitor End of Support dates

Review the End of Support Announcement letters regularly, see <https://www.ibm.com/software/passportadvantage/endofsupportannouncementletters.html>

End of support announcements are generally made twice a year in April and September and are subject to change. You can confirm dates by visiting the IBM Software Support Lifecycle policy site, see <https://www.ibm.com/support/home/pages/lifecycle/index.html>

For a complete list of supported versions of IBM Spectrum Control, see <https://www.ibm.com/support/pages/overview-ibm-spectrum-control-releases>

End of support options

The best option for you when a version or release of IBM Spectrum Control is going into end of support is to upgrade to a newer version or release. You not only maintain access to new fixes and features, but you can open support cases that ensure if you do have an issue that requires immediate attention that you can get it.

You can purchase an IBM Software Support Service Extension (also known as Extended Support). Service Extensions give you access to product fixes and the ability to engage with IBM Support for use and defect support after your End of Support date is reached. Note, these extensions are not available for all products. Ask your IBM Support representative if IBM Spectrum Control is eligible for the extension.

Collaborating with the team

Collaborate with the IBM Spectrum® Control team to help improve the product.

About this task

Got a great idea for making IBM Spectrum Control even better? Do you want to vote for an enhancement that was requested by another user? The IBM® System Storage® Ideas Portal is a place where you can collaborate with the development team for IBM Spectrum Control and other users through your ability to search, view, comment on, submit and track product requests. Help shape the future of IBM!

Procedure

1. Go to the IBM System Storage Ideas Portal at <https://ibm-sys-storage.ideas.ibm.com/ideas?project=SPCO>.

2. To submit an enhancement request, click Add A New Idea.
3. Log in with your IBMid.
4. In the Choose a workspace for this idea drop-down menu, select IBM Spectrum Control .
5. Complete the form and click Add Idea.

Reporting a problem

Report problems that you encounter in IBM Spectrum® Control.

Before you begin

IBM® is committed to customer satisfaction and is ready to assist if you encounter any problems with IBM Spectrum Control. By opening a case, you can ensure that IBM Support will be informed of your problem. When you open a case, have the following information ready:

- The version, release, modification, and service level number of your IBM Spectrum Control installation.
- The communication protocol (for example, TCP/IP), version, and release number that you are using.
- The activity that you were doing when the problem occurred, listing the steps that you followed before the problem occurred.
- The exact text of any error messages.

Procedure

To open a case for IBM Spectrum Control, complete the following steps:

1. Go to the [IBM Support portal](#).
2. Click Open a case.
3. Log in with your IBMid.
4. Describe the problem.
5. Submit the case.

Videos: The IBM Support portal is supported by IBM Watson® and provides you with enhanced transparency into ticket resolution workflow and improved self-service options. Watch a few short videos to learn more:

- [IBM Support Community: Forums](#)

Key concepts

This section contains a technical overview that will help you understand how IBM Spectrum® Control works. An understanding of the concepts in this section will help you use IBM Spectrum Control effectively.

- **[Data collection](#)**
To help you implement a storage management strategy, it is critical that you determine the information that you want to gather about the resources within your environment. You can schedule different data collection jobs depending on the types of information that you want to gather and the resources that you want to monitor.
- **[Performance monitoring and troubleshooting](#)**
IBM Spectrum Control can collect information about the performance of storage systems and switches. This information includes key performance metrics and alerts of threshold violations that can help you measure, identify, and troubleshoot performance issues and bottlenecks in your storage.
- **[Applications, departments, and general groups](#)**
Use applications and departments to organize the resources in your storage environment into a hierarchy that matches the structure of your business organization. The information can be used to view the performance of resources that belong to an application and the capacity growth of a department. Use general groups to group your resources, such as the storage systems with lease agreements that end in the current year, so that you can view information about the resources at one location in the GUI.
- **[Storage optimization](#)**
To optimize the resources in your storage environment, you can create tasks to balance pools, re-tier volumes, or transform volumes that are in storage virtualizer pools.
- **[Cloud configuration](#)**
To take advantage of the simplified provisioning and optimization capabilities in IBM Spectrum Control, some configuration is required.
- **[Provisioning storage overview](#)**
IBM Spectrum Control guides you through the steps for provisioning storage volumes or network-attached storage (NAS) shares. You can provision storage volumes or NAS file shares to one or more servers, one or more hypervisors, or one cluster.
- **[Storage reclamation](#)**
You can use volume reclamation recommendations to reclaim unused storage capacity in your environment and use your storage more efficiently.
- **[Alerts and alert policies](#)**
Specify conditions that trigger alerts and the actions to take when those alerts are triggered, such as notify an email address. Use alert policies to define those alert conditions and notification settings for a group of resources.
- **[Reporting](#)**
Use reporting functions to view overview and detailed information about your storage.
- **[Rollup servers](#)**
Rollup reporting combines capacity and status information from multiple instances of IBM Spectrum Control for monitoring and reporting. In rollup mode, secondary rollup servers collect information from managed resources and roll that data up to primary rollup servers.
- **[Units of measurement for storage data](#)**
IBM Spectrum Control uses decimal and binary units of measurement to express the size of storage data.
- **[Role-based authorization](#)**
Roles determine the functions that are available to users of IBM Spectrum Control. When a user ID is authenticated to IBM Spectrum Control through the GUI, CLI,

or APIs, membership in an operating system or LDAP group determines the authorization level of the user.

- **[Fabrics and zones](#)**

Use the IBM Spectrum Control to learn more about fabrics and zones.

- **[Agents](#)**

The IBM Spectrum Control uses agents to gather data: Common Information Model (CIM) agents, Storage Resource agents, and SNMP agents.

- **[IBM Spectrum Control REST API](#)**

You can use the Representational State Transfer (REST) API for IBM Spectrum Control to access information about resources and to generate custom capacity, configuration, and performance reports.

Data collection

To help you implement a storage management strategy, it is critical that you determine the information that you want to gather about the resources within your environment. You can schedule different data collection jobs depending on the types of information that you want to gather and the resources that you want to monitor.

Use probes and performance monitors to collect detailed information about resources. You must schedule and run these data collection jobs before you can complete other tasks within IBM Spectrum® Control, such as viewing reports, setting alerts, and managing storage systems.

You schedule probe and performance monitor jobs for a resource when you add the resource for monitoring. After you add the resource, you can modify the probe and performance monitor job schedules on the list and details pages for the resource. For example, to modify the probe job schedule for a storage system, go to the Storage Systems page or the Storage System details page in the GUI.

Schedule data collection jobs to gather the following types of information:

Asset and status information

Use [probes](#) to collect asset, storage statistics, and status information about resources. You can run probes on all the resources that are monitored by IBM Spectrum Control.

Performance monitoring

Use [performance monitors](#) to collect metrics that measure the performance of switches and storage systems.

Performance monitoring and troubleshooting

IBM Spectrum® Control can collect information about the performance of storage systems and switches. This information includes key performance metrics and alerts of threshold violations that can help you measure, identify, and troubleshoot performance issues and bottlenecks in your storage.

To monitor the performance of resources and check for threshold violations, complete the following tasks:

- Add resources for monitoring and schedule data collection
- Define alerts for performance thresholds
- View and troubleshoot performance issues

Collect performance data

Before you can troubleshoot and view reports about performance, you must collect data about monitored resources. Performance monitors are data collection jobs that gather performance information about resources. This information includes metrics that measure the performance of the components within a resource. Metrics measure the performance characteristics of volumes, ports, and disks on storage systems and switches. IBM Spectrum Control provides many different metrics for measuring performance. For example, some key metrics for storage systems are I/O rate in I/O operations per second, data rate in MiB per second, and response time in milliseconds.

You can use metrics in IBM Spectrum Control to track growth or change in I/O rates, data rates, and response times. In many environments, I/O and data rates grow over time, and response times increase as those rates increase. This relationship can help with "capacity planning" for your storage. As rates and response times increase, you can use these trends to project when more storage performance and capacity is required.

Define alerts for performance thresholds

Alerts can notify you when the performance of a monitored resource falls outside of a specified range and might represent a potential problem. When you define an alert for an internal component of a resource, select a specific metric that you want to measure and its boundary values. When the performance of a resource falls outside the boundary values, an alert is triggered.

For example, you can define an alert that is triggered when the overall back-end response time for a managed disk on a SAN Volume Controller exceeds a certain value. The overall back-end response time is a metric that measures the average number of milliseconds that it takes to service each I/O operation on a managed disk.

View and troubleshoot performance issues

After data collection and performance thresholds are configured, you can use the web-based GUI to complete the following tasks:

- Measure, compare, and troubleshoot the performance of switches, storage systems, and their internal resources.
- Review the threshold violations and alerts that were triggered when the performance of a resource fell outside of a specific range.
- View performance information in a chart or table format to help you quickly identify where and when performance issues are occurring. The chart is a visual representation of how the performance of resources trend over time.
- Customize views of performance so that you can analyze specific resources and metrics during time ranges that you specify.
- Drill down into resources to view detailed information about the performance of internal and related resources. For example, if a SAN Volume Controller storage system is shown in the chart, you can quickly view and compare the performance of its internal and related resources, such as disks, volumes, ports, managed disks, and back-end storage.
- Implement server-centric monitoring of SAN resources without requiring a Storage Resource agent. When you add an agentless server for monitoring, IBM Spectrum Control automatically correlates that server with the ports on known host connections. If matches are found between the server and host connections on

monitored storage systems, you can view the performance of the internal resources that are directly associated with the SAN storage that is assigned to the server. For example, if a SAN Volume Controller maps two volumes to the server, you can view the performance of those volumes and the related managed disks.

- Export performance information to a CSV file. A CSV file is a file that contains comma-delimited values and can be viewed with a text editor or imported into a spreadsheet application.
- In the optional Cognos® Analytics reporting tool, you can also view and create performance reports about multiple resources.

Applications, departments, and general groups

Use applications and departments to organize the resources in your storage environment into a hierarchy that matches the structure of your business organization. The information can be used to view the performance of resources that belong to an application and the capacity growth of a department. Use general groups to group your resources, such as the storage systems with lease agreements that end in the current year, so that you can view information about the resources at one location in the GUI.

IBM Spectrum® Control provides storage grouping to define resources that utilize application and department business modeling. The information can be used to view the performance of resources that belong to an application and the capacity growth of a department. The pages for the monitoring and management of applications and departments are aligned with user scenarios, for example, capacity trending, resource health monitoring and performance troubleshooting

To manage and administer applications and departments, complete the following tasks:

- Create applications and departments to model data for storage resources, allowing for enhanced capacity trending and performance troubleshooting.
- View the status of resources that make up the applications and departments.
- Create resource filters to automatically add resources to applications.
- Add resources directly to applications.
- Add applications to existing applications and departments.
- Add departments to existing departments.
- View subcomponent (member application) information to support hierarchical levels of storage grouping.

Applications

An application is a program or a project that consumes storage resources within an organization and interfaces with other enterprise groups that are important to the running of a business. Use IBM Spectrum Control to model the storage usage that is consumed in your environment by assigning the usage to applications to see the overall health status.

An application can be part of a department and have its own subcomponents (member applications) that are used to create a five level deep hierarchy. Applications that are grouped together can range from large line-of-business systems to specialized software, in a department, that runs on either client computers or servers. For example, an application might be an automated billing system within the Finance department, VMware running in the Information Technology department or an email marketing system that is part of the Marketing department.

The Applications page shows capacity information about the applications that are monitored by organization and interfaces with other enterprise groups that are important to the running of a business. Use IBM Spectrum Control to view and manage the resources that are defined to the applications. If the application is associated with a department, information about that department is also shown.

Departments

A department is a division within a business. Use IBM Spectrum Control to model the storage capacity that is consumed in your department for your business environment, in accordance with other department members.

A department can be hierarchical in its organizational layout. For example, a department might use 15 applications and be part of another five departments. A department might share storage resources with another department, subdepartment or an application even if they don't belong in the same hierarchy. For example, in a collaboration scenario, a single IBM® SAN Volume Controller might be shared by multiple departments.

The Departments page shows storage capacity information about the top-level departments, the subdepartments and any applications that belong to the department that are monitored by IBM Spectrum Control.

General groups

Create general groups to quickly view information about storage resources that have common characteristics. For example, you might group the subset of ports on a SAN Volume Controller that are used for inter-node communication or the storage systems that are used by a critical business application.

You can organize your storage resources into a general group hierarchy. Organizing resources into general groups and their subgroups can be helpful when you want to quickly view information about a group of resources, but you also want to view information about subgroups of resources within the group. For example, you can group the

resources that are used by your production application so that you can monitor all the application resources and separately monitor the specific subgroups of storage systems and ports.

Storage optimization

To optimize the resources in your storage environment, you can create tasks to balance pools, re-tier volumes, or transform volumes that are in storage virtualizer pools.

Discontinued support: Storage optimization is no longer supported in IBM Spectrum® Control. While the feature might still work in this release, it's recommended that you use another tool for your optimization needs, when possible. For a complete list of discontinued features, see [Discontinued features in IBM Spectrum Control](#).

Balancing the workload of volumes across storage pools

You can balance the workload of volumes across pools on the same tier. The pools are analyzed and recommendations are generated to move volumes from pools with high-activity values to pools with low-activity values.

Re-tiering volumes

You can re-tier volumes to balance pools or to tier volumes based on the criteria that you set in tiering policies. For example, you can tier volumes that are based on the volume workload or on file usage, or both. Depending on the conditions that are set in the tiering policy, recommendations are generated. For example, you can reduce storage costs by moving volumes with low workloads to lower or less expensive tiers. You can also improve performance and use storage more efficiently by moving volumes with heavy workloads to the tiers that best meet their workload requirements.

Transforming volumes

You can complete the following tasks for one or more volumes in storage virtualizer pools:

- Move volumes from one storage virtualizer pool to another pool on the same storage virtualizer.
- Move volumes in a storage virtualizer pool to a pool that is enabled for Easy Tier®.
- Convert fully allocated volumes to thin-provisioned volumes and convert thin-provisioned volumes to fully allocated volumes.
- Convert fully allocated volumes to compressed volumes and convert compressed volumes to fully allocated volumes.

The pools are analyzed and recommendations are generated. For example, analysis occurs to ensure that there is sufficient space in the pool to convert volumes or add volumes.

Cloud configuration

To take advantage of the simplified provisioning and optimization capabilities in IBM Spectrum® Control, some configuration is required.

Discontinued support: Cloud configuration, provisioning, and optimization are no longer supported in IBM Spectrum Control. While these features might still work in this release, it's recommended that you use another tool for your provisioning and optimization needs, when possible. For a complete list of discontinued features, see [Discontinued features in IBM Spectrum Control](#).

To provision storage, you are required to specify only the storage capacity and storage quality that is required. After volumes are created, IBM Spectrum Control can analyze and optimize volume performance. To take advantage of these capabilities, create service classes and, optionally, capacity pools.

A tutorial of cloud configuration concepts is available in the GUI. In the menu bar, go to Advanced Analytics >> Cloud Configuration, and click Learn the Concepts.

- **[Service classes](#)**
A service class is a set of properties that describe capabilities and characteristics of storage resources. A service class typically describes a particular quality of service, and is used during provisioning to describe storage requirements. For example, a block-storage service class specifies properties such as a required RAID level, and whether storage resources must be able to encrypt or thin provision volumes.
- **[Capacity pools](#)**
Capacity pools are groups of storage resources. You can use capacity pools to separate storage resources in any way that serves the needs of your environment or business. Configure capacity pools to track the used and available capacity for block and file storage on any set of storage resources. Provisioning requests can also be restricted to resources in a capacity pool.

Service classes

A service class is a set of properties that describe capabilities and characteristics of storage resources. A service class typically describes a particular quality of service, and is used during provisioning to describe storage requirements. For example, a block-storage service class specifies properties such as a required RAID level, and

whether storage resources must be able to encrypt or thin provision volumes.

Service classes simplify provisioning requests by representing a level or type of storage quality. When you are requesting storage, only the required capacity and service class must be specified. Before you can provision storage, you must create service classes that describe the capabilities and characteristics of the storage you want to be able to provision. Service classes can later be modified or deleted as the needs of your installation change.

Block-storage service classes

A block-storage service class describes attributes and capabilities of block storage resources. When you provision volumes, you specify the requirements by using a block-storage service class. Based on the requirements of the service class, IBM Spectrum® Control identifies a storage pool for the volume.

File-storage service classes

A file-storage service class describes attributes of file storage resources. The file storage resources include Network Attached Storage (NAS) filers, Network Shared Disks (NSDs), and file systems. When you provision shares, you specify the requirements by using a file-storage service class. Based on the requirements of the service class, IBM Spectrum Control identifies a file system or NSD for the share. Space on an NSD is allocated if a new file system is required or an existing file system requires more space.

Service class properties

A service class represents storage resources with common traits. These common traits are the service class properties, and collectively describe a particular quality of service. Before you create service classes, consider the levels of storage quality that you want to have available for provisioning requests. For block storage, for example, you can organize service classes by storage tier or RAID level. Some service class properties are used during provisioning to identify the best location for storage placement. Other service class properties determine how the storage is configured, and reflect the performance, reliability, or security considerations for the level of service.

In addition to the standard properties of a service class, you can create your own properties by using custom tags. Custom tags can represent any common trait that storage systems must have. For more information about creating your own properties by using custom tags, see [Custom tags](#).

Block-storage service classes can specify the following properties:

- Storage tier or range of storage tiers
- RAID level
- Whether volume virtualization is required or not allowed. This property is available only when at least one IBM® storage virtualizer is managed by IBM Spectrum Control. The IBM storage virtualizers include SAN Volume Controller, Storwize® V7000, and Storwize V7000 Unified. If volume virtualization is required, the VDisk mirroring property specifies whether volumes are mirrored to a second storage pool, which uses different backend storage, on the same IBM storage virtualizer.

- Whether volumes must be thin provisioned or must not be thin provisioned. When a thin-provisioned volume is created in a DS8000®, an extent space efficient (ESE) volume is created.

If thin provisioning is required, you can specify thin-provisioning configuration properties for the IBM storage virtualizers and IBM XIV® Storage System. The following properties might be available:

- If the volume is created on an XIV, the locking behavior configuration property affects the volume that is created.
- If the volume is created on an IBM storage virtualizer, the following configuration properties affect the volume that is created:
 - Used capacity
 - Auto-expand
 - Warning level
 - Grain size

- Whether volumes are compressed. This property is applied only when an IBM storage virtualizer has at least one I/O group that contains a compressed volume. If there are no existing compressed volumes in an I/O group, IBM Spectrum Control will not create compressed volumes.

This property is available only when the thin provisioning property is enabled.

- A multipathing policy. If a server has a Storage Resource agent (SRA) and uses an IBM System Storage® Multipath Subsystem Device Driver (SDD), the server multipathing policy is used to configure the driver. If a multipathing policy is set, and fabrics are managed by IBM Spectrum Control, the following properties affect how the storage system is connected to the host:
 - Whether the storage system and the client host are connected through fully redundant paths
 - Number of paths between the storage system and the client host
- If at least one DS8000 Encryption Group is discovered by IBM Spectrum Control, the following properties are available and affect the storage placement and configuration of volumes:
 - Whether volumes must be encrypted
 - If volumes must be encrypted, the DS8000 encryption group to use

File-storage service classes have the following properties:

- Whether dedicated storage is required, or whether shared storage is allowed. In other words, whether the file system from which the NAS share is provisioned can contain other NAS shares.
- Fileset type. The fileset type is either an independent fileset with its own allocated nodes, or a dependent fileset allocated on the file system.
- Access path host name replacement.

Predefined service classes

To illustrate service classes, a set of predefined service classes are provided. From the Service Classes page in the web-based GUI, you can view any of these service classes for more information. Select a service class and then select Actions, > View / Modify. To display help information about a service class property, complete the following steps:

1. Move the mouse pointer over the field or control. A question mark icon is displayed next to the field.

2. Move the mouse pointer over the question mark icon to display an explanation of the property.

The following sample block-storage service classes are provided for illustration.

Gold

The Gold service class represents the highest-performing storage resources for mission-critical applications.

Silver

The Silver service class represents high-performing storage resources for applications in production.

Bronze

The Bronze service class represents standard storage resources for non-mission-critical applications.

The following sample file-storage service classes are provided for illustration.

NormalIsolation

The NormalIsolation service class describes normal isolation file storage by specifying that shared storage is allowed. The file system from which the NAS share is provisioned can contain other NAS shares.

EnhancedIsolation

The EnhancedIsolation service class describes enhanced isolation file storage by specifying that dedicated storage is required. The file system from which the NAS share is provisioned cannot contain other NAS shares.

Custom tags

During provisioning, IBM Spectrum Control determines candidates for storage placement by comparing the requirements of a service class with the known capabilities, configuration, and performance of the available storage systems. You can think of the storage placement determination as a filtering process. IBM Spectrum Control filters the set of available storage resources against properties of the service class until only the storage resources that can satisfy all of the requirements remain.

In addition to the standard properties of a service class, you can create custom requirements for the service class by specifying up to three custom tags. To provide the service class, storage resources must have all the same tags that are specified in the service class.

When you specify tags on a block-storage service class, only pools that have all the same tags are candidates for provisioning. If a pool is not tagged, any tags on the containing storage system also apply to the pool.

When you specify tags on a file-storage service class, only file systems and NSDs that have all the same tags are candidates for provisioning. If a file system or NSD is not tagged, any tags on the containing storage system also apply to the internal resource.

During provisioning, IBM Spectrum Control filters candidates for provisioning against the custom tags.

Before you create service classes, consider whether there are any special requirements for provisioning that are not addressed by the standard properties of the service class. If so, tag the appropriate storage resources to satisfy custom requirements of a service class. When you are defining the service class, specify the custom tags that are required.

Adding users to a service class

By default, only administrators can provision storage. However, an administrator can add users to a service class to grant them permission to provision by using the service class. In order for an administrator to grant permission to provision to a user, the user must be assigned to the Monitor or External Application role.

When you are granting users permission to provision by using a particular service class, you can also specify whether execution of provisioning plans created by these users requires administrator approval. The requirement for administrator approval applies to all non-administrative users who are added to the service class, and also applies to external applications. Approval cannot be required for some non-administrative users and not for others.

Before you create service classes, consider whether you want to allow users to request their own storage. Consider whether you want user provisioning requests to require administrator approval.

Associating capacity pools with a service class

Before you create service classes, consider whether certain storage requests must always be satisfied from a particular set of resources. If so, you can associate one or more capacity pools with a service class. For example, suppose that a set of storage resources are allocated to a particular department of your business. All storage requests for that department must be satisfied by those storage resources. In this case, you can add all the storage resources to a capacity pool and associate that capacity pool with a service class. You can also add the members of the department to the service class. The department members can then request their own storage as needed. However, the requests can be satisfied only by the storage resources that are allocated to the department.

When you are configuring capacity pools and service classes, keep in mind that a storage resource can be a member of only one capacity pool. Adding storage resources to a capacity pool is not a viable approach if the resources are already members of another capacity pool. Consider specifying custom tags to achieve the same result. In the preceding example, suppose that some or all of the storage resources that are allocated to the department are already members of capacity pools. In this case, you can instead tag the storage systems and the service class with matching tags to achieve the same result. With either approach, only the storage systems that are allocated to the department are candidates for provisioning when storage is requested by using the service class.

Capacity pools

Capacity pools are groups of storage resources. You can use capacity pools to separate storage resources in any way that serves the needs of your environment or business. Configure capacity pools to track the used and available capacity for block and file storage on any set of storage resources. Provisioning requests can also be restricted to resources in a capacity pool.

The following types of storage resources can be grouped into capacity pools:

- Storage systems
- Storage pools
- File systems of file storage systems

You can organize storage resources into capacity pools in any way that serves your business needs. For example, you can separate the storage resources that are allocated for separate divisions of your business into separate capacity pools. You can then track the storage use for each division separately, and restrict provisioning requests to the appropriate set of storage resources.

Tracking used and available capacity in a capacity pool

You can track the used and available capacity for any set of storage resources by adding the storage resources to a capacity pool. From the Capacity Pools page of the GUI, you can view the total capacity of the resources, and monitor the following capacity measurements:

- Used file space
- Available file space
- Used block space
- Available block space

Restricting a provisioning request to a capacity pool

You can use capacity pools to define a set of storage resources from which provisioning requests must be satisfied. When you are provisioning storage, you can specify a capacity pool. If you do, the provisioning request is restricted to resources in the capacity pool. Only those resources are candidates for provisioning.

You can also associate a service class with capacity pools. If a service class is associated with capacity pools, provisioning requests for the service class must specify, and be constrained to, one of the associated capacity pools. Because you can also grant non-administrative users permission to provision storage by using the service class, associating capacity pools with the service class restricts the users to a specific set of resources.

Provisioning storage overview

IBM Spectrum® Control guides you through the steps for provisioning storage volumes or network-attached storage (NAS) shares. You can provision storage volumes or NAS file shares to one or more servers, one or more hypervisors, or one cluster.

Discontinued support: Provisioning is no longer supported in IBM Spectrum Control. While the feature might still work in this release, it's recommended that you use another tool for your provisioning needs, when possible. For a complete list of discontinued features, see [Discontinued features in IBM Spectrum Control](#).

Storage requirements

When you set up provisioning, you must specify your storage requirements by defining a service class. Certain properties of the service class describe capabilities that storage resources must have so they can provide the service class. For example, when you provision volumes, a block-storage service class specifies properties such as a storage tier, a RAID level, and whether the pool must be able to encrypt or thin provision volumes.

A service class typically represents a quality or service. For example, IBM Spectrum Control provides predefined block-storage service classes that are named Gold, Silver, and Bronze. Gold represents the highest-performing storage resources, and Silver and Bronze represent lesser levels of storage quality.

The different levels of storage quality that are provided by each service class are defined by the service class properties. For example, each service class specifies a different required storage tier that depends on the level of service that is required. Because the Gold service class is for mission critical applications, it sets off thin provisioning.

When IBM Spectrum Control guides you through the steps for provisioning, you concern yourself only with which service class is needed for the new volumes or shares, and how much capacity you require. However, if you are unfamiliar with the service classes, you can open a separate window to view service class information. If you have Administrator privileges, you can modify or create service classes.

Storage constraints

IBM Spectrum Control identifies the storage resources that can provide the capacity and the service class from a set of storage resources. This set might be all the storage resources that are known to IBM Spectrum Control, or it might be constrained to a subset of those resources. In particular, your site can create capacity pools. *Capacity pools* are groups of storage resources. You can use capacity pools to separate storage resources in any way that serves the needs of your environment or business. For example, a capacity pool might contain the storage resources that are allocated to a particular department or division of your business.

A service class might restrict storage placement to one or more capacity pools. If the service class you are provisioning from restricts placement, you must select one of the allowed capacity pools. If the service class does not restrict storage placement, you can specify that candidates for provisioning can be selected from all storage resources that are known to IBM Spectrum Control, all storage resources in any capacity pool, or storage resources in a particular capacity pool. If you are unfamiliar with the capacity pools that you can select when you set up provisioning, you can open a separate window to view capacity pool information. If you have Administrator privileges, you can modify or create capacity pools.

If the fabrics are managed by IBM Spectrum Control, the set of storage resources might be further constrained by your zoning policy. If the zoning policy is not configured to automatic zoning, only storage systems with connectivity to the server or hypervisor are candidates for storage placement.

Provisioning volumes

Restriction: To provision volumes, you must have the IBM Spectrum Control Advanced Edition license.

To provision volumes, you must select one or more servers or hypervisors. You can request one or more volumes. For each volume, you specify a volume name, the capacity that is required, a service class, and, optionally, a capacity pool. For each volume, IBM Spectrum Control identifies the storage pools that can provide the capacity and the service class. From the set of pools that can provide the capacity and service class, IBM Spectrum Control identifies the best location for the storage. The best location for the storage is based on the available capacity in the pool and performance data. Preference is first given to storage pools and systems that already contain volumes for the selected server or hypervisor. Preference is then given to systems that have available performance data.

On storage systems, volumes are allocated in increments of a set unit size that depends on the storage system type. Depending on the storage system that was identified as the best location for the storage, the volumes that are allocated might be larger than the capacity you requested for the following reasons:

- On SAN Volume Controller, Storwize® V7000, and Storwize V7000 Unified, volumes are allocated in increments of an extent size. The extent size is set when the MDisk group is created. The capacity that you requested is rounded up, if necessary, to the full extent size.
- On a DS8000®, volumes are allocated in increments of a 1 GiB fixed extent size. The capacity that you requested is rounded up, if necessary, to the full extent size.
- On an XIV®, volumes are allocated in fixed increments of 16 GiB. The capacity that you requested is rounded up, if necessary, to complete the 16 GiB increment.

Provisioning shares

To provision a share, you must first select one or more servers or hypervisors. You specify the capacity that is required for the share, a service class, and information about how to export the share. IBM Spectrum Control identifies the file systems and Network Shared Disks (NSDs) that can provide the capacity and the service class. From the set of file systems and NSDs that can provide the capacity and service class, IBM Spectrum Control identifies the best location for the storage. The best location for the storage is based on the available capacity on the file system or NSD.

The provisioning task

When you complete the steps for setting up provisioning, IBM Spectrum Control creates a provisioning task for the share or volume. If you request multiple volumes, a separate task is created for each unique service class and capacity pool combination you specify in your volumes request. If a requested volume is not constrained to a capacity pool, the set of all available storage resources is considered the capacity pool. If you have Administrator privileges, you can save, run, or schedule provisioning tasks.

In the service class, an administrator can grant users permission to provision by using the service class. In the service class, an administrator can also specify whether scheduling or running provisioning tasks that are created by using the service class requires administrator approval. If you are a user with permission to provision by using the service class, and administrator approval is not required, you can save, run, or schedule the task. You can save the task, if administrator approval is required. Also, if you save the task, an administrator can later schedule or run it.

Although IBM Spectrum Control identifies the best location for storage when it creates the provisioning task, the implementation of the task might fail. For example, the implementation of the task might fail because of changes in the environment that occur after the task is created and before it is run. The implementation of the task might also fail because of storage system restrictions that are not considered when the task is created.

Viewing task details and logs

When a provisioning task is running, you can view its status in a details page. If you run the provisioning task immediately after you complete the steps for setting up provisioning, the details page is already displayed. You can also display details of a provisioning task from the Tasks page. From the details page, you can open logs for the provisioning task. The logs show the steps that are taken by the task during processing and include detailed information about any warnings or errors.

Tracking

When you set up provisioning, you can specify a ticket identifier for tracking purposes. The ticket identifier is associated with the provisioning task, and with any volume or share that is created by the provisioning task.

The ticket identifier can be viewed by showing the Ticket column in the Volumes page or the Shares page. The ticket identifier can also be viewed in the properties notebook for a volume or share.

Tip: If you request multiple volumes, a separate provisioning task is created for each unique service class and capacity pool combination you specify in your volumes request. By specifying a ticket identifier when you request the volumes, you can easily track the set of provisioning tasks and volumes that are created by the single request.

Storage configuration

Whether you are provisioning volumes or shares, IBM Spectrum Control configures the storage and resources as specified by certain properties of the service class, and, in the case of volumes, according to your zoning policy.

When you provision volumes, IBM Spectrum Control can configure volumes and resources according to properties of the service class:

- If the service class requires thin provisioning, the volume is created in a pool that can thin provision volumes. During provisioning, other properties of the service class are used to configure the thin provisioned volume for the particular type of storage system that contains the pool. Because you configure thin provisioned volumes differently for the different storage system types, the service class has a unique set of thin provisioning properties for each type.
- If the service class specifies a multipathing policy for servers, the IBM® System Storage® Multipath Subsystem Device Driver (SDD) on the server is configured to use that policy. For the SDD to be configured, a Storage Resource agent (SRA) must be running on the server.

When you are provisioning volumes, if automatic zoning is enabled, new zones might be created to connect a server to the storage system. Existing zones are used if the server already has connectivity to the storage system. Otherwise, one or more new zones are created between a host initiator port and a controller, node, or module port.

When you provision shares, IBM Spectrum Control configures at least one file access protocol for the file share.

Storage reclamation

You can use volume reclamation recommendations to reclaim unused storage capacity in your environment and use your storage more efficiently.

The block storage systems in your data center that you add for monitoring are regularly analyzed. You can view a list of the volumes that are not mapped to servers or that have no recorded I/O activity. By reclaiming the volumes that are not being used, you can recycle existing storage space instead of purchasing new storage media.

Supported storage systems: Go to see <https://www.ibm.com/support/pages/node/388393>, and then click the release number in the Storage column.

Alerts and alert policies

Specify conditions that trigger alerts and the actions to take when those alerts are triggered, such as notify an email address. Use alert policies to define those alert conditions and notification settings for a group of resources.

Alerting functions examine the attributes, capacity, and performance of resources. If the conditions that are defined for alerts are met, the actions that are specified for the alert are taken. Typically, the actions include sending a notification. For example, if the status of a SAN Volume Controller storage system changes to Error, an alert is displayed in the Alerts page in the GUI, and an email might be sent to a storage administrator.

You can manage alerts in your storage environment in the following ways:

- Use alert policies to manage the alert definitions and notification settings that apply to different sets of resources. For example, you can use one alert policy for the storage systems in your test environment, and another for the storage systems in your production environment. Alert policies manage one type of resource only. For example, if you have SAN Volume Controller and FlashSystem 900 storage systems in your storage environment, you cannot have both types of resource in one alert policy.

A resource can be managed by only one alert policy. When you add a resource to be monitored by IBM Spectrum® Control, it is added to a default alert policy automatically.

If a resource is managed by a policy, the resource cannot have alert definitions and notification settings that are independent of the policy. The alert definitions and notification settings that apply to the resource come from the policy.

Default policies with alerts already configured are available. You can create copies of the default policies and assign resources to the new policies. Your alerts are configured with the default settings.

- Define alert conditions and notification settings for individual resources. It is not a requirement for resources to be managed by an alert policy. A resource can have its own alert definitions and notification settings, independent of an alert policy.
- Define alerts and notification settings for applications and general groups. Use applications or general groups to manage alerts for groups of resource components such as volumes or pools. For example, you might want to define alerts on the response time for volumes in an application, depending on the response time requirements of the application. In this case, it is not useful to configure volume response time thresholds for the entire storage system because the storage system might serve many different applications with different needs.

Triggering conditions for alerts

The conditions that trigger alert notifications depend on the type of resource that you are monitoring. In general, the following types of conditions can trigger alerts:

- An attribute or configuration of a resource changed
- The capacity of a resource fell outside a specified range
- The performance of a resource fell outside a specified range
- The storage infrastructure was changed, such as a new or removed resource
- Data is not being collected for a resource

For example, you can use performance thresholds to be notified when the total I/O rate for storage systems falls outside a specified range. This information can help you identify areas in your storage infrastructure that are over used or under used. IBM Spectrum Control provides many metrics for measuring performance and determining violations of the thresholds that you specify.

Alert notifications and triggered actions

When an event occurs and triggers an alert, the alert is written to a log. You can also select one or more other ways to be notified of the event. These alert notifications include SNMP traps, IBM® Tivoli® Netcool®/OMNIBus events, login notifications, entries in Windows event log or UNIX syslog, and emails. Additionally, if a Storage Resource agent is deployed on a monitored server, you can run a script or start an IBM Spectrum Protect job in response to the alert.

Acknowledging alerts: Some alerts are triggered by conditions that commonly occur and can be ignored. In such cases, you acknowledge these alerts to indicate that they were reviewed and do not require immediate resolution. By acknowledging alerts, you can more quickly identify other alerts that must be reviewed and resolved.

Event processing

Alerts are generated when particular conditions are detected during data collection and event processing. For some storage systems such as IBM Spectrum Accelerate and the XIV®, events are polled every minute from the resource.

For other resources, events are subscription-based, where the resource itself or a data source such as an SMI-S provider (also called CIM agent or CIMOM) sends the events to IBM Spectrum Control when conditions change on the resource. Examples of storage systems that use subscription-based event processing include SAN Volume Controller, Storwize® V7000, Storwize V7000 Unified, and FlashSystem V9000. For these storage systems, a probe is automatically run when many events are received from the storage system in a short time period. To avoid performance bottlenecks, probes are run only every 20 minutes.

Prerequisites for using alerts

The following conditions must be met to successfully use alerts:

- Data collection schedules are configured and scheduled to run regularly. For example, to detect violations of performance thresholds, you must run performance monitors to collect performance data about resources. Running performance monitors regularly also helps to establish a history of performance for trending analysis.
- If you want to be notified about an alert in some way other than an entry in the log file, such as using SNMP traps, IBM Tivoli Netcool/OMNIBus events, or email, you must configure those alert destinations before you use the alert.
- If an alert is triggered based on an SNMP trap from the monitored resource, you must properly configure the SNMP server of the monitor resource to enable IBM Spectrum Control to listen to SNMP traps. The default port number is 162, and the default community is public.

Reporting

Use reporting functions to view overview and detailed information about your storage.

You can view detailed capacity information for storage systems, servers, hypervisors and their internal resources, such as volumes, pools, disks, and virtual machines. For example, you can view the total amount of storage capacity that is committed to a volume, the capacity that is used by a volume, and the capacity that is allocated to a volume and is not yet used.

In rollup mode, secondary rollup servers collect information from managed resources and roll that data up to primary rollup servers. This gives you a network-wide perspective of storage usage in your environment when you have multiple IBM Spectrum® Control servers deployed.

You can use the IBM® Cognos® Analytics reporting tool to view predefined reports and create custom reports about the resources managed by IBM Spectrum Control. Use the IBM Cognos Analytics reporting tool to view predefined reports about the capacity and performance of your resources. Charts are automatically generated for most of the predefined reports. Depending on the type of resource, the charts show statistics for space usage, workload activity, bandwidth percentage, and other statistics. You can schedule reports and specify to create the report output in HTML, PDF, and other formats. You can also configure reports to save the report output to your local file system, and to send reports as email attachments.

You must collect information about your environment before you can use reports to view details about the storage resources in it. You can use IBM Spectrum Control monitoring jobs, such as probes and performance monitors, to gather comprehensive information and statistics about your storage resources.

Rollup servers

Rollup reporting combines capacity and status information from multiple instances of IBM Spectrum® Control for monitoring and reporting. In rollup mode, secondary rollup servers collect information from managed resources and roll that data up to primary rollup servers.

Rollup capability requires two types of servers: a primary rollup server running IBM Spectrum Control, which collects capacity and status information from one or more secondary rollup servers. Secondary rollup servers communicate with the primary rollup server during server probes.

The primary rollup server collects capacity and status information about storage resources that are managed by the secondary rollup servers. This primary/secondary rollup server configuration is called *rollup mode*. When you enable rollup mode on the primary rollup server, you can see capacity and status information in the rollup resource pages for the storage systems, servers, hypervisors, switches, and fabrics that are monitored by your rollup servers.

You can also configure a primary rollup server as a secondary rollup server to other primary servers. This allows you to create a comprehensive rollup reporting structure across your enterprise.

Note: If you configure a primary rollup server as a secondary rollup server to another primary server, the data collected by that primary server is not rolled up to the higher primary server. Primary rollup servers only collect and display data from their immediate secondary rollup servers. For example, if you configure primary rollup server 2 as a secondary to primary rollup server 1, the data that is rolled up to primary rollup server 2 from its secondary servers is not collected by primary rollup server 1. Primary rollup server 1 only collects capacity and status information about primary rollup server 2, not the secondary servers monitored by primary rollup server 2.

Note: After you upgrade a primary rollup server you must run probes of the secondary rollup servers that were added to the primary server prior to the upgrade. Use the Start Probe action to run probes of the secondary rollup servers. Wait for the first probe (manual or scheduled) to complete, before you work with a new function.

Managing secondary rollup servers

After you add a secondary rollup server on the Settings > Rollup Server Connections page, you can view information about the server and perform actions on it. You must have IBM Spectrum Control Administrator role authorization to add, remove, and manage secondary rollup servers on this page.

Information about secondary rollup servers

IBM Spectrum Control provides the following information about the secondary rollup servers on the Rollup Server Connections page:

Managed resources

The number of block storage systems, servers, switches, fabrics, and hypervisors that the secondary rollup server is managing. You can view information about these resources on the rollup resource list pages for the resources, such as the Switches (Rollup) page. NPV switches are not included in this number on either the primary rollup or secondary rollup Switches (Rollup) resource list pages.

Data collection

The status of the last probe of the secondary rollup server, and the time of the next probe of the server. Hourly probes are automatically scheduled when a secondary rollup server is added to a primary rollup server.

Actions

You can perform the following actions on the secondary rollup server. Unless otherwise noted, you must have Administrator role authority to perform these actions.

Open logs

Opens the probe logs window for the secondary rollup server in a separate browser window. Any IBM Spectrum Control user role can perform this action.

Start probe

Starts a probe of the secondary rollup server. If a probe is already running for the server, you must wait until the current probe completes before starting a new probe.

Remove server

Removes the secondary rollup server from the Rollup Server Connections page and the Servers (Rollup) list. Also removes any associated resources that are managed by the secondary rollup server. For example, if a secondary rollup server is the managing instance for a switch and the secondary server is removed from the primary rollup server, the switch will no longer display on the Switches (Rollup) resource list page.

Note: Removing a secondary rollup server on the Rollup Server Connections page does not remove that server from the non-rollup Servers page. If the server has been added by using the Add Server dialog on the non-rollup Servers page, IBM Spectrum Control will continue to manage that server unless you remove it from the Servers page.

Modify connection

Allows you to change the host name, user name, password, and port of the secondary rollup server.

Rollup mode

Rollup mode is a special view of your enterprise and is enabled by configuring your IBM Spectrum Control servers to communicate and gather data through server probes. Rollup mode requires a primary rollup server configured to collect capacity and status information from one or more secondary rollup servers. Once you have configured a

primary rollup server with at least one secondary rollup server, you can go to the rollup icon  in the menu bar to enter rollup mode. The rollup icon does not display until you have configured at least one secondary rollup server for the primary rollup (local) server. You might have to refresh your browser window to see the rollup icon after you add the first secondary rollup server for the primary rollup server you are configuring.

Entering rollup mode

To view rollup capacity and status information from your IBM Spectrum Control servers, you must enter rollup mode.

1. On the Rollup Server Connections page, add at least one secondary rollup server. Secondary rollup servers must have IBM Spectrum Control installed and running.
2. Move the mouse pointer over the rollup icon in the menu bar and select Enter rollup mode.

You will see the following changes in the menu bar:

- The color of the rollup icon changes: .
- The lower edge of the menu bar changes to orange.
- The menu bar options change to Storage, Servers, Network, Rollup Server Connections.

Using rollup mode

Rollup mode provides lists of resources that are managed by secondary rollup servers. For example, you can see a list of all the network switches that are managed by a primary rollup server and its associated secondary rollup servers. These resource list pages are similar to the pages you work with when not in rollup mode. However, in some cases rollup mode provides different data columns and different actions that you can take on the rollup storage devices.

View rollup information

1. In the rollup menu bar, select the type of storage device you want to view information about. For example, Servers.
2. Select one of the available menu options. The Servers menu bar item has two options: Servers and Hypervisors.
3. On the resource list page, you can see the data about that resource type that has been collected from the primary and secondary rollup servers.
4. Rollup resource lists function similar to non-rollup pages: you can add and reorder data columns, right-click items in the resource list to perform actions on them, and other familiar functions. You can also use Ctrl-click to select multiple list items.

Actions

You can perform actions on items in the resource lists by right-clicking them or by selecting one or more list items and clicking Actions.

View properties

View the properties of the selected item in the resource list. This action is not available for multiple selections at the same time.

Export

Export the data for one or more list items. You can specify PDF, CSV, or HTML output.

Units of measurement for storage data

IBM Spectrum® Control uses decimal and binary units of measurement to express the size of storage data.

Decimal units such as kilobyte (KB), megabyte (MB), and gigabyte (GB) are commonly used to express the size of data. Binary units of measurement include kibibyte (KiB), mebibyte (MiB), and gibibyte (GiB). [Table 1](#) compares the names, symbols, and values of decimal and binary units.

Table 1. Comparison of binary and decimal units and values

Binary			Decimal		
Name	Symbol	Value (base 2)	Name	Symbol	Value (base 10)
kibibyte	KiB	2 ¹⁰	kilobyte	KB	10 ³
mebibyte	MiB	2 ²⁰	megabyte	MB	10 ⁶
gibibyte	GiB	2 ³⁰	gigabyte	GB	10 ⁹
tebibyte	TiB	2 ⁴⁰	terabyte	TB	10 ¹²

Binary			Decimal		
Name	Symbol	Value (base 2)	Name	Symbol	Value (base 10)
pebibyte	PiB	2 ⁵⁰	petabyte	PB	10 ¹⁵
exbibyte	EiB	2 ⁶⁰	exabyte	EB	10 ¹⁸

Binary units of measurement express the size of data more accurately. When you compare the size of 100 KB to 100 KiB, the difference is relatively small, 2.35%. However, this difference grows as the size of the data values increases. When you compare the size of 100 TB to 100 TiB, the difference is 9.06%.

In general, IBM Spectrum Control uses base 2 values for memory and disk space values, and base 10 values for space on physical hard drives.

[Table 2](#) shows the percentage difference between decimal and binary values across a range of data sizes.

Table 2. Percentage difference between decimal and binary units

Decimal value	Binary equivalent of decimal value	Difference
100 kilobytes (KB)	97.65 kibibytes (KiB)	2.35%
100 megabytes (MB)	95.36 mebibytes (MiB)	4.64%
100 gigabytes (GB)	93.13 gibibytes (GiB)	6.87%
100 terabytes (TB)	90.94 tebibytes (TiB)	9.06%
100 petabytes (PB)	88.81 pebibytes (PiB)	11.19%
100 exabytes (EB)	86.73 exbibytes (EiB)	13.27%

Role-based authorization

Roles determine the functions that are available to users of IBM Spectrum® Control. When a user ID is authenticated to IBM Spectrum Control through the GUI, CLI, or APIs, membership in an operating system or LDAP group determines the authorization level of the user.

The following table shows the IBM Spectrum Control roles and their authorization levels:

Table 1. IBM Spectrum Control roles and authorization levels

Roles	Authorization level
Administrator	This role has full access to all monitoring and administrative functions. At least one group must have the Administrator role. Note: When IBM Spectrum Control is first installed, the following operating system groups are assigned the Administrator role: <ul style="list-style-type: none"> Windows: Administrators UNIX and Linux®: root AIX®: system
Monitor	This role has access to the following read-only functions: <ul style="list-style-type: none"> Viewing and exporting information about monitored resources Viewing, acknowledging, and removing alerts Viewing tasks and data collection jobs Opening management GUIs Opening logs Viewing chargeback, consumer, predefined capacity and inventory, and custom reports Exception: Users with the Monitor role can provision storage if they are granted permission in a service class. A service class is a logical entity that describes storage capabilities and characteristics and can be used to specify requirements for storage provisioning. For more information about service classes, see Creating service classes .
External Application	If you assign the External Application role to the user, you must also assign one or more service classes to the user. This role does not enable users to log in to the IBM Spectrum Control GUI.

Tips:

- To determine the role of the user who is logged in, click the user icon  in the upper-right corner of any page in the GUI.
- If a user belongs to multiple groups and the groups have different roles, the role with the highest level of authorization is granted to the user. For example, if a user belongs to a group that is assigned the Administrator role and also belongs to a group that is assigned a Monitor role, the user is granted the authorization of the Administrator role.
- If a user is not a member of a group that is assigned an IBM Spectrum Control role, no access is granted to that user.
- If assigned the Monitor role, a user can only open and view logs from the Data Collection page for the selected resource.

Nested groups are not supported: Adding active directory or any other type of domain user group to a local operating system group is not supported in IBM Spectrum Control. You can configure IBM Spectrum Control to authenticate domain IDs that rely on the operating system to perform the authentication operation against the active directory, but it cannot resolve nested groups.

Alternatively, you can configure LDAP authentication to perform queries against active directory user repositories and assign domain groups directly to roles within IBM Spectrum Control.

Fabrics and zones

Use the IBM Spectrum® Control to learn more about fabrics and zones.

- [Monitoring fabrics and zones in the GUI](#)

You can monitor switches and fabrics in the IBM Spectrum Control GUI. You can also enable automatic zoning so that new zones are created during storage provisioning, if necessary, to connect a server to a storage system.

- [Zones, zone aliases, and zone sets](#)

Zones, zone aliases, and zone sets allow logical grouping of ports and storage devices within a storage area network. This section describes zoning concepts and elements.

- [Switch zoning capabilities](#)

When you select a fabric in which to perform zoning operations, Fabric Manager determines the capabilities of the switches in the SAN and limits the zoning operations based on that information.

Related tasks

- [Provisioning with zone control](#)

Monitoring fabrics and zones in the GUI

You can monitor switches and fabrics in the IBM Spectrum® Control GUI. You can also enable automatic zoning so that new zones are created during storage provisioning, if necessary, to connect a server to a storage system.

You can use the GUI to add switches and fabrics for monitoring. You can add the following types of switches:

- Brocade
- Cisco

After switches and fabrics are probed, you can view detailed status and performance information about the switches and fabrics. You can also test the connection to the switch or fabric.

Information that you can view about a fabric includes the following properties:

- The fabric type
- The number of physical and virtual switches in the fabric
- The number of ports that are on all the switches in the fabric
- The number of switch ports that are online and connected to other ports in a fabric
- The name of the principal switch of the fabric

Information that you can view about a switch includes the following properties:

- The number of ports on a switch
- The number of ports that are connected to a storage resource
- The name of the fabric where a switch is a member
- The name of the vendor or manufacturer for a switch

From the Details page of a fabric, you can open the Zone Sets page to view information about the zone sets on the fabric, and to identify which is the active zone set.

You can enable automatic zoning in the GUI. When automatic zoning is enabled, IBM Spectrum Control creates new zones during provisioning if new zones are needed to connect the storage system with the server.

Zones, zone aliases, and zone sets

Zones, zone aliases, and zone sets allow logical grouping of ports and storage devices within a storage area network. This section describes zoning concepts and elements.

In a storage area network a *zone* is a logical grouping of ports to form a virtual private storage network. Zones that belong to a single SAN can be grouped into a *zone set*, which can be activated or deactivated as a single entity across all switches in the fabric. A zone set can contain one or more zones, and a zone can be a member of more than one zone set. Using zoning, you can automatically or dynamically arrange fabric-connected devices into logical groups across a physical fabric.

Ports and devices in a zone are called *zone members*. A zone can contain one or more zone members. Ports that are members of a zone can communicate with each other, but they are isolated from ports in other zones. Devices, however, can belong to more than one zone. A *zone alias* is a collection of zone members. A zone alias can be added to one or more zones.

Note: In some cases, inactive zones might not have any zone members. Activating an inactive zone set that contains empty zones will fail if a switch does not support empty zones in active zone definitions.

Zone membership can be specified by:

- The N_Port_Name of the N_Port connected to the switch (also known as WWN zoning or port name zoning)
- The N_Port address identifier assigned during fabric login (also known as PortId or FCID zoning)
- The Node_Name associated with the N_Port
- The Domain identification (Domain_ID) and physical port ID of the Switch Port to which the N_Port is attached (also known as domain port zoning)
- An alias name

Zoning supports the use of aliases, which are meaningful names assigned to devices. An alias can also be a group of devices that are managed together to make zoning easier.

There are two types of zoning:

Hardware zoning (port zoning)

In hardware zoning (also called *port zoning*), the members of a zone are the physical ports on a fabric switch.

Software zoning (WWN zoning)

Software zoning uses the Simple Name Server (SNS) that runs inside a fabric switch. It is based on the node WWN or port WWN of the zone members to be included. Software zoning lets you create symbolic names for the zones and zone members.

A *default zone* is a group of devices that are not members of the active zone set. These can communicate with each other but not with members of any other zone. Default zoning is enabled by default. You can use a switch element manager to configure the Default Zone option to enable or disable the default zone independently of the active zone set.

Note:

1. If the default zone is disabled, devices that are not members of the active zone set cannot communicate.
2. If the default zone is disabled and no zone set is active, no devices can communicate.
3. If default zoning is enabled, deactivating the active zone set makes all devices members of the default zone. If default zoning is disabled, all communication stops.
4. If you activate one zone set while another zone set is active, the currently active zone set is deactivated.
5. If your EFC Manager manages multiple fabrics, ensure that you have the correct zone set for the fabric you are currently updating.

Switch zoning capabilities

When you select a fabric in which to perform zoning operations, Fabric Manager determines the capabilities of the switches in the SAN and limits the zoning operations based on that information.

To see a list of supported switches and their capabilities, default values, ranges, and possible effects, go to [IBM Spectrum Control interoperability matrix for switches](#).

- [Zoning for Cisco MDS 9000 switches](#)
Cisco switches support virtual SANs (VSANs), which is the logical partitioning of a fabric into multiple fabrics. The overall network is referred to as the physical infrastructure, and the logical fabrics are the VSANs. IBM Spectrum Control provides basic zone discovery for the Cisco MDS 9000 series switches.
- [Brocade switches in zones](#)
Brocade switches that are managed by using Brocade Network Advisor support some non-standard zones such as quick loop zones, fabric assist zones, and protocol zones. If the switch configurations have these zones already defined, IBM Spectrum Control preserves them and does not modify them in any way.

Zoning for Cisco MDS 9000 switches

Cisco switches support virtual SANs (VSANs), which is the logical partitioning of a fabric into multiple fabrics. The overall network is referred to as the physical infrastructure, and the logical fabrics are the VSANs. IBM Spectrum® Control provides basic zone discovery for the Cisco MDS 9000 series switches.

IBM Spectrum Control supports these zone member types:

- N_Port WWN
- FC ID (the fibre channel ID of an N_port attached to the switch)

IBM Spectrum Control does not allow zone management of zones that contain unsupported members.

Brocade switches in zones

Brocade switches that are managed by using Brocade Network Advisor support some non-standard zones such as quick loop zones, fabric assist zones, and protocol zones. If the switch configurations have these zones already defined, IBM Spectrum® Control preserves them and does not modify them in any way.

You can create, change, and delete non-standard zones by using the Brocade switch management application.

Note: IBM Spectrum Control allows you to add empty zones to an inactive zone definition. Activation of a zone set containing empty zones may still fail if the switch does not support empty zones in active zone definitions.

Agents

The IBM Spectrum® Control uses agents to gather data: Common Information Model (CIM) agents, Storage Resource agents, and SNMP agents.

- [SMI-S providers](#)
SMI-S providers enable communication between storage devices, such as storage systems and fabric switches, and IBM Spectrum Control. Each storage device that you want to manage must have an SMI-S provider either installed or embedded unless it is a device that uses Native API connection.
- [Storage Resource agents](#)
Use Storage Resource agents to collect information about storage resources such as servers, virtual machines, workstations, and HBAs.
- [SNMP agents](#)
An SNMP agent, also called an out-of-band agent, is software that runs on a switch and can be used to monitor and manage systems and devices in your network. IBM Spectrum Control uses SNMP to retrieve information about specific switches, such as Cisco switches, and the fabrics that the switches are members of.

SMI-S providers

SMI-S providers enable communication between storage devices, such as storage systems and fabric switches, and IBM Spectrum® Control. Each storage device that you want to manage must have an SMI-S provider either installed or embedded unless it is a device that uses Native API connection.

SMI-S providers are provided by the vendor of the storage subsystem or fabric switch. Each vendor provides unique agent code for their family of storage devices. This code implements a Common Information Model Object Manager (CIMOM) that conforms to the Storage Management Initiative Specification (SMI-S) of the Storage Networking Industry Association (SNIA).

The SMI-S provider enables communication between the storage device and IBM Spectrum Control. Commands and responses are transmitted between IBM Spectrum Control and the SMI-S provider using an XML transport layer. The SMI-S provider to storage device layer uses a vendor-specific proprietary interface.

The SMI-S provider usually must be installed and configured, so that it can identify the storage devices with which it communicates. Some storage devices, such as fabric switches, contain embedded SMI-S providers and so do not require that SMI-S providers be installed. In these cases, IBM Spectrum Control must be configured to point directly to the storage devices that contain the embedded SMI-S providers.

SMI-S providers can be referred to as CIM agents, CIM proxy agents, and CIMOM agents. SMI-S providers can be embedded in the device or installed on a separate computer.

Note:

- Do not install multiple SMI-S providers on a single computer because of port conflicts.
- Do not install a SMI-S provider on the system where a IBM Spectrum Control server component is installed.

Related tasks

Related reference

- [Storage Management Initiative Specification](#)
- [SMI-S providers](#)

Storage Resource agents

Use Storage Resource agents to collect information about storage resources such as servers, virtual machines, workstations, and HBAs.

You must deploy Storage Resource agents on resources where you want to gather the following information:

- Asset information
- File and file system attributes
- Network-attached storage (NAS) device information

Tip: IBM Spectrum® Control creates and updates agentless servers automatically after it probes storage systems and hypervisors.

Related tasks

SNMP agents

An SNMP agent, also called an out-of-band agent, is software that runs on a switch and can be used to monitor and manage systems and devices in your network. IBM Spectrum® Control uses SNMP to retrieve information about specific switches, such as Cisco switches, and the fabrics that the switches are members of.

IBM Spectrum Control uses SNMPv3 (preferred) or SNMPv1 to probe Cisco switches to collect performance data. Some switches are configured to use SNMPv3 by default.

Optimizing the performance of storage virtualizers

In this tutorial, you balance pools and analyze tiering to help resolve performance hotspots and manage storage resources efficiently.

Before you begin

You can optimize the placement of volumes on the following storage virtualizers:

- SAN Volume Controller
- Storwize® V7000
- Storwize V7000 Unified block storage

Learn more: For information about the components that can be used with IBM Spectrum® Control Version 5.2 (or later), see [IBM Spectrum Control interoperability matrix](#).

To optimize the placement of volumes in storage virtualizer pools, you must complete the following tasks:

- Probe the storage virtualizers.
- Set the tier level of the storage pools that you want to analyze.
- Collect performance data to analyze the pools and volumes.

When you run the analysis to balance pools, you optimize storage performance by redistributing volume workloads across pools on the same tier.

When you run the tiering analysis, you optimize storage performance by specifying thresholds to move volumes to higher and lower tiers.

- [Tutorial: Analyzing and re-tiering volumes in pools on tier 1](#)

In this tutorial task, you analyze the current placement of volumes in pools on tier 1 so that you can move volumes with low workloads from tier 1 to tier 2 or tier 3 pools.

- [Tutorial: Collocating volumes](#)

In this tutorial task, you want to minimize the exposure of servers to multiple back-end storage systems by collocating volumes that are assigned to the same hypervisor or server. You can enforce the collocation of volumes when you enter the criteria for analyzing tiering and balancing pools.

Related tasks

- [Optimizing storage tiering](#)

Tutorial: Analyzing and re-tiering volumes in pools on tier 1

In this tutorial task, you analyze the current placement of volumes in pools on tier 1 so that you can move volumes with low workloads from tier 1 to tier 2 or tier 3 pools.

About this task

The pools that you want to analyze are on a SAN Volume Controller with two DS8000® storage systems. The pools on the storage virtualizer are assigned to tier 1, tier 2, and tier 3.

Choosing the performance data that is used in the analysis

1 Analysis period and data collection days

The analysis period is set to 10 days and Saturdays and Sundays are excluded from the analysis.

Mo	Tu	We	Th	Fr	Sa	Su
Mo	Tu	We	Th	Fr	Sa	Su

The performance data that is collected is used in the analysis.

The performance data that is collected isn't used in the analysis.

2 Data collection period

09:00 is selected as the start time and 18:00 is selected as the end time.

3 Analysis schedule

You create the analysis on Monday and schedule the analysis to run every 14 days.

Mo	Tu	We	Th	Fr	Sa	Su
Mo	Tu	We	Th	Fr	Sa	Su
Mo	Tu	We	Th	Fr	Sa	Su

The day that you created the analysis is the day that the analysis is run.

For example, you want to analyze the data that is collected over 10 days and when the volumes are most active. So, you set the period for the analysis to 10 days and exclude the data that is collected at the weekend. You also exclude the data that is collected before 9 AM and after 6 PM because you know that the volumes are most

Tiering and volume placement criteria

1 Tiering criteria

The source volumes that are selected are in pools on Tier 1, and the target pools that are selected are on Tier 1, Tier 2, and Tier 3. The tiering thresholds for the volumes are >1000 I/O per second for Tier 1 and >500 I/O per second for Tier 2.

Tiering Criteria	Tier 1: Volume Analysis	Tiering recommendations
Tier 1 I/O Rate: >1000	 I/O Rate = 900	 Place volume in pool on Tier 2
Tier 2 I/O Rate: <1000 and >500	 I/O Rate = 400	 Place volume in pool on Tier 3
Tier 3 I/O Rate: <500		

2 Volume placement criteria

To ensure that the pools that are selected as target pools can handle the additional workload, you specify the maximum I/O rates for the target pools on each tier.

Target Pools	Below Threshold	Add Volume
 Target Pool 1	 Yes	 Yes
 Target Pool 2	 No	 No

You want volumes with the highest workloads in tier 1 pools and you want volumes with low workloads in tier 2 or tier 3 pools. To tier your storage, you enter two I/O rate thresholds to generate recommendations to re-tier the volumes.
Tip: You can tier volumes by I/O rate or I/O density.
To ensure that the pools that are selected as destination pools for the volumes can handle the additional workload, you specify the maximum I/O rates for pools on each tier of storage. Only the pools with I/O rates below the maximum I/O rate can be selected as destination pools for the volumes.

Procedure

1. From the Storage menu, click Storage Systems.
2. Right-click the storage virtualizer and click View Details.
3. In the navigation pane, click Pools.
To organize the pools by tier level, click the Tier column heading.
4. Select the pools on tier 1, right-click and then click Analyze Tiering.
5. Select all of the pools on tier 2 and tier 3 as target pools, and then click Next.
6. Select the period that you want to use to analyze the performance data.
7. Set the threshold for moving volumes from tier 1 to tier 2.
The volumes with I/O rates above the threshold that you set remain in the tier 1 pools. The volumes with I/O rates below the threshold that you set are moved down to tier 2 pools.
8. Set the threshold for moving volumes from tier 2 to tier 3.
The volumes with I/O rates above the threshold that you set remain in the tier 2 pools. The volumes with I/O rates below the threshold that you set are moved down to tier 3 pools.
9. Set the maximum I/O rate for pools on each tier.
10. Click Analyze.

Results

The Analyze Tiering task is shown.

What to do next

Click Execute to implement the recommendations. To create a schedule, click [Schedule > Analysis](#). Alternatively, you can modify the criteria that you set for analyzing the volumes on the Tasks page and run the analysis again.

Related tasks

- [Modifying the criteria for analyzing tiering](#)

Tutorial: Collocating volumes

In this tutorial task, you want to minimize the exposure of servers to multiple back-end storage systems by collocating volumes that are assigned to the same hypervisor or server. You can enforce the collocation of volumes when you enter the criteria for analyzing tiering and balancing pools.

About this task

To ensure that volumes in the same storage pool that are assigned to the same server or hypervisor are kept together, you want to enforce the collocation of volumes. By enforcing the collocation of volumes, you prevent the placement of related volumes in destination pools that might be on multiple back-end storage systems. Multiple host connections to the same hypervisor or server: If the volumes in the source pool that are assigned to the same hypervisor or server are assigned to different host connections, the collocation of the volumes is affected. In such cases, if volumes require optimization, the volumes that are assigned to the same host connection are kept together. To view information about the host connection for the volume, right-click the volume, select View Details, and then click the Host Connections tab.

Procedure

1. From the Storage menu, click Pools.
2. Right-click the pools that you want to analyze, and then click Analyze Tiering.
3. Select the target storage pools.
4. On the Optimize the Placement of Volumes page, ensure that Collocate volumes is set to Yes.
5. Click Analyze.

Results

If a volume requires re-tiering, a recommendation is generated to move all of the volumes that are assigned to the same server to the same destination pool. If none of the target pools have sufficient space to accommodate all of the volumes, then recommendations to move the volumes are not generated.

Monitoring capacity usage at different levels of a business hierarchy

The monitoring and management of applications and departments enables you to monitor storage capacity usage, recognize trends, monitor health status, and troubleshoot performance of the storage resources in your business organization.

Before you begin

The department model comprises these main elements:

- The department
- The subdepartments that the department contains
- The applications, or the application subcomponents, or both that the department uses

In the following tutorial, you want to create a department model that monitors the capacity and space usage of the Books Sales department, and these subdepartments:

- Wholesale
- Retail
- Online

To monitor the capacity and space usage of the departments, you add the applications that the department and its subdepartment use to each of the subdepartments.

The department model that you create determines how you can view capacity usage and space information. To view the total capacity and space usage of a department regardless of the subdepartments that the department contains, you create a department and add the applications and subcomponents to the department.

If, however, you want to see the capacity and space usage of the subdepartment and its subdepartments, you create a department hierarchy by adding subdepartments to departments. You then add the applications and application subcomponents that each subdepartment uses to the subdepartments. You can then view capacity and space usage for the department and for the individual subdepartments.

You can create more complex models of departments by adding subdepartments to subdepartments. In the following illustration, the department model is extended to include two more layers of subdepartments under the Wholesale subdepartment.

To monitor the capacity and space usage of the departments in your business organization, complete the following tasks:

- Create the Book Sales department.
- Create the Wholesale, Retail, and Online departments to represent the subdepartments.
- Add the Wholesale, Retail, and Online as subdepartments to the Book Sales department.
- Create the Book Sales DB application and the Wholesale Transactions, Retail Transactions and Online Transactions applications to represent the subcomponents that are used by the departments.

Different applications require different storage capabilities, and different levels of performance and uptime. The storage requirements of the departments are constantly growing and they need to modify their behaviors in a way that justifies the cost of their actions concerning storage utilization. The data modeling of storage resources using the application and department concept enables you to plan and implement a chargeback system if necessary.

- [Tutorial: Comparing storage usage in each department](#)
In this tutorial, you compare the storage usage in each department within your organization to spot a potential storage usage issue.

Tutorial: Comparing storage usage in each department

In this tutorial, you compare the storage usage in each department within your organization to spot a potential storage usage issue.

About this task

To monitor the capacity and space usage of a department, you create the department and subdepartments, and you add the application subcomponents to the subdepartments.

You want to monitor the capacity and space usage of departments in an organization that sells books.

The sales department of the organization, Book Sales, has these subdepartments:

- Wholesale
- Retail
- Online

Although you can add applications and application subcomponents when you create departments, it is easier and quicker to create the applications and application subcomponents beforehand.

You want to know the total amount of storage space that the Book Sales department uses, and you want to know the amount of space that each subdepartment uses. To know how much space the Book Sales and its subdepartments use, you must associate the department and its subdepartments with the applications that they use. For example, the Book Sales department and its subdepartments use a database application named Book Sales DB. The Book Sales DB application contains these subcomponents:

- Wholesale Transactions
- Retail Transactions
- Online Transactions

Procedure

To create the department and subdepartments, you complete these tasks:

1. You create the Wholesale department and add the applications and application subcomponents that the subdepartment uses.
2. You create the Retail department and add the applications and application subcomponents that the subdepartment uses.
3. You create the Online department and add the applications and application subcomponents that the subdepartment uses.
4. You create the Book Sales department.
You do not have to add applications or subcomponents to the Book Sales department because the Book Sales department inherits the applications and application subcomponents that are added to the subdepartments.
5. You add the Wholesale, Retail, and Online departments as subdepartments to the Book Sales department.

Results

When you complete adding the departments and associating the departments with the applications that are used by the departments, you can view the information that is collected about the departments on the Departments page and on the details page for the department.

What to do next

You want to target what department and what storage resources might be responsible for a change or an upward trend in significant storage usage. By correctly classifying the department or departments you can properly plan to archive or switch the storage within the organization.

Using applications and subcomponents to monitor capacity and space usage

To monitor the performance, capacity, and space usage of the applications in your business organization, create applications and subcomponents. You can also add applications to departments so that storage capacity and usage can be monitored in an overall business hierarchical manner.

Before you begin

You can create a simple application model, which consists of an application and use a filter to associate the storage resources that the application uses with the application. Alternatively, you can create a complex application model that comprises an application and application subcomponents and then add filters to associate the storage resources that each application subcomponent uses with each of the subcomponents.

Besides creating applications to monitor the performance, capacity, and space usage of the applications in your business organization, you also create applications to add them to departments. When you add applications to departments, you can monitor the capacity and space usage of the departments and you can monitor the performance of the storage resources that are associated with the applications that each department uses.

To monitor the capacity of an application, you create an application model that is based on the following elements:

- The application
- The subcomponents that the application contains
- The applications, application subcomponents, or both that are added to the department

In the following tutorial, you want to create an application model that monitors the capacity, space usage, and performance of the Book Sales DB application. The application model that you want to create comprises these application subcomponents:

- Wholesale Transactions
- Retail Transactions
- Online Transactions

Figure 1. An application with a three subcomponent hierarchy

To understand how capacity is trending for storage in an application and subcomponents, complete these tasks:

1. Create the Book Sales DB application.
2. Create the Wholesale Transactions, Retail Transactions and Online Transactions applications to represent the subcomponents.
3. Add the Wholesale Transactions, Retail Transactions, and Online Transactions as subcomponents to the Book Sales DB application.
4. Create the Book Sales department and the Wholesale, Retail, and Online subdepartments to be associated with the applications.

- **[Tutorial: Viewing storage capacity and usage trends](#)**

You can view the capacity and usage trends of storage resources used by an application and subcomponents to diagnose how much storage a particular application is using in relation to the other applications and departments in the business hierarchy.

Related concepts

- [Applications](#)

Related tasks

- [Creating applications](#)

Tutorial: Viewing storage capacity and usage trends

You can view the capacity and usage trends of storage resources used by an application and subcomponents to diagnose how much storage a particular application is using in relation to the other applications and departments in the business hierarchy.

About this task

You want to understand how capacity is trending for storage that is used by the Book Sales DB application and the Wholesale Transaction, Retail Transactions and Online Transactions subcomponents and the association the application has with the Book Sales department and subdepartments.

Procedure

The storage resources that are used by the application and that are used by each subcomponent are associated with the application and its subcomponents. For example, the storage resources are assigned as follows:

1. Create a database application called Book Sales DB and assign resources that use the volumes on the IBM® Storwize® V7000 with names that begin with bksales for storing sales transactions.
2. Create the subcomponent applications named Wholesale Transaction, Retail Transactions and Online Transactions.
3. Assign the volumes on the IBM Storwize V7000 with names that begin with bksales_ws to the Wholesale Transactions subcomponent, which is used for storing wholesale sales transactions.
4. Assign the volumes on the IBM Storwize V7000 with names that begin with bksales_rt to the Retail Transactions subcomponent, which is used for storing retail sales transactions.
5. Assign the volumes on the IBM Storwize V7000 with names that begin with bksales_ol to the Online Transactions subcomponent, which is used for storing online sales transactions.

Note: On the Create Filter page, you can specify a name pattern to determine which volumes to include. For volumes, you can specify name patterns to determine from which servers, storage systems, or pools the volumes are selected. You can then click Preview to view the volumes that are selected for inclusion in your application.

Results

To monitor space usage for the Book Sales department and its subdepartments, you associate the Book Sales DB application and the Wholesale, Retail, and Online Transactions subcomponents of the application as follows:

- You associate the Book Sales DB application with the Book Sales department.
- You associate the Wholesale subdepartment with the Wholesale Transactions subcomponent.
- You associate the Retail subdepartment with the Retail Transactions subcomponent.
- You associate the Online subdepartment with the Online Transactions subcomponent.

Figure 1. The application, subcomponent, assigned resources and department association

What to do next

You can view the capacity information that is collected about the application on the Applications page. You can also view capacity information for each application and subcomponent on the details page. When you complete adding the departments and associating the departments with the applications that are used by the departments, you can view the information that is collected about the departments on the Departments page and on the details page for the department.

Tutorial: Viewing NPIV connections between server ports and switch ports in a fabric

In this tutorial, a storage administrator views the N-Port ID Virtualization (NPIV) connections between the server ports and the switch port in the fabric. With NPIV, multiple node ports can be logically connected to one switch port.

About this task

You want to view connectivity information for a switch port that has NPIV connections.

Procedure

1. In the menu bar, go to **Network > Switches**. Double-click the switch that you want to view, or right-click the switch and click **View Details**.
Tip: Alternatively, in the menu bar, go to **Network > Fabrics**. Double-click the fabric that you want to view, or right-click the fabric and click **View Details**. In the **Internal Resources** section, click **Switches**. Double-click the switch that you want to view, or right-click the switch and click **View Details**.
2. In the **Internal Resources** section, click **Ports**. You can view details about the ports, including the number of NPIV connections.
3. In the **Connected NPIV Ports** column for the port that you want to view, click the number of ports. You can view the following information about the NPIV connections:
 - In the **Connected NPIV Ports** tab, you can view details about the NPIV connections, such as the port type and the name of the connected resource. The port type can be **N_Port** (end node port) or **NP_Port** (proxy node port).
 - In the **Connectivity** tab, you can view details about the physically connected end-node port.
Tip: If IBM Spectrum® Control does not differentiate between the physical and logical connections for the switch port, the details about the NPIV connections are displayed in the **Connectivity** tab. The **Connected NPIV Ports** tab is not displayed.

Tutorial: Exporting and uploading performance data for a SAN Volume Controller system

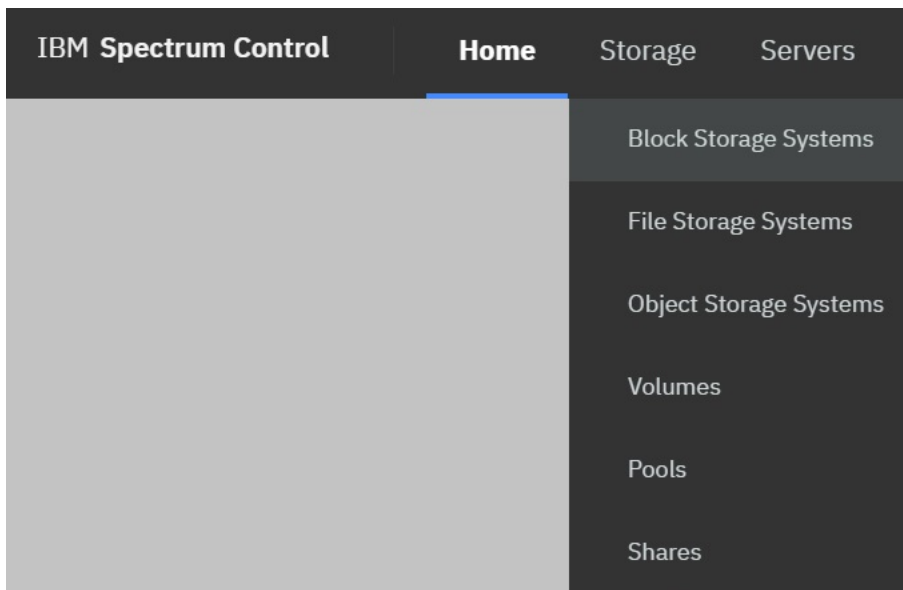

In this tutorial, you export performance data for a SAN Volume Controller to a compressed package » and upload it to a support ticket. « You can also send the package to IBM® Support.

About this task

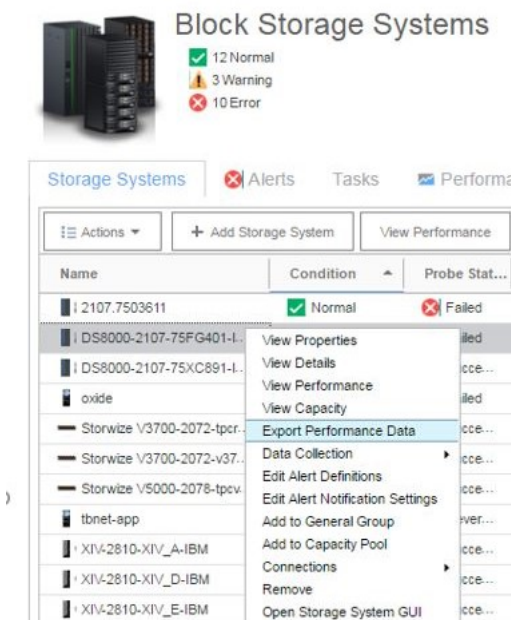

Some volumes on a SAN Volume Controller system have performance problems. You consult IBM Support who require detailed performance data about the SAN Volume Controller system to diagnose the problem. You are asked to export performance data by using IBM Spectrum® Control.

Procedure

1. Go to **Storage > Block Storage Systems**.

2. Right-click the SAN Volume Controller system, then click Export Performance Data.

3. For the Export type, specify whether to download performance data to a local file or to download it to a local file and upload it to a support ticket. For this scenario, select Upload to Ticket.

»You must select the ticket number from the list or manually type it in the Ticket field.

4. Select a time range for the support package.

Typically, the time range includes the time when the performance problem occurred.

5. If you are instructed to do so, select the Advanced export check box. Click Done.

»A task is started and shown in the Running and Completed tasks icon on the menu bar.

6. »When the task is complete, click the Download icon in the task to save the file locally.

Results

»The package is downloaded and uploaded to a support ticket.

Tutorial: Comparing the performance of storage systems

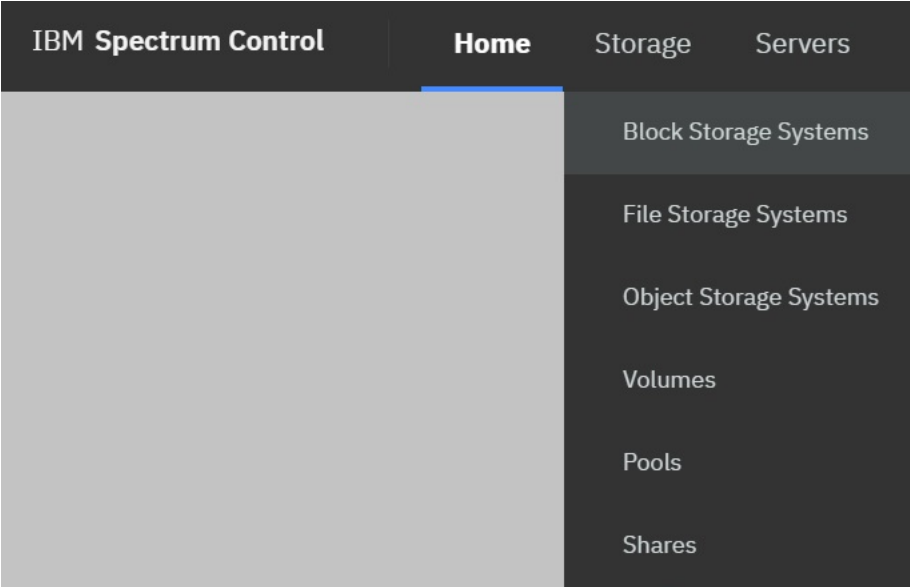

In this tutorial, you compare the performance of two storage systems.

About this task

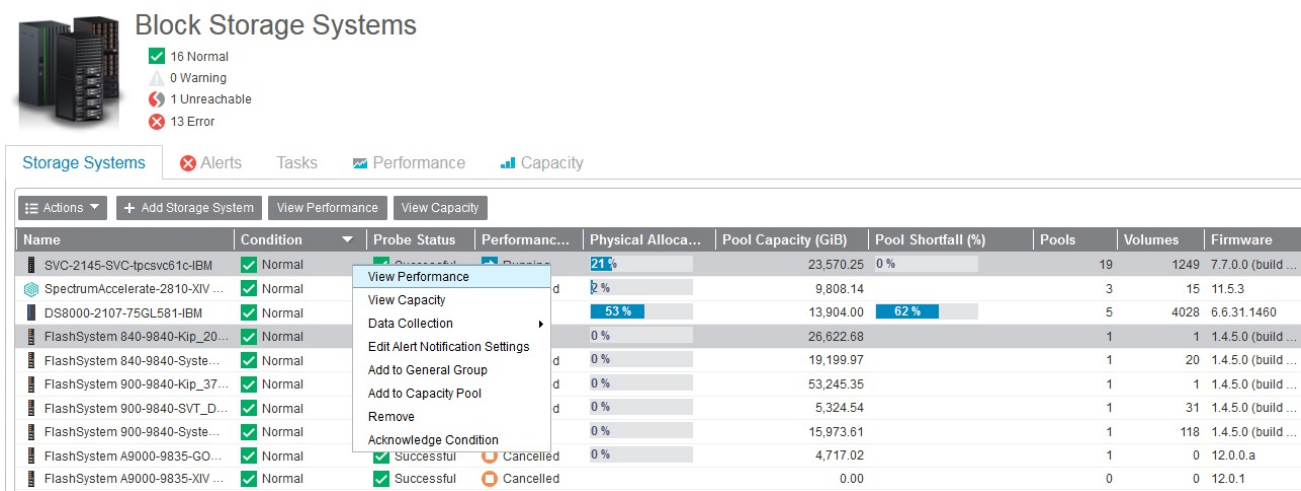

Your company recently purchased an IBM FlashSystem® 900 storage system. The storage system was added to IBM Spectrum® Control and the performance of the storage system is being monitored. Your managers ask you to compare the performance of the FlashSystem 900 storage system to another storage system so that they can assess the performance of their investment. In particular, your managers are interested in the response times and the I/O rates of the FlashSystem 900.

Procedure

1. Go to Storage > Block Storage Systems.

2. Click the FlashSystem 900 storage system and the non-flash storage system that you want to compare the FlashSystem 900 with.
3. Right-click the selected storage systems, then click View Performance.

Results

A performance view is displayed. The view shows the performance of the two storage systems on a chart and in a table. By default, the performance view shows the Total I/O Rate - overall and Overall Response Time metrics. The time period for the information is the last 12 hours.

Tutorial: Reviewing and updating your agentless servers

In this tutorial, you review the agentless servers that are created automatically by IBM Spectrum® Control, and update your agentless servers.

About this task

Every month, you create a chargeback report for the physical servers in your storage environment. The report shows how much capacity is used by physical servers, and the cost of that capacity.

IBM Spectrum Control creates and updates agentless servers automatically after storage systems and hypervisors are probed. The agentless server information is used to create an accurate model of your storage environment, which is then used by the chargeback report to show the consumption of storage by server. You want to review your agentless servers to make sure that they accurately represent your storage environment.

Procedure

1. Go to Servers > Servers.
2. Review the servers that have Agentless in the Condition column.
You notice that IBM Spectrum Control identified 4 host connections and created an agentless server for each host connection. However, in your environment, these 4 host connections are on one server. You need to combine the 4 agentless servers into a server.
3. Select the four agentless servers, right-click, and then click Merge Servers.

Servers

4. Type a name for the new server, then click Merge.

5. Review the agentless servers again.

You notice that IBM Spectrum Control created an agentless server from a group of host connections that appear to be related. However, in your environment, these host connections are actually individual servers. You need to separate the agentless server into individual servers.

6. Select the agentless server, right-click, and then click Separate Server.

7. If any WWPNs on the server are used by more than one host connection, an error message is displayed. The message displays the WWPNs that are used by more than one host connection. Review the WWPNs and make sure that each WWPN is used by only one host connection. Then, try to separate the server again.

8. On the Separate Servers dialog, click Apply.

On the resource list page for servers, an agentless server is created for each of the servers.

Tutorial: Troubleshooting performance

Bob is a storage administrator. One morning, he receives a ticket: A critical medical application, Epic Database, has a performance problem. Bob must investigate the problem and identify the cause.

About this task

Previously, Bob created an Epic Database application on IBM Spectrum® Control and specified the resources that the application uses.

Procedure

1. Bob clicks Applications on the dashboard to troubleshoot only the Epic Database resources.

[Applications](#) [17](#)

2. Bob right-clicks the Epic Database application on the Applications page, then clicks View Details.

Applications

Applications						
<div> <div> <div>⋮</div> <div>Actions</div> </div> <div> <div>+</div> <div>Create Application</div> </div> </div>						
Name	Block Capacity (GiB)	File Capacity (GiB)	Volumes	Servers	Hypervisors	
Accelerate Group	112.18	0.00	7			
Cigna Online	64.11	0.00	4			
Citrix	528.00	0.00	34	tivfcm		
Connections Nodes	112.00	0.00	6			
DB2 Database Ser...	450.00	0.00	9	tpcaix01.democent...		
demo database	416.00	0.00	28	tivfcm		
DemoCentral vm...	205,570.21	0.00	101			
Epic Database	568.00	0.00	12			
Epic Reporting		0.00	9			
Exchange		0.00	29			
Exchange Mail Box...		0.00		2	2	
FileSet SPinst1		160.00				
Intranet Web Servers		0.00	12			

Bob immediately notices the high response times of one volume, vsc-epic-db-test-goldp1, in the Most Active Volumes chart. He sees at a glance that this volume is well above 10 ms/op.

Bob is familiar with the response times and other network conditions that are acceptable for the application. He knows that this response time is too high for this application. He also notes that the high response time is sustained, not just spikes. Bob decides to look more closely at the performance of the volume.

3. Bob clicks Volumes in the Related Resources section, then clicks the Performance tab.

4. Bob uses the chart and table in the Performance tab to further investigate the cause of the problem with the Epic Database application.

He uses the chart and table in the Performance tab to investigate by using the following techniques:

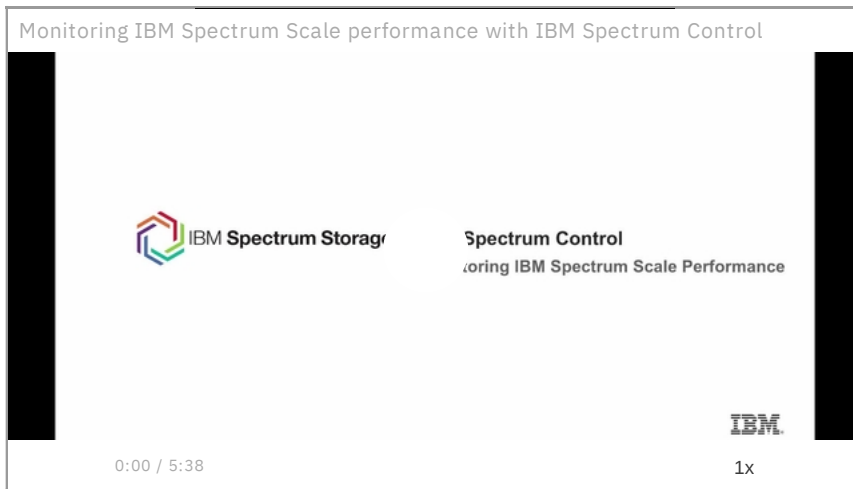

- Change which metrics are displayed in the performance charts. He clicks a metric in the chart legend to display only that metric. He also clicks the Select Chart Metrics icon to add other metrics to the chart.
- Change which resources are displayed in the performance charts. He clicks a resource in the legend to display only that metric. He also clicks resources in the table to add them to the chart.
- View the relationships between resources.
- Compare metrics by time range. To make this comparison, he can select either a predefined time range or a custom time range.
- Compare different metrics within the same time range.
- Compare the same metrics across different time ranges.
- Identify the best or worst values for a performance metric from a large list of resources. For example, Bob might want to see which of the managed disks is handling the most workload, or which volumes have the highest response times.
- Compare performance charts side by side. To compare charts, Bob opens a chart in a new window and arranges the charts beside one another.
- Synchronize all charts so that they all show data for the same time period.
- Export the data from a chart in CSV format.

Tutorial: Monitoring IBM Spectrum Scale performance

You can use IBM Spectrum® Control to monitor the performance of the IBM Spectrum Scale clusters in your storage environment.

In the following video, you learn how to use the following techniques to identify performance issues and bottlenecks in your storage:

- Analyze the performance of all your clusters over a period to determine which clusters have the heaviest I/O loads or the longest response times.
- View which of the nodes that mount a file system have the heaviest I/O loads and highest CPU utilization.
- Compare the file systems on a cluster to determine which file systems have the heaviest I/O loads and the longest response times.
- Monitor the performance of SAN attached volumes that are backing the Network Shared Disks (NSDs) in the cluster. If you have block storage devices, such as IBM Spectrum Accelerate or IBM FlashSystem®, that are providing storage for your clusters, you can monitor the block volumes that are backing the NSDs.

Tutorial: Viewing the aggregated workload for an application

Bob is a storage administrator. Bob wants to easily evaluate the performance of the accounting application because the Accounts department is expanding to a new location and they want to replicate their data across both locations. Bob needs to work out the inter-site link capacity requirements.

About this task

Previously, Bob created an accounting application, Accounts Database, and specified the resources that the application uses.

Procedure

1. Bob clicks Applications on the dashboard to view only the Accounts Database resources.

Applications 17

2. Bob right-clicks the Accounts Db application on the Applications page, then clicks View Details.

Applications

Applications Capacity

Actions Create Application Create Report View Performance View Capacity

Name	Block Capacity (GiB)	File Capacity (GiB)	Object Capacity (GiB)	Volumes	Servers	Hypervisors
Accounts DB	452.48	0.00	0.00	52	4	

View Properties View Details View Performance View Alert Definitions View Capacity Add to... Delete

Bob can use the Aggregated Workload chart to quickly evaluate the throughput required for the link between both sites.

Overview

Bob can toggle between seeing the aggregated I/O rate and the data rate for the application using the arrow (↔) icons either side of the chart.

Overview

3. The rates are aggregated on the primary volumes associated with the application which allows Bob to accurately assess the required MiB/s throughput he will need between both locations.

Tutorial: Identifying the source of slow drain problems caused by depletion of buffer credits

Use this tutorial to find out how to use IBM Spectrum® Control to identify a host that has depleted buffer credits that are causing a slow drain condition.

About this task

Fibre Channel (FC) networks use buffer credits to control the flow of data frames from port to port. The number of buffer credits for a port is the number of data frames that the port can receive. When that number is reached, ports cannot send further data frames until the receiving port indicates that it is ready. If all of the buffer credits of a port are being used, then the port cannot receive more data.

For example, if a host has a performance problem, then its ports might not be able to clear their buffer credits to receive more data. If the host ports cannot receive data, then switch ports cannot send data to the host ports, so the buffer credits of the switch port become depleted too. Ports on other switches in the fabric that try to send data through the switch port are also affected, and their buffer credits become depleted in turn. In this way, the buffer credit problem builds throughout the storage environment. The buffer credit depletion on the host ports impacts the switches that communicated with the host. The switches that communicate with that switch cannot use their buffer credits, so storage systems cannot communicate with the switches.

In this way, a single host with a performance problem can impact all the hosts that use the same switches and inter-switch links. This condition is called *slow drain*. Slow drain in your storage environment can manifest as a problem with storage systems rather than with a host.

Procedure

1. Configure a performance alert for Port Send Delay Time, Port Send Delay I/O Percentage, or Zero Buffer Credit Timer, depending on the storage system. For example, configure a Port Send Delay I/O Percentage alert for FlashSystem 9100 that is triggered when the delay is greater than 20%.

Showing 59 items | Selected 0 items Refreshed a few moments ago

- To view the alerts, click Home and then click Alerts. If the Port Send Delay Time alert was triggered, note the time of the alert.
- To view information about the affected storage system, click the link in the Resource column.
- In the Internal Resources section of the storage system details page, click Volumes.
- Click the Performance tab.
- Set a time period for the performance chart. Set the start time to before the alert occurred and the end time to after the alert occurred.
- Set the chart to display the following metrics:
 - Read Data Rate
 - Overall Response time
- Sort the performance table by the Max Total I/O Rate column.
- Click the volume with the highest Total I/O Rate to show the volume in the chart. Verify that the Read Data Rate spiked at the time that the alert occurred.

- Right-click the volume in the performance table, then click Host Connection Performance.
- Set the chart to display the following metrics:
 - Read Data Rate
 - Overall Response time
- Verify that the spike for the Read Data Rate and the Overall Response Time occurred when the alert was triggered. If the spike occurred at the same time, the host **P9_lpar5_epictest01** is the source of the slow drain that is causing problems on the storage system.

Tip: If the buffer credit problem occurs in a cluster, there might be multiple hosts that are mapped to the volume. In this case, you must investigate the hosts individually to determine which ones cause the delay in sending from the port.

Tutorial: Identifying the locations of devices

Identify the locations of devices that are monitored by IBM Spectrum® Control. You can also apply custom tags to more easily identify, sort, or group devices based on location or another attribute that you specify.

About this task

In large or distributed environments, it can be a challenge to manually keep track of all the physical locations where your devices reside. This challenge might be especially true in organizations with data centers that span multiple time zones and countries. In IBM Spectrum Control, when you add a device for monitoring, it automatically tracks the locations and time zones of devices for you.

Use the following steps to identify the location and time zone of devices that are being monitored. You can also apply custom tags to better filter or sort the devices in the GUI or in an external application if the data is shared or exported.

Procedure

1. In the menu bar, select the device type.
For example, if you want to identify the locations of block storage systems, go to **Storage > Block Storage Systems**.
2. Right-click a device and select **View Properties**.
3. On the **General** tab, scroll down until you see the **Time Zone** and **Location** values. Use these values to identify where a device resides.
To further refine location information, such as differentiating devices in the same geographic location but separate data centers, you can apply up to three custom tags.
4. Optional: To apply a custom tag to a device, click **Edit**.
5. Optional: Enter a value in a **Custom Tag** field and click **Save**.
Use custom tags to help you more easily identify, sort, or group devices. For example, you might enter values like **Data Center X** or **Data Center Y**, depending on the location of a device.
Tip: You can bulk apply custom tags to multiple devices at the same time. For example, on the **Block Storage Systems** page, click **Ctrl + click** or **Shift + click** to select multiple storage systems. Then, right-click the selected storage systems, click **Edit Properties**, and enter values in the **Custom Tag** fields.

Example

After custom tags are applied to devices, you can sort, filter, group, and export the devices based on those tags.

For example, on the **Block Storage Systems** page, you can sort the list so that storage systems with a specific custom tag, such as **Data Center X**, are shown at the top of the list. To sort the list, right-click any of the column headings and select the check box next to **Custom Tag 1**. Then, click the **Custom Tag 1** column to sort the list.

You can also filter the list to only show storage systems with a specific custom tag. To filter the list, enter that custom tag value in the **Filter** text box and press **Enter**. Only the storage systems with custom tags that match or partially match the filter text are shown on the page. You can also complete the following actions:

- To group the filtered storage systems, click **Ctrl + click** or **Shift + click** to select them. Then, right-click the selected storage systems, click **Add to General Group**, and follow the prompts.
- To export the filtered storage systems to a file, select **Actions > Export** and select the file format that you want to use.

Planning

The following sections provide information to help plan your IBM Spectrum® Control environment before you install the product. In a complex environment, good planning helps you avoid delays and problems in getting your system up and running.

- **Planning for installation**
You can install IBM Spectrum Control by using the installation program or the command line in silent mode. Installing IBM Spectrum Control by using console mode is not supported. Also, upgrading the operating system of a server where IBM Spectrum Control is installed is not supported. If you must upgrade the server, contact the IBM® Support team for IBM Spectrum Control Support to discuss your options.

- [Planning for configuration](#)
Use this information to plan your IBM Spectrum Control environment. The information includes general configuration guidelines, TCP/IP ports, user names and user rights, and SMI-S support.
- [Planning for storage management](#)
Plan for how to use IBM Spectrum Control to manage the storage and storage resources in your environment.
- [Sudo command privileges](#)
When you install, operate, or uninstall IBM Spectrum Control as a non-root user on AIX® or Linux® operating systems, you are required to have sudo privileges to multiple commands. Use command aliases in the `/etc/sudoers` file to configure your sudo privileges for multiple commands.

Planning for installation

You can install IBM Spectrum® Control by using the installation program or the command line in silent mode. Installing IBM Spectrum Control by using console mode is not supported. Also, upgrading the operating system of a server where IBM Spectrum Control is installed is not supported. If you must upgrade the server, contact the IBM® Support team for IBM Spectrum Control Support to discuss your options.

Antivirus software considerations

Installing IBM Spectrum Control involves making use of your operating system in manners typical for installing new application software. If your antivirus software is set on the maximum mode, it might prevent some of your changes from being accepted.

To verify that your installation completes correctly, enable your antivirus software product to allow the following instances:

- The `/etc/hosts` file can be edited
- Files can be created in the `/temp` directory
- New executable files can be created in the `C:\Program Files` directory

McAfee tip for Windows: If McAfee Adaptive Threat Protection is enabled on the server where IBM Spectrum Control is installed, it might prevent some services from starting or stopping. To help avoid this issue, open McAfee Adaptive Threat Protection and go to settings. In the Real Protect Scanning (Windows only) section, verify if Enable client-based scanning is selected. If so, select Low from the Sensitivity level list.

For more information about McAfee Adaptive Threat Protection, see the following links:

- [Adaptive Threat Protection — Options](#)
- [Overview of Adaptive Threat Protection](#)

Recommended skills and knowledge

Administrators and users of IBM Spectrum Control should be familiar with the following skills and topics:

- General procedures for installing software on Microsoft Windows, IBM AIX®, and Linux® operating systems
- Storage Area Network (SAN) concepts
- IBM Spectrum Control concepts
- IBM Database
- Simple Network Management Protocol (SNMP) concepts

Required user privileges for installation

Ensure that you have the required privileges to install Db2® and IBM Spectrum Control. If you are installing on a Windows operating system, you must install as a user with administrator privileges. If you are installing on an AIX or Linux operating system, you must install as a root user or as a non-root user who has sudo privileges.

Fully qualified host names

Some systems might be configured to return a short host name such as `server22`, instead of a fully qualified host name such as `server22.myorg.mycompany.com`. IBM Spectrum Control requires fully qualified host names, so you must install the product on a computer that has a fully qualified host name.

Restriction:

Hostnames must be 15 characters or less and cannot contain special characters, for example, a space or an underscore. Use characters a through z, or characters 0 - 9. Hyphens (-) are also allowed.

Important: Before you run your Db2 installation and begin your IBM Spectrum Control installation, please validate that the Windows server hostname is 15 characters or less in length.

For more information about determining whether you have a fully qualified domain name, see [Checking for a fully qualified host name](#).

Self signed certificate considerations

There are new certificate requirements from the [CA/B Forum](#) that are strictly enforced for macOS Catalina users that might affect your ability to access the IBM Spectrum Control GUI. During an upgrade of IBM Spectrum Control, certificates self-signed by IBM Spectrum Control will be made automatically compliant. However, if one or more of your certificates are not self-signed by IBM Spectrum Control, see [IBM Spectrum Control and macOS Catalina \(10.15\) Increased Security Policies on SSL Certificates](#) and validate that your certificates are compliant.

Starting with IBM Spectrum Control 5.3.6, all default self-signed certificates have an expiration date of 825 days based on the new certificate requirements from the CA/B Forum. By default, upgrades of IBM Spectrum Control always renew the expiration of all default self-signed certificates used by the product for another 825 days. However, if you have installed your own certificates, IBM Spectrum Control does not modify those certificates for you.

For more information about determining whether you have a fully qualified domain name, see [Replacing the default SSL certificate for the Device, Alert, or Web server with a self-signed certificate](#).

For more information about determining whether you have a fully qualified domain name, see [Replacing the default SSL certificate for the Export server](#).

Hardware and software requirements

The IBM Spectrum Control server can require a large amount of memory, disk space, network bandwidth, and processor resources. To promote consistent availability and performance, install IBM Spectrum Control on a dedicated server where no other critical business applications, including IBM Copy Services Manager, are installed. IBM Software Support is not responsible for availability, performance, and functional problems that are caused by other business applications that are deployed on the same server as IBM Spectrum Control.

Before you install IBM Spectrum Control, apply all available updates and patches to the operating system on the target computer.

For information about hardware requirements, see [Hardware requirements](#).

For information about software requirements, see [Software requirements](#).

For information about updates to product and operating system support, see *Find the Supported Hardware, Products and Platforms Interoperability Matrix Links* at <https://www.ibm.com/support/pages/node/388393>.

Installation methods

You can install Db2 and IBM Spectrum Control by using the GUI or silent mode. In silent mode, a command is provided with the values in a response file.

Use the silent-mode installation to install on a server that cannot display graphics. For example, if you are installing on an AIX or Linux server that does not have the X Window System installed.

On a server that does not have the X Window System installed, you cannot change the Db2 and IBM Spectrum Control passwords within IBM Spectrum Control by using the change password tool. For information on how to change the passwords, see [Changing passwords on AIX and Linux systems using the Command Line Interface \(CLI\)](#).

Installation images

Compressed installation images are available electronically. Download and extract these images to a location with adequate disk space. For disk space requirements by operating system, see *IBM Spectrum Control - Hardware Support: Memory, Processor and Disk Space* at [IBM Spectrum Control - Hardware Support: Memory, Processor and Disk Space](#).

Download the installation images for each product into a separate directory. The following list provides sample download directory paths:

- c:\downloads\DB2
- c:\downloads\SC

Extract the image files into a separate temporary directory for each product. For example:

- c:\temp\DB2
- c:\temp\SC

Attention: If you do not extract the files into separate directories for each product, the common paths or path structures might overwrite each other, and you cannot install the products.

Follow these rules for naming the directories:

- Do not include spaces in the directory name.
- Keep the directory name short.
- For Linux or AIX operating systems, do not include a period (.) at the end of the directory name.

During the extraction of multi-part images, if you are prompted to merge or replace folders or files with the same name, click Merge/Replace.

Installation files for the following components are provided with IBM Spectrum Control:

Db2

- Db2 for Windows (64-bit)
- Db2 for Linux (64-bit)
- Db2 for AIX (64-bit)

IBM Spectrum Control

- IBM Spectrum Control for AIX
- IBM Spectrum Control for Linux
- IBM Spectrum Control for Windows

In addition, installation files for the following optional agents are available with IBM Spectrum Control:

- IBM Spectrum Control Storage Resource agent for Windows
- IBM Spectrum Control Storage Resource agent for UNIX

On Windows operating systems, assign the appropriate security settings for the Db2 and IBM Spectrum Control compressed files by completing the following steps:

1. Right-click one of the compressed installation files.
2. Examine the General tab and determine whether the Unblock button is displayed.
3. If the Unblock button is displayed:
 - a. Right-click the compressed file and click Properties.
 - b. On the General tab, next to Security, click Unblock.
4. Verify that the compressed installation files no longer have the Unblock button displayed.

IBM Spectrum Control GUI

After IBM Spectrum Control is installed, use the GUI to complete your storage management tasks. The GUI runs in a web browser and includes the ability to monitor, manage, and troubleshoot storage resources. You can access this interface from anywhere that you have a web browser and connectivity to a network. You can also use the IBM Cognos® Analytics reporting tool to generate, save, and view reports about the condition, capacity, and performance resources.

Installation language

When you install IBM Spectrum Control, you must select one of the following languages:

- English
- Czech
- French
- German
- Hungarian
- Italian
- Japanese
- Korean
- Polish
- Brazilian Portuguese
- Russian
- Spanish
- Chinese (Simplified)
- Chinese (Traditional)

For more information about changing the operating system for the user interface, see [Changing languages](#).

Messages, online help, and text are displayed in the language that you select. You are not required to install a language pack after installation. When you use IBM Spectrum Control, the language that is displayed is the language setting of the operating system.

To install IBM Spectrum Control on a Windows domain, see [Planning to install IBM Spectrum Control in a Windows domain](#) and [Installing IBM Spectrum Control on a Windows domain](#).

Installation images on AIX

When you extract installation images, use the GNU tape archive (tar) program instead of the AIX tape archive program. The AIX tape archive program might truncate long file names, which can cause installation errors in IBM Spectrum Control.

To get the GNU tape archive program, go to [AIX Toolbox for Open Source Software](#). Find tar in the Package column, and click RPM to download the program. You must specify this program as the default tape archive program in the PATH environment variable.

For more information on using the correct program to extract the IBM Spectrum Control installation media, see [How to install GNU tar on AIX operating system](#).

- [Planning to install IBM Spectrum Control in a Windows domain](#)
Before you can install IBM Spectrum Control on a Windows domain, you must determine which installation method is appropriate, based on your environment.
- [Required user privileges in installation scenarios](#)
When you are planning to install IBM Spectrum Control, there are users to consider for the installation.

Planning to install IBM Spectrum Control in a Windows domain

Before you can install IBM Spectrum® Control on a Windows domain, you must determine which installation method is appropriate, based on your environment.

Installation methods

Install Db2® and IBM Spectrum Control in one of the following ways:

- Use local user accounts to install both Db2 and IBM Spectrum Control.
- Use a local user account to install Db2 and a domain user account to install IBM Spectrum Control.
- Use domain user accounts to install both Db2 and IBM Spectrum Control.
- [Windows domain and local user accounts](#)
When a computer is a member of a Windows domain, you can install IBM Db2 on the local computer or on a computer that is a member of a Windows domain. The installation process creates a local Db2 user account or a domain Db2 user account.
- [Adding a computer to the Windows domain](#)
Before you can install IBM Spectrum Control in a Windows domain, you must first add the computer on which you plan to install IBM Spectrum Control to the domain.
- [Verifying that the Netlogon service is running](#)
IBM Spectrum Control uses WebSphere® Application Server Liberty to authenticate domain users. WebSphere Application Server Liberty requires that the Microsoft Netlogon service is enabled and running to authenticate these users.
- [Installing Db2 by using a Windows domain user account](#)
Before you install IBM Spectrum Control in a Windows domain, you must install Db2 and register the Db2 license key.
- [Creating a Windows domain common user account for IBM Spectrum Control](#)
You must create a Windows domain common user account before you can install IBM Spectrum Control in a Windows domain.
- [Granting Db2 SYSADM authority to a Windows domain user account](#)
If a Windows domain user account is used to install IBM Spectrum Control, the user account may not have the Db2 SYSADM authority, because Db2 goes to the domain controller computer to list the groups. Before you install IBM Spectrum Control, you must grant the Windows domain user accounts the Db2 SYSADM authority.

Windows domain and local user accounts

When a computer is a member of a Windows domain, you can install IBM® Db2® on the local computer or on a computer that is a member of a Windows domain. The installation process creates a local Db2 user account or a domain Db2 user account.

User accounts

Windows domain user accounts are used to manage multiple computers, and local user accounts can be used to manage one computer.

Important: You set the common user for IBM Spectrum® Control during the initial installation of the product. When that common user is set, it cannot be changed during the life of that IBM Spectrum Control system. For example, if you set the common user to be *db2admin* during the initial installation of IBM Spectrum Control on a Windows operating system, then the *db2admin* user is the constant common user for that particular IBM Spectrum Control system.

Restriction: Before you install IBM Spectrum Control by using a Windows domain or a local user account as the common user name, you must add the Windows domain user account or local user account to the local administrators group. The IBM Spectrum Control installation software recognizes only Windows domain or local user accounts (and not Windows domain or local groups) that are added to the local administrators group.

domain Db2 user account is an example of a Windows domain user account, and *local Db2 user account* is an example of a local user account.

Naming conventions for user accounts

You can install IBM Spectrum Control by using the same user account that is defined in both the local and Windows domain registries. The Windows operating system resolves this naming collision on computers that belong to a Windows domain by prefixing the user name with the host name or domain name. This user name is also called a *fully qualified user name*.

You must use the following naming conventions for each user account:

- *domain_name\administrator*
- *domain_name\user 1, domain_name\user2, domain_name\userN.*
- *host_name\administrator*
- *host_name\user1, host_name\user2, host_name\userN.*

For example, if the domain name is **TPC51**, and the user name is **db2admin**, the Windows domain user account is **TPC51\db2admin**. The naming convention for a local user account is *host_name\user name*. For example, if the host name is **machine2**, and the user name is **db2admin**, the user account is **machine2\db2admin**. You must enter the fully qualified user names in the common user name field when you install IBM Spectrum Control on computers that are members of a Windows domain.

Installation considerations

As part of your planning process, you must determine which user accounts to use when you install IBM Spectrum Control and Db2, consider the environment and security requirements.

IBM Spectrum Control uses WebSphere® Application Server Liberty to authenticate the users for local and domain user accounts. When the computer that hosts the WebSphere Application Server Liberty process is a member of a Windows domain, by default local and domain user registries are used, but the Windows domain user registry takes precedence.

Related reference

- [Adding a computer to the Windows domain](#)
- [Installing Db2 by using a Windows domain user account](#)
- [Creating a Windows domain common user account for IBM Spectrum Control](#)
- [Granting Db2 SYSADM authority to a Windows domain user account](#)
- [Installing IBM Spectrum Control on a Windows domain](#)

Adding a computer to the Windows domain

Before you can install IBM Spectrum® Control in a Windows domain, you must first add the computer on which you plan to install IBM Spectrum Control to the domain.

You can log on to a computer that is a member of a Windows domain by entering a user name that is prefixed with the domain name. For example, you can enter **TPC52\Administrator** if you are the domain administrator of the **TPC52** domain.

To add a computer to a Windows domain, complete the following steps:

1. Click Start > Control Panel > Network and Internet > Network and Sharing Center.
2. On the Network and Sharing Center window, click the left mouse button on your local area connection and click Properties.
3. Select the Internet Protocol Version 4 (TCP/IP4) check box, and click Properties.
Tip: If you are using Windows Server 2012, ensure that the Client for Microsoft Networks check box is selected.
4. On the General tab, select Use the following DNS server addresses.
5. In the Preferred DNS server field, enter the IP address of the domain controller computer.
6. In the Alternate DNS server field, enter the IP address of the alternate DNS server.
7. Click Advanced.
8. On the DNS tab, review the list of IP addresses.
9. In DNS suffix for this connection field, enter the fully qualified domain name.
10. Click OK.
11. Right-click Computer and select Properties.
12. In the Computer name, domain, and workgroup settings section, click Change settings.
13. Click Change.
14. On the Computer Name/Domain Changes window, select Domain, enter the fully qualified domain name, and click OK.
15. Enter the user name and password for the domain controller computer.

- Important: The user name and password that you enter must be a domain administrator user name and password.
- Click OK for the changes to take effect and to start the computer again.

Verifying that the Netlogon service is running

IBM Spectrum® Control uses WebSphere® Application Server Liberty to authenticate domain users. WebSphere Application Server Liberty requires that the Microsoft Netlogon service is enabled and running to authenticate these users.

To verify that the Netlogon service is running on the domain controller computer and the computer that is a member of a domain, complete the following steps:

- Right-click Computer and select Manage.
- In the navigation tree view, click Server Manager > Configuration > Services.
- Verify that the Netlogon service is started.
If the service has a Stopped/Disabled status on the domain controller computer, you must also restart the computer that is a member of a Windows domain after you start the service on the domain controller computer.

Installing Db2 by using a Windows domain user account

Before you install IBM Spectrum® Control in a Windows domain, you must install Db2® and register the Db2 license key.

The following table shows the privileges that are required for users associated with installing and running Db2 in a Windows domain environment:

Table 1. User privileges related to Db2 in a Windows domain environment

User role	Required privileges
Installing Db2 on the target Windows domain member machine such that the Db2 instance owner (typically db2admin) is a domain user and the Db2 groups (typically DB2ADMNS and DB2USERS) are domain groups	Local Administrator and Domain Administrator The Db2 installation needs to access and update the Db2 user and group information in the Active Directory that is running on the Windows Domain Controller machine.
Db2 instance owner (typically db2admin) that runs Db2 after Db2 is installed	Local Administrator

Tip: It is recommended that you manually create the Db2 user (the user who will own the Db2 instance that gets created when Db2 is installed, typically *db2admin*), and the Db2 groups (typically *DB2ADMNS* and *DB2USERS*) in the Active Directory on the Domain Controller before you install Db2 on the Windows domain member machine. The Db2 user *must* be a member of both Db2 groups in the Active Directory and a member of the local Administrators group on the Windows domain member machine. To install Db2 by using a Windows domain user account, complete the following steps:

- Log on to Windows as a user that has the correct privileges.
- In Windows Explorer, go to the directory where Db2 installation image is located.
- Right-click **setup.exe** and select Run as administrator.
- Complete the Db2 Setup program.
- On the Set user information for the Db2 Administration Server page, in the User Information panel, select your domain.
- Enter the name of the Db2 user (the user who will own the Db2 instance, typically *db2admin*) that you manually created in the Active Directory on the Domain Controller then enter and confirm the corresponding password.
- On the Enable operating system security for Db2 objects page, complete the following steps:
 - Verify that Enable operating system security check box is selected.
 - In the Db2 administrators group and Db2 users group sections, select your domain and then enter the names of the Db2 groups that you manually created in the Active Directory on the Domain Controller.
 - Click **OK** in the dialog warning you that these groups already exist.

Creating a Windows domain common user account for IBM Spectrum Control

You must create a Windows domain common user account before you can install IBM Spectrum® Control in a Windows domain.

Important: You set the common user for IBM Spectrum Control during the initial installation of the product. When that common user is set, it cannot be changed during the life of that IBM Spectrum Control system. For example, if you set the common user to be *db2admin* during the initial installation of IBM Spectrum Control on a Windows operating system, then the *db2admin* user is the constant common user for that particular IBM Spectrum Control system.

To create a domain common user account for IBM Spectrum Control, complete the following steps:

- Log on to the domain controller computer by using a domain administrator user account.
- Click Start > Administrative Tools > Active Directory Users and Computers.
- Right-click on the Users folder and select New > User.
- On the domain controller computer, click Start > All Programs > Administrative Tools > Active Directory Users and Computers.
- Right-click on the domain user you created and click Properties > Member Of.
- On the Member of tab, click Add and add DB2ADMNS.
- Click Check Names.
- If the name you entered is located, click OK.
- Repeat steps 4 - 8 and add the DB2USERS group.
Tip: The Domain Users group exists.
- Follow the prompts to create the domain common user account for IBM Spectrum Control.
- Log on to the domain client computer on which you want to install IBM Spectrum Control by using a domain administrator user account.
When you log in to computer that is a member of a Windows domain by using the domain administrator user account, and you encounter the 'DB2® UDB SQL5005C System Error' message, complete the following steps:
 - Log in to the computer that is a member of a domain by using the local user name.
 - Click Server Manager > Configuration > Local Users and Groups > Groups > DB2ADMNS > Properties > Add.
 - Add *domain\domain user name*.

- d. Click Check Names.
- e. If the user name that you checked for is underlined, click Apply.
12. Open Server Manager.
13. In the navigation tree, click Server Manager, Configuration, Local Users and Groups, Groups.
14. Add the domain common user name that you created in step 3 (**commonid**) to the local administrator group.

Restriction: When you install IBM Spectrum Control by using a Windows domain user account, the *sAMAccountName* and *userPrincipalName* (the User login name) Active Directory attributes in the Windows domain user account cannot contain spaces. The *sAMAccountName* must have the same value as the part of the *userPrincipalName* Active Directory attribute that precedes the @ character.

Granting Db2 SYSADM authority to a Windows domain user account

If a Windows domain user account is used to install IBM Spectrum® Control, the user account may not have the Db2® SYSADM authority, because Db2 goes to the domain controller computer to list the groups. Before you install IBM Spectrum Control, you must grant the Windows domain user accounts the Db2 SYSADM authority.

To enter the commands, and Db2 SYSADM authority, complete the following steps:

1. Click Start, Command Prompt.
2. Right-click Command Prompt and select Run as administrator.
3. Enter these commands:

```
db2cmd
db2set -g DB2_GRP_LOOKUP=local,TOKENLOCAL
db2 force application all
db2stop
db2start
db2set -all
```

After you run the commands, you can log in to IBM Spectrum Control by using a user account that has Db2 SYSADM authority.

If you are logged in by using your Windows domain user account, you may not have the authorization to run the **db2 force application all** command.

Important: When you grant Db2 SYSADM authority, and the **db2 force application all** command does not work, you can enter the **db2stop** command instead of the **db2 force application all** command.
 For more information about acquiring user group information in the Windows operating system, see [Using an access token to acquire users' group information \(Windows\)](#).
 For more information about the sysadmin_group parameter, see [System administration authority \(SYSADM\)](#).

Required user privileges in installation scenarios

When you are planning to install IBM Spectrum® Control, there are users to consider for the installation.

These are the users to consider:

- Application administrator
 - The user who logs in to the operating system and does the installation of IBM Spectrum Control.
- Common user
 - The user that you set during the installation of IBM Spectrum Control. The user name that is used to run IBM Spectrum Control.
 - Important: You set the common user for IBM Spectrum Control during the initial installation of the product. When that common user is set, it cannot be changed during the life of that IBM Spectrum Control system. For example, if you set the common user to be *db2admin* during the initial installation of IBM Spectrum Control on a Windows operating system, then the *db2admin* user is the constant common user for that particular IBM Spectrum Control system.
- Db2® user
 - The user that you set during the installation of IBM Spectrum Control. The user name that is used to install and operate the database repository for IBM Spectrum Control.

There are user privileges that are required in various IBM Spectrum Control installation scenarios.

Important: The required user privileges for Common User and Db2 user *cannot* be changed or removed after you complete the installation of IBM Spectrum Control. You can change the required user privileges for the Application administrator after that user completes the installation of IBM Spectrum Control, but only if the Application administrator is *not* set as the Common User or Db2 user in IBM Spectrum Control.
 The following table shows the required user privileges in IBM Spectrum Control installation scenarios:

Table 1. Required user privileges for an IBM Spectrum Control installation

Installation scenario	Required privilege
-----------------------	--------------------

Installation scenario	Required privilege
Setting <i>only</i> the Common User, single-server installation, <i>not</i> in a Windows domain environment	<p>Application administrator:</p> <p>Windows operating system: You must be an Administrator and must have the <i>Debug programs</i> privilege and must <i>not</i> have the <i>Deny access to this computer from the network</i> privilege in the Windows operating system security policy. These privileges can be found in Administrative Tools -> Local Security Policy -> Local Policies -> User Rights Assignment</p> <p>Linux® operating system: You must be a root user or a non-root user with sudo privileges.</p> <p>AIX® operating system: You must be a root user or a non-root user with sudo privileges.</p> <p>Common user:</p> <p>Windows operating system: A member of the local Administrators group, a member of the local Db2 groups (typically DB2ADMNS and DB2USERS).</p> <p>Linux operating system: A member of the root group, a member of the Db2 group (typically db2iadm1).</p> <p>AIX® operating system: member of the system group, member of the Db2 group (typically db2iadm1).</p>
Setting the Common User and Db2 user, single-server installation, <i>not</i> a Windows domain environment	<p>Application administrator:</p> <p>Windows operating system: You must be an Administrator and must have the <i>Debug programs</i> privilege and must <i>not</i> have the <i>Deny access to this computer from the network</i> privilege in the Windows operating system security policy. These privileges can be found in Administrative Tools -> Local Security Policy -> Local Policies -> User Rights Assignment</p> <p>Linux operating system: You must be a root user or a non-root user with sudo privileges.</p> <p>AIX operating system: You must be a root user or a non-root user with sudo privileges.</p> <p>Common User:</p> <p>Windows operating system: A member of the local Administrators group.</p> <p>Linux operating system: A member of the root group.</p> <p>AIX operating system: A member of the system group.</p> <p>Db2 user:</p> <p>Windows operating system: A member of the local Db2 groups (typically DB2ADMNS and DB2USERS).</p> <p>Linux operating system: A member of the Db2 group (typically db2iadm1).</p> <p>AIX operating system: A member of the Db2 group (typically db2iadm1).</p>
Setting <i>only</i> the Common User, single-server installation, in a Windows domain environment with Db2 installed so the Db2 instance owner (typically db2admin) is a domain user and the Db2 groups (typically DB2ADMNS and DB2USERS) are domain groups.	<p>Application administrator:</p> <p>You must be an Administrator and must have the <i>Debug programs</i> privilege and must <i>not</i> have the <i>Deny access to this computer from the network</i> privilege in the Windows operating system security policy. These privileges can be found in Administrative Tools -> Local Security Policy -> Local Policies -> User Rights Assignment</p> <p>Common user:</p> <p>A member of the local Administrators group, a member of the domain Db2 groups (typically DB2ADMNS and DB2USERS; these groups are stored in the domain Active Directory).</p>
Setting the Common User and Db2 user, single-server installation, in a Windows domain environment with Db2 installed so the Db2 instance owner (typically db2admin) is a domain user and the Db2 groups (typically DB2ADMNS and DB2USERS) are domain groups.	<p>Application administrator:</p> <p>You must be an Administrator and must have the <i>Debug programs</i> privilege and must <i>not</i> have the <i>Deny access to this computer from the network</i> privilege in the Windows operating system security policy. These privileges can be found in Administrative Tools -> Local Security Policy -> Local Policies -> User Rights Assignment</p> <p>Common User: A member of the local Administrators group.</p> <p>Db2 user: A member of the domain Db2 groups (typically DB2ADMNS and DB2USERS; these groups are stored in the domain Active Directory).</p>

Installation scenario	Required privilege
Setting <i>only</i> the Db2 user, multiple server installation (Database repository), <i>not</i> in a Windows domain environment.	<p>Application administrator:</p> <p>Windows operating system:</p> <p>You must be an Administrator and must have the <i>Debug programs</i> privilege and must <i>not</i> have the <i>Deny access to this computer from the network</i> privilege in the Windows operating system security policy. These privileges can be found in Administrative Tools -> Local Security Policy -> Local Policies -> User Rights Assignment</p> <p>Linux operating system: Must be a root user or a non-root user with sudo privileges.</p> <p>AIX operating system: Must be a root user or a non-root user with sudo privileges</p> <p>Db2 user:</p> <p>Windows operating system: A member of the local DB2® groups (typically DB2ADMNS and DB2USERS).</p> <p>Linux operating system: A member of the DB2 group (typically db2iadm1).</p> <p>AIX operating system: A member of the DB2 group (typically db2iadm1).</p>
Setting <i>only</i> the Common User, multiple server installation (IBM Spectrum Control Servers), <i>not</i> in a Windows domain environment.	<p>Application administrator:</p> <p>Windows operating system:</p> <p>You must be an Administrator and must have the <i>Debug programs</i> privilege and must <i>not</i> have the <i>Deny access to this computer from the network</i> privilege in the Windows operating system security policy. These privileges can be found in Administrative Tools -> Local Security Policy -> Local Policies -> User Rights Assignment</p> <p>Linux operating system: Must be a root user or a non-root user with sudo privileges.</p> <p>AIX operating system: Must be a root user or a non-root user with sudo privileges.</p> <p>Common user:</p> <p>Windows operating system: A member of the local Administrators group.</p> <p>Linux operating system: A member of the root group.</p> <p>AIX operating system: A member of the system group.</p>
Setting <i>only</i> the Db2 user, multiple server installation (Database repository), in a Windows domain environment with Db2 installed so the Db2 instance owner (typically db2admin) is a domain user and the Db2 groups (typically DB2ADMNS and DB2USERS) are domain groups.	<p>Application administrator:</p> <p>You must be an Administrator and must have the <i>Debug programs</i> privilege and must <i>not</i> have the <i>Deny access to this computer from the network</i> privilege in the Windows operating system security policy. These privileges can be found in Administrative Tools -> Local Security Policy -> Local Policies -> User Rights Assignment</p> <p>Db2 user:</p> <p>A member of the domain Db2 groups (typically DB2ADMNS and DB2USERS; these groups are stored in the domain Active Directory).</p>
Setting <i>only</i> the Common User, multiple server installation (IBM Spectrum Control Servers), in a Windows domain environment.	<p>Application administrator:</p> <p>You must be an Administrator and must have the <i>Debug programs</i> privilege and must <i>not</i> have the <i>Deny access to this computer from the network</i> privilege in the Windows operating system security policy. These privileges can be found in Administrative Tools -> Local Security Policy -> Local Policies -> User Rights Assignment</p> <p>Common user:</p> <p>A member of the local Administrators group.</p>

Planning for configuration

Use this information to plan your IBM Spectrum® Control environment. The information includes general configuration guidelines, TCP/IP ports, user names and user rights, and SMI-S support.

- [Planning for capacity](#)
The following guidelines can help you determine the capacity for IBM Spectrum Control.
- [Planning for IBM Spectrum Control authentication and authorization](#)
An operating system user name is required to install and log on to IBM Spectrum Control for the first time. After you install IBM Spectrum Control, you can assign roles to users. Roles determine the product functions that are available to users.
- [User names and passwords](#)
Several user names and passwords are required to install, configure, and use IBM Spectrum Control. There are also some requirements and limitations that you must understand before you install IBM Spectrum Control.
- [Ports used by IBM Spectrum Control](#)
When you install IBM Spectrum Control, the ports must be opened through the firewall. You must disable the firewall program or open the ports to allow incoming requests to the IBM Spectrum Control ports. Review these ports before you install IBM Spectrum Control.
- [Planning for multipath subsystem device drivers](#)
The subsystem device driver (SDD) is a software solution for multiple configuration environments in supported storage resources.

- [Planning for Storage Resource agents](#)
Use Storage Resource agents to collect asset and configuration information about servers.
- [Planning for Internet Protocol Version 6](#)
IBM Spectrum Control supports Internet Protocol Version 6 (IPv6) for communication between its components. The key IPv6 enhancement is the expansion of IP address spaces from 32 bits (up to 15 characters in length) to 128 bits (up to 45 characters in length).
- [Planning to use LDAP for IBM Spectrum Control authentication](#)
The Lightweight Directory Access Protocol (LDAP) is an application protocol that you can use to query and modify directory services running over TCP/IP. The IBM Spectrum Control installation program establishes a default authentication configuration using the federated repositories feature of the IBM® WebSphere® Application Server Liberty. You can configure IBM Spectrum Control for LDAP authentication as a post-installation activity.

Planning for capacity

The following guidelines can help you determine the capacity for IBM Spectrum® Control.

About this task

Consider the following guidelines when you determine your capacity requirements:

Database repository

For best optimal read/write performance, install IBM Spectrum Control, Db2® data, and the Db2 logs on separate physical disks, which are separate from the host server's operating system. Of course, how you configure your environment is based on your storage technology.

IBM Spectrum Control server

The IBM Spectrum Control server must meet the following requirements:

- The IBM Spectrum Control server must have dual 3.2 GHz processors with a minimum of 8 GB of random access memory (RAM).
- The IBM Spectrum Control server must be a dedicated computer for IBM Spectrum Control operations and not shared with other applications.
- Paging space: On AIX® operating systems, the paging space must be at least half or, if possible, the same amount as the physical memory. You must periodically monitor paging space usage by running the `lsps -s` command and increasing the space if the percentage used is higher than 50%.

LSI SMI-S Provider

IBM Spectrum Control supports up to five storage systems with the LSI SMI-S Provider 1.3 or later.

Planning for IBM Spectrum Control authentication and authorization

An operating system user name is required to install and log on to IBM Spectrum® Control for the first time. After you install IBM Spectrum Control, you can assign roles to users. Roles determine the product functions that are available to users.

User requirements for installing IBM Spectrum Control

The user name that you use when you run the IBM Spectrum Control installation program must belong to the following operating system groups. The user that you define as the common user during the IBM Spectrum Control installation must also belong to these groups. The IBM Spectrum Control installation program automatically maps these groups to the IBM Spectrum Control Administrator role.

Table 1. Operating system groups that are mapped to the Administrator role

Operating System	Group
Windows	Administrators
AIX®	system
Linux®	root

The user name that is used to install the database repository must belong to one of the following Db2® groups. The user name that is used to install the database repository depends on your installation configuration. For example, if you installed IBM Spectrum Control on a single server and you did not enter separate user information for Db2, the database repository is installed by using the common user name. Therefore, the common user must have these Db2 privileges.

Table 2. Db2 groups that are required to install the database repository

Operating System	Group
Windows	DB2ADMNS
AIX and Linux	db2iadm1

The IBM Spectrum Control installation program establishes a default authentication configuration by using the federated repositories feature of the WebSphere® Application Server Liberty.

If you want to change the user authentication configuration, see [Configuring user authentication](#).

For more information about installing IBM Spectrum Control on a Windows domain, see [Planning to install IBM Spectrum Control in a Windows domain](#) and [Installing IBM Spectrum Control on a Windows domain](#).

Defining roles for IBM Spectrum Control

After you install IBM Spectrum Control, you can assign roles for IBM Spectrum Control users. These roles are predefined in IBM Spectrum Control and are assigned at the group level. The role determines the authorization level for the users who are in the group. The authorization level determines the functions in IBM Spectrum Control that the user can access.

For example, if a user is in a group that is assigned to the Administrator role, the user has full access to all IBM Spectrum Control functions. However, if a user is in a group that is assigned to the Monitor role, the user has access to only a limited set of functions.

For more information about roles and groups, see [Role-based authorization](#).

User names and passwords

Several user names and passwords are required to install, configure, and use IBM Spectrum® Control. There are also some requirements and limitations that you must understand before you install IBM Spectrum Control.

A worksheet is also provided to help you plan and document the user names and passwords that you use with IBM Spectrum Control. Keep the completed worksheet in a safe, secure place. Before you install IBM Spectrum Control, you must understand your local security policies and requirements. These policies can impose certain standards that you must consider when you create user names and passwords to comply with requirements.

- [User name and password requirements](#)
This information helps you create valid user names and passwords for IBM Spectrum Control and understand any special character restrictions.
- [Db2 user names and passwords](#)
These are the rules for using Db2® user names and passwords.
- [Required user roles for monitoring resources](#)
When you add storage systems, switches, and hypervisors for monitoring, you must provide a user name and password for logging in to those resources. The role or user group that is assigned to the user name determines the data collection and storage functions that you can use.
- [Worksheet for user names and passwords](#)
Use this worksheet to document the user names and passwords that you create when you install and administer IBM Spectrum Control. Space is provided for you to list more user names and passwords that you create when you configure more devices in IBM Spectrum Control.

- [Worksheet for user names and passwords](#)

User name and password requirements

This information helps you create valid user names and passwords for IBM Spectrum® Control and understand any special character restrictions.

[Table 1](#) lists the user names and passwords that are used with IBM Spectrum Control and specifies the following criteria:

- User names must be local or a Windows domain account or an LDAP account
Restriction: If you use LDAP, IBM Spectrum Control must be configured for LDAP authentication.
- Valid user name characters must comply with the minimum and maximum length requirements
- Valid password characters must comply with the minimum and maximum length requirements

Restriction: If the IBM Spectrum Control common user name is the same as the IBM Spectrum Control Db2® user name (for example, if you did not use a custom Db2 user name to install IBM Spectrum Control), the corresponding password must be valid as a Db2 password and as a WebSphere® Liberty password. For more information about valid Db2 and WebSphere Liberty passwords, see [Table 1](#). This restriction applies during a IBM Spectrum Control installation and when you use the IBM Spectrum Control change password tool.

For more information about setting passwords on the Windows operating system, see the see the Microsoft Windows Dev Center - Desktop website at <http://msdn.microsoft.com/en-us/library/windows/desktop/ms675092%28v=vs.85%29.aspx>. Search for the *SAM-Account-Name* attribute.

Table 1. Valid characters for user names and passwords

User name and password for	Windows domain OK?	LDAP OK?	Valid characters
IBM Spectrum Control installation	Yes	No	Not applicable
IBM Spectrum Control common user	Yes Restriction: You must follow these naming conventions: <ul style="list-style-type: none">• Windows domain user name: <i>domain_name\user_name format</i>• Local user name: <i>machine_name\username format</i>	No	<ul style="list-style-type: none">• A through Z (uppercase characters)• a through z (lowercase characters)• 0 through 9 (numeric characters)• Special characters: '_' and '~' <p>Restriction: The user name cannot contain spaces, \$ and ! signs, must have at least 1 character and must not start with a number or underscore. On Windows operating systems, the only valid special characters are ` , ~ , # , % , (,) , - , _ , { , } , ' , and .</p>
IBM Spectrum Control common user passwords	Yes	Yes	<ul style="list-style-type: none">• A through Z (uppercase characters)• a through z (lowercase characters)• 0 through 9 (numeric characters)• Special characters: [,] , ? , ` , ~ , ! , (,) , - , _ , * , % , + , and . <p>Restriction: Passwords cannot contain spaces, must have at least 1 character and must not start with a number, dash character {-}, or underscore.</p>

User name and password for	Windows domain OK?	LDAP OK?	Valid characters
Db2 administrator, Db2 user	Yes Restriction: You must follow these naming conventions: <ul style="list-style-type: none"> Windows domain user name: <code>domain_name\user_name format</code> Local user name: <code>machine_name\user_name format</code> 	Yes	<ul style="list-style-type: none"> A through Z (uppercase characters) a through z (lowercase characters) 0 through 9 (numeric characters) Special characters: ` , @ , # , % , ^ , - , () , _ , { } " . <p>Restriction: User names and passwords cannot contain spaces and must have at least 1 character. User names also must not start with a number or underscore</p>
Db2 passwords	Yes	Yes	<ul style="list-style-type: none"> A through Z (uppercase characters) a through z (lowercase characters) 0 through 9 (numeric characters) Special characters: \$, ~ , @ , # , (,) , - , _ , { , } , [,] , ? , * , % , + , and . <p>Restriction: Passwords cannot contain spaces, must have at least 1 character and must not start with a number or underscore.</p>
NAS Filer user name	No	No	<ul style="list-style-type: none"> A through Z (uppercase characters) a through z (lowercase characters) 0 through 9 (numeric characters) Special characters: ` ~ # % ^ & () - _ { } ' . <p>Restriction: User names and passwords cannot contain spaces and must have at least 1 character.</p>
NAS Filer password	No	No	<ul style="list-style-type: none"> A through Z (uppercase characters) a through z (lowercase characters) 0 through 9 (numeric characters) Special characters: ` ~ @ # % ^ & * () - _ = + [] { } \ ; : ' " , . < > / ? <p>Restriction: User names and passwords cannot contain spaces and must have at least 1 character.</p>

Password and name restrictions for monitored resources:

- Cisco switches: The password that IBM Spectrum Control uses to connect to a Cisco switch can't contain these special characters: < > .
- XIV® storage systems: The password that IBM Spectrum Control uses to connect to an XIV storage system can't contain this special character: & .
- When you add a resource for monitoring, you must enter a user name and password that is used to connect to that resource. In rare cases, special characters in the user name or password might not be allowed by IBM Spectrum Control. If you can't add a resource for monitoring because of restricted characters, try changing its credentials and adding it again. Then, open a ticket for the character limitation so that it can be addressed in a future update.
- Performance metadata can't be collected about a device that includes a forward slash (/) or backslash (\) in its name. Before you add a device for monitoring, remove any slashes in its name.

Db2 user names and passwords

These are the rules for using Db2® user names and passwords.

Db2 user names and passwords must follow these rules:

- UNIX user names and passwords cannot be more than eight characters long. They cannot begin with a numeric digit or end with \$.
- Group and instance names can contain 1 to 8 characters.
- Names cannot be any of the following:
 - USERS
 - ADMINS
 - GUESTS
 - PUBLIC
 - LOCAL
- Names cannot begin with:
 - IBM®
 - SQL
 - SYS
- Names cannot include accented characters.
- UNIX users, groups, and instance names must be lowercase.

Required user roles for monitoring resources

When you add storage systems, switches, and hypervisors for monitoring, you must provide a user name and password for logging in to those resources. The role or user group that is assigned to the user name determines the data collection and storage functions that you can use.

The following roles are associated with the user names that IBM Spectrum® Control uses to log in to resources. Specify user names when you add a resource for monitoring. These roles are different from IBM Spectrum Control roles, which are assigned to users that log in to IBM Spectrum Control. For more information about IBM

Spectrum Control roles, see [Role-based authorization](#).

Any roles that are not listed, but include the privileges of the roles that are listed, can also be used for monitoring resources.

Table 1. Required roles for storage system, switch, and hypervisor users

Resource	Required role for performance monitors	Required role for probes	Required role for provisioning, optimizing, and transforming
DS8000®	Monitor role or higher	Monitor role or higher	Administrator, Physical operator, or Logical operator
SAN Volume Controller	For versions earlier than 8.3.1.2, Administrator, or SecurityAdmin. For 8.3.1.2 or later, any role but some limitations might apply. Learn more	Monitor role or higher	Administrator
Storwize® V3500 Storwize V3700 Storwize V5000 Storwize V7000	For versions earlier than 8.3.1.2, Administrator, or SecurityAdmin. For 8.3.1.2 or later, any role but some limitations might apply. Learn more	Monitor role or higher	Administrator
Storwize V7000 Unified (block storage)	Administrator	Monitor role or higher	Administrator
FlashSystem 5000 FlashSystem 5100 FlashSystem 7200 FlashSystem 9100 FlashSystem 9200 FlashSystem V9000	For versions earlier than 8.3.1.2, Administrator, or SecurityAdmin. For 8.3.1.2 or later, any role but some limitations might apply. Learn more	Monitor role or higher	Administrator
IBM Spectrum Virtualize for Public Cloud	For versions earlier than 8.3.1.2, Administrator, or SecurityAdmin. For 8.3.1.2 or later, any role but some limitations might apply. Learn more	Monitor role or higher	Administrator
Storwize V7000 Unified (file storage)	Performance monitoring is not available	Monitor	Administrator, or Export Administrator + Storage Administrator.
XIV®	Monitor role or higher	Any role	Storage administrator
IBM Spectrum Accelerate IBM FlashSystem® A9000 IBM FlashSystem A9000R	Monitor role or higher	Any role	Not available
IBM FlashSystem 900	Monitor role or higher	Monitor role or higher	Not available
IBM Spectrum Scale (file storage)	Any role	Root or non-root*	Not available
IBM Spectrum Scale (object storage)	Performance monitoring is not available	The Keystone admin role. Information is collected only for the object storage accounts and containers that the user has access to. If you want to monitor all accounts and containers, the user must also be assigned the role that is defined in the reseller_admin_role configuration option in the Swift proxy server. The default value for the reseller_admin_role option is ResellerAdmin.	Not available

Resource	Required role for performance monitors	Required role for probes	Required role for provisioning, optimizing, and transforming
IBM® Cloud Object Storage	Performance monitoring is not available	Operator, System Administrator, or Super User role	Not available
Dell EMC storage systems	Operator role or higher	Operator role or higher	Not available
Hitachi storage systems	In Hitachi Device Manager: The user for the Export Tool must have the Storage Administrator (Performance Management) role	In Hitachi Command Suite: ViewGroup or higher and AdminGroup permission.	Provisioning is not available
NetApp storage systems	Operator role or higher	Operator role or higher	Not available
Pure storage systems	Role with read-only permission or higher	Role with read-only permission or higher	Not available
Cisco switches	Network-admin	Network-admin	Not applicable
Brocade switches with Fabric OS 8.2.1 or later	User or admin role that has the chassis-role permission	User or admin role that has the chassis-role permission	Not applicable
Brocade switches with a Fabric OS version earlier than 8.2.1	Administrator user in Brocade Network Advisor (BNA)	Administrator user in BNA	Not applicable
Hypervisors (such as ESX, ESXi, and vCenter Servers)	Performance monitoring is not available	A role that has permission to browse through data stores. For example: Administrator role or Virtual Machine Power® User role. For more information about roles and permission to browse data stores, see Checking permissions to browse data stores .	Any role
Rollup servers	Performance monitoring is not available	Administrator	Not available
Note: * You can add IBM Spectrum Scale and GSS systems as a non-root user, but that user must have privileges to run a set of specified administration commands using the sudo command on the cluster node. For more information, see Monitoring IBM Spectrum Scale without requiring root privileges .			

Worksheet for user names and passwords

Use this worksheet to document the user names and passwords that you create when you install and administer IBM Spectrum® Control. Space is provided for you to list more user names and passwords that you create when you configure more devices in IBM Spectrum Control.

Table 1. User names and passwords for a IBM Spectrum Control installation

Item	Description	Your input
IBM Spectrum Control and Db2® installation user <ul style="list-style-type: none"> Windows: local administrator UNIX: root 		
Db2 administrator user name and password	The Db2 administrator user name and password are created when you install Db2 and is required to install IBM Spectrum Control. On the Windows operating system, this user name must be a member of the DB2ADMNS group and Administrators group. On UNIX, the user name must be the instance owner of the instance you want to use. This user name and password are created when you install Db2.	
LDAP bind user name	This user name has the authority to log in and connect to the LDAP server for authentication. It is not needed if the LDAP server allows anonymous bind. This user name and password must be provided to you by your LDAP administrator.	
Storage subsystem user name for access from IBM Spectrum Control	This user name is the user name that IBM Spectrum Control uses to log in to a storage device.	
CIMOM or SMI provider login name	This user name has log in access to the CIMOM or SMI provider software that interfaces with a storage device or a switch in a fabric.	
NAS filer user name and password	IBM Spectrum Control uses this user name to log in to a NAS device.

Ports used by IBM Spectrum Control

When you install IBM Spectrum® Control, the ports must be opened through the firewall. You must disable the firewall program or open the ports to allow incoming requests to the IBM Spectrum Control ports. Review these ports before you install IBM Spectrum Control.

Restriction: IBM Spectrum Control uses TLS 1.2 protocol for communicating on ports. It does not use TLS 1.3, and TLS 1.1 and 1.0 are disabled by default for increased security.

For information about how to re-enable TLS 1.1 and 1.0 for IBM Spectrum Control ports, see [Enabling TLS 1.1 and 1.0 for IBM Spectrum Control ports](#).

IBM Spectrum Control ports used for TCP/IP

Table 1 lists the IBM Spectrum Control default ports.

All ports in Table 1 are configured during installation using the installation program. For a silent mode installation, use the varTPCPortRangeSP parameter in the installation response file.

Table 1. IBM Spectrum Control ports used by TCP/IP for incoming communication

Ports	Component and port information
9549	Data server 9549 listens for communications from the Device server, CLI, and Storage Resource agents.
9550-9551 9553 9572	Device server 9550-9551 listens for communications from the Data server, Alert server, and Web server. 9553 listens for logging commands. 9572 listens for IBM® WebSphere® Application Server Liberty administrative commands.
9556 9570 9571	Alert server 9556 listens for communications from the Device server. 9570 listens for logging commands. 9571 listens for WebSphere Application Server Liberty administrative commands.
9510 9567	Storage Resource agent 9510 listens for communications from the Data server if the Storage Resource agent is deployed in daemon mode. The only exception is the Storage Resource agent that is deployed on the IBM Spectrum Control server at installation time, which listens on port 9567 instead. If the Storage Resource agent is deployed in non-daemon mode, the Storage Resource agent does not need any listening ports. The Data server uses RXA to communicate with the Storage Resource agent in non-daemon mode. RXA uses the following default ports for the protocols: 22 SSH 512 Remote Execution (REXEC) 514 Remote Shell (rsh) 445 Windows SMB protocol The Storage Resource agent sends responses back to the Data server on port 9549, in both daemon mode and non-daemon mode.
9554 9568 9569	Web server 9554 is used by WebSphere Application Server Liberty. The following ports are used for the GUI: <ul style="list-style-type: none">• 9568 (non-secure)• 9569 (secure) 9569 is used for the REST API.
9562	Export server 9562 listens for communications from the Web server.
25000 50000	Db2® By default, Db2 listens on port 25000 for communication from IBM Spectrum Control and other clients. Port 50000 can also be used. The default port can be changed only during the Db2 installation.

Restrictions: The following restrictions apply to the ports that are listed in [Table 1](#):

- The ports apply only to a fresh installation of IBM Spectrum Control. If you upgrade from an earlier version of IBM Spectrum Control that used different ports, those ports are reused for your installation.
- The ports are used for incoming communication and are configured during installation. *Do not* change these ports after your installation is complete.

Other IBM Spectrum Control IP ports

To collect performance metadata, complete the following actions: <p>IBM Spectrum Scale 5.1.0 and earlier:</p> <p>Ensure that the queryinterface property is set to "0.0.0.0" in the ZIMonCollector.cfg file on the cluster node.</p> <pre>queryinterface="0.0.0.0"</pre> <p>IBM Spectrum Scale 5.1.1 and later:</p> <p>Ensure that the zimmon/ZIMonCollector.cfg file on the cluster node includes the following properties:</p> <pre>fallbackqueryinterface = "0.0.0.0" # "0.0.0.0" to allow remote connections (or ":::0" for IPv6) fallbackqueryport = "9084"</pre> <p>For more information, see Configuring the collection of performance data for IBM Spectrum Scale.</p> Object storage: <ul style="list-style-type: none"> 5000, 8080, 35357 listen for data about any object storage or OpenStack Swift configurations on the IBM Spectrum Scale cluster node where the collector component is running.
IBM Cloud Object Storage Port: 443 (unidirectional)	443 listens for HTTPS communication from IBM Spectrum Control.
Dell EMC Unity Port: 443 (unidirectional)	443 listens for communication from IBM Spectrum Control.
Other Dell EMC storage systems Port: 5991 (unidirectional)	<p>5991 listens for events that are coming from Dell EMC CIMOMs .</p> <p>To change this port, use the CLI setdscfg command and change the value for the Event.ListenerPort parameter. Then, restart the Device server.</p> <p>For example, to set the port to 7200, run this command from the <i>installation_dir/cli/</i> subdirectory:</p> <p>For Windows operating system:</p> <pre>tpctool.bat setdscfg -user <user name> -pwd <password> -property Event.ListenerPort 7200</pre> <p>For AIX and Linux operating systems:</p> <pre>./tpctool.sh setdscfg -user <user name> -pwd <password> -property Event.ListenerPort 7200</pre> <p>You can also modify the protocol for listening to events that are coming from Dell EMC CIMOMs. By default, this protocol is set http.</p> <p>To change this protocol, use the CLI setdscfg command and change the value for the Event.ListenerProtocol parameter. Then, restart the External Process component.</p> <p>For example, to set the protocol to https, run this command from the <i>installation_dir/cli/</i> subdirectory:</p> <p>For Windows operating system:</p> <pre>tpctool.bat setdscfg -user <user name> -pwd <password> -property Event.ListenerProtocol https</pre> <p>For AIX and Linux operating systems:</p> <pre>./tpctool.sh setdscfg -user <user name> -pwd <password> -property Event.ListenerProtocol https</pre>
Hitachi VSP storage systems: <ul style="list-style-type: none"> Hitachi Command Suite: Port: 2443 (unidirectional) Hitachi Device Manager: Port: 2443 (unidirectional) 	2443 listens for communication from IBM Spectrum Control.

Resource and ports	Port information
NetApp ONTAP 9 Port: 22 (unidirectional)	22 listens for communication from IBM Spectrum Control.
Other NetApp storage systems Port: 80 (unidirectional)	80 listens for communication from IBM Spectrum Control using the NetApp Data ONTAP API (NAPI), if the storage system is a file storage system. If the NetApp storage system is a block storage system, the CIM agent ports are used to listen for communication from the Device server.
Pure storage systems Port: 443 (unidirectional)	443 listens for communication from IBM Spectrum Control.
SMI-S providers and CIM agents for switches and managed storage systems Ports: 5988, 5989, 5990 (unidirectional)	5988 listens for non-secure communication from the Device server. 5989 listens for secure communication from the Device server. 5990 IBM Spectrum Control listens on this port for events coming from CIM agents for managed storage systems. To change the port that IBM Spectrum Control uses to listen for events coming from CIM agents for managed storage systems, use the CLI setdscfg command. Change the value for the Indication.PermanentListenerPort parameter then restart the Device server. For example, to set the port to 7100, run this command from the <i>installation_dir/cli/</i> subdirectory: For Windows operating system: <pre>tpctool.bat setdscfg -user <user name> -pwd <password> -property Indication.PermanentListenerPort 7100</pre> For AIX and Linux operating systems: <pre>./tpctool.sh setdscfg -user <user name> -pwd <password> -property Indication.PermanentListenerPort 7100</pre>
Brocade switches, Fabric OS 8.2.1 and later Ports: 80, 443 (unidirectional)	80 listens for HTTP communication from IBM Spectrum Control. 443 listens for HTTPS communication from IBM Spectrum Control.
VMware vCenter Servers Port: 443 (unidirectional)	443 listens for communication from IBM Spectrum Control.
IBM Spectrum Control Device server Ports: 162 (UDP), 5960 (UDP), (both unidirectional) Ports: 49152 (UDP) (bidirectional)	162 (UDP) listens for SNMP traps coming from managed storage systems. 5960 (UDP) listens for forwarded SNMP messages. 49152 (UDP) IBM Spectrum Control uses this port to forward SNMP traps. To change these ports, use these steps: 1. Log on to IBM Spectrum Control as a user with administrative privileges. 2. Stop the Device server. 3. Create a backup of the <i>installation_dir/device/conf/user.properties</i> file. 4. Change the parameter that corresponds to the port to an available port number and save the file. 162 SnmpTrapPort 5960 SnmpForwardedTrapListeningPort 49152 SnmpForwardingPort 5. Start the Device server.
All monitored resources 7 (ECHO port) (bidirectional)	Before you can discover resources, ensure that port 7 (ECHO port) is open on the resources, and Internet Control Message Protocol (ICMP) is available.
IBM Cognos® Analytics Port: 9300 (unidirectional)	Listens for communication from web browsers and other clients.

Planning for multipath subsystem device drivers

The subsystem device driver (SDD) is a software solution for multiple configuration environments in supported storage resources.

The subsystem device driver is installed on a host system with the native disk-device driver and provides the following functions:

- Enhanced data availability
- Dynamic input/output (I/O) load balancing across multiple paths
- Automatic path failover protection
- You can download licensed machine code at the same time that applications are running

For the most current support for multipath subsystem device drivers, go to [IBM Spectrum Control - Platform Support: Agents, Servers and Browsers - Multipathing section](#).

Note:

1. The AIX® SDD cannot coexist with SDDPCM on the same system.
2. The Linux® SDD driver is no longer available. Starting with Red Hat® Enterprise Linux 5 and SUSE Linux Enterprise Server 10, only the DM_Multipath is available.
3. The SDD driver is no longer supported on HP, starting with HP-UX 11i 3 with Itanium®.

For more information about multipath subsystem device drivers, see <https://www.ibm.com/support/pages/node/651823>.

For more information about how to install, configure, and use the subsystem device drivers, see <https://www.ibm.com/support/pages/node/651689>.

Upgrading subsystem device drivers

SDD drivers cannot coexist on the same host with the SDDPCM, SDDDSM, or DM_Multipath drivers. You must upgrade from the existing SDD drivers to the SDDPCM or SDDDSM driver. Part of the upgrade process is to unconfigure and remove all SDD vpath devices. After the upgrade and configuration of the devices, the device names might differ from the previous names. Each device is detected by IBM Spectrum® Control as a new device. For information about how to upgrade SDD, see <http://www.ibm.com/support/docview.wss?rs=540&context=ST52G7&uid=ssg1S7000303>.

Dell EMC PowerPath Multipathing

Dell EMC PowerPath Multipathing supports a wide range of servers including cluster servers connected to Dell EMC storage systems. It tunes your storage area network and selects alternate paths for your data if necessary. It also integrates multiple path I/O capabilities, automatic load balancing, and path failover functions. For more information about Dell EMC PowerPath Multipathing, see <http://www.dellemc.com>. Search for **PowerPath**.

Planning for Storage Resource agents

Use Storage Resource agents to collect asset and configuration information about servers.

You can deploy Storage Resource agents from the IBM Spectrum® Control GUI. You must have administrative privileges to deploy Storage Resource agents.

To deploy a Storage Resource agent from the GUI, go to **Servers > Servers**. Click **Add Server**, select **Deploy an agent for full server monitoring**, and select a method for adding a server. You can add a single server by manually entering server information or you can add multiple servers by importing configuration information from a file. If you add multiple servers, a time span is calculated during which the agents are deployed. The agents are deployed at regular intervals during the time span to avoid excessive load on the IBM Spectrum Control server.

For more information about Storage Resource agents, see [Deployment guidelines and limitations for Storage Resource agents](#).

- [Protocol support for Storage Resource agents](#)
When installing the Storage Resource agent, IBM Spectrum Control uses specific protocols for connectivity between the server and agent.

Protocol support for Storage Resource agents

When installing the Storage Resource agent, IBM Spectrum® Control uses specific protocols for connectivity between the server and agent.

When installing the Storage Resource agent, IBM Spectrum Control uses the following protocol for connectivity between the server and agent (listed in order):

1. Secure Shell protocol (SSH).
2. Windows server message block protocol (SMB protocol).
3. Remote execution protocol (REXEC).
4. Remote shell protocol (RSH).

At run time, the connectivity that is used between the server and agent depends on the type of service that is running: On-Demand service (non-daemon service) or run as a service (daemon service).

On-Demand service (non-daemon service)

In this case, connectivity between the server and agent is established by using the same protocols as for installation of the agent: SSH, SMB, REXEC, or RSH.

Run as a service (daemon service)

In this case, connectivity between the server and agent is established by using the secured socket connection. The server and agent have their respective certificates and no additional information is needed besides the certificates and the security that is provided by the SSH protocol.

Note: Running the Storage Resource agent in daemon mode requires only one socket connection to be open and thus simplifies any firewall rules that might be in place. However, the daemon mode always consumes resources (although a very small amount) when idle. In non-daemon mode, the Storage Resource agent only consumes resources when actively working for the IBM Spectrum Control server. Because the non-daemon mode uses the RXA protocol, additional firewall ports and security configuration are required.

The information required for these protocols is as follows:

SSH protocol

There are two cases where you can use the SSH protocol:

- You supply the user ID and password to connect to the server by using the SSH protocol. This user ID must have administrative privileges.
- You supply a user ID, certificate, and passphrase. You create the certificate and use that certificate when you connect to the agent. This certificate must be accessible from the server.

Windows SMB protocol

You supply the user ID and password. The user ID must have administrative privileges. You must also enable **File & Printer Sharing for Microsoft Windows** under **Network Properties** for the connected network adapter. Make sure that the Server service is running on the system.

RExec protocol

You supply the user ID and password. The user ID must have administrative privileges. The system must be enabled for remote execution of commands.

RSH protocol

You supply the user ID with administrative privileges. The system must be enabled for the user to be able to run commands through the remote shell.

To enable RSH, edit the .rhosts file in the login directory of the user. The rhosts file provides access for the user to connect from a remote system.

If you elect to use a Microsoft directory, you can also get a list of domain computers. You are required to enter the domain controller, user ID, password, and certificate location. After the list is displayed, you can select a list of computers on which to deploy the agent.

After the agent is deployed, a probe job is automatically run.

The agent that is deployed on a Windows system has its registry information in the Windows registry. For UNIX or Linux®, the registry information is stored in the following file: `/etc/Tivoli/TSRM/registryNA`.

Planning for Internet Protocol Version 6

IBM Spectrum® Control supports Internet Protocol Version 6 (IPv6) for communication between its components. The key IPv6 enhancement is the expansion of IP address spaces from 32 bits (up to 15 characters in length) to 128 bits (up to 45 characters in length).

Overview

You can install and run IBM Spectrum Control on systems that are enabled for IPv4, IPv6, or dual stack. *Dual stack* indicates that a system has both the IPv4 and IPv6 stacks enabled and both addresses configured.

You can use IPv6 addresses if one of the following conditions are met:

- The system where IBM Spectrum Control is installed is IPv6.
- Dual stack (IPv4 and IPv6) is enabled.

IBM Spectrum Control can communicate with the following external components over IPv6:

- SMI-S CIM agents
- SLP directory agents
- SNMP agents
- Storage resources
- SMTP server

Note: These external components must be IPv6 enabled to communicate with IBM Spectrum Control by using the IPv6 protocol.

Not all components and their related functions of IBM Spectrum Control are enabled for IPv6. Any functions that are not enabled for IPv6 are unavailable through the user interface when you install IBM Spectrum Control on an IPv6-only system.

If you have a system that is configured for dual stack networking, IBM Spectrum Control defaults to IPv4 addressing.

The preferred IPv6 address representation is written as eight groups of four hexadecimal digits `xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx`, where each x is a hexadecimal that represents 4 bits. You can also specify IPv6 addresses by using shortened formats that omit leading zeros or use double colons in place of a series of zeros. You can specify only one double colon (::) in an IPv6 address.

The following examples show an IPv6 address in the long form and in the short form:

Long form: `2001:db8:0:0:0:0:0:0`

Short form: `2001:db8::`

IPv6 and IBM Spectrum Control installation

If you are installing IBM Spectrum Control in an IPv6-only environment, the following requirements apply:

- For Windows operating systems, the IPv4 loopback interface is enabled.
 - For AIX® or Linux® operating systems, the localhost option resolves to the IPv4 address 127.0.0.1, instead of the IPv6 address ::1. This value is specified in the `/etc/hosts` file.
- For Windows operating systems, the localhost option is specified in the `C:\Windows\system32\drivers\etc\hosts` directory and file.

Table 1. IPv4 and IPv6 configurations in a multiple-servers environment

If the database repository server is configured for...	The IBM Spectrum Control server is configured for...
IPv4	IPv4
IPv4	Dual stack
Dual stack	IPv4
Dual stack	Dual stack
Dual stack	IPv6
IPv6	IPv6

Restriction: When you install the product on servers that are configured for IPv6 only, you cannot use IBM® Tivoli Enterprise Console® events as triggered actions in alerts.

Planning to use LDAP for IBM Spectrum Control authentication

The Lightweight Directory Access Protocol (LDAP) is an application protocol that you can use to query and modify directory services running over TCP/IP. The IBM Spectrum® Control installation program establishes a default authentication configuration using the federated repositories feature of the IBM® WebSphere® Application Server Liberty. You can configure IBM Spectrum Control for LDAP authentication as a post-installation activity.

About this task

A *directory* is a set of objects with similar attributes that are organized in a logical and hierarchical manner. An LDAP directory tree often reflects various political, geographic, and organizational boundaries, depending on the model chosen. The directory might contain entries representing people, organizational units, printers, documents, groups of people, or anything else that represents a tree entry (or multiple entries).

In the federated repositories framework, the IBM Spectrum Control installation program creates the following repositories:

File-based user repository

This repository contains the `tpcFileRegistryUser` user ID. This user password is the same as the common user password that you enter during the IBM Spectrum Control installation.

Operating system repository

This repository contains the users and groups managed by the local operating system.

With this default authentication configuration, you cannot use the IBM Spectrum Control single sign-on feature. Storage system element managers do not support the operating system repository or the file-based repository for single sign-on, even if the element manager is installed on the same system as IBM Spectrum Control.

To change the user authentication configuration, add or remove an LDAP repository in the federated repositories framework.

To authenticate user names on the IBM Spectrum Control by using an instance of Microsoft Active Directory, complete one of the following options:

Authenticate User names: Method one

1. Install IBM Spectrum Control on an AIX®, Linux®, or Windows operating system.
2. Configure IBM Spectrum Control for LDAP authentication.

The target LDAP repository is an instance of Active Directory running on Windows 2003 or later. This method provides the following benefits:

- The IBM Spectrum Control target system does not have to be a Windows system.
- The IBM Spectrum Control target system does not have to be a member of a Windows domain.
- There are fewer configuration steps for IBM Spectrum Control or Windows.
- The IBM Spectrum Control user names and group names do not have to include the Windows Domain Name.
- You can use the single-sign on feature between IBM Spectrum Control and storage system element managers.

Authenticate User names: Method two

1. Install IBM Spectrum Control on a Windows system that is a member of a Windows domain or on the Windows Domain Controller.
2. Configure IBM Spectrum Control for operating system authentication.

Planning for storage management

Plan for how to use IBM Spectrum® Control to manage the storage and storage resources in your environment.

- [Planning for storage systems](#)
To effectively plan your storage subsystems, you must understand the terminology.
- [Planning to monitor performance](#)
IBM Spectrum Control can collect performance metrics for resources that use the native interfaces, such as DS8000®, XIV®, SAN Volume Controller, Storwize® V7000 Unified, or Storwize V7000 storage systems, or for storage systems and Fibre Channel switches that use SMI-S providers (also called CIM agents or CIMOMs). The resources that use SMI-S providers must be SMI-S 1.1 compliant. To collect performance metrics for IBM FlashSystem® 900, the SNMP agent must be enabled on the storage system.
- [Planning for switches and fabrics](#)
IBM Spectrum Control supports IBM®, Brocade, and Cisco switches. Use IBM Spectrum Control to help manage the switches and fabrics that connect host systems and applications to storage resources.
- [Planning for VMware](#)
IBM Spectrum Control supports the VMware vSphere components ESXi and vCenter Server.
- [Planning for files systems and volume managers](#)
Information about the file system formats and volume managers that are supported by IBM Spectrum Control can help you set up and configure your environment.
- [Planning for PowerHASystemMirror for AIX](#)
IBM Spectrum Control supports Storage Resource agents that are installed on IBM PowerHA® SystemMirror® for AIX® nodes. Use this information to configure the

PowerHA SystemMirror for AIX environment before you use it with IBM Spectrum Control.

- [NAS support](#)

You can use the information to plan your Network Attached Storage (NAS) support.

- [Microsoft Cluster Server](#)

IBM Spectrum Control can monitor and report on Microsoft Cluster Server (MSCS) clustered nodes and cluster resource groups.

- [Planning for the Virtual I/O Server](#)

You can use the Storage Resource agent to gather information about Virtual I/O Servers. Before you can monitor Virtual I/O Servers, you must plan on how to install the agents in your environment.

- [Planning to monitor Db2](#)

It is a good practice to monitor your IBM Db2® environment to better understand what is happening inside your Db2 data server. Db2 11.5 or later includes enhancements that make monitoring Db2 database environments more comprehensive with higher granularity of control.

Planning for storage systems

To effectively plan your storage subsystems, you must understand the terminology.

About this task

IBM Spectrum® Control uses abstract terminology, such as pools and volumes, to help you view and manage your heterogeneous storage systems. Most of these terms are derived from SMI-S, which already provides a common model for storage subsystems.

storage pool

A collection of storage capacity that provides the capacity requirements for a volume. A pool has certain storage capabilities, which indicate the range of quality of service requirements that can be applied to objects created from the pool.

primordial pool

A type of storage pool. This pool might contain unformatted, unprepared, or unassigned capacity. Storage capacity is drawn from the primordial storage pool to create concrete storage pools. The primordial storage pool aggregates storage capacity that has not been assigned to a concrete storage pool. Storage volumes are allocated from concrete storage pools. For DS8000® storage systems, the primordial pool is the disk groups or array sites that are installed in the machine but have not yet been configured into RAID arrays. Primordial pools for SAN Volume Controller or Storwize® V7000 are those MDisk that are available, but have not yet been configured to any MDisk Group (one primordial pool per back-end controller). The Primordial pool for the XIV® is a virtual concept that represents the aggregation of system-wide deallocated storage capacity that is available but unassigned to the XIV storage pools.

storage volumes

Allocations of storage capacity that is exposed from a system through an external interface. In SCSI terms, these storage volumes are logical units.

The following table shows the mapping of the IBM Spectrum Control terms to the device-specific terms.

IBM Spectrum Control terms:	Storage pool	Primordial pool	Storage volume	Disk
Device terms				
DS8000	Extent pool	Unconfigured disk groups or array sites	Volume	Disk drive module (DDM)
SAN Volume Controller or Storwize V7000 or FlashSystem 7200	MDisk group	Managed disks	Volume	MDisk
XIV	Storage pool	not applicable	Volume	Disk
VMAX	Data Pool	not applicable	Volume	Disk
VNX and VNXe	Pool/RAID Group	not applicable	LUN	Disk

Many disk arrays provide an interface for the administrator to specify which initiators can access what volumes through which target ports. The effect is that the volume is only visible to SCSI commands that originate from the specified initiators through specific sets of target ports. There might also be a capability to select the SCSI Logical Unit Number as seen by an initiator through a specific set of ports. The ability to limit access is called *device masking*. The ability to specify the device address that is seen by particular initiators is called device mapping. For SCSI systems, these terms are known as LUN masking and LUN mapping. In IBM Spectrum Control, masking and mapping are handled through host assignment.

Note:

- DS8000 storage systems track the number of spares still available after a spare disk has been used to replace a failing disk drive in the device by marking the failing drive with an operational status of "Predictive Failure." If there are not enough remaining spare disks for a rank, then the operational status of the disk also shows a status of "Error."
If a DS8000 storage system marks a disk drive with a status of "Predictive Failure" but not "Error", then IBM Spectrum Control shows a green icon with a consolidated status of "OK" in the health overlay, and does not create an alert.

IBM Spectrum Control supports IBM® and independent storage vendor systems through the native interfaces or with Storage Management Interface Specification (SMI-S) compatible interfaces. This support includes storage provisioning, asset reporting, and capacity reporting.

The following table shows the IBM storage systems that you can use, and the data sources that you can use with them:

IBM storage system	Data source
SAN Volume Controller	Native interface
DS8000 series	Native interface
XIV	Native interface
IBM Spectrum Accelerate	Native interface. Storage provisioning is not supported.
IBM FlashSystem® devices that run IBM Spectrum Virtualize	Native interface
IBM FlashSystem 900	Native interface. Performance monitoring and storage provisioning are not supported by the native interface. You must use SNMP to collect performance data.
FlashSystem A9000	Native interface
FlashSystem A9000R	Native interface
Storwize V7000	Native interface

IBM storage system	Data source
Storwize V7000 Unified	Native interface
IBM Spectrum Scale	Native interface. Storage provisioning is not supported.
IBM Cloud Object Storage	Native interface. Storage provisioning is not supported.
SMI-S certified storage systems	For information about SMI-S certified storage systems, see https://www.snia.org/ctp/conforming_providers_archive .

Restriction:

- A specific SAN Volume Controller system must not be managed by more than one IBM Spectrum Control server at the same time.

For the most current information about storage systems, firmware, and provider levels that are supported, see the IBM Spectrum Control support website at <https://www.ibm.com/support/pages/node/388393>

Planning for monitoring storage systems

Plan for monitoring the storage systems in your environment.

Procedure

1. Prepare for collecting data about storage systems.
For storage systems that require SMI-S providers (also called CIM agents or CIMOMs), ensure that the following conditions are met before you add the SMI-S provider to IBM Spectrum® Control:
 - The version of SMI-S provider and firmware for the storage system is supported. For information about the SMI-S provider and firmware that is supported, see [IBM Spectrum Control interoperability matrix for storage systems](#).
 - An SMI-S provider is installed on a different server than the IBM Spectrum Control server.
 - For storage systems on a private network, ensure that the SMI-S provider is installed on a gateway machine so that the IBM Spectrum Control server can communicate with that agent.
 - The SMI-S provider is configured to manage the intended storage system.
 For information about how to install and configure the SMI-S provider, contact the vendor of the SMI-S provider.
2. Add storage systems for monitoring with the IBM Spectrum Control GUI.
When you add storage systems for monitoring, you can automatically schedule the following data collection jobs:
 - Probes are data collection jobs that collect asset, status, and storage data about storage systems.
 - Performance monitors are data collection jobs that collect performance information about storage systems.
 Tips for probes and SMI-S providers: Running a probe puts additional workload on the IBM Spectrum Control server, the repository database, and the SMI-S providers. For probes, the additional workload is especially important if multiple devices are managed by the same SMI-S provider and are probed concurrently. As

a result, the probe completion time is impacted by the number of devices that are probed in parallel. This fact is especially important if the SMI-S provider machines are lower-end machines of the hardware prerequisites.

To help keep the workload low, run probes at a time when IBM Spectrum Control and the network are not used heavily, which is typically at night. To allow this workload distribution, schedule probes for each storage system to run one after the other.

The following example shows how you might schedule probes. This environment assumes that you have four storage systems (SS1, SS2, SS3, and SS4), with three of them having a probe duration of less than 30 minutes and one (SS3) taking 90 minutes to complete. You can schedule the probes according to the following table:

Probe	Probe 1	Probe 2	Probe 3	Probe 4
Storage system	SS1	SS2	SS3	SS4
Start time	0:30	1:30	2:30	4:30

Probes collect detailed information about the configuration of the storage systems and the properties that describe those configuration elements. Information about the following elements is gathered:

- Component computer systems (for SAN Volume Controller or Storwize® V7000 nodes)
- Pools
- Volumes
- Fibre Channel ports
- Disks
- Host-to-volume assignments
- Relationships among the internal resources (for example, pool-to-volume relationships)

Probe storage systems once every one or two days. The following factors can influence this schedule:

- Is the storage system managed by IBM Spectrum Control or is a different tool used (for example, a device-specific CLI)?
- How extensively are IBM Spectrum Control alerts used?

3. Create alert definitions to determine when and how you are alerted to conditions or violations on storage systems. Alerts are triggered by conditions that are detected during data collection and event processing. Use alert policies to manage the alert definitions that apply to groups of resources of the same type. You can use default alert policies, or create your own by copying a default policy.

For some storage systems such as IBM Spectrum Accelerate and the XIV®, events are polled every minute from the resource. For IBM Spectrum Scale, status change events are polled frequently, typically within minutes. For other resources, events are subscription-based, where the resource itself or a data source such as an SMI-S provider sends the events to IBM Spectrum Control when conditions change on the resource.

Examples of storage systems that use subscription-based event processing include SAN Volume Controller, Storwize V7000, Storwize V7000 Unified, and FlashSystem V9000. For these storage systems, a probe is automatically run when many events are received from the storage system in a short time period. To avoid performance bottlenecks, probes are run only every 20 minutes.

4. Configure data retention.

On the History Retention page in the IBM Spectrum Control GUI, configure how long to retain data that is collected about storage systems. By configuring data retention, you can control the amount of data that is retained and available for historical analysis and charting. The longer you keep the data, the more informative your analysis.

Planning for SMI-S providers

SMI-S providers are provided by the vendor of certain types of storage systems and switches. IBM Spectrum® Control communicates with an SMI-S provider to collect information about the resources that the agent manages.

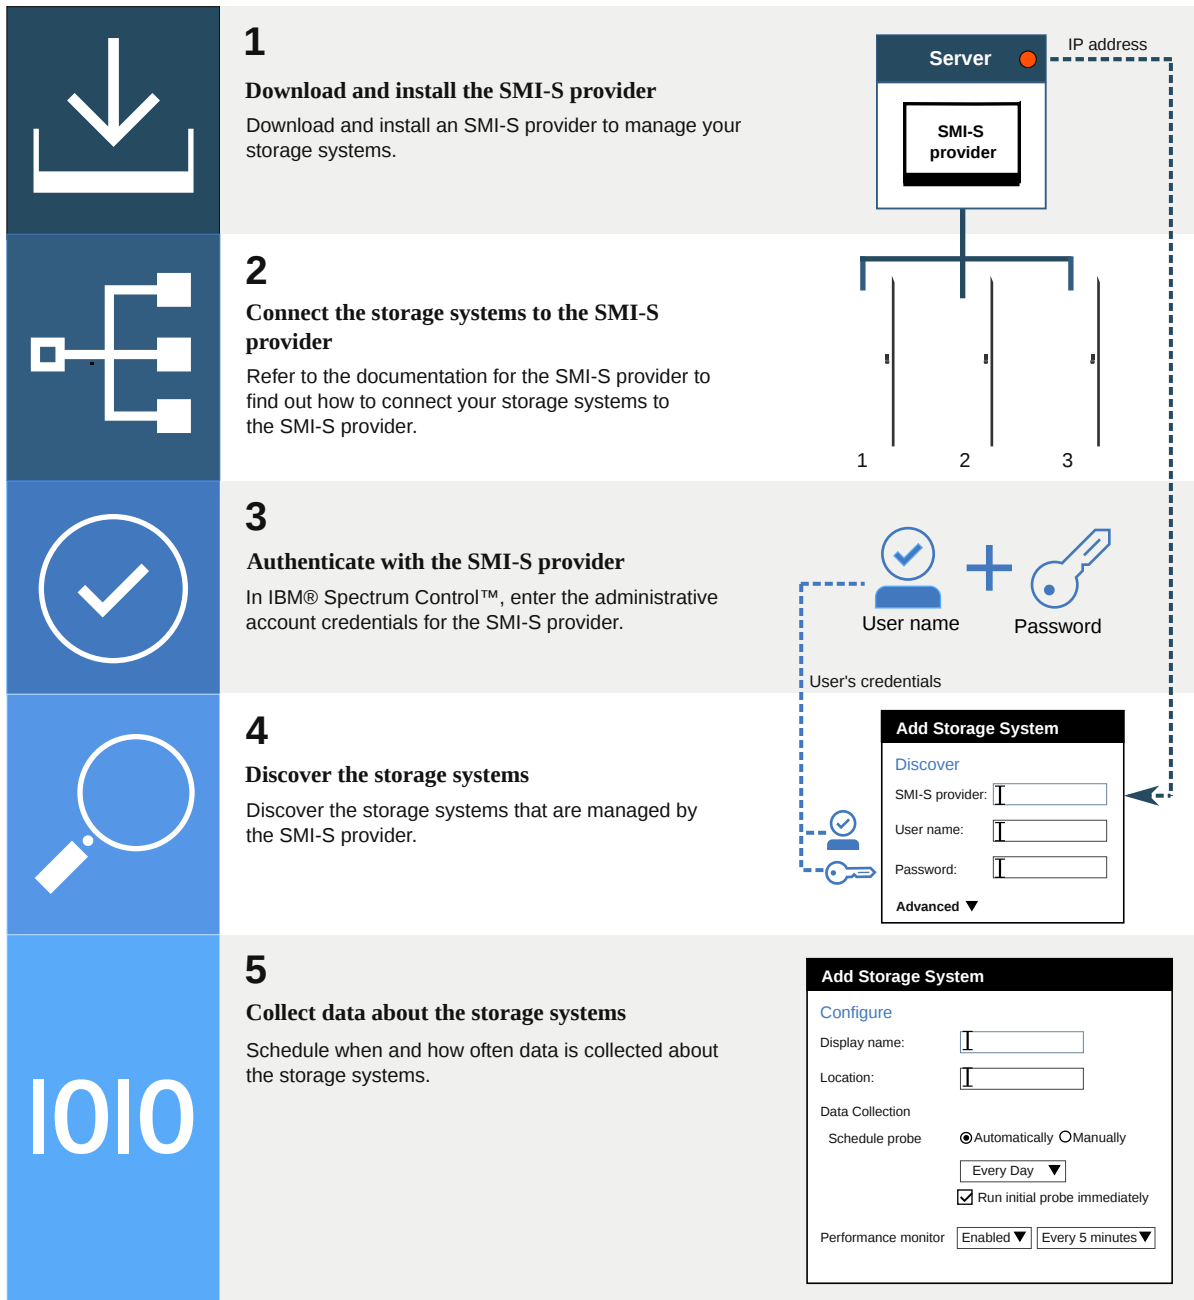

About this task

For some storage systems, SMI-S providers are required for collecting storage asset information, provisioning, alerting, and performance monitoring. SMI-S providers must conform to the SNIA SMI-S specification to provide a communication transport between IBM Spectrum Control and storage resources.

Note: For DS8000®, the XIV®, IBM Spectrum Accelerate, IBM FlashSystem® devices that run IBM Spectrum Virtualize, SAN Volume Controller, Storwize® V7000 Unified, Storwize V7000, IBM Spectrum Scale, and IBM® Cloud Object Storage, you do not need an SMI-S provider. IBM Spectrum Control communicates with these storage systems by using the native interface.

The SMI-S providers can be referred to by various names, such as CIM agent, CIMOM (CIM Object Manager) agent, or SMI-S agent. A CIM agent consists of a CIMOM and an SMI-S device provider for the managed resource. The SMI-S provider can be a separate agent installation or can be embedded in the resource itself, as is the case with Cisco fabric switches. In this case, there is no proxy agent to install and IBM Spectrum Control is configured to point to the managed resource itself.

After the SMI-S provider is installed and configured, IBM Spectrum Control can be configured to communicate with it.

SMI-S providers are not required for storage systems that communicate through a native interface. For those resources that require SMI-S providers to be set up, review the SMI-S provider documentation to understand how many resources that the SMI-S provider can be configured to manage. The memory that is consumed by the SMI-S provider includes the memory that is required for IBM Spectrum Control to probe a resource through the SMI-S provider. The SMI-S provider is typically affected by the number of resources that the SMI-S provider manages. If no guidelines are available in the SMI-S provider documentation for the storage system, limit the number of storage systems to three per SMI-S provider.

For information about the latest SMI-S provider support for IBM Spectrum Control, see the <https://www.ibm.com/support/pages/node/388393> site and go to the *Switches and Directors* and *Storage* sections.

For information about certified SMI-S devices, see http://www.snia.org/ctp/conforming_providers.

- [Performance metrics for other storage systems](#)

Planning for TagmaStore CIM agents

The TagmaStore CIM agents are provided by Hitachi Data Systems for the TagmaStore storage system. The TagmaStore CIM agent collects information from the TagmaStore storage system.

IBM Spectrum® Control supports Hitachi Device Manager software.

All volumes are created from a storage pool that is allocated from a primordial storage pool and an imported primordial pool. A volume cannot be created over both local and virtual extents.

For LUN and volume correlation, the host machine must have the Storage Resource agent installed and the TagmaStore resource must be in the same SAN fabric. You must also have a zone configured in the active zone set between the ports of the host machine and the ports of the TagmaStore device. The Storage Resource agent must monitor the fabric to which the host is connected.

For back-end correlation, the TagmaStore device ports and back-end storage system ports must be in the same zone and the back-end storage system has assigned storage volumes to all ports of the TagmaStore device.

The following TagmaStore storage system events are reported to IBM Spectrum Control by CIM agents:

- Generation of a volume
- Deletion of a volume
- Allocation of a path
- Cancellation of a path

When you delete a volume, you can only delete the latest created volume. For example, if you create five volumes, you need to delete the volumes in reverse order from the creation order.

General procedure

Complete the following general steps to monitor a TagmaStore storage system in IBM Spectrum Control:

1. In IBM Spectrum Control, add TagmaStore storage system for monitoring. To add the storage system, you must specify information about the CIM agent that manages it.
2. Run a probe to collect information about the storage system.
3. Go to the Block Storage Systems page, right-click the TagmaStore storage system, and select View Details.

- <http://www.ibm.com/support/docview.wss?uid=swg21667294>

Planning for the native interface

IBM Spectrum® Control communicates with DS8000®, the SAN Volume Controller, XIV®, IBM Spectrum Accelerate, and Storwize® V7000 storage systems through their native interfaces. You do not need to install and maintain Common Information Model (CIM) agents to collect data from these storage systems.

Support for the native interfaces

For the DS8000, IBM Spectrum Control communication with the storage system is through the ESSNI interface. Through this interface, IBM Spectrum Control collects device information, performance information, and can detect changes and complete provisioning operations. This support simplifies the IBM Spectrum Control configuration and the launch in context configuration required to manage the storage system. IBM Spectrum Control also supports dual HMC environments.

For the SAN Volume Controller or Storwize V7000, IBM Spectrum Control uses the CLI interface to communicate with the storage system. Through this interface, IBM Spectrum Control collects device information, performance information, and can detect changes and complete provisioning operations. This support simplifies the IBM Spectrum Control configuration and the launch in context configuration required to manage the storage system.

For the XIV or IBM Spectrum Accelerate, IBM Spectrum Control uses the XIV XML API interface to communicate with the storage system. The IBM Spectrum Control server communicates directly with the storage system using XML over an SSL socket. Through this interface, IBM Spectrum Control collects device information, performance information, and can detect changes and complete provisioning operations. This support simplifies the IBM Spectrum Control configuration and the launch in context configuration required to manage the storage system.

Use the add storage system action on storage system pages to define native interface connection information as described in [Adding resources](#).

Storage capacity of volumes

IBM Spectrum® Control displays the storage capacity of volumes.

About this task

The disk storage that IBM Spectrum Control supports is expressed in powers of two:

1 KB = 2 to the power of 10 bytes (1024)
1 MB = 2 to the power of 20 bytes (1 048 576)
1 GB = 2 to the power of 30 bytes (1 073 741 824)
1 TB = 2 to the power of 40 bytes (1.09951E+12)
1 PB = 2 to the power of 50 bytes (1.1259E+15)

This matches the convention of many storage systems but does not match the behavior of the the IBM® XIV® Storage System or IBM Spectrum Accelerate. Therefore, a volume that is created by using the the XIV GUI with a size of 17 GB might be displayed by IBM Spectrum Control as 16 GB in size. The DS8000® storage system GUIs display the storage as powers of two.

Planning for DS8000

Use this information to plan for using the IBM® DS8000® storage system with IBM Spectrum® Control.

IBM System Storage® DS8000 series is a high-performance, high-capacity series of disk storage that is designed to support continuous operations. The DS8000 uses the IBM Spectrum Control native interface for connecting to the device. CIM agents are no longer required for the DS8000.

For more information about DS8000, see the IBM Docs at <https://www.ibm.com/docs/en/ds8870>.

To view information about a DS8000, complete the following steps:

1. In the menu bar, go to Storage > Block Storage Systems.
2. Click Add Storage System.
3. Click the DS8000 icon.
4. Add the storage system for monitoring. A probe automatically collects configuration information about the storage system.
5. View information about the DS8000 storage system in the IBM Spectrum Control GUI.

Important information about host connections: For DS8000 storage systems, if host connections were created by using the **mkhostconnect** command, those host connections might not be displayed on the details page for the storage system in IBM Spectrum Control. Hosts that were configured with the **mkhost** command are displayed properly.

To ensure that the host connections that were configured with **mkhostconnect** and any related agentless servers are displayed properly in IBM Spectrum Control, complete the steps at [Host connections for DS8000 storage systems are not being displayed](#).

Related reference

- [Performance metrics for DS8000](#)

Planning for SAN Volume Controller

Plan for using the SAN Volume Controller with IBM Spectrum® Control.

When you have hosts connected to storage subsystems which have multi-pathing enabled, you must have the multi-pathing subsystem device drivers (SDD) installed on the hosts. For more information, see the documentation for SAN Volume Controller at <https://www.ibm.com/docs/en/sanvolumecontroller/8.3.1> or <https://www.ibm.com/docs/en/sanvolumecontroller/8.4.0>.

SAN Volume Controller 6.1 or later

SAN Volume Controller includes IBM® System Storage® Easy Tier®, a function that responds to the presence of solid-state drives (SSDs) in a storage pool that also contains hard disk drives (HDDs). The system automatically and nondisruptively moves frequently accessed data from HDD MDisks to SSD MDisks, thus placing such data in a faster tier of storage.

Easy Tier eliminates manual intervention when assigning highly active data on volumes to faster responding storage. In this dynamically tiered environment, data movement is seamless to the host application regardless of the storage tier in which the data resides.

SAN Volume Controller supports these tiers:

Generic SSD tier

The SSD tier exists when SSDs are in the storage pool. The SSDs provide greater performance than hard disk drives (HDDs).

Generic HDD tier

The HDD tier exists when HDDs are in the storage pool.

All MDisks belong to one tier or the other, which includes MDisks that are not yet part of a storage pool.

If you create a storage pool (managed disk group) with both generic SSD MDisks and generic HDD MDisks, Easy Tier is automatically turned on for pools with both SSD MDisks and HDD MDisks. SAN Volume Controller does not automatically identify external SSD MDisks; all external MDisks are put into the HDD tier by default. You must manually identify external SSD MDisks and change their tiers.

Note:

- The terminology for this release of SAN Volume Controller has changed:
 - Error is now event
 - MDisk is now storage pool
 - Space-efficient is now thin provisioning
 - VDisk is now volumeHowever, the terms have not been changed in IBM Spectrum Control reports and views.
- In SAN Volume Controller 5.1 or earlier, there was a one-to-one mapping between MDisks and internal SSD drives. For SAN Volume Controller 6.1 or later, there are now one-to-many mapping between MDisks and drives.

In addition to information already available for SAN Volume Controller, IBM Spectrum Control provides information about the tier, tier capacity, and tier free capacity.

You can also open the management GUI for SAN Volume Controller from inside the IBM Spectrum Control GUI.

Upgrading SAN Volume Controller 5.1

Currently SAN Volume Controller Version 6.1 does not support the solid-state drives. This support will be added in a future fix pack.

If you are upgrading SAN Volume Controller 5.1 to 6.1, you have the following options:

- Do not upgrade SAN Volume Controller 5.1 to 6.1 until the solid-state drive support is available.
- Follow these steps to upgrade SAN Volume Controller 5.1:
 1. Migrate data off the solid-state drive MDisks.
 2. Unconfigure (unmanage) the solid-state drive MDisks.
 3. Run a probe to collect the latest configuration data about the SAN Volume Controller.
 4. Upgrade the SAN Volume Controller 5.1 to 6.1.

Note: SAN Volume Controller does not permit an upgrade of SAN Volume Controller 5.1 to 6.1 while there are managed solid-state drive MDisks. After the upgrade, the unmanaged solid-state drive MDisk objects are marked as unused drive objects. You cannot configure these drive objects into a RAID.

Planning for IBM Spectrum Virtualize for Public Cloud

IBM Spectrum Virtualize is a software-defined storage solution that has been proven for years in SAN Volume Controller and the IBM® Storwize® family. IBM Spectrum Virtualize for Public Cloud extends that solution to a hybrid-cloud or cloud-based model, where servers, storage, and network infrastructure are delivered in a public cloud environment. It can be deployed on either IBM® Cloud or Amazon Web Services (AWS) cloud infrastructures.

With IBM Spectrum® Control, you can view the capacity, space usage, and performance of your IBM Spectrum Virtualize for Public Cloud storage systems. Other monitoring features, such as alerting, health checking, advanced analytics, and reporting are also supported.

Benefits

IBM Spectrum Control can help you predict and prevent storage problems before they impact your business. Here are some key benefits of using IBM Spectrum Control to monitor your IBM Spectrum Virtualize for Public Cloud storage systems:

- View detailed information about capacity, storage usage, and performance.
- Monitor health, status, and availability.
- Use alerts and alert policies to be notified of conditions and potential problems.
- Use advanced analytics to provision, optimize, and reclaim storage.
- Create and share reports about inventory, capacity, performance, and storage consumption.

How to monitor

Before you can add an IBM Spectrum Virtualize for Public Cloud storage system for monitoring, you must ensure that IBM Spectrum Control can connect to it. To enable a connection, you can use the site-to-site VPN IPsec tunnel that exists between the on-premises environment and the IBM Spectrum Virtualize for Public Cloud instances in AWS or IBM Cloud®.

Tips:

- For more information about configuring the connection between IBM Spectrum Control and IBM Spectrum Virtualize for Public Cloud, see [Configuring IBM Spectrum Virtualize for Public Cloud for monitoring](#).
- IBM Spectrum Control uses the following ports for communicating with IBM Spectrum Virtualize for Public Cloud:
 - Outbound: 22 for SSH
 - Outbound: 5989. Optionally, the SSH key can be uploaded once at setup time using the 5989 port.

By default, IBM Spectrum Control creates a connection between IBM Spectrum Virtualize for Public Cloud and a local port to listen for events. The default range is 49152 to 65535. These ports are on the IBM Spectrum Control Device server only; you do not need to configure the firewall for them. The ports are used for a SSH tunnel to connect to the event port on IBM Spectrum Control. All communication to IBM Spectrum Control runs through the SSH connection. No other ports need to be open for events.

Supported features

View a detailed list of the features in IBM Spectrum Control that you can use to monitor IBM Spectrum Virtualize for Public Cloud storage systems:

Table 1. Supported features for monitoring IBM Spectrum Virtualize for Public Cloud

Resource Monitoring	Features	Supported
Understanding the environment	Monitor storage inventory and configuration. Includes information about type, model, serial number, and firmware.	✓
	Understand storage relationships, from volume and share down to server and application.	✓
	Explore virtualization relationships.	✓
	Explore replication relationships.	✓
	View dashboards to get insights into key aspects of your storage at a glance and one-click access to web-based element managers.	✓
Monitoring capacity	Collect storage consumption and capacity metrics.	✓
	View data reduction information.	✓
	View copy data information.	✓
	View internal storage tiers such as EasyTier.	✓
	Monitor the storage consumed by applications.	✓
Monitoring performance	Collect performance metrics about the workload on resources.	✓*
	View calculated metrics to gain insights into performance conditions.	✓
	Export performance data to a compressed file.	✓
	Drill down performance workflows to troubleshoot bottlenecks.	✓

Resource Monitoring	Features	Supported
	Compare the performance of resources.	✓
Monitoring health	Understand the health of resources.	✓
	Receive notifications when the status of a resource changes.	✓
	View the status of elements that are not represented as resources.	✓
Alerting	Alert on conditions within your storage environment.	✓
	Define alerts to identify issues based on multiple conditions.	✓
	Define alert policies to be notified of changes across related resources.	✓
Reporting	View predefined reports.	✓
	View chargeback and consumer reports.	✓
	Create custom reports by using the REST API.	✓
	Create rollup reports to view information across multiple IBM Spectrum Control servers.	✓
Analytics	Analyze business impact (applications, departments, and groups).	✓
	Optimize data placement with tiering.	✓
	Optimize capacity with reclamation.	✓
* Performance metadata for managed disks in IBM Spectrum Virtualize for Public Cloud is not available.		

For your reference: Want to learn more about IBM Spectrum Virtualize for Public Cloud? No problem. IBM provides the following documentation for your reference:

- [IBM Spectrum Virtualize for Public Cloud Knowledge documentation](#)
- [Redbook \[PDF\]: Implementation guide for IBM Spectrum Virtualize for Public Cloud 8.3](#)
- [Redbook \[PDF\]: IBM Spectrum Virtualize for Public Cloud on AWS Implementation Guide](#)

What's next

After you establish the method for connecting IBM Spectrum Control to a IBM Spectrum Virtualize for Public Cloud storage system, you can add that storage system for monitoring, alerting, and reporting.

For instructions on how to add storage systems for monitoring, see [Adding storage systems](#).

Planning for Storwize V7000

Storwize® V7000 is a hardware and software solution that provides unmatched performance, availability, advanced functions, and highly scalable capacity.

General concepts

Storwize V7000 offers IBM® storage virtualization, SSD optimization and “thin provisioning” technologies built in to improve storage utilization. The storage system can be reconfigured to meet changing needs quickly and easily. This solution helps to reduce costs without performance degradation.

The Storwize V7000 hardware consists of a set of drive enclosures. Control enclosures contain disk drives and two node canisters. The two nodes within the canisters make an I/O group that is attached to the SAN fabric. A single pair of nodes is responsible for serving I/O on a given volume. Because a volume is served by two nodes, there is no loss of availability if one node fails or is taken offline.

Storwize V7000 can be used as a traditional RAID storage system where the internal drives are configured into arrays, and volumes are created from those arrays. Storwize V7000 can also be used to virtualize other storage systems.

Storwize V7000 supports both regular and solid-state drives (SSDs). A Storwize V7000 system without any internal drives can be used as a storage virtualization solution.

Each Storwize V7000 node has two Ethernet ports that can be used for management. Ethernet port 1 must be configured with a management IP address and must be connected on all nodes in the system. The use of Ethernet port 2 is optional. At any point in time, only one node in the system can operate as the focal point for configuration and monitoring requests. This node is called the configuration node and is the only node that activates the management IP addresses.

Each Storwize V7000 can have zero to four management IP addresses. You can assign up to two IPv4 addresses and up to two IPv6 addresses.

All configuration, monitoring, and service tasks are performed at the cluster level (a cluster is a Storwize V7000 system that consists of two nodes).

Storwize V7000 includes IBM System Storage® Easy Tier®, a function that supports solid-state drives (SSDs) in a storage pool that also contains hard disk drives (HDDs). The system automatically and nondisruptively moves frequently accessed data from HDD MDisks to SSD MDisks, thus placing such data in a faster tier of storage.

Easy Tier eliminates manual intervention when assigning highly active data on volumes to faster responding storage. In this dynamically tiered environment, data movement is seamless to the host application regardless of the storage tier in which the data resides. Manual controls exist so that you can change the default behavior, for example, such as turning off Easy Tier on storage pools that have both types of MDisks.

Using IBM Spectrum Control to monitor Storwize V7000

IBM Spectrum® Control communicates with Storwize V7000 storage systems through a native interface. No CIM agents are required.

Use IBM Spectrum Control to monitor Storwize V7000 systems, including asset, status, and configuration information, performance monitoring, trending, storage optimization, and provisioning. IBM Spectrum Control also provides information about the tier, tier capacity, and tier free capacity.

Restriction: You can't use IBM Spectrum Control to monitor the SAS ports on a Storwize device. To monitor those ports, use the management GUI for the device.

Planning for Storwize V7000 Unified

The IBM® Storwize® V7000 Unified system is a virtualizing redundant array of independent disks (RAID) storage system that supports both block protocols and file protocols. This unified system includes Storwize V7000 File Module and the Storwize V7000 storage system.

Using IBM Spectrum Control to monitor Storwize V7000 Unified

IBM Spectrum® Control communicates with Storwize V7000 Unified storage systems through a native interface. No CIM agents are required.

You can add a Storwize V7000 Unified storage system as a block storage system, a file storage system, or both. IBM Spectrum Control collects different information depending on how you add a Storwize V7000 Unified storage system, which includes information about capacity and configuration (block and file), performance (block only), and trending (block and file). IBM Spectrum Control reports also provide information about the tier, tier capacity, and tier free capacity for Storwize V7000 Unified.

Viewing Storwize V7000 Unified storage systems in the user interface

To view information about a Storwize V7000 Unified system, go to the Storage > Block Storage Systems or Storage > File Storage Systems page in the GUI. You can right-click a storage system and select View Details or View Properties to see additional information.

Planning for XIV storage systems

Plan to monitor XIV® storage systems with IBM Spectrum® Control.

IBM® XIV Storage System is a disk storage architecture designed to eliminate the complexity of administration and management of storage. The XIV parallelized architecture of the system, optimal exploitation of all system components (including disks, CPUs, and switches), and unique caching architecture all translate into excellent performance.

The unique balancing of all data across system components prevents the occurrence of hot spots. With all components working under the same load, performance and reliability are exceptional.

XIV storage systems use large capacity Serial Advanced Technology Attachment (SATA) disk drives which optimizes the use of disk capacity, resulting in outstanding power consumption without compromising performance.

XIV storage systems are designed to be scalable in storage, interfaces, cache, CPU power, and internal bandwidth. The architecture supports each aspect to grow independently, resulting in a scalable system in both capacity and performance.

XIV storage systems provide data protection and availability. All disk drives, modules, switches, and uninterruptible power supply units are fully redundant, ensuring high reliability and excellent performance.

The built-in thin provisioning of XIV storage systems helps reduce direct and indirect costs by allowing users to install capacity only for data written. You can grow your data capacity over time with minimal management effort.

For more information about XIV storage systems, see the XIV documentation at <https://www.ibm.com/docs/en/xiv-storage-system>.

IBM Spectrum Control support

IBM Spectrum Control uses the native interface for XIV storage systems to collect metadata. Because of the dynamic XIV architecture, where volume data is spread over all disks, no data that describes the space allocation from volumes to a specific physical disk is available.

The XIV systems have the capability of defining up to three administrative nodes, each with their own IP address. In IBM Spectrum Control 5.1 or later, if an XIV is configured with multiple administrative nodes, IBM Spectrum Control detects the IP addresses for these nodes. If IBM Spectrum Control fails to connect to one of the IP addresses, then an attempt is made to connect to the XIV using one of the other IP addresses.

Restrictions:

- You cannot use IPv6 addresses when monitoring XIV storage systems.
- The password that IBM Spectrum Control uses to connect to an XIV storage system can't contain this special character: **&**.

Data collection for XIV systems

The following considerations apply to values shown in the XIV and IBM Spectrum Control GUI.

- IBM Spectrum Control displays capacity values in base 2 (GiB), while the XIV management GUI displays capacity values in base 10 (GB, TB). Even though different units of measurement are used, the storage values are equivalent. For more information about units of measurement, see [Units of measurement for storage data](#).

- The XIV differentiates thin provisioned pools from non-thin provisioned (regular) pools and volumes in a thin provisioned pool and a non-thin provisioned pool. When hard size is equal to soft size, the pool is represented as a regular pool, otherwise the pool is represented as thin provisioned. However, the XIV CLI and CIM do not distinguish between regular and thin provisioned pools and all pool volume names in IBM Spectrum Control are prefixed with an asterisk (*) to indicate that the volume is thin provisioned.

Planning for Dell EMC storage systems

Dell EMC resources provide block and unified storage for organizations with network-attached storage or storage area network environments that have file and block-level services. IBM Spectrum® Control provides enhanced monitoring for Unity, VMAX, VNX, and VNXe storage systems.

IBM Spectrum Control 5.3.5 or later supports the Unity storage system by connecting directly to the device.

IBM Spectrum Control version 5.2.13 or later supports versions of Dell EMC SMI-S Provider or Dell EMC Solutions Enabler that are compliant with SMI-S 1.6. Through SMI-S 1.6, the following storage systems are monitored:

- VMAX family
- VNX family
- VNXe family

For other Dell EMC storage systems, monitoring is through SMI-S 1.2.

Supported versions: To view the versions of Dell EMC storage systems that are supported in IBM Spectrum Control, go to the [Dell EMC support page](#).

Dell EMC Unity Device configuration

A Unity device can be added to IBM Spectrum Control as a block storage system, a file storage system, or both. When you add a Unity storage system, IBM Spectrum Control collects data by connecting directly to the storage system.

Antivirus software restriction: If your antivirus software is set on the maximum mode, it might prevent your Unity storage systems from being added to IBM Spectrum Control. For more information about how to configure your antivirus software, see [Installation checklists for IBM Spectrum Control](#).

Benefits

IBM Spectrum Control can help you predict and prevent storage problems before they impact your business. Here are some key benefits of using IBM Spectrum Control to monitor your Dell EMC storage systems:

- View detailed information about capacity, storage usage, and performance.
- Monitor health, status, and availability.
- Use alerts and alert policies to be notified of conditions and potential problems.
- Use advanced analytics to reclaim storage.
- Create and share reports about inventory, capacity, performance, and storage consumption.

Supported features

View a detailed list of the features in IBM Spectrum Control that you can use to monitor Dell EMC Unity storage systems:

Table 1. Supported features for Dell EMC Unity

Resource Monitoring	Features	Supported
Understanding the environment	Monitor storage inventory and configuration. Includes information about type, model, serial number, and firmware.	✓
	Understand storage relationships, from volume and share down to server and application.	✓
	Explore virtualization relationships.	
	Explore replication relationships.	✓
	View dashboards to get insights into key aspects of your storage at a glance and one-click access to web-based element managers.	✓
	Support for multiple protocols and storage types, such as FC, iSCSI, NVMe, CIFS, and NFS.	✓
Monitoring capacity	Collect storage consumption and capacity metrics.	✓
	View data reduction information.	✓
	View copy data information.	✓
	View internal storage tiers such as Easy Tier® and EMC FAST.	✓
	Monitor the storage consumed by applications.	✓
Monitoring performance	Collect performance metrics about the workload on resources.	✓
	View calculated metrics to gain insights into performance conditions.	✓
	Export performance data to a compressed file.	✓
	Drill down performance workflows to troubleshoot bottlenecks.	✓
	Compare the performance of resources.	✓
Monitoring health	Understand the health of resources.	✓
	Receive notifications when the status of a resource changes.	
	View the status of elements that are not represented as resources.	✓
Alerting	Alert on conditions within your storage environment.	✓

Resource Monitoring	Features	Supported
	Define alerts to identify issues based on multiple conditions.	✓
	Define alert policies to be notified of changes across related resources.	✓
Reporting	View predefined reports.	✓
	View chargeback and consumer reports.	✓
	Create custom reports by using the REST API.	✓
	Create rollup reports to view information across multiple IBM Spectrum Control servers.	✓
Analytics	Performance planning	✓
	Capacity planning	✓
	Business impact analysis (applications, departments, and groups)	✓
	Optimize data placement with tiering	
	Optimize capacity with reclamation.	✓

Restriction: In replication relationships, any snapshot volumes in either source or target storage systems that are not assigned to a host, are not stored in IBM Spectrum Control. The volumes are listed in the Copy Data page but do not have hyperlinks.

Metadata collection schedule

By default, asset, capacity, and configuration metadata is aggregated and collected daily. You can schedule daily capacity and inventory reports to gain insights about your Dell EMC storage systems.

For Dell EMC Unity storage systems, the collection intervals for performance metadata are 5 minutes and 60 minutes. The default interval is 5 minutes.

Performance metadata is collected every 15 minutes for VMAX, VNX, and VNXe block storage systems.

What's next

Before you can monitor, alert, and report on your Dell EMC storage systems, you must add them to IBM Spectrum Control.

For instructions on how to add storage systems for monitoring, see [Adding storage systems](#).

Planning for Hitachi storage systems

Hitachi resources provide block storage for organizations with network-attached storage or storage area network environments that have block-level services. IBM Spectrum® Control provides enhanced monitoring for Hitachi VSP F and G Series storage systems.

Hitachi VSP F and G Series Device configuration

A Hitachi VSP device can be added to IBM Spectrum Control as a block storage system. When you add a Hitachi VSP storage system, IBM Spectrum Control collects data by connecting to the Hitachi Command Suite that is managing the device. Connect to the Hitachi Device Manager to enable the Hitachi Export Tool to collect performance information from the storage system.

To view the versions of Hitachi VSP storage systems that are supported in IBM Spectrum Control, go to the [Hitachi support page](#).

Restrictions:

- Performance monitoring on Hitachi VSP storage systems is supported when IBM Spectrum Control is installed on Windows and Linux®. It is not supported when IBM Spectrum Control is installed on AIX®.
- You must set the Hitachi Performance Monitor Monitoring Switch to **Enabled** in the Hitachi Device Manager and then set the Sample Interval to **1 minute** or **5 minutes** only. Any other interval options are not supported. If performance monitoring is already enabled at an unsupported interval and you want to keep the previous monitoring data, first export the data by using the Export Tool and then restart monitoring.

Antivirus software restriction: If your antivirus software is set on the maximum mode, it might prevent your Hitachi VSP storage systems from being added to IBM Spectrum Control. For more information about how to configure your antivirus software, see [Installation checklists for IBM Spectrum Control](#).

Benefits

IBM Spectrum Control can help you predict and prevent storage problems before they impact your business. Here are some key benefits of using IBM Spectrum Control to monitor your Hitachi VSP storage systems:

- View detailed information about capacity, storage usage, and performance.
- Monitor health, status, and availability.
- Use alerts and alert policies to be notified of conditions and potential problems.
- Use advanced analytics to reclaim storage.
- Create and share reports about inventory, capacity, performance, and storage consumption.

Supported features

View a detailed list of the features in IBM Spectrum Control that you can use to monitor Hitachi VSP F and G Series storage systems:

Table 1. Supported features for Hitachi VSP F and G Series

Resource Monitoring	Features	Supported
Understanding the environment	Monitor storage inventory and configuration. Includes information about type, model, serial number, and firmware.	✓
	Understand storage relationships, from volume and share down to server and application.	✓
	Explore virtualization relationships.	
	Explore replication relationships.	✓
	View dashboards to get insights into key aspects of your storage at a glance and one-click access to web-based element managers.	✓
	Support for multiple protocols and storage types, such as FC, iSCSI, and PVMe.	✓
Monitoring capacity	Collect storage consumption and capacity metrics.	✓
	View data reduction information.	✓
	View copy data information.	✓
	View internal storage tiers such as Easy Tier®.	
	Monitor the storage consumed by applications.	✓
Monitoring performance	Collect performance metrics about the workload on resources.	✓
	View calculated metrics to gain insights into performance conditions.	✓
	Export performance data to a compressed file.	✓
	Drill down performance workflows to troubleshoot bottlenecks.	✓
	Compare the performance of resources.	✓
Monitoring health	Understand the health of resources.	✓
	Receive notifications when the status of a resource changes.	
	View the status of elements that are not represented as resources.	✓
Alerting	Alert on conditions within your storage environment.	✓
	Define alerts to identify issues based on multiple conditions.	✓
	Define alert policies to be notified of changes across related resources.	✓

	Capacity planning	✓
	Business impact analysis (applications, departments, and groups)	✓
	Optimize data placement with tiering	
	Optimize capacity with reclamation.	✓

Restriction: In replication relationships, any snapshot volumes in either source or target storage systems that are not assigned to a host, are not stored in IBM Spectrum Control. The volumes are listed in the Copy Data page but do not have hyperlinks.

Metadata collection schedule

By default, asset, capacity, and configuration metadata is aggregated and collected daily. Schedule daily reports to gain insights about your Hitachi VSP storage systems.

IBM Spectrum Control collects performance metadata from Hitachi VSP storage systems at intervals of 5 minutes and 60 minutes. The default interval is 5 minutes.

Important: When you set the Sample Interval in Hitachi Device Manger to 1 minute or 5 minutes, there will be a gap in the performance data after performance monitoring starts because no data has accumulated. Depending on the value of the Performance Monitor interval in IBM Spectrum Control, the resulting gap in performance data will be 35 minutes or 90 minutes.

What's next

Before you can monitor, alert, and report on your Hitachi VSP storage systems, you must add them to IBM Spectrum Control.

Important: If you want to monitor performance information, you must install the Hitachi Export Tool. The Export Tool requires that the password for connecting to the storage system is temporarily stored as clear text in a file on the server or virtual machine where IBM Spectrum Control is installed. For security reasons, ensure access to that server or virtual machine is restricted to key personnel. The file is automatically deleted after metadata is collected.

For your reference: Want to learn more about support for Hitachi VSP storage systems in IBM Spectrum Control? No problem. Take a look at the following documentation:

- For instructions on how to add storage systems for monitoring, see [Adding storage systems](#).
- For instructions on how to install the Hitachi Export Tool, see [Installing the Hitachi Export Tool](#).
- For instructions on using Hitachi Performance Monitoring and the Hitachi Export Tool, see the Hitachi documentation at <https://knowledge.hitachivantara.com/Documents/Storage>

- [Performance metrics for Hitachi VSP storage systems](#)

Planning for NetApp device support

NetApp devices provide unified storage for organizations with network-attached storage or storage area network environments that have file and block-level services. Plan for how to use IBM Spectrum® Control to monitor your NetApp storage systems.

To view the versions of NetApp storage systems that are supported in IBM Spectrum Control, go to the [NetApp support page](#).

Benefits

IBM Spectrum Control can help you predict and prevent storage problems before they impact your business. Here are some key benefits of using IBM Spectrum Control to monitor your NetApp storage systems:

- View detailed information about capacity, storage usage, and performance.
- Monitor health, status, and availability.
- Use alerts and alert policies to be notified of conditions and potential problems.
- Use advanced analytics to reclaim storage.
- Create and share reports about inventory, capacity, performance, and storage consumption.

Device configuration

IBM Spectrum Control can manage different types of network-attached storage. The requirements and device management capabilities are different depending on the type of network-attached storage system you are managing with IBM Spectrum Control.

Device configuration for NetApp storage systems running ONTAP 9

You can add a NetApp storage system running ONTAP 9 to IBM Spectrum Control as either a block or file storage system to view all of the block and file data on the system. When you add a NetApp ONTAP 9 device, IBM Spectrum Control collects data by connecting directly to the storage system.

Antivirus software restriction: If your antivirus software is set on the maximum mode, it might prevent your ONTAP 9 storage systems from being added to IBM Spectrum Control. For more information about how to configure your antivirus software, see [Installation checklists for IBM Spectrum Control](#).

Device configuration for NetApp storage systems running ONTAP 8 (7- mode), or earlier

A NetApp device running ONTAP 8 (7- mode), or earlier, can be added to IBM Spectrum Control as a block storage system, a file storage system, or both.

- When you add a NetApp device running ONTAP 8 (7- mode), or earlier, as a block storage system, IBM Spectrum Control collects data by using an SMI-S agent.
- When you add a NetApp device running ONTAP 8 (7- mode), or earlier, as a file storage system, IBM Spectrum Control collects data through the native API (NAPI) of the device.

Note: For new IBM Spectrum Control installations, Storage Resource agents are no longer supported for managing NetApp devices. If you upgrade from a previous version of IBM Spectrum Control, you can continue to manage NetApp devices that have Storage Resource agents installed from a previous release.

For NetApp devices that you managed with earlier versions of IBM Spectrum Control, you can continue to use the Storage Resource agents that you installed. When you upgrade to IBM Spectrum Control, you can easily upgrade those devices to SMI-S agents (block storage) or network API (file storage). For devices that you continue to manage with Storage Resource agents, use the following guidelines:

- If you configured a Storage Resource agent to be a Scan/Proxy agent, IBM Spectrum Control collects file storage information.
- If you configure a NetApp SMI-S agent (CIM agent), IBM Spectrum Control collects block storage information.
- If you configure a NetApp device as both a filer and a storage system, IBM Spectrum Control collects both file and block storage information.
- If multiple Storage Resource agents are configured to probe the same NetApp filer, the Storage Resource agent that was added to IBM Spectrum Control first is used. Therefore, only data that is gathered by the first Storage Resource agent is shown. For example, if you add a Storage Resource Agent for the Windows operating system and then you add a Storage Resource Agent for the UNIX operating system, Windows operating system-related data such as shares are shown, but not exports.

If you initially configured a NetApp device using a Storage Resource agent in an earlier release of IBM Spectrum Control, you do not lose any function if you decide to also configure the NetApp device by using an SMI-S agent when you upgrade to IBM Spectrum Control.

Supported features

View a detailed list of the features in IBM Spectrum Control that you can use to monitor NetApp ONTAP 9 storage systems:

Table 1. Supported features for NetApp storage systems running ONTAP 9

Resource Monitoring	Features	Supported
Understanding the environment	Monitor storage inventory and configuration. Includes information about type, model, serial number, and firmware.	✓
	Understand storage relationships, from volume and share down to server and application.	✓
	Explore virtualization relationships.	
	Explore replication relationships.	✓
	View dashboards to get insights into key aspects of your storage at a glance and one-click access to web-based element managers.	✓
	Support for multiple protocols and storage types, such as FC, NVMe, CIFS, and NFS.	✓
Monitoring capacity	Collect storage consumption and capacity metrics.	✓
	View data reduction information.	✓
	View copy data information.	✓
	View internal storage tiers such as Easy Tier®.	✓
	Monitor the storage consumed by applications.	✓
Monitoring performance	Collect performance metrics about the workload on resources.	✓
	View calculated metrics to gain insights into performance conditions.	✓
	Export performance data to a compressed file.	✓
	Drill down performance workflows to troubleshoot bottlenecks.	✓
	Compare the performance of resources.	✓
Monitoring health	Understand the health of resources.	✓
	Receive notifications when the status of a resource changes.	✓
	View the status of elements that are not represented as resources.	✓

Resource Monitoring	Features	Supported
Alerting	Alert on conditions within your storage environment.	✓
	Define alerts to identify issues based on multiple conditions.	✓
	Define alert policies to be notified of changes across related resources.	✓
Reporting	View predefined reports.	✓
	View chargeback and consumer reports.	✓
	Create custom reports by using the REST API.	✓
	Create rollup reports to view information across multiple IBM Spectrum Control servers.	✓
Analytics	Performance planning	✓
	Capacity planning	✓
	Business impact analysis (applications, departments, and groups)	✓
	Optimize data placement with tiering	
	Optimize capacity with reclamation.	✓

Restrictions:

- In replication relationships, any snapshot volumes in either source or target storage systems that are not assigned to a host, are not stored in IBM Spectrum Control. The volumes are listed in the Copy Data page but do not have hyperlinks.
- Although you can view the remote and FlashCopy® relationships for NetApp storage systems, the data is not correlated.
- NetApp doesn't provide performance data for any volumes that don't have host connections. Because of this, the number of volumes on the Volumes Performance page might not match the number of volumes on the Volumes page.
- NetApp doesn't provide performance data for any drives that don't have RAID arrays. Because of this, the number of drives on the Drives Performance page might not match the number of drives on the Drives page.

Metadata collection schedule

By default, asset, capacity, and configuration metadata is aggregated and collected daily. You can schedule daily capacity and inventory reports to gain insights about your NetApp storage systems.

For NetApp storage systems running ONTAP 9, the collection intervals for performance metadata are 5 minutes and 60 minutes. The default interval is 5 minutes.

Performance metadata is collected every 15 minutes for other NetApp storage systems.

What's next

Before you can monitor, alert, and report on your NetApp storage systems, you must add them to IBM Spectrum Control.

For instructions on how to add storage systems for monitoring, see [Adding storage systems](#).

Limitations of support for NetApp storage systems running ONTAP 8 (7- mode)

Keep in mind the following limitations for NetApp support:

- The NetApp Data ONTAP SMI-S Agent 3.0 or later implements the Block Server Performance subprofile. It provides volume performance data but for now, does not provide performance data at the storage system level.
- IBM Spectrum Control supports only the SMI-S Array profile of the NetApp Data ONTAP SMI-S Agent. Other SMI-S profiles, including the self-contained NAS profile and the NAS Head profile, are not supported.
- For the Data ONTAP SMI-S 3.0 agent or later, if a volume is offline, the performance monitor might fail with the message: **PM HWNP2132W Performance data could not be collected for device device.**

Planning for Pure Storage systems

Pure storage resources provide block storage for organizations with network-attached storage or storage area network environments that have block-level services. IBM Spectrum® Control provides enhanced monitoring for Pure FlashArray//M and FlashArray//X storage systems.

Pure FlashArray//M and FlashArray//X Device configuration

A Pure FlashArray//M or FlashArray//X can be added to IBM Spectrum Control as a block storage system. When you add a Pure storage system, IBM Spectrum Control collects data by connecting directly to the storage system.

To view the versions of Pure storage systems that are supported in IBM Spectrum Control, go to the [Pure Storage support page](#).

Antivirus software restriction: If your antivirus software is set on the maximum mode, it might prevent your Pure Storage systems from being added to IBM Spectrum Control. For more information about how to configure your antivirus software, see [Installation checklists for IBM Spectrum Control](#).

Benefits

IBM Spectrum Control can help you predict and prevent storage problems before they impact your business. Here are some key benefits of using IBM Spectrum Control to monitor your Pure storage systems:

- View detailed information about capacity, storage usage, and performance.
- Monitor health, status, and availability.
- Use alerts and alert policies to be notified of conditions and potential problems.
- Use advanced analytics to reclaim storage.
- Create and share reports about inventory, capacity, performance, and storage consumption.

Supported features

View a detailed list of the features in IBM Spectrum Control that you can use to monitor PureFlashArray//M and FlashArray//X storage systems:

Table 1. Supported features for PureFlashArray//M and FlashArray//X

Resource Monitoring	Features	Supported
Understanding the environment	Monitor storage inventory and configuration. Includes information about type, model, serial number, and firmware.	✓
	Understand storage relationships, from volume and share down to server and application.	✓
	Explore virtualization relationships.	
	Explore replication relationships.	✓
	View dashboards to get insights into key aspects of your storage at a glance and one-click access to web-based element managers.	✓
	Support for multiple protocols and storage types, such as FC, iSCSI, and NVMe.	✓

Analytics	Performance planning.	✓
	Capacity planning.	✓
	Business impact analysis (applications, departments, and groups).	✓
	Optimize data placement with tiering.	
	Optimize capacity with reclamation.	✓

Restrictions:

- In replication relationships, any snapshot volumes in either source or target storage systems that are not assigned to a host, are not stored in IBM Spectrum Control. The volumes are listed in the Copy Data page but do not have hyperlinks.
- For asynchronous remote relationships, note the following limitations.
 - From the target storage system perspective, no details are available for the source storage system.
 - From the source storage system perspective, the remote storage systems and volumes are listed in the Copy Data page. However, the remote volumes cannot be correlated with the volumes on the source system and so do not have hyperlinks.

Metadata collection schedule

By default, asset, capacity, and configuration metadata is aggregated and collected daily. Schedule daily reports to gain insights about your Pure storage systems.

For Pure storage systems, the collection intervals for performance metadata are 5 minutes and 60 minutes. The default interval is 5 minutes.

What's next

Before you can monitor, alert, and report on your Pure storage systems, you must add them to IBM Spectrum Control.

For instructions on how to add storage systems for monitoring, see [Adding storage systems](#).

Planning to monitor performance

IBM Spectrum® Control can collect performance metrics for resources that use the native interfaces, such as DS8000®, XIV®, SAN Volume Controller, Storwize® V7000 Unified, or Storwize V7000 storage systems, or for storage systems and Fibre Channel switches that use SMI-S providers (also called CIM agents or CIMOMs). The resources that use SMI-S providers must be SMI-S 1.1 compliant. To collect performance metrics for IBM FlashSystem® 900, the SNMP agent must be enabled on the storage system.

About this task

You can monitor the performance of storage resources by completing the following tasks:

- Schedule performance monitors to collect performance information about a resource.
- Use the performance alerts in the default alert policies or create alerts that notify when performance thresholds are met or exceeded for a resource.
- View performance metrics, charts, and reports about a resource.

You can use a combination of these tasks to achieve the following goals:

- Monitor a complicated storage network environment.
- Predict warning signs of system failure.
- Do capacity planning as overall workload grows.
- [Performance metrics](#)
IBM Spectrum Control can collect many different performance metrics, which indicate the particular performance characteristics of monitored resources.
- [Performance configuration](#)
Performance data can be collected from resources that are managed through the native interfaces or from resources that are managed by an SMI-S provider (also called CIM agent or CIMOM). Resources that use an SMI-S provider must be SMI-S compliant.

Performance metrics

IBM Spectrum® Control can collect many different performance metrics, which indicate the particular performance characteristics of monitored resources.

About this task

Two important metrics for storage systems are throughput in I/O per second, and the response time in milliseconds. Throughput is measured and reported in several different ways:

- Throughput of an entire box (storage system)
- Each cluster
- Each controller (Examples: DS8000®)
- Each I/O Group (Example: storage systems that run IBM Spectrum Virtualize)

Throughputs are measured for:

- Each volume (or LUN)
- At the Fibre Channel interfaces (ports) on some of the storage boxes
- On Fibre Channel switches
- At the RAID array after cache hits have been filtered out

For storage systems, the performance statistics are separated into frontend I/O metrics and back-end I/O metrics. Front-end I/O metrics are a measure of the traffic between the servers and storage systems. Back-end I/O metrics are a measure of all traffic between the storage system cache and the disks in the RAID arrays in the back-end of the storage system. Most storage systems give metrics for both kinds of I/O operations: front-end and back-end operations. It is important to know whether the throughput and response times are at the front-end (close to the system level response time as measured from a server) or back-end (between the cache and disk).

The main front-end throughput metrics are:

- Total IO rate (overall)
- Read IO rate (overall)
- Write IO rate (overall)

The corresponding front-end response time metrics are:

- Overall response time
- Read response time
- Write response time

The main back-end throughput metrics are:

- Total back-end IO rate (overall)
- Back-end read IO rate (overall)
- Back-end write IO rate (overall)

The corresponding back-end response time metrics are:

- Overall back-end response time
- Back-end read response time
- Back-end write response time

For planning purposes, it's important to track any growth or change in the rates and response times. It frequently happens that I/O rate grows over time, and that response time increases as the I/O rates increase. This relationship is what "capacity planning" is all about. As I/O rates increase, and as response times increase, you can use these trends to project when additional storage performance (as well as capacity) is required.

Depending on the particular storage environment, it might be that throughput or response time times change drastically from hour to hour or day to day. There might be periods when the values fall outside the expected range of values. In that case, other performance metrics can be used to understand what is happening. Here are some additional metrics that can be used to make sense of throughput and response times:

- Total cache hit percentage
- Read cache hit percentage
- Write-cache delay percentage (previously known as NVS full percentage)
- Read transfer size (KB/operation)
- Write transfer size (KB/operation)

Low cache hit percentages can drive up response times, because a cache miss requires access to back-end storage. Low hit percentages also tend to increase the utilization percentage of the back-end storage, which might adversely affect the back-end throughput and response times. High write-cache delay percentage (previously known as NVS full percentage) can drive up the write response times. High transfer sizes typically indicate more of a batch workload, in which case the overall data rates are more important than the I/O rates and the response times.

All these metrics can be monitored through lists, charts, and reports in IBM Spectrum Control. Some examples of supported thresholds are:

- Total I/O rate and total data rate thresholds
- Total back-end I/O rate and total back-end data rate thresholds
- Read back-end response time and write back-end response time thresholds
- Total port I/O rate (packet rate) and data rate thresholds
- Overall port response time threshold
- Port send utilization percentage and port receive utilization percentage thresholds
- Port send bandwidth percentage and port receive bandwidth percentage thresholds

For Fibre Channel switches, the important metrics are total port packet rate and total port data rate, which provide the traffic pattern over a particular switch port. Port bandwidth percentage metrics are also important to provide an indicator of bandwidth usage based on port speeds. When there are lost frames from the host to the switch port, or from the switch port to a storage device, the dumped frame rate on the port can be monitored.

The important things are:

- Monitor the throughput and response time patterns over time for your environment
- Develop an understanding of expected behaviors
- Investigate the deviations from normal patterns of behavior to get warning signs of abnormal behavior
- Generate the trend of workload changes

- [Performance metrics](#)

Performance configuration

Performance data can be collected from resources that are managed through the native interfaces or from resources that are managed by an SMI-S provider (also called CIM agent or CIMOM). Resources that use an SMI-S provider must be SMI-S compliant.

Procedure

To monitor the performance of resources, you must complete the following tasks:

1. Prepare for performance monitoring.
For resources that require an SMI-S provider, ensure that the following conditions are met before you add the SMI-S provider to IBM Spectrum® Control:
 - The version of the SMI-S provider and the firmware for the device is supported. For information about the SMI-S provider and firmware that is supported, see <https://www.ibm.com/support/pages/node/388393> and go to the *Storage* section.
 - An SMI-S provider is installed on a different server than the IBM Spectrum Control server. For some switch vendors, the switch comes with an embedded SMI-S provider, so an SMI-S provider does not need to be installed.
 - For storage systems or switches on a private network, ensure that the SMI-S provider is installed on a gateway machine so that the IBM Spectrum Control server can communicate with that agent.
 - The SMI-S provider is configured to manage the intended resource.
2. Add resources for monitoring and schedule data collection.
Before you can view the performance of a resource, you must add it to IBM Spectrum Control for monitoring. When you add resources, you can automatically schedule performance monitors. Performance monitors are data collection jobs that collect performance information.
For more information about adding resources, see [Adding resources](#) and search for *adding resources*.
3. Use the performance alerts in the default alert policies or create alerts for performance thresholds.
To be notified when the performance of a resource might represent a potential problem, define a threshold alert to monitor a specific metric. In a threshold alert, you can specify one or more boundary values for a metric. When the performance of a resource falls outside these boundaries, an alert is generated. For example, you can define an alert threshold that notifies you when the total I/O rate for a port on a storage system falls outside a specified range. Chronologically, you must define a threshold alert before a performance monitor starts collecting data.
Alerts are triggered by conditions and violations of performance thresholds that are detected during data collection and event processing. For some storage systems such as IBM Spectrum Accelerate and the XIV®, events are polled every minute from the resource. For IBM Spectrum Scale, status change events are

polled frequently, typically within minutes. For other resources, events are subscription-based, where the resource itself or a data source such as an SMI-S provider sends the events to IBM Spectrum Control when conditions change on the resource. Examples of storage systems that use subscription-based event processing include SAN Volume Controller, Storwize® V7000, Storwize V7000 Unified, and FlashSystem V9000.

Tip: Alerts can be created, deleted, or modified at any time, even if the performance monitor is already running. Changes are applied dynamically to the running performance monitor and take effect the next time that data is collected.

4. Check the status of a performance monitor.

When a performance monitor starts to run, IBM Spectrum Control begins to collect performance data for the specified resource. To check the status of the performance monitor to ensure that it is running or completed successfully, complete the following steps:

- In the menu bar, go to Home > Performance Monitors.
- In the Name column, locate the name of the resource that was included in the performance monitor.
- In the Status column, check the status of the performance monitor.

5. Specify how long performance data is retained.

In the GUI, go to Settings > History Retention to configure how long to retain performance data that IBM Spectrum Control collects about resources. You can specify a retention period for collected sample data, for aggregated hourly data, and for daily data. The retention period applies to all performance monitors. The longer that you keep data, the more informative your analysis.

Sample data is the data that is collected at the specified interval length of the performance monitor. For example, data is collected every 5 minutes. For storage systems, the most numerous components are usually volumes, therefore the largest amount of performance data is collected for volumes.

Planning for switches and fabrics

IBM Spectrum® Control supports IBM®, Brocade, and Cisco switches. Use IBM Spectrum Control to help manage the switches and fabrics that connect host systems and applications to storage resources.

Switches

IBM Spectrum Control can monitor the following switches:

Brocade

IBM Spectrum Control can monitor Brocade switches and fabrics in either of the following ways:

- For switches with Fabric OS 8.2.1 or later, connect directly to the switches and use the REST API to manage the switches and fabrics.
- For switches with a Fabric OS version earlier than 8.2.1, use the Brocade Network Advisor (BNA) Storage Management Initiative (SMI) agent to manage the switches and fabrics. The SMI agent is embedded in the BNA. BNA can manage multiple fabrics within and across data centers. When you configure BNA, you set up one switch to be the *seed* switch that interconnects to all the other switches in the fabric. Important: The embedded SMI agent is only available in the Professional Plus and Enterprise editions of BNA. BNA is no longer available for purchase, although it will be supported by Broadcom until February 2022. For more information about end of support for BNA, see <https://www.broadcom.com/support/fibre-channel-networking/eol>.

Cisco

IBM Spectrum Control uses Simple Network Management Protocol (SNMP) agents to discover and collect data about Cisco switches and fabrics in your environment.

For the most current information about switches and directors supported, see the IBM Spectrum Control support website at <https://www.ibm.com/support/pages/node/6249365>.

Fabrics

The main IBM Spectrum Control functions for managing fabrics are shown in the following table.

Table 1. Main fabric management features

Feature	Advantages	Benefit
Monitoring and alerts	Monitor SAN events and alerts administrators of problems	Helps maintain the availability of your SAN
SAN reporting	Generate reports on the SAN devices	Quickly provides reports and inventories of your SAN
Enterprise scalability	Scale from SAN islands to enterprise SANs	Accommodates new and ever changing business needs
Monitoring performance	Monitor the performance of switches by defining performance alerts and viewing performance reports. The performance reporting is at the switch and port levels.	Helps you maintain high SAN availability

Note:

1. IBM Spectrum Control provides predictive fault analytics for the SAN infrastructure through reporting, monitoring, and alerting of link failure rates and error frame rates. These transient errors are indicative of potential pending SAN link failures.
2. IBM Spectrum Control 5.1 or later do not support heterogeneous fabrics.

Monitoring fabrics and switches

Switches must be added to IBM Spectrum Control before they can be monitored. When you add the switch for monitoring, ensure that you schedule a probe and performance monitor to collect configuration and performance information about that switch.

For information about adding switches and fabrics for monitoring, see [Adding fabrics and switches](#).

Some switch vendors recommend a private IP network for Fibre Channel (FC) switches.

Collecting data about fabrics

IBM Spectrum® Control uses REST APIs, SMI agents, and SNMP agents to collect data about Brocade and Cisco fabrics and switches.

About this task

The actions that trigger data collection, and the data that is collected, depend on how the switch is monitored.

Brocade switches with Fabric OS 8.2.1 or later: REST API

You connect directly to Brocade switches that are running Fabric OS 8.2.1 or later, and monitor the switches by using the Fabric OS REST API. Data is collected in the following ways:

- Probe jobs collect asset and status information about the switches. You can schedule probes or start them when you need them to collect data immediately. To collect complete asset and status information about a fabric, every switch on the fabric must be probed.
- Performance monitors collect metrics about the performance of switches. You can schedule performance monitors for switches only, not for fabrics.

IBM Spectrum Control does not collect event-driven data for Brocade switches that are running Fabric OS 8.2.1 or later.

Brocade switches with a Fabric OS version earlier than 8.2.1: Network Advisor SMI agent

Brocade switches use the Brocade Network Advisor (BNA) SMI agents to send CIM indications to the IBM Spectrum Control server. IBM Spectrum Control automatically subscribes to these CIM indications, so you do not need to do any additional configuration to receive these notifications.

The SMI agent does a mini-probe to collect information that is relevant to the indication received. The SMI agent might do one of the following actions:

- Retrieve switches and fabrics.
- Retrieve zoning data.
- Retrieve switch port status and connection to node.
- Retrieve switch blade status and all port connections for the blade.
- Set fabric, switch, blades, connections, or nodes as missing.

Cisco switches: SNMP agent

An SNMP trap is received from a Cisco switch, and this triggers data collection. The SNMP agent performs a probe of fabrics for which the traps were received. The SNMP agent does the following actions:

- Retrieves switch and topology information. To collect complete asset and status information about a fabric, every switch on the fabric must be probed.
- Retrieves Cisco VSAN and physical infrastructure and correlates VSAN to physical infrastructure.
- Gathers zoning information and provides zone control support for Cisco switches.

For information about the supported agent types by switch vendor, see [Planning for Brocade](#) or [Planning for Cisco](#).

Planning for Brocade

IBM Spectrum® Control can monitor Brocade switches and fabrics by connecting directly to the switches, or by using the SMI agent that is embedded in Brocade Network Advisor (BNA).

Supported Brocade models

To see the Brocade models, firmware versions, and agents that are used by IBM Spectrum Control, see the [IBM Spectrum Control interoperability matrix](#).

Monitoring fabrics and switches

IBM Spectrum Control can monitor Brocade switches and fabrics in either of the following ways:

- For switches with Fabric OS 8.2.1 or later, connect directly to the switch and use the REST API to manage the switches and fabrics.
IBM Spectrum Control connects to the switch that you added, and automatically discovers the fabrics and switches that they manage. The discovered fabrics and switches are automatically added for monitoring, if they have the same credentials as the switches that you added. When you add switches, you can schedule probes and performance monitors to collect data for your switches and fabrics.
- For switches with a Fabric OS version earlier than 8.2.1, use the BNA Storage Management Initiative (SMI) agent to manage the switches and fabrics. The SMI agent is embedded in the BNA. BNA can manage multiple fabrics within and across data centers. When you configure BNA, you set up one switch to be the *seed* switch that interconnects to all the other switches in the fabric.

When you add fabrics and switches for monitoring, you can specify the SMI agent that manages them. IBM Spectrum Control connects to the agent and automatically discovers the fabrics and switches that it manages.

BNA can manage multiple fabrics within and across data centers. When you configure BNA, you set up one switch to be the *seed* switch that interconnects to all the other switches in the fabric.

Important: The embedded SMI agent is only available in the Professional Plus and Enterprise editions of BNA. BNA is no longer available for purchase, although it is supported by Broadcom until February 2022. For more information about end of support for BNA, see <https://www.broadcom.com/support/fibre-channel-networking/eol>.

Updating BNA: You can access Brocade FOS firmware and Network Advisor *updates* (not new installations) through IBM® Fix Central. You no longer need to open a case with IBM support to request them. For more information, see [Brocade FOS and Network Advisor updates](#).

Choosing whether to use REST API or BNA to monitor switches

Use the following table to help decide how to monitor your Brocade switches:

Monitoring method	Use in these situations
Direct REST API (No other software is required)	<ul style="list-style-type: none">• BNA is not available to you.• You are not monitoring any switches or fabrics yet.• Your models of Brocade switches are not supported by BNA.• You are adding a new fabric to IBM Spectrum Control. <p>Consider the following additional information when you are connecting directly to switches:</p> <ul style="list-style-type: none">• If you are connecting directly to Brocade switches, you need to add only one switch from each fabric to IBM Spectrum Control. If other switches that are on the same fabric are running Fabric OS 8.2.1 or later and have the same username, password, protocol, and port, they are added to IBM Spectrum Control automatically. The switches are probed automatically and the performance monitoring starts running.• Switches that have different authentication credentials or that are running a version of Fabric OS earlier than 8.2.1, are added to the Switches page with a Not Monitored condition. You can add the switches that are not monitored by following the usual process to add switches.• If you are monitoring a switch through BNA and want to use the REST API instead, you must first remove that switch and then add it again for monitoring. When you remove a switch, its history of performance metadata is automatically deleted and no longer available.
SMI-S (Network Advisor is required)	<ul style="list-style-type: none">• You are already monitoring switches by using BNA.• You are adding switches that are supported by BNA.

Tip:

- After you add a switch, you can modify its connection. For example, if you add a switch by using its IP address, or a switch was automatically discovered and added by IBM Spectrum Control using an IP address, you can later modify its connection to use a host name instead. To save time, if you want to collect metadata for multiple switches in the same way (host name or IP address), it is recommended that you use that method when you add the switches for monitoring.
- When you add switches through the REST API, the Brocade model name for IBM-branded OEM switch models is shown in the GUI. To help you identify a switch with IBM support, edit the Custom Tag in the properties for that switch.

Restriction:

- BNA is supported by Broadcom until February 2022. However, support for new models of switch will not be added to the SMI agent.
- You cannot manage a mixture of directly connected switches and switches that are managed by BNA on the same fabric. It is recommended that you move switches that are monitored through BNA to a separate fabric from REST-enabled switches.
- If you are adding switches that are not supported by BNA, then you must connect to the new switches directly and use Fabric OS REST API to manage them.

Restrictions for connecting directly to Brocade switches

Consider the following information when you are planning to monitor directly connected switches that are running Fabric OS 8.2.1 or later:

- Brocade switches and their associated fabrics can be monitored only through one data source at a time. If you upgrade from an earlier version of IBM Spectrum Control, you must remove the fabrics that are monitored through BNA before you can add the switches in those fabrics by direct connection.
- To schedule probes for Brocade switches, use the Switches page, not the Fabrics page.
- ISLs and trunks are shown for switches only after both the switch and the connected switch are probed.
- In rollup mode, information is only displayed for the default logical switch when virtualization is enabled on the switch. Information is not displayed for the physical switch.
- You can't receive asynchronous events from your switches if you are monitoring your fabrics and switches by using Fabric OS REST API.
- [Planning to use the BNA SMI agent](#)
The SMI agent, sometimes known as a CIM agent, is embedded in the Brocade Network Advisor (BNA). BNA manages multiple fabrics within and across data centers. When you configure BNA, you set up one switch to be the *seed* switch that interconnects to all the other switches in the fabric.
- [Support for Access Gateway switches and virtual fabrics](#)
IBM Spectrum Control can monitor Brocade Access Gateway switches and virtual fabrics.

Related concepts

- [Agents](#)

- [Data sources for switches and fabrics](#)

Planning to use the BNA SMI agent

The SMI agent, sometimes known as a CIM agent, is embedded in the Brocade Network Advisor (BNA). BNA manages multiple fabrics within and across data centers. When you configure BNA, you set up one switch to be the *seed* switch that interconnects to all the other switches in the fabric.

Configuring the Brocade switch

Before IBM Spectrum® Control can discover the switches in a fabric through the SMI agent, you must configure BNA to manage the fabric. Use a seed switch to configure BNA to manage the fabric.

There might be significant limitations on managing fabrics, depending on the version of BNA that you are running. Check the [IBM Spectrum Control interoperability matrix for switches](#) for information about the switches and directors that are supported by IBM Spectrum Control, and limitations that you need to know about when you use BNA.

Important: The embedded SMI agent is only available in the Professional Plus and Enterprise editions of BNA. BNA is no longer available for purchase, although it will be supported by Broadcom until February 2022. For more information about end of support for BNA, see <https://www.broadcom.com/support/fibre-channel-networking/eol>. Updating BNA: You can access Brocade FOS firmware and Network Advisor *updates* (not new installations) through IBM® Fix Central. You no longer need to open a case with IBM support to request them. For more information, see [Brocade FOS and Network Advisor updates](#).

Support for Access Gateway switches and virtual fabrics

IBM Spectrum® Control can monitor Brocade Access Gateway switches and virtual fabrics.

Support for Brocade Access Gateway switches

IBM Spectrum Control discovers and monitors Brocade Access Gateway switches, also called N_Port Virtualizer (NPV) switches. These switches are not probed as part of the fabric. Each Brocade Access Gateway switch has a separate probe job defined. The probe collects the following information:

- The switch properties.
- The ports of the switch.
- The connections to these switch ports.

Support for Brocade virtual fabrics

You can monitor Brocade virtual fabrics, with some limitations. To monitor Brocade virtual fabrics, you can:

- Discover Brocade virtual fabrics and switches.
- Schedule probes to collect asset and status data about Brocade virtual fabrics.
- Schedule monitors to collect information about the performance of Brocade virtual switches.

When you add and collect information about Brocade virtual fabrics, you can:

- See the properties of Brocade virtual fabrics and switches and the resources that are connected to them. The virtual fabrics and switches are displayed as if they are physical fabrics and switches.
- Control zones for virtual fabrics. Zones are created during storage provisioning.

The following limitations apply to the support for Brocade virtual fabrics that use Brocade Network Advisor (BNA):

- If Brocade switches are partitioned into virtual fabrics, the virtual fabrics and switches are displayed in the IBM Spectrum Control GUI, but the physical fabrics and physical switches are not displayed.
- The virtual fabrics and switches are displayed as if they are physical fabrics and switches. Therefore, you cannot see which virtual fabrics are on the same physical fabric, and you cannot see which virtual switches are on the same physical switch.
- In the IBM Spectrum Control GUI and in Cognos® Analytics reports, the Brocade virtual fabrics and switches are incorrectly identified as physical fabrics and switches.

There might be significant limitations on managing fabrics, depending on the version of BNA that you are running. Check the [IBM Spectrum Control interoperability matrix for switches](#) for information about the switches that are supported by IBM Spectrum Control, and any limitations that you need to know about when you use BNA.

Planning for Cisco

IBM Spectrum® Control uses Simple Network Management Protocol (SNMP) data sources to manage Cisco switches and fabrics.

Supported Cisco models

IBM Spectrum Control supports a number of different Cisco switch models and firmware versions. For information about the supported versions, see the **IBM Spectrum Control 5.3.x - Switches - Supported Products Matrix** at <https://www.ibm.com/support/pages/node/6249365>.

Consider the following information when you are using Cisco switches with IBM Spectrum Control:

- The Cisco Nexus 5000 switch is supported in toleration mode only. IBM Spectrum Control does not support the Converged Enhanced Ethernet (CEE) or Fibre Channel over Ethernet (FCoE) connectivity functions for the Cisco Nexus 5000 switch.

- The Fibre Channel (FC) or Fibre Channel over Ethernet (FCoE) protocols must be enabled on the switch. Some switches, such as the Cisco Nexus 5000 series, require you to enable these protocols. Otherwise, IBM Spectrum Control will not recognize the switch when you try to add it using the Add Switches and Fabrics for Monitoring dialog. For instructions on how to configure Cisco switches for FCoE enablement, go to the Cisco product website at <http://www.cisco.com> and click Support.
- IBM Spectrum Control also does not support domain-port zoning for Cisco Nexus switches. IBM Spectrum Control displays the FCoE and FC ports in the switch port lists.
- The password that IBM Spectrum Control uses to connect to a Cisco switch can't contain these special characters: < >.

Supported fabric management functions

The following fabric management functions are supported by SNMP data sources, also referred to as SNMP agents:

- Collecting information about Cisco switches and switch ports.
- Collecting information about topology connectivity.
- Collecting information about zoning information and zone control.
- Monitoring performance.
- Generating alerts.
- **Cisco SNMP agent**
IBM Spectrum Control uses SNMP queries to discover information about the SAN. Management Information Base (MIB) information is collected from the switches and directors by the SNMP agent. Switches and directors can be added as SNMP agents and contacted from the IBM Spectrum Control Device server by SNMP.
- **Configuration requirements for Cisco switches and directors**
IBM Spectrum Control uses SNMP agents to collect data about Cisco switches and fabrics in the SAN.

Related concepts

- [Agents](#)

Cisco SNMP agent

IBM Spectrum® Control uses SNMP queries to discover information about the SAN. Management Information Base (MIB) information is collected from the switches and directors by the SNMP agent. Switches and directors can be added as SNMP agents and contacted from the IBM Spectrum Control Device server by SNMP.

SNMP agent functions

The SNMP agent performs the following functions:

- Gathers information about the fabric by querying the switch or director.
- Gathers virtual SAN information for Cisco switches.
- Gathers zoning information and provides zone control support for Cisco switches.

Important note: Topology information is only gathered for the switch added as an SNMP agent. The agent cannot gather the topology information for any connected switches unless they are also defined as SNMP agents. If you are performing discovery on a fabric with several switches, you must install an SNMP agent for each switch in the fabric to discover the whole fabric.

Limitations:

- Information about fabric node devices such as servers and storage devices is limited. Most devices are unknown with a type of "Other" and are identified by their WWN.
- There must be a TCP/IP connection between the switch and the IBM Spectrum Control Device server.
- To enable events from the switch to the Device server, the switch must be configured to send SNMP traps to the Device server.

Determining why an SNMP agent shows a state of "not contacted"

Complete the following tasks to determine why an SNMP agent shows a state of "not contacted":

- Check that the IP address or host name is entered correctly in the switch properties page.
- Ensure that the Fibre Alliance FC Management MIB is enabled on the switch. IBM Spectrum Control uses the SNMP protocol to send queries across the IP network to management information bases (MIBs) supported on the switch. IBM Spectrum Control uses the Fibre Alliance FC Management MIB and the Fibre Channel FE MIB.
- Ensure that the server IP address is included in any SNMP Access Control List that exists on the switch.
- The switch must be configured to receive SNMP queries and respond using SNMP. SNMPv3 is the preferred version. Some switches are configured to use earlier versions of SNMP by default, and should be configured to use SNMPv3 if possible.

Configuration requirements for Cisco switches and directors

IBM Spectrum® Control uses SNMP agents to collect data about Cisco switches and fabrics in the SAN.

For IBM Spectrum Control to gather and display information from Cisco switches and directors, the SNMP communication protocol must be configured correctly.

Incorrect switch configuration can lead to missing information and misconceptions about the IBM Spectrum Control product not working properly with certain switches.

For a Cisco switch to successfully receive and respond to queries from IBM Spectrum Control, the following basic requirements must be met:

- IBM Spectrum Control can use SNMPv3 (preferred) or SNMPv1 to probe switches and fabrics. The SNMPv3 protocol is preferred because it provides better security, but switches that use the SNMPv1 protocol are also supported. Some switches are configured to use SNMPv3 by default.
- The Fibre Alliance FC Management MIB (FA MIB) and Fibre Channel Fabric Element MIB (FE MIB) must be enabled on the switch.
- When you use the SNMPv1 protocol, the community string that is configured in IBM Spectrum Control must match one of the community strings that are configured on the switch with read access. Additionally, Cisco switches must have a community string match for write access. The default community strings in IBM Spectrum Control are "public" for read access and "private" for write access. Other community strings can be defined on the switches, but are not used. Community strings are not relevant when you use the SNMPv3 protocol.
- SNMP access control lists must include the IBM Spectrum Control system. These access control lists are defined and configured on the switches. Some lists automatically include all hosts, while others exclude all by default.
- The Fibre Channel (FC) or Fibre Channel over Ethernet (FCoE) protocols must be enabled on the switch. Some switches, such as the Cisco Nexus 5000 series, require you to enable these protocols. Otherwise, IBM Spectrum Control does not recognize the switch when you try to add it using the Add Switches and Fabrics for Monitoring dialog. For instructions on how to configure Cisco switches for FCoE enablement, go to the Cisco product website at <http://www.cisco.com> and click Support.

You can configure Cisco switches to notify IBM Spectrum Control of changes in the SAN that occur between your scheduled data collection probes. These notifications, called asynchronous event notifications, are processed as they are received by IBM Spectrum Control. If you want the Cisco switches to send these event notifications to IBM Spectrum Control, configure one or more switches to send SNMP traps to the server.

SNMP traps are generated by Cisco switches and directed to the IBM Spectrum Control Device server. The SNMP trap is an indication that something changed in the fabric, and that a discovery must occur to identify the changes. The default configuration for handling switch traps is to send them from the switch to port 162 on the IBM Spectrum Control Device server. For the successful generation and reception of SNMP traps, the following configuration is required:

- The trap destination must be specified on the switch. The trap destination is typically the IBM Spectrum Control Device server, but it can also be an intermediary SNMP manager that receives the trap and sends it to IBM Spectrum Control.
- The destination port must be specified on the switch. IBM Spectrum Control listens on port 162 by default.
- The traps must be sent as SNMPv3 or SNMPv1. The SNMP designation is set on the switch.
- The trap severity level must be set to generate traps for change conditions. The trap severity level indicates that error level traps and anything more severe are sent. The trap severity level is set on the switch.

Migrating fabrics and switches

IBM Spectrum® Control can monitor Brocade or Broadcom switches and fabrics by connecting directly to the switches, or by using the SMI agent that is embedded in Brocade Network Advisor (BNA). IBM Spectrum Control can also monitor Cisco switches and fabrics by using an SNMP agent.

You can migrate Brocade switches that use the Brocade Network Advisor (BNA) SMI agent to use the Fabric OS REST API, if the switch is running Fabric OS 8.2.1 or later.

Important: The embedded SMI agent is only available in the Professional Plus and Enterprise editions of BNA. BNA is no longer available for purchase, although it is supported by Broadcom until February 2022. For more information about end of support for BNA, see <https://www.broadcom.com/support/fibre-channel-networking/eol>.

Scenario	Considerations
Brocade switches with a version of Fabric OS earlier than 8.2.1 that are managed by using BNA SMI agent.	<p>To manage the switches by using the Fabric OS REST API, you must update the switches to Fabric OS 8.2.1 or later. If you want to use HTTPS to communicate with the switch, you must enable HTTPS on the switch. For more information about how to configure the switch, see the documentation at:</p> <ul style="list-style-type: none"> • IBM® Storage Networking Fibre Channel SAN b-type family documentation • IBM Storage Networking SAN96B-5 Product documents • Broadcom or Brocade Fibre Channel Networking Switches
Brocade switches with Fabric OS 8.2.1 or later that are managed by using BNA SMI agent.	<p>The BNA SMI agent is supported by Broadcom until February 2022, so you can continue to use BNA to manage your switches and fabrics. Use BNA if you want to retain the following benefits:</p> <ul style="list-style-type: none"> • Continue to receive asynchronous events from the switches. • Retain historical performance and error metric data for the switches. • Retain IBM Spectrum Control customizations for the switches, such as reports, alerts, custom properties, and group membership. <p>Your organization might upgrade your switches before the end of support of BNA. In this case, consider continuing to use BNA. If your organization gets new switches, connect to the switches directly and monitor the switch by using the Fabric OS REST API.</p> <p>Note: You cannot manage a mixture of switches that are directly connected and switches that are managed by BNA on the same fabric.</p> <p>If you must add switches that are not supported by BNA, then you must connect to the new switches directly and use the Fabric OS REST API to manage them. Therefore, you must remove the switches from IBM Spectrum Control. Then, add the switches to IBM Spectrum Control again. Select the 8.2.1 or later value for the Fabric OS version.</p> <p>Restriction: If you remove a switch, the asset and performance data is also removed from IBM Spectrum Control. If you defined alerts for a switch that is removed, the alerts are removed also. However, if the alert configuration for the switch was defined in an alert policy, you can apply the alert policy after you connect directly to the switch.</p>

Migrating switches and fabrics from using BNA to connecting directly with REST API

To migrate Brocade switches that use the BNA SMI agent to connect directly to the switches and use the Fabric OS REST API, follow these steps:

1. Remove the switches and fabrics from IBM Spectrum Control.
Restriction: If you remove a switch, the asset and performance data is also removed from IBM Spectrum Control.
2. Remove the switches and fabrics from BNA.
3. Update the version of Fabric OS to 8.2.1 or later on the switches.
4. Add the switches to IBM Spectrum Control.

Tip: You need to add only one switch from each fabric to IBM Spectrum Control. If other switches that are on the same fabric are running Fabric OS 8.2.1 or later and have the same username, password, protocol, and port, they are added to IBM Spectrum Control automatically.

- [Adding fabrics and switches](#)
- [Removing resources](#)

Planning for private switch networks

Some switch vendors recommend a private IP network for Fibre Channel (FC) switches.

If you are planning a private IP network for FC switches, consider the following information:

- The IBM Spectrum® Control server can't communicate with the switches if they are on a private IP network.
- SNMP agents for Cisco fabrics require a TCP/IP connection from the IBM Spectrum Control server to the switch.
- SNMP traps from Cisco switches can't travel directly from the switches to the IBM Spectrum Control server.

To collect SAN data and forward SAN events to the IBM Spectrum Control server, you must enable the server to communicate with the private switch network. Use a second network interface card (NIC) to enable the server to communicate with the private switch network.

Planning for VMware

IBM Spectrum® Control supports the VMware vSphere components ESXi and vCenter Server.

Overview

VMware ESXi is a true hypervisor product that can host multiple virtual machines that run independently of each other while sharing hardware resources. The vCenter Server is the management application that is the central entry point for the management and monitoring of the ESXi hosts for a data center. A Storage Resource agent must be installed on each virtual machine that is hosted by ESXi.

For more information about ESXi or vCenter Server, see <http://www.vmware.com>.

For information about permissions required by IBM Spectrum Control to access information from VMware, see [Checking permissions to browse data stores](#).

For information about the storage systems and platforms supported on VMware, see [Hypervisors and VMware® monitoring support](#).

For full function, both the Storage Resource agent and the ESXi host must be up and running. If one of the items is not present in a given environment, only a limited picture is presented to the user. Some virtual machines might not be recognized.

The hierarchical mapping of storage allocated to the virtual machine is available for the virtual machines on the ESXi host.

Software requirements

For information about the software requirements for your VMware ESXi or vCenter Server environment, see [Software requirements for operating systems](#).

The IBM Spectrum Control server on a virtual machine

You can install the IBM Spectrum Control server on a virtual machine on VMware ESX server 3.5.x. The hardware and operating system requirements are the same requirements as for a physical machine.

In addition, the following requirements must be met:

CPU

For the ESX server, do not have more virtual processors than there are physical cores in the system. Plan your system so that no processor scheduling is required by the VM kernel for the virtual machine.

RAM

Ensure that you have enough RAM in the ESX server to service all the virtual machines with a maximum RAM usage. Plan your system so that the ESX server does not need to swap RAM for the virtual machine.

Disk

Use the SAN-attached RDM with SCSI pass-through for DB2® data and log storage.

Important: To prevent high virtual disk latency and poor virtual machine performance, you must use a dedicated VMDK (Virtual Machine Disk) for the virtual machine where you plan to install IBM Spectrum Control. Do not use a shared VMDK for the virtual machine. When you use a shared VMDK, it reduces the total number of disk IOPS (Input/Output Operations Per Second) available to the virtual machine.

For more information, see <https://kb.vmware.com/s/article/1031773>.

For more information about VMware, see the following publications:

- "Using VMware ESX Server with IBM® WebSphere® Application Server" at http://www.vmware.com/partners/vmware/ESX_WAS_WP.pdf.
- "Scaling IBM DB2 9 in a VMware Infrastructure 3 Environment" at http://www.vmware.com/pdf/db2_scalability_wp_vi3.pdf.
- [Configuring VMware in a IBM Spectrum Control environment](#)
Before you can view information about VMware hypervisors and clusters, you must ensure that the VMware data sources are configured in IBM Spectrum Control.
- [VMware capacity reports](#)
You must probe both the ESX Server and the Storage Resource agent on the virtual machines before you can generate accurate reports for disk and file system

capacity.

Configuring VMware in a IBM Spectrum Control environment

Before you can view information about VMware hypervisors and clusters, you must ensure that the VMware data sources are configured in IBM Spectrum® Control.

About this task

To configure the VMware data sources in IBM Spectrum Control, complete the following steps:

Procedure

1. Add the VMware vSphere data source.
For example, add a vCenter Server, ESX, or ESXi hypervisor.
When you add a vCenter Server, each of the hypervisors that it manages are discovered and probed, as well as any clusters.
2. Schedule a probe to collect asset and status data about a hypervisor.
You must collect data before you can view and manage a hypervisor.
3. To manage the conditions that trigger alerts and the actions to take when those alerts are triggered, use the default alert policy that is automatically added to the hypervisor. Alternatively, you can configure alerts for each hypervisor so that you're notified of any critical conditions that are detected during a probe.

Related reference

- [Triggering conditions for hypervisor alerts](#)

VMware capacity reports

You must probe both the ESX Server and the Storage Resource agent on the virtual machines before you can generate accurate reports for disk and file system capacity.

About this task

The TOTAL row in the capacity report shows the capacity for the file system or the disk capacity. The total includes virtualized disks, virtual machines, non-virtualized disks, and non-virtualized machines.

For example, you have an ESX Server that has a capacity of 100 GB and 60 GB is allocated to the virtual machine. The virtual machine uses 5 GB of space. Both the ESX Server (H1) and the virtual machine (VC1) are probed. You also have a physical machine (PC1) that is probed. The capacity is shown in the report, as follows:

Column heading	Capacity	Used Capacity (calculated as Capacity minus Free Space)	Free space
TOTAL	130 GB	25 GB	105 GB
H1	100 GB	60 GB	40 GB
VC1	60 GB	5 GB	55 GB
PC1	30 GB	20 GB	10 GB

If you probed the physical machine (PC1) and the virtual machine (VC1) but did not probe the ESX Server (hypervisor), the capacity is shown as follows:

Column heading	Capacity	Used Capacity (calculated as Capacity minus Free Space; negative values are shown as 0)	Free Space
TOTAL	30 GB	0 GB	65 GB
PC1	30 GB	20 GB	10 GB
VC1	60 GB	5 GB	55 GB

If you probed the hypervisor (H1) and the physical machine (PC1) but did not probe the virtual machine (VC1), the capacity is shown as follows:

Column heading	Capacity	Used Capacity (calculated as Capacity minus Free Space)	Free Space
TOTAL	130 GB	80 GB	50 GB
H1	100 GB	60 GB	40 GB
PC1	30 GB	20 GB	10 GB

If you have an ESX Server that has devices that are directly attached to the virtual machine, the file system capacity created on the virtual machine is not added in the TOTAL row.

For example, the file system capacity shown in the table is based on the following factors:

- The file system (FS1) created on the hypervisor has a capacity of 100 GB and uses 60 GB of space.
- The file system (FS1) created from internal storage on the hypervisor (H1) has a capacity of 60 GB and uses 5 GB of space.
- The file system (FS2) on the device that is directly attached to the virtual machine (VC1) has a capacity of 5 GB and uses 4 GB of space.
- The file system created on the physical machine (PC1) has a capacity of 30 GB and uses 20 GB of space.

Column heading	Capacity	Used Capacity (calculated as Capacity minus Free Space)	Free Space
TOTAL	130 GB	24 GB	106 GB
H1 FS1	100 GB	60 GB	40 GB
VC1 FS1	60 GB	5 GB	55 GB
VC1 FS2	5 GB	4 GB	1 GB
PC1 FS1	30 GB	20 GB	10 GB

Planning for files systems and volume managers

Information about the file system formats and volume managers that are supported by IBM Spectrum® Control can help you set up and configure your environment.

About this task

- [File systems](#)
The file systems that are supported for monitoring and reporting by IBM Spectrum Control are listed.
- [Networked file systems](#)
This section describes support for IBM® General Parallel File System.
- [Volume managers](#)
This section lists the volume managers supported for monitoring by IBM Spectrum Control.

File systems

The file systems that are supported for monitoring and reporting by IBM Spectrum® Control are listed.

About this task

The Data Server supports monitoring and reporting of the following file systems:

- AIX® JFS, JFS2
 - Data ONTAP V7 for Network Appliance, including flexible volumes (FlexVol). With Flexvol, you can create multiple flexible volumes on a large pool of disks.
 - EXT2, EXT3, EXT4
 - FAT, FAT32
 - General Parallel File System (GPFS). For a list of the GPFS versions that are supported, view the information in the Agents, Servers and Browsers section of the [IBM Spectrum Control interoperability matrix](#).
 - HP_HFS
 - NTFS4, NTFS5
 - REISERFS
 - SAN File System (SANFS)
 - Temporary File System (TMPFS)
 - UFS
 - VMFS
 - Veritas File System (VxFS) r4.5 and 5 (all releases) on the following operating systems:
 - AIX
 - Linux®
- Tip: You can use IBM Spectrum Control with file systems and volumes that are created by using Veritas File System (VxFS) and Veritas Volume Manager (VxVM) releases 4 and 5, if the file systems and volumes conform to the features in Version 3 of VxFS and VxVM. IBM Spectrum Control cannot work with volumes and file systems with features that were introduced in VxFS and VxVM releases 4 and 5.
- WAFL
 - IBM Spectrum Control SAN File System

Networked file systems

This section describes support for IBM® General Parallel File System.

About this task

When using the Data server, you can use the monitoring and reporting of the IBM General Parallel File System (GPFS) 3.2 on AIX®.

- The IBM Spectrum® Control Storage Resource agent must be installed on one node within a GPFS *nodeset*. A nodeset is a collection of computers that see the same file system. If multiple agents are installed per GPFS nodeset, the first agent that sees the file system owns the file system. You cannot change the owning (or scanning) agent. If the agent is deleted, another agent takes ownership.

Because only one agent owns the file system and a file system cannot be scanned by more than one agent, there is no benefit to having more than one agent.

If more than one agent is installed, the last agent that runs a probe job takes ownership of the volume group. If a GPFS file system exists in that volume group and the agent that owns the volume group is not the agent that owns the file system, the file system information is not displayed in the volume group. The volume group is part of the asset tree. However, when the agent that owns the file system probes again, the data is corrected.

There must be physical access to the GPFS disk for IBM Spectrum Control to gather hardware disk information.

Volume managers

This section lists the volume managers supported for monitoring by IBM Spectrum® Control.

About this task

The Data Server supports the monitoring of the following volume managers:

- Veritas Volume Manager is supported on the following operating systems:
 - AIX®
 - Linux®
- AIX Logical Volume Manager (LVM)

Using these volume managers, you can create groups of logical volumes and disks. You can generate various reports for these disk and volume groups.

Planning for PowerHASystemMirror for AIX

IBM Spectrum® Control supports Storage Resource agents that are installed on IBM® PowerHA® SystemMirror® for AIX® nodes. Use this information to configure the PowerHA SystemMirror for AIX environment before you use it with IBM Spectrum Control.

Cluster resource groups

A *cluster resource group* represents a PowerHA SystemMirror for AIX entity.

You can configure PowerHA SystemMirror for AIX into cluster resource groups so that they can be highly available. You can define resource group policies and attributes that dictate how PowerHA SystemMirror for AIX manages resources to keep them highly available at different stages of cluster operation (startup, failover, and fallback). You can put the following types of resources into clustered resource groups.

Volume groups

A set of physical volumes that AIX treats as a contiguous, addressable disk region.

Logical volumes

A set of logical partitions that AIX makes available as a single storage unit. The logical volume is the "logical view" of a physical disk.

File system

A file system is written to a single logical volume. Typically, you organize a set of files as a file system for convenience and speed in managing data.

Shared file systems

A journaled file system that is entirely in a shared logical volume.

Applications

Critical services that are accessible to users.

Service IP labels or addresses

A way to establish communication between client nodes and the server node. Services, such as a database application, are provided by using the connection mode over the service IP label.

Tape resources

You can configure a SCSI or a Fibre Channel tape drive as a cluster resource in a non-concurrent resource group, making it highly available to two nodes in a cluster.

Communication links

You can define communication links as resources in a PowerHA SystemMirror for AIX resource group.

Planning for PowerHA SystemMirror for AIX support

With PowerHA SystemMirror for AIX, you can use the following types of configurations:

- PowerHA SystemMirror for AIX with cluster resources groups that are nonconcurrent. Concurrent cluster resource groups are not supported.
- The following volume groups in a PowerHA SystemMirror for AIX environment:
 - Standard volume groups
 - Enhanced concurrent-mode volume groups
 - Scalable volume groups

When you create an IBM Spectrum Control configuration, include the Storage Resource agent. A Storage Resource agent must be installed on each node of the cluster. All agents in a cluster must be configured to use the same listening port. You must also have a cluster resource group (CRG) with at least one IP address that is accessible from the IBM Spectrum Control server if you plan to run scans on the cluster resource group. Each Storage Resource agent collects information about the local node and the clustered resources that are currently hosted on the node.

The following operations are not supported.

- Probing and scanning of clustered databases
- Reporting on cluster information when the cluster is configured to have concurrent cluster resource groups

Note:

- Cluster resource group scanning is only supported by the IBM Spectrum Control Advanced Edition license.
- If the Storage Resource agent port is behind a firewall, that port must be opened for all virtual server and cluster resource group addresses.

Reports

The asset reporting navigation tree includes a By Cluster report that shows the nodes and cluster resource groups in each cluster. The disks, volume groups, and file systems that are shared as clustered resources are associated with the cluster resource group and not with the node where they are hosted.

When generating reports, you can use the By Cluster report subtype wherever the By Computer subtype is available. The By Cluster report summarizes the results of the nodes and the cluster resource groups in the cluster.

Monitoring groups

When you create a monitoring group or create a data collection schedule, you can select individual nodes and cluster resource groups. You can create a file system monitoring group that includes clustered and non-clustered resources.

Computer alerts

You can register for cluster-specific alerts that notify you that your cluster went through a configuration change. A cluster resource that is being added or removed is an example of such changes. You can also register for an alert that is triggered when a cluster resource group is moved. The same alert is used for a cluster resource group failover, cluster resource group fallback, and when the cluster resource group is manually moved to a new node. Cluster alerts will not be triggered until the next time the cluster is probed.

Installing PowerHA SystemMirror for AIX support

To install PowerHA SystemMirror for AIX support, complete the following steps:

1. Ensure that your PowerHA SystemMirror for AIX environment is configured for IBM Spectrum Control support.
2. Create a service IP label for the CRG with an IP address that can be contacted from the IBM Spectrum Control server.
3. Install a Storage Resource agent on each node of the cluster. All agents in the cluster must be configured to use the same listening port.
4. Run a discovery job for the agent.
5. Run a probe job on the agents.
6. Run a scan job on the agents.
7. Run a scan job on the cluster resource groups.
8. View reports for the PowerHA SystemMirror for AIX entities.
9. View the PowerHA SystemMirror for AIX environment in the topology viewer.

- [PowerHA SystemMirror for AIX environment](#)
Monitoring an IBM PowerHA SystemMirror for AIX environment with IBM Spectrum Control.

PowerHA SystemMirror for AIX environment

Monitoring an IBM® PowerHA® SystemMirror® for AIX® environment with IBM Spectrum® Control.

About this task

IBM Spectrum Control supports Storage Resource agents installed on PowerHA SystemMirror for AIX nodes. The Storage Resource agent must be installed on every node in the cluster. You cannot configure the Storage Resource agent as a clustered application.

The Storage Resource agent collects information from the cluster when the node is probed. Resources that are not clustered are reported under the node. The resources that are associated with a cluster resource group are reported under a computer entity that represents the cluster resource group. r.

The following entities are reported under the associated clustered resource group and not the node:

- Volume groups
- NFS shares
- Service IP labels

Physical volumes, logical volumes, and file systems for clustered volume groups are also reported under the cluster resource group.

Restriction: You can use PowerHA SystemMirror for AIX only with cluster resource groups that are nonconcurrent. You cannot use PowerHA SystemMirror for AIX with concurrent cluster resource groups.

The following information lists the support requirements for a PowerHA SystemMirror for AIX cluster environment.

Agent requirement

Each node in a PowerHA SystemMirror for AIX cluster must have a Storage Resource agent installed. IBM Spectrum Control can only monitor and report on nodes with a Storage Resource agent that is run in daemon mode. All Storage Resource agents that are installed in a cluster must listen on the same port number. Storage Resource agents in other clusters can be configured with a different port address. However, all agents in the cluster must use the port address used by the other agents in that cluster.

Probe requirements

Probes are not automatically executed in response to cluster events. Schedule probes to run as appropriate for the needs of the environment.

NAS support

You can use the information to plan your Network Attached Storage (NAS) support.

About this task

- [Network-attached storage system requirements](#)
Before adding network-attached storage (NAS) systems and NetApp devices for monitoring, ensure that you understand the system requirements.

Network-attached storage system requirements

Before adding network-attached storage (NAS) systems and NetApp devices for monitoring, ensure that you understand the system requirements.

NetApp devices

A NetApp device (7-mode only) can be added to IBM Spectrum® Control as a block storage device, a file storage device, or both.

- When you add a NetApp device as a block storage system, IBM Spectrum Control collects data by using a CIM agent.
- When you add a NetApp device as a file storage system, IBM Spectrum Control collects data through the native API (NAPI) of the device.

For a list of NetApp devices that can be monitored, see [NetApp support page](#).

Note: For new IBM Spectrum Control installations, Storage Resource agents are no longer supported for managing NetApp devices. If you upgrade from a previous version of IBM Spectrum Control, you can continue to manage NetApp devices that have Storage Resource agents installed from a previous release.

Other NAS devices

NAS devices other than Network Appliance devices must meet the following criteria in order to be supported by IBM Spectrum Control:

- If scanned from a UNIX agent, a NAS device must support Network File System (NFS) queries.
- If scanned from a Windows agent, a NAS device must support Common Internet File System (CIFS) queries.
- A NAS device must support SNMP queries (sysName and sysOID).
- A NAS device must supply a unique sysName.

The following conditions might be necessary for adding other NAS systems for monitoring and management by IBM Spectrum Control.

Agent requirements

You must install the agent on a machine that has access to the NAS filers within your environment that you want to monitor.

Windows

The agent that is logging in to and scanning the NAS filer is not required to be in the same domain as the user or the NAS filer. If you install the agent on a different domain from the NAS filer, the agent scans the NAS filer *if* the domain of the agent computer is a "trusted domain" by the domain of the NAS filer.

UNIX and Linux®

The agent computer must import the NAS filer export files as NFS mounts (or automounts on Oracle Solaris).

Note:

- You do not install agents to the NAS filers themselves.
- For IBM Spectrum Control 5196 Network Attached Storage 300 G machines only, install the agent directly on those machines. If the 300 G is clustered, you need to install an agent on each local node.

NAS requirements

The NAS filers within your environment must be visible to the machines where you install the agent or agents. If you want to monitor NAS filers from Windows, you must configure those NAS filers to be members of a Windows domain.

Microsoft Cluster Server

IBM Spectrum® Control can monitor and report on Microsoft Cluster Server (MSCS) clustered nodes and cluster resource groups.

About this task

Microsoft Cluster Server (MSCS) is a built-in feature of the Windows operating system. It is software that supports the connection of up to eight servers into a "cluster" for higher availability and easier manageability of data and applications. MSCS can automatically detect and recover from server or application failures. It can be used to move server workload to balance utilization and to provide for planned maintenance without downtime.

As with standard Windows clusters, you perform most of the configuration tasks, and also the management tasks, associated with Exchange clusters using the Cluster Administrator. Cluster Administrator is installed by default on servers that have Cluster Service installed.

You can also use Cluster Administrator to remotely administer a server cluster. Computers that are used to administer a server cluster remotely must be secure and restricted to trusted personnel.

When a cluster node is probed, there are normal errors in the logs for the disks belonging to the cluster resource groups that are not currently hosted on this node.

When looking at an MSCS cluster problem, the current state of the clustering environment is often needed. Microsoft provides a tool to dump the MSCS cluster configuration into a set of files.

Note: The term "virtual servers" is replaced with "cluster resource groups" in IBM Spectrum Control. Microsoft still refers to "virtual servers."

- [Microsoft Cluster Server environment](#)
To monitor resources in an MSCS environment, you must be aware of IBM Spectrum Control requirements.
- [Microsoft Cluster Server support](#)
Plan how to use IBM Spectrum Control to monitor resources in an MSCS environment.

Microsoft Cluster Server environment

To monitor resources in an MSCS environment, you must be aware of IBM Spectrum® Control requirements.

About this task

In an MSCS environment, you can collect information about local resources for a clustered node and the resources in a cluster resource group. The Storage Resource agent for IBM Spectrum Control is not cluster aware, so it cannot run in the cluster resource group and fail over from one node to another. However, the agent supports failover of a clustered file system so that IBM Spectrum Control probes can continue to work when the clustered file system is moved from one node to another.

The Storage Resource agent that runs on the node that hosts the cluster resource group is that agent discovers the resources on that cluster resource group.

Restriction: You cannot use IBM Spectrum Control to monitor a clustered database application.
To use IBM Spectrum Control in an MSCS cluster environment, consider the following requirements:

Server requirement

Not applicable. You cannot install the IBM Spectrum Control server on a node in an MSCS cluster.

Client requirement

Not applicable. You cannot install the IBM Spectrum Control client on a node in an MSCS cluster.

Agent requirements

- You must install a Storage Resource agent on each node in an MSCS cluster. IBM Spectrum Control can monitor and report only on nodes where a Storage Resource agent is installed and configured to run in daemon mode.
- If the Storage Resource agent port is behind a firewall, that port needs to be opened for all virtual server and cluster resource group addresses.
- All agents that are installed in a cluster must use the same port number to communicate with IBM Spectrum Control. Agents in other clusters can be configured with a different port address.
Tip: All agents in a cluster must use the port address used by the other agents in that cluster.

Microsoft Cluster Server support

Plan how to use IBM Spectrum® Control to monitor resources in an MSCS environment.

Cluster resource groups

A *cluster resource group* represents an MSCS entity.

You can configure MSCS into cluster resource groups. You can define resource group policies and attributes that dictate how MSCS manages resources to keep them highly available at different stages of cluster operation (startup, failover, and fallback). You can put the following types of resources into clustered resource groups.

Logical volumes

A set of logical partitions that MSCS makes available as a single storage unit. The logical volume is the "logical view" of a physical disk.

File system

A file system is written to a single logical volume. Typically, you organize a set of files as a file system for convenience and speed in managing data.

Shared file systems

A file system that is entirely in a shared logical volume.

Physical disk

A physical disk.

Network name

A network name.

IP address

An IP address.

Upgrading agents in an MSCS cluster

To upgrade the IBM Spectrum Control agents in an MSCS cluster, complete the following steps:

- Ensure that all Storage Resource agents in the cluster are configured to use the same port address.
- In the IBM Spectrum Control GUI, upgrade the agents.
- Do not probe agents in the cluster while the upgrade is in progress.
- When all agents in the cluster are upgraded successfully, run a probe on the cluster.

For more information about upgrading IBM Spectrum Control agents, see [Upgrading Storage Resource agents](#).

Configuring MSCS for monitoring

To use IBM Spectrum Control to monitor MSCS, complete the following steps:

1. Ensure that your MSCS environment is configured for IBM Spectrum Control support.
2. Install a Storage Resource agent on each node of the cluster. All agents in the cluster must be configured to use the same listening port.
3. Probe the nodes.
4. View information about the nodes on the Servers page.

Planning for the Virtual I/O Server

You can use the Storage Resource agent to gather information about Virtual I/O Servers. Before you can monitor Virtual I/O Servers, you must plan on how to install the agents in your environment.

Overview

The Virtual I/O Server is part of the IBM® PowerVM® hardware feature. The Virtual I/O Server allows the sharing of physical resources between LPARs including Virtual SCSI and virtual networking. Sharing of physical resources allows more efficient utilization of physical resources through sharing between LPARs and facilitates server consolidation.

Support for Virtual SCSI environment

The Virtual SCSI environment consists of a Virtual SCSI Server Adapter or Adapters that are created on the Virtual I/O Server and mapped to a Virtual I/O Client. If you have a Virtual SCSI environment and the virtual target device has a one to one mapping to a storage volume, IBM Spectrum® Control can extract the storage system serial number and correlate the Virtual SCSI disk on the LPAR to a corresponding storage volume. This function means that the Storage Resource agent installed on the Virtual I/O Client (LPAR), can collect this information. The Linux® system must be running on the IBM Power® System.

Note:

- IBM Spectrum Control performs the correlation only if the virtual target device is a one to one mapping to a single storage system volume.

The storage systems supported are:

- DS8000®
- SAN Volume Controller
- Storwize® V7000
- Storwize V7000 Unified

After the Storage Resource agent is installed on the Virtual I/O Server, you can see the following information:

- Storage system serial number
- Virtual SCSI Client Adapter
- Virtual SCSI disk
- Volume groups, logical volumes, and file system

Note:

- Currently, the correlation of Virtual SCSI disks that originate from the XIV® is not performed.
- IBM Spectrum Control can perform the correlation of Virtual SCSI disks only if AIX® Multiple Path I/O (MPIO) or SDDPCM multipath driver is used on the Virtual I/O Server.
- If there is one or more Virtual SCSI disks present on an LPAR, IBM Spectrum Control considers the LPAR as a virtual machine. In this case, IBM Spectrum Control does not include disk space for this LPAR in the TOTAL disk space reports. Disks that are assigned directly through the physical Fibre Channel adapter to the LPAR in a Virtual SCSI environment are listed as virtual disks in IBM Spectrum Control.

Login requirements

Use the **padmin** user ID when logging in to a Virtual I/O Server, **padmin** is the main administrator ID for Virtual I/O Servers. Upon login, a password change is required. There is no default password to remember.

The Virtual I/O Server does not support users logging in as root to install or configure IBM Spectrum Control agents. However, you can debug errors generated by agents as a root user. For example, you can run the **service.sh** script to gather debugging information.

Upon logging in to the Virtual I/O Server, you are placed into a restricted Korn shell. The restricted Korn shell works the same way as a regular Korn shell, except you cannot:

- Change the current working directory.
- Set the value of the SHELL, ENV, or PATH variable.
- Specify the path name of the command that contains a redirect output of a command with a >, >|, <>, or >.

As a result of these restrictions, you cannot run commands that are in locations not defined in your PATH variable. These restrictions prevent you from directly sending the output of the command to a file, instead requiring you to pipe the output to the **tee** command.

Installation requirements

The installation requirements are:

- IBM Spectrum Control supports Virtual I/O Server 1.5.2 or later.
- The Virtual I/O Server for POWER6® processor-based systems, must have a minimum of 768 MB of memory.

For information about disk space requirements for the Storage Resource agent, see [Hardware requirements](#) (Hardware requirements for the IBM Spectrum Control agents).

General procedure to install and configure agents

To install and configure the agents on the Virtual I/O Server, complete the following steps:

1. Install IBM Spectrum Control.
2. Install and configure the agents on the Virtual I/O Server.
3. When you install the agents, they are automatically started
4. Collect information about a Virtual I/O Server by running probe jobs.
5. View the storage information gathered by the monitoring jobs through the reports that you can generate through the IBM Spectrum Control GUI.

See the *IBM Spectrum Control User's Guide* for more information about how to use the IBM Spectrum Control user interface to collect and view information that is gathered by agents on the Virtual I/O Servers.

Planning to monitor Db2

It is a good practice to monitor your IBM® Db2® environment to better understand what is happening inside your Db2 data server. Db2 11.5 or later includes enhancements that make monitoring Db2 database environments more comprehensive with higher granularity of control.

About this task

This infrastructure is a superior alternative to the existing system monitor, event monitors, snapshot commands, and snapshot SQL interfaces.

For more information about monitoring your Db2 environment, see [IBM DB2® 11.5 for Linux®, Unix and Windows](#).

Sudo command privileges

When you install, operate, or uninstall IBM Spectrum® Control as a non-root user on AIX® or Linux® operating systems, you are required to have sudo privileges to multiple commands. Use command aliases in the /etc/sudoers file to configure your sudo privileges for multiple commands.

Example command aliases

The following command aliases are examples that you can create for installing, operating, and uninstalling IBM Spectrum Control:

- `Cmnd_Alias IBMSC_INSTALL = /usr/bin/xauth, /Downloads/Db2_11.5_image/server_dec/db2setup, /opt/ibm/db2/V11.5/cfg/db2ln, /Downloads/IBM_Spectrum_Control_image/SC/setup.bin`
- `Cmnd_Alias IBMSC_OPERATION = /opt/IBM/TPC/scripts/*.sh, /opt/IBM/TPC/scripts/ldap/*.sh, /opt/IBM/TPC/agent/bin/agent.sh, \ /opt/IBM/TPC/service/*.sh, /opt/IBM/TPC/service/changepasswords, /opt/IBM/TPC/client_images/*.sh, \ /opt/IBM/TPC/cli/*.sh, /opt/IBM/TPC/data/scripts/logCleanup.sh, /opt/IBM/TPC/data/scripts/EncryptPassword.sh, \ /opt/IBM/TPC/data/server/tools/repocopy, /opt/IBM/TPC/data/server/tools/runTPCDBMaintenance, \ /opt/IBM/TPC/device/bin/linux/setenv.sh, /opt/IBM/TPC/device/bin/linux/enableapialerts.sh, \ /opt/IBM/TPC/device/bin/linux/disableapialerts.sh, /opt/IBM/TPC/wlp/bin/server, \ /opt/IBM/TPC/wlp/bin/securityUtility, /opt/IBM/TPC/jre/bin/ikeyman, /opt/IBM/TPC/jre/bin/ikeycmd, /bin/kill`
- `Cmnd_Alias IBMSC_UNINSTALL = /opt/IBM/TPC/_uninst/uninstall`

The following examples show how to use the command aliases to provide non-root users privileges to the various commands:

```
username1 ALL=(root) SETENV: IBMSC_INSTALL
username2 ALL=(root) SETENV: IBMSC_OPERATION
username3 ALL=(root) SETENV: IBMSC_UNINSTALL
```

Installing

Before you install IBM Spectrum® Control, you must install IBM® Db2® because Db2 is required for the IBM Spectrum Control database repository.

- [IBM Spectrum Control components](#)
You can install IBM Spectrum Control in single-server or multiple-server environments. In a single-server environment, all components are installed on one server.
- [Hardware requirements](#)
The hardware requirements of the IBM Spectrum Control server.
- [Software requirements](#)
This section describes the software that is required to install and run your system. This section includes operating systems supported, browsers supported, databases supported, and other software required such as Db2.
- [Installing IBM Spectrum Control](#)
Install IBM Spectrum Control and its components in your environment. You can use the installation program or the command line in silent mode.
- [Installing IBM Cognos Analytics](#)
You can install the optional IBM Cognos® Analytics 11.2.0 or later reporting tool on one computer, on multiple servers for a distributed installation, or you can expand an existing single computer installation to another server to improve performance. Cognos Analytics provides an installation program that guides you through the installation process.
- [Configuring IBM Cognos Analytics](#)
After you install the optional IBM Cognos Analytics, to view predefined reports and create custom reports about IBM Spectrum Control, you must copy Db2 files, create a content store database, save your configuration settings, and start the services.
- [Reinstalling the software if a failure occurs](#)
If an installation failure occurs, you do not have to uninstall components that were successfully installed. IBM Spectrum Control provides an option to partially, or fully, roll back the installation.
- [Taking the first steps after installation](#)
After IBM Spectrum Control is installed, configure it to monitor the resources in your environment.

IBM Spectrum Control components

You can install IBM Spectrum® Control in single-server or multiple-server environments. In a single-server environment, all components are installed on one server.

In single-server or multiple-server environments, when you install IBM Spectrum Control, the following components are installed:

- Database repository
- IBM Spectrum Control servers, which comprise the following components:
 - Data server
 - Device server
 - Alert server
 - Export server
 - Web server
 - IBM Spectrum Control GUI

- Command-line interface (CLI)
- Storage Resource agent

IBM Spectrum Control in an IPv4 or IPv6 environment

IBM Spectrum Control can use both IPv4 and IPv6 addresses for communication between its components.

If you have a system that is configured for dual-stack networking (with both IPv4 and IPv6 addresses), IBM Spectrum Control defaults to IPv4 addressing.

For information about using IPv4 and IPv6, see [Planning for Internet Protocol Version 6](#).

Hardware requirements

The hardware requirements of the IBM Spectrum® Control server.

Important: IBM Spectrum Control server can require a large amount of memory, disk space, network bandwidth, and processor resources. To promote consistent availability and performance, install IBM Spectrum Control on a dedicated server where no other critical business applications, including IBM® Copy Services Manager, are installed. IBM Software Support is not responsible for availability, performance, and functional problems that are caused by other business applications that are deployed on the same server as IBM Spectrum Control.

For information about the hardware requirements for IBM Spectrum Control, see *Hardware Support: Memory, Processor and Disk Space* at [IBM Spectrum Control - Hardware Support: Memory, Processor and Disk Space](#).

For information about the components that can be used with IBM Spectrum Control, see *Find the Supported Hardware, Products and Platforms Interoperability Matrix Links* at <https://www.ibm.com/support/pages/node/388393>.

Restriction: On AIX® or Linux® operating systems, when you use a Virtual Network Computing (VNC) client that is connected to a VNC server, do not use the following key combinations:

- Alt + H to start the Help page
- Alt + N to proceed to next page
- Alt + P to return to the previous page
- Alt + I to start an installation action on the Summary page

You must press Tab and then press Enter or the spacebar when the button you want to press is selected. For example, to start the Help, press Tab until the Help button is highlighted and then press Enter or the spacebar.

Software requirements

This section describes the software that is required to install and run your system. This section includes operating systems supported, browsers supported, databases supported, and other software required such as Db2®.

About this task

- [Software requirements for operating systems](#)
The IBM Spectrum Control family supports a variety of operating systems.
- [Software requirements for Storage Resource agents](#)
Storage Resource agents can be used by IBM Spectrum Control in various operating systems.
- [Software requirements for the database repository](#)
IBM Spectrum Control uses Db2 as the database repository.
- [Web browser support](#)
The IBM Spectrum Control GUI runs in a web browser and includes the ability to monitor, manage, and troubleshoot storage resources. You can access this interface from anywhere that you have a web browser and connectivity to a network.
- [Software requirements for LDAP servers](#)
The LDAP repositories that are available on Windows, Linux® and AIX® operating systems, can be used with IBM Spectrum Control.
- [Software requirements for CIM agents](#)
IBM Spectrum Control requires CIM agents for some IBM storage devices.

Software requirements for operating systems

The IBM Spectrum® Control family supports a variety of operating systems.

Before you install IBM Spectrum Control, check the IBM Spectrum Control support site at <https://www.ibm.com/support/pages/node/6249361#Server> for the latest operating system support.

Software requirements for Storage Resource agents

Storage Resource agents can be used by IBM Spectrum® Control in various operating systems.

For a list of the operating systems that are supported for Storage Resource agents, go to <https://www.ibm.com/support/pages/node/6249361#Agents>.

Software requirements for the database repository

IBM Spectrum® Control uses Db2® as the database repository.

Important: You must use a 64-bit version of Db2 with IBM Spectrum Control.

Supported versions of Db2

For a list of the supported Db2 versions, go to <http://www.ibm.com/support/pages/node/6249361#DB>.

Web browser support

The IBM Spectrum® Control GUI runs in a web browser and includes the ability to monitor, manage, and troubleshoot storage resources. You can access this interface from anywhere that you have a web browser and connectivity to a network.

Before you start IBM Spectrum Control, ensure that you are using a supported web browser. For a list of web browsers that you can use with IBM Spectrum Control, see the support matrix at [IBM Spectrum Control - Platform Support: Servers, Agents, and Browsers - Web Browsers](#).

Note: The IBM Spectrum Control GUI requires the use of cookies to manage user preferences, such as table customization and frequently viewed charts. Ensure that cookies are enabled to use these features.

Software requirements for LDAP servers

The LDAP repositories that are available on Windows, Linux® and AIX® operating systems, can be used with IBM Spectrum® Control.

For information about the LDAP repositories that are supported, see one of the following WebSphere® Application Server Liberty web pages:

- For version information, see [WebSphere Liberty - Detailed Requirements](#) - On the Supported Software tab, click LDAP Servers.
- For fix pack information, see [Fix list for IBM® WebSphere Application Server Liberty](#).

Software requirements for CIM agents

IBM Spectrum® Control requires CIM agents for some IBM® storage devices.

CIM agents for switches and directors

CIM agents (SMI-S providers) are also required for switches and directors. For a complete list of switches and directors that are supported and the level of CIM agents that are required for each device, see <https://www.ibm.com/support/pages/node/388393>.

CIM agents for non-IBM storage systems

IBM Spectrum Control also supports some non-IBM storage systems. For example, IBM Spectrum Control supports HP, TagmaStore, CLARiiON, Symmetrix, and other storage systems.

For a complete list of storage systems that are supported and the level of CIM agents that are required for each device, see <https://www.ibm.com/support/pages/node/388393>.

Installing IBM Spectrum Control

Install IBM Spectrum® Control and its components in your environment. You can use the installation program or the command line in silent mode.

- **[Installation checklists for IBM Spectrum Control](#)**
The installation of IBM Spectrum Control requires you to install a number of components. You can use the following checklists to guide you through the installation procedures for each component. Use separate checklists for multiple server installations.
- **[Db2](#)**
You can install the most recent version of Db2 that IBM Spectrum Control supports on the Linux®, AIX®, or Windows operating systems.
- **[Starting the installation programs](#)**
There are various methods to start the IBM Spectrum Control installation programs and on various operating systems.
- **[Installing IBM Spectrum Control in a single-server environment](#)**
Install IBM Spectrum Control by using the installation program or the command line in silent mode.
- **[Installing IBM Spectrum Control in a multiple-server environment](#)**
You can install IBM Spectrum Control by using the installation program or by using silent mode from the command line. Note, installing IBM Spectrum Control by using console mode is not supported.
- **[Accessing IBM Spectrum Control server from a remote computer using Command Line Interface](#)**
Accessing client components on a remote computer helps you complete storage management tasks from a computer that does not have a IBM Spectrum Control server that is installed on it.
- **[Installing IBM Spectrum Control on a Windows domain](#)**
You can install IBM Spectrum Control and Db2 by using a Windows domain or a local user account.

- [Verifying the connection to the domain controller computer by using the Dcdiag tool](#)
Use the Dcdiag command line tool to help you determine whether the domain controller computer is registered with the domain name server (DNS), whether the controller can be pinged, and whether the controller has Lightweight Directory Access Protocol (LDAP) connectivity.
- [Installing IBM Spectrum Control and associated products using minimal space on the Windows C: drive](#)
In some cases, you might not want to install Db2 or IBM Spectrum Control on the C: drive.
- [Verifying the installation](#)
After you install IBM Spectrum Control, you can verify whether the installation was successful.
- [Reviewing the log files to resolve installation issues](#)
If an error occurs during IBM Spectrum Control installation, you can review the error log files to resolve issues and continue the installation.
- [Changing languages](#)
You can change the operating system language and web browser that determines the language in which IBM Spectrum Control services and the IBM Spectrum Control GUI are displayed.
- [Adding an installation license](#)
If you installed IBM Spectrum Control and want to add a IBM Spectrum Control license so that you can monitor storage systems with different license models, you can use the installation program or silent-mode installation.
- [Installing Storage Resource agents](#)
You can install Storage Resource agents by using the IBM Spectrum Control user interface or a command.

Installation checklists for IBM Spectrum Control

The installation of IBM Spectrum® Control requires you to install a number of components. You can use the following checklists to guide you through the installation procedures for each component. Use separate checklists for multiple server installations.

Prepare your environment for installation

Ensure that your target environment is ready for an installation.

Table 1. Prepare your environment for an installation check list

Check	Required for	Task
<input type="checkbox"/>	Antivirus software	<p>Installing IBM Spectrum Control involves making use of your operating system in manners typical for installing new application software. If your antivirus software is set on the maximum mode, it might prevent some of your changes from being accepted.</p> <p>To verify that your installation completes correctly, enable your antivirus software product to allow the following instances:</p> <ul style="list-style-type: none"> • The /etc/hosts file can be edited • Files can be created in the /temp directory • New executable files can be created in the C:\Program Files directory <p>If McAfee Adaptive Threat Protection is enabled on the server where IBM Spectrum Control is installed, it might prevent some services from starting or stopping. To help avoid this issue, open McAfee Adaptive Threat Protection and go to settings. In the Real Protect Scanning (Windows only) section, verify if Enable client-based scanning is selected. If so, select Low from the Sensitivity level list.</p> <p>For more information about McAfee Adaptive Threat Protection, see the following links:</p> <ul style="list-style-type: none"> • Adaptive Threat Protection — Options • Overview of Adaptive Threat Protection
<input type="checkbox"/>	Fully qualified host names	IBM Spectrum Control requires fully qualified host names, so you must install the product on a computer that has a fully qualified host name. For example, abc.tucson.example.com is a fully qualified host name where abc is the host name and tucson.example.com is the full domain name.
<input type="checkbox"/>	Hardware prerequisites	For information about the hardware requirements for IBM Spectrum Control, see <i>Hardware Support: Memory, Processor and Disk Space</i> at https://www.ibm.com/support/pages/node/388393 .
<input type="checkbox"/>	Software prerequisites	<ul style="list-style-type: none"> • The IBM Spectrum Control family supports various operating systems, see Software requirements for operating systems • For the database repository, see Software requirements for the database repository • For LDAP servers, see Software requirements for LDAP servers
<input type="checkbox"/>	Required user privileges	<p>Ensure that you have the required privileges to install Db2 and IBM Spectrum Control.</p> <p>If you are installing on a Windows operating system, you must install as a user with administrator privileges. If you are installing on an AIX or Linux operating system, you must install as a root user or as a non-root user who has sudo privileges.</p> <p>If you want to install as a non-root user, your system administrator must complete configuration tasks on the target server before you begin the installation. These tasks are listed in Installing Db2 on AIX or Linux and Installing IBM Spectrum Control in a single-server AIX or Linux environment.</p> <p>Ensure that Windows administrators have the Debug programs privilege.</p>
<input type="checkbox"/>	Download packages	<p>You must download the installation packages or images into a separate directory for each product. The following list provides suggested download directory paths:</p> <ul style="list-style-type: none"> • Windows operating systems: <ul style="list-style-type: none"> ◦ c:\downloads\DB2 ◦ c:\downloads\TPC • AIX or Linux operating systems: <ul style="list-style-type: none"> ◦ /downloads/DB2 ◦ /downloads/TPC <p>For more information, see Planning for installation</p>

Check	Required for	Task
<input type="checkbox"/>	Language setting	Determine the operating system language that you want to use for IBM Spectrum Control. For optimal support, it's recommended that you use English. The web browser determines the language in which IBM Spectrum Control services and the IBM Spectrum Control GUI are displayed. For more information, see Changing languages .

Windows domain

Before you can install IBM Spectrum Control on a Windows domain, you must determine which installation method is appropriate, based on your environment. For more information, see [Planning to install IBM Spectrum Control in a Windows domain](#)

Table 2. Windows domain installation check list

Check	Required for	Task
<input type="checkbox"/>	Windows domain and local user accounts	When a computer is a member of a Windows domain, you can install IBM® Db2® on the computer such that the Db2® installation process creates a local Db2® user account or a domain Db2 user account. n Important: Before you run your Db2 installation and begin your IBM Spectrum Control installation, please validate that the Windows server hostname is 15 characters or less in length. See Windows domain and local user accounts .
<input type="checkbox"/>	Adding a computer to the Windows domain	Before you can install IBM Spectrum Control in a Windows domain, you must first add the computer on which you plan to install IBM Spectrum Control to the domain, see Adding a computer to the Windows domain .
<input type="checkbox"/>	Create Windows domain common user account	You must create a Windows domain common user account before you can install IBM Spectrum Control in a Windows domain, see Creating a Windows domain common user account for IBM Spectrum Control .
<input type="checkbox"/>	Grant Db2 SYSADM authority to Windows domain user account	If a Windows domain user account is used to install IBM Spectrum Control, the user account might not have the Db2 SYSADM authority, because Db2 goes to the domain controller computer to list the groups. Before you install IBM Spectrum Control, you must grant the Windows domain user accounts the Db2 SYSADM authority, see Granting Db2 SYSADM authority to a Windows domain user account .

Db2

Install Db2 11.5.7 on Linux, AIX, or Windows operating systems.

Table 3. Db2 installation check list

Check	Required for	Task
<input type="checkbox"/>	Prepare for Db2 installation	<ul style="list-style-type: none"> When you install Db2 11.5.7, a default user name and groups are created. This default user name and password are used to install IBM Spectrum Control. See Preparing to install Db2.
<input type="checkbox"/>	Install on Windows	For information on how to install Db2 on Windows operating systems, see Installing Db2 on Windows .
<input type="checkbox"/>	Install Db2 by using a Windows domain user account	Before you install IBM Spectrum Control in a Windows domain, you must install Db2 and register the Db2 license key. You must have domain administrator access. Important: Before you run your Db2 installation please validate that the Windows server hostname is 15 characters or less in length. You do not need to complete this task if you are planning to install Db2 by using a local user account, see Installing Db2 by using a Windows domain user account .
<input type="checkbox"/>	Install Db2 on AIX or Linux - GUI installation	For information on how to install Db2 on AIX or Linux by using the GUI installation process, see Installing Db2 on AIX or Linux .
<input type="checkbox"/>	Install Db2 on AIX by using the command line	For more information on how to install Db2 on AIX by using the command line, see Installing Db2 on AIX or Linux by using the command-line .
<input type="checkbox"/>	Verify Db2 installation	You can verify that Db2 11.5.7 is installed properly by using the command line processor (CLP) or the First Steps GUI, see Verifying that Db2 is installed correctly .

IBM Spectrum Control

Install IBM Spectrum Control by using the installation program or the command line in silent mode.

Table 4. Installation check list

Check	Required for	Task
<input type="checkbox"/>	Choose installation method	For more information about what methods are available to install IBM Spectrum Control, see Planning for installation
<input type="checkbox"/>	Install IBM Spectrum Control on a single server.	For more information about how to install IBM Spectrum Control on a single server, see Installing IBM Spectrum Control in a single-server environment
<input type="checkbox"/>	Install IBM Spectrum Control on multiple servers.	For more information about how to install IBM Spectrum Control on multiple servers, see Installing IBM Spectrum Control in a multiple-server environment

Db2

You can install the most recent version of Db2® that IBM Spectrum® Control supports on the Linux®, AIX®, or Windows operating systems.

About this task

For more information about the supported versions, see [Software requirements for the database repository](#).

- **Preparing to install Db2**
Before you install Db2, run the **db2prereqcheck** command on the target installation server to ensure that the server meets the prerequisites for Db2. For example, **db2prereqcheck -v 11.5.7.0**. You can ignore the section on the Db2 pureScale® prerequisites.
- **Installing Db2**
You can install IBM® Db2 on AIX, Linux, or Windows operating systems.
- **Verifying that Db2 is installed correctly**
You can verify that Db2 is installed properly by using the command-line processor (CLP) or the First Steps GUI.
- **Licensing Db2**
You can apply a valid license to Db2 by using the **db2licm** command.

Preparing to install Db2

Before you install Db2, run the **db2prereqcheck** command on the target installation server to ensure that the server meets the prerequisites for Db2. For example, **db2prereqcheck -v 11.5.7.0**. You can ignore the section on the Db2 pureScale® prerequisites.

About this task

Before you install Db2, a default username and groups are created. This default username and password are used to install IBM Spectrum® Control. You can use the default username and password or provide your own.

Note: Windows operating systems do not support systems that are configured only for IP 6. (Windows is enabled for IP 6 and IP 4.)

- **Preparing to install Db2 on Windows**
Before you install Db2 on Windows operating systems, ensure that you correctly configured your directory names.
- **Preparing to install Db2 on UNIX or Linux**
To operate Db2 on operating systems such as UNIX or Linux, the instance owner, the fenced user, and the Db2 administration server user are required. These users and groups are automatically created when Db2 is installed.

Preparing to install Db2 on Windows

Before you install Db2 on Windows operating systems, ensure that you correctly configured your directory names.

Short file names

If Db2 is installed on a drive on which 8.3 file names are disabled, and the Db2 installation directory name has spaces in it, Db2 must be reinstalled on a drive that has 8.3 file names enabled, or in a directory that does not have spaces in the name.

To check the current 8.3 file name settings for a drive, in a Db2 command window, run the **'fsutil.exe behavior query disable8dot3'** command.

These are the values when you run the command:

- **0** = Create 8.3 short file names (default)
- **1** = Do not create 8.3 file names
- **2** = Set 8.3 file names on a per volume basis
- **3** = Disable 8.3 file names on all volumes, except the system volume

The registry state of **NtfsDisable8dot3NameCreation** is **0**, which means that 8.3 file names are enabled on all volumes.

To enable 8.3 file names on a global basis, run the **fsutil.exe behavior set disable8dot3 0** command.

Preparing to install Db2 on UNIX or Linux

To operate Db2® on operating systems such as UNIX or Linux®, the instance owner, the fenced user, and the Db2 administration server user are required. These users and groups are automatically created when Db2 is installed.

About this task

The user ID you need to install IBM Spectrum® Control must be the owner of the instance that you want to use; this user ID and password are created when you install Db2.

[Table 1](#) provides a list of the default user and group names.

Table 1. Db2 setup default user and group names

Required user	Default user name	Default group name	Description
instance owner	db2inst1	db2iadm1	Created in the instance owner home directory. This user ID controls all Db2 processes and owns all file systems and devices used by the databases contained within the instance.
fenced user	db2fenc1	db2fadm1	Used to run user-defined functions and stored procedures that are separate from the address space that is used by the Db2 database.

Installing Db2

You can install IBM® Db2® on AIX®, Linux®, or Windows operating systems.

- [Installing Db2 on Windows](#)
Before you can install IBM Spectrum Control, you must install Db2®.
- [Installing Db2 on AIX or Linux](#)
You can install Db2 as a root user or non-root user on an AIX or Linux operating system by using the Db2 Setup program. To install Db2 as a non-root user, the user must have sudo privileges on the target AIX or Linux server.
- [Installing Db2 on AIX or Linux by using the command-line](#)
You can install Db2 on AIX or Linux operating systems by using commands.

Installing Db2 on Windows

Before you can install IBM Spectrum® Control, you must install Db2®.

Before you begin

If you are installing Db2 in a Windows domain environment: See [Installing Db2 by using a Windows domain user account](#) for additional and alternate steps that are required for the installation of Db2.

Tip: You can disable the IBM® SSH server in Db2 11.1 or later because it is a Db2 service that is not used and can appear as an issue in security scans. See [IBM Spectrum Control Server Vulnerability Scan Reports Weak Cipher](#).

Note, Db2 11.5.5 or later on Windows does not include the IBM SSH Server.

About this task

To install Db2 on a Windows operating system, complete the following steps:

1. Log on with a user ID that has Administrator authority on Windows.
2. Use the extracted Db2 installation image. Windows Autorun starts the launchpad.
If you are using Windows Autorun, the installation program should start in 15-30 seconds. If the installation program does not start, complete one of the following steps:
 - In a command prompt, to start the Db2 set up page, go to `web_image_extraction\server_folder` and run the `setup.exe` command.
 - In Windows Explorer, go to `web_image_extraction\server_folder`, and double-click the setup.exe file.Where `server_folder` in the preceding steps is the location of the Db2 installation program.
3. In the DB2® Setup Launchpad, click Install a Product.
4. Click Install New for Db2 11.5.7.0 Server Editions.
Note: If you do not see the Db2 Setup program, it is probably running in the background. Look for a blinking icon in the Windows taskbar and click it to bring it to the foreground.
5. On the Welcome page of the Db2 Setup program, click Next.
6. On the Software License Agreement page, review and accept the license agreement, and click Next.
7. On the Select the installation type page, click Typical, and click Next.
8. On the Select the installation, response file creation, or both page, select Install Db2 Server Edition on this computer and save my settings in a response file.
9. Enter a response file name or accept the default, and click Next.
10. On the Select the installation folder page, enter a directory or accept the default, and click Next.
11. On the Set user information for the Db2 Administration Server page, enter the following user information:
 - a. Leave the Domain field blank.
 - b. In the User name field, type the Db2 user ID that you want to use or accept the default.
 - c. In the Password field, type a password and confirm the password by typing it again in the Confirm password field.
12. Select the Use the same account for the remaining Db2 services check box and click Next.
13. On the Configure Db2 instances page, click Next.
14. On the Set up notifications page, clear the Set up your Db2 server to send notifications check box, and click Next.
15. On the Enable operating system security for Db2 objects page, accept the defaults, and click Next.
The default is to enable operating system security.

Note: If you installed Db2 before on this system, and the DB2ADMS group exists, when you click Next, the following message is displayed:

Warning

The group name "DB2ADMS" already exists in the system and will be granted complete access to the DB2 folders and objects through the operating system.
Click OK to continue installation, or click Cancel to input another group name.

16. On the Start copying files and create response file page, review the current settings, and click Finish.
17. On the Setup is complete page, review the information, and click Next.
18. On the Install additional products page, click Finish.
19. The setup program closes and the Db2 First Steps page opens. Close the Db2 First Steps page.
20. Restart the system.

Note: To prevent the Db2 logs from filling up the C drive on the system you are installing on, you can set the *DIAGPATH* and *SPM_LOG_PATH* variables to point to an external, fast disk drive.

What to do next

After you restart your computer, you must install IBM Spectrum Control. For more information about installing IBM Spectrum Control in a single-server environment, see [Installing IBM Spectrum Control in a single-server Windows environment](#). For information about installing IBM Spectrum Control in a multiple-server environment, see [Installing IBM Spectrum Control with a remote database by using the installation program](#).

Installing Db2 on AIX or Linux

You can install Db2® as a root user or non-root user on an AIX® or Linux® operating system by using the Db2 Setup program. To install Db2 as a non-root user, the user must have sudo privileges on the target AIX or Linux server.

Before you begin

The X Window System is required on the AIX or Linux server to install Db2 by using the installation program.

If you want to install Db2 as a non-root user, have your system administrator complete the following tasks on the target server before you begin the installation:

- If you are installing Db2 on an AIX server, install sudo on the server. The default AIX distribution does not include sudo. To get the sudo installation package, go to <https://ibm.biz/BdftKL>. Find *sudo-version* in the Package column, and click RPM to download the package.
- Ensure that the non-root user has sudo privileges for the following commands on the server:
 - **xauth** (Enables the non-root user to provide access to their X Window System display for the root user.)
 - **db2setup** (Enables the non-root user to launch the Db2 installation program.)

You must enter the full path to the commands when you configure the sudo privileges. For example:

```
username      ALL=(root)      SETENV: /usr/bin/xauth,/home/username/Downloads/DB2/server_dec/db2setup
```

- Ensure that the following requirements are met to enable the installation of Db2 by using the Setup program:
 - The non-root user is able to use the X Window System on the target server and the X Window System **DISPLAY** environment variable is set correctly for the not-root user.
 - The **DISPLAY** environment variable is preserved in the sudo environment.
 - The root user has access to the X Window System display that is owned by the non-root user.
- If you are installing Db2 on an AIX server, ensure that the **ODMDIR** environment variable is preserved in the sudo environment.

Procedure

1. Log on to the target server as the root user or as a non-root user who has sudo privileges.
2. Use an extraction tool to extract the installation image files on the server.
3. In a command shell, change the directory to the location of the Db2 installation program db2setup, and then enter one of the following commands:

Root user

```
./db2setup
```

Non-root user

```
sudo ./db2setup
```

4. On the Db2 Setup Welcome page, click New Install.
5. On the Choose a Product page, select Db2 11.5.7.0 Server Editions and click Next.
6. On the Configuration page:
 - a. Enter an installation directory or accept the default.
 - b. Select Typical as the installation type.
 - c. Select Create an instance.
 - d. Review and agree to the IBM® terms.
 - e. Click Next.
7. On the Instance Owner page, select New user, and enter the following information:
 - a. User name
Db2 adds this user ID to the **db2iadm1** group, and if this user ID does not exist, Db2 creates it.
 - b. Group name
 - c. Password
 - d. Home directory
The Db2 instance owner user is the user that you enter when you install IBM Spectrum Control.
8. Select Use default UID and Use default GID, and click Next.
9. On the Fenced User page, select New user, and enter the following information:
 - a. User name
Db2 adds this user ID to the **db2fadm1** group, and if this user ID does not exist, Db2 creates it.
 - b. Group name
 - c. Password
 - d. Home directory
The fenced user is used to run user-defined functions and stored procedures that are separate from the address space that is used by the Db2 database.
10. Select Use default UID and Use default GID, and click Next.
11. On the Response File and Summary page:

- a. Select Install Db2 Server Edition on this computer and save my settings in a response file.
 - b. Enter a response file name or accept the default.
 - c. Review the Summary and click Finish.
12. On the Setup has completed successfully page, review the information, and click Finish.

What to do next

To ensure that Db2 starts when the server starts, run the **db2iauto** command.

Root user

```
DB2_installation_directory/bin/db2iauto -on DB2_instance_name
```

Non-root user

```
sudo DB2_installation_directory/bin/db2iauto -on DB2_instance_name
```

Where *DB2_installation_directory* is the location of Db2 and *DB2_instance_name* is the instance that you created when you installed Db2. The default instance name is *db2inst1*.

Installing Db2 on AIX or Linux by using the command-line

You can install Db2® on AIX® or Linux® operating systems by using commands.

Before you begin

Ensure that you have:

- 2 - 3 GB of hard disk drive space for the Db2 installation **tar** file and extracted files.
- A file system with at least 30 GB for the IBM Spectrum® Control repository.

Procedure

To install Db2 on AIX or Linux operating systems by using a command line, complete the following steps:

1. Log in with a user ID that has root authority.
2. Install Db2.
 - a. Create a temporary directory (for example, **db2temp**) to hold the Db2 installation image and extracted files.
 - b. Copy or download the Db2 installation image into **db2temp**. The name of the file varies depending on the location from where the file is downloaded or copied and the language to which it is associated.
 - c. Use an extraction tool to extract the installation image files.
For example, if the name of the file is **v11.5_aix64_server.tar.gz**, enter **tar -zxf v11.5_aix64_server.tar.gz**. In this example, **v11.5_aix64_server.tar.gz** is extracted in the **db2temp** directory.
 - d. Change directory to the location of the Db2 installation program: **db2_install**.
 - e. Enter **./db2_install** to run the command-line installation program.
 - f. Enter yes to accept the license agreement terms.
 - g. Enter yes to install into the default directory; enter no to install into a directory you specify.
 - h. Enter **SERVER** for the Db2 product to install.
 - i. Enter no because you do not want to install the Db2 pureScale® feature.
The Installation Summary is displayed, which indicates a completed installation. Errors related to the install of the TSAMP file set can be ignored.
3. Create users and groups for Db2 on AIX.
 - a. Enter the following commands to create the Db2 groups:

```
mkgroup db2iadml
```

```
mkgroup db2fadml
```

- b. Enter the following commands to create the Db2 users and assign them to the Db2 groups:

```
mkuser pgrp=db2iadml groups=db2iadml home=/home/db2inst1 db2inst1
```

```
mkuser pgrp=db2fadml groups=db2fadml home=/home/db2fenc1 db2fenc1
```

- c. Enter the following commands to set the correct ownership on the Db2 users' home directories:

```
chown -R db2inst1:db2iadml /home/db2inst1
```

```
chown -R db2fenc1:db2fadml /home/db2fenc1
```

- d. Enter the following commands to set the password for the Db2 user db2inst1:

```
passwd db2inst1
```

```
pwdadm -f NOCHECK db2inst1
```

- e. Enter the following commands to set the password for the Db2 user db2fenc1:

```
passwd db2fenc1
```

```
pwdadm -f NOCHECK db2fenc1
```

- f. Enter the following command to add the Db2 user db2inst1 to the groups staff and system:

```
usermod -G staff,system db2inst1
```

4. Create users and groups for Db2 on Linux:

a. Enter the following commands to create the Db2 groups:

```
groupadd db2iadm1
```

```
groupadd db2fadm1
```

b. Enter the following commands to create the Db2 users:

```
useradd db2inst1
```

```
useradd db2fenc1
```

c. Enter the following commands to assign the Db2 users to the Db2 groups:

```
usermod -a -G db2iadm1 db2inst1
```

```
usermod -a -G db2fadm1 db2fenc1
```

d. Enter the following commands to set the correct ownership on the Db2 users' home directories:

```
chown -R db2inst1:db2iadm1 /home/db2inst1
```

```
chown -R db2fenc1:db2fadm1 /home/db2fenc1
```

e. Enter the following command to set the password for the Db2 user db2inst1:

```
passwd db2inst1
```

f. Enter the following command to set the password for the Db2 user db2fenc1:

```
passwd db2fenc1
```

g. Enter the following command to add the Db2 user db2inst1 to the group root:

```
usermod -a -G root db2inst1
```

5. Create a Db2 instance named **db2inst1**:

a. Change directory to `<Db2_installation_dir>/instance`.

b. Enter the command:

```
./db2icrt -a server -u db2fenc1 db2inst1
```

c. Enter the command:

```
. /home/db2inst1/sqllib/db2profile
```

d. Enter the command:

```
db2start
```

6. Configure Db2 communication.

a. Examine the `/etc/services` file. If the line **db2c_db2inst1**

25010/tcp exists in that file, proceed to Step 7. If the line **db2c_db2inst1**
25010/tcp does **not** exist in that file, do the following:

b. Edit the `/etc/services` file and add the following line at the end of the file: **db2c_db2inst1 25000/tcp**.

c. Enter the command:

```
db2 update dbm cfg using svcename db2c_db2inst1
```

d. Enter the command:

```
db2set DB2COMM=tpcipc
```

e. Enter the command:

```
db2stop
```

f. Enter the command:

```
db2start
```

7. Enter the command: **db2level** to verify the installed version of Db2.

Verifying that Db2 is installed correctly

You can verify that Db2® is installed properly by using the command-line processor (CLP) or the First Steps GUI.

About this task

To verify that Db2 is installed, complete the following steps:

1. Create the SAMPLE database.
2. Connect to the SAMPLE database.
3. Run a query against the SAMPLE database.
4. Drop the SAMPLE database.

- [Verifying Db2 installation using the command-line processor \(CLP\)](#)
You can verify that Db2 is successfully installed using the command-line processor (CLP).
- [Verifying Db2 installation by using the First Steps tool](#)
You can verify that Db2 is installed successfully, by using the First Steps tool.

Verifying Db2 installation using the command-line processor (CLP)

You can verify that Db2® is successfully installed using the command-line processor (CLP).

About this task

To verify that Db2 is installed using the command line processor, complete the following steps:

Procedure

1. Log on to the system as a user with SYSADM authority.
2. Enter `db2start` to start the database manager.
In operating systems such as AIX® and Linux®, you must source the `db2profile` before you run the **db2start** command. For more information about sourcing the profile, go to the IBM Spectrum® Control Knowledge documentation and search for *Using the command line on AIX and Linux*.
3. Enter the **db2sample** command to create the **SAMPLE** database.
This command might take a few minutes to process. There is no completion message. When the command prompt returns, the process is complete. The **SAMPLE** database is automatically cataloged with the database alias **SAMPLE** when it is created.
4. Enter the following commands in a Db2 command window to connect to the SAMPLE database, retrieve a list of all the employees who work in Department 20, and reset the database connection:

```
db2 connect to sample
db2 "select * from staff where dept = 20"
db2 connect reset
```
5. After verifying the installation, remove the **SAMPLE** database to free up disk space.
For more information about verifying Db2 installation, refer to the Db2 documentation for your operating system.
6. Enter `db2 drop database sample` to drop the **SAMPLE** database.

Verifying Db2 installation by using the First Steps tool

You can verify that Db2® is installed successfully, by using the First Steps tool.

Before you begin

- Ensure that the domain user account that you use to create the sample database has SYSADM or SYSCTRL authority.
- Install IBM® Data Studio and the First Steps component.

About this task

The First Steps tool is part of the getting started component grouping in the Db2 setup program. It is installed as part of a typical installation or you can select the First Steps tool during a custom installation.

Procedure

To verify the Db2 installation by using the First Steps tool, complete the following steps:

1. Log on to the system with the user account that you want to use to verify the installation.
2. Start First Steps by completing one of the following steps:
 - On operating systems such as AIX® or Linux®, run the `db2fs` command.
 - On Windows, run the `db2fs.bat` command.
3. On the First Steps window, select Create Sample Databases.
4. On the Create Sample Databases page, select the databases that you want to create and click OK.
By default, the SAMPLE database is created on the computer where Db2 is installed.
5. Click OK.
6. Open Data Studio.
7. Expand the navigation tree to view the SAMPLE database and SAMPLE database objects.
8. Select the Tables object to view the SAMPLE database tables.
9. After you verify the installation, remove the SAMPLE database to free disk space.
10. Enter the **db2 drop database sample** command to drop the SAMPLE database.

Licensing Db2

You can apply a valid license to Db2® by using the **db2licm** command.

About this task

The installation and operation of IBM Spectrum® Control requires that Db2 is running on your system. Important: After your Db2 11.1 trial license period expires, Db2 11.1 does not start without a valid license. IBM Spectrum Control does not support the Db2 11.5 Community license.

Procedure

To apply a valid license to Db2 with the **db2licm** command, complete the following steps:

1. Retrieve and extract a valid Db2 license that is supplied on the IBM Spectrum Control download site.
2. Open a Db2 command prompt or switch to the Db2 instance owner user and in the location where you extracted your Db2 license, change to the following directory:

```
awse_o/db2/license/          if you are using Db2 11.1
std_vpc/db2/license/         if you are using Db2 11.5
```

3. Run the following command:

Using Db2 11.1 on the Windows operating system:

```
Db2_installation_location\BIN\db2licm -a db2awse_o.lic
```

Using Db2 11.5 on the Windows operating system:

```
Db2_installation_location\BIN\db2licm -a db2std_o.lic
```

where *Db2_installation_location* is the base installation directory for Db2 on your computer. For example, C:\Program Files\IBM\SQLLIB.

Using Db2 11.1 on the AIX®/Linux® operating system:

```
Db2_installation_location/adm/db2licm -a db2awse_o.lic
```

Using Db2 11.5 on the AIX/Linux operating system:

```
Db2_installation_location/adm/db2licm -a db2std_o.lic
```

where *Db2_installation_location* is the base installation directory for Db2 on your computer. For example, /opt/ibm/db2/V11.5.

Related information

- [db2licm - License management tool command](#)

Starting the installation programs

There are various methods to start the IBM Spectrum® Control installation programs and on various operating systems.

Installation program methods

You can use these methods to start the installation programs:

Installation images

You must select an installation image and download and extract these images to a location with adequate disk space.

Storage Resource agent

Contains the files to run local Storage Resource agent installations. You must download the file for the system on which you want the agent to be in.

- The Storage Resource agent location and operating system file name is the same as the product electronic image.
- The Storage Resource agent image is in *installation_dir/data/sra/operating_system_name*.

The operating systems that are supported for the Storage Resource agents are listed in the following table.

Table 1. Operating system for Storage Resource agents.

Operating system	Operating system name
Windows	windows
AIX®	aix_power
Linux® x86	linux_ix86
Linux for Power Systems Servers	linux_power
Linux s390	linux_s390

Important:

- If you are using IBM Spectrum Control electronic installation images that are decompressed in a directory that has spaces in the name, IBM Spectrum Control does not install correctly.

For example, if you have the following directory name:

- On Windows operating systems:

```
C:\Spectrum Control\disk\SC
```

- On AIX and Linux operating systems:

```
/temp/Spectrum Control/disk/SC
```

IBM Spectrum Control does not install correctly.

When you remove the spaces, and rename the directory, for example:

- On Windows operating systems:

```
C:\SpectrumControl\disk\SC
```

- On AIX and Linux operating systems:

```
/temp/SpectrumControl/disk/SC
```

IBM Spectrum Control installs correctly.

- If you are using IBM Spectrum Control electronic installation images for Linux or AIX operating systems and you download the images to a directory, ensure that your folder name *does not* contain a . at the end of the folder name.

For example, if you have a directory name

```
C:\SpectrumControl\disk\SC.
```

When you rename the folder and remove the . at the end of the name, for example:

```
C:\SpectrumControl\disk\SC.August3
```

IBM Spectrum Control installs correctly.

Starting the installation program on the Windows operating system

To start the IBM Spectrum Control installation program by using an electronic image, complete the following steps.

1. Download the image into a directory.
2. Extract the image files.
3. At the command prompt, enter `cd source_installation_directory\SC` and then enter `setup.bat`.

Starting the installation program on the Linux operating system

To start the IBM Spectrum Control installation program from the electronic image, complete the following steps.

1. Enter the following to create a directory:

```
mkdir /SpectrumControl
```

2. Download the image into the SpectrumControl directory.
3. Enter this command to extract the image files:

```
tar -xvzf filename.tar.gz
```

4. Ensure that the user name that you plan to use as the IBM Spectrum Control common user is in the `root` group and the `db2iadm1` group. If the user name is not in a group, you can add the user as shown in the following command example. In this example, the user name is `db2inst1`.

```
usermod -a -G root db2inst1
```

5. Navigate to the `/SpectrumControl/SC` directory by entering:

```
cd /SpectrumControl/SC
```

6. Set up your shell environment to point to the instance where the database repository is installed. Source the `db2profile` for the instance that you want. For example, if the Db2® instance is `db2inst1`, you can source the `db2profile` by entering:

```
./home/db2inst1/sqllib/db2profile
```

Remember: There is a space between . and /home.

7. Start the installation program by running the `./setup.bin` command from the same command shell that you used in [step 6](#).

Starting the installation program on the AIX operating system

To start the IBM Spectrum Control installation program from the electronic image, complete the following steps:

1. Enter the following to create a directory:

```
mkdir /SpectrumControl
```

2. Download the image into the SpectrumControl directory.
3. Enter this command to extract the image files:

```
tar -xvzf filename.tar.gz
```

4. Ensure that the user name that you plan to use as the IBM Spectrum Control common user is in the `system` group and the `db2iadm1` group. If the user name is not in a group, you can add the user as shown in the following command example. In this example, the user name is `db2inst1`.

```
usermod -G system db2inst1
```

Tip: If the user is already a member of secondary groups, the `usermod` command removes the `db2inst1` user name from all of the secondary groups except for the system group. To preserve the existing secondary group memberships, provide a comma separated list of secondary groups after the -G flag. For more information, enter `man usermod` at the command prompt.

5. Navigate to the `/SpectrumControl/SC` directory.

```
cd /SpectrumControl/SC
```

6. Set up your shell environment to point to the instance where the database repository is installed. Source the `db2profile` for the instance that you want. For example, if the Db2 instance is `db2inst1`, you can source the `db2profile` by entering:

```
. /home/db2inst1/sqllib/db2profile
```

Remember: There is a space between `.` and `/home`.

7. Start the installation program by running the `./setup.bin` command from the same command shell that you used in [step 6](#).

Installing IBM Spectrum Control in a single-server environment

Install IBM Spectrum® Control by using the installation program or the command line in silent mode.

Installation considerations

Before you begin the installation of IBM Spectrum Control, ensure that Db2® is installed. To learn how to install Db2, see [Installing Db2](#). If you install Db2 on a Windows server, reboot the system before you install IBM Spectrum Control.

When you install IBM Spectrum Control, a database that is called *TPCDB* is created. In this repository, the IBM Spectrum Control database schema is created, which describes the structure of the database repository. If you already have the *TPCDB* database on your system, IBM Spectrum Control assigns a new default database repository name with a number as a suffix. For example, *TPCDB1*.

If the operating system on which you are installing IBM Spectrum Control is sensitive to spaces in directory paths, change the default installation location to not include spaces, for example, `C:\apps\IBM\SC`.

- [Installing IBM Spectrum Control in a single-server Windows environment](#)
You can install IBM Spectrum Control by using the IBM Spectrum Control installation program.
- [Installing IBM Spectrum Control in a single-server AIX or Linux environment](#)
You can install IBM Spectrum Control as a root user or non-root user on an AIX or Linux operating system by using the IBM Spectrum Control installation program. To install IBM Spectrum Control as a non-root user, the user must have sudo privileges on the target AIX or Linux server.
- [Installing IBM Spectrum Control in a single-server environment by using silent mode](#)
You can install IBM Spectrum Control by using silent mode. The installation program does not display any configuration options during the installation process.

Installing IBM Spectrum Control in a single-server Windows environment

You can install IBM Spectrum® Control by using the IBM Spectrum Control installation program.

Procedure

To install IBM Spectrum Control in a single-server environment, complete the following steps:

1. Log on to the target server a user who as administrator privileges.
Note: Confirm that your Windows firewalls are disabled in the Control Panel.
2. When you install IBM Spectrum Control, the TPCDB database is created in the location that you specify in the Db2® `DFTDBPATH` variable.
To determine the current `DFTDBPATH` value, run the following command in a Db2 CLI window:

```
get dbm cfg
```

If you want to install this database in a location that is other than the default location, run the following command in a Db2 CLI window:

```
update dbm cfg using DFTDBPATH path
```

where *path* is the new value for the `DFTDBPATH` variable.

3. Use an extraction tool to extract the installation image files on the server.
4. In a command window, change the directory to the location of the IBM Spectrum Control installation files and enter the following command:

```
setup.bat
```

5. Follow the prompts in the installation program to install IBM Spectrum Control.

Results

If an error occurred during the IBM Spectrum Control installation process, review the IBM Spectrum Control installation log files to find details about the error.

Installing IBM Spectrum Control in a single-server AIX or Linux environment

You can install IBM Spectrum® Control as a root user or non-root user on an AIX® or Linux® operating system by using the IBM Spectrum Control installation program. To install IBM Spectrum Control as a non-root user, the user must have sudo privileges on the target AIX or Linux server.

Before you begin

Before you install IBM Spectrum Control, check the IBM Spectrum Control support site at <https://www.ibm.com/support/pages/node/6249361#Server> for the latest operating system support.

Ensure that X Window System is installed on the target AIX or Linux server. The X Window System is required to install IBM Spectrum Control by using the installation program.

If you want to install IBM Spectrum Control as a non-root user, have your system administrator complete the following tasks on the target server before you begin the installation:

- If you are installing IBM Spectrum Control on an AIX server, install sudo on the server. The default AIX distribution does not include sudo. To get the sudo installation package, go to [AIX Toolbox for Linux Applications](#). Find `sudo-version` in the Package column, and click RPM to download the package.
- Ensure that the non-root user has sudo privileges for the following commands on the server:
 - **xauth** (Enables the non-root user to provide access to their X Window System display for the root user.)
 - **db2ln** (Enables the non-root user to create the links for the Db2® system files.)
 - **setup.bin** (Enables the non-root user to launch the IBM Spectrum Control installation program.)

You must enter the full path to the commands when you configure the sudo privileges. For example:

```
username      ALL=(root)      SETENV:
/usr/bin/xauth, /opt/ibm/db2/V11.5/cfg/db2ln, /home/username/Downloads/IBMSC/SC/setup.bin
```

- If the sudo environment on the server uses the `secure_path` option, ensure that the following directories are included in the `secure_path` value for the non-root user who is installing IBM Spectrum Control:
 - `DB2_instance_owner_home_directory/sqllib/bin` (Example: `/home/db2inst1/sqllib/bin`)
 - `DB2_instance_owner_home_directory/sqllib/adm` (Example: `/home/db2inst1/sqllib/adm`)
 - `DB2_instance_owner_home_directory/sqllib/misc` (Example: `/home/db2inst1/sqllib/misc`)
- Ensure that the following requirements are met to enable the installation of IBM Spectrum Control by using the installation program:
 - The non-root user is able to use the X Window System on the target server and the X Window System **DISPLAY** environment variable is set correctly for the not-root user.
 - The **DISPLAY** environment variable is preserved in the sudo environment.
 - The root user has access to the X Window System display that is owned by the non-root user.These display requirements do not apply if you install IBM Spectrum Control in silent mode.
- If you are installing IBM Spectrum Control on an AIX server, ensure that the **ODMDIR** environment variable is preserved in the sudo environment.

Procedure

To install IBM Spectrum Control in a single-server environment, complete the following steps:

1. Log on to the target server as the root user or as a non-root user who has sudo privileges.
2. If you logged on as a non-root user, run the following command in a command shell:

```
sudo DB2_installation_directory/cfg/db2ln
```

For example:

```
sudo /opt/ibm/db2/V11.5/cfg/db2ln
```

3. When you install IBM Spectrum Control, the TPCDB database is created in the location that you specify in the Db2 **DFTDBPATH** variable. To determine the current **DFTDBPATH** value, run the following command in a Db2 CLI window:

```
get dbm cfg
```

If you want to install this database in a location that is other than the default location:

- a. Run the following command in a Db2 CLI window:

```
update dbm cfg using DFTDBPATH path
```

where *path* is the new value for the **DFTDBPATH** variable.

- b. Run the **db2stop** and **db2start** commands to stop and restart Db2.

4. Use an extraction tool to extract the installation image files on the server.
5. In a command shell, source the Db2 user profile **db2profile** for the Db2 instance owner. For example:

```
. /home/db2inst1/sqllib/db2profile
```

6. In a command shell, change the directory to the location of the IBM Spectrum Control installation program **setup.bin**, and then enter the following command:

Root user

```
./setup.bin
```

Non-root user

```
sudo -E ./setup.bin
```

7. Follow the prompts in the installation program to install IBM Spectrum Control.

Results

If an error occurred during the IBM Spectrum Control installation process, review the IBM Spectrum Control installation log files to find details about the error.

Installing IBM Spectrum Control in a single-server environment by using silent mode

You can install IBM Spectrum® Control by using silent mode. The installation program does not display any configuration options during the installation process.

Before you begin

If you plan to install IBM Spectrum Control as a non-root user, have your system administrator complete the tasks that are described in [Installing IBM Spectrum Control in a single-server AIX or Linux environment](#) on the target server before you begin the installation.

If you are installing on a Windows operating system, confirm that your Windows firewalls are disabled in the Control panel.

Procedure

To install IBM Spectrum Control in a single-server environment by using silent mode, complete the following steps:

1. Log on to the server where you want to install IBM Spectrum Control.
If you are installing on a Windows operating system, log on as a user who has administrator privileges. If you are installing on an AIX or Linux operating system, log on as the root user or as a non-root user who has *sudo* privileges.

2. If you logged on as an AIX or Linux non-root user, run the following command in a command shell:

```
sudo Db2_installation_directory/cfg/db2ln
```

For example:

```
sudo /opt/ibm/db2/V11.5/cfg/db2ln
```

3. When you install IBM Spectrum Control, the TPCDB database is created in the location that you specify in the Db2® **DFTDBPATH** variable.
To determine the current **DFTDBPATH** value, run the following command from a Db2 CLI window:

```
get dbm cfg
```

If you want to install this database in a location that is other than the default location:

- a. Run the following command in a Db2 CLI window:

```
update dbm cfg using DFTDBPATH path
```

where *path* is the new value for the **DFTDBPATH** variable.

- b. If you are installing on an AIX or Linux operating system, run the **db2stop** and **db2start** commands to stop and restart Db2.

4. Edit and save the appropriate response file.

For more information about editing the response file, see [Editing the response file](#).

5. If you are installing on an AIX or Linux operating system, in a command shell, source the Db2 user profile **db2profile** for the Db2 instance owner.
For example:

```
. /home/db2inst1/sqllib/db2profile
```

6. Run the silent mode installation program.

- For Windows operating systems, run the following command:

```
setup.bat -l language -i silent -f absolute_path_to_response_file
```

where *language* can be one of the following values:

- Czech - cs
- English - en
- French - fr
- German - de
- Hungarian - hu
- Italian - it
- Japanese - ja
- Korean - ko
- Polish - pl
- Brazilian Portuguese - pt_BR
- Russian - ru
- Spanish - es
- Chinese (Simplified) - zh_CN
- Chinese (Traditional) - zh_TW

absolute_path_to_response_file is the absolute path to the response file. For example, the following command specifies the language and the path:

```
setup.bat -l fr -i silent -f c:\TPC\silent_SingleServerTypical.properties
```

- For AIX or Linux operating systems, run the following command:

Root user

```
./setup.bin -l language -i silent -f /absolute_path_to_response_file
```

For example, the following command specifies the language and the path:

```
./setup.bin -l de -i silent -f /TPC/silent_SingleServerTypical.properties
```

Non-root user

```
sudo -E ./setup.bin -l language -i silent -f /absolute_path_to_response_file
```

For example, the following command specifies the language and the path:

```
sudo -E ./setup.bin -l de -i silent -f /TPC/silent_SingleServerTypical.properties
```

If you do not specify a language or if the language is not specified correctly, the installation program uses the English language as the default.

7. Optional: Monitor the progress of the installation.

- To view the progress of the silent mode installation on Windows operating systems, check the trace log in the following path:

```
installation_dir\logs\traceTPCInstall.log
```

- To view the progress of the silent mode installation on AIX or Linux operating systems, check the trace log in the following path:

`installation_dir/logs/traceTPCInstall.log`

- **Editing the response file**

You must edit and save the appropriate response file when you install IBM Spectrum Control by using silent mode. The silent mode installation option for the response file is `-f absolute_path_to_response_file`. For example, in the Windows operating system, you enter `-f C:\installimage\silent_SingleServerTypical.properties`.

Editing the response file

You must edit and save the appropriate response file when you install IBM Spectrum® Control by using silent mode. The silent mode installation option for the response file is `-f absolute_path_to_response_file`. For example, in the Windows operating system, you enter `-f C:\installimage\silent_SingleServerTypical.properties`.

Use the following response files during a silent mode installation:

`silent_SingleServerTypical.properties`

This file specifies that all the IBM Spectrum Control components are installed on one server. You can customize this file by changing the ports for the Data server, Device server, Alert server, Export server, web server, and Storage Resource agent.

`silent_SingleServerCustom.properties`

This file specifies that all the IBM Spectrum Control components are installed on one server with the following customization options:

- Change the user name and password to install the database repository.
- Change the name of the database repository.
- Change the paths for the database repository.
- Change the path for the database repository log.
- Change the ports for the Data server, Device server, Alert server, Export server, web server, and Storage Resource agent.

`silent_MultipleServer.properties`

This file specifies the information that is required for a multiple-server environment. You can install the database repository on a remote server and install the other IBM Spectrum Control components on a local server.

Common response file parameters

These installation parameters are valid for all the response files.

`CHOSEN_INSTALL_TYPE="option"`

Specifies the installation type. Not all options are available in all the response files. [Table 1](#) shows you the options that you can specify.

Table 1. Options for the `CHOSEN_INSTALL_TYPE` parameter

Properties file	Valid options
<code>silent_SingleServerTypical</code>	<ul style="list-style-type: none"> • Single Server Install • License Upgrade
<code>silent_SingleServerCustom</code>	<ul style="list-style-type: none"> • Single Server Install • License Upgrade
<code>silent_MultipleServer</code>	<ul style="list-style-type: none"> • Multiple Server Install • License Upgrade

For example:

`CHOSEN_INSTALL_TYPE="Single Server Install"`

`LICENSE_ACCEPTED=false`

Specifies whether the user accepts the IBM Spectrum Control license agreement. The options are as follows:

`true`

The user accepts all the terms and conditions of the IBM Spectrum Control license agreement.

`false` or any other value

The user does not accept the IBM Spectrum Control license agreement. The installation program exits.

`USER_INSTALL_DIR=option`

Specifies the location where you want to install IBM Spectrum Control.

On Windows operating systems, you must use double backslashes. For example:

`USER_INSTALL_DIR=C:\\Program Files\\IBM\\TPC`

The default value for Windows operating systems is `C:\\Program Files\\IBM\\TPC`.

Note: If the operating system on which you are installing IBM Spectrum Control is sensitive to spaces in directory paths, change the default installation location to not include spaces, for example, `C:\\apps\\IBM\\SC`.

The default value for AIX® or Linux® operating systems is `/opt/IBM/TPC`.

`varSrvName=option`

Specifies the fully qualified host name of the server.

If your system is configured for dual stack networking (with both IPv4 and IPv6 addresses), IBM Spectrum Control defaults to IPv4 addressing.

Ensure that DNS is configured correctly on your server and verify that these files exist on your target server:

- For Windows operating systems, `C:\\Windows\\system32\\drivers\\etc\\hosts`.

- For AIX or Linux operating systems, /etc/hosts.

These files must have an entry similar to the following example:

```
myserver.example.mycompany.com myserver
```

varTPCPortRangeSP=port

Specifies the first port in a range of ports. The default beginning port is 9549. These ports are used by the IBM Spectrum Control servers, and the Storage Resource agent.

varCommonUsrID=user_name

Specifies the user name to install IBM Spectrum Control. The default user name for Windows operating system is db2admin. The default user name for AIX or Linux operating system is db2inst1.

The user name that you select must have the following operating system privileges:

- For Windows operating systems, the user name must be in the administrators group.
- For Linux operating systems, the user name must be in the root group.
- For AIX operating systems, the user name must be in the system group.

If you are using the common user name to also install the database repository, the user name must have these Db2® privileges:

- For Windows operating systems, the user name must be in the DB2ADMNS group.
- For AIX or Linux operating systems, the user name must be in the db2iadm1 group.

varCommonUsrPw=password

Specifies the password for the common user name.

varFullRollback=value

Specifies whether a full rollback or partial rollback is done when an installation failure occurs. These are the values:

- 0
Specifies that a partial rollback occurs. This value is the default.
- 1
Specifies that a full rollback occurs.

varUseLicenseKeyOnImage=value

Specifies whether to use the license key file that is present on the installation image. The value can be:

- 0
Uses the license key that is present on the installation image (default value)
- 1
Provides the location of the license key file

Depending on the license package you purchased, one of these license files is included with IBM Spectrum Control in the product electronic image:

```
nodeLock.AE
    IBM Spectrum Control license
nodeLock.AS
    IBM Spectrum Control Select Edition license
```

varLicenseKeyFile=location_of_license_key_file

Specifies the path for the license key file. This value must be set if the varUseLicenseKeyOnImage=1 parameter is specified.

On the Windows operating system, you must use double backslashes. For example:

```
C:\\license\\key\\nodeLock.AE
```

Response file parameters for advanced customization of the database repository

These parameters are used for the **silent_SingleServerCustom.properties** and **silent_MultipleServer.properties** response files to configure the database repository.

varDBAdmUsr=user_name

Specifies the user name that you must use to install the IBM Spectrum Control database. The user who logs in with this user name must be the owner of the Db2 instance where the database is created.

This user name must have these Db2 privileges:

- For Windows operating systems, the user name must be in the DB2ADMNS group. The default user name is db2admin.
- For AIX or Linux operating systems, the user name must be in the db2iadm1 group. The default user name is db2inst1.

varDBAdmPW=password

Specifies the password that is associated with the Db2 user name.

varDBName=database_name

Specifies the name of the IBM Spectrum Control database. The default database name is TPCDB.

Specify the database name by using the following rules:

- The name can contain the following characters:
 - a - z
 - A - Z
 - 0 - 9
- The name must be 1 - 8 characters long.

Restriction: The database name cannot have the following conditions:

- Contain a space or a blank.
- Begin with SYS, DBM, or IBM®.

- Be the name of an existing database.

`varDBPath=database_location, database_location, ...`
Specifies the absolute paths for the database.

The database path must follow these rules:

- The path cannot be longer than 242 bytes.
- The path must be an absolute path and not a relative path, for example, C:\

You can specify a maximum of 10 database paths and separate them with commas. For example, in the Windows operating system, you would specify `C: ,D: .` In the AIX or Linux operating system, you would specify `/home/db2inst1,/testPath`.

- For example, on the Windows operating system, if the database is on the C drive, you can add a D drive, an E drive. On Windows operating systems, you must use double backslashes. For example:

```
C: \DB2 \TPCDB ,D: \TPCDB ,E: \TPCDB
```

- For example, on the AIX operating system:

```
/home/db2inst1,/testPath
```

`varDBLogPath=log_location`

Specifies the absolute path where the database log files are stored. The default value of the variable is set to `<dftdbpath>/<instance name>/<varDBName>/SQLLOG`.

For example:

- On Windows operating systems, `c:\DB2\TPCDB\SQLLOG`
- On AIX operating systems, `/home/db2inst1/db2inst1/TPCDB/SQLLOG`

Response file parameter for the multiple-server environment

This parameter is valid for the `silent_MultipleServer.properties` file.

`varMultipleServerComponentList=components`

Specifies the IBM Spectrum Control components to install.

`database`

Installs the IBM Spectrum Control database repository.

`servers`

Installs the Data server, Device server, Alert server, Web server, the Storage Resource agent, CLI, and the IBM Spectrum Control GUI.

Response file parameters for the remote database

The following parameters are used only in the `silent_MultipleServer.properties` response file to access the IBM Spectrum Control database on a remote server. Remember: The Db2 database must be installed before you can use these parameters to access the database.

`varRemoteDBSrvName=host_name`

Specifies the fully qualified host name or IP address of the remote server where the IBM Spectrum Control database repository is installed. IBM Spectrum Control accepts both IPv4 and IPv6 addresses. If you have a system that is configured for dual stack networking (with both IPv4 and IPv6 addresses), IBM Spectrum Control defaults to IPv4 addressing.

For example, an IPv6 address in long form can be `2001:DB8:0:0:0:0:0:0`. An IPv6 address in short form can be `2001:DB8::` or `2001:DB8:0:0:0:0:0:0`.

`varRemoteDBPort=port`

Specifies the Db2 port on the remote server. The default port is 25000. Port 50000 can also be used.

`varRemoteDBAdmUsr=user_name`

Specifies the administrative user name to connect to the remote database. The default user name for the Windows operating system is `db2admin`. The default user name for the AIX or Linux operating system is `db2inst1`.

`varRemoteDBAdmPW=password`

Specifies the password for the user name.

`varRemoteDBName=database_name`

Specifies the IBM Spectrum Control database on the remote server. The default name is `TPCDB`.

Installing IBM Spectrum Control in a multiple-server environment

You can install IBM Spectrum® Control by using the installation program or by using silent mode from the command line. Note, installing IBM Spectrum Control by using console mode is not supported.

A multiple-server environment is ideal if you are monitoring large storage environments, where one server is not sufficient to manage the IBM Spectrum Control components.

If you have different administrators for Db2® and IBM Spectrum Control, this environment allows the database repository and Db2 to be installed and managed on a separate server.

Installation considerations

When you install IBM Spectrum Control, a database that is called TPCDB is created. In this repository, the IBM Spectrum Control database schema is created, which describes the structure of the database repository. If you already have the TPCDB database on your system, IBM Spectrum Control assigns a new default database repository name with a number as a suffix. For example, TPCDB1.

If the operating system on which you are installing IBM Spectrum Control is sensitive to spaces in directory paths, change the default installation location to not include spaces, for example, C:\apps\IBM\SC.

Installing IBM Spectrum Control with a remote database by using the installation program

You can install IBM Spectrum® Control in a multiple-server environment by using the installation program.

Before you begin

For this procedure, the terms *Server A* and *Server B* denote the two servers. If you plan to install IBM Spectrum Control as a non-root user, have your system administrator complete the tasks that are described in [Installing IBM Spectrum Control in a single-server AIX or Linux environment](#) on both servers before you begin the installation.

About this task

Server A will have Db2® and the IBM Spectrum Control database repository installed. Server B will have the IBM Spectrum Control servers installed.

Procedure

To install IBM Spectrum Control with a remote database by using the installation program, complete the following steps:

1. Complete the following steps on Server A:
 - a. Log on to Server A.
If you are installing on a Windows operating system, log on as a user who has administrator privileges. If you are installing on an AIX or Linux operating system, log on as the root user or as a non-root user who has sudo privileges.
Note: Confirm that your Windows firewalls are disabled in the Control Panel.
 - b. Install Db2 on Server A.
For more information about installing Db2, see [Installing Db2](#). If you install Db2 on a Windows server, restart the server before you install IBM Spectrum Control.
 - c. If you logged on as an AIX or Linux non-root user, run the following command in a command shell:

```
sudo DB2_installation_directory/cfg/db2ln
```

For example:

```
sudo /opt/ibm/db2/V11.5/cfg/db2ln
```

- d. When you install IBM Spectrum Control, the TPCDB database is created in the location that you specify in the Db2 **DFTDBPATH** variable.
To determine the current **DFTDBPATH** value, run the following command in a Db2 CLI window:

```
get dbm cfg
```

If you want to install this database in a location that is other than the default location:

- i. Run the following command in a Db2 CLI window:

```
update dbm cfg using DFTDBPATH path
```

where *path* is the new value for the **DFTDBPATH** variable.

- ii. If you are installing on an AIX or Linux operating system, run the **db2stop** and **db2start** commands to stop and restart Db2.

- e. If you are installing on an AIX or Linux operating system, in a command shell, source the Db2 user profile **db2profile** for the Db2 instance owner.
For example:

```
. /home/db2inst1/sqllib/db2profile
```

- f. Start the IBM Spectrum Control installation program on Server A.

In a command window or command shell, change the directory to the location of the IBM Spectrum Control installation files and enter the following command:

Windows

```
setup.bat
```

AIX or Linux root user

```
./setup.bin
```

AIX or Linux non-root user

```
sudo -E ./setup.bin
```

- g. On the Before You Begin page, because only the IBM Spectrum Control database repository will be installed on Server A, click Next.
 - h. On the Choose Installation Location and Type page, select Multiple servers and click Next.
 - i. On the Multiple Server Option: Select the Components page, select Database repository and click Next.
 - j. Follow the prompts in the installation program to install the IBM Spectrum Control database repository on Server A.
 - k. After the installation is finished, review the message log on Server A to ensure that no errors occurred.
2. Complete the following steps on Server B:
- a. Log on to Server B.
If you are installing on a Windows operating system, log on as a user who has administrator privileges. If you are installing on an AIX or Linux operating system, log on as the root user or as a non-root user who has sudo privileges.
 - b. Start the IBM Spectrum Control installation program on Server B.
In a command window or command shell, change the directory to the location of the IBM Spectrum Control installation files and enter the following command:
Windows

```
setup.bat
```

AIX or Linux root user

```
./setup.bin
```

AIX or Linux non-root user

```
sudo -E ./setup.bin
```
 - c. On the Choose Installation Location and Type page, select Multiple servers and click Next.
 - d. On the Multiple Server Options: Select the Components page, select IBM Spectrum Control Servers and click Next.
Attention: **IBM Spectrum Control servers** include the following components:
 - IBM Spectrum Control GUI
 - CLI
 - Storage Resource agent
 - e. Follow the prompts in the installation program to install the IBM Spectrum Control Servers on Server B.
 - f. After the installation program is finished, review the message log on Server B to ensure that no errors occurred.

Installing IBM Spectrum Control with a remote database by using silent mode

You can install IBM Spectrum® Control in a multiple-server environment by using silent mode.

Before you begin

For this procedure, the terms *Server A* and *Server B* denote the two servers. If you plan to install IBM Spectrum Control as a non-root user, have your system administrator complete the tasks that are described in [Installing IBM Spectrum Control in a single-server AIX or Linux environment](#) on both servers before you begin the installation.

If you are installing IBM Spectrum Control in silent mode on a Windows operating system, confirm that your Windows firewalls are disabled in the Control Panel.

About this task

Server A will have Db2® and the IBM Spectrum Control database repository installed. Server B will have the IBM Spectrum Control servers installed.

To install IBM Spectrum Control in a multiple-server environment by using silent mode, complete the following steps:

Procedure

1. Complete the following steps on Server A:
 - a. Log on to Server A.
If you are installing on a Windows operating system, log on as a user who has administrator privileges. If you are installing on an AIX or Linux operating system, log on as the root user or as a non-root user who has sudo privileges.
 - b. Install Db2 on Server A.
For more information about installing Db2, see [Installing Db2](#). If you install Db2 on a Windows server, make sure that you restart the server before you install IBM Spectrum Control.
 - c. If you logged on as an AIX or Linux non-root user, run the following command in a command shell:

```
sudo DB2_installation_directory/cfg/db2ln
```

For example:

```
sudo /opt/ibm/db2/V11.5/cfg/db2ln
```

- d. When you install IBM Spectrum Control, the TPCDB database is created in the location that you specify in the Db2 **DFTDBPATH** variable. To determine the current **DFTDBPATH** value, run the following command in a Db2 CLI window:

```
get dbm cfg
```

If you want to install this database in a location that is other than the default location:

- i. Run the following command in a Db2 CLI window:

```
update dbm cfg using DFTDBPATH path
```

where *path* is the new value for the **DFTDBPATH** variable.

- ii. If you are installing on an AIX or Linux operating system, run the **db2stop** and **db2start** commands to stop and restart Db2.

- e. On Server A, set the following parameters in the **silent_MultipleServer.properties** response file to install the remote database repository.

- LICENSE_ACCEPTED=true
- CHOSEN_INSTALL_TYPE="Multiple Server Install"
- varMultipleServerComponentList=database
- USER_INSTALL_DIR=option
- varSrvName=option
- varDBAdmUsr=user_name
- varDBAdmPW=password
- varDBName=database_name
- varDBPath=database_location
- varDBLogPath=log_location

For more information about editing the **silent_MultipleServer.properties** file, see [Editing the response file](#).

- f. Save the response file.

- g. If you are installing on an AIX or Linux operating system, in a command shell, source the Db2 user profile **db2profile** for the Db2 instance owner. For example:

```
. /home/db2inst1/sqllib/db2profile
```

- h. Run the silent mode installation program on Server A.

- For Windows operating systems, run the following command:

```
setup.bat -l language -i silent -f absolute_path_to_response_file
```

where *language* can be one of the following values:

- Czech - cs
- English - en
- French - fr
- German - de
- Hungarian - hu
- Italian - it
- Japanese - ja
- Korean - ko
- Polish - pl
- Brazilian Portuguese - pt_BR
- Russian - ru
- Spanish - es
- Chinese (Simplified) - zh_CN
- Chinese (Traditional) - zh_TW

absolute_path_to_response_file is the absolute path to the response file. For example, the following command specifies the language and the path:

```
setup.bat -l fr -i silent -f c:\TPC\silent_MultipleServer.properties
```

- For AIX or Linux operating systems, run the following command:

Root user

```
./setup.bin -l language -i silent -f /absolute_path_to_response_file
```

For example, the following command specifies the language and the path:

```
./setup.bin -l de -i silent -f /TPC/silent_MultipleServer.properties
```

Non-root user

```
sudo -E ./setup.bin -l language -i silent -f /absolute_path_to_response_file
```

For example, the following command specifies the language and the path:

```
sudo -E ./setup.bin -l de -i silent -f /TPC/silent_MultipleServer.properties
```

If you do not specify a language or if the language is not specified correctly, the installation program uses the English language as the default.

- i. Optional: Monitor the progress of the installation.

- To view the progress of the silent mode installation on Windows operating systems, check the trace log in the following path:

```
installation_dir\logs\traceTPCInstall.log
```

- To view the progress of the silent mode installation on AIX or Linux operating systems, check the trace log in the following path:

```
installation_dir/logs/traceTPCInstall.log
```

Tip: If there are preinstallation errors, you can review the **lax*out.txt** and **lax*err.txt** files that are in the **/tmp** and **%TEMP%** directories.

2. Complete the following steps on Server B:

a. Log on to Server B.

If you are installing on a Windows operating system, log on as a user who has administrator privileges. If you are installing on an AIX or Linux operating system, log on as the root user or as a non-root user who has sudo privileges.

b. On Server B, set the following parameters in the `silent_MultipleServer.properties` response file:

- `LICENSE_ACCEPTED=true`
- `CHOSEN_INSTALL_TYPE="Multiple Server Install"`
- `varMultipleServerComponentList=servers`
- `USER_INSTALL_DIR=option`
- `varSrvName=option`
- `varTPCPortRangeSP=port`
- `varCommonUsrID=user_name`
- `varCommonUsrPw=password`
- `varRemoteDBSrvName=host_name`
- `varRemoteDBPort=port`
- `varRemoteDBAdmUsr=user_name`
- `varRemoteDBAdmPW=password`
- `varRemoteDBName=database_name`

For more information about editing the `silent_MultipleServer.properties` file, see [Editing the response file](#).

c. Run the silent mode installation program on Server B.

- For Windows operating systems, run the following command:

```
setup.bat -l language -i silent -f absolute_path_to_response_file
```

where *language* can be one of the following values:

- Czech - cs
- English - en
- French - fr
- German - de
- Hungarian - hu
- Italian - it
- Japanese - ja
- Korean - ko
- Polish - pl
- Brazilian Portuguese - pt_BR
- Russian - ru
- Spanish - es
- Chinese (Simplified) - zh_CN
- Chinese (Traditional) - zh_TW

`absolute_path_to_response_file` is the absolute path to the response file. For example, the following command specifies the language and the path:

```
setup.bat -l fr -i silent -f c:\TPC\silent_MultipleServer.properties
```

- For AIX or Linux operating systems, run the following command:

Root user

```
./setup.bin -l language -i silent -f /absolute_path_to_response_file
```

For example, the following command specifies the language and the path:

```
./setup.bin -l de -i silent -f /TPC/silent_MultipleServer.properties
```

Non-root user

```
sudo -E ./setup.bin -l language -i silent -f /absolute_path_to_response_file
```

For example, the following command specifies the language and the path:

```
sudo -E ./setup.bin -l de -i silent -f /TPC/silent_MultipleServer.properties
```

If you do not specify a language or if the language is not specified correctly, the installation program uses the English language as the default.

d. Optional: Monitor the progress of the installation.

- To view the progress of the silent mode installation on Windows operating systems, check the trace log in the following path:

```
installation_dir\logs\traceTPCInstall.log
```

- To view the progress of the silent mode installation on AIX or Linux operating systems, check the trace log in the following path:

```
installation_dir/logs/traceTPCInstall.log
```

Note: If there are preinstallation errors, you can review the `lax*out.txt` and `lax*err.txt` files that are in the `/tmp` and `%TEMP%` directories.

Accessing IBM Spectrum Control server from a remote computer using Command Line Interface

Accessing client components on a remote computer helps you complete storage management tasks from a computer that does not have a IBM Spectrum® Control server that is installed on it.

Procedure

To access IBM Spectrum Control server on a remote computer, complete the following steps:

1. Go to the `client_images` subdirectory in the IBM Spectrum Control installation directory.

- On AIX® or Linux® operating systems, here is an example of a subdirectory:

```
/opt/IBM/TPC/client_images
```

- On Windows operating systems, here is an example of a subdirectory:

```
C:\Program Files\IBM\TPC\client_images
```

2. To create a client image, run one of the following commands for the operating system of the computer on which you want to access the command-line interface (CLI):

- On AIX or Linux operating systems, run the following command:

```
createClientImage.sh [aix | linux | windows | all]
```

When you include the `[aix | linux | windows | all]` parameters, you can create AIX, Linux, and Windows client images on a computer that is running AIX or Linux operating systems.

- On Windows operating systems run the following command:

```
createClientImage.bat [aix | linux | windows | all]
```

When you include the `[aix | linux | windows | all]` parameters, you can create AIX, Linux, and Windows client images on a computer that is running AIX and Linux or Windows operating systems.

Tip: Each parameter creates one of the following compressed client image files:

`aix`

Creates a `TPC_CLIENT_AIX.tar` image.

`linux`

Creates a `TPC_CLIENT_LINUX.zip` image.

`windows`

Creates a `TPC_CLIENT_WIN.zip` image.

`all`

Creates all of the client images.

3. Extract the appropriate compressed file on the remote computer.

- On AIX operating systems, extract the `TPC_CLIENT_AIX.tar` file to a folder, for example:

```
/opt/IBM/TPCclient
```

- On Linux operating systems, extract the `TPC_CLIENT_LINUX.zip` file to a folder, for example:

```
/opt/IBM/TPCclient
```

- On Windows operating systems, extract the `TPC_CLIENT_WIN.zip` file to a folder, for example:

```
c:/Program Files/IBM/TPCclient
```

4. Ensure that the following directories appear in the folder where you extracted the client image compressed file:

- `cli`
- `jre`

The `cli` folder contains the files to start the IBM Spectrum Control command-line interface and the Replication command-line interface. The `jre` folder contains other files that are necessary to start the command-line interface.

5. To start the IBM Spectrum Control command-line interface, run one of the following commands:

- On AIX or Linux operating systems:

```
/opt/IBM/TPCclient/cli/tpctool.sh
```

- On Windows operating systems:

```
C:\Program Files\IBM\TPCclient\cli\tpctool.bat
```

Installing IBM Spectrum Control on a Windows domain

You can install IBM Spectrum® Control and Db2® by using a Windows domain or a local user account.

Installing Db2 and IBM Spectrum Control by using local user accounts

Prerequisite: If the local user account is used to install the database repository, this account must be a member of the Db2 administrator (DB2ADMNS) group. To install IBM Spectrum Control and Db2 by using local user account, complete the following steps:

1. Install Db2 by using a local user account.
2. Log on to the Windows domain computer on which you plan to install IBM Spectrum Control by using a local user account that is a member of the local Administrators group and the local Db2 Administrators (DB2ADMNS) group.
3. On the Single Server Installation Information page, in the User name field, enter a local user account that is a member of local administrator group.

Installing Db2 by using a local user account and IBM Spectrum Control by using a domain user account

Prerequisite: If the local user account is used to install the database repository, this account must be a member of the Db2 administrator (DB2ADMNS) group. To install Db2 with a local user account and IBM Spectrum Control with a domain user account, complete the following steps:

1. Install Db2 by using a local user account.
2. Log on to the Windows domain computer on which you plan to install IBM Spectrum Control by using a domain user account that is a member of the local Administrators group and the local Db2 Administrators (DB2ADMNS) group.
This user must have the Act as part of the operating system and Login as a service permissions set in the security policy.
3. On the Single Server Installation Information page, in the User name field, enter a domain user account (with a Windows domain name prefix) that is a member of the local administrators group.
4. Click Configure Database repository.
5. On the Configure the Database Repository page, enter the Db2 user name **without** a Windows domain name prefix, enter the password for the Db2 user, and click Validate.
6. When the validation is complete, click OK to return to the Single Server Installation Information page.

Restriction: If the domain security policy overrides the local security policy, you must set the indicators on the domain controller computer.

Installing Db2 and IBM Spectrum Control by using domain user accounts

Prerequisite: If the domain user account is used to install the database repository, this user account must have Db2 SYSADM authority. To install IBM Spectrum Control and Db2 by using domain user accounts complete the following steps:

1. Install Db2 by using a domain user account.
2. Log on to the Windows domain computer on which you plan to install IBM Spectrum Control by using a domain user account that is a member of the local Administrators group and the domain Db2 Administrators (DB2ADMNS) group.
3. On the Single Server Installation Information page, in the User name field, enter a domain user account (with a Windows domain name prefix) that is a member of the local administrators group.
4. Click Configure Database repository.
5. On the Configure the Database Repository page, enter the Db2 user name **without** a Windows domain name prefix, enter the password for the Db2 user, and click Validate.
6. When the validation is complete, click OK to return to the Single Server Installation Information page.

Resolving Windows domain prevalidation errors

Adding Windows domain user accounts to a local group, such as Administrator or DB2ADMNS, and later deleting these user accounts from the domain controller computer can cause an error when the account is validated.

When you delete user accounts from the domain controller computer, a reference to the user account is created as a security ID on the computer that is a member of a Windows domain. If these references are not removed, the IBM Spectrum Control installation can fail.

To locate the references that have a security ID, complete these steps:

1. On the domain member computer, click Start > Control Panel > Administrative Tools > Computer Management. If you are prompted by a User Account Control window, click Yes.
2. In the Computer Management navigation tree view, expand the Local Users and Groups node and select Groups.
3. In the Name column, look for a security ID like the following example:

```
S-1-5-21-337177553-1671989427-887411491-500
```

4. To remove a reference, select the security ID and click Delete.
 - a. To add the user account back to the group, click Add. The user account now belongs to the group.

When a prevalidation error occurs, depending on the type of user account and the group, error messages might be displayed:

- BPCIN0109E An unexpected error occurred.....
For more information, review the log files and see the IBM Documentation.

To resolve this situation, use these steps:

1. On the domain controller computer, open Users and Groups on the Active Directory.
2. Delete all groups from the user account, and then add the groups again.
3. Log on to the computer again that is the member of the domain.

You have to add the DB2ADMNS rights to the user account again.

Locate the installation log files, lax*-out.txt and lax*-err.txt, for more details about the root cause of the error message. For example,

```
name=DB2ADMNS An error occurred while enumerating the groups.  
The group could be found.
```

- BPCIN0244E An error occurred while enumerating the local administrator group membership. On the current computer, on the Properties page of this group, remove the user names that are displayed with a security ID (SID). An example of a SID is S-1-5-21-337177553-1671989427-887411491-500 and is used instead of a user name.
- BPCIN0245E An error occurred while enumerating the local DB2 administrator group membership. On the current computer, on the Properties page of this group, remove the user names that are displayed with a security ID (SID). An example of a SID is S-1-5-21-337177553-1671989427-887411491-500 and is used instead of a user name.

For more information about these messages, go to IBM® Docs and search for the message number.
In the error message window, click OK to resume the installation program or Quit to restart the IBM Spectrum Control.

Verifying the connection to the domain controller computer by using the Dcdiag tool

Use the Dcdiag command line tool to help you determine whether the domain controller computer is registered with the domain name server (DNS), whether the controller can be pinged, and whether the controller has Lightweight Directory Access Protocol (LDAP) connectivity.

About this task

The Dcdiag tool is build into Windows Server versions 2019, 2016, and 2012 R2.

To use the Dcdiag tool, complete the following steps:

Procedure

1. On a computer that is a member of a Windows domain, go to [https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2012-r2-and-2012/cc731968\(v=ws.11\)](https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2012-r2-and-2012/cc731968(v=ws.11)).

To download the Dcdiag tool, complete the following steps:

- a. Go to the Windows Start menu and start the Server Manager.
- b. On the Server Manager Dashboard, click Add roles and features.
- c. On the Before You Begin page, click Next.
- d. On the Installation Type page, verify that Role-based or feature-based installation' is selected and click Next.
- e. On the Server Selection page, ensure that your server is selected and click Next.
- f. On the Server Roles page, click Next.
- g. On the Features page, go to Remote Server Administration Tools -> Role Administration Tools -> AD DS.
- h. Select AD LDS Tools -> AD DS Tools, and click AD DS Snap-Ins and then Command Line Tools. Click Next.
- i. On the Confirmation page, click Install.
- j. Verify that your installation is complete, then click Close.

2. In a command prompt, enter the following command:

```
DCDIAG /TEST:DNS /V /E /S:domaincontroller
```

Where *domaincontroller* is the name of the domain controller computer, for example, *TPCDomain*.

Important: You can run the command only if you are logged in with a Windows domain user name. If you try to run the command when you are logged in with a local user name, the following error message is displayed:

```
Connecting to directory service on server 10.10.10.10  
LDAP bind failed with error 1326,  
Logon failure: unknown user name or bad password.
```

Example

When you run the **DCDIAG** command, and you connect to the domain controller computer, the output contains text such as `passed test Connectivity`. This text is displayed even if text such as `system1.srm.tpc.example.com failed test DNS` is displayed at the end of the output.

The following output shows that the connection was successful:

```
Starting test: Connectivity  
* Active Directory LDAP Services Check  
*** Warning: could not confirm the identity  
of this server in the directory versus  
the names returned by DNS servers. If  
there are problems accessing this directory  
server then you may need to check that this  
server is correctly registered with DNS
```

Installing IBM Spectrum Control and associated products using minimal space on the Windows C: drive

In some cases, you might not want to install Db2® or IBM Spectrum® Control on the C: drive.

For example, you might have limited space on the drive. You can install these products on a different drive that meets the space requirements for the products. You can also minimize the space that is used on the C: drive during the installation process by directing temporary files to another drive.

The procedures that are provided apply to installing the products on a single server using the appropriate installation programs. The procedures can be modified to suit different installation scenarios.

Installing Db2

Complete the following steps to install Db2 with minimal space used on the C: drive:

1. Open a command window and complete the following steps in the same window session:
 - a. At the command prompt, change the directory to the location of the Db2 Setup program setup.exe file.
 - b. Run the following commands to change the TEMP and TMP environment variable settings to the drive and directory where you want to direct the temporary files that are created during the installation of Db2.
Important: The directory that is specified in these commands must be an existing directory. If the directory does not exist, you must create it before you start the installation of Db2.

```
set TEMP=drive_and_directory
set TMP=drive_and_directory
```

For example:

```
set TEMP=Q:\Temp
set TMP=Q:\Temp
```

2. Start the Db2 Setup program and follow the prompts in the program to complete a typical installation on a drive other than the C: drive. Ensure that you set the correct drive and directory on the following pages:
 - Select the installation folder
 - Select the IBM SSH server installation folder and startup option

After the installation, the files and directories that are related to Db2 use approximately 75 MB of space on the C: drive.

Installing IBM Spectrum Control

Complete the following steps to install IBM Spectrum Control with minimal space used on the C: drive:

1. Open a command window and complete the following steps in the same window session:
 - a. At the command prompt, change the directory to the location of the IBM Spectrum Control installation program setup.bat file.
 - b. Run the following commands to change the TEMP and TMP environment variable settings to the drive and directory where you want to direct the temporary files that are created during the installation of IBM Spectrum Control.
Important: The directory that is specified in these commands must be an existing directory. If the directory does not exist, you must create it before you start the installation of IBM Spectrum Control.

```
set TEMP=drive_and_directory
set TMP=drive_and_directory
```

For example:

```
set TEMP=Q:\Temp
set TMP=Q:\Temp
```

2. Start the IBM Spectrum Control program and follow the prompts to complete the installation on a drive other than the C: drive. Ensure that you set the correct drive and directory on the following pages:
 - Choose the Installation Location and Type page in the IBM Spectrum Control installation program.
 - Configure the Database Repository page in the IBM Spectrum Control installation program.

After the installation, the files and directories that are related to IBM Spectrum Control use approximately 5 MB on the C: drive.

Verifying the installation

After you install IBM Spectrum® Control, you can verify whether the installation was successful.

Use the following questions to guide you through the verification process.

Remember the following information when you are verifying the installation:

- You must use a user name with Db2® administrative privileges to run any Db2 commands.
- You must run any Db2 commands on the Db2 command line.

Was the TPCDB database created?

Run the following Db2 command:

```
db2 list db directory
```

This command returns information about the TPCDB database.

Are the tables and views present in the TPCDB database?

Run the following Db2 commands:

```
db2 connect to TPCDB
db2 list tables for schema TPC
db2 disconnect TPCDB
```

These commands indicate that you can connect to and disconnect from the IBM Spectrum Control database repository and lists the tables and views in the TPCDB database.

Is the Data server running?

On the Windows operating system:

Go to the Services listing and find IBM Spectrum Control - Data Server.

On the AIX® or Linux® operating system:

Run the following command:

```
ps -eaf | grep DataServer.jar
```

This command returns a list of the Data server processes in the process table.

Is the Device server running?

On the Windows operating system:

1. Go to the Services listing and find IBM Spectrum Control - Device Server.
2. In a Windows command window, go to the following directory:

```
installation_dir\wlp\bin\
```

where *installation_dir* is the top-level directory in which you installed IBM Spectrum Control (for example, *C:\Program Files\IBM\TPC*).

3. Run the following command:

```
server.bat status deviceServer
```

This command returns a status of *running*.

On the AIX or Linux operating system:

1. In a command-line window, go to the following directory:

```
installation_dir/wlp/bin/
```

where *installation_dir* is the top-level directory in which you installed IBM Spectrum Control (for example, */opt/IBM/TPC/*).

2. Run the following command:

```
./server status deviceServer
```

This command returns a status of *running*.

It can take several minutes after the Device server starts for all services to be running.

Are all Device server services running?

Go to

```
https://localhost:port/ITSRM/ServiceManager
```

Where *port* is the value of the *WC_defaulthost_secure* key in the *installation_dir/device/portdef.props* file. The default port number is 9551.

Is the Storage Resource agent running?

On the Windows operating system:

Go to the Services window and find IBM Spectrum Control Storage Resource Agent.

On the AIX or Linux operating system:

Run the following command:

```
ps -eaf | grep Agent
```

This command returns a list of the Storage Resource agent processes in the process table.

Is the web server running?

On the Windows operating system:

Go to the Services window and find IBM Spectrum Control - Web Server.

On the AIX or Linux operating system:

Run the following command:

```
ps -eaf | grep webServer
```

This command returns a list of the web server processes in the process table.

Can I log on to the IBM Spectrum Control GUI?

Open a web browser and enter the following web address:

```
https://host_name:port/srm
```

Where *host_name* is the fully qualified host name of the computer where the IBM Spectrum Control Web server is installed and *port* is the value of the *httpsPort* key in the *installation_dir/wlp/usr/servers/webServer/server.xml* file. The default port is 9569.

Reviewing the log files to resolve installation issues

If an error occurs during IBM Spectrum® Control installation, you can review the error log files to resolve issues and continue the installation.

To resolve errors that occur during the preinstall steps in the IBM Spectrum Control installation program, complete the following steps:

1. Navigate to one of the following directories:
 - For the Windows operating system, go to %TEMP% directory
 - For the AIX® or Linux® operating system, go to /tmp directory
2. Review the following log files:
 - lax-xxxxx-out.txt
 - lax-xxxxx-err.txt

Tip: The files are InstallAnywhere log files and are automatically generated. The xxxxx are numeric characters that are assigned by the InstallAnywhere software. To resolve errors after the IBM Spectrum Control installation starts, complete the following steps:

1. Navigate to one of the following default directories:
 - For the Windows operating system, go to `C:\Program Files\IBM\TPC\logs`
 - For the AIX or Linux operating system, go to `/opt/IBM/TPC/logs`
2. Review these log files:
 - msgTPCInstall.log
 - traceTPCInstall.log
 - sra\install\agent.trace
 - sra\install\agent_number.log
3. For agent log files, navigate to one of the following default directories:
 - For the Windows operating system, go to `SRA_location\log`
 - For the AIX or Linux operating system, go to `SRA_location/log`where `SRA_location` is where the Storage Resource agent is installed.

If an installation error occurred and you decide to do a partial rollback, the msgTPCInstall.log and traceTPCInstall.log files are updated with additional information when you resume the installation.

Changing languages

You can change the operating system language and web browser that determines the language in which IBM Spectrum® Control services and the IBM Spectrum Control GUI are displayed.

For IBM Spectrum Control, the following languages are supported:

- English
 - Czech
 - French
 - German
 - Hungarian
 - Italian
 - Japanese
 - Korean
 - Polish
 - Brazilian Portuguese
 - Russian
 - Spanish
 - Chinese (Simplified)
 - Chinese (Traditional)
- [Changing the language of the IBM Spectrum Control GUI](#)
Change the language that is displayed in your web browser for the IBM Spectrum Control GUI.
 - [Changing the operating system language for Windows](#)
Change the operating system language for Windows.
 - [Changing the operating system language for AIX](#)
Change the operating system language for AIX®.

Changing the language of the IBM Spectrum Control GUI

Change the language that is displayed in your web browser for the IBM Spectrum® Control GUI.

Procedure

1. Choose one of these options to access the settings page in the web browser:

Option	Description
Mozilla Firefox (ESR 31 and later)	In the menu bar, click Tools > Options.
Google Chrome	Click the customization control in the upper-right corner of the page and click Settings.
Internet Explorer (v11 and later)	In the menu bar, click Tools > Internet Options.

2. Access the language settings in the web browser:

Option	Description
Mozilla Firefox (ESR 31 and later)	Scroll to the Language and Appearance section and click Choose.
Google Chrome	Scroll to the bottom of the Settings page and click Advanced.
Internet Explorer (v11 and later)	In the General tab on the Internet Options page, click Languages.

3. Select the language that you want to display:

Option	Description
Mozilla Firefox (ESR 31 and later)	Select the language that you want to display in the browser and click Move up until it's at the top of the list. Click Ok.
Google Chrome	Scroll to the Languages section, click the action customization next to the language that you want to display, and select Move to the top.
Internet Explorer (v11 and later)	Select the language that you want to display in the browser and click Move up until it's at the top of the list. Click Ok twice to return to the main browser page.

4. Refresh the browser tab where the IBM Spectrum Control GUI is displayed to apply the language setting.

Related tasks

- [Changing the language in a web browser doesn't change the entire IBM Spectrum Control GUI](#)

Changing the operating system language for Windows

Change the operating system language for Windows.

Procedure

To change the operating system language for Windows servers, for example from English to German (**de_DE**), complete these steps:

1. Choose one of these options:

Option	Description
Windows Server 2012	On the Dashboard page, hover the mouse over the lower left corner of the page next to the Server Manager taskbar button, and then click Start.
Windows Server 2012 R2, Windows Server 2016, Windows Server 2019	Click Start.

2. Click Control Panel .
3. Click Clock, Language, and Region > Region and Language.
Tip: The exact links that you click might vary between the different versions of Windows. For example, Region and Language might be separate links in more recent versions of Windows. In those cases, click Language.
4. On the Format tab, select a language and click OK.
Tip: The exact links that you click might vary between the different versions of Windows. For example, you might need to click the Administrative tab rather than the Format tab to change the system locale.
5. Restart all the IBM Spectrum® Control services or restart the Windows server.

Changing the operating system language for AIX

Change the operating system language for AIX®.

Procedure

To change the operating system language for AIX systems, for example from English to German (**de_DE**), complete these steps:

1. At the command prompt, run the following commands:

```
chlang -m de_DE de_DE
export LANG=de_DE
```

2. Restart all the IBM Spectrum® Control services or restart the AIX system.

Adding an installation license

If you installed IBM Spectrum® Control and want to add an IBM Spectrum Control license so that you can monitor storage systems with different license models, you can use the installation program or silent-mode installation.

About this task

To determine the type of license you have, find these files in the `<installation_dir>/swidtag` directory:

- ibm.com_IBM_Spectrum_Control-version.swidtag
Indicates that you have an IBM Spectrum Control license.
- ibm.com_IBM_Spectrum_Control_Standard_Select_Edition-version.swidtag
Indicates that you have an IBM Spectrum Control Select Edition license.

Depending on the license you purchased, one of the following license key files can be found in the **license\key** sub-directory of the electronic image:

node.lock.AE

IBM Spectrum Control license

node.lock.AS

IBM Spectrum Control Select Edition license

- [Adding an installation license using the installation program](#)
If you installed IBM Spectrum Control and want to add an IBM Spectrum Control license for additional function, you can do so by using the installation program.
- [Adding an installation license using silent mode](#)
If you installed IBM Spectrum Control and want to add an IBM Spectrum Control license to access more function, you can do so by using silent-mode installation.

Adding an installation license using the installation program

If you installed IBM Spectrum® Control and want to add an IBM Spectrum Control license for additional function, you can do so by using the installation program.

Procedure

To add the license to your system using the installation program, complete the following steps:

1. Log on to the IBM Spectrum Control system with the appropriate user privileges.
2. Start the IBM Spectrum Control installation program.
3. On the Choose Installation Location and Type page, select License upgrade and click Next.
4. On the Upgrade License page, select which license key file to use and click Next.
5. Verify the information on the Preinstallation Summary page and click Install.
6. On the Installation Completed page, click Done.
When the installer upgrades the license, it also stops and restarts the following IBM Spectrum Control servers: Web, Data, and Device.

Related reference

- [Planning for IBM Spectrum Control authentication and authorization](#)

Adding an installation license using silent mode

If you installed IBM Spectrum® Control and want to add an IBM Spectrum Control license to access more function, you can do so by using silent-mode installation.

Procedure

To add the license to your system that uses the silent-mode installation, complete the following steps:

1. Log on to your IBM Spectrum Control system with the appropriate user privileges.
2. Modify the following parameters in the silent_SingleServerTypical.properties, silent_SingleServerCustom.properties, or silent_MultipleServer.properties file:
 - CHOSEN_INSTALL_TYPE="License Upgrade"
 - varUseLicenseKeyOnImage=
 - varLicenseKeyFile=

For more information, see [Editing the response file](#).

3. Save the appropriate response file.
4. Start the IBM Spectrum Control installation program.
For Windows operating system, run the command:

```
setup.bat -l language -i silent -f absolute_path_to_response_file
```

For AIX® or Linux® operating system, run the following command:

```
./setup.bin -l language -i silent -f absolute_path_to_response_file
```

When the installer upgrades the license, it also stops and restarts the IBM Spectrum Control Web, Data, and Device servers.

Related reference

- [Planning for IBM Spectrum Control authentication and authorization](#)

Installing Storage Resource agents

You can install Storage Resource agents by using the IBM Spectrum® Control user interface or a command.

About this task

You can select one of the following agent installation scenarios:

- To deploy a Storage Resource agent using the GUI, see [Deploying Storage Resource agents](#).
- To install the agent using a command, see [Installing Storage Resource agents by using a command](#).

Restriction:

- You cannot use Storage Resource agents as data sources for switches and fabrics. For Brocade switches, you must use CIM agents. For Cisco switches, you must use SNMP agents.
- Before you install or deploy a Storage Resource agent on a system, you must disable the firewall on that system.
- If you are using IBM® PowerHA® SystemMirror® for AIX®, a Storage Resource agent must be installed on each node of the cluster and all agents in a cluster must be configured to use the same listening port.
- To scan a cluster resource group, you must configure the cluster resource group to have at least one IP address that is accessible from the IBM Spectrum Control server.

To deploy a Storage Resource agent, you must log in as a user with the following authority:

On Windows operating systems

You must have Windows Administrator authority.

On UNIX or Linux® operating systems

You must be logged in as the root user.

- [Installing Storage Resource agents by using a command](#)

You typically install Storage Resource agents by using the IBM Spectrum Control GUI. However, if you must install Storage Resource agents locally, you can do so with limited support.

Installing Storage Resource agents by using a command

You typically install Storage Resource agents by using the IBM Spectrum® Control GUI. However, if you must install Storage Resource agents locally, you can do so with limited support.

About this task

During this installation method, a return code of zero means that a successful installation occurred and a nonzero return code means that an unsuccessful installation occurred. If you have an unsuccessful installation, you must review the log files to determine the problem.

The-force option can be used when you have a Storage Resource agent point to multiple servers. If an agent is installed on one server, and another server wants to install an agent in the same location, the second server can use the -force option to install the agent.

If you use this installation method, when you enter a directory to install the Storage Resource agent, do not add an ending slash mark (\). For example, do not specify C:\agent1\. This action causes the installation to fail.

If you run the agent as a non-daemon service (on-demand service), you must make sure that at least one protocol is valid for a successful connection from the server to the agent. See [Table 1](#) for the required parameters for each protocol.

Table 1. Parameters required for each protocol

Protocol	Description
SSH	Requires the user ID and password or user ID, certificate, and passphrase.
Windows (SMB)	Requires the user ID and password.
REXEC	Requires user ID and password.
RSH	Requires the user ID.

The Storage Resource Agent image contains the installation images for the Storage Resource agents in the following directory:

DVD_installation_image_location/data/sra/operating_system

See [Table 2](#) for the Storage Resource agent installation images.

Table 2. Storage Resource agent installation images

Operating system	Operating system name
AIX®	aix_power
Linux® x86	linux_ix86
Linux for Power Systems Servers	linux_power
Linux s390	linux_s390
Windows	windows

To install the Storage Resource agents locally, complete the following steps:

Procedure

1. Go to the installation image location:

```
cd DVD_installation_image_location
```

2. Run the following command:

```
bin/Agent -install -serverPort server_secure_port -force
-serverIP server_IP_address -installLoc Agent_install_location -debug MAX
```

```

>> -agentPort agent_port — -commtype daemon >>
>> 1 >>
>> -userID user_ID — -password password — -certFile certificate_file >>
>> 2 >>
>> -passphrase passphrase >>
>> 3 >>

```

Notes:

- ¹ Parameters when the agent is run as a daemon service.
- ² Parameters when the agent is run as a non-daemon service. See [Table 1](#) to determine which parameter is required for each protocol.
- ³ Parameters when the agent is run as a non-daemon service. See [Table 1](#) to determine which parameter is required for each protocol.

The parameters are as follows.

```

-install
    Installs the Storage Resource agent.

-force
    Forces the agent to be installed. The two different situations in which this parameter must be specified are as follows.
    • If an earlier installation failed and there is residue on the system that causes further installations to fail. You must verify that all the parameters that are provided are valid, such as the installation location, port .
    • If the agent is already installed from one server and you now must install the agent pointing to another server.

-serverPort server_secure_port
    The default port for the Data server is 9549.

-serverIP server_IP_address
    The IP address of the server. If the server can be reached through multiple IP addresses, then multiple IP addresses can be specified with IP addresses separated with a comma.

-installLoc "Agent_install_location"
    Location where the agent is installed. Enclose the directory name in quotation marks, for example, "C:\Program Files\IBM\TPC_SRA".

-debug MAX
    Optional parameter for debugging purposes.

-agentPort agent_port
    If the agent is run as a daemon service, the agent port must be specified. The default agent port is 9510.

-commtype daemon
    If the agent is run as a daemon service, then this parameter must be specified.

-userID user_ID
    For non-daemon service. The user ID defined on the agent system. This user ID is used by the server to connect to the agent system.

-password password
    For non-daemon service. Password for the user ID.

-certFile "certificate_file"
    For non-daemon service. The certificate that is used for SSH communication between the server and agent. This certificate must be stored on the server system. Enclose the directory name in quotation marks, for example, "c:\keys\id_sra".
    For information about SSH protocol and SSL protocol certificates, see Creating a certificate for SSH protocol and Replacing default SSL certificates for the Data server and Storage Resource agents with custom SSL certificates.

-passphrase passphrase
    For non-daemon service. The passphrase that is defined for the certificate that is used in SSH communication.

```

What to do next

After you install a Storage Resource agent by using a command, you must schedule a probe to collect data about the associated resource. For information about how to schedule a probe, see [Creating probes](#).

Installing IBM Cognos Analytics

You can install the optional IBM® Cognos® Analytics 11.2.0 or later reporting tool on one computer, on multiple servers for a distributed installation, or you can expand an existing single computer installation to another server to improve performance. Cognos Analytics provides an installation program that guides you through the installation process.

Once you have installed Cognos Analytics you can view predefined reports and create custom reports about IBM Spectrum® Control. You can access reports from IBM Spectrum Control, and work with the reports in the Cognos Analytics reporting tool.

- [Installing Cognos Analytics in a single Windows environment](#)
You can install Cognos Analytics in a Microsoft Windows environment by using the Cognos Analytics installation program.
- [Installing Cognos Analytics in a single Linux environment](#)
You can install Cognos Analytics in a Linux® environment by using the Cognos Analytics installation program. To run the graphical-mode installation program, your computer must support a Java™-based graphical user interface.
- [Installing Cognos Analytics in a single AIX environment](#)
You can install Cognos Analytics in an AIX® environment by using the Cognos Analytics installation program. To run the graphical-mode installation program, your computer must support a Java-based graphical user interface.

Installing Cognos Analytics in a single Windows environment

You can install Cognos® Analytics in a Microsoft Windows environment by using the Cognos Analytics installation program.

Before you begin

The IBM® Cognos Analytics 11.2.0 or later installation consists of the following components:

- Installer executable file
- Repository .zip file

Important: When you run the installer, you must point to the server repository.zip file.

For Microsoft Windows operating system installations, ensure that you have administrator privileges for the Windows computer you are doing the installation on. Also, ensure that your computer has a TEMP system variable that points to the directory where you want to store temporary files. During installation, files from the disk are temporarily copied to this directory.

For more information, see [Verify system requirements](#).

For more information, see [Software Product Compatibility Reports](#).

Procedure

1. Log in to your Windows computer as a user with administrative privileges.
2. Start the Cognos Analytics installer executable file.
3. Select the language to use for your installation and click Next.
4. On the Repository selection page, click Choose.
5. On the Please Choose a File page, select the server repository zip file and click Open.
6. Click Next.
7. On the Product Install page, select IBM Cognos Analytics and click Next.
8. On the License Agreement page, accept the license agreement and click Next.
9. On the Location page, provide your installation location and name of the Shortcut folder and click Next.
If you want the IBM Cognos Analytics installation to automatically create the installation location for you, click Yes.
10. On the Installation type page, select Custom and click Next.
The Custom option offers full flexibility to select the IBM Cognos Analytics components that you want to install. You might want to customize or integrate Cognos Analytics with third-party software? If so, this option is one you would select.
11. On the Choose components page, accept the default selections, and click Next.
12. On the Pre-Installation Summary page, review your information for accuracy and click Install.
13. When the installation is complete, click Done.

Installing Cognos Analytics in a single Linux environment

You can install Cognos® Analytics in a Linux® environment by using the Cognos Analytics installation program. To run the graphical-mode installation program, your computer must support a Java™-based graphical user interface.

Before you begin

The IBM® Cognos Analytics 11.2.0 or later installation consists of the following components:

- Installer executable file
- Repository .zip file

When you run the installer, you must point to the server repository .zip file.

For Linux operating system installations, ensure that you are a root user for the computer you are doing the installation on.

Verify that the Cognos Analytics installer executable file has 755 permissions and that the Cognos Analytics repository .zip file has 644 permissions.

You *do not* need to set the JAVA_HOME environment variable before you start the IBM Cognos Analytics 11.2.0 or later installation program.

Verify that you have installed the following prerequisite packages on a Linux computer for IBM Cognos Analytics 11.2.0 or later.

The prerequisite packages for Red Hat® Enterprise Linux (RHEL) 6 are:

```
glibc-2.12-1.166.el6 or later (both i686 and x86_64 packages)
libstdc++-4.4.7-16.el6 or later (both i686 and x86_64 packages)
nspr-4.9.2-1.el6 or later (both i686 and x86_64 packages)
nss-3.14.0-12.el6 or later (both i686 and x86_64 packages)
openmotif-2.3.3-5.el6 or later (both i686 and x86_64 packages)
```

The prerequisite packages for Red Hat Enterprise Linux (RHEL) 7 are:

```
glibc-2.17-55.el7 or later (both i686 and x86_64 packages)
libstdc++-4.8.2-16.el7 or later (both i686 and x86_64 packages)
nspr-4.10.2-4.el7 or later (both i686 and x86_64 packages)
nss-3.15.4-6.el7 or later (both i686 and x86_64 packages)
motif-2.3.4-7.el7 or later (both i686 and x86_64 packages)
```

The prerequisite packages for Red Hat Enterprise Linux (RHEL) 8 are:

```
unzip-6.0-41.el8.x86_64 or later
libstdc++-8.3.1-4.5.el8 or later (both i686 and x86_64 packages)
```

```
glibc-2.28-72.el8 or later (both i686 and x86_64 packages)
libXaw-1.0.13-10.el8.x86_64 or later
libXtst-1.2.3-7.el8.x86_64 or later
libXi-1.7.9-7.el8.x86_64 or later
libXft-2.3.2-10.el8 or later (both i686 and x86_64 packages)
libX11-1.6.7-1.el8 or later (both i686 and x86_64 packages)
motif-2.3.4-16.el8 or later (both i686 and x86_64 packages)
nss-3.44.0-9.el8_1 or later (both i686 and x86_64 packages)
nspr-4.21.0-2.el8_0 or later (both i686 and x86_64 packages)
libnsl-2.28-72.el8 or later (both i686 and x86_64 packages)
```

For more information, see [Verify system requirements](#).

For more information, see [Software Product Compatibility Reports](#).

You need to set the correct ulimit values in the /etc/security/limits.conf file for IBM Cognos Analytics 11.2.0 or later.

Here is an example of the entries you might need to add to the /etc/security/limits.conf file:

```
*      soft    nproc    unlimited
*      hard    nproc    unlimited
*      soft    nofile   8192
*      hard    nofile   8192
*      soft    stack    unlimited
*      hard    stack    unlimited
```

After you set and save your ulimit values, restart your computer and verify the correct ulimit values.

For more information, see [Set the ulimit values on UNIX and Linux operating systems](#).

Procedure

1. Log in to your Linux computer as a root user.
2. Start the Cognos Analytics installer executable file.
3. Select the language to use for your installation and click Next.
4. On the Repository selection page, click Choose.
5. On the Please Choose a File page, select the server repository zip file and click Open.
6. Click Next.
7. On the Product Install page, select IBM Cognos Analytics and click Next.
8. On the License Agreement page, accept the license agreement and click Next.
9. On the Location page, provide your installation location and click Next.
If you want the IBM Cognos Analytics installation to automatically create the installation location for you, click Yes.
10. On the Choose components page, accept the default selections, and click Next.
11. On the Pre-Installation Summary page, review your information for accuracy and click Install.
12. When the installation is complete, click Done.

Installing Cognos Analytics in a single AIX environment

You can install Cognos® Analytics in an AIX® environment by using the Cognos Analytics installation program. To run the graphical-mode installation program, your computer must support a Java™-based graphical user interface.

Before you begin

The IBM® Cognos Analytics 11.2.0 or later installation consists of the following components:

- Installer executable file
- Repository .zip file

When you run the installer, you must point to the server repository .zip file.

For AIX operating system installations, ensure that you are a root user for the computer you are installing on.

Verify that the Cognos Analytics installer executable file has 755 permissions and that the Cognos Analytics repository .zip file has 644 permissions.

You *do not* need to set the JAVA_HOME environment variable before you start the Cognos Analytics 11.2.0 or later installation program.

Verify that you have the following prerequisite packages installed on a AIX computer for Cognos Analytics 11.2.0 or later.

The prerequisites for AIX 7.1 or later are:

- IBM XL C/C++ for AIX, V12.1 Runtime Environment. If using AIX XL C++ Runtime it is recommended to use 13.1.2.160112 or later.
- bos.pmap.lib

For more information, see [Verify system requirements](#).

For more information, see [Software Product Compatibility Reports](#)

You need to set the correct ulimit values in the /etc/security/limits file for IBM Cognos Analytics 11.0.9 or later.

Here is an example of the entries you might need to add to the `/etc/security/limits` file:

```
default:
fsize = -1
core = -1
cpu = -1
rss = -1
stack = 16384
nofiles = 8192
```

After you set and save your ulimit values, restart your computer and verify the correct ulimit values.

For more information, see [Set the ulimit values on UNIX and Linux® operating systems](#).

Procedure

1. Log in to your AIX computer as a root user.
2. Start the Cognos Analytics installer executable file.
3. Select the language to use for your installation and click Next.
4. On the Repository selection page, click Choose.
5. On the Please Choose a File page, select the server repository zip file and click Open.
6. Click Next.
7. On the Product Install page, select IBM Cognos Analytics and click Next.
8. On the License Agreement page, accept the license agreement and click Next.
9. On the Location page, provide your installation location and click Next.
If you want the IBM Cognos Analytics installation to automatically create the installation location for you, click Yes.
10. On the Choose components page, accept the default selections, and click Next.
11. On the Pre-Installation Summary page, review your information for accuracy and click Install.
12. When the installation is complete, click Done.

Configuring IBM Cognos Analytics

After you install the optional IBM® Cognos® Analytics, to view predefined reports and create custom reports about IBM Spectrum® Control, you must copy Db2® files, create a content store database, save your configuration settings, and start the services.

Important: The configuration procedures assume that you are going to use Db2 for the Cognos Analytics content store. *It is not required* that the Cognos Analytics content store use Db2. Cognos Analytics supports other database products for the content store.

The IBM Spectrum Control database repository uses Db2. If you do not use Db2 for the content store, you still need to copy the Db2 JDBC driver files into the Cognos Analytics installation location and link the 32-Bit Db2 library file (Linux® and AIX® only) in order for Cognos Analytics to connect to the IBM Spectrum Control database repository.

A general overview to complete the configuration tasks in order to view predefined reports and create custom reports about IBM Spectrum Control:

- Copying Db2 files and linking Db2 libraries
- Creating the content store
- Creating a data source
- Importing pre-defined reports package
- [Copying JDBC files for Db2 on Windows](#)
You must copy JDBC driver files from your Db2 installation directory to your Cognos Analytics installation location.
- [Copying Db2 files and linking the Db2 library on Linux and AIX](#)
You must copy JDBC driver files from your Db2 installation directory to your Cognos Analytics installation location and then link the Db2 library.
- [Creating a content store and starting Cognos Analytics on Windows](#)
The information that you enter in IBM Cognos Configuration for Cognos Analytics is used to generate a script that you use to create the content store database.
- [Creating a content store and starting Cognos Analytics on Linux or AIX](#)
The information that you enter in IBM Cognos Configuration for Cognos Analytics is used to generate a script that you use to create the content store database.
- [Creating Cognos Analytics data source for the IBM Spectrum Control database](#)
You can create an IBM Cognos Analytics data source for your IBM Spectrum Control database.
- [Importing IBM Spectrum Control pre-defined reports package](#)
Complete this procedure to import the IBM Spectrum Control predefined reports package into the IBM Cognos Analytics reporting tool.
- [Configuring access to the Cognos Analytics reporting tool](#)
Specify which user IDs and groups of user IDs can use reports, report tools, and report administration functions in the Cognos Analytics tool.

Copying JDBC files for Db2 on Windows

You must copy JDBC driver files from your Db2® installation directory to your Cognos® Analytics installation location.

Procedure

Copy the following Db2 JDBC driver files from the *Db2_installation_dir\java* directory to the *Cognos_installation_dir\drivers* directory:

- db2jcc.jar - This JDBC driver file does not exist for Db2 11.5 or later
- db2jcc_license_cu.jar
- db2jcc4.jar

For more information, see [Configuration actions that are critical to the success of your installation](#).

Copying Db2 files and linking the Db2 library on Linux and AIX

You must copy JDBC driver files from your Db2® installation directory to your Cognos® Analytics installation location and then link the Db2 library.

Procedure

1. Copy the following Db2 JDBC driver files from the *Db2_installation_dir/java/* directory to the *Cognos_installation_dir/drivers/* directory:
 - db2jcc.jar - This JDBC driver file does not exist for Db2 11.5 or later
 - db2jcc_license_cu.jar
 - db2jcc4.jar

For more information, see [Configuration actions that are critical to the success of your installation](#).

2. Enter the following command as the root user:

```
cd Cognos_installation_dir/drivers/  
chmod +x db2jcc*.jar
```

3. Enter the following command as the root user:
On the Linux® operating system:

```
ln -s Db2_instance_owner_home_directory/sqlib/lib32/libdb2.so Cognos_installation_dir/bin/
```

On the AIX® operating system:

```
ln -s Db2_instance_owner_home_directory/sqlib/lib32/libdb2.a Cognos_installation_dir/bin/
```

In the IBM Spectrum® Control Predefined Reports use Compatibility Query Mode, Cognos Analytics needs to use the 32-Bit Db2 library in order to connect to the IBM Spectrum Control database as a data source.

Creating a content store and starting Cognos Analytics on Windows

The information that you enter in IBM® Cognos® Configuration for Cognos Analytics is used to generate a script that you use to create the content store database.

Procedure

1. Create the content store for Cognos Analytics.
 - a. From the Windows Start menu, select IBM Cognos Analytics > IBM Cognos Configuration.
 - b. In the Explorer window, expand Data Access > Content Manager and click Content Store.
 - c. In the Type property, enter DB2 database.
 - d. In the Database server and port number property, enter localhost or the fully qualified domain name of the machine where Db2® is installed.
For example, *localhost:25000* or *FQDN_Of_Your_Machine:25000* where 25000 is the default port number that is used by Db2. If you are using a different port number (for example, 50000), ensure that you use that value. To determine the port that is used by Db2, examine the varDBPort parameter in the *installation_dir\config\InstallVariable.properties* file.
 - e. In the User ID and password property, enter the user name of the owner of the Db2 instance where the content store database will be located and the password that is associated with that user name.
Typically, this user name is *db2admin*. If the user name is a Windows domain user name, enter the user name *without* a Windows domain name prefix or suffix.
 - f. In the Database name property, verify that the default value is cm.
 - g. From the File menu, click Save.
 - h. In the informational window, click Close.
 - i. In the Explorer window, expand Data Access > Content Manager and click Content Store.
 - j. Right-click Content Store and click Generate DDL.
 - k. In the informational window, click Close.
 - l. From the Windows Start menu, select IBM Db2 Db2COPY1 (Default) > Db2 Command Window - Administrator. Then, enter the following command:

```
db2 -tvf "Cognos_installation_dir\configuration\schemas\content\db2\createDb.sql"
```

On Windows, add quotes around the directory path if it contains spaces. For example:

```
db2 -tvf "C:\Program Files\IBM\Cognos\analytics\configuration\schemas\content\db2\createDb.sql"
```

This process might take a few minutes.

- m. From the Actions menu, click Test.
You are testing the connection between content manager and the content store database.

- n. In the informational window, click Close.
For more information, see [Generating a script file to create a database for a Db2 content store](#).
2. Start Cognos Analytics (content manager and application services).
It might take Cognos Analytics a few minutes to start.
 - a. In IBM Cognos Configuration, in the Explorer window, click Local Configuration.
 - b. From the Actions menu, click Test.
Tip: If you are not configuring Cognos Analytics to send notifications, you can ignore the testing the mail server connection failure message. If there is a failure related to NIST SP800-131A conformance, click Details in the dialog to see more information. The integration between Cognos Analytics and IBM Spectrum® Control is not affected by this setting.
 - c. From the Actions menu, click Start.
3. Exit IBM Cognos Configuration.

Creating a content store and starting Cognos Analytics on Linux or AIX

The information that you enter in IBM® Cognos Configuration for Cognos Analytics is used to generate a script that you use to create the content store database.

Procedure

1. Create the content store for Cognos Analytics.
 - a. Enter the following commands to start IBM Cognos Configuration:

```
cd <Cognos_installation_dir>/bin64/
. /home/db2inst1/sqllib/db2profile
./cogconfig.sh
```

Notice the space between the . and the / in the second command.

Tip:
It's recommended to source-in the db2profile (. /home/db2inst1/sqllib/db2profile) anytime you are going to start IBM Cognos Configuration.
 - b. In the Explorer window, expand Data Access, Content Manager and click Content Store.
 - c. In the Database server and port number property, enter localhost or the fully qualified domain name of the computer where Db2® is installed.
For example, localhost:25000 or FQDN_Of_Your_Machine:25000 where 25000 is the default port number that is used by Db2. If you are using a different port number (for example, 50000), ensure that you use that value. To determine the port that is used by Db2, examine the varDBPort parameter in the installation_dir/config/InstallVariable.properties file.
 - d. In the User ID and password property, enter the user name of the owner of the Db2 instance where the content store database is located and the password that is associated with that user name.
 - e. In the Database name property, verify that the default value is cm.
 - f. From the File menu, click Save.
 - g. In the Explorer window, go to Data Access, Content Manager and click Content Store.
 - h. Right-click Content Store and click Generate DDL.
 - i. In the informational window, click Close.
 - j. While you are logged in to the Linux® or AIX® operating system as the root user, switch to the user that is the Db2 instance owner (for example, db2inst1).
 - k. Enter the following Db2 command:

```
db2 -tvf Cognos_installation_dir/configuration/schemas/content/db2/createDb.sql
```

If the results of this command contain the following similar messages, you can safely ignore those messages because the Db2 instance owner already has the necessary privileges:

```
GRANT CREATETAB,BINDADD,CONNECT,IMPLICIT_SCHEMA ON DATABASE TO USER db2inst1
DB21034E The command was processed as an SQL statement because it was not a
valid Command Line Processor command. During SQL processing it returned:
SQL0554N An authorization ID cannot grant a privilege or authority to itself.
SQLSTATE=42502
```

```
GRANT CREATEIN,DROPIN,ALTERIN ON SCHEMA DB2COGNOS TO USER db2inst1
DB21034E The command was processed as an SQL statement because it was not a
valid Command Line Processor command. During SQL processing it returned:
SQL0554N An authorization ID cannot grant a privilege or authority to itself.
SQLSTATE=42502
```

```
GRANT USE OF TABLESPACE TSN_USR_cm TO USER db2inst1
DB21034E The command was processed as an SQL statement because it was not a
valid Command Line Processor command. During SQL processing it returned:
SQL0554N An authorization ID cannot grant a privilege or authority to itself.
SQLSTATE=42502
```

```
GRANT USE OF TABLESPACE TSN_REG_cm TO USER db2inst1
DB21034E The command was processed as an SQL statement because it was not a
valid Command Line Processor command. During SQL processing it returned:
SQL0554N An authorization ID cannot grant a privilege or authority to itself.
SQLSTATE=42502
```

- l. Go back to the root user.
- m. From the Actions menu, click Test.
You are testing the connection between Content Manager and the content store database.
- n. In the informational window, click Close.
For more information, see [Generating a script file to create a database for a Db2 content store](#).
2. Start Cognos Analytics (Content Manager and application services).
 - a. In IBM Cognos Configuration, in the Explorer window, click Local Configuration.

- b. From the Actions menu, click Test.
Tip: If you are not configuring Cognos Analytics to send notifications, you can ignore the testing the mail server connection failure message. If there is a failure related to NIST SP800-131A conformance, click Details in the dialog to see more information. The integration between Cognos Analytics and IBM Spectrum® Control is not affected by this setting.
 - c. From the Actions menu, click Start.
3. When Cognos Analytics starts, exit IBM Cognos Configuration.

Creating Cognos Analytics data source for the IBM Spectrum Control database

You can create an IBM® Cognos® Analytics data source for your IBM Spectrum® Control database.

Before you begin

The following table shows the Db2® actions that are required before you create an IBM Cognos Analytics data source for the IBM Spectrum Control database:

Table 1. Required Db2 actions for IBM Spectrum Control/Cognos Analytics integration scenarios

IBM Spectrum Control - Cognos Analytics integration scenario	Required Db2 actions
IBM Spectrum Control database and Cognos Analytics on the same Windows or Linux® computer	There are no Db2 actions required
IBM Spectrum Control database and Cognos Analytics on the same AIX® computer	<p>Configure the connectivity with the IBM Spectrum Control database to use the loopback mode, or Cognos Analytics will fail to connect to the IBM Spectrum Control database source when running reports multiple times.</p> <p>Complete the following steps on the AIX computer:</p> <ol style="list-style-type: none"> 1. Log on to the computer as a user with root privileges 2. Switch to the user that is the Db2 instance owner (for example, <i>db2inst1</i>). 3. Run this command: <pre>db2 catalog tcpip node loopbk remote 127.0.0.1 server 25000</pre> <p>If your Db2 instance uses a different port other than 25000, provide that port value in the command. For example, 50000.</p> 4. Run this command: <pre>db2 catalog database TPCDB as TPCDB_LP at node loopbk</pre> <p>If your IBM Spectrum Control database has a name other than TPCDB, provide that database name in the command.</p> <p>If you have upgraded from an earlier version of IBM Spectrum Control, you might find that you already have the loopback connection configured and the above mentioned commands return errors. Confirm the configuration using the 'db2 list database directory' command and look for TPCDB_LP.</p>
IBM Spectrum Control database on a different computer than where you installed Cognos Analytics, all platforms	<p>Catalog the node and database for the remote IBM Spectrum Control database.</p> <p>Complete the following steps on the computer where you installed Cognos Analytics:</p> <ol style="list-style-type: none"> 1. On Windows operating system: Log in as a user with administrative privileges. <ol style="list-style-type: none"> a. On Linux or AIX operating system: Log in as a user with root privileges. 2. On Windows operating system, from the Start Menu, select IBM DB2 DB2COPY1 (Default) > DB2 Command Window - Administrator. <ol style="list-style-type: none"> a. On Linux or AIX operating system: Switch to the user that is the Db2 instance owner (for example, <i>db2inst1</i>). 3. Enter the following command to catalog the remote node: <pre>db2 catalog tcpip node node_name remote server_fqdn server port</pre> <p>Where <i>node_name</i> is a new value you provide to name the node. For example, remoteSC. The <i>server_fqdn</i> value is the fully qualified domain name of the machine where the IBM Spectrum Control database resides. For example, myserver.mycompany.com. The <i>port</i> value is the port number that is used by Db2. The default value is 25000. Port 50000 can also be used.</p> <p>Example:</p> <pre>db2 catalog tcpip node remoteSC remote myserver.mycompany.com server 25000</pre> 4. Enter the following command to catalog the remote database: <pre>db2 catalog database database_name as alias at node node_name</pre> <p>Where <i>database_name</i> is the name of the IBM Spectrum Control database. Typically, this name is TPCDB. The <i>alias</i> value is a new value that you provide to reference the cataloged database. For example, remDB. The <i>node_name</i> value is the value that you set in Step 3.</p> <p>Example:</p> <pre>db2 catalog database TPCDB as remDB at node remoteSC</pre>

Procedure

To create an Cognos Analytics data source for the IBM Spectrum Control database, complete the following steps:

1. Open a web browser and enter the following URL:

`http://FQDN_Of_Your_Machine:9300/bi`

Where **http** is the protocol, and *FQDN_Of_Your_Machine* is your fully qualified domain name, (for example, *myserver.mycompany.com*).

2. Select Manage Administration console.
3. In the IBM Cognos Administration GUI, select the Configuration tab.
4. In the Configuration tab, select Data Source Connections.
5. On the toolbar, click the New Data Source icon. It is the first icon in the list.
6. On the Specify a name and description page, in the Name property, enter **TPCDB**.
You must enter the TPCDB value or the IBM Spectrum Control predefined reports will not generate successfully.
7. On the Specify a name and description page, click Next.
8. On the Specify the connection page, select IBM DB2 from the Type field.
9. Verify that Use the default object gateway is selected.
10. Unmark Configure JDBC connection and click Next.
11. On the Specify the IBM DB2 connection string page, in the DB2 database name property, complete one of the following steps:
 - a. If the IBM Spectrum Control database is on the same Windows or Linux computer as where you installed Cognos Analytics (first row scenario from Table 1), enter the name of the IBM Spectrum Control database. Typically, this name is **TPCDB**.
 - b. If the IBM Spectrum Control database is on the same AIX computer as where you installed Cognos Analytics (second row scenario from Table 1), enter the alias value that you created when you cataloged the loopback database. Typically, this value is **TPCDB_LP**.
 - c. If the IBM Spectrum Control database is on a different computer than where you installed Cognos Analytics (third row scenario from Table 1), enter the *alias* value that you created when you cataloged the remote database. For example, **remDB**.
12. On the Specify the IBM DB2 connection string page, in the Signon section, do the following:
 - a. Verify that Signons is selected.
 - b. Select Password.
 - c. In the User ID property, enter the user name of the owner of the Db2 instance where the IBM Spectrum Control database is located. On a Window operating system, this user name is typically *db2admin*.
On Linux or AIX operating system, this user name is typically *db2inst1*.
 - d. In the Password and Confirm password properties, enter the password that is associated with the User ID property from the previous substep.
13. On the Specify the IBM DB2 connection string page, in the Testing section, click Test the connection.
14. On the Test the connection page, click Test.
15. When the test is successful, on the View the results page, click Close.
16. On the Test the connection page, click Close.
17. On the Specify the IBM DB2 connection string page, click Next.
18. On the Specify the commands page, click Finish.
19. Close your web browser.

- [Using Cognos Analytics with multiple remote IBM Spectrum Control databases](#)

You can configure multiple connections within a single Cognos Analytics data source to use Cognos Analytics with multiple remote IBM Spectrum Control databases.

Related information

- [Creating a data source connection](#)

Using Cognos Analytics with multiple remote IBM Spectrum Control databases

You can configure multiple connections within a single Cognos® Analytics data source to use Cognos Analytics with multiple remote IBM Spectrum® Control databases.

Before you begin

On the machine where you have Cognos Analytics installed, you must catalog the node and the database for each remote IBM Spectrum Control database that you want to query when generating Cognos Analytics reports.

Follow the steps in the *Before you begin* section of [Creating Cognos Analytics data source for the IBM Spectrum Control database](#) to catalog the node and the database for each remote IBM Spectrum Control database. Then, follow the steps in the *Procedure* section of the same topic to create the single data source for the IBM Spectrum Control databases and to create the first connection to a specific IBM Spectrum Control database within that data source.

At this point, you will have one data source named **TPCDB** defined in Cognos Analytics and within that one data source, you will have one connection defined, which is also named **TPCDB**.

About this task

It's assumed that Cognos Analytics is installed on its own machine and that you have multiple IBM Spectrum Control systems installed on separate machines.

Procedure

To rename the **TPCDB** connection and to create more connections to other remote IBM Spectrum Control databases within the single data source, complete the following steps:

1. Open a web browser and enter the following URL:

`http://FQDN_Of_Your_Machine:9300/bi`

Where `http` is the protocol, and `FQDN_Of_Your_Machine` is your fully qualified domain name, (for example, `myserver.mycompany.com`) of the machine where you installed Cognos Analytics.

2. Select Manage Administration console.
3. In the IBM Cognos Administration GUI, select the Configuration tab.
4. In the Configuration tab, select Data Source Connections.
5. On the Data Source Connections page, click the TPCDB data source. This action will drill down one level and you will see the TPCDB connection.
6. In Actions, click the Set properties - TPCDB icon; it's the first icon in the list.
7. On the Set properties - TPCDB page, change the Name value from TPCDB to a value that reflects the particular IBM Spectrum Control database that this connection uses (for example, `scserv1`).
8. Click OK.
You are returned to the Data Source Connections page and your first data source has been renamed.
9. On the Data Source Connections page, in the toolbar, click the New Connection icon. It's the first icon in the list.
10. On the Specify a name and description - New Connection page, in the Name property, enter a value that reflects the particular IBM Spectrum Control database that this connection will use (for example, `myserv2`).
11. On the Specify a name and description - New Connection page, click Next.
12. On the Specify a name and description - New Connection page, select IBM Db2 from the Type field.
13. Verify that Use the default object gateway is selected.
14. Unmark Configure JDBC connection and click Next.
15. On the Specify the IBM Db2 connection string - New Connection page, in the DB2 database name property, enter the *alias* value that you created when you cataloged a particular remote IBM Spectrum Control database.
16. On the Specify the IBM Db2 connection string - New Connection page, in the Signon section, do the following:
 - a. Verify that Signons is selected.
 - b. Select Password.
 - c. In the User ID property, enter the user name of the owner of the Db2® instance where the remote IBM Spectrum Control database is located. Note: On a Windows operating system, this user name is typically `db2admin`. On Linux® or AIX® operating systems, this user name is typically `db2inst1`.
 - d. In the Password and Confirm password properties, enter the password that is associated with the User ID value from the previous substep.
17. On the Specify the IBM Db2 connection string - New Connection page, in the Testing section, click Test the connection.
18. Click Test.
19. When the test is successful, on the View the results page, click Close.
20. On the Test the connection - New Connection page, click Close.
21. On the Specify the IBM Db2 connection string - New Connection page, click Next.
22. On the Specify the commands - New Connection page, click Finish.

Results

Your new connection is added to the list of connections defined for the single **TPCDB** data source. You can repeat Steps 10 - 23 to create a new connection for each remote IBM Spectrum Control database that you want to use when you generate reports. When you have multiple connections defined and you generate a report, you are prompted to select a specific connection to use for that report.

Importing IBM Spectrum Control pre-defined reports package

Complete this procedure to import the IBM Spectrum® Control predefined reports package into the IBM® Cognos® Analytics reporting tool.

Procedure

1. Copy the IBM Spectrum Control predefined reports package `TPC_deployment_pkg.zip` file from the `installation_dir\data\gui\` directory, on the machine where you installed IBM Spectrum Control, to the `Cognos_Install_Dir\deployment\` directory on the machine where you installed Cognos Analytics.

2. Import the package into Cognos Analytics.
 - a. Open a web browser and enter the following URL:

`http://machine_FQDN:9300/bi`

Where `machine_FQDN` is the fully qualified domain name of the machine where you installed Cognos Analytics. For example, `mycognos.mycompany.com`.
Warning: At this point Cognos Analytics is configured with anonymous access so that anyone is able to access it.

- b. Select Manage Administration console.
- c. In the IBM Cognos Administration GUI, select the Configuration tab.
- d. In the Configuration tab, select Content Administration.
- e. On the toolbar, click the New Import icon.
It is the fourth icon in the list.
- f. On the Select a deployment archive page, select `TPC_deployment_pkg` and click Next.
- g. On the Specify a name and description page, enter a name for your import and click Next.
- h. On the Select the public folders, directory, and library content page, select the following entries:
 - IBM Spectrum Control Packages
 - IBM Spectrum Control Predefined Reports
 - IBM Spectrum Control Report Layouts
- i. Click Next.
- j. On the Specify the general options page, click Next.
- k. On the Review the summary page, click Next.
- l. On the Select an action page, select Save and run once and click Finish.
- m. On the Run with Options page, select Upgrade all report specifications to the latest version and Assign new IDs during import.
For more information, see [Run an import](#).
- n. Click Run.
- o. On the IBM Cognos software page, select View the details of this import after closing this dialog and click OK.

- p. On the View run history details page, click Refresh.
Do *not* log off from the IBM Cognos Administration GUI until the import job is complete.
Important:
The import job might take 15 minutes or more to resolve. Click Refresh periodically to check the status.
- q. After the import job is complete, on the View an import deployment record page, click Close.
- r. Exit the IBM Cognos Administration GUI and return to the Cognos Analytics GUI.
3. Verify that the imported content is displayed in Cognos Analytics.
- a. Open a web browser and enter the following URL:

`http://machine_FQDN:9300/bi`

Where *machine_FQDN* is the fully qualified domain name of the machine where you installed Cognos Analytics. For example, *mycognos.mycompany.com*.

b. On the IBM Cognos Analytics Welcome page, click Team content.

c. Verify that the following content is listed:

- IBM Spectrum Control Packages
- IBM Spectrum Control Predefined Reports
- IBM Spectrum Control Report Layouts

Configuring access to the Cognos Analytics reporting tool

Specify which user IDs and groups of user IDs can use reports, report tools, and report administration functions in the Cognos® Analytics tool.

About this task

You can configure access in the following ways in the Cognos Analytics reporting tool:

- Create user IDs and groups of user IDs so that you can specify access for those users and groups.
- Assign administrative privileges to administrator IDs and remove administrative privileges from other user IDs.
- Specify which user IDs or groups can access individual reports or report folders.
- Specify which user IDs or groups can access individual Cognos Analytics reporting tool functions.

Information about how to configure security for Cognos Analytics is available in the IBM® Docs for Cognos Analytics. Use the following links to view this information:

Table 1. Information about configuring security for Cognos Analytics

Task	Link to information

	Set access permissions for an entry

Reinstalling the software if a failure occurs

If an installation failure occurs, you do not have to uninstall components that were successfully installed. IBM Spectrum® Control provides an option to partially, or fully, roll back the installation.

A full rollback uninstalls all the components (even if they were installed successfully), and a partial rollback uninstalls only the components that were not successfully installed. The partial rollback option helps you resolve the problems that are causing the installation failure. After you resolve the problem, you can install the remaining components. For example, if the correct libraries were not installed for the Linux® operating system, and the installation stops. You can install the correct libraries and resume the installation.

If you install IBM Spectrum Control on the Windows operating system and select Full Rollback, you must restart the server after the rollback is complete.

If you originally selected a partial rollback, but decided to completely uninstall, you must run the uninstallation program before you reinstall IBM Spectrum Control.

The following table shows the results from a partial rollback. The components are listed in the order in which they were installed.

Table 1. Results from a partial rollback

If an installation failure occurs when you install this component...	Partial rollback results are...
IBM Spectrum Control common files and Java™ Runtime Environment	There is no partial rollback. The installation program completes a full rollback.
Database repository	The database repository is uninstalled.
Data server	The Data server is uninstalled.
WebSphere® Application Server Liberty profile	WebSphere Application Server Liberty profile is uninstalled.
Alert server	The Alert server is uninstalled.
Device server	The Device server is uninstalled.
Export server	The Export server is uninstalled.
IBM Spectrum Control GUI	The IBM Spectrum Control GUI is uninstalled.
CLI	The command-line interface is uninstalled.
Storage Resource agent	The Storage Resource agent is uninstalled.

Taking the first steps after installation

After IBM Spectrum® Control is installed, configure it to monitor the resources in your environment.

Access the IBM Spectrum Control GUI

To configure IBM Spectrum Control for your environment, access the GUI.

For information about how to start the GUI, see [Opening IBM Spectrum Control GUIs and CLIs](#).

To set up IBM Spectrum Control for monitoring and managing resources, complete the following tasks:

Add resources for monitoring.

You can add the following resources for monitoring:

- Storage systems
- Servers
- Hypervisors
- Switches
- Fabrics
- NetApp Filers

Configure the retention of data in the database repository

Determine how long that IBM Spectrum Control stores data about the resources that are being monitored.

(Optional) Configure the collection of data about the sizes of GPFS snapshots

By default, IBM Spectrum Control does not collect information about the size of GPFS snapshots. To view that information, you must enable IBM Spectrum Control to collect information about the size of GPFS snapshots.

For information about how to configure collection of snapshot size information, see [Collecting information about the sizes of snapshots in IBM Spectrum Scale](#).

Configure alert notifications for conditions that are detected on monitored resources

Determining when and how you're alerted to configuration and performance conditions within your storage environment is important to helping you maintain and administer storage resources. Many conditions can trigger alerts. IBM Spectrum Control provides default alert policies for each resource type, or you can configure alert definitions so that IBM Spectrum Control examines the data about your resources for the conditions that you specify.

Specify the users that can access the product and the functions that are available to them

Assign roles to groups of users to determine which functions are available in IBM Spectrum Control. When a user ID is authenticated to IBM Spectrum Control through the GUI, CLI, or APIs, membership in an operating system or LDAP group determines the authorization level of the user.

Deploy Storage Resource agents to set up data features

Deploy Storage Resource agents on servers to enable data collection and to monitor the fabrics that are visible to the server.

Monitor and manage resources

Access the IBM Spectrum Control GUI to monitor and manage your storage, including the following tasks:

- Monitor the status of resources
- View capacity and asset information about resources
- Troubleshoot the performance of resources
- Set performance thresholds and alerts
- View the relationships between resources
- Optimize storage
- Configure for the cloud and storage provisioning
- Generate detailed reports about resources

Remove the IBM Spectrum Control installation directory from the antivirus scan

Scans that are conducted by antivirus software cause more I/O write operations on the IBM Spectrum Control and server disk drives. For example, the antivirus software can be set to scan any file, record, or process that is written to or read from. The scan includes logs, read/write operations for database records, and Java™ processes that are used by IBM Spectrum Control. The antivirus software performs write operations on the objects that it identifies with these scans. These additional operations affect product performance and are visible in the performance monitoring tools for the operating system on which the IBM Spectrum Control server is installed. For example, on the Windows operating system, the Reliability and Performance Monitor might show an unusually high number of active write operations for IBM Spectrum Control. To improve performance, update your antivirus software so that it excludes the IBM Spectrum Control installation directory from scans.

McAfee tip for Windows: If McAfee Adaptive Threat Protection is enabled on the server where IBM Spectrum Control is installed, it might prevent some services from starting or stopping. To help avoid this issue, open McAfee Adaptive Threat Protection and go to settings. In the Real Protect Scanning (Windows only) section, verify if Enable client-based scanning is selected. If so, select Low from the Sensitivity level list.

For more information about McAfee Adaptive Threat Protection, see the following links:

- [Adaptive Threat Protection — Options](#)
- [Overview of Adaptive Threat Protection](#)

For more information about these tasks and how to manage and monitor your resources with IBM Spectrum Control, see [Managing resources](#).

Uninstalling

You can uninstall IBM Spectrum® Control by using the uninstallation program or by using silent mode from the command line.

About this task

To uninstall IBM Spectrum Control, uninstall these components and related software:

- Uninstall any Storage Resource agents installed on your remote systems.

- If all IBM Spectrum Control components are installed on one server, uninstall all components.
- If the database repository is installed on a separate server, uninstall the IBM Spectrum Control components on the first server, and then uninstall the database repository on the second server.
- Uninstall IBM® Db2®.

Note: On the Windows operating system, before you uninstall IBM Spectrum Control, if you installed the Monitoring Agent service, stop the Monitoring Agent for Windows OS - Primary and Monitoring Agent for Windows OS - Watchdog services.

- [Uninstalling IBM Spectrum Control in a single-server environment](#)
In a single-server environment, you can uninstall IBM Spectrum Control by using the uninstallation program. The uninstallation process requires minimal user interaction.

You can uninstall locally or remotely installed Storage Resource agents.
- [Uninstalling Db2](#)
Uninstall IBM Db2 after you uninstall IBM Spectrum Control. You must use the Db2 uninstallation program to uninstall Db2.
- [Uninstalling IBM Cognos Analytics](#)
To uninstall IBM Cognos® Analytics, follow the procedures in the Cognos Analytics documentation.

Uninstalling IBM Spectrum Control in a single-server environment

In a single-server environment, you can uninstall IBM Spectrum® Control by using the uninstallation program. The uninstallation process requires minimal user interaction.

Procedure

To uninstall the software in a single-server environment:

1. Log on to the IBM Spectrum Control host server with the appropriate user privileges.
2. Start the IBM Spectrum Control uninstallation program for your operating system.
 - For the Windows operating system:
 - Click Start > Control Panel > Programs > Programs and Features.
 - Highlight IBM Spectrum Control and click Uninstall/Change.
 - For the AIX® or Linux® operating systems:
Run the following command from the root directory:

```
installation_dir/_uninst/uninstall
```

 where *installation_dir* is where IBM Spectrum Control is installed.
3. Review the message that indicates that all the installed IBM Spectrum Control components are uninstalled.
4. Click Uninstall and click Next.
You cannot cancel the uninstallation process after it starts.
5. Restart the system if needed.
For the Windows operating system, you can restart the system now or later. You must restart the system to reinstall IBM Spectrum Control.

For the AIX or Linux operating system, you *do not* have to restart the system.
6. If an error occurred during the uninstallation process, review the installation log files.

Uninstalling IBM Spectrum Control in a multiple-server environment

You can uninstall IBM Spectrum® Control by using the uninstallation program. This uninstallation process requires minimal user interaction.

About this task

For this procedure, the terms *Server A* and *Server B* denote the two servers. The IBM Spectrum Control database repository is installed on *Server A* and the IBM Spectrum Control servers are installed on *Server B*.

Procedure

To uninstall the software in a multiple-server environment, complete the following steps:

1. Complete these steps on *Server B*:
 - a. Log on to *Server B* with the appropriate user privileges to uninstall the IBM Spectrum Control components.
 - b. Start the IBM Spectrum Control uninstallation program.
For the Windows operating system, click Start > Control Panel > Programs > Programs and Features. Highlight IBM Spectrum Control and click Uninstall/Change.
For the AIX® or Linux® operating system, run the following command from the root directory:

```
installation_dir/_uninst/uninstall
```

where *installation_dir* is the location where IBM Spectrum Control is installed.
A window is displayed that indicates that all IBM Spectrum Control components installed on the system will be uninstalled.
 - c. Click Uninstall. A confirmation is displayed.
 - d. Click Next to start the uninstallation process.
Tip:
Remember the following for your operating system:
 - For the Windows operating system, when the uninstallation process is finished, a window is displayed so you can choose to start your system now or later. You must restart the system before you can reinstall IBM Spectrum Control.
 - For the AIX or Linux operating system, you do not have to restart your system.
2. Complete these steps for *Server A*:
 - a. Log on to *Server A* with the appropriate user privileges to uninstall the IBM Spectrum Control database repository.
 - b. Start the IBM Spectrum Control uninstallation program.
 - c. Follow the instructions to uninstall the database repository.
3. If an error occurred during the installation process, review the installation log files.

Related reference

Uninstalling IBM Spectrum Control by using silent mode

You can uninstall IBM Spectrum® Control by using silent mode. This mode is useful if your system is running from a terminal that cannot display graphics.

About this task

In silent mode, the following server configurations are possible:

Tip: The terms *Server A* and *Server B* denote the two servers in a multiserver environment.

Option 1

All IBM Spectrum Control components are installed on one server (single-server environment).

Option 2

The IBM Spectrum Control database repository is installed on *Server A* and all other IBM Spectrum Control components are installed on *Server B*.

To uninstall IBM Spectrum Control by using silent mode, complete the following steps:

Procedure

1. Complete the following steps for option 1:
 - a. Log on to the IBM Spectrum Control system with the appropriate user privileges.
 - b. Start the uninstallation program.
 - For the Windows operating system, run the following in the C:\ directory:

```
installation_dir\_uninst\uninstall.bat -i silent
```
 - For the AIX® or Linux® operating systems, run the following command from the root directory:

```
installation_dir/_uninst/uninstall -i silent
```

where *installation_dir* is where IBM Spectrum Control is installed.
 - c. Restart the system, if needed.
 - For the Windows operating systems, restart the system after the uninstallation process is complete.
 - For the AIX or Linux operating systems, you do not have to restart your system.
2. Complete the following steps for option 2:
 - a. Log on to *Server B* with the appropriate user privileges to uninstall IBM Spectrum Control.
 - b. Start the uninstallation program.
 - For the Windows operating system, run the following from the C:\ directory:

```
installation_dir\_uninst\uninstall.bat -i silent
```
 - For the AIX or Linux operating system, run the following command from the root directory:

```
installation_dir/_uninst/uninstall -i silent
```
 - c. Restart the system, if needed.
 - For the Windows operating systems, restart the system after the uninstallation process is complete.
 - For the AIX or Linux operating systems, you do not have to restart your system.
 - d. Log on to *Server A* with the appropriate user privileges to uninstall the IBM Spectrum Control database repository.
 - e. Start the uninstallation program.

- For the Windows operating system, run the following command from the C:\ directory:

```
installation_dir\uninst\uninstall.bat -i silent
```

f. Restart the system, if needed.

- For the Windows operating systems, restart the system after the uninstallation process is complete.
- For the AIX or Linux operating systems, you do not have to restart your system.

Manually uninstalling IBM Spectrum Control components on AIX® or Linux®

If the IBM Spectrum® Control uninstallation process fails, you must manually uninstall the components.

Before you begin

This procedure assumes the following conditions:

- You installed IBM Spectrum Control in the default directory.
- You used default ports.
- You used the default IBM Spectrum Control database repository named TPCDB.

Procedure

To manually uninstall IBM Spectrum Control components, complete the following steps:

1. Run the following command to stop the Storage Resource agent:

```
kill -9 `ps -aef | grep /opt/IBM/TPC/agent | grep -v grep | awk '{ print $2 }'` 2> /dev/null
```

2. Run the following command to stop the Data server:

```
kill -9 `ps -aef | grep data | grep -v grep | awk '{ print $2 }'` 2> /dev/null
```

3. Run the following command to stop the Device server:

```
kill -9 `ps -aef | grep deviceServer | grep -v grep | awk '{ print $2 }'` 2> /dev/null
```

4. Run the following command to stop the Alert server:

```
kill -9 `ps -aef | grep alertServer | grep -v grep | awk '{ print $2 }'` 2> /dev/null
```

5. Run the following command to stop the Export server:

```
kill -9 `ps -aef | grep export | grep -v grep | awk '{ print $2 }'` 2> /dev/null
```

6. Run the following command to stop the GUI:

```
kill -9 `ps -aef | grep webServer | grep -v grep | awk '{ print $2 }'` 2> /dev/null
```

7. Run the following command to stop the data collector:

```
kill -9 `ps -aef | grep collector | grep -v grep | awk '{ print $2 }'` 2> /dev/null
```

8. Drop the database by completing the following steps:

- a. Source the **db2profile**.

- b. Enter **db2 drop db TPCDB**.

9. Go to the **/db2_admin_home/db2_instance_name/** directory and ensure that the database directory is deleted.

10. Delete the following files and folders:

- **rm -r `find /etc -name *tpcdsrv* -print`**
- **rm -r `find / -name *itsanm* -print`**
- **rm -r /etc/Tivoli/TSRM/registry**
- **rm -r /etc/Tivoli/TSRM/registryNA**
- **rm -r /etc/Tivoli/TSRM/lock**
- **rm -fr /opt/IBM/TPC**

Manually uninstalling IBM Spectrum Control components on Windows

If the IBM Spectrum® Control uninstallation process fails, you must manually uninstall the components.

Before you begin

This procedure assumes that the following conditions are met:

- You installed IBM Spectrum Control in the default directory.
- You used default ports.
- The Storage Resource agent service name is *Agent1*.
- You used the default IBM Spectrum Control database repository name *TPCDB*.

About this task

To manually uninstall IBM Spectrum Control components, complete the following steps in a Windows command window:

Procedure

1. To uninstall the Storage Resource agent, run the following command:

```
sc stop Agent1
sc delete Agent1
```

2. To remove the Storage Resource agent registry entries, run the following command:

```
reg delete HKLM\SOFTWARE\IBM\TPCAGENT\1
```

where 1 is the instance of the Agent.

If you do not have multiple agents, you can also run the following command:

```
reg delete HKEY_LOCAL_MACHINE\SOFTWARE\IBM\TPCAGENT
```

Important: If you have multiple agents and you run this command, all of the agents are deleted.

3. To uninstall the Data server, run the following commands:

```
sc stop TSRMsrvt
sc delete TSRMsrvt
```

4. To stop the Device server and data collector, run the following command:

```
cd C:\Program Files\IBM\TPC\scripts
stopTPCdevice.bat
```

Tip: If the script does not exist, run the following command to stop the Device server:

```
sc stop deviceServer
```

If the script does not exist, run the following command to stop the data collector:

```
sc stop datacollector1
```

5. To delete the Device server, run the following command:

```
sc delete deviceServer
```

6. To delete the data collector, run the following command:

```
sc delete datacollector1
```

7. Run the following commands to uninstall the Alert server:

```
sc stop alertServer
sc delete alertServer
```

8. Run the following commands to uninstall the Export server:

```
sc stop exportServer
sc delete exportServer
```

9. Run the following commands to uninstall the Web server:

```
sc stop webServer
sc delete webServer
```

10. Run the following commands to delete the **wlp** directories:

```
cd C:\Program Files\IBM\TPC
del wlp
```

11. Run the following command to remove the IBM Spectrum Control directories:

```
rmdir /s/q "C:\Program Files\IBM\TPC"
```

12. Restart your computer.

Uninstalling Storage Resource agents

You can uninstall locally or remotely installed Storage Resource agents.

About this task

To uninstall a Storage Resource agent, use the GUI to remove the server that the agent is deployed on.

- [Uninstalling Storage Resource agents manually](#)
You can manually uninstall Storage Resource agents.
- [Deleting Storage Resource agent registry entries after a failed installation or uninstallation](#)
If your IBM Spectrum Control installation or uninstallation fails, you must find and manually delete the Storage Resource agent registry entries that remain.
- [Removing servers](#)
You can remove servers that you no longer want to monitor with IBM Spectrum Control.

Uninstalling Storage Resource agents manually

You can manually uninstall Storage Resource agents.

Procedure

To uninstall a Storage Resource agent, complete the following steps:

1. If the Storage Resource agent is on the Virtual I/O system, complete the following steps:
 - a. Log in with the **padmin** user ID.
 - b. Run the following command to set up the AIX® environment:

```
oem_setup_env
```

2. Go to the directory where the agent is installed:

```
agent_install_location
```

where *agent_install_location* is where the Storage Resource agent is installed.

3. Run the uninstallation command:

Restriction: Do not delete the Storage Resource agent component from the IBM Spectrum® Control server by using the GUI or the command-line interface. This component must exist on the server to complete the uninstall process.

```
➤ bin/Agent -uninstall -force -serverName TPC_server_name -debug MAX
```

Where:

-uninstall

Uninstalls the agent.

-force

This optional parameter forces an uninstallation. If you use this parameter, do not provide the **serverName** parameter.

-serverName *TPC_server_name*

TPC_server_name is the Data server name as defined in IBM Spectrum Control. You can check the configuration file for the server name:

```
agent_install_location/config/Agent.config
```

where *agent_install_location* is where the agent is installed.

-debug MAX

This optional parameter is for debugging purposes. If you set the -debug parameter, then some files are not deleted.

Tip: If you run the uninstallation program from the bin directory, the bin directory is not deleted.

If you run the uninstallation program outside of the agent installation directory, then you must specify the full path.

If the uninstallation fails, you must look at the return codes. For more information about return codes, see [Return codes used by Storage Resource agent](#).

Deleting Storage Resource agent registry entries after a failed installation or uninstallation

If your IBM Spectrum® Control installation or uninstallation fails, you must find and manually delete the Storage Resource agent registry entries that remain.

Deleting registry files in the Windows operating system

To delete registry entries after a failed installation or uninstallation in the Windows operating system:

1. In Windows Registry Editor, navigate to **HKEY_LOCAL_MACHINE > SOFTWARE > IBM > TPCAGENT > NUMBER** or **HKEY_LOCAL_MACHINE > SOFTWARE > IBM > TPCAGENT**.
2. Delete this entry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\IBM\TPCAGENT\1]  
"Home"="C:\Program Files\IBM\TPC"  
"Port"="9567"
```

3. If the Storage Resource agent is running as a daemon service, delete the service.
For example, `sc delete AgentX`, where AgentX is the name of the Storage Resource agent.
4. Delete the folder in which the agent was installed.

Display the agent name and folder by running **services.msc** and right-click the service to see the properties.

- For daemon agents, verify that the associated CAP file was deleted.
The CAP file is located in the `%ALLUSERSPROFILE%\Application Data\IBM\CAP` folder. The naming convention for this file is `srainstance_default.xml`.

Remember: After uninstalling a daemon agent, you must restart your system.

Deleting registry files on the UNIX or Linux operating systems

To delete registry entries after a failed installation or uninstallation on the UNIX or Linux® operating systems:

- Delete the Storage Resource agent entry that is associated with the IBM Spectrum Control installation on the local server.
The terms *Server A* and *Server B* are used in this procedure to denote the different servers.

When you install IBM Spectrum Control on Server A, a Storage Resource agent is also installed on Server A. When you deploy another Storage Resource agent from IBM Spectrum Control Server B to Server A, an entry is added to the file `/etc/Tivoli/TSRM/registryNA` on Server A. This entry is associated with the Storage Resource agent deployed from Server B.

If a failure occurs when you install or uninstall the Storage Resource agent from Server A, you must delete the entry from the `/etc/Tivoli/TSRM/registryNA` file that is associated with the agent on Server A. For example, you would delete these lines from the file:

```
Instance=1
Home=/opt/IBM/TPC
Port=9567
```

- If the agent was a daemon, verify that the process is running and stop it.
 - To list all the running processes, run the following command:

```
ps -ef
```

- To stop a process, run the following command:

```
kill -9 process_number
```

- For daemon agents, verify that the associated CAP File was deleted.
The CAP file is located in the `/opt/IBM/CAP` directory. The naming convention for this file is `srainstance_default.xml`.

Removing servers

You can remove servers that you no longer want to monitor with IBM Spectrum® Control.

About this task

You can use the GUI to remove servers. If a Storage Resource agent is deployed to the server, the agent is uninstalled.

When the server is removed, it is no longer monitored by IBM Spectrum Control. All the data that was collected about the server is removed from the database repository.

Tip: When you remove a server, it is only removed from IBM Spectrum Control. The server is not physically deleted from the storage environment.

Procedure

To remove a server, complete the following steps:

- In the menu bar, go to Servers, > Servers.
- On the Servers page, right-click the server where the agent is deployed and select Remove.
- Click Remove to confirm that you want to remove the server.

Uninstalling Db2

Uninstall IBM® Db2® after you uninstall IBM Spectrum® Control. You must use the Db2 uninstallation program to uninstall Db2.

About this task

For information about uninstalling Db2® 11.1 on the Windows operating system, go to [Uninstalling your DB2® database product \(Windows\)](#).

For information about uninstalling Db2 11.5 on the Windows operating system, go to [Uninstalling your DB2 database product \(Windows\)](#).

- [Uninstalling Db2 on AIX or Linux](#)
You can uninstall IBM® Db2® on UNIX or Linux® systems.

Uninstalling Db2 on AIX or Linux

You can uninstall IBM® Db2® on UNIX or Linux® systems.

About this task

To uninstall Db2® on AIX® and Linux, complete the following steps:

Procedure

1. As the Db2 instance user (typically db2inst1), drop the databases, and stop Db2.
 - a. If you are the user with root authority, run the **su - db2inst1** command to switch the user to the Db2 instance user. Otherwise, log in as the Db2 instance user.
 - b. Run the **db2 list db directory** command to list the databases that might not have been removed by the IBM Spectrum® Control uninstallation program.
 - c. For each database name listed by the command in the previous step, run the **database_name** command. For example:

```
Command:
$ db2 drop db tcpdb
Response:
DB20000I The DROP DATABASE command completed successfully.
$ db2 drop db ibmcdm
Response:
DB20000I The DROP DATABASE command completed successfully.
```

- d. Run the **db2stop force** command. The following messages are displayed:

```
08/10/2015 21:46:13 0 0 SQL1064N DB2STOP processing was successful.
SQL1064N DB2STOP processing was successful.
```

- e. Run **db2 terminate**. The following message is displayed:

```
DB20000I The TERMINATE command completed successfully.
```

- f. Run the **exit** command to close the su shell or log out.

On Linux run the following commands:

```
groupdel dasadm1
groupdel db2iadm1
groupdel db2fadm1
```

7. Remove the Db2 directory.
 - a. Run the **cd** command.
 - b. Run the command to remove the Db2 directory on your operating system:
On AIX, run the **rm -r /opt/IBM/db2** command.

On Linux, run **rm -r /opt/ibm/db2** command.
8. Remove any Db2 definitions from `/etc/services`.

Uninstalling IBM Cognos Analytics

To uninstall IBM® Cognos® Analytics, follow the procedures in the Cognos Analytics documentation.

For information on uninstalling Cognos Analytics in a Microsoft Windows environment, go to [Uninstall IBM Cognos Analytics on Microsoft Windows operating systems](#).

For information on uninstalling Cognos Analytics in an UNIX or Linux® environment, go to [Uninstall IBM Cognos Analytics on UNIX or Linux operating systems](#).

Related information

- [Silent installation, uninstallation, and configuration](#)

Upgrading and migrating

Learn about the key tasks in the upgrade process for IBM Spectrum® Control.

The IBM Spectrum Control upgrade process guides you through the steps for upgrading to the current version.

Important: Upgrading the operating system of a server where IBM Spectrum Control is installed is not supported. If you upgrade the operating system of the server, IBM Spectrum Control might be unable to continue monitoring your resources. If you must upgrade the server, contact the IBM® Support team for IBM Spectrum Control Support to discuss your options.

Use the following image to find information about upgrading IBM Spectrum Control.

Tip: Click a step to view more information.

- [Preparing to upgrade](#)
You can use the following information to help prepare your upgrade of IBM Spectrum Control. Good planning helps you avoid delays and problems when you upgrade your system.
- [Backups](#)
Before you upgrade, you must back up the entire IBM Spectrum Control system.
- [Example of upgrading Db2 in a Windows environment](#)
To complete an upgrade from IBM Db2 11.1 to IBM Db2 11.5.7, stop the IBM Spectrum Control servers before you begin the upgrade procedure.
- [Example of upgrading Db2 in a AIX or Linux environment](#)
To complete an upgrade from IBM Db2 11.1 to IBM Db2 11.5.7, stop the IBM Spectrum Control servers before you begin the upgrade.
- [Upgrading IBM Spectrum Control in a single-server environment](#)
You can upgrade IBM Spectrum Control by using the installation program or silent mode.

- [Upgrading IBM Spectrum Control in a multiple-server environment](#)
To upgrade IBM Spectrum Control in a multiple-server environment, start the installation program on the server on which the database repository is installed. After you complete the installation program on this server, you can start the start the installation program on the other server.
- [Upgrading Storage Resource agents](#)
Upgrade Storage Resource agents to ensure that they are at the same release level as the IBM Spectrum Control server.
- [Upgrading SMI-S providers for storage systems](#)
Before you upgrade an SMI-S provider (also called the CIM agent or CIMOM agent), ensure that IBM Spectrum Control supports the SMI-S provider that you want and that the provider is compatible with the firmware versions of your storage systems.
- [Migrating alert definitions to alert policies](#)
When you upgrade to IBM Spectrum Control 5.3.2 or later, all of your monitored resources retain their existing alert definitions and are not included in an alert policy. However, at any time, you can place resources into an alert policy or create a policy based on a resource.
- [Scenario: Changing from LDAP and Local OS authentication to only LDAP or Local OS authentication after an upgrade](#)
In this scenario, you change from LDAP and Local OS authentication to only LDAP or Local OS authentication.

Preparing to upgrade

You can use the following information to help prepare your upgrade of IBM Spectrum® Control. Good planning helps you avoid delays and problems when you upgrade your system.

General considerations

Attention:

- You cannot upgrade from any release before IBM Spectrum Control 5.3.0. If you are currently running a version of IBM Spectrum Control earlier than 5.3.0, you must upgrade to IBM Spectrum Control 5.3.0 or later. For more information, see [IBM Spectrum Control interoperability matrix](#). When you are at IBM Spectrum Control 5.3.0 or later, you can upgrade to the highest version of IBM Spectrum Control.
- To help streamline, improve and clarify the product licenses for IBM Spectrum Control, the following licenses were renamed:
 - IBM Spectrum Control Standard Edition is now IBM Spectrum Control
 - IBM Spectrum Control Standard Select Edition is now IBM Spectrum Control Select Edition
 If you have the Advanced edition from previous releases, you are not affected by the renaming of product licenses. After you upgrade to 5.4.0, you can pick up right where you left off. However, keep in mind that all licenses are impacted by the deprecated features that are listed at [Discontinued features in IBM Spectrum Control](#).
- Upgrading the operating system of a server where IBM Spectrum Control is installed is not supported. If you upgrade the operating system of the server, IBM Spectrum Control might be unable to continue monitoring your resources. If you must upgrade the server, contact the IBM® Support team for IBM Spectrum Control Support to discuss your options.

Before you upgrade

Consider the following information before you upgrade:

- Before you upgrade IBM Spectrum Control, apply all available updates and patches to the operating system of the server where you installed IBM Spectrum Control. This is *not* the same as upgrading the operating system of the server where IBM Spectrum Control is installed, which is not supported.
- IBM Spectrum Control no longer supports Tivoli® Storage Productivity Center for Replication. To learn more about how to download and install IBM Copy Services Manager, see [IBM Copy Services Manager](#).
- The time and space considerations that are required to upgrade IBM Spectrum Control varies from site to site. Several factors, such as how many devices are being monitored and the version from which you are upgrading, affect the time that is required for the upgrade to complete. In some cases, the upgrade might take up to several hours to complete.
Note, that when you upgrade IBM Spectrum Control the database repository for metadata is reorganized to include all the latest changes and improvements in the new release. During the upgrade, the database reorganization process might take some time to complete or appear to be frozen. This behavior is typical, especially for larger environments or when you are upgrading from a much older release.

To help ensure that the upgrade and database reorganization complete successfully, make sure that you have enough space on your file system:

- On a Windows operating system: 1 GB - 2 GB on the drive where you installed IBM Spectrum Control.
- On a Linux® operating system: 100 MB - 300 MB in the /home file system and 1 GB - 2 GB in the / file system.
- On a AIX® operating system: 100 MB - 300 MB in the /home file system and 1 GB - 2 GB in the /opt file system.
- When you do upgrades of IBM Spectrum Control an offline reorganization of tables in the database repository occurs. These table reorganizations do not use temporary table space, so you need to consider the amount of free disk space you need to have before your upgrade. During an upgrade of IBM Spectrum Control, you must have free disk space equivalent to the largest amount of disk space that is being used by a single table in the database repository.

To determine the largest amount of disk space that is being used by a single table in the database repository, complete the following tasks on the computer where the IBM Spectrum Control database repository is installed:

1. Open a Db2® command prompt or switch to the Db2 instance owner.
2. Run the following commands:

```
a. db2 connect to <database name>

b. db2 "select MAX(physical_space) as needed_space from
(select
decimal((DATA_OBJECT_P_SIZE+INDEX_OBJECT_P_SIZE+LONG_OBJECT_P_SIZE+LOB_OBJECT_P_SIZE+XML_OBJECT_P_SIZE+COL_OBJEC
T_P_SIZE)/1024,10,2)
as physical_space from sysibmadm.admintabinfo where TABSCHEMA='TPC' order by physical_space desc)"

c. db2 disconnect <database name>
```

where <database name> is the name of the IBM Spectrum Control database repository, which is *TPCDB* by default.

Record the result from Step 2b and increase that value by 10 percent; this is the required amount of free disk space in megabytes.

The required free disk space must be available in each file system or drive where the database repository tables are stored.

To determine the file systems or drives where the database repository tables are stored, do the following tasks on the computer where the IBM Spectrum Control database repository is installed:

1. Examine the `installation_dir/config/InstallVariable.properties` file.
2. Record the value of the following parameters:

DFTDBPATH
CSTDBPATH

Each directory that is listed in the previously mentioned values is in a file system (AIX /Linux) or in a drive (Windows). The required free disk space must be available in each file system or drive.

During the upgrade of IBM Spectrum Control, the reorganization of tables in the database repository is logged to the `installation_dir/logs/log/traceInstaller_0.log` file.

- On Windows operating systems, ensure that all command prompts are closed. If you have open command prompts that have a current working directory in the IBM Spectrum Control installation directory structure, the upgrade might fail in various places because the upgrade process modifies certain directories.
- On Windows operating systems, ensure that the user who logs into the operating system to perform the upgrade of IBM Spectrum Control is an Administrator and does have the *Debug programs* privilege and does *not* have the *Deny access to this computer from the network* privilege in the Windows operating system security policy. These privileges can be found in Administrative Tools -> Local Security Policy -> Local Policies -> User Rights Assignment. After the upgrade of IBM Spectrum Control is complete, the required privileges for the user who performed the upgrade can be changed, but only if that user is *not* set as the Common User or the Db2 user in IBM Spectrum Control.
- The full X Window System must be installed to display the IBM Spectrum Control installation program on AIX and Linux operating systems.
- On Windows operating systems, if you installed the IBM Monitoring Agent, stop the Monitoring Agent for Windows OS Primary and Monitoring Agent for Windows OS Watchdog services. After your upgrade is complete, you can start these services again.

Security

Consider the following security information related to upgrades:

- Installing IBM Spectrum Control involves using your operating system in manners typical for installing new application software. If your antivirus software is set on the maximum mode, it might prevent some of your changes from being accepted. To verify that your upgrade completes correctly, enable your antivirus software product to allow the following instances:
 - The `/etc/hosts` file can be edited
 - Files can be created in the `/temp` directory
 - New executable files can be created in the `C:\Program Files` directory.McAfee tip for Windows: If McAfee Adaptive Threat Protection is enabled on the server where IBM Spectrum Control is installed, it might prevent some services from starting or stopping. To help avoid this issue, open McAfee Adaptive Threat Protection and go to settings. In the Real Protect Scanning (Windows only) section, verify if Enable client-based scanning is selected. If so, select Low from the Sensitivity level list. For more information about McAfee Adaptive Threat Protection, see the following links:
 - [Adaptive Threat Protection — Options](#)
 - [Overview of Adaptive Threat Protection](#)
- If you upgrade from a release earlier than IBM Spectrum Control 5.3.6 to the current version of IBM Spectrum Control, the SSL certificates that are used by the Data server and Storage Resource agents are not updated automatically to the SHA-256 hash algorithm. If you want to use the SHA-256 hash algorithm after you upgrade to the current version of IBM Spectrum Control, you must perform the steps in [Replacing default SSL certificates for the Data server and Storage Resource agents with custom SSL certificates](#).
- There are new certificate requirements from the [CA/B Forum](#) that are strictly enforced for macOS Catalina users that might affect your ability to access the IBM Spectrum Control GUI. During an upgrade of IBM Spectrum Control, certificates self-signed by IBM Spectrum Control will be made automatically compliant. However, if one or more of your certificates are not self-signed by IBM Spectrum Control, see [IBM Spectrum Control and macOS Catalina \(10.15\) Increased Security Policies on SSL Certificates](#) and validate that your certificates are compliant.
- Starting with IBM Spectrum Control 5.3.6, all default self-signed certificates have an expiration date of 825 days based on the new certificate requirements from the CA/B Forum. By default, upgrades of IBM Spectrum Control always renew the expiration of all default self-signed certificates used by the product for another 825 days. However, if you have installed your own certificates, IBM Spectrum Control does not modify those certificates for you.

After you upgrade

Consider the following information after you upgrade:

- If your upgrade process fails and a component cannot be upgraded, the upgrade process ends and the status of the component is shown as failed. When you start the upgrade process again, the installation program resumes upgrading the failed component.
- If you do a version upgrade of Db2 (For example, 11.1 to 11.5.7), you must apply a valid license to Db2 following the upgrade.
- After you upgrade to IBM Spectrum Control, all trace settings are reset to the default values. If you changed the trace settings, you must reset the trace settings after an upgrade.

Cognos Analytics

Consider the following information if you use Cognos® Analytics 11:

- If you plan to upgrade your Cognos Analytics 11 environment, see [How to upgrade your version of Cognos Analytics](#). After you upgrade IBM Spectrum Control and upgrade your Cognos Analytics 11 environment, you can upgrade the pre-defined reports by importing the pre-defined reports package from the most updated version of IBM Spectrum Control into Cognos Analytics. See [Importing IBM Spectrum Control pre-defined reports package](#).
- After you complete the upgrade of your Cognos Analytics 11 environment on Linux or AIX, verify that the link from the 32-Bit Db2 library to the `Cognos_installation_dir/bin/` directory is still present. If it is not present, perform Step 3 in [Copying Db2 files and linking the Db2 library on Linux and AIX](#).
- When you complete the upgrade of your Cognos Analytics 11 environment, and you save the Cognos Configuration, if you encounter a failure in the Check password for JVM truststore step, and it generates the **CAM-CRP-1613** error in the Details, see [How to regenerate cryptographic keys in Cognos Analytics 11](#).
- The IBM Cognos BI Reports component is no longer part of the IBM Spectrum Control product and is uninstalled during the upgrade. It is recommended that you back up your entire IBM Spectrum Control system before you proceed with an upgrade.

After you upgrade IBM Spectrum Control and are using IBM Cognos Analytics, import the pre-defined reports package into Cognos Analytics. See [Importing IBM Spectrum Control pre-defined reports package](#).

Backups

Before you upgrade, you must back up the entire IBM Spectrum® Control system.

The process involves backing up the following parts:

- IBM Spectrum Control database by using Db2® backup utilities.
For more information about backing up your database, see [Backing up the database offline using the command line](#).
- The entire IBM Spectrum Control server by using software such as IBM Spectrum Protect.

Tip: The frequency of backups depends on the data protection policies of your company, the IBM Spectrum Control work load, and the size of the IBM Spectrum Control environment. Your backup plan must include documentation with the user names and passwords for Db2 and IBM Spectrum Control.

If you experience problems during the migration, use these backups to restore your original IBM Spectrum Control system and try to migrate again. For more information about restoring the IBM Spectrum Control database, see [Restoring the database](#).

Restriction:

Do not restore the IBM Spectrum Control database from one version of IBM Spectrum Control into another version. For example, do not restore a backup from IBM Spectrum Control 5.3.3 into 5.3.4, or any other version.

Example of upgrading Db2 in a Windows environment

To complete an upgrade from IBM® Db2® 11.1 to IBM Db2 11.5.7, stop the IBM Spectrum® Control servers before you begin the upgrade procedure.

About this task

You can upgrade to the latest version of Db2 that IBM Spectrum Control supports before you install the latest version of IBM Spectrum Control.

Important: The following steps are an example of one way to upgrade from Db2 11.1 to Db2® 11.5.7 on a Windows operating system.

Procedure

1. Stop all of the Windows services for the IBM Spectrum Control servers, including IBM Cognos® Analytics (if you installed it on your system).
2. In a Db2 command window, run the following commands to force all users or applications to disconnect from Db2:

```
db2 force application all
db2 terminate
```

3. In a Db2 command window, run the following command to ensure that no applications are accessing Db2:

```
db2 list applications
```

4. Create a directory to back up the database.
For example: `C:\downloads\db2_backup`
5. In a Db2 command window, run the following command:

```
db2 BACKUP DATABASE database to C:\downloads\db2_backup
```

where *database* is the name of the IBM Spectrum Control database (usually TPCDB). If the Cognos Analytics database is installed (usually CM), make a similar backup of that database.

6. Stop all Db2 Windows services and exit Db2 in the Windows System Tray.
7. In Windows Explorer, go to the following directory:

```
C:\Db2_11.5.7_download_directory\SERVER_DEC\image
```

Where *Db2_11.5.7_download_directory* is where you downloaded the Db2 installation files.

8. Double-click the setup.exe file.

9. On the Db2 Setup Launchpad navigation tree view, click Install a Product.
10. On the Install a Product page, in the Db2 11.5.7 Server Editions section, click Work with Existing.
11. In the Work with an Existing Db2 Copy window, select the Db2 copy for Db2 11.1.
12. Click Launch Db2 Setup wizard.
13. On the Warning window about upgrading Db2, click OK.
14. In the Db2 Setup wizard, complete the following steps:
 - a. On the Welcome page, click Next.
 - b. On the Software License Agreement page, review and accept the license agreement, and click Next.
 - c. On the Select the installation type page, select Typical and click Next.
 - d. On the Select the installation, response file creation, or both page, keep the default selection and click Next.
 - e. On the Installation folder page, click Next.
 - f. On the Set the Db2 copy name page, click Next.
 - g. On the Set user information for the default Db2 instance page, enter the correct user name and password values for the existing Db2 11.1 installation, and click Next.
 - h. On the Enable operating system security for Db2 objects page, ensure that the settings and values are correct for the existing Db2 11.1 installation, and click Next.
 - i. If the Warning window about existing group names is displayed, click OK.
 - j. On the Start copying files and create response file page, click Finish.
 - k. If Warning windows are displayed about a restart that is required to complete the setup, click OK.
 - l. On the Setup is complete page, click Finish.
 - m. In the Db2 First Steps page, click Do not create profile.
 - n. Close the Db2 First Steps window.
15. Apply a valid license to Db2 and remove the trial license.
16. In a Db2 command window, run the following command to upgrade the IBM Spectrum Control database to Db2 11.5.7:

```
db2 UPGRADE DATABASE database USER user_name USING password
```

where *database* is the name of the IBM Spectrum Control database (usually TPCDB), *user_name* is the user who owns the Db2 instance where the database is located (usually db2admin), and *password* is the password that is associated with that user name.

17. In a Db2 command window, run the following command to upgrade the Cognos Analytics (if installed) database to Db2 11.5.7:

```
db2 UPGRADE DATABASE database USER user_name USING password
```

Where *database* is the name of the Cognos Analytics database (usually CM), *user_name* is the user who owns the Db2 instance where the database is located (typically db2admin), and *password* is the password that is associated with that user name. You might encounter the following message when you upgrade the Cognos Analytics database to Db2 11.5.7:

```
SQL0954C Not enough storage is available in the application heap to process the statement.
```

18. Restart your computer and ensure that all of the Windows services for the IBM Spectrum Control servers, including Cognos Analytics are started.

Example of upgrading Db2 in a AIX or Linux environment

To complete an upgrade from IBM® Db2® 11.1 to IBM Db2 11.5.7, stop the IBM Spectrum® Control servers before you begin the upgrade.

About this task

You can upgrade to the latest version of Db2 that IBM Spectrum Control supports before you install the latest version of IBM Spectrum Control.

Important: The following steps are an *example* of one way to upgrade from Db2 11.1 to Db2 11.5.7 in a AIX® or Linux® environment.

Procedure

1. Stop all IBM Spectrum Control servers, including IBM Cognos® Analytics (if you installed it on your system).
2. Switch user to the Db2 instance owner (usually db2inst1).
3. From a command shell, run the following commands to force all users or applications to disconnect from Db2:

```
db2 force application all
```

```
db2 terminate
```

4. From a command shell, run the following command to ensure that no applications are accessing Db2:

```
db2 list applications
```

5. Create a directory to backup the database.
For example: /tmp/db2_backup

6. From a command shell, run the following command:

```
db2 BACKUP DATABASE database to /tmp/db2_backup
```

where *database* is the name of the IBM Spectrum Control database (usually TPCDB). If the Cognos Analytics database is installed (usually CM), make a similar backup of that database.

7. Switch user back to root.

8. From a command shell, change the directory to the location of the Db2 11.5.7 db2setup installation program and enter the following command:

```
./db2setup
```

9. On the Db2 Setup Welcome page, click New Install.

10. On the Choose a Product page, select Db2 Version 11.5.7.0 Server Editions and click Next.

11. On the Configuration page:

- Enter an installation directory or accept the default.
- Select Typical as the installation type.
- IMPORTANT:** Deselect Create an instance.
- Review and agree to the IBM terms and click Next.

12. On the Response File and Summary page:

- Select Install Db2 Server Edition on this computer and save my settings in a response file.
- Enter a response file name or accept the default.
- Review the Summary and click Finish

13. On the Setup has completed successfully page, review the information, and click Finish.

14. Switch user to the Db2 instance owner (usually db2inst1).

15. From a command shell, run the following command:

```
db2stop
```

16. Switch user back to root.

17. From a command shell, run the following commands:

```
installation_dir_for_Db2_11.5.7/instance/db2iupgrade Db2_instance
```

where *installation_dir_for_Db2_11.5.7* is the installation location of Db2 11.5.7 and *Db2_instance* is the Db2 instance where the database is located, usually db2inst1.

18. Switch user to the Db2 instance owner (usually db2inst1).

19. From a command shell, run the following command:

```
db2start
```

20. Apply a valid license to Db2 and remove the trial license.

21. From a command shell, run the following command to upgrade the IBM Spectrum Control database from Db2 11.1 to Db2 11.5.7:

```
db2 UPGRADE DATABASE database USER user_name USING password
```

where *database* is the name of the IBM Spectrum Control database (usually TPCDB), *user_name* is the user who owns the Db2 instance where the database is located (usually db2inst1), and *password* is the password associated with that user name.

22. From a command shell, run the following command to upgrade the Cognos Analytics (if installed) database from Db2 11.1 to Db2 11.5.7:

```
db2 UPGRADE DATABASE database USER user_name USING password
```

where *database* is the name of the Cognos Analytics database (usually CM), *user_name* is the user who owns the Db2 instance where the database is located (usually db2inst1), and *password* is the password associated with that user name.

23. Switch user back to root.

24. Start all of the IBM Spectrum Control servers, including Cognos Analytics (if you installed it on your system).

Upgrading IBM Spectrum Control in a single-server Windows environment by using the installation program

You can upgrade IBM Spectrum® Control by using the installation program.

Before you begin

Before you upgrade, you must back up the entire IBM Spectrum Control system.

Procedure

To upgrade IBM Spectrum Control in a single-server Windows environment, complete the following steps:

1. Log on to the IBM Spectrum Control computer with the appropriate user privileges.
2. Start the IBM Spectrum Control installation program.
 - a. Download the image into a directory.
 - b. Extract the image files.
 - c. Enter the following command: `cd image_directory\SC` and then enter `setup.bat`.
3. Follow the prompts in the installation program to upgrade IBM Spectrum Control.
4. After the upgrade is finished, review the message log to ensure that no errors occurred.

Upgrading IBM Spectrum Control in a single-server AIX or Linux environment by using the installation program

You can upgrade IBM Spectrum® Control as a root user or non-root user on an AIX® or Linux® operating system by using the IBM Spectrum Control installation program. To upgrade IBM Spectrum Control as a non-root user, you must have sudo privileges on the target AIX or Linux server.

Before you begin

Before you upgrade, you must back up the entire IBM Spectrum Control system.

Ensure that X Window System is installed on the target AIX or Linux server. The X Window System is required to upgrade IBM Spectrum Control by using the installation program.

If you want to upgrade IBM Spectrum Control as a non-root user, have your system administrator complete the following tasks on the target server before you begin the upgrade:

- If you are upgrading IBM Spectrum Control on an AIX server, install sudo on the server. The default AIX distribution does not include sudo privileges. To get the sudo installation package, go to <http://www.ibm.com/systems/power/software/ aix/linux/toolbox/date.html>. Find `sudo-version` in the Package column, and click RPM to download the package.
- Ensure that the non-root user has sudo privileges for the following commands on the server:
 - **xauth** (Enables the non-root user to provide access to their X Window System display for the root user.)
 - **setup.bin** (Enables the non-root user to launch the IBM Spectrum Control installation program.)

You must enter the full path to the commands when you configure the sudo privileges. For example:

```
username      ALL=(root)      SETENV: /usr/bin/xauth, /home/username/Downloads/IBMSC/SC/setup.bin
```

- If the sudo environment on the server uses the `secure_path` option, ensure that the following directories are included in the `secure_path` value for the non-root user who is upgrading IBM Spectrum Control:
 - `DB2_instance_owner_home_directory/sqllib/bin` (Example: `/home/db2inst1/sqllib/bin`)
 - `DB2_instance_owner_home_directory/sqllib/adm` (Example: `/home/db2inst1/sqllib/adm`)
 - `DB2_instance_owner_home_directory/sqllib/misc` (Example: `/home/db2inst1/sqllib/misc`)
- Ensure that the following requirements are met to enable the upgrade of IBM Spectrum Control by using the installation program:
 - The non-root user is able to use the X Window System on the target server and the X Window System **DISPLAY** environment variable is set correctly for the not-root user.
 - The **DISPLAY** environment variable is preserved in the sudo environment.
 - The root user has access to the X Window System display that is owned by the non-root user.

These display requirements do not apply if you upgrade IBM Spectrum Control in silent mode.

- If you are upgrading IBM Spectrum Control on an AIX server, ensure that the **ODMDIR** environment variable is preserved in the sudo environment.

Procedure

1. Log on to the IBM Spectrum Control computer as the root user or as the non-root user who has sudo privileges.
2. Start the IBM Spectrum Control installation program.

- a. Create a directory. Enter:

```
mkdir /SpectrumControl
```

- b. Download the image into the **SpectrumControl** directory.
- c. Enter the following command to extract the image files:

```
tar -xzf filename.tar.gz
```

- d. Ensure that the user name that you plan to use as the IBM Spectrum Control common user is in the **system** group and the **db2iadm1** group.
If the user name is not in a group, you can add the user as shown in the following command example. In this example, the user name is **db2inst1**:

```
usermod -G system db2inst1
```

Tip: If the user is already a member of secondary groups, the **usermod** command removes the **db2inst1** user name from all the secondary groups except for the system group. To preserve the existing secondary group memberships, provide a comma separated list of secondary groups after the **-G** flag. For more information, enter **man usermod** at the command prompt.

- e. Go to the **/SpectrumControl/SC** directory:

```
cd /SpectrumControl/SC
```

- f. Set up your shell environment to point to the instance where the database repository is installed. Source the **db2profile** for the instance that you want. For example, if the Db2® instance is **db2inst1**, you can source the **db2profile** by entering:

```
./home/db2inst1/sqllib/db2profile
```

Remember: There is a space between **.** and **/home**.

- g. Start the installation program by running the **./setup.bin** or **sudo -E ./setup.bin** command from the same command shell that you used in the previous step.
3. Follow the prompts in the installation program to upgrade IBM Spectrum Control.
 4. After the upgrade is finished, review the message log to ensure that no errors occurred.

Upgrading IBM Spectrum Control in a single-server environment by using silent mode

You can upgrade IBM Spectrum® Control by using silent mode. This upgrade method is useful if your computer cannot display graphics.

Before you begin

Before you upgrade, you must back up the entire IBM Spectrum Control system.

Procedure

To upgrade IBM Spectrum Control in a single-server environment by using silent mode, complete the following steps:

1. Log on to the IBM Spectrum Control computer with the appropriate user privileges.
2. Edit and save the appropriate response file.
 - Edit the **silent_upgrade.properties** file and set the following parameters:
 - **LICENSE_ACCEPTED=true**
 - **CHOSEN_INSTALL_TYPE="Upgrade"**
3. Run the silent mode installation program.
 - On Windows operating systems, run the following command:

```
setup.bat -l language -i silent -f absolute_path_to_response_file
```

where *language* can be one of the following values:

- Czech - cs
- English - en
- French - fr
- German - de
- Hungarian - hu

- Italian - it
- Japanese - ja
- Korean - ko
- Polish - pl
- Brazilian Portuguese - pt_BR
- Russian - ru
- Spanish - es
- Chinese (Simplified) - zh_CN
- Chinese (Traditional) - zh_TW

absolute_path_to_response_file is the absolute path to the response file. For example, the following command specifies the language and the path:

```
setup.bat -l fr -i silent -f
c:\SpectrumControl\silent_Upgrade.properties
```

- On the AIX® or Linux® operating system, you must source the Db2® profile, **db2profile**, for the instance owner of the Db2 database. The following text is an example of the command you run to source the user profile:

```
./home/db2inst1/sql1lib/db2profile
```

- On AIX or Linux operating systems, run the following command:

```
./setup.bin -l language -i silent -f /absolute_path_to_response_file
```

Where **absolute_path_to_response_file** is the absolute path to the response file. For example, the following command specifies the language and the path:

```
./setup.bin -l de -i silent -f /SpectrumControl/silent_Upgrade.properties
```

If you do not specify a language or if the language is not specified correctly, the installation program uses the English language as the default.

- Optional: Monitor the progress of the upgrade.

- To view the progress of the silent mode installation on Windows operating systems, check the trace log in the following path:

```
installation_dir\logs\traceTPCInstall.log
```

- To view the progress of the silent mode installation on AIX or Linux operating systems, check the trace log in the following path:

```
installation_dir/logs/traceTPCInstall.log
```

Editing the upgrade response file

When you upgrade using the silent mode, use the **silent_Upgrade.properties** file.

Parameters in the silent_Upgrade.properties file

The **silent_Upgrade.properties** file contains the following parameters:

LICENSE_ACCEPTED=false

Specifies whether you accept the IBM Spectrum® Control license agreement. The options are:

true

You accept all the terms and conditions of the IBM Spectrum Control license agreement.

false or any other value

You do not accept the IBM Spectrum Control license agreement. The installation program exits.

CHOSEN_INSTALL_TYPE="Upgrade"

Specifies the upgrade type.

Important: Do not change the value for this parameter.

varAlertKeystorePW=default

varDeviceKeystorePW=default

varWebKeystorePW=default

Specify the password for the Alert server, Device server, and Web server keystore files.

The default keystore password is *default*. If any of the specified keystore passwords are incorrect, the upgrade exits.

Upgrading IBM Spectrum Control in a multiple-server environment

To upgrade IBM Spectrum® Control in a multiple-server environment, start the installation program on the server on which the database repository is installed. After you complete the installation program on this server, you can start the start the installation program on the other server.

- [Upgrading to IBM Spectrum Control 5.3.0 or later with a remote database by using the installation program](#)
You can upgrade to IBM Spectrum Control 5.3.0 or later with a remote database by using the installation program.
- [Upgrading IBM Spectrum Control with a remote database by using silent mode](#)
You can upgrade IBM Spectrum Control in a multiple-server environment with a remote database by using silent mode.

Upgrading to IBM Spectrum Control 5.3.0 or later with a remote database by using the installation program

You can upgrade to IBM Spectrum® Control 5.3.0 or later with a remote database by using the installation program.

Before you begin

Before you upgrade, you must back up the entire IBM Spectrum Control system.

About this task

For this procedure, the terms *Server A* and *Server B* denote the two servers. Server A has Db2® Server Edition and the IBM Spectrum Control database repository installed. Server B has all of the other IBM Spectrum Control components installed.

Procedure

To upgrade using the installation program, complete the following steps:

1. Complete the following steps on Server B:
 - a. Log on to Server B with the appropriate user privileges.
 - b. On Server B, stop all IBM Spectrum Control services.
2. Complete the following steps on Server A:
 - a. Log on to Server A with the appropriate user privileges.
 - b. If necessary, upgrade Db2 on Server A to a version that is supported by IBM Spectrum Control.
For more information about the supported Db2 versions, see <http://www.ibm.com/support/pages/node/6249361#DB>. For more information about upgrading Db2, see [Upgrading Db2 servers](#).
Before you start the IBM Spectrum Control installation program on AIX® or Linux® operating systems, you must source the user profile, `db2profile`, for the instance owner of the Db2 database. The following text is an example of the command to source the user profile:

```
. /home/db2inst1/sqllib/db2profile
```
 - c. Start the IBM Spectrum Control installation program on Server A.
 - d. Follow the prompts in the installation program to upgrade the database repository on Server A.
 - e. After the upgrade is finished on Server A, review the message log to ensure that no errors occurred.
3. Complete the following steps on Server B:
 - a. Log on to Server B with the appropriate user privileges.
 - b. Start the IBM Spectrum Control installation program on Server B.
 - c. Follow the prompts in the installation program to upgrade the IBM Spectrum Control components on Server B.
 - d. After the upgrade is finished, review the message log file on Server B to ensure that no errors occurred.

Upgrading IBM Spectrum Control with a remote database by using silent mode

You can upgrade IBM Spectrum® Control in a multiple-server environment with a remote database by using silent mode.

Before you begin

Before you upgrade, you must back up the entire IBM Spectrum Control system.

About this task

For this procedure, the terms *Server A* and *Server B* denote the two servers. Server A has Db2® and the IBM Spectrum Control database repository installed. Server B has all of the other IBM Spectrum Control components installed.

Procedure

To upgrade IBM Spectrum Control by using silent mode, complete the following steps:

1. Complete the following steps on Server B:
 - a. Log on to Server B with the appropriate user privileges.
 - b. On Server B, stop all of the IBM Spectrum Control services.
See [Stopping the IBM Spectrum Control servers by using the GUI](#).
2. Complete the following steps on Server A:
 - a. Log on to Server A with the appropriate user privileges.
 - b. If necessary, upgrade Db2 on Server A to a version that is supported by IBM Spectrum Control.
For more information about the supported Db2 versions, see <http://www.ibm.com/support/pages/node/6249361#DB>. For more information about upgrading Db2, see [Upgrading DB2® servers](#).
 - c. Edit and save the appropriate response file.
 - Edit the `silent_Upgrade.properties` file and set the following parameters:
 - `LICENSE_ACCEPTED=true`
 - `CHOSEN_INSTALL_TYPE="Upgrade"`
 - d. On AIX® or Linux® operating systems, source the user profile (`db2profile`) for the instance owner of the Db2 database.
For example:

```
. /home/db2inst1/sqllib/db2profile
```

- e. Run the silent mode installation program on Server A.
 - For Windows operating systems, run the following command:

```
setup.bat -l language -i silent -f absolute_path_to_response_file
```

where *language* can be one of the following values:

- Czech - cs
- English - en
- French - fr
- German - de
- Hungarian - hu
- Italian - it
- Japanese - ja
- Korean - ko
- Polish - pl
- Brazilian Portuguese - pt_BR
- Russian - ru
- Spanish - es
- Chinese (Simplified) - zh_CN
- Chinese (Traditional) - zh_TW

`absolute_path_to_response_file` is the absolute path to the response file. For example, the following command specifies the language and the path:

```
setup.bat -l fr -i silent -f  
c:\SpectrumControl\silent_Upgrade.properties
```

- For AIX or Linux operating systems, run the following command:

```
./setup.bin -l language -i silent -f /absolute_path_to_response_file
```

For example, the following command specifies the language and the path:

```
./setup.bin -l de -i silent -f /SpectrumControl/silent_Upgrade.properties
```

If you do not specify a language or if the language is not specified correctly, the installation program uses the English language as the default.

- f. Optional: Monitor the progress of the upgrade on Server A.
 - To view the progress of the silent mode installation on Windows operating systems, check the trace log in the following path:

```
installation_dir\logs\traceTPCInstall.log
```

- To view the progress of the silent mode installation on AIX or Linux operating systems, check the trace log in the following path:

```
installation_dir/logs/traceTPCInstall.log
```

3. Complete the following steps on Server B:
 - a. Log on to Server B with the appropriate user privileges.
 - b. Edit and save the appropriate response file on Server B.
 - Edit the `silent_Upgrade.properties` file and set the following parameters:
 - `LICENSE_ACCEPTED=true`
 - `CHOSEN_INSTALL_TYPE="Upgrade"`
 - c. Run the silent mode installation program on Server B.
 - For Windows operating systems, run the following command:

```
setup.bat -l language -i silent -f absolute_path_to_response_file
```

where *language* can be one of the following values:

- Czech - cs
- English - en
- French - fr
- German - de
- Hungarian - hu
- Italian - it
- Japanese - ja
- Korean - ko
- Polish - pl
- Brazilian Portuguese - pt_BR
- Russian - ru
- Spanish - es
- Chinese (Simplified) - zh_CN
- Chinese (Traditional) - zh_TW

absolute_path_to_response_file is the absolute path to the response file. For example, the following command specifies the language and the path:

```
setup.bat -l fr -i silent -f  
c:\SpectrumControl\silent_Upgrade.properties.properties
```

- For AIX or Linux operating systems, run the following command:

```
./setup.bin -l language -i silent -f /absolute_path_to_response_file
```

For example, the following command specifies the language and the path:

```
./setup.bin -l de -i silent -f /SpectrumControl/silent_Upgrade.properties
```

If you do not specify a language or if the language is not specified correctly, the installation program uses the English language as the default.

- d. Monitor the progress of the upgrade on Server B.

- To view the progress of the silent mode installation on Windows operating systems, check the trace log in the following path:

```
installation_dir\logs\traceTPCInstall.log
```

- To view the progress of the silent mode installation on AIX or Linux operating systems, check the trace log in the following path:

```
installation_dir/logs/traceTPCInstall.log
```

Upgrading Storage Resource agents

Upgrade Storage Resource agents to ensure that they are at the same release level as the IBM Spectrum® Control server.

About this task

When you apply maintenance to IBM Spectrum Control, you can upgrade Storage Resource agents immediately or at a later time. To ensure that all your agents are at the current release level and to manage your network load, schedule upgrades regularly.

If a Storage Resource agent is not at the same level as the IBM Spectrum Control server, the following limitations occur:

- New functions in the current release might not be available for the resources that are monitored by the agent.
- Problem fixes are not applied to the agent.

You can upgrade Storage Resource agents by using the following methods:

- Use the Modify Agents > Upgrade action on the Servers page in the GUI.
- Use a Storage Resource agent command.

Procedure

To determine if a Storage Resource agent must be upgraded, complete the following steps:

1. In the menu bar, go to Servers > Servers.
2. View the values in the Agent State column.
If the state of the agent is Upgraded needed, the Storage Resource agent for the related server must be upgraded.

- [Starting agent upgrades](#)
Upgrade a Storage Resource agent to the same release level as the IBM Spectrum Control server.
- [Scheduling agent upgrades](#)
Schedule the upgrade process for a Storage Resource agent.
- [Upgrading Storage Resource agents by using a command](#)
You can manually upgrade Storage Resource agents.

Starting agent upgrades

Upgrade a Storage Resource agent to the same release level as the IBM Spectrum® Control server.

About this task

The ability to start the upgrade process for a Storage Resource agent is available when the following conditions are met:

- A Storage Resource agent must be deployed on the server that you want IBM Spectrum Control to monitor.
- An agent upgrade is not currently running for the server.
- The version of the agent that is deployed on the server is earlier than the IBM Spectrum Control server version.

Procedure

To upgrade a Storage Resource agent that was not upgraded at maintenance time, complete the following steps:

1. In the menu bar, go to Servers, > Servers.
2. On the Servers page, right-click the server that contains the Storage Resource agent to upgrade and select Modify Agents, > Upgrade.
3. Select Immediate from the Agent Upgrade list on the Upgrade Agent window.
4. Click Upgrade to start the upgrade process.

Scheduling agent upgrades

Schedule the upgrade process for a Storage Resource agent.

About this task

You can schedule the upgrade process for a Storage Resource agent when the following conditions are met:

- A Storage Resource agent must be deployed on the server that you want IBM Spectrum® Control to monitor.
- An agent upgrade is not currently running for the server.
- The version of the agent that is deployed on the server is earlier than the IBM Spectrum Control server version.

Tips:

- To manage the workload for a server and the network, schedule the agent upgrade for a time when the server and network are not busy.
- The scheduled time for an agent upgrade is based on the time zone of the IBM Spectrum Control server, not the time zone of the server where the Storage Resource agent is installed. For example, if an agent is installed on a server in the Central (CST) time zone, but the IBM Spectrum Control server is in the Pacific (PST) time zone, the time that is shown in the GUI when you schedule the upgrade is PST.

Procedure

To schedule the upgrade of a Storage Resource agent that was not upgraded at maintenance time, complete the following steps:

1. In the menu bar, go to Servers, > Servers.
2. On the Servers page, right-click the server that contains the Storage Resource agent to upgrade and select Modify Agents, > Upgrade.
3. Select Scheduled from the Agent Upgrade list on the Upgrade Agent window.
4. Select the date and time and click Upgrade to schedule the agent upgrade.

Upgrading Storage Resource agents by using a command

You can manually upgrade Storage Resource agents.

About this task

To manually upgrade the Storage Resource agent, complete the following steps:

Procedure

1. Go to the DVD location of the installation program (by using the **Storage Resource Agent** image) and go to the **bin** directory:

```
cd DVD_image_location/data/sra/operating_system_name
```

Where *DVD_image_location* is the location of the installation image for the Storage Resource agent.

2. Run the upgrade command:

```
bin/Agent -upgrade -installLoc agent_install_directory ->
- commType Daemon ->
1
```

Notes:

- 1 Parameter when the agent is run as a daemon service.

The parameters are:

-installLoc "*agent_install_directory*"

Location where the agent is installed. Enclose the directory name in quotation marks, for example, "C:\Program Files\IBM\TPC_SRA\".

-commType Daemon

If the agent is run as a daemon service, then this parameter must be specified.

Here is an example for a daemon-based service by using the default location:

```
bin/Agent -upgrade
-installLoc "/opt/IBM/TPC/"
-commType Daemon
```

Here is an example for a non-daemon service by using a non-default location:

```
bin/Agent
-upgrade -installLoc "C:\Program Files\IBM\TPC_SRA\"
```

Tip: If you run the upgrade program outside of the *DVD_image_location* installation directory, then you must specify the full path.

If the upgrade fails, see the return codes in [Return codes used by Storage Resource agent](#).

Upgrading SMI-S providers for storage systems

Before you upgrade an SMI-S provider (also called the CIM agent or CIMOM agent), ensure that IBM Spectrum® Control supports the SMI-S provider that you want and that the provider is compatible with the firmware versions of your storage systems.

To ensure that an SMI-S provider is supported, review the supported products list for the current release of IBM Spectrum Control. For more information about the products that are supported by IBM Spectrum Control 5.3.0 or later, see <https://www.ibm.com/support/pages/node/388393>. Under Storage, click the link for the appropriate release. If you are uncertain about the SMI-S provider support, contact IBM® customer support to help you with your upgrade plans.

- [Upgrading CIM agents](#)

To upgrade a Common Information Model (CIM) agent, you must have the upgrade instructions that are supplied by the provider of the agent.

Upgrading CIM agents

To upgrade a Common Information Model (CIM) agent, you must have the upgrade instructions that are supplied by the provider of the agent.

Procedure

To upgrade the CIM agent, follow these steps:

1. Stop all IBM Spectrum® Control server activity that might be dependent on the CIM agent (for example, performance monitor jobs, and discovery or probe jobs).
2. Stop the IBM Spectrum Control server services.
3. If any IBM Spectrum Control server processes remain, shut down the IBM Spectrum Control server for the duration of the CIM agent upgrade. If it is not possible to shut down the IBM Spectrum Control server, stop or kill the running processes.
4. Upgrade the CIM agent.
 - a. Refer to the instructions supplied by the CIM agent to perform the upgrade.
 - b. Verify that the CIM agent configuration is intact after the upgrade. Make sure that user accounts and passwords used with IBM Spectrum Control are still in place, and that all devices managed by the CIM agent are still listed.
5. Restart the IBM Spectrum Control server and IBM Spectrum Control server services.
6. Open the IBM Spectrum Control GUI.
7. Run a CIM object manager (CIMOM) discovery job.
8. Run a probe job for each storage system that is managed by the CIM agent.

Migrating alert definitions to alert policies

When you upgrade to IBM Spectrum® Control 5.3.2 or later, all of your monitored resources retain their existing alert definitions and are not included in an alert policy. However, at any time, you can place resources into an alert policy or create a policy based on a resource.

Use alert policies to manage the alert definitions and notification settings that apply to different sets of resources. Here are some reasons to place resources in an alert policy:

- You want to manage alert conditions and notification settings for a group of resources of the same type. For example, if you have several SAN Volume Controller storage systems in your environment, you can create an alert policy so that the alert definitions are the same for all of the SAN Volume Controller systems. Note that alert policies manage one type of resource only.
- You want to use one alert policy for the storage systems in your test environment, and another for the storage systems in your production environment.

Tips:

- Alert policies manage one type of resource only.
- A resource can be managed by only one alert policy.
- If a resource is managed by a policy, the resource cannot have alert definitions and notification settings that are independent of the policy. The alert definitions and notification settings that apply to the resource come from the policy.

It is not a requirement for resources to be managed by an alert policy. You can define alert conditions and notification settings for individual resources.

You can also define alerts and notification settings for applications and general groups to manage alerts for groups of resource components such as volumes or pools.

Migrating alert definitions from resources to alert policies

If you want to create a new alert policy that uses the alert definitions from one of your resources, complete the following steps:

1. Go to the details page for the resource from which you want to create the policy. For example, to create an alert policy from a FlashSystem 9100, click [Storage > Block Storage Systems](#).
2. Right-click the resource, then click View Alert Definitions.
3. Click Create Policy from the Policy Actions menu.
4. Type a name for the policy.
5. Make sure that the Use alert definitions and notification settings from *resource_name* option is selected.
6. Select any other resources that you want to add to the policy from the table of resources. Alert definitions in the policy are automatically applied to the resources you select. You can also choose to add resources later.

Scenario: Changing from LDAP and Local OS authentication to only LDAP or Local OS authentication after an upgrade

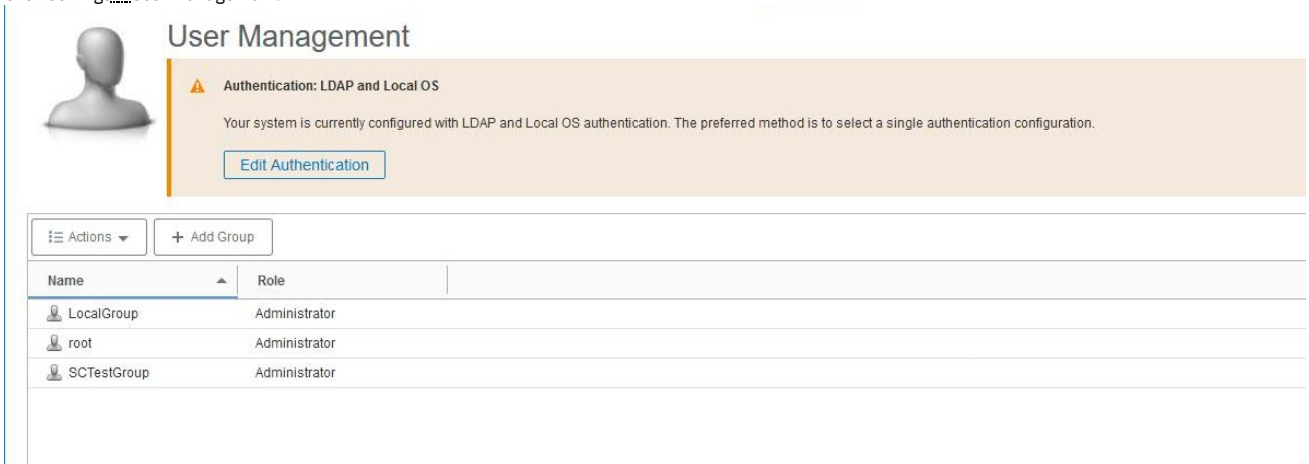

In this scenario, you change from LDAP and Local OS authentication to only LDAP or Local OS authentication.

About this task

You were running an earlier version of IBM Spectrum® Control with both LDAP and Local OS authentication configured. You upgraded to the latest version of IBM Spectrum Control. The preferred method of authentication is to select either LDAP or Local OS authentication.

Procedure

1. Back up the ldapregistry.xml file in the *installation_dir\wlp\usr\servers\webServer\registry* directory.
2. Log on as an administrator to the IBM Spectrum Control GUI.
3. Click [Settings > User Management](#).

4. Click Edit Authentication.
 - a. On the Authentication Configuration page, uncheck LDAP, if you want to change from LDAP and Local OS authentication to *only* Local OS authentication, and click Save.
 - b. On the Authentication Configuration page, uncheck Local OS, if you want to change from LDAP and Local OS authentication to *only* LDAP authentication and you do not want to alter your LDAP settings, and click Save.
 - c. On the Authentication Configuration page, uncheck Local OS, if you want to change from LDAP and Local OS authentication to *only* LDAP authentication and you do want to alter your LDAP settings, then start with Step 6 in [Changing from operating system to LDAP authentication](#)

Configuring

After IBM Spectrum Control is installed, you can configure it according to the standards and requirements of your storage environment.

- [Starting IBM Spectrum Control](#)
You can start IBM Spectrum Control by opening a web browser and entering a web address for the IBM Spectrum Control logon page. For example, you might enter

<https://storage.example.com:9569/srm>.

- [Configuring history and data retention](#)
Specify how long to retain the data that is collected about resources and the log files that are generated by IBM Spectrum Control. By specifying the number of weeks for history retention, you can control the amount of data that is retained and available for historical analysis and charting. The longer that you retain data, the more informative your analysis, but the more storage space that is required to store that data.
- [Configuring user authentication](#)
When IBM Spectrum Control is installed, default repositories are created, which allow you to control user access to the product.
- [Adding customized text to the logon page](#)
On the logon page for IBM Spectrum Control, you can show customized text when users access the GUI.
- [Managing a SAN without agents](#)
You can manage a SAN when there are no agents.
- [Setting timeout values for the Device server](#)
If a probe or discovery of a storage subsystem times out before the operation completes, you can increase the timeout values for the Device server.
- [Configuring Service Location Protocol](#)
You can enable IBM Spectrum Control to discover a larger set of storage devices through Service Location Protocol (SLP). In addition to some of the more common SLP configuration issues, there is also information about router configuration, SLP directory agent configuration, and environment configuration.
- [Configuring IP addressing](#)
This section provides information about configuring IP addressing.
- [Deploying Storage Resource agents](#)
You can manage your Storage Resource agent deployments.
- [Configuration guidelines for 500 or more agents](#)
You can use this information to help you manage 500 or more Storage Resource agents in IBM Spectrum Control.
- [Including a Storage Resource agent with a server golden image](#)
If you use a golden operating system image to deploy new servers in your environment, you can include the Storage Resource agent on that golden image. The golden image enables the agents to start and register with the IBM Spectrum Control server automatically upon deployment. This support applies only to Storage Resource agents running in daemon mode.
- [Checking for a fully qualified host name](#)
IBM Spectrum Control requires fully qualified host names. Some machines might be configured to return a short host name, such as system1 instead of a fully qualified host name, such as system1.tpc.example.com. This topic provides information on how to check for a fully qualified host name.
- [Granting local administrative privileges to a domain account](#)
Automatically grant administrative privileges to Windows domain accounts. The user account for the Storage Resource agent requires local administrative rights. Because these rights are not necessarily guaranteed for domain users in a Windows domain environment, you are shown how to grant local administrative rights to domain users. Using this procedure, you do not have to manually process each machine in the domain.
- [Importing authentication information for a Storage Resource agent](#)
The Storage Resource agent is installed as a non-daemon or daemon process. IBM Spectrum Control stores the authentication information to connect to the host on which the Storage Resource agent has installed for the non-daemon agent. This authentication information can be changed depending on the environment.
- [Installing and configuring the IBM Spectrum Control server with multiple NIC cards](#)
If your IBM Spectrum Control server has multiple network interface cards (NIC), install the IBM Spectrum Control server using a fully qualified hostname that resolves to the IP address of NIC card you want to use. After you install the server, all incoming and outgoing communication are successfully handled.
- [Replacing the default SSL certificate for the Device, Alert, or Web server with a self-signed certificate](#)
To replace the default SSL certificate for the Device, Alert, or Web server, with a self signed certificate, use the IBM® Key Management (iKeyman) utility.
- [Replacing the default SSL certificate for the Device, Alert, or Web server with a certificate from an external certificate authority](#)
To replace the default SSL certificate for the Device, Alert, or Web server, with a certificate from an external certificate authority, use the IBM Key Management (iKeyman) utility.
- [Replacing the default SSL certificate for the Export server](#)
You can replace the default SSL certificate for the Export server by adding the certificate and private key file to the appropriate directory and restarting the Export server.
- [Generating a new default self-signed SSL certificate for the Export server](#)
You can generate a new, default self-signed SSL certificate for the Export server by using the **openssl** command.
- [Enabling TLS 1.0 and 1.1 for ports](#)
IBM Spectrum Control uses Transport Layer Security (TLS) to secure communications between IBM Spectrum Control components.
- [Configuring Db2, AIX, and Linux for IPv6-only environment](#)
Use this information to configure Db2®, AIX®, and Linux® for an IPv6-only environment.

Starting IBM Spectrum Control

You can start IBM Spectrum® Control by opening a web browser and entering a web address for the IBM Spectrum Control logon page. For example, you might enter <https://storage.example.com:9569/srm>.

Before you begin

Before you start IBM Spectrum Control, ensure that you are using a supported web browser. For a list of web browsers that you can use with IBM Spectrum Control, see [IBM Spectrum Control - Platform Support: Servers, Agents, and Browsers - Web Browsers](#).

About this task

Start the IBM Spectrum Control GUI to administer and monitor the condition, capacity, and relationships of the resources within your storage environment.

Procedure

1. On a server running the Windows operating system, start IBM Spectrum Control GUI. For information about how to start the GUI on Windows operating systems, see [Opening IBM Spectrum Control GUIs and CLIs](#). If you are not on a server running the Windows operating system, start a web browser and enter the following address in the address field:

https://host_name:port/srm

In the preceding address, specify the following values:

host_name

The IBM Spectrum Control server. You can specify the host name as an IP address or a Domain Name System (DNS) name.

port

The port number for IBM Spectrum Control. The default port number for connecting to IBM Spectrum Control by using the HTTPS protocol is 9569. However, this port number might be different for your site. For example, the port number might be different if the default port range was not accepted during installation. If the default port number does not work, ask your IBM Spectrum Control administrator for the correct port number.

Tip: If you have a non-default port, check the value of the `WC_defaulthost_secure` property in `installation_dir/web/conf/portdef.props` file.

2. From the IBM Spectrum Control logon page, type your user name and password and click **Log in**.

The GUI opens in the browser.

Tip: If you want to log on to the GUI with Windows Domain credentials, use this form: `domain_name\user`.

Configuring history and data retention

Specify how long to retain the data that is collected about resources and the log files that are generated by IBM Spectrum® Control. By specifying the number of weeks for history retention, you can control the amount of data that is retained and available for historical analysis and charting. The longer that you retain data, the more informative your analysis, but the more storage space that is required to store that data.

About this task

Data that IBM Spectrum Control collects about a storage environment is stored in a DB2® database repository. The amount of data that is retained about resources can grow over time, and thus require more storage space for the repository. You can use the History Retention page to modify the data retention settings according to the monitoring and storage requirements of your environment. You must be assigned the Administrator role to modify data retention settings.

Procedure

1. In the menu bar, go to Settings > History Retention.
2. Click Edit to modify the following data retention settings:

Capacity history

Specify how long to retain a history of the capacity data that is collected about monitored resources. This value determines the amount of capacity data that is retained and available for historical analysis and charting. The longer that you retain data, the more informative your analysis, but the more storage space that is required.

Daily

Specify how long to retain capacity data that is collected daily about resources. You can retain daily data for up to 72 weeks and a minimum of 2 weeks.

Weekly

Specify how long to retain capacity data that is aggregated weekly for monitored resources. You can retain weekly aggregates for up to 96 weeks and a minimum of 4 weeks.

Monthly

Specify how long to retain capacity data that is aggregated monthly for monitored resources. You can retain monthly aggregates for up to 48 months and a minimum of 2 months.

Performance data

Specify how long to retain data that is collected by performance monitors.

Sample

Specify how long to retain sample data that is collected by performance monitors. Sample data represents the data that is collected each time a performance monitor is run. Because sample data is collected frequently, retaining that data can require significant disk space in the database repository. The required disk space is determined by the types of switches, storage systems, and number of volumes that are being monitored. You can retain sample data for up to 12 weeks.

Hourly

Specify how long to retain hourly data that is collected by performance monitors. You can retain hourly data for up to 24 weeks.

Daily

Specify how long to retain daily data that is collected by performance monitors. You can retain daily data for up to 156 weeks.

Consolidating performance data: Performance data is collected at intervals. An interval represents the number of minutes over which samples of performance data are averaged. When performance history is retained, data that is collected at certain intervals is automatically consolidated, or rolled up, to higher intervals. For example, data collected at 1-minute intervals is consolidated into 5-minute data; data collected at 5-minute intervals is consolidated into 1-hour data; and so on.

Tip: If performance data is collected at 1-minute intervals, the amount of data that is stored in the database repository increases significantly. The product stores only 7 days of sample data that is collected at 1-minute intervals.

Data for missing resources

Specify how long to retain data about internal resources that are no longer detected by IBM Spectrum Control. You can retain the data of removed resources for up to 52 weeks.

If the internal resource of a top-level resource is not detected when that top-level resource is probed, data about the resource is removed when the time limit is reached. The internal resource is removed only from the top-level resource that is probed. For example, if two weeks are specified, the data for a pool that is missing from a storage system for more than two weeks will be removed.

Only internal resources are automatically removed according to this setting. Storage systems, servers, hypervisors, switches, and fabrics must be removed manually.

Alert logs

Specify how long to retain alerts. An entry is generated each time that an alert condition is detected on a resource. Any alert that is older than this value is deleted. You can retain alerts for up to 12 weeks.

Job logs

Specify the maximum number of logs that are retained for data collection jobs. A log file is created each time that a job is run. When this number is reached, the entry for the oldest log is deleted. For example, if you accept the default value 5, and then run a probe 6 times, the log file for the first run is deleted. You can retain up to 20 logs for a job.

3. Click Save to apply the retention settings.
4. Optional: Click Restore Defaults to restore the retention settings to their default values.

Configuring user authentication

When IBM Spectrum® Control is installed, default repositories are created, which allow you to control user access to the product.

In the federated repositories framework, the following repositories are created:

File-based user repository

This repository contains the **tpcFileRegistryUser** user ID. This user password is the same as the Common User password that was entered during the IBM Spectrum Control installation.

When you use the password tools to change the IBM Spectrum Control passwords, the tpcFileRegistryUser user password gets changed so that it continues matching the Common User password.

If you encounter problems accessing IBM Spectrum Control using local operating system or LDAP credentials, you can log on to IBM Spectrum Control using the **tpcFileRegistryUser** user ID which is not affected by authentication configuration changes.

Operating system repository

In the federated repositories framework, the IBM Spectrum Control installation program creates two repositories on the IBM Spectrum Control web server. This server, which is in the installation_dir/wlp/usr/servers/webServer directory, is used as the primary WebSphere® Application Server Liberty server for user authentication in IBM Spectrum Control.

The Device server also runs on WebSphere Application Server Liberty, and it is only configured with the File-based user repository. If the web server is down, the Device server is used as the backup server to perform the user authentication and allows the common user name that was provided during IBM Spectrum Control installation and the **tpcFileRegistryUser** user ID to log on to IBM Spectrum Control.

You can add an LDAP repository and disable the operating system repository after you install IBM Spectrum Control; this configuration is completed in IBM Spectrum Control. The LDAP repository configuration settings are not propagated to the Device server. Therefore, if the web server is not running, the authorized LDAP users cannot log in to IBM Spectrum Control. The backup user authentication mechanism that is based on Device server allows the common user name that was entered during the IBM Spectrum Control installation, and the **tpcFileRegistryUser** user ID to be used to log on to IBM Spectrum Control.

If the computer is correctly configured with the Windows domain, the operating system repository also contains the domain users and groups that are managed by the Windows domain.

IBM Spectrum Control integrates with third party modules on the Linux® and AIX® operating systems for local user authentication. IBM Spectrum Control only supports the default module configuration settings with the AIX or Linux operating systems. The customization of configuration settings or using additional modules is not supported by IBM Spectrum Control.

The LDAP repositories that are supported by IBM Spectrum Control depend on WebSphere Application Server Liberty support. For more information, about the LDAP repositories that are supported, see <http://www.ibm.com/support/docview.wss?uid=swg27036471>.

WebSphere Application Server Liberty cannot resolve users or groups that are present in more than one repository in the federated repositories framework. Because of this limitation, you must select either the operating system repository or the LDAP repository for user authentication and authorization in IBM Spectrum Control. If you upgraded from an earlier version of IBM Spectrum Control with both the operating system repository and an LDAP repository configured, you can keep using both repositories. However, it is recommended that you select either the operating system repository or the LDAP repository.

The following table shows which user repositories are checked for IBM Spectrum Control authentication configurations when accessing IBM Spectrum Control using the IBM Spectrum Control GUI, the CLI, or the REST API:

Table 1. Authentication configurations and associated user repositories

Authentication configuration	User repositories checked
Local OS (default configuration)	Local operating system repository and file-based user repository
LDAP	LDAP repository and file-based user repository
LDAP and Local OS	Local operating system repository, LDAP repository, and file-based user repository

- **Authorizing users**
After IBM Spectrum Control is installed, you can assign roles to the user groups that are contained in the authentication repository. Roles determine the functions that are available to the users that are in a group.
- **Managing authentication**
The IBM Spectrum Control installation program establishes a default authentication configuration using the federated repositories feature of the WebSphere Application Server Liberty. You can configure and manage IBM Spectrum Control for LDAP authentication as a post-installation activity.

Authorizing users

After IBM Spectrum® Control is installed, you can assign roles to the user groups that are contained in the authentication repository. Roles determine the functions that are available to the users that are in a group.

About this task

The authentication repository can be an operating system repository or a Lightweight Directory Access Protocol (LDAP) repository. When IBM Spectrum Control is installed, the following user and groups are automatically configured for authentication to the product:

- User: tpcFileRegistryUser

- Windows group: Administrators group
- UNIX and Linux® group: root
- AIX® group: system

There are three IBM Spectrum Control roles that you can assign to user groups:

- Administrator (the Administrator, root, and system groups are automatically assigned to this role)
- Monitor
- External Application

Each role provides access to a specific set of functions. For more information about the functions that are available in each role, see [Role-based authorization](#).

- **[Role-based authorization](#)**
Roles determine the functions that are available to users of IBM Spectrum Control. When a user ID is authenticated to IBM Spectrum Control through the GUI, CLI, or APIs, membership in an operating system or LDAP group determines the authorization level of the user.
- **[Assigning a role to a group](#)**
Assign an IBM Spectrum Control role to one or more user groups. The role that is assigned to a group determines the product functions that are available to the users in that group.
- **[Determining the groups to which a user belongs](#)**
You can determine the groups to which a user belongs to and ensure that the user is in a group or groups that are assigned the correct IBM Spectrum Control role.
- **[Modifying the authentication mechanism](#)**
To modify how IBM Spectrum Control authenticates users and user groups, configure the authentication repository.
- **[Actions that are available based on role](#)**
Your IBM Spectrum Control role and product license determine the actions that are available in the product.

Role-based authorization

Roles determine the functions that are available to users of IBM Spectrum® Control. When a user ID is authenticated to IBM Spectrum Control through the GUI, CLI, or APIs, membership in an operating system or LDAP group determines the authorization level of the user.

The following table shows the IBM Spectrum Control roles and their authorization levels:

Table 1. IBM Spectrum Control roles and authorization levels

Roles	Authorization level
Administrator	<p>This role has full access to all monitoring and administrative functions. At least one group must have the Administrator role.</p> <p>Note: When IBM Spectrum Control is first installed, the following operating system groups are assigned the Administrator role:</p> <ul style="list-style-type: none"> • Windows: Administrators • UNIX and Linux®: root • AIX®: system
Monitor	<p>This role has access to the following read-only functions:</p> <ul style="list-style-type: none"> • Viewing and exporting information about monitored resources • Viewing, acknowledging, and removing alerts • Viewing tasks and data collection jobs • Opening management GUIs • Opening logs • Viewing chargeback, consumer, predefined capacity and inventory, and custom reports <p>Exception: Users with the Monitor role can provision storage if they are granted permission in a service class. A service class is a logical entity that describes storage capabilities and characteristics and can be used to specify requirements for storage provisioning. For more information about service classes, see Creating service classes.</p>
External Application	<p>If you assign the External Application role to the user, you must also assign one or more service classes to the user.</p> <p>This role does not enable users to log in to the IBM Spectrum Control GUI.</p>

Tips:

- To determine the role of the user who is logged in, click the user icon  in the upper-right corner of any page in the GUI.
- If a user belongs to multiple groups and the groups have different roles, the role with the highest level of authorization is granted to the user. For example, if a user belongs to a group that is assigned the Administrator role and also belongs to a group that is assigned a Monitor role, the user is granted the authorization of the Administrator role.
- If a user is not a member of a group that is assigned a IBM Spectrum Control role, no access is granted to that user.
- If assigned the Monitor role, a user can only open and view logs from the Data Collection page for the selected resource.

Nested groups are not supported: Adding active directory or any other type of domain user group to a local operating system group is not supported in IBM Spectrum Control. You can configure IBM Spectrum Control to authenticate domain IDs that rely on the operating system to perform the authentication operation against the active directory, but it cannot resolve nested groups.

Alternatively, you can configure LDAP authentication to perform queries against active directory user repositories and assign domain groups directly to roles within IBM Spectrum Control.

Assigning a role to a group

Assign an IBM Spectrum® Control role to one or more user groups. The role that is assigned to a group determines the product functions that are available to the users in that group.

About this task

If you are using LDAP authentication and you are using Microsoft Active Directory as your LDAP repository, do not assign the Active Directory Primary group for a user to an IBM Spectrum Control role. IBM Spectrum Control cannot identify user membership in a Primary group. Assign an IBM Spectrum Control role to a group that is not the Primary group for the user.

To assign a role to a group, complete the following steps:

Procedure

1. In the menu bar in the web-based GUI, go to Settings > User Management.
2. Click Add Group to search for groups that are defined in the authentication repository.
You can type the name of a group if you know its name, or specify a filter to search for existing groups in the authentication repository. For filters, use an asterisk (*) to represent unknown characters. You must enter at least one character in addition to an *.
For example, type `tpc*` to search for groups that begin with the letters "tpc" or "TPC". Type `*t` to search for groups that begin with or contain the letter "t" or "T".
3. In the list of groups, select one or more groups to which you want to assign a role.
4. In the Role field, select the role to assign to the group.
5. Click OK to assign the role.
The role that you select is applied to all the groups that you are adding. You can change the role assignments at any time after the group is added.

Determining the groups to which a user belongs

You can determine the groups to which a user belongs to and ensure that the user is in a group or groups that are assigned the correct IBM Spectrum® Control role.

About this task

Use a command prompt to find the groups to which a user belongs.

Procedure

To determine the groups to which a user belongs, complete the following steps depending on your operating system:

1. Log on to the computer where the IBM Spectrum Control servers are installed, open a command prompt, and enter:

Option	Description
Windows standalone operating system	<code>net user <username></code>
Windows Domain	<code>net user <username> /DOMAIN</code>
Linux® and AIX® operating system	<code>groups <username></code>
LDAP	See your LDAP administrator for more information.

2. Verify that the user is in a group or groups that are assigned the correct IBM Spectrum Control role.

Modifying the authentication mechanism

To modify how IBM Spectrum® Control authenticates users and user groups, configure the authentication repository.

Before you begin

You must be assigned the Administrator role to modify the authentication repository and manage role and group assignments.

About this task

The authentication mechanism determines how IBM Spectrum Control authenticates users and the user groups that are available for assigned roles. During the installation process, the WebSphere® Application Server Liberty is configured with federated repositories. By default, authentication is configured to use the federated repositories, which contain a file repository and an operating system repository. The operating system repository includes the operating system users and groups that are defined on the server where IBM Spectrum Control is installed. For a server that is a member of a Windows domain, the operating system repository also includes the users and groups that are defined in that domain.

Important: WebSphere Application Server Liberty cannot resolve users or groups that are present in more than one repository in the federated repositories framework. Because of this limitation, you must select either the operating system repository or the LDAP repository for user authentication and authorization in IBM Spectrum Control. If you upgraded from an earlier version of IBM Spectrum Control with both the operating system repository and an LDAP repository configured, you can keep using both repositories. However, it is recommended that you select either the operating system repository or the LDAP repository.

Procedure

To modify your authentication, complete the following steps:

1. In the menu bar, go to Settings > User Management.
2. On the User Management page, click Edit Authentication.
The Authentication Configuration page is displayed.
3. Make your modifications.

Actions that are available based on role

Your IBM Spectrum® Control role and product license determine the actions that are available in the product.

Users who are assigned the Administrator role or the Monitor role can use product functions. The actions that are available for each function depend on the role that is assigned to the user:

Administrator role

Users who are assigned the Administrator role have access to all monitoring and administrative actions.

Monitor role

Users who are assigned the Monitor role can view information about monitored resources and other objects such as tasks, alerts, and service classes. They can acknowledge alerts and resource statuses, open logs, and open management GUIs.

The following table outlines the actions that are available only for the Administrators role. All other actions are available to the Monitor and Administrator roles. In addition to the restrictions listed in this table, users who are assigned the Monitor role do not have access to user management functions.

Table 1. Product actions that are available only to users with the Administrator role

Function	Actions that require the Administrator role
Single dashboard view of the storage environment that you can use to manage storage systems, hypervisors, servers, and Fibre Channel fabrics.	<ul style="list-style-type: none">• Adding and removing resources• Administering connections• Scheduling data collection• Changing and viewing the automated probe schedule• Viewing and editing history retention settings• Modifying license settings
Performance monitoring for storage systems and Fibre Channel networks.	<ul style="list-style-type: none">• Scheduling performance monitors• Starting or stopping performance monitors
Capacity and usage monitoring of resources.	<ul style="list-style-type: none">• Scheduling probes• Starting or stopping probes• Modifying Storage Resource agents• Enabling automatic zoning
Health and alerting for hypervisors, networks, servers, and storage systems.	<ul style="list-style-type: none">• Creating, modifying, and deleting alert policies• Setting which alert policy manages a resource• Adding and modifying resources for management by an alert policy• Defining and modifying alert definitions• Editing alert notification settings

Function	Actions that require the Administrator role
Capacity and performance of the storage that applications, departments, and general groups use.	<ul style="list-style-type: none"> • Creating applications, departments, and general groups • Creating, modifying, and removing filters to add resources to applications • Adding and removing resources in applications and general groups, directly • Adding applications as members of other applications • Adding departments to other departments • Adding applications to departments
Storage reclamation	Viewing volumes that can be reclaimed
Roll-up reporting, in which capacity data is combined from multiple instances of IBM Spectrum Control for reporting purposes.	<ul style="list-style-type: none"> • Adding and removing subordinate servers • Starting a probe for a subordinate server • Modifying the connection information for a subordinate server
Predefined Reports <ul style="list-style-type: none"> • Predefined capacity reports allow users to quickly create reports about capacity anomalies and shortfalls, which can be scheduled and sent by email or saved to the user's file system, or both. • Predefined inventory reports allow users to quickly create reports about their storage resources, which can be scheduled and sent by email or saved to the user's file system, or both. 	<ul style="list-style-type: none"> • Creating, deleting, and editing reports • Configuring the email server • Emailing reports • Saving reports to the file system
Custom reports From any table view in the GUI, custom reports can be created, which can be scheduled and sent by email or saved to the user's file system, or both, about capacity of storage resources, the configuration and attributes of storage resources, and the performance of storage resources.	<ul style="list-style-type: none"> • Creating, deleting, and editing reports • Configuring the email server • Emailing reports • Saving reports to the file system
Chargeback and consumer reports <ul style="list-style-type: none"> • Chargeback reports show the capacity and the cost of the storage that is used by applications, departments, hypervisors, and physical servers. • Consumer reports show the capacity and the cost of the block storage that is used by an application, department, hypervisor, and physical server. 	<ul style="list-style-type: none"> • Creating, deleting, and editing reports • Configuring the email server • Emailing reports
Capacity limits for block storage systems and pools If your company has a policy to set a limit on the capacity that is used, you can set a capacity limit. When the capacity limit is set, you can then monitor the amount of capacity that is available before the capacity limit is reached.	<ul style="list-style-type: none"> • Setting capacity limits • Defining alerts for capacity limits • Removing capacity limits

Managing authentication

The IBM Spectrum® Control installation program establishes a default authentication configuration using the federated repositories feature of the WebSphere® Application Server Liberty. You can configure and manage IBM Spectrum Control for LDAP authentication as a post-installation activity.

Important: WebSphere Application Server Liberty cannot resolve users or groups that are present in more than one repository in the federated repositories framework. Because of this limitation, you must select either the operating system repository or the LDAP repository for user authentication and authorization in IBM Spectrum Control. If you upgraded from an earlier version of IBM Spectrum Control with both the operating system repository and an LDAP repository configured, you can keep using both repositories. However, it is recommended that you select either the operating system repository or the LDAP repository.

- [Changing from operating system to LDAP authentication](#)
You can configure IBM Spectrum Control to communicate with an external LDAP repository. For example, IBM® Tivoli® Directory Server or Microsoft Active Directory. This makes IBM Spectrum Control available to a larger set of users and groups. You are able to log in to IBM Spectrum Control with one set of credentials.
- [Changing from LDAP to operating system authentication](#)
To change from LDAP authentication to operating system authentication in IBM Spectrum Control, you can use the IBM Spectrum Control GUI.
- [Configuring user authentication alternatives](#)
If you encounter any issues with the recommended procedures for configuring user authentication, see the following topics for support.
- [Using the `ldapEntityType` element for advanced LDAP configuration](#)
To narrow the IBM Spectrum Control view of your LDAP structure so that you can find and map your groups to IBM Spectrum Control roles, you need to configure the `ldapEntityType` element within the `ldapRegistry` element.

Changing from operating system to LDAP authentication

You can configure IBM Spectrum® Control to communicate with an external LDAP repository. For example, IBM® Tivoli® Directory Server or Microsoft Active Directory. This makes IBM Spectrum Control available to a larger set of users and groups. You are able to log in to IBM Spectrum Control with one set of credentials.

Before you begin

When you change the authentication configuration, IBM Spectrum Control is available to users and groups in other repositories.

Important: WebSphere® Application Server Liberty cannot resolve users or groups that are present in more than one repository in the federated repositories framework. Because of this limitation, you must select either the operating system repository or the LDAP repository for user authentication and authorization in IBM Spectrum Control. If you upgraded from an earlier version of IBM Spectrum Control with both the operating system repository and an LDAP repository that is configured, you can keep using both repositories. However, it is recommended that you select either the operating system repository or the LDAP repository.

Procedure

1. Back up the `ldapregistry.xml` file in the `installation_dir/wlp/usr/servers/webServer/registry/` directory.
2. Log on as an administrator to the IBM Spectrum Control GUI.
3. Click Settings > User Management.
4. Click Edit Authentication.
5. On the Authentication Configuration page, select LDAP.
6. Click Download Files.
7. Save and extract the `ldapExamples.zip` file to the computer where you run your browser.
8. Use the information to edit the XML template file for your vendor.

For example, if your LDAP server is IBM Tivoli Directory Server, edit the `IBMDirectoryServer.xml` file and if your LDAP server is Microsoft Active Directory, edit the `ActiveDirectoryServerDefault.xml` file.

Edit the following parameters:

`id`

The unique identifier for the LDAP repository, which identifies the repository in the realm, for example, `LDAP1`.

`host`

The hostname of the primary LDAP server. The hostname is either the IP address or the computer name in a domain name system (DNS).

`sslEnabled`

Indicates whether SSL is used to connect to the LDAP server.

Important: If you set this parameter to `true`, and set the `port` parameter to the LDAP server secure communications port, when you upload the edited XML template file, IBM Spectrum Control downloads the SSL certificate from the LDAP server. Then, it is added to the Web server keystore. You must restart the Web server.

`port`

The port number for the LDAP server. By default, the port number for secure communication is 636, and for non-secure communication is 389.

Tip: Depending on the configuration of your LDAP server, you can specify a different port number.

`baseDN`

The baseDN (Distinguished Name) is the starting point for searches for users in the LDAP directory server. For example, if you have a DN value of `cn=John Doe, ou=rochester, o=ibm, c=us`, you can specify the LDAP base entry as any of the following options:

- `ou=rochester, o=ibm, c=us`
- `o=ibm, c=us`
- `c=us`

Important: The DN value that you enter in this field must be extensive enough to include all of the groups to which the users belong. For example, if a user in `ou=rochester, o=ibm, c=us` is also a member of groups that are in `ou=stategroups, o=ibm, c=us`, enter `o=ibm, c=us`.

If you want to set multiple baseDN parameters for your LDAP authentication configuration, then you must create a separate `<ldapRegistry>` entry in the XML template file for each unique baseDN parameter. For example:

```
<server description="IBM Web Server">
  <ldapRegistry activatedFilters="active_dir_server1" baseDN="ou=Marketing,dc=storage,dc=ibm,dc=com"
  bindDN="cn=Administrator,cn=users,dc=storage,dc=ibm,dc=com" bindPassword="password"
  host="ldap.storage.ibm.com"
  id=" _home_markdown_jenkins_workspace_Transform_in_SS5R93_5.4.9_docs_configuring_fqz0_t_config_ldap_active_directory_I
  DAP1" ignoreCase="true" ldapType="Microsoft Active Directory"
  port="389" realm="TPCRealm" sslEnabled="false"/>
  <activatedLdapFilterProperties groupFilter="(& (cn=%v) (objectcategory=group))"
  groupIdMap="*:cn" groupMemberIdMap="memberof:member"
  id=" _home_markdown_jenkins_workspace_Transform_in_SS5R93_5.4.9_docs_configuring_fqz0_t_config_ldap_active_directory_a
  ctive_dir_server1" userFilter="(& (sAMAccountName=%v) (objectcategory=user))"
  userIdMap="user:sAMAccountName"/>
  <ldapRegistry activatedFilters="active_dir_server2" baseDN="ou=Sales,dc=storage,dc=ibm,dc=com"
  bindDN="cn=Administrator,cn=users,dc=storage,dc=ibm,dc=com" bindPassword="password"
  host="ldap.storage.ibm.com"
  id=" _home_markdown_jenkins_workspace_Transform_in_SS5R93_5.4.9_docs_configuring_fqz0_t_config_ldap_active_directory_I
  DAP2" ignoreCase="true" ldapType="Microsoft Active Directory"
  port="389" realm="TPCRealm" sslEnabled="false"/>
  <activatedLdapFilterProperties groupFilter="(& (cn=%v) (objectcategory=group))"
  groupIdMap="*:cn" groupMemberIdMap="memberof:member"
  id=" _home_markdown_jenkins_workspace_Transform_in_SS5R93_5.4.9_docs_configuring_fqz0_t_config_ldap_active_directory_a
  ctive_dir_server2" userFilter="(& (sAMAccountName=%v) (objectcategory=user))"
  userIdMap="user:sAMAccountName"/>
  <ldapRegistry activatedFilters="active_dir_server3" baseDN="ou=Management,dc=storage,dc=ibm,dc=com"
  bindDN="cn=Administrator,cn=users,dc=storage,dc=ibm,dc=com" bindPassword="password"
  host="ldap.storage.ibm.com"
  id=" _home_markdown_jenkins_workspace_Transform_in_SS5R93_5.4.9_docs_configuring_fqz0_t_config_ldap_active_directory_I
```

```

DAP3" ignoreCase="true" ldapType="Microsoft Active Directory"
port="389" realm="TPCRealm" sslEnabled="false"/>
<activeLdapFilterProperties groupFilter="(& (cn=%v) (objectcategory=group))"
groupIdMap="*:cn" groupMemberIdMap="memberof:member"
id=" home markdown_jenkins_workspace_Transform_in_SS5R93_5.4.9_docs_configuring_fqz0_t_config_ldap_active_directory_a
ctive_dir_server3" userFilter="(& (sAMAccountName=%v) (objectcategory=user))"
userIdMap="user:sAMAccountName"/>
<federatedRepository>
  <primaryRealm allowOpIfRepoDown="true" name="TPCRealm">
    <participatingBaseEntry name="ou=Marketing,dc=storage,dc=ibm,dc=com"/>
    <participatingBaseEntry name="ou=Sales,dc=storage,dc=ibm,dc=com"/>
    <participatingBaseEntry name="ou=Management,dc=storage,dc=ibm,dc=com"/>
    <!-- The next two entries must NOT be changed -->
    <participatingBaseEntry name="o=TPCRealm"/>
    <participatingBaseEntry name="o=OSRealm"/>
  </primaryRealm>
</federatedRepository>
</server>

```

The preceding example contains the following information:

- Each `<ldapRegistry>` entry contains the identical values for the host, port, sslEnabled, bindDN, and bindPassword parameters.
- Each `<ldapRegistry>` entry contains a unique value for the baseDN and id parameters.
- Each `<ldapRegistry>` entry references its' own unique `<activeLdapFilterProperties>` entry.
- The `<federatedRepository>` entry contains multiple `<participatingBaseEntry>` entries, with each one matching one of the baseDN values in the `<ldapRegistry>` sections.

bindDN

The distinguished name that WebSphere Application Server Liberty uses when it binds to the LDAP repository. If no name is specified, WebSphere Application Server Liberty binds anonymously to the LDAP repository. In most cases, the bindDN and bindPassword values are required. However, when an anonymous bind satisfies all of the required functions, the bindDN and bindPassword values can be left blank except for the double quotes, which must have no spaces between them.

For example:

```

bindDN=""
bindPassword=""

```

If you are not sure whether an anonymous bind satisfies the required functions, contact your LDAP server administrator.

Attention: No single value for the bindDN parameter is correct for every Active Directory Server or for every LDAP server. The correct value for the bindDN parameter depends on the configuration of your Active Directory Server or your LDAP server. If you are unsure about the correct value to use for the bindDN parameter, contact your LDAP server administrator.

If you are using Active Directory as your LDAP repository and you know the *Active_Directory_user's_samAccountName_value*, but you want the Active Directory user full distinguished name in order to use that value as the bindDN parameter, run the following command on the Active Directory machine:

```
dsquery user -samid Active_Directory_user's_samAccountName_value
```

Example:

```

C:\Users\Administrator>dsquery user -samid SCAdministratorMSAD
"CN=SCAdministratorMSAD,CN=Users,DC=vcloud101dc,DC=local"

```

For more information about the **dsquery** command, see <https://social.technet.microsoft.com/wiki/contents/articles/2195.active-directory-dsquery-commands.aspx?PageIndex=3>

bindPassword

The password that WebSphere Application Server Liberty uses when it binds to the LDAP repository.

If the bindPassword parameter is already encrypted in the XML file, enter only an LDAP user name and password to test the pending LDAP authentication configuration. After your LDAP credentials are validated, you must immediately map an LDAP group to an IBM Spectrum Control role in the GUI before you log out with your Local OS credentials.

participatingBaseEntry

You must set this value to the same value as you set for the baseDN parameter or the federation for the LDAP repository fails. For example, if you set the baseDN parameter to `ou=rochester, o=ibm, c=us`, you must set the participatingBaseEntry parameter to: `<participatingBaseEntry name="ou=rochester, o=ibm, c=us" />`.

Important: Do not change these participatingBaseEntry parameters in the XML template file:

```

<participatingBaseEntry name="o=TPCRealm" />
<participatingBaseEntry name="o=OSRealm" />

```

9. Save the XML template file.
10. On the Authentication Configuration page, click Browse.
11. On the File Upload page, select the XML template file that you previously edited and click Open.
The XML template file is then uploaded to the IBM Spectrum Control server.
12. After IBM Spectrum Control downloads the SSL certificate from the LDAP server and adds it to the Web server keystore, click Restart Web Server.
Note: While the Web server is restarting, do not refresh your browser or attempt to navigate to another part of the GUI.
13. When the Web server is back online, on the LDAP Settings page, enter your LDAP user name, password, group name and click Save.
Note: The user name must be a member of the group.
If your change from Local OS authentication to LDAP authentication is successful, you are logged out of the IBM Spectrum Control GUI. You can log into the GUI using your LDAP credentials. You cannot log into the GUI using your operating system credentials.

If your change from Local OS authentication to LDAP authentication is *not* successful, click Discard. After the confirmation, your previous Local OS authentication is restored and you are returned to the User Management page.

Tip:

If you encounter any issues with above mentioned procedure, see [Configuring user authentication alternatives](#).

Results

You have changed from local operating system authentication to LDAP authentication in IBM Spectrum Control. You can log on to the IBM Spectrum Control GUI with LDAP credentials.

Changing from LDAP to operating system authentication

To change from LDAP authentication to operating system authentication in IBM Spectrum® Control, you can use the IBM Spectrum Control GUI.

Before you begin

WebSphere® Application Server Liberty cannot resolve users or groups that are present in more than one repository in the federated repositories framework. Because of this limitation, you must select either the operating system repository or an LDAP repository for user authentication and authorization in IBM Spectrum Control. If you upgraded from an earlier version of IBM Spectrum Control with both the operating system repository and an LDAP repository configured, you can keep using both repositories. However, it is recommended that you select either the operating system repository or the LDAP repository.

The use of the IBM Spectrum Control single sign-on feature is limited when you change from LDAP authentication to operating system authentication in IBM Spectrum Control. Storage system element managers do not support the operating system repository for single sign-on, even if the element manager is installed on the same system as IBM Spectrum Control.

Procedure

1. Back up the ldapregistry.xml file in the *installation_dir/wlp/usr/servers/webServer/registry/* directory.
2. Log on as an administrator to the IBM Spectrum Control GUI.
3. Click Settings > User Management.
4. Click Edit Authentication.
5. On the Authentication Configuration page, select Local OS and click Save.
6. On the OS Settings page, enter your local operating system user name, password, group name and click Save.

Note: The user name must be a member of the group.

If your change from LDAP authentication to Local OS authentication is successful, you are logged out of the IBM Spectrum Control GUI. You can log into the GUI using your local operating system credentials. You cannot log into the GUI using your LDAP credentials.

If your change from LDAP authentication to Local OS authentication is *not* successful, click Discard. After the confirmation, your previous LDAP authentication is restored and you are returned to the User Management page.

Results

You have changed from LDAP authentication to local operating system in IBM Spectrum Control. You can log on to the IBM Spectrum Control GUI with your local operating system credentials.

Configuring user authentication alternatives

If you encounter any issues with the recommended procedures for configuring user authentication, see the following topics for support.

- [Enabling secure communication between IBM Spectrum Control and the LDAP repository](#)
You can use the Secure Socket Layer (SSL) protocol to secure the communication between IBM Spectrum Control and the LDAP repository that you are using for user authentication. The SSL protocol provides security and data integrity for communications over Transmission Control Protocol/Internet Protocol (TCP/IP) networks.
- [Disabling secure communication between IBM Spectrum Control and the LDAP repository](#)
You can disable the Secure Socket Layer (SSL) protocol between IBM Spectrum Control and the LDAP repository at any time using the IBM Spectrum Control GUI.
- [Exporting SSL certificate from the IBM Security Directory Server to a file](#)
To secure communications between IBM Spectrum Control and IBM® Security Directory Server, you must export the SSL certificate to a file. The file that is created can then be added to the keystore for IBM Spectrum Control.
- [Exporting SSL certificate from the Microsoft Active Directory to a file](#)
To secure communications between IBM Spectrum Control and Microsoft Active Directory, you must export the SSL certificate from the Microsoft Active Directory to a file. The file that is created can then be added to the web server keystore for IBM Spectrum Control.
- [Adding the SSL certificate for the LDAP server to the web server keystore that uses the IKEYCMD command](#)
To secure communications between the IBM Spectrum Control server and the LDAP server, you must add the SSL certificate from the LDAP server to the web server keystore for IBM Spectrum Control.

Enabling secure communication between IBM Spectrum Control and the LDAP repository

You can use the Secure Socket Layer (SSL) protocol to secure the communication between IBM Spectrum® Control and the LDAP repository that you are using for user authentication. The SSL protocol provides security and data integrity for communications over Transmission Control Protocol/Internet Protocol (TCP/IP) networks.

Before you begin

You added an LDAP repository to the federated repositories for IBM Spectrum Control and your system is operating properly with non-secure communication between IBM Spectrum Control and the LDAP repository. Before you implement the following procedure, add the SSL certificate from the LDAP server to the IBM Spectrum Control web server keystore or the connectivity between IBM Spectrum Control and the LDAP server fails.

Procedure

1. Log in to the IBM Spectrum Control GUI as an LDAP user with the Administrator role.
2. In the menu bar, go to Settings > User Management.
3. On the User Management page, click Edit Authentication.
4. On the Authentication Configuration page, click Advanced Configuration Options.
Depending on the LDAP user account that you used to log into the IBM Spectrum Control GUI, you might have to explicitly log into the Liberty Admin Center as the Common User or the file-based user.
5. On the Server Config page, click LDAP User Registry.
6. Change the value in the Ldap ssl enabled field from false to true.
7. Change the value of the Port field to the LDAP server port that listens for secure communications.
The typical value is 636. Depending on your LDAP server configuration, you can specify a different port. If you do not know which port to use, contact your LDAP server administrator.
8. Click Save and log out of the Liberty Admin Center.
9. On the Authentication Configuration page, click Cancel.

Results

Secure communications are established between IBM Spectrum Control and the LDAP repository with SSL protocol.

Related tasks

- [Exporting SSL certificate from the IBM Security Directory Server to a file](#)
- [Exporting SSL certificate from the Microsoft Active Directory to a file](#)
- [Adding the SSL certificate for the LDAP server to the web server keystore that uses the IKEYCMD command](#)

Disabling secure communication between IBM Spectrum Control and the LDAP repository

You can disable the Secure Socket Layer (SSL) protocol between IBM Spectrum® Control and the LDAP repository at any time using the IBM Spectrum Control GUI.

Procedure

1. Log in to the IBM Spectrum Control GUI as an LDAP user with Administrator role.
2. In the menu bar, go to Settings > User Management.
3. On the User Management page, click Authentication Configuration.
4. On the Authentication Configuration page, click Advanced Configuration Options.
Depending on the LDAP user account that you used to log into the IBM Spectrum Control GUI, you might have to explicitly log into the Liberty Admin Center as the Common User or the file-based user.
5. On the Server Config page, click LDAP User Registry.
6. Change the value of the Ldap ssl enabled field from true to false.
7. Change the value of the Port field to the LDAP server port that listens for non-secure communications.
The typical value is 389. Depending on your LDAP server configuration, you can specify a different port. If you do not know which port to use, contact your LDAP server administrator.
8. Click Save and log out of the Liberty Admin Center.
9. On the Authentication Configuration page, click Cancel.

Exporting SSL certificate from the IBM Security Directory Server to a file

To secure communications between IBM Spectrum Control and IBM® Security Directory Server, you must export the SSL certificate to a file. The file that is created can then be added to the keystore for IBM Spectrum Control.

Before you begin

Important: This topic is an example of exporting the SSL certificate from the IBM Security Directory Server to a file.
If your LDAP server is the IBM Security Directory Server verify that the Web Administration tool is installed with your IBM Security Directory Server because it includes the correct IBM Key Management (iKeyman) utility.
For more information about exporting the SSL certificate from the LDAP server, see your LDAP administrator and the documentation for your specific LDAP server product.

Procedure

1. Open the IBM Key Management utility in your IBM WebSphere® Application Server directory structure.
2. Select Key Database File, Open.
3. Complete the following steps:
 - a. In Key database type field, select CMS.
 - b. In the File Name field, click Browse and go to the location of the key database (.kdb) file that is associated with your IBM Security Directory Server.
 - c. Click Open.
 - d. Click OK.
4. On the Password Prompt page, enter the correct password for the key database file and click OK.
5. In the Personal Certificates list, select the certificate that is the SSL certificate for the IBM Security Directory Server and click Extract Certificate.
6. Select Base64-encoded ASCII data as the data type and provide a Certificate file name, Location, and click OK.

Results

The SSL certificate is exported from IBM Security Directory Server to a file so it can be added to the web server keystore for IBM Spectrum® Control.

Exporting SSL certificate from the Microsoft Active Directory to a file

To secure communications between IBM Spectrum Control and Microsoft Active Directory, you must export the SSL certificate from the Microsoft Active Directory to a file. The file that is created can then be added to the web server keystore for IBM Spectrum Control.

Before you begin

Important: This topic is an example of exporting the SSL certificate from the Microsoft Active Directory to a file.

You can use the Certification Authority tool to export the SSL certificate.

For more information about exporting the SSL certificate from the LDAP server, see your LDAP administrator and the documentation for your specific LDAP server product.

Procedure

1. Open the Certification Authority tool.
2. Select Certification Authority, Issued Certificates.
3. Select your current SSL certificate for the Microsoft Active Directory and open the certificate.
4. On the Certificate page, click the Details tab and click Copy to File.
5. In the Certificate Export Wizard, select Base-64 encoded X.509 (.CER) and click Next.
6. Provide a file name and click Next.
7. Review your settings to verify that you have the correct Base-64 encoded X.509 (.CER) file and click Finish.

Results

The SSL certificate is exported from Microsoft Active Directory to a file so it can be added to the web server keystore for IBM Spectrum® Control.

Adding the SSL certificate for the LDAP server to the web server keystore that uses the IKEYCMD command

To secure communications between the IBM Spectrum® Control server and the LDAP server, you must add the SSL certificate from the LDAP server to the web server keystore for IBM Spectrum Control.

About this task

Tip: Contact your LDAP administrator and obtain the SSL certificate for your LDAP server. The SSL certificate must be in the form of a Base64-encoded file.

You can use the IBM® Key Management (IKEYCMD) command to add the LDAP SSL certificate to the IBM Spectrum Control web server keystore.

Procedure

1. Copy the Base64-encoded file to the location of your IBM Spectrum Control server.
2. Log on to the IBM Spectrum Control server with administrative privileges.
3. Open a command prompt and go to *installation_dir\re/bin* directory.
4. Choose one of these options to add the SSL certificate for the LDAP server to the keystore for the web server:
 - Windows operating systems:

```
keycmd -cert -add -db installation_dir\wlp\usr\servers\webServer\resources
\security\key.p12 -pw password -label label -file LDAP SSL certificate
```

- AIX® and Linux® operating systems:

```
./ikeycmd -cert -add -db installation_dir\wlp\usr\servers\webServer/resources
/security/key.p12 -pw password -label label -file LDAP SSL certificate
```

Where the *label* value is for the LDAP SSL certificate you are adding to the IBM Spectrum Control web server keystore. The *password* value is the password that is associated with the keystore. The *default* value for this password is *default*. The *LDAP SSL certificate* value is the Base64-encoded file that contains the SSL certificate from your LDAP server.

5. Restart the IBM Spectrum Control web server.
6. Choose one of these options to verify that the SSL certificate for LDAP was added to the keystore for the web server:
 - For Windows operating systems:

```
ikeycmd -cert -list -db installation_dir\wlp\usr\servers\webServer
\resources\security\key.pl2 -pw password
```

- For AIX and Linux operating systems:

```
./ikeycmd -cert -list -db installation_dir/wlp/usr/servers/webServer
/resources/security/key.pl2 -pw password
```

Results

The SSL certificate from the LDAP server was added to the IBM Spectrum Control web server keystore to enable secure communications.

Using the ldapEntityType element for advanced LDAP configuration

To narrow the IBM Spectrum® Control view of your LDAP structure so that you can find and map your groups to IBM Spectrum Control roles, you need to configure the **ldapEntityType** element within the **ldapRegistry** element.

Example: LDAP user and group scenario

In this scenario, you want to provide access to LDAP users that reside in a different node of the LDAP structure than your LDAP groups. You also want to prevent authorization of LDAP users and groups that are not associated with IBM Spectrum Control.

In this scenario, the LDAP users use the following distinguished names:

- LDAP user 1: **cn=LDAPUser1,ou=MarketingUsers,dc=storage,dc=company,dc=com**
- LDAP user 2: **cn=LDAPUser2,ou=SalesUsers,dc=storage,dc=company,dc=com**
- LDAP user 3: **cn=LDAPUser3,ou=ManagementUsers,dc=storage,dc=company,dc=com**

In this scenario, the LDAP groups use the following distinguished names:

- LDAP user 1 is a member of LDAP group 1: **cn=LDAPGroup1,ou=MarketingGroups,dc=storage,dc=company,dc=com**
- LDAP user 2 is a member LDAP group 2: **cn=LDAPGroup2,ou=SalesGroups,dc=storage,dc=company,dc=com**
- LDAP user 3 is a member of LDAP group 3: **cn=LDAPGroup3,ou=ManagementGroups,dc=storage,dc=company,dc=com**

In this scenario, **LDAPUser1** and **LDAPUser2** are in different nodes of the LDAP structure than the associated LDAP groups, **LDAPGroup1** and **LDAPGroup2**. You need to find and map **LDAPGroup1** and **LDAPGroup2** to the IBM Spectrum Control roles and be able to log in to IBM Spectrum Control as the **LDAPUser1** and **LDAPUser2**.

When you configure IBM Spectrum Control for LDAP authentication and you encounter this scenario, set the baseDN value in your LDAP XML template file to **dc=storage, dc=company, dc=com**.

In following example, this baseDN value is common to all LDAP users and groups.

Example of the LDAP XML template file that implements this baseDN value:

```
<server description="IBM Web Server">
  <ldapRegistry activatedFilters="active_dir_server" baseDN="dc=storage,dc=company,dc=com"
    bindDN="cn=Administrator,cn=users,dc=storage,dc=company,dc=com" bindPassword="password"
    host="ldap.storage.company.com"
  id="_home_markdown_jenkins_workspace_Transform_in_SS5R93_5.4.9_docs_configuring_cfg_ldap_advanced_LDAP1" ignoreCase="true"
    ldapType="Microsoft Active Directory"
    port="389" realm="TPCRealm" sslEnabled="false">
    </ldapRegistry>

    <activatedLdapFilterProperties groupFilter="(& (cn=%v) (objectcategory=group))" groupIdMap="*:cn"
      groupMemberIdMap="memberof:member"
    id="_home_markdown_jenkins_workspace_Transform_in_SS5R93_5.4.9_docs_configuring_cfg_ldap_advanced_active_dir_server"
      userFilter="(& (sAMAccountName=%v) (objectcategory=user))" userIdMap="user:sAMAccountName"/>

    <federatedRepository>
      <primaryRealm allowOpIfRepoDown="true" name="TPCRealm">
        <participatingBaseEntry name="dc=storage,dc=company,dc=com"/>
        <!-- The next two entries must NOT be changed -->
        <participatingBaseEntry name="o=TPCRealm"/>
        <participatingBaseEntry name="o=OSRealm"/>
      </primaryRealm>
    </federatedRepository>
  </server>
```

When you use this example LDAP XML template file, you also are able to find and map **LDAPGroup3** to an IBM Spectrum Control role. This behavior enables **LDAPUser3** to log in to IBM Spectrum Control, which is not part of the successful outcome. Use the **ldapEntityType** element within the **ldapRegistry** element so you can only find and map **LDAPGroup1** and **LDAPGroup2** to IBM Spectrum Control roles.

Tip: Whenever you modify the **ldapRegistry** element, in the LDAP XML template file, verify that the XML file is valid by opening it in a web browser and checking the results.

This is the previous example of the LDAP XML template file that was edited to use the `ldapEntityType` element within the `ldapRegistry` element:

```
<server description="IBM Web Server">
  <ldapRegistry activatedFilters="active_dir_server" baseDN="dc=storage,dc=company,dc=com"
bindDN="cn=Administrator,cn=users,dc=storage,dc=company,dc=com" bindPassword="password"
host="ldap.storage.company.com"
id="_home_markdown_jenkins_workspace_Transform_in_SS5R93_5.4.9_docs_configuring_cfg_ldap_advanced_LDAP1" ignoreCase="true"
ldapType="Microsoft Active Directory"
port="389" realm="TPCRealm" sslEnabled="false">

    <ldapEntityType name="Group">
      <objectClass>group</objectClass>
      <searchBase>ou=MarketingGroups,dc=storage,dc=company,dc=com</searchBase>
      <searchBase>ou=SalesGroups,dc=storage,dc=company,dc=com</searchBase>
    </ldapEntityType>

    <ldapEntityType name="PersonAccount">
      <objectClass>user</objectClass>
      <searchBase>ou=MarketingUsers,dc=storage,dc=company,dc=com</searchBase>
      <searchBase>ou=SalesUsers,dc=storage,dc=company,dc=com</searchBase>
    </ldapEntityType>

  </ldapRegistry>

  <activatedLdapFilterProperties groupFilter="(& (cn=%v) (objectcategory=group)) "
groupIdMap="*:cn" groupMemberIdMap="memberof:member"
id="_home_markdown_jenkins_workspace_Transform_in_SS5R93_5.4.9_docs_configuring_cfg_ldap_advanced_active_dir_server"
userFilter="(& (sAMAccountName=%v) (objectcategory=user)) "
userIdMap="user:sAMAccountName"/>

  <federatedRepository>
    <primaryRealm allowOpIfRepoDown="true" name="TPCRealm">
      <participatingBaseEntry name="dc=storage,dc=company,dc=com"/>
      <!-- The next two entries must NOT be changed -->
      <participatingBaseEntry name="o=TPCRealm"/>
      <participatingBaseEntry name="o=OSRealm"/>
    </primaryRealm>
  </federatedRepository>
</server>
```

When you use the LDAP XML template that implements the `ldapEntityType` element, it prevents you from finding and mapping `LDAPGroup3` to IBM Spectrum Control role. However, you can find and map `LDAPGroup1` and `LDAPGroup2` to IBM Spectrum Control roles and `LDAPUser1` and `LDAPUser2` can log in to IBM Spectrum Control.

Adding customized text to the logon page

On the logon page for IBM Spectrum® Control, you can show customized text when users access the GUI.

Procedure

1. Open the directory that was created to install IBM Spectrum Control:
 - The default installation directory for Windows operating systems is C:\Program Files\IBM\TPC.
 - The default installation directory for AIX® or Linux® operating systems is /opt/IBM/TPC.
2. Go to one of the following directories:

Windows operating systems
 \wlp\usr\servers\webServer\customization
AIX or Linux operating systems
 /wlp/usr/servers/webServer/customization
3. Open the LoginText.html file in a text editor:
 - a. Type the text that you want to show to the user before they log on to the GUI.
 Tip: To format the text that you want to add, you can use HTML tags, such as paragraph tags, list tags, bold tags, and italic tags.
 - b. Save the LoginText.html file.
4. Open the GUI.

Results

The customized text that you added is shown under the logon page.

Managing a SAN without agents

You can manage a SAN when there are no agents.

About this task

In the following situations, there might not be any agents on the SAN:

- The hosts do not currently have a Storage Resource agent or Fabric agent installed.
- The host operating system is not supported by the Storage Resource agent or Fabric agent.
- The customer requirements do not require the deployment of a Storage Resource agent or Fabric agent.

In these cases, it is recommended that an agent is installed on the Device server itself. This action allows the Device server to use advanced features like Remote Node Identification, which requires an agent.

Normally the Device server does not have a Fibre Channel host bus adapter. In this configuration, the following steps are taken:

1. A Fibre Channel host bus adapter is added to the manager.
2. An agent is installed on the Device server (the Device server is installed first).
3. All storage devices are verified to ensure that they use LUN masking techniques. The LUN masking techniques prevent the Device server from accessing the disks used by the host systems.
4. The Fibre Channel host bus adapter is attached to the SAN to be managed. This host is added to each zone that is intended to be managed by the Device server.

Setting timeout values for the Device server

If a probe or discovery of a storage subsystem times out before the operation completes, you can increase the timeout values for the Device server.

Before you begin

If a probe or discovery of a storage subsystem times out before the operation completes, you receive the following error message:

**HWN021650E Encountered timeout while connecting to CIMOM IP:port.
Check the CIMOM or increase timeout value.**

where *IP* is the IP address, and *port* is the port number. If you determine that the Common Information Model Object Manager (CIMOM) is not the cause of the problem, you can use the command-line interface (CLI) to increase the timeout values for the Device server.

For those storage systems that use native interfaces to connect to IBM Spectrum® Control you see this error message:

HWN020103E The external process exceeded the timeout limit and was cancelled.

The following storage systems use native interfaces to connect to IBM Spectrum Control:

- System Storage® DS8000®
- SAN Volume Controller
- The XIV®
- IBM Spectrum Accelerate
- Storwize® V3500
- Storwize V3700
- Storwize V7000
- Storwize V7000 Unified
- IBM FlashSystem® devices that run IBM Spectrum Virtualize
- IBM Spectrum Scale
- IBM® Cloud Object Storage

Procedure

1. Run the **getdscfg** command to determine the current values of the timeout properties. From the command prompt, enter the following command:

```
cli>tpctool getdscfg -user user -pwd password -url host:port  
-property timeout_property
```

where:

- *user* is an IBM Spectrum Control user ID.
- *password* is the password for the IBM Spectrum Control user ID.
- *host* is the host name or IP address, and *port* is a valid port number for the HTTP service of the Device server. The default value for *port* is typically 9550.
- *timeout_property* is one of the following strings:
 - httpTimeout
 - CIMClientWrapper.Timeout
 - Probe.Timeout.Array
 - Probe.Timeout.LMM
 - Discovery.Timeout
 - CIMOMManager.TestConnectionTimeout

Important: Timeout properties are displayed in milliseconds. If the value is 0 (zero), it means that there is no timeout.

For the storage systems that use the native interface, the *timeout_property* strings are:

- NAPI.Timeout.TestConnection
- NAPI.Timeout.Probe
- NAPI.Timeout.EventPoll

2. Run the **setdscfg** command to increase the timeout value. Run the following command:

```
cli>tpctool setdscfg -user user -pwd password -url host:port  
-property timeout_property timeout_value
```

Tip: For Storwize V7000 Unified, the refresh of configuration data from the storage system can take some time to complete and might cause the probe to time out, even if the timeout value is increased. To reduce the duration of the probe run for Storwize V7000 Unified, run the following command:

```
cli>tpctool setdscfg -user user -pwd password -url host:port  
-property Probe.GetRecentStorwizeUnifiedData -context DeviceServer false
```

This command changes the probe configuration to use cached configuration data from the storage system, which reduces the duration of the probe run. However, the information that is collected by the probe might be slightly out of date.

What to do next

For more information about **tpctool**, see [tpctool command](#). You also can view help from the command line by issuing the command with the **-help** option.

Configuring Service Location Protocol

You can enable IBM Spectrum® Control to discover a larger set of storage devices through Service Location Protocol (SLP). In addition to some of the more common SLP configuration issues, there is also information about router configuration, SLP directory agent configuration, and environment configuration.

About this task

For additional information about SLP, see the **Service Location Protocol Request for Comments** website at <http://www.ietf.org/rfc/rfc2165.txt>.

Note: The storage systems that use the native interfaces (DS8000®, XIV®, SAN Volume Controller, and Storwize® V7000) do not use SLP discovery.

- **Router configuration**
Configure the routers in the network to enable general multicasting or to allow multicasting for the SLP multicast address and port, 239.255.255.253, port 427. The routers of interest are the ones associated with subnets that contain one or more storage devices that are to be discovered and managed by IBM Spectrum Control.
- **SLP directory agent configuration**
Review these suggestions when you configure the SLP directory agent.
- **Environment configuration**
This section provides information about the configuration of your environment.
- **SLP registration and the slptool command**
- **SLP discovery**
A common problem with SLP discovery is due to IP multicasting being disabled on the network router. Communication between the SLP SA and UA is done with IP multicasting. Follow these recovery procedures when there are SLP discovery problems and IP multicasting is disabled on the network router.

Router configuration

Configure the routers in the network to enable general multicasting or to allow multicasting for the SLP multicast address and port, 239.255.255.253, port 427. The routers of interest are the ones associated with subnets that contain one or more storage devices that are to be discovered and managed by IBM Spectrum® Control.

About this task

To configure your router hardware and software, refer to your router and configuration documentation.

SLP directory agent configuration

Review these suggestions when you configure the SLP directory agent.

About this task

Configure the SLP directory agents (DAs) to circumvent the multicast limitations. With statically configured DAs, all service requests are unicast by the user agent. Therefore, it is possible to configure one DA for each subnet that contains storage devices that are to be discovered by IBM Spectrum® Control. One DA is sufficient for each of the subnets. Each of these DAs can discover all services within its own subnet, but no other services outside its own subnet. To allow IBM Spectrum Control to discover all the devices, it needs to be statically configured with the addresses of each of these DAs. This operation can be accomplished by using the IBM Spectrum Control Discovery Preference panel.

You can use this panel to enter a list of DA addresses. IBM Spectrum Control sends unicast service requests to each of these statically configured DAs, and sends multicast service requests on the local subnet on which IBM Spectrum Control is installed. Configure an SLP DA by changing the configuration of the SLP service agent (SA) that is included as part of an existing CIM Agent installation. This action causes the program that normally runs as an SLP SA to run as an SLP DA.

Note: The change from SA to DA does not affect the CIMOM service of the subject CIM Agent, which continues to function normally, sending registration and deregistration commands to the DA directly.

Environment configuration

This section provides information about the configuration of your environment.

About this task

It might be advantageous to configure SLP DAs in the following environments:

- In environments where there are other non-IBM Spectrum® Control SLP UAs that frequently perform discovery on the available services, an SLP DA must be configured. This action ensures that the existing SAs are not overwhelmed by too many service requests.
- In environments where there are many SLP SAs, a DA helps decrease network traffic that is generated by the multitude of service replies. It also ensures that all registered services can be discovered by a given UA. The configuration of an SLP DA is recommended when there are more than 60 SAs that need to respond to any given multicast service request.

SLP registration and the slptool command

About this task

IBM Spectrum® Control uses Service Location Protocol (SLP) discovery, which requires that all the discovered CIM agents are registered by using the SLP.

In a non-multicast network environment, SLP can only discover CIM agents that are registered in its IP subnet. For CIM agents outside of the IP subnet, you need to use an SLP DA and register the CIM agents by using **slptool**. Ensure that the CIM_InteropSchemaNamespace and Namespace attributes are specified.

For example, enter the following command:

```
slptool register service:wbem:https://myhost.com:port
```

Where *myhost.com* is the name of the server that is hosting the CIM agent, and *port* is the port number of the service, for example 5989.

Note: **slptool** is installed with a CIM agent. Run the command from the computer that is hosting the CIM agent.

SLP discovery

A common problem with SLP discovery is due to IP multicasting being disabled on the network router. Communication between the SLP SA and UA is done with IP multicasting. Follow these recovery procedures when there are SLP discovery problems and IP multicasting is disabled on the network router.

About this task

Note: The storage systems that use native interfaces, for example, DS8000®, XIV®, SAN Volume Controller, and Storwize® V7000 do not use SLP discovery. There are two recovery procedures when there are SLP discovery problems and IP multicasting is disabled on the network router:

1. Configure one DA for each subnet within the environment.
2. Enable IP multicasting on the router which is disabled by default. Here is a list of common router configurations for multicasting:
 - Internet Group Management Protocol (IGMP) is used to register individual hosts in particular multicast groups and to query group membership on particular subnets.
 - Distance Vector Multicast Routing Protocol (DVMRP) is a set of routing algorithms that use a technique called reverse path forwarding. These algorithms provide the best solution for how multicast packets are to be routed in the network.
 - Protocol-Independent Multicast (PIM) comes in two varieties: dense mode (PIM-DM) and sparse mode (PIM-SM). The dense mode and sparse mode routines are optimized for networks where either a large percentage of nodes requires multicast traffic (dense) or a small percentage of nodes requires the sparse traffic.
 - Multicast Open Shortest Path First (MOSPF) is an extension of OSPF. It is a link-state unicast routing protocol that attempts to find the shortest path between any two networks or subnets to provide the most optimal packet routing.

To properly configure the routers for multicasting, see the reference and configuration documentation from the router manufacturer.

Configuring IP addressing

This section provides information about configuring IP addressing.

About this task

- **Configuring IBM Spectrum Control with multiple IP addresses**
If the system where IBM Spectrum Control is to be installed has multiple IP addresses, then a configuration value must be set manually as a post-installation task by using the **tpctool setdscfg** command. The value to be set is for the local IP address, which must be used for subscription for CIM Indications for CIM agents.
- **Changing the HOSTS file**
When you install IBM Spectrum Control on your Windows operating systems, you must follow these steps to avoid addressing problems with the systems you want to manage. These problems are caused by the address resolution protocol that returns the host short name rather than the fully qualified host name. You can avoid this by modifying the entries in the corresponding host tables on the DNS server and on the local computer system. The fully qualified host name must be listed before the short name in each entry that is associated with systems managed by IBM Spectrum Control.

Configuring IBM Spectrum Control with multiple IP addresses

If the system where IBM Spectrum® Control is to be installed has multiple IP addresses, then a configuration value must be set manually as a post-installation task by using the **tpctool setdscfg** command. The value to be set is for the local IP address, which must be used for subscription for CIM Indications for CIM agents.

About this task

Restriction: This task does not apply to storage systems that use the native interfaces, for example, DS8000®, XIV®, SAN Volume Controller, and Storwize® V7000. If you are using IPv6 computers, see [Planning for Internet Protocol Version 6](#).

For multiple IPv6 addresses, the IPv6 address to use for CIM indication subscription by IBM Spectrum Control can be specified by setting the property **System.LocalIPv6Address** as described.

With dual stack IPv4 and IPv6 IBM Spectrum Control servers, two IP addresses are required to subscribe to IPv4 CIMOMs and IPv6 CIMOMs. The configuration property **System.LocalIPv6Address** is used for IPv6 CIMOMs and the property **System.LocalIPAddress** is used for IPv4 CIMOMs.

To change the IP address, follow these steps:

Procedure

1. Open a command prompt window on the server system.
2. Change to the following directory:

```
cd installation_dir\cli
```

3. Enter the following command:

```
tpctool setdscfg -user user_ID -pwd password -url  
host:port -property System.LocalIPv6Address value
```

Where:

user_ID

Is the user ID.

password

Is the password for the user.

host

Is either the host name or IP address of the system that is running IBM Spectrum Control.

port

Is a valid port number for the HTTP service of the Device server (the default is 9550).

value

Is the local IP address, which must be used for subscription for CIM Indications for CIM agents.

4. Verify that the command was successful by entering this command:

```
tpctool getdscfg -user user_ID -pwd password  
-url host:port -property System.LocalIPv6Address
```

Changing the HOSTS file

When you install IBM Spectrum® Control on your Windows operating systems, you must follow these steps to avoid addressing problems with the systems you want to manage. These problems are caused by the address resolution protocol that returns the host short name rather than the fully qualified host name. You can avoid this by modifying the entries in the corresponding host tables on the DNS server and on the local computer system. The fully qualified host name must be listed before the short name in each entry that is associated with systems managed by IBM Spectrum Control.

About this task

The **HOSTS** file is in the **%SystemRoot%\system32\drivers\etc** directory. To change the HOSTS file, follow these steps:

Procedure

1. Open the HOSTS file in a text editor.
2. Add, remove, or modify the host entries. In the following example of a HOSTS file, the short name is incorrectly listed before the fully qualified host name. This can cause address resolution problems in IBM Spectrum Control.

```
# Copyright (c) 1993-2009 Microsoft Corp.  
#  
# This is a sample HOSTS file used by Microsoft TCP/IP for Windows.  
#  
# This file contains the mappings of IP addresses to host names. Each  
# entry should be kept on an individual line. The IP address should  
# be placed in the first column followed by the corresponding host name.  
# The IP address and the host name should be separated by at least one  
# space.  
#  
# Additionally, comments (such as these) may be inserted on individual  
# lines or following the machine name denoted by a '#' symbol.  
#  
# For example:  
#  
#       102.54.94.97       rhino.acme.com   # source server  
#       38.25.63.10       x.acme.com      # x client host  
#  
192.168.123.146          jason           jason.groupa.mycompany.com
```

3. In the following example, the order of the host names has been changed so that the fully qualified host name is placed before the short name. The host names must be entered in the order that is shown so IBM Spectrum Control can locate the host. Use this format for any hosts that are associated with IBM Spectrum Control.

```
# For example:  
#  
#       102.54.94.97       rhino.acme.com   # source server  
#       38.25.63.10       x.acme.com      # x client host  
#  
192.168.123.146          jason.groupa.mycompany.com   jason
```

Note: Host names are case-sensitive. This is a WebSphere® requirement. For example, if your computer shows the name as JASON (uppercase), then you must enter JASON in the HOSTS file.

Deploying Storage Resource agents

You can manage your Storage Resource agent deployments.

Deploy Storage Resource agents through the user interface rather than a separate installation wizard. You can have only one agent per host that points to the same IBM Spectrum® Control server.

Before you begin: Before you deploy Storage Resource agents, see [Deployment guidelines and limitations for Storage Resource agents](#) for a list of considerations. If you deploy Storage Resource agents on multiple computers at the same time, the computers must have the same administrative user ID and password. IBM Spectrum Control uses these user credentials to log on to the computers when the Storage Resource agents are deployed.

To deploy Storage Resource agents, complete the following steps:

1. In the menu bar, go to Servers > Servers.
2. Click Add Server.
3. Select Deploy an agent for full server monitoring.
4. Select one of the following methods for adding a server:
 - Add a server by manually entering information about the server and the Storage Resource agent.
 - Add one or more servers by importing configuration information from a comma-delimited file.
5. Configure deployment information for the Storage Resource agents.
6. Schedule the agent deployment and the data collection for the servers.
7. Click Finish to deploy the Storage Resource agents.

- [Deployment guidelines and limitations for Storage Resource agents](#)

You must consider the following guidelines and limitations when you manage Storage Resource agents in your environment.

- [Creating a certificate for SSH protocol](#)

Before you install the Storage Resource agents by using the SSH protocol, you can optionally create a certificate.

- [Replacing default SSL certificates for the Data server and Storage Resource agents with custom SSL certificates](#)

IBM Spectrum Control provides default SSL certificates for communication between the Data server and Storage Resource agent. You can replace the default SSL certificates. You must use the script that is provided by IBM Spectrum Control to generate new SSL certificates. You cannot use any third-party tools to generate the custom SSL certificates.

Deployment guidelines and limitations for Storage Resource agents

You must consider the following guidelines and limitations when you manage Storage Resource agents in your environment.

Use the following information when you deploy Storage Resource agents:

- [Multiple Storage Resource agents that are probing or scanning the same storage resources](#)
- [Platforms that support the deployment of Storage Resource agents](#)
- [Product functions that are not available for storage devices monitored by Storage Resource agents](#)
- [Required authority for deploying Storage Resource agents](#)
- [Orphan zones](#)
- [Firewalls and Storage Resource agents deployments](#)
- [Deploying Storage Resource agents on multiple computers](#)
- [Communication between the IBM Spectrum® Control server and a Storage Resource agent](#)
- [Daemon and non-daemon services](#)
- [Port numbers for Storage Resource agents deployed as a daemon service](#)
- [Authentication between the IBM Spectrum Control server and a Storage Resource agent](#)
- [Replacing default SSL certificates](#)
- [Storage Resource agents on the same computer](#)
- [Time zones for computers monitored by Storage Resource agents](#)
- [Connections for Linux® and AIX® operating systems by using Remote Shell protocol \(RSH\)](#)
- [Deployments on Windows - NetBIOS setting](#)
- [Deployments on Windows - User Account Control \(UAC\) remote restrictions](#)

Multiple Storage Resource agents that are probing or scanning the same resources

If multiple Storage Resource agents are set up to probe or scan the same storage resources, the Storage Resource agent that was added to IBM Spectrum Control first is used for the probe or scan. Therefore, only data that is gathered by the first Storage Resource agent is shown.

Platforms that support the deployment of Storage Resource agents

For a list of platforms on which you can deploy Storage Resource agents, see the [IBM Spectrum Control interoperability matrix](#) and go to the *Agents, Servers and Browsers* section.

Product functions that are unavailable for resources that are monitored by Storage Resource agents

Before you deploy a Storage Resource agent, ensure that the product functions you want to use on the monitored resources are available for those agents. The following functions are not available for resources that are monitored by Storage Resource agents:

- Certain relational database monitoring. For list of relational databases that can be monitored by Storage Resource agents, see the [IBM Spectrum Control interoperability matrix](#) and go to the *Agents, Servers and Browsers* section.
- The reporting of HBA, fabric topology, or zoning information for fabrics that are connected to hosts that are running Linux on IBM® System z® hardware. These limitations also apply to Storage Resource agents on all guest operating systems for VMware configurations.

Required authorities for deploying and running Storage Resource agents

Before you can create deployment schedules and deploy Storage Resource agents on target computers, you must meet the following requirements:

- To create deployment schedules, you must be logged in to IBM Spectrum Control with a user ID that has the Administrator role. For information about user roles, see [Authorizing users](#).
- To deploy Storage Resource agents on target computers, you must provide a user ID that has administrative rights on those computers. You enter this ID when you create a deployment schedule. IBM Spectrum Control uses this ID to log on to the target computers and install and configure the necessary runtime files for the agents.

The user under which a Storage Resource agent (daemon or non-daemon) runs must have the following authorities on the target computers:

- On the Linux or AIX operating systems, the user must have root authority. By default, an agent runs under the user 'root'.
- On the Windows operating systems, the user must have Administrator authority and be a member of the Administrators group. By default, a Storage Resource agent runs under the 'Local System' account.

Orphan zones

Storage Resource agents do not collect information about orphan zones. An orphan zone is a zone that does not belong to at least one zoneset.

Firewalls and Storage Resource agent deployments

Before you can deploy a Storage Resource agent on a computer, you must turn off the firewall on that computer. If you do not turn off the firewall, the deployment fails.

Deploying Storage Resource agents on multiple computers

If you deploy Storage Resource agents on multiple computers at the same time, the computers must have the same administrative user ID and password. IBM Spectrum Control uses these user credentials to log on to the computers when you install Storage Resource agents.

Tip: When you deploy Storage Resource agents on multiple computers, a globally unique identifier (GUID) is created for each computer (if one does not exist).

Communication between the IBM Spectrum Control server and a Storage Resource agent

The IBM Spectrum Control server connects to a monitored computer when a Storage Resource agent is deployed and whenever a data collection schedule runs against that agent.

During deployment, the server communicates with the target computer by using one of the following protocols:

- Windows server message block protocol (SMB)
- Secure Shell protocol (SSH)
- Remote execution protocol (REXEC)
- Remote shell protocol (RSH)

After deployment, the type of communication between the server and agent on that computer depends on whether you deployed the agent as daemon service or non-daemon service.

Daemon and non-daemon services

You can deploy a Storage Resource agent as a daemon or non-daemon service:

- A Storage Resource agent that is deployed as a daemon service runs in the background on the monitored computer and listens for requests from the IBM Spectrum Control server. Connectivity between the server and agent is established by using SSL. The server and agent have their respective certificates and no additional information is required besides those certificates and the security that is provided by the SSL protocol.
- A Storage Resource agent deployed as a service on demand (non-daemon service) runs as a stand-alone executable file on the monitored computer. Communication from the server to the agent uses the same protocol that was used during the deployment of the agent. Communication from the agent to the server uses SSL.
- A Storage Resource agent that is deployed as a daemon service on AIX, Linux, and Windows servers monitors disk paths in near real-time to detect errors. When deployed as a daemon service on an AIX server, the agent also monitors disk error events in near real-time. If the Storage Resource agent detects path status changes or disk errors, they are included in the status of the disks and paths. You can define alerts so that you are notified of changes to the status of the paths on monitored disks.

Only status changes for existing paths are detected. If a new path is added, or an existing path is removed, the number of paths that is displayed is not updated immediately. The number of paths is updated after the next scheduled probe collects data.

If a disk on an AIX server has an error status and you fix the error, you might want the new status of the disk to be displayed immediately. To display the new status immediately, you must reset the status indicator for the disk. To reset the status indicator, use the **errclear** command to clear the error log. To clear the error log, use the following syntax:

```
errclear -d H -N disk_name 0
```

For example, if you fixed an error on hdisk4, and want to display the new status immediately, run the following command:

```
errclear -d H -N hdisk4 0
```

If you do not reset the status indicator for the disk, the status changes automatically after a few hours.

For information about the **errclear** command, see [errclear Command](#).

Port numbers for Storage Resource agents deployed as a daemon service

The following port numbers are used by Storage Resource agents that are deployed as daemon service:

- 9567 (For the Storage Resource agent that is deployed on the same server as IBM Spectrum Control.)
- 9510 (For Storage Resource agents that are deployed on remote servers.)

Storage Resource agents that are deployed as a non-daemon service do not use a port.

Authentication between the IBM Spectrum Control server and a Storage Resource agent

IBM Spectrum Control requires the correct authentication information (user name, password, port, certificate location, or passphrase) for monitored computers each time it communicates with Storage Resource agents on those computers. If the authentication information changes for a host computer on which a Storage Resource agent is deployed, the authentication information for that agent must be updated by using the Modify Agents > Update Credentials action on the Servers page in the GUI.

Replacing default SSL certificates

IBM Spectrum Control provides default SSL certificates for communication between the Data server and Storage Resource agent.

IBM Spectrum Control 5.2.2 uses SSL certificates with 2048-bit encryption keys whereas previous versions of IBM Spectrum Control used 1024-bit encryption keys. If you upgrade IBM Spectrum Control from a version earlier than 5.2.2, your SSL certificates are not updated automatically. If you want to use 2048-bit encryption keys with previous versions of IBM Spectrum Control, you must replace the default SSL certificates with custom SSL certificates.

For information about how to replace SSL certificates, see [Replacing default SSL certificates for the Data server and Storage Resource agents with custom SSL certificates](#).

Storage Resource agents on the same computer

You cannot deploy a Storage Resource agent on a computer where a Storage Resource agent is already installed and pointing to the same Data server. You can deploy a Storage Resource agent on the same computer as another Storage Resource agent if those agents communicate with different Data servers and use different ports when you listen for requests.

Time zones for computers that are monitored by Storage Resource agents

The time zones of computers that are monitored by Storage Resource agents are shown as Greenwich mean time (GMT) offsets in IBM Spectrum Control reports. For example, a computer in Los Angeles shows the following time zones in the By Computer report in Asset reporting:

(GMT-8:00) GMT-8:00

Connections for Linux and AIX operating systems by using Remote Shell protocol (RSH)

If RSH is configured to use a user ID and password, the connection fails. To successfully connect to a system by using RSH, you must set up the `.rhosts` file (in the home directory of the account). RSH must be configured to accept a login from the system that is running your application.

Deployments on Windows operating systems - NetBIOS setting

To install a Storage Resource agent on Windows targets, the Enable NetBIOS over TCP/IP option must be selected in the Control Panel settings for the computer's network connections properties. To set this option, complete the following steps:

1. Open Windows Control Panel. For information about how to open Windows Control Panel, see [Accessing administration tools](#).
2. Select Network and Dial-Up Connections, > some_connection > Properties > Internet Protocol (TCP/IP) > Advanced > WINS > Enable NetBIOS over TCP/IP.

To determine whether these ports are not blocked for inbound requests, see the documentation for your firewall.

To determine whether security policies are blocking the connection ports, open Administrative Tools. For information about how to open Administrative Tools, see [Accessing administration tools](#).

Depending on whether your policies are stored locally or in Active Directory, follow these directions:

Policies that are stored locally

For policies that are stored locally, complete the following steps:

1. Open Windows Administrative Services.
2. Click Local Security Policy > IP Security Policies on Local Computer.

Policies that are stored in Active Directory

For policies that are stored in Active Directory, examine the IP security policies and edit or remove filters that block the ports:

- Click Administrative Tools > Default Domain Security Settings > IP Security Policies on Active Directory.
- Click Administrative Tools > Default Domain Controller Security Settings > IP Security Policies on Active Directory.

For all Windows systems, the Server service must be running to connect to a Windows system by using the Windows protocol.

The following table lists the ports that are reserved for NetBIOS. Ensure that these ports are not blocked.

Port	Description
135	NetBIOS Remote procedure call. (Not currently used.)
137	NetBIOS name service.
138	NetBIOS datagram. (Not currently used.)
139	NetBIOS session (for file and print sharing).
445	CIFS (on Windows XP).

For Windows, shares must be shared for the Guest or Everyone accounts, and password protected sharing must be disabled. To disable password protected sharing, follow these steps:

1. Click Control Panel > Networking and Sharing Center.
2. Click Change advanced sharing settings.
3. Click the down arrow next to All Networks.
4. Select Turn off password protected sharing.
5. Click Save Changes.
6. Exit from the Control Panel.

Deployments on Windows - User Account Control (UAC) remote restrictions

To install Storage Resource agents remotely on a Windows operating system, you must disable the User Account Control (UAC) remote restrictions on the Windows operating system. User Account Control is a security component on Windows operating systems.

Tip: To disable UAC restrictions, you must modify the computer registry. Serious problems might occur if you modify the registry incorrectly. Therefore, make sure that you follow these steps carefully. For added protection, back up the registry before you modify it. Then, you can restore the registry if problems occur. For information about how to back up and restore the registry, see <http://support.microsoft.com/kb/322756/>.

To disable UAC remote restrictions, follow these steps:

1. Open the Windows Run window. For information about how to open the Run window, see [Accessing administration tools](#).
2. Enter **regedit** and click OK.
3. Locate and click the following registry subkey:

HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\ Policies\System

4. Double click the EnableLUA registry entry.
5. In the Edit DWORD (32-Bit) dialog, change the value in the Value data field from 1 to 0.
6. Click OK.
7. Exit the registry editor.

- [Planning for Storage Resource agents](#)

Creating a certificate for SSH protocol

Before you install the Storage Resource agents by using the SSH protocol, you can optionally create a certificate.

Note: The Storage Resource agent only supports either DES-EDE3-CBC encryption or no encryption for the private key used in SSH protocol communication between the server and agent. The default encryption that is used in the **ssh-keygen** command on UNIX is always DES-EDE3-CBC. However, with Windows Cygwin, the **ssh-keygen** command generates a key with AES-128-CBC encryption if a passphrase is specified. If there is no passphrase, the private key is generated without encryption. For more information about encryption, see <https://www.openssl.org/docs/man1.0.2/man1/enc.html>.

Creating a certificate for SSH protocol (non-Windows)

The Storage Resource agent only supports either DES-EDE3-CBC encryption or no encryption for the private key used in SSH protocol communication between the server and agent. The default encryption used in the **ssh-keygen** command on UNIX is always DES-EDE3-CBC but with Windows Cygwin, it is using AES-128-CBC encryption if a passphrase is specified. If there is no passphrase, the private key is generated without encryption.

To create a certificate for SSH protocol, complete the following steps:

1. Telnet to the remote machine using the root user ID.
2. To create an SSH certificate on AIX®, you must first install the following packages (if not already installed):

```
openssl.base.openssh.base.client  
openssl.base.server
```

3. Go to the directory where you want to create the certificate:

```
cd ~/.ssh
```

4. Enter **ssh-keygen -t rsa**. Accept the default names (for example, **id_rsa**).
5. Enter the passphrase.
6. Two files are created:

```
id_rsa  
    The private key.  
id_rsa.pub  
    The public key.
```

7. Create an **authorized_key** file in the same location as **id_rsa.pub** by entering the following command:

```
cat id_rsa.pub >> authorized_keys
```

8. Copy the **id_rsa** (private key) to your server machine. For example, to copy the **id_rsa** file to `:\keys\id_rsa` on the IBM Spectrum® Control server (user responses are in boldface type):

```
# ssh-keygen  
Generating public/private rsa key pair.  
Enter file in which to save the key (//.ssh/id_rsa):  
Enter passphrase (empty for no passphrase):  
Enter same passphrase again:  
Your identification has been save in //.ssh/id_rsa.  
Your public key has been save in //.ssh/id_rsa.pub.  
The key fingerprint is:  
xx:xx:xx:xx:xx:xx:xx:xx:xx:xx:xx:xx:xx:xx:xx:xx root@server  
# cat id_rsa >> authorized_keys  
# ls -l  
total 24  
-rw-r--r-- 1 root system 1743 Oct 15 09:40 authorized_keys  
-rw--- 1 root system 1743 Oct 15 09:39 id_rsa  
-rw-r--r- 1 root system 399 Oct 15 09:39 id_rsa.pub  
#
```

Note: You must copy the file in binary mode.

9. To connect to the remote system by using the private key, enter the following information in the Remote Agent Machines window of the GUI, when you install the Storage Resource agent:
 - User
 - Certificate Location (c:\keys\id_rsa)
 - Passphrase

Setting up an SSH daemon on Windows

On Windows you must run the **ssh-host-config** command.

Note: Cygwin is not a prerequisite for the Storage Resource agent on Windows. To use the SSH protocol on Windows, an SSH software program must be used because Windows does not come with an SSH service. Cygwin is a free software program providing SSH access to a Windows server. Cygwin can be used if you want to run the Storage Resource agent by using the SSH protocol.

You must be in a Cygwin window or be an X term user to create the **sshd** service. In most cases, you click the **cygwin.bat** file to start the Bash shell.

Complete the following steps:

1. Install Cygwin.
2. Set up your **sshd** service in Cygwin.
3. Create the certificate.

Installing Cygwin

To install Cygwin, go to <http://cygwin.com>. This page contains a link that displays help for the setup program and a link to download the setup program. Read the help before running the setup program. Then download the Cygwin program by clicking the **Install Cygwin now** link. Start the setup program on your computer by running the **setup.exe** program. Select the appropriate download option (**Install from Internet**, **Download from Internet**, or **Install from Local Directory**) as described in the help files.

If you are upgrading from an older version of Cygwin to a newer version, you need to remove the **sshd** service before installing the new version of Cygwin.

Accept the default installation options as they are presented to you (Root Directory, Install For, Default Text File Type, and so on). Select a download mirror that is geographically close to your location. Some sites require an FTP account before you can install Cygwin. You can either request an account or simply select another mirror.

During the installation process, a Select Packages list is displayed. Expand the plus sign (+) next to the Admin category and select **cygrunsrv** and the **Bin** check box. Expand the plus sign (+) next to the Net category and select **openssh**. Expand the plus sign (+) next to the Util category and select **diffutils**. Click **Next** to resume the setup program. The time required to download the packages depends on how busy the mirror is, and on the speed of your internet connection. With **openssh** and **cygrunsrv**, the downloaded files require approximately 70 MB of disk space. Allow 20 minutes to 30 minutes for the download and installation to complete.

Setting up your sshd service in Cygwin

Here is an example of the sequence of steps and responses. The responses to the prompts are in boldfaced type.

1. Run the **ssh-host-config** command.

Note: With Cygwin, you might experience permission problems when running the **ssh-host-config** command. If you have permission problems, run these commands:

```
chmod +r /etc/passwd
chmod +r /etc/group
chmod 777 /var
```

```
$ ssh-host-config
```

```

```

```
*** Info: Host configuration finished. Have fun!
```

2. Start the **sshd** service:

- Open a command prompt window.
- Enter **net start sshd** or in a Bash prompt, enter **cygrunsrv -S sshd**.
- Verify that the daemon is running.
- Enter **ps -a**. Examine the output to see if `/usr/sbin/sshd` is contained in the list of running processes.

To stop the service from a Windows command prompt, enter **net stop sshd**. Alternatively, you can change to the `C:\cygwin\bin` directory (or open a Bash shell) and enter **cygrunsrv -E sshd**.

3. When you have started the **sshd** service, test it by entering the following command from a Bash shell prompt:

```
ssh localhost
or
ssh host_name
```

If **localhost** does not work, use the short host name. If you receive a message indicating that the authenticity of **localhost** cannot be established, answer **Yes** to the question "Are you sure you want to continue connecting?" When prompted for your account password on **localhost**, enter the password you use when logging in to the computer.

4. Set the **TEMP** environment variable. For information about setting the environment variable, see <http://www.cygwin.com/cygwin-ug-net/setup-env.html>.

Here is an example of setting the environment variable:

- Click **My Computer** > **Properties** > **Advanced** > **Environment Variables**.
- Under **System variables**, find out the value of **TEMP**. For example, "`C:\WINNT\TEMP`".
- Set the **TEMP** environment variable to point to the Cygwin format of **TEMP** in the `~/ .bashrc` file. For example run the following command:

```
export TEMP=/cygdrive/c/WINNT/temp
```

Uncomment and modify this line in the `~/ .bashrc` file from the default:

```
# export TEMP=/tmp
to
export TEMP=/cygdrive/c/WINNT/temp
```

The Cygwin **sshd** service must be added as a service that starts automatically. To verify this step, click **Start** > **Settings** > **Control Panel** > **Administrative Tools** > **Services**. Look for **CYGBIN sshd** in the name list. Verify that it is started and configured to start automatically.

Creating the certificate

To create a certificate for SSH protocol, complete the following steps:

1. Run this command:

```
cd ~/.ssh
```

2. Generate the public and private keys with a passphrase. The passphrase is required.

From the Bash shell prompt, here is an example of the input and output (user responses are in boldface type):

```
Administrator ~/.ssh
$ openssl genrsa -des3 -out key 1024
Generating RSA private key, 1024 bit long modulus
.....+++++
.....+++++
e is 65537 (0x10001)
Enter pass phrase for key:passphrase
Verifying - Enter pass phrase for key:passphrase

Administrator ~/.ssh
$ chmod 600 ~/.ssh/key
$ ssh-keygen
Generating public/private rsa key pair.
Enter file in which to save the key (/home/Administrator/.ssh/id_rsa): key_pairs
Enter passphrase (empty for no passphrase):passphrase
Enter same passphrase again:passphrase
Your identification has been saved in key_pairs.
Your public key has been saved in key_pairs.pub.
The key fingerprint is:
SHA256:ew0Octa24Qw917tRqPcn9hETlRakksKcTgGrPkh4UZs Sheila@IBM243-PC0CJ5EF
The key's randomart image is:
+---[RSA 2048]-----+
|  . . . . .o+ |
|  . o + o . .o |
|  . E . * o . . |
|  . . . oo . . . |
|  . o . . S.B . oo |
|  o o + O B . oo |
|  . o . * o + . |
|  . . . .o+o |
|  . . . .o+ |
+---[SHA256]-----+
Administrator ~/.ssh
$ cat id_rsa.pub >> authorized_keys
$
```

3. Copy the **id_rsa** (private key) to the IBM Spectrum Control server.

4. To connect to the remote system by using the private key, enter the following information in the GUI, when you install the Storage Resource agent:

- User
- Certificate Location (`c:\keys\id_rsa`)

- Passphrase

Replacing default SSL certificates for the Data server and Storage Resource agents with custom SSL certificates

IBM Spectrum® Control provides default SSL certificates for communication between the Data server and Storage Resource agent. You can replace the default SSL certificates. You must use the script that is provided by IBM Spectrum Control to generate new SSL certificates. You cannot use any third-party tools to generate the custom SSL certificates.

Overview of replacing default SSL certificates for the Data server and Storage Resource agents

IBM Spectrum Control uses SSL certificates for communication between the Data server and Storage Resource agents. IBM Spectrum Control provides default SSL certificates for this communication. If you want to generate new certificates, you can replace the default SSL certificates with updated SSL certificates.

Data server certificate

The IBM Spectrum Control Data server uses the **TPCDataServer.jks** and **server.pwd** files for communication with the Storage Resource agents. If you use custom SSL certificates, you must replace these files.

Storage Resource agent certificate

The Storage Resource agent uses the **sra.pem** and **sra.pwd** files for communication with the Data server. These two files are compressed into the **certs.zip** file on the IBM Spectrum Control server system for Storage Resource agent deployment purposes. If you use custom SSL certificates, you must replace these files.

These general steps are for replacing the default SSL certificates:

1. Generate the custom SSL certificates.
2. Stop the Data server and all Storage Resource agents, including the one on the IBM Spectrum Control server.
3. Replace the default SSL certificate for the Data server and all Storage Resource agents. Also, replace the default SSL certificate for the Storage Resource agents in the IBM Spectrum Control installation image or in the Storage Resource agent installation image.
4. Start the Data server and all Storage Resource agents, including the one on the IBM Spectrum Control server.

Important: When you generate custom SSL certificates, the certificates have a start date, end date, and time when they are valid. These dates and times are related to the system where these custom certificates were generated (which is usually the server system). When you install a Storage Resource agent on a remote system, you must check the date and time on the Storage Resource agent system. If the server and agent systems are in the same time zone, they must have the same date and time. Otherwise, the time zone difference must be set.

For example, if the server system is 8:00 PM, the agent system must also be 8:00 PM. If the agent system is set at a different time (for example, 6:00 PM) at the time the SSL custom certificates are generated on the server system with a time of 8:00 PM, the deployment of the Storage Resource agent fails.

How to generate custom SSL certificates

The **createSRACerts.sh** script (for Linux® or UNIX) or the **createSRACerts.bat** file (for Windows) is located in the following directory:

installation_dir/data/sra/tools/certs

Where **installation_dir** is the directory where the IBM Spectrum Control servers are installed. The default directory is **/opt/IBM/TPC** for Linux or UNIX or **C:\Program Files\IBM\TPC** for Windows.

To replace the default SSL certificates, follow these steps:

1. Create the custom SSL certificates.

The **createSRACerts** script creates the custom SSL certificates.

The syntax is:

output_directory

Directory where the certificates are created. You must provide a valid directory. The script creates the **sra_certs_out** subdirectory and places the certificate files in that subdirectory.

rootCAPassword

Root CA password (root certificate authority password). You can enter a new root certificate authority password or you can enter the default root certificate authority password: **s5umEvApR6cafruhustu**.

server_key_password

Server key password. You can enter a new server key password or you can enter the default server key password: **drUtaxahaswefraf9uth**.

server_store_password

Server store password. You can enter a new server store password or you can enter the default server store password: **wr4d5Xekaqafeh5u2a**.

agent_password

Agent password. You can enter a new agent password or you can enter the default agent password: **jawUchezuthew6azEjef**.

Important: The **createSRACerts** script strictly assumes the order of the command line parameters **output_directory**, **rootCAPassword**, **server_key_password**, **server_store_password**, and **agent_password**. For example, if you want to pass the **rootCAPassword** parameter to the script, the **rootCAPassword** parameter must be the second argument to the script and you must also pass the **output_directory** parameter as the first argument to the script.

Another example: If you want to pass the **server_store_password** parameter to the script, the **server_store_password** parameter must be the fourth argument to the script and you must also pass the **server_key_password** parameter as the third argument, the **rootCAPassword** parameter as the second argument, and the **output_directory** parameter as the first argument to the script.

Important: During the script generation, the script prompts you twice for the pass phrase for `tpcrootca.key`. If you enter a new root certificate authority password on the command line when you run the script, enter that same new root certificate authority password at each prompt. If you enter the default root certificate authority password on the command line when you run the script or you do not enter the root certificate authority password on the command line at all when you run the script, enter the default root certificate authority password at each prompt. The following example creates the SSL certificates by using the default passwords and placing the certificate files in the `sra_certs_out` subdirectory of the current working directory:

```
createSRACerts .
```

The following examples create the SSL certificates by using the default passwords and placing the certificate files in `C:\Temp\sra_certs_out\` on Windows and in `/tmp/sra_certs_out/` on UNIX or Linux.

Windows

```
createSRACerts C:\temp
```

UNIX or Linux

```
./createSRACerts.sh /tmp
```

The following examples create the SSL certificates by using new passwords for the root certificate authority password and the server key password and placing the certificate files in the `C:\Temp\sra_certs_out\` directory on Windows and in the `/tmp/sra_certs_out/` directory on UNIX or Linux:

Windows

```
createSRACerts C:\temp newpasswordforrootCA newpasswordforserver
```

UNIX or Linux

```
./createSRACerts.sh /tmp newpasswordforrootCA newpasswordforserver
```

2. Generate the certificates again if you have a failure. Delete the files in the output directory before you rerun the `createSRACerts` script.
3. Stop all Storage Resource agents and the Data server.
For more information about starting or stopping IBM Spectrum Control services, see [Starting and stopping the IBM Spectrum Control servers](#).
4. Replace the certificate files:
 - Replace the certificate files for the Data server.
 - Replace the certificate files for the local Storage Resource agent that runs on the IBM Spectrum Control server.
 - Replace the certificate files for the remote Storage Resource agents that run on computers other than the IBM Spectrum Control server.
 - Replace the certificate files in the locations used for future installations of the remote Storage Resource agents.

Replace the certificate files for the Data server.

The new Data server certificate files are created in the following directory:

```
output_directory/sra_certs_out/server
```

By default, the `output_directory` is the directory where the `createSRACerts` script is run:

```
installation_dir/data/sra/tools/certs
```

These files are the Data server certificate files:

```
TPCDataServer.jks  
server.pwd
```

Copy the Data server certificate files to the following directory:

```
installation_dir/data/sra/certs
```

Replace the certificate files for the local Storage Resource agent that runs on the IBM Spectrum Control server.

The new Storage Resource agent certificates are created on the IBM Spectrum Control server in the following directory:

```
output_directory/sra_certs_out/agent
```

By default, the `output_directory` is the directory where the `createSRACerts` script is run:

```
installation_dir/data/sra/tools/certs
```

The Storage Resource agent certificate file is:

```
certs.zip
```

Copy the Storage Resource agent certificate file to the following directory on the IBM Spectrum Control server:

```
installation_dir/data/sra/server_operating_system
```

Where `server_operating_system` is the operating system on which the IBM Spectrum Control Data server is installed.

Extract the Storage Resource agent certificate file in the following directory on the IBM Spectrum Control server:

```
installation_dir/agent
```

Replace the certificate files for the remote Storage Resource agents that run on computers other than the IBM Spectrum Control server

The new Storage Resource agent certificates are created on the IBM Spectrum Control server in the following directory:

```
output_directory/sra_certs_out/agent
```

By default, the `output_directory` is the directory where the `createSRACerts` script is run:

```
installation_dir/data/sra/tools/certs
```

The Storage Resource agent certificate file is:

certs.zip

Copy the Storage Resource agent certificate file to the following directories on the IBM Spectrum Control server:

installation_dir/data/sra/remote_agent_operating_system

Where *remote_agent_operating_system* is an operating system on which a remote Storage Resource agent is installed.

Extract the Storage Resource agent certificate file in the following directory on the computer where the remote Storage Resource agent is installed:

installation_dir/agent

Replace the certificate files in the locations used for future installations of remote Storage Resource agents.

The new Storage Resource agent certificates are created on the IBM Spectrum Control server in the following directory:

output_directory/sra_certs_out/agent

By default, the **output_directory** is the directory where the **createSRACerts** script is run::

installation_dir/data/sra/tools/certs

The Storage Resource agent certificate file is:

certs.zip

Copy the Storage Resource agent certificate file to the following directories on the IBM Spectrum Control server:

installation_dir/data/sra/future_remote_agent_operating_system

Where *future_remote_agent_operating_system* is an operating system on which you install a Storage Resource agent some time in the future.

Restriction: This process assumes that the Storage Resource agent disk image can be modified. You must copy the installation files to a writable location before proceeding.

Before the Storage Resource agent can be installed locally, the new certificate must be copied to the agent system. Copy the new **certs.zip** Storage Resource agent certificate file from the **output_directory/sra_certs_out/agent** directory on the IBM Spectrum Control server to the agent system.

- a. On the agent system, extract the Storage Resource agent installation image in the **SRA_image_install_directory**.
- b. Copy the new **certs.zip** file into the following directory:

SRA_image_install_directory/sra/agent_operating_system

- c. Extract the new **certs.zip** file in the following directory:

SRA_image_install_directory/sra/agent_operating_system

Note: The **SRA_image_install_directory** value is the directory where the Storage Resource agent image was extracted and *agent_operating_system* is the directory that is named for the operating system that is running on the computer where you intend to install the Storage Resource agent.

- d. Install the Storage Resource agent with the wanted options.

5. Start the Data server and Storage Resource agents.

For more information about starting or stopping IBM Spectrum Control services, see [Starting and stopping the IBM Spectrum Control servers](#).

Configuration guidelines for 500 or more agents

You can use this information to help you manage 500 or more Storage Resource agents in IBM Spectrum® Control.

About this task

If you have 500 or more Storage Resource agents communicating with IBM Spectrum Control, complete the following steps:

Procedure

1. Probe the servers at least once a day or more, depending on when you want to test for alert conditions.
2. Set the following parameters in the **server.config** file:

MaxConnections=1200

The default is 500. Agents can have multiple connections to the server.

routerThreads=3 (max)

Incoming connections need to be routed to the correct Data Manager "service" queue and can stack up behind this thread. The server service runs the router and the agent service is where the connections are queued once routed and saved by any of three threads here to the repository.

3. Set the following parameter in the **Scheduler.config** file:

MaxSubmitthreads=8

Tells how many threads are used to tell the agents to start a job. Agent connections can queue up the scheduler service. After a job is run, the agent makes a connection to communicate with this thread to give it the job status.

Including a Storage Resource agent with a server golden image

If you use a golden operating system image to deploy new servers in your environment, you can include the Storage Resource agent on that golden image. The golden image enables the agents to start and register with the IBM Spectrum® Control server automatically upon deployment. This support applies only to Storage Resource agents running in daemon mode.

About this task

The default agent directory is:

- For Windows: `C:\Program Files\IBM\TPC\agent`
- For UNIX: `/opt/IBM/TPC/agent`

Follow these instructions to include the IBM Spectrum Control agent on a golden image.

Procedure

1. Install the Storage Resource agent in daemon mode on the golden image system.
2. Stop the Storage Resource agent on the golden image system.
For the Windows system: Click `Start > Settings > Control Panel > Administrative Tools > Services`. Stop the following service: IBM Spectrum Control Storage Resource Agent - *directory*. *directory* is where the Storage Resource agent is installed. The default directory is `installation_dir\agent`.

For the UNIX or Linux® system, run the following commands:

```
cd /opt/IBM/TPC/agent/bin/  
./agent.sh stop
```

3. Create one of the following files in the root directory for the agent. These files can be empty. Any content in these files is ignored.

REGISTERSRA

The file name must be uppercase with no file extension. This file causes the agent to run a probe and then register with the server. This file will use the existing Globally Unique Identifier (GUID).

REGISTERSRA_REGENGUID

The file name must be uppercase with no file extension. This file causes the agent to regenerate a new Globally Unique Identifier (GUID), run a probe, and then register with the server.

4. Delete the contents of the `agent_installation_directory/logs` directory. This clears any existing log messages so that you can view new messages that are logged.
5. Create the golden image copies of this system.
6. When a new system is preinstalled from this image and then started, the REGISTERSRA or REGISTERSRA_REGENGUID file is run. The Storage Resource agent automatically registers with the new IBM Spectrum Control server. You can then use the GUI to manage the Storage Resource agent deployment. For example, to confirm that the Storage Resource agent was deployed successfully, go to the Servers page and refresh the list.

Checking for a fully qualified host name

IBM Spectrum® Control requires fully qualified host names. Some machines might be configured to return a short host name, such as `system1` instead of a fully qualified host name, such as `system1.tpc.example.com`. This topic provides information on how to check for a fully qualified host name.

- [Checking for a fully qualified host name for AIX systems](#)
This topic provides information on how to verify a fully qualified host name for AIX®.

This topic provides information on how to verify a fully qualified host name for Linux®.
- [Checking for a fully qualified host name for Oracle Solaris](#)
This topic provides information about how to verify a fully qualified host name for Oracle Solaris systems.
- [Checking for a fully qualified host name for Windows systems](#)
Verify the fully qualified host name on Windows operating systems.

Checking for a fully qualified host name for AIX systems

This topic provides information on how to verify a fully qualified host name for AIX®.

About this task

The default domain name search order is as follows:

1. Domain Name System (DNS) server
2. Network Information Service (NIS)
3. Local `/etc/hosts` file.

If the `/etc/resolv.conf` file does not exist, the `/etc/hosts` file is used. If only the `/etc/hosts` file is used, the fully qualified computer name must be the first one that is listed after the IP address.

Verify that the `/etc/resolv.conf` file exists and contains the appropriate information, such as:

```
domain mydivision.mycompany.com
nameserver 123.123.123.123
```

If NIS is installed, the `/etc/irs.conf` file overrides the system default. It contains the following information:

```
hosts = bind,local
```

The `/etc/netsvc.conf` file, if it exists, overrides the `/etc/irs.conf` file and the system default. It contains the following information:

```
hosts = bind,local
```

If the NSORDER environment variable is set, it overrides all of the preceding files. It contains the following information:

```
export NSORDER=bind,local
```

Checking for a fully qualified host name for Linux systems

This topic provides information on how to verify a fully qualified host name for Linux®.

About this task

Linux uses a resolver library to obtain the IP address corresponding to a host name. The `/etc/host.conf` file specifies how names are resolved. The entries in the `/etc/host.conf` file tell the resolver library what services to use, and in what order, to resolve names. Edit the `host.conf` file using the `vi` editor to add the following lines:

```
# Lookup names through DNS first then fall back to /etc/hosts.
order bind,hosts
# Machines with multiple IP addresses.
multi on
# Check for IP address spoofing.
nospoof on
```

The **order** option indicates the order of services. The sample entry specifies that the resolver library should first consult the name server to resolve a name and then check the `/etc/hosts` file. It is recommended to set the resolver library to first check the name server, **bind** file, and then the **hosts** file (hosts) for better performance and security on all your servers. You must have the DNS and BIND software installed for this configuration to work.

The **multi** option determines whether a host in the `/etc/hosts` file can have multiple IP addresses. Hosts that have more than one IP address are said to be multihomed, because the presence of multiple IP addresses implies that the host has several network interfaces.

The **nospoof** option takes care of not permitting spoofing on this machine. IP-Spoofing is a security exploit that works by tricking computers into a trust relationship that you are someone that you really are not. In this type of attack, a machine is set up to look like a legitimate server and then issue connections and other types of network activities to legitimize end systems, other servers, or large data repository systems. This option must be set ON for all types of servers.

Checking for a fully qualified host name for Oracle Solaris

This topic provides information about how to verify a fully qualified host name for Oracle Solaris systems.

About this task

Verify that the `/etc/resolv.conf` file exists and contains the appropriate information, such as:

```
domain mydivision.mycompany.com
nameserver 123.123.123.123
```

A short name is used if the `/etc/nsswitch.conf` file contains a line that begins as follows and if the `/etc/hosts` file contains the short name for the computer:

```
hosts: files
```

To correct this problem, follow these steps:

Procedure

1. Change the line in the `/etc/nsswitch.conf` file to the following:

```
hosts: dns nis files
```

2. Enter the following command to stop the **inet** service:

```
/etc/init.d/inetd stop
```

3. Enter the following command to restart the **inet** service:

```
/etc/init.d/inetd start
```

Checking for a fully qualified host name for Windows systems

Verify the fully qualified host name on Windows operating systems.

Procedure

1. Choose one of these options:

Option	Description
Windows Server 2012	a. On the Dashboard page, hover the mouse over the lower left corner of the page next to the Server Manager taskbar button, and then click Start. b. Click Control Panel, and then click System. c. Click Change Settings, click Change, and then click Change again.
Windows Server 2012 R2, Windows Server 2016, Windows Server 2019	a. Click Start, Control Panel, System and Security. b. Click System, and then click Change Settings. c. On the Computer Name tab, click Change.

2. In the Computer name field, enter the fully qualified host name, and then click More.
3. Verify that the Primary DNS suffix field contains a domain name, and then click OK.

Granting local administrative privileges to a domain account

Automatically grant administrative privileges to Windows domain accounts. The user account for the Storage Resource agent requires local administrative rights. Because these rights are not necessarily guaranteed for domain users in a Windows domain environment, you are shown how to grant local administrative rights to domain users. Using this procedure, you do not have to manually process each machine in the domain.

About this task

Note: These steps are for a Windows system that is a member of a Windows domain and not for the Windows Domain Primary Domain Controller. To use Group Policy to grant local administrative privileges to a domain account, complete the following steps:

Procedure

1. On the domain controller, go to Administrative Tools, Active Directory Users and Computers (you must be running with Domain Administrator privileges).
2. Right-click on the Organizational Unit (OU) upon which you want to apply the Group Policy. Click Properties.
3. The Group Policy Properties panel is displayed. Select the Group Policy tab and click New to create a Group Policy.
4. Designate a name for the new Group Policy. Select the new Group Policy and click Edit.
5. The Group Policy Object Editor panel is displayed. Go to New Group Policy Object *your_policy*, Computer Configuration, Windows Settings, Security Settings, Restricted Groups. Right-click Restricted Groups, and then click Add Group.
6. For example, name the new group Administrators. Under Properties, add the user Administrator, and the domain accounts or groups upon which you want the Group Policy in effect for. For example, you can add TPC\storageadmin, TPC\storagegroup, and TPC\TestGroup. Click OK.
7. Add these user rights to the domain account:
 - Act as part of the operating system
 - Log on as a serviceIn the Group Policy Object Editor, go to New Group Policy Object *your_policy*, Computer Configuration, Windows Settings, Security Settings, Local Policies, User Rights Assignments. In the content pane, select "Log on as a service" and double-click. Add the domain user for whom you are granting user rights and click OK. Repeat this step for "Act as part of the operating system."
8. The group policy is now enforced for the Organizational Unit to include the domain accounts and groups specified under the local Administrators group on each computer in the Organizational Unit. In addition, the domain user has been granted the necessary rights. To verify the user rights, log in to a domain computer and open the Computer Management console. Select Groups, double-click the Administrators group, and verify the membership of the domain users.

Importing authentication information for a Storage Resource agent

The Storage Resource agent is installed as a non-daemon or daemon process. IBM Spectrum® Control stores the authentication information to connect to the host on which the Storage Resource agent has installed for the non-daemon agent. This authentication information can be changed depending on the environment.

To change the authentication information for a Storage Resource agent for non-daemon service, follow these steps:

1. Export the authentication information for a Storage Resource agent.
2. The data file exported contains information such as the host name, user ID, password, certificate location, and passphrase for every agent selected. The information is separated by the pipe character (|). For example,

```
agent_host|user|password|certificate|passphrase
```

You can update the password or passphrase in encrypted format or plain text format. If you want to update the password or passphrase in encrypted format, then you can use the **tpctool**. For example, go to this directory and run the **tpctool**:

```
cd installation_dir/cli
tpctool encrypt string_to_be_encrypted
```

This generates an encrypted string. Place this string in the data file to be imported and add @ENC@ to the end of the encrypted string. For example,

```
agent_host|usera|encrypted_password@ENC@|certificate|
encrypted_passphrase@ENC@
```

encrypted_password is the encrypted string for the password and *encrypted_passphrase* is the encrypted string for the passphrase.

3. Import the data file.

Installing and configuring the IBM Spectrum Control server with multiple NIC cards

If your IBM Spectrum® Control server has multiple network interface cards (NIC), install the IBM Spectrum Control server using a fully qualified hostname that resolves to the IP address of NIC card you want to use. After you install the server, all incoming and outgoing communication are successfully handled.

Installing IBM Spectrum Control for a multiple network configuration

If the IBM Spectrum Control server you are installing has multiple NIC, and is configured to use multiple network addresses, ensure that you use the fully qualified hostname that resolves to the appropriate IP address during installation. You can either setup the HOSTS file or the DNS to resolve the fully qualified host names to appropriate IP addresses.

Outgoing communication initiated by the IBM Spectrum Control server

All the outgoing communication that is initiated by the IBM Spectrum Control server is not affected if the server is configured for a multiple network environment.

For example, if you have a IBM Spectrum Control server with two IP addresses: 10.10.10.11 and 9.9.9.10, and 10.10.10.11 is used during installation, all outgoing transmissions can be sent to the devices and agents in both networks.

The following list includes examples of outgoing communication that is initiated by the IBM Spectrum Control server:

- Storage systems using native interfaces
 - Run probe, performance monitor, and provisioning. Examples of storage systems that use the native interface include SAN Volume Controller, Storwize® V7000 Unified, Storwize V7000, and XIV® system.
- Switches (SNMP and SMIS-S providers)
 - Run SNMP and SMI-S provider probes.
- SMI-S providers
 - IBM Spectrum Control uses SMI-S providers (CIM agents) for the managed objects to gather information about the resource.
- VMware vCenter
 - Run probes.
- Agents (Storage Resource agents)
 - Deploy agents, run data collection, and run scripts.
- IBM Spectrum Control servers
 - Run data collection.

Incoming communication that is initiated by the resources, agents, and GUI

Incoming communication that is initiated by the resources or agents can work with only the IP address that is specified during the installation with the exception of DS8000® events.

For DS8000 events, the IBM Spectrum Control server must initiate and establish a socket connection directly with the Hardware Management Console (HMC) to receive events. The DS8000 HMC uses that socket connection to send events. As long as the IBM Spectrum Control server can initiate the communication to the HMC, DS8000 events can be received.

IBM Spectrum Control informs resources and agents to initiate communication to the IP address provided during the installation. This example uses the IP address 10.10.10.11. However, depending on the communication, you might be able to change the IP address. For example, IBM Spectrum Control does not configure SAN switches to send SNMP traps to IBM Spectrum Control, so you can use either 9.9.9.10 or 10.10.10.11.

The following list includes examples of incoming communication that are initiated by the resources, agents, and the GUI:

- DS8000 events
 - Events sent by the HMC to the IBM Spectrum Control server
- SNMP trap notifications
 - SNMP traps sent from the switches and other resources
- CIM indications
 - Indications sent by the SMI-S providers (CIM agents).
- Servers (agents)
 - Job results and registration
- IBM Spectrum Control GUI
 - Any request.

CIM indications

A CIM indication is an event that occurs on a managed object, for example, the completion or failure of an operation. The CIM indications are managed by the CIM object manager. IBM Spectrum Control uses the SMI-S providers for the managed objects to gather information about the resource.

Manually customize CIM indications on a IBM Spectrum Control system that has multiple IP addresses. To configure IBM Spectrum Control to receive CIM indications in an IPv4, IPv6, and dual stack (IPv4 and IPv6) environment, see [Configuring IBM Spectrum Control with multiple IP addresses](#).

The manual customization task does not apply to storage devices that use the native interfaces.

Replacing the default SSL certificate for the Device, Alert, or Web server with a self-signed certificate

To replace the default SSL certificate for the Device, Alert, or Web server, with a self signed certificate, use the IBM® Key Management (iKeyman) utility.

About this task

If you have strong security requirements, you might want to replace the default certificate for the Web server, with a self-signed certificate so that you can securely connect to the Web server while you use the `https` protocol.

Procedure

1. Log on to the server where IBM Spectrum® Control is installed. Ensure that you log on with the appropriate user privileges.
2. Open the `/jre/bin` directory where IBM Spectrum Control is installed.
3. Enter the iKeyman utility command.
For Windows operating system, enter the following command:

```
ikeyman.exe
```

For AIX® or Linux® operating system, enter the following command:

```
./ikeyman
```
4. Click Key Database File > Open.
5. Complete the following tasks:
 - a. Set the Key database type to PKCS12.
 - b. In the **File Name** field, click Browse. Note: You can replace only one certificate at a time.
To replace the default SSL certificate for the Device server, go to the `installation_dir/wlp/usr/servers/deviceServer/resources/security/` directory, select the `key.p12` file, and click Open.

To replace the default SSL certificate for the Alert server, go to the `installation_dir/wlp/usr/servers/alertServer/resources/security/` directory, select the `key.p12` file, and click Open.

To replace the default SSL certificate for the Web server, go to the `installation_dir/wlp/usr/servers/webServer/resources/security/` directory, select the `key.p12` file, and click Open.
 - c. Click OK.
6. On the Password Prompt page, type `default`, and click OK.
The Personal Certificates list contains only the certificate with the `default` label.
To replace the default certificate with a new self-signed certificate, complete the following tasks:
 - a. Click New Self-Signed.
 - b. On the Create New Self-Signed Certificate page, enter a unique value in the Key Label field.
 - c. Provide values for the other fields, and click OK.
The list of Personal Certificates contains your new self-signed certificate with the label that you provided and the old self signed certificate with the `default` label.
 - d. Select the old self signed certificate with the `default` label and click Rename.
 - e. Enter a new label for the old self signed certificate, and click OK.
 - f. Select the new self signed certificate and click Rename.
 - g. Enter `default` as the new label, for the new self-signed certificate, and click OK.
7. In the iKeyman utility, click Key Database File > Exit.
8. Stop and start the Device, Alert, or Web server.

Related tasks

- [Updating IBM Spectrum Control data collector trusted certificates after replacing default SSL certificate for the Device server with a self-signed certificate OR an external certificate](#)

Replacing the default SSL certificate for the Device, Alert, or Web server with a certificate from an external certificate authority

To replace the default SSL certificate for the Device, Alert, or Web server, with a certificate from an external certificate authority, use the IBM® Key Management (iKeyman) utility.

About this task

If you have strong security requirements, you might want to replace the default certificate for the Web server, with a certificate from an external certificate authority so that you can securely connect to the Web server while you use the `https` protocol. When you replace the existing certificate, it can remove web browser certificate error warnings.

Procedure

1. Log on to the server where IBM Spectrum® Control is installed. Ensure that you log on with the appropriate user privileges.
2. Open the `/jre/bin` directory where IBM Spectrum Control is installed.
3. Enter the iKeyman utility command.
For Windows operating system, enter the following command:

```
ikeyman.exe
```

For AIX® or Linux® operating system, enter the following command:

```
./ikeyman
```

4. Click Key Database File > Open.
 5. Complete the following tasks:
 - a. Set the Key database type to PKCS12.
 - b. In the **File Name** field, click Browse. Note: You can replace only one certificate at a time.
 To replace the default SSL certificate for the Device server, go to the `installation_dir/wlp/usr/servers/deviceServer/resources/security/` directory, select the key.p12 file, and click Open.

 To replace the default SSL certificate for the Alert server, go to the `installation_dir/wlp/usr/servers/alertServer/resources/security/` directory, select the key.p12 file, and click Open.

 To replace the default SSL certificate for the Web server, go to the `installation_dir/wlp/usr/servers/webServer/resources/security/` directory, select the key.p12 file, and click Open.
 - c. Click OK.
 6. In the iKeyman utility, select Create > New Certificate Request.
 7. Enter a unique value in the Key Label field and provide values for the other fields.
 8. Pay special attention to the value you provide in the Enter the name of a file in which to store the certificate request field and click OK.
 A message is displayed that informs you the location of the file that contains your new certificate request. You need to send the new certificate request file to your external certificate authority.
 9. On the Message page, click OK.
 The external certificate authority signs your new certificate request and sends back your new certificate. The external certificate authority might send their signer certificate or the external certificate authority might assume that you already have their signer certificate in the key database file.
 If the external certificate authority sends their signer certificate, complete the following tasks:
 - a. Select Signer Certificates and click Add.
 - b. Provide the File Name and Location values of the file that contains the Signer Certificate and click OK.
 - c. Enter a label for the signer certificate, and click OK.
 If the external certificate authority assumes that you already have their signer certificate in the key database file, complete the following tasks:
 - d. Select Signer Certificates and click Populate.
 - e. Search the lists of CA Certificates, select the one or the ones for the external certificate authority that signed your new certificate request, and click OK.
 If the lists of CA Certificates do not contain the one(s) for the external certificate authority that signed your new certificate request, ask your external certificate authority to send their signer certificate.
 After you have the signer certificate for the external certificate authority in the keystore, complete the following tasks to receive the new certificate signed by the external certificate authority:
 - f. Select Personal Certificates and click Receive.
 - g. Provide the File Name and Location values of the file that contains your new certificate from the external certificate authority and click OK.
 - h. Select the old self-signed certificate with the `default` label and click Rename.
 - i. Enter a new label for the old self-signed certificate and click OK.
 - j. Select your new certificate from the external certificate authority and click Rename.
 - k. Enter `default` as the new label for the new certificate from the external certificate authority and click OK.
 10. In the iKeyman utility, click Key Database File > Exit.
 11. Stop and start the Device, Alert, or Web server.
- [Updating IBM Spectrum Control data collector trusted certificates after replacing default SSL certificate for the Device server with a self-signed certificate OR an external certificate](#)
 Use the **keytool** command to update the IBM Spectrum Control data collector trusted certificates after you replace the default SSL certificate for the IBM Spectrum Control Device server.

Related tasks

Updating IBM Spectrum Control data collector trusted certificates after replacing default SSL certificate for the Device server with a self-signed certificate OR an external certificate

Use the **keytool** command to update the IBM Spectrum® Control data collector trusted certificates after you replace the default SSL certificate for the IBM Spectrum Control Device server.

About this task

If you replace the default SSL certificate for the IBM Spectrum Control Device server, you must update the IBM Spectrum Control data collector trusted certificates or else the data collector does not communicate properly with the Device server.

Procedure

1. Log on to the server where IBM Spectrum Control is installed. Ensure that you log on with the appropriate user privileges.
2. Stop the Device server.
3. Open the `/jre/bin` directory where IBM Spectrum Control is installed.
4. Enter the following command to export the default SSL certificate from the Device server keystore.
 For Windows operating system, enter the following command:

```
keytool.exe -exportcert -alias default  
-keystore "installation_dir\wlp\usr\servers\deviceServer\resources\security\key.p12" -storetype pkcs12  
-storepass device_server_keystore_password -file deviceServer.cert
```

Where *device_server_keystore_password* is the Device server keystore password and the default value for this password is *default*.

For AIX® or Linux® operating system, enter the following command:

```
./keytool -exportcert -alias default  
-keystore installation_dir/wlp/usr/servers/deviceServer/resources/security/key.p12 -storetype pkcs12  
-storepass device_server_keystore_password -file deviceServer.cert
```

Where *device_server_keystore_password* is the Device server keystore password and the default value for this password is *default*.

5. Enter the following command to delete the previous IBM Spectrum Control Device server SSL certificate from the IBM Spectrum Control data collector trusted certificates.

For Windows operating system, enter the following command:

```
keytool.exe -delete -alias deviceServer -keystore "installation_dir\jre\lib\security\cacerts" -storepass  
data_collector_keystore_password
```

Where *data_collector_keystore_password* is the IBM Spectrum Control data collector keystore password and the default value for this password is *changeit*.

For AIX or Linux operating system, enter the following command:

```
./keytool -delete -alias deviceServer -keystore installation_dir/jre/lib/security/cacerts  
-storepass data_collector_keystore_password
```

Where *data_collector_keystore_password* is the IBM Spectrum Control data collector keystore password and the default value for this password is *changeit*.

6. Enter the following command to add the default SSL certificate from the IBM Spectrum Control Device server to the IBM Spectrum Control data collector trusted certificates.

For Windows operating system, enter the following command:

```
keytool.exe -importcert -noprompt -trustcacerts -alias deviceServer -file deviceServer.cert  
-keystore "installation_dir\jre\lib\security\cacerts" -storepass data_collector_keystore_password
```

Where *data_collector_keystore_password* is the IBM Spectrum Control data collector keystore password and the default value for this password is *changeit*.

For AIX or Linux operating system, enter the following command:

```
./keytool -importcert -noprompt -trustcacerts -alias deviceServer -file ./deviceServer.cert  
-keystore installation_dir/jre/lib/security/cacerts -storepass data_collector_keystore_password
```

Where *data_collector_keystore_password* is the IBM Spectrum Control data collector keystore password and the default value for this password is *changeit*.

7. Start the Device server.

Related tasks

- [Starting and stopping the IBM Spectrum Control servers](#)

Replacing the default SSL certificate for the Export server

You can replace the default SSL certificate for the Export server by adding the certificate and private key file to the appropriate directory and restarting the Export server.

About this task

The Export server is used by the Web server to generate certain types of reports. By default, the certificate for the Export server is self-signed and the corresponding private key does not have a password. However, if you have strong security requirements, you might want to replace the default certificate and the corresponding private key used by the Export server.

Procedure

1. Stop the Export server.
2. If your signed certificate has an accompanying chain certificate, append the contents of the chain certificate to the bottom of your signed certificate file.
3. Place the signed certificate in the *installation_dir/export/conf/* directory.
4. Place the matching private key file in the *installation_dir/export/conf/* directory.
5. If your private key file requires a password, create and place the password in the *installation_dir/export/conf/* directory.
6. Start the Export server again.

Related tasks

- [Starting and stopping the IBM Spectrum Control servers](#)

Generating a new default self-signed SSL certificate for the Export server

You can generate a new, default self-signed SSL certificate for the Export server by using the **openssl** command.

Before you begin

You must have the extracted IBM Spectrum® Control installation image files present on the IBM Spectrum Control server where you are going to generate a new, default self-signed SSL certificate for the Export server.

Procedure

1. Log on to the server where IBM Spectrum Control is installed.
Ensure that you log on with the appropriate user privileges.
2. Stop the Export server.
3. Enter the **openssl** command to generate a new, default self-signed SSL certificate for the Export server.
For the Windows operating system, enter the following command:

```
installation_dir\data\sra\tools\openssl\openssl req  
-config extracted_image_dir\scripts\export\openssl.cfg  
-new -newkey rsa:2048 -x509 -nodes -keyout installation_dir\export\conf\export.key  
-out installation_dir\export\conf\export.cert -days 3650  
-subj /C=us/O=ibm/OU=exportServer/CN=machine_FQDN
```

Where *installation_dir* is the location where IBM Spectrum Control is installed, *extracted_image_dir* is the location where the IBM Spectrum Control installation image is extracted, and *machine_FQDN* is the fully qualified domain name of the machine where you installed IBM Spectrum Control. For example, *myserver.mycompany.com*.

If your *installation_dir* or *extracted_image_dir* location contains spaces, use double quotes around those paths.

For example:

```
"C:\Program Files\IBM\TPC\data\sra\tools\openssl\openssl" req  
-config C:\Downloads\SC-Image\SC\scripts\export\openssl.cfg  
-new -newkey rsa:2048 -x509 -nodes -keyout "C:\Program Files\IBM\TPC\export\conf\export.key"  
-out "C:\Program Files\IBM\TPC\export\conf\export.cert" -days 3650  
-subj /C=us/O=ibm/OU=exportServer/CN=myserver.mycompany.com
```

For the AIX® or Linux® operating systems, enter the following command:

```
installation_dir/data/sra/tools/openssl/openssl req  
-config extracted_image_dir/scripts/export/openssl.cfg  
-new -newkey rsa:2048 -x509 -nodes -keyout installation_dir/export/conf/export.key  
-out installation_dir/export/conf/export.cert -days 3650  
-subj /C=us/O=ibm/OU=exportServer/CN=machine_FQDN
```

Where *installation_dir* is the location where IBM Spectrum Control is installed, *extracted_image_dir* is the location where the IBM Spectrum Control installation image is extracted, and *machine_FQDN* is the fully qualified domain name of the machine where you installed IBM Spectrum Control. For example, *myserver.mycompany.com*.

4. Start the Export server.

Related tasks

- [Starting and stopping the IBM Spectrum Control servers](#)

Enabling TLS 1.0 and 1.1 for ports

IBM Spectrum® Control uses Transport Layer Security (TLS) to secure communications between IBM Spectrum Control components.

Restriction: IBM Spectrum Control uses TLS 1.2 protocol for communicating on ports. It does not use TLS 1.3, and TLS 1.1 and 1.0 are disabled by default for increased security.

- [Enabling TLS 1.1 and 1.0 for IBM Spectrum Control ports](#)
To enable TLS 1.1 and 1.0 for IBM Spectrum Control ports, update the `java.security` file (Alert, Data, Device, and Web server) and the `server.config` file (Export server).

Enabling TLS 1.1 and 1.0 for IBM Spectrum Control ports

To enable TLS 1.1 and 1.0 for IBM Spectrum Control ports, update the `java.security` file (Alert, Data, Device, and Web server) and the `server.config` file (Export server).

Before you begin

IBM Spectrum Control ports have TLS 1.1 and 1.0 disabled by default for increased security. Therefore, IBM Spectrum Control will not be able to communicate with resources that do not support TLS 1.2. If you want to upgrade your resources to a version that supports TLS 1.2, contact your vendor. You can also re-enable TLS 1.1 and 1.0 for IBM Spectrum Control ports.

Procedure

1. Stop all IBM Spectrum Control servers.
2. Open the `installation_dir/jre/lib/security/java.security` file.
3. To enable TLS 1.1 and 1.2 in the Alert, Data, Device, and Web server, remove the "`TLSv1.1` ," text from the `jdk.tls.disabledAlgorithms` line.
BEFORE:

```
jdk.tls.disabledAlgorithms=MD5withRSA, DH keySize < 1024, TLSv1, TLSv1.1 , EC keySize < 224, anon, NULL
```

AFTER:

```
jdk.tls.disabledAlgorithms=MD5withRSA, DH keySize < 1024, TLSv1, EC keySize < 224, anon, NULL
```

To enable TLS 1.0, 1.1, and 1.2 in the Alert, Data, Device, and Web server, remove the "TLSv1, TLSv1.1 , " text from the `jdk.tls.disabledAlgorithms` line.

BEFORE:

```
jdk.tls.disabledAlgorithms=MD5withRSA, DH keySize < 1024, TLSv1, TLSv1.1 , EC keySize < 224, anon, NULL
```

AFTER:

```
jdk.tls.disabledAlgorithms=MD5withRSA, DH keySize < 1024, EC keySize < 224, anon, NULL
```

4. Open the `installation_dir/export/conf/server.config` file.

5. To enable only TLS 1.1 in the Export server, change the "secureProtocol" value from "TLSv1_2_method" to "TLSv1_1_method".

For example:

```
"secureProtocol": "TLSv1_1_method"
```

To enable only TLS 1.0 in the Export server, change the "secureProtocol" value from "TLSv1_2_method" to "TLSv1_method".

For example:

```
"secureProtocol": "TLSv1_method"
```

To enable TLS 1.0, 1.1, and 1.2 in the Export server, change the "secureProtocol" value from "TLSv1_2_method" to "".

For example:

```
"secureProtocol": ""
```

You cannot configure the Export server such that only TLS 1.1 and 1.2 are enabled.

6. Restart the IBM Spectrum Control servers.

Configuring Db2, AIX, and Linux for IPv6-only environment

Use this information to configure Db2®, AIX®, and Linux® for an IPv6-only environment.

Configuring the AIX system for IPv6 only

For IPv6 support, the AIX operating system must have level TL 5300–06 installed.

To configure the AIX operating system for IPv6, complete the following steps:

1. Obtain the most recent versions of **openssh** and **openssl** packages for AIX and install them. Some older version of **openssh** does not work in an IPv6-only environment.
2. Change **sshd** (Secure Shell Daemon) on AIX system to accept IPv6 connections.
 - a. In the `/etc/ssh/sshd_config` file, uncomment the line "ListenAddress:".
 - b. Restart **sshd** with the following commands:

```
stopsrc -g ssh
startsrc -g ssh
```
 - c. From another IPv6 system, verify that you contact AIX over IPv6 (by using ssh).
3. In SMIT, set the IPv4 address to 0.0.0.0 for all interfaces. Save the file.
4. Edit the `/etc/resolv.conf` file to use IPv6 DNS server or servers.

Configuring Db2 on AIX for IPv6 systems

To get Db2 on AIX operating systems to work on IPv6 systems, complete the following steps:

1. Identify the host name that is used by Db2 in the `db2nodes.cfg` file:

```
# cat ~db2inst1/sqllib/db2nodes.cfg
0 myhost 0
#
```

2. Edit the `/etc/hosts` file and make sure that the host name found in the `db2nodes.cfg` file resolves to an IPv6 address. Use the **vi** editor to verify that the host name is not on any line with an IPv4 address. In particular, ensure that the host name is not listed as an alias for the IPv4 loopback address 127.0.0.1.

```
# vi /etc/hosts
127.0.0.1 loopback localhost
::1 localhost
2001:db8:0:0:209:6bff:fe09:63fa myhost.mydomain myhost
```

3. Stop Db2 and set Db2 to use IPv6 addressing. Restart Db2.
 - a. Source the Db2 profile:

```
. ~db2inst1/sqllib/db2profile
```

- b. Stop Db2:

```
db2stop
```

c. Configure Db2 to use IPv6.

```
db2set
```

An example of the output is: **DB2FCMCOMM=TCPIP6**.
d. Start Db2.

```
db2start
```

In some installations, the AIX server does not have a graphical console that is attached to the server. In this situation, you can select another system with an X11 server to display the IBM Spectrum® Control installation and IBM Spectrum Control application. The X11 server must have IPv6 configured and an SSH client installed. Open an SSH connection from a shell on the X11 server desktop with the -X option to permit forwarding of X11 applications from the remote AIX server. Start the IBM Spectrum Control installation program or application from the SSH shell.

```
ssh -X my_IPv6_host  
/opt/IBM/TPC/gui/TPCD.sh
```

Configuring Db2 on Linux for IPv6-only systems

To get Db2 on Linux systems to work in an IPv6-only environment, follow these steps:

1. Install Db2 in dual-stack configuration.
2. Stop Db2 and set Db2 to use IPv6 addressing:
 - a. As the root user from the Linux command-line, run this command:

```
su - db2inst1
```

b. Stop Db2 by running this command:

```
db2stop
```

c. Configure Db2 to use IPv6 by running this command:

```
db2set
```

An example of the output is: **DB2FCMCOMM=TCPIP6**.

The host name in the **db2nodes.cfg** file resolves to an IPv6 address. This action can require you to change the domain or search directive in the **/etc/resolv.conf** file to specify a domain in which the host name can resolve to IPv6. You can also edit the **/etc/hosts** file so that the host name resolves to an IPv6 address.

d. Start Db2 by running this command:

```
db2start
```

Administering

Administer IBM Spectrum® Control and its components to ensure that your storage environment is being monitored as intended. Some administering tasks include stopping and starting product services, increasing memory allocation, monitoring the health of product components, and managing storage resources and data sources. You can use the Db2® command-line interface or IBM® Data Studio to administer Db2.

- [Administering resources and data sources](#)
Administer monitored resources and the data sources that are associated with those resources. Data sources can be agents that manage resources or VMware vCenter servers. An agent might be a CIM agent or a Storage Resource agent.
- [Starting and stopping the IBM Spectrum Control servers](#)
You can start and stop the IBM Spectrum Control servers in the GUI or by running scripts.
- [Checking the version and license of IBM Spectrum Control](#)
The version and license of IBM Spectrum Control that is installed on your system determine the IBM Spectrum Control functions that are available.
- [Checking IBM Spectrum Control status](#)
The System Management page shows a high-level summary of the status of the server or servers on which IBM Spectrum Control is installed. Use the System Management page to troubleshoot problems with the system, create trace logs, and get technical support.
- [Increasing the memory allocation for the Data server](#)
If the data memory that is allocated for your Data server is insufficient, you can increase the memory. The default maximum memory for the Data server is set to 1024 MB.
- [Changing passwords](#)
IBM Spectrum Control provides a GUI and non-GUI password tool; however, both tools achieve the same purpose.
- [Granting local administrative privileges to a domain account](#)
Automatically grant administrative privileges to Windows domain accounts. The user account for the Storage Resource agent requires local administrative rights. Because these rights are not necessarily guaranteed for domain users in a Windows domain environment, you are shown how to grant local administrative rights to domain users. Using this procedure, you do not have to manually process each machine in the domain.
- [Collecting diagnostic information about IBM Spectrum Control](#)
You can use the service tool to collect diagnostic information about IBM Spectrum Control. The tool detects the system configuration, collects the applicable information, and creates a compressed file that can be sent to IBM Software Support.
- [Administering the IBM Spectrum Control database](#)
The IBM Spectrum Control database is the repository for information that is collected about the monitored resources in your environment.
- [Administering Db2](#)
Administer IBM Db2 by backing up the IBM Spectrum Control database, starting the IBM Data Studio full client, and starting and stopping Db2.

Administering resources and data sources

Administer monitored resources and the data sources that are associated with those resources. Data sources can be agents that manage resources or VMware vCenter servers. An agent might be a CIM agent or a Storage Resource agent.

- **[Storage systems](#)**
Administer the storage systems that are monitored by IBM Spectrum Control. Administering actions include adding and removing storage systems, updating credentials, and testing connections.
- **[Hypervisors and VMware data sources](#)**
Administer the hypervisors, vCenter Server Appliance systems and vCenter Server systems that are monitored by IBM Spectrum Control. vCenter Server Appliance systems and vCenter Server systems are data sources that can monitor multiple hypervisors. A hypervisor can be an ESX or ESXi host. Each hypervisor can host multiple virtual machines.
- **[Switches and fabrics](#)**
Administer the switches and fabrics that are monitored by IBM Spectrum Control. Administering actions include adding and removing switches and fabrics, modifying connection information, and testing connections.
- **[Servers and Storage Resource agents](#)**
Administer servers and the Storage Resource agents that collect asset, status, and file system information about servers.
- **[SMI-S providers](#)**
Administer SMI-S providers that are associated with storage resources that are monitored by IBM Spectrum Control. SMI-S providers enable communication between IBM Spectrum Control and certain types of storage systems and switches.
- **[SNMP agents](#)**
SNMP agents are switches and directors that communicate with IBM Spectrum Control through SNMP. [»](#)IBM Spectrum Control supports SNMPv1, SNMPv2, and SNMPv3 for connecting to switches and sending alert notifications to SNMP trap destinations. [«](#)

Storage systems

Administer the storage systems that are monitored by IBM Spectrum® Control. Administering actions include adding and removing storage systems, updating credentials, and testing connections.

- **[Viewing information about storage systems](#)**
View detailed information about storage systems that are monitored by IBM Spectrum Control.
- **[Updating the credentials for storage systems](#)**
Change the credentials that IBM Spectrum Control uses to authenticate to a storage system or the CIM agent that manages a storage system. You can also change the host name or the IP address.
- **[Testing the connection to a storage system](#)**
Verify that IBM Spectrum Control can communicate with a monitored storage system. For storage systems that are managed by a CIM agent or Storage Resource agent, the connection to the agent is tested.
- **[Collecting CIM agent logs](#)**
You can collect logs for certain IBM® CIM agents using the command line interface.
- **[Removing storage systems](#)**
Remove storage systems that you no longer want to monitor with IBM Spectrum Control.

Viewing information about storage systems

View detailed information about storage systems that are monitored by IBM Spectrum® Control.

Procedure

To view information about storage systems, complete the following steps:

1. Depending on how the storage system is configured, go to **Storage > Block Storage Systems**, **Storage > File Storage Systems**, or **Storage > Object Storage Systems**. Storage systems can be configured in the following ways:
 - Block storage system
Storage systems that are configured for storing or retrieving data only in block format include System Storage® DS series, SAN Volume Controller, Storwize® V7000, and other SAN-based storage systems.
Storage systems that can be configured for both file and block data include Storwize V7000 Unified and NetApp Filers.
 - File storage system
Storage systems that can be configured for both file and block data include Storwize V7000 Unified and NetApp Filers.
 - Object storage system
The storage system that can be configured for both file and object data is IBM Spectrum Scale storage system.
The storage system that can be configured only for object data is IBM® Cloud Object Storage.
- Information about monitored storage systems is displayed.
2. Right-click a storage system and select **View Properties** to view the key properties for the system.

Updating the credentials for storage systems

Change the credentials that IBM Spectrum® Control uses to authenticate to a storage system or the CIM agent that manages a storage system. You can also change the host name or the IP address.

Before you begin

If the storage system is managed by multiple data sources, for example multiple CIM agents, the menu is displayed as **Connections > Modify Connection > data_sources**. Select the data source for which you want to update the credentials.

The type of storage system determines the credentials that you can update.

- [Updating the credentials for a System Storage DS8000 storage system](#)
Change the credentials that IBM Spectrum Control uses to authenticate to a System Storage® DS8000® storage system.
- [Updating the credentials for an XIV or IBM Spectrum Accelerate](#)
Change the credentials that IBM Spectrum Control uses to authenticate to an XIV® or IBM Spectrum Accelerate.
- [Updating the credentials for storage systems that run IBM Spectrum Virtualize](#)
Change the credentials that IBM Spectrum Control uses to authenticate to IBM Spectrum Virtualize storage systems.
- [Updating the credentials for a Storwize V7000 Unified storage system](#)
Change the credentials that IBM Spectrum Control uses to authenticate to a Storwize® V7000 Unified storage system.
- [Updating the credentials for a storage system that is managed by a CIM agent](#)
Change the credentials that IBM Spectrum Control uses to authenticate to a CIM agent.

Updating the credentials for a System Storage DS8000 storage system

Change the credentials that IBM Spectrum® Control uses to authenticate to a System Storage® DS8000® storage system.

About this task

To update the credentials for a System Storage DS8000 storage system, complete the following steps. You can update the host name or IP address for the secondary HMC that is used to manage the storage system, the user name, and the password.

Procedure

1. In the menu bar, go to **Storage > Block Storage Systems**.
Information about monitored storage systems is displayed.
2. Right-click a storage system and click **Connections > Modify Connection**.
3. Change the secondary HMC host name or IP address, the user name, or the password, and then click OK.

Updating the credentials for an XIV or IBM Spectrum Accelerate

Change the credentials that IBM Spectrum® Control uses to authenticate to an XIV® or IBM Spectrum Accelerate.

About this task

To update the credentials for an XIV or IBM Spectrum Accelerate, complete the following steps. You can update the IP address or host name, the user name, and the password.

Procedure

1. In the menu bar, go to **Storage > Block Storage Systems**.
2. Right-click a storage system and click **Connections > Modify Connection**.
3. Change the host name or IP address, user name, or password, then click OK.

Updating the credentials for storage systems that run IBM Spectrum Virtualize

Change the credentials that IBM Spectrum® Control uses to authenticate to IBM Spectrum Virtualize storage systems.

Before you begin

In this documentation, IBM Spectrum Virtualize is used to refer collectively to IBM® SAN Volume Controller, IBM Spectrum Virtualize for Public Cloud, IBM Spectrum Virtualize as Software Only, and IBM Storwize® storage systems, and to IBM FlashSystem® devices that run IBM Spectrum Virtualize.

About this task

You can update the IP address or host name, the user name, and the password.

Procedure

1. In the menu bar, go to **Storage > Block Storage Systems**.
Information about monitored storage systems is displayed.
2. Right-click a storage system and click **Connections > Modify Connection**.
3. Update the following credentials as required and then click OK:

Authentication

You can use a user name and password or a private Secure Shell (SSH) key to log on to the storage system. The authentication method that you select determines the options that are displayed.

User name/Password

The user name and password for logging on to the storage system.

Secure Shell (SSH)

Use a private SSH key to log in to the storage system.

Authenticate with an SSH key

When you upload the SSH private key, you must add the SSH user who is associated with that SSH private key when it was created.

SSH user

The user that was associated with the SSH key when it was created. The user must have an Administrator role so that configuration, capacity, status, and performance metadata can be collected about the device.

SSH password

The password associated with the SSH user. If the password was not created, leave this field blank.

SSH key

Upload the new SSH private key that was generated to authenticate with the storage system. The valid file formats for SSH keys are PEM and PuTTY. If the key is in another format such as OpenSSH, it must be converted to PEM or PuTTY before it can be used.

The SSH key file is transferred from the computer where the web browser is located to the computer where the IBM Spectrum Control server is located.

The default location is \${device.conf}\tpc_svc.pem, which represents the IBM Spectrum Control default key file tpc_svc.pem. The tpc_svc.pem file is in the conf directory where the Device server is installed.

Restriction: PuTTY Private Key version 3 files are not supported. If you use PuTTYgen 0.75 or later to generate keys, ensure that you choose the option to generate version 2 keys. In PuTTYgen, click 2 for PPK file version on the Private Key File Parameters window before you generate the key.

For more information about PuTTYgen, see <https://www.chiark.greenend.org.uk/~sgtatham/putty/latest.html>.

Passphrase

The passphrase that is associated with the SSH key pair. If a passphrase was not created for the SSH key pair, leave the field blank. For SSH keys that use the PuTTY file format, you cannot use a passphrase to protect the private key.

Updating the credentials for a Storwize V7000 Unified storage system

Change the credentials that IBM Spectrum® Control uses to authenticate to a Storwize® V7000 Unified storage system.

About this task

To update the credentials for a Storwize V7000 Unified storage system, complete the following steps. You can update the IP address or host name, the user name, and the password.

Procedure

1. In the menu bar, go to Storage > Block Storage Systems.
Information about monitored storage systems is displayed.
2. Right-click a storage system and click Connections > Modify Connection.
3. Update the following credentials as required, and then click OK:

Authentication

You can use a user name and password or a private Secure Shell (SSH) key to log on to the storage system. The authentication method that you select determines the options that are displayed.

User name/Password

The user name and password for logging on to the storage system.

Secure Shell (SSH)

Use a private SSH key to log in to the storage system.

Authenticate with an SSH key

When you upload the SSH private key, you must add the SSH user who is associated with that SSH private key when it was created.

SSH user

The user that was associated with the SSH key when it was created. The user must have an Administrator role so that configuration, capacity, status, and performance metadata can be collected about the device.

SSH password

The password associated with the SSH user. If the password was not created, leave this field blank.

SSH key

Upload the new SSH private key that was generated to authenticate with the storage system. The valid file formats for SSH keys are PEM and PuTTY. If the key is in another format such as OpenSSH, it must be converted to PEM or PuTTY before it can be used.

The SSH key file is transferred from the computer where the web browser is located to the computer where the IBM Spectrum Control server is located.

The default location is \${device.conf}\tpc_svc.pem, which represents the IBM Spectrum Control default key file tpc_svc.pem. The tpc_svc.pem file is in the conf directory where the Device server is installed.

Restriction: PuTTY Private Key version 3 files are not supported. If you use PuTTYgen 0.75 or later to generate keys, ensure that you choose the option to generate version 2 keys. In PuTTYgen, click 2 for PPK file version on the Private Key File Parameters window before you generate the key.

For more information about PuTTYgen, see <https://www.chiark.greenend.org.uk/~sgtatham/putty/latest.html>.

Passphrase

The passphrase that is associated with the SSH key pair. If a passphrase was not created for the SSH key pair, leave the field blank. For SSH keys that use the PuTTY file format, you cannot use a passphrase to protect the private key.

Use different authentication credentials for file storage

Storwize V7000 Unified contains block-level and file-level data. If the credentials are different for block storage and file storage, select this check box to define the credentials for file storage. The options and fields that are displayed are described previously under Authentication.

Tip: If you use an SSH key to log on to the file module, the user that you associate with the key must exist on the Storwize V7000 File Module.

Updating the credentials for a storage system that is managed by a CIM agent

Change the credentials that IBM Spectrum® Control uses to authenticate to a CIM agent.

About this task

IBM Spectrum Control communicates with SMI-S providers to collect information about the following resources:

- Non-IBM® storage systems that are managed by SMI-S certified Common Information Model Object Manager (CIMOM), such as Dell EMC storage systems other than Unity, Hitachi, and NetApp
- Switches: Brocade switches that are running with a version of Fabric OS earlier than 8.2.1, monitored through Brocade Network Advisor

To update the credentials for a CIM agent for a storage system, complete the following steps. You can update the host name or IP address, user name, password, and other information. You can also update the CIM agent credentials for other devices, such as switches, from the GUI pages for those devices.

Procedure

1. In the menu bar, go to Storage > Block Storage Systems.
Information about monitored storage systems is displayed.
2. Right-click a storage system and click Connections > Modify Connection.
3. Change the CIM agent host name or IP address, the user name, or the password. Under Advanced, you can also specify the protocol, port, and namespace. Click OK.

Testing the connection to a storage system

Verify that IBM Spectrum® Control can communicate with a monitored storage system. For storage systems that are managed by a CIM agent or Storage Resource agent, the connection to the agent is tested.

About this task

To test the connection to a storage system, complete the following steps:

Procedure

1. Depending on the type of storage system that you want to test, go to Storage > Block Storage Systems, Storage > File Storage Systems, or Storage > Object Storage Systems.
Information about monitored storage systems is displayed.
2. Right-click a storage system and click Connections > Test Connection.
A message that shows the results of the test is displayed.

Collecting CIM agent logs

You can collect logs for certain IBM® CIM agents using the command line interface.

About this task

Remember: Storage systems that use the native interfaces (for example, DS8000®, the XIV®, SAN Volume Controller, and Storwize® V7000) do not use CIM agents.

Procedure

1. Change to the directory where the CIM agent is installed.
2. Run one of the following commands:

On Linux® operating systems

collectLogs.sh

On Windows operating systems

collectLogs.bat

A **collectedLogs.zip** file is created.

Important: This file is overwritten if you run the script again.

Removing storage systems

Remove storage systems that you no longer want to monitor with IBM Spectrum® Control.

About this task

To remove a storage system, complete the following steps:

Procedure

1. In the menu bar, go to Storage and select the type of storage system that you want to remove.
2. Right-click a storage system and click Remove.
3. Click Remove to confirm that you want to remove the storage system.

Hypervisors and VMware data sources

Administer the hypervisors, vCenter Server Appliance systems and vCenter Server systems that are monitored by IBM Spectrum® Control. vCenter Server Appliance systems and vCenter Server systems are data sources that can monitor multiple hypervisors. A hypervisor can be an ESX or ESXi host. Each hypervisor can host multiple virtual machines.

About this task

- [Checking permissions to browse data stores](#)
Determine if the user name that you specified for a VMware data source has permission to browse through the data stores on a hypervisor.
- [Viewing information about hypervisors](#)
View detailed information about hypervisors that are monitored by IBM Spectrum Control.
- [Updating the credentials for a hypervisor](#)
You can change the user name and password that IBM Spectrum Control uses to log in to a hypervisor. You can also change the host name or IP address of the hypervisor.
- [Removing hypervisors and VMware data sources](#)
Remove hypervisors and VMware vCenter servers that you no longer want to monitor with IBM Spectrum Control.

Checking permissions to browse data stores

Determine if the user name that you specified for a VMware data source has permission to browse through the data stores on a hypervisor.

About this task

When you add a VMware data source in IBM Spectrum® Control, the user name that you specify must have permission to browse through the data stores on VMware. IBM Spectrum Control must browse through the data stores to collect information from the hypervisors. However, the "Read Only" role as defined by VMware does not allow IBM Spectrum Control to browse the data stores. You can use the "Virtual Machine Power® User" role if you do not want to use the Administrator role, or you can create a custom role with the required permissions.

Procedure

To verify that a VMware user is assigned the correct role and privileges to monitor VMware data sources, follow these steps:

1. Ensure that the user role has the required VMware datastore permissions by completing the following steps:
 - a. Connect the vSphere Web Client to the VMware data source.
The data source can be an ESX server, a vCenter Server Appliance, or a vCenter Server.
 - b. From the Inventories view, select Hosts and Clusters.
 - c. Select a host, and click the Related Objects tab.
 - d. View the datastores by clicking the Datastores tab.
 - e. Right-click a datastore, and select File Browser. If you can view the Files tab for the datastore, your browse permission is working correctly.
2. Determine the role that is assigned to the user by logging in to the vSphere Web Client by using the administrator user ID. From the Administration view, select Roles. Verify the role name that is assigned to the user.
3. Determine the privileges that are assigned to the role by selecting the user's role and clicking Privileges. Expand the privilege groups to view the specific privileges.
4. Optional: If you must edit the privileges for the role, select the role and click the Edit role action icon. Select privilege groups or expand to select specific privileges.

What to do next

For more information about VMware user roles, go to the [VMware documentation center](#) and search for *vSphere users and permissions*.

Viewing information about hypervisors

View detailed information about hypervisors that are monitored by IBM Spectrum® Control.

Procedure

To view information about hypervisors and vCenter servers, complete the following steps:

1. Go to Servers > Hypervisors
Information about monitored hypervisors and vCenter servers is displayed.
2. Right-click a hypervisor and select View Properties to view the key properties of that hypervisor.
3. Optional: Right-click a hypervisor and select View Details to view more detailed information about that hypervisor, such as triggered alerts, data collection schedules, and information about its internal and related resources.

Updating the credentials for a hypervisor

You can change the user name and password that IBM Spectrum® Control uses to log in to a hypervisor. You can also change the host name or IP address of the hypervisor.

Procedure

1. In the menu bar, go to Servers > Hypervisors.
2. Right-click a hypervisor and select Connections > Modify Connection.
3. Update the host name or IP address, user name, or password for the hypervisor.
The user name and password must contain the following valid characters:
 - A through Z (uppercase characters)
 - a through z (lowercase characters)
 - 0 through 9 (numeric characters)
 - Special characters: ! # % & * + - / = ? ^ _ { } () . ,Restrictions:
 - User names and passwords cannot contain spaces and must have at least one character.
 - The maximum length of a user name or password is 128 characters.
 - The user name must have permission to browse the data stores on a hypervisor. For more information about permissions, see [Checking permissions to browse data stores](#).
4. Click OK.

Removing hypervisors and VMware data sources

Remove hypervisors and VMware vCenter servers that you no longer want to monitor with IBM Spectrum® Control.

Procedure

To remove hypervisors and vCenter servers, complete the following steps:

1. Go to Servers > Hypervisors
Information about monitored hypervisors and vCenter servers is displayed.
2. Right-click a hypervisor and select Remove.
The hypervisor and all its data are removed from IBM Spectrum Control immediately. Any data collection jobs and alerts are also removed.
When you remove a vCenter Server, the hypervisors that it manages are also removed from IBM Spectrum Control. However, information about the hypervisors is not removed immediately, but is retained according to the Data for missing resources setting on the History Retention page. The default setting is 14 days. If the default setting is used, all information about the hypervisors is deleted 14 days after the related vCenter Server was removed.
Tips: After a vCenter Server is removed, but before its managed hypervisors are removed according to the retention settings, the following conditions occur:
 - Any data collection jobs that are scheduled for the hypervisors fail.
 - Because data is no longer collected, any alerts that were based on that data are not generated.

Switches and fabrics

Administer the switches and fabrics that are monitored by IBM Spectrum® Control. Administering actions include adding and removing switches and fabrics, modifying connection information, and testing connections.

- [Viewing information about switches and fabrics](#)
View detailed information about switches and fabrics that are monitored by IBM Spectrum Control.
- [Updating the connection information for switches and fabrics](#)
Change the connection information that IBM Spectrum Control uses to authenticate to a data source that manages a switch or fabric.
- [Testing the connection to a switch or fabric](#)
Verify that IBM Spectrum Control can communicate with the data source that manages a switch or fabric.
- [Removing switches and fabrics](#)
Remove a switch or fabric that you no longer want to monitor with IBM Spectrum Control.

Viewing information about switches and fabrics

View detailed information about switches and fabrics that are monitored by IBM Spectrum® Control.

About this task

To view information about switches and fabrics, complete the following steps:

Procedure

1. In the menu bar in the web-based GUI, go to Network > Switches or Network > Fabrics. Information about monitored switches or fabrics is displayed.
2. Right-click a switch or fabric and click View Properties to view the key properties for the switch or fabric.

Updating the connection information for switches and fabrics

Change the connection information that IBM Spectrum® Control uses to authenticate to a data source that manages a switch or fabric.

Before you begin

IBM Spectrum Control uses REST APIs, SMI agents, and SNMP agents to collect data about switches and fabrics in your SAN. You can update the connection information for a switch and fabric to change its data source at any time. The type of data source determines the connection information that you can update.

- [Updating the connection information for a switch](#)
Change the connection information that IBM Spectrum Control uses to authenticate to a data source that manages a switch. The data source can be a REST API, SMI agent, or SNMP agent.
- [Updating the connection information for a fabric](#)
Change the connection information that IBM Spectrum Control uses to authenticate to a data source that manages a fabric. The data source can be an SMI-S provider or an SNMP agent.

Updating the connection information for a switch

Change the connection information that IBM Spectrum® Control uses to authenticate to a data source that manages a switch. The data source can be a REST API, SMI agent, or SNMP agent.

About this task

To update the connection information for a switch, complete the following steps:

Procedure

1. In the menu bar, go to Network > Switches. Information about monitored switches is displayed.
2. Right-click a switch and click Connections > Modify Connection.
Tip: If a switch is managed by multiple data sources, the menu is displayed as Connections > Modify Connection > *data_sources*. Select the data source for which you want to update the connection information. For example, a Brocade switch that is running with a version of Fabric OS earlier than 8.2.1 might have multiple SMI-S providers, and therefore multiple data sources.
3. Update the following information as required and then click OK.
The information that is displayed depends on the type of data source.

REST API

Host names or IP addresses

The IP address or host name to use to connect to the switch.

Protocol, Port

The https or http protocol and the 443 or 80 port to use to connect to the switch.

User name, Password

The user name and password for logging on to the switch.

SMI-S provider

SMI-S provider host name or IP address

The IP address or host name of the SMI-S provider that manages the switch. For Brocade switches, the SMI-S provider is on Brocade Network Advisor (BNA).

User name, Password

The user name and password for logging on to the SMI-S provider.

Advanced

Protocol, Port

The https or http protocol and the 5989 or 5988 port to use to connect to the SMI-S provider.

Namespace

The namespace that includes the class instances of the Server Profile. The interaction with the SMI-S provider when information is retrieved is determined by the namespace.

SNMPv3 agent

SNMP version

The SNMP version of the agent.

User name

The user name used to log in to the switch.
Authentication password
The password for the user logged in to the switch.
Authentication protocol
The protocol or digest used for authentication to the switch.
Encryption protocol
The protocol used for encryption.

SNMPv1 agent

SNMP version
The SNMP version of the agent.
Read community
The SNMP community string. The default is public.
Write community
The SNMP community string. The default is private.

Updating the connection information for a fabric

Change the connection information that IBM Spectrum® Control uses to authenticate to a data source that manages a fabric. The data source can be an SMI-S provider or an SNMP agent.

About this task

To update the connection information for a fabric, complete the following steps:

Procedure

1. In the menu bar, go to Network > Fabrics.
Information about monitored fabrics is displayed.
2. Right-click a fabric and click Connections > Modify Connection.
Tip: If a fabric is managed by multiple data sources, for example multiple SMI-S providers, the menu is displayed as Connections > Modify Connection > *data_sources*. Select the data source for which you want to update the connection information.
3. Update the following information as required and then click OK.
The information that is displayed depends on the type of data source.

SMI-S provider

SMI-S provider host name or IP address
The IP address or host name of the SMI-S provider that manages the switch. For Brocade switches, the SMI-S provider is on Brocade Network Advisor (BNA).
User name, Password
The user name and password for logging on to the SMI-S provider.
Advanced
Protocol, Port
The https or http protocol and the 5989 or 5988 port to use to connect to the SMI-S provider.
Namespace
The namespace that includes the class instances of the Server Profile. The interaction with the SMI-S provider when information is retrieved is determined by the namespace.

SNMPv3 agent

SNMP version
The SNMP version of the agent.
User name
The user name used to log in to the switch.
Authentication password
The password for the user logged in to the switch.
Authentication protocol
The protocol or digest used for authentication to the switch.
Encryption protocol
The protocol used for encryption.

SNMPv1 agent

SNMP version
The SNMP version of the agent.
Read community
The SNMP community string. The default is public.
Write community
The SNMP community string. The default is private.

Testing the connection to a switch or fabric

Verify that IBM Spectrum® Control can communicate with the data source that manages a switch or fabric.

About this task

To test the connection to the data source that manages a switch or fabric, complete the following steps:

Procedure

1. In the menu bar in the web-based GUI, go to **Network > Switches** or **Network > Fabrics**.
Information about monitored fabrics or switches is displayed.
2. Right-click a switch or fabric and click **Connections > Test Connection**.
A message that shows the results of the test is displayed.

Removing switches and fabrics

Remove a switch or fabric that you no longer want to monitor with IBM Spectrum® Control.

About this task

To remove a switch or fabric, complete the following steps:

Procedure

1. In the menu bar in the web-based GUI, go to **Network > Switches** or **Network > Fabrics**.
Information about monitored fabrics or switches is displayed.
2. Right-click a fabric or switch and select **Remove**.
Note: To remove a Cisco fabric, you must remove all the switches in that fabric. The Cisco fabric is then automatically removed.
3. Follow the directions that are presented in the information message.

Servers and Storage Resource agents

Administer servers and the Storage Resource agents that collect asset, status, and file system information about servers.

- **[Fixing deployments](#)**
Use the Servers page to monitor servers that are added to IBM Spectrum® Control by deploying a Storage Resource agent. You can identify agents that failed to deploy, investigate and resolve the problems that caused the deployment failure, and deploy the agents again.
- **[Canceling deployments](#)**
Use the Servers page to cancel the deployment of Storage Resource agents.
- **[Modifying deployment schedules](#)**
Use the Servers page to modify deployment schedules for Storage Resource agents.
- **[Viewing information about Storage Resource agents](#)**
View detailed information about the Storage Resource agents that are deployed on monitored resources.
- **[Viewing Storage Resource agent log files](#)**
The log files for a Storage Resource agent contain informational, warning, and error messages for the actions that were taken by the agent. You can use the content of the log files to troubleshoot any errors that might occur when a Storage Resource agent is started, processing data, or shut down.
- **[Disabling Storage Resource agents](#)**
Disable Storage Resource agents so that they no longer collect data or run IBM Spectrum Control jobs.
- **[Enabling Storage Resource agents](#)**
You can enable Storage Resource agents that are in a Disabled or Down state. After an agent is enabled, the IBM Spectrum Control server resumes communication with that agent.
- **[Testing the connection with a Storage Resource agent](#)**
Verify that the IBM Spectrum Control server can communicate with the server where a Storage Resource agent is deployed.
- **[Changing credentials for Storage Resource agents](#)**
You can change Storage Resource agent credentials, such as the user name and password that IBM Spectrum Control uses for logging on to the server where the agent is deployed.
- **[Collecting service data](#)**
Collect service data about the selected Storage Resource agent. Service data includes diagnostic information such as logs, trace files, configuration information, and computer details. Use this information to troubleshoot any errors that might occur during startup, processing, or shutdown of a Storage Resource agent.
- **[Enabling or disabling scripts for Storage Resource agents](#)**
You can enable or disable scripts that are sent from the IBM Spectrum Control server to Storage Resource agents.
- **[Enabling or disabling the monitoring of fabrics by Storage Resource agents](#)**
You can enable or disable fabric monitoring by Storage Resource agents. Fabric monitoring is enabled by default. When you enable fabric monitoring, the agent collects information about fabrics that the server is connected to.
- **[Using the help command for Storage Resource agents](#)**
The **help** command for Storage Resource agents provides information about the parameters for installing, uninstalling, and upgrading Storage Resource agents.
- **[Removing servers](#)**
You can remove servers that you no longer want to monitor with IBM Spectrum Control.
- **[Registering a Storage Resource agent with a different IBM Spectrum Control server](#)**
You can register a Storage Resource agent with a different IBM Spectrum Control server.
- **[Manually changing the Windows service logon](#)**
Change the Windows service logon for a Storage Resource agent.

- [Deployment guidelines and limitations for Storage Resource agents](#)

You must consider the following guidelines and limitations when you manage Storage Resource agents in your environment.

Related tasks

- [Upgrading Storage Resource agents](#)

Fixing deployments

Use the Servers page to monitor servers that are added to IBM Spectrum® Control by deploying a Storage Resource agent. You can identify agents that failed to deploy, investigate and resolve the problems that caused the deployment failure, and deploy the agents again.

Before you begin

To use the Fix Deployment action, you must have Administrator privileges.

About this task

When you use the Fix Deployment action, the existing agent deployment on the server is automatically overwritten when the agent is deployed again.

Use the following steps to identify and fix Storage Resource agents that failed to deploy:

1. Use the Status column on the Servers page to identify agents that failed to deploy. A status of Failed deployment indicates that an error occurred when the agent was deployed.
2. Use the deployment log to investigate the problems that prevented the agent from deploying.
Tip: The Open Logs action is not available if you select multiple server rows. The Fix Deployment action is available if you select a single server row or multiple server rows.
3. Use the Fix Deployment action to change the deployment settings for the agents and deploy the agents again.

The following examples show some of the problems that cause agent deployments to fail and the actions that you might take to resolve the problems:

Errors that do not require changes to the deployment settings

The log message indicates that the Db2® database or the Data server is not running. Start the service that is not running and use the Fix Deployment action to deploy the agent. You do not need to change the deployment settings.

Errors that require changes to the deployment settings

The log message indicates that the port number on which the agent listens for requests from IBM Spectrum Control is in use by another service. Use the Fix Deployment action to change the setting for the Port field and to deploy the agent.

Procedure

1. In the menu bar, go to Servers > Servers.
2. Locate the servers with failed agent deployments that you want to fix.
3. For each server with a status of Failed deployment, complete the following steps:
 - a. To view the error messages, right-click the server row and click Open Logs.
 - b. Investigate and resolve the errors.
4. Click a single or multiple servers with a status of Failed deployment and click Actions > Fix Deployment.
5. On the Deploy Agent page, change the settings that caused the deployment errors.
For example, if the deployment fails because there is not enough disk space at the location that is specified in the Installation path field, you might change the installation location for the agents.
If you selected multiple servers with different operating systems, separate configuration pages are displayed for agents that are deployed on Windows servers and agents that are deployed on UNIX servers.

Tip: If you select multiple servers, the following rules are used to determine the settings for the agent deployment fields:
 - a. If the servers use different authentication methods, you cannot change the authentication settings. Keep current settings is displayed in the Authentication field and the fields that are used to configure the authentication settings are hidden.
 - b. If the servers are configured with different daemon modes, you can specify the daemon mode to apply to all the selected servers.
 - c. For other fields, if the servers have the same value for the field, the value is displayed. If the servers have different values for the field, the field is blank.
6. On the Configure page, if the setting for the Location field caused a deployment error, change the field setting.
7. Schedule the deployment of the Storage Resource agents.
If you are fixing the agent deployment for multiple servers, a time span is calculated during which the agents are deployed. The agents are deployed at regular intervals during the time span to avoid excessive load on the IBM Spectrum Control server.
8. Schedule the time and frequency that probes are run for the servers.
If you are fixing the agent deployment for multiple servers, a time span is calculated during which the servers are probed.
9. Click Finish to deploy the agents.

Results

The changes are applied to the servers that have a status of Failed deployment. If you select servers that have other statuses, for example, Pending deployment, those servers are not affected by the action.

A probe is automatically run for a server after the agent is successfully deployed.

What to do next

To monitor the status of the agent deployment, check the Agent State column on the Servers page.

Canceling deployments

Use the Servers page to cancel the deployment of Storage Resource agents.

Before you begin

To use the Cancel Deployment action, you must have Administrator privileges.

About this task

Check the Agent State column on the Servers page to identify the agent deployments that you can cancel. You can cancel the agent deployment for servers with a status of Failed deployment or Pending deployment.

Procedure

1. In the menu bar, go to Servers, > Servers.
2. Locate the servers with the agent deployments that you want to cancel.
3. Click a single or multiple servers with a status of Failed deployment or Pending deployment, and then click Actions, > Cancel Deployment.

Results

The agent deployment is canceled for the servers with a status of Failed deployment or Pending deployment. If you select servers that have other statuses, for example, Deploying, those servers are not affected by the action.

When you cancel the agent deployments, the servers are removed from IBM Spectrum® Control. To add the servers again, click Deploy Agent.

Modifying deployment schedules

Use the Servers page to modify deployment schedules for Storage Resource agents.

Before you begin

To use the Modify Deployment Schedule action, you must have Administrator privileges.

About this task

Check the Agent state column on the Servers page to identify the agent deployments that you can modify. You can modify the deployment schedules for servers that have a status of Pending deployment.

The Modify Deployment Schedule action is available if you click a single server row or multiple server rows.

Procedure

1. In the menu bar, go to Servers, > Servers.
2. Locate the servers with the agent deployments that you want to modify.
3. Click a single or multiple servers with a status of Pending deployment, and then click Actions, > Modify Deployment Schedule.
4. On the Modify Deployment Schedule window, the current schedule values for the agent deployments are shown. You can change the date and time that agents are deployed.

If you are modifying the deployment schedule for multiple agents, a time span is calculated during which the agents are deployed. The agents are deployed at regular intervals during the time span to avoid excessive load on the IBM Spectrum® Control server.

Tips:

- If you select multiple servers and the servers have the same value for a field, the value is displayed. For example, if the selected servers have the same deployment date, the date is displayed. If the servers have different values for the field, the field is blank.
- The scheduled time for an agent deployment is based on the time zone of the IBM Spectrum Control server, not the time zone of the server where the agent is deployed.

5. Click Save.

Results

The deployment schedules are modified for the servers that have a status of Pending deployment. If you select servers that have a status other than Pending deployment, the changes to the deployment schedule are not applied to those servers.

Viewing information about Storage Resource agents

View detailed information about the Storage Resource agents that are deployed on monitored resources.

Procedure

To view information about a Storage Resource agent, complete the following steps:

1. In the menu bar, go to Servers, > Servers.
2. On the Servers page, right-click the server where the agent is deployed and select View Properties.
3. In the properties notebook, click the Agent tab.

Results

Detailed information about the agent is shown, such as the agent state and version, and the date and time when the agent was last updated.

If the Storage Resource agent has a state of Upgrade needed, the agent must be upgraded to the same version level as the IBM Spectrum® Control server to which it is communicating.

Viewing Storage Resource agent log files

The log files for a Storage Resource agent contain informational, warning, and error messages for the actions that were taken by the agent. You can use the content of the log files to troubleshoot any errors that might occur when a Storage Resource agent is started, processing data, or shut down.

About this task

By default, the log files are located in the following directories on the server where an agent is deployed:

Windows

C:\Program Files\IBM\TPC\agent\log\SRV1\agent.log

Linux®, UNIX, and AIX®

/opt/IBM/TPC/agent/log/computer_name/agent.log

where *computer_name* represents the name of the server where IBM Spectrum® Control is installed. If an agent communicates with more than one installation of IBM Spectrum Control, a subfolder is created for each installation. For example, if the agent communicates with servers named SRV1 and SRV2, the following folders are created:

- C:\Program Files\IBM\TPC\agent\log\SRV1\agent.log
- C:\Program Files\IBM\TPC\agent\log\SRV2\agent.log

To view the log file for a Storage Resource agent, complete the following steps:

Procedure

1. In the menu bar, go to Servers, > Servers.
2. On the Servers page, locate the server that contains the Storage Resource agent that you want to analyze.
3. Right-click the server row and select Logs, > View Agent Log.
4. Optional: To view only the log entries that have a Warning or Error status, select an option from the Show all list.
You can choose to view only entries that have the following statuses:

-  Only error entries
-  Only warning entries
-  Error and warning entries

5. Optional: To view an explanation of the message that is associated with a log entry, click the link in the ID column.

Disabling Storage Resource agents

Disable Storage Resource agents so that they no longer collect data or run IBM Spectrum® Control jobs.

About this task

You might want to disable a Storage Resource agent under the following conditions:

- The monitored server is undergoing maintenance and is unavailable. This action prevents IBM Spectrum Control from flagging the agent as "down" if it cannot reach the agent. The number of times that the server tries to contact the agent is defined by the agentErrorLimit parameter in the server.config file.
- The monitored server is busy with resource-intensive processing and you do not want to add any IBM Spectrum Control jobs to that processing load.

Procedure

To disable a Storage Resource agent, complete the following steps:

1. In the menu bar, go to Servers, > Servers.
2. On the Servers page, right-click the server where the agent is deployed and select Modify Agents, > Disable.
3. Click OK to confirm that you want to disable the agent.

The state of the agent is changed to Disabled and remains in that state until it is enabled again. You can disable agents on multiple servers at the same time.

Results

When you disable a Storage Resource agent that is deployed as a daemon service, the service is shut down, and the agent is disabled. IBM Spectrum Control no longer sends requests to the agent or contacts it for job processing. A Storage Resource agent that is deployed as a non-daemon agent runs as a stand-alone process. Because a service is not required for this type of agent, it is not necessary to shut down the agent before it is disabled.

Enabling Storage Resource agents

You can enable Storage Resource agents that are in a Disabled or Down state. After an agent is enabled, the IBM Spectrum® Control server resumes communication with that agent.

About this task

If the IBM Spectrum Control server cannot contact an agent, the agent is automatically flagged as "down". You can use the Enable action to reestablish communication between the agent and the IBM Spectrum Control server. The number of times that the IBM Spectrum Control server tries to contact the agent is specified in the agentErrorLimit parameter in the server.config file. The default value for the agentErrorLimit parameter is 3.

By default, the server.config file is located in the following directory:

Windows

C:\Program Files\IBM\TPC\Data\config

Linux® or UNIX

/opt/IBM/TPC/Data/config

Procedure

1. In the menu bar, go to Servers, > Servers.
2. On the Servers page, right-click the server where the agent is deployed and select Modify Agents, > Enable.
You can enable agents on multiple servers at the same time.
3. Click OK to confirm that you want to enable the agent.
4. If the agent is running as a daemon service, enter the user ID, password, and other credentials for the server where the agent is deployed. Click OK to start the service and enable the agent.

Results

The agent is enabled and the state of the agent is updated to reflect its current condition, such as Up or Upgrade needed. If the agent is deployed as a daemon service, the service is started when you enable the agent.

Testing the connection with a Storage Resource agent

Verify that the IBM Spectrum® Control server can communicate with the server where a Storage Resource agent is deployed.

About this task

Use the Test Connection action in the web-based GUI to verify the state of the Storage Resource agent. For example, if the agent has a state of Down or Unreachable on the Servers page, you can test the connection to verify the state of the agent.

Procedure

1. In the menu bar, go to Servers, > Servers.
2. On the Servers page, right-click the server where the Storage Resource agent is deployed and select Modify Agents, > Test Connection.
3. Optional: If the process is slow, click Close in the Testing Agent Connection window to run the operation in the background.

Results

When the operation is complete, the server status and the agent state are automatically updated on the Servers page.

Changing credentials for Storage Resource agents

You can change Storage Resource agent credentials, such as the user name and password that IBM Spectrum® Control uses for logging on to the server where the agent is deployed.

Procedure

1. In the menu bar, go to Servers, > Servers.
2. On the Servers page, right-click the server where the agent is deployed and select Modify Agents, > Update Credentials.
3. In the Enter User Credentials window, change the credentials for logging on to the server where the agent is installed.
You can change the following credentials:

User name, Password

The user name and password that IBM Spectrum Control uses for logging on to the server where the Storage Resource agent is deployed. The user name must have administrative or root privileges on the server. This action is available only for Storage Resource agents that were deployed as non-daemon services.

The user name and password must contain valid characters. You can enter the following characters:

- A - Z (uppercase characters)
- a - z (lowercase characters)
- 0 - 9 (numeric characters)
- Series of punctuation marks or special characters: ! # % & * + - / = ? ^ _ { } () . ,

Restrictions:

- User names and passwords cannot contain spaces and must have at least one character.
- The maximum length of a user name or password is 128 characters.

Certificate location

The fully qualified path of the certificate file for the Storage Resource agent, for example, `installation_dir/data/sra/operating_system/certs/sra.pem`. This file is on the computer where the IBM Spectrum Control server is installed. If the agent uses Secure Shell (SSH) protocol for communication, the certificate location field is displayed.

Passphrase

The passphrase for the certificate file. The passphrase was created when the certificate was generated.

4. Click OK to save the changes.

What to do next

Related reference

- [Protocol support for Storage Resource agents](#)

Collecting service data

Collect service data about the selected Storage Resource agent. Service data includes diagnostic information such as logs, trace files, configuration information, and computer details. Use this information to troubleshoot any errors that might occur during startup, processing, or shutdown of a Storage Resource agent.

Procedure

To collect service data for a Storage Resource agent, complete the following steps:

1. In the menu bar, go to Servers > Servers.
2. Right-click a server and select Logs > Collect Agent Logs.
A message is displayed that shows the location where the service file is stored on the IBM Spectrum® Control server.
3. In a command line or other navigation tool, go to the directory where the service file is located and unpack its contents.

Results

If the collection of service data is successful, a message is displayed that shows the location of the resulting service file (.zip). The file is stored in a directory on the same computer as the IBM Spectrum Control server. The file is in the following default directories:

- Windows operating system: `C:\Program Files\IBM\TPC\data\log\SRATraces\agent_computer_name\TPCServiceInfo.zip`
- UNIX or Linux® operating system: `/opt/IBM/TPC/data/log/SRATraces/agent_computer_name/TPCServiceInfo.zip`

Where *agent_computer_name* represents the name of the server on which a Storage Resource agent is deployed. If an agent communicates with more than one installation of IBM Spectrum Control, a subfolder is created for each installation.

If the collection of service data fails, an error message is displayed. For more information about why a data collection failed, see the server log file or the services script. These files are in the following default directories:

- Server log file (on the computer where the IBM Spectrum Control server is installed):
 - Windows operating system: `c:\Program Files\IBM\TPC\data\log`
 - UNIX or Linux operating system: `/opt/IBM/TPC/data/log`
- Services script file (on the server where the Storage Resource agent is deployed):
 - Windows operating system: `C:\Program Files\IBM\TPC\agent\service\agent_computer_name\TPCServiceInfo.html`
 - UNIX or Linux operating system: `/opt/IBM/TPC/agent/service/agent_computer_name/TPCServiceInfo.html`

Where *agent_computer_name* represents the name of the server on which the Storage Resource agent is deployed.

Enabling or disabling scripts for Storage Resource agents

You can enable or disable scripts that are sent from the IBM Spectrum® Control server to Storage Resource agents.

About this task

If you enable scripts to run, the Storage Resource agent runs the scripts that are sent from the IBM Spectrum Control server.

If you disable scripts from running, the Storage Resource agent only runs the scripts that are stored on the server where the agent is deployed. The agent does not run scripts that are sent from the IBM Spectrum Control server.

Procedure

1. In the menu bar, go to Servers, > Servers.
2. On the Servers page, right-click the server where the agent is deployed. Select Modify Agents > Enable running scripts on agent or Modify Agents > Disable running scripts on agent to enable or disable scripts from running.

Enabling or disabling the monitoring of fabrics by Storage Resource agents

You can enable or disable fabric monitoring by Storage Resource agents. Fabric monitoring is enabled by default. When you enable fabric monitoring, the agent collects information about fabrics that the server is connected to.

About this task

After you install a Storage Resource agent on a server, you can enable or disable the monitoring of fabrics that the server is connected to. If you enable fabric monitoring, the agent collects information about the SAN and zoning. If you disable fabric monitoring, the agent cannot collect fabric information or monitor fabrics that the server is connected to. If the agent is the only data source that is managing the fabric, the fabric is no longer managed. A state of Unreachable is shown for the fabric on the Fabrics page.

Procedure

1. In the menu bar, go to Servers, > Servers.
2. On the Servers page, right-click the server where the agent is deployed. Select Modify Agents > Enable Fabric Functions or Modify Agents > Disable Fabric Functions to enable or disable fabric monitoring.

Using the help command for Storage Resource agents

The **help** command for Storage Resource agents provides information about the parameters for installing, uninstalling, and upgrading Storage Resource agents.

About this task

For information about the Storage Resource agent commands, run the **help** command. Follow these steps:

1. Go to the installation location for the Storage Resource agent:

```
cd <installation_location>
```

2. Run the following command:

```
bin/Agent -help
```

3. The output from the **help** command is as follows:

```
Usage:
Agent -INSTALL
      [-COMMTYPE DAEMON -AGENTPORT portnumber]
      [-FORCE]
      -INSTALLLOC pathname
      -SERVERIP address[,address,...]
      -SERVERPORT portnumber
      [-USERID username -PASSWORD password -CERT file -PASSPHRASE phrase]

Agent -UNINSTALL
      [-FORCE]
      -SERVERNAME servername

Agent -UPGRADE
      -INSTALLLOC pathname
```

For information about how to install the Storage Resource agent using commands, see [Installing Storage Resource agents by using a command](#).

For information about how to uninstall the Storage Resource agent using commands, see [Uninstalling Storage Resource agents manually](#).

For information about how to upgrade the Storage Resource agent using commands, see [Upgrading Storage Resource agents by using a command](#).

Removing servers

You can remove servers that you no longer want to monitor with IBM Spectrum® Control.

About this task

You can use the GUI to remove servers. If a Storage Resource agent is deployed to the server, the agent is uninstalled.

When the server is removed, it is no longer monitored by IBM Spectrum Control. All the data that was collected about the server is removed from the database repository.

Tip: When you remove a server, it is only removed from IBM Spectrum Control. The server is not physically deleted from the storage environment.

Procedure

To remove a server, complete the following steps:

1. In the menu bar, go to Servers, > Servers.
2. On the Servers page, right-click the server where the agent is deployed and select Remove.
3. Click Remove to confirm that you want to remove the server.

Registering a Storage Resource agent with a different IBM Spectrum Control server

You can register a Storage Resource agent with a different IBM Spectrum® Control server.

About this task

A Storage Resource agent is registered with IBM Spectrum Control server A. You want the Storage Resource agent to point instead to IBM Spectrum Control server B.

Procedure

To register a Storage Resource agent with a different IBM Spectrum Control server, use these steps:

1. From server B, in the menu bar, go to Servers, > Servers. Click Add Server, select Deploy an agent for full server monitoring, and click Manually.
2. On the Deploy Agent page, configure deployment information for the Storage Resource agent. Specify the same port number and installation location that are used for the Storage Resource agent on server A. Select Overwrite previously installed agents.
3. On the Configure page, schedule the deployment of the Storage Resource agent and click Finish.

Results

When the deployment job completes, the Storage Resource agent is registered with server B.

What to do next

Server A can no longer communicate with the Storage Resource agent. To remove the Storage Resource agent from server A, on the Servers page in the web-based GUI, right-click the server that the Storage Resource agent is deployed on and click Remove.

Manually changing the Windows service logon

Change the Windows service logon for a Storage Resource agent.

Procedure

1. Start Windows Services.
2. On the Services window, right-click **IBM Spectrum® Control Storage Resource agent - 'C:\Program Files\IBM\TPC\'**.
3. Select Properties.
4. Click the Log On tab.
5. Change the values for This account, Password, and Confirm password to the login credentials that you want to use.
If your IBM Spectrum Control server is part of a Windows domain, change this logon to <domain>\<account>. For example: mydomain\myaccount.
Important: The Storage Resource agent requires that the domain account has local administrator privileges and the "Log on as a service" and "Act as part of the operating system" user rights.
6. Click Apply and then OK to save your changes.

Deployment guidelines and limitations for Storage Resource agents

You must consider the following guidelines and limitations when you manage Storage Resource agents in your environment.

Use the following information when you deploy Storage Resource agents:

- [Multiple Storage Resource agents that are probing or scanning the same storage resources](#)
- [Platforms that support the deployment of Storage Resource agents](#)
- [Product functions that are not available for storage devices monitored by Storage Resource agents](#)
- [Required authority for deploying Storage Resource agents](#)
- [Orphan zones](#)
- [Firewalls and Storage Resource agents deployments](#)

- [Deploying Storage Resource agents on multiple computers](#)
- [Communication between the IBM Spectrum® Control server and a Storage Resource agent](#)
- [Daemon and non-daemon services](#)
- [Port numbers for Storage Resource agents deployed as a daemon service](#)
- [Authentication between the IBM Spectrum Control server and a Storage Resource agent](#)
- [Replacing default SSL certificates](#)
- [Storage Resource agents on the same computer](#)
- [Time zones for computers monitored by Storage Resource agents](#)
- [Connections for Linux® and AIX® operating systems by using Remote Shell protocol \(RSH\)](#)
- [Deployments on Windows - NetBIOS setting](#)
- [Deployments on Windows - User Account Control \(UAC\) remote restrictions](#)

Multiple Storage Resource agents that are probing or scanning the same resources

If multiple Storage Resource agents are set up to probe or scan the same storage resources, the Storage Resource agents that was added to IBM Spectrum Control first is used for the probe or scan. Therefore, only data that is gathered by the first Storage Resource agent is shown.

Platforms that support the deployment of Storage Resource agents

For a list of platforms on which you can deploy Storage Resource agents, see the [IBM Spectrum Control interoperability matrix](#) and go to the *Agents, Servers and Browsers* section.

Product functions that are unavailable for resources that are monitored by Storage Resource agents

Before you deploy a Storage Resource agent, ensure that the product functions you want to use on the monitored resources are available for those agents. The following functions are not available for resources that are monitored by Storage Resource agents:

- Certain relational database monitoring. For list of relational databases that can be monitored by Storage Resource agents, see the [IBM Spectrum Control interoperability matrix](#) and go to the *Agents, Servers and Browsers* section.
- The reporting of HBA, fabric topology, or zoning information for fabrics that are connected to hosts that are running Linux on IBM® System z® hardware. These limitations also apply to Storage Resource agents on all guest operating systems for VMware configurations.

Required authorities for deploying and running Storage Resource agents

Before you can create deployment schedules and deploy Storage Resource agents on target computers, you must meet the following requirements:

- To create deployment schedules, you must be logged in to IBM Spectrum Control with a user ID that has the Administrator role. For information about user roles, see [Authorizing users](#).
- To deploy Storage Resource agents on target computers, you must provide a user ID that has administrative rights on those computers. You enter this ID when you create a deployment schedule. IBM Spectrum Control uses this ID to log on to the target computers and install and configure the necessary runtime files for the agents.

The user under which a Storage Resource agent (daemon or non-daemon) runs must have the following authorities on the target computers:

- On the Linux or AIX operating systems, the user must have root authority. By default, an agent runs under the user 'root'.
- On the Windows operating systems, the user must have Administrator authority and be a member of the Administrators group. By default, a Storage Resource agent runs under the 'Local System' account.

Orphan zones

Storage Resource agents do not collect information about orphan zones. An orphan zone is a zone that does not belong to at least one zoneset.

Firewalls and Storage Resource agent deployments

Before you can deploy a Storage Resource agent on a computer, you must turn off the firewall on that computer. If you do not turn off the firewall, the deployment fails.

Deploying Storage Resource agents on multiple computers

If you deploy Storage Resource agents on multiple computers at the same time, the computers must have the same administrative user ID and password. IBM Spectrum Control uses these user credentials to log on to the computers when you install Storage Resource agents.

Tip: When you deploy Storage Resource agents on multiple computers, a globally unique identifier (GUID) is created for each computer (if one does not exist).

Communication between the IBM Spectrum Control server and a Storage Resource agent

The IBM Spectrum Control server connects to a monitored computer when a Storage Resource agent is deployed and whenever a data collection schedule runs against that agent.

During deployment, the server communicates with the target computer by using one of the following protocols:

- Windows server message block protocol (SMB)
- Secure Shell protocol (SSH)
- Remote execution protocol (REXEC)
- Remote shell protocol (RSH)

After deployment, the type of communication between the server and agent on that computer depends on whether you deployed the agent as daemon service or non-daemon service.

Daemon and non-daemon services

You can deploy a Storage Resource agent as a daemon or non-daemon service:

- A Storage Resource agent that is deployed as a daemon service runs in the background on the monitored computer and listens for requests from the IBM Spectrum Control server. Connectivity between the server and agent is established by using SSL. The server and agent have their respective certificates and no additional information is required besides those certificates and the security that is provided by the SSL protocol.
- A Storage Resource agent deployed as a service on demand (non-daemon service) runs as a stand-alone executable file on the monitored computer. Communication from the server to the agent uses the same protocol that was used during the deployment of the agent. Communication from the agent to the server uses SSL.
- A Storage Resource agent that is deployed as a daemon service on AIX, Linux, and Windows servers monitors disk paths in near real-time to detect errors. When deployed as a daemon service on an AIX server, the agent also monitors disk error events in near real-time. If the Storage Resource agent detects path status changes or disk errors, they are included in the status of the disks and paths. You can define alerts so that you are notified of changes to the status of the paths on monitored disks.

Only status changes for existing paths are detected. If a new path is added, or an existing path is removed, the number of paths that is displayed is not updated immediately. The number of paths is updated after the next scheduled probe collects data.

If a disk on an AIX server has an error status and you fix the error, you might want the new status of the disk to be displayed immediately. To display the new status immediately, you must reset the status indicator for the disk. To reset the status indicator, use the **errclear** command to clear the error log. To clear

the error log, use the following syntax:

```
errclear -d H -N disk_name 0
```

For example, if you fixed an error on hdisk4, and want to display the new status immediately, run the following command:

```
errclear -d H -N hdisk4 0
```

If you do not reset the status indicator for the disk, the status changes automatically after a few hours.

For information about the **errclear** command, see [errclear Command](#).

Port numbers for Storage Resource agents deployed as a daemon service

The following port numbers are used by Storage Resource agents that are deployed as daemon service:

- 9567 (For the Storage Resource agent that is deployed on the same server as IBM Spectrum Control.)
- 9510 (For Storage Resource agents that are deployed on remote servers.)

Storage Resource agents that are deployed as a non-daemon service do not use a port.

Authentication between the IBM Spectrum Control server and a Storage Resource agent

IBM Spectrum Control requires the correct authentication information (user name, password, port, certificate location, or passphrase) for monitored computers each time it communicates with Storage Resource agents on those computers. If the authentication information changes for a host computer on which a Storage Resource agent is deployed, the authentication information for that agent must be updated by using the Modify Agents, Update Credentials action on the Servers page in the GUI.

Replacing default SSL certificates

IBM Spectrum Control provides default SSL certificates for communication between the Data server and Storage Resource agent.

IBM Spectrum Control 5.2.2 uses SSL certificates with 2048-bit encryption keys whereas previous versions of IBM Spectrum Control used 1024-bit encryption keys. If you upgrade IBM Spectrum Control from a version earlier than 5.2.2, your SSL certificates are not updated automatically. If you want to use 2048-bit encryption keys with previous versions of IBM Spectrum Control, you must replace the default SSL certificates with custom SSL certificates.

For information about how to replace SSL certificates, see [Replacing default SSL certificates for the Data server and Storage Resource agents with custom SSL certificates](#).

Storage Resource agents on the same computer

You cannot deploy a Storage Resource agent on a computer where a Storage Resource agent is already installed and pointing to the same Data server. You can deploy a Storage Resource agent on the same computer as another Storage Resource agent if those agents communicate with different Data servers and use different ports when you listen for requests.

Time zones for computers that are monitored by Storage Resource agents

The time zones of computers that are monitored by Storage Resource agents are shown as Greenwich mean time (GMT) offsets in IBM Spectrum Control reports.

For example, a computer in Los Angeles shows the following time zones in the By Computer report in Asset reporting:

```
(GMT-8:00) GMT-8:00
```

Connections for Linux and AIX operating systems by using Remote Shell protocol (RSH)

If RSH is configured to use a user ID and password, the connection fails. To successfully connect to a system by using RSH, you must set up the **.rhosts** file (in the home directory of the account). RSH must be configured to accept a login from the system that is running your application.

Deployments on Windows operating systems - NetBIOS setting

To install a Storage Resource agent on Windows targets, the Enable NetBIOS over TCP/IP option must be selected in the Control Panel settings for the computer's network connections properties. To set this option, complete the following steps:

1. Open Windows Control Panel. For information about how to open Windows Control Panel, see [Accessing administration tools](#).
2. Select Network and Dial-Up Connections, some_connection, Properties, Internet Protocol (TCP/IP), Advanced, WINS, Enable NetBIOS over TCP/IP.

To determine whether these ports are not blocked for inbound requests, see the documentation for your firewall.

To determine whether security policies are blocking the connection ports, open Administrative Tools. For information about how to open Administrative Tools, see [Accessing administration tools](#).

Depending on whether your policies are stored locally or in Active Directory, follow these directions:

Policies that are stored locally

For policies that are stored locally, complete the following steps:

1. Open Windows Administrative Services.
2. Click Local Security Policy, IP Security Policies on Local Computer.

Policies that are stored in Active Directory

For policies that are stored in Active Directory, examine the IP security policies and edit or remove filters that block the ports:

- Click Administrative Tools, Default Domain Security Settings, IP Security Policies on Active Directory.
- Click Administrative Tools, Default Domain Controller Security Settings, IP Security Policies on Active Directory.

For all Windows systems, the Server service must be running to connect to a Windows system by using the Windows protocol.

The following table lists the ports that are reserved for NetBIOS. Ensure that these ports are not blocked.

Port	Description
135	NetBIOS Remote procedure call. (Not currently used.)
137	NetBIOS name service.
138	NetBIOS datagram. (Not currently used.)
139	NetBIOS session (for file and print sharing).
445	CIFS (on Windows XP).

For Windows, shares must be shared for the Guest or Everyone accounts, and password protected sharing must be disabled. To disable password protected sharing, follow these steps:

1. Click Control Panel, Networking and Sharing Center.
2. Click Change advanced sharing settings.

3. Click the down arrow next to All Networks.
4. Select Turn off password protected sharing.
5. Click Save Changes.
6. Exit from the Control Panel.

Deployments on Windows - User Account Control (UAC) remote restrictions

To install Storage Resource agents remotely on a Windows operating system, you must disable the User Account Control (UAC) remote restrictions on the Windows operating system. User Account Control is a security component on Windows operating systems.

Tip: To disable UAC restrictions, you must modify the computer registry. Serious problems might occur if you modify the registry incorrectly. Therefore, make sure that you follow these steps carefully. For added protection, back up the registry before you modify it. Then, you can restore the registry if problems occur. For information about how to back up and restore the registry, see <http://support.microsoft.com/kb/322756/>.

To disable UAC remote restrictions, follow these steps:

1. Open the Windows Run window. For information about how to open the Run window, see [Accessing administration tools](#).
2. Enter **regedit** and click OK.
3. Locate and click the following registry subkey:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\
Policies\System
```

4. Double click the EnableLUA registry entry.
5. In the Edit DWORD (32-Bit) dialog, change the value in the Value data field from 1 to 0.
6. Click OK.
7. Exit the registry editor.

SMI-S providers

Administer SMI-S providers that are associated with storage resources that are monitored by IBM Spectrum® Control. SMI-S providers enable communication between IBM Spectrum Control and certain types of storage systems and switches.

IBM Spectrum Control communicates with SMI-S providers to collect information about the following resources:

- Non-IBM® storage systems that are managed by SMI-S certified Common Information Model Object Manager (CIMOM), such as Dell EMC storage systems other than Unity, Hitachi, and NetApp
- Switches: Brocade switches that are running with a version of Fabric OS earlier than 8.2.1, monitored through Brocade Network Advisor

IBM Spectrum Control communicates directly with the following resources and does not require SMI-S providers:

- System Storage® DS8000®
- SAN Volume Controller
- The XIV®
- IBM Spectrum Accelerate
- Storwize® family of storage systems
- IBM FlashSystem® family of storage systems
- IBM Cloud Object Storage
- Dell EMC Unity
- Switches: Brocade switches that are connected to directly, that are running with Fabric OS 8.2.1 or later, and that are monitored through REST API
- Switches: Cisco switches monitored through SNMPv3 or SNMPv1

- [Verifying that an SMI agent is running](#)

You can verify that an SMI agent is running from the command line interface.

- [Replacing an SMI agent for block storage systems, fabrics, and switches](#)

You can replace the SMI agent for storage resources without interrupting the collection of performance data or losing historical data.

- [Interop namespaces for SMI-S providers for switches and storage systems](#)

This section describes the namespaces for switches and storage system SMI-S providers (also called CIM agents or CIMOMs) that are used in IBM Spectrum Control.

Related tasks

- [Replacing an SMI agent for block storage systems, fabrics, and switches](#)

Verifying that an SMI agent is running

You can verify that an SMI agent is running from the command line interface.

Procedure

Run the following command:

```
telnet <IP> <port>
```

Where <IP> is the IP address of the system where the SMI agent is installed, and <port> is the port number. By default, this is 5989 for a secure connection and 5988 for an unsecured connection.

Replacing an SMI agent for block storage systems, fabrics, and switches

You can replace the SMI agent for storage resources without interrupting the collection of performance data or losing historical data.

Before you begin

Attention: Before you begin, check whether a probe job is already in progress for the resource or is scheduled to occur while you replace the SMI agent. Plan the replacement during a time when the probe job is not occurring.

About this task

You might want to replace a SMI agent for a storage resource for the following reasons:

- The SMI agent might need to be upgraded to support data collection for the storage resource.
- The SMI agent might run on a different operating system, network, or with a different IP address.

You can replace an SMI agent on a third-party block storage system, such as a Dell EMC storage system. You cannot replace an SMI agent on IBM® System Storage® DS8000® (the DS8000 uses a native API (NAPI) connection, rather than an SMI-S provider).

To replace an SMI agent, follow these steps:

Procedure

1. Using the instructions that came with your SMI agent software, install the new SMI agent and add the storage resource that it manages. The procedure varies, depending on the type of storage resource.
2. Choose one of the following procedures:

Type of storage resource	Procedure for adding a storage resource to the SMI agent configuration
To add a storage system	See Adding storage systems
To add a fabric or a switch	See Adding fabrics and switches
3. In IBM Spectrum Control, run the Add Device Wizard for the new SMI agent.
After the wizard discovers the storage resource, a message is displayed to confirm that the data source (SMI agent) was added for monitoring. Close the window.
4. In the IBM Spectrum Control GUI, right-click the storage resource and click *Connections > Test Connection > [IP address of the new SMI agent]*.
Verify that the test was successful.
5. Remove the storage system or fabric switch from the old SMI agent.
6. Optional: Shut down the old SMI agent services or the device that runs the old SMI agent.
7. Restart the probe to continue the collection of asset, capacity, and configuration data for the resource.
8. Check the status of the probe and performance monitor to ensure that the data is being collected for the storage resource.

Results

The SMI agent is replaced. Depending on your resource or SMI agent, the old association of storage resource and SMI agent might continue to display with the new association in the Connections menu. The old SMI agent does not interfere with operation. It cannot be selected as an SMI agent for the storage resource.

What to do next

For more information, see [SMI-S providers](#) in the *IBM Spectrum Control Knowledge documentation*.

Related reference

- [SMI-S providers](#)

Interop namespaces for SMI-S providers for switches and storage systems

This section describes the namespaces for switches and storage system SMI-S providers (also called CIM agents or CIMOMs) that are used in IBM Spectrum® Control.

If you specify an incorrect namespace the following issues might occur:

- The connection test fails when the SMI-S provider is added.
- The discovery does not discover all information of the system that is managed by the SMI-S provider.
- The probe fails.
- The function that you want to perform on the system might fail (for example, collecting performance data).

For information about the interoperability namespaces for storage systems, see the [IBM Spectrum Control interoperability matrix for storage systems](#).

For information about the interoperability namespace for switches and directors, see the [IBM Spectrum Control interoperability matrix for switches](#).

SNMP agents

SNMP agents are switches and directors that communicate with IBM Spectrum® Control through SNMP. »IBM Spectrum Control supports SNMPv1, SNMPv2, and SNMPv3 for connecting to switches and sending alert notifications to SNMP trap destinations.«

About this task

IBM Spectrum Control uses SNMP to send queries across the IP network to management information bases (MIBs) supported on switches and directors. IBM Spectrum Control uses the Fibre Alliance FC Management MIB and the Fibre Channel FE MIB specifications. The queries are sent only to switches that were added to IBM Spectrum Control for use as SNMP agents. Information is collected from each switch that is configured to use SNMP. The SNMP discovery registers each switch.

You add a switch as an SNMP agent on the Network » Switches page. You can then perform actions on the switch, including:

- running an immediate probe job, or scheduling a probe job to collect data from the switch at a specified time
- viewing information about the switch, such as the condition of the switch, the status of the most recent probe job, and other information
- modifying the connection information and credentials for the switch
- removing the switch so it is no longer managed by IBM Spectrum Control.

For information about adding switches to IBM Spectrum Control, see [Adding resources](#).

- **Displaying information about an SNMP agent**
You can view information about an SNMP agent including the IP address, user name, and password.
- **Removing an SNMP agent**
To remove an SNMP agent that is being managed by IBM Spectrum Control, you must remove the switch or fabric that the SNMP agent is monitoring. Data collected by the agent is not removed from the database repository.

Displaying information about an SNMP agent

You can view information about an SNMP agent including the IP address, user name, and password.

About this task

To display information about an SNMP agent, follow this procedure:

Procedure

1. In the menu bar, go to Network » Switches. Information about monitored switches is displayed.
2. Right-click an SNMP switch and click Connections » Modify Connection.
3. The following information is displayed.

SNMPv3 agent

- SNMP version
The SNMP version of the agent.
- User name
The user name used to log in to the switch.
- Authentication password
The password for the user logged in to the switch.
- Authentication protocol
The protocol or digest used for authentication to the switch.
- Encryption protocol
The protocol used for encryption.

SNMPv1 agent

- SNMP version
The SNMP version of the agent.
- Read community
The SNMP community string. The default is public.
- Write community
The SNMP community string. The default is private.

Removing an SNMP agent

To remove an SNMP agent that is being managed by IBM Spectrum® Control, you must remove the switch or fabric that the SNMP agent is monitoring. Data collected by the agent is not removed from the database repository.

About this task

To remove an SNMP agent, follow this procedure:

Procedure

1. In the menu bar of the GUI, go to Network > Switches or Network > Fabrics.
2. Right-click a switch or fabric and select Remove.
To remove a Cisco fabric, you must remove all the switches in that fabric. The Cisco fabric is then automatically removed.
3. Follow the directions that are presented in the information message.

Starting and stopping the IBM Spectrum Control servers

You can start and stop the IBM Spectrum® Control servers in the GUI or by running scripts.

About this task

IBM Spectrum Control provides scripts for starting and stopping the servers that run within the product. To run these scripts, on a Windows operating system, you must have Administrator authority.

Tip: The default *installation_dir* is C:\Program Files\IBM\TPC.

Note: IBM Spectrum Control servers start automatically on Windows, Linux®, or AIX® operating systems when the operating system is started.

- [Starting the IBM Spectrum Control servers by using the GUI](#)
Start the IBM Spectrum Control Data server, Device server, or Alert server by using the System Management page in the GUI.
- [Starting the IBM Spectrum Control servers by using scripts](#)
Run scripts to start the IBM Spectrum Control servers on the Windows, Linux, or AIX operating systems. Note: IBM Spectrum Control servers start automatically on all platforms when the operating system is started.
- [Stopping the IBM Spectrum Control servers by using the GUI](#)
Stop the IBM Spectrum Control Data server, Device server, or Alert server by using the System Management page in the GUI.
- [Stopping the IBM Spectrum Control servers by using scripts](#)
Run scripts to stop the IBM Spectrum Control servers on the Windows, Linux, or AIX operating systems.

- [Default locations of log files](#)

Starting the IBM Spectrum Control servers by using the GUI

Start the IBM Spectrum® Control Data server, Device server, or Alert server by using the System Management page in the GUI.

Procedure

1. In the menu bar, go to Home > System Management.
2. Click Component Servers in the Components section.
3. Click Start Server next to the server that you want to start.
Tip: To start the Web server, use scripts that are provided with the product.

Results

In the Overview section of the System Management page, the running icon  is displayed next to the server to indicate that it is running.

Related concepts

Starting the IBM Spectrum Control servers by using scripts

Run scripts to start the IBM Spectrum® Control servers on the Windows, Linux®, or AIX® operating systems. Note: IBM Spectrum Control servers start automatically on all platforms when the operating system is started.

Starting the IBM Spectrum Control servers on Windows

Important: IBM Spectrum Control provides scripts for starting and stopping the servers that run within the product. To run these scripts, you must have Administrator authority.

Tip: The default *installation_dir* is C:\Program Files\IBM\TPC.

To start the servers on the Windows operating system, enter the following commands in the following order:

Data server

installation_dir\scripts\startTPCData.bat

Device server

installation_dir\scripts\startTPCDevice.bat

Alert server

installation_dir\scripts\startTPCAAlert.bat

Export server

installation_dir\scripts\startTPCExport.bat

Web server

installation_dir\scripts\startTPCWeb.bat

Storage Resource Agent - *directory*

Tip: The Storage Resource Agent service is started on the Windows operating system by using Windows Services.

To start the Storage Resource Agent service on Windows, complete the following steps:

1. Open Windows Services. For information about how to start Services, see [Accessing administration tools](#).
2. Start the IBM Storage Resource Agent - *directory* service where *directory* is where the Storage Resource agent is installed.

Starting the IBM Spectrum Control servers on Linux or AIX

Note: The default *installation_dir* is /opt/IBM/TPC.

To start the servers on the Linux or AIX operating systems, enter the following commands in the following order:

Data server

/installation_dir/scripts/startTPCData.sh

Device server

/installation_dir/scripts/startTPCDevice.sh

Alert server

installation_dir/scripts/startTPCAAlert.sh

Export server

installation_dir/scripts/startTPCExport.sh

Web server

/installation_dir/scripts/startTPCWeb.sh

Storage Resource Agent

/installation_dir/agent/bin/agent.sh start

Checking the version and license of IBM Spectrum Control

The version and license of IBM Spectrum® Control that is installed on your system determine the IBM Spectrum Control functions that are available.

About this task

Check the version of IBM Spectrum Control that is installed on your system to verify that you are using the correct level of the documentation.

Check the license that is installed on your system if documented functions are not available. The functions might be restricted to a different license.

Procedure

To check the version and license of IBM Spectrum Control that is installed, complete the following steps in the web-based GUI:

1. Click the question mark icon in the banner pane of the window to display a list of help topics.

2. From the list of help topics, select About.

Checking IBM Spectrum Control status

The System Management page shows a high-level summary of the status of the server or servers on which IBM Spectrum® Control is installed. Use the System Management page to troubleshoot problems with the system, create trace logs, and get technical support.

The following system status information is available:

- The state of component servers, such as the Data, Device, and Alert servers, and the Db2® database. In a multiple-server environment, the IBM® Cognos® Analytics 11.2.0 or later server or the Db2 database can run on a separate server from the Data, Device, and Alert servers. In such a multiple-server environment, the System Management page shows which components are installed on each server.
- A chart showing the amount of used and available file system space on the server over time. Use this chart to view the storage usage trends on the server to identify or predict performance problems. In a multiple-server environment, a separate chart is shown for the two servers.
- A set of charts showing performance information for the storage system volumes that the server writes to and reads from most often. The charts show the following information for the volumes:
 - Volume utilization
 - I/O rate
 - Data rate
 - Response time
 - Read cache hits

In a multiple-server environment, these charts are shown for each server.

- Alert conditions detected on the server or servers on which IBM Spectrum Control is installed.
- [Troubleshooting problems with the IBM Spectrum Control component and servers](#)
If IBM Spectrum Control is not running or its performance has degraded, you can use the System Management page of the IBM Spectrum Control GUI to assess the overall condition of the system. You can also view the file system capacity and volume performance trends to help you anticipate future needs and prevent problems.
- [Packaging and sending log files from the System Management page](#)
To provide trace information to IBM Support about the performance of IBM Spectrum Control, you might be asked to package and send a set of log files. One way to package and send the log files is from the Spectrum Control System Management page.

Troubleshooting problems with the IBM Spectrum Control component and servers

If IBM Spectrum® Control is not running or its performance has degraded, you can use the System Management page of the IBM Spectrum Control GUI to assess the overall condition of the system. You can also view the file system capacity and volume performance trends to help you anticipate future needs and prevent problems.

Before you begin

To view file system capacity information, the Storage Resource agent on the IBM Spectrum Control server must be running. In a multiple-server environment, a Storage Resource agent must be installed and running on the secondary server to view file system capacity information for the secondary server.

To view performance information for storage system volumes, the storage systems must be managed by IBM Spectrum Control and have performance monitors running.

About this task

The System Management page shows a high-level summary of the condition of the server or servers on which IBM Spectrum Control is installed.

Procedure

To troubleshoot problems with IBM Spectrum Control, complete the following steps:

1. In the menu bar, go to Home > System Management.
2. Use the System Management page to view the status of the IBM Spectrum Control system.
 - Check the state of each component server and the DB2® database to verify that they are all running. To examine the status and resource usage of component resources in detail and, if necessary, to restart the Data server, Device server, or Alert server, complete the following steps:
 - Click Component Servers in the Components section. View the state, memory use, and database connections for each component server.
 - Optional: If the Data server, Device server, or Alert server is not running, click the Start Server button to restart the server. If the Device server is running, but one or more of its services are not running, click the Start Services button to restart the services.
 - If the performance of the IBM Spectrum Control is slow, examine the chart for available file system space and the volume performance charts.
 - Check whether there are any alerts for the server or servers on which IBM Spectrum Control is installed. The Alerts link in the Overview section shows the number of alerts and the greatest alert severity. Click Alerts in the Overview section to view the alerts.
3. Optional: You can also view the status of the product servers on Windows:
 - a. On the Windows desktop, click Start > Control Panel > Administrative Tools > Services.
Tip: For information about how to view information about services on different versions of Windows, see [Accessing administration tools](#).
 - b. On the Services window, locate the names of the server services. For example, the service for the Alert server is IBM Spectrum Control - Alert Server.
 - c. View the Status column to determine if the service is running or stopped.
 - d. Optional: If a server is not running and you want to restart it, right-click the service name for that server and click Start.

Packaging and sending log files from the System Management page

To provide trace information to IBM® Support about the performance of IBM Spectrum® Control, you might be asked to package and send a set of log files. One way to package and send the log files is from the Spectrum Control System Management page.

Before you begin

To package and send IBM Spectrum Control log files, you must be assigned to the Administrator role and open a support ticket with IBM Support. You can open a support ticket in IBM Spectrum Control as described in the following procedure or on the IBM Support website. For information about how to open a support ticket on the IBM Support website, go to [Getting support](#).

Tip: Before you package the log files, you can, optionally, adjust the level of trace recording for each component server. By selectively setting trace levels, you can provide IBM Support with more information on particular component servers that are the suspected source of the problem. You can also reduce the trace level for a particular component server to improve system performance.

About this task

When the IBM Spectrum Control component servers are running, they write trace information to log files. The log files contain trace information for component servers such as the Data server, Device server, Web server, and Alert server.

On the System Management page, you can collect the log files from all the component servers and package them into a single compressed file. You can then send the file to IBM Support automatically using FTP or manually after packaging is complete.

You can also package the log files from the command line. For more information, go to [Packaging log files from the command line and sending them to IBM Support](#).

Tip: Only one version of the log file package is retained at a time. When you create a new package, the previous package is overwritten.

Procedure

To package log files on the System Management page and send them to IBM Support, complete the following steps:

1. In the menu bar, go to Home, > System Management.
2. Optional: To adjust the trace level for any of the component servers, complete the following steps:
 - a. Click Component Servers in the Components section. In the Component Servers pane, you can view performance information for each component server. The current trace level for each of the services on a component server is displayed.
 - b. Adjust the trace level for a component server by clicking Off or On for each of the component's services.

Tip: If you adjust the trace level for one or more component servers, wait at least several hours before you package the log files. If you package the log files too soon after you adjust the trace levels, the logs will not contain enough traces at the new level. Before you create the logs, you might want to try to re-create the problem so that the log files contain the relevant trace data.
3. Click Get Support in the General section.
4. If you do not already have a support ticket associated with your issue, click **Open Support Ticket** on the Get Support page to open a support ticket. A support ticket is used by IBM Support to track and manage your issue and is required when you upload a log file package.
5. Click Collect Log.
6. Optional: If you wish to automatically send your logs using FTP, under Option 1: Automatic Upload, enter your support ticket number and your email address and then click Collect and Upload log.
7. Optional: If you prefer not to automatically send your logs using FTP, click Collect and Download Log under Option 2: Manual Upload.
8. Click Close to close out of the Creating Logs and Collect Log windows.
9. If you selected Collect and Download Log in step 7, after the log package is created, select the appropriate manual upload method under Manual Upload and complete the indicated steps.

Note: The manual upload methods are also detailed on [Getting support](#).

For more information about resolving any FTP-related problems when you upload the package, see [Troubleshooting FTP transfers](#).

Results

It can take 20 minutes or longer for IBM Spectrum Control to generate and package the log files. You can do other work or log out of IBM Spectrum Control while the package is being created. When the process completes, you can download the package by clicking the provided link on the System Management page.

Depending on the environment, the size of the log file package can vary. Its size is determined by the following factors:

- How frequently the product is used
- The number of resources that are monitored, the type of data that is being collected, and how frequently that data is collected
- The length of time that the product has been up and running

For example, if the product monitors five storage systems over a period of three days, and collects asset and performance each day, the size of the package might be 200 - 300 MB.

Increasing the memory allocation for the Data server

If the data memory that is allocated for your Data server is insufficient, you can increase the memory. The default maximum memory for the Data server is set to 1024 MB.

About this task

You cannot increase the memory for the Device server. The memory for the Device server is set to the maximum heap size for the JVM.

- [Increasing the memory allocation for the Data server that is running on AIX](#)
Increase the memory allocation for the Data server that is running on AIX®.
- [Increasing the memory allocation for the Data server that is running on Linux](#)
Increase the memory allocation for the Data server that is running on Linux®.
- [Increasing memory allocation for Data server that is running on Windows](#)
Increase the memory allocation for the Data server that is running on Windows.

Increasing the memory allocation for the Data server that is running on AIX

Increase the memory allocation for the Data server that is running on AIX®.

About this task

To increase the memory that is allocated for the Data server, complete the following steps:

Procedure

1. Log on as a user with root authority.
2. Stop the Data server. From the command line, run the following command:

```
/TPC_install_directory/scripts/stopTPCData.sh
```

Where *TPC_install_directory* is the installation directory. The default directory is */opt/IBM/TPC*.

3. Using a text editor, open the */TPC_install_directory/data/server/tpcdsrv1* file.
4. Locate the following line:

```
exec $JAVAEXE -Dsun.net.inetaddr.ttl=300 -Xrs -XmxXXXXm  
-cp $CLASSPATH com.tivoli.itsrm.server.Server &
```

where XXXX is the memory allocated for the Data server. The default is **1024m** (1024 MB).

5. Increase the memory that is allocated for the Data server. For example, to increase the memory to 1536 MB, change the line to read as follows:

```
exec $JAVAEXE -Dsun.net.inetaddr.ttl=300 -Xrs -Xmx1536m  
-cp $CLASSPATH com.tivoli.itsrm.server.Server &
```

6. Save the modified *tpcdsrv1* file.
7. Start the Data server by running the following command:

```
/TPC_install_directory/scripts/startTPCData.sh
```

Increasing the memory allocation for the Data server that is running on Linux

Increase the memory allocation for the Data server that is running on Linux®.

Procedure

To increase the memory that is allocated for the Data server, complete the following steps:

1. Log on as a user with root authority.
2. Stop the Data server.
3. From the command line, run the following command:

```
/installation_dir/scripts/stopTPCData.sh
```

Where *installation_dir* is the installation directory. The default directory is */opt/IBM/TPC*.

4. Using a text editor, open the */installation_dir/data/server/tpcdsrv1* file.
5. Locate the following line:

```
exec $JAVAEXE -Dsun.net.inetaddr.ttl=300 -Xrs -XmxXXXXm  
-cp $CLASSPATH com.tivoli.itsrm.server.Server &
```

Where XXXX is the memory that is allocated for the Data server. The default is **1024m** (1024 MB).

6. Increase the memory that is allocated for the Data server. For example, to increase the memory to 1536 MB, change the line to read as follows:

```
exec $JAVAEXE -Dsun.net.inetaddr.ttl=300 -Xrs -Xmx1536m  
-cp $CLASSPATH com.tivoli.itsrm.server.Server &
```

7. Save the modified *tpcdsrv1* file.
8. Start the Data server by running the following command:

```
/installation_dir/scripts/startTPCData.sh
```

Increasing memory allocation for Data server that is running on Windows

Increase the memory allocation for the Data server that is running on Windows.

About this task

To increase the memory that is allocated for the Data server, complete the following steps:

Procedure

1. Open the Run window. For information about how to open the Run window, see [Accessing administration tools](#).
2. Type `regedit` and click OK. The Registry Editor window is displayed.
3. Expand the HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\IBM\TSRM\1 in the Registry Editor window.
4. Right-click the 1 folder and click New\String Value.
5. Type `SRVJPARMS` as the name of the string.
6. Right-click the name of the string and click Modify.
7. Enter `-Xmx.XXXM` in the Value data field, where XXXX represents the number of megabytes for the server maximum heap size. Click OK.
The default size is 1024 MB. The largest possible value for the maximum heap size is 1536 MB. If the value is set to something larger than 1536, that value is ignored and 1536 MB is used as the maximum heap size.
8. Stop and restart the server to have the changes take effect. To stop the server, complete the following steps:
 - a. Open Windows Services. For information about how to open Services, see [Accessing administration tools](#).
 - b. Right-click IBM Spectrum® Control - Data Server and click Stop.
To restart the server, right-click the service and click Start.

Changing passwords

IBM Spectrum® Control provides a GUI and non-GUI password tool; however, both tools achieve the same purpose.

Attention: For Linux® and AIX® operating systems, it is recommended that you use the GUI password tool. However, if you use the non-GUI password tool for future updates, then *do not* use the GUI password tool to update your passwords on the same system at a later time or the IBM Spectrum Control servers might not operate properly.

If you installed IBM Spectrum Control and used the same Db2® user ID and password for the items IBM Spectrum Control requires, then when you change the Db2 password, you must also change the passwords for the items that the Db2 password applies to.

The Db2 administrative password might also apply to the following items:

- The database administration user ID and password (for the Data or Device server to connect to the database).
- The database user ID and password to create the database schema.
- The host authentication password (for the Storage Resource agents to communicate with the Device server).
- The Storage Resource agent service login user ID and password (for Windows only, if this user ID does not exist).
- [Changing passwords by using the password tool](#)
Use the password tool to change the passwords for Db2 and IBM Spectrum Control so that they can continue to authenticate to one another whenever you change a password.
- [Changing passwords on AIX and Linux systems using the Command Line Interface \(CLI\)](#)
Use the `changepasswords_noX.sh` script to change the passwords for IBM Spectrum Control on an AIX or Linux server that does not have the X Windows System installed.
- [Changing passwords on Windows systems from the Command Line Interface \(CLI\)](#)
Use the `changepasswords.bat` script to change the stored passwords of the user IDs used by IBM Spectrum Control.

Changing passwords by using the password tool

Use the password tool to change the passwords for Db2® and IBM Spectrum® Control so that they can continue to authenticate to one another whenever you change a password.

Attention: For Linux® and AIX® operating systems, it is recommended that you use the GUI password tool. However, if you use the non-GUI password tool for future updates, then *do not* use the GUI password tool to update your passwords on the same system at a later time or the IBM Spectrum Control servers might not operate properly.

If you are logged on to IBM Spectrum Control by using a domain user account, which is also a member of the local administrator group, when you run the change password tool, passwords are not updated. If you run the tool by using a local OS user account, and an error occurs, complete these steps.

To run the password tool when you log in by using a domain user account, choose one of the following methods:

- Right-click the `changepasswords.bat` file and select Run as administrator.
Or
 1. Click Start\All Programs\Open Administrative Tools\Local Security Policy. For information about how to open Administrative Tools, see [Accessing administration tools](#).
 2. On the Local Security Policy window, disable User Account Control: Run all administrators in Admin Approval Mode.
 3. Restart your computer.
- [Single server installation where components use the same logon credentials](#)
Use the password tool to change the password for IBM Spectrum Control when it is installed on a single server and the Common User and the Db2 User are

identical and use the same logon credentials. The credentials are usually *db2admin* on a Windows operating system or *db2inst1* on AIX and Linux operating systems.

- [Single-server installation where components use different logon credentials](#)

Use the password tool to change the passwords for IBM Spectrum Control when it is installed on a single server and the Common User and the Db2 User are different and use different logon credentials.

- [Multiple-server installation where Db2 is remote](#)

Use the password tool to change the passwords for IBM Spectrum Control when the IBM Spectrum Control database repository and the IBM Spectrum Control servers are installed on different servers.

Single server installation where components use the same logon credentials

Use the password tool to change the password for IBM Spectrum® Control when it is installed on a single server and the Common User and the Db2® User are identical and use the same logon credentials. The credentials are usually *db2admin* on Windows operating system or *db2inst1* on AIX® and Linux® operating systems.

Before you begin

Before you use the password tool, ensure that you know the existing password or passwords that you want to change. Stop the IBM Spectrum Control servers.

Use the following steps to change the Db2 password in the Windows, AIX, or Linux operating systems. Then, use the IBM Spectrum Control password tool to update the IBM Spectrum Control servers to use the new Db2 password.

Procedure

To change a password in the Windows operating system, follow these steps:

1. Open the Control Panel. For more information, see [Accessing administration tools](#).

- a. Select User Accounts and click Change account type.
- b. Select the user account of the password that you want to change.
- c. Select Change password.
- d. Enter and confirm the new password and click Change password.

If the password, for the Windows domain user ID that you used as the IBM Spectrum Control Common User expired, change that password in the Windows domain before you continue. If you see the following error or a similar error after you run the password tool, verify that the password for your Common User Windows domain user ID did not expire:

```
com.tivoli.itsrm.tools.changepasswords.ChangePasswords error  
SEVERE: The DB2 password is invalid.
```

If necessary, change the Common User Windows domain password and run the password tool again.

To change a password in the AIX or Linux operating system, follow these steps:

2. Log in as the root user.

- a. Run the following command:

```
passwd username
```

Where *username* is the user whose password you want to change.

- b. Enter the new password and confirm that new password is correct.

To use the IBM Spectrum Control password tool to update the IBM Spectrum Control servers to use the new password, follow these steps:

3. Open a command prompt and change the directory to the following directory:

Windows operating systems

```
Spectrum_Control_Installation_dir\service
```

Linux or UNIX operating systems

```
Spectrum_Control_Installation_dir/service
```

4. Start the password tool by running the following command:

Windows operating systems

```
changepasswords.bat
```

Linux or UNIX operating systems

```
./changepasswords
```

5. Select Change the IBM Spectrum Control and DB2 Passwords and click OK..

6. Enter and then confirm the same new password that you entered when you changed the password in the operating system in Step 1 or Step 2. Verify that the Restart servers option is selected.

7. Click OK.

8. In the Confirm password change window, click Yes.

9. When the tool finishes, click Back To Main.

10. Click Exit program..

Tip: To verify that the password changes were successful, review the log file that is located in the *Spectrum_Control_installation_dir\service\log* directory.

Related tasks

Single-server installation where components use different logon credentials

Use the password tool to change the passwords for IBM Spectrum® Control when it is installed on a single server and the Common User and the Db2® User are different and use different logon credentials.

Before you begin

Before you use the password tool, ensure that you know the existing password or passwords that you want to change. Stop the IBM Spectrum Control servers.

Use the following steps to change the passwords in the Windows, AIX®, or Linux® operating systems. Then, use the IBM Spectrum Control password tool to update the IBM Spectrum Control servers to use the new passwords.

Procedure

To change a password in the Windows operating system, follow these steps:

1. Open the Control Panel. For more information, see [Accessing administration tools](#).
 - a. Select User Accounts and click Change account type.
 - b. Select the user account of the password that you want to change.
 - c. Select Change password.
 - d. Enter and confirm the new password and click Change password.

If the password, for the Windows domain user ID that you used as the IBM Spectrum Control Common User expired, change that password in the Windows domain before you continue. If you see the following error or a similar error after you run the password tool, verify that the password for your Common User Windows domain user ID did not expire:

```
com.tivoli.itsrm.tools.changepasswords.ChangePasswords error  
SEVERE: The DB2 password is invalid.
```

If necessary, change the Common User Windows domain password and run the password tool again.

To change a password in the AIX or Linux operating system, follow these steps:

2. Log in as the root user.
 - a. Run the following command:

```
passwd username
```

Where *username* is the user whose password you want to change.

- b. Enter the new password and confirm that new password is correct.

To use the IBM Spectrum Control password tool to update the IBM Spectrum Control servers to use the new passwords, follow these steps:

3. Open a command prompt and change the directory to the following directory:

Windows operating systems

```
Spectrum_Control_Installation_dir\service
```

Linux or UNIX operating systems

```
Spectrum_Control_Installation_dir/service
```

4. Start the password tool by running the following command:

Windows operating systems

```
changepasswords.bat
```

Linux or UNIX operating systems

```
./changepasswords
```

5. To change the Common User's password in IBM Spectrum Control, do the following in the password tool:
 - a. Select Change IBM Spectrum Control Passwords and click OK.
 - b. Enter and then confirm the same new password that you entered when you changed the Common User's password in the operating system in Step 1 or Step 2.
 - c. Click OK.
 - d. In the Confirm password change window, click Yes.
 - e. When the process is completed, click Back to Main.
6. To change the Db2 User's password in IBM Spectrum Control, do the following in the password tool:

- a. Select Change DB2 password and click OK.
 - b. Enter and confirm the same new password as you entered when changing the Db2 User's password in the operating system in Step 1 or Step 2. Verify that the Restart servers option is selected.
 - c. Click OK.
 - d. In the Confirm password change window, click Yes.
 - e. When the process is completed, click Back to Main.
7. Click Exit Program.

Tip: To verify that the password changes were successful, review the log file that is located in the *Spectrum_Control_installation_dir*\service\log directory.

Related tasks

Multiple-server installation where Db2 is remote

Use the password tool to change the passwords for IBM Spectrum® Control when the IBM Spectrum Control database repository and the IBM Spectrum Control servers are installed on different servers.

Before you begin

For this procedure, the terms *Server A* and *Server B* denote the two servers. *Server A* has Db2® and the IBM Spectrum Control database repository installed. *Server B* has the IBM Spectrum Control servers installed.

Before you use the password tool, ensure that you know the existing passwords that you want to change. Stop the IBM Spectrum Control servers on *Server B*.

Use the following steps to change the passwords in the Windows, Linux®, or AIX® operating system on *Server A* and *Server B*. Then, use the IBM Spectrum Control password tool on *Server A* and *Server B* to update IBM Spectrum Control to use the new passwords.

Procedure

To change a password in the Windows operating system, follow these steps:

1. Open the Control Panel.

For more information, see [Accessing administration tools](#).

- a. Select User Accounts and click Change account type.
- b. Select the user account of the password that you want to change.
- c. Select Change password.
- d. Enter and confirm the new password and click Change password.

If the password for the Windows domain user ID that you used as the IBM Spectrum Control Common User expired, change that password in the Windows domain before you continue. If you see the following error or a similar error after you run the password tool, verify that the password for your Common User Windows domain user ID did not expire:

```
com.tivoli.itsrm.tools.changepasswords.ChangePasswords error
SEVERE: The DB2 password is invalid.
```

If necessary, change the Common User Windows domain password and run the password tool again.

To change a password in the AIX or Linux operating system, follow these steps:

2. Log in as the root user.

- a. Run the following command:

```
passwd username
```

Where *username* is the user whose password you want to change.

- b. Enter the new password and confirm that new password is correct.

To use the IBM Spectrum Control password tool to update IBM Spectrum Control to use the new passwords, follow these steps:

3. On *Server A*, open a command prompt and change the directory to the following directory:

Windows operating systems

```
Spectrum_Control_Installation_dir\service
```

Linux or UNIX operating systems

```
Spectrum_Control_Installation_dir/service
```

4. On *Server A* start the password tool by running the following command:

- For Windows operating system:

```
changepasswords.bat
```

- For Linux or AIX operating system:

changepasswords

5. Select Change DB2 password and click OK.
6. Enter and confirm the same new password as you entered when changing the Db2 User's password in the operating system in Step 1 or Step 2. Verify that the Restart servers option is selected.
7. Click OK.
8. In the Confirm password change window, click Yes.
9. When the process is completed, click Back to Main.
10. Click Exit Program.
11. On *Server B*, open a command prompt window and change the directory to the following directory:

Windows operating systems

Spectrum_Control_Installation_dir\service

Linux or UNIX operating systems

Spectrum_Control_Installation_dir/service

12. On *Server B* start the password tool by running the following command:

- For Windows operating system:

changepasswords.bat

- For Linux or AIX operating system:

changepasswords

13. To change the Common User's password in IBM Spectrum Control on *Server B*, do the following in the password tool:
 - a. Select Change IBM Spectrum Control Passwords and click OK.
 - b. Enter and then confirm the same new password that you entered when you changed the Common User's password in the operating system in Step 1 or Step 2.
 - c. Click OK.
 - d. In the Confirm password change window, click Yes.
 - e. When the process is completed, click Back to Main.
14. To change the Db2 User's password in IBM Spectrum Control on *Server B*, do the following in the password tool:
 - a. Select Change DB2 password and click OK.
 - b. Enter and confirm the same new password as you entered when you changed the Db2 User's password in the operating system on *Server A* in Step 1 or Step 2. Verify that the Restart servers option is selected.
 - c. Click OK.
 - d. In the Confirm password change window, click Yes.
 - e. When the process is completed, click Back to Main.
15. Click Exit Program.

Tip: To verify that the password changes were successful, review the log file that is located in the *Spectrum_Control_installation_dir\service\log* directory.

Changing passwords on AIX and Linux systems using the Command Line Interface (CLI)

Use the `changepasswords_noX.sh` script to change the passwords for IBM Spectrum® Control on an AIX® or Linux® server that does not have the X Windows System installed.

Before you begin

Attention: It is recommended that you use the GUI password tool. However, if you use the non-GUI password tool for future updates, then *do not* use the GUI password tool to update your passwords on the same system at a later time or the IBM Spectrum Control servers might not operate properly. Before you use the `changepasswords_noX.sh` script, ensure that you know the existing passwords that you want to change. Stop the IBM Spectrum Control servers.

Use the following steps to change the Db2® password in the Windows, AIX, or Linux operating systems. Then, use the IBM Spectrum Control `changepasswords_noX.sh` script to update the IBM Spectrum Control servers to use the new passwords.

Procedure

To change a password in the AIX or Linux operating system, follow these steps:

1. Log in as the root user.
 - a. Run the following command:

```
passwd username
```

Where *username* is the user whose password you want to change.

- b. Enter the new password and confirm that new password is correct.

To use the IBM Spectrum Control `changepasswords_noX.sh` script to update the IBM Spectrum Control servers to use the new passwords, follow these steps:

2. Open a command prompt and change the directory to the following directory:

```
Spectrum_Control_Installation_dir/service
```

3. Start the `changepasswords_noX.sh` script by running the following command:

```
./changepasswords_noX.sh
```

4. Enter the corresponding option for the password that you want to change: `tpc` or `db`.
5. Enter the same new password that you entered when you changed the user password in the operating system in Step 1.
6. When you are finished using the `changepasswords_noX.sh` script, enter `quit` in the prompt window.

Changing passwords on Windows systems from the Command Line Interface (CLI)

Use the `changepasswords.bat` script to change the stored passwords of the user IDs used by IBM Spectrum® Control.

Before you use the `changepasswords.bat` to update the passwords in IBM Spectrum Control, you must change the passwords for the user IDs on the Windows operating system.

Note: The `changepasswords.bat` file is located in the `installation_dir/service` directory.

```
➔ changepasswords.bat -sc -tpc -db -p password -i -r
```

Required Parameters:

- sc OR -tpc
Changes the password stored for the user ID for IBM Spectrum Control.
- db
Changes the password stored for the database administrator user ID.
- p
Enter the new password.
- i
The new password is read from standard input, that is, you enter the password when prompted by the `changepasswords.bat` script.

Optional Parameters:

- r
Restart the IBM Spectrum Control server services.

Granting local administrative privileges to a domain account

Automatically grant administrative privileges to Windows domain accounts. The user account for the Storage Resource agent requires local administrative rights. Because these rights are not necessarily guaranteed for domain users in a Windows domain environment, you are shown how to grant local administrative rights to domain users. Using this procedure, you do not have to manually process each machine in the domain.

About this task

Note: These steps are for a Windows system that is a member of a Windows domain and not for the Windows Domain Primary Domain Controller. To use Group Policy to grant local administrative privileges to a domain account, complete the following steps:

Procedure

1. On the domain controller, go to Administrative Tools > Active Directory Users and Computers (you must be running with Domain Administrator privileges).
2. Right-click on the Organizational Unit (OU) upon which you want to apply the Group Policy. Click Properties.
3. The Group Policy Properties panel is displayed. Select the Group Policy tab and click New to create a Group Policy.
4. Designate a name for the new Group Policy. Select the new Group Policy and click Edit.
5. The Group Policy Object Editor panel is displayed. Go to New Group Policy Object *your_policy* > Computer Configuration > Windows Settings > Security Settings > Restricted Groups. Right-click Restricted Groups, and then click Add Group.
6. For example, name the new group `Administrators`. Under Properties, add the user `Administrator`, and the domain accounts or groups upon which you want the Group Policy in effect for. For example, you can add `TPC\storageadmin`, `TPC\storagegroup`, and `TPC\TestGroup`. Click OK.
7. Add these user rights to the domain account:
 - Act as part of the operating system
 - Log on as a serviceIn the Group Policy Object Editor, go to New Group Policy Object *your_policy* > Computer Configuration > Windows Settings > Security Settings > Local Policies > User Rights Assignments. In the content pane, select "Log on as a service" and double-click. Add the domain user for whom you are granting user rights and click

OK. Repeat this step for "Act as part of the operating system."

8. The group policy is now enforced for the Organizational Unit to include the domain accounts and groups specified under the local Administrators group on each computer in the Organizational Unit. In addition, the domain user has been granted the necessary rights. To verify the user rights, log in to a domain computer and open the Computer Management console. Select Groups, double-click the Administrators group, and verify the membership of the domain users.

Collecting diagnostic information about IBM Spectrum Control

You can use the service tool to collect diagnostic information about IBM Spectrum® Control. The tool detects the system configuration, collects the applicable information, and creates a compressed file that can be sent to IBM® Software Support.

- [Service tool overview](#)
The service tool collects information from all installed IBM Spectrum Control components. The tool detects the system configuration, collects the applicable information, and creates a compressed file that can be sent to IBM Software Support.
- [Packaging log files from the command line and sending them to IBM Support](#)
To provide trace information to IBM Support about the performance of IBM Spectrum Control, you might be asked to package and send a set of log files. You can run the service tool from the command line to create the log package and then manually upload it to IBM Support.

Service tool overview

The service tool collects information from all installed IBM Spectrum® Control components. The tool detects the system configuration, collects the applicable information, and creates a compressed file that can be sent to IBM® Software Support.

The service tool collects the following information:

- Host name
- IP address and configuration information
- Operating system and version. On the Windows operating system, a `msInfo.txt` report is also generated
- Java™ home, version, and class path
- Java Virtual Machine (JVM) implementation name and version
- Protocol statistics
- Internet Protocol network connections for IBM Spectrum Control, including listening ports
- Diagnostic information about the system and its services
- Listing of all library files, for example, server and library and agent and library
- HOSTS file
- IBM Spectrum Control version and license files

When the service tool is run on the system where the Data server or the Device server are installed, it also collects the following information:

- For the Data server, information about all of the remote and local graphical user interfaces (GUIs) that are associated with it
- For the Export server, information about this component configuration and logs
- For the Device server, Alert server, and web server, information about their profiles in IBM WebSphere® Application Server Liberty
- For the Data server, Device server, Alert server, web server, and data collector - all JavaCore files, the most recent Java heap dump file, and the most recent snap trace file.

The service tool can collect Java core dump files for these IBM Spectrum Control components, but it *does not* by default. The values for the `javaCoreFiles`, `heapDumpFiles`, `snapFiles`, and `coreFiles` parameters in the `installation_dir/service/service.properties` file dictate which types of files and how many of each file type are collected by the service tool.

- All applied interim fixes
- Installation logs
- The contents of the `log` and `logs` directory, including subdirectories
- The contents of the `conf` and `config` directory
- Directory listing of the `lib` and `bin` directory
- The contents of the `log` and `conf` subdirectories of the `web` directory
- For the IBM Spectrum Control GUI, information about its profile in the embedded WebSphere Application Server Liberty
- Information from the `ipconfig /all` command on Windows operating systems
- Information from the `ipconfig -a` command on Linux® and AIX® operating systems
- Information from the `netstat -an` command on all operating systems

When the service tool is run on the system where the database repository is installed, it also collects the DB2® support information. When the service tool runs on the Storage Resource agent computer, it collects the following information:

- All applied interim fixes
- Everything in the **config**, **log**, **nls**, **output**, and **service** directories, including subdirectories
- Everything in the **opt/IBM/CAP** directory on Linux and AIX operating systems
- Directory listing of the **ProgramData\Application Data\IBM\CAP** directory on Windows operating systems
- Directory listing of the **agent** directory
- Directory listing of the **bin** directory
- Listing of version numbers for the Storage Resource agent component
- Information from the **ipconfig /all** command on Windows operating systems
- Information from the **ifconfig -a** command on Linux and AIX operating systems
- Information from the **netstat -an** command on all operating systems

By default, the service data is collected in one of the following directories:

For Windows operating systems:

installation_dir\service\data

For Linux and AIX operating systems:

installation_dir/service/data

For more information about changing the default directory, see [How to customize the service tool](#).

You can run the service tool on IBM Spectrum Control regardless of whether you configured it on a single server or on multiple servers. The service tool automatically recognizes the installed components and collects service data about them. For more information about running the service tool for servers, see [Packaging log files from the command line and sending them to IBM Support](#).

Packaging log files from the command line and sending them to IBM Support

To provide trace information to IBM® Support about the performance of IBM Spectrum® Control, you might be asked to package and send a set of log files. You can run the service tool from the command line to create the log package and then manually upload it to IBM Support.

Before you begin

To package IBM Spectrum Control log files, you must have administrator authority on Windows operating systems or root authority on AIX® and Linux® operating systems. Before packaging or sending the log files, you must first open a support ticket with IBM Support. For information, see [Getting support](#).

In order to run the service tool when you log in by using a Windows domain user account, you must grant Db2® SYSADM authority to that Windows domain user account.

To run the service tool when you log in by using a domain user account, choose one of the following methods:

- Right-click the **service.bat** file and select Run as administrator.
Or
- Click Start > All Programs > Open Administrative Tools > Local Security Policy. For information about how to open Administrative Tools, see [Accessing administration tools](#).
- On the Local Security Policy window, disable User Account Control: Run all administrators in Admin Approval Mode.
- Restart your computer.

About this task

The compressed file contains data about the following IBM Spectrum Control components: Alert server, Data server, Device server, Web server, Storage Resource agent, DB2®, CLI, and installation.

Tip: You can customize the service tool to collect data about specific IBM Spectrum Control components. For more information, see [How to customize the service tool](#).

Procedure

To run the service tool for all components, follow these steps:

1. Log on to the system where IBM Spectrum Control is installed.
2. Go to the following directory:

Windows operating systems:
installation_dir\service

Linux or AIX operating systems:
installation_dir/service/

3. Run the following program:

Windows operating systems:
service.bat

Linux or AIX operating systems:
service.sh

A compressed file, *SCServiceFiles_all.zip*, is created in the following directory:

Windows operating systems:
 `installation_dir\service\data\`
Linux or AIX operating systems:
 `installation_dir/service/data/`

4. Upload the log package by using one of the following methods:

If . . .	Then . . .
You are a US healthcare client	Blue Diamond data upload instructions.
The log file is < 200 MiB	Upload and attach the file to the case.
The log file is > 200 MiB	Enhanced Customer Data Repository (ECuRep) - Send data (FTP).

Related tasks

Related reference

- [How to customize the service tool](#)

Creating a compressed file for a Storage Resource agent

Run the service tool on Storage Resource agents that were deployed by using the web-based GUI to create a compressed file that can be sent to IBM® Software Support.

Before you begin

You must have administrator authority on Windows operating systems or root authority on AIX® and Linux® operating systems.

Procedure

To run the service tool on the Storage Resource agents, complete the following steps:

1. In the menu bar, go to Servers, > Servers.
2. Right-click the server where the Storage Resource agent is deployed, and select Logs, > Collect Agent Logs.

Results

The following compressed files are created:

Windows operating systems:
 `C:\Program Files\IBM\TPC\data\log\SRATraces\SRA_computer_name\SCServiceInfo.zip`
AIX and Linux operating systems:
 `/opt/IBM/TPC/data/log/SRATraces/SRA_computer_name/SCServiceInfo.zip`

where `SRA_computer_name` represents the name of the computer on which the Storage Resource agent is located.
If the compressed file cannot be created, a message indicates that the job was unsuccessful.

For more information about the error, see the server log file or the services script information file. The files are in one of the following default directories:

Server log file

This file is on the system where IBM Spectrum® Control is installed:

Windows operating systems:
 `c:\Program Files\IBM\TPC\data\log`
AIX or Linux operating systems:
 `/opt/IBM/TPC/data/log`

Services script information file

This file is on the computer on which the Storage Resource agent is installed:

Windows operating systems:
 `c:\Program Files\IBM\TPC\SRA_computer_name\services\SCServiceInfo.log`
AIX or Linux operating systems:
 `/opt/IBM/TPC/SRA_computer_name/services/SCServiceInfo.log`

For more information about customizing the data that is collected by the service tool, see [How to customize the service tool](#).

Related tasks

- [Packaging log files from the command line and sending them to IBM Support](#)

How to customize the service tool

The default behavior of the service tool is to collect data about all IBM Spectrum® Control components, but you can use the service tool to collect data about specific components. You can also use command-line parameters to specify a location to place the data that is collected, specify that the data is compressed, or to specify both.

Specifying help and output command-line parameters

To obtain information about the service tool usage, use the `-help` command-line parameter.

To specify the data that is collected by the service tool, use the following command-line parameters when you run service tool:

-output *directory_path*

Places the files that contain the data that was collected in a directory that you specify. If you specify a directory that does not exist on your system, that directory is created. If you do not use the `-output directory_path` parameter, the files are placed in the default directory:

Windows operating systems

`installation_dir\service\data`

Linux® or AIX® operating systems

`installation_dir/service/data`

Restriction: If you specify a directory, the directory path cannot contain spaces. This restriction refers to the `-output` option.

-pmr

The number of the PMR to which the support information is related. Use the following format to enter the number: `nnnnnn,nnn,nnn` where `n` represents a number, such as `12345,123,123`. If you enter a value for the `-pmr` parameter, the service tool automatically uses FTP to upload the service information to IBM®. If the service tool cannot upload the service information to IBM from the IBM Spectrum Control server, the generated file must be uploaded manually. The `-pmr` parameter is ignored if the `-nozip` parameter is used.

-nozip

When you use this parameter, the compressed collected data archives are no longer created. The service tool creates separate directories for each component for which data was collected. You can then create compressed archives for the collected files. In this way, you can control the size and content of each compressed file. To specify a directory other than the default directory, use the `-output directory_path` parameter.

Tip: You can specify more than one parameter, for example, `C:\Program Files\IBM\TPC\service>service -install -nozip`.

Specifying Javacore, Java heap dump, snap trace, and Java core dump file collection

By default, the service tool collects all Java™ core files, the most recent Java heap dump file, and the most recent snap trace file for the Data server, Device server, Alert server, web server, and data collector. The service tool can collect Java core dump files for these IBM Spectrum Control components, but it *does not* by default. You can edit the following parameters in the `installation_dir/service/service.properties` file in order to control which types of files and how many of each file type are collected by the service tool:

coreFiles=0

Specifies how many Java core dump files are collected. The default value is 0 because Java core dump files are generally very large. The valid values for this parameter are 0 or a positive integer. Any other value results in the default behavior.

javaCoreFiles=-1

Specifies how many Javacore txt files are collected. The default value of -1 means that all Javacore txt files are collected. The valid values for this parameter are 0 or a positive integer. Any other value results in the default behavior.

heapDumpFiles=1

Specifies how many Java heap dump files are collected. The default is to collect the most recent Java heap dump file. The valid values for this parameter are 0 or a positive integer. Any other value results in the default behavior.

snapFiles=1

Specifies how many snap trace files are collected. The default is to collect the most recent snap trace file. The valid values for this parameter are 0 or a positive integer. Any other value results in the default behavior.

Collecting data for specific IBM Spectrum Control components

You can use the service tool to collect data about specific IBM Spectrum Control components.

Use the following parameters to specify the components:

-all

All components. The default behavior is to collect data about all components.

-install

Installation component files.

-data

Data server component files.

-device

Device server component files.

-datacollector

Data collector component files.

-alert

Alert server component files.

-export

Export server component files.

-sra

Storage Resource agent component files.

-db

Db2® files.

-cli

Command-line interface files.

-gui

Collects data about GUI files.

If you collect information about a particular component, and you do not specify the `-nozip` parameter, you can identify the contents of a compressed service file from its name. For example, if you specify the `-db -gui` parameters but did not specify the `-nozip` parameter, a file named `SCServiceFiles_db_gui.zip` is created.

Warning: An existing compressed file is overwritten when another file of the same name is created. For example, if you run `C:\Program Files\IBM\TPC\service>service -db -gui`, a file named `SCServiceFiles_db_gui.zip` is created. If you rerun the tool with the same component options, a new file named `SCServiceFiles_db_gui.zip` is created. This new file overwrites the previously created file unless you specify the `-nozip` parameter, or use the `-output` parameter to specify a different path. If you specify the `-nozip` parameter, a directory is created for the components that you specified in the parameter. If you did not specify a specific component, data is collected for all installed components, and the data is placed in files in the following directory:

Windows operating systems:
`installation_dir\service\data`
Linux or AIX operating systems:
`installation_dir/service/data`

Files for particular components are then placed in a directory that corresponds to that component. Common files, such as `license.txt`, are placed in the following directory:

Windows operating systems:
`installation_dir\service\data`
Linux or AIX operating systems:
`installation_dir/service/data`

Restriction: You cannot specify a specific component as a command-line parameter when you specify the `-all` parameter. Also, when you specify a component that is not installed on the computer, the service tool displays an error message.

You can use the database maintenance tool to calculate statistics for the IBM Spectrum Control database. The tool can also reorganize the database to restore efficiency and improve performance.
- [Repository copy tool](#)
You can use the Repository copy tool, **repocopy**, to export all the tables in the IBM Spectrum Control database repository for purposes of debugging problems.

Backing up the database

Choose and then implement the Db2® backup method for securing the data that is collected and stored in the database for IBM Spectrum® Control.

Backup types

To back up your database, choose one of the following options:

Offline (Default)
When the data is being backed up, you can neither access nor connect to the database.

Online
When the data is being backed up, you can access and connect to the database. Unlike the offline option, the database remains available to you and the applications that use the database. To configure this option, requires a good knowledge of Db2.

Output locations

To specify the location of the data that is backed up, choose one of the following options:

File system (Default)
Back up the data on a file system.
You can copy the file system that you specified to a removable tape or use IBM Spectrum Protect to back up the file system.

IBM Spectrum Protect
Back up the data to IBM Spectrum Protect. To back up the data, use IBM Spectrum Protect Backup/Archive client and client API on the same computer that hosts the IBM Spectrum Control Db2 databases.

Logging types

In the event of a system failure, the log files are used to recover data. You can choose either circular logging or archive logging.

The types of logging are:

Circular (Default)

This type of logging is used with IBM Spectrum Control for an offline backup.

Archive

This type of logging is used with an online backup. With archive logging, you can enable a rollforward recovery of the database to a specific date and time. A good knowledge of Db2 is needed to manage this type of logging.

- [Comparison of database backup methods](#)

The method that you choose to back up your data determines whether IBM Spectrum Control remains online or offline during the backup process.

- [Backing up the database offline using the command line](#)

By default, the IBM Spectrum Control database (TPCDB) is configured to use circular logging that requires backups to be performed offline. You can use the command line to perform the offline backup.

- [Backing up the database offline using IBM® Data Studio client](#)

By default, the IBM Spectrum Control database (TPCDB) is configured to use circular logging that requires backups to be performed offline. You can use the IBM® Data Studio client to perform the offline backup.

- [Backing up the database online using IBM® Data Studio client](#)

Comparison of database backup methods

The method that you choose to back up your data determines whether IBM Spectrum® Control remains online or offline during the backup process.

Advantages of an offline backup

The advantages of the offline backup method are:

- The offline backup method is the default method and it is easier than the online method to configure and to maintain.
- The circular type of logging that is used for offline backups is easier to configure and maintain than the type of logging that is used for online backups.

Disadvantages of an offline backup

The disadvantages of the offline backup method are:

- You must stop IBM Spectrum Control when you back up the data. So data is not collected and your storage resources are not being monitored during the back up process.
- You cannot collect performance data for the disk subsystems and SAN fabrics when data is being backed up.
- You might miss critical events, for example, failures within a SAN fabric, that occur during the backup process.

Tip: To minimize the loss of data for your storage resources and to ensure that you do not miss critical events, back up your data when your storage resources are not being used or when storage usage is low.

Advantages of an online backup

The advantages of the online backup method are:

- You continue to collect data and monitor your storage resources during the backup process because you do not have to stop IBM Spectrum Control.
- You continue to receive alerts and can respond quickly to critical events at any time of day.
- You continue to collect performance data for your disk subsystems and SAN fabrics.

Disadvantages of an online backup

The disadvantages of the online backup method are:

- The archive type of logging that is used with this type of backup is a more advanced method; it requires a good knowledge DB2® operation and administration.
- Software upgrades to IBM Spectrum Control that involve changes to the layout of the database might not complete successfully. In such cases, you can use circular logging to ensure that the software upgrade succeeds. You can switch back to archive logging after the software upgrade is installed.

Backing up the database offline using the command line

By default, the IBM Spectrum Control database (TPCDB) is configured to use circular logging that requires backups to be performed offline. You can use the command line to perform the offline backup.

Procedure

To back up the database using the command line, complete the following steps:

1. Close the IBM Spectrum Control GUI.
2. Stop the IBM Spectrum Control services.
3. Complete these steps to initialize the Db2® environment:
 - a. While you are logged in to the Windows operating system as an Administrator, from the Windows Start menu, select IBM DB2 DB2COPY1 (Default) > DB2 Command Window - Administrator.
 - b. While you are logged in to the Linux® or AIX® operating system as the root user, switch to the user that is the Db2 instance owner (for example, db2inst1)
4. In the Db2 environment, run the following commands to prevent all users and applications from accessing Db2:

```
db2 force application all
db2 terminate
db2 list applications
```

5. Create a directory to store the backup of the IBM Spectrum Control database.
Tip: Choose a directory location that has enough free space to hold the number of backups that you plan to retain. Use a separate file system rather than the file system that contains the IBM Spectrum Control database. You can choose to use a location that is a remotely mounted Common Internet File System (CIFS) or Network File System (NFS), so the backup data is secured to another server.
6. In the Db2 environment, run the following command to backup the IBM Spectrum Control database:

```
DB2 BACKUP DATABASE TPCDB USER user_name USING password TO location COMPRESS
```

where *user_name* is the user who owns the Db2 instance where the IBM Spectrum Control database is located, *password* is the password that is associated with that user name, and *location* is the directory (created in step 5) where the backup is stored.

Examples:

- Windows operating system:

```
DB2 BACKUP DATABASE
TPCDB USER johndoe USING password1234 TO C:\DB_Backup COMPRESS
```
- Linux and AIX operating systems:

```
DB2 BACKUP DATABASE TPCDB USER johndoe USING password1234 TO
/tmp/DB_Backup COMPRESS
```

7. Restart the IBM Spectrum Control services.

Results

The offline database backup to a file system is run and the IBM Spectrum Control services are started again.

Backing up the database offline using IBM® Data Studio client

By default, the IBM Spectrum Control database (TPCDB) is configured to use circular logging that requires backups to be performed offline. You can use the IBM® Data Studio client to perform the offline backup.

Procedure

1. Stop the IBM Spectrum Control services.
2. Start the IBM Data Studio client.
To start the IBM Data Studio client from a command window, enter:

- On Windows operating system:

```
product_installation_directory\eclipse.exe
```

- On Linux® operating system:

`.product_installation_directory/eclipse`

3. On the New Connection page, select DB2 for Linux, UNIX and Windows and configure your IBM Spectrum Control database connection parameters.
4. Click Next.
5. On the Database Administration - IBM Data Studio page, expand DB2 .
6. Right-click DB2 and select TPCDB, Back Up and Restore, Back Up.
7. On the Back up TPCDB page, confirm the details of your database.
8. Click Backup Type.
9. Click Backup Image and select File System as the media type.
10. Click Backup Options.
11. In the Backup options compression and throttle section, select the Compress backup image and Throttle this utility to regulate the performance impact on the database workload check boxes.
12. Click Backup Performance.
To accelerate the backup process, you can increase the number of table spaces and buffers.
13. After you have set all of the options, click Run or Preview Command to see the actual Db2® command that is run to backup the data.
14. Restart the IBM Spectrum Control services.

Results

The offline database backup to a file system is run and the IBM Spectrum Control services are started again.

Backing up the database online using IBM® Data Studio client

You can use the online method to back up a IBM Spectrum Control database and ensure continuous availability of the database and the applications that use it.

About this task

When you use the online backup method, Db2® does not clean up old archive log files. You need to have processes in place to clean up the old log files after a specific amount of time to prevent the system from filling up. You also need to plan for the amount of space you might need. The log space that is required for a IBM Spectrum Control database can grow larger than the Db2 database over period of time.

Procedure

To backup the database, complete these steps:

1. Open IBM® Data Studio client.
2. Start the IBM Data Studio client.

To start the product from a command window, enter:

- On Windows operating system:

`product_installation_directory\eclipse.exe`

- On Linux® operating system:

`.product_installation_directory/eclipse`

3. On the New Connection page, select Db2 for Linux, UNIX and Windows and configure your IBM Spectrum Control database connection parameters.
4. Click Next.
5. On the Database Administration - IBM Data Studio page, expand Db2 .
6. Right-click Db2 for Linux, UNIX and Windows and select TPCDB, Set Up and Configure, Configure Database Logging.
7. On the Configure Database Logging TPCDB page, click Logging Type and select Archive.
8. Click Logging Size and enter your log file size information. For example, 2500.
9. Click Log Location and enter the Db2 log path information.
10. On the Database Administration - IBM Data Studio page, expand Db2 .
11. Right-click Db2 and select TPCDB and select Back Up and Restore, Back Up.
12. Click Backup Image and select File System as the media type.
13. Click Backup Options.
14. In the Backup options compression and throttle section, select the Compress backup image and Throttle this utility to regulate the performance impact on the database workload check boxes.
15. Click Backup Performance.
You can increase the number of table spaces and buffers, from the default values, to improve performance.
16. After you set all of the options, click Run or Preview Command to see the actual Db2 command that is run as part of the backup.

Results

The online database backup to a file system is run and the backup is complete.

Tip: You can also perform an online backup of the IBM Spectrum Control databases to an IBM Spectrum Protect server. The significant difference between online and offline backup is the need to enable archive logging on the databases. When you use the online method, it provides many backup and recovery benefits at the expense of increased complexity in the database operation. Set up and test your Db2 to IBM Spectrum Protect integration before you implement the online method to the IBM Spectrum Protect output destination to verify the communication is working properly.

- [Starting the IBM Data Studio full client](#)
- [SQL0294N SQLB_CONTAINER IN USE error when restoring database](#)

Restoring the database using the command line

You can use the command line to restore your backup of the IBM Spectrum® Control database.

About this task

Restriction: Do not restore the IBM Spectrum Control database backup from one version of IBM Spectrum Control into another version. For example, do not restore a backup from IBM Spectrum Control 5.3.4 into 5.3.7, or any other.

Procedure

1. Stop the IBM Spectrum Control services.
2. Complete these steps to initialize the Db2® environment:
 - a. While you are logged in to the Windows operating system as an Administrator, from the Windows Start menu, select IBM DB2 DB2COPY1 (Default) > DB2 Command Window - Administrator.
 - b. While you are logged in to the Linux® or AIX® operating system as the root user, switch to the user that is the Db2 instance owner (for example, db2inst1)
3. In the Db2 environment, run the following commands to prevent all users and applications from accessing Db2:

```
db2 force application all
db2 terminate
db2 list applications
```

4. In the Db2 environment, run the following command to restore your backup of the IBM Spectrum Control database:

```
DB2 RESTORE DATABASE TPCDB FROM location INTO TPCDB REPLACE EXISTING
```

where *location* is the directory where you stored the backup.

Examples:

- Windows operating system: **DB2 RESTORE DATABASE TPCDB FROM C:\DB_Backup INTO TPCDB REPLACE EXISTING**
- Linux and AIX operating systems: **DB2 RESTORE DATABASE TPCDB FROM /tmp/DB_Backup INTO TPCDB REPLACE EXISTING**

5. Restart the IBM Spectrum Control services.

Restoring the database using IBM Data Studio client

To restore the IBM Spectrum® Control database (TPCDB), use IBM® Data Studio client.

Before you begin

Download and install the IBM Data Studio client. For more information about how to download and install the IBM Data Studio client, see <http://www.ibm.com/developerworks/downloads/im/data/>.

Before you can use the IBM Data Studio client to restore the IBM Spectrum Control database, you must add a connection to the database in the IBM Data Studio client.

Restriction:

Do not restore the IBM Spectrum Control database backup from one version of IBM Spectrum Control into another version. For example, do not restore a backup from IBM Spectrum Control Version 5.3.4 into Version 5.3.7, or any other version.

Procedure

1. Stop the IBM Spectrum Control services.
2. Start the IBM Data Studio client.
3. Click the Administer tab in the Data Studio client Task Launcher, then click Connect and browse a database.

4. On the Connection Parameters page, click DB2 for Linux, UNIX, and Windows and configure your IBM Spectrum Control database connection parameters.
5. Click Next.
6. On the Database Administration - IBM Data Studio page, expand DB2.
7. Right-click TPCDB, then click Back Up and Restore, Restore.
8. On the Restore Database TPCDB page, click Restore backup to the current database to set the restore type.
9. Click Restore Objects, and then click Restore the entire database.
10. Select the backup image that you want to restore.
11. On the Restore Database TPCDB page, click Run.
12. Restart the IBM Spectrum Control services.

Disaster recovery

Back up your database regularly to be prepared for disaster recovery if a disaster event occurs.

Disaster recovery is the rebuilding of a database or table space after a disaster event such as media or storage failure, power interruption, or application failure occurs. If a disaster event occurs and a database or table space is damaged or corrupted, you can restore one of your backups.

Maintaining and improving the performance of the database

You can use the database maintenance tool to calculate statistics for the IBM Spectrum Control database. The tool can also reorganize the database to restore efficiency and improve performance.

About this task

By default, the database maintenance tool runs the Db2® **runstats** command on all database tables that are used by IBM Spectrum Control. By using the **runstats** command, the database maintenance tool updates statistics about the characteristics of a table and its associated indexes. Because Db2 uses the statistics to determine access paths to data, when you run the database maintenance tool you help to ensure the effectiveness of the paths that are selected.

By specifying an option of the database maintenance tool, you can instruct the tool to reorganize the database tables, if necessary. A set of formulas are applied to the statistics that were collected about the database to determine if reorganization is necessary. Tables are reorganized by reconstructing rows to eliminate fragmented data and by compacting information. Index data is reorganized into unfragmented, physically contiguous pages.

You can customize the reorganization function in the database maintenance tool by updating a properties file. Properties determine which formulas can trigger database reorganization. You can specify properties that exclude tables from being reorganized based on size. Also, you can specify a property to force database reorganization.

- [Updating database statistics](#)
Use the database maintenance tool to update statistics about the databases that are used by IBM Spectrum Control. Because DB2® uses these statistics to select access paths to data, when you run the database maintenance tool, you can help to improve the effectiveness of the paths that DB2 selects.
- [Reorganizing database tables](#)
Use the database maintenance tool to analyze the database tables that are used by IBM Spectrum Control. If necessary, the database maintenance tool reorganizes the database tables and indexes.
- [Customizing the reorganization function of the database maintenance tool](#)
You can customize the database maintenance tool to specify which formulas determine whether a database is reorganized.

Updating database statistics

Use the database maintenance tool to update statistics about the databases that are used by IBM Spectrum® Control. Because DB2® uses these statistics to select access paths to data, when you run the database maintenance tool, you can help to improve the effectiveness of the paths that DB2 selects.

About this task

Run the database maintenance tool to make substantial changes to the IBM Spectrum Control database, such as numerous table space updates, deletions, or insertions. The database maintenance tool uses the **RUNSTATS** command to update statistics about the physical characteristics of a table and the associated indexes.

Note:

The database maintenance script for updating statistics for IBM Spectrum Control can be run online or offline.

Procedure

To update statistics for databases, follow these steps:

1. Log on to the computer where you installed IBM Spectrum Control.
2. Change the directory.

```
Linux® and UNIX operating systems
/opt/IBM/TPC/data/server/tools/
Windows operating systems
C:\Program files\IBM\TPC\data\server\tools\
```

3. Enter the following command to run the database maintenance tool:

```
Linux and UNIX operating systems
runTPCDBMaintenance
Windows operating systems
runTPCDBMaintenance.bat
```

Note: To monitor the progress of a statistical update for the database, redirect your output to a file.

Example

```
runTPCDBMaintenance > /tmp/tpcdb_update_stats.txt
```

Reorganizing database tables

Use the database maintenance tool to analyze the database tables that are used by IBM Spectrum® Control. If necessary, the database maintenance tool reorganizes the database tables and indexes.

About this task

The database maintenance tool uses a set of formulas to analyze the physical location of rows, and the size of the tables; it analyzes the indexes and their relationship to the table. If the calculated result of a formula exceeds set boundaries, the tool reorganizes the tables and indexes as needed. The tool reorganizes database tables, if necessary, by reconstructing rows to eliminate fragmented data. The tool reorganizes index data, if necessary, into unfragmented, physically contiguous pages.

Tips:

- Run the database maintenance script for analyzing database tables while IBM Spectrum Control is offline; no database workload is present.
- Ensure that you have enough available capacity to reorganize the database tables. An offline reorg might require an amount of available capacity that is to 2 to 3 times the size of the existing IBM Spectrum Control tables.

Procedure

To analyze and reorganize databases, follow these steps:

1. Log on to the computer where you installed IBM Spectrum Control.
2. Change the directory.

```
Linux® and UNIX operating systems
/opt/IBM/TPC/data/server/tools/
Windows operating systems
C:\Program files\IBM\TPC\data\server\tools\
```

3. Enter the following command to run the database maintenance tool to analyze and reorganize databases:

```
Linux and UNIX operating systems
runTPCDBMaintenance reorg
Windows operating systems
runTPCDBMaintenance.bat reorg
```

Example

```
runTPCDBMaintenance reorg > /tmp/tpcdb_reorg.txt
```

Note: To monitor the progress of the database reorganization, redirect your output to a file.

Customizing the reorganization function of the database maintenance tool

You can customize the database maintenance tool to specify which formulas determine whether a database is reorganized.

About this task

To specify which formulas can trigger a database reorganization, edit the properties in the TPCDBMaintenance.properties file. For example, you can customize the tool to ignore tables that are smaller or larger than the defined size limits, or customize it to always reorganize the database.

Procedure

To analyze and reorganize databases, follow these steps:

1. Log on to the system where IBM Spectrum® Control is installed.
2. Change to the following directory:

```
Linux® and UNIX operating systems
/opt/IBM/TPC/data/server/tools/
Windows operating systems
C:\Program files\IBM\TPC\data\server\tools\
```

3. Open TPCDBMaintenance.properties in a text editor and modify the property settings as needed.

The f1-f8 properties all refer to the same formulas that are used by the DB2® **REORGCHK** command. For more information about any of these formulas, see the DB2 product documentation about the **REORGCHK** command at <https://www.ibm.com/docs/en/db2>.

You can modify the following properties:

f1= {true | false}
Specifies whether the result of formula 1 can trigger a database table reorganization. Formula 1 checks the number of overflow rows in a table.

f2= {true | false}
Specifies whether the result of formula 2 can trigger a database table reorganization. Formula 2 checks the effective space utilization of data pages.

f3= {true | false}
Specifies whether the result of formula 3 can trigger a database table reorganization. Formula 3 checks the number of empty pages. Pages can become empty after rows are deleted.

f4= {true | false}
Specifies whether the result of formula 4 can trigger the reorganization of index data. Formula 4 checks the clustering ratio of an index.

f5= {true | false}
Specifies whether the result of formula 5 can trigger the reorganization of index data. Formula 5 checks the space that is reserved for index entries.

f6= {true | false}
Specifies whether the result of formula 6 can trigger the reorganization of index data. Formula 6 determines whether re-creating an index would result in a tree with fewer levels.

f7= {true | false}
Specifies whether the result of formula 7 can trigger the reorganization of index data. Formula 7 checks the number of pseudo-deleted RIDs on non-pseudo-empty pages.

f8= {true | false}
Specifies whether the result of formula 8 can trigger the reorganization of index data. Formula 8 checks the number of pseudo-empty leaf pages.

maxReorgTableSize= {size_in_bytes | none}
Specifies the maximum size that a database table must be to be considered for reorganization.

minReorgTableSize= {size_in_bytes | none}
Specifies the minimum size that a database table must be to be considered for reorganization.

forceReorg= {true | false}
Specifies whether the database is always reorganized by the database maintenance tool when the reorg argument is specified. If this property is set to true, all other properties in the file are ignored.

4. Save TPCDBMaintenance.properties.

Repository copy tool

You can use the Repository copy tool, **repocopy**, to export all the tables in the IBM Spectrum® Control database repository for purposes of debugging problems.

You can send the exported data to IBM® Software Support to help debug problems.

Tip: If you want to export only performance data from the IBM Spectrum Control repository, you can create performance support packages. You can create performance support packages for storage systems or fabrics. For more information about exporting performance support packages, see [Exporting performance data for storage systems and fabrics](#).

- [Exporting repository data](#)
Use the Repository copy tool to export data from an existing repository into a text file.

Exporting repository data

Use the Repository copy tool to export data from an existing repository into a text file.

Procedure

To export repository data, follow these steps:

1. Go to the following default directory:

```
Windows operating systems:
c:\Program Files\IBM\TPC\data\server\tools
```

```
Linux® or AIX® operating systems:
/opt/IBM/TPC/data/server/tools
```

2. Issue the **repocopy** command:

```
Windows operating systems:
repocopy.bat
```

Linux or AIX operating systems:

repocopy

3. Select Export data from repository tables and click Next.
4. In the Options for Import/Export window, enter information in the following fields:

Directory for Export

Enter the directory where the comma-delimited file is saved.

Delimiter

Enter a delimiter for the delimited file format (a comma is the default).

Quote

Enter the symbol that contains string data (double quotation marks is the default).

IBM Spectrum® Control exports the data into the comma-delimited file that you specify, and places it in a file named *tablename.txt*. Click Next.

5. Select one of the following options and click Next.
 - Export by using DB2® native format.
 - Export by using text files (the preferred method).
6. Select one of the following options and click Next.
 - Export base tables (always export the base tables)
 - Export Performance Manager tables, if requested by IBM® Software Support
 - Export history tables, if requested by IBM Software Support.

The information that is detected in the server.config file is displayed in the Connection Properties window within the following fields:

- Database Types
- User name
- Password
- Driver Class
- Driver URL
- Database
- DB Creator
- Classpath

If you want to export data from a different database from the one listed in the server.config file, you can select the database from the Database Types list box.

Manually enter the database information.

7. Click Finish.
8. Click Run.

Results

As you progress through the export process, messages are written to a progress log that is displayed. You can track the steps through the progress log.

When the **repocopy** command is used with a remote database, the DB2 shared library is not available for loading the **libTSRMinsubd.so** file. You can ignore this message. Click OK and continue.

Administering Db2

Administer IBM® Db2® by backing up the IBM Spectrum® Control database, starting the IBM Data Studio full client, and starting and stopping Db2.

- [Using the command line on UNIX and Linux](#)
This topic describes how to use a command line to perform actions against a IBM Db2 instance under UNIX or Linux®.
- [Manually starting Db2 on Windows](#)
Start DB2® on Windows operating systems.
- [Manually stopping Db2 on Windows](#)
You can stop IBM Db2 manually on Windows.
- [Starting the IBM Data Studio full client](#)
You can start the Data Studio full client on your workstation from either a menu option or the command line.
- [Monitoring Db2](#)
The minimum user authority level needed for monitoring IBM Db2 instances is a user with Db2® system maintenance authority (SYSMAINT).

Related reference

- [Db2 and database troubleshooting](#)

Using the command line on UNIX and Linux

This topic describes how to use a command line to perform actions against a IBM® Db2® instance under UNIX or Linux®.

About this task

If the Db2 Control Center is unavailable or you do not have access to a graphical user interface, you can use a command line to execute Db2 commands such as starting and stopping an instance.

Important: If you are using DB2® 10.1 or higher, you must use the command-line interface.

To use a command line to perform actions against an instance of Db2, complete the following steps:

Procedure

1. Log in with a user ID or name that has ROOT, SYSADM, SYSCTRL, or SYSMAINT authority on the instance; or log in as the instance owner.
2. Run the startup script:
 - For Bourne or Korn shell, type: **. HOME/sqllib/db2profile**.
 - For C shell, type: **source HOME/sqllib/db2cshrc**.where **HOME** is the home directory of the instance you want to use.
3. To start the instance using the command line, type **db2start**.
Note: When you run commands to start the database manager instance, the Db2 database manager applies the command to the current instance.
4. To stop the instance using the command line, type **db2stop**.
Note: When you run commands to stop the database manager instance, the Db2 database manager applies the command to the current instance.

Manually starting Db2 on Windows

Start DB2® on Windows operating systems.

About this task

To start Db2® manually, complete the following steps:

Procedure

1. Start the following Windows services:
 - DB - DB2-0
 - DB2DAS - DB2DAS00
 - DB2 JDBC Applet Server
 - DB2 License Server
 - DB2 Security Server
2. Open a Db2 command window.
3. From the Db2 Command window, run the **db2start** command.

Related information

- [Accessing administration tools](#)
- [Opening IBM Spectrum Control GUIs and CLIs](#)

Manually stopping Db2 on Windows

You can stop IBM® Db2® manually on Windows.

Procedure

1. Stop the following Windows services:
 - Db2 Security Server
 - Db2 License Server
 - Db2 JDBC Applet Server
 - Db2DAS - Db2DAS00
 - Db2 - Db2-0Note: When you stop the Db2 Security Server service, you are prompted to stop the Warehouse logger and Warehouse Serve. Click Yes.
2. To open a Db2 command window, click Start, > Programs, > IBM Db2, > Command Line Tools, > Command Window.
3. From the Db2 Command window, issue the **db2stop** command.

Results

To restart Db2, issue the **db2start** command from the Db2 Command window. Before you can issue the command, you must first start these services on the Windows Services panel:

```
DB2 - DB2-0
DB2DAS - DB2DAS00
DB2 JDBC Applet Server
DB2 License Server
DB2 Security Server
```

Related tasks

- [Accessing administration tools](#)
- [Opening IBM Spectrum Control GUIs and CLIs](#)

Starting the IBM Data Studio full client

You can start the Data Studio full client on your workstation from either a menu option or the command line.

Opening IBM Data Studio Administration client on Windows operating systems

Procedure

1. Choose one of these options:

Option	Description
Windows Server 2012	a. On the Dashboard page, hover the mouse over the lower left corner of the page next to the Server Manager taskbar button, and then click Start. b. On the Start page, right-click, and then click the All apps taskbar button.
Windows Server 2012 R2, Windows Server 2016, Windows Server 2019	Click Start > All Programs.

2. Click IBM Data Studio > Data Studio Administration Client.

Open IBM Data Studio Administration client on Linux® and AIX® operating systems

On the command line, issue the following command:

```
DS_install_dir/eclipse
```

where DS_install_dir is the directory where you installed the full client.

Example

```
/opt/IBM/DS3.1.1/eclipse
```

Monitoring Db2

The minimum user authority level needed for monitoring IBM® Db2® instances is a user with Db2® system maintenance authority (SYSMAINT).

To check and set SYSMAINT authority, follow these steps:

1. Run this command in the Db2 command prompt window to check to see if there is an operating system user group defined to have SYSMAINT authority:

```
db2 get dbm cfg
```

In the output file, look for this information:

```
SYSADM group name      (SYSADM_GROUP) =
SYSCtrl group name     (SYSCtrl_GROUP) =
SYSMAINT group name    (SYSMAINT_GROUP) =
SYSMON group name      (SYSMON_GROUP) =
```

If the setup for the operating system group has not been done, you do not see a value set.

If the setup has been done, this example shows what you can expect to see:

```
SYSADM group name      (SYSADM_GROUP) =
SYSCtrl group name     (SYSCtrl_GROUP) =
SYSMAINT group name    (SYSMAINT_GROUP) = ADMINISTRATORS
SYSMON group name      (SYSMON_GROUP) =
```

In this example, the "ADMINISTRATORS" group has SYSMAINT_GROUP authority.

2. If the setup has been done, add the user you want to use to the ADMINISTRATORS group using the operating system utilities or use a user that already belongs to the ADMINISTRATORS group.

If you want to give a user group "SYSMAINT_GROUP" authority, follow these steps:

- a. If a user (for example **userA**) belongs to an operating system group called **db2monitor**, here is an example of setting the **db2monitor** group with SYSMAINT authority. From the Db2 command prompt window, run the following command:

```
db2 update dbm cfg using SYSMAINT_GROUP db2monitor
```

- b. After issuing the **db2 update** command, restart Db2 by running the following command from the Db2 command prompt window or restarting the system:

```
db2 force application all
```

This command might need to be issued a few times to stop all the database connections.

- c. Run the following commands from the Db2 command prompt window:

```
db2stop
db2start
```

- d. **UserA** can now monitor the Db2 database.

Managing resources

Use IBM Spectrum® Control to monitor and manage the resources and storage infrastructure in an enterprise environment. In the GUI, you can view the condition, capacity, performance, and relationships of storage resources.

- **Resources that you can monitor**

You can use IBM Spectrum Control to monitor storage systems, servers, hypervisors, fabrics, and SAN switches. Information about these top-level resources includes information about their internal resources and related resources. Internal resources are components that exist in a top-level resource. Related resources are external to a top-level resource, but are related to it through assigned storage, a network connection, or virtual hosting.

- [Adding resources](#)
You must add resources to IBM Spectrum Control before you can collect data, generate reports, and manage storage that is related to those resources.
- [Adding rollup servers](#)
Rollup servers gather capacity and status information from IBM Spectrum Control servers in your enterprise. You can add rollup servers for monitoring on the Settings > Rollup Server Connections page.
- [Removing resources](#)
Remove resources that you no longer want to monitor with IBM Spectrum Control.
- [Collecting data](#)
Determining the data that you want to gather about storage resources is critical to helping you implement a storage management strategy. IBM Spectrum Control provides two different jobs for collecting data about resources.
- [Alerting](#)
Specify conditions that trigger alerts and the actions to take when those alerts are triggered, such as notify an email address. Use alert policies to define those alert conditions and notification settings for a group of resources.
- [Viewing information about resources](#)
You can view detailed information about the resources that are monitored by IBM Spectrum Control. Resources include storage systems, volumes, pools, servers, hypervisors, fabrics, and switches. You can also view information about internal and related resources.
- [Monitoring the status and condition of resources](#)
Monitor the operational condition of storage systems, servers, hypervisors, fabrics, and switches and the status of their internal resources. Use this information to identify potential problem areas in a storage environment.
- [Monitoring the performance of resources](#)
IBM Spectrum Control can collect information about the performance of storage systems and switches. This information includes key performance metrics that can help you measure, identify, and troubleshoot performance issues and bottlenecks in your storage.
- [Monitoring the capacity of resources](#)
IBM Spectrum Control can collect information about the capacity and space usage of block, file, and object storage resources. This information includes key metrics that can help you measure, identify, and troubleshoot capacity and space usage issues in your storage. You can view capacity metrics for storage resources, including tiers.
- [Monitoring and administering applications, departments, and general groups](#)
You create applications to monitor the storage capacity, space usage, and performance of applications, and you create departments to monitor the space usage of the applications in the department. You can structure your applications and departments hierarchically to match the structure of your business organization.
- [Provisioning storage](#)
You can assign storage to servers, hypervisors, and clusters on servers and hypervisors in the GUI.
- [Optimizing storage tiering](#)
To optimize the placement of volumes on storage tiers, analyze the tiering of volumes in your storage environment.
- [Optimizing storage pools](#)
Analyze the activity of pools and resolve performance hot spots by redistributing volumes across each storage tier.
- [Reclaiming storage](#)
Use the recommendations to reclaim capacity before you plan new capacity purchases.
- [Transforming and migrating volumes](#)
You can transform fully allocated volumes to compressed or thin-provisioned volumes, or transform compressed or thin-provisioned volumes to fully allocated volumes. You can move volumes to other pools or to pools that are enabled for Easy Tier®.
- [Modifying the period for analyzing performance data](#)
To change the default period for analyzing performance data in storage virtualizer pools, issue the `setdscfg` command. You can extend or shorten the default period for a more accurate analysis.
- [Modifying the properties of resources](#)
Add or change the properties for individual resources or for multiple resources. You can use the properties to filter or sort the resources in the GUI or in an external application if the data is shared or exported.
- [Opening the management GUI for a resource](#)
Resources such as storage systems and switches can have their own management GUIs or element managers. In IBM Spectrum Control, you can open the start page in these GUIs from resource list pages, such as the Storage Systems page and Switches page.
- [Exporting information to a file](#)
You can save information about resources, tasks, or alerts to a PDF, CSV, or HTML file. Information that you can export from the GUI includes all the values that are being shown in the columns for a list of resources, tasks, or alerts.
- [Customizing lists](#)
Customize lists to focus on the information that is important to you. You can filter information, sort rows, and show, hide, and reorder columns in the table views for resources, tasks, alerts, and other objects.
- [Managing tasks](#)
Tasks are used to provision storage and optimize resources in your storage environment. Use the Tasks page to manage all the tasks that are used by IBM Spectrum Control to provision storage and optimize resources. Use resource list and resource details pages to manage the tasks for specific resources and resource types.
- [Planning copy data resources](#)
To plan for your block storage requirements, you need to be able to see how you currently use block storage in your storage environment.
- [IBM Spectrum Control REST API](#)
You can use the Representational State Transfer (REST) API for IBM Spectrum Control to access information about resources and to generate custom capacity, configuration, and performance reports.

Resources that you can monitor

You can use IBM Spectrum® Control to monitor storage systems, servers, hypervisors, fabrics, and SAN switches. Information about these top-level resources includes information about their internal resources and related resources. Internal resources are components that exist in a top-level resource. Related resources are external to a top-level resource, but are related to it through assigned storage, a network connection, or virtual hosting.

Information about object storage systems includes information about their object resources and related resources. Object resources are resources in an IBM Spectrum Scale cluster, such as accounts and containers, that enable the cluster to be used as an object storage system.

Icon legend: Each resource that you monitor with IBM Spectrum Control is represented by an icon for easy identification. View the following information to see the icons that are associated with each resource.

Fabrics

A *fabric* is a network of hubs, switches, adapter endpoints, and connecting cables that support a communication protocol between devices. The following table shows the internal resources and related resources that you can monitor for fabrics.

Table 1. Fabric resources that you can monitor

Fabric icon	Internal resources	Related resources	*Connected resources (to ports)
 Physical fabric  Virtual fabric	 Logical switches  Physical switches  Inter-switch connections  Blades  Ports  Zone sets	 Hypervisors  Servers  Storage systems  NPV switches (Cisco switches in NPV mode and Brocade switches in Access Gateway mode)  Discovered ports	All monitored resources that are connected to ports, plus the following resources:  Unmanaged resource. The name is determined from a fabric zone alias.  Unmanaged resource. The name is determined from a storage system's mapping to a host.  Unmanaged resource. The name is determined from one of a storage system's mappings to a host when multiple mappings are found.
*Connected resources (to ports): The icons for any resources that are managed by IBM Spectrum Control and connected to a port are shown in this column. Icons are also shown for connected resources whose names are known from a fabric zone alias or a storage system's mapping to a host (host connection) but are not currently being managed. If both a fabric zone alias and a storage system's mapping to a host are found for the same unmanaged resource, the fabric zone alias is shown as the name.			

Hypervisors

A *hypervisor* is a layer of software or a physical device that manages multiple, virtual instances of operating systems on the same hardware. Hypervisors that you can monitor include VMWare vSphere data sources such as ESX, ESXi, and vCenter servers. If a hypervisor is part of a cluster, information about that cluster is also available.

The following table shows the internal resources and related resources that you can monitor for hypervisors.

Table 2. Hypervisor resources that you can monitor

Hypervisor icon	Internal resources	Related resources
	 Controllers  Disks  Data stores  Virtual machine that is associated with an agentless server  Virtual machine that is associated with a Storage Resource agent  Virtual machine that was discovered, but isn't associated with an agentless server or Storage Resource agent	 Storage systems  Fabrics  Switches  Cluster

Servers

A *server* is a computer or host that is connected to a network and provides an access point to that network. If a server is part of a cluster, information about that cluster is also available. You can monitor the following internal resources and related resources for servers.

Table 3. Server resources that you can monitor

Server icon	Internal resources	Related resources
	 Controllers  Disks  Volume groups  File systems and logical volumes  Shares and exports	 Storage systems  Fabrics  Switches

Storage systems

A *storage system* is a device, such as a Redundant Array of Independent Disks (RAID) controller that creates and manages other storage devices. A storage virtualizer is a storage system that virtualizes storage space from internal storage or from another storage system.

Storage systems can be configured for block storage, file storage, a combination of block and file storage, or a combination of file and object storage. The method that a storage system uses for managing data determines the internal resources or object resources that are monitored.

The following tables show the internal resources, object resources, and related resources that you can monitor for block, file, and object storage systems.

Block storage systems

Table 4. Block storage system resources that you can monitor

Block storage system icon	Internal resources	Related resources
	<ul style="list-style-type: none"> Active quorum Disks Drives Enclosures External disks FC ports Host connections I/O groups IP ports Managed disks Modules Nodes Pools RAID arrays Volumes 	<ul style="list-style-type: none"> Back-end storage systems Fabrics Hypervisors Servers Switches Virtualizer storage systems GPFS clusters

File storage systems

Table 5. File storage system resources that you can monitor

File storage system icon	Internal resources	Related resources
	<ul style="list-style-type: none"> Disk Controllers Clusters Disks Shares Filesets File systems Network shared disks Nodes Pools Snapshots Quotas 	<ul style="list-style-type: none"> Block storage systems Fabrics GPFS clusters Object storage systems Hypervisors Servers Switches

Object storage systems

Table 6. Object storage system resources that you can monitor

Object storage system icons	Object internal resources	Object resources	Related resources
<ul style="list-style-type: none"> Object storage system IBM® Cloud Object Storage 	<ul style="list-style-type: none"> Access pools Accesser® nodes Mirrors Sites Slicestor® nodes Storage pools Vaults 	<ul style="list-style-type: none"> Accounts Containers 	<ul style="list-style-type: none"> Back-end storage systems Fabrics GPFS clusters Hypervisors Servers Switches

Switches

A SAN switch is a network infrastructure component to which multiple nodes attach. In IBM Spectrum Control, you can monitor Fibre Channel (FC) switches. The following table shows the internal resources and related resources that you can monitor for switches.

Table 7. Switch resources that you can monitor

Switch icon	Internal resources	Related resources	*Connected resources (to ports)
 Physical switch  Logical switch	 Inter-switch connections  Blades  Logical switches  Physical switches  Ports	 Fabrics  Hypervisors  Servers  Storage systems  Switches  Discovered ports	All monitored resources that are connected to ports, plus the following resources:  Unmanaged resource. The name is determined from a fabric zone alias.  Unmanaged resource. The name is determined from a storage system's mapping to a host.  Unmanaged resource. The name is determined from one of a storage system's mappings to a host when multiple mappings are found.

*Connected resources (to ports): The icons for any resources that are managed by IBM Spectrum Control and connected to a port are shown in this column. Icons are also shown for connected resources whose names are known from a fabric zone alias or a storage system's mapping to a host (host connection) but are not currently being managed. If both a fabric zone alias and a storage system's mapping to a host are found for the same unmanaged resource, the fabric zone alias is shown as the name.

Adding resources

You must add resources to IBM Spectrum® Control before you can collect data, generate reports, and manage storage that is related to those resources.

Before you begin

Restriction: You can't collect performance metadata about a device that includes a forward slash (/) or backslash (\) in its name. Before you add a device for monitoring, remove any slashes in its name.

- [Required user roles for monitoring resources](#)
When you add storage systems, switches, and hypervisors for monitoring, you must provide a user name and password for logging in to those resources. The role or user group that is assigned to the user name determines the data collection and storage functions that you can use.
- [Adding storage systems](#)
Add the storage systems that you want to monitor in IBM Spectrum Control.
- [Adding fabrics and switches](#)
Add fabrics and switches for monitoring.
- [Adding hypervisors](#)
You can add hypervisors for monitoring by IBM Spectrum Control. Hypervisors include VMware vSphere data sources such as ESX and ESXi, and vCenter Server systems. When you add vSphere data sources, you can then collect data, generate reports, and manage storage that is related to those resources.
- [Adding servers](#)
Add servers for monitoring. IBM Spectrum Control creates and updates agentless servers automatically after it probes storage systems and hypervisors. You can also add a server by deploying a Storage Resource agent.

Required user roles for monitoring resources

When you add storage systems, switches, and hypervisors for monitoring, you must provide a user name and password for logging in to those resources. The role or user group that is assigned to the user name determines the data collection and storage functions that you can use.

The following roles are associated with the user names that IBM Spectrum® Control uses to log in to resources. Specify user names when you add a resource for monitoring. These roles are different from IBM Spectrum Control roles, which are assigned to users that log in to IBM Spectrum Control. For more information about IBM Spectrum Control roles, see [Role-based authorization](#).

Any roles that are not listed, but include the privileges of the roles that are listed, can also be used for monitoring resources.

Table 1. Required roles for storage system, switch, and hypervisor users

Resource	Required role for performance monitors	Required role for probes	Required role for provisioning, optimizing, and transforming
DS8000®	Monitor role or higher	Monitor role or higher	Administrator, Physical operator, or Logical operator
SAN Volume Controller	For versions earlier than 8.3.1.2, Administrator, or SecurityAdmin. For 8.3.1.2 or later, any role but some limitations might apply. Learn more	Monitor role or higher	Administrator
Storwize® V3500 Storwize V3700 Storwize V5000 Storwize V7000	For versions earlier than 8.3.1.2, Administrator, or SecurityAdmin. For 8.3.1.2 or later, any role but some limitations might apply. Learn more	Monitor role or higher	Administrator
Storwize V7000 Unified (block storage)	Administrator	Monitor role or higher	Administrator
FlashSystem 5000 FlashSystem 5100 FlashSystem 7200 FlashSystem 9100 FlashSystem 9200 FlashSystem V9000	For versions earlier than 8.3.1.2, Administrator, or SecurityAdmin. For 8.3.1.2 or later, any role but some limitations might apply. Learn more	Monitor role or higher	Administrator
IBM Spectrum Virtualize for Public Cloud	For versions earlier than 8.3.1.2, Administrator, or SecurityAdmin. For 8.3.1.2 or later, any role but some limitations might apply. Learn more	Monitor role or higher	Administrator
Storwize V7000 Unified (file storage)	Performance monitoring is not available	Monitor	Administrator, or Export Administrator + Storage Administrator.
XIV®	Monitor role or higher	Any role	Storage administrator

IBM FlashSystem 900	Monitor role or higher	Monitor role or higher	Not available
IBM Spectrum Scale (file storage)	Any role	Root or non-root*	Not available
IBM Spectrum Scale (object storage)	Performance monitoring is not available	The Keystone admin role. Information is collected only for the object storage accounts and containers that the user has access to. If you want to monitor all accounts and containers, the user must also be assigned the role that is defined in the reseller_admin_role configuration option in the Swift proxy server. The default value for the reseller_admin_role option is ResellerAdmin.	Not available
IBM® Cloud Object Storage	Performance monitoring is not available	Operator, System Administrator, or Super User role	Not available
Dell EMC storage systems	Operator role or higher	Operator role or higher	Not available

Resource	Required role for performance monitors	Required role for probes	Required role for provisioning, optimizing, and transforming
Hitachi storage systems	In Hitachi Device Manager: The user for the Export Tool must have the Storage Administrator (Performance Management) role	In Hitachi Command Suite: ViewGroup or higher and AdminGroup permission.	Provisioning is not available
NetApp storage systems	Operator role or higher	Operator role or higher	Not available
Pure storage systems	Role with read-only permission or higher	Role with read-only permission or higher	Not available
Cisco switches	Network-admin	Network-admin	Not applicable
Brocade switches with Fabric OS 8.2.1 or later	User or admin role that has the chassis-role permission	User or admin role that has the chassis-role permission	Not applicable
Brocade switches with a Fabric OS version earlier than 8.2.1	Administrator user in Brocade Network Advisor (BNA)	Administrator user in BNA	Not applicable
Hypervisors (such as ESX, ESXi, and vCenter Servers)	Performance monitoring is not available	A role that has permission to browse through data stores. For example: Administrator role or Virtual Machine Power® User role. For more information about roles and permission to browse data stores, see Checking permissions to browse data stores .	Any role
Rollup servers	Performance monitoring is not available	Administrator	Not available
Note: * You can add IBM Spectrum Scale and GSS systems as a non-root user, but that user must have privileges to run a set of specified administration commands using the sudo command on the cluster node. For more information, see Monitoring IBM Spectrum Scale without requiring root privileges .			

Adding storage systems

Add the storage systems that you want to monitor in IBM Spectrum® Control.

About this task

When you add block storage systems, asset, capacity, and configuration metadata and performance metadata is automatically collected and analyzed. When you add storage systems that manage block and file storage, the asset, capacity, and configuration metadata for file storage is also automatically collected and analyzed. Metadata Collection Schedule: By default, asset, capacity, and configuration metadata is aggregated and collected daily. Performance metadata is collected at the following intervals:

- Every 1 minute for IBM® block storage systems
- Every 5 minutes for Dell EMC Unity storage systems
- Every 5 minutes for Hitachi VSP storage systems
- Every 5 minutes for NetApp storage systems that are running ONTAP 9
- Every 5 minutes for Pure storage systems
- Every 15 minutes for other Dell EMC block storage systems.

You can add multiple storage systems at the same time, or add them one by one. To add multiple storage systems, the storage systems must be of the same type and share authentication credentials.

Important: To add storage systems, you must have Administrator privileges.

You can add the following types of storage systems for monitoring:

Table 1. Storage systems that can be monitored in IBM Spectrum Control

Storage system	Can add many at same time.
DS8000®	✓
Dell EMC Unity	✓
Dell EMC VMAX	
Dell EMC VNX

Storwize V7000	✓
IBMStorwize Flex System V7000 Storage Node	
Storwize V7000 Unified	
XIV®	✓
All others (managed by SMI-S providers)	

Restriction:

- When you add a storage system for monitoring, you must enter a user name and password that is used to connect to that storage system. In rare cases, special characters in the user name or password might not be allowed by IBM Spectrum Control. If you can't add a storage system because of restricted characters, change its credentials and try to add it again. Then, open a ticket for the character limitation so that it can be addressed in a future update.
- IBM Spectrum Control doesn't support monitoring non-IBM software-defined storage devices. However, it can monitor IBM software-defined storage devices, such as IBM SAN Volume Controller. For a list of storage devices that can be monitored, check out <https://www.ibm.com/support/pages/node/6249369>.

Tips:

- To monitor the performance of a Storwize V7000 Unified storage system, you must add it as a block storage system.
- To monitor an IBM Spectrum Virtualize for Public Cloud storage system, you must configure it for communication with IBM Spectrum Control. For more information, see [Configuring IBM Spectrum Virtualize for Public Cloud](#).
- For a complete list of the versions of storage systems and SMI-S providers that you can add, and the firmware levels of supported storage systems, see [IBM Spectrum Control interoperability matrix for storage systems](#).

Procedure

- To add block storage systems, go to Storage > Block Storage Systems. To add a file storage system, go to Storage > File Storage Systems. To add an object storage system, go to Storage > Object Storage Systems.
- Click Add Storage Systems or Add Storage System.
- Click the icon for the type of storage system that you want to add.

Click this icon	To add these storage systems
Storwize Family	IBM® Storwize® V3500, Storwize V3700, Storwize V5000Storwize V7000
SVC or Spectrum Virtualize	SAN Volume Controller, IBM Spectrum Virtualize for Public Cloud, or IBM Spectrum Virtualize software-only clusters
FlashSystem Family	FlashSystem 5000 (formerly known as IBM Storwize V5000), , FlashSystem 5200, FlashSystem 7200 (formerly known as IBM Storwize V7000), FlashSystem 7300, FlashSystem 9100, FlashSystem 9200, FlashSystem 9500, FlashSystem V9000, FlashSystem 900, FlashSystem A9000, FlashSystem A9000R
Dell EMC	<ul style="list-style-type: none"> Unity VMAX family with support for SMI-S 1.6 VNX family with support for SMI-S 1.6 VNXe family with support for SMI-S 1.6 All other Dell EMC storage systems with support for SMI-S 1.2
Hitachi	Hitachi VSP
NetApp	<ul style="list-style-type: none"> ONTAP 9 ONTAP 8 (7- mode)
Pure	<ul style="list-style-type: none"> FlashArray//M FlashArray//X
Others	Other non-IBM storage systems

- Specify the connection details and the authentication credentials for the storage systems that you want to add, then click Connect. You can close the window and continue your work. To change the default probes and performance monitors, keep the window open and update them when the storage systems are connected.

Results

The storage systems are added for monitoring. Each storage system is automatically added to the default alert policy for the storage system type. A probe is automatically run to collect status and asset information about the storage systems.

Storage systems can be configured for block storage, file storage, a combination of block and file storage, or a combination of file and object storage. The method that a storage system uses for managing data determines the internal resources and object resources that are monitored.

After you add storage systems, a task is added to the list of running tasks on the page banner. If the task fails, the task is added to the list of failed tasks on the page banner. You can retry failed tasks or clear them from the list.

What to do next

When the collection of data is complete, you can view status information and capacity data about the storage system on the resource list page for the block, file, or object storage system. For example, for block storage systems, you can view the information on the Block Storage Systems page.

After the probe is run, agentless servers are updated with any new information about the host connections on the storage systems. You can review the agentless servers on the Servers page, and make any changes that are required.

Managing alert conditions and notification settings: Review the alert configuration for the storage system. You can change which alert policy manages the storage system. You can also set a storage system to not be managed by any policy.

Related information

- [Collecting data](#)

Hitachi

Add Hitachi Virtual Storage Platform (VSP) F and G Series storage systems to get performance, asset, capacity, and configuration metadata analyzed for block storage so that you can detect performance issues, changes in storage usage, and plan for future storage needs.

You can add a VSP system by connecting to the Hitachi Command Suite that is managing the device. By default, the asset, capacity, and configuration metadata that is collected from storage systems is refreshed every 24 hours. Performance metadata is collected at a default collection interval of 5 minutes.

Use the following information to add VSP storage systems so that they can be monitored and their metadata can be collected, analyzed, and presented in the GUI. Add a VSP storage system by connecting to the Hitachi Command Suite that manages the device. Connect to the Hitachi Device Manager to enable the Export Tool to collect performance information from the storage system.

Supported versions: To view the versions of Hitachi VSP storage systems that are supported in IBM Spectrum® Control, go to the [Hitachi support page](#).

Restriction: Performance monitoring is not supported when IBM Spectrum Control is installed on AIX®.

Complete the following steps to add your Hitachi VSP storage systems for monitoring.

- Add Hitachi VSP F and G Series by connecting to Hitachi Command Suite. See [Credentials for Hitachi Command Suite](#).
- Enable performance monitoring while you are adding your Hitachi VSP systems. See [Performance](#).
- Install the Hitachi Export Tool to collect performance information and export it from your storage system. See [Installing the Hitachi Export Tool](#).
- To enable or disable performance monitoring, see [Creating performance monitors in IBM Spectrum Control](#) and [Starting and stopping performance monitors](#).

Add Hitachi VSP F and G Series

When you select Hitachi VSP, you can add one or more storage systems by entering the connection information for the Hitachi Command Suite that is managing those devices.

Important: To discover and monitor Hitachi VSP F and G Series storage systems, you must provide a user name for connecting to the associated Hitachi Command Suite. This user name must be assigned to the View Group user group and have AdminGroup permission in the Hitachi Command Suite.

Credentials for Hitachi Command Suite

IBM Spectrum Control monitors capacity and configuration information about Hitachi devices by using the Hitachi Command Suite. Provide the connection information for the Hitachi Command Suite installation that is monitoring the devices.

Host name or IP address

The host name or IP address that you use to connect to Hitachi Command Suite. Depending on what is supported in your environment, you can enter an Internet Protocol version 4 (IPv4) or IPv6 address. If you enter an IPv6 address, the preferred representation is written as eight groups of four hexadecimal digits. Example: 2001:DB95:0000:1234:0000:0000:5678:ABCD.

User Name and Password

The account credentials that are required to connect to Hitachi Command Suite. The role or user group that is assigned to the user name must have the appropriate privileges to monitor the data that is collected and, if required, to change the frequency of the data collection schedules. [Learn more about the role requirements for the user name.](#)

Performance

Enable performance monitoring

When you enable performance monitoring in IBM Spectrum Control, the user name and password that you provided to connect to the Hitachi Command Suite are also used to connect to Hitachi Device Manager. Hitachi Device Manager provides the connection information for the storage system to the Export Tool, which then sends the performance information to IBM Spectrum Control.

Requirement: You might already have created credentials for Hitachi Device Manager, but you must create new credentials to match the credentials used for Command Suite. Device Manager uses these credentials exclusively for the Export Tool.

Important: To collect performance metadata, Hitachi requires that the password for connecting to the storage system be temporarily stored as clear text in a file on the server where IBM Spectrum Control is installed. For security reasons, ensure access to that server is restricted to key personnel. The file is automatically deleted after metadata is collected.

User Name and Password

The account credentials that are required to connect to Hitachi Device Manager. The role or user group that is assigned to the user name must have the appropriate privileges to monitor the data that is collected and, if required, to change the frequency of the data collection schedules. [Learn more about the role requirements for the user name.](#)

Capacity

Asset, capacity, and configuration metadata is collected by probes. By default, a probe collects metadata from Hitachi VSP systems once every 24 hours.

Configure

If you want to change the default probes and performance monitors, keep the Add Storage System window open. When the storage system or systems are connected, select the systems that you want to configure. To select multiple storage systems, press Ctrl and click or Shift and click. The default configuration settings are applied to the remaining storage systems.

Display Name

The name of the storage system that is displayed in the IBM Spectrum Control interface. If you do not enter a value, the default name is provided. This is the name that is provided with the storage system.

Location

The location, such as the geographical location or the building, where the resource is located.

Data Collection

Schedule the probe and performance monitor for the storage system. The probe collects status, asset, and storage information about the storage system. The performance monitor collects metrics that measure the performance of the storage system.

Probe

Enter the time and schedule for the storage system probe to run.

Enter the time in *hh:mm* format, where *hh* equals the hour and *mm* equals the minute. The time zone that is shown is determined by the location of the Data server for IBM Spectrum Control.

Performance Monitor

If you enabled performance monitoring when you added the Hitachi storage systems, you can change the performance monitoring interval from every 5 minutes to every 60 minutes. You can also disable performance monitoring.

- **[Installing the Hitachi Export Tool](#)**

To collect performance data from a Hitachi storage system, you must install the Hitachi Export Tool on the server or virtual machine where IBM Spectrum Control is installed. If you have many Hitachi storage systems in your environment, you must install the appropriate version of the Export Tool for each model of storage system.

Installing the Hitachi Export Tool

To collect performance data from a Hitachi storage system, you must install the Hitachi Export Tool on the server or virtual machine where IBM Spectrum® Control is installed. If you have many Hitachi storage systems in your environment, you must install the appropriate version of the Export Tool for each model of storage system.

About this task

To collect performance metadata, the Hitachi Export Tool requires that the password for connecting to the storage system is temporarily stored as clear text in a file on the server or virtual machine where IBM Spectrum Control is installed. For security reasons, ensure access to that server or virtual machine is restricted to key personnel. The file is automatically deleted after metadata is collected.

Procedure

1. Use your Hitachi account to download the Export Tool from the following location:
https://knowledge.hitachivantara.com/Knowledge/Storage/How_to_Download_the_Appropriate_Export_Tool_Version_Specific_to_Array_Microcode
Tip: If you have more than one model of Hitachi storage system, you must download the version of the Export Tool for each model.
2. To install the tool into the default directory, first create the following directory structure where *hitachi_model* is the directory name that corresponds to the Export Tool for the model of your storage system.

Windows

Program Files\monitor\export\hitachi_model

Linux®

/opt/monitor/export/hitachi_model

Where *hitachi_model* is the directory name. See the following table for the directory details.

Table 1. Hitachi storage system models and export tool directories

Model	Property Name	Directory Name
Hitachi Virtual Storage Platform 5100/5100H/5500/5500H	hitachi_5000_ExportToolPath	5000
Hitachi Virtual Storage Platform E990	hitachi_E_ExportToolPath	eseries
Hitachi VSP G200/400/600/800 and F400/600/800	hitachi_FGX00_ExportToolPath	fgx00
Hitachi VSP G130/350/370/700/900 and F350/370/700/900	hitachi_FGXX0_ExportToolPath	fgxx0
Hitachi VSP G1000/1500 and F1500	hitachi_FG1X00_ExportToolPath	fg1x00
Hitachi VSP N400/600/800	hitachi_N_ExportToolPath	nseries
Hitachi Virtual Storage Platform (VSP)	hitachi_LegacyVSP_ExportToolPath	legacyvsp

3. Ensure that the Export Tool directory has write permission for users.

4. For each Export Tool that you downloaded, open the disk image and extract the tool for your chosen operating system.

5. Install the tool into the default directory.

6. Optional: If it is not possible to run the Export Tool from the default directory, another directory can be used. However, you must modify the setup.properties file in the DataCollector/conf directory to specify the new location.

Modify the *hitachi_model_ExportToolPath* property for your specific Hitachi storage system as in the following examples for Hitachi VSP G200/400*/600/800 and F400/600/800.

Windows

```
hitachi_FGX00_ExportToolPath=C:\User1\HitachiExportTool\export\fgx00
```

Where folders are separated by \\

Linux

```
hitachi_FGX00_ExportToolPath=/usr/abc/HitachiExportTool/export/fgx00
```

7. Optional: If you changed the setup.properties file, save it and then restart the device server.

Adding and configuring NetApp resources

After adding and configuring a NetApp resource, you can use IBM Spectrum® Control to administer and monitor the status, configuration, capacity, performance, and information that is collected about the resource.

About this task

A NetApp ONTAP 9 resource can be added to IBM Spectrum Control as either a block or file storage system to view all of the block and file data on the system. A NetApp ONTAP 8 (7- mode) resource can be added to IBM Spectrum Control as a block storage device, a file storage device, or both. IBM Spectrum Control collects different information from the device, depending on the type of storage system you specify. For all NetApp storage systems IBM Spectrum Control collects data by directly connecting to the resource.

Important:

- For new IBM Spectrum Control installations, you can no longer deploy Storage Resource agents for monitoring NetApp resources. You must now monitor those resources through an SMI-S provider or a direct connection. However, if you upgrade from a previous version of the product, you can continue to manage NetApp resources that have Storage Resource agents deployed from that previous version.
- When you upgrade from a previous version to IBM Spectrum Control 5.2.10 or later, the existing alert definitions for NetApp filers are migrated to the new version. However, to generate alerts for those filers, you must monitor them through direct connections rather than through Storage Resource agents. To set up direct connections for those NetApp filers, add them again for monitoring and enter the credentials for connecting to them directly. After you add the NetApp filers, their previous entries are automatically removed and alerts will be generated for the alert definitions that were migrated.
- For a complete list of NetApp devices that can be monitored, see [NetApp support page](#).
- For NetApp storage systems managed by SMI-S providers, performance monitoring is supported only for volumes and front-end ports. It is not supported at the storage system level.

To add a NetApp resource for monitoring by IBM Spectrum Control, complete the following steps:

Procedure

- To add a NetApp resource as a block storage system, go to Storage > Block Storage Systems. To add the resource as a file storage system, go to Storage > File Storage Systems.
- Click Add Storage System.
- Click the NetApp icon to add the resource as a storage system.
- Complete the connection information for the storage system and schedule the collection of data.

Results

After the initial discovery has completed, you can view information about the NetApp device in the File Storage Systems or Block Storage Systems pages in the GUI.

Antivirus software restriction: If your antivirus software is set on the maximum mode, it might prevent your ONTAP 9 storage systems from being added to IBM Spectrum Control. For more information about how to configure your antivirus software, see [Installation checklists for IBM Spectrum Control](#).

What to do next

By default, asset, capacity, and configuration metadata is aggregated and collected daily. You can schedule daily capacity and inventory reports to gain insights about your NetApp storage systems.

Configuring IBM Spectrum Virtualize for Public Cloud for monitoring

Configure IBM Spectrum Virtualize for Public Cloud for monitoring with IBM Spectrum® Control.

About this task

IBM Spectrum Virtualize is a software-defined storage solution that has been proven for years in SAN Volume Controller and the IBM® Storwize® family. IBM Spectrum Virtualize for Public Cloud extends that solution to a hybrid-cloud or cloud-based model, where servers, storage, and network infrastructure are delivered in a public cloud environment. It can be deployed on either IBM® Cloud or Amazon Web Services (AWS) cloud infrastructures.

With IBM Spectrum Control, you can view the capacity, space usage, and performance of your IBM Spectrum Virtualize for Public Cloud storage systems. Other monitoring features, such as alerting, health checking, advanced analytics, and reporting are also supported.

Before you can add an IBM Spectrum Virtualize for Public Cloud storage system for monitoring, you must ensure that IBM Spectrum Control can connect to it. To enable a connection, you can use the site-to-site VPN IPsec tunnel that exists between the on-premises environment and the IBM Spectrum Virtualize for Public Cloud storage systems.

- **Monitoring IBM Spectrum Virtualize for Public Cloud with on-premises data collection (Site to Site VPN IPsec)**
You can connect and monitor IBM Spectrum Virtualize for Public Cloud storage with IBM Spectrum Control by using the site-to-site virtual private network (VPN) IPsec tunnel that exists between the on-premises environment and the IBM Spectrum Virtualize for Public Cloud instances.

Monitoring IBM Spectrum Virtualize for Public Cloud with on-premises data collection (Site to Site VPN IPsec)

You can connect and monitor IBM Spectrum Virtualize for Public Cloud storage with IBM Spectrum® Control by using the site-to-site virtual private network (VPN) IPsec tunnel that exists between the on-premises environment and the IBM Spectrum Virtualize for Public Cloud instances.

About this task

The VPN IPsec site-to-site tunnel is a secure communication network between the cloud infrastructure and the on-premises environment. Network communication between the private subnets is controlled by the access control list (ACL) that is populated when you create the VPN IPsec site-to-site tunnel.

Typically, a bi-directional, IPsec site-to-site tunnel is limited to the subnets that contain the following IP addresses:

- On-premises IBM Spectrum Virtualize cluster and replication target
- Cloud-based IBM Spectrum Virtualize for Public Cloud cluster and replication target

To use the IPsec site-to-site tunnel for communication between IBM Spectrum Control and IBM Spectrum Virtualize for Public Cloud, you must include the IP addresses of your IBM Spectrum Control servers (or the subnet in which they reside) in the tunnel definition as one of the on-premises endpoints.

For example, in the AWS Management Console, you can define the following:

- The external (internet-routable) IP address of the on-premises IPsec tunnel endpoint.
- The subnet / IP addresses for the on-premises IBM Spectrum Control servers, IBM Spectrum Virtualize cluster, and replication target that will communicate through the tunnel.
- The IP addresses of the IBM Spectrum Virtualize for Public Cloud cluster and replication target in AWS that will communicate through the tunnel.

When defined, you can export a configuration file that can be used in different IPsec VPN devices, such as Vyatta and Juniper (Junos VPN Site Secure). Contact your network and firewall administrators to help set up this communication between IBM Spectrum Control and IBM Spectrum Virtualize for Public Cloud.

Procedure

After configuring the connection between IBM Spectrum Virtualize for Public Cloud and IBM Spectrum Control, add the storage system for monitoring by completing the following steps:

1. In IBM Spectrum Control, go to **Storage > Block Storage Systems**.
2. Click **Add Storage Systems**.
3. Click the SVC or Spectrum Virtualize icon.
4. Specify the IP address and authentication credentials for the IBM Spectrum Virtualize for Public Cloud instance that you want to monitor.
5. Click **Connect**.

Results

The storage system is added for monitoring and is automatically added to the default alert policy for the storage system type. Data collection is automatically run to collect status, configuration, capacity, and performance metadata about the storage system.

What to do next

By default, asset, capacity, and configuration metadata is aggregated and collected daily. Performance metadata is collected every 5 minutes. You can schedule daily capacity and inventory reports to gain insights about your IBM Spectrum Virtualize for Public Cloud storage systems.

User roles for collecting performance metadata from IBM Spectrum Virtualize

When you add IBM Spectrum Virtualize storage systems, you must add the credentials of a user who can log on to the storage system and collect performance metadata.

The required role of the user on your storage system for collecting performance metadata depends on the version of IBM Spectrum Virtualize.

Versions earlier than 8.3.1.2

The user must have the role of Administrator or SecurityAdmin.

Version 8.3.1.2 or later

The user can have any role, such as the Monitor role.

Important information about user roles for IBM Spectrum Virtualize 8.3.1.2 or later

If the collection of performance metadata is stopped on the storage system, the role of the storage system user determines whether the collection can be automatically restarted. For example, if the storage system user has the Monitor role and your administrator has stopped the collection on the storage system, the collection must be manually restarted by your administrator before IBM Spectrum® Control can collect performance metadata.

User has privileges to start collections

If the user has the Administrator or SecurityAdmin role on the storage system, the collection is automatically restarted and the performance metadata is collected.

User does not have privileges to start collections

If the user has the Monitor role on the storage system, IBM Spectrum Control can't automatically restart the collection. To manually start the collection of performance metadata on the storage system, complete the following steps:

1. Log on to the storage system as a user with the Administrator, or SecurityAdmin role.
2. Run the following command:

```
svctask startstats -interval time in minutes
```

The interval must be less than or equal to the performance monitor interval for the storage system in IBM Spectrum Control. To check the value, in the IBM Spectrum Control GUI, go to the Block Storage Systems page and view the value for Performance Monitor Interval for the storage system.

Monitoring IBM Spectrum Scale without requiring root privileges

You can enable a non-root user on a IBM Spectrum Scale cluster node to monitor IBM Spectrum Scale storage systems.

About this task

Before you add the IBM Spectrum Scale storage system for monitoring, complete this task.

To grant access to the user, make the following changes to the sudoers file on the cluster node that is used for authentication:

- Add the set of administration commands that are required to monitor the storage system.
- Associate the user with the set of administration commands.

Important:

- You must configure IBM Spectrum Scale cluster nodes for SSH login without requiring a password.
- You can't monitor IBM Spectrum Scale clusters that are configured with a sudo wrapper environment. This configuration is not supported because mmdsh* commands are required to collect configuration information from the IBM Spectrum Scale cluster.

Procedure

1. Log on to the cluster node that is used for authentication with a user name that has root privileges.
2. To edit the sudoers file, enter the following command:

```
visudo -f /etc/sudoers
```

3. Add the following command aliases to the `sudoers` file.

The command aliases contain the commands that the user must be able to issue to monitor the storage system.

Important: Each command alias must be on a single line without line breaks.

```
Cmdnd Alias TPC_GPFS_MMCD = /usr/lpp/mmfs/bin/mmsdrquery, /usr/lpp/mmfs/bin/mmfsconfig,  
/usr/lpp/mmfs/bin/mmgetstate, /usr/lpp/mmfs/bin/mmfsnodeclass, /usr/lpp/mmfs/bin/mmfsfs,  
/usr/lpp/mmfs/bin/mmdf, /usr/lpp/mmfs/bin/mmfsnsd, /usr/lpp/mmfs/bin/mmfsfileset,  
/usr/lpp/mmfs/bin/mmcloudgateway, /usr/lpp/mmfs/bin/mmfsmount, /usr/lpp/mmfs/bin/mmfsnapshot,  
/usr/lpp/mmfs/bin/mmrepquota, /usr/lpp/mmfs/bin/mmfspolicy, /usr/lpp/mmfs/bin/mmapplypolicy
```

```
Cmdnd Alias TPC_GPFS_MMDSH = /usr/lpp/mmfs/bin/mmdsh -N * /usr/lpp/mmfs/bin/mmdiag --version,  
/usr/lpp/mmfs/bin/mmdsh -N * /lib/udev/scsi_id --whitelisted *,  
/usr/lpp/mmfs/bin/mmdsh -N * /sbin/blockdev --getsize64 *,  
/usr/lpp/mmfs/bin/mmdsh -N * /usr/bin/getconf DISK_SIZE *,  
/usr/lpp/mmfs/bin/mmdsh -f 20000 -N linuxNodes 'cat /sys/class/fc_host/*',  
/usr/lpp/mmfs/bin/mmdsh -N * /usr/lpp/mmfs/bin/mmces node list,  
/usr/lpp/mmfs/bin/mmdsh -N * /usr/lpp/mmfs/bin/mmces service list -a,  
/usr/lpp/mmfs/bin/mmdsh -N * /usr/lpp/mmfs/bin/mmces address list|grep object_database_node,  
/usr/lpp/mmfs/bin/mmdsh -N * /usr/lpp/mmfs/bin/mmces address list  
--by-node|grep object_database_node,  
/usr/lpp/mmfs/bin/mmdsh -v -N cesNodes /usr/lpp/mmfs/bin/mmobj config list  
--ccrfile object-server.conf --section DEFAULT --property devices,
```

```

/usr/lpp/mmfs/bin/mmdsh -f 20000 -v -N * "test -e /opt/IBM/zimon/ZIMonSensors.cfg &&
(grep -w collectors -A 4 /opt/IBM/zimon/ZIMonSensors.cfg | grep -w host) || true",
/usr/lpp/mmfs/bin/mmdsh -f 20000 -v -N nonWindowsNodes hostname

Cmd Alias TPC_GPFS_MMDSH2 = /usr/lpp/mmfs/bin/mmdsh -f 20000 -v -N localhost test -e /opt/IBM/zimon/ZIMonSensors.cfg &&
(grep \
 \ -w 'collectors' -A 4 /opt/IBM/zimon/ZIMonSensors.cfg \ | grep -w 'host') || true

Cmd Alias TPC_GPFS_MMDSH3 = /usr/lpp/mmfs/bin/mmdsh -f 20000 -v -N linuxNodes test -e /opt/IBM/zimon/ZIMonSensors.cfg &&
(grep \
 \ -w 'collectors' -A 4 /opt/IBM/zimon/ZIMonSensors.cfg \ | grep -w 'host') || true

Cmd Alias TPC_GPFS_OTHER = /bin/cat *release,/usr/bin/lsb_release -a, /bin/date, /usr/bin/date, /bin/grep,
/bin/true, /usr/bin/test

Cmd Alias TPC_GPFS_CMDS = TPC_GPFS_MMCMDS, TPC_GPFS_MMDSH, TPC_GPFS_OTHER, TPC_GPFS_MMDSH2, TPC_GPFS_MMDSH3

```

4. To enable the user to issue the commands, add the following lines after the command aliases:

```

Defaults:user_name !requiretty
user_name ALL=(ALL) TPC_GPFS_CMDS

```

where *user_name* is the user name that you enter when you add the storage system for monitoring.

Results

The user that you added to the sudoers file can now monitor the IBM Spectrum Scale storage system.

Verifying that asset, capacity, and configuration metadata can be collected for object storage

To probe object storage, IBM Spectrum® Control server must be able to connect to the OpenStack Swift and Keystone endpoints that are used to access object services.

Procedure

To verify that the server can access the object services, complete these steps:

1. List the URLs for the Keystone and Swift services by running commands on a IBM Spectrum Scale cluster node that is configured for object storage. Run the following commands with a user name that has root privileges:

```

. ~/openrc
openstack endpoint list

```
2. Ensure that the IBM Spectrum Control server can connect to the IP addresses and host names that are included in the Keystone and Swift services URLs. For example, the URL for the Keystone service might be `http://gpfs420proto1:5000/v3`. The IBM Spectrum Control server must be able to connect to the `gpfs420proto1` host name.

Related concepts

- [Collecting asset and status data by using IBM Spectrum Control probes](#)

Configuring the collection of performance data for IBM Spectrum Scale

Configure the collection of information about the performance of IBM Spectrum Scale file storage systems.

About this task

To collect performance data, you must first configure the IBM Spectrum Scale performance monitoring tool on the IBM Spectrum Scale cluster. Then, use the IBM Spectrum® Control GUI to schedule the collection of performance data.

Procedure

1. Configure the IBM Spectrum Scale performance monitoring tool by using the **mmperfmon config** command. For more information on the configuration code list, see the documentation for the https://www.ibm.com/docs/en/STXKQY_5.1.1/com.ibm.spectrum.scale.v5r10.doc/bl1adm_mmperfmon.htm. Set the **--collector** property of **mmperfmon config** to the IBM Spectrum Scale cluster node where the collector component will run. The **--collectors** property must be set to one of the following options:
 - An IP address that can be reached by the IBM Spectrum Control server
 - A host name that resolves to an IP address that is reachable by the IBM Spectrum Control server

Ensuring that the collector node can be reached by IBM Spectrum Control:
If the **--collectors** property is set to the internal host name of the collector node, the collector node might not be reachable by the IBM Spectrum Control server.

Update the hosts file on the IBM Spectrum Control server to resolve the internal host name of the collector node to the public IP address that the IBM Spectrum Control server can access.

2. Configure the collector component of the performance monitoring tool so that the IBM Spectrum Control server can connect to port 9084 on the cluster node where the collector component will run.
Configure the collector component by editing the `/opt/IBM/zimon/ZIMonCollector.cfg` file on the IBM Spectrum Scale cluster node where the collector component will run.

IBM Spectrum Scale 5.1.0 or earlier

To collect performance metadata, ensure that the `queryinterface` property is set to "0.0.0.0" in `ZIMonCollector.cfg` file on the cluster node:

```
queryinterface = "0.0.0.0"
```

IBM Spectrum Scale 5.1.1 or later

To collect performance metadata, ensure that `zimon/ZIMonCollector.cfg` file on the cluster node includes the following properties:

```
fallbackqueryinterface = "0.0.0.0" # "0.0.0.0" to allow remote connections (or ":::0" for IPv6)
fallbackqueryport = "9084"
```

3. Restart the collector component.
4. Use the `mmperfmon` command to assign the `perfmon` designation to each node for which you want to collect performance data. For more information, see the documentation for the <https://www.ibm.com/docs/en/spectrum-scale/5.1.1?topic=reference-mmchnode-command>
Note: By default in IBM Spectrum Scale 5.0.0 or higher, the sensors are started on all nodes.
5. Schedule the collection of performance data by creating a performance monitor in the IBM Spectrum Control GUI.
You can create performance monitors in the GUI when you add resources for monitoring or you can create them later.

Results

A performance monitor is created for the IBM Spectrum Scale storage system. If a successful probe run is completed for the resource, the performance monitor runs according to the defined interval.

What to do next

To check the progress of a performance monitor, you can complete the following actions:

- View the Performance Monitor Status column on the File Storage Systems page.
- From the File Storage Systems page, right-click a row, and select Data Collection > Open Performance Monitor Logs.

To learn more about configuring the performance monitoring tool, see https://www.ibm.com/support/knowledgecenter/STXKQY_5.0.1/com.ibm.spectrum.scale.v5r01.doc/bl1adv_PMToverview.htm.

Configuring OpenStack access to monitor the object storage system

Configure OpenStack access for the user name that is used to monitor the IBM Spectrum Scale object storage system.

About this task

Before you add the IBM Spectrum Scale object storage system for monitoring, ensure that the user name that you use to monitor the storage system has access to object storage accounts.

Tip: The terms "account" and "project" mean the same thing. Swift, the OpenStack object storage service, uses the term "account" and Keystone, the OpenStack identity service, uses the term "project."

Procedure

1. Set the object storage account and the domain for the user. By default, the domain is set to Default and cannot be modified after you create the user account.
Choose one of the following actions:

- a. To set the account and domain when you create a user account, use the following command:

```
openstack user create --domain domainname --project projectname
--password Password username
```

- b. To set the account and the domain for an existing user name, use the following command:

```
openstack user set --project projectname username
```

2. Assign the admin role for an object storage account to the user name.
Use the following command:

```
openstack role add --user username --project projectname admin
```

3. To monitor all accounts on the object storage system, assign to the user name the role that is defined in the `reseller_admin_role` configuration option in the Swift proxy server. The default value for the `reseller_admin_role` option is `ResellerAdmin`.

For example, use the following command:

```
openstack role add --user username --project projectname ResellerAdmin
```

Restriction: If you do not assign the ResellerAdmin role, information is collected only for the object storage accounts that the user has admin access to.

What to do next

To learn more about configuring and assigning user roles in OpenStack, see <https://docs.openstack.org/>.

Adding fabrics and switches

Add fabrics and switches for monitoring.

Before you begin

When you add switches for monitoring, you must provide a user name and password for logging in to those switches. The role or user group of the user determines the type of data that can be collected. To see the privileges that are required for switch users, see [Required user roles for monitoring resources](#).

For a Cisco switch to successfully receive and respond to queries from IBM Spectrum® Control, the following basic requirements must be met:

- IBM Spectrum Control can use SNMPv3 (preferred) or SNMPv1 to probe switches and fabrics. The SNMPv3 protocol is preferred because it provides better security, but switches that use the SNMPv1 protocol are also supported. Some switches are configured to use SNMPv3 by default.
- The Fibre Alliance FC Management MIB (FA MIB) and Fibre Channel Fabric Element MIB (FE MIB) must be enabled on the switch.
- When you use the SNMPv1 protocol, the community string that is configured in IBM Spectrum Control must match one of the community strings that are configured on the switch with read access. Additionally, Cisco switches must have a community string match for write access. The default community strings in IBM Spectrum Control are "public" for read access and "private" for write access. Other community strings can be defined on the switches, but are not used. Community strings are not relevant when you use the SNMPv3 protocol.
- SNMP access control lists must include the IBM Spectrum Control system. These access control lists are defined and configured on the switches. Some lists automatically include all hosts, while others exclude all by default.
- The Fibre Channel (FC) or Fibre Channel over Ethernet (FCoE) protocols must be enabled on the switch. Some switches, such as the Cisco Nexus 5000 series, require you to enable these protocols. Otherwise, IBM Spectrum Control does not recognize the switch when you try to add it using the Add Switches and Fabrics for Monitoring dialog. For instructions on how to configure Cisco switches for FCoE enablement, go to the Cisco product website at <http://www.cisco.com> and click Support.

IBM Spectrum Control can monitor Brocade switches and fabrics in either of the following ways:

- Use the REST API to manage the switches and fabrics.
- Use the Brocade Network Advisor (BNA) Storage Management Initiative (SMI) agent to manage the switches and fabrics. The SMI agent is embedded in the BNA. BNA can manage multiple fabrics within and across data centers. When you configure BNA, you set up one switch to be the *seed* switch that interconnects to all the other switches in the fabric.

Important: The embedded SMI agent is only available in the Professional Plus and Enterprise editions of BNA. BNA is no longer available for purchase, although it will be supported by Broadcom until February 2022. For more information about end of support for BNA, see <https://www.broadcom.com/support/fibre-channel-networking/eol>.

About this task

In IBM Spectrum Control, you can add switches and fabrics for monitoring at the same time. You can add the following types of switches:

- Brocade
- Cisco

For a complete list of the firmware levels of supported switches, see <https://www.ibm.com/support/pages/node/6249365>.

Procedure

1. From the Network menu, click Switches or Fabrics.
2. Click Add Switch or Add Fabric.
3. Select the vendor: Brocade or Cisco.
4. Specify how you want to discover the switches and the fabrics that are connected to the switches. For Brocade switches and fabrics, you can connect using either REST API or an SMI-S provider on Brocade Network Advisor (BNA). For Cisco switches and fabrics, you must use SNMP agents.

Type of switch	Steps
Brocade	<p>Complete the following steps:</p> <ol style="list-style-type: none">a. Select the version of the Fabric OS that is running on the switches.b. If you select 8.2.1 or later, specify the connection details and the authentication credentials for the switches that you want to add. You need to add only one switch from each fabric to IBM Spectrum Control. If other switches that are on the same fabric are running Fabric OS 8.2.1 or later and have the same username, password, protocol, and port, they are added to IBM Spectrum Control automatically. The user must have a user or admin account with chassis-role privileges for the switches that are added. <p>Click Next.</p> <ol style="list-style-type: none">c. If you select Earlier than 8.2.1, make sure that the switch that you want to add is monitored by BNA. BNA is required for monitoring Brocade switches with Fabric OS versions earlier than 8.2.1. Click Next, then specify the connection details and the authentication credentials for the BNA SMI agent that you want to add. You can close the window and continue your work. To change the default probes and performance monitors, keep the window open and update them when the switches are connected.

Type of switch	Steps
Cisco	<p>To enable the collection of data with SNMP agents, complete the following steps:</p> <ol style="list-style-type: none"> Specify the version of SNMP: v3 (preferred) or v1. If you choose to use v3, specify the User name and associated Authentication password. Select an Authentication protocol and an Encryption protocol. If you choose to use v1, define the Read community and the Write community. Identify the Host name or IP address of each switch that you want to add. Click Next. You can close the window and continue your work. To change the default probes and performance monitors, keep the window open and update them when the switches are connected.

5. Specify the display name and location of the switches and fabrics that are discovered.

Results

The discovered switches are automatically added for monitoring, if they have the same credentials as the switches that you added. A probe is automatically run to collect status and asset information about the resources.

When Brocade switches are added, other switches in the same fabric that do not have the same authentication credentials might also be discovered. These switches are not added for monitoring. They are added to the Switches page with a Not Monitored condition.

What to do next

When the collection of data is complete, you can view status information about the fabric or switch on the Fabrics page or Switches page.

If you want to monitor multiple switches that have Not Monitored status, you must add them with the correct credentials. To add a list of Not Monitored switches, add the IP Address column to the Switches page. Then, select Condition as the filter, and Not Monitored as the filter value. Review the switches and gather the IP addresses of the switches that you want to add for monitoring. Then, add the switches in the usual way.

Managing alert conditions and notification settings: Review the alert configuration for the fabric or switch.

If you configured data collection for the switches or fabric, they are automatically added to the default alert policy for their type.

You can change which alert policy manages a switch, and you can also set a switch to not be managed by any policy. For example, to change the alert policy for a switch, go to Settings > Alert Policies and click the Resources by Policy tab. Click Switches, select a switch, and then select Actions > Set Policy.

Restriction: If you don't configure data collection for the switches and fabric, they are not added to the default alert policy.

- [Data sources for switches and fabrics](#)

Depending on the type of switch that you want to monitor, you can use Fabric OS REST API, SMI agents, or SNMP agents to monitor switches and fabrics. SMI agents are also known as CIM agents, CIMOM (CIM Object Manager) agents, or SMI-S providers.

- [Configuring Brocade switches for monitoring](#)

Configure Brocade switches for monitoring through a direct connection. IBM Spectrum Control establishes this connection by using the Brocade REST API and requires Fabric OS 8.2.1 or later.

Related tasks

Data sources for switches and fabrics

Depending on the type of switch that you want to monitor, you can use Fabric OS REST API, SMI agents, or SNMP agents to monitor switches and fabrics. SMI agents are also known as CIM agents, CIMOM (CIM Object Manager) agents, or SMI-S providers.

The vendors of switches can help you determine which agents to use.

Table 1. Agent types for switch and fabric functions

Function	Brocade	Cisco
Monitor performance	REST API or SMI agent	SNMP agent
Collect information about switches and switch ports	REST API or SMI agent	SNMP agent
Collect information about topology connectivity	REST API or SMI agent	SNMP agent
Collect information about zoning information and zone control	REST API or SMI agent	SNMP agent
Generate alerts	REST API or SMI agent	SNMP agent

Important: The embedded SMI agent is only available in the Professional Plus and Enterprise editions of Brocade Network Advisor (BNA). BNA is no longer available for purchase, although it will be supported by Broadcom until February 2022. For more information about end of support for BNA, see <https://www.broadcom.com/support/fibre-channel-networking/eol>.

Configuring Brocade switches for monitoring

Configure Brocade switches for monitoring through a direct connection. IBM Spectrum® Control establishes this connection by using the Brocade REST API and requires Fabric OS 8.2.1 or later.

About this task

Before you add a Brocade switch for monitoring in IBM Spectrum Control, you must configure it for HTTPS and set up the proper user role.

Procedure

1. To enhance security, configure a switch for HTTPS. This action disables HTTP access.

Option 1

Create a self-signed HTTPS certificate by using the **seccertmgmt generate** command.

```
seccertmgmt generate -cert [https | extn -keypair_tag keypair_tag] [-type [rsa | dsa | ecdsa]] [-keysize value] [-hash type] [-years value] [-f]
```

For example:

```
switch:admin> seccertmgmt generate -cert https
```

Option 2

Upload a CA-signed certificate by using the **seccertmgmt import** command.

```
seccertmgmt import -cert [fcap | commoncert | https | radius | ldap | syslog | extn -keypair_tag keypair_tag | mgmtip] -protocol [scp | ftp] -ipaddr IP address -remotedir remote_directory -certname certificate_name -cacert preimported_local_ca_cert -login login_name -password password
```

For more information, see [Brocade® Fabric OS® Command Reference Manual, 8.2.x](#).

2. Configure a user with required roles for the switches.
 - a. To collect metadata about a switch, IBM Spectrum Control requires a user account with "user" or "admin" role. If the switch is virtualized, the user must also have a "user" or "admin" role for the chassis and have access to all the Logical Fabric IDs 1 - 128.
 - b. To create a user with the required roles, run one of the following commands.
 - For virtualized switches, run the **userconfig --add** command with the **-r role**, **-l LF_ID_LIST**, and **-c chassis_role** options.

```
virtualizedswitch:admin> userconfig --add user_name -r user -l 1-128 -c user -p MyPassword
```
 - For non-virtualized switches, run the **userconfig --add** command with the **-r role** option.

```
physicalswitch:admin> userconfig --add user_name -r user -p MyPassword
```
 - c. To change the role for an existing user, run one of the following commands.
 - For virtualized switches, run the **userconfig --change** command with the **-r**, **-l**, or **-c** options along with the **userconfig --addlf** command to expand the list of Logical Fabric IDs.

For example, run the following command to change the chassis role and the list of Logical Fabric IDs that the user is allowed to access.

```
virtualizedswitch:admin> userconfig --change user_name -c admin -l 128
```

```
virtualizedswitch:admin> userconfig --addlf user_name -c admin -l 1-128
```
 - For non-virtualized switches, run the **userconfig --change** command with the **-r** option.

```
physicalswitch:admin> userconfig --change user_name -r admin
```
 - d. To verify the roles, run the **userconfig --show** command. Add the **-a** option to list all users on the switch.

Adding hypervisors

You can add hypervisors for monitoring by IBM Spectrum Control. Hypervisors include VMware vSphere data sources such as ESX and ESXi, and vCenter Server systems. When you add vSphere data sources, you can then collect data, generate reports, and manage storage that is related to those resources. To add a hypervisor, you specify connection information for the ESX or ESXi data source. You can add multiple hypervisors by specifying connection information for a vCenter Server system.

- [Adding ESX and ESXi hypervisors](#)
Add ESX and ESXi hypervisors for monitoring by IBM Spectrum Control.
- [Adding vCenter Server systems](#)
For IBM Spectrum Control to monitor multiple hypervisors, you must first add a vCenter Server system.

Adding ESX and ESXi hypervisors

Add ESX and ESXi hypervisors for monitoring by IBM Spectrum Control.

About this task

You can add an ESX or ESXi hypervisor by specifying connection information for that hypervisor. For a complete list of hypervisors that you can add, see the [IBM Spectrum Control interoperability matrix](#), and go to the *Agents, Servers and Browsers* section.

Procedure

1. In the menu bar, go to Servers > Hypervisors.
2. Click Add Hypervisor.
3. Select ESX/ESXi and enter connection information about the hypervisor.
4. Schedule a probe of the hypervisor.
5. Follow the instructions in the GUI to add the hypervisor.

Results

The hypervisor is added for monitoring. A probe is automatically run to collect status and asset information about the hypervisor.

What to do next

When the collection of data is complete, you can view status information and capacity data about the hypervisor on the Hypervisors page.

Managing alert conditions and notification settings: Review the alert configuration for the hypervisor. Each hypervisor is automatically added to the default alert policy for the hypervisor type. You can change which alert policy manages a hypervisor, and you can also set a hypervisor to not be managed by any policy. For example, to change the alert policy for a hypervisor, go to Settings, > Alert Policies and click the Resources by Policy tab. Click Hypervisors, select a hypervisor, and then select Actions, > Set Policy.

- [Checking permissions to browse data stores](#)

Determine if the user name that you specified for a VMware data source has permission to browse through the data stores on a hypervisor.

Related tasks

- [Adding vCenter Server systems](#)

Checking permissions to browse data stores

Determine if the user name that you specified for a VMware data source has permission to browse through the data stores on a hypervisor.

About this task

When you add a VMware data source in IBM Spectrum® Control, the user name that you specify must have permission to browse through the data stores on VMware. IBM Spectrum Control must browse through the data stores to collect information from the hypervisors. However, the "Read Only" role as defined by VMware does not allow IBM Spectrum Control to browse the data stores. You can use the "Virtual Machine Power® User" role if you do not want to use the Administrator role, or you can create a custom role with the required permissions.

Procedure

To verify that a VMware user is assigned the correct role and privileges to monitor VMware data sources, follow these steps:

1. Ensure that the user role has the required VMware datastore permissions by completing the following steps:
 - a. Connect the vSphere Web Client to the VMware data source.
The data source can be an ESX server, a vCenter Server Appliance, or a vCenter Server.
 - b. From the Inventories view, select Hosts and Clusters.
 - c. Select a host, and click the Related Objects tab.
 - d. View the datastores by clicking the Datastores tab.
 - e. Right-click a datastore, and select File Browser. If you can view the Files tab for the datastore, your browse permission is working correctly.
2. Determine the role that is assigned to the user by logging in to the vSphere Web Client by using the administrator user ID. From the Administration view, select Roles. Verify the role name that is assigned to the user.
3. Determine the privileges that are assigned to the role by selecting the user's role and clicking Privileges. Expand the privilege groups to view the specific privileges.
4. Optional: If you must edit the privileges for the role, select the role and click the Edit role action icon. Select privilege groups or expand to select specific privileges.

What to do next

For more information about VMware user roles, go to the [VMware documentation center](#) and search for *vSphere users and permissions*.

Adding vCenter Server systems

For IBM Spectrum Control to monitor multiple hypervisors, you must first add a vCenter Server system.

About this task

You can add multiple hypervisors by specifying connection information for a vCenter Server system. For a complete list of hypervisors and vCenter Server systems that you can add, see the [IBM Spectrum Control interoperability matrix](#), and go to the *Agents, Servers, and Browsers* section.

Procedure

1. In the menu bar, go to Servers, > Hypervisors.
2. Click Add Hypervisor.
3. Select VMware vCenter and enter connection information about the vCenter Server system.
4. Schedule a probe for the hypervisors that were discovered.
5. Follow the instructions in the wizard to add the vCenter Server system.

Results

After a vCenter Server system is added for monitoring, probes collect status and asset information about its hypervisors.

What to do next

When the collection of data is complete, you can view status information and capacity data about the hypervisors on the Hypervisors page.

Managing alert conditions and notification settings: Review the alert configuration for the hypervisor.

Each hypervisor is automatically added to the default alert policy for the hypervisor type. You can change which alert policy manages a hypervisor, and you can also set a hypervisor to not be managed by any policy.

You can also create an alert policy from the alert definitions and notification settings of a hypervisor. Click Servers > Hypervisors. Right-click the hypervisor from which you want to create an alert policy, then click View Alert Definitions. Click Create Policy from the Policy Actions menu.

Adding servers

Add servers for monitoring. IBM Spectrum® Control creates and updates agentless servers automatically after it probes storage systems and hypervisors. You can also add a server by deploying a Storage Resource agent.

- **Agentless servers**
IBM Spectrum Control creates and updates agentless servers automatically after it probes storage systems and hypervisors.
- **Adding servers with Storage Resource agents**
You can deploy a Storage Resource agent to a server if you want to view information about the resources that are internal to a server, or about the fabrics that are visible to the server. Internal resources include controllers, disks, file systems, logical volumes, shares, and directories.

Agentless servers

IBM Spectrum® Control creates and updates agentless servers automatically after it probes storage systems and hypervisors.

IBM Spectrum Control creates agentless servers by using information about the following resources:

- Host connections on storage systems
- Host bus adapters (HBAs) on fabrics
- Discovered virtual machines

Depending on your storage environment, IBM Spectrum Control might not model all of the servers in your environment correctly. For example, IBM Spectrum Control might identify six host connections and create an agentless server for each host connection. However, in your environment, these six host connections represent one server computer. In this case, you need to merge the six agentless servers into one agentless server.

Similarly, IBM Spectrum Control might create a single agentless server from a group of host connections that appear to be related. However, in your environment, each of these host connections represents a separate server computer. In this case, you can separate the agentless server into multiple agentless servers, one for each of the servers in your environment.

Adding servers with Storage Resource agents

You can deploy a Storage Resource agent to a server if you want to view information about the resources that are internal to a server, or about the fabrics that are visible to the server. Internal resources include controllers, disks, file systems, logical volumes, shares, and directories.

Before you begin

To deploy a Storage Resource agent, you must have Administrator privileges.

For each installation of IBM Spectrum® Control, you can deploy only one Storage Resource agent on each server. If you attempt to deploy additional Storage Resource agents on a server, the deployments fail.

Procedure

1. In the menu bar, go to Servers > Servers.
2. Click Deploy Agent.
3. Select one of the following methods for deploying Storage Resource agents:
 - Enter information about the server and the Storage Resource agent manually.
 - Import configuration information from a comma-delimited file.
4. On the Deploy Agent page, configure deployment information for the Storage Resource agents.
If you deploy multiple agents with different operating systems, separate configuration pages are displayed for agents that are deployed on Windows servers and agents that are deployed on UNIX servers.
5. On the Configure page, schedule the deployment of the Storage Resource agents.
If you are deploying agents on multiple servers, a time span is calculated during which the agents are deployed. The agents are deployed at regular intervals during the time span to avoid excessive load on the IBM Spectrum Control server.

6. Schedule the time and frequency that probes are run for the servers.
If you add multiple servers, a time span is calculated during which the servers are probed.
7. To add the servers, click Finish.

Results

A probe is automatically run for a server after the agent is successfully deployed.

What to do next

Use Agent State on the Servers page to monitor the status of the agent deployment.

Managing alert conditions and notification settings: Review the alert configuration for the server.

Each server is automatically added to the default alert policy for the server type. You can change which alert policy manages a server, and you can also set a server to not be managed by any policy.

You can also create an alert policy from the alert definitions and notification settings of a server. Click Servers > Servers. Right-click the server from which you want to create an alert policy, then click View Alert Definitions. Click Create Policy from the Policy Actions menu.

- [File List](#)
Add one or more servers with Storage Resource agents by importing the configuration information from a comma-delimited file.

File List

Add one or more servers with Storage Resource agents by importing the configuration information from a comma-delimited file.

The web-based GUI guides you through the following steps for adding servers:

- Select the input file.
- Configure deployment information.
- Schedule the agent deployment and data collection for the servers.

The comma-delimited file that you use to import the configuration information for servers can contain entries for a single server or multiple servers. Each line in the file represents a server that you want to add. The information about each server must be organized in the following format:

```
host name or IP address,OS type,location,custom tag 1,custom tag 2,custom tag 3
```

where:

- **host name or IP address** is required for each server entry. An IP address can be in an IPv4 or IPv6 format. A host name or IP address can contain the following characters or symbols:
 - A - Z (uppercase characters)
 - a - z (lowercase characters)
 - 0 - 9 (numeric characters)
 - Symbols: - . : _
- **OS type** is required and represents the operating system of the server. The OS type for a server must be one of the following values:
 - Windows
 - Linux®
 - AIX®
- **location** is optional and represents the physical location of the server. The location value can be up to 64 characters in length. If the length exceeds 64 characters, the location value is truncated when the server is added.
- **custom tag 1, custom tag 2, and custom tag 3** are optional and represent any additional information that you want to provide about the server. The custom tag values can be up to 64 characters in length. If the length exceeds 64 characters, the custom tag value is truncated when the server is added.
Tip: The custom tags can be displayed on the Servers page or can be included as report columns when you generate reports for the server.

If a server has no information for an optional field, you must add a comma separator unless there are no further values for that server.

Example

```
host1,Windows,San Jose,Accounting department
host5,Linux,London,Finance department
198.51.100.22,AIX,,Computing department
2001:DB8:0:0:0:0:0:0,Windows,Tokyo
```

Tips:

- If the comma-delimited file contains entries for multiple servers, it might take some time to add the servers. To confirm that the servers are added, check the Status column on the Servers page.
- To comment out a line, enter a "#" at the beginning of the line. The server on that line is not added when the list is imported.
Example:

```
# host1,Windows,San Jose,Accounting department
```

- If there are syntax problems in the file, none of the servers in the file are added.

Adding rollup servers

Rollup servers gather capacity and status information from IBM Spectrum® Control servers in your enterprise. You can add rollup servers for monitoring on the Settings > Rollup Server Connections page.

IBM Spectrum Control supports primary and secondary rollup servers. Primary rollup servers gather capacity and status information about the storage resources that are managed by secondary rollup servers. You can view this information by enabling IBM Spectrum Control rollup mode. These managed resources include servers, hypervisors, fabrics, switches, and block storage systems.

Configuring rollup servers

To configure rollup servers, you add one or more secondary rollup servers to a primary rollup server. The primary rollup server uses probes to collect capacity and status information from the secondary rollup servers. Primary rollup servers must have IBM Spectrum Control 5.3.0 or later installed and running. Secondary rollup servers must have IBM Spectrum Control 5.3.0 or later installed.

Adding a rollup server

To add and configure secondary rollup servers, go to Settings > Rollup Server Connections. You can add one or more secondary rollup servers to the primary rollup (local) server. You can also add a primary rollup server as a secondary rollup server to another primary server.

Viewing rollup information

To view information about the resources managed by your rollup servers, you must be in *rollup mode*. To enter rollup mode, hover your pointer over the rollup mode icon  on the menu bar and select Enter rollup mode. You cannot enter rollup mode unless you have added at least one secondary rollup server to the primary rollup (local) server.

For more information about rollup servers and rollup mode, see [Rollup servers](#).

- **Restrictions for rollup servers**

When you use rollup mode to view information that was collected by secondary servers and rolled up to primary servers, keep in mind the following limitations, restrictions, and considerations.

Restrictions for rollup servers

When you use rollup mode to view information that was collected by secondary servers and rolled up to primary servers, keep in mind the following limitations, restrictions, and considerations.

Required versions of IBM Spectrum® Control

Primary rollup servers must have IBM Spectrum Control 5.3.0 or later installed. You can add secondary rollup servers that run any version of IBM Spectrum Control 5.3.0 or later.

Collecting data after you upgrade

After you upgrade a primary rollup server you must run probes of the secondary rollup servers that were added to the primary server prior to the upgrade. Use the Start Probe action to run probes of the secondary rollup servers. Wait for the first probe (manual or scheduled) to complete, before you work with a new function.

Unmapped Capacity and Mapped Capacity values are slightly different between the secondary and primary rollup servers

Due to differences in the methods that are used to calculate Unmapped Capacity and Mapped Capacity, there might be minor variations between the primary and secondary rollup servers. The value that is recorded in the secondary rollup server resource list panel is the definitive one.

Removing resources

Remove resources that you no longer want to monitor with IBM Spectrum® Control.

Procedure

1. In the menu bar, go to the type of resource that you want to remove.

Resource	Menu bar
Block storage systems	Storage > Block Storage Systems
File storage systems	Storage > File Storage Systems
Object storage systems	Storage > Object Storage Systems
Servers	Servers > Servers
Hypervisors	Servers > Hypervisors
Switches	Network > Switches
Fabrics	Network > Fabrics
Rollup subordinate servers	Settings > Rollup Server Connections

2. Right-click the resource and click Remove.

Tips:

- To remove rollup subordinate servers, click Actions > Remove Server.
- To remove a Cisco fabric, you must remove all the switches in that fabric. The Cisco fabric is then automatically removed.
- To remove a NetApp storage system configured for block storage, or configured for block storage and file storage, go to Storage > Block Storage Systems. If the NetApp storage system is configured only as a filer, then go to Storage > File Storage Systems.

3. Click Remove to confirm that you want to remove the resource.

Results

When you remove a resource, it is no longer monitored by IBM Spectrum Control. All the data that is associated with the resource, including historical data, is removed from the database. All the scheduled tasks and data collection jobs for the resource are canceled.

Collecting data

Determining the data that you want to gather about storage resources is critical to helping you implement a storage management strategy. IBM Spectrum® Control provides two different jobs for collecting data about resources.

Table 1. Data collection jobs, resources, and related tasks

Data collection job	Resources	Related tasks
Probe Use probes to collect status, asset, configuration, and capacity information about resources.	Storage systems Servers Hypervisors Fabrics Switches Rollup servers (capacity and status information only)	<ul style="list-style-type: none">Schedule a probe when you add a resource for monitoring.Modify the schedule for a probe at any time on the list and details pages for a resource. For example, to modify the schedule for a block storage system, go to the Block Storage Systems page or the details page for the block storage system.Use the Rollup server connections page to manage probes for rollup servers. Learn more...
Performance monitor Use performance monitors to collect metrics that measure the performance of resources.	Block storage systems File storage systems	<ul style="list-style-type: none">Schedule a performance monitor when you add a resource for monitoring.Modify the schedule for a performance monitor at any time on the Performance page, and on the list and details pages for the resource. Learn more...

- [Collecting asset and status data by using IBM Spectrum Control probes](#)
Use IBM Spectrum Control probes to collect asset, status, and storage data about monitored resources in your environment. Probes are also used to discover information about new or removed disks and file systems. You can view information about probes on the resource pages in IBM Spectrum Control, for example, the Block Storage Systems page, or the Block Storage Systems details page.
- [Collecting performance data by using IBM Spectrum Control performance monitors](#)
Before you can monitor the performance of the resources in your environment, you must collect data about those resources. IBM Spectrum Control uses performance monitors to collect metrics for measuring the performance of storage systems and switches. Use the Performance Monitors page to view and manage performance monitors.
- [Collecting information about shares on storage systems](#)
To collect information about shares in file systems, you must modify the TPCD.config file. When you provision shares, you can then view such information as the name of the share, the name of the file system, and the protocols that are used to share files.
- [Collecting information about the sizes of snapshots in IBM Spectrum Scale](#)
By default, IBM Spectrum Control does not collect information about the size of GPFS snapshots in IBM Spectrum Scale. To view that information, you must enable IBM Spectrum Control to collect information about the size of snapshots.

Creating probes in IBM Spectrum Control

Use probes to collect asset, status, and storage data about resources that are monitored by IBM Spectrum® Control. You can create probes when you add resources for monitoring or after you add the resources for monitoring.

About this task

You can create probes for one or more resources at the same time. You can also create an automated or manual probe. Schedule an automated probe to manage your probe jobs efficiently and to minimize the load on the IBM Spectrum Control server. If you want to run a probe at a specific time, schedule a manual probe.

Procedure

1. To schedule a probe for a resource, choose one of the following options from the menu bar:

Resource	Menu bar
Block storage systems	Storage > Block Storage Systems
File storage systems	Storage > File Storage Systems
Object storage systems	Storage > Object Storage Systems
Servers	Servers > Servers
Hypervisors	Servers > Hypervisors
Switches	Network > Switches
Fabrics	Network > Fabrics
Rollup subordinate servers	Settings > Rollup server connections

Tip: For switches, probes also collect asset and topology information about the fabrics that include those switches.

2. Locate the resources that you want to probe.
3. Select the resource rows and click Actions > Data Collection > Schedule. For Rollup subordinate servers, select Actions > Start probe for the server.
4. On the Data Collection Schedule window, set the probe to Enabled.
5. From the following table, choose the type of probe that you want. Make your selections for the data collection, and save your selections.

Type of probe	Selections for probe
Automated probe	Select the frequency of the data collection. Click Save.
Manual probe	Select the time and the frequency of the data collection. Click Save.

For automated probes, the start time is determined by an algorithm that minimizes the number of concurrent probe jobs to avoid excessive load on the IBM Spectrum Control server. Automated probe jobs are scheduled by IBM Spectrum Control within the time interval that you define in the Automated Probe Run Window.

Tips for manually scheduling probes:

- When you schedule probes to collect data about resources, schedule the probes to run at different times. By scheduling data collection so that no two probes run at the same time, you can help improve the overall performance of the product and ensure that data is collected successfully.
- If you schedule manual probes for multiple resources, a time span is calculated during which the resources are probed. The resources are probed at different times during the time span to avoid excessive load on the IBM Spectrum Control server.

Results

Probe schedules are created for the resources that are selected. The probe jobs run according to the modified schedule. If you disabled the probes, IBM Spectrum Control stops collecting asset, status, and capacity data for the monitored resources.

Note: Status and asset information about logical switches is collected when the parent switch is probed.

Example

You select three storage systems, `storage_system_a`, `storage_system_b`, and `storage_system_c`. A probe schedule was defined for `storage_system_c`, but not for `storage_system_a` and `storage_system_b`. You set the time and frequency fields, and set the probe to Enabled. When you click Save, probe schedules are created for `storage_system_a` and `storage_system_b`. The probe schedule that was defined for `storage_system_c` remains unchanged.

• How automated probes are scheduled

When you schedule probes, you can manually specify when they run, or you can have IBM Spectrum Control automatically schedule them. Automated probe scheduling helps remove the complexity of manually planning when probes are run and ensures that server resources (CPU, Memory, and so on) required for data collection are distributed over time. Distributing the use of system resources over time helps avoid excessive load on IBM Spectrum Control at any one time.

How automated probes are scheduled

When you schedule probes, you can manually specify when they run, or you can have IBM Spectrum® Control automatically schedule them. Automated probe scheduling helps remove the complexity of manually planning when probes are run and ensures that server resources (CPU, Memory, and so on) required for data collection are distributed over time. Distributing the use of system resources over time helps avoid excessive load on IBM Spectrum Control at any one time.

To schedule probes automatically, an algorithm is used to determine the best times for when the probes are run. To determine this time, the algorithm considers the existing schedules of probes for all types of resources. For example, when an automated probe of a storage system is scheduled, IBM Spectrum Control attempts to minimize the number of probes that are running concurrently by analyzing the existing probes of switches, servers, hypervisors, and other storage systems.

IBM Spectrum Control also analyzes the frequency, start time, and expected duration of existing probe schedules. This analysis includes probes that were scheduled automatically or manually. After the analysis, IBM Spectrum Control creates a unique probe schedule for each day of the week.

Keep in mind the following information about automatic probe scheduling:

- When you schedule a new probe during the week, the schedule of existing probes does not change. Existing probes are considered when the schedule of the new probe is determined, but they continue to run according to the previously defined schedule for that week.
- When a probe is scheduled to run on a frequency of every X days where $X > 1$, IBM Spectrum Control determines the days for that frequency based on a number of conditions. Some of the conditions include whether the probe was run previously as a scheduled probe and how much time is available until the end of the current probe window.
- Automated probes can be rescheduled by IBM Spectrum Control under the following conditions:
 - When you change the time range for the automated probe schedule, IBM Spectrum Control reschedules all the automated probes to optimize when probes are run during that new time range.
 - On Saturday night (in the time zone of the IBM Spectrum Control server) of every week, all automated probes are rescheduled. During the rescheduling process, the algorithm is again applied to determine the best times to run automated probes on each day of the upcoming week. Because all automated probes are rescheduled weekly, IBM Spectrum Control ensures that the average number of concurrent probes is kept minimized for your environment on an ongoing basis.

Verifying that a probe is running for a resource

Verify that a probe is running for a resource to ensure that IBM Spectrum® Control is collecting asset and status information about the resource.

About this task

To verify that a probe is running for a resource, use the resource list page in the web-based GUI.

Procedure

1. From the menu bar, go to a resource list page for a resource type.
For example, to verify that a probe is running for a storage system, go to Storage and select the type of storage system you want to monitor.
2. Locate the resource that you want to check.
3. View the Probe Status column.
A value of **Successful** or **Running** indicates that the probe is collecting asset and status information about the resource. The Last Successful Probe column shows the most recent date and time when the probe successfully collected data.
4. Optional: If the Probe Status column shows a status of **Failed** or **Warning**, right-click the resource and click Data Collection > Open Probe Logs to view the messages in the log file.
5. Optional: If the Probe Status column shows a status of **Never probed**, right-click the resource and click Data Collection > Schedule to schedule a probe for the resource.

Modifying probes

Probes are data collection jobs that collect status and asset information about monitored resources in your environment. To modify a probe in IBM Spectrum® Control, use the resource list page for the monitored resource in the web-based GUI.

About this task

You can select one or more devices and modify their schedules.

Procedure

1. To modify a probe for a resource, choose one of the following options from the menu bar:

Resource	Menu bar
Block storage systems	Storage > Block Storage Systems
File storage systems	Storage > File Storage Systems
Object storage systems	Storage > Object Storage Systems
Servers	Servers > Servers
Hypervisors	Servers > Hypervisors
Switches	Network > Switches
Fabrics	Network > Fabrics

Tip: For switches, probes also collect asset and topology information about the fabrics that include those switches.

2. Locate the resources that you want to probe.
3. Select the resource rows and click Actions > Data Collection > Schedule.
4. On the Data Collection Schedule window, modify the schedule for the probes, and click Save.

For automated probes, the start time is determined by an algorithm that minimizes the number of concurrent probe jobs to avoid excessive load on the IBM Spectrum Control server. Automated probe jobs are scheduled by IBM Spectrum Control within the time interval that you defined in the Automated Probe Run Window.

If you schedule manual probes for multiple resources, a time span is calculated during which the resources are probed. The resources are probed at different times during the time span to avoid excessive load on the IBM Spectrum Control server.

The following rules determine the settings for the probe fields when you open the Data Collection Schedule window:

- The Enable Probe check box is checked by default. Uncheck this box to disable the probe operation for all selected resources.
- If all selected resources are configured with automated probe scheduling, then Automatically is selected; if all selected resources are configured with manual probe scheduling, then Manually is selected. If some resources are configured with automatic probe scheduling and some resources are configured with manual probe scheduling, then neither Automatically nor Manually is selected.

- Fields that are blank indicate that more than one value (Automatically or Manually) is used among the selected resources. If the field contains a red asterisk (*), you must set a value. If the field is blank, the existing values are preserved unless you select a new value to be applied to all of the selected resources.

Results

The probe jobs run according to the modified schedule. If you disabled the probes, IBM Spectrum Control stops collecting asset and status data for the monitored resources.

The changes that you make to the probe schedule are applied to all the resources that you select. For example, you select two servers with different probe frequency values. Probes are disabled for both servers. When you open the Data Collection Schedule window, the probe status field is set to Disabled and the frequency field is blank. You set the status field to Enabled and the frequency field to **Every 2 days**. When you click Save, the probe is enabled with the new frequency value for the two servers that you selected

Configuring alerts for probes

Configure the alert notifications that are generated if a probe fails to run.

About this task

You can define alerts for a resource if you want to be notified when the following conditions occur:

- The status of its probe is error or warning. An error status occurs when a probe did not complete and no data was collected about a resource. A warning status occurs when a probe completes, but might not have collected a complete set of data.
- A specified amount of time has passed since a probe collected data about a resource. You can use this type of alert to be notified when up-to-date configuration and status data is not being collected about a resource and its existing data might be stale.

Procedure

To define an alert for the probe that collects data about a resource, complete the following steps:

- To select a resource, choose one of the following options from the menu bar:

Resource	Menu bar
Block storage systems	Storage_> Block Storage Systems
File storage systems	Storage_> File Storage Systems
Object storage systems	Storage_> Object Storage Systems
Servers	Servers_> Servers
Hypervisors	Servers_> Hypervisors
Switches	Network_> Switches
Fabrics	Network_> Fabrics

- Right-click a resource in the list and click Edit Alert Definitions.
- To enable the Probe Status alert for an attribute, click the corresponding switch icon  and select a status to be alerted on.
You can use this alert to be notified when a probe is only collecting partial data about a resource or not collecting any data.
- To enable the Last Successful Probe alert for an attribute, click the corresponding switch icon  and specify how much time can pass before an alert is generated.
You can use this alert to be notified when up-to-date configuration and status data is not being collected about a resource and its existing data might be stale.
- Click Save.

Starting probes

Use the Start Probe action to immediately collect data about resources.

Before you begin

If a probe job is not defined for the resource, use the Schedule action to create a probe.

About this task

You can start probes for multiple resources at the same time.

Tip: When you start a probe for a switch, the probe gathers statistics about the fabric that the switch is a part of.

Procedure

- From the menu bar, go to the resource list page for a resource type.
For example, to start a probe for a storage system, go to Storage and select the type of storage system you want to monitor.
- Locate the resources that you want to probe.
- Select the resource rows and click Actions_>Data Collection_>Start Probe.
The Start Probe action is available for the resources that you select if at least one of the resources meets the following criteria:
 - A probe job is defined for the resource.
 - The probe job is enabled.
 - The probe job is not currently running.

Results

The probe status changes to Running.

Probes are started for all the resources that meet the criteria. For example, you select two storage systems, **Storage_System_a** and **Storage_System_b**. Probes are enabled for both of the storage systems and a probe is running for **Storage_System_a**. The probe is started for **Storage_System_b** when you select Start Probe. **Storage_System_a** is not affected by the action because a probe is already running for the resource.

Viewing probes for a specific resource

You can view information for specific resources on the resource details pages. For example, use the Storage Systems details page to view the date and time when data was last collected.

Procedure

1. In the menu bar in the web-based GUI, go to a type of top-level resource.
For example, if you want to view the resource information for a storage system, go to Storage and select the type of storage system you want to monitor.
2. Locate the resource that you want to view information for.
3. Right-click the resource row and select View Details.
4. In the General section of the resource details page, click Data Collection.

Results

The Data Collection pane is displayed, which contains information about the data collection jobs that are defined for the resource.

Note: To view information about rollup resources, you must be in *rollup mode*. To enter rollup mode, move the mouse pointer over the rollup icon  in the menu bar and select Enter rollup mode.

Viewing probe logs

A probe log file is created for each run of a probe on a storage resource. Probe logs include detailed information about the status, actions, and progress of a probe.

Procedure

1. In the menu bar in the web-based GUI, go to a resource list page for a resource type.
For example, to view the probe logs for a storage system, go to Storage and select the type of storage system you want to monitor.
2. Locate the resource that you want to view.
3. Right-click the resource row, and select Data Collection > Open Probe Logs.
Restriction: If you select multiple rows, the Open Probe Logs action is not available.
The Logs page opens and shows log entries for the most recent run of the probe.
4. Optional: On the Logs page, to view a previous probe log, select a log from the Select a log list.
5. Optional: To view only the log entries that have a Warning or Error status, select an option from the Show all list.
You can choose to view only entries that have the following statuses:
 -  Only error entries
 -  Only warning entries
 -  Error and warning entries
6. Optional: To view an explanation of the message that is associated with a log entry, click the link in the ID column.

What to do next

You can view the following information on the Logs page:

- The overall status of a probe. The icon that is shown in the Select a log list represents the most critical status that was generated by an action in the job run.
- The status for each probe action.
- The date and time when an action was completed. The date, time, and time zone of an action is shown in the Date and Time column.
- The description of an action.

Collecting performance data by using IBM Spectrum Control performance monitors

Before you can monitor the performance of the resources in your environment, you must collect data about those resources. IBM Spectrum® Control uses performance monitors to collect metrics for measuring the performance of storage systems and switches. Use the Performance Monitors page to view and manage performance monitors.

About this task

You must schedule and run performance monitors before you can complete other tasks, such as optimizing storage tiering, balancing pools, and running performance reports.

Before you can view performance information for resources, you must complete the following tasks:

- Add the storage system or switch for monitoring by IBM Spectrum Control.
- Schedule a performance monitor to collect performance data about the resource.
- Define a performance alert so that you are notified when the performance of a resource might represent a potential problem. For example, you can define an alert threshold that notifies you when the total I/O port rate for a storage system falls outside a specified range.

The performance information that is gathered includes metrics that measure the performance of volumes, ports, and disks. You can view performance metrics on resource list and detail pages for switches and storage systems. For example, you can view performance metrics that are related to switches in the Performance tab on the Switches page.

- [Creating performance monitors in IBM Spectrum Control](#)
Performance monitors are data collection jobs that collect metrics for measuring the performance of storage systems and switches. You can create performance monitors in IBM Spectrum Control when you add resources for monitoring or at a later time.
- [Verifying that a performance monitor is running for a resource](#)

Creating performance monitors in IBM Spectrum Control

Performance monitors are data collection jobs that collect metrics for measuring the performance of storage systems and switches. You can create performance monitors in IBM Spectrum® Control when you add resources for monitoring or at a later time.

Before you begin

To create performance monitors, you must have Administrator privileges.

About this task

To create performance monitors for resources in your environment, you can use the list and detail pages for the resources. For example, to create performance monitors for switches, use the Switches page. You can create performance monitors for multiple resources at the same time.

Restrictions:

- You can define only one performance monitor for a resource.
- You can create performance monitors for the following resources only:
 - Storage systems
 - Switches that are managed by a CIM agent

Procedure

1. From the menu bar, go to a resource list page for a resource type.
For example, to create performance monitors for storage systems, go to Storage and select the type of storage system you want to monitor.
2. Locate the resources that you want to monitor.
3. Select the resource rows and click Actions, > Data Collection > Schedule.
4. On the Data Collection Schedule window, set the performance monitors to Enabled.
You can set a performance monitor to Enabled only if the probe is set to Enabled.
5. Select the interval for the performance monitors, and click Save.
The interval represents the number of minutes over which samples of performance data are averaged. If you are creating performance monitors for multiple resources, the interval list displays the performance monitor intervals that are common to all resources.
For example, you select two storage systems. **Storage_System_a** specifies performance monitor intervals of 5 minutes, 10 minutes, and 15 minutes. **Storage_System_b** specifies intervals of 10 minutes, 15 minutes, and 20 minutes. The interval list displays intervals of 10 minutes and 15 minutes.
Restrictions:
Note the following restrictions when you create performance monitors:
 - a. If you specify a 1-minute interval for performance monitors, data collection samples might be inconsistent lengths. The inconsistent lengths occur because it might take longer than 1 minute to collect the data on some systems. The inconsistent lengths can cause the data in the historical line chart to be

misleading. This problem can also occur for the 5-minute summary chart when a 1-minute interval was specified for data collection. Check the messages in the job log to determine the length of time that data collection takes for a resource. If the data collection takes longer than 1 minute, consider changing the interval to 5 minutes. You can use a 1-minute interval when you want to troubleshoot a resource.

- b. If you specify a 1-minute interval, the amount of data that is stored in the database repository increases significantly. IBM Spectrum Control stores only 7 days of sample data that is collected at 1-minute intervals.

Results

Performance monitors are created for the resources that are selected, and that meet the criteria. For example, you select three storage systems, **Storage_System_a**, **Storage_System_b**, and **Storage_System_c**. You enable the performance monitors and set the interval field. When you click Save, performance monitors are created for **Storage_System_a** and **Storage_System_b**. **Storage_System_c** is not affected by the action because you cannot configure performance monitors for that storage system.

If a successful probe run is completed for a resource, the performance monitor runs according to the defined interval.

What to do next

To check the progress of a performance monitor, you can complete the following actions:

- From the resource list page, right-click a resource row, and select **Data Collection > Open Performance Monitor Logs**. You can view detailed informational, warning, and error messages that are related to the performance monitor. Use this information to troubleshoot any errors that might occur when the performance monitor runs.
- View the Performance Monitor Status column on the resource list page.

Verifying that a performance monitor is running for a resource

Verify that a performance monitor is running for a resource to ensure that IBM Spectrum® Control is collecting performance metrics about the resource. Use performance monitors to collect metrics about the performance of storage systems and switches.

About this task

To verify that a performance monitor is running for a resource, use the resource list page in the web-based GUI.

Procedure

1. From the menu bar, go to a resource list page for a resource type.
For example, to verify that a performance monitor is running for a storage system, go to **Storage** and select the type of storage system you want to monitor.
2. Locate the resource that you want to check.
3. View the Performance Monitor Status column.
A value of **Completed** or **Running** indicates that the performance monitor is collecting performance metrics about the resource. The **Last Successful Monitor** column shows the most recent date and time when the performance monitor successfully collected data.
4. Optional: If the Performance Monitor Status column shows a status of **Running with problems**, **Completed with warnings**, **Failed**, or **Canceled**, you can view the logs to troubleshoot the error or warning messages. To view the performance monitor logs, right-click the resource row and click **Data Collection > Open Performance Monitor Logs**.
5. Optional: If the Performance Monitor Status column shows a status of **Disabled**, to enable the performance monitor for the resource, right-click the resource row and click **Data Collection > Schedule**. On the **Data Collection Schedule** page, select **Enabled**.
Tip: You can set the performance monitor to **Enabled** only if the probe is set to **Enabled**. If a probe is set to **Disabled**, the performance monitor cannot run.

Modifying performance monitors

To modify all of the performance monitors that are used by IBM Spectrum® Control, use the **Performance Monitors** page in the web-based GUI. To modify performance monitors for specific resources, use the resource list and resource detail pages.

Before you begin

To modify performance monitors, you must have Administrator privileges.

About this task

You can modify the schedule for multiple performance monitors at the same time.

You can enable or disable performance monitors and modify the interval. The interval represents the number of minutes over which samples of performance data are averaged.

Procedure

1. In the menu bar in the web-based GUI, go to Home > Performance Monitors.
Detailed information about all performance monitors is shown in the Performance Monitors tab.
 2. Locate the performance monitors that you want to modify.
 3. Select the performance monitor rows and click Actions > Schedule.
 4. On the Data Collection Schedule window, modify the schedule for the performance monitors.
If you select multiple performance monitors, the following rules are used to determine the field settings when you open the Data Collection Schedule window:
 - If all of the performance monitors that you select are enabled, the Enabled value is displayed. If all of the performance monitors are disabled, the Disabled value is displayed. Otherwise, the state field for the performance monitors is blank.
 - If the performance monitors have different interval values, the interval field is blank. If the performance monitors have the same interval value, the value is displayed.Intervals that are common to all performance monitors that you select are displayed in the interval list. For example, you select performance monitors for two storage systems. **Storage_System_a** specifies performance monitor intervals of 5 minutes, 10 minutes, and 15 minutes. **Storage_System_b** specifies intervals of 10 minutes, 15 minutes, and 20 minutes. The interval list displays intervals of 10 minutes and 15 minutes.
5. Click Save.

Results

The changes are applied to all the performance monitors that are selected. The performance monitors run according to the modified schedule. If you disabled a performance monitor, IBM Spectrum Control stops collecting performance metrics for the storage system or switch.

What to do next

- To check the progress of the performance monitors, you can complete the following actions on the Performance Monitors page:
- View information such as the status of the performance monitor and the most recent date and time when performance data was collected about a resource.
 - Right-click the performance monitor row, and select Open Logs. You can view detailed informational, warning, and error messages that are related to the performance monitor job. Use this information to troubleshoot any errors that might occur when the job runs.

Configuring alerts for performance monitors

Configure the alert notifications that are generated if a performance monitor fails to run.

About this task

- You can define alerts for a storage system or switch if you want to be notified when the following conditions occur:
- The status of its performance monitor is error or warning. An error status occurs when a performance monitor did not complete and no performance data was collected about a resource. A warning status occurs when a performance monitor completes, but might not have collected a complete set of performance data.
 - A specified amount of time has passed since a performance monitor collected data about a resource. You can use this type of alert to be notified when up-to-date performance data is not being collected about a resource and its existing data might be stale.

Procedure

- To define an alert for the probe that collects data about a resource, complete the following steps:
1. To select a resource, choose one of the following options from the menu bar:

Resource	Menu bar
Block storage systems	Storage > Block Storage Systems
File storage systems	Storage > File Storage Systems
Switches	Network > Switches
 2. Right-click a resource in the list and click Edit Alert Definitions.
 3. To enable the Performance Monitor Status alert for an attribute, click the corresponding switch icon  and select a status to be alerted on.
You can use this alert to be notified when a performance monitor is only collecting partial data about a resource or not collecting any data.
 4. To enable the Last Successful Monitor alert for an attribute, click the corresponding switch icon  and specify how much time can pass before an alert is generated.
You can use this alert to be notified when up-to-date performance data is not being collected about a resource and its existing data might be stale.
 5. Click Save.

Starting and stopping performance monitors

To start or stop performance monitors for storage systems and switches, use the Performance Monitors page in the GUI.

Before you begin

To start or stop performance monitors, you must have Administrator privileges.

About this task

You can start or stop performance monitors for multiple resources at the same time.

Restriction: A successful probe must be completed on the resource before a performance monitor can start. If a successful probe is not run, you cannot start the performance monitor for the resource.

Procedure

1. In the menu bar in the GUI, go to Home > Performance Monitors.
2. Click the Performance Monitors tab.
3. Locate the performance monitors that you want to start or stop.
4. Select the performance monitor rows and click Actions > Start or Actions > Stop.

Results

Performance monitors are started or stopped for all the resources that meet the criteria. For example, you select two storage systems, **Storage_System_a** and **Storage_System_b**. Performance monitors are enabled for the storage systems and both resources are probed. A performance monitor is running for **Storage_System_a** but not for **Storage_System_b**. The performance monitor is started for **Storage_System_b** when you select Start. **Storage_System_a** is not affected by the action because a performance monitor is already running for the resource.

Starting or stopping a performance monitor has the following effects:

Start

Starting a performance monitor starts the immediate collection of data from the monitored resource. The status of the performance monitor changes to Running.

Stop

Stopping a performance monitor stops the collection of performance data from the resource. If a performance monitor is running, it stops. Performance data is not collected from the resource until you restart the performance monitor. The status of the performance monitor changes to Canceled.

What to do next

To check the progress of the performance monitor, you can complete the following actions on the Performance Monitors page:

- View information such as the status of the performance monitor and the percentage of data collections that succeeded during the most recent 24 hours when the performance monitor was active.
- Right-click the performance monitor row, and select Open Logs. You can view detailed informational, warning, and error messages that are related to the performance monitor. Use this information to troubleshoot any errors that might occur when the performance monitor runs.

Viewing performance monitors

To view all of the performance monitors that IBM Spectrum® Control uses to collect metrics for measuring the performance of resources, use the Performance Monitors page. To view the performance monitors for specific resources, use resource list and resource details pages.

- [Viewing all performance monitors](#)
To view all of the performance monitors that IBM Spectrum Control uses to collect metrics for measuring the performance of storage systems and switches, use the Performance Monitors page.
- [Viewing performance monitors for specific resources](#)
To view the performance monitors for specific storage systems and switches, use the resource detail pages in the web-based GUI. For example, use the Storage Systems detail page to view performance monitor information for a specific storage system.
- [Viewing performance monitors logs](#)
Use performance monitor logs to view detailed information about the status, actions, and progress of a performance monitor. You can use this information to troubleshoot any errors that might occur when a performance monitor is running.

Viewing all performance monitors

To view all of the performance monitors that IBM Spectrum® Control uses to collect metrics for measuring the performance of storage systems and switches, use the Performance Monitors page.

About this task

The Performance Monitors page displays one row for each storage system or switch that IBM Spectrum Control is monitoring. If a performance monitor is not scheduled for a resource, the status column is set to Disabled for the performance monitor row.

Before IBM Spectrum Control can collect performance metrics for a resource, the resource must fulfill the following conditions:

- A probe must be run for the resource.
- For switches, the switch must be managed by a CIM agent.

Procedure

1. In the menu bar, go to Home > Performance Monitors.
On the Performance Monitors tab, the information about performance monitors is organized into columns. These columns include the status of performance monitors, the names of the monitored resources, and the most recent dates and times when data was successfully collected.
2. Optional: View the status icons at the top of the page to view a summary of performance monitor statuses.
This summary includes the number of performance monitors that have a Running, Running with problems, Failed, or Not Running status.

Viewing performance monitors for specific resources

To view the performance monitors for specific storage systems and switches, use the resource detail pages in the web-based GUI. For example, use the Storage Systems detail page to view performance monitor information for a specific storage system.

About this task

If performance monitor information is not displayed on the resource detail page, this indicates that the resource does not support the collection of performance metrics by IBM Spectrum® Control.

Procedure

1. In the menu bar in the web-based GUI, go to a type of top-level resource.
For example, if you want to view the performance monitor for a storage system, go to Storage and select the type of storage system you want to monitor.
2. Right-click a resource in the list, and select View Details.
The resource detail page is displayed.
In the General section, the number next to Data Collection represents the number of data collection jobs that are associated with the resource. For example, Data Collection (2) indicates that you can view a performance monitor and a probe for the resource.

The icon next to the Data Collection link represents the most critical status of the data collection jobs that are associated with the resource. For example, if a job failed, the following icon is shown:

Data Collection (2) 
3. In the General section, click Data Collection to view information about the performance monitor for the switch or storage system.
On the Data Collection pane, you can view information such as the status of the most recent run of a performance monitor, the performance monitor interval, and the most recent data and time that data was successfully collected.
Tip: You can use the columns on the resource list pages to view information about the performance monitors that are defined for storage systems or switches. For example, use the Storage Systems page to view performance monitor information for storage systems.

Viewing performance monitors logs

Use performance monitor logs to view detailed information about the status, actions, and progress of a performance monitor. You can use this information to troubleshoot any errors that might occur when a performance monitor is running.

About this task

Performance monitor logs contain informational, warning, and error messages that are related to each action that is taken during the processing of a performance monitor.

Procedure

1. In the menu bar in the web-based GUI, go to Home > Performance Monitors.
2. In the Performance Monitors tab, locate the performance monitor that you want to view.
3. Right-click the performance monitor row, and select Open Logs.
Restriction: If you select multiple rows, the Open Logs action is not available.
The Logs page opens and shows log entries for the most recent performance monitor log. A new log file is created when you stop and restart a performance monitor.
4. Optional: On the Logs page, to view a previous performance monitor log, select a log from the Select a log list.
5. Optional: To view only the log entries that have a Warning or Error status, select an option from the Show all list.
You can choose to view only entries that have the following statuses:
 -  Only error entries
 -  Only warning entries
 -   Error and warning entries
6. Optional: To view an explanation of the message that is associated with a log entry, click the link in the ID column.

Results

The information on the Logs page is automatically updated every 30 seconds. New entries are added to the end of a log. You can view the following information on the Logs page:

- The overall status of a performance monitor. The icon that is shown in the Select a log list represents the most critical status that was generated by an action in the job run.
- The status for each performance monitor action.
- The date and time when an action was completed. The date, time, and time zone of an action is shown in the Date and Time column.
- The ID of the message that is associated with an action. You can click the value in the ID column to view more information about a message.
- The description of an action.

Tip: You can use the navigation and search functions of the web browser to locate information on the page.

Collecting information about shares on storage systems

To collect information about shares in file systems, you must modify the TPCD.config file. When you provision shares, you can then view such information as the name of the share, the name of the file system, and the protocols that are used to share files.

About this task

Set the `saveNonRoot` parameter to `saveNonRoot=1` in the TPCD.config file to view the information that is collected about shares in the GUI.

Procedure

1. Open the TPCD.config file.

For Windows operating systems:

By default, the TPCD.config file is in the `installation_dir\data\config\` directory.

For Linux® or UNIX operating systems:

By default, the TPCD.config file is in the `installation_dir/data/config/` directory.

Where `installation_dir` is where IBM Spectrum® Control is installed.

2. In the **[server]** section of the TPCD.config file, change the value of the `saveNonRoot` parameter to 1 as shown in the following example:

```
saveNonRoot=1
```

3. Save the TPCD.config file.
4. Restart the Data server.

Results

When you provision new shares, you can view information about the shares on the Provisioning task page in the GUI. On the Shares page, you can view more information about shares, for example, the servers that have access to the share.

Collecting information about the sizes of snapshots in IBM Spectrum Scale

By default, IBM Spectrum® Control does not collect information about the size of GPFS snapshots in IBM Spectrum Scale. To view that information, you must enable IBM Spectrum Control to collect information about the size of snapshots.

About this task

Restriction: When you enable data to be collected about the size of GPFS snapshots, the collection might put a significant load on the IBM Spectrum Scale cluster during the probe. This load might affect other applications that use the same cluster.

Procedure

1. Run the following command to set the `Probe.GetGPFSnapshotSize` property for the Device server to true:

```
tpctool setdscfg -user user_ID -pwd password -url localhost:9550  
-property Probe.GetGPFSnapshotSize true
```

Where `user_ID` is an IBM Spectrum Control user ID and `password` is the password for the IBM Spectrum Control user ID.

2. Restart the IBM Spectrum Control Device server and the web server.

Alerting

Specify conditions that trigger alerts and the actions to take when those alerts are triggered, such as notify an email address. Use alert policies to define those alert conditions and notification settings for a group of resources.

Alerting functions examine the attributes, capacity, and performance of resources. If the conditions that are defined for alerts are met, the actions that are specified for the alert are taken. Typically, the actions include sending a notification. For example, if the status of a SAN Volume Controller storage system changes to Error, an alert is displayed in the Alerts page in the GUI, and an email might be sent to a storage administrator.

You can manage alerts in your storage environment in the following ways:

- Use alert policies to manage the alert definitions and notification settings that apply to different sets of resources. For example, you can use one alert policy for the servers in your test environment, and another for the servers in your production environment. Here are some important points about alert policies:
 - Alert policies manage one type of resource only. For example, if you have SAN Volume Controller and FlashSystem 900 storage systems in your storage environment, you cannot have both types of resource in one alert policy.
 - A resource can be managed by only one alert policy.
 - When you add a resource to be monitored by IBM Spectrum® Control, it is added to a default alert policy automatically. However, default alert policies are not provided for agentless servers.
 - If a resource is managed by a policy, the resource cannot have alert definitions and notification settings that are independent of the policy. The alert definitions and notification settings that apply to the resource come from the policy.

- It is not a requirement for resources to be managed by an alert policy. A resource can have its own alert definitions and notification settings, independent of an alert policy.
 - When you add a resource to be monitored by IBM Spectrum Control, it is added to a default alert policy automatically.
 - Default policies with alerts already configured are available. You can create copies of the default policies and assign resources to the new policies. Your alerts are configured with the default settings.
 - If you add a resource to a policy, any existing alert definitions for the resource are replaced by the alert definitions in that policy. You can't restore the original alert definitions for a resource after you move it into the policy.
To store a copy of the original alert definitions for a resource before you move it into a policy, create a policy based on the alert configuration of the resource. Then, move the resource to another policy. If you want to reapply the original alert definitions later, you can add the resource to the policy with the original alert configuration.
- Define alert conditions and notification settings for individual resources. It is not a requirement for resources to be managed by an alert policy. A resource can have its own alert definitions and notification settings, independent of an alert policy.
 - Define alerts and notification settings for applications and general groups. Use applications or general groups to manage alerts for groups of resource components such as volumes or pools. For example, you might want to define alerts on the response time for volumes in an application, depending on the response time requirements of the application. In this case, it is not useful to configure volume response time thresholds for the entire storage system because the storage system might serve many different applications with different needs.
 - [How alerts work](#)
Alerting functions examine the attributes, capacity, and performance of resources. If the conditions that are defined for alerts are met, the actions that are specified for the alert are taken. Typically, the actions include sending a notification. For example, if the status of a SAN Volume Controller storage system changes to Error, an alert is displayed in the Alerts page in the GUI, and an email might be sent to a storage administrator.
 - [Viewing and administering alerts](#)
View and administer the alert that were detected on monitored resources, applications, and general groups.
 - [Viewing and administering alert definitions](#)
View and administer the alert definitions and notification settings for alert policies, resources, applications, and general groups.
 - [Alert policies](#)
Use the Alert Policies page as a central location to view and manage all your alert policies.
 - [Defining notification settings for alerts](#)
You can define the alert notification settings to determine the actions that are taken when alert conditions are detected for a resource. The settings are applied to all of the alert definitions that are specified for the resource.
 - [Alert severities](#)
IBM Spectrum Control determines the severity of alert conditions that it detects on monitored resources. Use the severity level to help determine the priority in which you resolve alerts.
 - [Defining alerts](#)
Define how and when you are alerted to changes in your storage environment. You can define alerts for alert policies, for individual resources, or for sets of resources that are included in an application or general group.
 - [Configuring alert notifications](#)
Alerts can define notification actions that send email, generate Simple Network Management Protocol (SNMP) traps, or generate IBM® Tivoli® Netcool®/OMNIBus events. To enable these notification actions, you must configure IBM Spectrum Control for email, SNMP, or Tivoli Netcool/OMNIBus alert notifications.
 - [Triggering conditions for alerts](#)
Define alerts so that IBM Spectrum Control automatically notifies you when certain conditions or events are detected on monitored resources. Such conditions are the *triggering conditions* for the alert. The specific conditions that can trigger alerts depend on the type of resource that is being monitored.
 - [Alert notifications and actions](#)
Specify how you are notified when alert conditions are detected on resources, and define actions to take as a result of those alerts. These settings are defined globally for all resources, and can be overridden for a specific alert definition, for all alert definitions that apply to a specific resource, or for an alert policy.

How alerts work

Alerting functions examine the attributes, capacity, and performance of resources. If the conditions that are defined for alerts are met, the actions that are specified for the alert are taken. Typically, the actions include sending a notification. For example, if the status of a SAN Volume Controller storage system changes to Error, an alert is displayed in the Alerts page in the GUI, and an email might be sent to a storage administrator.

Triggering conditions for alerts

[Learn more](#) about the conditions that can trigger alerts for each type of resource.

Event processing

Conditions that generate alerts are detected during data collection and event processing. By default, probes collect storage system data once every 24 hours. For some storage systems such as IBM Spectrum Accelerate and the XIV®, events are polled every minute from the resource. For IBM Spectrum Scale, status change events are polled frequently, typically within minutes. For other resources, events are subscription-based, where the resource itself or a data source such as a CIM agent sends the events to IBM Spectrum Control when conditions change on the resource.

Examples of storage systems that use subscription-based event processing include SAN Volume Controller and IBM FlashSystem® devices that run IBM Spectrum Virtualize. For these storage systems, a probe is automatically run when many events are received from the storage system in a short time period. To avoid performance bottlenecks, probes are run only every 20 minutes.

Determining which type of alert to use

To determine whether to define alerts in alert policies, for individual resources, or for the set of resources that are included in an application or general group, follow these guidelines:

Which type of alerts to use?	Scenario	 Learn more
Alerts defined in alert policies	You want to manage alert conditions and notification settings for a group of resources of the same type. For example, if you have several SAN Volume Controller storage systems in your environment, you can create an alert policy so that the alert definitions are the same for all of the SAN Volume Controller systems. If you have some SAN Volume Controller systems in a test environment, and some in a production environment, you can use one alert policy for the test environment, and another for the production environment.	<ul style="list-style-type: none"> • Alerts and alert policies
Resource alerts	You want to receive alert notifications about changes for a specific resource, or its internal resources. For example, for a storage system, you can alert on the attributes of the system itself, and on the attributes of its volumes, pools, ports, and other internal resources. If you define an alert for a resource, for example, a performance alert for the ports on a storage system, the alert threshold value applies to all of the ports on the storage system. You cannot apply different alert thresholds to internal resources of the same type on a resource.	<ul style="list-style-type: none"> • Defining alert definitions for performance changes • Defining custom alerts for resources
Application alerts	Use application alerts in the following scenarios: <ul style="list-style-type: none"> • You want to receive alert notifications for all the resources of a certain type in an application. For example, if your application uses multiple storage systems, you can define the storage system alerts once for the application and the alerts apply to all the storage systems. If you later add more storage systems to the application, the existing application alerts apply to those storage systems also. • You want to apply different thresholds to internal resources of the same type on a storage system. For example, you have production applications and test applications that use volumes on a SAN Volume Controller. The production applications require response times of 6 milliseconds or less while the test applications can tolerate response times up to 30 milliseconds. You can use application alerts to set separate response time thresholds for volumes used by the different applications, depending on the needs of that application. 	<ul style="list-style-type: none"> • Application alerts for performance metrics • Defining custom alerts for applications
General group alerts	Use general group alerts in the following scenarios: <ul style="list-style-type: none"> • You want to receive alert notifications about changes for a subset of the resources of a particular type. For example, you can detect when the ports that are used for replication on your SAN Volume Controller have insufficient buffer-to-buffer credit. Alert notifications are not generated for ports that are not used for replication. • You want to receive alert notifications about changes for a group of resources that are logically related. You can group all the storage systems at a specific location or all the servers that use a particular operating system. For example, you can receive alert notifications when the used capacity of any of your Linux® servers exceeds 80%. 	<ul style="list-style-type: none"> • General group alerts for performance metrics • Defining custom alerts for general groups

Tip: If a resource is in both an alert policy and a general group, the alert definitions for both the policy and the group are applied.

Viewing and administering alerts

View and administer the alert that were detected on monitored resources, applications, and general groups.

Table 1. Viewing and administering alerts

Actions	Steps
Remove alerts.	<ol style="list-style-type: none"> 1. For resources, go to the resource list page for the resource. For applications, go to Groups > Applications. For general groups, go to Groups > General Groups. 2. Right-click a resource, application, or general group and click View Details. 3. Click Alerts in the General section. 4. Right-click one or more alerts and click Remove alerts. 5. Click Remove. <p>To remove all alerts go to Home > Alerts, and then click Remove all alerts in the Actions menu.</p>
Acknowledge alerts.	<ol style="list-style-type: none"> 1. For resources, go to the resource list page for the resource. For applications, go to Groups > Applications. For general groups, go to Groups > General Groups. 2. Right-click a resource, application, or general group and click View Details. 3. Click Alerts in the General section. 4. Double-click the alert then click Acknowledge in the alert details pane. 5. To acknowledge multiple alerts, press Ctrl and click the alerts. Right-click the alerts and click View Alerts. Review the summary details of the alerts in the details pane, then click Acknowledge. <p>To acknowledge all alerts, go to Home > Alerts, and then click Acknowledge all alerts in the Actions menu.</p>

Click the check mark to remove the check mark from the alert definition. 5. Click Save Changes.

Alert policies

Use the Alert Policies page as a central location to view and manage all your alert policies.

To view the Alerts Policies page, click Settings > Alert Policies.

The Alert Policies page lists the default policies for your monitored resources and custom policies that you create. The page shows the following information for each alert policy:

- The types of resource that are allowed in the policy.
- The number of resources that are managed. To see which policies you are using, you can sort the list of policies by the number of resources.
- The number of alerts that are defined.
- Any email addresses that are specified to be notified about alerts instead of the default policy contacts.

You can manage the alert definitions and notification settings of the following types of resource using policies:

- Block storage systems
- File storage systems
- Object storage systems
- Hypervisors
- Switches
- Fabrics
- Servers

Here are some important points about alert policies:

- Alert policies manage one type of resource only.
- A resource can be managed by only one alert policy.
- It is not a requirement for resources to be managed by an alert policy. A resource can have its own alert definitions and notification settings, independent of an alert policy.
- If a resource is managed by a policy, the resource cannot have alert definitions and notification settings that are independent of the policy. The alert definitions and notification settings that apply to the resource come from the policy.
- When you add a resource to be monitored by IBM Spectrum® Control, it is added to a default alert policy automatically.
- Default policies with alerts already configured are available. You can create copies of the default policies and assign resources to the new policies. Your alerts are configured with the default settings.
- If you add a resource to a policy, any existing alert definitions for the resource are replaced by the alert definitions in that policy. You can't restore the original alert definitions for a resource after you move it into the policy.
To store a copy of the original alert definitions for a resource before you move it into a policy, create a policy based on the alert configuration of the resource. Then, move the resource to another policy. If you want to reapply the original alert definitions later, you can add the resource to the policy with the original alert configuration.

The Resources by Policy page lists the resources and the policies that manage the resources.

Tips:

- If you have both Cisco and Brocade switches in your storage environment, you can manage the alert definitions for the different types of switch with different policies. Create the policies from the existing alert definitions in your switches. Alternatively, create copies of the default switch policy and edit the definitions to suit your requirements.
- Default alert policies are not provided for agentless servers.

[Video] How to create alert policies

Watch a short video about how create an alert policy and view alert notifications in IBM® Storage Insights Pro.

Defining notification settings for alerts

You can define the alert notification settings to determine the actions that are taken when alert conditions are detected for a resource. The settings are applied to all of the alert definitions that are specified for the resource.

Procedure

1. To define notification settings for alerts, choose one of the following options:

Option	Steps
--------	-------

Option	Steps
Define notification settings for alerts in a policy	a. Go to Settings > Alert Policies. b. Double-click the policy. c. Click Edit Policy Notifications.
Define notification settings for alerts for a resource that is not managed by a policy	a. Go to the resource list page for the resource. For example, to modify notification settings for alerts for a block storage system, go to Storage > Block Storage Systems. To modify notification settings for a switch, go to Network > Switches. b. Right-click the resource for which you want to define alerts, then click View Alert Definitions. c. Click Edit Notifications in the Resource Notifications area.

2. If you want to send email notifications of alert violations, enter the email addresses in the Email Addresses field.

Tip: If you enter an email address in the Email Addresses field, only that email address receives notifications for the alert. The following contacts do not receive notifications:

- Any email addresses that are specified as policy contacts, if the alert is in an alert policy.
- Any global email addresses that are specified for alert notifications. To view the global alert notification addresses, go to Settings > Notification Settings.

3. To specify other notification actions, click the switch icon  for the type of action. Enter any details required for the action.

You can specify that the following notification actions are taken when alert conditions are detected on monitored resources:

Run script

Run a script when an alert is triggered for the condition. Use a script to call external programs or run commands that take action as the result of an alert. By using a script, you can automatically address potential storage issues when they are detected to avoid unplanned downtime or performance bottlenecks.

[Learn more.](#)

Restriction: You can only specify to run a script for an individual alert; you cannot specify to run a script for all alerts in an alert policy.

SNMP

Generate SNMP trap messages to any network management station (NMS), console, or terminal when an alert condition is detected. System administrators must set up their SNMP trap ringer with the provided management information base (MIB) files to receive SNMP traps from the product.

Netcool® / OMNIBus

Send alert notifications to a Netcool server or OMNIBus EIF probe server within your environment that was configured to receive IBM Spectrum Control alerts.

Windows event log or UNIX syslog

Write alert messages to the OS log. If you already have an administrator monitoring OS logs, this method is a way to centralize your priority messages for quick notification and viewing.

4. Click Save Changes.

Alert severities

IBM Spectrum® Control determines the severity of alert conditions that it detects on monitored resources. Use the severity level to help determine the priority in which you resolve alerts.

Each severity is represented by an icon in the web-based GUI.

Icon	Status	Description
	Critical	An alert with a Critical severity represents a serious problem on a resource or on its internal resources. Resolve these problems as soon as possible. Review the condition that triggered an alert for more information about the problem.
	Critical - Acknowledged	An alert with a Critical severity was acknowledged. A Critical - Acknowledged severity indicates that an alert was reviewed and is either resolved or can be ignored.
	Warning	An alert with a Warning severity represents potential problems on a resource or on its internal resources. Resolve these problems after you fix any critical alerts. Review the condition that triggered an alert for more information about the problem.
	Warning - Acknowledged	An alert with a Warning severity was acknowledged. A Warning - Acknowledged severity indicates that an alert was reviewed and is either resolved or can be ignored.
	Informational	An alert with an Informational severity does not represent a problem, but is intended to provide information about actions related to a resource.
	Informational - Acknowledged	An alert with an Informational severity was acknowledged. An Informational - Acknowledged severity indicates that an alert was reviewed and can be ignored.

Defining alerts

Define how and when you are alerted to changes in your storage environment. You can define alerts for alert policies, for individual resources, or for sets of resources that are included in an application or general group.

Before you begin

Configure IBM Spectrum® Control to send alert notifications by using email, SNMP traps, or a Tivoli® Netcool®/OMNIBus server.

- [Defining alerts for resources](#)**
Define alerts for changes in the configuration, attributes, and performance of monitored resources.
- [Defining alerts for applications](#)**
Define alerts for changes in the configuration, attributes, and performance of the servers , volumes, filesets, and shares in your application.
- [Defining alerts for general groups](#)**
Define alerts for changes in the configuration, attributes, and performance of the resources in your general groups.

Defining alerts for resources

Define alerts for changes in the configuration, attributes, and performance of monitored resources.

- [Defining alert definitions for general attributes and capacity changes](#)
You can define alerts that are triggered when the attributes or capacity of a resource changes. Attributes represent the key properties and configuration of a resource, such as status, versions, removals, discoveries, and data collection status. Capacity represents storage statistics such as available capacity, used capacity, drive capacity, reserved capacity, and more.
- [Defining alert definitions for performance changes](#)
You can define alerts that are triggered when the performance of a resource falls outside a specified threshold.
- [Defining custom alerts for resources](#)
You can define alerts that are triggered when two or more changes occur in the attributes, capacity, and performance of resources.

Defining alert definitions for general attributes and capacity changes

You can define alerts that are triggered when the attributes or capacity of a resource changes. Attributes represent the key properties and configuration of a resource, such as status, versions, removals, discoveries, and data collection status. Capacity represents storage statistics such as available capacity, used capacity, drive capacity, reserved capacity, and more.

About this task

Asset, capacity, and configuration metadata are aggregated and collected when probes collect the metadata from the resources. By default, the metadata that is collected from storage systems is refreshed every 24 hours. Define alerts to track daily changes to the attributes of a storage system.

Procedure

1. To define alerts for resources, choose one of the following options:

Option	Steps
Define alerts for a policy	<ol style="list-style-type: none"> a. Go to Settings > Alert Policies. b. Double-click the policy. c. Click Edit Alert Definitions on the Alert Definitions tab.
Define alerts for a resource that is not managed by a policy	<ol style="list-style-type: none"> a. Go to the resource list page for the resource. For example, to define alerts for a block storage system, go to Storage > Block Storage Systems. To define alerts for a switch, go to Network > Switches. b. Right-click the resource for which you want to define alerts, then click View Alert Definitions. c. Click Edit Alert Definitions.

2. Click the type of resource that you want to alert on. For example, click Storage System.

3. Click the category of the attributes that you want to alert on.

Category	Description
General	Attributes for the key properties of a resource, such as status, version changes, removals, discoveries, state, and data collection status.
Capacity	Attributes for capacity statistics of a resource, such as available capacity, used capacity, drive capacity, reserved capacity, and more.

Restriction: Not all categories are available for some resources.

4. To enable the alert for an attribute, click the check mark for the attribute.
The advanced options for the alert, such as notification frequency, are displayed.
5. Specify the conditions for generating an alert for an attribute.
Conditions can include operators such as >=, or <=. Conditions can also include storage values and time values.
For example, for a capacity attribute such as Available Capacity, you can specify that an alert is generated when the amount of available capacity on a resource's pools is less than or equal to 50 GiB.

☒ Available Capacity

Operator	Value	Unit
<=	50	GiB

Tips:

- Not all attributes require conditions to generate an alert. For example, you can enable an alert for the Deleted Volume attribute, but you don't need to specify any conditions.
 - Some attributes use operators such as *is*, *is not*, *contains*, and *changes*. For example, for the Firmware attribute for a DS8000® you can select the operator Contains and enter R5 in the value field. An alert is triggered if the firmware is at the R5 level rather than at a later version such as R6.1, R6.2, or R6.3. You can use this alert definition if you want to be notified when the firmware for a storage system is reverted to a previous version.
6. Assign a severity to an alert.

Assigning a severity can help you more quickly identify and address the critical conditions that are detected on resources. The severity that you assign depends on the guidelines and procedures within your organization. Default assignments are provided for each alert.

Option	Description
 Critical	Alert is critical and needs to be resolved. For example, alerts that notify you when the amount of available capacity on a file system falls below a specified threshold.
 Warning	Alerts that are not critical, but represent potential problems. For example, alerts that notify you when the status of a data collection job is not normal.
 Informational	Alerts that might not require any action to resolve and are primarily for informational purposes. For example, alerts that are generated when a new pool is added to a storage system.

7. Optional: If you want to send email notifications of alert violations to contacts other than the policy contacts or global alert notification addresses, enter the email addresses in the Email Override field.
Tip: If you enter an email address in the Email Override field, only that email address receives notifications for the alert. The following contacts do not receive notifications:
 - Any email addresses that are specified as policy contacts, if the alert is in an alert policy.
 - Any global email addresses that are specified for alert notifications. To view the global alert notification addresses, go to [Settings > Notification Settings](#).
8. Optional: Click View Additional Options to specify how frequently you are notified of alerts.
Use these settings to avoid triggering too many alerts for some conditions.
9. Optional: Click View Additional Options to specify that the following actions are taken when alert conditions are detected on monitored resources:

Run script

Run a script when an alert is triggered for the condition. Use a script to call external programs or run commands that take action as the result of an alert. By using a script, you can automatically address potential storage issues when they are detected to avoid unplanned downtime or performance bottlenecks.

[Learn more](#)

Netcool® / OMNIBus

Send alert notifications to a Netcool server or OMNIBus EIF probe server within your environment that was configured to receive IBM Spectrum Control alerts.

SNMP

Generate SNMP trap messages to any network management station (NMS), console, or terminal when an alert condition is detected. System administrators must set up their SNMP trap ringer with the provided management information base (MIB) files to receive SNMP traps from the product.

Windows event log or UNIX syslog

Write alert messages to the OS log. If you already have an administrator monitoring OS logs, this method is a way to centralize your priority messages for quick notification and viewing.

10. Optional: [+](#) Duplicate an alert.

Use this action when you want to define another alert for the same attribute but with different conditions and settings.

Duplicating alerts can be helpful in the following situations:

- When you want to generate separate warning alerts and critical alerts for different conditions on the same attribute.
For example, for a capacity attribute such as Available Capacity, you might want to define the following alerts:
 - Define a warning alert  to be generated when the amount of available capacity on a resource's pools is less than or equal to 50 GiB.
 - Duplicate the alert, but this time, specify a critical severity  when the amount of available capacity on a resource's pools is less than or equal to 10 GiB.
- When you want to send, alert notifications to different people based on the severity of an alert.
In the previous example for the Available Pool Space attribute, you can configure the notification settings so that warning alerts are sent to junior administrators, while critical alerts are sent to more senior administrators.

11. Click Save Changes.

Defining alert definitions for performance changes

You can define alerts that are triggered when the performance of a resource falls outside a specified threshold.

Procedure

1. To define alerts for resources, choose one of the following options:

Option	Steps
Define alerts for a policy	a. Go to Settings > Alert Policies . b. Double-click the policy. c. Click Edit Alert Definitions on the Alert Definitions tab.
Define alerts for a resource that is not managed by a policy	a. Go to the resource list page for the resource. For example, to define alerts for a block storage system, go to Storage > Block Storage Systems . To define alerts for a switch, go to Network > Switches . b. Right-click the resource for which you want to define alerts, then click View Alert Definitions. c. Click Edit Alert Definitions.

2. Click the type of resource that you want to alert on. For example, click Storage System.
3. Click the Performance category.

4. To enable the alert for a performance metric, click the check mark for the metric. If the metric that you want is not displayed, click Add Metrics then select the metric you want.
5. Specify the conditions for generating an alert.
Conditions include an operator and a threshold value.
 - a. Select an operator.
An operator determines whether an alert is triggered when the performance of a resource is *greater than or equal to* or *less than or equal to* the specified threshold value.
 - b. Enter a threshold value.
For example, to trigger an alert if the Total I/O Rate for a storage system is greater than or equal to 500 ops/s, enter the value 500.
Tips for threshold values:
 - IBM Spectrum® Control provides recommended values for threshold values that do not vary much between environments. For example, the default threshold values for Port Send Bandwidth Percentage are greater than or equal to 75% for warning alerts, and greater than or equal to 85% for critical alerts.
However, for metrics that measure throughput and response times, thresholds can vary because of workload, model of hardware, amount of cache memory, and other factors. In these cases, there are no recommended values. To help determine threshold values for a resource, collect performance data over time to establish a baseline of the normal and expected performance behavior for that resource. After you determine a set of baseline values, define alerts to trigger if the measured performance behavior falls outside the normally expected range.
 - For some metrics, lower values might indicate more stress and higher values might indicate idle behavior. For example, a lower threshold value for the Cache Holding Time Threshold metric might indicate a performance problem.
6. Optional: Click View Performance to view a chart of the performance of the resource. Use the chart to evaluate the current and historical performance of a resource to help determine the threshold value for an alert.
The chart displays a horizontal color line at the specified threshold value. The color of the line indicates the severity of the alert:
 - Critical alert: red
 - Warning alert: yellow
 - Information alert: blue

For multi-conditional alerts, the chart displays a horizontal line for each condition that shows the threshold value and severity.

To customize the chart, click Top 10 or Bottom 10 to show resources according to their performance, click a time period, and change the start and end dates for the data that is displayed.

7. Assign a severity to an alert.

Assigning a severity can help you more quickly to identify and address the critical conditions that are detected on resources. The severity that you assign depends on the guidelines and procedures within your organization. Default assignments are provided for each alert.

Option	Description
 Critical	Assign this severity to alerts that are critical and need to be resolved. For example, assign a critical severity to alerts that notify you when the Port Send Bandwidth Percentage is greater than or equal to 85%.
 Warning	Assign this severity to alerts that are not critical, but represent potential problems. For example, assign a warning severity to alerts that notify you when the Port Send Bandwidth Percentage is greater than or equal to 75% but less than 85%.
 Informational	Assign this severity to alerts that might not require any action to resolve and are primarily for informational purposes.

8. Optional: If you want to send email notifications of alert violations to contacts other than the policy contacts or global alert notification addresses, enter the email addresses in the Email Override field.
Tip: If you enter an email address in the Email Override field, only that email address receives notifications for the alert. The following contacts do not receive notifications:
 - Any email addresses that are specified as policy contacts, if the alert is in an alert policy.
 - Any global email addresses that are specified for alert notifications. To view the global alert notification addresses, go to Settings > Notification Settings.
9. Optional: Click View Additional Options to specify how frequently you are notified of alerts.
Use these settings to avoid triggering too many alerts for some conditions.
10. Optional: Click View Additional Options to specify that the following actions are taken when alert conditions are detected on monitored resources:

Run script

Run a script when an alert is triggered for the condition. Use a script to call external programs or run commands that take action as the result of an alert. By using a script, you can automatically address potential storage issues when they are detected to avoid unplanned downtime or performance bottlenecks.
[Learn more.](#)

Netcool® / OMNIBus

Send alert notifications to a Netcool server or OMNIBus EIF probe server within your environment that was configured to receive IBM Spectrum Control alerts.

SNMP

Generate SNMP trap messages to any network management station (NMS), console, or terminal when an alert condition is detected. System administrators must set up their SNMP trap ringer with the provided management information base (MIB) files to receive SNMP traps from the product.

Windows event log or UNIX syslog

Write alert messages to the OS log. If you already have an administrator monitoring OS logs, this method is a way to centralize your priority messages for quick notification and viewing.

11. Optional:  Duplicate an alert.

Use this action when you want to define another alert for the same metric but with different conditions and settings.

Duplicating alerts can be helpful in the following situations:

- When you want to generate separate warning alerts and critical alerts for different thresholds on the same metric.
For example, for the CRC Error Rate metric for ports, you might want to define the following alerts:
 - Define a warning alert  to be generated when the number of frames per second that are received with cyclic redundancy check (CRC) errors is greater than or equal to 0.01 counts per second.
 - Duplicate the alert, but this time, specify a critical severity  when the CRC error rate is greater than or equal to 0.03 counts per second.
- When you want to send alert notifications to different people based on the severity of an alert.
In the previous example for the CRC Error Rate metric, you can configure the notification settings so that warning alerts are sent to junior administrators, while critical alerts are sent to more senior administrators to resolve.

12. Click Save Changes.

Results

To view all the alerts generated by IBM Spectrum Control, go to Home > Alerts in the GUI.

Tip: If a performance monitor is already collecting data about a resource when you add, modify, or remove a performance alert for that resource, changes are applied dynamically. You do not have to stop and restart the performance monitor to apply the changes. A confirmation message is recorded in the log of the performance monitor when the alert is updated.

Defining custom alerts for resources

You can define alerts that are triggered when two or more changes occur in the attributes, capacity, and performance of resources.

About this task

To define a custom alert, select the general attributes, capacity, and performance metrics that you want to combine to trigger an alert and specify their conditions and threshold values. You can combine conditions for the resource and its internal resources into a custom alert. The alert is triggered when the conditions for the attributes and capacity of the resource are met, and the performance of the resource falls outside the threshold values.

For example, you can create a custom alert that notifies you when the overall response time for the volumes on a SAN Volume Controller system is worse than 20 milliseconds per operation *and* the system CPU utilization on the nodes on the system is greater than 70%. The Overall Response Time is a metric that measures the average number of milliseconds that it takes to service each I/O operation on a volume. The System CPU Utilization is a metric that measures the average percentage of time that the processors on nodes are busy doing system I/O tasks.

Procedure

1. To define alerts for resources, choose one of the following options:

Option	Steps
Define alerts for a policy	a. Go to Settings > Alert Policies. b. Double-click the policy. c. Click Edit Alert Definitions on the Alert Definitions tab.
Define alerts for a resource that is not managed by a policy	a. Go to the resource list page for the resource. For example, to define alerts for a block storage system, go to Storage > Block Storage Systems. To define alerts for a switch, go to Network > Switches. b. Right-click the resource for which you want to define alerts, then click View Alert Definitions. c. Click Edit Alert Definitions.

2. Click Custom.

3.  Click the create alert icon, then enter a name for the alert.

4. Assign a severity to the alert.

Assigning a severity can help you more quickly identify and address the critical conditions that are detected on resources. The severity that you assign depends on the guidelines and procedures within your organization.

Option	Description
 Critical	Assign this severity to alerts that are critical and need to be resolved. For example, assign a critical severity to alerts that notify you when the Port Send Bandwidth Percentage is greater than or equal to 85%. The default severity for custom alerts is critical.
 Warning	Assign this severity to alerts that are not critical, but represent potential problems. For example, assign a warning severity to alerts that notify you when the Port Send Bandwidth Percentage is greater than or equal to 75% but less than 85%.
 Informational	Assign this severity to alerts that might not require any action to resolve and are primarily for informational purposes.

5. Select a component, category, and group for the alert.

For example, select Storage System, Capacity, and Available Capacity.

6. To generate an alert for a general or capacity attribute, specify the conditions for the alert.

Conditions can include operators such as >=, or <=. Conditions can also include storage values and time values.

For example, for a capacity attribute such as Available Capacity, you can specify that an alert is generated when the amount of available capacity on a resource's pools is less than or equal to 50 GiB.

☒ Available Capacity

Operator	Value	Unit
<div><=</div> <div>▼</div>	<div>50</div> <div>▲</div> <div>▼</div>	<div>GiB</div> <div>▼</div>

Tips:

- Not all attributes require conditions to generate an alert. For example, you can enable an alert for the Deleted Volume attribute, but you don't need to specify any conditions.
- Some attributes use operators such as *is*, *is not*, *contains*, and *changes*. For example, for the Firmware attribute for a DS8000® you can select the operator Contains and enter R5 in the value field. An alert is triggered if the firmware is at the R5 level rather than at a later version such as R6.1, R6.2, or R6.3. You can use this alert definition if you want to be notified when the firmware for a storage system is reverted to a previous version.

7. To generate an alert for a performance metric, specify the conditions for the alert.
Conditions include an operator and a threshold value.
 - a. Select an operator.
An operator determines if an alert is triggered when the performance of a resource is *greater than or equal to* or *less than or equal to* the specified threshold value.
 - b. Enter a threshold value.
For example, to trigger an alert if the Total I/O Rate for a storage system is greater than or equal to 500 ops/s, enter the value 500.

Tips for threshold values:

 - IBM Spectrum® Control provides recommended values for threshold values that do not vary much between environments. For example, the default threshold values for Port Send Bandwidth Percentage are greater than or equal to 75% for warning alerts, and greater than or equal to 85% for critical alerts.
However, for metrics that measure throughput and response times, thresholds can vary because of workload, model of hardware, amount of cache memory, and other factors. In these cases, there are no recommended values. To help determine threshold values for a resource, collect performance data over time to establish a baseline of the normal and expected performance behavior for that resource. After you determine a set of baseline values, define alerts to trigger if the measured performance behavior falls outside the normally expected range.
 - For some metrics, lower values might indicate more stress and higher values might indicate idle behavior. For example, a lower threshold value for the Cache Holding Time Threshold metric might indicate a performance problem.
8. Optional: Click View Performance to view a chart of the performance of the resource. Use the chart to evaluate the current and historical performance of a resource to help determine the threshold value for an alert.
The chart uses colored lines to represent the different threshold values and severities that can be defined for an alert:
 - Critical alert: red
 - Warning alert: orange
 - Information alert: blue

To customize the chart, click Top 10 or Bottom 10 to show resources according to their performance, click a time period, and change the start and end dates for the data that is displayed.
9.  Duplicate an alert.
Use this action to add a second and subsequent condition to the alert.
10. Repeat steps 5 - 9 to add more conditions to the alert.
11. Optional: If you want to send email notifications of alert violations to contacts other than the policy contacts or global alert notification addresses, enter the email addresses in the Email Override field.
Tip: If you enter an email address in the Email Override field, only that email address receives notifications for the alert. The following contacts do not receive notifications:
 - Any email addresses that are specified as policy contacts, if the alert is in an alert policy.
 - Any global email addresses that are specified for alert notifications. To view the global alert notification addresses, go to Settings > Notification Settings.
12. Optional: Click View Additional Options to specify how frequently you are notified of alerts.
Use these settings to avoid triggering too many alerts for some conditions.
13. Optional: Click View Additional Options to specify that the following actions are taken when alert conditions are detected on monitored resources:

Run script
Run a script when an alert is triggered for the condition. Use a script to call external programs or run commands that take action as the result of an alert. By using a script, you can automatically address potential storage issues when they are detected to avoid unplanned downtime or performance bottlenecks.
[Learn more.](#)

Netcool® / OMNIBus
Send alert notifications to a Netcool server or OMNIBus EIF probe server within your environment that was configured to receive IBM Spectrum Control alerts.

SNMP
Generate SNMP trap messages to any network management station (NMS), console, or terminal when an alert condition is detected. System administrators must set up their SNMP trap ringer with the provided management information base (MIB) files to receive SNMP traps from the product.

Windows event log or UNIX syslog
Write alert messages to the OS log. If you already have an administrator monitoring OS logs, this method is a way to centralize your priority messages for quick notification and viewing.
14. Click Save Changes.

Results

To view all the alerts generated by IBM Spectrum Control, go to Home > Alerts in the GUI.

- [Scenarios for custom alerts](#)
Create custom alerts with one or more conditions that trigger when all the conditions are met for a given resource. By creating a custom alert, you can detect multiple configuration, capacity, and performance conditions together to determine whether an urgent situation occurred in your storage or SAN fabric.

Scenarios for custom alerts

Create custom alerts with one or more conditions that trigger when all the conditions are met for a given resource. By creating a custom alert, you can detect multiple configuration, capacity, and performance conditions together to determine whether an urgent situation occurred in your storage or SAN fabric.

The requirements of your environment determine the custom alerts that you create. For example, your storage systems might run critical production applications on tier 1 storage. In this case, you don't want the performance of the tier 1 storage to fall below a certain threshold. To be notified when that situation occurs, you can create a custom alert that checks if the overall response time of tier 1 storage is too high.

Tip: You can define alerts for storage systems, servers, hypervisors, fabrics, and switches and their internal resources. However, the resources in an alert must be along the same data path. For example, if you create an alert for a storage system volume, resources along the same data path include the pool that volume is part of, the switch

ports that are used to access that volume, and the host that maps the volume.
Use the following example scenarios as guides to help you create custom alerts for your environment.

- [Receive alerts when the response time of storage on a specific tier is too high](#)
- [Receive alerts when the response time of volumes is too high during times of active I/O](#)
- [Receive alerts when the response time of volumes is too high, but do not generate these alerts when batch and backup jobs are running](#)
- [Receive alerts if a port is being used for both inter-node communication and host I/O exchanges](#)
- [Receive alerts for link resets that are not associated with link initialization](#)
- [Receive alerts for invalid word transmissions that are not associated with link initialization](#)

Receive alerts when the response time of storage on a specific tier is too high

Your storage systems run both critical production applications and noncritical test applications. The production applications use tier 1 storage, while the test applications use storage on tiers 2 and 3.

To ensure consistent, top performance for tier 1 storage, you want to be notified when its response time is higher than 6 ms/op so that you can resolve the bottleneck. However, to avoid too many alerts, you do not want to receive notifications when the response time of tier 2 or 3 storage exceeds 6 ms/op.

Solution

Define a custom alert that checks if the volumes used by an application are in Tier 1 pools and if their Overall Response Time is higher than 6 ms/op.

For a storage system, set up a custom alert with the following attributes and conditions:

☒ High response time for tier 1 stor

Severity

ComponentCategoryAttribute

PoolsGeneralTier

ConditionValue

Is1

ComponentCategoryAttribute

VolumesPerformanceOverall Response Time

OperatorValue

>=6ms/op

Attribute	Condition
Overall Response time (Storage System > Volumes > Performance)	Greater than or equal to (>=) 6 ms/op
Tier (Storage System > Pools > General)	Tier 1

Receive alerts when the response time of volumes is too high during times of active I/O

You care about high read response times on your volumes, but they can be caused by cache misses when there is only a trickle of I/O.

Solution

Define a custom alert with volume-level thresholds that combines checks for response times and I/O.

☒ Response time with workload

Severity

ComponentCategoryAttribute

VolumesPerformanceOverall Response Time

OperatorValue

>=10ms/op

ComponentCategoryAttribute

VolumesPerformanceTotal I/O Rate - overall

OperatorValue

>=50ops/s

Attribute	Condition
Overall Response time (Storage System > Volumes > Performance)	Greater than or equal to (\geq) 10 ms/op
Total I/O Rate - overall (Storage System > Volumes > Performance)	Greater than or equal to (\geq) 50 ms/op

Receive alerts when the response time of volumes is too high, but do not generate these alerts when batch and backup jobs are running

To ensure the consistent, top performance of your volumes, you want to be notified when their response times are becoming too high. However, to avoid too many alerts, you do not want to receive notifications when batch and backup jobs are running on your storage. You understand that these jobs can cause an expected spike in response times and do not require action on your part.

Solution

Define a custom alert that checks if the Read Response Time of volumes exceeds an amount that is more than expected in your environment and the Read Transfer Size is less than 256 KiB/op. Typically, read transfer sizes greater than 256KiB/op indicate that batch or backup jobs are running in the background.

For a storage system, set up a custom alert with the following attributes and conditions:

☒ Slow performance of volumes

Severity

Component

Volumes

Read Transfer Size

Operator

\leq

Value

256

KiB/op

Attribute	Condition
Read Response Time (Custom > Volumes > Performance)	Greater than or equal to (\geq) 20 ms/op
Read Transfer Size (Custom > Volumes > Performance)	Less than or equal to (\leq) 256 KiB/op

Receive alerts if a port is being used for both inter-node communication and host I/O exchanges

You want to avoid potential bottlenecks by ensuring that storage system ports aren't being used for both inter-node communication in the local cluster and for I/O exchanges to host computers. You can also use this custom alert to check for adherence to best practices that are related to configuring ports for nodes with 8 or more ports. It does not apply to nodes that contain only 4 ports.

Solution

Define a custom alert that checks if the I/O rate for ports indicates exchanges between local nodes and hosts. For a storage system, set up a custom alert with the following attributes and conditions:

☒ Dual use ports

Severity

Component

FC Ports

Category

Performance

Attribute

Total Port to Host I/O...

Operator

\geq

Attribute	Condition
Total Port-to-Host I/O Rate (Custom > Ports > Performance)	Greater than or equal to (\geq) .01 ops/s
Total Port-to-Local Node I/O Rate (Custom > Ports > Performance)	Greater than or equal to (\geq) .01 ops/s

Tip: Optionally, you can define other custom alerts to be notified of this situation, depending on your storage requirements. For example:

Attribute	Condition
Total Port-to-Disk I/O Rate (Custom > Ports > Performance)	Greater than or equal to (\geq) .01 ops/s
Total Port-to-Local Node I/O Rate (Custom > Ports > Performance)	Greater than or equal to (\geq) .01 ops/s
Total Port-to-Remote I/O Rate (Custom > Ports > Performance)	Greater than or equal to (\geq) .01 ops/s

Receive alerts for link resets that are not associated with link initialization

You want to identify link resets that are generated in response to hardware failures or link congestion. Link Resets generated by link initialization are ignored.

Solution

Define a custom alert that checks if link resets occur and if those resets are not associated with a link initialization. For a switch, set up a custom alert with the following attributes and conditions:

☒ Link reset not initialized

Severity

Component FC Ports **Category** Performance **Attribute** Loss of Sync Rate

Operator \leq **Value** 0 cnt/s

Component FC Ports **Category** Performance **Attribute** Loss of Signal Rate

Operator \leq **Value** 0 cnt/s

Attribute	Condition
Link Reset Received Rate (Storage System > Ports > Performance)	Greater than or equal to (\geq) .01 cnt/s
OR	
Link Transmitted Received Rate (Storage System > Ports > Performance)	
Sync Loss (Storage System > Ports > Performance)	Less than or equal to (\leq) 0 cnt/s
Signal Loss (Storage System > Ports > Performance)	Less than or equal to (\leq) 0 cnt/s

Receive alerts for invalid word transmissions that are not associated with link initialization

You want to identify invalid transmission words that are generated because of poor link quality. Poor or marginal link quality can be caused by a bad SFP, HBA, or cable. Invalid transmission words that are generated by link initialization are ignored.

Solution

Define a custom alert that checks if invalid word transmissions occur and if those resets are not associated with a link initialization. For a switch, set up a custom alert with the following attributes and conditions:

☒ Invalid word transmission not ini

Defining alerts for applications

Define alerts for changes in the configuration, attributes, and performance of the servers , volumes, filesets, and shares in your application.

About this task

You can quickly identify and address the critical conditions that are detected on the servers , volumes, filesets, and shares in your application by using alerts. Application alerts can be helpful in the following situations:

- When you want to apply different thresholds to internal resources of the same type on a storage system.
For example, you have production applications and test applications that use volumes on a SAN Volume Controller. The production applications require response times of 6 milliseconds or less while the test applications can tolerate response times up to 30 milliseconds. You can use application alerts to set separate response time thresholds for volumes used by the different applications, depending on the needs of that application.
- When you want to quickly define alerts for multiple resources of the same type. You can define alerts once for the application and the alerts apply to all the resources of that type in the application.
For example, if your application uses multiple servers , you can define the servers alerts once for the application and the alerts apply to all the servers . If you later add more servers to the application, the existing application alerts apply to those servers also.

Tips for working with alerts in application hierarchies:

- When you define an application alert for a resource such as a volume, the alert applies to all the resources of that type that belong to that application and all child applications.
- If you define an application alert for a resource such as a servers , and the servers also belongs to child applications, the alert is generated once at the parent application level. Separate alerts are not generated for each of the child applications that contain the servers .
- If a child application has the same alert as a parent application but with different conditions, separate alerts are generated for the child application for the different alert conditions.
- Defining application alerts for attribute and capacity changes**
You can define alerts that are triggered when the attributes or capacity of the servers , volumes, filesets, or shares in an application change.
- Defining application alerts for performance metrics**
You can define alerts that are triggered when the performance of the volumes that belong to an application fall outside a specified threshold.
- Defining custom alerts for applications**
Define a custom alert to combine multiple conditions from multiple resources for an application in a single alert. By creating a custom alert, you can analyze multiple configuration, capacity, and performance conditions together to determine whether an urgent situation occurred on the servers, volumes, filesets, and shares in an application.

Related concepts

- [Applications](#)

Defining application alerts for attribute and capacity changes

You can define alerts that are triggered when the attributes or capacity of the servers , volumes, filesets, or shares in an application change.

About this task

Attributes represent the key properties and configuration of a resource, such as status, removals, discoveries, and data collection status. Capacity represents storage statistics such as available and used file system capacity, drive capacity, and volume used capacity.

Procedure

To define an application alert for attribute and capacity changes, complete these steps:

1. In the menu bar, select Groups, Applications.
2. Right-click an application in the list and click View Alert Definitions.
3. Click Edit Alert Definitions.
4. Click the type of resource that you want to set an alert for. You can set an alert for one or more of the attributes of servers , volumes, filesets, or shares.
5. Click the category of the attributes that you want to set an alert for.

Category	Description
General	Attributes for the key properties of a resource, such as status, removals, discoveries, and data collection status.
Capacity	Attributes for capacity statistics of a resource, such as used capacity, available file system capacity, drive capacity, and volume used capacity.

6. To enable the alert for an attribute, click the check mark for the attribute.
7. Specify the conditions for generating an alert for an attribute.
Conditions can include operators such as *greater than or equal to*, or *less than or equal to*. Conditions can also include storage values and time values.
For example, for a capacity attribute such as Available Capacity, you can be alerted when the amount of available capacity on a volume is less than or equal to 50 GiB.

☒ Available Capacity

Operator	Value	Unit
<div><=</div>	<div>50</div>	<div>GiB</div>

Tip: Not all attributes require conditions to generate an alert. For example, you can enable an alert for the New Fileset attribute for an IBM Spectrum Scale, but you don't need to specify any conditions.

8. Assign a severity to an alert to help you more quickly identify and address the critical conditions that are detected on resources.
The severity that you assign depends on the guidelines and procedures within your organization. Default assignments are provided for each alert.

Option	Description
 Critical	Assign this severity to alerts that are critical and must be resolved. For example, assign a critical severity to alerts that notify you when the amount of available capacity on a file system falls below a specified threshold.
 Warning	Assign this severity to alerts that are not critical, but represent potential problems. For example, assign a warning severity to alerts that notify you when the status of a data collection job is not normal.
 Informational	Assign this severity to alerts that might not require any action to resolve and are primarily for informational purposes. For example, assign an informational severity to alerts that are generated when a new fileset is added to a storage system.

9. Optional: If you want to send email notifications of alert violations to contacts other than the policy contacts or global alert notification addresses, enter the email addresses in the Email Override field.

Tip: If you enter an email address in the Email Override field, only that email address receives notifications for the alert. The following contacts do not receive notifications:

- Any email addresses that are specified as policy contacts, if the alert is in an alert policy.
- Any global email addresses that are specified for alert notifications. To view the global alert notification addresses, go to Settings, Notification Settings.

10. Optional: Click View Additional Options to specify how frequently you are notified of alerts.

Use these settings to avoid triggering too many alerts for some conditions.

11. Optional: Click the icon  to duplicate an alert.

Use this action when you want to define another alert for the same attribute but with different criteria and settings.

Duplicating alerts can be helpful in the following situations:

- When you want to generate separate warning alerts and critical alerts for different conditions on the same attribute.
For example, for a capacity attribute such as Available Capacity, you might want to define the following alerts:
 - Define a warning alert  to be generated when the amount of available capacity on a resource's disks is less than or equal to 50 GiB.
 - Duplicate the alert, but this time, specify a critical severity  when the amount of available capacity on a resource's disks is less than or equal to 10 GiB.
- When you want to send alert notifications to different people based on the severity of an alert.
In the previous example for the Available Capacity attribute, you can configure the notification settings so that warning alerts are sent to junior administrators, while critical alerts are sent to more senior administrators to resolve.

12. Click Save Changes.

Defining application alerts for performance metrics

You can define alerts that are triggered when the performance of the volumes that belong to an application fall outside a specified threshold.

About this task

To define an application alert for performance metrics, select the metric that you want to measure for the volumes in an application and specify a threshold value. When the performance of a volume falls outside the threshold, an alert is generated. For example, by using the Read Response Time metric you can define an alert that notifies you when the response time for a volume exceeds 20 milliseconds per read operation.

Procedure

To define an application alert for performance metrics, complete these steps:

1. In the menu bar, select Groups > Applications.
2. Right-click an application in the list and click View Alert Definitions.
3. Click Edit Alert Definitions.
4. Click Volumes and then click Performance.
5. Click Add Metrics.
6. Select one or more metrics to alert on and click OK.
7. To enable the alert for a performance metric, click the check mark for the metric.
8. Specify the conditions for generating an alert.

Conditions include an operator and a threshold value.

- a. Select an operator.

An operator determines if an alert is triggered when the performance of a resource is *greater than or equal to* or *less than or equal to* the specified threshold value.

- b. Enter a threshold value.

For example, to trigger an alert if the Total I/O Rate for a storage system is greater than or equal to 500 ops/s, enter the value 500.

Tips for threshold values:

- IBM Spectrum® Control provides recommended values for threshold values that do not vary much between environments. For example, the default threshold values for Port Send Bandwidth Percentage are greater than or equal to 75% for warning alerts, and greater than or equal to 85% for critical alerts.
However, for metrics that measure throughput and response times, thresholds can vary because of workload, model of hardware, amount of cache memory, and other factors. In these cases, there are no recommended values. To help determine threshold values for a resource, collect performance data over time to establish a baseline of the normal and expected performance behavior for that resource. After you determine a set of baseline values, define alerts to trigger if the measured performance behavior falls outside the normally expected range.
- For some metrics, lower values might indicate more stress and higher values might indicate idle behavior. For example, a lower threshold value for the Cache Holding Time Threshold metric might indicate a performance problem.

9. Assign a severity to an alert.

Assigning a severity can help you more quickly identify and address the critical performance conditions that are detected on volumes. The severity that you assign depends on the guidelines and procedures within your organization. Default assignments are provided for each alert.

Option	Description
 Critical	Assign this severity to alerts that are critical and must be resolved. For example, you might assign a critical severity to alerts that notify you when the average Read Response Time for volumes is greater than or equal to 20 ms/op.
 Warning	Assign this severity to alerts that are not critical, but represent potential problems. For example, you might assign a warning severity to alerts that notify you when the average Read Response Time for volumes is greater than 10 ms/op but less than 20 ms/op.
 Informational	Assign this severity to alerts that might not require any action to resolve and are primarily for informational purposes.

10. Optional: Click View Performance to view a chart of the performance of the resource. Use the chart to evaluate the current and historical performance of a resource to help determine the threshold value for an alert.

The chart uses colored lines to represent the different threshold values and severities that can be defined for an alert:

- Critical alert: red
- Warning alert: orange
- Information alert: blue

To customize the chart, click Top 10 or Bottom 10 to show resources according to their performance, click a time period, and change the start and end dates for the data that is displayed.

11. Optional: If you want to send email notifications of alert violations to contacts other than the policy contacts or global alert notification addresses, enter the email addresses in the Email Override field.

Tip: If you enter an email address in the Email Override field, only that email address receives notifications for the alert. The following contacts do not receive notifications:

- Any email addresses that are specified as policy contacts, if the alert is in an alert policy.
- Any global email addresses that are specified for alert notifications. To view the global alert notification addresses, go to Settings > Notification Settings.

12. Optional: Click View Additional Options to specify how frequently you are notified of alerts.

Use these settings to avoid triggering too many alerts for some conditions.

13. Optional: Click the icon  to duplicate an alert.

Use this action when you want to define another alert for the same metric but with different criteria and settings.

Duplicating alerts can be helpful in the following situations:

- When you want to generate separate warning alerts and critical alerts for different thresholds on the same metric.
For example, for the Read Response Time metric for volumes, you might want to define the following alerts:
 - Define a warning alert  to be generated when the average time that it takes to service each read operation is greater than or equal to 10 milliseconds.
 - Duplicate the alert, but this time, specify a critical severity  when the average time is greater than or equal to 20 milliseconds.
- When you want to send alert notifications to different people based on the severity of an alert.
In the previous example for the Read Response Time metric, you can configure the notification settings so that warning alerts are sent to junior administrators, while critical alerts are sent to more senior administrators to resolve.

14. Click Save Changes.

Defining custom alerts for applications

Define a custom alert to combine multiple conditions from multiple resources for an application in a single alert. By creating a custom alert, you can analyze multiple configuration, capacity, and performance conditions together to determine whether an urgent situation occurred on the servers, volumes, filesets, and shares in an application.

About this task

For example, you can create a custom alert that notifies you when the used capacity on both volumes and filesets is greater than a specified amount.

Tip: In a custom alert, the resource types that you specify conditions for must be associated with the same type of top-level resource. For example, if you include conditions for storage system volumes, you can also include additional conditions for filesets and shares, but you cannot include conditions for servers.

Procedure

1. In the menu bar, select Groups > Applications.
2. Right-click an application in the list and click View Alert Definitions.
3. Click Edit Alert Definitions.
4. Click Custom.
5. Click the  Create Alert icon, then enter a name for the alert.
6. Assign a severity to the alert.

Assigning a severity can help you more quickly identify and address the critical conditions that are detected on resources. The severity that you assign depends on the guidelines and procedures within your organization.

Option	Description
 Critical	Assign this severity to alerts that are critical and need to be resolved. For example, assign a critical severity to alerts that notify you when the Port Send Bandwidth Percentage is greater than or equal to 85%. The default severity for custom alerts is critical.
 Warning	Assign this severity to alerts that are not critical, but represent potential problems. For example, assign a warning severity to alerts that notify you when the Port Send Bandwidth Percentage is greater than or equal to 75% but less than 85%.
 Informational	Assign this severity to alerts that might not require any action to resolve and are primarily for informational purposes.

7. Select a component, category, and group for the alert.
For example, select Volumes, Capacity, and Used Capacity.
8. For general and capacity attributes, specify the criteria for generating an alert.
Use criteria such as greater than or equal to, less than or equal to, storage values, and time measurements to customize the conditions under which attributes generate alerts.
For example, for a capacity attribute such as Used Capacity, you can specify that an alert is generated when the amount of used capacity on a resource is more than or equal to 75%. The operator (less than or equal to) + a specified amount of space (75) + the unit of measurement (%) is the criteria that determines if an alert is generated.
Tips:
 - Not all attributes require criteria for generating alerts. The category and type of an attribute determines whether you can specify criteria and the options that you can select.
 - Some attributes can use the operators such as *is*, *is not*, and *changes*. For example, for the Used Inodes attribute for a fileset, select the operator changes to be notified if the current number of used inodes for a fileset changes.
9. For performance attributes, click Add Metrics. Specify the criteria for generating an alert.
Criteria includes an operator and a threshold value.
 - a. Select an operator.
An operator determines if an alert is triggered when the performance of a resource is *greater than or equal to* or *less than or equal to* the specified threshold value.
 - b. Enter a threshold value.
For example, to trigger an alert if the Total I/O Rate for a volume is greater than or equal to 500 ops/s, enter the value 500.
Tips for threshold values:
 - For metrics that measure throughput and response times, thresholds can vary because of workload, model of hardware, amount of cache memory, and other factors. In these cases, there are no recommended values. To help determine threshold values for a resource, collect performance data over time to establish a baseline of the normal and expected performance behavior for that resource. After you determine a set of baseline values, define alerts to trigger if the measured performance behavior falls outside the normally expected range.
 - For some metrics, lower values might indicate more stress and higher values might indicate idle behavior. For example, a lower threshold value for the Cache Holding Time Threshold metric might indicate a performance problem.
10. Optional: Click View Performance to view a chart of the performance of the resource. Use the chart to evaluate the current and historical performance of a resource to help determine the threshold value for an alert.
The chart uses colored lines to represent the different threshold values and severities that can be defined for an alert:
 - Critical alert: red
 - Warning alert: orange
 - Information alert: blue
To customize the chart, click Top 10 or Bottom 10 to show resources according to their performance, click a time period, and change the start and end dates for the data that is displayed.

11. Optional: If you want to send email notifications of alert violations to contacts other than the policy contacts or global alert notification addresses, enter the email addresses in the Email Override field.
Tip: If you enter an email address in the Email Override field, only that email address receives notifications for the alert. The following contacts do not receive notifications:
 - Any email addresses that are specified as policy contacts, if the alert is in an alert policy.
 - Any global email addresses that are specified for alert notifications. To view the global alert notification addresses, go to Settings > Notification Settings.
12. Optional: Click View Additional Options to specify how frequently you are notified of alerts.
Use these settings to avoid triggering too many alerts for some conditions.
13. + Add another condition to the custom alert and repeat steps 7 - 11.
If you do not want to add another condition, continue to the next step.
14. Click Save Changes.

Defining alerts for general groups

Define alerts for changes in the configuration, attributes, and performance of the resources in your general groups.

Before you begin

Before you can define general group alerts for a resource type, you must first add resources of that type to the group or one of its subgroups. For example, if you want to set an alert for the attributes of a switch, you must first add one or more switches to your general group or one of its subgroups.

About this task

Tips for working with alerts in general group hierarchies:

- When you edit the alert definitions for a general group, you can edit the alert definitions for its subgroups at the same time. The resources for all subgroups of the general group are shown when you edit the alert definitions for a parent general group.
- If you define a general group alert for a resource such as a server, and the server also belongs to subgroups, the alert is generated once at the parent group level. Separate alerts are not generated for each of the subgroups that contain the server.
- If a subgroup has the same alert as a parent group but with different conditions, separate alerts are generated for the subgroup for the different alert conditions.
- [Defining general group alerts for attribute and capacity changes](#)
You can define alerts that are triggered when the attributes or capacity of the resources that belong to a general group change.
- [Defining general group alerts for performance metrics](#)
You can define alerts that are triggered when the performance of the storage systems or switches that belong to a general group fall outside a specified threshold.
- [Defining custom alerts for general groups](#)
Define a custom alert to combine multiple conditions from multiple resources for a general group in a single alert. By creating a custom alert, you can analyze multiple configuration, capacity, and performance conditions together to determine whether an urgent situation occurred on the resources in a group.

- [General groups](#)

Defining general group alerts for attribute and capacity changes

You can define alerts that are triggered when the attributes or capacity of the resources that belong to a general group change.

Before you begin

Attributes represent the key properties and configuration of a resource, such as status, removals, discoveries, and data collection status. Capacity represents storage statistics such as available and used file system capacity, drive capacity, and volume used capacity.

Procedure

To define a general group alert for attribute and capacity changes, complete these steps:

1. In the menu bar, select Groups > General Groups.
2. Right-click a general group in the list and click View Alert Definitions.
3. Click Edit Alert Definitions.
4. Click the type of resource that you want to set an alert for.
You can set an alert for one or more of the attributes of the resource itself or its internal resources.
For example, for a switch, you can set an alert for the attributes of the switch itself and for the attributes of the blades, inter-switch connections, and ports.
5. Click the category of the attributes that you want to alert for.

Category	Description
General	Attributes for the key properties of a resource, such as status, removals, discoveries, and data collection status.
Capacity	Attributes for capacity statistics of a resource, such as available and used capacity, drive capacity, file systems, volumes, and pools, and reserved capacity.

6. To enable the alert for an attribute, click the check mark for the attribute.

7. Specify the conditions for generating an alert for an attribute.

Conditions can include operators such as >=, or <=. Conditions can also include storage values and time values.

For example, for a capacity attribute such as Available Capacity, you can specify that an alert is generated when the amount of available capacity on a resource's pools is less than or equal to 50 GiB.

☒ Available Capacity

Operator	Value	Unit
<=	50	GiB

Tips:

- Not all attributes require criteria for generating alerts. The category and type of an attribute determines whether you can specify criteria and the options that you can select.
- Some attributes can use the operators such as *is*, *is not*, and *contains*. For example, for the Firmware attribute on a DS8000® storage system, select the operator contains. Then, in the value field, type R5 to be notified if the firmware is at the R5 level rather than at a later version such as R6.3, R6.2, or R6.3.

8. Assign a severity to an alert to help you more quickly identify and address the critical conditions that are detected on resources.

The severity that you assign depends on the guidelines and procedures within your organization. Default assignments are provided for each alert.

Option	Description
 Critical	Assign this severity to alerts that are critical and must be resolved. For example, assign a critical severity to alerts that notify you when the amount of available capacity on a file system falls below a specified threshold.
 Warning	Assign this severity to alerts that are not critical, but represent potential problems. For example, assign a warning severity to alerts that notify you when the status of a data collection job is not normal.
 Informational	Assign this severity to alerts that might not require any action to resolve and are primarily for informational purposes. For example, assign an informational severity to alerts that are generated when a new fileset is added to a storage system.

9. Optional: If you want to send email notifications of alert violations to contacts other than the policy contacts or global alert notification addresses, enter the email addresses in the Email Override field.

Tip: If you enter an email address in the Email Override field, only that email address receives notifications for the alert. The following contacts do not receive notifications:

- Any email addresses that are specified as policy contacts, if the alert is in an alert policy.
- Any global email addresses that are specified for alert notifications. To view the global alert notification addresses, go to Settings > Notification Settings.

10. Optional: Click View Additional Options to specify how frequently you are notified of alerts.

Use these settings to avoid triggering too many alerts for some conditions.

11. Optional: Click the icon  to duplicate an alert.

Use this action when you want to define another alert for the same attribute but with different criteria and settings.

Duplicating alerts can be helpful in the following situations:

- When you want to generate separate warning alerts and critical alerts for different conditions on the same attribute.
For example, for a capacity attribute such as Available Capacity, you might want to define the following alerts:
 - Define a warning alert  to be generated when the amount of available capacity on a resource's disks is less than or equal to 50 GiB.
 - Duplicate the alert, but this time, specify a critical severity  when the amount of available capacity on a resource's disks is less than or equal to 10 GiB.
- When you want to send alert notifications to different people based on the severity of an alert.
In the previous example for the Available Capacity attribute, you can configure the notification settings so that warning alerts are sent to junior administrators, while critical alerts are sent to more senior administrators to resolve.

12. Click Save Changes.

- [Alert notifications and actions](#)

Defining general group alerts for performance metrics

You can define alerts that are triggered when the performance of the storage systems or switches that belong to a general group fall outside a specified threshold.

About this task

To define a general group alert for performance metrics, select the metric that you want to measure and specify a threshold value. When the performance of that resource falls outside the threshold, an alert is generated. For example, you can define an alert that notifies you when the back-end response times for managed disks on a SAN Volume Controller exceed 35 milliseconds per read operation. The Overall Back-end Response Time is a metric that measures the average number of milliseconds that it takes to service each read operation on a managed disk.

Procedure

To define a general group alert for performance metrics, complete these steps:

1. In the menu bar, select Groups > General Groups.
2. Right-click a general group in the list and click View Alert Definitions.
3. Click Edit Alert Definitions.
4. Click the type of resource that you want to alert on.
5. Click Performance and then click Add Metrics.
6. Select one or more metrics to alert on and click OK.
7. To enable the alert for a performance metric, click the check mark for the metric.
8. Specify the conditions for generating an alert.

Conditions include an operator and a threshold value.

- a. Select an operator.

An operator determines if an alert is triggered when the performance of a resource is *greater than or equal to* or *less than or equal to* the specified threshold value.

- b. Enter a threshold value.

For example, to trigger an alert if the Total I/O Rate for a storage system is greater than or equal to 500 ops/s, enter the value 500.

Tips for threshold values:

- IBM Spectrum® Control provides recommended values for threshold values that do not vary much between environments. For example, the default threshold values for Port Send Bandwidth Percentage are greater than or equal to 75% for warning alerts, and greater than or equal to 85% for critical alerts.
However, for metrics that measure throughput and response times, thresholds can vary because of workload, model of hardware, amount of cache memory, and other factors. In these cases, there are no recommended values. To help determine threshold values for a resource, collect performance data over time to establish a baseline of the normal and expected performance behavior for that resource. After you determine a set of baseline values, define alerts to trigger if the measured performance behavior falls outside the normally expected range.
- For some metrics, lower values might indicate more stress and higher values might indicate idle behavior. For example, a lower threshold value for the Cache Holding Time Threshold metric might indicate a performance problem.

9. Optional: Click View Performance to view a chart of the performance of the resource. Use the chart to evaluate the current and historical performance of a resource to help determine the threshold value for an alert.

The chart displays a horizontal color line at the specified threshold value. The color of the line indicates the severity of the alert:

- Critical alert: red
- Warning alert: yellow
- Information alert: blue

For multi-conditional alerts, the chart displays a horizontal line for each condition that shows the threshold value and severity.

To customize the chart, click Top 10 or Bottom 10 to show resources according to their performance, click a time period, and change the start and end dates for the data that is displayed.

10. Assign a severity to an alert.

Assigning a severity can help you more quickly identify and address the critical performance conditions that are detected on resources. The severity that you assign depends on the guidelines and procedures within your organization. Default assignments are provided for each alert.

Option	Description
 Critical	Assign this severity to alerts that are critical and must be resolved. For example, assign a critical severity to alerts that notify you when the Port Send Bandwidth Percentage is greater than or equal to 85%.
 Warning	Assign this severity to alerts that are not critical, but represent potential problems. For example, assign a warning severity to alerts that notify you when the Port Send Bandwidth Percentage is greater than or equal to 75% but less than 85%.
 Informational	Assign this severity to alerts that might not require any action to resolve and are primarily for informational purposes.

11. Optional: If you want to send email notifications of alert violations to contacts other than the policy contacts or global alert notification addresses, enter the email addresses in the Email Override field.

Tip: If you enter an email address in the Email Override field, only that email address receives notifications for the alert. The following contacts do not receive notifications:

- Any email addresses that are specified as policy contacts, if the alert is in an alert policy.
- Any global email addresses that are specified for alert notifications. To view the global alert notification addresses, go to Settings > Notification Settings.

12. Optional: Click View Additional Options to specify how frequently you are notified of alerts.

Use these settings to avoid triggering too many alerts for some conditions.

13. Optional: Click the icon  to duplicate an alert.

Use this action when you want to define another alert for the same metric but with different criteria and settings.

Duplicating alerts can be helpful in the following situations:

- When you want to generate separate warning alerts and critical alerts for different thresholds on the same metric.
For example, for the CRC Error Rate metric for ports, you might want to define the following alerts:
 - Define a warning alert  to be generated when the number of frames per second that are received with cyclic redundancy check (CRC) errors is greater than or equal to 0.01 counts per second.
 - Duplicate the alert, but this time, specify a critical severity  when the CRC error rate is greater than or equal to 0.03 counts per second.
- When you want to send alert notifications to different people based on the severity of an alert.
In the previous example for the CRC Error Rate metric, you can configure the notification settings so that warning alerts are sent to junior administrators, while critical alerts are sent to more senior administrators to resolve.

14. Click Save Changes.

Defining custom alerts for general groups

Define a custom alert to combine multiple conditions from multiple resources for a general group in a single alert. By creating a custom alert, you can analyze multiple configuration, capacity, and performance conditions together to determine whether an urgent situation occurred on the resources in a group.

About this task

For example, you can create a custom alert that notifies you when the response times for volumes and pools in a group exceed a certain threshold and the performance monitors for storage systems are running without problems.

Tip: In a custom alert, the resource types that you specify conditions for must be associated with the same type of top-level resource. For example, if you include conditions for storage systems, you can also include additional conditions for pools and volumes, but you cannot include conditions for servers.

Procedure

1. In the menu bar, select Groups > General Groups.
2. Right-click a general group in the list and click View Alert Definitions.
3. Click Edit Alert Definitions.
4. Click Custom.
5. Click Create Alert, then enter a name for the custom alert.
6. Assign a severity to the alert.

Assigning a severity can help you more quickly identify and address the critical conditions that are detected on resources. The severity that you assign depends on the guidelines and procedures within your organization.

Option	Description
 Critical	Assign this severity to alerts that are critical and need to be resolved. For example, assign a critical severity to alerts that notify you when the Port Send Bandwidth Percentage is greater than or equal to 85%. The default severity for custom alerts is critical.
 Warning	Assign this severity to alerts that are not critical, but represent potential problems. For example, assign a warning severity to alerts that notify you when the Port Send Bandwidth Percentage is greater than or equal to 75% but less than 85%.
 Informational	Assign this severity to alerts that might not require any action to resolve and are primarily for informational purposes.

7. Select a component, category, and group for the alert.
For example, select Volumes, Capacity, and Available Capacity.
8. For general and capacity attributes, specify the criteria for generating an alert.
Use criteria such as greater than or equal to, less than or equal to, storage values, and time measurements to customize the conditions under which attributes generate alerts.
For example, for a capacity attribute such as Used Capacity, you can specify that an alert is generated when the amount of used capacity on a resource is more than or equal to 75%. The operator (less than or equal to) + a specified amount of space (75) + the unit of measurement (%) is the criteria that determines if an alert is generated.
Tips:
 - Not all attributes require criteria for generating alerts. The category and type of an attribute determines whether you can specify criteria and the options that you can select.
 - Some attributes can use the operators such as *is*, *is not*, and *changes*. For example, for the Firmware attribute on a DS8000® storage system, select the operator contains. Then, in the value field, type R5 to be notified if the firmware is at the R5 level rather than at a later version such as R6.3, R6.2, or R6.3. This alert definition might be useful if you want to be notified when the firmware for a storage system was reverted to a previous version for some reason.
9. For performance attributes, specify the criteria for generating an alert.
Criteria includes an operator and a threshold value.
 - a. Select an operator.
An operator determines if an alert is triggered when the performance of a resource is *greater than or equal to* or *less than or equal to* the specified threshold value.
 - b. Enter a threshold value.
For example, to trigger an alert if the Total I/O Rate for a volume is greater than or equal to 500 ops/s, enter the value 500.
Tips for threshold values:
 - For metrics that measure throughput and response times, thresholds can vary because of workload, model of hardware, amount of cache memory, and other factors. In these cases, there are no recommended values. To help determine threshold values for a resource, collect performance data over time to establish a baseline of the normal and expected performance behavior for that resource. After you determine a set of baseline values, define alerts to trigger if the measured performance behavior falls outside the normally expected range.
 - For some metrics, lower values might indicate more stress and higher values might indicate idle behavior. For example, a lower threshold value for the Cache Holding Time Threshold metric might indicate a performance problem.
10. Optional: Click View Performance to view a chart of the performance of the resource. Use the chart to evaluate the current and historical performance of a resource to help determine the threshold value for an alert.
The chart uses colored lines to represent the different threshold values and severities that can be defined for an alert:
 - Critical alert: red
 - Warning alert: orange
 - Information alert: blueTo customize the chart, click Top 10 or Bottom 10 to show resources according to their performance, click a time period, and change the start and end dates for the data that is displayed.
11. Optional: If you want to send email notifications of alert violations to contacts other than the policy contacts or global alert notification addresses, enter the email addresses in the Email Override field.
Tip: If you enter an email address in the Email Override field, only that email address receives notifications for the alert. The following contacts do not receive notifications:
 - Any email addresses that are specified as policy contacts, if the alert is in an alert policy.
 - Any global email addresses that are specified for alert notifications. To view the global alert notification addresses, go to Settings > Notification Settings.
12. + Add another condition to the custom alert and repeat steps 7 - 11.
If you do not want to add another condition, continue to the next step.
13. Optional: Click View Additional Options to specify how frequently you are notified of alerts.
Use these settings to avoid triggering too many alerts for some conditions.
14. Click Save Changes.

Configuring alert notifications

Alerts can define notification actions that send email, generate Simple Network Management Protocol (SNMP) traps, or generate IBM® Tivoli® Netcool®/OMNIBus events. To enable these notification actions, you must configure IBM Spectrum® Control for email, SNMP, or Tivoli Netcool/OMNIBus alert notifications.

Tip: For alert notifications to generate SNMP traps or IBM Tivoli Netcool/OMNIBus events, first configure IBM Spectrum Control for these notification actions. Then, enable the actions as alert notifications for an alert policy, a resource, or an individual alert.

- [Configuring email alert notifications](#)
To send alert notifications and reports, you must configure the email server.
- [Configuring SNMP alert notifications](#)
You can define an alert to generate SNMP traps when an alert condition is detected on a monitored resource. To enable SNMP alert notifications, configure IBM Spectrum Control to direct the traps to at least one SNMP destination.
- [Configuring Tivoli Netcool/OMNIBus alert notifications](#)
You can define an alert to generate Tivoli Netcool/OMNIBus events when an alert condition is detected on a monitored resource. To enable Tivoli Netcool/OMNIBus notifications, configure IBM Spectrum Control to direct the events to a Tivoli Netcool/OMNIBus server.

Configuring email alert notifications

To send alert notifications and reports, you must configure the email server.

Before you begin

To add or modify settings for the email server, you must be assigned the Administrator role.

About this task

The email server that is used to send alert notifications is also used to send reports. If you didn't configure the email server for alert notifications, you must configure the email server before you create reports.

IBM Spectrum® Control ensures, when it sends alert notifications and reports by email to your email server, that it complies with the security standards that you configure on your email server. For example, if your email server requires authentication and TLS to send emails, then IBM Spectrum Control uses the authentication credentials that you provide when you set up the email server, and uses TLS to establish the connection with your email server. Because the email server that you set up is automatically trusted, you don't have any additional management tasks such as importing the server certificate into the keystores that are used by IBM Spectrum Control.

Procedure

1. Click Settings > Notification Settings.
2. Type the host name, or IPv4, or IPv6 address of the email server.
3. Type the port number that is used by the email server to send alert notifications and reports.
4. Type the name of the user and the password that you want to use to authenticate with the email server.
5. Optional: Type the email address, such as the email address of the administrator, that you want to use for receiving replies to alert notifications and reports.
If you don't enter a value, and you entered an email address in the User Name field, then replies are sent to that address. Otherwise, replies are sent to **no-reply@<Spectrum_Control_server_host_name>**.
Tip: Before you save the settings for the email server, test the connection.
6. Optional: To specify the email addresses that you want to notify when an alert notification is generated, click Global email notification settings, and add each email address separated by a comma.
You can override the global setting for alert notifications by editing the notification settings for a specific alert policy, for a specific resource, or for a specific alert definition that is associated with a resource.
Restriction: Applies only to alert notifications.
7. Click Save.

Configuring SNMP alert notifications

You can define an alert to generate SNMP traps when an alert condition is detected on a monitored resource. To enable SNMP alert notifications, configure IBM Spectrum® Control to direct the traps to at least one SNMP destination.

Before you begin

To modify alert notification settings, you must be assigned the Administrator role.

You must also be running an SNMP management application in your system environment. A Management Information Base (MIB) file is provided in the IBM Spectrum Control installation. You must set up the SNMP trap receiver with the MIB file to receive SNMP traps.

The MIB is automatically deployed when you install IBM Spectrum Control, and can also be found on the installation media.

Table 1. Location of MIB file

Location of MIB file	Directory
Installation media	\data\snmp\tivoliSRM.mib
After IBM Spectrum Control is installed	installation_dir\data\snmp\tivoliSRM.mib

SNMP version support: »IBM Spectrum Control supports SNMPv1, SNMPv2, and SNMPv3 for using SNMP traps destinations to receive alert notifications.⏏

Procedure

To configure SNMP alert notifications, complete the following steps:

1. Go to Settings > Notification Settings.
2. Click the SNMP tab.
3. Click Edit, and specify new settings or remove existing settings.
 - To specify new settings, complete the following steps:
 - Specify the following SNMP alert notification settings for each SNMP destination. You can specify up to two SNMP destinations.

Community

Specify the name of the SNMP community for sending SNMP traps. By default, the community is *public*.

IP address

Specify the host that is configured to receive SNMP traps. You can specify a host name, an IPv4 address, or an IPv6 address depending on what is supported within your environment.

Port

Specify the port number for receiving SNMP traps. SNMP trap messages are sent to this port when an alert condition is detected. By default, the port is set to 162.

- Click Save.
- To delete the current configuration settings without specifying new settings, click Remove.

Configuring Tivoli Netcool/OMNIBus alert notifications

You can define an alert to generate Tivoli® Netcool®/OMNIBus events when an alert condition is detected on a monitored resource. To enable Tivoli Netcool/OMNIBus notifications, configure IBM Spectrum® Control to direct the events to a Tivoli Netcool/OMNIBus server.

Before you begin

To modify alert notification settings, you must be assigned the Administrator role.
In your system environment, you must be running a Tivoli Netcool/OMNIBus server that is configured to receive IBM Spectrum Control alerts.

Procedure

To configure Tivoli Netcool/OMNIBus alert notifications, complete the following steps:

1. Go to Settings > Notification Settings.
2. Click Netcool/OMNIBus in the left-side navigation.
3. Click Edit and specify new settings or remove existing settings.
 - To specify new settings, complete the following steps:
 - Specify the following Tivoli Netcool/OMNIBus alert notification settings:

IP address

Specify the NetCool/OMNIBus server that is configured to receive notifications. You can specify a host name, and IPv4 address, or an IPv6 address. You cannot use a server that is configured for IPv6 only. The server must be IPv4 or dual stack enabled.

Port

Specify the port for receiving alert notifications. Alert notifications are sent to this port when an alert condition is detected. By default, the port is set to 5529.

- Click Save.
 - To delete the current configuration settings without specifying new settings, click Remove.
4. Copy the EIF rules files that are provided with IBM Spectrum Control to the appropriate directory in the Tivoli Netcool/OMNIBus installation.

Rules file names	Location of rules files in IBM Spectrum Control	Copy rules files to this location in Tivoli Netcool/OMNIBus
<ul style="list-style-type: none">• tivoli_eif_tpc.rules• tivoli_eif_tpc_tbsm.rules	<i>extracted_installation_image/data/omnibus</i>	<i>\$OMNIHOME/probes/arch/</i>

For more information about rules file, see the [Tivoli Netcool/OMNIBus Knowledge Center](#).

Triggering conditions for alerts

Define alerts so that IBM Spectrum® Control automatically notifies you when certain conditions or events are detected on monitored resources. Such conditions are the *triggering conditions* for the alert. The specific conditions that can trigger alerts depend on the type of resource that is being monitored.

- [Triggering conditions for storage system alerts](#)
You can set up IBM Spectrum Control so that it examines the attributes, capacity, and performance of a storage system and notifies you when changes or violations are detected.
- [Triggering conditions for hypervisor alerts](#)
You can set up IBM Spectrum Control so that it examines the attributes and capacity of a hypervisor and notifies you when changes are detected.
- [Triggering conditions for switch alerts](#)
You can set up IBM Spectrum Control so that it examines the attributes and performance of a switch and notifies you when changes or violations are detected.
- [Triggering conditions for fabric alerts](#)
You can set up IBM Spectrum Control so that it examines the attributes of a fabric and notifies you when changes are detected.
- [Triggering conditions for server alerts](#)
You can set up IBM Spectrum Control so that it examines the attributes and capacity of a server and notifies you when changes are detected.

Related concepts

- [Triggering actions and notifications for alerts](#)

Triggering conditions for storage system alerts

You can set up IBM Spectrum® Control so that it examines the attributes, capacity, and performance of a storage system and notifies you when changes or violations are detected.

Alerts can notify you of general, capacity, and performance changes and potential issues on the following resources:

- [Performance alert conditions for storage systems](#)
- [Capacity alert conditions for storage systems](#)
- [General alert conditions for storage systems](#)
- [Triggering conditions for storage system internal resource alerts](#)

Important: Not all the attributes upon which you can alert are listed here. To view a complete list of attributes upon which you can alert, go to Settings > Alert Policies. Double-click a default policy for a storage system. Click Edit Alert Definitions on the Alert Definitions tab. View the attributes that are available in the general, capacity, and performance categories. Note that the attributes that are automatically configured for alerts in the default alert policies, or default alerts, have a status of Active. In the tables, default alerts are marked with an asterisk (*).

Tips:

- The type of storage system determines which attributes and performance conditions are available for alerts. For example, triggering conditions for shares are available only for storage systems that are configured for file storage, such as Storwize® V7000 Unified.
- For capacity attributes, you can generate alerts when the amount of storage is greater than, less than, or equal to a specified value. You can also determine the unit of measurement for the attribute, such as KiB, MiB, GiB, or TiB.
- If you are doing tasks where many volumes are being deleted, you might want to temporarily disable alerts that use the Deleted Volume attribute. For example, you might want to disable Deleted Volume alerts temporarily if you are doing maintenance tasks or decommissioning storage.

Performance alert conditions for storage systems

Define alerts that notify you when the performance of a storage system falls outside a specified threshold. In alerts, you can specify conditions based on metrics that measure the performance of volumes, disks, ports, and nodes. By creating alerts with performance conditions, you can be informed about potential bottlenecks in your storage infrastructure.

Examples:

- You can define an alert to be notified when the average number of I/O operations per second for read and write operations on a storage system's volumes is greater than or equal to a specified threshold. Use this alert to be notified when the workload of a volume is high and you might need to balance that load across other volumes to improve overall performance.
- You can define an alert to be notified when the percentage of the average response time that can be attributed to delays from host systems is greater than or equal to a specified threshold. Use this alert to be notified of slow hosts and fabrics that might not be working efficiently.
- You can also define an alert that notifies you when a metric is less than a specified threshold, such as if you want to identify volumes that might be under used.

Tips:

- The type of storage system determines the metrics that can be alerted upon. For a list of the metrics that are available for each type of storage system, see [Performance metrics](#).
- A performance monitor must collect data about a resource before IBM Spectrum Control can determine whether a threshold is violated and an alert is generated for a performance condition.

Best practice: When you set thresholds for performance conditions, try to determine the best value so you can derive the maximum benefit without generating too many false alerts. Because suitable thresholds are highly dependent on the type of workload that is being run, hardware configuration, the number of physical disks, exact model numbers, and other factors, there are no easy or standard default rules.

A recommended approach is to monitor the performance of resources for a number of weeks and by using this historical data, determine reasonable threshold values for each performance condition. After that is done, you can fine-tune the condition settings to minimize the number of false alerts.

Capacity alert conditions for storage systems

Capacity metadata is aggregated and collected by probes. By default, this metadata is collected once every 24 hours.

Table 1. Triggering attributes and conditions for capacity changes on storage systems

Capacity Attributes	Triggering Conditions for Attributes
---------------------	--------------------------------------

Capacity Attributes	Triggering Conditions for Attributes
Adjusted Used Capacity	<p>The amount of capacity that can be used without exceeding the capacity limit. For example, you set a capacity limit of 80% for your storage systems. You want to get an informational alert when the adjusted used capacity exceeds 60% and a critical alert when the adjusted used capacity exceeds 80%. So, you define an informational alert with these parameters:</p> <p>Adjusted Used Capacity \geq 60%</p> <p>And, you define a critical alert with these parameters:</p> <p>Adjusted Used Capacity \geq 80%</p>
Available Capacity (Previously known as Available Pool Space)	<p>The total amount of the space in the pools that is not allocated to the volumes in the pools. To calculate available capacity, the following formula is used:</p> <p>(pool capacity - used capacity)</p> <p>For XIV® systems, pool capacity is the physical capacity of the pools and does not include the provisioned capacity of the pools.</p>
Available Written Capacity (Previously known as Effective Available Capacity)	The total amount of the provisioned capacity in the pools that is not allocated to the volumes in the pools.
Capacity (Previously known as Pool Capacity)	The amount of space in the pools on the storage system that is available for creating volumes.
Capacity-to-Limit	<p>The amount of capacity that is available for storing data before the capacity limit is reached. For example, if you set a capacity limit, you can define a warning alert when the available capacity, in relation to the capacity limit, falls below the value that you specify such as:</p> <p>Capacity-to-Limit \leq 500 GiB</p>
Compression Savings	The estimated percentage of capacity that is saved by using data compression, across all pools on the storage system. The percentage is calculated across all compressed volumes in the pools and does not include the capacity of non-compressed volumes. Inline compression is a software feature that is supported by FlashSystem A9000 and FlashSystem A9000R, IBM Spectrum Accelerate, XIV storage systems with firmware version 11.6 or later, and resources that run IBM Spectrum Virtualize.
Deduplication Savings	The estimated percentage of capacity that is saved by using data deduplication, across all data reduction pools on the storage system. The percentage is calculated across all deduplicated volumes in the pools and does not include the capacity of volumes that are not deduplicated. Available for FlashSystem A9000, FlashSystem A9000R, and resources that run IBM Spectrum Virtualize 8.1.3 or later.
File System Capacity	The total capacity on all of the file systems on the storage system or filer.
Mapped Capacity (Previously known as Assigned Volume Space)	The total volume space in the storage system that is mapped or assigned to host systems, including child pool capacity.
Overprovisioned Capacity (Previously known as Unallocatable Volume Space)	<p>The capacity that cannot be allocated to volumes because the physical capacity of the pools cannot meet the demands for provisioned capacity.</p> <p>IBM Spectrum Control uses the following formula to determine this value: Provisioned Capacity - Capacity</p> <p>Available only for thin-provisioned volumes.</p>
Provisioned Capacity (Previously known as Total Volume Capacity)	The total storage space on all the volumes in pools. For thin-provisioned and compressed volumes, this value includes provisioned capacity. For volumes with parent pools, this value includes child pool capacity.
Raw Capacity (Previously known as Raw Disk Capacity)	The total unformatted disk capacity of a storage system. When this value is calculated, IBM Spectrum Control does not include the capacity of storage system disks that become missing after data collection.
Total Capacity Savings (Previously known as Total Data Reduction Savings)	<p>The estimated percentage of capacity that is saved by using data deduplication, data compression, and thin provisioning.</p> <p>Available for FlashSystem A9000 and FlashSystem A9000R, IBM Spectrum Accelerate, XIV storage systems with firmware version 11.6 or later, and resources that run IBM Spectrum Virtualize.</p>
Reserved Capacity (Previously known as Reserved Pool Space)	<p>The amount of unused capacity in the pool that is reserved for provisioning and optimization tasks.</p> <p>Pool capacity is reserved when a provisioning or optimization task is created, and used when the task is run.</p>
Safeguarded Capacity	The total amount of capacity that is used to store volume backups that are created by the Safeguarded Copy feature in DS8000®.
Shortfall	<p>The difference between the amount of provisioned capacity that is committed to the volumes in the pools and the actual physical space that is available in the pools. As the provisioned capacity is allocated to the thin-provisioned and compressed volumes, the shortfall increases and becomes more critical.</p> <p>This value is determined by the formula, <i>Overprovisioned Capacity ÷ Committed but Unused Capacity</i></p> <p>For example, the physical capacity of the pools is 70 GiB, but 150 GiB of provisioned capacity was committed to the thin-provisioned volumes. If the volumes are using 50 GiB, then there is still 100 GiB committed to those volumes (150 GiB - 50 GiB) with only 20 GiB of available pool capacity (70 GiB - 50 GiB). Because only 20 GiB of the pool capacity is available, 80 GiB of the committed capacity cannot be allocated (100 GiB - 20 GiB).</p>
Snapshot Space	The amount of space that is used by all of the snapshots of the file systems that are associated with the IBM Spectrum Scale cluster.
Unreserved Capacity (Previously known as Unreserved Pool Space)	The amount of space in storage system pools that is not allocated for volumes, and is not reserved by pending or scheduled provisioning tasks.
Unmapped Capacity	The total volume space in the storage system that is not mapped or assigned to host systems.
Unused Volume Capacity (Previously known as Effective Unallocated Volume Space)	The amount of the provisioned capacity in the storage pool that is not used.

Capacity Attributes	Triggering Conditions for Attributes
Used Capacity (Previously known as Physical Allocation)	The percentage of physical capacity in pools that is allocated to volumes, including child pools. The value is always less than or equal to 100% because you cannot allocate more physical capacity to the volumes than is available in the pools. This value is determined by the formula, $Used\ Capacity \div Capacity \times 100$. For example, if the capacity that is reserved for volumes is 50 GiB for a volume size of 200 GiB, used capacity is 25%.
Used Capacity (Previously known as Used Pool Space)	The capacity in the pool that is allocated to and used by volumes.
Used Written Capacity (%) (Previously known as Effective Used Capacity)	The percentage of capacity that is provisioned to the standard-provisioned volumes and the thin-provisioned volume, given the drive compression savings.
Used Written Capacity (Previously known as Effective Used Capacity)	The total amount of provisioned capacity that is used by all volumes, given the drive compression savings.
Written Capacity Limit (Previously known as Effective Capacity)	The amount of provisioned capacity that can be created, given the drive compression savings.

General alert conditions for storage systems

Asset, capacity, and configuration metadata is aggregated and collected when probes collect storage system metadata. By default, metadata is collected once every 24 hours.

Table 2. Triggering attributes and conditions for general changes on storage systems

General Attributes	Triggering Conditions for Attributes
Firmware	<p>The firmware version of the microcode on a storage system. For the DS-series of storage systems, this value represents the SEA version of the firmware.</p> <p>To view information about the code bundles for the firmware versions of the DS-series, go to IBM® Support and search for code bundle information. An internet connection is required to access the support site.</p>
